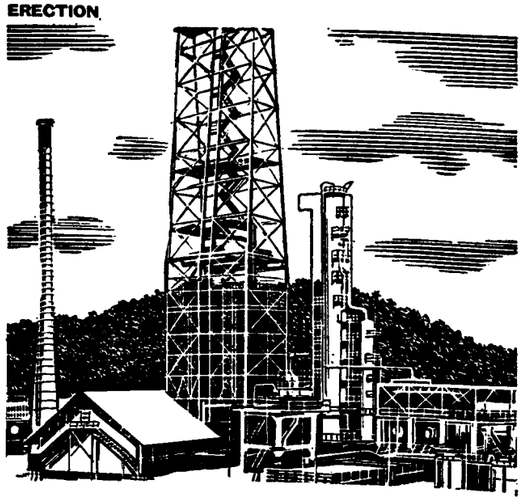
The Union Food Ministry, apparently, is conscious of this. It is understood to have planned rice imports during the next twelve months to the tune of six lakh tons — three lakh tons on commercial account from Burma and the U.A.R. and the remaining three lakh tons from the United States (1.5 lakh tons under the 1960 P.L. 480 deal and 1.5 lakh tons offered by the U.S. Administration for the current emergency at the rate of 2,000 tons per month till the middle of the next year). These imports, coupled with a slightly better crop this year than the previous year's 33.61 million tons, should help in maintaining a fair balance between supply and demand. But to keep the prices on an even keel, a dexterous handling of the situation would be, obviously, required.

The rice procurement and distribution policy finalised by the Union Food Ministry, with its adjuncts of monetary and inter-State movement restrictions, though imaginative, requires for its success the whole-hearted support of the trade. The trade will do a national service of extending its helping hand, without any reserve, especially by regulating its profit margin at not more than 1.5 per cent for cash sales and 2 per cent for credit sales at the wholesale level and 5 per cent at the retail level. These margins bear the approval of the Federation of the All-India Foodgrain Dealers' Association. The consumer also can do a yeoman service in the onerous task of containing rice prices by adapting his habits a little and taking to wheat at least to save 10 per cent of his rice consumption as appealed by Mr. Patil.

All this, of course, does not obviate the necessity of stepping up our rice output in the coming years. Let us not be waylaid that the war will be a few months' affair. Even otherwise, we have to become self-sufficient in our rice requirements to conserve the precious foreign exchange for economic development. Our rice yields per unit-area are not only the lowest in the world but they also vary considerably from one State to another. In areas like the Orissa State, where the peasantry is extremely poor and devoid of resources, the yields have not shown any significant improvement during the 'fifties despite all the planning and concerted efforts. In such areas, apart from strengthening the administrative machinery connected with the development of agriculture, there is a case for making available to the farmer such pre-requisites of farming as chemical fertilizers, improved seeds and implements and irrigation facilities, at subsidised rates.



PLANNING AND DESIGN

MANUFACTURE

ERECTION

SERVICING

L&T service to industry—complete jobs from blueprint to production *...all you do is turn the key*

Procurement of plant and machinery is only one step in setting up factories. From blueprint to production, many more services are required.

L&T have been leading suppliers of industrial plant and machinery in India for 24 years, gradually extending their services to planning, design, erection, civil engineering and construction and manufacture, and spreading 20 Regional Branch offices and Representatives all over India

Rapid industrialisation needs rational co-ordination. **L&T Turnkey Jobs** combine the services and products of many associated companies. Collaborations were entered into with foresight and services perfected through experience, to make L&T the Co-ordinator, who now places tailor-made factories ready for operation on the industrial scene.

Design, Erection, Service and Civil Engineering Departments, together with L&T's own manufacturing lines—welding alloys for gas and arc welding, electrical equipment and switchgear, drills and bits, industrial appliances, instruments, cooling towers, stainless steel, copper, aluminium and mild steel vessels, cast iron and steel lubricated taper plug valves, etc.—fully illustrate L&T's competence to serve Indian industries from blueprint to production

At Kansbahal, Orissa, three leading German firms—Gutehoffnungshuette Sterkrade AG., J.M Voith G.m.b.H and Heinrich Koppers G,m.b.H.—and Larsen & Toubro Limited, have pooled their vast resources and experience to set up UTMAL, a major undertaking for manufacturing heavy machinery. UTMAL will play a significant role in the rapid industrialisation of our country, by supplying a wide range of industrial machinery.

THE WEEK'S NOTES

Communist Unity

INTERNAL STRESSES

CUBA, and now India, have brought to the surface very forcibly the internal stresses and strains within the Communist bloc. It is not necessary to trace the history of these stresses to about a decade and a half back when Marshal Tito raised the open banner of revolt against Stalin. Yugoslavia was written off without much ceremony with the ruthlessness which was so characteristic of Stalin. But the ideological differences between Peking and Moscow could not be concealed, when six years ago the Communist bloc received its first shock with Mr. Khrushchev's forthright strategy of the denegration of Stalin and, what is more important, his ushering in the phase of de-Stalinisation. Peking has always ever since then taken the dogged attitude that the Khrushchev way was a way of deviationism and that the heritage to carry the trust of Communism had descended to it. Over 40 years of tight centralised rule in Russia brought about a change in the direction of softening the methods of the regime which were exhibited at their worst by Stalin. From Russia's experience Mr. Khrushchev looked at Mr. Mao's determined efforts at communisation of villages and rapid industrialisation of China's economy, irrespective of any cost in human toil and sufferings, as nothing but a repetition of what took place under Stalin.

The Chinese have, of course, a supreme sense of confidence in themselves and apparently in their infallibility. Their opportunity came with Cuba and, casting aside the erstwhile dignified methods, Peking began to indulge in open thrusts against Moscow, running down the Cuba compromise as blatant appeasement of America. But China's unexpected massive invasion of India created another source of threatened rupture between the two contenders to the leadership of the Communist bloc. Mr. Khrushchev's anxiety is to let nothing happen which will endanger India's position as a non-aligned power because that would lead to the rapid disintegration and final disappearance of the non-aligned bloc. This explains Mr. Khrushchev's present attitude of benevolent neutrality in the Sino-Indian dispute. It would be too much to expect that there will be an open rupture between China and Moscow in the immediate future and a polarization inside the Communist bloc. But the massive and unbreakable unity of this bloc has undoubtedly been weakened.

The Constitution

ILL-CONCEIVED AMENDMENTS

MR. BHUPESH GUPTA'S Bill to amend certain provisions of the Constitution was patently ill-conceived and if any vestige of doubt was left about their ill-conceived nature it was removed by the overwhelming opposition expressed vehemently by members representing different parties in the Rajya Sabha. To begin with, Mr. Bhupesh Gupta wanted the powers of the President to be curtailed and restricted by Statute so as to make the advice of the Prime Minister binding upon the President in every single instance. The President is elected under the Constitution by an electoral college and precisely for this reason it was necessary to build up a convention that he should be guided by the advice of his Council of Ministers. The choice before the framers of the Constitution was to devise a suitable solution to this question, in view of the fact that a clear and statutory definition of the relation between the two was not feasible, as we have not adopted the Presidential type of constitution as in the United States. This point was very soundly argued by Mr. K. Santhanam, who went, and quite rightly, at some length to explain why the provisions were so framed by the Constituent Assembly. There need not be any reasonable apprehensions at all that the convention whereby the President is bound by the advice of his Council of Ministers will not work smoothly as heretofore. It is well to remember that the President has a dual role to play—that of a Constitutional Head and that of the Guardian of the Constitution. It is for the second purpose that the prerogative or residuary powers, as they may be termed, can be exercised by the President in abnormal cases. In case the Cabinet of Ministers decides to undertake a course of action which is directly harmful to the public interest—to make a hypothetical assumption—the President can come forth with the exercise of his authority not to accept the advice of his Ministers and in turn warn them that he would be prepared to face the eventuality of impeachment, if need be. But it must be emphasized that this assumption is no more than an abstract possibility.

Mr. Bhupesh Gupta's another amendment related to the appointment of the judges of High Courts. The amendment seeks to do away with the advice of the Council of Ministers in this matter and proposes that the judges should be appointed by the President on the advice of the Chief Justices of the High Courts. This again is highly questionable and its practical implications are not fully considered. If the objection to the present provision is that Ministers will import political considerations in the appointment of judges, it was rightly argued that the Chief Justices also cannot be considered as infallible and free from personal preferences and prejudices. In the last resort the Home Minister will be answerable to the legislature in this matter too and it is because of this responsibility that he must have the voice in their appointments. Parliament's vigilance and its powers of corrective criticism are always there as safeguards against any likely trend towards selection of judges on extraneous considerations. Mr. Gupta's proposal to the effect that, in case of a conflict between the President and the Chief Justice, the issue should be referred to the legislature exposes the untenability of his amendment.

Mr. Phizo

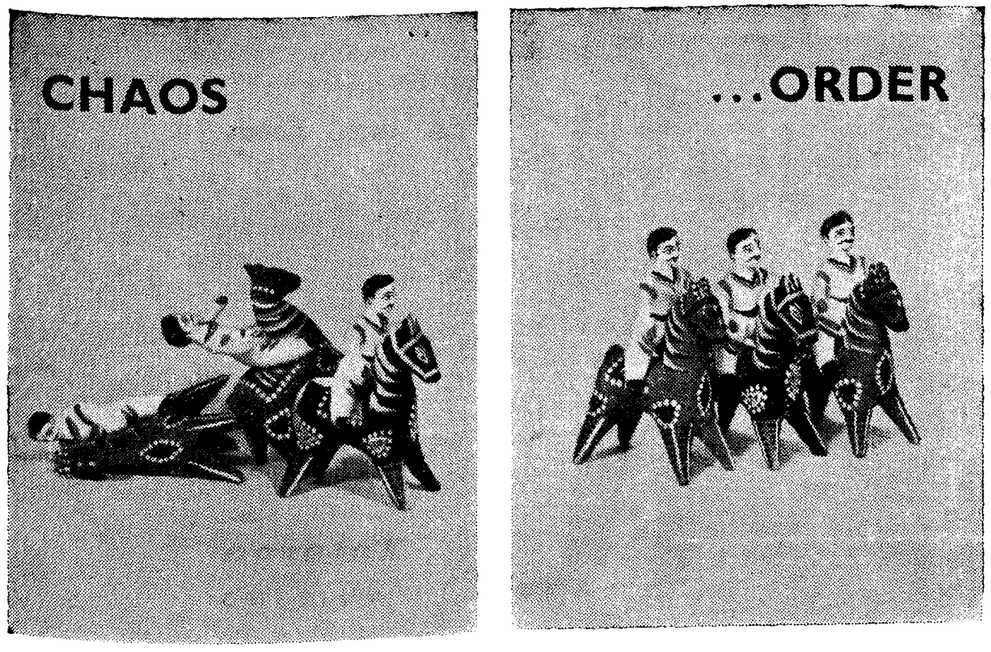
A HEROIC "OFFER"

MR. PHIZO'S offer of joining hands with the Government of India to fight the Chinese invaders was announced in London with all the fanfare of publicity. The manner in which the Press Conference was arranged thoroughly exposes his design. There may be some among his audience who may have been misled into accepting his bona fides and, what is still more curious, his capacity to "offer" the help on the stupendous scale he declared with such show of

authority. But none in this country, and certainly none in Nagaland, will be deceived by his words of bravado. In substance Mr. Phizo's offer is that he would mobilize under his command 40,000 strong Naga guerillas to fight in the cause of repelling the Chinese aggression. This mobilization would enable the Government of India to deploy to other areas of action an equivalent number of soldiers and equipment with which they are fighting. Since the arms for Phizo would be necessary their supply should be underwritten by Britain and America and its flow supervised by their representatives. Mr. Phizo would enter into a truce with the Government of India for one year.

Mr. Phizo, now a fugitive in London, took asylum there for no other reason than that he had lost the following in Nagaland and he knew that he could not pursue by guerilla tactics and violence his objective of achieving a free Nagaland. There never was a time when Mr. Phizo gave any demonstration of 40,000 Naga guerillas ready to act under his command against the Government of India and now that he has retired in the safe haven of London it is to be wondered what influence he can wield over any mentionable section of the Nagas. What is the truce that he is talking about when he has left whatever few followers he has to fend for themselves?

In the alternative, this self-styled commander of 40,000 strong guerillas has given a veiled threat to the Government of India that, if his offer of alliance is not accepted, the youth in Nagaland would turn towards China. There is little doubt whether the youth or any other section of the Nagas will do anything at his bidding. Nagaland has been conferred the status of an autonomous State and the Nagas have been convinced that they have been given an adequate measure to be the masters of their own destiny and their political, economic and social well-being is tied up with India. This "offer" has received only scant attention. Mr. Phizo's bluff has been called.



Retirement Age

HIGHER LIMIT

SINCE THE Second Pay Commission made its recommendation to raise the age of retirement for Central Government employees from 55 to 58 and the Government of India virtually declined to accept it, there has been an element of controversy over this issue. It would now appear that the Government has modified its attitude maintained hitherto and agreed to raise the limit to 58 years. This is, of course, subject to the condition, as the Home Minister, Mr. Lal Bahadur Shastri, pointed out, of physical fitness to continue to be in service for three years more. Barring this understandable qualification, the practical rule would be retirement at 58. This decision is to be commended for reasons which do not require any elaborate argument. At 55 an overwhelming majority of the employees possess sound health and they are physically fit to carry the burden of official business. But more important than that, their extension beyond 55 gives the State the benefit of experience and maturity of judgment which ordinarily go with the passage of time and seniority. Since the demands of our welfare State and the five-year plans have given an urgency to manpower supply, a great dearth of talent or personnel of requisite average qualifications is keenly felt. The raising of the retirement age would mitigate this handicap in a good measure. Under the present rule of 55 most of the retired employees have to seek post-retirement jobs if only because of the hardships of a sudden reduction of 50 per cent in the incomes in a period of progressive inflation. Many of the officers find themselves acceptable in responsible positions to private business organisations, but this avenue has led to a controversy. The higher retirement limit is expected to resolve this problem.

Mr. Lal Bahadur Shastri has announced that in view of Government's new policy of the higher retirement age there would be a decline in recruitment in the first three years of 12,000 persons. This may operate harshly upon new entrants, but it is not difficult to see how Parkinson's Law has demonstrated itself with a force in the Central Government establishments. If medium level officials will find their chances of promotion postponed for three years, they have the counter-balancing assurance that they would not be deprived of effective elevation in view of their retirement at 58. One of the major decisions in regard to the economy in expenditure which the Government is now going to take is to reduce new recruitment. And it has been emphasized especially that the requirements of the Ministries of Defence and of Economic and Defence Coordination for larger personnel consequent on the emergency should be made by transfers from other Ministries. This in itself is an indication, making allowance for austerity, of the surpluses available as a result of over-expansion.

Running a race? Running a business? The keynote is CONTROL.

But control is a complicated problem in a business organisation, for it means consultation and assessment of records. It also means arrangement of all kinds of records and information in such a manner that they can be consulted easily and quickly.

We have gone a step further in the Systems Division of Remington Rand.

We have devised Systems which not only arrange all your records for easy consultation, they even provide the *Control*. They convert your piles of files and notes and lists and ledgers into a *Working Force*.

Remington Systems can be arranged to tell you when to act, how to act. They can quickly and easily give you all the data you need to do the one thing they *cannot* do, use your judgement.

You do not have to be a big businessman to use a *Remington System*. You just have to be a good businessman.

MAKE YOUR RECORDS WORK FOR YOU

The World Abroad

MANAGERIAL EFFICIENCY IN THE U.S.A. AND THE U.S.S.R.

By ODYSSEUS

THE CLASH OF IDEAS between the USSR and the free world, together with the adoption of national planning by so many newly independent countries, has created world-wide interest in the Soviet economic system. At first this interest was largely satisfied by propaganda expositions for or against the Soviets. But, with the passing of the years, increasing efforts have been made to substitute serious academic investigation for sterile polemics.

Richard D. Irwin Inc., (1800 Ridge Road, Homewood, Illinois, USA) are to be warmly congratulated on their latest publication "The Soviet Economy" (edited by Professors M. Bornstein and D. R. Fusfeld of Michigan University), a symposium of eighteen essays by leading American and British authorities, covering the background of the USSR's economic performance, a comparison of the USSR and the USA national products, a comparison of the supply of professional manpower in the USSR and the USA, a study of the availability and reliability of USSR statistics, the Soviet experience in planning, the Soviet price system, the financing of Soviet development, managerial incentives and decision-making in the USSR and the USA, the Soviet labour market, trends in USSR wage differentials, the USSR's agricultural policy, Soviet trade and aid, the Soviet-bloc foreign trade system, levels of living wages, and prices in the USSR and the USA, and social welfare in the USSR.

All these essays are clearly written, with a minimum of economic jargon and a maximum of academic objectivity. One of the most fascinating is that by Professor J. S. Berliner, of Syracuse University, comparing managerial incentives in the USSR and the USA.

PERSONAL GAIN: KEY TO SOVIET EFFICIENCY

The moving force of free enterprise is the pursuit of personal gain. The worker chooses the higher paying job, the businessman accepts the most profitable contract. The USSR have experimented with other systems but practicality has defeated dogma and personal gain has been the chief incentive to Soviet managers for the past thirty years. There is high authority for this: Lenin said that Communism must be built "not directly on enthusiasm but with the aid of enthusiasm .." and "on private interest, on personal incentive, on business-like accounting."

For the Western entrepreneur, managing his own business, profit is the key guide. But most Western entreprises are now run by salaried managers, and the profit belongs to the shareholders, not the manager. In order to approximate the interests of managers and shareholders as closely as possible most Western companies have bonus systems, assuming that if managers have a stake in the profits, their decisions will maximise profits. In setting up incentives for its managers, the USSR faced the same problem as Western shareholders, and evolved the same answer—bonuses.

The amount of income that bonuses earn in the USSR is substantial. In 1947, for example, managers in the USSR iron and steel industry earned average bonuses of 51.4 percent of their basic salaries. Since this was the average, many individual managers earned much more.

Nobody disputes that the USSR economy is efficient. The question is: how efficient? Like those of the West, Soviet managers are deeply involved in their work: they worry about production quotas, they demand results from their workers. But the pressure in Soviet industry is probably greater than in the West, because the absence of free trade unions makes it difficult for workers to resist pressure for intense cooperation and managers are under constant official exhortation to step up production. But whereas the bonus system in the West works, by and large, towards approximating the interests of managers and shareholders, countless efforts to ensure that it works in the interests of the state in the USSR have been less successful.

In a planned economy it is vital for the planners to have accurate information about productive capacity, but Soviet managers persistently under-state capacity, because their bonuses depend on the over-fulfilment of targets. If the manager reports his capacity honestly, and something goes wrong, then he and his staff lose that month's bonus. It is therefore safer to report a smaller capacity in order to allow for the unforeseen. This is why Soviet planners are never sure that their plans are based on accurate figures. One way in which they try to solve this problem is arbitrarily to raise targets. Targets have, on occasion, been set so high that one third of all enterprises failed to achieve them. The intense pace of plant operation does elicit a high level of endeavour from managers, but the price paid is the manager's effort to defend his enterprise by concealing his full capacity.

When the target is set, the manager's bonus depends on fulfilling it. Most of his production does follow the plan, but when the end of the month comes, and as may often happen, production is short, managers resort to a variety of defences. In metals, for example, the target is in tons. If he is short, the manager may order curtailment of production of special or quality lighter metals and concentration on the heavy weights. In textiles, managers may over-produce narrow-width and under-produce broad-width cloths. Where production targets are set in money values, managers may over-produce higher priced products or may use more expensive materials to drive up the value of production. Managers may also "borrow" production from the next month, i.e., they report items as having been produced this month and hope to make up the deficit next month, like the Western bank clerk who "borrows" from the till, intending to make it up later.

More serious than falsification is deterioration in production. Much "economy" in quality is hard to detect: fewer stitches in a garment, fewer screws in a piece, greener timbers in a building, more impurities in a metal.

Another Soviet problem is the perpetual shortage of supplies. To ensure the greatest possible production from available supplies, the USSR uses many devices to economise the use of material in production and in stock. These do control waste, but they also compel managers to trick the planners. The basic problem of the manager is that he simply can't trust the planning system to provide him with the needed supplies at the right time in the right quantities and

qualities. What can he do? He over-orders in hopes that if he doesn't get all, he may at least get what he needs. A survey of 15 Moscow enterprises revealed a 10.4 percent over-ordering of metals. The consequence is that the accumulating of hoards of Ridden supplies of all kinds is one of the USSR planners' headaches.

BRIBERY

Managers solve the difficulty of ensuring their supplies by employing illicit special supply expediters, called "tolkachi". This agent visits his enterprise's suppliers, handing out bribes to ensure that his orders are well handled, and picking up other supplies of one kind or another, which his firm may be able to use or to exchange for other needed goods. Much of the "tolkachi's" time is spent on the black market, i.e. obtaining materials for which the planners have issued no allocation order. They do this either by wheedling an order out of a reluctant official or by persuading a venial official to sell them goods without an order.

The "tolkachi" fully earn their high incomes because their work is important and because they run the risk of prison. On the debit side, their work means the transfer to one fortunate enterprise of resources that would have gone to another with a higher prority. On the credit side, their wide knowledge of sources of supply, of who has what to sell, speeds the movement of supplies that would otherwise lie idle in one plant while another needs them.

Bonuses also induce managers to resist technological innovation, because new methods involve risks, take time to learn, and, once introduced, cause higher targets to be set, which make it more difficult to earn bonuses. When a manager has a well-running plant and the workers know their jobs, it is courting disaster to try new ways: production difficulties have to be overcome, workers re-trained, time is lost, spoilage is high. If old machines are wearing out, it is safer to repair, or even rebuild, them than try more complicated new models. Expenditures on re-building old machines often exceed the price of a new modern machine. Even if the potential gains are great, it is often some years before they can be achieved, but since it is Soviet policy to shift managers around from plant to plant every few years, managers take the short-term view. Why take on the headaches of a new line when you are not likely to be there to enjoy the benefits? The state combats managerial resistance to innovation by pressure and by direct orders, but recent economic literature continues to be full of discussion on how to speed up innovation.

Professor Berliner warns us not to conclude that the USSR economy does not work well. He emphasises that he does not seek to suggest that the Soviets are ineffective but to throw light on the gap that every economy shows between the ideal and the actual. He drives home his point by comparing Soviet and American managers. American managers are extremely efficient, but it would be fatuous to claim that they are one hundred percent efficient. Exploration of the gap between the ideal and the actual in American management will help to place the corresponding gap in the USSR in perspective. We will explore this next week.

Kirloskar a MUST for small Industrialists

GRADE 1 CENTRE LATHES MODEL 'MBD' 165 mm CENTRE HEIGHT

built to high precision. Inspected and stamped by Government of India. Available in two sizes:

MBD 1 – Distance between Centres 600 mm
Bed Length 1350 mm

MBD 2 – Distance between Centres 1000 mm
Bed Length 1800 mm

Motor drive situated underneath the bed in steel cabinet.

Machine fitted with Norton type quick-change gearbox enabling screw-cutting by simply changing levers thus avoiding tedious process of changing gears for different pitches.

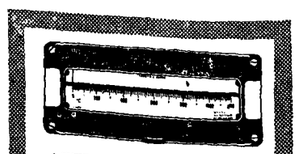
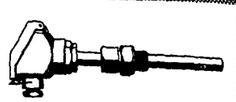
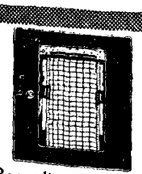
THE
THERMOCOUPLE CIRCA 1800



THE TRAIL-BLAZING OF A DEDICATED SCIENTIST PAVED THE WAY FOR TODAY'S HIGH TEMPERATURE MEASURING EQUIPMENT





Today's electric high temperature measuring equipment owes much to the pioneering of an early 19th century scientist. Seebeck's discovery—like most great findings—stemmed from a simple experiment. He joined a copper wire and bismuth wire at each end, heated one junction and discovered that an electric force was generated.. Seebeck had made the first thermocouple and the principle for electric high temperature measuring equipment was established.

In 1826, another scientist, Becquerel, converted the principle to practical use. He joined two strips of dissimilar metals, immersed one junction in a bath of mercury and attached the other to a dial indicating instrument. He heated the mercury, checking its temperature with a thermometer. The electric force thus generated caused deflections in the dial indicator. By relating these deflections to the thermometer readings Becquerel calibrated the dial indicator up to 300°C. He further extrapolated temperatures up to 1350°C. Seebeck's and Becquerel's experiments paved the way for the modern thermocouple.

Negretti and Zambra too, have pioneered in the field of temperature. Over a century's experience lies behind their range of electrical indicating, recording and controlling instruments. To industry worldwide, the name Negretti and Zambra means instrumentation of faultless workmanship and trusted reliability.

The European Scene

ITALIAN NEO-CAPITALISM

From Our Special West European Correspondent

PARIS, November 18

THE Italian economic miracle is now a decade old. Whether or not expansion can be maintained henceforth at the same pace as in recent years (and there is no good reason why it should not; it might well even gather momentum), it is clear that Italy has undergone an irreversible change: economic progress has become a habit, something that all entrepreneurs take for normal. Business confidence will have its ups and downs, as in the past, and the level of activity in other countries will impinge on Italian industry, but the economy will never be the same again. Something broke around 1950, releasing a new current into the nation's economic life, a current that will flow now strongly, now hesitantly, but which cannot be snuffed out. What was it that broke?—so that, for example, the production of petro-chemicals was multiplied by 23 between 1953 and 1960, and so on through the list of manufactures. Looking back to the crucial period when Italy got over a watershed in her history, one can see various factors that were no doubt necessary conditions of the mutation: the monetary stabilisation, American assistance and the initial liberalisation of foreign trade. Yet these do not seem sufficent to have triggered the transformation of Italian industry. The discovery of the vast deposits of methane gas in the Po valley, occurring at the psychological moment and falling into the hands of Enrico Mattei, was probably a more decisive fact. Once the process was set going, for whatever reason, it is easy to see why progress should be rapid: 20 years of Fascism and then the war had cut Italy off from most technological advance, so there was bound to be a period of feverish catching up. The large reserves of unemployed, the loss of the colonies and all imperial ambition, and the low level of military expenses meant that resources were available for this effort.

Nevertheless, given the structure of Italian industry, it was perfectly possible that all these opportunities could have been missed. The most important sectors were dominated by one or two big firms each, and these unadventurous corporations were long used to exercising their monopoly powers to resist all innovation. Edison in electricity, Montecatini in chemicals, Fiat in motor cars, the ENI in oil and the other private or public corporations each in its respective sector, were not seeking to stimulate, and did not even expect, the mutation that was soon to come over the Italian scene. Italian capitalism was corporate in structure (in the medieval sense of corporation) and unenterprising in character; it resisted the liberalisation of trade, denounced the first plans for a European Common Market and opposed the establishment of an integrated-cycle steel industry in the peninsula. The decisive change that was to transform Italy would not, it appeared, come from that quarter. But it did, if Eugenio Scalfari is correct in his reading of 'Italian Neo-Capitalism' in a book of that title just published. (Rapporto sul neocapitalismo italiano).

He claims that events in Italy provide a demonstration of the notion of "lateral entry", as defined by theorists of imperfect competition. When each branch of basic industry is more or less monopolised by one enterprise, it is virtually impossible for new competitors to arise within any sector. The monopolist that dominates that market can wipe them out before they become dangerous: by cutting them off from raw materials, asphyxiating them by denying them access to the distribution network, ruining them by dumping, and in general using its vast financial resources to prevent disturbing outsiders attaining the large scale of operation necessary in any important modern industry. In these conditions, a sort of equilibrium may be reached, where economic growth and innovation are resisted successfully. Unless—and this is the one danger that the big corporation cannot ward off—another corporation equally big but hitherto confined to its sector decides to break all the rules and invade a neighbour's kingdom. That is "lateral entry". Once the oligopolies begin treading on each other's toes, the equilibrium is broken and growth (very rapid growth at that) becomes possible.

This is what happened in Italy in 1949-50, and Scalfari claims to be able to pinpoint the instant when one monopoly resolved to break the rules—which, as long as they were observed, were conveninent for all the big firms concerned, though not for Italy. That moment came when Edison, the biggest electric supply firm, panicked at the thought that electricity might be nationalised. It has been since, this very year; but the project had been in the air for over a decade, for it was the prime condition of political co-operation between the ruling Christian Democrats and the non-Communist Left. Foreseeing the day when it would lose its productive assets, Edison very reasonably decided to launch out into a new field. Since electric power is by far the most important "raw material" in several branches of the chemicals industry, it chose chemicals. But that meant declaring war on Montecatini, which at that time produced in Italy: 90 per cent of pyrites, 92 per cent of dyes, 86 per cent of nitrogenous products, 70 per cent of aluminium, 75 per cent of superphosphates, 75 per cent of rayon—and so on through the list; in short it dominated the chemicals industry as comfortably as Edison and its allies did electric supply.

Hostilities commenced in typically Italian style: Edison stole from Montecatini its most brilliant chemical engineer, Angelo Fornara. (Signor Fornara is a key man in the story, because when Enrico Mattei decided some years later to invade chemicals, in turn, he stole Fornara from Edison.) Though irritated, Montecatini watched Edison's first steps in the chemicals industry with some condescension, perhaps hoping to acquire on the cheap Edison's ambitious plant when the electric supplier discovered how difficult the new field was. In that, they underestimated the immense reserves Edison had built up during its long career as an electric supplier with dominating power over rate-fixing, and its anxiety to put those reserves beyond the reach of a government that might decide to nationalise electricity. Edison's ventures were bold, imaginative and successful and by the time Montecatini realised the extent of the danger it was too late—the oil monopoly under Enrico Mattei had entered the fray, because Mattei was as afraid of being strangled by his private enemies as Edison was of being nationalised. At least, it was too late for any other answer than the one Montecatini chose: it fought back by expanding in

other chemicals branches and by invading other people's preserves in its turn: Mattei's, by beginning to prospect for oil, and then Edison's, by taking up nuclear energy.

The gloves were off, and the old corporative structure of Italian industry shattered beyond repair. Edison's enemies stepped up the campaign for the nationalisation of electricity, and began revealing to the public just what profits Edison had been making thanks to its power over rate-fixing. More important than this political mud-slinging was the price war they unleashed. When Mattei and Edison had their fertiliser plant at work, they began with price cuts of 15 per cent which soon became 70 per cent. The price of polyethylene crashed in two years from 800 liras a kilo to 260, which is lower than the American price. To wage this battle, the firms involved had to multiply their turnover by proportions never before seen in Italy and push the country along the way to the era of mass consumption. Indeed before long, production was reaching figures that Italy alone could not cope with, and the big corporations became converts to the Common Market faith. From there on the story is familiar, but Scalfari thinks he has found its starting point in the war that Edison and the ENI of Enrico Mattei declared on Montecatini.

"The battle", he added, "is far from finished. In a sense, one could say that it is just beginning. The positive aspect of this phenomenon is evident: by creating for the first time a vast market in our country and by restoring a minimum of competition in a milieu hitherto dominated by corporative relations, it has unleashed a whole set of centrifugal forces and countervailing powers previously unknown in Italy. If this movement is continued .... democracy in our country only stands to gain." It is true that the story of the Italian miracle cannot be told without mention of the transformation that occurred within (and in relations between) Montecatini, Edison, ENI, Fiat, Snia Viscosa, Pirelli and Italcementi; these firms and a handful of others are behind almost everything that has happened in the peninsula. It is the extent of their resources, for example, that explains how industrial expansion has occurred with very little recourse to bank finance and only a modest appeal to the stock market. The sinister power of High Finance, if that suggests the banks and the bourse, has played no role, so to speak, in the long industrial boom, because the funds for it were found by the erstwhile monopolies in the acquired substance they had after many years of comfortable and non-competitive living.

That hostility among this small group of corporations explains much of Italian economic progress seems to be contradicted by the fact that their capital structure today is interlocking: each owns a good packet of the others' equity. Scalfari finds the reason of that in a mutual defence reaction to take-over bids by outsiders. Early in the 1950's "old-style" capitalists (families that had amased fortunes in textiles, mainly) saw that technological progress favoured the new industries (chemicals, oil, automobiles) and sought to take them over in stock-market raids. This would have been fairly simple, because the interests that in fact managed those corporations held quite small parts of the share-capital: the Pirelli family hold only 8 per cent of the stock in the company of that name, for example. To guard against the invasion of interlopers, the big corporations exchanged blocks of stock so that each held the other to ransom and all were safe from take-over bids. The breaking down of the system of monopoly "reserves" was compatible, it seems, with co-operation at the level of defence against interests from outside the small field of giant corporations.

PIA CARGO SERVICE

PIA are great people to fly freight with! Most of the India-Pakistan cargo to the U.K. and Europe is flown by the smooth, fast Viscounts and Jets of PIA. In the last five years their tonnage has increased enormously.

There is a regular cargo service on all flights, from Delhi to Karachi by Viscount, joining the international route at Karachi and on to London and New York by Jet stopping at major Middle East & European cities. This enables goods to travel by one air-line all the way thus saving time, eliminating loss, and ensuring their arrival in perfect condition.

Departure timings are arranged to suit market requirements— a great advantage, especially for agricultural and other easily perishable commodities. This convenience enables shippers to outsell competitors and get a quicker turnover.

Careful handling of cargo gives the minimum damage and loss in transportation.

For further details contact your travel agent or your nearest PIA Cargo Office.

Economic Report from the U.S.

DOLLAR STABILITY

By GUY SIMS FITCH

WASHINGTON, November 13.

THE U.S. dollar has weathered the Cuban situation in fine style — a tribute to the underlying international confidence in its stability and to the highly effective co-operative measures which have been worked out by the United States and other free nations for handling financial strains. This combination has discouraged speculation and has helped the dollar meet all the demands placed upon it. Dollar stability has remained strong even in the face of some disappointing developments. The U.S. economic advance has continued, but at a somewhat slower pace than anticipated, and the U.S. balance of international payments suffered a temporary worsening in the third quarter of this year after many months of steady improvement.

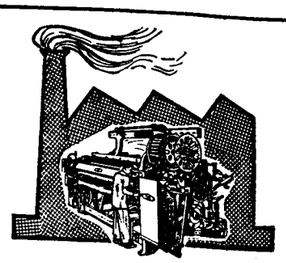
These developments have intensified the long-smouldering interest in expansionary policies. Normally, one might expect a balance-of-payments deficit to rule out such policies, which could enlarge the deficit in the national budget and could lead to price increases. In theory, both of these outcomes would be inflationary and would affect a nation's ability to compete in world markets. Significantly, however, expansionary U.S. policies seem to be winning general acceptance. At the recently concluded meeting in Paris of the Organization for Economic Co-operation and Development (OECD), considerable support seems to have been expressed for American policies, including tax cuts, that would further accelerate U.S. economic expansion. There is growing recognition that these policies need not lead to serious inflationary pressures in the United States, even if the result were a temporary enlargement of the budget deficit. With the economy still operating well below its potential and ample productive capacity available, U.S. production could increase substantially without generating any serious upward pressure on the general price level. In addition, a vigorous U.S. expansion would tend to benefit other nations as well, in view of the important position the United States occupies in international trade, finance and investment. It is even conceded that a U.S. policy of expansion could have a favourable impact on the balance of payments. Improvement in U.S. economic growth could encourage a flow of investment capital to the United States, and this would be an important plus in U.S. international accounts.

Behind this reasoning is an appreciation of the basic soundness of the U.S. position at home and abroad. The deficit in the balance of payments has been diminishing markedly for two years, and will be noticeably lower this year than last despite the recent faltering. This deficit moreover, is not caused by any basic trade weakness, as U.S. merchandise exports continue to outrun imports by some $5,000 million a year. Rather, it is due to the next outflow of capital in such forms as government economic and military aid and private tourism and investment. Indeed, U.S. private investments abroad can be viewed as important assets which help stimulate exports to some degree and which, through their earnings, may well contribute in time to the strengthening of the U.S. payments position.

It also is recognized that the world has in the dollar an acceptable, convertible and reliable medium of exchange, which everywhere commands goods and services or gold. In effect, international exchange rates are tied to it. It is hard to find any disagreement with President Kennedy's observation, at the recent Washington meeting of the World Bank and the International Monetary Fund (IMF), that if the dollar did not exist the world would have to invent it. IMF Director Per Jacobsson re-emphasized these points of view at the recent National Foreign Trade Convention in New York. In a major address to the 2,000 business men and observers present, he called attention to the soundness of the U.S. economy and strongly suggested that intelligent expansionary policies could be pursued at this time without unduly upsetting the considerable progress that has been made toward easing the deficit in the balance of payments. The IMF Director also hailed the international co-operation that has been developing among the free nations in trade, fiscal and monetary fields. He noted that intensification of this co-operation could contribute to further economic gains not only in the United States but around the world.

OUR HUMBLE OFFERINGS TO THE DEFENDERS

OF THE MOTHERLAND



In view of the National Emergency The Punjab National Bank Limited offers the Armed Forces Personnel and their wives FREE OF ANY CHARGE the usual banking facilities such as remittances from one office of the Bank to another to the same or any other Account, collection of salary and other cheques, carrying out of standing instructions for recurring payments. No incidental charges will be levied on Current and Savings Fund Accounts. For particulars please contact our nearest office.

All contributions by the public to the National Defence Fund will be remitted by all offices of the Bank without any charge.

Special Article

HOLDING THE PRICE LINE

HOW can the iron laws of economics be softened in a national emergency so that the pressures are not unevenly communicated to the masses? One major problem which has disturbed the planners is the anticipated rise in prices as a result of the bottlenecks which are likely to emerge in the foreseeable future (unless the Sino-Indian war is not prolonged) and when defence expenditure steadily mounts, increasing the volume of money supply in the hands of the public. Numerous suggestions have been given and some of them have already been discussed at length in the columns of this journal. Price determination by the Stabilisation Committee, the consumer co-operatives, the fair price shops, the display of price lists, and a host of other recommendations have been listed so that the man in the street who is bending all his energies to drive out the invader is not put under hardship by unscrupulous elements of society. The purpose of this Special Article is to assess how far the pressure of additional money is likely to be instrumental in generating inflationary pressure in the light of the recent history and how the impact of mounting money supply can be reduced.

It will be necessary first to highlight an extraneous factor which has a great bearing on the price situation in recent weeks. The psychology of the people has played a dominant part in not allowing prices to rise. Remarkably, the people have felt that this is a war in which nation's independence and territorial integrity must be protected and anybody who takes a wrong step so as to thwart the defence effort will be working against the national interest. All sections of society, especially the business community, have assisted in keeping the prices down. The consumers have also lent their support by curtailing their purchases and have preferred not to increase their indents out of sheer panic. In certain sectors, there has been even a virtual debacle in prices. In the light of these considerations, whatever measures are necessary to curb the rising prices will relate to long-term trends and not for the short-term period.

The table below sets out three series of economic indicators, namely, the wholesale prices, the money supply and the national income since 1951-52. Prima facie there is a close correlation between these three economic barometers. Any increase in money supply, if not simultaneously compensated by rise in national income, results in pushing up the prices. The movements have been of fluctuating nature and two clear-cut trends are apparent. In the case of prices, the break which started early in 1952 continued its downward trend unabated till

MONEY SUPPLY IN RELATION TO NATI ONAL INCOME AND WHOLESALE PRICES

Period	Index Numbers (Base: 1951-52 = 100)			Deviation of Wholesale Prices from Money Supply (1—2)	Deviation of Money Supply from National Income (2—3)	Net Variation of Prices and National Income from Money Supply (4+5)

* Average for 7 years.

** At 1948-49 prices.

1955-56 — the last year of the First Five-Year Plan. The phase of increasing deficit financing started with the Second Five-Year Plan which pushed up the money supply with the public much faster than in the First Five-Year Plan with the result that the increase in national income was not able to neutralise completely the effect of increased money supply and hence prices recorded a pronounced recovery. It is to be conceded, however, that the national income statistics in this comparison have got to be employed with some reservations because of the large percentage (believed to be nearly one-third of the total income) of the non-monetized sector. Since the varying ratio of the monetized and non-monetized sectors of the national income are not known, we are compelled to make use of this overall indicator. In any such calculation, however, the correct measure would be to relate the monetized income to money supply and wholesale prices. By and large, the comparison shows that the increase in money supply has invariably been followed by a rise in prices. That has been the pattern during the past decade; the economy may not operate differently in the future.

It does not mean, however, that national income would fail to rise in the coming years. In fact, the present trends show that with the same resources, the country is now being geared to war economy so as to produce much more than has been done in the recent months. To that extent, again, the increased supply of goods and services will produce a whittling down of the inflationary rise in prices. The diversion of the resources to certain strategic materials for conducting the war and the increased purchasing power in the hands of the people will, however, continue to press on prices. If during the next four months, money supply is increased by another Rs. 200 crores while national income—at least the consumer component—remains static, the increase in prices may be of the order not more than 3 to 4 per cent*. This is the impact of enforced circumstances and the hardship is not so great which the people may not be able to put up with. In fact, in the recent years, even under our five-year plans, inflation of this order has been tolerated by the people. Anything above that may be intolerable and must be curbed by regulating the economy which, however, it is known will not completely save the situation. Controls, as a matter of fact, should be imposed only as a last resort, whether through fair price shops or through the imposition of fixed prices or through any other means. If the supplies become scarce, not everyone is likely to obtain them at equitable prices. That may be the price that the people have to pay for waging the war and driving out the invader. The nation in its present mood is willing to put up with these hardships and there need not be any doubt that with the instruments available in the armoury of the Government it will be possible to keep the demon of rising prices under control and people will bear with fortitude any difficulties that may ultimately arise.

* The index of wholesale prices with base 1951-52=100 may rise from 106.0 in 1961-62 to 109.7 in 1962-63.

*are limited in certain areas.

Alongside these spontaneous offers to give of their best, all sections of the public, more particularly the business community on whose role depends, to a great extent, the morale of the common man, have also made a number of constructive suggestions which require to be carefully and promptly looked into. For instance, Mr. A. D. Shroff suggested the other day that the Government should introduce war risk insurance without delay. This is an eminently constructive suggestion, a suggestion motivated not by any desire to make sure of recovering personal losses by business men, but by a genuine desire to see that no effort is spared to sustain the morale of the business community. And yet, the business community has still been patiently waiting to hear of a concrete move on the part of the Government in the matter. In contrast to this tardiness, I vividly recall the expeditious manner in which insurance protection was made available to business men when there was an explosion in the Bombay docks in the forties by the alian Government then in power. The enemy and the war, we should have known at least by now from our bitter experience of the past few days, will not wait until we have made all our preparations. What is urgently needed is a sense of furious urgency in all these matters, and if Mr. Chavan succeeds in instilling this sense of urgency, I make bold to say, he will have won half the war against the Chinese.

Business Notes

Shipping

MODERNISING MAHARASHTRA'S MAIN PORT

UNDER THE development programmes envisaged in the Third Plan for major ports, the Bombay Port has been allotted an outlay of Rs. 26 crores for dock modernisation schemes, dredging of the main harbour channel, expansion of Ballard Pier, and a labour housing scheme, among others. It will be recalled that the World Bank agreed to provide the needed foreign exchange component of this total outlay, namely Rs. 8.57 crores. According to the latest annual Administration Report of the Bombay Port Trust (B.P.T.), the scheme for combining Victoria Dock with Alexandra Dock was modified and accepted as recommended by Mr. Posthuma, Managing Director of the Port of Rotterdam, whose services were secured by the Government of India. The modified scheme — the Dock Expansion Scheme (1962) as it is called — provides for the extension northwords of the eastern arm of the Alexandra Dock Basin so as to form four deep-water berths and for the shifting of the Ferry Wharf to the KLM berths, Prince's Dock, thereby releasing three more deep-water berths. With regard to the Dredging Project, the whole contract for dredging of the main channel and tanker anchorages has been given to a Dutch firm, to be carried out in two phases, involving the deepening of the middle and the northern portions, with the option, for the Port Trustees, if need be, to terminate the contract after the first phase is completed. Among others, the work of hydrographic survey of the entire harbour and the collection of siltation data, which were in progress even when the portion of the harbour between Trombay Jetty and Butcher Island was being surveyed, has since been completed.

Since the inception of planning in the country, there has been a phenomenal increase in the volume of cargo handled at the docks and bunders in the Bombay Port. Thus, the total weight of cargo handled in 1951-52 which amounted to 7.6 million dwt. — 5.9 million dwt. in imports and 1.7 million dwt. in exports — rose to 14.55 million dwt., with imports comprising 10.41 million dwt. and exports 4.14 million dwt., in 1961-62.

The year under review was one of record surplus for the Bombay Port. The Trustees closed the General Account for 1961-62 with a surplus of as much as Rs. 392.37 lakhs, as against a surplus of only Rs. 268.62 lakhs envisaged in the revised estimates. The Pilotage Account showed a surplus of Rs. 13.08 lakhs, as compared to the estimated surplus of Rs. 10.76 lakhs in the revised estimates. Even so, it is intriguing that the report should be rather apologetic, instead of being jubilant, about this surplus. This is probably because, according to the Report, this surplus is negligible in the context of the Port's steadily mounting expenditure. The B.P.T., we are told, has made payments of approximately Rs. 1.00 crore to the staff since 1962, by way of arrears of pay and allowances on account of the implementation of the decisions of the Jeejeebhoy Committee and the recommendations of the Second Pay Commission. The effect of the increase in the emoluments of the staff as above is estimated to cost about Rs. 28 lakhs from the current year onwards. In addition to these, the Report fears, the heavy expenditure ahead of it, when the implementation of the schemes of the Third Plan starts, would entail a heavy drain on the Port's reserves. All this is understandable, and one can also sympathise with the B.P.T. in its plight, but one only hopes that considerations of finance will not come in the way of prompt implementation of the work in hand. Indeed, the present emergency demands that the pace of implementing the programme of work should be accelerated as far as practicable.

I.O.C.

COLLABORATION WITH MOBIL

THE INDIAN OIL COMPANY, the Government-owned marketing organisation formed in 1959, has taken over the distribution of Mobil premium industrial and automotive lubricating oils and greases in India. This follows an agreement concluded recently with Mobil Petroleum, a wholly-owned subsidiary of the Socony Mobil Oil Company, Inc., whose products are sold in more than 150 countries and territories. Consignments of Flying Red Horse brand products have started arriving from the USA and are ready for distribution in India.

As part of an over-all agreement with the Mobil Petroleum Company Inc., New York, a new company, the Indian Oil Blending Limited, will be formed on a 50-50 partnership arrangement. This joint company will construct and operate two plants for the blending of industrial and automotive lubricating oils, one at Bombay and the other at Calcutta. Construction work will begin shortly. Both the plants are expected to go into production in a year.

The signing of the agreements with the Indian Oil Company assures the continued availability of Mobil products in India, despite the breakup, last April, of the Standard Vacuum Oil Company. It may be recalled that Standard Vacuum, originally owned 50-50 by the Socony Mobil Oil Company and the

Standard Oil Company (New Jersey), was divided between its owners, after 29 years of operation in South and South-East Asia, the Far East, Australasia and Southern and Eastern Africa. Virtually, all the products marketed by Standard Vacuum bore the Mobil name and the Flying Red Horse trade mark and conformed to Mobil specifications. Under the terms of the equitable divisions of assets, India was one of the countries wherein Standard of Jersey assumed the business of Standard Vacuum.

Commenting on the new Agreement, Mr. P. A. Gopalkrishnan, Managing Director of the Indian Oil Company, said: "We welcome the opportunity to participate with Mobil in this business venture. Their products, bearing the Flying Red Horse trade mark, have been sold in India since before the turn of the century, and our studies show the consumer, who has come to depend on them, wants them to continue on the Indian market. Besides the products and their reputation and the financial commitment, Mobil has assured us of such continuing technical assistance and training programmes as are needed to make it possible for the Indian Oil Company and its Indian personnel to best serve Indian industry".

Referring to the same agreement, Mr. V. A. Bellman, President of Mobil Petroleum, said in New York: It was inconceivable that Mobil would not take a vigorous initiative to return its products to India. The growth of India's industrial complex under her Five-Year Plans has been impressive, and her plans for further development in a free society promise tremendous growth opportunities for the nation, her people and commercial enterprises. Our participation in these ventures demonstrates our interest in India and the Indian economy. The past reception of Mobil products in India makes us confident that our new arrangement will be welcomed by the many thousands of former customers. We envisage a steady growth in the sale of Mobil products there".

Oil

ROYALTY DISPUTE SETTLED

THE PRIME MINISTER has given his award on the oil royalty dispute in Assam. He has fixed the rate of royalty at Rs. 7.50 per ton. This would be a specific figure per ton instead of being based on a calculation on the well-head value of crude as has been the case hitherto. Further, the rate would be a uniform one applicable to the whole of India and not only to Assam.

The dispute arose on the rate of royalty to be paid by Oil India Limited to the Government of Assam. Until July, 1961, the royalty had been calculated at 10 per cent of the well-head value of crude "in a substantial free market" which had been equated to the Oklahoma prices in the United States. This worked out to about Rs. 10|- per ton. In July, 1961, as a result, however, of an agreement between the Central Government and Oil India, this rate was reduced to Rs. 4.8 per ton.

The Prime Minister's Award has held that it would not be appropriate to continue the old basis of calculating the rate according to the prices prevailing in a foreign market. At the same time, in the present stage of exploration and development in India it would be difficult to arrive at a proper definition of a well-head value. The Award, therefore, has taken into account the actual selling price of crude oil in India (imported as well as indigenous), which ranges around Rs. 75|- per ton, as an index for apportioning the incidence of royalty. At 10 per cent of Rs. 75|- the royalty has been fixed at Rs. 7.50 per ton. It has been further provided that this rate should remain in force for a specified period of 4 years and could be reviewed at the end of that period.

Steel

RETENTION PRICES AND THE EMERGENCY

MR. J. R. D. TATA'S statement to the shareholders of the Tata Iron and Steel Company Ltd., brings forth a forceful rebuttal to the arguments presented by Mr. C. Subramaniam, Union Minister for Steel and Heavy Industries, about a couple of months ago in regard to the steel retention prices. Most of the arguments are almost the same which were listed by Sir Biren Mookerjee in his long speech last week, but Mr. Tata has particularly highlighted the fact that the judgment of the Tariff Commission was based on a study of performance of these units during the last two years and hence there was very little cause for the Government to whittle down the retention prices as recommended by the Tariff Commission. He further stated that the assumption made by the Government that the steel companies have enjoyed the benefit of large interest-free deposits from the customers was not based on facts. He particularly objected to the verdict of the Government in reversing its previous decision that the retention prices should include an element for the repayment with interest of their special advances in terms of their agreements with the companies.

Despite these differences with the Government, Mr. Tata rose to the occasion by making a categorical statement that in view of the national emergency created by the Chinese invasion, the company would make an earnest effort to provide unstinted co-operation to the Government in its war effort. That is a very reassuring statement because in the present emergency the safety of the country must come on top of all other considerations. The dispute about the retention prices pales into nothing while placed along with the peril to the nation.

Cement

HIGHER OUTPUT

WHILE INAUGURATING the Mysore Cements Factory recently at Ammasandra, near Bangalore, Mr. C. Subramaniam, Union Minister for Steel and Heavy Industries, indicated that, in the face of the present emergency, it might be necessary to revise the cement production target upward. The present output of cement is around 10 million tons and the present target for the end of the Third Plan is about 16 million tons. It might be added that the target for the Second Plan was originally much higher but had to be scaled down. Now that the shortages of cement have been insistent and there has been an added demand, the Government has good reasons to step up the target. In fact, it was revealed at the occasion that the Planning Commission would actually be considering the proposal.

It goes without saying that a basic industry like cement has to play an important role in building the economic and military strength of the country and this is the time to implement various vital projects

more efficiently and effectively. It was in this light that the Minister welcomed the commencement of this unit of Mysore Cements which has been accomplished as a result of collaboration between Indian and American enterprises. On this occasion tributes were paid to the entrepreneurial capacity of the promoter, Mr. S. K. Sarangapani Mudaliar as well as his American collaborator, Mr. Edgar Kaiser. The present capacity of the unit that has commenced production now is 100,000 tons per day. Foundation was also laid for the second stage of the plant which, when completed by the end of 1963, would result in doubling the present capacity.

This occasion also gained significance on account of the generous offer made by Mr. Edger Kaiser. He made it known that being the head of the Kaiser organisation in the U.S., he was prepared to place all their resources at the disposal of India for the purpose of meeting the emergency. This friendly offer coming at this critical juncture has to be appreciated. This gesture was further substantiated by a donation of Rs. 1 lakh in dollars to the Defence Fund. This indeed is a healthy indication and is a pointer to the fact that the private entrepreneur in America has started taking added interest in the economic uplift of our country in the face of the present emergency.

Explosives

MANUFACTURE BY DHARAMSI MORARJI-KHATAU

THE GOVERNMENT of India seems to have given the green signal to the Dharamsi Morarji-Khatau combine to manufacture explosives in this country. The foreign collaboration will be by the famous Italian firm Montecatini. Dharamsi Chemicals and Khatau and the foreign collaborators will each provide 33 per cent of the equity capital and the balance will be offered for public subscription. A new company with an equity capital of Rs. 3 crores is proposed to be floated for implementing the projects. proposed plants will have a capacity to manufacture 6,000 tons of nitro-cellulose, 10 million coils of safety fuses and 50 million detonators.

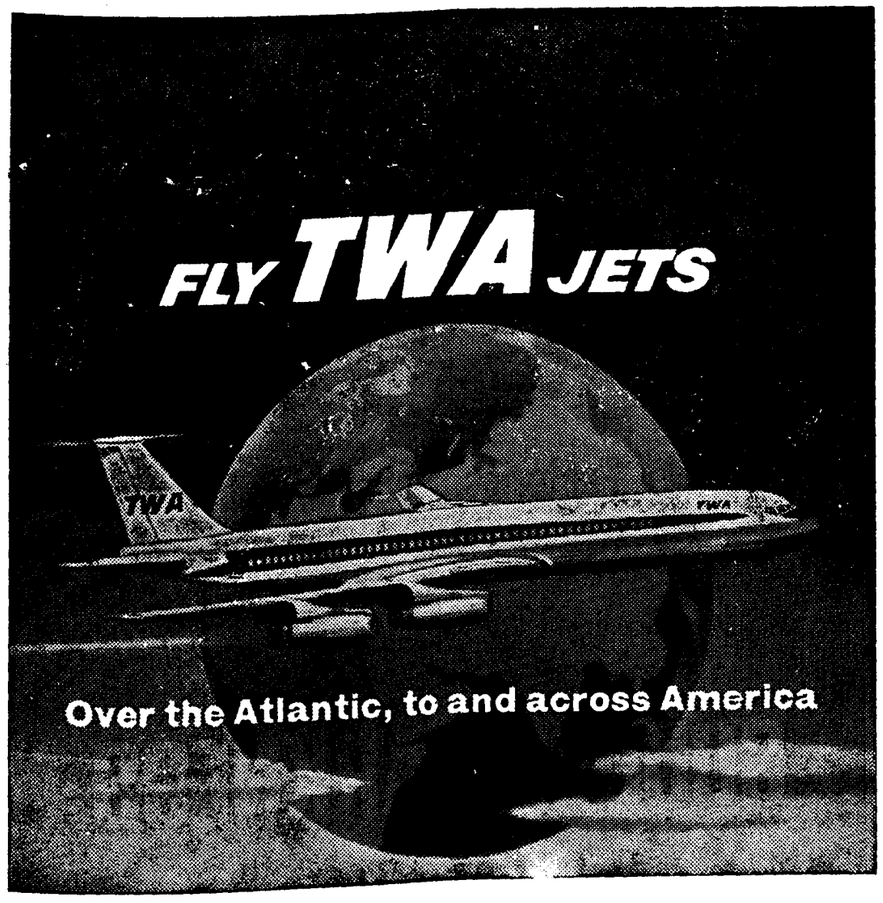
The well-known Italian firm of Montecatini has a considerable experience in the manufacture of explosives and its collaboration with the Indian firm is considered to be most timely. There has been increasing demand of nitro-cellulose and coils of safety fuses in this country and the Dharamsi Morarji-Khatau combine is likely to meet this demand to a great extent.

Leaving aside the manufacture of explosives it is also interesting to note that Dharamsi Chemicals also proposes to diversify its activities further by taking up the manufacture of strategic boron products, such as borax and boric acid, in collaboration with the well-known British firm Borax (Holdings) Ltd. which controls 70 to 80 per cent of the world's borax deposits and is the biggest producer of the borax in the world with a business net-work spread over the U.K., France, Spain, Australia, the U.S.A. and Latin America. Nearly 80 to 90 per cent of the Indian requirements of borax are also met by the British firm. Since borax is a vital raw material for a number of industries like glass, enamels, porcelain and detergents, the diversification of the activities of this company is considered very heartening for it would not only save foreign exchange on the imported stuff but would also provide requirements of agriculture in the form of boron. A new company named Borax Mararji Ltd. is proposed to be set up for the aforesaid purpose. The foreign collaborators are understood to have agreed not to charge any fee or royalty for the supply of technical know-how. The Dharamsi Chemicals is at present going ahead with its scheme of setting up of a new sulphuric acid plant with a production capacity of 300 tons per day. Orders for the necessary machinery and equipment have already been placed and the plant is expected to be commissioned by the end of next year.

New Floatations

HIND AUTO INDUSTRIES

THE INDIAN Automobile Industry moves a step forward as a result of the installation of a factory by Hind Auto Industries Limited for the manufacture of components. This new company has been sponsored by Premier Motors Private Limited of Lucknow in collaboration with the West German firm Alfred Sell Autoteilefabrik GmbH. The plant will be located at Lucknow and will manufacture tie rod ends, spring shackle bolts and pins and king bolts. In fact, the sponsors of this company, Messrs. Premier Motors Private Limited, are licensed to manufacture automobile components like tie rod ends, universal joint couplings, water pump repairing kits, king bolts and crown wheel tail pinions.



Now the Premier Motors has asked the Government of India for the transfer of this licence to the new company. The licensed capacities for different items in the first, second and third years of production as follows:

Items	1st year	2nd year	3rd year
Tie Rod Ends	2,00,000	3,00,000	3,60,000
Universal Joint Couplings	40,000	48,000	48,000
Water Pump Repairing Kits	22,000	26,400	26,400
King Bolts	78,000	1,17,000	2,34,000
Spring Shackle Bolts and Pins	2,50,000	3,75,000	7,50,000

The foreign exchange required for the import of machinery is reported to have been sanctioned already by the Government of India and the company has submitted an application to the Controller of Imports and Exports for the import of machinery. The authorised capital of the company is likely to be Rs. 1 crore and the issued capital will be Rs. 50 lakhs, divided into 5 lakh shares of Rs. 10 each. The company is likely to approach the market to raise capital sometime before the end of this year.

MADURA MILLS

MADURA MILLS COMPANY LIMITED has grown into its present size during the last 70 years to be one of the largest textiles manufacturers in the country. Apart from the textile units, the company has diversified its activities and today it manufactures several items such as yarns used for the production of tyre cord, sewing, thread, canvas and industrial products like hard and soft ducks and fan belts. Now the company has planned further expansion and has obtained a sanction to install 450 modern automatic looms partly to augment production of industrial fabrics and partly to produce other medium weight fabrics. This project is to be followed closely by

In Hospitals, Factories, Schools, Public places...

PUT AN END TO THE DANGERS OF

SUDDEN DARKNESS

In hospitals sudden darkness can be a danger to life. Emergency lighting is the obvious safeguard—and that's where Keepalite comes into its own. Keepalite is an automatic emergency lighting system employing lead-acid storage batteries which are automatically triggered into operation by the actual mains failure. Modern methods of control and 'trickle' charging mean that Keepalite equipment has outstandingly long life and requires minimum of maintenance. That's why architects everywhere specify Keepalite as sure inexpensive protection for hospitals, factories, schools, banks and public places.

KEEPALITE

BESC.79

dyeing, bleaching and finishing plant and further expansion of an additional 500 automatic looms.

To execute this programme, the company proposes to raise a sum of Rs. 1.25 crores by the issue of 7 per cent debenture stock 1974|76 in units of Rs. 1,000 each at par. The entire amount of this issue has been underwritten by various institutions and the company has agreed to a firm allotment of Rs. 63.75 lakhs debenture stock to these underwriters: The Industrial Credit and Investment Corporation of India (Rs. 16 lakhs); Great Eastern Shipping Company Limited (Rs. 20 lakhs); Pandyan Insurance Company Limited (Rs. 1.25 lakhs), Paternson and Company Limited (Rs. 7.5 lakhs); Chitra and Company (Rs. 11.5 lakhs) Harkishondass Lukhmidass (Rs. 7.5 lakhs). The remaining debentures are to be thrown open for public subscription on November 26. The list will close on November 30 or earlier at the discretion of the directors but not before November 28.

I.L.O.

NEED FOR MANPOWER CO-ORDINATION

ALTHOUGH CONSIDERABLE economic development has taken place and social welfare has been brought about in the Asian countries, yet it cannot be said to be commensurate with the magnitude of human needs. National and international action, therefore, will have to be accelerated to speed up the process of development in the Asian countries, so says the annual report of the Director-General of the ILO on social and labour policies in relation to the economic development problems of Asian countries. This report would figure as the first item on the agenda before the Fifth Asian Regional Conference to be held at Melbourne, Australia, from November 26 to December 8, 1962.

Mr. Morse, Director-General of the ILO, analyses the process of economic development in this report from the standpoint of the ILO and the suggestions that he makes are mostly from that angle. It is true that social change would not come just in the wake of economic development and therefore some direct purposeful action will have to be resorted to to bring about that change. The major needs of the Asian countries at the moment are that there should take place a rapid development in the rural areas and small-scale industrial undertakings be put on a suitable footing because they constitute a major segment of the national industrial structure. To have appropriate manpower development programme is also very essential as without proper manpower development programmes it may not be possible to execute our plans in a rightful manner and eliminate the crucial bottlenecks that exist in the process of development. Unemployment problem will have to be solved in a more extensive manner so that the fast-growing population in search of work may be able to contribute positively to the economic growth instead of acting as a drag on it. A strong trade union movement is, of course, the need of the hour because it is only through a strong trade union movement that a healthy collaboration can be brought about between the employers and the employees. The ILO has been conscious and statements have been made time and again in this respect but nothing concrete seems to have been done so far. It is high time that a serious thought is given to it.

There is no doubt that the process of development will have to be shaped in accordance with the needs and requirements of each country and the ILO could certainly help, as the Director-General has remarked, by intensifying the action in manpower development and giving further co-operation by lending it experts. But in view of the changing needs of the Asian countries, new lines of approach and types of assistance will be called for. In India the Institute of Applied Manpower Research has been set up, but it still is in a nascent stage. The staff there is rather limited and is not in a position to cope up with the work. Although it may not be advisable to recruit new personnel in view of the national emergency declared in the country, yet it would be wrong not to fill in the posts the need for which was realised long ago. Experts are needed to execute the various schemes and they by their experience either in research or in economic field, can certainly contribute to gearing the wheels of the economy to the war effort.

Non-Ferrous Metals

INCENTIVES REQUIRED FOR FURTHER PRODUCTION

AT A time when there is an urgent need to utilise the capacities of various industries fully, it is in fairness with things that a plea has been made by Dr. D. P. Antia, presiding over the 13th annual general meeting of the Indian Non-ferrous Metals Manufacturers' Association, that the method be reconsidered of allocating metals to manufacturers. One can understand the very tight foreign exchange position, but the only way to solve this is to increase our exports and for that Dr. Antia's suggestion is that sufficient incentives must be provided in the form of credit facilities etc. The solving of procedural difficulties is, of course, a necessity and sooner it is done away with the better it would be.

The greatest drag at the moment that is felt by the Industry is in regard to excise duties. To solve the problem, Dr. Antia made a point that rules be amended in such a way that procedures were clarified and no ambiguities arose in the amount of duty to be levied. He urged upon the Government to take the association into confidence in regard to the interpretation of orders regarding excise duties. One way of minimising difficulties would be to impose duty on primary metal only, rather than on primary metal as well as on semi-manufactures in different forms and at different rates. Since the future of mineral and metal industries in the country was closely linked with the many fiscal and other levies imposed at various stages of mining, production etc., it would be proper to consider giving similar incentives to the mineral and metal industries in India as has been done in many other countries of the world. The need for further production of non-ferrous metals cannot be questioned as on it depends to a considerable extent the growth of various industries. Although efforts are being made in the Third Five-Year Plan to increase the production of copper, zinc, lead, etc., still they need to be intensified on a much larger scale.

So far as the proposal concerning the central industrial laboratory is concerned, Dr. Antia said that much has not been done in the matter and a fund will have to be created to execute the scheme successfully. Training of managerial and technical personnel is, of course, a necessity not only for the non-ferrous metal industry as such but for the development of the economy as a whole. It is, therefore, to be hoped that proper schemes and plans would not only be executed but also co-ordinated in the right manner.

Plastic Cables

RE-ORIENTATION OF THE CONTROL ORDER

THE DELHI Plastic Cables Manufacturers' Association, in a note to the Secretary of the Ministry of Commerce and Industry, has advocated that non-ferrous Metals Control Order 1958 should be reviewed in view of the present emergency. This, they say, is essential because there are certain loopholes and according to their past experience, certain consumers do not get sufficient raw material. They have, therefore, suggested that, in the first instance, a proper categorisation should be evolved in respect of (i) actual user industries, (ii) essential industries, (iii) non-essential industries and (iv) industries which deserve priority. Moreover, they desire that the position of middle men fabricators, such as wire drawers, should be properly defined and classified. They have further put forward the proposal that priority should be given to the industries which manufacture goods for export followed by those units which manufacture items that help to cut down imports and the third place should be given to the units which are categorised under actual users and are engaged in essential industries. They have further proposed that the middlemen fabricators—the wire drawers all over India for instance—should be asked to supply at least 50 per cent of their products manufactured against the stocks released by the Government, to the actual users engaged in essential industries. They should however be at liberty to sell their remaining 50 per cent stocks to whomsoever they like.

Another significant suggestion put forward by the Plastic Cable Manufacturers is that a directive should be issued to those processors of semis who possibly can switch on their production to drawing aluminium conductors. This, it may be added, was in the light of the fact that the policy of the Government of India was to encourage the use of aluminium conductors as far as possible. If once certain producers did that, it would be possible that other actual users would naturally divert their production to the use of aluminium conductors in those sizes where aluminium could be used satisfactorily.

These suggestions, it may be added, look quite reasonable and will have to be seen in the light that these producers should keep getting at least a part supply of raw materials so that their output machinery was not interrupted. It would be worthwhile that specific minimum quotas were made available to the established manufacturers.

Engineering

EXPORTS TO AUSTRALIA

IT IS A SAD commentary that engineering goods have not been able to capture the market in Australia where the demand for these goods exists in great abundance. Brands from U.K., West Germany and the U.S. keep on ousting the engineering goods from India in the Australian market. The recent report of the Indian Trade Mission in Australia states that our traditional items like jute goods, cotton piecegoods, tea, linseed oil and kardiseed oil are losing ground to Pakistan, Japan, China, Hong Kong, Ceylon and Indonesia. It also states that in view of this losing of the market for traditional goods, it becomes imperative that full attention be devoted to the export of non-traditional items like engineering goods for which there exists a considerable scope. In order to capture the Australian markets we will have to gear our publicity in the best possible manner. Until and unless this is done, it would be impossible to expect any substantial returns. The Exhibition Directorate of the Union Ministry of Commerce and Industry has decided to arrange India's official participation in the National Trade Fair to be held in Melbourne from February 27 to March 16, 1963. This is a step in the right direction as this would help us to display and publicise our goods in that market.

The foreign exchange earned by way of export of engineering goods although increased from Rs. 53,805 in 1959 to Rs. 1,03,212 in 1960, but it again fell to Rs. 88,745 in 1961. During the first nine months of the current year, exports were of the order of Rs. 3,13,711. There is no doubt that the latest trend is heartening to a certain extent, but the unsteady nature of exports of engineering goods to this region calls for much more efforts on our part. Although we are exporting about 20 different engineering items to Australia, only very few items like electric fans, sewing machines, small tools, machine tools and metal ware have fairly big export figures to their credit. The market ahead for engineering goods is great, it now depends upon us how we mobilise our efforts to capture that market.

CENTRAL REVENUE COLLECTIONS IN SEPTEMBER, 1962

THE REVENUE realised from items on which duties are levied and collected by the Central Government, in the first six months of the financial year 1962 63 amounted to Rs. 507.19 crores. Of this, Rs. 115.66 crores were collected during September, 1962. The corresponding figures for the first six months of the financial year 1961-62 and for September, 1961, were Rs. 441.38 crores and Rs. 102.40 crores, respectively.

The following are the details of the revenue realised under various heads:—

(In Lakhs of Rupees)

Revenue Head	September		April to September	
	1962	1961	1962-63	1961-62
1. Customs ..	19,44	17,71	1,15,43	95,99
2. Union Excise Duties excluding cesses on Salt, Coal and Iron Ore ..	44,57	39,12	2,68,43	2,29,48
3. Corporation Tax ..	34,63	23,85	65,94	51,58
4. Income Tax ..	15,65	20,50	52,32	58,57
5. Estate Duty ..	27	36	1,22	1,31
6. Taxes on Wealth ..	31	31	1,34	1,39
7. Expenditure Tax ..	1	1	3	12
8. Gift Tax ..	6	4	24	23
9. Opium ..	72	50	2,24	2,71
TOTAL: ..	1,15,66	1,02,40	5,07,19	4,41,38

FROM THE CAPITAL'S CORRIDORS

MINISTRY OF ECONOMIC AND DEFENCE CO-ORDINATION

A Ministry of Economic and Defence Co-ordination has been set up at the Centre with Mr. T. T. Krishnamachari as its head. It will have three Departments, namely, (1) Department of Supply; (2) Department of Co-ordination; and (3) Department of Technical Development.

The Department of Supply will deal with (1) Purchase, inspection and shipment of stores for the Central Government other than the items the purchase, inspection and shipment of which are delegated to other authorities by a general or special order; (2) Disposal of surplus stores; (3) Residual work of supply and disposal relating to the late war organisations, including the Directorate General Aircraft (including Civil Maintenance Units) and Directorate General Ship Repairs; and (4) Administration of (a) Directorate General of Supplies and Disposals, (b) Government Test House, Alipore, Calcutta, (c) India Stores Department, U.K., and (d) India Supply Mission, U.S.A.

The Department of Coordination, similarly, will deal with (1) Coordination of Civil and Defence Production and Supplies; and (2) Such other subjects as may be assigned to it by the Prime Minister from time to time.

The jurisdiction over the Development Wing has been transferred from the Ministry of Commerce and Industry to the Ministry of Economic and Defence Co-ordination. It has been re-named as Department of Technical Development. The Department of Supply, similarly, has been delinked from the Ministry of Works, Housing and Supply, which, in future will be called the Ministry of Works, Housing and Rehabilitation.

The Department of Supply will be under the charge of a Minister of State, Mr. J. L. Hathi, and will function as an integral part of the Ministry of Economic and Defence Coordination. The Department of Defence Production, similarly, has been placed under Mr. K. Raghuramaiah, who has been named as the Minister for Defence Production.

Mr. T. T. Krishnamachari has proposed the creation of two Cabinet sub-committees to deal with war production and mobilisation of public services for stepping up the defence effort.

The first sub-committee is expected to consist of Mr. Krishnamachari; Mr. K. C. Reddy, Minister for Commerce and Industry; Mr. C. Subramaniam, Minister for Steel and Heavy Industries; Mr. K. D. Malaviya, Minister for Mines and Fuel; Mr. Manubhai Shah, Minister for International Trade; Mr. K. Raghuramaiah, Minister for Defence Production; and Mr. Jaisukhlal Hathi, Minister for Supplies.

The second sub-committee is likely to consist of Mr. Krishnamachari; Mr. Swaran Singh, Minister for Railways; Mr. Jagjivan Ram, Minister for Transport and Communications; Mr. B. Gopala Reddi, Minister for Information and Broadcasting; Mr. Raj Bahadur, Minister for Shipping; Mr. Mehr Chand Khanna, Minister for Works and Housing; and Dr. Sushila Nayar, Minister for Health.

Mr. S. Boothalingam, Secretary in the Department of Expenditure in the Ministry of Finance, has been appointed Secretary of the new Ministry of Economic and Defence Coordination.

INCREASE IN DEFENCE EXPENDITURE

The Union Finance Minister has presented supplementary demands for Grants, which include provisions for Defence Services, Effective Army, Rs. 67,00,00,000 and Effective Air Force, Rs. 8,00,00,000, in addition to Defence Capital Outlay, Rs. 20,00,00,000.

The additional provision is required to meet the increase in expenditure as a result of the measures taken to meet the Chinese aggression. Briefly, these are acceleration of the measures for the expansion of the Army and further augmentation of its sanctioned strength, embodiment of the Territorial Army, increased movement of personnel and stores, hire of transport, procurement and manufacture of equipment and stores and operational and urgent works to be met from general revenue.

ASSESSMENT OF EXTERNAL AID REQUIREMENTS

A three-member World Bank Team, consisting of Mr. Alexander Stevenson, Assistant Director, Department of Operations, South Asia and the Middle East, Mr. Philip Squire, Assistant Director, Department of Technical Operations, and Dr. Benjamin B. King, Resident Representative-designate of the World Bank in India, is currently holding discussions with the various Economic Ministries of the Government of India to make an assessment of India's foreign aid requirements for the next year. The report which this Team will be preparing will form the basis of discussions in regard to the Aid-India Club allocations of assistance for the third year of the current Plan at the Club's next meeting.

The total amount of foreign exchange so far made available or promised as external assistance for the Third Plan projects and programmes from all the friendly countries is Rs. 1,880 crores. Unutilised assistance from the Second Plan was Rs. 375 crores.

U.S. AID FOR THERMAL POWER

The United States Government has granted another loan of Rs. 11.95 crores to the Government of India for development of thermal power. It is the eighteenth loan in foreign exchange that the U.S. Administration has made available to this country for power development. Like the other two loans announced a few weeks ago, for development of thermal power capacity in Delhi and Andhra Pradash, this loan is repayable over a period of 40 years. No interest is to be charged on it except a service charge of 3|4 per cent. No payment, either on account of repayment of capital or in regard to the service charges, is to be made during the first ten years.

The loan is to be used for financing the major portion of the foreign exchange cost of setting up a 300 MW capacity thermal power plant and the accompanying facilities at Satpura, in Madhya Pradesh. The power from this plant will be supplied to the transmission system serving both Madhya Pradesh and Rajasthan. The local currency cost of the project, estimated at Rs. 14.8 crores, will be shared by the Rajasthan and the Madhya Pradesh Governments. There is a possibility of a U.S. rupee loan being made available to meet this cost from the sales proceeds under P. L. 480.

The first unit of this plant is expected to be com-

missioned in late 1965. Production at the rated capacity is envisaged to be achieved by 1966-67.

REVIEW OF LICENSING POLICY

The Government of India proposes to give the highest priority to industries having a direct bearing on the defence effort, both for licensing under the Industries (Development and Regulation) Act and for capital goods imports.

The policy with regard to licensing under the Industries (Development and Regulation) Act for other industries is being reviewed. The Government proposes to issue shortly a revised expanded list of industries with regard to which applications will be automatically rejected.

Apart from the foreign exchange requirements of industries directed to the defence effort, which will have the highest priority, the licensing of capital goods will be based on the priority list of 21 industries, which was recently announced.

EXPORT OF STRATEGIC MATERIALS

The Union Government is taking powers under the Defence of India Ordinance, to further restrict or regulate the export of certain items of strategic importance. These restrictions will be applicable to all the countries, including the rupee payment countries. There is no intention to allow the export of strategic materials to any country and much less to the communist Bloc from where, it is apprehended, they will be re-exported to China and used against our own forces. The first step taken in this regard is that restrictions have been placed on exports of woollen goods to the rupee payment countries. Two other factors also have played a significant role in this matter; firstly, the difficulties of importing wool tops involving heavy expenditure in free foreign exchange, and secondly, the demand for these goods going up appreciably from the Defence Ministry.

Apart from tightening up of regulations and restrictions on the export of strategic materials, the pattern of export trade in general is also being adjusted to meet the defence requirement of the country. By and large, exports of the traditional items are proposed to be continued as hitherto. But in a number of cases, exports will be permitted only from the surpluses left over after meeting the full requirements of the Defence Ministry and the civilian population. Exports of engineering goods, which though not very substantial at present, are also expected to suffer somewhat as a sequel to the diversion of supplies of steel for producing armaments and other defence requirements. Exports of automobiles and their parts have already been banned.

EXPORT OF TEXTILE MACHINERY

Mr. C. Subramaniam, Union Minister for Steel and Heavy Industries, has ruled out any large-scale export of textile machinery in spite of the recent introduction of a special export incentive scheme. "Our requirements are great and if we allow large-scale exports now we will have to import them from abroad," he said in the Lok Sabha last week. Mr. Subramaniam added that textile machinery and spares and accessories valued at Rs. 26 crores were now being produced in the country. The present annual licensed capacity was for goods worth Rs. 44 crores. Licences for the manufacture of textile machinery were being liberally granted and priority was being given for the import of capital goods for the textile industry.

Replying to a number of supplementaries, the Minister said a large part of the installed capacity of the textile machinery industry was not being utilised. Only 33 per cent of the capacity was now being used and the Government was trying to increase it to 70 or 80 per cent before the end of the current Plan period. He added that the real difficulty was with the private sector. "Our needs are more. In spite of it, our installed capacity is not being used fully. We are goading the manufacturers to increase production by various methods and take it to about 80 per cent."

PIG IRON PLANTS

Mr. Subramaniam has also revealed that two licences for starting pig iron plants in the private sector in Andhra Pradesh had been issued by the Government. He said that a third application for starting a pig iron plant had been received from the Andhra Pradesh Development Corporation, a State Government undertaking, and the matter was under consideration. Each of the two plants to be started in the private sector would have a capacity of 100,000 tons.

Mr. Subramaniam added that investigations had shown that it was feasible to produce pig iron in Andhra Pradesh by using the locally available ore and coal.

MOVEMENT OF COAL

During the last two months, the position relating to transport of coal is stated to have shown considerable improvement. It has been possible to move more coal both by rail and by road.

Under the scheme for transport of coal by road and river from the coal mines in Bihar to consumers in Allahabad, a trial run is expected to be undertaken shortly. In the immediate future, about 800-1,000 tons of coal per month will be carried by utilising part of the fleet of the Ganga-Brahmputra Water Transport Board. Studies for the long-term scheme, under which it might be possible to step up the movement of coal by road and river to 3.5 million tons per annum, are being undertaken.

STEPPING UP FERTILIZER OUTPUT

The Union Ministry of Heavy Industries is understood to have bestowed last week considerable thought on ironing out the difficulties in the way of speedy commissioning of various fertilizer projects. Discussions are stated to have been held with the World Bank Team which is here to study the feasibility of the Kothagudium project. The World Bank Team, it is learnt, has been favourably impressed by this scheme. This project originally was intended to be taken up by the Andhra Pradesh Government, but subsequently was transferred to the private sector. As planned at present, it will have a capacity to produce, in the form of urea, 80,000 tons of nitrogen per annum. It is to be executed by Messrs. Andhra Sugars Limited and Messrs. Seshasayee Brothers. Production is expected to start by 1965.

The second fertiliser project about which discussions were held is the one to be undertaken at Mangalore by Rallis and Shaw Wallace in collaboration with the Dutch State Mines. A Dutch team is expected here shortly to finalise the collaboration arrangements with the Indian partners. This project is expected to go into production by 1966.

Some progress has also been reported about the setting up of the Visakhapatnam Fertilizer Factory by Parry and Company, of Madras, in financial and tech-

You can depend on BOAC

THE ROLLS ROYCE AIRLINE

BRITISH OVERSEAS AIRWAYS CORPORATION WITH AIR-INDIA AND QANTAS

The Third Five Year Plan
Bird-Heilgers' part in it...

MADE IN INDIA

A SIMPLE PHRASE...
...VITALLY IMPORTANT!

"...special emphasis is being placed on... steel and machine-building and the manufacture of producer goods". The Third Plan very rightly stresses the need for rapid industrial development. Every new project for domestic production creates employment, saves foreign exchange, adds to the national striving for economic independence. The expansion of indigenous manufacture is critically important, and Bird-Heilgers is deeply committed to this decisive aspect of the Plan.

Steel for a solid industrial base

Steel is the very life-blood of an economy. Industries, utilities, homes, all depend on steel. Steady steel production depends, in turn, on the uninterrupted supply of minerals to the nation's blast furnaces. Bird-Heilgers supplies these minerals. Between 1957 and 1961, the group's output of minerals—coal, dolomite, iron and manganese ore and limestone—shot up almost 100% to well over 6,000,000 tons. The group will continue to help meet demand...to feed the blast furnaces with the minerals they must have

"Made in India"—by Bird-Heilgers

A vast range of products, hitherto imported, are now manufactured in India by Bird-Heilgers. The group produces jute goods, paper and board, water treatment equipment, air compressors and springs, castings and fabricated steel. The refractory manufacturing plant is the largest single unit in the East. A factory for the production of coal washeries was the first in India.

The group's engineering units are extremely flexible. They contribute, with equal facility, to projects as far removed as blast furnaces and ceramic plants. Planned diversification finds the group engaged in shipping, insurance, exporting and importing. The agency department handles everything from heavy capital equipment to light consumer goods.

Towards a self-generating economy

A phrase on everyone's lips. A phrase that finds concrete expression in the urgent activity of an economy on the move. Bird-Heilgers reflects the nation's striving. The group is alive to the problems of a growing economy. It deploys the full potential of a century's resources, technical knowledge and executive skill to broaden its activities...increase domestic production...join in the national drive to economic independence.

nical collaboration with the California Chemical Company and the International Minerals and Chemicals Corporation of the United States. The capacity of this plant, based on naphtha to be supplied by Caltex, will be about 80,000 tons of fixed nitrogen per annum, in the form of 365,000 tons of ammonium phosphate of various grades and 16,500 tons of prilled urea.

PROTECTION TO INDUSTRIES

The Government of India has announced its acceptance of the following recommendations of the Tariff Commission:—

1. that, protection to the Ball Bearings Industry should be continued at the existing rate of duty for a further period of three years ending December 31, 1965.

2. that, protection to copper pipes and tubes, brass pipes and tubes, extruded copper rods other than electrolytic copper rods, and extruded brass rods should be continued at the existing rate of duty for a period of three years from January 1, 1963. Protection is also being extended to extruded copper sections, extruded brass sections and highly polished zinc sheets for making process blocks at enhanced rates of duty for a period of three years from January 1, 1963. Protection granted to lead sheets other than sheets for teachests, zinc sheets not otherwise specified and zinc strips is being discontinued at the existing rate of duty on the expiry of the current period of protection from January 1, 1963. Protection granted to copper rods manufactured by rolling process and rolled brass rods is also being withdrawn from January 1, 1963 and will be assessable to revenue duty which is lower than the existing duty.

3. that, protection to the sheet glass industry should be continued at the existing rate of duty, viz. 70 per cent ad valorem, for a further period of three years, namely, upto December 31, 1965.

4. that, protection to the Plastics (Phenol Formaldehyde Moulding Powder) Industry need not be continued beyond December 31, 1962.

GOLD BONDS

The Central Board of Revenue has issued formal instructions to the appropriate field officers dealing with Income-tax, Customs, Central Excise and Foreign Exchange Control, with regard to those who may wish to subscribe to the Gold Bonds, 1977.

The Finance Minister, in a broadcast to the nation recently, had given an assurance that those who came forward with their gold in order to subscribe to the Gold Bonds would not have to explain the origin of this gold. This assurance has now been embodied in suitable directives issued by the Central Board of Revenue.

The directives have also made it clear that the money value of the gold in the hands of the original purchasers of Gold Bonds would not be subject to income-tax assessment. Further, there would be no enquiry about the source of the money with which such gold was purchased. This concession will, however, be available only to those who actually tender gold and buy the Bonds.

These directives have been issued in order to avoid any action which might create apprehension in the minds of those who intend to purchase Gold Bonds as a service to the nation.

As already announced, the Gold Bonds will be exempt from Wealth Tax. Also, any capital gain arising from their sale will not be liable to Capital Gains Tax nor will loss, if any, be eligible for being set off. Suitable amendments are being made in the Income and Wealth Tax Acts for this purpose.

INTERIM WAGE INCREASE FOR STEEL WORKERS

The Government of India has accepted the recommendations of the Central Wage Board for Iron and Steel Industry regarding interim relief to workers. The Board had recommended that at this stage excluding the Tata Iron and Steel Co., all other steel plants should pay Rs. 95 for the lowest paid unskilled worker. This wage should consist of the basic wage, the dearness allowance and, where it exists uniformly for all workers, the coke subsidy and house rent allowance. The pay scales should be adjusted on the basis of the lowest paid worker upto a maximum of Rs. 500.

In the case of the Tata Iron and Steel Co., the Board had recommended that at this stage, they should pay a flat rate of Rs. 10 per month to all the workers, including Rezas drawing a maximum pay upto Rs. 500 per month.

These recommendations are to be given effect to from December 1, 1962.

The amount of interim increase will be treated as an additional cash payment which will not count for production bonus or any other fringe benefit pending the final recommendations of the Wage Board.

SHIPPING TRADE

The three Indian shipping companies, Scindia Steam Navigation Company, India Steamship Company and the Shipping Corporation of India, have come to an agreement among themselves on the division of the Indian share in the country's foreign trade with the Continent. So far as India-U.K. trade is concerned, the three companies will be dividing the first 30 per cent of the Indian share in this trade as follows: Scindias—9|20; India Steamship—9|20; Shipping Corporation—1|10. The Indian share in this trade over and above this level—it has already been increased to 39.475 per cent since September 1, 1962, and will go upto 48.475 per cent by January 1, 1971—will be divided among the three companies in the ratio of 1:1:4.

In the India-North Continent trade, the Indian share is 39 per cent. It is to be divided by the three companies as follows: Scindias—16|39; India Steamship—16|39; Shipping Corporation—7|39.

In the trade between India and Poland, East Germany, the U.S.S.R., Finland|Scandinavia and Adriatic Coast ports|Egypt, the three companies will share the freight earnings in an equal proportion. No specific proportion has been agreed upon about the share of trade between India and Rumania and India and the Levant.

IDA CREDIT FOR SONE BARRAGE

The International Development Association has agreed to make available for the Sone Barrage Project a development credit equivalent to 15 million dollars. The estimated cost of the project is about Rs. 14.43 crores, excluding the High-Level Canal System. The project, expected to be completed by March 31, 1966, will provide improved irrigation facilities to about 7.3 lakh acres and new irrigation to an additional area of about 3 lakh acres. No power generation is proposed.

AID FOR BEAS PROJECT

The U.S. Administration and the World Bank have indicated their willingness to make available two loans

164818
JL
Xm 2, N49LE N49.29

of $ 33 million and $ 23 million, respectively, for meeting the foreign exchange requirements of the Beas Project. The negotiations for the terms and conditions of the loans are stated to be in progress. The World Bank has agreed to reimburse an amount of Rs. 1.64 crores required to meet the immediate requirements of machinery for the project (including the Pong Dam) from this loan. Foreign exchange to the extent of Rs. 1,31,64,089 has already been sanctioned for the import of earth-moving machinery for the project. Applications for the balance amount of Rs. 32,35,911 are under consideration.

MANUFACTURE OF WAR EQUIPMENT

Four new ordnance factories, one each at Bhandara (Maharashtra), Chandigarh (Punjab) and two at Avadi (Madras) are being set up. This was disclosed by Mr. K. Raghuramiah, Minister for Defence Production, in the Lok Sabha on Monday. Mr. Raghuramiah also told the House that a proposal to establish an Institute for the Advancement of Flying Sciences and Technology was under examination.

The Deputy Minister for Defence, Mr. D. R. Chavan, revealed in the Lok Sabha the same day that the Government had decided to build major warships at the Mazagon Dock in Bombay and had approved a plan to expand the existing facilities at the yard to undertake this work.

The manufacture of medium tanks is envisaged to begin at Avadi by 1965.

A site has been selected in Orissa State for setting up an aircraft factory where Migs are proposed to be manufactured. The factory will have two units, one to manufacture engines and the other to manufacture air-frames etc.

IN BRIEF ....

The Union Government has decided that the State Trading Corporation of India should purchase raw jute through co-operative societies. The Corporation will generally operate through the National Agricultural Co-operative Marketing Federation Ltd., which is the central body representing the co-operative societies. Purchase operations have already commenced. This is in addition to the operations of the existing Jute Buffer Stock Association.

*

Four mechanised brick kilns have been licensed by the Government for Madras State. The capacity of these units will vary from 150 lakh to 375 lakh bricks per annum, compared to 50 lakh bricks per annum capacity of the conventional non-mechanised brick kilns. Two kilns will be in the public sector and two in the private sector. All the four kilns will be located in the vicinity of Madras City, where acute shortage of bricks has been experienced. For one of the units, a licence to import plant and machinery worth Rs. 13 lakhs from rupee payment area has already been issued. No foreign exchange in respect of the other three units has been released as yet as detailed proposals have not been received.

*

The various aspects of the question of nationalisation of general insurance are at present being examined by the Government. The examination is expected to be completed in the near future.

*

A licence for import of machinery, valued at Rs. 1,92,000, has been issued to N. S. I. C. for the manufacture of rubberised coconut fibre products by Messrs. Fibre Foam Industries, Kodvapally, Kerala State.

*

A Japanese team is at present in New Delhi for detailed discussions with the representatives of the Government of India and the Government of Orissa in regard to exports of iron ore from Pradip.

*

Messrs. Bechtel Corporation of the United States has been entrusted with the designing, construction and management of the 260 miles Siliguri-Gauhati products pipeline. The estimated cost of this project is $ 12.6 million. Laying of products pipeline from Gauhati to Calcutta and Tezpur are also under active consideration.

*

The Soviet Union has agreed to increase exports of furnace oil to India. India is also stated to be negotiating with ENI for additional supplies of furnace oil, demand for which has in the recent past exceeded its availability.

*

Formica International Limited, a member of the De la Rue Group, has announced the formation of Formica (India) Ltd., which will undertake the manufacture in India of industrial and decorative laminates in collaboration with the Bombay Burma Trading Corporation. The issued capital of the new company will be Rs. 1.5 crores. Half of this will be held by Formica International. The plant is expected to be located near Poona and is envisaged to go into production within two years.

*

Hind Traders, Bombay, which had been granted in December, 1960, a licence for the manufacture of pig iron in low-shaft furnaces, has been sanctioned a production capacity of 96,000 tons per annum.

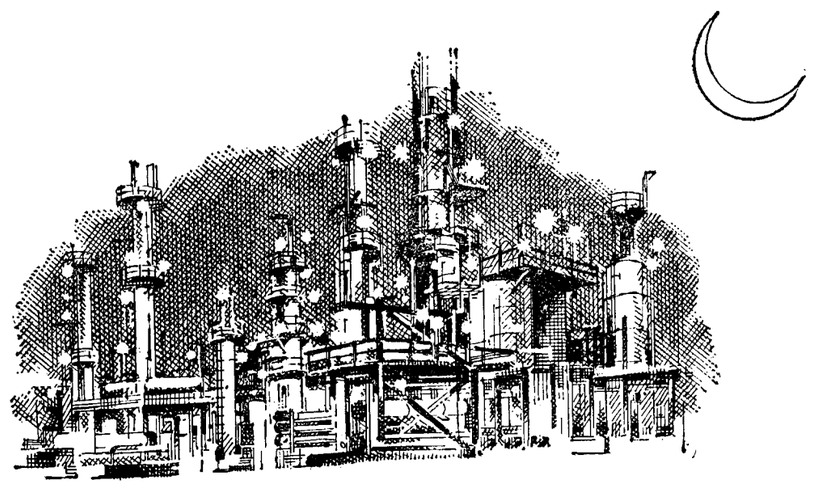
*

The difficulties which the Koyna Aluminium Project faced have been nearly ironed out. The foreign collaborators for this project are Germans. Difficulties experienced in connection with the Sharavathi Aluminium Project, to be executed in collaboration with Reynolds International of U.S.A., have not yet been straightened out. The Government, it is understood, has under consideration association of some other Indian party in this project.

*

With the agreement in principle having been reached for setting up a 7,000 tons per annum stainless steel plant at Madras and a 10,000 tons capacity plant at Vatva, near Ahmedabad, in Gujarat State, no further capacity for stainless steel manufacture, it is stated, is to be licensed in the private sector. The Third Plan target of 50,000 tons output per annum is said to have been fully licensed, taking into consideration the capacity in the public sector.

*



A contract has been signed with an international trade house to export two lakh tons of raw sugar to Japan, South Korea, South Vietnam and Western Europe in 1963. Fifty per cent of the proceeds from these exports would be used for import of fertilizers.

*

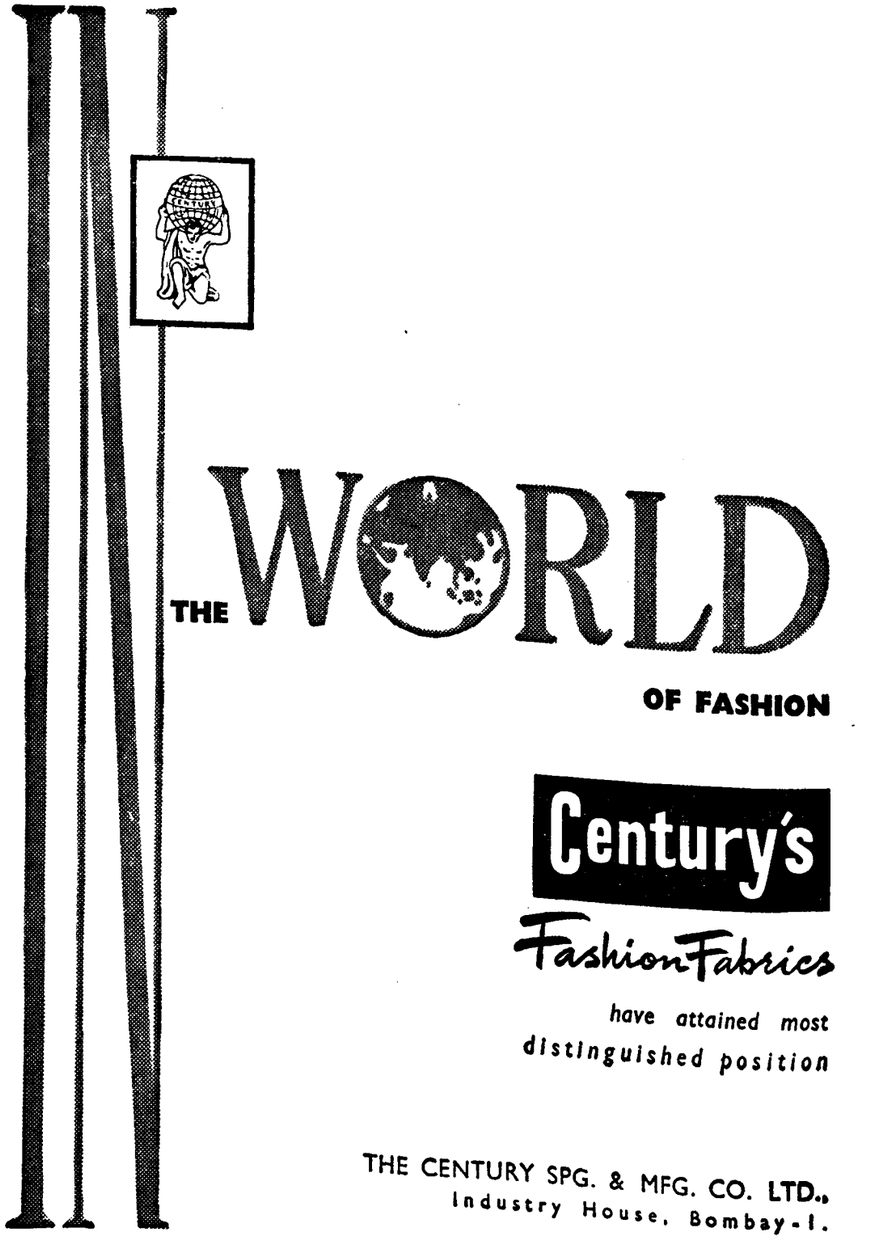
India and the Soviet Union have signed a new shipping agreement under which there would be 20 ships plying between India and Russia as against 14 at present.

*

The maximum limits to which investments in the 10-year Defence Deposit Certificates and the 12-year National Defence Certificates can be made have been raised from Rs. 25,000 per individual and Rs. 50,000 by two persons jointly, to Rs. 35,000 and Rs. 70,000, respectively, including the investments in the former Treasury Savings Deposit Certificates and 12-year National Plan Savings Certificates.

NIGHT SHIFT

In the oil refinery, the night shift has taken over. Flame-proof lamps shine from the towering columns where the hydrocarbons in crude oil are being separated, reassembled and rearranged. Inside the plant, chemists and control room staffs check the temperatures, pressures and flows of the complex processes which give the market not only petrol, kerosine and lubricants but hundreds of other useful products as well, from paraffin wax to insecticides—all of which must measure up to rigid standards of quality.



Like drilling for new sources of oil, refining goes on day and night. Such a continuous effort calls for trained operators, varied skills, scientific techniques and highly specialised equipment—essential factors in all branches of the petroleum industry's operations.

The British Steel Review states that the British steel industry has doubled its production capacity since 1945.

COMPANY AFFAIRS

HINDUSTAN SHIPYARD

The working results of Hindustan Shipyard Limited for the year ended March 31, 1962, reveal that there was a profit to the extent of Rs. 24,418 after providing a sum of Rs. 22.77 lakhs for depreciation. The annual report shows that credit has been taken for a sum of Rs. 86.57 lakhs representing the amount claimed as subsidy from the Government of India on the vessels completed and delivered during the year. The Government of India advanced a sum of Rs. 8.73 lakhs for financing the approved programme of yard development. This amount has been converted into share capital for the issue of ordinary shares of the value of Rs. 1,000 each in favour of the President of India.

Total production of the Visakhapatnam Yard inclusive of ship construction, ship repairs and capital amounted to Rs. 461.43 lakhs against Rs. 465.8 lakhs a year before. Though there was a minor decline, it is evident that a strike that lasted nearly 24 days did not hit the output so much.

The Directors' report show that with the commissioning of the galvanising plant and the extension of the outfit jetty, the first two phases of the shipyard development programme can be regarded as having been fully implemented. As regards future development works, out of a provision of Rs. 244 lakhs made in the Third Plan, only few essential items of machinery and equipment have been approved by the Government which would cost nearly Rs. 73.44 lakhs. The remaining programme to be taken up during the period of the Third Plan is still under examination. The Directors also report that the supply position of steel for the new Mitsubishi vessels from indigenous sources has not been satisfactory. Consequently steps were being taken to import directly 4,600 tons of steel during the year. It might be necessary to continue such imports till the indigenous steel plants were in a position to meet the requirements in full. The shipyard had to accept, it is stated, orders for the nine Mitsubishi type of vessels at fixed prices which were below the cost of construction in the context of severe competition. The state of the industry, it appears, is far from satisfactory.

THE JEYPORE SUGAR

The Directors of the Jeypore Sugar Company Limited, in their annual report for the year to June 30, 1962, indicated that there was a profit of the order of Rs. 16.68 lakhs. After adding the balance brought forward from the previous year and a sum of Rs. 10,443 as refund of agricultural income tax of earlier years, there was a sum of Rs. 16.87 lakhs at the disposal of the Directors. A sum of Rs. 1.65 lakhs was provided for the development rebate reserve, Rs. 4.75 lakhs for taxation and Rs. 3 lakhs for general reserve. The Directors have recommended the payment of a dividend at the rate of 15 per cent on equity shares which would be subject to the sanction of Industrial Finance and Investment Corporation of India.

The company's sugar factory at Chagallu commenced crushing on December 2, 1961 and the season lasted till April 22, 1962, with a duration of 141 days and actual crushing on 131 days. A total of 68,588 tons of cane was crushed during the season resulting in a production of 7,246 tons of sugar with a recovery of 10.64 per cent. For the season 1962-63, the company was engaged in the exclusive production of raw sugar, which would be wholly exported out of India. The company has entered into a contract for the export of 10,000 tonnes of raw sugar during the 1962-63 season. Rayaghada Sugar Factory commenced crushing on December 6, 1961 and the season lasted for 166 days closing on May 20, 1962. 48,798 tonnes of cane were crushed during the season resulting in a production of 2,242 tonnes of sugar and a recovery of 8.69 per cent. Due to improved offtake of sugar from the factories and larger exports out of India, the loss on which is largely met by the Government, the cut of 10 per cent imposed last year on production of sugar by factories has been restored for the current year. As much as 18,411 tonnes of manganese ore was mined in the company's own mines out of which 10,631 tonnes were used in the production of ferro-manganese by the company.

NEW ISSUES

The Controller of Capital Issues has authorised 9 companies to issue capital totalling Rs. 3.69 crores. One is a new company. Three companies are issuing bonus shares, four equities and two equity plus preference shares. Part of the shares of two companies is being issued to their foreign collaborators. The consent in all cases is valid for 12 months.

Motor Industries Company Limited, Bangalore, will issue bonus shares of the value of Rs. 45 lakhs in proportion of one bonus share for every four equity shares held by the existing shareholders.

United Breweries Limited, Mysore, is issuing bonus shares of the value of Rs. 25 lakhs to the existing shareholders on capitalisation of reserves to a like extent.

Electrical Manufacturing Company Limited, Calcutta, is to issue bonus shares of the value of Rs 14,79,200 on capitalisation of its reserves.

Chemicals and Plastics India Limited, Madras will issue equity capital of Rs. 135 lakhs and preference capital of Rs. 150 lakhs at par. Out of this, equity shares worth Rs. 34,42,500 will be issued to B.F. Goodrich Company, U.S.A.

Bhaskar Textile Mills Limited Calcutta, is issuing capital of Rs. 35 lakhs divided into Rs. 28 lakhs in equity shares and Rs. 7 lakhs in preference shares.

Roha Pulp and Paper Mills Limited, Delhi, a new company, will issue capital of Rs. 50 lakhs in equity shares of Rs. 10 each for cash at par.

The Andhra Pradesh Mining Corporation, Limited, Hyderabad, will issue further equity capital of Rs. 20 lakhs in equity shares of Rs. 1,000 each to be issued entirely to the Government of Andhra Pradesh, for cash at par.

Kerry Jost Tool Company Limited, Maharashtra, is issuing equity capital of Rs. 20 lakhs in shares of Rs. 100 each. Of this, shares worth Rs. 6 lakhs will be issued to Kerry's (Great Britain) Limited, U.K., for other than cash against supply of technical know-how and machinery and the balance shares will be issued for cash at par in India.

Punalur Paper Mills Limited, Punalur, is to issue capital of Rs. 10,03,600 in 40,144 equity shares of Rs. 25 each for cash at a premium of Rs. 10 per share on rights basis.

Company Meeting

THE TATA IRON AND STEEL CO., LTD.

Statement of the Chairman

THE following statement by Mr. J. R. D. Tata, Chairman of the Tata Iron and Steel Company, Limited, dealing with Company's working for the year ended 31st March, 1962, has been issued to shareholders. The Annual General Meeting of the Company will be held on Thursday, the 13th December 1962 at 4-30 p.m. at the Birla Matushri Sabhagar, 19 Marine Lines, Bombay 1.

TO THE MEMBERS,

This statement comes to you at a time of national emergency created by the Chinese invasion of India, when our own problems and difficulties must be viewed against this background of war and peril to our country. Whatever our differences with Government may be in regard to their attitude towards our industry and although we may disagree with some of their economic policies, I am sure we are all agreed that, as in previous emergencies involving the country's security, the Company should offer unstinted cooperation and assistance to Government in the prosecution of the war effort.

2. The year under review was dominated by the Tariff Commission's Inquiry and Report and Government's orders thereon. The main features of both have been explained in the Directors' Report. We are mainly concerned here with the reduction which Government have effected, unjustifiably in our view, in the retention prices recommended by the Commission. In this context it is important to bear in mind that the Commission's Inquiry and recommendations related exclusively to a two-year period which had already elapsed by the time the Commission reported. One would have therefore expected that here, if ever, was an occasion when Government could hardly disagree with the Tariff Commission since the Commission's recommendations were based not on estimates, theories and assumptions relating to a period still in the future, but on actual known figures, facts and conditions about the truth and reality of which there could be no argument.

3. After nearly five months of cogitation, Government not only disagreed with some of the Commission's principal findings but even reversed their own previous decision and instructions to the Commission on the important question of the repayment of the special advance.

4. The changes made by Government resulting in a total reduction of Rs. 27.50 per ton in the average retention price recommended by the Commission for the two years 1960-61 and 1961-62, are explained in paras 12 and 13 of the Directors' Report. The most serious change has been in regard to the provision for depreciation and return on gross block. Government rejected the Tariff Commission's view that, for purposes of calculating the incidence per ton of depreciation and return, an output of saleable steel at a rate of 90% of capacity was reasonable. Apart from the fact that it normally takes several years to overcome "teething" troubles and train staff in the use of new equipment and techniques, before so complex a unit as a new steel plant can be made to operate smoothly, the additional handicaps imposed on the steel companies by the conditions prevailing in the country were so serious that, if anything, the Commission was unduly severe in adopting a rate as high as 90% as a basis for their calculations. Yet Government, although well aware that the inability of the steel plants to make more steel was largely due to the appalling quality of unwashed market coal allocated by the Coal Controller and the deficiencies in transport, for both of which they were themselves mainly responsible, decided that the steel plants should have worked at 100% of capacity during these two years and deserved to be penalised for not having done so. Government accordingly reduced the retention prices on that account by Rs. 16.5 per ton which cost our Company Rs. 4 crores over the two-year period, and thus unfairly deprived both the steel companies of the full depreciation and return prescribed by the Commission. This action, coupled with the Minister of Steel's subsequent speeches or statements at Press conferences in which he equated with inefficiency the industry's failure to achieve 100% performance, was particularly hard on our Company which has had to struggle against heavy odds during and after the last World War, and which undertook, at considerable risk, a crash programme of expansion at the express request of Government.

5. Government, according to their resolution dated 7th September 1962, also excluded from the capital block the Special Advance made to the Company between 1954 and 1956. This must mean that in Government's view Rs. 10 crores worth of physical assets should earn no depreciation, let alone a return, on the ground that their cost was initially met from a Government advance. Apart from its unfairness, such a view ignores the obvious reality that plant and machinery are subject to wear and obsolescence, irrespective of the manner in which they were originally financed, and that failure to provide depreciation would clearly be contrary to sound principles of accounting and financial management.

6. In justifying the reduction in the provision for interest on working capital, Government, according to a statement by the Minister as reported in the papers, based their decision on the assumption that the Steel Companies enjoyed the benefit of large interest-free deposits from customers and of large arrears of surcharge not paid into the Iron and Steel Controller's Equalisation Fund. This assumption is totally incorrect in both respects. Advance deposits which are taken only against so-called "bazaar" indents have at no time exceeded a crore, while our dues to the Equalisation Fund were at the end of July 1962 only about Rs. 2½ crores and not Rs. 12 crores as the Minister is reported to have stated in Parliament.

7. Government's reversal of their previous decision that the retention price should include an element for the repayment, with interest, of their Special Advances in terms of their agreements with the two Companies is disturbing although it may not immediately affect our financial position. However, their announcement that, as an alternative, they are consi-

dering the possibility of a part of the special advances being repaid out of fresh capital, raises fundamental issues of grave concern to the Companies and their shareholders. This is not the occasion for me to discuss the legal aspects of the matter, but I am sure shareholders will be relieved to learn that the Company has informed Government that an issue of fresh capital would be unthinkable in the present circumstances and, for a number of cogent reasons, would be unacceptable to the shareholders whose consent would be required for the purpose.

8. In our representation to Government we have pointed out that the low retention prices fixed by them, if maintained in the future, will seriously affect our ability to finance the heavy commitment which Government themselves have asked us to undertake to double our coal output in the Jharia Field. The whole of the cost of this project, if it ultimately materialises, will have to be financed from borrowings, including a further loan from the World Bank to meet the foreign exchange cost. Our capacity to service and repay such fresh borrowings in addition to our existing loans must obviously depend on the resources we are able to raise over the years from retained earnings.

9. If the steel industry of the country in both public and private sectors is to remain healthy and to make its full potential contribution to the security of the country, it is imperative that it be ensured the wherewithal to finance the continuous process of replacement and development essential to maximum production and efficiency.

10. We do not ask for favours at the expense of the consumer or the tax-payer nor do we expect that prices fixed by Government should reward inefficiency, but we do ask that a more realistic account be taken of the conditions under which the steel industry is compelled to operate in India and, particularly, of the shortages and deficiencies in raw materials, transport and other factors over which it has no control.

11. I regard with dismay Government's growing propensity to brush aside the carefully calculated and reasoned recommendations of the Tariff Commission, which consists of "men of ability and standing who have shown capacity in dealing with problems relating to commerce or industry or in administration"—to quote the relevant section of the Tariff Commission Act, 1951. I do not suggest of course that Government should automatically accept every recommendation of the Commission, but I do urge that their advice should be set aside only in the most exceptional cricumstances and for the most convincing reasons. From a speech made by the Minister for Steel to the Committee of the Indian Merchants' Chamber in Bombay, it would seem that Government consider the Tariff Commission and their approach as completely out-dated and that some other method of fixing prices should be evolved. As the only practical alternative I can see would be for the Ministry concerned to determine prices at its sole discretion and thus become the exclusive arbiter of an industry's destinies, one cannot but view with alarm this indication of Government's intention to scrap the long-standing and salutary practice of seeking independent and impartial advice in fixing prices in major controlled industries. In a planned and controlled economy such as ours, it is only by exercising restraint in the use of their enormous economic powers that Government can retain the confidence of the people in the fairness and impartiality of their policies and actions.

12. Before I close, I cannot, in fairness to the Company, leave unanswered the criticism voiced by the Minister for Steel, that the Company's expansion programme was originally estimated to cost Rs. 66 crores but had actually cost Rs. 120 crores. In my statement to the shareholders two years ago, in answer to a similar criticism, I gave the true facts, of which Government should therefore be well aware. The estimated cost of the two million ton programme, as accepted by the World Bank in 1956, was Rs. 95 crores. The actual cost including subsequent additions and modifications was about Rs. 110 crores. Excluding about Rs. 6 crores of expenditure arising from subsequent increases in import duties and manufacturers' escalations, over both of which the Company had obviously no control, and additional purchases of spare parts decided upon for the sake of added safety, the total excess came to about Rs. 9 crores, equivalent to only 10% over the estimates, a remarkably low figure of excess for a project of such magnitude and complexity. It is somewhat disheartening to find that the Steel Minister should have been provided with such incorrect data despite the facts that correct information was available to Government.

13. The tenor of this Statement may sound out of tune with my opening remarks but its main purpose is to clear the air and set the record straight. Having done so, I can assure Government of the Company's unstinted support and cooperation in the Defence effort. We fully realise the importance of steel production to a country at war. In the grievous and complex tasks ahead, we place ourselves, our staff, our technical and human resources and our long experience of the steel industry at the disposal of Government in the furtherance of the country's total war effort.

Bombay, 8th November, 1962.

Note: The above statement is not a document purporting to be a report of the proceedings of the Annual General Meeting.

AUSTRALIA'S LARGEST COMMERCIAL BANK CAN HELP YOU TO PROMOTE TWO-WAY

TRADE WITH AUSTRALIA, NEW ZEALAND, AND FIJI

Want to sell? Want to buy? Want market information? The international Division of the Bank of New South Wales can tell you about the opportunities for trade offering with these countries.

The Bank's complete banking service includes such specialized facilities as trade introductions to buyers and sellers, industrial enquiries, economic and market information, and a complete travel service. The Bank is closely and constantly in touch with industry, business, and agriculture in the areas it serves through more than 1,100 branches and agencies.

● Enquiries may be made through your own bankers or direct to

Arms Assured

THE high level missions from America and Britain which completed their assignment with remarkable expedition were as much diplomatic in character as they were military. The assessment on the spot made by Mr. Averell Harriman and Mr. Duncan Sandys with the assistance of their top experts will provide an exhaustive and clear picture of the Indian crisis to the governments of the two countries. The agreement for the supply of armament which has been concluded with Britain and the agreement whose framework has been practically finalised by Mr. Harriman have presumably in view India's requirements in the short run. Aid in the long perspective, too, is assured.

The terms on which supply of arms is to be made go a long way to accommodate India in the fullest measure. Britain is providing the arms free of cost, but subject to a mutually agreed financial ceiling which will remain undisclosed. Equally important is a term that Britain would undertake the entire responsibility for the transport of the arms part of which will necessarily be airborne. American armaments are to be provided on rupee payment, which is by any criterion a very liberal condition in the context of our continuing stringent foreign exchange position. The details of the agreement are still to be worked out, but it is now a foregone conclusion that American arms assistance will be massive in size. It was explained, and quite advisedly, that missiles were not envisaged during the discussion. The rupee balances which the American Administration will acquire may possibly be utilized for a boost to India's exports or for rupee financing of arms production in India or for economic development. It may be that the balances may be directed towards all the three objectives.

It is an encouraging thought that what is likely to emerge is a pattern of aid from the Western countries taking the shape of a consortium. More Commonwealth countries are certain to come forth with offers of armament assistance and similar helpful attitude from some of the Continental countries is also within sight. Co-ordination to eliminate duplication is implicit in the consortium pattern of arms aid and indeed in the supplies from America and Britain. The accent is to be on weapons for mountain warfare.

One of the clearest conclusions that has emerged in the discussions between the Government of India and the heads of the two missions corroborates the belief universally held in this country that the Chinese war will be a long-drawn-out affair. The need to meet the unscrupulous enemy, who may relapse into fits of aggression at any moment, imposes on this country a special obligation to prepare a plan of defence on the basis of a long-term strategy. The first essential is the supply of modern defensive weapons and, in view of the long-term duration of the threat, domestic production of arms will need to be given high priority. Mr. Harriman indicated in his Press Conference that American collaboration in the production of arms would be quite feasible when India indicates her intention to ask for it.

India has undertaken not to transfer the arms to be obtained under the agreements without the concurrence of the supplying Governments and to allow access to their representatives in India for observing and making periodical reviews of the use of the arms to repel the Chinese invasion. Any surplus quantities that may remain in India's hands after the conflict is over are to be returned to the suppliers. This undertaking was promised by India long before the missions arrived here, but it was obviously incorporated in the pact with Britain (and will be included in the agreement with America) for the definite purpose of allaying Pakistan's apprehensions that American arms aid in particular would upset the balance of military strength in the Indian sub-continent. It is unfortunate that Pakistan allowed herself to be too much pre-occupied with the short-term and immediate objectives of China's invasion on India's northern border. Such a short view of the menace is surely not conducive to her own territorial security.

Mr. Harriman took particular care to emphasize that the problem ought to be viewed from the angle of the security of the entire sub-continent which involves the free existence of the two powers. If he found it necessary to be strong in expressing his views, uttering a warming that the American Government's policy cannot be dictated by any other power, the reason is quite apparent. Pakistan's Foreign Minister seems in no hurry to visit Peking as earlier contemplated and her reply to China's offer of a no-war pact may finally turn to be not positive. These developments, however, do not affect, rather, they urge, the advisability of trying to find a solution for the root cause of the deep differences between India and Pakistan. The Kashmir issue cropped up in the discussions with the two heads of the delegations. While they wish the issue to be settled directly by the two parties, their good offices will be available. As this issue is being printed comes the welcome news that Mr. Nehru and President Ayub Khan will hold direct talks on Kashmir to arrive at an honourable solution.

Russia: Stricter Centralisation

MR. KHRUSHCHEV'S marathon speech before the Central Committee of the Soviet Communist Party reveals deep concern over the present state of the productive apparatus of the economy. Agriculture has suffered a sizable decline in output and industry has not much to boast of. In the perspective of the current Soviet Seven-Year Plan the industrial achievements hardly add up to anything near the impressive over-reaching of targets as under most of the earlier plans. It is these fundamental facts which over-shadow the proposals of reform made by Mr. Khrushchev for introducing a revised system of control of the economy based on a more thorough centralisation.

The highlight of the evaluation of the performance of the Seven-Year Plan during the first four years — 1959 to 1962 — brings out the salient fact that industry could have shown a better performance which it did not. In agriculture the setbacks which are in evidence over the past few years have not been overcome. Labour productivity did not rise in industry in accordance with the assigned target and Mr. Khrushchev gave a warning of impending changes in labour legislation to ensure higher norms of output.

Only five years ago in 1957, the Soviet Premier came forward as an ardent advocate of progressive decentralisation of the control of production. The intensely centralised direction of the productive apparatus in both the sectors, industrial and agricultural, concentrated in the hand of the Economic Ministries located in Moscow, was considerably modified by him as a matter of deliberate policy to pave the way for cautious decentralisation. Planning and economic administration were given a pronounced regional bias. Moscow's tight control down to matters of detail was substantially dismantled and authority to plan for the expansion programmes of factory and farm was vested in the 100 regional councils.

Apparently, decentralization has not delivered the goods to satisfaction. Mr. Khrushchev's trenchant criticism of the bureaucratic centralized control of the economy fortified during the Stalin regime could hardly conceal the switch-over to another type of centralised control. The distinction is one of variety. Lenin's dictum of Party and State Control of the economic apparatus is now invoked for the re-introduction of centralization of the planning and implementation of economic development programmes. The Regional Councils are to be reduced to about 40, ostensibly because the decentralization of 1957 tended to drift towards parochialism in planning. But the major component in the new apparatus of control by the State and the Party has relegated regional authority of the remaining 40 councils to a subordinate place. The Communist Party is to be reorganized into two wings for the purpose of the control and direction of the economy in its two basic sectors — agriculture and industry.

The Soviet Union Council of National Economy is to be the new apex control organization which will inevitably supersede to a substantial extent the regional councils. The new Soviet Union Council will be charged with the task of prescribing the annual plans, while prospective planning will be the concern of the State Planning Committee. The object is to make the control of the Party over the centralized apparatus supreme and to that end large corps of volunteer supervisors drawn from the Party would be assigned the continuous work of vigilance over the implementation of the annual plans. The wide publicity that was given to misappropriations of millions of roubles by bureaucratic officials, synchronizing with the session of the Central Committee of the Party, was not without design. This is yet another technique to discredit bureaucratic control.

Mr. Khrushchev's forthright exhortation calling upon the Communist Party to be prepared to emulate what was profitable and good in the capitalist system sounds so heterodox. What he, in fact, did was to rely upon an extensive quotation on the same thesis from Lenin. But the new economic reforms to be introduced do not disclose any evidence of this thesis of profiting from the good that is in the capitalist system. The recent discussion in the Russian Press and outside on the value of the profit motive as a lever to industrial expansion was practically bypassed. The profit motive and the incentives which it provides for economic stimulation lie at the root of the capitalist system. What Mr. Khrushchev indicated was that profit as related to individual enterprises was an acceptable principle, since it constituted one of the vital indicators of industrial efficiency. There was little departure from the prevailing pratice in this statement. Russian industrial enterprises are already working on the basis of progressive margins of profit for financing further development.

Foreign Capital

DURING the last ten years, India has attracted substantial capital from abroad both through private and official sources. This speaks highly of the sound lines on which the Indian economy has been run and the sagacity of the political leaders who have been able to preserve a political climate which is unmatched in any of the other Asian countries. An analysis made by the Reserve Bank of India in regard to foreign investments in India in 1960 with estimates of probable trends of 1961 confirms the thesis that foreign capital has reassuring faith in the Indian economy and in the stability of the administration as well as government policies. The Reserve Bank's study published in the latest issue of the Bulletin shows that net foreign investments in the private sector touched a record figure of Rs. 78.4 crores in 1960. This level was attained after allowing for repatriation of capital and revaluation of assets amounting to nearly Rs. 2 crores mostly in the tea companies.

The new investment in 1960 was more than double of the level prevalent in the preceding year. Again, it is noteworthy that a substantial portion of this rise in foreign investments was due to foreign private sources, while capital from official sources recorded a slight fall. Outstanding foreign investments in the private sector were estimated at Rs. 690.5 crores in 1960. Official sources also steadily increased their share from Rs. 2.7 crores in 1955 to Rs. 124.1 crores in 1960.

In terms of gross capital inflow from private sources, 1960 recorded a substantial improvement over 1959. As against the inflow of Rs. 25.8 crores in 1959, the level was more than double at Rs. 62.4 crores in 1960. The entire increase in 1960 was due to fresh capital receipts as the retained earnings in 1960 were slightly lower than in 1959. The petroleum sector attracted more new capital than the manufacturing industries.

Despite the fact that the retained earnings were lower in 1960 as compared to 1959, the earnings of foreign capital were not at all affected. The foreign controlled companies yielded to non-residents a total earning of Rs. 41 crores in 1960 as against Rs. 38.6 crores only in 1959 and Rs. 35 crores in each of the earlier two years. The rise in earnings was caused, by and large, by the higher yields in the manufacturing sector and the improved performance in the plantation groups.

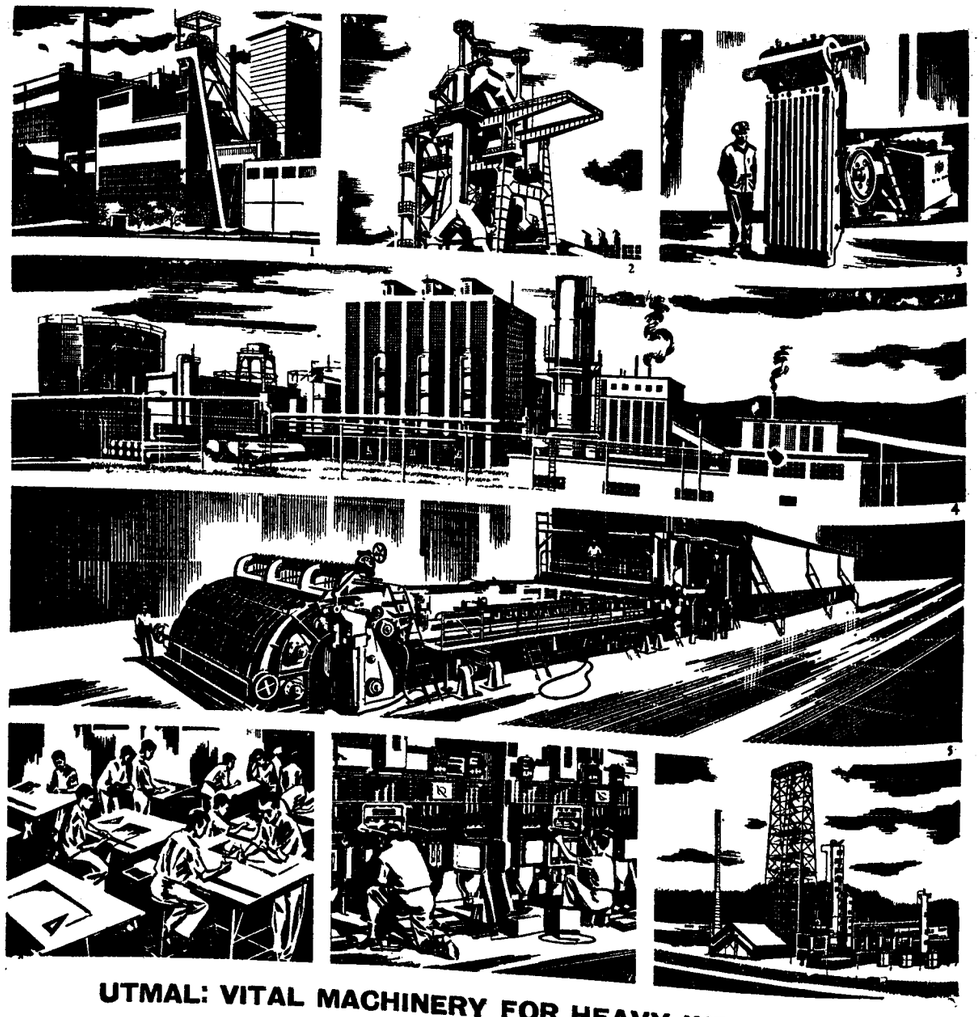
the United Kingdom once again emerged as the principal supplier of capital in 1960. Of the total capital inflow of Rs. 78.4 crores, the share of the United Kingdom was more than half at Rs. 44.5 crores. Incidentally, almost the whole of this new capital was from private sources, the official share being only Rs. 2 crores.

The indications for 1961 are to the effect that in overall terms 1961 may not be as promising as 1960 mainly due to the reason that the investments of the petroleum companies dropped to a rather more normal level. In the non-petroleum sector, however, the net inflow of capital is likely to be an improvement over 1960. The official capital is likely to be also on the higher side in 1961 as against 1960. The estimates made by the Reserve Bank show that the foreign indebtedness of the country would rise in 1961 by about Rs. 351 crores against Rs. 414 crores in 1960.

What will be the picture like in 1962? Up till October of this year, the climate was very favourable for foreign capital and new capital issues had been sanctioned almost every week. The new issues of capital had been greeted by the investing public with great enthusiasm and whatever the dampness during the last two months of the current year, the net inflow of capital may not be smaller than in 1961.

A question which has been frequently asked by all foreign entrepreneurs in India is whether the foreign collaborators who have been given sanctions to set up plants in this country, would be allowed to continue their work under the present emergency. Official sources have already indicated that all those industries which impinge on the defence effort will be requested to hasten their pace and complete their work ahead of schedule. Even in the case of consumer industries the Government of India, in its present mood, is willing to provide all facilities so as to increase the productive effort of the country. Any doubts lurking in the minds of the foreign investors that the Government in any way would like to go back upon any of its previous commitments is based on unsound foundations. The manner in which the United Kingdom, the United States of America, West Germany and France have come forward to assist India in her present hour of trial shows that there will be no holding back on this vital front and that the broad co-ordinates of the Third Five-Year Plan will be allowed to be fulfilled with the massive assistance of these countries in the domain of defence.

Prohibition in the Reverse Gear?



THE dramatic announcement by the U.P. Government to scrap prohibition from December 1 was an important event of this week. The U.P. Government's this forthright measure has been interpreted as putting the prohibition policy of the country in the reverse gear and is taken as a precursor to similar steps by the Governments in other States. The Mysore Government, reports suggest, may follow suit shortly. Ominous rumblings have been heard from Bombay as well. The Labour and Taxation Minister of Punjab is said to have disclosed the State Government's plan to cry halt to further prohibition there. The West Bengal Government has all through been only half-hearted in its extension and enforcement of prohibition.

But to style these developments as a planned retreat from the policy of prohibition on principle is perhaps not warranted. The reversal has obviously been occasioned by the expediency to raise revenue by all possible means to fight the Chinese menace. Various estimates have been made in the recent past of the loss of revenue to the States' exchequer from this source; they range from Rs. 300 crores to Rs. 400 crores per annum. But if the cost of enforcement of the policy is also taken into account, the total amount would grow further by a sizable quantity. Even accrual of 50 per cent of this revenue and saving in the cost of enforcing prohibition should help in financing State expenditure and providing relief to the Centre in the war effort, if not fully, to a large extent. Resort to any further massive taxation measures in the States will only accentuate the inflationary tendencies when supplies of various commodities start falling short of demand, say in another six months.

The question arises whether in the wake of the U.P. Government's step and in view of the fact that no State has taken advantage of the Union Government's year-old offer to make good half the loss of revenue on account of extension of prohibition (which implies lack of enthusiasm on their part to pursue this policy to its full end), there should be a re-appraisal of the policy on an all-India basis. *The Eastern Economist* though never an enthusiastic supporter of prohibition, does not consider the present juncture quite an opportune moment for such a review. Enshrined in our Constitution as the objective of prohibition is, a policy decision by the Union Government on this important issue may be deferred to normal times and not hustled through when the country has been shoved into a tight corner. Whatever may be the opinion about the success or failure of this policy over the past years, there is every likelihood of the present exigency imparting undue bias to immediate abolition.

In the current emergency situation, it would be appropriate if the individual States are given a free hand to form their own prohibition policies in the light of the circumstances obtaining there. There is no denying the fact that wherever prohibition has been practised, alongwith yielding some wholesome results, it has led to boot-legging, springing up on a wide scale of traffic in illicit distillation and corruption in the enforcement staff. To stamp out these evils in those areas is no less an easy task than enforcement of prohibition itself. There, a sudden and complete reversal of the policy can well be expected to raise new law and order problems which it should be prudent to avoid in the near future when all efforts need to be geared to armed as well as civil defence. The Union Government, which has hitherto kept a meaningful silence over the issue, will do well to maintain its this prudent attitude.

While from the point of view of raising resources for the war effort, scrapping or slowing down of prohibition is a welcome step, it passes one's comprehension why various States should be kept saddled with unduly large cabinets which not only are a drain on the national resources but have also made co-ordination an onerous task. In the face of the magnificent voluntary effort of the nation to boost the National Defence Fund, it ill-behoves the party magnates not to set an example in economy without sacrifice of efficiency.

UTMAL: VITAL MACHINERY FOR HEAVY INDUSTRIES

UTKAL Machinery Limited (Utmal), now getting ready to swing into full operation, is one of India's largest machinery-manufacturing enterprises. ■ UTMAL combines the resources and experience of three of the best-known German firms—GHH, Koppers and Voith—and a well-established Indian company: Larsen & Toubro Limited. Each is a leader in its own field, associated with pioneering ventures that have revolutionised many industrial techniques. ■ UTMAL will fully utilise indigenous technical skill, labour and raw materials. Through a special training programme, Indian engineers and administrative staff will play an increasingly important role in its development.

■ UTMAL has a multi-phased programme of manufacturing essential equipment for India's developing industries: Blast furnaces, steel works plant, pig casting machines, sintering plant, coke ovens and by-products recovery plant, plant and equipment for the cement, fertiliser, petro-chemical, paper and hydraulic industries, etc.

GHH One of the foremost manufacturers of heavy machinery in Germany. They are acknowledged pioneers in many fields—particularly in steel production. GHH export machinery to many parts of the world. Their products include plant and equipment for the iron and steel, mining, cement, sugar and chemical industries, floating docks, aerial ropeways, etc.

KOPPERS Experts in the field of fuel refining, Koppers design and construct coking plants and low temperature carbonisation plants with all by-product plants; plants for synthesis gas production from fuels of all kinds; mineral oil refineries, plants for water treatment and waste water purification, industrial furnaces of all types and plants for the chemical industry.

VOITH The largest manufacturers in Europe of pulp and paper machinery. Since their inception almost a century ago, Voith have made many important contributions to the development of this industry. With their extensive experience VOITH offer their services as project engineers for the design of complete plants.

L&T Larsen & Toubro Limited are one of the leading engineering concerns in India. They have wide experience in the manufacture, supply and installation of different types of machinery and industrial plants.

They specialise in the manufacture of chemical plants in stainless steel, aluminium and copper, switchgear, petrol pumps, dairie and ancillary equipment cooling towers, general fabrication etc. They have undertaken the complete installation of many major industrial projects in the country.

1,2,3: GHH Winding Tower ■ Blast Furnace ■ Stone Crusher

THE WEEK'S NOTES

The Cease-fire

APPRISING THE NON-ALIGNED

MR. NEHRU'S announcement in the Lok Sabha on November 26 about the despatch of ministerial delegations to some of the non-aligned countries of Asia and Africa brings the reassurance that we have now awakened to a sense of quickness in explaining our position in international disputes in which we are dragged. The announcement is apparently expedited by a move undertaken by the Government of Ceylon to convene a meeting of the representatives of the United Arab Republic, Ghana, Burma, Cambodia and Indonesia in the first week of the next month for the specific purpose of discussing the India-China conflict and possibly evolving a formula for compromise. It is no reflection on the good intentions of Ceylon (or of those of any of the countries which may have instantaneously reacted to respond to the invitation) that the ministerial deputations are being sent to them to apprise them of the reasonableness of India's stand in this conflict. In the course of his reply in the Lower House to the debate on the resolution on the Chinese aggression, Mr. Nehru took care to pay compliment to President Nasser of the UAR for his painstaking attitude to understand the issues involved in this conflict and to attempt to devise solutions in their light. But Mr. Nehru was constrained to point out that some other countries, Ghana for instance, could not somehow get a proper appreciation of these issues in their first reaction to the Chinese invasion.

Mr. A. K. Sen, the Central Law Minister, and Mr. R. K. Nehru, the Secretary-General to the Ministry of External Affairs, are being deputed to the UAR and Ghana. The task of explaining India's position and contentions to the Governments of Burma, Cambodia and Indonesia has devolved upon Mrs. Lakshmi Menon, Minister in the Ministry of External Affairs. The urgency of these ministerial delegations to explain in its true perspective India's case has become all the more pressing because of the calculated and nefarious attempts made by China in her note to India announcing the ceasefire and possible withdrawal of her troops by making pointed and repeated appeals to the Afro-Asian nations to exercise their good offices to prevail upon India to accept the offer in the interests of world peace.

It is hardly proper to expect foreign governments to be conversant with the minute, though basically important, details of the offers and counter-offers made by India and China. But China's note of October 26 has been couched in such a language of sweet reasonableness that to those, who are not acquainted with the inner issues of the border strategic points and areas, the impression is conveyed that China has not only agreed to India's offer to restore the position as it stood on September 8, 1962, but has gone one step beyond in graciously undertaking to abandon the achievements of her aggression in NEFA. The truth of the matter is that the position in NEFA and the character of the so-called withdrawal are ambiguous in the extreme, while what China really aims at is to obtain before-hand the ratification of the possession of the territory which she has grabbed in Ladakh by giving a new definition to the territorial position as it obtained on November 7, 1959, placing that territory above the plane of negotiations. The Ministers who will proceed to these countries will, it is trusted, find a receptive climate to India's case which has been maintained consistently through-

Pakistan

REGRETTABLE POSTURES

IT IS a matter for deep regret that Pakistan has chosen to take a short view of the implications of China's invasion of India. Initially, prior to the point of China's massive push into the NEFA area and then in the direction of Assam, there may have been some ground to see in this aggression high pressure tactics to coerce India into conceding a corridor to China between Sinkiang and Tibet. But in view of China's surprise and altogether unexpected invasion of NEFA deep into the interior, the entire aggression has taken a sinister complexion and its consequences cannot by any stretch of reasoning be interpreted as confined to India. It is a threat to the territorial integrity of the entire sub-continent and it is not difficult to see that the threat in the eastern sector has some very anxiety-provoking pointers to the Eastern Wing of Pakistan. But the real implications transcend even the Indian sub-continent. China has never concealed her blunt conviction in the spread of world communism by armed force. When and how she may be inclined to translate this conviction into action is a perpetual Chinese puzzle, although, as some think, this may not be at the back of her mind at the present time.

Containing China beyond the McMahon Line and the traditionally and historically recognized line in Ladakh is, therefore, conducive to the safety of the two powers in the Indian sub-continent. Even in her self-interest Pakistan would be expected to do nothing that would embarrass India and add to her difficulties in this hour of the gravest of crises. But Pakistan has taken the stand that American armed assistance to India would upset the present balance of strength and would place in the hands of India a potential which would be a threat to the security of Pakistan. These fears have been completely allayed by India's undertaking to allow the actual use of American and British armament to be watched by the observers of these two countries and by her irrevocable pledge to return all residuary or surplus armaments after the end of China's aggression to the supplying countries. No more reassuring commitment could be made on this armament issue. America's determination to go ahead with the supplies of arms to India on an elaborate scale after a survey by a technical military mission gives a positive indication of her final attitude.

Now Pakistan's Foreign Minister, Mr. Mohammed Ali, has come out with a slanderous statement alleging that India has long since entered into a secret military defensive pact with America. This allegation stands exposed by the simple clarification that what is really referred to are the agreements of 1951 and 1958, which India signed pursuant to the American law on the purchase of arms on commercial terms, like several other non-pact countries. This is an open book for anybody to see and the total purchases under the agreements have added up to a mere Rs. 29 crores. Now comes another wave of attack in the form of publicity given to the Chinese offer of a no-war pact with Pakistan. What value should be given to such a pact, if at all concluded, is for Pakistan to decide. But China's respect for international obligations and solemn agreements concluded with foreign governments is there for anybody to see. Even before the ink was dry on the Panchsheel Agreement signed by China with India, that country started its long-planned strategy of military invasion of India with road construction in the western sector of the Himalayan border. India's offer of a no-war pact to Pakistan is of long standing and it still stands. It is to be trusted that the goodwill

efforts of Mr. Harriman and Mr. Sandys in Karachi on their way back home will prove wholesome.

China : Co-operation

THE COMMONWEALTH TIE

IT SPEAKS eloquently for the spontaneity and strength of the Commonwealth tie that the British Government has politely declined to proceed further with the trade talks that it started months back with the Government of China. Mr. Lu Hsu-chang, the Chinese Vice-Minister of Foreign Trade, was invited as long back as April last by the British Government to pay a visit to London as a matter of reciprocity in the course of these talks. Mr. Lu Hsu-chang was due to be in London on November 29 for a stay of three weeks. Apparently these three weeks were to be taken up by a resumption of the talks. But the Chinese Vice-Minister has now been told to postpone his goodwill visit "for the time being". Presumably, "for the time being" is a synonym for "for the duration of China's hostilities with India". This inference is obvious from the explanation assigned for the suggestion to postpone the visit. That explanation is that the postponement has been urged "in view of the possibility that the success of this visit might be prejudiced in the present disturbed situation". Shorn of diplomatic courtesy, the reason implies that Britain cannot countenance the proposal of a trade pact with China so long as China is misbehaving by means of blatant aggression against a Commonwealth partner.

Australia and Canada are two Commonwealth countries on whose imported foodgrains China is feeding her population. There was an element of philanthropy in the supplies of wheat made by these two countries to China in the initial context of famine in that country. The responsible and representative Press in both the countries is now pressing upon their Governments to stop these supplies to a country which shows not the least regard for peace and international norms.

These moves and proposals which partake of the complexion of economic sanctions will not go in vain, for China's economic strength at the present time to sustain a long drawn-out and full-scale war against India is perhaps being exaggerated out of proportion in this country.

Dr. Lubke

A GOODWILL MISSION AND MORE

DR. HEINRICH LUBKE, President of West Germany, is most welcome in this country at a critical juncture in its post-independence history. He comes essentially on a goodwill mission to India, but there is, it is to be presumed, something more of tangible importance in it. In the team which accompanies the President is a distinguished figure — West Germany's Foreign Minister, Dr. Gerhard Schroeder. When Dr. Lubke pays a visit to Rourkela, the proud monument to Germany's economic and technical assistance in India's enterprise of development, he will be accompanied by quite a number of the top ranking representatives of West German industry. West Germany has now emerged as the second biggest provider of economic assistance to this country next only after America. There are signs that this position will be maintained as a matter of firm policy by West Germany.

There could be no more fitting ambassador of the goodwill of the German people to the people of India than Dr. Lubke. In his own country he has earned a place of eminence as the counterpart of Dr. Ludwig Erhard in the domain of agriculture. If German agriculture has been elevated to the high level on which it stands today, Dr. Lubke is its main inspiration. For many years he bore the brunt of office as Minister for Agriculture. Drawn from the peasant stock, he maintains the simplicity of life even to this day. He politely declined to move to the Presidential mansion and insisted on staying in his simple family flat which he acquired after years of hard work. This attitude will be highly appreciated in India which has always professed simplicity in her way of life. The disturbing thought, however, cannot but be mentioned that sometimes we tend to lapse from the ideal and we have the opposite of the example of Dr. Lubke in Ministers persisting in staying in the ministerial bungalows after they cease to hold office.

Of profound significance was Dr. Lubke's one outstanding observation at the banquet given in his honour in Rashtrapati Bhawan. Conveying to the people of India the message of their sympathy and support to the Indian people in their present ordeal of the Chinese invasion, Dr. Lubke stated that the Germans knew war with all its horrors and they hated it from the bottom of their hearts. They have now learnt that peace is difficult to preserve since it stands jeopardized by the threats of the totalitarian forces. We in India are learning both these bitter experiences in spite of our twelve years of consistent efforts to maintain friendly relations with China. Let us beware that a totalitarian power right on our border is a constant threat and a perpetual warning to be on the alert.

British By-elections

CONSERVATIVE LOSSES

IN THE five British by-elections whose results were announced last week-end the Conservative Party lost in the key constituencies to its opponents and where it won the majority was barely marginal, showing a loss in the electorate's support. To the second category belong Central Norfolk, South Northamptonshire and Chippenham. In Chippenham the Liberal contestant ran almost a close race with the Tory candidate who was returned by a narrow majority. In the other two constituencies the Conservatives were returned with a substantially reduced strength in votes.

But of much greater consequence were the out and out Conservative reverses in South Dorset and Woodside (Glasgow). South Dorset was the citadel of the Conservatives which returned a Tory candidate for the past half a century. But here the Labour success was largely due to a curious intervention. Viscount Hichinbrooke (now Earl of Sandwich), who formerly represented South Dorset, pulled his weight on behalf of the Independent Sir Piers Debenham. This is a predominantly agricultural constituency where the Common Market issue is a burning question. The Earl of Sandwich is an anti-Market advocate and on this issue he could succeed in swinging a good deal of votes for his Independent friend, Sir Piers. The result was that the split gave a crucial advantage to the Labour Party. The vote was 13,783 for Mr. Barnett (Labour) as against 13,079 for Mr. Maude (Conservative). In the Woodside constituency, Labour won by a good majority polling 8,303 votes as against the Conservative poll of 6,935. The Liberal candidate came lowest with 5,000 votes. These five by-elections were almost confidently taken for granted as Conservative successes. This time the Gallup poll went wide of the mark. By-elections do not necessarily give a firm indication of the trends in the general election. But if the general election is held some time at the beginning of the fourth quarter of 1963 on the issue of the Common Market, the Conservatives will have to educate the electorate and arm themselves for another term by an intensive campaign.

The World Abroad

BUSINESS MORALS IN THE U.S.A. AND THE U.S.S.R.

By ODYSSEUS

IN EVERY ECONOMIC system, there is a vast difference between its ideal and its real functioning. A fascinating book, "The Soviet Economy", just published by Richard D. Irwin Inc. (1800 Ridge Road, Homewood, Illinois, USA), contains 18 essays by American and British experts covering Soviet planning, problems of management, labour, agriculture, foreign trade, wages, prices, and social welfare, which should be of absorbing interest (a) to India's planners, and (b) to all those in government and industry affected by their plans.

Last week, I outlined Professor J. S. Berliner's essay on managerial incentives in the USSR. He warns us that we should not conclude from his analysis of the weak points of the Soviet system that it does not work. Today, we follow the Professor in exploring the gap between the ideal and the actual performance of American managers in order to gain a better perspective of both systems.

The typical US company today is not managed by an owner-entrepreneur, working for himself, but by salaried managers working for the shareholders. The US manager has only a limited share in profits and often looks on shareholders as outsiders whose demands for dividends are necessary evils. In like manner, the Soviet manager often resents the intrusion of his owners—the State—into "his" affairs. We saw last week how he tries to protect himself against the state. In the USA (as in other Western economies), managers try to protect their interests by ploughing back profits for the sake of enlarging their company. They are unwilling to liquidate failing enterprises, and thus put themselves out of jobs, although liquidation may be in the interests of the shareholders. The growth of company self-financing has strengthened the manager's power to expand "his" enterprise without submitting to the test of the market for capital.

While the Soviet manager's desire for security leads him to such practices as concealing production capacity and resisting technological change, Western economists also note the change from the adventurous entrepreneurs of earlier days to the cautious "industrial bureaucrats", who play for safety today.

CONTROLS BREED CORRUPTION

The Soviet manager is compelled to evade the law, because he is surrounded by so many regulations. The US manager is somewhat better placed. If a Chicago manufacturer ships an order to Seattle instead of New York, he has nothing to fear but the ire of the New York firm. But if a Kiev manufacturer ships an order to Moscow instead of Leningrad, he suffers state disciplinary action. If a US manager sells a substandard generator, he may lose money or his business. If a Soviet manager does the same, he risks prison. Since, however, the USSR business world is (like the Indian) tangled in a much greater web of controls than that of the USA, or of the West in general, the Soviet manager finds his interests in conflict with the law much more, and it is inevitable that evasion and corruption should be far greater than

On the other hand, with the growing complexity of Western society, more and more laws are passed to protect the public from potential abuses. The USSR manager sets out to evade such laws when they conflict with the interests of his firm, his career, or his pocket. What does the American do?

Professir E. H. Sutherland's book, "White Collar Crime" (Dryden. New York. 1949) studied legal decisions against 70 large industrial companies, which in 1935|44 were convicted 585 times for such practices as restraint of trade, misrepresentation in advertising, unfair labour practices, etc. The average was 8.5 convictions per company. Sutherland concluded that his figures under-stated the extent of such practices, which, he said, were "very prevalent".

The point is that when US managers find themselves in positions similar to those of Soviet managers, they behave in the same ways. There is evidence that the Soviet manager, aware that everyone under-states capacity, hoards supplies, gets them from black markets, or mis-states his monthly returns in order not to lose his bonus; he reckons that investigating agencies have limited budgets, and counts on the law of averages (and his own superior shrewdness) to get away with it. Likewise, an American authority wrote that about the only thing which keeps many a businessman free from federal indictment is that, under hit-or-miss methods of prosecution, the law of averages has not struck him down.

Managerial attitudes are also similar in the USSR and the USA. The Soviet manager does not think it "wrong" to use influence to secure supplies illegally, or to falsify his reports to the central planners. What is important is success. If you are successful, you can get away with all sorts of violations. There is evidence that the Soviet manager feels contempt for planners and party officials, who try to tell him how to run his business, but who themselves have "never met a payroll". Sutherland's picture of US managers is similar. The American businessman who violates laws intended to regulate business does not usually lose status among his associates. If a few think less of him, others admire him. American businessmen usually regard government officials as "politicians" and "bureaucrats" and official inspectors as "snoopers".

Professor Berliner says that one of the Soviet system's assets is the planners' ability to keep the economy in over-full employment: the demand for labour and supplies is greater than the supply; the engine works all out all the time. For this it has, however, to pay the price of over-ordering, hoarding, and deterioration of quality. The USSR is a permanent sellers' market.

The American, and average Western, economy is only exceptionally faced with over-full employment. Hoarding makes no sense when supplies are adequate. Competition and consumer resistance keep quality of production up to standard. The role of influence has been narrowed by the disappearance of

war time bureaucratic controls. The American and Western manager's biggest problem is selling, not buying. The energy that the Soviet manager spends on obtaining materials is spent by the Western firm in selling and advertising—which, I suggest, is greatly to the advantage of the Western consumer in the volume, variety, and quality of goods that it makes available to him.

Thus the differences in USSR and US managerial practice basically spring from differences in environment. How do US managers behave when placed in a similar environment? World War II forced over full employment on the USA. It is noteworthy that the rate of growth of production in the war rivalled current levels of Soviet production. This means that there is no magic in the Soviet system. The US economy could grow as fast if Americans would agree to be pushed around as totally as the Russians.

BLACK MARKETS IN THE U.S.A.

War-time over full employment in the USA was achieved by government controls, allocation of supplies, controlled prices, cost-plus contracting, and shortage of supplies, and, like the Soviets, the Americans paid for their high rate of production by much waste. Control and allocation of materials created black markets. So extensive was connivance at black markets, and other illegal practices, among businessmen, criminals, and average citizens, that I am led to suspect that it must have had as permanently a lowering effect on American standards of conduct as the disastrous interwar experiment in prohibition, whose effects are still visible in the average American's acceptance of excessive drinking as a natural phenomenon.

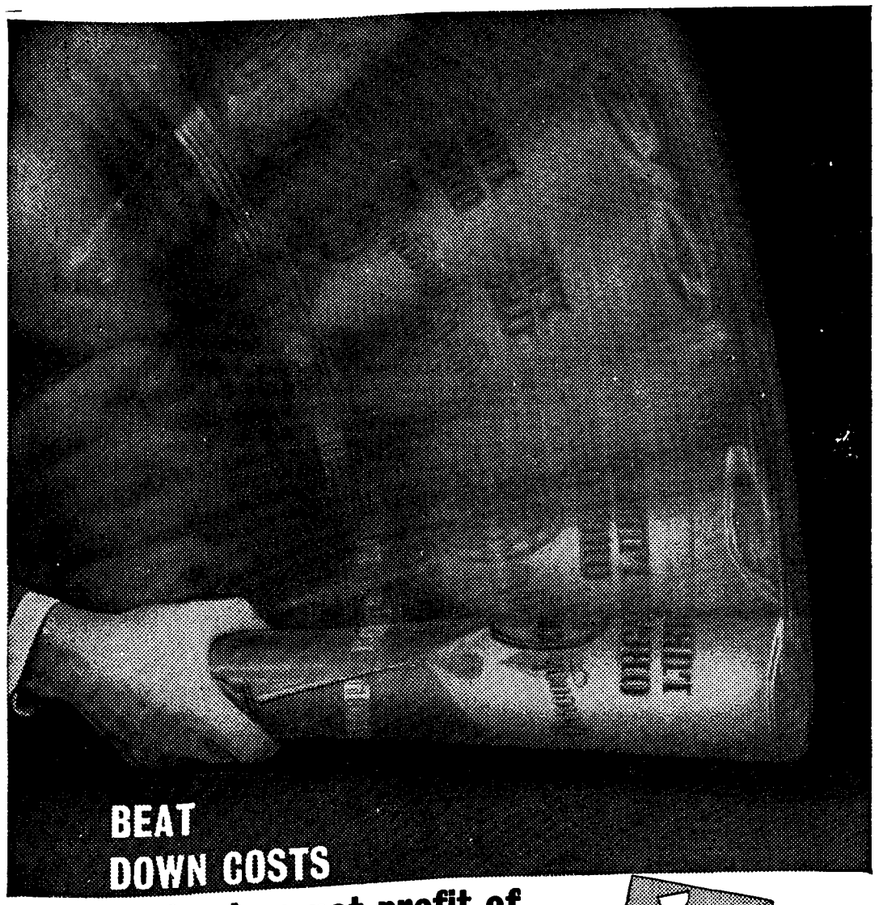
The reputation of American production for high quality is, in normal times, world-wide, but war-time controls and shortages produced the same results as in the USSR. One of the commonest expedients of Soviet managers is to upgrade lower quality goods and sell them at higher quality prices. This was widespread in war-time America: it is difficult to detect, even with an enormous, wasteful, and time-consuming system of inspection.

The Soviet manager is protected by the mutual support among the many officials whose fortunes depend on the success of his enterprise. The Communist Party secretary is reluctant to report the violations of a manager, from whose success the party benefits. Other officials hesitate to dismiss him, because while the next manager may be more law abiding, he may not succeed in fulfilling his plan. This solidarity exasperates the highest levels of USSR ministers and planners but they have no cure for it. The same solidarity characterised businessmen in war-time America.

The influential "contact man" comes into his own in all closely regulated economies. He flourishes in Delhi today as he does in Moscow, as he did in Nazi Germany. Mr. L. Hamburger describes in his "How Nazi Germany Controlled Business" (Brookings. Washington. D. C. 1943) how the contact man pulled wires. He knew the influential Party members who controlled orders and allocations. The American influence-pedlar does the same job in so far as the law attempts to control business. Bribes and favours pullulate in Moscow, Washington D. C., and—alsewhere.

The moral is that a nation should seek to create a social climate favourable to high standards of public and private conduct. You do not do this by controls, regulations, or Acts of Parliament. On the contrary, the wider the regulations, the wider the corruption, the lower the standards. Human nature in all countries is the same mixture of good and evil, of aspirations and failures, but all history suggests that free societies, which face the individual with the responsibility for making his own choice between the better or the worse, breed responsible citizens with higher standards. From a purely material viewpoint, the rate of economic growth is likely to be slower than in a regimented society. If so, my vote is still for freedom.

OUR HUMBLE OFFERINGS TO THE DEFENDERS



OF THE MOTHERLAND

In view of the National Emergency The Punjab National Bank Limited offers the Armed Forces Personnel and their wives FREE OF ANY CHARGE the usual banking facilities such as remittances from one office of the Bank to another to the same or any other Account, collection of salary and other cheques, carrying out of standing instructions for recurring payments. No incidental charges will be levied on Current and Savings Fund Accounts. For particulars please contact our nearest office.

All contributions by the public to the National Defence Fund will be remitted by all offices of the Bank without any charge.

The European Scene

WEST EUROPE IN 1970

From Our Special West European Correspondent

PARIS, November 25.

BUSINESS forecasts are intended to enlighten, but they have become so frequent in West Europe nowadays, and are offered by so many different authorities, that they create confusion. Scarcely a week passes without a government agency, planning board, statistical institute, chamber of commerce or industrial association offering its forecast of the course of economic activity in the coming months. These have to be added to the forecasts put out by the Common Market authorities and international agencies (OECD and UN organisms) for this region, and must be read with the similar spate of business forecasts published in the USA, for these latter, if realised, would impinge on European affairs. Confusion is confounded because these various forecasts are more or less contradictory: at the present moment, the European business man has a choice between hypotheses of a major slowdown, even recession, over here next year, and projections that promise a maintained, even accelerated, pace of expansion throughout 1963. As far as concerns forecasts uttered at the start of this year regarding the level of business in this country, to the extent there was any consensus it has been belied by the facts. Most people expected, on the strength of expert studies, a slowdown that has in no way materialised.

One takes up rather gingerly, therefore, the projection just published, by a group of economists headed by Pierre Uri and appointed by the Common Market Commission, for the period 1960-1970 in this region. This distrust is perhaps misplaced, for long-range forecasts are considerably more reliable than short-term prophesies. It is harder to say whether business will be brisk next summer than to give the broad outlines of development over the next decade—but, of course, vast assumptions have to be made, such as that wars and recessions do not occur. When the Twentieth Century Fund (to cite yet another recent forecast) predicts that by 1970 in West Europe sales of household gadgets will rise by 90 per cent and of automobiles by 145 per cent, this is a more reliable statement than a prediction about the level of private investment in the Common Market in 1963; it rests on surer evidence, namely in this case the rise in revenues and the spread of consumer credit. The interest of uncovering this sort of long-range trend is familiar to readers of Colin Clark's Economics of 1960 or of Jean Fourastie's Civilisation of 1975.

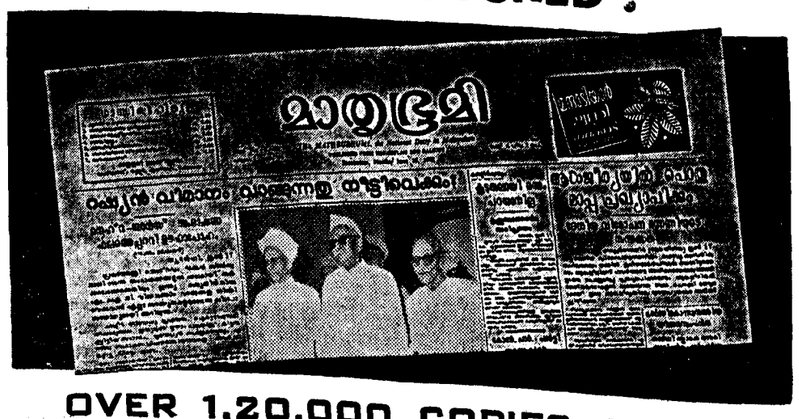
The Uri group predicts that in 1970 the gross national product of the six present members of the Common Market will be 59 per cent higher than it was in 1960. It will be remembered that the OECD has adopted the target of a 50 per cent rise for the 20 members of that organisation (West Europe plus the USA and Canada) in the same period. The Uri group's calculation is a more rigorous (or less hazardous) one than the rather vague forecast of the OECD, and moreover it appears that the Six will have more chance of expanding at the pace it augurs than will the 20 of the OECD. The US economy alone makes up 60 per cent of the gross production of the OECD countries, so if that country is lagging the group as a whole has little hope of reaching its objective. In fact, it is lagging: in the first two years of this decade, the rate of expansion in the USA has been only 3.5 per cent annually, bringing the average for the 20 countries down to 3.8 per cent, whereas an annual increment of 4.1 per cent would be required to add on 50 per cent in ten years. Still, there remains plenty of time for the Americans to make up their arrears, and the tax cuts proposed by Washington might be decisive in that sense. At all events, the Six will have an easier time living up to the Uri group's expectations.

The group has worked out the implications of two different hypotheses about the pace of expansion: a "principal hypothesis" (the one they think more reasonable) that assumes generally favourable conditions in Europe for rapid growth, and a "secondary hypothesis" about slower progress. On the former and more optimistic view, the following table gives the percentage increases in gross product for two past and two future periods of five years in the Common Market countries:-

	1950-55	1955-60	1960-65	1965-70	1960-70
W. Germany	54.2	35	24.1	21.9	51.1
Belgium	17.6	12.9	20.5	21.1	45.9
France	24.2	22.9	28.8	25.8	62
Italy ,	33.6	33	33.5	32.3	76.6
Holland	31.3	22.6	23.4	27.2	57
Whole ECM	35	28.1	27	25.3	59.1

It will be noted that, even on this more favourable hypothesis, there will be a slowing down of the pace of expansion, which is more noticeable still on a per capita basis: gross product per head of population rose by 58.5 per cent in the decade 1950-60 but is expected to rise by 47.6 per cent in the decade 1960-70. The reasons are the size, age distribution and occupational structure of the European population. In the present decade the population of the Common Market will, on present indications, increase by 7.8 per cent (from 168.8 million in 1960 to 181.9 millions in 1970). Not only will the swelling product have to be shared among more people, but the number of active economic agents in the total will diminish as a percentage: the active working force will grow by only 6.3 per cent. The reasons for that are the increase in schooling time, at the one end, and longer-living old people at the other end. (The Common Market includes, in France, the oldest nation in the world: 7.5 million people over 60 out of a population of 47 million. Yet that same country has more children, because of the recent increase in natality, than most of its bigger neighbours. Thus the working people carry a heavier burden of inactive consumers.)

Not only that, but the active population is moving rapidly into the less productive sectors, i.e. out of agriculture and industry into tertiary services, where the rate of increase in productivity is negligible. In 1970 the Common Market will employ 16 per cent of its active people in agriculture, 44 per cent in industry and 40 per cent in services, thereby approaching nearer the American situation where there are more people engaged in services than in productive industry and agriculture. Since, as far as we can see at the moment, increases in productivity in services will be small and slow, the transfer of population to services must bring a slowing down in the pace of growth. We have heard so much of the transfer of labour from the fields to the factories that one misses the fact that the real movement is from the farms into tertiary



services: the peasant does not become a factory hand but a tradesman, member of the liberal professions or supplier of other services. It is as though needs for food, and then for manufactures, were following a curve that flattens out as saturation is approached, while humanity remains avid for the assistance of milkmen, teachers, hairdressers, musicians, psychoanalysts and tourist agents.

The figures also indicate that differences between the various countries will diminish: progress will be fastest in Italy and next in France, where there are today large parts of the population that live well below the European average. It will be less marked in West Germany and particularly in Belgium, where industrialisation and bourgeois comfort are already universal. Differences will however remain considerable, and it will not be until the year 2000 (according to another set of projections) that Italy draws equal with France. That equality, it should be noted, will be attained at levels far above those now known: French gross product per head in 1970 will be about double the Common Market average of 1960.

One hears folk here interpret pessimistically the Uri group's forecast of a slowing down of the pace of expansion later in the decade, and indeed the flattening out of the steep curve has provided all the newspaper headlines on accounts of this projection. Yet if people seriously expect recent rates of growth to be continued indefinitely into the future, they show that they have not understood the figures they are reading. We are supposed to have learned compound interest at school, so we should know that a 7 per cent annual increase in industrial output (and this pace has been quite common lately in Italy, France and Germany) means a doubling in ten years, a multiplication by 32 in 50 years, a multiplication by 1,024 in 100 years—and a multiplication by 1,050,000 in 200 years! Obviously such rates of expansion are impossible. If French industrial expansion continued for 140 years at the recent rate of 7 per cent, by the year 2,100 her steel production would be about 100,000,000,000 tons. "At that speed", Fourastie has observed, "the mass of the moon, then of the earth, of Mars, Venus and the whole solar system would be transformed in some years into refrigerators, washing machines and concrete buildings".

Such extrapolations are not just mathematical curiosities, but economic realities that have to be borne in mind in considering any long-range forecasts about the growth of the vigorous economies of the Common Market. For the fact is that we are living through a sort of economic explosion that began very recently and cannot continue indefinitely. There is a professor in Paris who tells his students to take French industrial production in 1913 as 100 and then guess what the index number was in 1939: guesses range widly from 130 to 150, when in fact the index in 1939 was 105. But, on present indications, it will be 335 in 1965 (it is 290 this year). In other words, the immensely fast pace of industrial growth in West Europe began in our lifetime, just after the war, and must—on grounds of sheer physical impossibility—be finished in the lifetime of our grand children. It is dangerous to juggle with such figures as those of the Uri group's projection unless one realises that they are inhuman figures, i.e. completely unnatural in a historical perspective and quite untypical both of humanity's experience in the past and of its likely experience in the future.

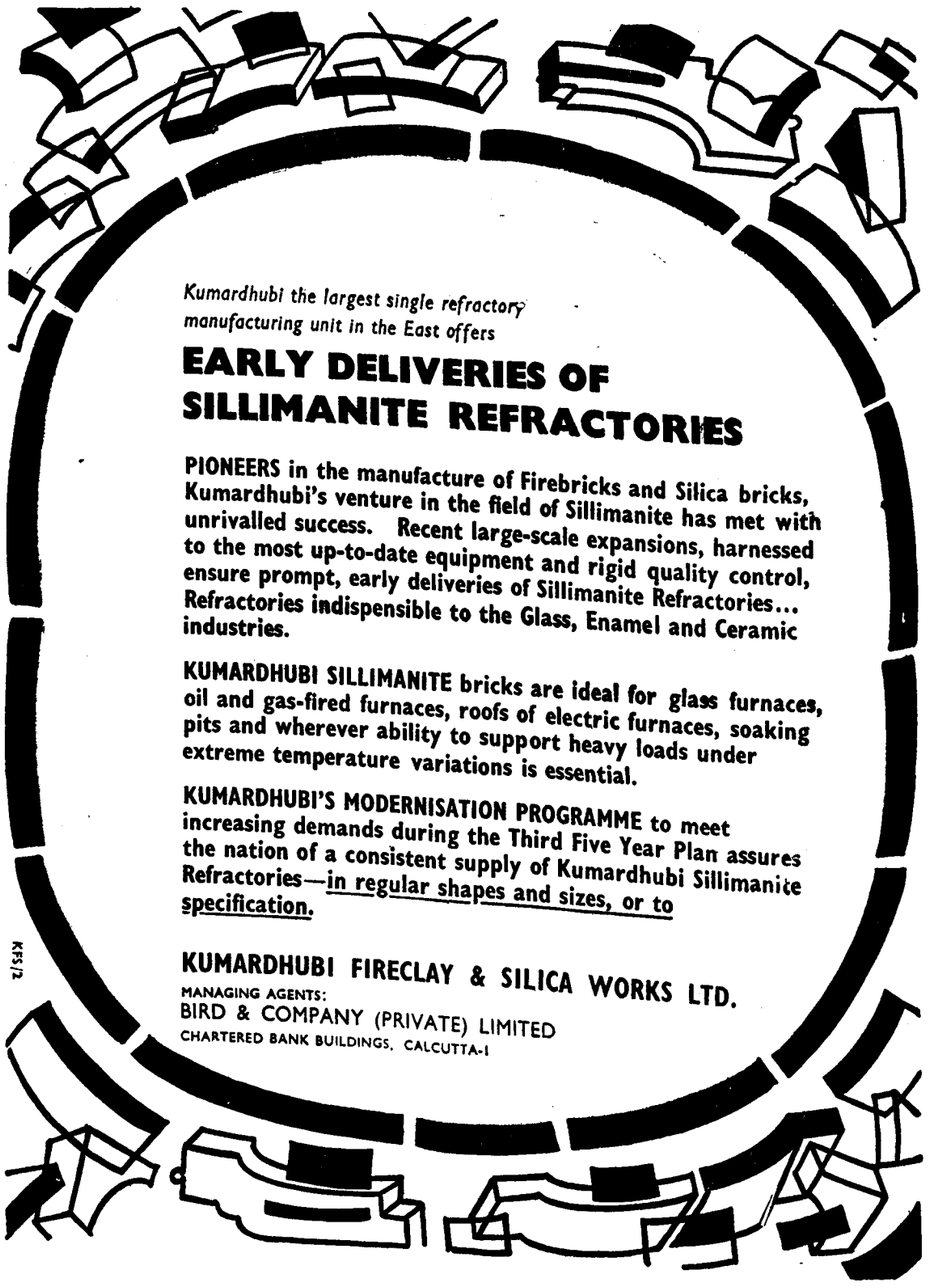
Economic Report from the U.S.

TAX REDUCTION: AN INVESTMENT IN ECONOMIC GROWTH

By GUY SIMS FITCH



WASHINGTON, November 20.

THE KENNEDY Administration is in the process of drawing up recommendations for substantial tax reduction and reform for submission to Congress early next year. These recommendations are not meant to be temporary palliatives, nor are they counter-cyclical in motivation or quality. They are designed as powerful stimulants to continued and accelerated expansion as an important investment in the long-term economic growth of the United States. This always has been a basic concern of the Kennedy Administration. While the economy has been on a steady upgrade for the past two years, and even shows signs of improving on its recent performance, its advance still has not been adequate to fully employ the nation's manpower and material resources.

The Administration's oft-expressed espousal of a tax programme that would bolster the economy's long-range performance now has been reaffirmed in clear and unqualified terms by top government officials at a meeting last week sponsored by the President's advisory committee on labour-management policy. This includes the Secretary of the Treasury, the Secretary of Labour, and the Chairman of President Kennedy's Council of Economic Advisors. At that meeting, leading economists from business, labour, government and the academic world reached a general consensus that sizable tax reduction are both desirable and feasible. This view has been echoed in an advisory committee report this week, urging a tax cut in the vicinity of $ 10,000 million for both individuals and corporations. Admittedly, a tax cut of this size would further enlarge the deficit in the national budget, which has been estimated at some $ 7,800 million for the 1963 fiscal year ending next June 30. But this is a risk the Administration appears ready to take in the interest of accelerating economic growth. In any case, there is a serious question of how soon the budget results could be improved at the present rate of economic expansion. The general view seems to be that if growth can be stimulated substantially, incomes and government revenues could increase sufficiently, even at lower tax rates, to restore a budget balance. This is not only logical, but in line with some previous experience. A $ 7,000 million tax cut back in 1954, for instance, made for a larger budget deficit that year, but it led to budget surpluses in ensuing years.

This emphasis on one phase of fiscal policy requires that the other side—that of government spending—not be allowed to work at cross-purposes to it. Most economists agree that no artificial restraints should be placed on government expenditures which might endanger important public programme or might act as deflationary influences and thus negate the effects of a tax slash. This does not imply spending for its own sake. Rather, the view is that the nation should continue to meet its domestic and international responsibilities, even if these call for some increases in expenditures. At the same time, of course, the Government would be exercising all reasonable prudence in the use of its funds. Monetary policy, which by itself has proved incapable of fostering the rapid economic expansion desired, also would have to be watched carefully. Interest rates, it is agreed, should not be permitted to rise to the point of choking off needed growth, nor should they be permitted to fall to the point where they would invite a renewed outflow of capital, to the possible deteriment of the balance of international payments. These principles are well enough understood to have won widespread support for the Kennedy Administration's tax policies both at home and abroad. Significantly, the report of the labour-management committee received the unanimous endorsement of its 21 members—those from business and labour as well as from Government. Even this broad approval, of course, does not guarantee a favourable Congressional reduction. Nor is there any official indication as yet for the exact form the Administration's proposals may take—either as to the magnitude, nature and timing of the tax cut, or the make-up of the structural reforms in the tax system. The broad outlines of the Administration's programme are evident, however, and the path of public policy has now been clearly charted.

pecial Article

AUSTERITY: ESSENTIALS OF POLICY

N addition to making all efforts for accelerating the war effort, it is necessary that voluntary control hould be imposed on consumption as well as on waste. n fact, earnest attempts should be made to activise ll those products which have been deemed as waste, ince, according to a popular saying, "waste is not vaste, if you do not want to waste it." This applies articularly to scrap and other industrial waste. Waste f either human effort or material goods is criminal ven in times of peace, leave alone the present hour of crisis. The public at large can contribute helpfully by keeping down the demand for various goods and services by putting into practice some of the austere measures which this country adopted during the last World War.

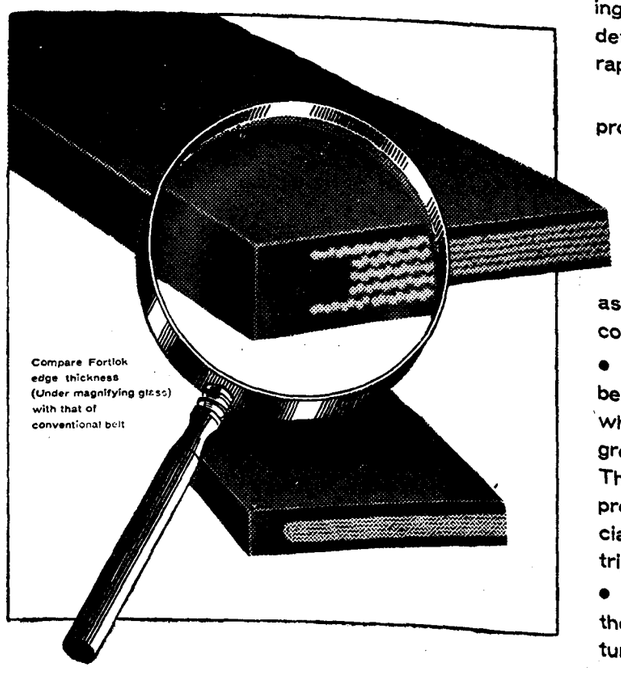
In this hour of the utmost need when the Government is rivetting all its attention on the maintenance of a healthy and stable economy — so that the civilian population can participate fully in the war effort — the pressure is likely to be felt in the case of consumer goods. While it is the policy of the Government to see that the minimum necessities of life do not rise in prices — and in this respect there has been remarkable success since the beginning of the hostilities —the fact remains that in certain sectors, the co-operation of the public is imperative if the price line is to be held firmly.

In certain sectors, the people have operated with great restraint and have put a brake on the upward trend of prices by reducing consumption. Mention needs to be made particularly of woollen textiles and hosiery goods which have indicated only a slight marginal increase over the preceding year. The prices of the woollen goods are the same today as they were before the commencement of the hostilities. The woollen textile mills have been diverted to the production of woollen goods for the forces and, therefore, it is natural that woollen textiles for the civilian population should fall in supply. In these circumstances, it is necessary — in fact, obligatory — to make use of the old woollen clothes that the people possess so that no additional pressure is imposed on the woollen goods market.

Unfortunately, in some sectors goods have already come under pressure. This refers particularly to kerosene whose price has spurted during the recent weeks. This is a vital commodity for the poor sections of society which have to keep their meagre dwellings aglow after sun-set. A rise in the price of kerosene certainly impinges heavily upon the poor man's budget and under the present circumstances, it is incumbent upon the kerosene dealers to see to it that their name is not tarnished at a time when all the trading associations throughout the country are vying with each other to win the confidence of the public in their efforts of keeping prices down. In the case of wheat, sugar, and other bare necessities, prices have eased in recent weeks showing slackness in demand; partly, according to the market reports, this downward trend is due to the voluntary efforts of the traders who have refused to cash in on the present adverse situation and partly due to the anti-inflationary measures taken by the Ministry of Finance.

The impact of the debacle in the stock exchanges and the bullion prices has eroded vast purchasing power in some sections of the business community which has, in turn, created a tightness in the money market. The fall in bullion prices as a result of the announcement of Mr. Morarji Desai that all attempts would be made within a month to bring the price of gold to Rs. 70 per tola so that all smuggling is rooted out, has had a very salutary effect. The banks have now pressed upon the loanees who had drawn advances against gold to square their accounts by the liquidation of gold. This anti-inflationary policy of the Government has been quite effective so far.

In the case of luxuries and semi-luxuries the story is quite the opposite. Tooth pastes, creams, soaps, etc. have come under pressure, in the sense that their prices have increased marginally because of the likely curtailment in production. The rise in prices in itself may be a restraining influence so that consumption would fall, thus putting a ban on further increase in prices. Such luxuries as mechanical appliances, decorative goods, cosmetics, shoes and accessories have fallen in demand. Even if the prices of these luxuries should rise, the vast majority of the people would not be affected and, therefore, no one need bother about the select few.



Austerity in consumption means that the people should help in curtailing consumption in many other ways. Some of the utilities are likely to be in great demand and it will be in the national interest to keep down the consumption of water, transport, power, etc. As during the last World War, an educational propaganda should be mounted to inform the people that they must keep their travel necessities to the minimum and if they must travel, they should travel light. Again, the civilian use of power can be reduced by people by minimising the use of electrical gadgets and by going to bed early and also rising early. The use of water also should be reduced; it will put a lesser pressure on the machinery and will reduce the consumption of some vital chemicals needed for the war activities. Instances of this type can be multiplied. In every sector, it must be the duty of every national to see to it that no waste takes place in the consumption of any commodity and that a cut in consumption is brought about even under conditions of slight hardship.

Austerity need not mean any slowing down in the tempo of our industrial development. All those industries which have a bearing, directly or indirectly, on the defence industries, must work round the clock to see that targets are achieved ahead of schedule. Unnecessary projects may be shelved for the time being. The schemes for building new housing colonies in urban areas may be deferred. A slowing down in the process of housing for civilian population at the present time will not only assist in diverting cement for military purposes but also reduce the pressure on the transport system. Even in offices, consumption of stationery and other equipment must be minimised. The liberal methods of salesmanship employed during peace time may not serve during the present emergency. Even in the case of employment, the Government at all levels must stop all recruitment which is not essential for conducting the war. The Union Minister for Finance, Mr. Desai, needs to be congratulated on his decision to cut administrative expenditure by 10 per cent immediately and reduce it further without affecting efficiency. This is the right course to channelise the productive effort so as to eliminate waste and unnecessary expenditure. The Government must spell out a detailed policy in this regard which should apply to all Government departments and agencies, whether at the Centre or the States.

NEW FORTLOK CONSTRUCTION GIVES DUNLOP CONVEYOR BELTS AN EDGE OVER OTHERS

Conveyor belts are most vulnerable at the edges. The new Dunlop **FORTLOK** construction more than doubles the life of the belt edge by providing double edge cushioning capacity.

A common cause of belts wearing out prematurely is edge wear due to rubbing against the side of the structure, against the chute, against jammed abrasive loads, or by the excessive use of guide idlers. When the edge has been worn or torn away, further wearing of the edge and consequent belt deterioration is usually comparatively rapid.

Dunlop **FORTLOK** overcomes this problem. Note its construction as shown under the magnifying glass in this illustration of a conveyor belt section.

- The thickness of the edge protection rubber has been doubled as compared with the conventional conveyor belt edge.
- Note, too, that the edge rubber has been keyed into the carcass of the belt which produces an anchorage infinitely greater than in conventional belt edges. This permits the use of thicker edge protection of assured stability—especially important where guide idlers or trippers are used.
- The thicker, stronger edge protects the belt carcass from attack by moisture, grit, acids, alkalis or oils.

FORTLOK is a registered Trade Mark.

THE BUSINESS WORLD

Co-ops or Co-operation with Existing Agencies?

By CROESUS

A few days ago, presiding over the annual general meeting of the Maharashtra Chamber of Commerce, Bombay, Mr. Lalchand Hirachand exhorted business men to maintain the price line and carry on their work as a distributing agency with a sense of service to the community. Having counselled this Gandhian concept of Trusteeship, he logically followed it up by calling upon the Government not to 'proceed with the substitute agency contempleted by it, namely, a chain of co-operative stores, thereby displacing a number of traders from their honest business and creating, in their stead, an inexperienced and costly machinery. He also suggested that the Government should enlist the support and co-operation of the recognised associations of business men in its tasks of procurement and distribution of essential commodities.

How sound the advice and how imperative it is to act as per that advice are strikingly brought home by a reference to the prevailing position in the case of atleast one important essential commodity—cloth. A comparative study of the production and stock figures of cloth with the cotton mill industry suggests that the industry is today saddled with more stocks—and that despite a steady decline in production from month to month—than it would wish. Thus, total stocks with all mills have been steadily going up since May without even the redeeming feature of a seasonal fall in October as in that month in the year 1961, as the following comparative figures show:—

(In bales of 1500 yrds. each)

1961	Month	1962
268,500	May	322,200
317,000	June	353,700
339,200	July	399,200
366,900	August	413,500
384,800	September	420,200
375,300	October	431,900

It is expected that the end-November, 1962, stock figures will be still higher than the end-October, 1962, figures. That this should be happening despite a lower monthly production in 1962 than in the previous year and a more or less steady fall since May last (July, 1962, was an exception) in the total monthly production this year (vide table below) shows that the markets are by no means starved of supplies and that there are hardly any signs of scarcity conditions, atleast in cotton mill cloth, to warrant any hasty move on the part of the authorities to supplant the existing agencies and replace them by new and inexperienced agencies (even if they happen to be co-operatives). Rather than resort to any such move, the authorities would be well advised to enlist the co-operation of the mill industry itself to prevail upon its member-mills to open more fair price shops in suitable localities, as some of the leading mills have even now been doing—and to very good purpose too This should take care of cloth distribution.

(* Provisional)

As regards production too, in the light of the aforesaid trend, there is urgent need for close liaison between the Government and the industry. It is a pity that, when all industries are being urged to maximise production, they should still be asked to wait when they approach the authorities as to what precise type or specification of products they have to turn out to further the war effort. Atleast two industries—the machine tool industry and the cotton mill industry—are reportedly in this unenviable position. It is no satisfactory explanation of this to point, for example, to the comprehensive bill that the Lok Sabha has just passed, providing for the establishment of a committee, with wide statutory powers, to ensure the quality of textiles and of textile machinery. What is needed, as Mr. Lalchand stressed in his presidential address, is a Production Promotion Council at the Centre, composed of all the interests concerned and charged with the twin tasks of both assessing and executing the requirements urgently needed to win the war. It would be worthwhile, again as Mr. Lalchand urged, to have a separate Minister in charge of Defence effort in every State to mobilise resources and co-ordinate the production and supply of defence requirements.

At a time such as the present, the authorities are apt to be overobsessed with war efforts and to underestimate or even overlook essential civilian needs. To cater to essential civilian needs is of no less importance both to sustain civilian morale and to hold the price line. This is presumably what the President of the Maharashtra Chamber of Commerce must have had at the back of his mind when he averred that there should be perspective thinking now to press into service the present capacities of manufacture and produce whatever is required not only for war effort, but also for the country or the community as a whole.

Of the many more important things that must en

gage the attention of the authorities today, but does not, unfortunately, appear to have happened yet, I must hark back to the subject of war risks insurance, to which I had alluded in these columns last week. Once more, to quote Mr. Lalchand, if I may, "it is imparative and necessary that steps should be taken to have compulsory war risks insurance at such a time. It would not only guarantee unforseen risks, but play a vital role in ensuring security and safety. It would also indirectly mobilise substantial funds without, in any way, accentuating the incidental burden". If the authorities are as convinced as the public of this country that to drive the Chinese from our soil is going to be a long-drawn-out affair and that that would involve many a grim battle on land and in the air alike, they should introduce this measure without any further delay.

Business Notes

Plastics

FUTURE OF P. F. MOULDING POWDER

FOLLOWING THE enquiry made by the Tariff Commission in August last and its recommendations thereon, the protection granted to the Phenol Formaldehyde Moulding Powder Industry will cease as from December 31, 1962. But then the Tariff Commission has not left the industry to fend for itself. In fact, it has suggested that, as and when protection is removed, the protective duty should be replaced by a revenue duty at a rate deemed to be suitable by the Government.

The industry had argued that the overseas manufacturers had still some special advantages in respect of lower cost of raw materials, and labour and so protection required to be continued for a further period and, in fact, at an enhanced rate of duty of 50 per cent ad valorem — this is now being levied on all other moulding powders as a revenue duty. It may be noted here that this argument also received the support of some State Governments. However, the Tariff Commission rejected the suggestion and, while doing so, pointed out that the advantages of overseas manufacturers in respect of lower cost of materials and labour, as urged by the industry, did not give rise to any special issue for consideration, inasmuch as their incidence had already been reflected in the landed costs of imports. Yet another argument for not accepting the industry's stand was that during the past 12 years of protection, the industry had not only expanded its capacity and increased its output but also diversified its production, thereby stabilising its position sufficiently.

The Tariff Commission had also recommended that the Government should extend necessary assistance for establishing the manufacture of Phenol, Formaldehyde and Hexamin in the country to meet the increasing demand of the Plastic Industry. Accepting this, the Government issued licences to three units for the manufacture of Phenol for an aggregate capacity of 1,96,000 tonnes, two units for Formaldehyde for 13,200 tonnes, and two units for Hexamin for 600 tonnes. Production of Formaldehyde and Hexamin has started in the country this year, while Phenol is expected to be available from March, 1964.

The present annual rated capacity of the Formaldehyde Moulding Powder industry is 2,195 tonnes on a single-shift basis in the six units currently manufacturing the commodity, as against only 1,524 tonnes that were produced by four units in 1959. Production of PF Moulding Powder has increased from 1,880 tonnes in 1959 to 2,219 tonnes in 1960, and to 2,244 tonnes in 1954. The domestic demand is estimated to go up to 5,000 tonnes by the end of the current Plan period from the present estimated demand of 3,000 tonnes. In view of this, it is felt that the present capacity of the industry should be quite adequate to meet the demand for the present as well as for the foreseeable future, provided the industry is enabled to work multiple shifts. With the increasing availability of indigenous raw materials, it is hoped that this industry would not only be able to lower its cost but, in due course, also compete with its foreign counterparts in the world markets.

EEC and COMECON

COEXISTENCE!

THE EUROPEAN Economic Community which was, at the time of its coming into being in 1958, denounced by the Communist leaders as an instrument of economic aggression, and was regarded by them as an adventure born to die its natural death, has of late come to be recognised as hard reality. And there is now to be seen a desire for closer trade ties between the EEC and the Council for Mutual Economic Aid (Comecon) — the Communist counterpart of the EEC. Mutual trade exchange between the two blocs through these agencies has increased steadily; between 1958 and 1961 it went up by no less than 68 per cent to a total volume of $ 2,200 million. This is a significant pointer to the fact that notwithstanding the special privileges created by the common tariff wall for the producers in the Common Market, outsiders have also reaped considerable benefits through increased trade opportunities, natural concomitant of larger markets. A further empirical proof: whereas during the first three years the imports of the member states from each other increased by 49 per cent, imports from outside world increased by 21 per cent, which is much more than the rate of increase in the world trade. This may be an unsolicited digression, perhaps to further buttress the argument of "The Eastern Economist" that, except for a short initial period of Britain's joining the EEC, a larger

CONTRIBUTE LIBERALLY

ARMED FORCES FLAG DAY

(December 7, 1962)

For the welfare of Ex-Servicemen

and their Families.

proportion of India's traditional and other exports will be directed towards the Community.

The main object here, however, is to examine the working of the two contrasting methods of international economic co-operation. The Comecon, senior by 14 years to the EEC, was originally rigged up as an answer to the European Marshall Plan. It constitutes an attempt of turning totally planned national economies of Communist countries to one joint master plan, without, however, eliminating the borders and other obstacles to trade between the members. As against this, in the EEC, all national borders between its member countries and all obstacles to trade within the Community are being abolished gradually. The Community acts towards the outside world as one entity; within the Community full freedom of traffic, transport, exchange of goods, trade, movement of persons, of capital and of services are intended to help assure maximum economic results for the entire Community.

There is a great deal of contrast between internal trade within each bloc. Whereas trade within the Comecon countries has made very little progress (a mere 10 per cent), internal trade of the EEC has risen by no less than 73 per cent since 1958, notwithstanding the substantial increase (by 25 per cent) in its trade with the rest of the world. Similarly, even though the Comecon, which is far larger in area and population than the EEC, with its percentage share of only 12 in the world trade, lags behind the EEC by about an equal percentage points. The answer to the EEC's edge over the Comecon may well be sought in the Western affluence — a mass consumption society. One healthy feature, obviously of recent origin, however, is the desire for closer co-operation between the two agencies.

Civil Aviation

PERFORMANCE OF MAJOR AIRLINES

WITH THE introduction of Boeing Jetliners four years ago, there are today more than 300 jetliners in service today, operated by twenty-six of the world's leading airlines and representing 40 per cent of the non-communist world's jet fleet. With the increase in numbers, the available tonne kilometres (atkm)—that is, the capacity of the airlines—also have increased considerably. But this phenomenal increase in capacities has not been followed by a corresponding rise in traffic, so that the overall performance of the leading airlines during 1961-62 was far from satisfactory, when compared with their performance in the preceding year. Considering this, Air-India's performance in 1961-62 must be regarded as creditable indeed.

To take now the profit and loss of some of the major airlines during the year under review, the only airline to make a relatively high profit was the PANAM, which stepped up its profit from Rs. 3,38.10 lakhs in 1960 to Rs. 4,23.82 lakhs in 1961. The BOAC, on the other hand, recorded an increase in its loss. So also Sabena and Lufthansa. Other airlines, such as TWA, KLM, and Air-France, registered losses, as against profits made in the previous year. Air-India, however, while sharing the experience of other airlines in the matter of reduced traffic, managed still to record a profit (Rs. 38.86 lakhs), but this did not compare favourably with the previous year's profit figure of Rs. 76.97 lakhs.

As regards the increases in capacity in terms of the available tonne-kilometrs in various airlines, there was an increase of as much as 33 per cent to 1,295,395 atkm in the case of the BOAC. In the case of Air-India, it rose from 161,447 atkm to 216,640 atkm, representing an increase of 34.2 per cent over the same period. Along with others, Alitalia, Lufthansa and Air-France witnessed increases in their capacities in terms of percentages at 417,790 atkm (54.2%), 454,800 atkm (43.3%) and 1,027,076 atkm (32.9%), respectively.

The picture that emerges from the foregoing brief analysis is that of an appreciable fall in earnings, both absolutely and relatively, in the case of all airlines except the PANAM. But what is significant is that, on comparison, the performance of Air-India last year did not turn out to be unsatisfactory, for, whilst augmenting its capacity, it still managed to make a profit, though it was appreciably reduced.

Economic Co-operation

INDIA AND WEST GERMANY

IT IS indeed a tribute to the present leadership in the Western countries that the Indian economic growth has been liberally assisted by them during the last decade. There always were certain gaps which could never have been filled except by the active participation of these countries. West Germany, after it regained its normal economic status shattered by World War II, has been participating actively in this programme. The West German aid to India has, therefore, been increasing steadily ever since 1955 and at present it ranks among the first four aid-giving countries from the West. The total development aid to India has been over 5,000 million D.M. that is about Rs. 600 crores. A credit of 660 million D.M. for Rourkela stood out as an important landmark in the transformation of the Indian economy. West Germany has also continued to provide financial credits for the Second and Third Five-Year Plans. Apart from the aid offered by the West German Government, the number of private entrepreneurs has not been small who have come forward to install various collaborations. This development, however, was comparatively of recent years. Up to the end of June 1962, for instance, private capital investment in India from West Germany was of the order of 72.6 million D.M. Even if this looked small as compared to the British investments in India, it has to be remembered that this investment has nearly doubled over the investment till 1958.

It has always been realised in India that in certain fields of technology the West Germans had accomplished such perfection that Indian industrialists in the preliminary stages chose to buy their capital goods from that country. It was for the same reason that Indian foreign trade always had such an important element of German imports. Every year the imports have been of the order of nearly Rs. 100 crores, and constituted between 10 and 15 per cent of the total import bill. Against this substantial figure of imports, the exports have always been very low. This was very natural because there were very few items which could be sold in the German market. During the last four years in the face of huge gap, efforts had been made to raise the exports and items like manganese ore, iron ore, cotton yarn, leather goods, and furs and skins, had found favourable markets. Gradually Indian tea also found a way into the German households and jute was also being received favourably in the German markets. While it is realised that in the years to come India will have to depend upon various types of German machinery, there are steady hopes that the

Indian goods will become more and more popular in that country.

War Effort

GEARING THE ECONOMY

FOR GEARING the economy to war effort, various suggestions have been made by the business community. Of the many proposals suggested, the one relating to compulsory war risk insurance made at the thirty-fifth annual general meeting of the Maharashtra Chamber of Commerce by Mr. Lalchand Hirachand, president of the Chamber, is quite an appropriate one. The enactment of compulsory war risk insurance would not only guarantee unforeseen risk but would also play a vital role in ensuring security and safety. It would also indirectly mobilise substantial funds without in any way accentuating the incidental burden. Mr. Lalchand Hirachand has also suggested that ways and means should be found to dig out hidden wealth. According to his proposal the only thing that the Government has got to do is to offer a promise to the owners of hidden funds that if they dig out their immobilised funds for use in the national emergency, no penal action would be taken against them even in the event of their being unable to explain the source. This proposal is on the same lines as embodied in the scheme of gold bonds and if constituted is expected to bring in sufficient money to gear the wheels of the economy directed to the war effort.

Mr. Lalchand Hirachand also emphasized that it is not only in the industrial field that specific directives are required as to what should be produced but special instructions will have to be issued in the field of agriculture as well. It is possible to grow more than one crop in the same land if proper irrigation is made available along with the adoption of scientific methods which, of cource, is a must.

So far as the suggestion relating to the appointment of a Production Promotion Council is concerned, it seems rather tenuous in view of setting up of the Ministry of Economic and Defence Co-ordination. Since the functions underlined by Mr. Hirachand for the Production Promotion Council appear to be the same that will have to be undertaken by the new Ministry, there does not seem to be any necessity for such a Council. What is actually required is a clear direction as to what is to be produced and what strategic industries should be given top-most priority. Now it is only to be hoped that the new Ministry would be able to co-ordinate all this and put the entire structure on a stable footing.

Referring to the Land Ceiling Act which the Maharashtra Government has passed despite the agitation of sugar factories in the Deccan, Mr. Lalchand Hirachand stated that the operative part of this Act should be put in cold storage so long as the emergency lasts. It would save the Government about 15 to 20 crores of rupees which they will be required to invest while taking over the sugarcane farms from the factories. The suggestion seems to be quite a reasonable one. By adhering to this course the Government could certainly make best use of the amount so saved for emergent defence purposes.

Refractories

ASSAM SILLIMANITE'S EXPANSION

MR. S. M. WAHI, Chairman, Assam Sillimanite Ltd. at the annual general meeting of the company held recently at Gauhati pointed out that the exports of sillimanite have been providing the bulk of sales revenue to the company. An extensive and concerted drive was made, he added, for creating interest and enthusiasm in this mineral with refractory manufacturers in Europe, Japan and Australia. Apart from these exports, the demand in the home market too has increased rapidly so that during the last five years it has multiplied five fold. The company in a way has played a double role. In the first place it has established itself as an important foreign exchange earner by entering the export market and in this field the potentialities of its better performance are assured. Secondly, by inspiring the confidence of indigenous consumers, the company has gone a long way in saving the foreign exchange that was being spent on the import of refractories. It has to be remembered that the import of refractories was of the order of Rs. 3 crores every year. In that light it is significant to note that against an output of nearly 8,000 tons in 1961-62, the company expects to meet the demand of 10,000 tons during 1962-63.

To execute this increased production capacity, the Chairman indicated that the company floated a new issue of Rs. 29 lakhs in equity shares in June 1962. Shares worth Rs. 4 lakhs were allotted to technical collaborators, Messrs. Vereinigte Grossalmeroder Thonwerke of West Germany for their technical know-how and service for stage one of the refractory project. The work on the new project at Ramgarh has commenced and this would gain momentum by the end of this year. The products of the initial plant have been well-received by most of the specialised consumers. The directors were hopeful that the first phase of the expansion programme would proceed according to schedule but the present state of emergency might cause certain hindrances. The delay might not, however, be very substantial; the company was struggling hard to achieve its projected higher levels of output.

Automobile Parts

A PLANT IN FARIDABAD

A PLANT to manufacture automobile electrical components would soon come into being in Faridabad (Punjab). The cornerstone of the new factory was laid by its Chairman on November, 24. The Electric Autolite Company of Toledo, Ohio, U.S.A., one of the world's largest independent manufacturers of automobile electrical components, has arranged to set up this plant. The new company that is being set up for the purpose will be known as Prestolite of India Ltd.

The company will manufacture automobile electrical components for use in electrical systems for internal combustion engines such as coils, voltage regulators, condensers, contact sets, horns, horn relays, solenides, switches, governors, lamps, spark plugs, cleaners, battery cables, ignition cables, distributors, distributor caps, rotos etc. under the trade name of Prestolite. A licence has already been obtained for the purpose.

To raise the capital, the company will be entering the market early next year. Its authorised capital will be Rs. 1 crore divided into 7,50,000 equity shares of Rs. 10 each and 25,000, 9.5 per cent redeemable cumulative preference shares of Rs. 100 each. The issued capital will be Rs. 40 lakhs divided into 400,000 equity shares of Rs. 10 each. Of the issued capital 700 equity shares of Rs. 10 each have been subscribed by the subscribers to the memorandum and articles of association while 74,300 equity shares have been subscribed by the directors and their friends for cash on which Rs. 5 have been paid up on each. The U.S. company will be subscribing for 1,75,000 equity shares. These shares have been allotted to the company in consideration of the supply of plant and machinery and are to be credited as fully paid-up. The balance of 1,50,000 equity shares will be issued to the public at par. The entire issue offered for public subscription has been under-written.

With the setting up of this plant the paucity of automobile parts is likely to be removed to a certain extent. Since there is a great demand for automobile electrical components, it is essential that a few more plants be set up in various regions of the country. At a time when the country's war economy is directed towards the war effort the need for such plants becomes all the more greater because these components would be required on an enlarged scale for trucks, jeeps and such other vehicles.

Engineering

EXPORT PROMOTION COUNCIL'S PERFORMANCE

THE VARIOUS export promotion councils set up during the past few years have played a considerable part in boosting our exports. The Engineering Export Promotion Council in this context needs particular mention. The outgoing President of the Council, Mr. A. K. Bhattacharya, at the seventh annual general meeting of the Council reviewed the performance and pointed out that although we have made good progress in the export of engineering goods, yet a great leeway remains to be made up. There are special problems connected with the export of some of the engineering goods and they mostly relate to long-term credit, availability of funds at concessional rate or special assistance for offering quotations against big tenders.

While exports of engineering goods rose from Rs. 4 crores in 1956 to Rs. 11 crores in 1961, the target still fell short by Rs. 1 crore. As to why we have not been able to capture the markets abroad is because of the fact that we are new entrants and have not yet got the fully developed techniques. To complete successfully we will have to exert every nerve and will have to produce the type of engineering goods that will be needed in the markets abroad. It is, however, significant that some new items have entered the field of our exports. Special mention may be made about transmission line towers, railway track material, auto engines, castings, stainless steel ware, steel ghamellas, bolts and nuts, hardware, dry batteries, bicycles and tea machinery etc.

Our exports of engineering goods when compared with other countries appear to be insignificant. The table below shows the export of engineering goods as percentage of total national exports in 1958. So far as India is concerned the contribution of engineering industries was less than one per cent in 1958. No doubt we have advanced much further during the last four years, but it seems doubtful if we will be able to achieve the Third Five-Year Plan target of Rs. 103 crores laid down by the Council. This figure on the very face of it seems to be very ambitious when it is viewed in the context of only Rs. 30 crores during the Second Plan period. Mr. Bhattacharya, however, feels that it is not impossible to make substantial progress as there exists a wide field in the markets abroad. He is of the opinion that if certain procedures are followed on the right lines, movement on rail is regulated and publicity abroad is strengthened, we may be able to make a considerable headway. In view of national emergency reasonable restriction on use of foreign exchange is understandable, but perhaps it would pay if the engineering industries are taken into full confidence by the Government when making moves for their development.

Countries	Engineering Export as percentage of total national exports in 1958.
Switzerland	53.5
West Germany	51.5
East Germany	50.0
U.K.	47.0
Czechoslovakia	46.0
Hungary	45.0
U.S.A.	38.9
Sweden	34.0
Italy	30.0
Japan	27.0
Poland	27.0
France	26.8
Austria	21.0
Denmark	19.7
Netherlands	18.9
U.S.S.R.	18.5
Canada	8.3

Trade

PROBLEMS OF INDO-PAK TRADE

THE FEDERATION of Indian Chambers of Commerce and Industry while reviewing the Indo-Pakistan Trade has informed the Government of India that certain positive difficulties have tended to impede the growth of trade between the two countries. Not only the Indian exports have tended to decline, but there has also been a continued adverse balance of trade which is disadvantageous to India in the context of present foreign exchange shortages. The Federation, for instance, has reminded that last time when the Indo-Pakistan trade agreement was reviewed the Federation had drawn the attention of the Government to the ban imposed in Pakistan on the import of cinematographic films wholly or partly exposed. The ban, it is indicated now, on the import of cinematographic films has not been lifted by the Pakistan Government though films are mentioned in schedule II of the protocol for the third year of the agreement. Recounting other similar difficulties the Federation has pointed out that the Pakistan Government on June 7 last issued a banking companies ordinance which made it incumbent on foreign banks in Pakistan to deposit with the State Bank of Pakistan within a period of six months five per cent of their liabilities in cash or in any unencumbered securities out of fresh remittances from abroad. The ordinance also empowered the Pakistan Government to give a year's notice after June 7, 1965 to foreign banks to stop receiving deposits. It need not be argued in details to prove that this is a measure that discourages the operation of Indian branches there and hinders augmentation of invisible foreign exchange earnings.

Other problems enumerated by the Federation were in respect of exports of linseed oil and bidi leaves from India. As far as linseed oil was concerned, the major hinderance was that the shippers to East Pakistan had to get their consignments inspected by the Deputy High Commissioner of Pakistan in Calcutta. It has been reported that often it took about 2 to 3 days' time for the goods to reach their destination. The documents relating to such consignments on the other hand, were received by the consignees only after a week's time. This delay caused certain complications because the railways charged certain demurrage. This delay was essentially administrative and there was no reason why this objection could not be eliminated

As far as the export of bidi leaves was concerned, the Federation has indicated that 70 per cent of the payment for the exports was made against letters of credit opened and the rest was paid after the approval of the quality of the goods by the buyers in East Pakistan. There were certain instances when consignments were rejected on the grounds of inferior quality. The Federation has added that one way to overcome this difficulty would be that the procedure of opening letters of credit was simplified. It could also be suggested that adequate pre-shipment inspection arrangement should be made in India to avoid the rejection at the other end. These problems should be discussed at the time of renewal of the agreement.

Food

ACCENT ON NUTRITION

SINCE IT is not so much on the intake of food itself as the nutritional content thereof that the health of a nation depends, it becomes imperative to change the habits of people towards a balanced diet. Stepping up the output and preservation of protective foods such as milk, fruit, eggs, fish and meat, are, therefore, obviously warranted.

The newly-formed Nutrition Division in the Union Food Ministry is a welcome addition. Its aim is not only to improve the quality of the normal foodstuffs available, but also to develop nutritional foods from raw materials which have not hitherto been adequately used. India has an abundant supply of vegetable protein and the Central Food Technological Research Insitute, Mysore, has shown how protein-rich material can be salvaged from oilseeds, like groundnuts, for human consumption. Since vegetable protein is as good as animal protein for human requirements, it is likely that people would prefer vegetable protein to animal protein, because of the cheapness of the former.

The Union Government, with UNICEF aid, is setting up two units, with a capacity of 10 tons each per day, one in Bombay and the other at Coimbatore, for the production of edible groundnut flour. A protein-rich food, known as Indian Multi-purpose Food, has been developed at the Central Food Technological Research Institute, by combining 75 parts of edible groundnut flour with 25 parts of Bengal gram flour and "fortifying" the product with suitable essential minerals and vitamins. A highly nutritious composite flour, containing up to 10 per cent of groundnut flour in combination with wheat flour, has already been prepared. Groundnut flour can also be incorporated in the preparation of tapioca macaroni and other enriched macaroni products. The application of science and technology to the conservation and effective utilisation of the available foodstuffs should help in reducing losses arising from their perishable qualities.

The reorganisation of the existing College of Catering and Management in Bombay and the opening up of the Institute of Catering Technology and Applied Nutrition in Delhi in September last are steps towards promoting a desirable change in the dietary habits of the Indian people through imparting of nutritional education.

CHRYSLER PLANT IN TURKEY

FOUNDATION WAS laid on November 21 for a new truck factory which will have a collaboration between Chrysler International and Turkish partners. The plant is to be located near Gebze and will be constructed by Chrysler Sanayi A.S. The total investment will be nearly 79 million Turkish Liras. The initial capacity of the plant will be 16 units a day and the trucks produced will have Turkish content of 20 per cent which will be progressively increased. The plant will be ready by late autumn of 1963. The initial production will be limited to trucks but at a later date the company will assemble passenger cars too.

Chrysler Corporation of the United States, it may be remembered, is the manufacturer of Valiant, Plymouth, Dodge, Chrysler and Imperial passenger cars as well as Dodge, DeSoto and Fargo trucks. Mr. J. Russel Longon, President and the Managing Directors of Chrysler International visited Turkey to participate in the ceremonies at the plant site. He said on the occasion that Chrysler presently has plants or major offices in eleven other countries and Turkey was the twelfth. He was hopeful that the standards of quality would be maintained at the levels attained in the United States and other advanced countries.

ANNOUNCEMENT

The following Annual Numbers of THE EASTERN ECONOMIST are available for sale. Special concession may be given to educational institutions, libraries and students, if a single order exceeds Rs. 50|-.

1. India & the World and India in 1950 — Rs. 5|-
2. A Social History of the Indian People & India in 1951 — Rs. 5|-

FROM THE CAPITAL'S CORRIDORS

COTTON TEXTILE INDUSTRY AND EMERGENCY

THE various problems of the cotton textile industry vis-a-vis the national emergency were reviewed here on Sunday last at a meeting of the Cotton Textiles Consultative Board. The Minister for International Trade, Mr. Manubhai Shah, presided.

The Board noted with satisfaction that the several steps taken by the Government and the cotton textile industry in the past few weeks had geared the entire industry to meet fully the needs of defence. The representatives of the industry present at the meeting assured the Government that the industry would extend its whole-hearted support to the country's defence effort by stepping up output to the extent necessary not only for the defence needs but also for meeting fully the requirements of the civilian population and exports.

The Board urged the Government to increase the supply of cotton. Indigenous production this year, it was stated, although satisfactory, required an approach to be made to the United States Government for supplies upto 8,00,000 bales under P. L. 480, if the industry was to be enabled to fulfil the new tasks enjoined upon it by the emergency. The Board hoped that it was possible for the U.S. Administration to release more cotton under P. L. 480 to India this year.

The Board also considered at length the question of holding the price line in regard to cotton textiles. The new arrangement to stamp prices, it was stated, was working satisfactorily and the Textile Commissioner as well as the representatives of the industry and trade would examine the issue again on receipt of the report of the Tariff Commission on the Price Enquiry of Cotton Textiles, likely to be made available in the next few days. The Industry offered to make available adequate supplies to the consumer and co-operative stores that the Government proposed to establish throughout the country with a view to contain prices.

In regard to meeting the yarn requirements of the handloom industry, the Board felt that if yarn supplies to the handloom sector were not found adequate, an additional allocation of cotton to spinning units should be considered so that the decentralised sector was able to get the required quantities of yarn at reasonable prices.

The progress of the modernisation of the textile industry was considered to be satisfactory. But the Board felt that additional steps should be taken by the individual units of the industry, with the assistance of the Government, to increase the pace of modernisation. The supply of machinery, primarily from indigenous sources supplemented by some imports of items not manufactured in the country, would help the process of modernisation. The Board expressed satisfaction at the start of the manufacture of automatic looms in the country.

In respect of textile exports, the Board felt that while exports to the existing markets should be maintained, efforts need to be made to explore new markets also. Exports of textiles, it was noted, had shown an improvement in the recent past. The additional efforts that the industry proposed to make in this direction, would, it was hoped, be able to improve the position further.

U.S.A. TO SUPPLY 3.75 LAKH BALES OF LONG-STAPLE COTTON

The very next day of the Cotton Textiles Consultative Board's meeting, calling on the Government of India to approach the U.S. Administration for supplies of 8,00,000 bales of cotton under P.L. 480 during the current year, an agreement was signed here between the Governments of India and the United States providing for sale to India under the U.S. Public Law 480 of 3,75,000 bales (400 lbs. gross each) of long-staple cotton, valued at $46.6 million (Rs. 22.19 crores). This value includes $44.5 million for the purchase of cotton and $2.1 million to meet the cost of ocean transport.

The sale proceeds of the cotton to be supplied under this deal are envisaged to be utilised as follows: 85 per cent will be lent to the Government of India for economic development purposes; 5 per cent will be available for loans to the private sector under provisions of the Cooley Amendment of the U.S. P.L. 480; the remaining 10 per cent will be used to pay for the U.S. obligations in India.

This agreement is the seventh one signed with the U.S. Government under P.L. 480. The total commitments made by the United States in these seven agreements amount to $2423.2 million (Rs. 1153.9 crores). Under the first six pacts — the sixth one was signed on May 17 this year involving 1,80,000 bales — the U.S. Administration had supplied to this country 1.6 million bales of cotton.

COTTON THROUGH BARTER

The Government of India in the recent past has also made arrangements for purchase of cotton from abroad in exchange for sugar and manganese exports. About 11,000 bales, valued at Rs. 81 lakhs, are stated to have been contracted for import against export of sugar and another 25,000 bales, valued at Rs. 1.75 crores, against export of manganese ore and ferro-manganese. Part of the cotton to be imported against manganese exports is expected to be supplied by the United States.

Earlier this year, the U.S.A. also entered into an agreement with India for supply of 55,000 bales of cotton against export of sugar. These imports are at present under way.

KAPAS FUTURES BANNED

With a view to check undue speculation in unginned cotton, resulting in instability in its prices, the Union Government has decided to ban, with immediate effect, forward trading in "Kapas" throughout the country. All the outstanding contracts have been ordered to be closed at the rates prevailing at the close of business on November 26, 1962.

ENGINEERING INDUSTRIES AND EMERGENCY

The schedule for the production of armour plates in steel plants for the manufacture of medium tanks is being advanced in view of the present emergency. These plates were originally planned to be produced in 1964.

Disclosing this at a meeting of the Parliamentary Consultative Committee, Mr. C. Subramaniam, Minister for Steel and Heavy Industries, said last week that fertilizer factories were now producing certain strategic materials for defence. The Rourkela fertilizer factory would go into production almost immediately, he added.

Mr. Subramaniam hinted that some engineering industries were being switched over to defence production. All machine tool factories, both in the public and the private sectors, had been asked to work round the clock.

The automobile industry, he continued, had been alerted not only to increase its production of trucks, but also to expand the assembly lines to meet defence requirements. The Finance Ministry had agreed to provide the foreign exchange required for the import of components and the expansion of the industry.

Mr. Subramaniam added that it had been decided to increase the production capacity of the ancillary and component industries. The Ministry of Economic and Defence Co-ordination was studying the implications of switching over certain engineering industries from civil to defence production.

The streamlining of the distribution machinery for essential materials was also under consideration, the Minister stated.

IMPLEMENTATION OF INDUSTRIAL TRUCE RESOLUTION

The Union Ministry of Labour and Employment has set up a six-man committee to advise the Government on the implementation of the part of the Industrial Truce Resolution dealing with production. The Committee will also consider what measures can be adopted for increasing productivity and reducing costs.

Prof. M. S. Thacker, Member of the Planning Commission, is the Chairman of the Committee. The other members are: (a) Dr. S. T. Merani, Joint Secretary, Ministry of Labour and Employment (Member-Secretary); (2) Mr. M. M. Sen, Joint Secretary, Ministry of Defence; (3) Mr. N. Chidambaram, Deputy Secretary, Ministry of Commerce and Industry; (4) a representative of the Ministry of Economic and Defence Co-ordination; and (5) a representative of the National Productivity Council.

The Resolution on Industrial Truce was adopted at a joint meeting of the Central Organisations of Employers and Workers held in New Delhi on November 5, 1962. The following is its text dealing with production:

"Realizing that a grave emergency has overtaken the nation on account of the Chinese aggression and the need has arisen for taking urgent steps, in every direction, to prepare adequately for the defence of the country, and repelling the invasion of its territory, the Joint Meeting of all Central Employers' and Workers' Organizations, held today, November 3, 1962, resolves that no effort shall be spared to achieve maximum production, and managements and workmen will strive in collaboration in all possible ways, to promote the defence effort of the country. Towards these ends, the following steps shall be taken:

"It is important that a suitable climate should be created and preserved for ensuring sustained effort and resolute action in pursuance of the aforesaid aim. Positive steps should be taken to promote constructive co-operation between management and workers, in all possible ways.

"(i) All impediments in the way of better and fuller utilisation of men, machinery and materials should be removed. There should be no idle plant capacity or waste. Managements should exercise the maximum economy in their operations.

"(ii) To maximise production, establishments should work, wherever possible, extra shifts, extra hours or on Sundays and holidays by mutual agreement. Full co-operation should be extended by all in this respect. All advantages accruing to industry out of the extra effort of the workers should go to the consumer and/or be made available for defence efforts.

"(iii) Absenteeism and turnover should be discouraged and reduced to the minimum. Negligence of duty, careless operation, damage to property and interference with or disturbance to normal work should be denounced by the unions. Similarly, any lapse on the part of the management that contravenes the spirit of the defence effort should be condemned and put right forthwith."

STOCKPILING OF RICE

The Union Government now intends to build up a reserve stock of about two million tons of rice, instead of one million tons contemplated earlier. This reserve is intended to be built up through imports from abroad as well as from procurement indigenously.

So far as imports are concerned, the Government is understood to have accepted the U.S. Government's proposal to supply rice to India at the rate of 2,000 tons a month, besides the normal exports under the 1960 P. L. 480 deal, upto the middle of next year. Under the P. L. 480 deal of 1960, nearly two-thirds of the rice supplies stipulated (one million metric tons) have yet to be received by India. Up to June next, nearly 1.5 lakh tons out of this remaining quantity (six lakh tons) are expected to reach the Indian shores.

Commercial imports of rice are planned to the tune of 3,00,000 tons—two lakh tons from Burma and one lakh tons from the United Arab Republic. An eight-man Burmese Delegation arrived here last week for trade talks with the Government of India. Imports of rice by India from Burma will be one of the main topics of discussion with this Delegation.

So far as indigenous procurement is concerned, Punjab, U.P. and Madhya Pradesh are the three States which procure rice for the Government of India by means of a levy on the rice mills and wholesale dealers. The levy in Punjab is 66.66 per cent, in U.P. 50 per cent and in Madhya Pradesh 25 per cent. The possibilities of procuring rice in other States are being examined.

MANUFACTURE OF ELECTRIC EQUIPMENT FOR LOCOMOTIVES

Details are now available of the collaboration agreement signed recently between the Union Ministry of Railways and the Group for the Study and Electrification of Railways at Single Phase, 50 cycles, Zurich—a combine of eight reputed electric equipment manufacturers of France, Belgium, Germany and Switzerland —for the manufacture in India of electric equipment for 25 KV AC electric freight-type locomotives. The salient features of the agreement are:

1. The Group has agreed to grant to the Government of India the right to manufacture in India electrical equipment for 25 KV AC freight locomotives and parts thereof, except (i) high voltage tap-changers and air blast circuit breakers, (ii) rectifiers, (iii) pantographs and (iv) non-specified traction materials and standard products like cables, batteries, and equipment being bought by the Group from sub-suppliers like measuring instruments, small relays etc.

2. The currency of the agreement is for a period of 8 years in the first instance. Right to manufacture will, however, continue thereafter without any extra payment.

3. The Group has to supply the technical know-how, design calculations, manufacturing drawings etc., for the manufacture of the electrical equipment.

4. The Government of India is at liberty to transfer all its rights and liabilities under this agreement to a Government company.

5. The following remuneration is payable to the Group:

(i) a consultation fee of 3 per cent on the total annual net sales value, as invoiced, (namely, excluding freight, packing and insurance charges) of the electrical equipment manufactured in India reduced by the cost of the components imported or purchased in India, subject to a minimum on-account payment of DM 7,50,000. When the total value of the locally manufactured equipment exceeds DM 30 million, the consultation fee shall be reduced to 2½ per cent.

(ii) a handling charge of 5 per cent to cover purchase, inspection etc., of the f.o.b. European Ports price of imported materials, not manufactured in the Group's works but purchased through its agency.

6. Until the items covered by the agreement are indigenously manufactured, they shall be procured, as far as circumstances permit, from the Group at cost plus profit not ordinarily exceeding 10 per cent.

The agreement will be implemented by Heavy Electricals (India) Ltd., Bhopal, on behalf of the Government of India in so far as setting up of indigenous manufacture of electrical equipment is concerned.

SPEEDING UP OF THE RAILWAYS ELECTRIFICATION PROGRAMME

Besides taking up electrification of additional branch lines in the coal-mining areas around Anara, Adra, etc., the target dates for the electrification of the following sections near Calcutta have been advanced as shown below:

SECTION	FROM	TO
1. Durgapur-Burdwan-Saktigarh	Early IV PLAN	December 1964.
2. Bandel-Burdwan Conversion	-do-	December 1964.
3. Sealdah South	September 1965	March 1965.
4. Saktigarh-Calcutta Docks, via Chord	Early IV PLAN	December 1964.
5. Howrah-Bandel, including Tarakeshwar Branch —Conversion	-do-	December 1965.

An order has been placed by the Railway Board with the Associated Electrical Industries of the United Kingdom for the supply of signalling cables worth over £ 5,00,000. The quantity involved is 20,00,000 yards (12 million "core yards" in all) of signal and multi-core rubber-insulated cables.

MANUFACTURE OF DIESEL LOCOMOTIVES

Details are now also available of the technical collaboration agreement signed with Messrs. Alco Products Inc.—an American firm—for setting up the diesel locomotive works at Varanasi. The agreement provides that the American firm would supply all the necessary technical know-how and assistance, including drawings, designs, factory, shop and machinery layouts etc., for the manufacture of diesel locomotives and engines at Varanasi and render all other ancillary advice to the Government on this subject. The firm will also arrange for the training of Indian Government personnel in the United States and submit a detailed scheme for training of artisans and supervisors in India. The technical personnel for establishing production in India will also be made available by the U.S. firm for periods as necessary.

The agreement provides for lump sum payments for each design purchased by the Government of India for manufacture. The payments vary from $ 40,000 to $ 50,000 in the case of engines and $ 20,000 to $ 25,000 in the case of the rest of the mechanical portions of the locomotives. The firm will also be entitled to an engineering fee and a royalty linked to actual production in India. The agreement is for a period of 10 years, but can be extended by mutual understanding.

NUCLEAR POWER STATION IN MAHARASHTRA

Of the seven tenders received by the Central Government from Canada, France, the U.K. and the U.S.A. for the installation of India's first nuclear power station at Tarapur, in the State of Maharashtra, the one from an American firm — International General Electric Company — is considered the most suitable.

A qualified letter of intent is reported to have already been sent to this firm; a definite contract will follow after making satisfactory arrangements with the U.S. Government in respect of fuel, financing and safeguards.

The proposal submitted by the International General Electric Company is for a station of 380 MW. "sent out capacity" from two water boiling reactors. The capacity outlay, after allowing for site development, housing and taxes, is estimated at Rs. 48.5 crores, which is less by Rs. 3 crores than what is provided in the Third Plan for a smaller station of 300 MW. The cost of power from the station is expected to be about 3.25 nP. per kilowatt-hour.

SULPHUR FROM AMJHORE PYRITES

The Pyrites and Chemicals Development Company Limited has made extensive efforts to locate a suitable alternative process for the extraction of elemental sulphur from Amjhore pyrites, in consultation with various firms of repute in the United States, West Germany, the United Kingdom, Italy, France and Belgium. The tests conducted by Messrs. Orklas, a leading Norwegian firm, with Amjhore pyrites for the extraction of elemental sulphur during October-November, 1960, had proved inconclusive and the firm had intimated that further large-scale tests would be necessary before any definite conclusion could be drawn. Orklas subsequently reported their inability to carry out further large-scale tests owing to certain local reasons. The only process that holds out any promise is the Outokumpu Process, based on which a 1,000-ton per day production plant is currently under construction in Kokkola, Finland. This process has been developed by a company in Finland called "Outokumpu O|Y".

KHETRI COPPER PROJECT

The Government of India has accepted the desirability of implementing the Khetri Copper Project with a capacity of 21,000 tons of electrolytic copper per annum as envisaged in the report on technical and economic feasibility of the project submitted by the foreign consultants Messrs. Western Knapp Engineering Company, instead of 11,500 tons which is the target mentioned in the Third Plan. The consultants are stated to have commenced work on the preparation of the detailed designs and drawings, specifications and bid documents in respect of the plant and equipment required for the project.

INDIA'S EXPORT TRADE

India's balance of trade in the first seven months of the current financial year has shown an improvement, according to the figures now available. Total exports from April 1962 to October 1962 amounted to

Rs. 385.43 crores, as against Rs. 379.80 crores during the corresponding period last year. Exports in October 1962 were of the order of Rs. 59.23 crores, as compared to Rs. 54.91 crores in October 1961. Total imports during the first seven months of the current financial year amounted to Rs. 590.56 crores, as compared to Rs. 621.57 crores in the corresponding period last year. Imports in October 1962 were of the order of Rs. 67.74 crores, as against Rs. 88.65 crores in October, 1961.

This slight narrowing down of the trade deficit, however, is not expected to last long as the gearing of the Indian economy to the war effort is anticipated to have some adverse effect on exports. Imports may also go up. The Minister for International Trade, Mr. Manubhai Shah, gave an indication of this fact in the Lok Sabha last week. He, however, assured that all efforts would be made to keep up exports to the extent possible. Among the causes hampering export trade at present, Mr. Shah listed the following: (1) diversion of exportable goods for the defence effort; (2) addition to the strain on the transport system; and (3) prices going further out of the line with the world market.

The Board of Trade is scheduled to meet on December 1, for a half-yearly review of the export trade.

CREDIT FROM AUSTRIA

The Government of Austria has made available a credit of $5 million to the Government of India. It will be utilised for the purchase of Austrian goods in connection with India's Third Five-Year Plan during 1963.

COMPANY REGISTRATIONS IN OCTOBER, 1962

According to the reports received in the Research and Statistics Division of the Department of Company Law Administration from the Registrars of Companies, 127 new companies with a total authorised capital of Rs. 2,427 lakhs were registered in the various States of the Indian Union during the month of October, 1962, as against 128 companies with a total authorised capital of Rs. 1,675 lakhs registered during the month of October, 1961. In the preceding month of September, 1962, 110 new companies with a total authorised capital of Rs. 2,662 lakhs were registered. Thus, the number of new registrations during the month under review recorded a rise by 17 over the preceding month, but fell short by one company over the corresponding month of the preceding year.

During the month under review, the largest number of companies was registered in the State of Madras, the number being 30. The State of Maharashtra came second with 22 new registerations. Twenty-one and 20 companies were registered in the State of West Bengal and Delhi, respectively. The remaining 34 companies were registered in the other States.

INTERIM WAGE INCREASE FOR COFFEE PLANTATION WORKERS

The Government of India has accepted the recommendations of the Central Wage Board for the Coffee Plantation Industry regarding interim relief to workers.

The interim wage increase in the rates of daily wages varies from 3 nP. per day to men workers in Mysore State to 13 nP. per day to men workers in Salem and Madurai districts of Madras. In the case of women workers, the rate of increase is 2 nP. per day in Mysore State and 10 nP. per day in Salem and Madurai districts. Correspondingly, there is also increase in rates of wages to adolescents and child labourers.

In the case of monthly-rated staff, which includes office, medical, education and field staff, the interim wage increase is Rs. 9 per month in gardens of 300 acres and above and Rs. 7.50 nP. per month in gardens of less than 300 acres.

The categories of employees which do not come either under labour or under clerical employees, will be treated for the purpose of interim wage increase in the same manner as they are treated for the purpose of annual bonus. In the case of mixed tea-cum-coffee or rubber-cum-coffee estates to which the tea or rubber interim increase does not apply and has not been paid and where only the statutory minimum wage is paid, such estates shall be treated as coffee estates and paid the coffee interim increase. In mixed coffee-cardamom estates in the Nelliampathies of Kerala State where the cardamom rates of wages are paid, this interim increase shall not apply.

The interim increase in wages takes effect from August 10, 1962, and is to be in addition to the wages prevailing on that day.

IN BRIEF ....

Messrs. General Tyres Limited, Calcutta, have been granted a licence to manufacture 1,80,000 tyres and tubes each.—1,20,000 giant tyres and tubes and 60,000 automobile tyres and tubes—per annum in collaboration with Messrs. Technoexport of Czechoslovakia.

*

The Union Government has recently approved an application from the Industrial Development Corporation of Orissa, a State Government enterprise, for setting up, in the Sambhalpur District of the State, a cement factory with a capacity of 12,000 tons per day or 3,96,000 tons per annum.

*

The Jayanti Shipping Company Private Limited has placed an order with a Japanese Shipyard for 8 bulk carriers. Two of these, of about 20,000 GRT each (32,250 DWT each) are expected to be delivered before March 31, 1963. All the eight vessels ordered are to be utilised for the overseas tramp trade.

*

The U.S.S.R. authorities have agreed in principle to import 4,000 tons of fresh bananas from India, on a trial basis. The details of transport and supply are at present being worked out.

*

A contract for the sale of 18,00,000 metres of Indian printed cotton textiles, valued at Rs. 25,81,750, has been finalised with the Soviet Union on the usual commercial terms. The question of further exports of textiles to the U.S.S.R. is still under consideration.

*

The total quantity of steel imported by the State Trading Corporation under rupee payment arrangements is 44,000 tons, valued at Rs. 3.3 crores. Imports have been effected from Hungary, Czechoslovakia, Poland and the U.S.S.R.

*

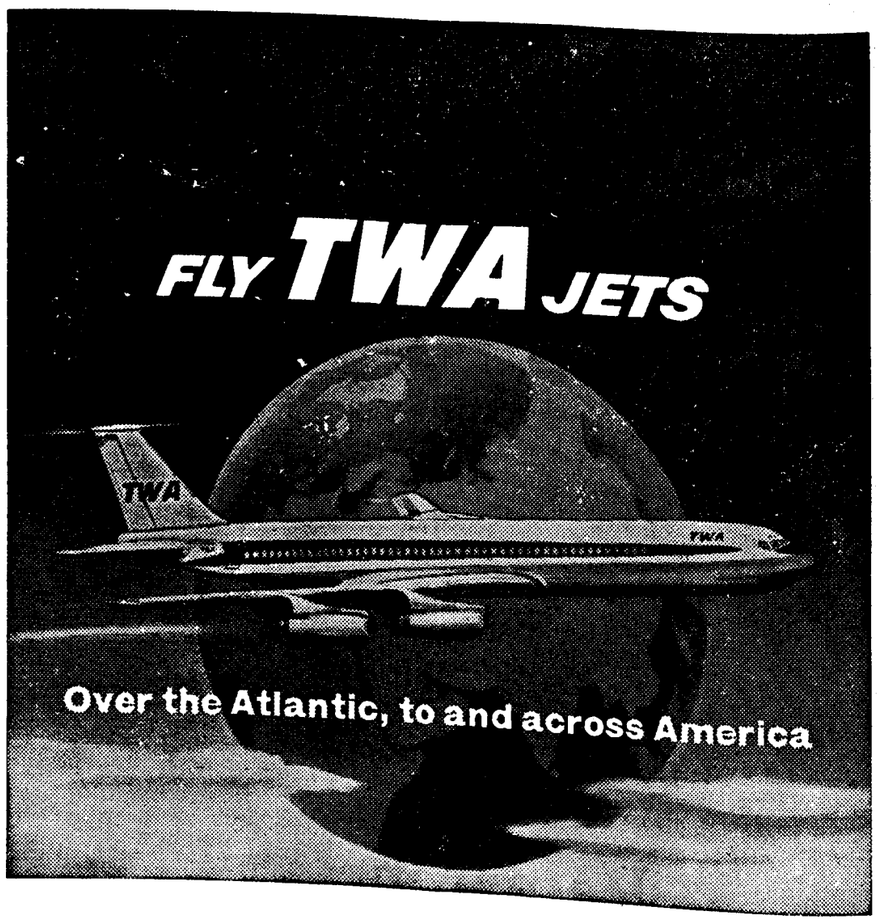
A private sector concern has been granted a licence for setting up a plant (the exact location is yet to be decided) for the manufacture of speed frames, draw frames, ring frames, high-speed wing (cone) machines and single spindle fully automatic Pirn winding machines with Russian collaboration.

*

Woollen textile mills will be allowed to import spare parts and accessories needed by them to step up production to their optimum capacity to meet defence requirements. In a circular letter, the Ministry of Commerce and Industry has asked woollen mills to apply immediately to the Controller of Woollen Textiles (Office of the Textile Commissioner, Bombay), giving details of their requirements, their c.i.f. value and the country of origin.

*

Mr. Jagannath Rao, at present Deputy Minister in the Ministry of Works and Housing, has been appointed Deputy Minister in the Ministry of Economic and Defence Co-ordination.



Research

Research is a feeling of discontent with the common and the usual. Research is a spirit of inquiry. Research is the seed of better products and improved processes. Continuous research related to actual needs and service conditions lies behind Shalimar Paint's leadership in paintmaking over the last sixty years. Research has helped Shalimar Paint produce the widest and most versatile range of superior quality paints available in India. Research is one of the four decisive elements —along with resources, know-how and quality-control—whose sum you are offered in every Shalimar Paint product.

COMPANY AFFAIRS

TATA IRON

The annual report for the working of the Tata Iron and Steel Company Limited during the year to March 31, 1962, shows that the Company recorded a profit of Rs. 6.09 crores after providing Rs. 13.15 crores for Depreciation. Profit during the previous year was slightly lower at Rs. 5.67 crores while Depreciation provided during the previous year was Rs. 13.92 crores. The physical performance is quite satisfactory and the rise in profit was the result of this improvement in production. Output during 1961-62 as against 1960-61 is given below:

	1961-62	1960-61
	('000 Metric Tons)	
Iron (Hot Metal) ..	1,645	1,586
Steel Ingots ..	1,643	1,622
Salable Steel ..	1,318	1,263

The Directors indicate that the salable steel production was about 78 per cent of the target of 1.5 million tons and the shortage was essentially due to the poor quality of raw materials and transport difficulties. It is pointed out that the washed coal supplied from the company's two washeries at Jamadoba and West Bokaro rose by about 140,000 tons during the year to a total of over 1.2 million tons. The ash content of the total coking coal mixture, however, increased slightly as a result of the allotment to the company of unwashed market coal of even poorer quality a year before.

The two million tons steel programme was based on the understanding that out of the total of 2.4 million tons of washed coal required by the company, 900,000 tons would be allocated from Government's Bhojudih washery. The company, the Directors said, was unexpectedly directed by the Government in December 1961 to make itself self-sufficient and not to count on supplies from Bhojudih washery for more than few years. The report also reveals that the production of iron ore from the company's washeries fell by about 170,000 tons to 2.1 million tons. The lower raisings were due to the closure of Sulaipat mine from January 1, 1962, and the exhaustion of good reserves in the lower section of the Gorumahisani mine. The company is adopting measures to raise both the quality and quantity of the ore.

Commenting on the decision taken by the Government on the Tariff Commission's report, the Directors have pointed out that the Commission had recommended an average retention price of Rs. 550 per ton. The Government, however, departed substantially from the Tariff Commission recommendation and the retention price was fixed at Rs. 522.5 per ton. The company proposes to address a representation to the Government protesting against the reduction in the retention prices.

These revised retention prices have affected the accounts too.The element for depreciation included in the revised retention price having been reduced from 6 per cent on the gross block to 5 per cent, the provision for depreciation for this year has been calculated at the latter rate. As in the previous year, the company has safeguarded against the claims for tax relief and an additional amount of Rs. 5.5 crores has been made for depreciation in order to bring up the total allocation to the level allowed for income tax purposes. The statutory allocation to the Development Rebate Reserve has been made for the full amount of Rs. 6.8 crores admissible for income tax purposes. The Directors have sanctioned the payment of a divided of Rs. 7.25 per share net (Rs. 10.36 gross) on ordinary shares which will absorb Rs. 3.8 crores. This dividend is nearly the same at last year's when net dividend was paid at the rate of Rs. 6.80 plus a bonus of Rs. 0.45 making a total of Rs. 7.25 net.

HASIMARA INDUSTRIES

Hasimara Industries Limited during a period of 15 months ended March 31, 1962, recorded a profit of Rs. 24.26 lakhs after debiting additional expenditure for three months compared with Rs. 36.40 lakhs a year before. A sum of Rs. 5.02 lakhs has been written off for depreciation against Rs. 6.34 lakhs a year before, A provision of Rs. 14.05 lakhs has been made for taxation against Rs. 12 lakhs last year. The dividend absorbs Rs. 7.50 lakhs after transferring Rs. 5.50 lakhs to general reserve. There has been some increase in the ordinary dividend from 17 per cent to 22½ per cent on the old capital including the interim dividend of 10 per cent already paid for the 15-month period ended March 31, 1962. The company issued bonus shares in the ratio of 1:1 to the ordinary share holders on June 1962, which rank pari pasu with the existing shares from the current financial year.

During the period the company worked the Seksaria Cotton Mills, Bombay on lease and licence in partnership for a period of 9 months. This venture has been very successful contributing as much as Rs. 19.49 lakhs to the company's profits. To ensure continuance of profits from the Cotton Mill the Company has entered into an agreement to secure one-third of Seksaria's profits for the next financial year with an option to exclusively take the Cotton Mill again on lease and licence for a period of 3 years. In spite of the hail damage suffered at three of the company's gardens, the total tea crop this season has increased from 27.87 lakhs kgs. to 28.49 lakh kgs., including 87,635 kgs. damaged by fire.

NEW ISSUES

The following companies have been authorised to issue fresh capital. Consent of the Controller of Capital Issues is valid for 12 months in all cases.

Tata Engg. and Locomotive Co. Ltd., Bombay, has been granted consent to the issue of Rs. 2 crores equity capital. The amount is divided into 2,00,000 equity shares of Rs. 100 each to be issued for cash at a premium of Rs. 50 per share.

Kores (India) Ltd., Bombay, is raising Rs. 5,00,000 divided into 5,00,000 equity shares of Re. 1 each to be issued as bonus shares to the existing shareholders of the company in the proportion of one such share for every two equity shares held, on capitalisation of the company's general reserves to a like extent.

Indian Drugs and Pharmaceuticals Ltd., Delhi, is to issue further capital of Rs. 100 lakhs divided into 10,000 equity shares of Rs. 1,000 each, for cash at par. Indian Drugs is a Union Government undertaking.

Mazagon Dock Ltd., Bombay, an existing Government company, will raise further capital of Rs. 50 lakhs dividend into 50,000 equity shares of Rs. 100 each for cash at par.

Leiner-Knit Gelatine Co. Ltd., Delhi, is to issue further capital of Rs. 16.5 lakhs divided into 16,500 equity shares of Rs. 100 each. Of this, shares for Rs. 3 lakhs will be allotted to a U.K. firm against supply of machinery and the balance will be issued for cash at par.

Globe Motor Ltd., Delhi, is raising further capital of Rs. 10 lakhs divided into 10,000 equity shares of Rs. 100 each as rights to its existing shareholders for cash at par. The proceeds will be utilised for purchasing shares of Luk Auto Ancilliary (India) Priv. Ltd.

Kirloskar Electric Co. Ltd., Bombay, is issuing capital of Rs. 17,52,840 divided into 1,75,284 equity shares of Rs. 10 each to be issued as bonus shares to the existing shareholders of the company in the proportion of two such shares for every five equity shares held, on capitalisation of the company's general reserves to a like extent.

AEG

AEG have a long and extensive experience in the manufacture of transformers of all sizes and up to the highest voltages. Three-phase generator transformers rated for 220.000V, 200.000kVA, with tap changing facilities and line transformers 220.000kVA, 400.000V with a total bank capacity of 660.000kVA are amongst the world's largest. The units are also built with attached radiators as mobile railway types.

Company Meeting

ASSAM SILLIMANITE LIMITED

CHAIRMAN'S STATEMENT

The following is the speech delivered by Shri S. M. WAHI, Chairman, Assam Sillimanite Ltd., Gauhati, at the Annual General Meeting of the shareholders held on November 20, 1962, in the office of the Company at A. T. Road, Gauhati:

Friends,

This Eleventh Annual General Meeting of the Company is meeting under a grim situation due to the events that have developed in the proximity of our mines in Assam. Your Directors met immediately after the Chinese aggression in October to take stock of the crisis and its effect on our operations and transportation The requisitioning of some of our transport vehicles, the continued strike of the Joint Steamer Company in the Pakistan region and the cutting off of transportation of Sillimanite from Assam engaged their constant attention. It became imperative to decide if at all this meeting could be held as planned in view of the cancellation of flights and the declaration of Emergency on October 27. The flights having been resumed meantime, the notices were issued and the meeting was decided to be held as scheduled. The situation today however, after the fall of Walong and Bomdila during last 24 hours, to the Chinese invaders, in grim in Assam.

I would like to welcome our new shareholders who are attending this meeting for the first time and hope to benefit by their advice and goodwill.

The Directors' Report, the Profit and Loss Account and the Balance Sheet of the Company for the year ended 31st of March, 1962, have been circulated to all of you and have been in your hands for some time and. with your permission, I shall take them as read. From the profit of Rs. 4,52,914, after payment of Tax, Rs. 1,80,000 has been set aside for dividend. The Directors had recommended a dividend of 5 per cent. with tax. to the Shareholders.

As I have submitted to you earlier, the country is passing through a critical period, Assam is one of the worst hit States. Our courageous Jawans, at great personal sacrifice and against all odds, have been holding back the enemy, as a result of which we are in a position to hold our meeting today. Many Indian Nationals have already donated all their life savings in cash and gold. Is it not, therefore, essential and proper that we, the Shareholders, should sacrifice the profit we are to earn this year for the Defence and protection of the country? **The Directors have already donated their modest fees for the Board meeting. I make bold to say that the Shareholders would approve whole-heartedly and without any reservation that the Dividend of 5 per cent declared be presented to the Prime Minister for the National Defence.** I sincerely hope that our new shareholders and collaborators, including International Finance Corporation, Washington, would appreciate the imperative need to make this donation for the National Defence. As we are in the midst of an all round Border conflict, I would earnestly hope that after the dividend has been passed, you all would authorise me, on behalf of the shareholders, to present the amount of dividend to the National Defence Fund. We hope and wish that very many more industries in India would be forthcoming with similar and perhaps with better gesture.

The production and sale of Sillimanite as well as profits during the year have been slightly higher than last year, despite the rise in the cost of production. The Balance Sheet would show that, year after year, this industry has had to carry an increase in expenses on mining due to the need to remove overburden, higher costs of transportation, sea freight and handling at Boko, Gauhati and Calcutta. There are limitations in passing the share of the enhanced cost of production to the buyers as Sillimanite is a raw material and the price charged both to the internal and overseas buyers is conditioned by world price for competitive refractory material.

Export of Sillimanite has been providing the bulk of the sales revenue since the past few years. With the taking over of the business operations of the Company by the present Managing Agents in 1957, an extensive and concerted drive was made for creating interest and enthusiasm in this mineral with Refractory Manufacturers in Europe, Japan, Australia etc. It is of interest to note that up to 1957-58 the demand in the Home Market did not exceed 400 tons and from 1958-59 to 1961-62 it rose up to 2,900 tons; whereas the requirements from the Export Market during the same period were more steadily growing. In 1962-63 the demand is approximately 10,000 tons. Despite increase in production cost, transportation, freight etc. prices were maintained at the 1958 level. It has, however, been decided that from 1963 the prices should be increased in proportion to the increased cost during the past two to three years.

It is thus clear that Sillimanite has become an established foreign exchange earner and the potentialities of continuous, also increased earnings are dependent on maintaining supplies to the Export Market. It is with this background that we have been requesting the Government to give priority in allocation for the Export Market and justified incentive.

Some of our foreign buyers have now been advised that in future they should except to get both the raw Sillimanite as well as finished products. On an equal tonnage basis it would mean an increased earning in foreign exchange by 300 to 400 per cent in finished goods as compared to raw material.

In June this year the Company floated a new issue of Rs. 29.00 lacs equity shares, of which the Life Insurance Corporation of India subscribed to Rs. 5.00 lacs and the balance was oversubscribed by the public. In consultation with the Calcutta Stock Exchange the Directors have since allotted these equity shares and the scrips are under issue to the new shareholders, whom we thank very much. Rs. 4.00 lacs worth shares have also been allotted to our Technical Collaborators, Messrs. Vereinigte Grossalmeroder Thonwerke of West Germany for their technical know-how and services for Stage I of the Refractory Project. A further sum of Rs. 6.00 lacs was taken up by the existing share-

holders as Rights Issue, making our total paid-up capital now as Rs. 69.00 lacs out of the total authorised capital of Rs. 1.00 crore. Shares worth Rs. 29.00 lacs have been set aside for International Finance Corporation of Washington, and balance Rs. 2.00 lacs for Vereinigte Grossalmeroder Thonwerke, Grossalmerode, West Germany, as per our agreements with them.

The work on the new project at Ramgarh has commenced and this should be in full swing by the end of this year. As your Directors have indicated in their Report, the Initial Plant's products have been well received by the major and specialised consumers. The Directors had hoped that the first phase of the expansion programme would proceed as scheduled but now with the invasion, the production may be delayed by some time.

I might recall that India has to depend on imports of refractories to the tune of Rs. 3 crores annually and your Company's expansion scheme has been well timed, in the context of the needs of the Country. With the present Chinese aggression, the drain on foreign exchange has increased and your Company has to make its contribution in filling the gap by making the quality refractory products available as quickly as possible as well as for Defence and Civil Industrial requirements. Even with the extreme limitations placed on transport, etc. the Company is proposing to get itself on a war footing and organise to produce more, both the raw material at the mines and finished products at Ramgarh and Paharpur. The ingenuity of the Company's staff is at test and they, I expect, shall rise up to the occasion to meet the threat to the Country and to their own existence. In view of the setback that we might have in the working results of the Company due to reasons beyond our control and foresight and with the likely delay in the implementation of the Ramgarh Project, it has been considered advisable to undertake and diversify our activities in the field of export of minerals and other products to bring additional revenue to the Company in the following year.

I would like to thank, on your behalf, our workers and staff for their sincere services and would appeal to them to increase our production to the maximum. I have also to express my gratefulness to the International Finance Corporation, Washington, and the shareholders who have made available the finance for the expansion of the industry. Thanks are also due to the Managing Agents, the United Provinces Commercial Corporation, for the careful way in which they have been looking after the affairs and the growth of the Company all these years, despite hurdles and setbacks here and there.

S. M. WAHI,
Chairman.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

Assam: First Problem

THE implications of the choice of the American and British missions to visit NEFA and Assam at the earliest for a fact-finding assignment are obvious. Ladakh was visited by the military experts on the eve of the departure of the leaders of the two delegations, since the problems of defence in the western sector are more or less crystallized. What is needed is an on-the-spot survey by the veterans to make their own assessment and advise their governments on the basis of it how the defensive strategy in Ladakh will need to be rectified and strengthened. But Assam presents a problem which stands in a class apart. The strategic importance of this State of the north-eastern frontier of India is derived from several vital factors.

It is no disclosure of any secret to state that from the defensive view-point Assam ought to be considered as the Achilles heel of India. Its territorial contiguity with East Pakistan and Bhutan is far more pronounced than it is with India. The contiguity with Bhutan presents no problem either of defensive strategy or communications. But the recent persistence on the part of the Pakistani crew in the joint steamer companies operating the trans-frontier waterways at this crucial time for several weeks on a flimsy excuse is but a revelation of how the export-import economy of this frontier State can be paralysed at the pleasure of the citizens of a neighbouring country, although the neighbouring government may not be involved in it.

Neither the Assam rail-link nor the costly transport by civil aircraft can answer the problems of Assam's communications for uninterrupted contact with India and the export markets. Hitherto in our transport system we were conventionally accustomed to the construction of strategic railways which were a financial burden on the exchequer. Now the crisis period has arrived which is introducing a new type of strategic transport — roads, bridges, etc., linking Assam with the rest of India and giving as much relief to her problems of movement of freight and passengers. This is, however, a medium-term problem, but its importance cannot be underestimated in view of the uncertainty about the prolongation of the war with China.

In the immediate context, the Chinese tactics of cease-fire and the so-called withdrawal of her troops should be a consideration of no consequence to us in the sense that we cannot relax in the defensive build-up. The Brahmaputra valley and the bountiful hill slopes abutting that valley make Assam a rich region to be coveted. The Chinese forces reached before the cease-fire a distance of only 200 miles from Digboi, the spring source of our oil resources. Assam produces nearly three-quarters of our total output of tea and even in the overall scale of our exports it occupies an important rank, never declining below the third alongside jute and cotton textiles.

It would be presumptuous to draw any inferences about the assessment which the military advisers to the two missions made of the defensive requirements of Assam in the light of the actual experience and the shortcomings of the strategy adopted by us in the surprise push of the Chinese forces in this direction. But it would appear to a layman that Assam's problem of effective defence is dependent first on the procurement of mountain warfare weapons and, in the second place, on the conventional but modernised weapons to fight on the plains. In this respect it is different from the problems of NEFA or Ladakh.

The presence of subversive elements in this State and the loss of nerve on the part of the officials combined to inflict a threat to the public morale. But Mr. Lal Bahadur Shastri's agonizing appraisal of the Tezpur disgrace resulted in the adoption of a firm policy. The presence of subversive elements whether of Chinese origin (and many of them seek employment in the tea gardens) or of non-Chinese agents of Peking is not in the least a figment of imagination. It is a cruel fact which came to the surface even after the cease-fire was announced. The public was prompt in apprehending subversive agents found in possession of receiving and transmitting wireless sets. This extensive network of espionage will have to be tracked with the utmost vigilance and ruthlessness. It is a tribute to the courage of the people that even in the midst of the crisis they did not allow their morale to be shaken.

There are heroic accounts pouring forth of plantation labour in the vicinity of Tezpur just refusing to flinch from their posts of duty. Youth is coming forward in large numbers making demands for the use of its services in the defence effort. It was quite appropriate that a large representative team of M.Ps. as well as a number of chosen members of the Congress Party toured Assam, surveyed the situation for themselves and gave the assurance that the rest of India would stand solidly behind the people of the State, who may have to bear the first brunt of a likely aggression. These measures are of the utmost importance in maintaining and boosting the morale of the public. But public patience is likely to be eroded, if active steps are not taken here and now in this strategic State to give training to the youth in civil defence involving a pronounced element of physical resistance. Alongside this effort, it is equally essential to train the other sections of the population in maintaining economic stability with particular reference to the battle against inflation.

This is not to say that there has been any negligence on the part of the Government to examine all these problems and make decisions for immediate action. But it would be necessary to remind ourselves that, while official effort has to give a sustained initiative, voluntary organisations can make a substantial complementary contribution to it.

Accent on Production

THERE seems to be complete unanimity in both the official and the non-official circles in regard to the manner in which the economy of the country needs to be geared to the war effort. The formula which is being advocated by the experts is: retain the essential co-ordinates of the Third Plan, increase production, reduce consumption, encourage savings, economise resources and eliminate waste. In his speech at Calcutta while addressing the Annual General Meeting of the Associated Chambers of Commerce, Mr. Morarji Desai, the Union Minister for Finance, stressed the same line of argument and rightly said that the objectives of defence and economic development were complementary and not contradictory. Earlier Mr. MacKay Tallack, President of the Associated Chambers of Commerce, had also emphasised the role of increased production in the present emergency. He said, "For the greater part we must rely on actual increased production of food, and materials and manufactures within the country." Thus, both the Union Minister for Finance and the President of the Associated Chambers were in complete agreement in that the objective of intensifying the war effort could be obtained only by multiplying output through the successful execution of the important essentials of the Plan and not by scuttling the Plan.

The key to the maximisation of production lies in a judicious use of the available resources so as to raise productivity. All bottlenecks such as shortage of power, transport, raw materials etc. need to be eliminated so as to put the available resources of capital, labour and equipment to the best possible use. Mr. A. R. Foster of the Bengal Chamber of Commerce brought out this aspect of the problem in a telling manner. He cited the examples of the workers at Jamshedpur (TISCO) and the Integral Coach Factory at Perambur to illustrate how the application of the productivity techniques can be instrumental in bringing about far-reaching changes. Here is what he said: "At Jamshedpur, 1954, it took six of Tata's workers to equal the output of one German doing similar work at the Mercedes Plant at Stuttgart; today the ratio is 6:5. When the Integral Coach Factory at Perambur began to produce railway coaches in 1955 it took over 19,600 man-hours to finish one coach compared with the Swiss 8,500. Today the Indian figure is 8,519 hours and it is still falling."

The paucity of resources makes the employment of the improved techniques imperative for all producing units. A rearrangement of the available machinery and re-allotment of workers under the modern principles of "work study" can go a long way in enhancing all round production with the tools currently available. A happy feature of the present situation is that workers have assured complete co-operation to speed up the production machinery at all levels and any innovations pressed into service will bear added fruit.

While the Union Government has, for the current year, come in for an extension in the defence budget by about Rs. 100 crores, it is believed that this volume of finance may not be sufficient and the gap would have to be made up by certain cuts in other directions. For the year 1963-64, the rough figure which is being suggested for stepping up the Defence expenditure of the country borders around Rs. 1,000 crores as against the present level of expenditure at Rs. 380 crores. Any increase in financial resources can emerge only from increased production, implying that the national income must become bigger through acceleration of the productive effort. The problem of finance cannot be solved by mere creation of money through deficit finance though it has its rightful share in the mechanism of war finance. The financial picture at present is reassuring because the response to the new issue of defence bonds, defence certificates, prize bonds and gold bonds has been encouraging except for the gold bonds which have still to gather momentum. The accent on production and voluntary savings coupled with austerity in consumption and elimination of waste will no doubt provide a new vigour to the economy so as to accelerate the output of sinews of war.

Strength in Unity

THE joint statement issued by President Ayub Khan and Prime Minister Nehru on November 29 was undoubtedly one of the most remarkable developments taking place in a rapid succession on the Indian sub-continent. This statement announced the decision of the two statesmen to hold direct talks to resolve the intractable Kashmir problem as well as other outstanding issues. Credit for bringing about this top level meeting goes unreservedly to Mr. Duncan Sandys and Mr. Averell Harriman. The continued deployment of Indian forces on the Pakistan frontier, at a time when every battalion that could be spared was sorely needed on the Himalayan border, was looked upon as a distressing problem here as well as abroad. Any apprehensions which Pakistan, particularly its public and the Press, felt over the supply of massive military assistance to India, was completely dispelled by India's unqualified undertaking to use it only to fight the Chinese aggression and to return all surplus armaments after this task was accomplished. The Indian forces are now being deployed for the China operation. No conditions have been laid down to restrict the scope of the talks and it is earnestly desired as much by the Governments and people of India and Pakistan as by the Governments and people of America and Britain that a satisfactory solution to the Kashmir problem will be evolved by the parties themselves and the unity of the sub-continent will be restored.

The need for accord between India and Pakistan not only on Kashmir but also on all other outstanding issues has all along been keenly felt if for no other reason than in the interest of political stability which is so essential for their economic development. But at the present juncture, when India has been a victim of an unprovoked aggression by China, its significance is all the more heightened. Various explanations have been heard of the Chinese unscrupulous invasion on this country, but the consensus of opinion the world over is that this aggressive act on the part of China is not a stray incident, but a deliberate, premeditated and calculated piece of strategy, in her grandiose plans of domination over Asia and Africa in the first instance and for ushering in World Communism ultimately. The Malayan Prime Minister, Tengku Abdul Rehman, gave a glimpse of Peking's expansionist designs in South-East Asia when early this week he held to the view of his countrymen a Chinese map showing Burma, Malaya, Cambodia, Laos, Thailand and Vietnam as parts of China.

What this cartographic expansion—the Peking warlords would grin and style it only an inadvertent error—means India knows to her cost. And this probably is only the first phase of this imperialist drama. The Chinese claims on others' territories, historians tell us, are based on all that their forefathers or even those—Manchurians and Mongols—who at one time or the other invaded Peking in its long history, held at any period, howsoever brief, even as tributaries. The Indian sub-continent, particularly the area now constituting West Pakistan, has suffered at the hands of the ferocious Mongols. Peking's friendly overtures to Rawalpindi today have a parellel in her slogans of *Hindi-Chini Bhai-Bhai*, and offers of peaceful parleys with New Delhi not long ago. It is not in the least implied that outside powers can arrogate to themselves the role of a preacher to Pakistan. The Pakistan authorities, who entered into military aid pacts with the Western Powers, know it fully well. Their membership of the SEATO and CENTO is indicative of their determination to fight Communism.

What India is fighting for today is not a few miles of territory but her dignity as an independent democratic nation. Democracy in the East lives, if India lives. That is precisely the reason why the United States and the United Kingdom have lent us all their support, both moral and material, in the gravest of our perils. India's hands obviously will be weakened in the fulfilment of this crucial task if her armed forces continue to be deployed on the Indo-Pakistan frontier when they are so urgently required elsewhere. An honourable understanding on the outstanding problems between Pakistan and India will obviously help in releasing these forces for the onerous task of throwing out the Chinese aggression from the sacred soil of this sub-continent. In fact, what is required today is an unqualified appreciation of the fact that the security of the sub-continent vis-a-vis Communist aggression from China is indivisible.

The Kashmir issue is considered intractable because of the rigid positions which passage of time and pressure of public sentiment have imposed on both New Delhi and Rawalpindi. But given some measure of flexibility and statesmanship, this deadlock is not that difficult to break. After all, a solution could be found out for resolving the Canal Waters Dispute through long-drawn negotiations. It is encouraging that the ice is being cut without the complications of any preconditions to determine the nature of the talks. Either party is free to put forth its viewpoint candidly. To soften the attitudes, it is proposed to include in the purview of these parleys the other outstanding issues between the two countries as well. Let there emerge a complete understanding on all the problems in a spirit of give and take. The statesmanship of both President Ayub and Prime Minister Nehru is on trial today. The Sino-Indian conflict would prove a blessing in disguise if it leads to the unity of the two neighbouring countries and their peoples.

A Demoralising Decision

IF it was the share markets that were caught in a panic early last month, today, it would appear, it is the authorities that are panic-stricken without provocation. Otherwise, there can be no valid explanation for the sudden ban on forward trading in shares clamped last Friday. Even the argument that it is the intention of the authorities to ban all forward trading for the emergency as a matter of policy does not hold water, for this has not been done in every case, the important cotton, oilseeds and gur—not to speak of silver—markets being still unaffected. Lack of consistency apart, the imposition of the ban, though hardly of any significance in the prevailing circumstances, where whatever forward business there was was merely confined to transactions of a squaring-up nature, has all but undone the salutary effects of the Government of India's Press Note of November 6, which reassured the investing public that the markets would steady themselves and that normalcy would be restored very soon. One felt greatly relieved by this seemingly—so it would appear in retrospect — realistic appraisal of the situation. And many took it to mean that the authorities were, by and large, appreciative of the voluntary measures taken by the stock exchange organisations in the country to keep their houses in order. True, inasmuch as there was not the requisite lack of uniformity and co-ordinated approach by all the stock exchanges in the country there were still a few loopholes enabling the anti-social elements to exploit the situation, but, over the past few days, even this deficiency may be said to have been overcome. Thanks to the series of measures taken, a sizable portion of the outstandings has been adjusted, thereby greatly reducing the load on the market.

By their decision, the authorities have, for the time being at any rate, occasioned a degree of demoralisation that was quite avoidable. As a result, the pressure to sell below the authorised minimum prices, which has so far been but a tendency, has mounted and this may compel the stock exchange authorities, if only to ensure liquidity, either to further reduce the minimum prices or to wink at sales below these prices. In turn, banks which have advanced money against shares will be obliged to call for more margins, which, again, will force the pace of liquidation to push down equity prices further. The effective way to arrest the deteriorating situation, is, as we pointed out three weeks ago, that the authorities should adopt a well-defined and co-ordinated investment policy through their several financial institutions. This is all the more imperative in the context of the prevailing parlous capital market.

Lest there should be any misunderstanding, we must make it clear that we do not question the propriety of a policy to do away with futures trading during an emergency such as the one we are passing through, but what we are bound to criticise is both the lack of consistency and the lack of time sense on the part of the authorities in dealing with such a sensitive economic mechanism as the share market. Economic stability presupposes not only prudence but also perspective.

THE WEEK'S NOTES

French Elections

VICTORY OF DE GAULLE

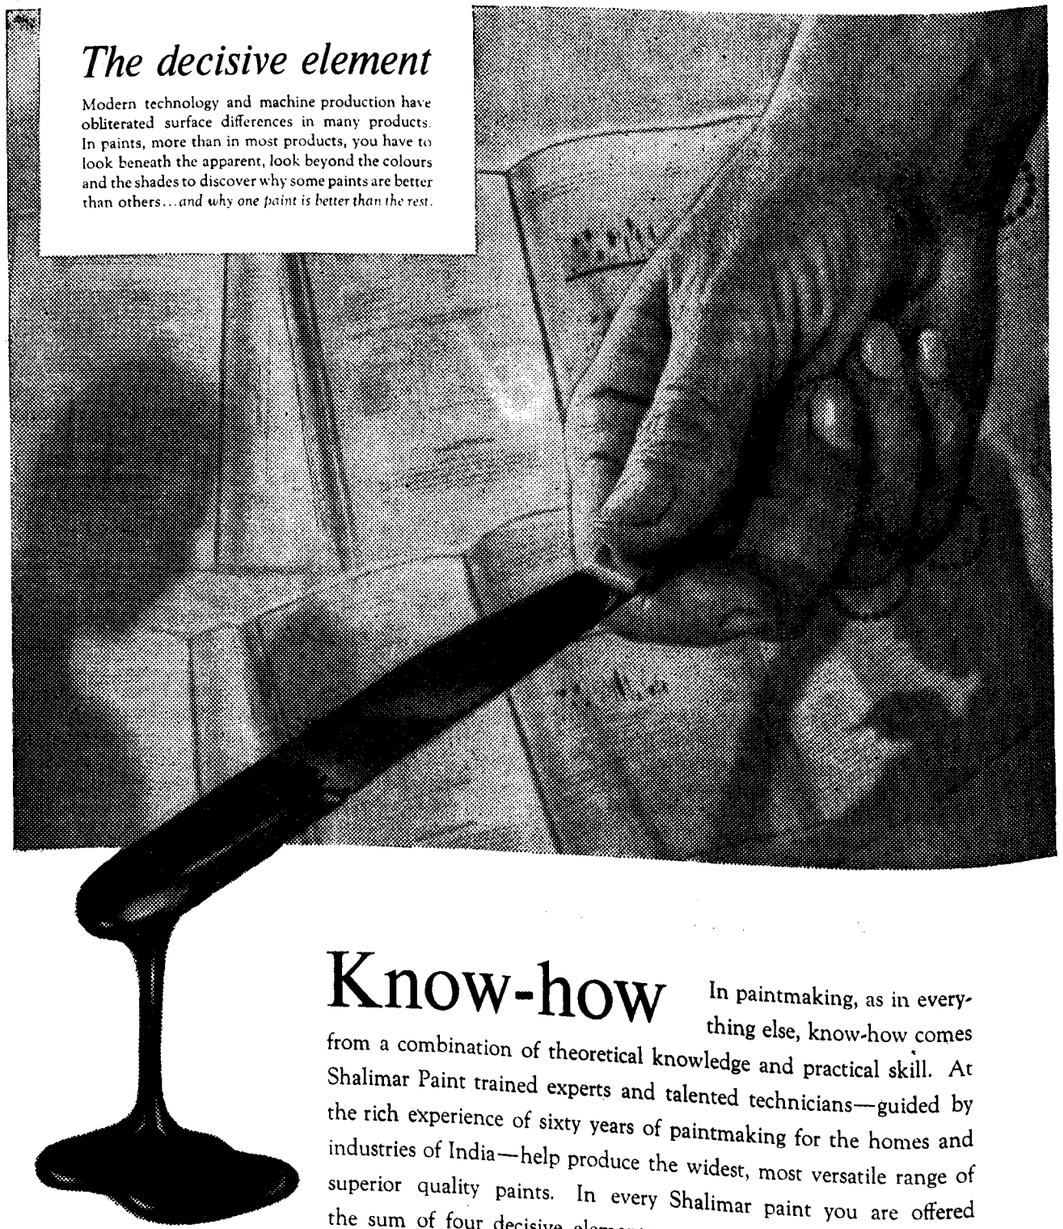
THE FIRST round of the general elections to the National Assembly in France held on November 18 could not be taken as a positive indication of what would follow in the final round fixed for November 25. The provisions of the French Constitution and the party politics in France, with its bane of multiplicity of political parties, have made the election outlook very uncertain. In the first ballot, under the Constitution, the candidate has to poll as much as 25 per cent of the vote on the register and furthermore he has to secure a majority of 51 per cent. This in itself is a very tough task. The real battle was to be waged for the second ballot. The truth of the matter was that there was a vital issue on which the general elections were being contested. The extra-constitutional manner in which President de Gaulle changed the mode of the election of the President by a plebiscite and placed it on a basis of direct vote had provoked genuine resistance. The magnitude of this resistance could be easily gathered from the vote of censure passed by the National Assembly on the Pompidou Government. Thus far the indications were that the opposition to de Gaulle, particularly derived from this fundamental issue of far-reaching consequence to the pattern of political power, would swing the vote.

But none would have been more surprised at the final outcome of the second ballot than the Gaullists themselves. The existence of a large number of parties or groups of various sizes in France has always placed obstacles in the way of the election of any one or at least two parties commanding an absolute majority, which could be relied upon for a sufficiently long period to give the country a stable administration. Shortlived coalitions, in the result, have become an inevitable feature of French politics. But the flexible and varied political creeds, to which parties or even different groups inside one single party subscribe, have made alliances of far less assuring duration than would have otherwise been possible. The one target in the election campaign was to prevent the Gaullists from winning a majority position. M. Mollet on behalf of the Socialists advocated a marriage of convenience with the Communist Party. But this alliance proved brittle and in his own constituency M. Mollet had to assert openly that he had not entered into any such formal and positive union with the Communists. The executive of the MRP who profess a leftist but moderate creed set their face firmly against the Communists. These difficulties of integrated alignments during the election split the opposition vote. The Gaullists came out as the largest single party with a total strength of 231 in the National Assembly consisting of 482 deputies. They are short of 20 for a majority. But the rightist element in the MRP and a few more deputies drawn possibly from independents and so forth will give the Gaullists more than a stable majority. Such a big vote for one party which is an uncommon feature in recent French politics makes the position of President De Gaulle secure.

Education

DEFENCE ORIENTATION

THERE ARE two angles from which the question of a redirection of the system of education at the secondary level for the purpose of orientating it to the requirements of defence in so far as they impinge on the student generation can be looked at. The first and the uppermost that comes to the mind is the direction that can be given immediately in order to satisfy the deep urge of the younger generation to contribute their mite to defending the integrity and honour of the country. The second angle is to lay the long-term foundations of the change in the structure of the curricula for secondary education. The note which has been addressed by the Secretary to the Central Ministry of Education to the State Governments deals essentially with the long-term aspect of this redirection. Looked at from this view-point there is not much on which there is room for divergence of opinion. The consciousness is gaining greater force, particularly after we entered on the phase of planned development of our economy, that scientific education should be given a place of higher priority than what it has enjoyed so far. If science and technology are the very foundations of progress in the modern era, it is simple logic that the basis of knowledge of science during the school training should be quite broad and solid. The Central Ministry has urged that in order to accommodate an increasing number of students taking science courses the facilities with regard to teachers and laboratories should be increased quickly. To this end double shift working in the laboratories has been recommended which is unexceptionable. Similarly, the retirement age of the teachers concerned is sought to be raised. But this device is unlikely to satisfy the demand for a larger number of teachers of the requisite experience. This is quite apparent from the Central Ministry's another suggestion that retired teachers should be called back to take their former posts again. In addition, short teachers' training courses for fresh science graduates have been recommended. When there is pressure of demand, it is likely that full considerations of quality and adequate training may have to be ignored somewhat.



But in respect of the short-term aspect of this problem the Central Ministry's thinking seems far from satisfying. The emergency is upon us as a cruel fact of the existing situation and what is required to harness the urge and enthusiasm of the younger students to serve the motherland is to give them facilities of service not only in the immediate future but directly in relation to the defence emergency. There is the scheme of the expansion of the NCC which should be taken vigorously in hand and as large numbers of students as possible should be encouraged to join it. Furthermore, there is the national discipline scheme in which students should be enlisted in large numbers. This, of course, ought to be without prejudice to the minimum requirements of physical fitness. The point of emphasis is that the students must feel the sense of effective participation in a tangible form in the defence of the country. This can be done not by the long-term planning but by their enlistment in civil defence and the two schemes already referred to. The sense of participation in this specific issue can have no appeal unless it takes a direct physical form.

U.S.S.R.

AN ECONOMIC REAPPRAISAL

DESPITE ALL the grandiose pronouncements hitherto made in regard to the spectacular advancement of the Soviet economy, it is now beginning to dawn on the Soviet leaders that its economic machinery and administration have bogged down in a puddle resulting in a break in the expansion of the economy. The entire economic machinery has to be re-organised with many features of the private-enterprise system fastened on to it. An expression to this realisation was given by the Soviet Premier, Mr. Khrushchev, in his speech before the Central Committee of the Communist Party of the USSR. Among other things, he argued in favour of the adoption of "modern business-like mentality"

The World Abroad

ODYSSEUS IN GERMANY

THE FORTNIGHT'S TOUR of Germany which I have just completed—my eighth since 1957—has revealed conflicting trends, which make diagnosis difficult and forecasts even more so. There can be no doubt that rapidly rising costs are cutting deeply into German profit margins. While the Federal Bank pursues a tight money policy in an effort to keep prices stable, the continuously rising expenditures of the central and state governments counter the Bank's efforts. It is true that budget cuts have been announced, but they are less cuts than curbs on the speed of increased expenditure on defence, building, and social security. Foreign observers have become uneasy about these trends and have been selling D Marks.

Does all this mean that competition and free enterprise, on which post-war Germany's economy has been professedly based, have at last been shown up as phoney?

THE FACTS OF THE "MIRACLE"

Let us recapitulate the facts.

The German gross national product rose in volume by 61 per cent between 1953-60, compared with 37 per cent on average in the OEEC member countries, and 21 per cent in the UK. The volume of private consumption per head has risen in Germany by 58 per cent, compared with 34 per cent in OEEC countries, and 25 per cent in the UK.

How was this record achieved? First, by high levels of productive investment, which between 1950-60 absorbed 21.9 per cent of the GNP at factor cost (cf. 16.6 per cent in the UK). Note that investment in machinery and equipment was as high as 11.2 per cent.

What released such large resources for investment was the readiness of the German masses to spend less on private consumption than their neighbours. Whereas private consumption in the USA and the UK average about 64 to 65 per cent of the GNP, in Germany between 1950-60 it averaged only 59 per cent—the lowest propensity to consume in Europe. This does not mean that consumer expenditure has not been rising. On the contrary, between 1951-59, consumption rose on average 6.09 per cent a year. As against consumption, however, the GNP itself rose on average 6.33 a year.

The first cause of this low average propensity to consume was the currency reform of 1948, the object, and effect, of which was to reduce by nine tenths the real value of everyone's cash in hand. This enforced reduction in wealth spurred the urge to save. A second and even more important cause was the low share of wages and salaries in the national income. During the 1950's, the share of wages and salaries (after payment of taxes on incomes and insurance contributions and the receipt of public transfer payments) in the GNP at current prices averaged just over 47 per cent in Germany, compared with 58 per cent in the UK. This made big profits possible, a very high proportion of which were ploughed back. The distribution of income in Germany thus (a) restrained consumers' demands, and (b) provided liquid funds for heavy investment.

The currency reform not only depleted personal holdings of cash but wiped out the funds of the trades unions, and so reduced their ability to finance strikes, while the steady influx of 13,000,000 refugees from behind the Iron Curtain further weakened their bargaining power. Finally, the German people's profound and understandable fear of inflation has been a further restraining influence.

THE HIGHEST WAGES IN EUROPE

None of this means that money wages have not risen in Germany. Between 1952-62, hourly earnings have risen nominally by 99 per cent, and as retail prices have only gone up by 17 per cent in that period, real earnings have therefore risen by no less than 70 per cent. By 1961, average labour costs per hour in Germany were DM 4.75, the highest in Europe (except for Norway: DM 4.78). British costs were DM 4.45. For the sake of comparison, between 1952-62, British hourly nominal earnings rose 80 per cent, but as retail prices rose 36 per cent, the real British gain was only 32 per cent.

Since, however, the German rate of earnings kept pace with, but did not exceed, the growth in output (until 1961-62), there was (until then) no redistribution of income in favour of wages and salaries.

I need not remind any regular adherent of this column that I do not assert that heavy capital investment necessarily leads to a higher GNP. In Germany's case, however, it has, partly because of the need to replace plant and equipment destroyed by war, and even more because all authorities agree that investment in new technology has been widespread.

If these facts explain the great growth of output in Germany since the war, they do not explain the relative stability of prices achieved. If the exceptional period of the Korean war — when prices all over the world were rising — is omitted, German retail prices rose by only 7 per cent between 1953-60.

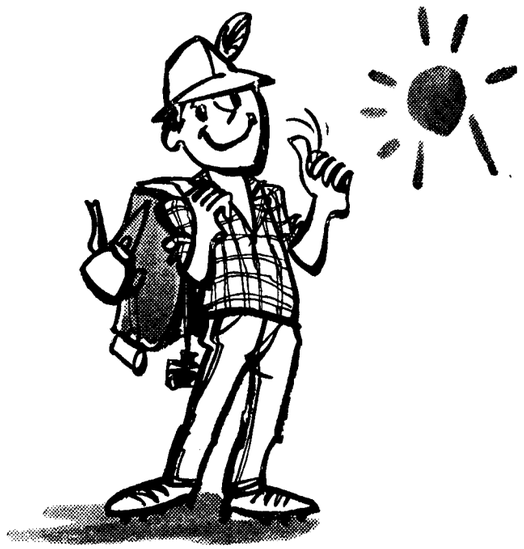
Price stability in Germany, as elsewhere, has, of course, been helped by the fall in import prices, but it has been maintained even more by the great rise in output per man hour, partly from the high proportion of GNP devoted to net investment, and partly from the inflow of refugee labour, which, because there is no closed shop in Germany, was allocated to the best possible use in the factories without obstruction from the trades unions.

Another great factor in Germany's expansion and growth has, of course, been her success in exporting. This sprang (1) partly from the lucky chance that the mark was undervalued by the exchange rate arbitrarily chosen at the 1948 currency reform, (2) partly from the growth of productivity within Germany, which meant that the mark became more undervalued as time went on, (3) partly because other countries were inflating much faster than Germany, so that her export prices remained more competitive, (4) partly because German industry concentrated on capital goods, for which in 1950-60 there was an inexhaustible world demand. The resulting export surpluses were not an unmixed blessing, first because owing to the comparative inefficiency of the German capital market, exports of capital rose very slowly, and, secondly, the Bundesbank's faith in orthodox monetary policy meant that when internal boom conditions were held to be threaten-

ing the price level, interest rates were stepped up, so that additional short-term capital was attracted into Germany at times when international considerations required an outflow of German funds. This inflow, when taken in conjunction with the government's steadily rising expenditure on social security and building, frustrated the Bank's efforts to curb domestic liquidity, and accounts in part for the degree of inflation that occurred.

The first obvious solution — a reorganisation of the capital market along the lines of the efficient British and American markets — involves a major evolution, which can only be a long-term development. The second solution — revaluation of the D mark — was forced on Germany when to rising social expenditure was added mounting defence expenditure. From £545 million in 1955-56, defence had risen by 92 per cent to £1,048 million in 1961.

Despite these difficulties, internal inflation was kept within fairly reasonable limits by the government's unforeseen accumulation of cash surpluses, intended for defence expenditure, but which, for practical reasons, could not be spent. These surpluses acted as an anti-inflationary force by withdrawing substantial amounts of money from circulation.

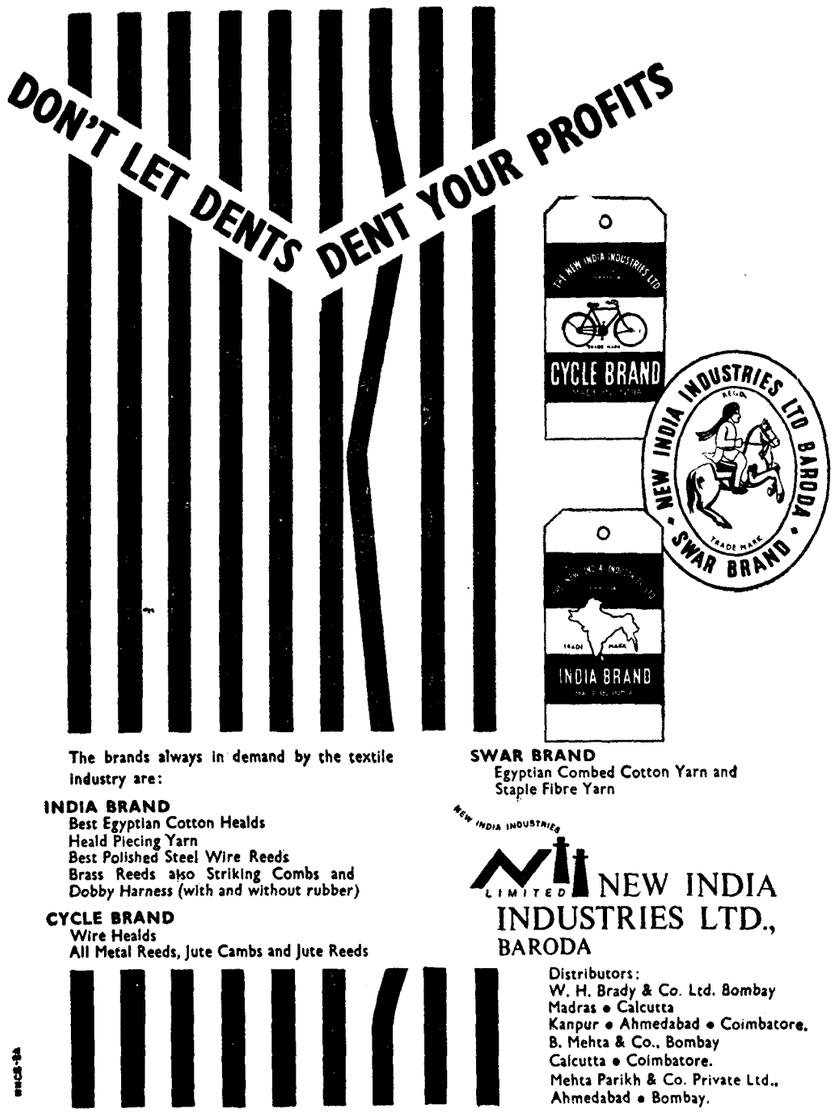


The revaluation of 4.8 per cent in March, 1961, seems to have got the balance of payments into equilibrium, but there are those who argue that it was too little to make its contribution to the new threat of further inflation, largely brought about by the emergence of over-full employment. In 1960, unemployment fell to 2.4 per cent; in 1961 to 1.2 per cent. In June, 1962, there were only 88,000 unemployed, or 0.48 of the total labour force.

Full employment has naturally been followed by demands for higher wages. The index of average gross hourly wages has risen from 115 in 1960, to 127 in 1961, to 141 by May, 1962. In 1961-62, wages rose by only 3.7 per cent in the USA, by 7.5 per cent in France, and by 2.8 per cent in the U.K.

LESSON OF GERMAN EXPERIENCE

Does all this, I ask again, mean that Germany's experience has now revealed competition and free enterprise to be an exploded mythology?



It reveals nothing of the kind. What would have happened if Germany had been handed over to the planners, as the British Socialist government hoped, in 1948? There is no need to speculate. We know, because their plans survive. The experts submitted a Long Term Programme to the Economic Co-operation Administration whereby the index of industrial production was to rise to 110 per cent of 1936 by 1953. They saw no hope of balancing Germany's foreign trade unless free access to the lost agricultural areas of East Germany was restored and unless, by means which they did not specify, Germany could earn $300 million a year from other dollar-short countries. But under the spur of necessity, competition, and enterprise, industrial production had risen by 1953 not to 110 but to 150. No, the lesson of Germany's post-war history is that with free wage bargaining, man-hour productivity must rise fast. The problem that democracy and free enterprise must now solve is how to reconcile full employment with free wage bargaining and lie in Wage policies? Taking a look at what is happening in 18 industrialised countries of the free world, we will have a shot at this problem next week.

Your idea of an ideal holiday–All on your own? foot-loose and fancy-free? or a group package tour?—everything laid on...new faces for company? BANKING ADVICE FROM

MANU THE LAW GIVER

Deposit banking in some form or the other existed in India in the second century A.D.

Manu, the law-giver, enjoined people to make deposits with bankers of good repute. "A sensible person should make a deposit only with a person of family, of good conduct, well acquainted with the law, veracious, having many relatives, wealthy and honourable."

The Union Bank of India, established in 1919, has enjoyed the highest reputation in reliability, strength and friendly transactions. The Union Bank prides itself on its unique *personalised service*, under which every depositor is treated as a Very Important Person.

The Union Bank Helps People

SERVICES OFFERED: Current, Savings Bank and Cumulative Deposit Accounts; Fixed Deposits and Three-year Cash Certificates; Inland Bills, Demand Drafts and Telegraphic Transfers; Letters of Credit and Guarantees; Foreign Bills and Remittances; Loans, Overdrafts and Cash Credits; Sale and Purchase of Government Securities and Shares and Safe Custody; Standing Instructions accepted; Credit Reports and Trade Information, Safe Deposit Vaults; TELEX contact with countries all over the world.

THE UNION BANK OF INDIA LIMITED

The European Scene

THE GAULLISTS' ECONOMIC PROGRAMME

From Our Special West European Correspondent

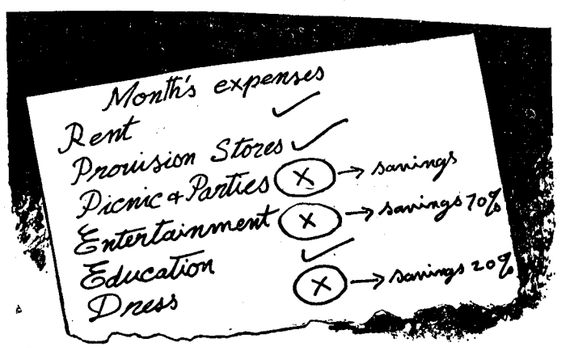
PARIS, December 2.

THE likely economic consequences of the extraordinary Gaullist victory in this month's French elections will concern, firstly of course, France's own economy and secondly, the evolution and enlargement of the Common Market. On present indications, it does not seem that the impact of the solidly Gaullist house will be very disturbing in either of these departments, except in so far as the existence of a stable government throughout the five-year legislature enables French policy to show more consistency and coherence than we are used to. For the fact is that economic development and European integration (in their purely economic aspects at least) have become, for most Frenchmen, non-party matters, and that is precisely why the electorate dismissed the old parties and gave power to a new formation that has no strongly characteristic economic ideology but promises continuity and stability. In other words, there is so much general agreement about what requires to be done, that voters could be convinced that the eternal and byzantine wrangles of the traditional parties had become irrelevant.

If the majority of the nation still believed that its problems could be tackled (effectively and in practice, not just in "programmes") in a Catholic way, a radical way, a conservative way or a socialist way, the new Assembly would no doubt show the familiar patchwork of French parliaments. It no longer believes any such thing, and that is why the old-style groups have been sent into five-year opposition. It seems to believe, rather, that these nuances are no longer meaningful, or at least could not be translated into practice. Some years ago the English coined the term Butskellism to signify their belief that, on the important economic issues, the Conservatives and the Labour Party were peddling much the same goods—or would, once either was in office and laid aside electoral rhetoric. It would be more difficult to coin a similar portmanteau word in this country where half a dozen groups were contesting for the honour to implement substantially the same programme. The choice, as many French electors saw it, was between entrusting implementation of this programme to one group that offers guarantees of continuity and party discipline; or alternatively to a multi-coloured coalition that is liable to fall out over minor questions that no longer interest citizens as much as they interest old-fashioned party bosses.

This impatience with stale quarrels and this preference for a consistent and effective approach to problems about whose urgency everyone agrees, is described by the defeated parties as "de-politicalisation". The barbarism is meant to suggest that most citizens are culpably becoming indifferent to the profound political issues that shook their grandfathers, and are handing over the power of decision to the General and his band of colourless followers. I see no sign of any such resignation, any such abdication. On the contrary, Frenchmen have lost interest in the ancient class and confessional disputes but they are passionately concerned with questions that they now consider of over-riding importance—as the new government will discover to its discomfiture if it delays or fumbles in dealing with them. European integration, resolution of the festering housing problem, provision of facilities to cope with the demographic expansion (especially educational facilities), full employment at rising real wages, improvement of the peasantry's economic status, are all issues on which the electorate is very much "politicalised" and is, in fact, ready to take direct action if Paris fails to give satisfaction on them.

It may be that the voters have made a mistake in entrusting these problems to a Gaullist majority, in which case the old parties will be able, provided they can sink their outdated differences and see at last what the people want, to take their revenge. It is too early to say that this will happen. The former system of government by shifting coalitions has been tried long enough and found wanting before the new national problems, so it is reasonable to try the very new experience of government by a stable majority and a popular President. The danger is that de Gaulle could take the security of an unchallengeable parliamentary majority as an alibi to neglect the very problems that engross the people, and attend instead to his own preoccupations, which centre around France's military power and international influence. In that event, he would be rudely recalled to his task and the most docile parliamentary majority could not protect him from discontent in a country where direct action retains all its attraction. Supposing he wanted to, the insistent pressure of peasants, students, workers and consumers would not allow him for long to delay the reforms the country is clamouring for. Unlike other Europeans, the French have never regarded parliamentary representation as a substitute for more effective demonstrations of their wishes.



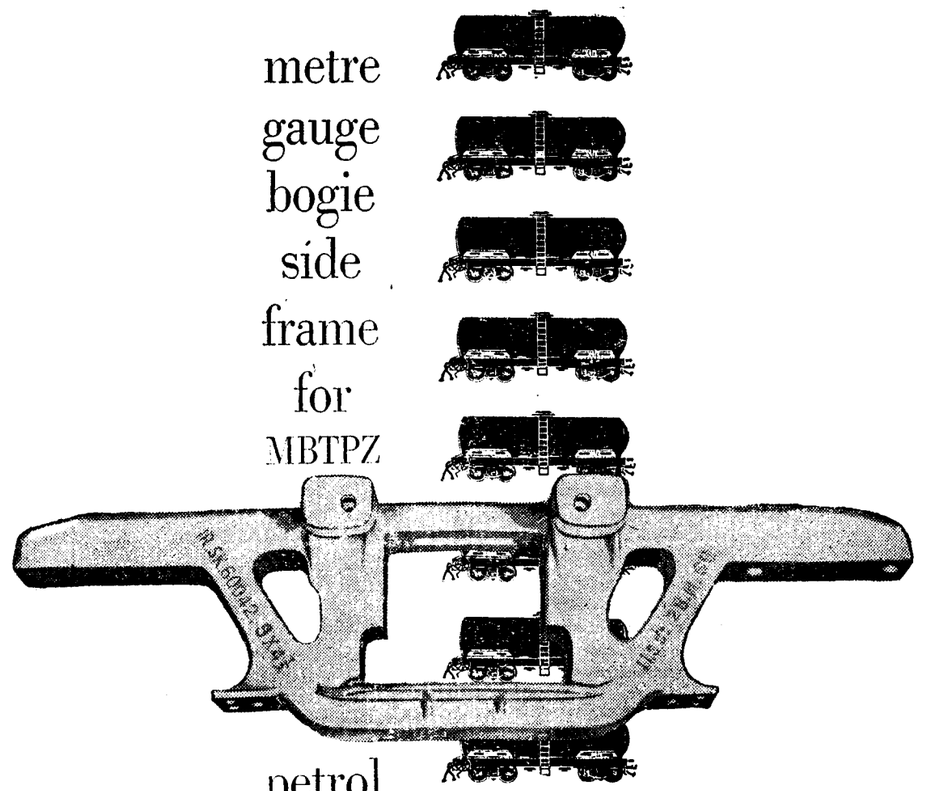
In reality, there is no reason to think that the new majority in the Assembly is insensitive to the demand for economic expansion and modernisation. It is not a "party of resistance" opposing a "party of movement", and in fact contains (along with a complacent conservative wing) elements as progressive and dynamic as are to be found in the country. Only on the issue of European federation—the surrender of national sovereignty in a European super-State—would it be, in so far as it followed its leader, "reactionary" in comparison with the socialists and Catholics, who are ready to go far and fast along that road. Yet this is not nearly as important an issue as the federalists imagine. Further economic integration is possible in the existing institutional framework of the Common Market, and the Gaullists are as prepared as any party to explore that path to the end. Besides, if the progress of the Common Market is taken to include its extension to other countries, as well as closer unification among present members, then the federal doctrine is an obstacle to progress; neither Britain nor, for example, Spain would have any place in a federal Europe but they could join, or be associated with, an economic union having the existing institutions. As for the economic price that will be asked of them for admission to that union, the Gaullists do not have any different an opinion to the other parties, for this is a non-party question. Despite the often obscure theological controversies about supranationalism, the course that European economic unification takes will be decided empirically rather than on doctrinal grounds—granted, of course, that the will to unite

is constant; and it is as well represented by the Gaullists as by the old parties.

On domestic economic policy, the Gaullists are indeed, as the Communist Party harps in all its propaganda, a capitalist party; but there is capitalism and capitalism, and the brand of it that is connected with the Gaullists is a considerably more dynamic and progressive variety than the colonial capitalism, liquor interests and conservative small business that had their heyday under the last republic. One cannot rest content with summary arguments such as the fact that M. Pompidou, de Gaulle's Prime Minister, was taken from the managing director's chair of the Rothschild Bank. The corporate enterprise that is associated with Gaullism is also deeply committed to the planning experiment in France and to the integration adventure in West Europe, and thus represents a type of capitalism that has never before had access to the seats of power. In any case, its influence should not be exaggerated for it is counterbalanced by what is often abusively termed the technocrat strain in Gaullism: the senior administrators from the finance departments, like Baumgartner and Giscard d'Estaing (the last two Finance Ministers) whose career has lain entirely in the public service, with intimate connection with national planning.

Neglecting for the time being the Left Gaullists (a more or less Bevanite wing of the party that is henceforth represented in parliament and in the ministry but has to prove the extent of its influence), these capitalist and technocrat elements plausibly claim to have "socially progressive" ideas that would be seen as Leftist by the Kennedy new-frontiersmen and the Young Tories. Their proposals for labour-capital partnership in industry are familiar, but probably not destined for implementation, as unpractical yet in France. Likely to secure earlier application are their ideas on a new sort of Senate, an upper house that would represent economic interests, and notably the trade unions. This reformed Senate would have as its main task examination and control of the national plan, in much greater detail than the conventionally elected lower house.

Finally, there is the question of international economic policy as this concerns the developing countries. Here, there is no doubt that the Gaullists are the only party in France (and perhaps in the Common Market) with enterprising ideas. The favourable reception the result of the elections had in Africa, where French economic influence is still predominant and likely to determine the pace of economic progress, is instructive on this point. The new ministry will, in the relevant departments, resemble the last one and will thus include the same men as have fought all along in Brussels for effective Common Market support to African development, often against reluctance from West German liberals. It will also include the architects of the Baumgartner - Pisani plan for reform of world markets in foodstuffs, which has the aim of putting an end to competitive dumping financed by export subsidies, in favour of distribution of Western surpluses to developing countries that cannot pay even the artificially depressed dumping prices. The Americans, it appeared at this week's meeting of the Organisation for Economic Co-operation and Development in Paris, are rallying to this scheme, which, for all its admitted difficulties and dangers, constitutes the only suggestion yet made for a humane and global solution of the problem of farm surpluses in a hungry world.



Strengthen your Economy by Thrift & Save for the Nation's Cause

At this time of the Nation's peril, do your bit to strengthen your own economy. Thrift & Saving will contribute in a great measure to this end. The Indian Bank Ltd., with its net work of 140 branches throughout India, manned by friendly officers will explain the various schemes of the Bank for Savings, according to your needs.

The Third Five Year Plan
Bird-Heilgers' part in it...

FOURTEEN MILLION NEW JOBS

Employment. A word that translates into a meaningful future for millions of people without jobs. India's Five Year Plans are aimed at the concept of full employment. The intensified drives of the Third Plan are estimated to create 14,000,000 new job opportunities—more jobs for more people than ever before in the economy's history! To achieve the employment target calls for a single-minded national effort. It must be co-ordinated, dedicated, complete...

75,000 jobs—and more in the offing

Bird-Heilgers is convinced that the quickening tempo of industrial activity must be accelerated if unemployment is to be checked and full employment brought about. Wedded to this concept, the group provides well-paid employment for approximately 75,000 people. They are concerned with iron ore and insurance policies, bridges and writing paper, gunny sacks and laboratory tests—a complex of goods and services which involves the group heavily in the industrial resurgence of India.

Towards a self-generating economy...

A phrase on everyone's lips. A phrase that finds concrete expression in the urgent activity of an economy on the move. Bird-Heilgers reflects the nation's striving. The group delivers millions of tons of basic materials to the new blast furnaces. It produces jute goods, paper and board, air compressors and springs, and engineering and water treatment equipment. A project for the manufacture of coal washeries was the first in India. Planned diversification finds the group engaged in shipping, insurance, exporting and importing. Its agency department handles everything from heavy capital equipment to light consumer goods.

...and an exciting, promising future

The Five Year Plans are a challenge: existing industries must expand, new industries open up, per capita income increase. India needs more goods and services than ever before. Bird-Heilgers is alive to the problems of a growing economy. The group deploys the full potential of a century's resources, technical knowledge and executive skill to increase and broaden its activities...provide employment for many more thousands...join the national drive to economic independence.

Economic Report from the U.S.

TAXES AND THE ECONOMY

By GUY SIMS FITCH

WASHINGTON, Nov. 27.

TAX revision has now emerged as a major policy issue in the United States, and next January, when Congress reconvenes, it promises to be the chief economic business in Washington. This much is clear from the avowed intention of the Kennedy Administration to see substantial tax cuts and reforms early next year. The question remains as to why tax slashes are necessary and how they would spur the nation's economic growth.

In good position to answer this question is the Chairman of President Kennedy's Council of Economic Advisors, Dr. Walter W. Heller. As he sees it, a sizable cut in tax liabilities both for households and businesses would push the economy toward more robust activity in three main ways.

(a) It would increase the spendable income of consumers. As consumers spend this income, markets strengthen, production rises, new jobs are created. This leads to added cycles of increased private incomes and spending, in what economists call the "multiplier effect." It produces a rise in the gross national product (GNP), or total output of goods and services, of perhaps two or three times the original reduction in taxes.

(b) By strengthening sales and pushing output closer to capacity, it would spur business investment in inventories and new plant and equipment. This has what is called an "accelerator effect," as it further stimulates consumption, increases business earnings, helps expand the GNP and overcome the deterrent effects of excess productive capacity.

(c) It would enlarge business profit margins and the supply of internal funds available for use. It thus would reinforce the incentive to undertake the risk of new investments and enhance the prospect of larger returns on new productive facilities. In sum, tax reduction would stimulate demand for both consmer and capital goods, thereby boosting the volume of sales and output, and would induce business men to produce, employ and innovate on a larger scale. If the economy were operating at close to capacity levels, tax reduction admittedly would be poor public policy. But this is not the case at present. Despite its encouraging progress of the past two years, which have seen it reach new highs in performance, the economy still is operating below its potential. In fact, it has fallen short of its potential ever since 1957. According to estimates, it would take a GNP rise some $30,000 million to bring the seasonally adjusted unemployment rate down to four per cent from its present 5.5 per cent.

One of the chief reasons for the relatively sluggish behaviour of the US economy over the past five years is the persistent drag exerted by the Federal tax system as now constituted. It is a system that drains off about 30 cents of every additional dollar generated by increased production. As a result, it takes an extraordinary expansionary thrust to keep driving the economy forward. Also, as the expansion develops, the Federal Budget begins to shift strongly from deficit to surplus. This has the effect of pulling larger increments of purchasing power out of the economy than it puts in, and tends to limit the magnitude and extent of the expansion. Thus, the main argument for reducing the tax burden is not that it is a short-term recession cure—hardly a tenable position when there is no recession—but that it is the best way to correct past deficiencies and accelerate long-term growth. It is this long view that motivates the Kennedy Administration and its supporters.

Admittedly, the Administration may face some tough hurdles in having its tax proposals, which have yet to be divulged in detail, translated into legislative action by Congress. One counter-argument the Administration undoubtedly will face concerns the possible enlargement of the Federal Budget deficit, which already is estimated at $7,800 million for the 1963 fiscal year that began July 1. It is well to note, however, that if the economy were operating at or near capacity, that deficit would turn into a surplus of some $2,000 million, according to government estimates. To the extent, then, that a reduced tax burden stimulated the economy to greater growth, it would in time more than pay for itself in added government revenues even at the lower rates. As Dr. Heller points out, a well-structured and well-timed package of tax reduction and reform would help convert today's deficits into tomorrow's surpluses.

Special Article

CEMENT UNDER PRESSURE

EVEN before the present emergency, the demand for cement far exceeded the supply and the State Governments had instituted a scheme for rational distribution of this vital commodity according to a list of priorities. It is now believed that the demand will increase further under the impetus of the war effort and might aggravate the situation further unless some corrective measures were taken in time. New Delhi has moved fast in the matter by declaring cement as an essential commodity whose manufacture or sale below the standards laid down by the Indian Standards Institution has been prohibited by a special circular of the Ministry of Steel and Heavy Industries. This new measure taken under the Essential Commodities Act, 1952, is intended to prevent "the possible adulteration of cement at a time when the demand exceeds availability within the country". In regard to curbing consumption of cement, West Bengal Government has given a lead to the other States by imposing certain restrictions during the period of the national emergency. According to the rules framed by the West Bengal Government, no cement would be provided for the construction of luxury buildings such as cinemas and hotels, for the construction of houses beyond two storeys and for the construction of both the boundary walls and the driveways. These new curbs, however, do not apply to public and charitable institutions like hospitals, and schools and also not to the industrial housing schemes. It is now presumed that all the other States will also take similar action so as to make a judicious use of this vital product and to make available as much cement as needed for defence industries and defence effort. This Special Article analyses the sectorwise consumption of cement during the last five years along with the proposals which have been set out for the Third Five-Year Plan with an assessment as to how this may have to be rearranged in the present circumstances.

A penetrating analysis of the pattern of cement consumption has been presented by Mr. V. Podder in a recent publication entitled "Cement Industry in India". Because of the strategic importance of cement in the building up of India's defence it is necessary to have a close look at sector-wise consumption during the Second Five-Year Plan and the proposed pattern evolved for the Third Five-Year Plan; drastic changes may have to be made in the Third Plan scheme of cement allocations so as to conform to the new emergency. A fact which has been brought out forcefully by Mr. Podder's study is that the rate of growth in consumption of cement in India on per capita basis in the period 1955-59 was significantly lower than that witnessed in China. As against the rate of rise of 25 per cent per annum in China, the Indian Union recorded a rise of 9.6 per cent only. It is true that the Chinese statistics are dubious and much reliance may not be placed on the official Chinese pronouncements, yet it seems that the estimates presented by Mr. Podder are realistic and much greater effort is needed to catch up with the Chinese rate of expansion in cement output and consumption.

Table I below shows the break-up of consumption of cement during the Five-Year Period 1956-57 to 1960-61. It will be seen that the total consumption at 37.1 million metric tons was shared, by and large, by housing, schools and hospitals, industries, irrigation projects and maintenance of old buildings. Nearly half of the total cement was consumed by "housing", "schools and hospitals" alone while defence claimed hardly 3 to 4 per cent

TABLE I

ESTIMATED CONSUMPTION OF CEMENT DURING SECOND PLAN PERIOD

Consuming Section	Net fixed investment (Rs. million)	% of expenditure on construction	Cement Consumption (Metric tons) Per million of Rs. of investment (2)	Per million of Rs. of expenditure (3)	Cement consumption ('000 metric tons)

11. Maintenance @10 % of (1-10)	..	..	..	..	3,382
TOTAL	..	..	..	..	37,105

of the total. From now on, the share of defence in cement consumption must necessarily rise. The estimated consumption of cement during the Third Five-Year Plan is placed at 67 million metric tons. At 1.5 million tons in five years, the allocation for defence seems to be on the peace-time pattern and it is highly likely that this may be increased many times during the remaining years of the Third Five-Year Plan.

The estimate of cement consumption at 67 million tons for the five years of the Third Plan seems to be on the liberal side. According to the performance of the cement factories since the commencement of the Plan and also according to their expansion plans, it is anticipated that total availability would not exceed beyond 55 million tons. In other words, the allocation of cement sector-wise is not likely to be fulfilled in the manner in which it has been set out in Table II. Any shortfall in availability will reflect itself in the two biggest consumers, namely "housing" and "schools, hospitals and other buildings". It also means that the supply of cement is likely to assume a very chronic situation in the coming years and considerable ingenuity will have to be exhibited by the administrators at the State level to allocate this commodity in such a manner as to get the best use out of the available supplies. Some hardship is inevitable and like similar pressures from other sectors, the nation will be prepared to tolerate it in the larger interest of the community. The administrators on their part have to show more alertness and have to cut down red tape and inefficiency for eliminating waste which might result from their careless and inefficient handling.

In keeping with the demand for new housing, schools and hospitals, the Third Five-Year Plan had allocated more than half of the new output of cement in these sectors. Diversion of more cement to industries and for railways, bridges, roads and other essential purposes for hastening defence is now a "must". The housing problem in particular—which, no doubt, is very acute at the present moment — may be deferred for some time; even if the quota for housing is halved to 10 million tons for the Third Five-Year Plan period, the public will certainly extend all co-operation in view of the extraordinary circumstances. Already, it seems, in the major cities the tempo of housing activity has slowed down, and the State Governments are contemplating stoppage of loans for building new houses. That in itself will slacken demand for cement and will allow sufficient volume to be poured into the defence-oriented sectors.

The consumption of cement at ten per cent of the total for purposes of maintenance seems to be on the higher side. This pattern may have been true during the Second Five-Year Plan when the share of new buildings was small, but the manner in which cement has been consumed during the last few years shows that the number of new buildings not needing any repairs will be so large that maintenance may assume a very minor role. Any saving of cement on this account can be availed of for defence.

While it is true that the cement supplies for civil use need to be curtailed, the available limited supplies of cement should be utilised to the best advantage of the nation; at the same time the small consumer should not be inconvenienced to such an extent that even minor repairs should become impossible. Mention here needs to be made of the chaotic condition of cement distribution in Delhi where the small consumer does not know how to fulfill his limited demands. While all new constructions of houses may be stayed, it is necessary that those which have already gone ahead with construction should not be left where they are. This will again mean improper use of resources.

TABLE II

ESTIMATED CONSUMPTION OF CEMENT DURING THIRD PLAN PERIOD

Consuming Section	Net fixed investment (Rs. million)	% of expenditure on construction	Cement Consumption (Metric tons) Per million of Rs. of investment	Per million of Rs. of expenditure	Cement consumption ('000 metric tons)

THE BUSINESS WORLD

Bonus-Rise Hopes Blasted

By

CROESUS

ALTHOUGH the results of the latest valuation — the third since the nationalisation of life insurance — leave no doubt in the mind of anyone about the bonus-earning capacity of the Life Insurance Corporation's (L.I.C.) business, they cannot be said to be as "gratifying" as the L.I.C. actuaries claim. For, despite the distinct improvement in actual mortality experience, the average rate of interest earned, and the lower renewal expense ratio, a higher rate of bonus has not been recommended by them. In a way, the maintenance of the same rate or rates of bonus as on the previous occasion is no matter for gratification at all, particularly in the context of the assurance held out by the Second Valuation Report thus: "The policyholders will be glad to know that further investigations made by us go to show that the Corporation is not only in a position to maintain the present bonuses in the future, but also to improve thereon, in due course, if the present favourable conditions continue".

That these favourable conditions have not only continued but have, in fact, been better during the valuation period in question is admitted by the actuaries themselves. Indeed, they have declared that, "having regard to the substantial increase in the yield on our investments, there would have been justification for using a slightly higher rate of interest in the valuation." Granting, as the actuaries say, that "this course is not considered advisable on the present occasion, in view of the likely effect on the national economy of a long-drawn Sino-Indian border conflict", one would like to know whether there was not still sufficient margin, provided by the favourable actual mortality experience and the fall in the renewal expense ratio, to allow of a higher rate of bonus. It is true that, under certain heads, "a somewhat, larger provision" has been made, but it is not clear from the Third Valuation Report whether the net effect of this has been such as to offset the beneficial effects of the favourable mortality experience and the lower renewal expense ratio.

Having said this, let me now briefly review the latest valuation results. A comparison of these results with those of the first and the second valuations shows that, as against 56.83 lakh policies assuring Rs. 1,472.81 crores (including bonus and annunity policies) and 69.29 lakh policies assuring Rs. 1,997.15 crores, respectively, the Third Valuation covers as many as 85.81 lakh policies assuring Rs. 2,738.92 crores. The rate of growth in the number of policies and in the total sum assured alike is quite gratifying. The surplus as per the valuation balance sheet is nearly Rs. 31 crores, but, thanks to certain tax adjustments, the surplus available for distribution is actually higher at Rs. 34.35 crores (inclusive of Central Government's share of Rs. 1.72 crores). The comparative figures for the 1957 and the 1959 valuations are Rs. 30.24 crores gross and Rs. 27.56 crores net and Rs. 26.08 crores gross and Rs. 24.47 crores net for participating policyholders, respectively.

No L.I.C. actuary could have wished for more satisfactory valuation data than what they had for the Corporation's Third Valuation. In the first place, the actual mortality experience during the valuation period has been more favourable than during the previous biennium. Even so, the actuaries have adopted the same mortality basis as in the previous valuation, namely Modified Oriental (1925-35) Ultimate Mortality Table, which gives, to quote the Valuation Report of the actuaries themselves, "a sufficient margin to contribute handsomely to the profit in future traceable to this source". Incidentally, it may be presumed, from what has been done in respect of the Third Valuation, that, for at least the next two valuations, the same mortality basis would be used. By then, perhaps, the Corporation would have in hand the results of the detailed investigation of the L.I.C. into the mortality experience during 1961-64, to think of adopting a more up-to-date or appropriate mortality basis. Secondly, the average net rate of interest earned during the valuation biennium has been 4.14 per cent, as compared to 3.81 per cent in respect of the previous valuation. Here, again, in conformity with the cutomary conservative caution of actuaries, the L.I.C. actuaries have used only 2-7/8 per cent, the same rate of interest as was used in the 1959 valuation, thereby leaving "an adequate margin for future profits". Thirdly, the renewal expense ratio has shown a steadily declining trend; from 12.90 per cent in 1960, the ratio fell to 12.42 per cent in 1961.

Although in the matter of the rate of bonus, the L.I.C. actuaries have not been as good as their word, in the matter of separating certain annuity policies from life business and also in valuing them separately, they have implemented the intention to this effect indicated by them in their previous Valuation Report. Consequent on this, a separate fund for certain annuity policies has also been set up and a provision of a little over Rs. 1.11 crores has been made.

Of the total number of assurance policies (85.81 lakh), 65 lakh policies were participating or with-profit policies, while of the latter, again, 62 lakh policies were endowment policies, the remaining 3 lakh policies being whole-life policies.

BINNY'S
NEW DRIP-DRY
BUSHCOATING

SAFARI, specially designed for bushcoats and slack shirts, features BINNY'S exciting new Bucklin finish—a finish which makes cotton fabrics highly resistant to creasing, adds lustre to their appearance and gives them all the advantages and convenience of drip-dry fabrics. Garments made from SAFARI wash easily—dry quickly—need little or no ironing.

Save on laundry charges and economise in your wardrobe by using Bucklin finished fabrics.

Business Notes

K.G.F.

CENTRE TAKES OVER

IRONICALLY ENOUGH, even when gold has been the most-discussed subject, both by the authorities and by the public, the formal take-over of the Kolar Gold Fields in Mysore State by the Central Government from December 1, 1962, has evoked little comment. This is, perhaps, because the take-over is in the nature of a fait accompli.

Although the saga of search for the yellow metal in the country was not as spectacular as the Gold Rush in America in the 18th century, the first venture dates back to 1804. Between then and the time that mining at K.G.F. commenced on a commercial scale, there were many individual attempts, but six out of eleven companies that attempted prospecting ceased their operations. It was in 1880 that Messrs. John Taylor and Sons, of London, were approached to undertake the development in certain of the properties of the K.G.F. Despite the fact that the previous attempts had all been disappointing, thanks to the fortitude and perseverence of Mr. John Taylor, the Kolar Gold Fields have turned out to be one of the world's biggest gold producers. After over 70 years, that is on November 29, 1956, the Mysore Government nationalised the K.G.F. But the change-over from private ownership to State ownership did not bring about any change either in the fortunes of the mining company or of the State of Mysore. For barely two years after that, the Government of India decided to take over the entire gold output of the mines at the international price; until then, the Mysore Government used to sell its gold in the open market, mostly in Bombay. While the Government of India did this, so as to fulfil its commitments to the International Monetary Fund as one of its members, the State Government was paid the difference between the international price and the domestic market price by way of subsidy. Perhaps it is the insistence of the State Government for the payment of this subsidy that led to the final take-over by the Centre. This change from the State to the Centre would entail the latter to pay a compensation of Rs. 3.5 crores, which also covers the compensation of Rs. 1.64 crores paid by the State Government to the original owners, Messrs. John Taylor and Sons, for nationalisation and the investments made during the years subsequent to the nationalisation by the State Government.

As regards production, the tonnage of ore milled for 59 months prior to nationalisation was 29,47,212—an average of 5,99,433 tons — whereas for the 52 months subsequent to nationalisation it was 27,42,263 tons giving an annual average of 6,32,830 tons, representing an improvement. Qualitatively, however, there has not been any improvement. In fact, the earlier extracted ore is believed to have been superior in grade to the later one.

Rural Credit

UNEVEN DEVELOPMENT OF CO-OPERATIVES

THE FACT that the problem of co-operative development is one that runs deep into the socio-economic structure of rural India, makes it necessary to have a thorough and periodical study of the growth and impact, as also of the shortfalls, of the movement. It is as a result of one such study in fact that we now know that, in spite of the so-called remarkable growth of credit co-operatives throughout the country, their achievements have been anything but spectacular, the obvious reason being that the forces of transformation were not as powerful as those that were sought to be counteracted. This, in a nutshell, is the conclusion of the General Review Report on Rural Credit Follow-up Survey, 1959-60, — the fourth in the series — released last week by the Reserve Bank of India. The Survey covered nine selected districts (Bijapur, Bilaspur, Tanjore, Krishna, Kanpur, Midnapur, Mohindargarh, Bhagalpur and Barmer). It may be mentioned here that all the districts, except Tanjore and Krishna, had also been covered by the All-India Rural Credit Survey conducted by the Reserve Bank of India in 1951-52, so that the latest Survey has enabled the Bank to make a broad comparison of the rural credit structure between the two periods of time in these districts.

According to the Report, among the selected districts, the better developed credit co-operatives were to be found only in Bijapur district (in the pre-reorganised Bombay State), where attempts had been made at re-orientation of the credit structure, State participation, and also introduction of the "Crop Loan System". In Mohindargarh and Midnapur, on the other hand, the progress was extremely unsatisfactory, but there was hardly any progress in the districts of Bhagalpur (Bihar) and Barmer (Rajasthan). The performance in the other districts remained fairly satisfactory.

CAUSES

Explaining this uneven development of co-operatives, the Survey has listed the following causes: (1) inadequacy of efforts at reorganisation and reorientation of the co-operative structure; (2) weakness of the primary credit structure; (3) weak financial position and liability of the central banks, in the context of arrangements regarding supervision and power of scrutiny of credit limits to play a pivotal role; (4) lack of adequate efforts at reorientation of the loan policy of central banks; (5) unsatisfactory performance of marketing co-operatives; (6) absence of adequate and co-ordinated efforts at setting up processing units in the co-operative sector; (7) weakness of land mortgage banks; (8) domination of co-operatives by vested interests; and (9) inadequate efforts at introducing State participation in the management of co-operatives. Of these, some at least are common to all the four surveys made so far. One would have liked to know the steps taken by those concerned to remedy the shortcomings noticed, as also the precise results thereof. In the absence of such indication, it would be difficult for anyone to say whether those in charge of co-operatives, at least in some places, have really grasped the fundamentals of the noble gospel of co-operation. Evidently, the powers-that-be are content with quantitative progress and are not too bothered about qualitative improvement, even after the defects noticed are brought to their attention.

Be that as it may, according to the Report, the pattern of demand for credit showed that the average debt per family outstanding at the end of the reference period was the highest in Mohindergarh (Rs. 1,219), followed by Krishna (Rs. 733), Tanjore, Bijapur and Barmer (between Rs. 400 and Rs. 500) and Bhagalpur

and Kanpur (around Rs. 235). The lowest debt was reported from Bilaspur at Rs. 52. The incidence of debt, in terms of proportion of debt to total value of recorded assets, was relatively high at 20 per cent and 13 per cent in Barmer and Mohindergarh, respectively. In Krishna, Tanjore and Bijapur, this proportion was between 7 per cent and 9 per cent, while, in the remaining four districts it was 4 per cent or less. The incidence was particularly low in Bilaspur and Midnapur, the respective proportions being 1 per cent and 2 per cent.

The most important purpose of borrowing in six districts was family expenditure; it accounted for 60 per cent or more of the total borrowings in four of them. However, expenditure on agriculture also was of considerable importance as a purpose of borrowing, accounting for about a fourth or more of the total borrowings in almost all the districts; in Bijapur, Krishna, Barmer and Bilaspur, for example, actually, 45 per cent or more of the borrowings were for agricultural purposes. In six of the nine selected districts, capital expenditure on agriculture as a purpose of borrowing was far more important than current expenditure.

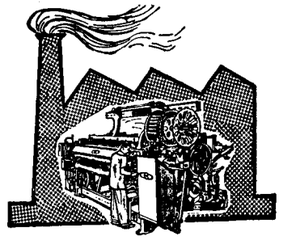
Co-operation

A GOOD RECORD

THE CO-OPERATIVE movement in India made a substantial progress during 1960-61. The report for its working released this week shows that the number of co-operative societies of all types functioning in the country rose in a year from 3.13 lakhs to 3.32 lakhs at the end of June 1961. The progress was uniform all through the country except in U.P. and West Bengal where the number declined as a result of certain steps taken to revitalise and reorganise the societies. Still U.P. remained the State with the highest number of co-operatives in the country. Financially too the co-operative societies improved and the working capital during the year increased to Rs. 1,312 crores against Rs. 1,083 crores a year before.

Agricultural credit societies form the most important sector of the Co-operative Movement in India. At the end of the year under review, there were 2.12 lakh such societies with a huge membership of over 170 lakhs and a working capital of nearly Rs. 374 crores. Their performance has been quite dynamic in the sense that loans advanced by them reached a new high of Rs. 202.75 crores as against Rs. 169 crores during the previous year. It is, however, to be added that a large portion of the loans advanced were short-term (Rs. 182.82 crores); medium term loans at Rs. 19.93 crores were much below the expected level. The trend has been towards the elimination of smaller societies which could not sustain themselves. That is why the number of large agricultural credit societies actually decreased in a year from 8,023 to 7,943 on June 30, 1961. Their membership, however, increased from 30.25 lakhs to 33.20 lakhs, which is a measure of strength.

Non-agricultural credit societies comprising urban banks, employees credit societies and other credit societies also improved their working. Their number increased to 11,995 against 11,371 a year before. Co-operative sector continued to make progress in the field of actual productions, particularly in sugar. The number of co-operative sugar factories went up during the year to 66 as against 57 a year before. Comparatively speaking the number of active factories increased, but it is a serious gap; there were only 32 factories mentioned as active. The societies for the supply of sugar cane also increased in number. The number of weavers' societies increased too. It has been estimated that today the co-operative movement touches as large as 39 per cent of the Indian population. If only the machinery that executes them can be simplified and is more realistic, there is no reason why they don't progress still more rapidly.



Foreign Trade

INDO-U.K. TRADE

DURING 1962 it is quite likely that India will have a favourable balance of trade with the U.K. This is the conclusion that can be drawn from the figures for the first nine months ending September 1962, that are available now. During the previous two years 1960 and 1961, India has been having a deficit balance. Indian exports during 1961 were around £145 million, while imports were to the extent of £152 million. For the nine months January-September 1962, the exports total up to £95.8 million and the imports remain around £86.1 million. This favourable balance of trade is essentially the product of a lower overall trade level. During the first nine months of 1961, the total trade was of the order of £230 million and during the same period this year it was £192 million. There has, therefore, been a fall of more than 20 per cent. In fact the decline has been more marked in the case of imports from U.K. which were something 30 per cent lower. The fall in the exports from India was nearly of 10 per cent.

There were certain items which continued to figure prominently in the Indian import bill. This could be explained by the fact that Indian industry, or for that matter many other sectors of the economy, depend heavily on British-made capital goods. The import of machinery, therefore, remained nearly the single most important item: as much as £41 million worth of machinery was imported during the nine months of 1962 as against £43 million for the same period of 1961. There were many items like boilers, aircraft engines, electronic apparatus which recorded marginal increases. Then a substantial increase was witnessed in the case of textile machinery which perhaps can be explained by the licences granted recently to several textile mills to import machinery for renovation and expansion. If any substantial decline in this category was recorded, it was in the case of industrial trucks and tractors which were imported nearly half as much during the previous year. The import of chemicals remained at the last year's level at £7.10 million. The import of railway vehicles increased quite substantially and was nearly double the last year's figure. The import of aircraft and road vehicles on the other hand declined to a large extent.

As far as Indian exports were concerned, tea and tobacco did not fair well as compared to the previous year. In fact the same was the case with leather and leather manufactures as well as cotton yarn and other textile manufactures. The only item which recorded a substantial increase was oilseed cake and meal which earned over £10 million during the nine months as against £8 million earned during the same period of 1961. One single factor which has caused decline in the exports of jute goods has been the progressive dependence of consumers in the U.K. on the substitutes like paper bags, plastics and other packing materials.

Made in India by Cimmco in close collaboration with Messrs. Enshu of Japan-Manufacturers of world famous Sakamoto looms

Cimmco Sakamoto Automatic Looms are a vital necessity, for India's textile mills.

CIMMCO-Sakamoto looms are backed by a powerful loom-building tradition combining Cimmco's 18 years of experience with Enshu's 34 years. Sakamoto looms are used in more than 40 countries of the world, and over 60% of the automatic looms installed in India are of the Sakamoto type.

With a low initial investment Cimmco Sakamoto automatic looms produce a greater volume and variety of quality textiles at lower running costs than any other looms in the same range.

Paper has largely displaced gunny bags for the packing of cement in the U.K. The bulk handling methods have also changed to our disadvantage. As far as tea is concerned, Ceylon has continued to increase her share in the U.K. market though India's overall share remains the largest. As yet Great Britain has not joined the Common Market, so there is no particular reason why a substantial decline should have been recorded in many other items. It is time that proper attention is paid so that Indian commodities are not manoeuvred out of the British market.

Leather

GOOD DEMAND IN EUROPE

THE FEARS of the leather merchants were set at rest by Mr. Nagappa Chettiar, Vice-President of the Leather Export Promotion Council, who recently returned from a tour of the Soviet Union and Eastern and Western Europe. He said that there existed a wide scope for the export of our leather goods in those countries. The only thing that we have to do here is a definite reorientation in tanning and finishing methods. Since the demand patterns keep on changing, we will have to prepare from now on for a pattern of demand that would change from time to time and with individual buyers. It is also important that the Indian merchants should co-operate between themselves to keep down competition within reasonable proportions.

Another cause why Indian leather goods will have a great market in European countries is because of the fact that a European worker does not like to do work in a smelly part of curing and tanning leather. Although the market cannot be predicted because of the possibility of U.K. joining the Common Market and what further changes there might be brought about, yet it is felt that subsequent reductions ranging from 6 per cent to 15 per cent in duty on Indian goods would be brought about and that in itself would provide a sufficient encouragement for us to export. So that we may be able to capture the foreign markets, it is equally important for us that we must participate in the international trade fairs. It has been witnessed that in the international trade fairs our goods always commanded a great market.

Complaints have often been heard regarding the poor quality of leather goods supplied to the foreign markets. It is, therefore, important that we must concentrate our attention in producing the right quality of goods and not try to sell those goods the quality of which is below standards. Another member of the Export Promotion Council who also toured the European countries along with Mr. Chettiar, underlined that the European merchants went in for leather from other countries owing to cheaper rates offered. In view of this it becomes imperative that we should see that our goods are not priced out of those markets and we are able to stand competition effectively. No doubt these things have been said time and again, but they need to be reiterated on account of their importance. Surely leather goods will be needed increasingly for defence purposes. But this should only be at the cost of civilian consumption and not at the cost of exports which earn foreign exchange.

Tube Investments

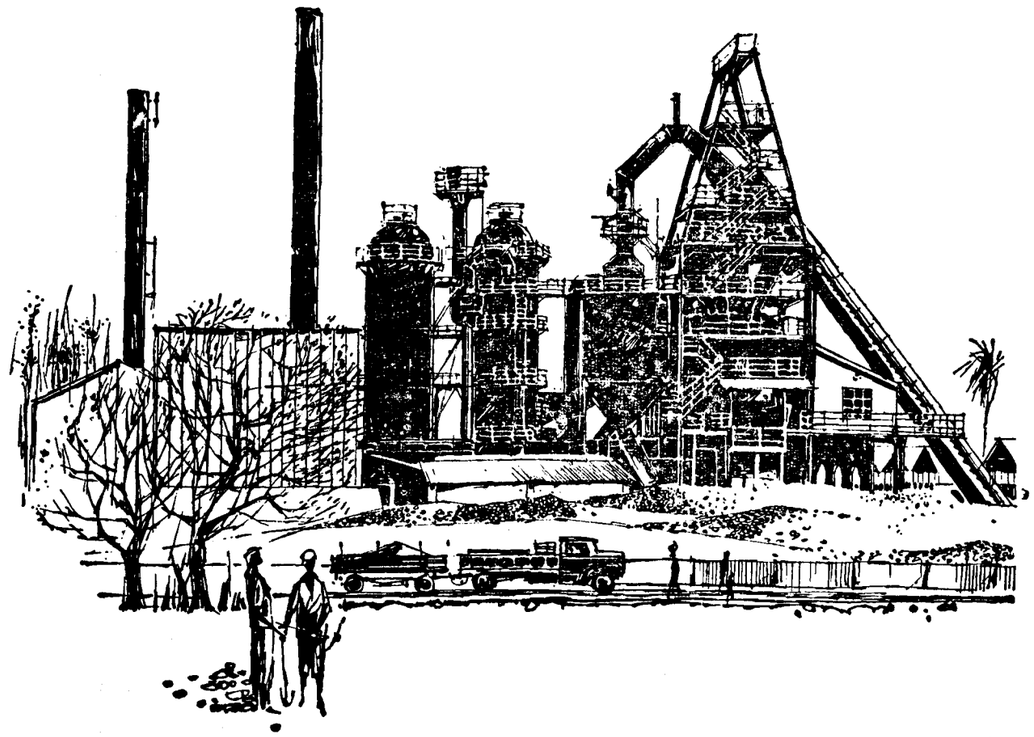
A REVIEW

RISING TO the occasion, the Tube Investments of India Ltd. have placed resources of its factories fully at the disposal of the Government of India meaning thereby that the Government can demand from these factories whatever it wants. In this context the cycle factory and in particular the tube factory need to be mentioned as they will produce such industrial products as may meet the defence requirements of India. In addition to contributing to the National Defence Fund, the Directors of the Tube Investments of India Ltd. have offered to give wholehearted support for the defence effort. This was revealed in a review of the company made by Sir A. Ramaswamy Mudaliar, its Chairman, speaking at the thirteenth annual general meeting of the shareholders on December 3, 1962.

So far as the progress of the company is concerned its record has been fairly progressive and it has taken place in spite of the shortage in raw materials. The raw material shortage has been mostly because of the import restrictions. It is heartening to note that the production of the cold rolling mill which has been installed at a cost of about Rs. 1.25 crores started satisfactorily in March 1962 and no teething troubles had to be faced. In the past the supply of indigenous hot rolled strip has not been adequate and promises made by the Indian suppliers have not been kept up. The Chairman, therefore, dwelt especially on this issue and opined that the products of this mill may particularly be useful at this present emergency period. He was also hopeful that there might be better co-ordination in the supply of such strip as may be required for variegated production which one may expect may be asked for by the Government.

So far as the industrial licence for the manufacture of copper-coated tubing called Bundy Tubing and push rods used for the automobile industry and refrigeration industries is concerned, it was revealed that the licence has been received. Details are now being finalised with Bundy Tubing of America and it is expected that a subsidiary company will soon be registered. The progress made in the two subsidiary companies, T. I. Diamond Chain Ltd., and T. I. Miller Ltd., has also been satisfactory. The operating results of the company on the whole have been quite good and it has been decided to pay the same rate of dividend to the shareholders as in the last year.

The relations between the employers and the employees have been to the satisfaction of both the parties and it goes to the credit of the management and the labour that successful achievement of the company in its various departments has been brought about. The company is in very capable hands and with the coming in of the new Chairman Lord Plowden, it is expected that a new dynamism will be imparted.



Chemicals

CHEMICAL POTENTIAL IN TIRUNEVELI

CONSIDERING THE industrial potentialities in the form of sea bittern and limestone available in Tirunelveli District, the Madras Small Industries Service Institute has, in its recent survey of the district, recommended the setting up of chemical units for production of potassium chloride, magnesium carbonate, anhydrous calcium sulphate and calcium carbonate. Since anhydrous calcium sulphate can be safely used as a cheap substitute for silica gel now being widely used in packing hydroscopic food products, pharmacenticals, drugs, instruments and machines, there is no reason why its use should not be increasingly resorted to, more so because of the large saving in cost ranging as much as from Rs. 4 to Rs. 6.50 per kgm.

The report states that about 4.6 lakh tons of sea bittern and about 60 million tons of limestone are available in the district. It further estimates the financial investment for a potassium chloride and magnesium sulphate plant with a daily capacity of three tons of potassium chloride and ten tons of epsom salt at about Rs. 7 lakhs with a possible return of about 48 per cent. Other estimates of investments given in the report relate to magnesium carbonate plant Rs. 2 lakhs, anhydrous calcium sulphate plant Rs. 50,000 and calcium carbonate plant Rs. 2.25 lakhs. The report states that rice bran, timber and other resources in the district warrant the starting of factories for manufacturing rice

KRUPP

Illustrated on this page is a low-shaft blast-furnace designed and built by Fried. Krupp Industriebau. Operating in Barbil (India), this unit is producing between 80 and 100 tons pig iron per day and is chiefly adapted for small-size, low-grade fuel unsuitable for use in the conventional blast-furnace process.

A World-wide Service to Industry

Exploration of mineral deposits, engineering of mining schemes.
Plants for the production of ferrous and non-ferrous metals.
Preparation and dressing plants for ore, coal and other minerals, chemical plants, cement plants, lime and gypsum plants.
Bridges and hydraulic structures.
Cranes for steelworks, ports and industrial purposes.
Castings, forgings, rolls, magnetic materials.
Cable making machinery.
Machinery for plastics, rubber and edible oil industry.
Can-making machinery.
Diesel and electric locomotives, special purpose wagons.
Giant excavators and bulk handling plants.

Wool DIGJAM

IMPORTANT ANNOUNCEMENT!

HELP US KEEP PRICES STABLE

✳ Wool is an essential commodity in the life of the Nation.

✳ Wool, in every form, is needed for our Jawans fighting on the borders.

✳ We need the cooperation of all our Agents and Stockists to sell our products only at the prices fixed by the Mills as per our printed price-list available with every dealer.

✳ Our customers are requested not to pay more.

✳ Prices in the printed list are inclusive of excise duty and all other levies.

✳ In view of the woollen goods required for the Defence, we request our patrons to purchase only the bare minimum during the present emergency period. This will help us to equip our Jawans quickly.

R. C. Birla

Chairman, Board of Directors
SHREE DIGVIJAYA WOOLLEN MILLS LTD.
JAMNAGAR

bran oil, shark liver oil and wooden bobbins, a boat building yard and a mobile timber sawing unit. About 2,000 tons of rice bran oil can be produced in the district.

Hotels

ASHOKA HOTEL'S YEAR OF SUCCESS

IF THE total income earned by any hotel is any criterion of success, Ashoka Hotel did quite well during the financial year 1961-62. Its income for the year at Rs. 104.2 lakhs was over 11 per cent more than the last year's income of Rs. 90.8 lakhs. The Directors report made available now substantiates this figure by the actual performance. For instance, the occupancy in the hotel continued to show an upward trend and the number of residents per day increased during the year under review to 367 as against 346 a year before and 305 a day during 1959-60. Taking into consideration the fact that April-September is usually a slack season for the hotels in Delhi, the average occupancy of 367 in a hotel with a capacity of 444 should be considered satisfactory.

During the first 2½ years of its working the hotel had recorded an actual loss of Rs. 55.76 lakhs but during the later two years it has been making profits which wiped out the losses. It is only during the year under review that the Ashoka Hotel earned a record profit of Rs. 33.42 lakhs out of which dividend have been proposed to be paid on A and B class preference shares. The hotel improved its position in another aspect also. The loan liability at the end of the year 1960-61 was around Rs. 87.5 lakhs. During the year under review the company paid to the Government on this account a sum of Rs. 37 lakhs. For 1962-63 again a sum of Rs. 11.5 lakhs has been paid so that the loan liability remained at only Rs. 39 lakhs. The directors expect positively better financial results in the coming years because of anticipated better occupancy and reduction in the loans.

TEXTILE MACHINERY IMPORTS UNDER YEN CREDIT

The Government of India, it is understood, has earmarked a sum of Rs. 4.76 crores ($10 million) out of the yen credit made available by the Japanese Government for the current financial year for the economic development of this country, for import of textile machinery. Of this, Rs. 4 crores worth of machinery is to be imported by the cotton textile industry, Rs. 20 lakhs worth by the art silk industry and Rs. 56 lakhs worth by the woollen industry. Essentiality certificates for the import of part of this machinery are said to have already been issued. Details about the rest are expected to be finalised soon. A Japanese delegation is expected here shortly to assess the future machinery requirements of the Indian textile industry.

(Continued from page 1067)

and of a "scientific scheme of management". It is open to question as to what extent it would be feasible to put this dictum into practice apart from the desire to have the best of the two systems, without losing the essential characteristics of any one. To be precise, if what he means by modern business-like mentality is profit-making, it is reasonable to argue how far it can be assiduously pursued in a Communist economy. What cannot be denied is that the declining trend in the Soviet industrial scene seems to have had a far-reaching impact. Official statistics in the Soviet Union over the last three years in particular have shown a slowing rate of expansion. The index of industrial production dropped to 9.2 per cent in 1961—the lowest since Mr. Khrushchev assumed power—from 10 per cent in 1960 and 11 per cent in 1959. This may have been partly due to the change of emphasis from the capital goods industries to consumer goods industries; in any case, the reappraisal in itself shows that the earlier dynamism of the Soviet economy is now showing signs of petering out.

FROM THE CAPITAL'S CORRIDORS

BOARD OF TRADE'S FIFTH MEETING

AT its fifth meeting held here last Saturday, the Board of Trade bestowed considerable thought on the likely impact of the present emergency on the country's exports and is understood to have reached a unanimous conclusion that in the context of the current emergency, it was of vital importance to step up exports to earn precious foreign exchange. The resilience of the economy and the increased production anticipated during the emergency period, it was felt, would adequately take care of the defence requirements and leave enough surpluses for export. Even if some restraint in terms of consumption of some commodities had to be resorted to, the Board felt that no objection could be taken to that.

The Board urged the industry to introduce diversification of manufacture for meeting the requirements of defence, civilian consumption as well as exports. It was recognised that some difficulties might be experienced in the transport sector, but efforts should be made, through a continuous vigilence, to ensure that transport bottlenecks did not hamper export trade.

While reviewing the recent trends in exports, on commodity-wise basis, the Board noted that even though export performance had not kept pace with the targets laid down in all the spheres, and although the emergency situation was likely to make the export task a little more difficult, there was no ground for any pessimism or alarm.

The Board took note of the fact that exports of various items such as steel and steel scrap, coffee, cotton textiles, hides and skins, ferro-manganese, cotton waste and fish and fish products, had been going down till lately, but in the case of a few items out of these (cotton textiles, for instance), exports had picked up a little during the past one or two months. To step up exports of items which had not shown any uptrend in the recent past, the Board formulated a number of measures. The Board felt that greater attention should be paid to exports of prime steel, steel structurals and fabrications which could be spared for exports, in view of the big fall that had been registered in the earnings from exports of pig iron as a sequel to the commissioning of the steel-making and rolling capacity in the new steel plants. To step up exports of coffee, the Board considered it desirable that facilities of artificial irrigation, which are at present being made available in tea-growing areas, should be provided in coffee-growing tracts too. As regards ferro-manganese, the Board was of the opinion that the possibilities of the demand for this commodity reviving in the world market being bright, the downward trend in its exports should reverse itself if concerted efforts were made. The need for reviewing at an early stage the export policy in respect of cotton waste was also stressed. In regard to fish and fish products exports, the Board noted that the meeting convened by the Ministry of Food and Agriculture with the Central Board of Fisheries would be taking place on December 12. The various problems of this industry, it was hoped, would be considered fully at this meeting.

The Board expressed satisfaction that exports of tea, jute, sugar, vegetable oils and oilcakes were showing good progress. Iron ore exports were thought to be making a steady headway, in spite of the difficulties of transport. But it was felt that these exports can be stepped up further substantially if rail transport facilities were good. Exports of cashewnuts, pepper, spices, cardamom, plastic goods, engineering goods and various other products, it was stated, had registered satisfactory progress.

Exports to Western Europe: Taking advantage of the presence at the meeting of the Indian Ambassador in Brussels, Mr. K. B. Lall, the Board reviewed the position of exports to West European countries. It was felt that positive efforts should be made by the industry and trade to develop the manufacture of goods for specifically meeting the requirements of the European countries. Over and above the normal flow of export trade to Western Europe, the Board felt that selected competent export firms should contact the important importers there for different commodities and some long-term arrangements should be made with such importing houses for the sale of Indian goods in this wide market. The Board also decided that a study should be undertaken to determine the pattern of utilisation of primary products, which were at present being exported to the European countries, in order to see that increasingly processed and manufactured goods were exported to these markets in preference to export of primary products.

The Board fully recognised the importance of a selective approach in the matter of encouraging exports so that expert assistance could be concentrated in order to produce maximum results with special reference to these sophisticated markets. In this connection, the Director of Foreign Trade in charge of the West European areas, would be undertaking suitable commodity studies and assisting the manufacturers and exporters in India to enter into suitable arrangements with the leading importers in the West European countries. Mr. K. B. Lall emphasised that only the question of competitive prices, as also the need for maintaining steady prices, should be pursued if a satisfactory expansion of Indian exports in these sophisticated markets was to be realised.

India Not a Low-Wage Country: The Board took note of the fact that there was a tendency in the industrialised countries to argue that processing and manufacture in under-developed countries were based on low labour costs. India, it was pointed out, had been telling the industrialised countries and the GATT that this argument was fallacious and that most of the developing countries were neither low-wage countries nor low-labour-cost countries. It was, therefore, decided to institute specific studies in relation to selected commodities to bring to the notice of the industrialised countries the obvious fact that the cost of production of many of the commodities and products in the developing countries, because of various historical and socio-economic reasons, was on the high side, and there was total absence of any sweated labour. The tariffs or quantitative restrictions placed on the entry of goods from under-developed countries into the markets of industrialised countries was, therefore, not justified on that ground.

Since the need for long-range solutions on cost reductions and quality maintenance had been accepted by the industry, the trade and the Government, the Board felt that much more work should be done in this direction on an immediate basis. The Board noted that the appointment of experts for cost reduction studies would be soon announced. It was also necessary that the Committee of the Board of Trade on "Export Sector" should identify individual areas and fields of export promotion and submit comprehensive interim reports on selected groups of industries in a phased manner to enable the implementation of these programmes.

World Trade Conference: The Board also noted that a World Trade Conference was being convened under the auspices of the United Nations for considering the trade and economic problems of the under-

developed countries regarding the flow of their trade into industrialised countries. As India was one of the main sponsors of this proposal, the Board decided to prepare a comprehensive study to place the Indian case and the case of the under-developed countries before the Conference. The Board appointed a Committee under the chairmanship of Mr. L. K. Jha, Secretary in the Union Ministry of Finance, to undertake these studies and submit a comprehensive report which could form the basis for representing India's specific points of view and the practical remedial measures which the under-developed countries would like to place before the World Trade Conference.

Fair Trade Practices: The report of the S. P. Jain Committee on fair trade practices was considered and fully accepted by the Board. The Board was glad to learn that the industry and trade in the country had already started taking steps in this direction on the initiative of the Federation of Indian Chambers of Commerce and Industry. The proposals for the display of price lists prominently, fixing of price tags on individual commodities, selection of 25 main commodities of daily consumption for this purpose and the covering of most of the urban areas with populations of over 50,000 in the first phase of this programme were considered satisfactory. It was decided that the Standing Committee of the Board of Trade on Fair Trade Practices would continue to watch the implementation of this programme and report periodically to the Board.

Free Trade Zones: The Board approved the approach and recommendations of the Committee on Free Trade Zones, headed by Dr. D. R. Gadgil. On the whole, the development of a few selected free trade zones, it was felt, would open up good possibilities of expanding India's export trade, particularly entrepot and processing trades. In view of the national emergency, the Board decided that the implementation of such a programme would have to wait for some time.

Shipping and Freight: Discussion on the problems of shipping and freight was continued at this meeting. Though the progress in the direction of liner trade was somewhat satisfactory, the Board felt that more attention should be paid to the development of bulk and tramp cargoes, and also to the liquid cargo to be carried in tankers. As the country had to undertake increasing exports of bulk cargoes, like iron ore, manganese ore, ferro-manganese, ilmenite, vegetable oils, liquid chemicals and also some import of various other liquid products (including crude oil), it was most essential that the Indian ships should carry the major portion of these cargoes. The Board constituted a small committee of experts which in co-operation with the State Trading Corporation, Ministry of Transport and Communications and the different shipping companies of India and the shippers' interests, would place before the Board an integrated programme containing recommendations on the steps to be taken for handling the bulk cargoes and for a programme of carrying these cargoes in Indian ships at least to the extent of 50 per cent. The Board was happy to note that the Conference Lines, in order to make the price of Indian goods competitive in the world market, had agreed to review, where necessary, the freight charges on the basis of the capacity of different commodities to bear such charges.

The sixth meeting of the Board will be held in Madras on January 19, 1963. The agenda will include consideration India's export trade on country-wise basis.

MR. HODGES ON EXPORTS

Mr. Luther H. Hodges, the US Secretary of Commerce, in a meeting with the representatives of the Federation of Indian Chambers of Commerce and Industry here last week, spelt out his basic philosophy of two-way travel, two-way investment and two-way trade. He felt that dramatic as industrial development has been in India, against a rural background, there was still great scope for all-round development. While the process of development was basically in the hands of the Indian authorities and the people, Mr. Hodges stated that American private enterprise and the US Government would be glad to extend such assistance as could be useful. The solution to the problem of export promotion, Mr. Hodges opined, lay in greater production at competitive prices. It is a matter, which Mr. Hodges felt, should be given the greatest priority by a country like India.

BURMA TO SUPPLY 225,000 TONS OF RICE

A Burmese Delegation led by Col. Chit Myaing, Member of the Revolutionary Council, arrived in New Delhi on November 24, 1962, and held discussions with representatives of the Government of India from November 25 to December 1, 1962. It was agreed that 225,000 tons of rice would be made available by Burma for export to India during 1963.

The representatives of the two Governments also considered the possibilities of a long-term trade agreement. Information about the commodities which either country can export to the other was exchanged. The talks will be concluded at Rangoon towards the middle of December when an Indian Trade Delegation is expected to visit Burma.

PRICE SUPPORT FOR RICE

Since zonal restrictions are in operation on the movement of rice within the country, the Union Ministry of Food and Agriculture has decided not to fix, for the current agricultural year, a uniform support or purchase price for this commodity as was done in the case of wheat. It has been decided to fix different purchase prices in the various regions, at which the State Governments will be prepared to buy any quantity of rice that is offered. Such prices are being worked out for various States and are likely to be announced shortly, along with the arrangements to be made for making the purchases.

It is believed that these steps would provide the paddy-growers an opportunity to get for their produce a price in reasonable relationship with the prices to be fixed for rice. If, however, it is not found to be so in any particular area, the State Government there will be asked to fix the corresponding price of paddy, which the rice mills will pay to the producers. The rice procured under this scheme is intended to be made available, to the extent required, to meet the local needs in the lean seasons; the balance would be placed at the disposal of the Central Government for meeting the emergency needs of the country and the requirements of the deficit areas.

The question of fixing a uniform minimum price for rice or different prices for various regions for the 1963-64 crop would be taken up in advance of the season. The Government hopes to make an announcement in this regard well before the sowing season begins.

COAL TRANSPORT

The Union Minister for Transport and Communications, Mr. Jagjiwan Ram, told the Informal Consultative Committee of Parliament attached to the Department of Transport, that the pilot scheme for movement of coal by road upto Makameh and then by river to Allahabad was expected to be launched towards the middle of this month. This pilot scheme is a part of the larger programme of harnessing inland waterways for the movement of coal in areas where there are terrible railway bottlenecks. It is intended to carry about 1,000 tons of coal per month under the pilot scheme whose first stage is estimated to cost Rs. 4.5 crores and involve conservency works, improvement of roads and purchase of craft and trucks.

Mr. Jagjiwan Ram also revealed at this meeting that the Union Government had decided to relax restrictions about permits in the case of trucks engaged for the purposes of defence and operating on inter-State roads. Motor vehicles transporting goods or personnel for defence, however, will have to carry a certificate signed by the District Magistrate or the Area Commanding Officer so as to entitle them for this exemption.

The Minister also declared that no difficulty would be allowed to stand in the way of movement of goods to and from Assam by road.

FOUNDRY/FORGE PLANT

Mr. Jan Rottenborn, Export Director of Skoda Works, Czechoslovakia, stated at a press conference here last week that the work on the Foundry/Forge Plant at Ranchi, being set up by the Heavy Engineering Corporation of India in collaboration with Czechoslovakia, was now in full swing. The initial difficulties had been fully overcome.

The initial production at this plant is expected to start in the second half of next year—more or less according to schedule. The plant will have a total capacity of producing 2,50,000 tons of castings, forgings and ingot rolls per year, to be achieved in three stages. So far as supply of machinery and construction is concerned, all the three stages are expected to be completed in about three years' time. The first two stages, which will prepare this project for producing heavier castings, will be running to their full capacity by the end of 1965.

The total cost of the machinery and equipment required for the project, including some machinery to be procured from indigenous sources during the third stage, is estimated in the neighbourhood of Rs. 25 crores. There is no technical fee involved, but the technicians to be loaned by the Czechoslovak company are to be paid for by the Government of India.

According to Mr. Rottenborn, this Foundry/Forge Plant will be the largest project of its kind in Asia and one of the largest complete plants ever exported by Czechoslovakia. It will supply castings and forgings to the Heavy Machinery Building Plant at Ranchi (being established in collaboration with the USSR) and the Heavy Machine Tools Plant, also at Ranchi (being built with collaboration from Czechoslovakia).

Paying a tribute to the Indian technicians and workers, Mr. Rottenborn observed: "The Indian technicians and workers have taken keen interest in getting all experience from their Czechoslovak co-operators and have shown unfathomable talent in mastering it in the shortest possible time. One of the most significant features is the working out of all working drawings and further designing by the Indian technicians themselves with the co-operation and advice of Czechoslovak experts, which should mean that in future the Indian friends would be able to plan and prepare any project of this kind on their own".

Skoda Works have over 100 years' tradition and reputation in the manufacture of machinery and equipment of varied types, including sugar mills, breweries, power stations, cement factories, rolling mills, foundries and forges, mining equipment, coal washeries, engineering plants, chemical plants etc. They have supplied nearly 500 complete plants to almost all the countries of the world. Apart from collaborating in setting up the Foundry/Forge Project and the Heavy Machine Tool Plant at Ranchi, they are co-operating with some Czechoslovak concerns for supplying machinery and equipment etc., for various other projects in India, including the Heavy Power Equipment Plant at Hyderabad.

COLLABORATION WITH FOREIGN FIRMS

The United Kingdom, the United States and West Germany have been in the forefront in extending collaboration in general and to the private sector in particular, for economic development of India. In 1959-60, as many as 171 collaboration arrangements were entered into by India. Out of these, 51 were with British companies, 27 with American enterprises and 29 with West German industrial units. In 1960-61, the number of collaboration arrangements entered into increased to 428. Of these, 137 were with the United Kingdom, 85 with West Germany and 69 with the United States. In 1961-62, the number of collaboration arrangements totalled 425. These included 129 collaboration arrangements with Britain, 97 with the United States and 62 with West Germany. During the first six months of the current financial year, 123 collaboration arrangements were finalised, Britain still retaining the lead with 31. Next came West Germany with 29 and then the United States with 16. During the past 3½ years, thus, India has entered into 1,147 collaboration arrangements with the friendly countries. As many as 348 of these have been with Britain, 209 with the United States and 205 with West Germany.

DEVELOPMENT OF MANGALORE PORT

The team of Italian and West German experts, which had been in India recently for conducting a survey in the Mysore State for the development of the Mangalore Port, is expected to submit to the Government of India shortly the blueprint for this development programme. The leader of the team, Dr. Paolo Tradardi, disclosed in New Delhi last week that the Mangalore Port after its development would be the most modern and well-equipped one in India. It would be capable of receiving 45,000-ton ships and will have a loading capacity of 4,000 tons per hour. It will compare favourably with the best ports in Africa, Brazil and Canada.

The project is likely to take at least four years for completion. The machinery and technical know-how will be provided by the West German and Italian manufacturers whom this experts team represented.

The railway authorities have also made a careful survey of the mining areas in the hinterland of this port with the purpose of laying a 200-kilometre track connecting Mangalore with Western Ghats.

NEW PILOT VESSELS FOR CALCUTTA PORT

A sum of Rs. 1.6 crores has been sanctioned by the Government of India for the purchase of two new pilot vessels by Calcutta Port. These vessels will replace the pilot vessels "Bengal" and "Hoogly".

The contract for the construction of the new vessels has been awarded to a British firm—Blith Dry Docks and Ship-Building Company.

WAR RISKS INSURANCE

A legislation is proposed to be introduced and enacted during the current session of Parliament in respect of insurance against war risks. The scheme drawn up in this regard covers industrial plants, both in the private and the public sectors, goods in stock and inland navigation. The risks will be covered all over the country.

The financial liability of this scheme, which is envisaged to be administered by a general insurance

subsidiary of the Life Insurance Corporation of India, will be that of the Government of India, upto the extent to which it cannot be covered by the premium income. The premium rates are expected to be different for the three types of property to be afforded cover.

CONTROL OF ENEMY FIRMS

The Defence of India Rules, 1962, have been amended to control enemy firms and prohibit trading with them.

The enemy, as defined by the Government notification, is any person or country committing external aggression against India or any individual resident in enemy territory or any person declared by the Central Government to be an enemy, etc.

According to the amended rules, the Government has assumed powers to appoint controllers, deputies or inspectors for enemy firms to prohibit trade with them, to inspect their books, to enter their premises, etc. No person is to pay or advance money, directly or indirectly, to them or to enter into any contract for their benefit.

A person will be considered to have traded with the enemy if he has had any commercial, financial or other dealings with such country or individual. Transactions on behalf of the Government or those already completed are exempted.

The Government is authorised to issue a "restriction order" to subject the business to such conditions as may be specified. A "winding-up order" can also be issued requiring the business to be wound up.

With a view to preventing the payment of money to an enemy firm and preserving enemy property, the Government is authorised to appoint a custodian of enemy property for India.

INDIA JOINS COFFEE AGREEMENT

India has joined the International Coffee Agreement and has been allotted an annual basic quota of 21,600 tons of coffee for export to member-countries. Since the countries of the East European bloc are not members of this agreement, India will be allowed to export any quantity of coffee to these countries in addition to the stipulated quota. Normally, India's exports of coffee amount to about 20,000 tons. The quota allotted under the ICA is, therefore, considered to be quite reasonable.

AGRICULTURAL REFINANCE CORPORATION

The Government of India intends to set up in the near future an Agricultural Refinance Corporation, mostly on the lines of its counterpart for industries.

The Corporation is likely to have an authorised capital of Rs. 25 crores and will be an affiliate of the Reserve Bank. It will help co-operative societies in launching programmes to boost the output of specific agricultural commodities.

If time permits, legislation to set up this Corporation will be considered during the current session of Parliament.

BAN ON FORWARD TRADING IN SHARES

With a view to prevent undesirable speculation, the Government of India has, with effect from November 29, 1962, banned forward trading in shares throughout the country. The existing contracts, entered into upto November 29 and remaining to be performed on that date, have been permitted to be liquidated in accordance with the rules, by-laws and regulations of the concerned stock exchanges.

NON - FERROUS METALS FUTURES ALSO BANNED

All forward trading in non-ferrous metals, namely, copper, zinc, lead and tin, has also been banned with effect from November 29, 1962, excluding, of course, the non-transferable specific delivery contracts. All the outstanding forward contracts in these metals have been ordered to be closed at the rates prevailing at the time at which forward markets in respective metals were closed on November 29.

AID FROM SWEDEN

An agreement has been signed between the Governments of India and Sweden under which the latter would be providing 8,000 tons of paper per annum for the next five years for production of text-books for the Indian school children. This assistance has been made available by the Swedish Government under the UNESCO Programme of helping spread of literacy in the under-developed countries.

IN BRIEF ...

Mr. Ambrose Congreve, head of the well-known firm of international consultants, contractors and engineers, Humphreys and Glasgow Limited, will be shortly visiting New Delhi for discussions with the Government of India and some leading industrialists for exploring possibilities of extending the services of this firm in this country. He arrived in Bombay a few days ago to review the progress made by his firm's Bombay branch which has on hand at present contracts valued at Rs. 8 crores, from various pharmaceutical manufacturers, included in which are Atul and Cibatul. Atul is setting up with assistance from Humphreys and Glasgow, a plant to manufacture dye-stuffs intermediates and allied products and Cibatul a plant to manufacture plastics and sulpha drugs.

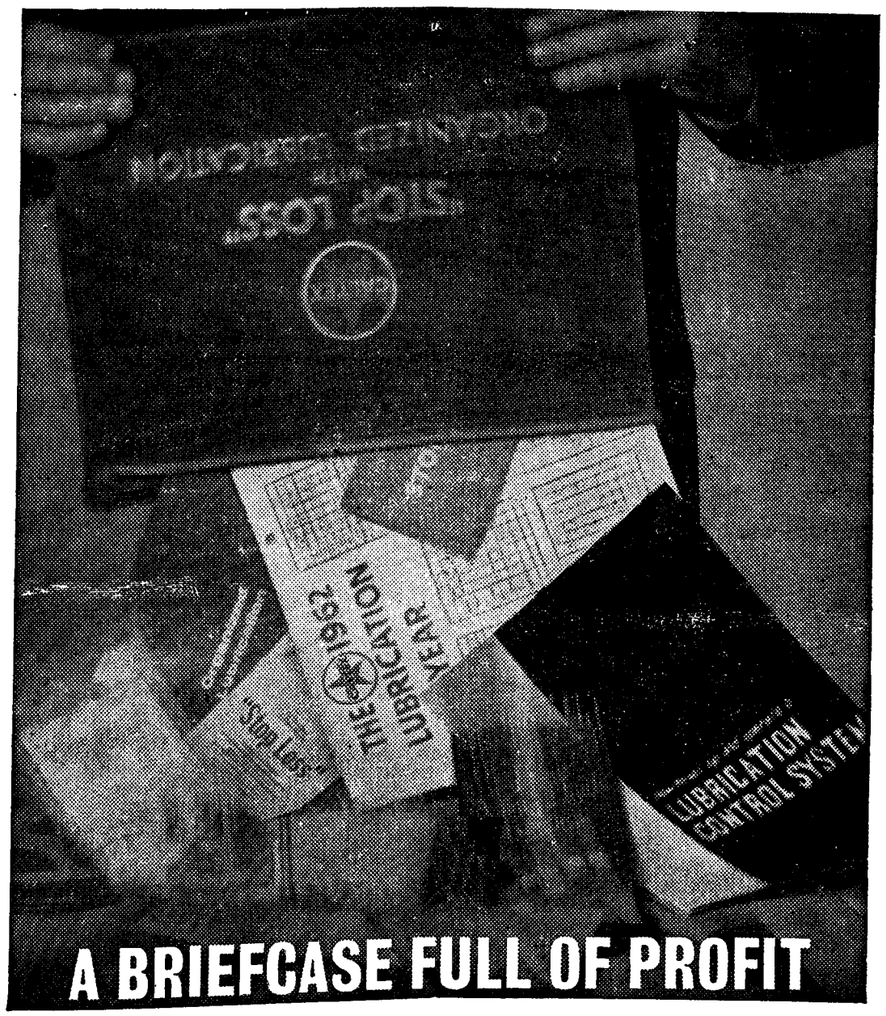
*

The all-India first estimate of mesta for 1962-63 shows that the area under this crop during the current year is nearly 55,000 acres or 7.8 per cent higher at 7,58,000 acres, compared to the corresponding estimate for 1961-62.

*

Cement has been declared an essential commodity under the Essential Commodities Act of 1955. Under the Cement (Quality Control) Order, 1962, the Government of India has prohibited manufacture or storage for sale or distribution of cement which is not in accordance with the relevant Indian Standards laid down for this commodity by the Indian Standards Institution.

*



The Union Government proposes to set up a Mineral and Metal Trading Corporation in the public sector.

*

The State Trading Corporation has acquired all the shares, totalling Rs. 12 lakhs, of the Indian Handicrafts Development Corporation. A new corporation, named the Handicrafts and Handloom Export Corporation of India Ltd., is being set up as a subsidiary to the STC. This organisation will take over the work of export of handicrafts and handloom products.

*

Mr. Ratanlal Kishorilal Malviya, at present Parliamentary Secretary to the Union Minister of Labour, Employment and Planning, has been appointed Deputy Minister of Labour and Employment.

A BRIEFCASE FULL OF PROFIT

For you...in the CALTEX "STOP-LOSS" Programme

Out of the Caltex Sales Engineer's briefcase comes a sheaf of ideas for cost control through organised lubrication—the Caltex "Stop-loss" Programme.

Start on the programme immediately. You will find that organised lubrication reduces losses in three important directions: production, maintenance and purchasing. The savings will go directly into profits —an average gain of upto 4% safely in the bag.

Ask your Caltex Sales Engineer for information

Company executives can obtain a free copy of this booklet by writing on their official letter-head to their nearest Caltex office.

The Indo-Japanese Prototype Production and Training Centre for small-scale industries at Howrah, West Bengal, was declared open on November 17.

*

The Union Government has decided to take over the Kolar Gold Mining Undertakings from the Mysore Government with effect from December 1.

*

The Punjab Government has constituted a 39-member board to examine problems facing the small-scale industry in the State.

*

The Export Promotion Council for Finished Leather will start functioning from Kanpur shortly.

*

The Union Government has decided to raise the age of retirement of Central Government employees from 55 to 58.

*

India can supply to the United States 20,332 short tons of sugar under the quotas announced for 1963.

*

The National Coal Development Corporation will shortly open a coal-mining project at Kathkona in Surguja district, Madhya Pradesh. The exploitation of the estimated reserves of 30 million tonnes, would cost over Rs. 2.6 crores.

*

The Overseas Communications Service has provided additional radio-telephone facilities to the United States, Australia, Japan and the Philippines.

*

Loading and unloading facilities at the Bombay Port will be considerably improved with the installation of a floating crane capable of lifting loads upto 125 tons. The crane has been designed by Indian engineers and built by a Japanese firm.

*

The Union Government has decided to set up an agricultural trading corporation with a view to exercising more effective control over the distribution and prices of both the internal and external markets.

*

The annual business turnover of the State Trading Corporation has increased from Rs. 10 crores in 1956-57 to Rs. 80 crores in 1961-62.

FOREIGN

The French Government has decided to grant a credit of $50 million to Syria for development projects, including a new international airport at Damascus.

*

An agreement has been signed in Ottawa providing for the supply of paper-making machinery worth $6.3 million from Canada to Pakistan.

*

The Spanish Government proposes to introduce a series of measures to liberalise her economy in an effort to speed up agricultural and industrial production .

*

The Allied Chemical Corporation, of USA, has entered into agreement with the Costa Rican Government and industrialists to set up an oil refinery at Puerto Limon at an estimated cost of $7.5 million. It will have a capacity of 3,000 barrels per day.

*

The British Air Ministry will study plans for the manufacture of super-bombers designed by Dr. Wallis, Chief of Aeronautical Research at Vickers. These bombers will have a speed of 15,000 miles and can fly at an altitude of 47 miles.

*

The South Korean Government has entered into a $16 million arrangement with the Fluor Corporation, USA, for the construction of an oil refinery with a capacity of 35,000 barrels per day.

*

A Japanese exhibition of modern electronics and laboratory equipment is scheduled to be held in Moscow from July 19 to August 1, 1963.

*

The University of Mainz, West Germany, has decided to establish an Institute of Medical Statistics and Documentation.

*

The Inter-American Development Bank and the International Finance Corporation will jointly contribute $19 million to the Compania Manufacturera de Papeles Y Cartones, S.A., of Chile, which has an expansion programme estimated to cost $31.5 million.

*

The United Nations Special Fund and the World Bank signed on November 16, an agreement covering $710,000 with the Government of El Salvador, Guatemala, Honduras, Nicaragua, and Panama, providing for a study of tele-communication needs in these countries.

*

The Government of Burma has banned all trade with South Africa from November 15.

*

The Shell B.P. Todd Oil Services have announced the discovery of natural gas reserves at Kapuni, New Zealand. It is estimated that production of natural gas at a daily rate of 60 million cubic feet will be possible.

*

The International Chamber of Commerce has urged banks throughout the world to adopt uniform custom and practice for documentary credits.

*

Trans World Airlines reports an increase of 44 per cent in its international cargo-ton-miles, 30 per cent in international economy travel, and 26 per cent in international revenue passenger-miles during October, compared to figures for the same period in 1961. The report attributes this remarkable progress to the reliability of schedules and the new terminal facilities, particularly the Trans World Flight Centre at New York.

COMPANY AFFAIRS

GREAT EASTERN SHIPPING

The Great Eastern Shipping Company Limited recorded an improvement in its working during the year to June 30, 1962. Against a net profit of Rs. 12.32 lakhs, after providing for fleet depreciation of Rs. 60.93 lakhs this year, the company had shown an actual loss of Rs. 3.19 lakhs during the previous year. The record would have been still better if the recommendations of the one-man Commission of Mr. R. G. Abbhi, on the basis of which the Government of India granted an increase of 15 per cent in coastal freight rate (excepting on the shipments of coal from Calcutta to destinations upto Cochin where the increase applied was 10 per cent), had come into effect earlier. Now these enhanced coastal freight rates came into effect on June 1, 1962, the last month of the financial year.

The annual report indicates that the average deadweight tanker under operation increased from 1.15 lakh tons to 1.17 lakh tons during the year under review. The two cargo ships ordered by the company from Japan were delivered in February 1962 and March 1962 respectively. The fleet and charter hire earnings during the year under review increased from Rs. 2.84 crores to Rs. 3.24 crores. The Directors of the company indicated that they have decided to operate cargo services on a regular basis from the West Coast of the U.S. and from Canada to India. The fleet of the company has been maintained in the highest class of Lloyd's. During the year old S.S. "Jagshanti", built in 1941, was sold to breakers. The Directors have also decided to discard and break up S.S. "Jag Mata" built twenty-two years ago.

The Directors have recommended the payment of a dividend at the rate of 10 per cent subject to tax on fully paid equity shares.

MORARJEE GOCULDAS

During the year to June 30, 1962, the Morarjee Goculdas Spinning and Weaving Company Limited, recorded a gross profit of Rs. 73.43 lakhs which was considerably more than last year's profit of Rs. 63.34 lakhs. Provision for depreciation and taxation is considerably higher than last year with the result that net profit is nearly at the last year's level. A sum of Rs. 8.25 lakhs has been transferred to General Reserve. The Directors have recommended the payment of a dividend at the rate of Rs. 6.43 per share subject to tax on 4½ per cent free of income tax Cumulative Preference Shares. The dividend on equity shares for the year under review has been proposed to be paid at the rate of Rs. 24 per share subject to tax which will absorb Rs. 12.42 lakhs.

The annual report reveals allocation of a huge sum on plant and machinery so that additions were made in that item to the extent of Rs. 51.25 lakhs. This, in a way, is a reflection of the fact that company is carrying through its programme of expansion to modernisation. Further orders on this score have been placed to the extent of nearly Rs. 60 lakhs and new machinery would be arriving soon. The company also purchased land, buildings, plant and machinery of the textile unit of B. R. Cotton Mills Limited at a price of Rs. 98 lakhs. The company has also taken over their stocks of cotton, stores and stores in process. The possession was taken over by the company on October 22, 1962. This mill is equipped with 49,312 spindles and 1,021 looms and also has a dye house. The company has also received a sanction for the installation of 22,800 spindles for balancing process out of which 3,392 spindles have already been received and installed and the remaining are on order. The company has received recently the sanction for the installation of 12,817 spindles orders for which will be placed very shortly.

PARKSIDE ESTATE

A peak level of output was achieved by the Parkside (Neilgherry Hills) Estate Company Limited during the year to June 30, 1962. This year's crop at 9.09 lakh lbs. was nearly 7 per cent more than last year's output of 8.46 lakh lbs., which again was the maximum during the last decade. The average sale price was also substantially higher. The result, therefore, has been that the company has shown very flattering results. Profit at Rs. 9.73 lakhs was the highest in history. After providing Rs. 4.55 lakhs for taxation, the Directors proposed the payment of a dividend at the rate of 27½ per cent on equity shares. 7½ per cent dividend was paid on interim basis on May 1, 1962 and remaining 20 per cent is proposed to be paid now. This provision compares quite favourably with last year's dividend of 22½ per cent.

The estimated cost of production per lb. of tea for the financial year under review was Rs. 1.33 against the estimate of Rs. 1.47 a year before. The lower cost of production is mainly due to higher crop harvest. The average sale price realised in the season improved to Rs. 2.92 per lb. against Rs. 2.68 per lb. realised last year. The company executed certain important improvements and the capital expenditure incurred was to the extent of Rs. 1.03 lakhs.

NEW ISSUES

Three companies including a new one have been authorised to issue capital totalling Rs. 1 crore. A fourth company has been conditionally allowed to postpone the date of redemption of its debenture.

Tata-Finlay Private Limited, Bombay, is to issue capital of Rs. 50 lakhs divided into 50,000 equity shares of Rs. 100 each for cash at par. Out of this shares of the value of Rs. 24.50 lakhs will be issued to James Finlay and Company Limited of U.K. and their associates. The consent is valid for 12 months.

Elect-O-Mech. Limited, Bombay, a new company, is raising capital of Rs. 35 lakhs in equity shares of Rs. 10 each for cash at par. The proceeds of the issue would be utilised for the manufacture of electrically operated hoists, battery/diesel operated industrial trucks, geared motors and spare parts, etc. The consent is valid for 12 months.

Bharat Fertiliser Industries (Private) Limited, Bombay, proposed to be converted into a public limited company, has been allowed to issue capital of Rs. 15 lakhs divided into 15,000 equity shares of Rs. 100 each, for cash at par. The consent order is valid upto September 16, 1963.

Shree Madhusudan Mills Limited, Calcutta, has been granted consent to the postponement of the date of redemption of its debenture issued in 1957 upto 1972. This is subject to the conditions, among others that any debenture holder who expresses his disagreement to the postponement shall be paid in cash.

Company Meeting

TUBE INVESTMENTS OF INDIA LIMITED

Chairman's Review

Speaking at the Thirteenth Annual General Meeting of the Shareholders held on December 3, 1962 at the Registered Office of the Company at 52/53, Jehangir Street, Madras, the Chairman, Sir A. Ramaswami Mudaliar, K.C.S.I., D.C.L. (Oxon), said:

Gentlemen,

I extend to you a cordial welcome to the Thirteenth Annual General Meeting of the shareholders of Tube Investments of India Limited. The Directors' Report, the Audited Balance Sheet and Profit and Loss Account for the year ended 31st July, 1962, have been in your hands for some time and with your permission I shall take them as read.

Before dealing with the work of the Company during the year, I feel I must refer to the emergency that has been declared in the Country following the aggression by China on India's borders. The whole Country has been shaken out of its complacency. The Country has realised that every effort must be made by all sections of the people and by every interest concerned, to preserve the independence and safeguard the integrity of the Country. The enthusiastic response that the Country has witnessed, the solid and massive support that has been given to the Government enjoining on themselves to fight till the finish, till the enemy is cleared out of Indian soil, has been a manifestation of the great unity of purpose in the Country and of the determination of the people. Your Company has already contributed its mite to the National Defence Fund and I am sure, with your full approval, it will continue to do whatever is necessary in this direction. Our officers and staff and our workers in the factories have shown an equal determination to help in this emergency. Above all, realising that the demands of war, while requiring sacrifices from everyone, casts a special obligation on industrial units and factories, your Directors, anticipating your desire in the matter, have placed the resources of your factories fully at the disposal of whatever the Government choose to demand from them. The cycle factory and in particular the tube factory may be called upon and will be most readily anxious to produce such industrial products as may supplement the defence requirements of India. I am certain I am voicing the wishes of all shareholders and the sentiments that they hold in this regard.

The Report of the Directors gives a fairly comprehensive view of the progress in manufacture that has been made during the year and refers to the setbacks we had in reaching our target—setbacks due to want of power, want of adequate water supply during certain months of the year and to the inadequacy of certain raw materials due to import restrictions. Taking all these factors into account, the financial results are fairly satisfactory.

COLD ROLL MILL: It will be heartening to you if I state that the production of cold roll mill which has been installed at a cost of about Rs. 1.25 crores was started satisfactorily in March, 1962 and that we have had no teething troubles and no serious difficulty in regard to the technique of the production. However, the supply of indigenous hot rolled strip has not been adequate and promises made by the Indian suppliers have not been kept up. The products of this Mill may particularly be useful at this present emergency period and I look forward to better co-ordination in the supply of such strip as may be required for the variegated production which one may expect may be asked for by the Government.

The Directors' Report refers to the industrial licence for the manufacture of copper-coated tubing, called "Bundy Tubing" and push rods used for the automobile industry and refrigeration industries. Since the Directors' Report was issued to you, the industrial licence for the manufacture of "Bundy Tubing" has been received. I may explain that the "Bundy Tubing" is double walled steel tubing manufactured from copper-coated steel strips by what is known as the "Bundy Process". The raw material required for this purpose is mainly copper-coated and tin-coated steel strips which, it is hoped, will be indigenously available before long, when the increased demand for such strip will make indigenous production economical. Until then the strip will have to be imported. Your Directors are now finalising details with Bundy Tubing of America and soon hope to have a subsidiary Company registered.

SUBSIDIARY COMPANIES: The progress made in the two subsidiary Companies, T. I. Diamond Chain Ltd., and T. I. Miller Ltd., has been adequately described in the Directors' Report and I need not add anything further to this.

OPERATING RESULTS: As I have already stated, the operating results of the Company have proved to be fairly satisfactory and the Directors, following their cautious policy, have decided that the same rate of dividend may be paid to the shareholders, transferring certain amounts to the various reserves.

BOARD OF DIRECTORS: You will notice from the Agenda that Sir Ivan Arthur Rice Stedeford, G.B.E., who is one of the founders of this Company is due to be re-elected this year. Sir Ivan has expressed a desire that he may retire as he will shortly cease to be the Chairman of Tube Investments Ltd., of Birmingham, but will hold the position of President of all the group of Companies. The Rt. Hon. The Lord Plowden, K.C.B., K.B.E., who will succeed him as Chairman will naturally be elected as one of your Directors representing Tube Investments Ltd., of Birmingham. I have no doubt he, with his wide experience both as an administrator and an industrialist, will be an invaluable asset to the Company. The Indian Directors were reluctant to part with Sir I. A. R. Stedeford on the Board. His sympathy, advice and guidance have been, in an exceptional measure, of help and value to the Company and to the Indian Directors. The Lord Plowden has been to India recently and the Indian Directors are glad to have him on the Board. We, however, hoped that both Sir I. A. R. Stedeford and The Rt. Hon. The Lord Plowden would continue as Directors though the former would not be as closely associated as before. I am glad to inform you that our request has been acceded to by Sir I.A.R. Stedeford and you will, therefore, be requested to elect both Sir Ivan Arthur Rice Stedeford and The Rt. Hon. The Lord Plowden to the Board of Directors. This would necessitate an increase in the Indian Directorate and you are being requested to elect Mr. D. K. V. Raghava Varma, as one of the Indian Directors. Mr. Varma has been the Secretary of the Company for several years now. His integrity, his personal character and his devotion to duty have shown themselves in several ways in the management of the Company's affairs and your Directors have, therefore, come to the

(Continued on Page 1104)

(Continued from Page 1103)

conclusion that it would be most appropriate if he were elected as a Director of the Company. Mr. Raghava Varma, whom I have personally known for over forty years, has, I am glad to say, consented to be a Director of the Company.

I should like to record my deep thanks and appreciation for the ready help and valuable advice that the Company has continued to receive from our Associates, Messrs. Tube Investments Ltd., of the United Kingdom and other companies in their group. The new foreign collaborators of our subsidiary Companies have given us their best advice and placed their technical know-how at the disposal of our factory without reserve. We are grateful to the Government of India and to the State Government of Madras, for the interest they have shown in the development of the Company, the facilities they have extended and the advice that they have given in its expansion programme.

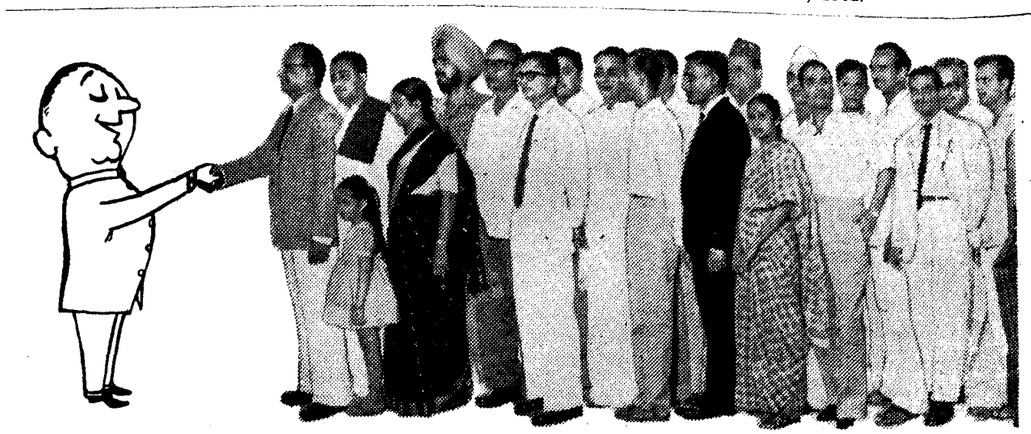
Our relations with all our employees including factory workers have been cordial and I have great pleasure in acknowledging with thanks the co-operation that they have extended and the enthusiasm they have shown in the successful working of the factories. The officers and staff both in the head office and in the factories and the workers in all our factories have been exceptionally enthusiastic in placing their full co-operation and support in this emergency and we are deeply grateful to them for their patriotic response.

I hope and pray that by the time we next meet at an Annual Meeting, the war clouds would have disappeared and the cunning of a treacherous and unscrupulous enemy would not only be exposed but equally frustrated and punished and India will once again be in a position to enjoy peace and happiness.

NOTE : This does not purport to be a record of the proceedings of the Annual General Meeting.

THE CALCUTTA ELECTRIC SUPPLY CORPORATION LIMITED

(Incorporated in England)



5½ RUPEE DEBENTURE STOCK, 1970
INTEREST FOR THE HALF-YEAR ENDING 31ST DECEMBER, 1962

Notice is hereby given that interest at the rate of Rs. 25 (less Indian Income Tax) per Rs. 1,000 of Stock will be paid on 1st January, 1963 to Debenture Stockholders registered in the books of the Company on 20th December, 1962. Applications for transfers received at the Company's Office at Victoria House, Post Box 304, Chowringhee Sq., Calcutta, upto 20th December, 1962, will, if otherwise satisfactory, be registered at that date for the purpose of participation in the above interest.

Debenture Stock Transfer Books will be closed from 21st December, 1962 to 31st December, 1962, both days inclusive.

By Order of the Board,
H. C. BOWKER
AGENT.

Victoria House,
Calcutta, 28th November, 1962.

WE WISH TO SHAKE HANDS WITH A MILLION PEOPLE

THIS YEAR, the Indian Overseas Bank completes twentyfive years of its service to the people. We feel so proud about it that we wish we could shake hands with everyone of our customers and well-wishers, here in India and abroad, whose understanding and support made it possible for us to grow.

The success of a Bank depends essentially on the confidence of the people—confidence in its stability and in its efficiency. The growth of the I.O.B. is a measure of the confidence it has been able to create in the minds of the people. Founded in 1937 by the late Mr. M. Ct. M Chidambaram Chettyar, the Bank has today grown into a mighty institution and is known throughout India, Burma, Ceylon, Hong Kong, Malaya, Singapore, Thailand and the rest of the world for its friendly service.

It was our earlier intention to celebrate this happy occasion in a fitting manner at each of our major branches in India and South-east Asia. Since then, India has had to face one of the greatest challenges in its recent history. We have, therefore, decided to cancel the formal celebration of this event, however important it be, and instead extend our fullest support to the mobilisation of the country's resources in this hour of emergency.

On this occasion of our Silver Jubilee we wish to say how deeply we appreciate the co-operation and support that we have throughout received from our clients and correspondents everywhere. We owe them a deep debt of gratitude and we rededicate ourselves to the ideal of greater service.

25 *Years of Friendly Service*

INDUSTRIAL **IBCON** CONSULTANTS

The industrial consultancy services offered by the group fall under the following headings:-

IN THE PLANT—

PLANT CAPACITY AND LAY-OUTS • PRODUCTION PLANNING AND CONTROL
STORES ORGANISATION • CONSUMABLE STORES CONTROL
RAW MATERIALS CONTROL • FUEL AND STEAM UTILISATION
TRANSPORTATION METHODS • MECHANICAL HANDLING
PRODUCT QUALITY CONTROL • OPERATIONAL RESEARCH
WORK STUDY • BUDGETARY CONTROLS
VALUATION OF PLANT & BUILDINGS
DESIGN AND ESTIMATES OF EXTENSIONS

ON LABOUR—

METHOD AND WORK STUDY • PRODUCTIVITY INDICES
TIMEKEEPING SYSTEMS • WAGE PAYMENT SYSTEMS
JOB EVALUATION • WAGE STRUCTURES
PERSONNEL RECORDS • LABOUR POLICIES
HUMAN RELATIONS • COMMUNICATION
REORIENTATION LECTURES • FOR LABOUR AND SUPERVISION

IN OFFICES—

MANAGEMENT ORGANISATION • EXECUTIVE LEVEL WORK
CLERICAL PROCEDURE • MANAGEMENT CONTROLS
WORK MEASUREMENT • BUDGET FORECASTS
LAYOUT, COMMUNICATIONS AND EQUIPMENT

AND

THE SETTING UP AND TRAINING OF THE CLIENT'S OWN INDUSTRIAL ENGINEERING DEPARTMENT

MARKET RESEARCH

PLANNING FOR MODERNISATION AND EXPANSION OF INDUSTRIES

TECHNOLOGICAL STUDIES IN RAW MATERIALS, PROCESS AND PLANT PERFORMANCE

Colombo: The First Round

NO judgment of a final nature can be formed about the achievement of the conference of the six non-aligned Afro-Asian powers at Colombo for the obvious reason that there is no basis available at this stage on which it can be attempted. The communique, nevertheless, gives the encouraging assurance that the mediating powers have desisted from resting content with a platitudinous appeal to India and China to undertake peaceful negotiations. They mean to place their good offices at the disposal of the two parties to bring them together for rapprochement. They are aware that matters have been aggravated and pushed to such an extent and the area of divergence between the two has been so grossly enlarged that efforts on their part to touch the heart of the issue of a solution of the conflict even in a remote manner would amount to making a beginning at the wrong end.

It was not expected of the mediators that they would fix responsibility for the conflict. But their embarrassment is apparent from the fact that even in keeping to the fringe of the problem, they had to summon great effort to preserve unanimity. The UAR has made no secret of its conviction and forthright attitude that India has gone a reasonable way in agreeing to accept the position of September 8, 1962. But the rest are obviously keen on steering a cautious neutralist course. However, they seem determined to maintain optimism about their mission of mediation and persevere in functioning on a continuing bas's by holding more meetings at appropriate occasions to strive for progressive success. This would only imply that the attitude of the Colombo powers would be one of hesitant caution and their labours would be modestly conceived.

The approach of the mediators is to delimit the cease-fire line. Normally, when fighting is stopped to negotiate a peaceful settlement, the line of cease-fire presents little difficulty since it is bilaterally agreed. But in this unilaterally announced cease-fire, the dogma of the line of actual control has introduced a highly complex element of controversy in place of the possibility of ready concurrence. It is, therefore, to the task of "consolidating" the cease-fire that the mediating powers are said to have addressed themselves. The nature and alignment of this "consolidation" have been kept a closely guarded secret, lest disclosure prior to consultation with the parties might seriously mar the chance of the success of the mission or render adjustments well-nigh impossible. But it goes without saying that any proposals in this behalf ought to meet the viewpoints of each party in an equitable manner without discrimination, if an acceptable basis for talks with honour is to be evolved. Has unanimity, or rather compromise, fulfilled this test? Apparently, hardly so.

Available indications show that the Colombo formula, tentative as it is, seeks to maintain the *status quo* in Ladakh, leaving China in possession of the territory recently occupied by her and asking India not to advance. In the middle sector the situation is vague. The insistence seems to be again on the *status quo*. In the eastern sector the position is to revert to what it was on September 8 last, India being free to occupy the territory up to the limit roughly corresponding to the McMahon Line. But there is vagueness here too. The position as regards Longju and Dhola is anything but clear, while still more vagueness surrounds the control of the Walong area. Is consolidation of the cease-fire line on this basis devised with reference to the root of the conflict in Ladakh?

Whether there are variations from this version in the formula unanimously hammered out by the mediators by means of a compromise, no one outside can venture to affirm. But to accept the proposition that the consolidation of the cease-fire as thus suggested deals fairly and properly with this limited issue is to ignore at least some vital issues of permanent interest to all the countries that may be similarly situated at any time in the future. As non-aligned nations, upholding peaceful methods to solve international disputes, the Colombo powers were expected to take the attitude that aggression cannot be acquiesced in. The opposition to the UAR's move to restore the position of September 8 last, as an indication that the gains of aggression cannot be endorsed, was reportedly led by Burma. Did China's menacing statement on the eve of the conference influence the anxiety of the mediators to reach a compromise in the form that has emerged?

The proposals are to be tendered to the two parties and to be recast, if necessary, in the light of their response. Mrs. Bandaranaike has been entrusted with the diplomatic assignment of explaining to the Prime Ministers of the two countries the mediators' background deliberations to seek their acceptance or to adduce from them their suggestions for modifications. India can convince her why the formula ought not to lean on the side of the Chinese claims as it tends to do now.

Faith in the earnestness of the mediators' self-imposed task demands that a fair chance should be offered to them. Since India has made her goal in this conflict clear and declared her determination to vindicate her territorial integrity, weakness cannot be attributed to her in showing willingness to accept proposals for giving a chance to peaceful negotiations. No loss of dignity is involved here and there can be no implication of compromise of the national interest by agreeing to the talks for a settlement, unless, of course, the terms are varied to her detriment. A rigid posture by us, while the aggressor makes a show of flexibility, may land us in a diplomatic lapse. And we have not proved that we can match our opponent at this strategic level .

The Debate on Emergency Powers

THE tone of the debate on the Defence of India Bill in the Rajya Sabha could not but produce the dominant impression that several participants tended to look upon it as a piece of a highly controversial legislation. Perhaps the purpose of the Bill and the extraordinary situation which it is intended to meet were not as fully kept in view as they ought to have been. There is another aspect to the background against which the debate on the Bill may be assessed. The original Ordinance and the subsequent Bill were hastily drafted and undoubtedly they erred on the side of too drastic provisions in several places. But, in the course of the passage of the Bill in the Lok Sabha, quite a large number of amendments were incorporated by the Law Minister who piloted the Bill and the severity of the provisions was ironed out. When the Bill, therefore, came up for discussion before the Rajya Sabha, there was hardly anything exceptionable in its character as an emergency measure. Even so, an unusually large number of amendments, one and a half times as many as the Clauses in the Bill, were moved in the Upper House. A majority of these 77 amendments were tabled on behalf of the Communist Party. The entire lot was finally thrown out.

Mr. Lal Bahadur Shastri was responsive to valid criticism. The assurances which he gave in the course of his reply to the debate went to meet the really outstanding demands raised in both the Houses. Easily, the greatest concession which Mr. Shastri made was to agree to the appointment of a compact special committee to review the working of the Defence of India Act in operation after a sufficient period of initial trial. The committee is expected to function in a business-like manner to watch the progress of this emergency legislation to safeguard against any excesses in its enforcement. Another noteworthy concession he made was about the composition of the special tribunals invested with extraordinary powers that do not belong to the normal courts of law. A persistent demand was made that High Court Judges should be appointed to these tribunals. Mr. Shastri promised the House to consider this counsel of caution after a reasonable period to tone up, if need be, the actual functioning of the tribunals.

Another pertinent criticism related to the right of criticism of the Government, in particular of the State Governments to whom the responsibility for administering most of the provisions of the Defence of India Bill has been delegated. Provisions for special powers, likely to impinge on the right of free expression of opinion, are inescapable in an emergency legislation. But the intention of the Government cannot be presumed to be to suppress the exercise of expression of responsible opinion or to stifle reasonable criticism. Criticism which tends to undermine the solidarity of the nation or results in creating a mood of defeatism alone is likely to come within the clutches of executive action. Experience since the introduction of the original Ordinance has shown that the right of criticism has not been abrogated but carefully preserved within the limits permissible under the exigencies of the situation.

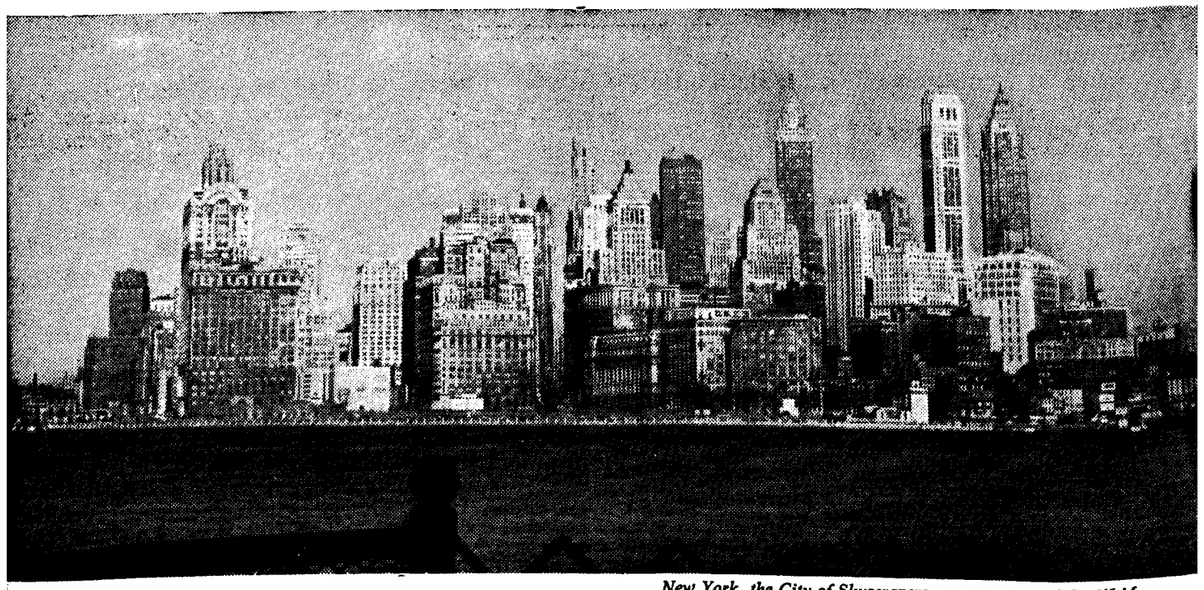
It was astonishing that the provisions relating to preventive detention should come in for severe and elaborate criticism in the course of the debate. The normal provisions obtaining under the Preventive Detention Act have been suspended precisely because subversive elements need to be clamped in an emergency to prevent any activities calculated to undermine the security of the State. The demand made for disclosure of the grounds of detention and review of individual cases by a Board are understandable in normal times, but they cannot be pressed during the emergency. Mr. Bhupesh Gupta seemed much obsessed with the purpose and consequences of this particular provision. He went to the extreme length of branding it as an instrument of oppression. His grievance was about a crusade having been launched under this special power against the Communist Party of India and he made the specific charge that mass arrests of its members were carried out which paralysed the party, in spite of its official policy to fight the Chinese aggression.

A plausible argument of such a variety can deceive none. Subversive elements have been dealt with under preventive detention on the individual basis and, if a majority of them belong to the CPI, it speaks for the utter vacillation of the leadership to set its house in order. The kind of intolerable propaganda which its pro-Chinese section carried out with a zest is clear from the calculated attempts to hold out the forces of aggression as the forces of liberation. If this rebel section of the CPI refused to give up its recalcitrance, the plain course for the Party Executive was their expulsion which it did not dare adopt. The paralysis of which Mr. Gupta speaks bears out the effective influence of this group in several parts of the country, if not everywhere. To water down the provision of preventive detention is to give a lease to subversive elements to undermine the security and integrity of the State.

The Age Pattern of Company Directors

SOCIOLOGISTS in this country have always been intrigued in regard to the background information of the leaders in industry and trade. They have wondered whether the expansion in industry, commerce and trade has been brought about by old and experienced brains or by young and enthusiastic entrepreneurs. They have also not been very sure whether a competent and successful industrialist or business man emerges from the field of business, law, accountancy or a similar profession. Answers to these queries are attempted by the Research and Statistics Division of the Department of Company Law Administration in a recent study in regard to the company directorships of big-sized firms. This survey of the directors of leading companies throws light, among others, on the age pattern of the directors and also illustrates their technical background.

The statistics collected by the Department relate to 1,320 directors out of which 1,110 are Indian directors and 210 are foreign directors. The average age of the Indian directors, according to this survey, turns out to be slightly higher than that of the foreign directors. The Indian directors' average age is placed at 48 years and 2 months as against the foreigners' average age of 47 years and 1 month. The marginal increase of the Indian directors' age is, however, of not much significance indicating that, on the average, the age pattern of the Indian directors closely follows that of the foreign directors in this country. It is, however, revealing that the proportion of foreign directors above the age of 60 is very small as compared to the corresponding ratio for Indian directors. The foreign directors in Indian companies above the age of 60 constitute 11.5 per cent of the total, while the Indian directors in Indian companies constitute nearly double that percentage at 22.9 per cent. Again, at the lower end, the percentage of Indian directors below the age of 40 is slightly higher than that of the foreign directors in Indian companies; the percentage of Indian directors in Indian companies under the age of 40 is 26.1 as against the percentage of foreign directors in Indian companies at 21.4 per cent. Thus, at both the extremes, the Indian companies offer a unique age pattern of the directors.



At the upper end, the proportion of older people is large; similarly at the lower end, the proportion of the younger people is also large. Consequently, Indian companies have utilised the mature experience of the older directors and have also offered opportunities to the younger generation to shoulder the new responsibilities. According to the current trend, it is believed that the new pressure will be shouldered by the younger generation and, therefore, the proportion of older people is likely to decline. The Indian Companies Act prescribes the maximum age of the director at 65 years. That in itself shows that the Government places a cautious premium on age in the administration of industry, commerce and trade. It is true that the experience of the older people should be made adequate use of, but in the changing world of today, the younger generation has to shoulder much greater responsibility because of the complexities in the techniques of production as well as management. The outgoing generation is likely to falter under the challenge of new and dynamic patterns of management which are unfolding themselves.

Another interesting comparison made in the survey relates to the age pattern of directors in Indian companies with their counterparts in the United States of America and the United Kingdom. American directors are overwhelmingly above the age of 60; nearly 63 per cent of all American directors are older people having enjoyed 60 summers or more. The corresponding percentage of British directors is only 30. At the lower end again, the figures thrown up by the British and American companies make very interesting reading. In America, to be young is a disqualification for holding the directorship of a company because not more than one per cent of the American directors are below the age of 40. The corresponding percentage for British directors is 9. It is noteworthy that while foreign directors below the age of 40 in Indian companies constituted nearly 21.4 per cent of the total, the British directors in their own country were placed at about 9 per cent. To a certain extent, to be young is again a disqualification in Britain. The disparity is possibly explained by the pressure at home and the demand abroad for managerial talent. In this comparison India comes out with a vigour showing more confidence in its younger people. It is also true that the acceleration of industrial expansion has made recourse to the younger element inevitable.

The overall explanation offered by the Research and Statistics Division of the Department of Company Law Administration in regard to this wide divergence is that "the higher average age in the case of American directors is mainly accounted for by the fact that the administrative structure in American corporations is very different from that of the Indian or British companies. The board of directors of American corporations tends, more often, to be a supervisory body of elderly statesmen of industries including bankers with representatives of leading stockholding families, while the boards of directors in the U.K. and India tend to be more often an active policy-making body."

For an accurate analysis of the occupational pattern of directors in Indian companies, it is necessary to conduct a comprehensive research. With the limited information available with the Department, the study under discussion threw some light on the occupational distribution of the company directors. By and large, the directors in Indian companies had business background while accountants, lawyers, technical men and administrators constituted nearly one-fourth of the total. Out of 1502 directors who constituted the sample for the survey, 116 belonged to services of specialized and technical nature, 173 came from services of administrative and executive nature and 103 from established professions such as accountancy and legal practice. The remaining 1,110 directors had no technical qualification except that they or their families had been in business — in some cases extending over decades. The preponderance of business men as directors is a legacy of the past because the industrialists of today had nearly 25 to 30 years ago strong moorings in business. It is only when they saw the dominating and prosperous character of British companies that they turned their attention to industry and in the process changed over from the family-business-type-organisation to the corporate, shareholders' pattern. It is, however, reassuring to note that the business families are taking into their fold some technical people as well, who have the capacity to face the new complexities of law, accountancy and production techniques.

While the age pattern of the directors in Indian companies shows a healthy trend, the occupational pattern of the directors needs much to be desired. The hold of the family needs to be loosened to a good extent to invite talent from other technical fields. The family tradition is unlikely to measure up to the new problems and the pace of the expansion of industry, business and trade. It is in the interest of the country that more and more trained young men from various fields should be provided opportunities to participate in the growing economy of the country.

New York, the City of Skyscrapers—so easy to reach by KLM.

What you should know about the remarkable reliability of KLM before your next flight to the U.S.A., Canada, Mexico and other parts of the world

KLM has had longer than any other airline to perfect its reliability—44 years. KLM was the first Continental European airline to inaugurate passage services to the USA. Read 20 other remarkable facts about KLM.

1. KLM has carried over twelve million passengers, a total of twenty-four billion passenger miles.

2. KLM was the first airline in the world to overhaul pressurization equipment in its own workshops. A delicate business. This equipment controls the air-conditioning that keeps you comfortable even at 40,000 feet.

3. KLM flies you from Calcutta, Delhi or Karachi to New York, Montreal, Houston and Mexico city via charming Amsterdam.

4. During the tourist season, KLM flies more than 30 scheduled flights between Europe and USA every week.

Comfort—the keynote of KLM jets

5. When you're first class on a DC-8 jet you relax in a seat that costs KLM fl 1500. It is as wide as an armchair, has built-in table lamp, pre-focussed reading lamp, air blower and finger-tip control panel.

6. The cabin of a DC-8 jet gets a fresh supply of air every three minutes.

7. Every KLM DC-8 jet has weather radar. Your Captain can see what the weather is like 150 miles ahead. If it looks turbulent, he finds a calmer route.

8. The engines of a KLM jet are so powerful, your Captain could fly from Amsterdam to New York with only two working.

Competent, careful crews

9. KLM spends fl 236,000 to train the flight crew for one DC-8 jet.

10. On a single trans-Atlantic flight, KLM's flying crews use four different check-lists. A pre-flight, an after take-off, a final and a pre-landing check-list.

11. KLM has special animal handlers. They are trained at zoos and coached by professors of the veterinary faculty at Utrecht University. KLM carried its first live cargo in 1920.

Service aloft and on the ground

12. KLM is one of the few airlines that has a special written menu for babies. This refinement was introduced at the suggestion of a KLM stewardess. It is very popular with mothers.

13. Every KLM stewardess must speak Dutch, English, French and German. They are always charming, even when they walk eight miles on a trans-Atlantic flight. They learn how to make up from Elizabeth Arden.

14. KLM provides many special services to air shippers. From expert advice on packing (to save weight!) to organising all required documentation (to save time!). Ask a KLM freight expert to help you with your freight problems.

Stopover in Amsterdam

15. Stopover in Amsterdam? Take advantage of a 'Holland Minitour'. Specially designed for air travellers with only a few hours between planes, the tours start and finish at the airport, take just 200 minutes, cost just fl 3.50.

16. KLM's DC-8 jet flights from Calcutta on Tuesdays, from Delhi on Saturdays and from Karachi on Mondays, Wednesdays, Thursdays, Saturdays and Sundays offer same day connections at Amsterdam Airport with KLM's DC-8 jet and low-cost DC-7C services to New York.

17. You can save fl 36.00 on your normal Economy Class return fare to New York or Montreal, by availing of KLM's DC-8 jet services to Amsterdam and back, and flying across the Atlantic on KLM DC-7C.

18. KLM employs 175 people in the Commercial Freight Department at Amsterdam Airport to smooth the way for cargoes. This department handles 120 tons of freight a day. Time saving automatic IBM machines speed work.

19. Make a point of routing your European trips through Amsterdam for Tax-Free Shopping bargain.

20. Ask your KLM Travel Agent about the many stopover opportunities available on the KLM Multi-Stopover Plan. In many cases you may be able to fly to several extra cities, not necessarily on the direct route, at no extra air fare!

THE WEEK'S NOTES

China

THE REPLY AND AFTER

THE GOVERNMENT OF INDIA'S reaction to China's latest menacing attitude, amounting to issuing an ultimatum to this country to hold negotiations on its three-point proposal and on no other basis, was the only appropriate and honourable course left open to it. It is becoming clearer from the successive statements issued from Peking that Mr. Mao Tse-tung has reached a stage when he is out-Hitlering Hitler. Peking's vituperative language and branding India as the aggressor are not the methods which can induce India to enter into negotiations. If it is Peking's intention to break the nerve of the Government and the people of this country, it is an idle dream. In polite but firm language, Mr. Nehru announced in the Lok Sabha that the basis of negotiations can only be the restoration of the position as it was on September 8, 1962, and no other. He has also expressed the Government's readiness to refer the dispute over the frontier territory to the International Court at The Hague after China vacates aggression. Howsoever appealing this rational course may be, China is neither going to vacate aggression nor has she shown the least respect for international law, obligations or authority.

If India has been firm in her reaction to China's more menacing postures, it is because she finds the consequences ensuing from the acceptance of China's three-point proposal basicaly unthinkable. To concede outright the Chinese claim over the Indian territory between Sinking and Tibet and to accept the 'actual line of control' in the eastern sector, with its sinister implications regarding China's assertion of the traditional and customary border south of the McMahon Line, would amount to allowing China to entrench herself south of the entire Himalayan border. This would give her the easy advantage of striking at India at any moment of her choice on any pretext. It would be no solution to the issues involved in the war, but a weak-kneed compromise yielding to the enemy a perpetual base of military operation.

But the immediate effect of the rejection of China's offer needs to be fully grasped. The cease-fire may vanish any moment as soon as China finds herself free from her internal difficulties to devote full-scale attention to mobilization and further thrusts across our border. First attention needs to be paid to safeguarding the security of Assam.

Non-alignment

PROCUREMENT OF ARMS

THE PROLONGED suspense over the supply of MIGs to India by Russia and over Russia's technical collaboration in setting up a factory for their manufacture in this country has been positively terminated. Mr. Nehru's statement in Parliament makes it clear that the delivery of the initial instalment of the MIG supersonic fighters to India will be effected during the current month of December, while the balance will continue to pour in over the next year and perhaps thereafter. The Russian Government is standing by its original offer to provide co-operation to our aircraft building technicians in setting up a plant for the manufacture of the MIGs for the future expansion of the Indian Air Force.

Meantime the Hindustan Aircraft Limited is going ahead with the manufacture of the selected design of HF-24. HAL has established a tradition, during its brief span, of research and invention and it is no doubt devoting necessary technical skills and outlay on this key sector of the plant. The progress of domestic manufacture of military aircraft has its basic significance from the angle of the long-term defensive preparations. But the problems posed by the Chinese invasion cannot wait over the long term and they demand a solution here and now. Even assuming that the surface war may not be lifted into the air in the near future, the deficiencies in our military air fleets are sufficiently big to demand immediate procurement of aircraft from abroad. In the mountainous terrain where the war started and where it still holds a threat of breaking out abruptly, our requirements of transport planes and helicopters acquire priority importance. Apart from this, there is the standing need for planes for reconnoitring operations. Canadian planes are eminently suited for the mountain operations by reason of their capability to dispense with the conventional airstrips for landing. Canada, therefore, is a strategic supplier to fill our gaps, although in terms of quantity her supplies may not measure up to what we are seeking to obtain from Britain, America and France. These three countries will remove our shortages in respect of transport.

The MIGs are unlikely to make much impact on our requirements in the near future of aircraft to strengthen the defensive effort. This would mean that they do not possess, according to present reckoning, a direct bearing on the Chinese invasion. But the supply of MIGs to India and, what is much more important, Russian co-operation in setting up a factory for their manufacture have been made a root cause of a major controversy and a heated protest by China. In China's view, Russia is guilty of strengthening the air force of the bourgeois and reactionary Government of India. But Russia has her own and correct view of the matter and in a telling manner she has given a retort to China that she cannot be dictated as to how she should direct her policy of arms assistance. This is also a further and unmistakable warning to China to mend in time her adventurous course of aggressive expansionism, in which Russia sees a great threat to the interests of the Communist Bloc itself.

A very heartening aspect of the supply of Russian MIGs (and military stores are also to be procured from Russia by us) is that this policy of non-alignment in the matter of obtaining arms and military equipment has been unreservedly endorsed by Mr. Averell Harriman. Apart from the fact that it signifies Russia's dogged refusal to toe the Chinese line, Mr. Harriman, undoubtedly speaking on behalf of the US Administration, sees in it encouraging signs of India being able to strengthen Russia's attitude of aloofness and neutrality in the India-China warfare. This is of vital importance in the context of the present rift between Russia and China on a number of issues.

Assam Waterways

THE END OF A STRIKE

AFTER A painful and protracted period of over seven weeks of the paralysis of its main water transport services, Assam finds that the way has been cleared for the resumption of normal traffic for export as well as import across the Pakistan territory to Calcutta port. The grounds on which the Pakistani crew of the joint steamer companies, which play an important role in the inland water transport system of Assam, struck work were flimsy. The service conditions of the crew had not been changed to their detriment nor had anything serious happened to the cost of living or other governing circumstances to justify any claims for their alteration. The question of the nationality of the crew was basically objectionable. If the principle of exclusive or majority employment of the crew of a particular nationality is sought to be enforced in international water transport, not only will investment and efficiency of the services be affected but this type of transport will lose its international character. It is of the essence of this transport that the personnel should be selected for their technical skill and merits and not for their nationality. But it is everybody's knowledge that this strike was political to its core. Its timing cannot be explained on any other hypothesis.

Large stocks of tea chests (as well as of raw jute) had accumulated at the gardens and different transit points because of the strike. Their value has been variously estimated, but the important point is that over 50 per cent of the consignments of Assam tea are destined for Mincing Lane, where they earn considerable foreign exchange. The importance of waterways in the transport system of Assam is easily guessed. About 66 per cent of the freight traffic is water-borne, while rail and road carry the remaining 34 per cent at a higher cost and with greater delay. This strike has vividly revealed the serious gaps in Assam's transport system and its vulnerability in relying upon water transport where the collaboration of transport operators from the neighbouring country is indispensable. The Government has now made a decision, not merely in the light of the defence emergency but from the long-range view-point, to strengthen the existing road bridges and to construct new ones in the hills and across the ravines and also to build roads to the extent it is practicable. It is openly recognised that this is going to be a high cost system of transport. But where the considerations are transport under our own control and cheaper transport with the goodwill (with its counterpart of illwill sometimes) of the operators from the neighbouring country, the decision to opt for strategic roads and bridges is certainly advisable.

Brunei

THE NEW TROUBLE SPOT

SINCE THE armed insurrection, led by the secret 'North Kalimantan (Borneo) National Army' broke out in Seria in Brunei and the oil installations were seized by it, events have moved in rapid succession. The insurrection took the Sultan's government completely by surprise and precisely the same was the predicament of the British Government, which, under the agreement of 1959, is responsible for the protection of the Government and the State of Brunei as well as for its defence and external affairs. The actual control of the captured territory and in particular of the air strip by the rebels was not expected to last long in view of the inevitable airlift of British forces to help the Sultan.

The real issue raised by this rebellion goes much deeper than the spread of the insurrection. It has a profound impact on the projected Federation of Malaysia. North Borneo and Sarawak have endorced the proposal to join the Federation along with Malaya and Singapore and the present indications are that the Federation would be launched around the end of August 1963. But Brunei has not yet made her decision, although the available indications show that the Sultan is convinced of the advisability of throwing the lot of his state and people with the Federation.

It is this likely intention of the Sultan to join the Federation that is opposed by certain elements in Brunei of which the secret army is a manifestation. But opposition to the Federation is not a new development emerging from the rebellion. The Rakhyat Party, led by Mr. M. Azahari, which has captured all the sixteen elected seats in the Legislative Council of Brunei (with a proponderance of nominated members) has led the opposition to the federation. This Party's contention is that there should be a federation of North Borneo, Sarawak and Brunei. Mr. Azahari was in Manila at the time of the outbreak of the insurrection, already engaged in an attempt to plead his case at the United Nations. It will be recalled that the Philippines has revived a far-fetched claim, based on some tenuous past historical evidence, to parts of North Borneo, but the Philippine Government does not seem to be fully aware that the opposition to the federation derives real inspiration from Peking acting through the Communist Party of Indonesia and the pro-Communist Socialist Front in Singapore. The composition of the population in Brunei is also stated to be a factor in Indonesia's sympathies for the rebel elements. Many of the Brunei-born Malays have close family ties with Indonesians. Indonesia's moral support to the rebels is not limited to the Communist Party. President Soekarno and his Information Minister have made public pronouncements welcoming the new movement in Brunei for full independence. There is no evidence to assume that the rebels have a broad base or countrywide support and the project of the Malaysian federation may well be achieved as contemplated. But Brunei may be strengthened and developed as a Communist trouble spot.

The Press

CARE AND CAUTION

MR. LAL BAHADUR SHASTRI'S address at the Standing Committee of the All-India Newspaper Editors' Conference has received the careful attention it deserves in the Press throughout the country. The tone of Mr. Shastri's speech can readily be appreciated when the fact is fully borne in mind that the role which a Home Minister has to play during a war emergency is very difficult to fulfil. The Press in India has always enjoyed a wide latitude in the expression of its views and comments as well as in the reporting of news and current events. But there is the equally important aspect of this latitude which is that it has been richly merited by a consistently creditable performance. This does not, of course, refute Mr. Shastri's point that in some sections of the Press there has been an improper use of this latitude. It was in a mood of a mild warning, rather than of resentment, that he made a specific reference to the editorial comments in a few papers having produced the effect of impeding the war effort. It is here that strict warning for initial lapses and appropriate action under the Defence of India Bill may have to be resorted to by the Home Minister.

Mr. Shastri also dilated on the place of prominance assigned by the Indian Press, by and large, to our military unpreparedness and reminded his audience that its effect could not but be to undermine the morale of the public and also of the armed forces. This criticism can hardly be accepted. Unpreparedness on the part of the Ministry of Defence was an undisputed fact and our initial reverses have been explained mostly in terms of lack of preparation as much as in terms of the sudden and massive invasion launched by the enemy. Now after the right steps have been taken to obtain armaments and equippment, the issue of unpreparedness has become a thing of the past and a reference to it was not called for at this stage. In a democracy the role of the Press is really difficult, since it cannot discharge its functions, unless it is candidly but honestly critical of the actions and policies of the Government. The bona fides of the Press must be presumed, unless the presumption can be rebuted in particular instances.

The Press is, of course, wide awake to its responsibility during the emergency and it fully realizes that it has to exercise due caution and care both in the presentation of news as well as in the expression of views. National defence requires that there should be, as far as possible, unanimity in approach and action and this is what the Press has actively sought to expound since the outbreak of the Chinese war. The anxiety of the Press in the matter of exercising restraint and caution is fully borne by the proposal mooted by the AINEC to appoint a Central Committee to assist the Government in taking appropriate action against defaulting newspapers. It will be the task of this committee to offer advice and to attempt to rectify the wrong attitudes of any particular newspaper, in the first instance. But when it comes to any governmental intervention, it will not be found wanting in placing its full co-operation at the disposal of the Government.

The CALTEX "Stop-loss" Programme helps cut plant-wide maintenance costs as much as 15%

"Stop-loss" organises lubrication throughout the plant—from purchasing on through actual application. By specifying multi-purpose lubricants and by eliminating duplication, a "Stop-loss" Programme can reduce the number of lubricants needed by as much as 50%. By streamlining purchasing procedures the programme can cut the number of purchase orders.

Best of all—by assuring proper lubrication to every piece of equipment in the plant, a "Stop-loss" Programme helps extend equipment life. Result—plant-wide maintenance savings upto 15%. *Ask your Caltex Sales Engineer for information.*

Company executives can obtain a free copy of this booklet by writing on their official letter-head to their nearest Caltex office.

WORKING DAYS LOST IN EUROPE

By ODYSSEUS

MOST INDUSTRIALISED COUNTRIES are struggling with cost-push inflation. They attribute their troubles largely to rising labour costs. This had led to a spate of studies of Wages policies. As the November issue of the "Westminster Bank Review" (41 Lothbury, London. E. C. 2.) points out, the term "Wages Policy" has several meanings.

One, which covers both wages and other forms of income, such as dividends, is better described as an Incomes policy. A second is the limitation of wages in accordance with government policy. A third emphasises the machinery for settling wage disputes, and the way in which it can be improved. We will here discuss the second and third senses.

There are 18 industrialised countries in the free world, in all of which the machinery for securing wage agreements and dealing with disputes is broadly similar. Most labour forces are normally covered by collective agreements between employees and employers. Disputes arise either (a) because of differences in the interpretation of an agreement or (b) during the negotiation of a new agreement.

Most of the differences in national procedures are in the way of settling disputes. The distinction between (a) disputes over the interpretation of an existing agreement and (b) those arising from the negotiation of a new agreement is incorporated in the labour laws of the Scandinavian countries, where strikes or lock-outs are prohibited as means of settling disputes over interpretation—called "conflicts of right". Failing agreement in such cases, an award is made by a labour court, whose decision is binding. Several other countries, including Australia, France, and the Netherlands, also follow this procedure.

It is normal for industrial action in defiance of the provisions of a collective agreement to be illegal (though not in the UK, Israel, or Japan). Perhaps the most important variation in the form of collective agreements is that in some countries they are valid for the same period and expire simultaneously, say, every other year. This leads to a regular succession of wage rounds as new agreements are negotiated. This is usual in Denmark, Norway, Sweden, Germany, the Netherlands, Eire, and Japan, where, since stoppages usually occur between agreements, strikes and lock-outs are concentrated in certain years.

Table I compares time lost by stoppages in 18 countries. To even out bad and good years for stoppages, combined figures are given for five successive years. The absolute total of man-days lost in stoppages means little but, when related to the number of working days

TABLE I.

	Employed civilians (average 1956-60) millions	Total annual holidays days	Working days per man per annum	Total working days (1x3) (average 1956-60) millions	Days spent on holiday (1x2) (average 1956-60) millions	Working days lost in stoppages (average 1956-60) thousands	Days lost in stoppages per million days worked (average 1956-60)
	(1)	(2)	(3)	(4)	(5)	(6)	(7)

in each country, an international "league table" of proficiency in avoiding stoppages emerges.

Noting that the UK stands twelfth out of 18 countries in this table, the "Westminster Bank Review" points out that any effort to reduce the number of UK stoppages is worthwhile only if they have in themselves a serious effect on the economy, and are not simply symptoms of deeply rooted labour conflicts, which ought to be tackled at their sources. Table II shows the stoppage problem in perspective by comparing the number of days lost in stoppages with the number lost as holidays. Column D shows that the ratio of holidays lost to stoppage losses ranges from nearly 250,000:1 to 191:1. Even in Finland, the reduction of public holidays by one day would secure far more work done than would a reduction in the number of stoppages. Another way of presenting the same truth is to show that an average worker in Finland spends 141 days on holiday and less than one day in a year on strike (See column 2 and E). In some countries, however, such as the UK, where there are fewer public holidays, it would be difficult to reduce them without public clamour, and even less practicable to suggest that other forms of holidays be reduced.

WHAT ABOUT INDIA ?

It would be instructive to draw up similar tables compring working days lost in strikes and in holidays in India, where the Government of India recognises no fewer than 23 national holidays in the year and individual states recognise many more. In Bombay, for example, special holidays covering Hindus, Parsees, Sunni Muslims, Shia Muslims, Jews, Jains, Hindus from Sind, Sikhs, and Christians add on another 30 days. Allowing for week ends and conservatively assuming ten days paid holiday in the year, that would make a total of 141 non-working days in the year in Bombay. How much would the Five-Year Plan gain if, for the duration of the present national emergency, holidays were halved ?

It is also possible to show statistically that absence on sick leave causes infinitely more days to be lost than strikes. In Germany, for example, it is estimated that, in 1961, on any one working day as many as 1,300,000 insured workers were absent sick, which means that the working population was reduced by over 6 per cent. The "Westminster Bank Review" suggests that steps taken to improve public health would reduce sickness absence. Possibly. But this has not been established in Germany, where since the practice has been inaugurated of granting sickness benefits on full pay from the third day of absence, instead of from the fourth day and on half pay, the number of absentees has risen by nearly 500,000 workers. May be some of these added 500,000 did not previously report sick when they were. But to combat this unforeseen rise in sickness in Germany, proposals are being discussed that each insured patient should make some contribution to his medical costs. Needless to say, these proposals are being fiercely resisted.

However, speculations about increasing efficiency by imprving national health or by reducing public holidays should not divert us from the problem of loss of production by strikes.

We will return to this next week. It will make next week's article clearer if you would be good enough to keep by you the tables published this week.

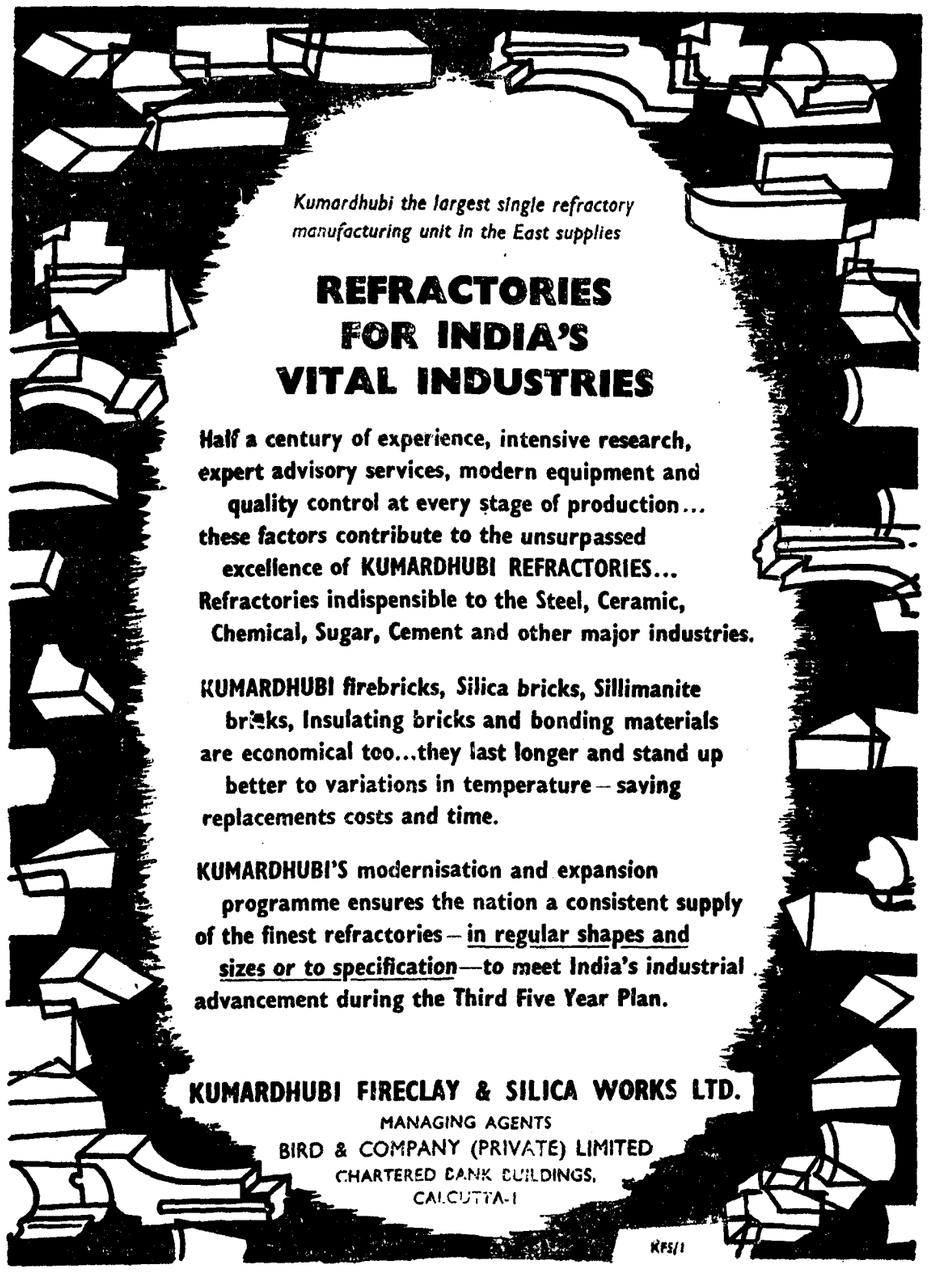

TABLE II.

PLANNERS AND LIBERALS IN THE ECM

From Our West European Correspondent

PARIS, December 8.

A CONFERENCE that closed in Rome on Sunday had for its theme "European economic programming and national economic programming in the Common Market". Its purpose was far from academic; it was the first full-dress effort to sound out member-governments' reactions to the suggestions of the ECM Commission regarding a Common Market plan. ('The Eastern Economist', Nov. 9). On the dais were M. Pierre Masse, Commissioner General of the French plan; Baron Kervyn de Lettenhove, Administrator of Belgium's Bureau of Economic Programming, set up three years ago; M. Tims, from the directorate of the Central Plantbureau that has been at work in Holland since 1945; and professor Pasquale Saraceno, vice-president of the National Economic Programming Commission established in Italy last August. In short, the chief agents of planning in those Common Market countries that are now writing plans, under whatever name. The absence of West German representatives holding similar responsibilities is normal, for Bonn is still dogmatically opposed to planning, but M. Langer, director of the Federal Republic's Commerce Ministry, and professor Meinhold of Heidelberg were there to present the official German case. These two gentlemen were indeed the stars of the show, because the audience of officials, industrialists and trade union leaders were waiting for their version of Dr. Erhard's regular, angry outbursts against planners.

There was no outburst and in fact the measure of agreement that emerged was surprising. So much so that M. Robert Marjolin, the French socialist who is the author of the ECM Commission's proposal for a European plan, could say at the end, "There is a lot of work that we can do together and in complete unanimity in the next two years". In other words, the Commission drew the encouraging conclusion that its general programme has been well received, so that it is free to begin putting up specific proposals to the Council of Ministers of the Six as from next month. Agreement was possible because both sides tried to break down the simple contrast of planning versus free enterprise; this black-and-white dogmatism is a caricature of their real positions, although it is obvious that differences of opinion remain between the German "liberals" and the rest of the Europeans. M. Marjolin began by saying, "in order to remove all misunderstanding", that he accepted the basic thesis of the liberals: "In a free economy, wherever competition is not too imperfect, the market mechanism ensures the best utilisation of available resources". The Germans met him half-way. M. Langer declared, "In actual practice we are not very far from each other", and Professor Meinhold said, "We are in agreement about a certain minimum" which he went on to define generously enough to leave open the prospects of a European economic "programme".

This is a suitable point at which to emphasise that the controversy about planning that now engrosses the Common Market is by no means a Germans-versus-the-rest match. There are planners and "programmers" in West Germany and some of them happen to be at the head of the country's biggest businesses; and, while the liberals have their most eminent spokesman in Dr. Erhard, they are well represented in France, the home of democratic planning. It was M. Jacques Rueff, principal architect of de Gaulle's 1958 stabilisation operation, who teased the planners during the Rome symposium by comparing them with Chantecler, the rooster who thought he made the sun rise by crowing at dawn. The performance of the French economy, he said, could be explained by the working of the market mechanism much more than by the interventions of the planners. And on Tuesday of this week M. Pierre Bercot, boss of the Citroen automobile company, delivered in the Sorbonne an attack on planning that Dr. Erhard would have signed with both hands.

"There is", declared M. Bercot, "total incompatibility between planning and the automobile industry". You cannot plan in our industry, he went on, unless you plan the consumer's choice for him and unless you plan all foreign motor car manufacturers too—"so are you going to plan the whole world?" What's more, he added, you cannot fiddle about with a plan in course of implementation, if it goes wrong, unless you show how manufacturers are going to amortise the cost of previous wrong decisions; and your plan has to be open enough to leave room for the manufacturer who upsets the apple cart by discovering some new improvement in automobile engines. Actually the planners are not as ignorant of these facts as M. Bercot pretended to believe. More important, two developments this week show that, in turn, the automobile manufacturers are not as indifferent to programming as all that. Firstly, the French car makers managed for the first time in their history to form an industrial association, to be presided over by M. J.-P. Peugeot. After ignoring each other for several generations, they will henceforth have a common meeting ground. Merely to form an industrial association does not show a drift to planning, but in this case it is obviously dictated by anxiety about the consequences of unlimited competition in a market that is getting dangerously chaotic. Secondly, the motor car firms have just received the ECM Commission's study on the likely evolution of their industry and its market between now and 1965—a report they helped prepare and which will be of great use to them in deciding investments in the next few years. Association and joint market research happen to be what the adversaries of the liberals mean by planning, so one understands why M. Langer could say that in practice the two camps are closer than might appear.

For example, in Rome last weekend there was little disagreement when M. Marjolin, after accepting the superiority of the free market mechanism in many situations, went on to say that four things nevertheless made some sort of planning necessary. The first was the existence of domains where the market mechanism could not work: agriculture, house-building, power supply and transport. No European government leaves these sectors "free" and it was only reasonable to coordinate intervention, both as between these non-competitive sectors and between them and other free parts

of the economy. Related to this was the appearance of monopoly in other sectors, which were thus virtually removed from the operation of free markets; there, M. Marjolin favoured tougher anti-trust legislation. The second was the role of the State (which is just as extensive in West Germany as elsewhere, despite some official hypocrisy about liberalism); no liberal theory can justify the absence of co-ordination between governmental administrations and agencies which play a dominant role in the economy whether we like it or not. At the present pace of expansion of the national product (around 5 per cent yearly), the State's revenues will double by 1970 in the Common Market countries and it is rational to look ahead and ask how these immense resources will be used.

The third factor is the universal desire to avoid the cycle of boom and slump in Western economies, to which economic prevision could contribute. The fourth and last is the prospect of extensive social consequences flowing from the reorganisation of European industries as the Common Market comes into effect. A new international division of labour is being brought about and no democratic government will want to leave to chance the impact of this on employment and on regional development. The free movement of capital between the six countries will make ineffective existing national controls over the flow of investment; this introduces a new element of insecurity which programming should seek to reduce. This point alone, incidentally, was regarded by the bankers present in Rome as sufficient reason to attempt some sort of European programming.

The Germans did not so much disagree with all this as insist on the distinction between flexible, short-range planning, which they accept, and attempts to decide the longer-range (over two years) development of an economy in the framework of a unique plan. Even for this longer term, they accepted the practice of "projections" into the future, such as the Uri group's forecasts of West Europe's evolution up to 1970 ('The Eastern Economist', Nov. 30). They were anxious, however, that such projections be prepared by independent economic experts and not commit the government, and that they be put forward in the shape of several alternative hypotheses between which entrepreneurs be left free to choose. They did not dispute the need of programming in sectors dominated by government, and in fact gave examples of the disastrous consequences of rigid, unco-ordinated adminstrative action in West Germany (in housing notably). Their main idea was that planning should be kept short-range and supple; there should be no one fixed plan, but a series of plans that could be brought out of the cupboard depending on the evolution of business activity and foreign trade from year to year.

From this meeting of minds, M. Marjolin claimed to be able to extract the European consensus on the issue. Everybody, including the West Germans, he said is agreed on the following points. Short-term previsions are possible and desirable. There should be long-term programmes for public investment and for all sectors where government intervention makes the free market an illusion. There should be long-term programmes, too, for agriculture and for regional development (depressed areas and the like). The ECM Commission should go ahead drawing up long-range projections for the Common Market economy as a whole, given that it adopts the system of alternative hypotheses. These hypotheses should not differ too much from one another; that is, the programmers must be fairly definite about the range of possible development curves, so that when entrepreneurs chose the one that seems most likely in their eyes they will not be acting on wildly conflicting assumptions. There was no formal vote on this concluding synthesis, but if M. Marjolin is correct in saying that all the Common Market capitals are agreed about so much, then there is plenty of room for an empirical beginning with a European plan as from next year.

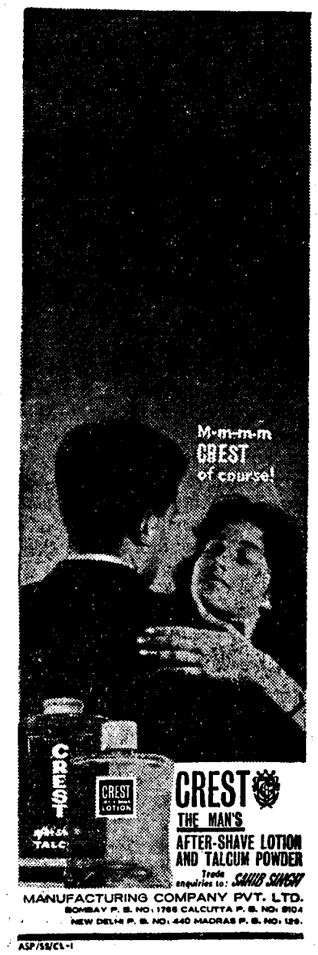
Economic Report from the U.S.

TRADE WITH AID



By GUY SIMS FITCH

WASHINGTON, Dec. 5.

THE inter-relationship between aid and trade is vital. This is a statement that has particular relevance to the economic growth of less-developed lands which are heavily dependent on both. It is of more than passing significance, then, that the governing ministerial council of the Organization for Economic Co-operation and Development (OECD) has adopted a resolution stressing the inter-dependence of aid and trade. The resolution, sponsored by US Under-secretary of State George Ball, unanimously recommended that the organization's 20 member-states formulate concerted policies in these two fields. What can be called the "trade with aid" approach emerged in a communique from Paris last week winding up the two-day ministerial session of OECD, which comprises the United States, Canada, and the countries of Western Europe. The communique in effect proposed that OECD nations take action to increase the volume and effectiveness of their aid to less-developed countries, and widen their markets to the exports from those countries. As Mr. Ball pointed out, it hardly makes for enlightened public policy to help newly developing lands expand and diversify their production, and then maintain trade restrictions that tend to frustrate those efforts and exclude that production from the expanding OECD markets.

The amount of assistance involved is quite substantial. A compilation by OECD's Development Assistance Committee (DAC), of which Japan also is a member, shows that free industrial nations last year handed out no less than $8,700 million in foreign aid, of which more than half—some $4,600 million—came from the United States. Just what the OECD nations, as a group or individually, can or will do to improve the export possibilities of less-developed areas remains to be determined. But the importance of their unanimous resolution as a statement of principle is not to be depreciated—especially since together they account for nearly two-thirds of the world's import trade. What has been said may have special reference to present and potential markets for light manufactured goods, but it applies also to primary products, which contribute importantly to the export earnings of many newly developing lands. It is with this in mind that the US has been interested in trying to assure greater market stability for these products, as in the case of the recent coffee agreement, even while stressing the need for diversification of production. The US interest in market access extends with equal force to the common agricultural policy now being drawn up by the European Economic Community (EEC), or Common Market whose six members also are members of OECD. Mr. Ball took the occasion of the OECD Ministerial meeting to reinforce the views expressed in Paris a week earlier by US Agriculture Secretary Orville Freeman, calling upon the EEC to adopt an agricultural policy that will be liberal rather than restrictive in its effects. A common agricultural policy is recognized as an integral part of the Common Market mechanism, of course, but by the same token, a policy that widens rather than narrows the channels of trade is viewed as properly in keeping with the EEC's growing strength and international responsibilities.

This is important not only to the United States, but to all countries both industrial and less-developed, with sizable agricultural exports. It is clear from all this that OECD is a body with wide-ranging international rather than strictly regional interests. It began its operations only little more than a year ago, yet it already has emerged as an organization with considerable current and even greater potential significance to the advancement of countries throughout the world. OECD is not without its internal activities, of course, particularly in the examination of the economic positions and policies of its members. Thus, its communique also noted that no substantial production slow-down is imminent in Western Europe, but recommended that if the need for expansionary policies should arise, member countries act promptly and in concert. The communique also gave full support to measures to accelerate the economic expansion of the US, whose production of goods and services represents 60 per cent of all OECD output. This is in line with President Kennedy's avowed intention to boost US economic activity through early tax cuts and other steps.

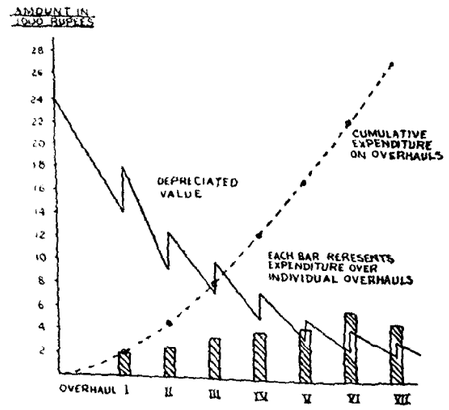
WHEN DOES THE OVERHAUL OF A VEHICLE BECOME UNECONOMICAL?

By Brigadier K. PENNATHUR, B.E., M.I.S.E., M.B.I.M, F. Inst. W.S.

THE economics of overhaul of vehicles is a very vast subject. In my survey, lasting over a year, the scope was limited to the critical analysis of three factors. Firstly, the basis for the frequency of overhauls was examined (whether it should be after a fixed period of time or fixed number of kilometres or after a specified fall in operational efficiency or a combination of these). Secondly, the optimum extent of work to be carried out in progressive overhauls was studied. Thirdly, the progressive stage beyond which an overhaul becomes uneconomical was scrutinised. This article deals with the third aspect of my survey: When does the overhaul of a vehicle become uneconomical?

People have diverse views on the number of progressive overhauls that may be carried out on a vehicle. Some people believe in changing their vehicles after a relatively short period of use.



Many transport operators use their vehicles to the very end, sandwiching as many overhauls as possible. Some use their vehicles for a fairly long period, with one or two overhauls in the course and then sell the vehicles off. There are some engineers of the view that the life of a vehicle can be perpetuated, almost without limit, provided they are thoroughly overhauled periodically. When there is a shortage of vehicles, it would be quite natural and correct to keep the existing fleet 'on the road' for as long as possible, by carrying out a large number of periodic overhauls. When the aim is to own the latest model, changing the vehicle every year would be the answer. But, under normal circumstances, where the supply can meet the demand and when the aim is maximum return for the money invested, the optimum stage in progressive overhauls, beyond which it would be uneconomical to carry out further overhauls, needs to be determined to a fair measure of accuracy.

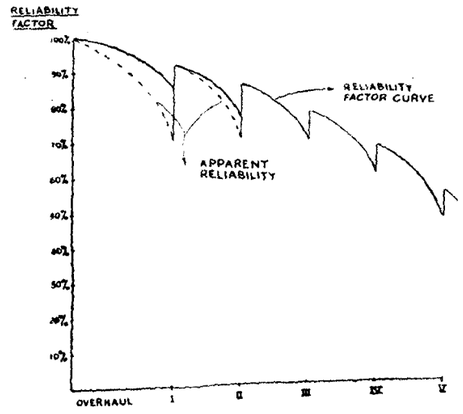
When a vehicle is in operation, its functional efficiency and external presentability decrease with usage. The aim of an overhaul is to render, to the extent possible, the condition of the used vehicle to a state of efficiency comparable with that of a new vehicle. A common fallacy is that an overhaul can render a vehicle as good as new. An overhaul would raise the efficiency of a vehicle but can never make it as efficient as a new one, unless there is a total replacement of all components and assemblies. The degree by which the efficiency of a vehicle is raised by an overhaul would depend on the scope and extent of overhaul.

From my survey, the case study of lorries 3 Ton 4 x 2, (petrol), used as load-carriers, is taken as a specific example for discussion in this article. The figures quoted are based on the average of 700 vehicles.

In transport operation for load-carrying purposes, the periodicity of overhaul was, almost universally, based on the mileage done. The first overhaul was undertaken after 55,000 Kms of operation and subsequent overhauls after 39,000 Kms of operation. The majority of vehicles were overhauled 7 times during their life. The overhauls were confined to the optimum amount of work and replacements necessary to bring up the operational efficiency of the vehicles.

Graph A brings out the relationship between the cost of overhauls and the depreciated value of the vehicle. The cost of overhauls is shown in two forms: expenditure on each overhaul (as a bar chart) and the cumulative expenditure on progressive overhauls (dotted curve). After the first overhaul, the cost of which is Rs. 2,000, the value of vehicle had appreciated by Rs. 4,000. At the third overhaul, the expenditure on overhaul equalled the appreciation in the value of the vehicle, as a result of the overhaul. From the fourth overhaul onwards, the expenditure on overhauls

GRAPH-A



had been more than the resultant appreciation in the value of the vehicle. Solely from this point of view, only the first three progressive overhauls appear to be economical. But, there are two further considerations to be taken into account. Firstly, how 'reliable' is the vehicle after each overhaul? In other words, what is the index of its functional efficiency? Secondly, for the expenditure incurred with each overhaul, what is the extent of earnings?

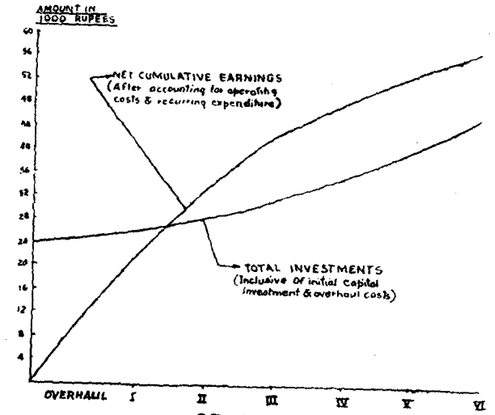
Graph B gives the fluctuations in the Index of Reliability. The Reliability factor is the assessed probability of efficient performance by a vehicle. The figures are subject to a variation of +/—2½ per cent. The minimum acceptable index for reliability must necessarily vary from situation to situation. An army, fighting a war, may not accept a reliability factor lower than 85 per cent. A person operating in a city might accept a factor as low as 50 per cent. For normal conditions, the acceptable minimum lies around 70 per cent.

From Graph B, it would be seen that the Reliability factor remains above 70 per cent upto the third overhaul. After the third overhaul, it goes up to 78 per cent but gradually drops to 61 per cent at which stage the fourth overhaul is undertaken. It would be of interest to note that the Reliability factor does not fall below 70 per cent till after §th of the interval between the third and the fourth overhauls. Hence, for 70 per cent Reliability (which is the normal minimum acceptable), operation must cease after a run of approximately 24,000 Kms after the third overhaul.

Many truck operators accept the risk of a minimum

limit of 60 per cent Reliability. There are some more who accept figures even below 60 per cent, but the risk is too great for safety and smooth operation of schedules.

GRAPH-B



Hence, any figure below 60 per cent is not worth considering. For those operating on a minimum of 60 per cent Reliability, about 22,000 Kms after the fourth overhaul is the safe limit, beyond which the vehicle should be disposed of.

Reverting to the acceptable minimum of 70 per cent Reliability, the safe operating limit would be 24,000 Kms after the third overhaul.

Graph C shows the relationship between the net cumulative earnings and the total investments. The net cumulative earnings were arrived at after deducting from the gross cumulative earnings the cumulative operating costs (fuel, oil, lubricants, driver's wages, vehicle maintenance and establishment overheads) and the cumulative recurring expenditure (insurance, vehicle tax, and replacement costs in respect of tubes and tyres). The total investments are the sum of the capital investment in the purchase of the truck and the cumulative cost of progressive overhauls. Although, at first glance, it might appear that, after the break-even point (after 70,000 Kms of operation), there is a steady return, it is worth examining the details of the return.

Table I below brings out the proportion of the net cumulative earnings to the total investments at various selected stages.

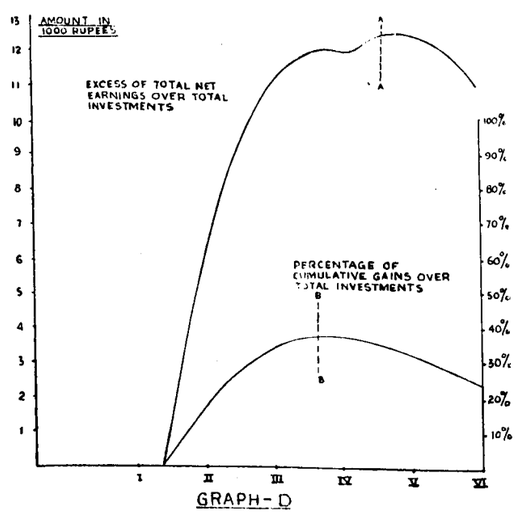
The results obtained in columns (e) and (f) are presented in Graph D. The curve representing column (e), i.e., excess of total net earnings over total investments reaches a maximum at Stage A marked in the graph. But, the second curve, representing column (f), i.e., percentage of the cumulative gains (excess of total net earnings over total investments) based on total investments shows that the increase in return stops at Stage B marked in the graph. It would, thus, be appa-

GRAPH-C

TABLE I.

Serial number	Stage	Net cumulative earnings (Rs.)	Total investments (Rs.)	Excess of (c) over (d) (Rs.)	Percentage of (e) over (d)
(a)	(b)	(c)	(d)	(e)	(f)
1.	On 70,000 Kms of operation	27,000	27,000	0	0
2.	On II overhaul	34,000	28,500	5,500	19.2%
3.	On III overhaul	43,000	32,000	11,000	34.4%
4.	On 24,000 Kms after III overhaul	47,000	34,000	13,000	38.2%
5.	On IV overhaul	49,000	36,000	13,000	36.1%
6.	On 22,000 Kms after IV overhaul	52,000	38,500	13,500	35.1%
7.	On V Overhaul	54,000	40,500	13,500	33.3%
8.	On VI overhaul	57,500	46,500	11,000	23.9%

rent that the stage where economic operation ceases is about 22,000 Kms after the III overhaul.



The overall assessment is given in Table II below.

The verdict of Table II is quite clear. The operation of the lorry must cease immediately after the III overhaul.

A very pertinent question that may be posed is how the truck operators in India carry on very much farther than the VI overhaul stage and still manage to render the operation a profitable proposition. A case, very relevant to this issue, is that of an operator in Dehra Dun. His gross gains had shown an upward trend till 24,000 Kms after the seventh overhaul.

The conditions on which the conclusions of this article are based may be recapitulated: that conditions are normal where the supply is able to meet the demand in full; and that overhauls are the optimum necessary to bring up the functional efficiency of the vehicle. Let us examine these in the light of conditions currently prevailing.

Conditions are, definitely, not quite normal. The demand is much greater than supply. This brings about, in its wake, three effects. Firstly, the depreciated value of the vehicle is very much higher than what it should be. In Dehra Dun, a lorry after the VII overhaul fetches a handsome price of Rs. 13,500. Secondly, the charges of transportation are higher than normal figures. The result of this is higher earnings. A reference back to Table II would bring out the fact that appreciable increases in columns (d) and (f) would raise the values in column (g) so as to make the operation profitable even beyond serial 8. The third effect of the demand being greater than the supply is acceptable in the lowering of the minimum acceptable Reliability factor. As mentioned before, there are quite a few operators who run the risk of a figure even below 50 per cent. Also, the condition of 'optimum' repairs and replacements is not generally followed by many operators. The risk of further lowering the Reliability factor is cheerfully accepted. In several cases, the operation is on an owner-driver basis with the result that there is a fairly reasonable level of apparent gains, because the wages for driving are additionally taken into account. The result of all these factors is prolonged operation of lorries, on a reasonably profitable basis, but with the attendant lowering of reliability and safety standard beyond normal acceptable minimum. In all cases, without exception, the rate of gains per Km run had dropped very gradually after the III overhaul stage.

GRAPH-D

The facts and figures quoted in this Paper are for standard conditions, but they can be used with a reasonable degree of accuracy, provided correction factors are employed, to suit existing conditions.

TABLE II.

Serial No.	Stage	Total investments (Rs.)	Depreciated value (Rs.)	Loss due to depreciation (c)—(d) (Rs.)	Cumulative net earnings (Rs.)	Cumulative gross gains (f)—(e) (Rs.)	Reliability factor
(a)	(b)	(c)	(d)	(e)	(f)	(g)	(h)
1.	On 70,000 Kms of operation	27,000	15,500	11,500	27,000	15,500	88%
2.	On II overhaul	28,500	12,500	16,000	34,000	18,000	86%
3.	On III overhaul	32,000	10,000	22,000	43,000	21,000	78%
4.	On 24,000 Kms after III overhaul ..	34,000	7,500	26,500	47,000	20,500	70%
5.	On IV overhaul	36,000	7,500	28,500	49,000	20,500	68%
6.	On 22,000 Kms after IV overhaul ..	38,500	5,000	33,500	52,000	19,000	61%
7.	On V overhaul	40,500	5,500	35,000	54,000	19,000	54%
8.	On VI overhaul	46,500	4,500	42,000	57,500	15,500	—

THE WEATHER

OUTSIDE

is difficult to predict and impossible to control.

The weather indoors is a different matter.

If you are planning to construct or renovate a large building, *plan* the weather in it to your requirement with

TRANE

Central air-conditioning equipment.

You can control the weather with special advantages like separate air-conditioning for each room, positive circulation and complete filtering of all air.

TRANE systems are extremely flexible too. You can shut down parts of the system without power wastage.

And if you haven't quite decided just how big your building is going to be, a TRANE central plant is still your answer, since it can be shifted, adjusted or expanded without rebalancing.

The Future of the Sterling Area

By PAUL BAREAU, Editor, The Statist

IT is not only Commonwealth trade and commercial preferences that are at risk in the continuing negotiations for Britain's entry into the Common Market. The future of the sterling area is also involved. The sterling area as we know it today is an even younger entity than the system of Commonwealth preferences; but it is a powerful strand in the nexus of economic relations between Commonwealth countries and its fate, assuming Britain becomes a member of the European Economic Community, deserves more attention than it has hitherto received.

The subject has recently come into focus for a number of reasons, one of them being the formulation by the EEC Commission of plans to create a single currency in Europe. The Treaty of Rome says nothing about such an extension of economic unity between the member countries, and at first sight such a project would seem to belong to a somewhat distant and hazy future. A common currency implies a common budget and taxation system and, in effect, the surrender to a unified or federal government of all the essential economic sovereignties that now belong to the separate members.

Nonetheless, the European civil servants in Brussels have propounded their scheme for currency unification and have even gone so far as to christen the new European unit of account. It is apparently to be known as the Monneur (which is an abbreviation of Monnaie Europeenne)—though some wits in Brussels have suggested as an alternative the Oreur to denote the joint loyalty to gold and to Europe which the new unit should have. Whatever its name it will represent the harmonisation of monetary policies and systems in Western Europe. If sterling joins this group and part of its identity is fused and lost in this wider monetary system, questions will inevitably be asked whether sterling itself can continue to be the anchor to which the currencies of countries now in the sterling area will be linked.

One of the features of the sterling area as it now operates is the freedom of movements of capital from Britain to all parts of the sterling area—a freedom, it should be added, which is not always reciprocated. One of the adjuncts of this absence of exchange control in the movement of funds from Britain to the sterling area is that sterling countries have throughout the post-war era had a privileged position in their access to the London market. Apart from a very few exceptions, the number of which can be counted on the fingers of one hand, all long-term external issues of capital in the London market have been on behalf of sterling area countries.

This preferential position of sterling area borrowers may be affected if Britain joins the Common Market. This is because the Treaty of Rome, though it says very little about monetary policy, does provide for the eventual freedom of all capital movements within the European Economic Community. Such freedom is not required immediately but must be secured by 1970, the end of the transition period. On this score, therefore, the sterling area would have at least to share its present preferential access to the London market with the other countries of the EEC.

The Treaty of Rome opens up an even more ominous prospect. It provides that in the event of balance of payments difficulties within the European Economic Community, the member countries might be called upon to apply exchange control against outsiders. If, therefore, Britain joins the Common Market and for one reason or another slips into such balance of payments difficulties as to require assistance from other countries of the Community, Britain might be required to apply exchange control against outsiders. These outsiders could, on present indications, include members of the sterling area and of the Commonwealth, assuming these did not become members or secure some form of association with the Common Market. It may be far fetched to imagine such developments but they lie within the bounds of possibility. If this were to happen it would echo in the realm of currency policy the inversion of commercial preferences which will occur ultimately if Britain goes into the Common Market and the rest of the Commonwealth does not.

Mention should, however, be made of a recent development which should give sterling area countries a certain measure of satisfaction and reassurance that the eventualities described above will not be realised. This is an alteration in the European Monetary Agreement under which Britain is about to get rid of the exchange guarantee which it now gives to all sterling balances held by central banks in Western Europe. The European Monetary Agreement was the successor of the European Payments Union which in turn was a very valuable offshoot of the Marshall Plan. It provides a mechanism by which payments between European countries can be made at monthly intervals if the foreign exchange market is unable to cope with them.

Under this agreement any mutual accumulation of currencies acquired by the members are covered by a dollar guarantee. These arrangements have worked in a very one-sided manner because sterling is the only European currency which is normally held either as working or reserve currencies by other central banks. European central banks have, therefore, had the advantage of a dollar guarantee on all their sterling balances and in this way have been treated preferentially since sterling area countries such as Australia and India have not enjoyed similar cover. Complaints were received from sterling countries which argued very convincingly that they had held sterling through thick and thin and did not deserve this adverse discrimination. The complaints were duly heeded and as a result of recent negotiations with Europeans in Paris the bulk of this exchange guarantee has disappeared.

In viewing the future of the sterling area in the light of Britain's possible move into the Common Market, one comes back to the arguments that have been used about the commercial arrangements. If entry into the Common Market strengthens sterling it should in the long run also strengthen the sterling area. The sterling area has no written constitution. It exists primarily because London provides the market and the banking, insurance and merchanting services which are the operational core of an international payments system. No damage to that core will be done if Britain enters the Common Market.

Business Notes

State Enterprises

PUBLIC PARTICIPATION IN CAPITAL

THE UNION GOVERNMENT appears to have decided against public participation in the share capital of State enterprises. At least that is the impression one gathers from the cryptic statement made by the Union Deputy Finance Minister, Mr. B. R. Bhagat, in the Rajya Sabha last week, while intervening in the debate on the 1960-61 report on the working of the public sector industrial and commercial undertakings. Mr. Bhagat disclosed that the Government had come to the conclusion that public participation in the State undertakings to the extent of 25 per cent capital was "not practical".

In the absence of any reasons put forth by Mr. Bhagat for this decision of the Union Government, it is difficult to say what exactly has prompted the Government to take this attitude. Public participation in State enterprises had been advocated on the grounds that this would help in running these undertakings on commercial basis and release additional resources for the development of the public sector. In the present-day emergency, these two reasons have assumed even greater significance. To fight the Chinese, the Union Government has to mobilise all resources it can. To the extent capital from the public can be available for a minority share in the State enterprises, funds would be available to the Government for meeting the more pressing demands on the Central Exchequer.

No doubt, efforts have been made in the recent past to improve the efficiency of the public sector undertakings through giving greater powers to their general managers and reducing the number of officials on their Boards of Directors, it needs hardly to be emphasised that association of private capital with these enterprises would go a long way in injecting higher efficiency in their functioning. The managements of State enterprises in that event will have to be on their toes to show wholesome results, for the primary objective of all private investments is profit. And profit motive today is not decried even in the socialist countries; utilisation of profits there may be for a different purpose. Premier Khrushchev's recent call to inject into the socialistic structure of the Soviet economy some healthy ingredients of the capitalistic system is an indication of this fact.

Hindustan Lever

INCREASE IN CAPITAL APPROVED

CONSIDERING THE obvious advantages of the offer and the undoubtedly generous gesture of Unilever Ltd., one thought that the extraordinary general meeting of Hindustan Lever Ltd., convened for last Friday, to adopt the relevant resolutions (authorising the increase in the latter company's capital from Rs. 8,24,36,000 — or 82,43,600 shares of Rs. 10 each — to Rs. 9,08,63,250 — 90,86,325 shares of Rs. 10 each—by the creation of 8,42,725 new shares of Rs. 10 each) would not last for more than an hour. But strange are the ways of shareholders, and the Hindustan Lever shareholders chose to drag on the meeting, with one shareholder after another making almost the same points.

One could, of course, understand the concern of the shareholders, especially the smaller ones (with, say, at least 37 shares), about finding the money for 25 right shares at Rs. 35 each or Rs. 875 in a lump sum if asked to pay immediately, but the meeting was only to authorise the proposed increase in capital and to make the offer of the new shares in the proportion indicated to the existing shareholders. If it was just to extract from the management an assurance that sufficient notice would be given to shareholders, as, indeed, one or two shareholders wanted, at least the Chairman, Mr. P. L. Tandon, was the last person to refuse it. But what several shareholders sought to impress upon was that conditions had worsened between the time the directors decided on the proposed increase in capital and now because of the Chinese aggression and that, inasmuch as no one could prophesy how long the resulting emergency would last, the directors should revise the terms of the offer, if only to make it doubly sure that the proposed rights issue did not prove a flop.

Strangely enough, none of those who put forward this view even as much as hinted about the tightness of the money market and the consequent difficulty to find funds — which would have been relevant and more readily accepted. All touched at length, however, on the state of the share market, more perhaps to impress upon the Chairman that the current quotation of Rs. 42 was more artificial than real and that, therefore, his calculating the yield on the probable ex-rights quotation based on this quotation was not valid. Ultimately, however, the resolutions were adopted, after the Chairman had put the whole matter in the form of

BUY ONLY WHEN
YOU MUST

KEEP PRICES
DOWN

a Hobson's choice, as it were. He told the shareholders that the choice before them was whether the company should go ahead with its expansion and diversification programmes or not, and exhorted them that, if they had enough confidence in the future of the company and the country, they should adopt the resolutions as they were.

Mr. Tandon resolutely resisted all suggestions for lowering the premium or for approaching the Government to lower it, as he rightly held that the premium had been jointly agreed to by both the company and the Government and that there was no question of modifying it at this stage. This apart, he pointed out the ludicrousness of any such move after the Unilever Ltd., who presently hold 90 per cent of the shares, had already agreed to the proposal and had, besides, also agreed to make other valuable concessions. The first of these relates to participation in the additional equity to the extent of the foreign exchange required and provision of the said foreign exchange with the consent of the U.K. Government, taking into account the stringent foreign exchange position of this country. The second concerns the voluntary limit imposed by Unilever Ltd., upon its qualification right upto the first 4,22,873 shares only of its total holdings (resulting in the issue to Unilever Ltd., of only 2,85,815 shares) so as to allow of an increase in Indian participation from the present 10 per cent to 15 per cent. These are, indeed, generous, the more so because they have been made at a time when the future is admittedly uncertain, thanks, to the Chinese. That Unilever Ltd., or the British Government would not allow these uncertainties to deter their gesture, one cannot help remarking, stands out in striking contrast to the rather avoidably gloomy picture sought to be conjured up by some Jeremiahs at the shareholders' meeting in India.

Anyway, all's well that ends well. Now that all the resolutions have been adopted, one may expect the company to go ahead not only with the proposed rights issue but also with the projected expansion programme. Besides this programme of expansion, the company may also have to embark on a vast programme of renovation and modernisation. For the present, however, attention is being centred, it would seem, on the Milk Scheme and the dehydrated vegetable schemes at Etah and on the manufacture of non-soapy detergents (Surf), nickel catalyst and animal feed stuffs. Side by side, research facilities are also being extended, and it is noteworthy that the slant in all these researches has been on expansion of activities into new fields, exploitation of the use of more indigenous raw materials and development of products to meet the special requirements of the export trade.

FACT

FIRST IN THE FIELD AGAIN

WITH THE inauguration of the oil gasification plant of the Fertilizers and Chemicals, Travancore, Ltd., (FACT), by Mr. R. Sankar, Chief Minister of Kerala, last week, the second stage of the Rs. 2 crore-expansion programme was completed; simultaneously, the doubling of the production of ammonia from 40 tons a day to 80 tons a day was also achieved. The oil gasification plant has replaced the old uneconomic wood gasification plant, besides also introducing, for the first time in this country, the famous Taxaco process of partial oxidation of oil.

It may be recalled that FACT was the result of the combined bold initiative and endeavour of Dr. C. P. Ramaswamy Aiyar, the then Dewan of the erstwhile Travancore State, as also of the late Mr V. S. Seshasayee, the founder of the famous "Seshasayee House," and Dr K. P. P. Menon, the then Chief Executive Engineer. When FACT started in 1944, it consisted of a wood gasification plant, an ammonia synthesis plant, a sulphuric acid plant, and an ammonium sulphate plant producing as much as 44,000 tons of fertilizers per annum. Soon a superphosphate unit also was added with a production capacity of 44,000 tons per annum. Then came the Korean War, which was a blessing in disguise. FACT was forced to seek ways and means of improving its economies of production. Gypsum, one of the principal raw materials, had to be imported from Cyprus, as the available gypsum reserves here had been fast declining, and this not only added to the already increased cost of production but also made the replacement of its expensive wood gasification plant imperative. Compelled by circumstances thus, FACT took to diversification of its products, which finally led to the establishment of an 8,000-ton ammonium chloride plant.

But a planned expansion scheme was drawn up by FACT only in 1954, after an expert examination had been concluded by a Committee appointed by the Government of India. The first stage of this scheme, involving an outlay of Rs. 3 crores, commenced in 1956 and was completed in 1959-60. It provided for the establishment of an electrolytic hydrogen plant and an air liquefaction plant capable of supplying sufficient gases to make 40 tons of ammonia per day, thereby raising the capacity of the factory from 10,000 tons of nitrogen to 20,000 tons per annum. In order to cope with the increased capacity, a 160-ton sulphuric acid plant was installed, in addition to the two already existing 75-ton plants. The capacity of the ammonia synthesis plant also was increased with the addition of an 80-ton a day converter with the necessary auxiliaries. Along with these, a 10-ton sulphur-doxide recovery plant too was established.

A notable feature of the first stage of development was the introduction of ammonium phosphate (16 : 20 grade) a brand new fertilizer, produced for the first time in the country. With the commissioning of the new oil gasification complex and the completing of the second stage of expansion, the nitrogen capacity of FACT has risen from 10,000 tons to 30,000 tons and of P_2O_5 from 10,300 tons to 13,600 tons per annum, the end-products being 100,000 tons of ammonium sulphate, 33,000 tons of ammonium phosphate, 8,000 tons of ammonium chloride and 44,000 tons of superphosphate. When the Rs. 11-crore final stage of expansion is completed, FACT would be producing, 200,000 tons per annum of ammonium sulphate, 135,000 tons per annum of ammonium phosphate, 25,000 tons per annum of ammonium chloride, and 44,000 tons per annum of superphosphate.

War Risks Insurance

A WELCOME STEP

THE INTRODUCTION of the War Risks Insurance Scheme at this time is most welcome. As during World War II, it has been decided to provide cover for emergency risks and loss or damage arising out of enemy action for industrial property on the one hand and to goods held in India for purposes of sale or in transit from one place to another within the country. The business community had been pressing for it for a long time and feels greatly relieved that this measure has at long last come into being. It is difficult to understand why the Government took so much time to make up its mind.

The maximum annual rate of premium would not exceed 3 per cent of the value insured. It has been proposed to fix a rate of premium at 2 per cent in the case of factories and plants and 3 per cent in the case of inland vessels. There are possibilities that, if the need arose, the scheme may be made applicable to oil installations and tea crops in Assam. The Oriental Fire and General Insurance Company is to be appointed as the agent to operate the scheme. The scheme would not apply to the Government Departments and departmentally-run undertakings but would apply without distinction to factories and plants in the public sector run on commercial lines in the same manner as to those in the private sector. On both the Bills the Government's liability as an insurer is limited to 80 per cent of the insurance value.

The War Risks Insurance should mostly be looked upon as an important instrument for mobilising resources for the defence effort. It is estimated that the fixed industrial assets in the private sector amount to Rs. 5,000 crores in terms of current prices. The income from the insurance of this property, assuming a premium of 2 per cent per annum, will be Rs. 100 crores. If urban and rural housing is brought within the purview of this scheme at a later date the amount that would accrue to the Government will be quite significant. The greatest advantage from the measure of this type would be that the Government would be assured of substantial funds, while the claims will become payable after the termination of hostilities.

Foreign Assistance

NEW LOANS FROM WEST GERMANY

AN AGREEMENT has been signed at New Delhi between the Governments of the Indian Union and the Federal Republic of Germany for the utilization of DM 470 million (Rs. 55.9 crores) credit provided by the

latter under the auspicies of the Aid-India Club for the second year of the Third Plan.

The credit has been allocated as follows:

(i) DM 56 million (Rs. 6.66 crores) for the Rourkela Steel Plant for:
  (a) replacement material, spare parts and machinery for the workshops (Rs. 3.57 crores),
  (b) railway rolling stock and establishment of a wagon repair shop (Rs. 1.31 crores), and
  (c) deputation of operation and maintenance personnel (Rs. 1.78 crores).

(ii) DM 100 million (Rs. 11.9 crores) to be used in 1962-63 for buying raw materials and auxiliaries, semi-finished products and other maintenance requirements of Indian industries. An additional sum of DM 75 million will be utilised during the next financial year for the same purpose.

(iii) DM 50 million (Rs. 5.95 crores) to be given as direct loans to the Industrial Finance Corporation of India, Industrial Credit and Investment Corporation of India and the National Small Industries Corporation which finance industries in the private sector.

(iv) DM 189 million (Rs. 22.5 crores) to be used for mutually agreed projects.

The duration of the loan is for a period of 20 years in all cases. For the first two categories of the loan there will be a grace period of 7 years and the rate of interest will be 3 per cent per annum. The loans to the three financial institutions which will carry an interest of 5½ per cent per annum are repayable by December, 1982. The period of the loan as well as the interest in respect of the amount of DM 189 million earmarked for projects will be determined separately.

TOTAL ASSISTANCE

West Germany has so far granted credits totalling DM 2876.6 million (Rs. 342.43 crores) towards assistanee for our development projects. Out of this, a sum of DM 1176.6 million (Rs. 140 crores) was made available during the Second Plan period and the balance of DM1700 million (Rs. 202.4 crores) which was indicated at the Consortium meeting held in May-June, 1961, is for the Third Plan.

The following is a breakdown of figures:

	Interest	Period	
Second Plan Credits:			
1. DM 660 m. (Rs. 78.57 crores)—1958 for financing payments to West German suppliers under contracts for Rourkela Steel Plant	6.3%	3 years	DM 624 m. used so far and balance of DM 36 m. expected to be used by 31-3-63.
2. DM 168 m. (Rs. 20 crores)—1959 for payments to West German suppliers under contracts concluded before 1-10-59	DM 48 m. 5.25% DM 100 m. 5.7 % DM 20 m. 7 % upto 30-1-61 and 5.5% thereafter.	20 years	Utilised
3. DM 125.1 m. (Rs. 14.89 crores)—1960 for import of equipment from West Germany	6.5 %	20 years	Utilised
4. DM 125.1 m. (Rs. 14.89 crores)—1960 for import of equipment from West Germany	6.5 % upto 19-1-61 and 5.5% thereafter.	15 years	Utilised
5. DM 98.36 m. (Rs. 11.71 crores)—1961 to refinance Rourkela repayments between 30-1-61—31-3-61 ..	5.75%	4 years	Utilised
Third Plan Credits:			
6. DM 230 m. (Rs. 27.38 crores)—1961 to refinance Rourkela repayments between 1-4-61—31-3-62 ..	5.5 %	13 years	Utilised
7. DM 100 m. (Rs. 11.9 crores)—1961 for balance of payments assistance. Includes DM 30 m. for loans through IFC, NSIC and ICICI	5.5 %	20 years	Utilised
8. DM 170 m. (Rs. 20.24 crores)—1961 for balance of payments assistance	3 %	20 years	Utilised
9. DM 85 m. (Rs. 10.12 crores)—1962 for refinancing Rourkela repayments during 1-4-62—31-3-63 ..	5.5 %	12 years	DM 60.3 utilised upto 31-10-62. Balance will be utilised before 31-3-63

Foreign Trade

TRADE WITH EAST EUROPEAN REGION

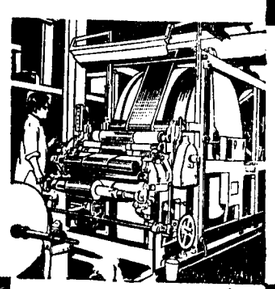
AT A time when we are diversifying our trade, the report of an eight-man delegation which has recently returned from a tour of the East European region, should prove to be highly useful. The delegation in its report has pointed out that there exists a vast scope for trade between India and this region. No doubt in the past there has taken place a substantial increase, but still compared with Western Europe and England, it is not much. The trade at the moment is shrinking with England and Western Europe, so here is an opportunity for us to gain a foothold in the East European region where there exists a vast scope. It is expected that experts would soon be arriving from the East European countries to define their requirements of manufactured goods included in the trade plan finalized by the trade delegation. This should enable the Export Promotion Councils to formulate their programmes for exports to this region for the next year. The State Trading Corporation will continue to be the main exporting agency for this region in respect of textiles. The total trade this year is expected to reach the Rs. 200 crores mark. The commodities where a substantial increase in the export plan is expected are textiles, iron ore, de-oiled cake, rolled steel products in-

60 YEARS IN INDIA

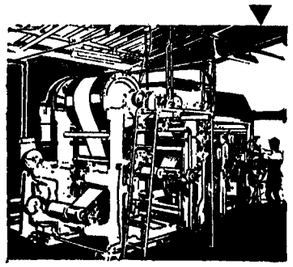
LAMINATING

The making and shaping of aluminium foil is an extremely skilled process. It calls for rigid control in rolling to gauge. Special techniques in applying scientifically formulated coatings. Skill and know-how when mounting foil on carefully selected substrates. Machine techniques, and material and production quality control demand the highest order of technical knowledge and experience—the kind of experience that India Foils have acquired in 60 years.

Heat-seal coating for dehydrated food and pharmaceutical packaging.



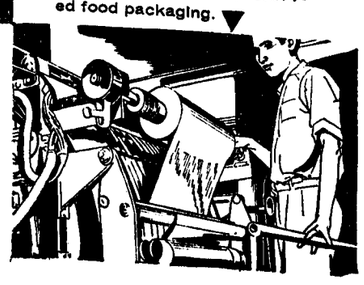
India Foils Limited



(Incorporated in Great Britain)

CALCUTTA BOMBAY MADRAS NEW DELHI

IFOC-36



Foil-Bitumen-Kraft lamination for water-proof outer wraps. Used extensively for the exterior packaging material for cigarettes and where water-proof mass packing is required.

Foil/Paper or Board lamination for Tea, Coffee, Biscuit and Confectionery packaging

Foil/Alkathene lamination for pharmaceuticals and preserved food packaging.

cluding castings and structurals, tobacco and castor oil. These countries have also shown interest in machine tools especially radial drilling machines and textile machinery.

The advantage of trade with the East European countries mainly is that there exists rupee payment arrangements which enable this country to purchase the much needed capital goods by promoting her exports without any strain on foreign exchange reserves. These rupee payment arrangements are also beneficial to the Communist countries because it gives them access to the vast Indian market which has a substantial trade potential for them. It is erroneous to think that the rupee reserves built by the Communist countries will be used for political purposes because it is easy to know at the annual reviews for what purposes the rupees earned by these countries are being used.

The trade delegation has shown the way where an increase in trade can take place. Now it remains for us to utilise this opportunity and try our best to retain these markets. On the domestic front, we must do everything possible to see that the specified type of goods are produced and that there does not take place any deterioration in the quality. It is only through this way that we will be able to establish an ever-lasting impression about the quality of our goods in these countries. The STC will also have to be much more energetic than before.

Non-ferrous Metals

LEAD AND ZINC INFORMATION CENTRE

WITH A view to serving the zinc and lead using industries in India with latest technical and scientific information on the wide range of processes in which zinc and lead are used, an Indian Lead and Zinc Information Centre is being set up in Calcutta by the internationally known Zinc and Lead Development Associations of Berkeley Square, London. Since January 1961 the Zinc Development Association and the Lead Development Association, which were till then two separate entities, have been integrated into one and the two associations will now work in close harmony in the establishment of the Indian Centre.

One of the functions of the Indian Centre will be to arrange small conference and discussion groups which will provide an occasion for the experts to meet together and exchange their ideas and views on matters of common interest. This apart, discussion on European practices will encourage technical progress here and the more efficient use of the two metals.

The abstracting service which in the past mainly covered the principal zinc and lead using processes, has been made much more comprehensive and now includes most of the minor uses of the two metals. Reports on the research work now being carried under Expanded Research Programme will be available through this Centre along with the information on the research and development work being carried out in the U.K., Europe and elsewhere.

Rubber

MADRAS RUBBER FACTORY COMMISSIONED

MR. R. VENKETARAMAN, Minister for Industry and Commerce in the Madras Cabinet, commissioned the main plant of Madras Rubber Factory last week. The occasion marked the start of this factory as a unit that will produce Mainsfield Tyres on a large scale. The capacity of the factory at full production will be nearly 3.6 lakh tyres and tubes every year. The factory had started with a pilot project, a unique idea tried for the first time in the country. It primarily helped to train Indian technicians and at the same time it gave an opportunity to test the tyres produced by the unit under the Indian conditions of climate and roads. It was indicated at the occasion that the results have been quite satisfactory. Now the company has launched the large-scale production.

Madras Rubber Factory is an instance of Indo-American co-operation in the field of industrial development. Mr. Venketaraman observed that the technical know-how and the latest improvements were being offered by the American collaborators, which definitely will help the unit. Mr. M. L. Bayer, personal representative of the President of the Mainsfield Tire and Rubber Company of Mainsfield, Ohio, U.S.A., who was present on the occasion, pointed out that Indian technicians have been trained very well and the present Madras factory has now one of the most well-equipped plants in India.

Cattle

DRY COW FARM'S IMPORTANCE

WHEN THE need for improving the cattle wealth of the country and increasing milk production thereof are being realised, it is gratifying to put on record the performance the Alamadhi Dry Cow Farm Project near Madras has demonstrated in recent years. The farm, maintained and run by the Animal Husbandry Department of the Madras State Government, was started with two-fold objectives. Firstly, to help the owners of cows from Madras City to keep their animals in the farm during their dry periods on a nominal fee and to return them to the owners after proper breeding and calving. Secondly, to prevent valuable cows from being sold for slaughter when they go dry.

Being one of the subsidised schemes, it costs the State Government nearly Rs. 1 lakh every year. At present it has a strength of 350 cows. On an average about 50 cows are admitted every month while a similar number return to their owners during the time after calving. Permanent pasture land is being progressively expanded at the farm to meet the growing needs and special varieties of fodder grass like Australian Drought-Resistant Grass, Buffalo Grass etc., are cultivated over large areas. The farm has its own full-fledged veterinary staff to take good care of the cows by periodical medical check-ups. Besides, the farm maintains its own excellent bulls of various types.

Dry cow farming in this country has not made much headway, although the need for it has never been felt any less. When the cows go dry and cannot yield any return to the owner, they are cared less than when they are milch. The need to keep them in good health till the time of next breed has hardly been realised and it is to this long-felt need the attention of the Government must now turn.

EXPERTS COMMITTEE ON COST REDUCTION STUDIES

FOLLOWING THE recommendations of the Board of Trade, the Government of India has appointed an Experts Committee on Cost Reduction Studies for formulating cost reduction programmes in respect of export commodities. The Committee will be headed by Dr. S. K. Muranjan as full-time Chairman. Dr. S. R. Sen of the Planning Commission will be one of its members. The Committee will have a Cost Accountant and a Research Officer to assist them in their work.

The terms of reference of the Committee are:

(i) to make intensive studies of the cost structure of specific commodities and industrial products which play a prominent role in the export trade of India;

(ii) to analyse in detail the various factors that go into the cost of production of such commodities and manufactured articles, and to make recommendations to the Central and State Gov-

ernments, on the one hand, and to industries, agriculture sector and commercial interests, on the other, so as to bring down the cost of production by (a) rationalising various burdens and imposts on these commodities and articles, (b) by increasing productivity, diversification, quality improvement and grading and (c) by such other measures as will make the commodities and manufactured articles more competitive in the world markets; and

(iii) to study, wherever necessary, policies and practices of production of different commodities and manufactured articles and to make confidential recommendations to the Government to take measures to develop production for export at competitive prices.

The Committee will start with the cost studies for vegetable oils, textile fabrics, (cotton, jute, man-made fabrics, woollen and mixed fabrics), sewing machines and bicycles.

Announcing

the publication of two new Law Journals—the Income-tax Journal and the Company Law Journal by the well-known firm of legal publishers, the M. L. J. Office, Madras. The two journals will make their appearance in January, 1963.

Leading Advocates, Chartered Accountants and top ranking specialists in Company Law and Income-tax Law and Practice will serve on the Editorial Board and will guide the policies of the Journals and enhance their usefulness.

INCOME-TAX JOURNAL

Prompt reporting of cases on Income-tax, Estate Duty, Gift Tax and Wealth Tax with exhaustive headnotes.

Articles by specialists on topics of interest.

Publication of select English Cases.

Issued Fortnightly — Two Volumes per Year
Annual Subscription Rs. 40. Post free

COMPANY LAW JOURNAL

Prompt reporting of cases on Companies Act, Banking Companies Act and Insurance Act. Articles on subjects of interest to Executives, Accountants, Advocates, and Auditors.

A Question and Answer departm ent which will answer simple queries from subscribers, free of charge.

Publication of select Foreign Cases.

Issued Fortnightly—Two Volumes per Year
Annual Subscription Rs. 25. Post free

SPECIAL INTRODUCTORY OFFER

On the inauguration of the new journals the Publishers offer a special Introductory Rate. Subscriptions for both the Journals received before 31st January, '63 will be accepted at the reduced rate of Rs. 50 instead of at Rs. 65.

For the I.T.J. the introductory offer rate will be Rs.30
For the C.L.J. the introductory offer rate will be Rs. 20.

Here is a valuable opportunity to equip one's library with standard journals at a rate that is a real bargain.

Note.—* A specimen copy will be sent on request.

M.L.J. OFFICE, P.B. 604, MADRAS-4.

FROM THE CAPITAL'S CORRIDORS

STATES ASKED TO MAKE HIGHER ALLOCATIONS FOR AGRICULTURE

WITH no confirmation available of the withdrawal of the Chinese troops from the positions occupied by them after their recent invasion in Ladakh and NEFA, the Government of India countinues to prepare the country for all exigencies. A number of steps were taken last week to strengthen the defence effort.

In a note sent to the State Governments, after consultation with the Planning Commission, the Union Minister for Food and Agriculture, Mr. S. K. Patil, has asked the State Governments to make, within the over-all Third Plan ceilings for 1963-64, "substantially" higher allocations for agricultural production, minor irrigation and soil conservation and to step up the financial resources available for agricultural component of the Community Development Programme.

The Minister has also directed the State Governments that increased allocations should as well be made for specific programmes to step up the production of rice, millets, gram and other pulses, cotton, oilseeds (particularly groundnuts and castorseeds), fruits, vegetables, milk, meat and eggs.

The State Governments have also been asked to review the present schemes of subsidies in force in their areas so that such schemes as may now be obsolete, may be abolished or changes brought about in them to provide the needed stimulus to the programme for accelerating production in an effort to achieve higher targets of output than those envisaged under the Third Plan.

STEPPING UP OUTPUT OF ENGINEERING INDUSTRIES

At a meeting of the Informal Consultative Committee of Parliament attached to his Ministry, the Union Minister for Steel and Heavy Industries, Mr. C. Subramaniam, stated that the Government would consider favourably all proposals from foreign concerns for collaboration in expanding India's light as well as heavy machine tools industry. The present licensed capacity of the machine tools industry in this country is of the order of Rs. 22 crores. But requirements at the end of the Third Plan are estimated at Rs. 60 crores. Mr. Subramaniam pointed out that this called for rapid expansion of the machine tools industry, not only to meet the growing civilian demand, but also to satisfy the defence needs.

Some units which have been licensed to increase their production capacity, the Minister added, were expected to complete their expansion programmes in the near future as foreign exchange was being made available to them expeditiously. With the commissioning of the increased capacity of these units, the manufacture of machine tools, both in the public sector and the private sector, would be stepped up considerably.

Mr. Subramaniam stressed that a very high priority had to be given to the heavy machine tools manufacturing programme. His Ministry was awaiting reports from the British and American teams on this subject and proposals for foreign collaboration would be examined on receipt of these reports.

The Minister also dwelt at some length on the manufacture of diesel engines, tractors and electrical equipment as also on the progress achieved by the heavy engineering industry. He informed the Committee that the production of diesel engines at present was sufficient to meet the defence needs. A number of new schemes had also been sanctioned recently for the manufacture of these engines. As soon as they are implemented, the production of diesel engines would expand considerably, thus easing the situation further, particularly from the point of view of civilian use. Manufacture of crawler tractors, Mr. Subramaniam pointed out, could only be undertaken by the ordnance factories, since demand for them was only from the Defence Ministry. No unit in the private sector is manufacturing crawler tractors.

Necessary steps, the Minister assured, were being taken to step up manufacture of electrical equipment. The Heavy Electricals Factory at Bhopal is expanding production according to its phased programme. The private firms manufacturing heavy electrical equipment are being given necessary facilities for maximum utilisation of their installed capacity, subject, of course, to the availability of foreign exchange.

In regard to heavy engineering industry, the Minister pointed out that substantial capacity had been created for the manufacture of cement machinery, coal washing machinery, paper-making machinery, etc. All this capacity, as also the capacity which is in the process of installation, can be made use of for defence purposes without much difficulty. Efforts are also being made to speed up the work on setting up the Heavy Engineering Project at Ranchi and to complete it as early as possible.

US LOANS FOR TWO AUTOMOBILE CONCERNS

The US Ambassador in India, Mr. J. K. Galbraith, last week announced two loans, totalling $29.5 million (Rs. 14 crores), to help India expand the manufacture of lorries. The recipients of these loans are Hindustan Motors Limited and Tata Engineering and Locomotive Company Limited. The former company will receive a loan of $15.8 million (Rs. 7.5 crores) and the latter $13.7 million (Rs. 6.5 crores).

Both the loans will be in foreign exchange and are to be provided by the United States Development Loan Fund to the Government of India at its usual terms and conditions. These are: (1) repayment is to be made by the Government of India over a period of 40 years, with no payment being due during the first ten years; and (2) there is to be no interest charge, but only a service charge of three-quarters of one per cent is to be paid. The two companies will receive the loans from the Government of India and will be required to repay them to the latter over a period of 10 years with a service charge of 5¾ per cent.

The loan to Telco will enable it to expand its lorry plant's capacity from 12,000 vehicles a year to 18,000 vehicles a year and increase the indigenously manufactured content of these vehicles from 74 per cent to 86 per cent by 1964 and to 90 per cent by 1965. The company will be expanding its alloy iron foundry to meet 100 per cent of its requirements for castings and the forge shop is to be augmented to make the entire range of forgings required for the future production of 24,000 vehicles per annum. It will also provide machining, pressing and assembling equipment for the production of 18,000 vehicles per year. The whole of this expansion programme is to be completed by 1963-64. Technical assistance would be arranged with Daimler-Benz AG of West Germany. Preliminary site preparations and construction of buildings are underway.

Telco's plant is located at Jamshedpur. It began operation in October, 1954, and the initial production target of 3,000 vehicles per annum was attained in a few months. The lorry production at this plant has been progressively expanded to 6,000 vehicles a year

in 1955, 7,200 vehicles in 1958 and 12,000 vehicles from January, 1961.

The loan to Hindustan Motors will enable it to step up its Bedford vehicles manufacturing capacity from 9,000 to 10,500 units per annum. The increase in indigenously manufactured content in them is envisaged to go up from 74 per cent to 90 per cent. The project involves import of machinery, equipment and tools to be installed in the machine shop, press plant, forge shop and foundry along with other related production activities. The machinery will be used for the manufacture of sheet metal stampings, springs, axle assemblies, chassis frames and related components of Hindustan vehicles.

Hindustan Motors has its plant in Uttarpara, in Hooghly District of West Bengal, about eight miles north-west of Calcutta. It covers a site of 735 acres. Presently, 25 per cent of the trucks and 50 per cent of the autos manufactured in India come out from this unit.

Along with the two credits made available by the US Development Loan Fund, totalling $10.2 million, to Premier Automobiles Limited, sometime ago, these two loans, it is hoped, will enable India to meet a large portion of her demand for lorries and jeeps, which is estimated to go up from about 28,000 lorries and 6,000 jeeps per annum in 1960-61 to 60,000 lorries and 10,000 jeeps a year by 1965-66.

WAR RISKS INSURANCE

Two Bills dealing with war insurance were introduced and passed by Lok Sabha last week. They were the Emergency Risks (Factories) Insurance Bill and the Emergency Risks (Goods) Insurance Bill.

As the degree of war risks is necessarily uncertain, it was considered that it would not be possible for the established insurers to cover them in the normal course. The scheme had, therefore, to be formulated and operated on behalf of the Central Government.

The two Bills seek to provide for drawing up a scheme of insurance based on premium rates which can be varied within certain limits with reference to the actual nature and extent of the risks as they may exist from time to time.

The Emergency Risks (Goods) Insurance Bill envisages that the rate of premium may not exceed $\frac{1}{4}$th of one per cent of the insurable value per quarter, to begin with. All persons holding property for sale in excess of a certain limit, namely Rs. 30,000 in any one district, would have to take out policies of insurance under this legislation compulsarily. Provision, however, has been made for exclusion of certain goods from the scope of this legislation. Intention is that the goods which are to be excluded should broadly be the same as in the last world war. But if any special problems exist in relation to goods of any class or description, Government, of course, will have the power to include or exclude them as the case may be at any time.

Under the Emergency Risks (Factories) Insurance Bill, the rate of premium may not exceed 4 per cent in two years or 2 per cent per annum payable in suitable quarterly instalments. A ceiling premium rate of 3 per cent was, however, passed by the House. In actual practice, the Finance Minister indicated, the premium rate for factories would not exceed 2 per cent. For inland vessels, for which the Government was empowered to fix different rates, the rate would not exceed 3 per cent.

It has been explained that under the Factories Insurance Bill, in view of the growth of mineral oil industry in recent years and the somewhat special position and importance of the tea industry in Assam, power has been acquired to provide, in case it becomes expedient or desirable to do so, insurance cover in respect of the plant, machinery and equipment of the oil companies or the standing tea crops, as the case may be, in addition to any other insurance which may be available in the normal course.

Government property is not insurable. It is, however, explained that this exemption in favour of the Government is available only in respect of factories or other properties which are departmentally-owned. The autonomous public sector undertakings and enterprises will, according to the scheme of the Bill, be subject to the same burdens and be eligible for the same rights as other units in the private sector.

The Oriental Fire and General Insurance Company, which has been appointed Government's agent for executing war risks insurance, will be making adequate arrangements for the persons who are liable to take out policies of insurance under this Act, to get any information or clarifications which they may need and to pay the premiums and to receive the policies or other benefits without inconvenience or delay.

PERSONAL INJURIES (EMERGENCY PROVISIONS) BILL

Apart from the above two war risks insurance measures, the Union Government has also sought powers to formulate a scheme for grant of relief during the current emergency in respect of (a) personal injuries sustained by gainfully occupied persons and by persons of such other classes as may be specified; and (b) personal service injuries sustained by civil defence volunteers. A Bill to this effect was introduced in Lok Sabha last week.

Persons suffering a personal injury or a personal service injury and benefiting from this proposed legislation will not be entitled to any relief under the Workmen's Compensation Act, 1923, or the Employees' State Insurance Act, 1948.

NEW DEFENCE CERTIFICATES

The Government of India has announced the issue of a new series of Defence Certificates for sale abroad with effect from December 20, 1962. For the present, these sales will only be made across the counter of the Indian Embassy in Washington and the High Commission of India in London.

The certificates will be issued in three denominations—Rs. 100, Rs. 500 and Rs. 1,000. They will be repaid at the end of 10 years after the date of sale at a premium of 60 per cent. There is no limit set for individual investments. The premium payable will be exempt from Indian income-tax.

The maturity value of the certificates will be repaid in India, but holders resident outside India will be permitted to repatriate the whole of this amount to their places of residence.

COMPANY DIRECTORSHIPS

A recent survey made by the Company Law Administration of the pattern of directorships of the big-sized companies makes an interesting reading. The following are its highlights.

(1) **Average Directorships Per Person:** The total number of directorships in the 331 companies selected for the survey came to 2,419 held by 1,502 persons acting as directors. On an average, a person was found to be holding 1.6 directorships in the aforesaid companies. These 1,502 persons, however, were found to be holding 9,785 directorships on the all-India basis, including the 2,419 directorships held in the 331 companies covered in the survey.

(2) **Directors Nominated by Managing Agents:** According to the study, out of the 331 companies, 90 companies were managed by managing agents and the number of their directorships came to 681. Out of these 681 directors, 157 were nominated directors. On an average-

Our E.R.W. Tubes, manufactured from high quality cold rolled steel strip lend strength to delicate steel furniture. The fine surface finish, dimensional accuracy, lightness and strength of these tubes, make steel furniture strong, light, functional and attractive.

"Here are five ways

BOAC Air Cargo can help your business!"

★ *Fast* BOAC jetliners slash transit time by *hours*.

★ *Direct* BOAC city-to-city freighting cuts out time wasting journeys to and from docks.

★ *Simple* (cheap) packaging is all that's needed with careful BOAC handling.

★ *Safe*, efficient BOAC freighting means lower insurance costs, wider coverage.

★ *Experienced* BOAC staff give all goods *individual* attention all the way.

We deliver your goods in hours, instead of days or weeks! And that's only one of the things you gain. Speed alone may not be enough for you—but BOAC Air Cargo gives more and more successful businessmen these extra advantages...advantages that can help and benefit *your* business!

Ask for details now—from your Forwarding Agent or BOAC offices at:

BOMBAY - NEW DELHI - CALCUTTA - MADRAS - COCHIN

B·O·A·C GIVES YOUR CARGO JET-AGE HANDLING

BRITISH OVERSEAS AIRWAYS CORPORATION IN ASSOCIATION WITH AIR-INDIA AND QANTAS

sized Board of 8 directors of these companies, two were the nominees of the managing agents. The managing agents, thus, exercised to the full extent the discretion of nominating directors granted to them by the Company Law.

(3) **Non-Indian Directors:** Out of the 1,502 directors, 345 directors were of non-Indian nationality. These foreign directors held 2,184 directorships. Thus, 22.3 per cent of the total directorships were held by the 345 directors of foreign nationality. Out of the 331 companies, 139 companies had Boards which included foreign directors. Of these, in 65 companies foreign directors were in majority, in 14 companies they were in equal strength with the Indian directors, and in 60 companies they were in minority. In the 139 companies where foreign element was present on the Boards of Directors, the ratio of Indian directors to foreign directors worked out as 1 : 1. As against this overall ratio, in the companies with foreign directors' predominance, the ratio of Indian to foreign directors worked out as 1 : 3, whereas in the companies with Indian predominance on the Boards, the ratio was reversed, namely 3 : 1.

(4) **Multiple Directorships :** An unofficial study of the multiple directorships made for the year 1949-50 which took into account the developments that had taken place during the war and post-World War II period revealed that about 100 persons held as many as 1,700 directorships of important concerns and of these, 30 persons among themselves held as many as 860 directorships, that is to say, on an average, 29 directorships per person. The same study further revealed that 10 top industrialists held about 400 directorships and of these 2 persons held as many as 50 directorships each. Commenting on this question of multiple directorships, the Bhabha Committee later stated that "in the course of our enquiry, it has been brought to our notice that even now the holding of 15 to 20 directorships is common, while the holding of 30 or more directorships is by no means unusual."

The present survey reveals that, of the 1,502 directors, 26.6 per cent held a single directorship, 53.2 per cent held two to ten directorships, 14.4 per cent eleven to twenty directorships and 5.8 per cent more than 20 directorships. In absolute terms, out of 1,502 directors, 399 held one directorship each, 799 between two to ten directorships, 217 between 11 to 20 directorships and 87 more than 20 directorships.

(5) **Inter - State Interests of Directors :** A surprising finding from the study of the inter-State interests of the directors is that in the case of the big and giant-sized companies which might be expected to be having on their Boards men of inter-State stature, only 117 out of the 1,502 directors served on the Boards of companies registered in two or more States of the country. Out of the remaining 1,385 directors, 986 directors served on more than one company registered in a single State. Of the 117 directors having inter - State interests, 102 directors served on companies registered in 2 States, 9 directors in companies registered in 3 States, 4 directors in companies registered in 4 States and 2 directors in companies registered in 5 States.

(6) **Directors' Age Pattern :** A detailed study of the age pattern of 1,320 directors belonging to 331 companies reveals that 113 directors were of 30 years or less of age, accounting for nearly 8.5 per cent of the total. The number of directors of the age group between 31-45 years and that of the directors of the age group of 46-55 years is 333 and 466, or, in terms of percentage, 25.2 per cent and 35.3 per cent, respectively. The number of directors in the age group between 56-65 years was 262, i.e. 20 per cent of the total. The number of superannuated directors, namely, those over the age of 65 years, was 146—11 per cent of the total. Dividing the directors in two categories, namely, 'young' directors who were of 45 years of age or less and 'mature and seasoned' directors whose age was over 45 years, it is seen that the former accounted for nearly 1/3rd of the total directors whereas 2/3rd were of the latter group.

(7) **Directors' Holdings :** Information on directors' holdings in the share capital of the companies is available for 883 directors belonging to 121 companies, out of the 2,419 directors (inclusive of duplication) serving in the 331 companies covered by this survey. Investigations have revealed that 883 directors of the 121 companies held among themselves, directly in their own names, 6 per cent of the total paid-up capital of the companies of which they were directors. The percentage holdings of the directors in the managing agency managed companies further work out to around 3 per cent, whereas those of the directors of the companies which are managed directly by Boards of Directors work out to around 9 per cent. The financial stake of the directors in the case of the managing agency managed companies is low because control in such companies is retained by the managing agency firm and not by the Board of Directors. As against this, it is quite understandable that the holdings of the directors in the companies managed by Boards of Directors should be higher as in their case, control and management of the companies are retained by the directors by virtue of the control over majority of the share capital of the company.

From the point of view of control, the present figure of 9 per cent appears to be very low and indicates that the directors, directly or indirectly, control a fairly high proportion of the capital of the companies through their benamdars, relatives, friends and financial institutions. Here it must also be mentioned that due to the dispersal of shareholdings over a large number of persons, majority of which is not taking active interest in corporate decisions, it is not necessary to have majority of the voting rights to get or retain the control of the company. Sometimes, even a block of 10 per cent to 20 per cent of the voting rights is enough to take over the control of the company. Apart from dispersed holdings, there are substantial holdings of share capital by disinterested financial institutions.

(8) **Holdings of Foreign Directors Smaller than those of Indian Directors :** A separate enquiry made into the financial stake of the foreign and Indian directors in the companies on whose Boards of Directors both were represented, reveals that the holdings of the foreign directors amounted to less than those of the Indian directors. In the 52 companies, where foreign directors were on the Boards of Directors, the average holdings per foreign director worked out to Rs. 48,000, whereas those of the Indian directors came to Rs. 64,000. If the 21 companies where foreign directors predominated in number on the Boards were alone taken into account, the average holdings of the foreign directors were observed to be Rs. 77,000, whereas those of their Indian counterparts were Rs. 1,05,000. In the seven companies where foreign directors were equal in number to the Indian directors, the average holdings of the foreign directors came to Rs. 23,000 as against Rs. 83,000 of the Indian directors. Further, in the 24 companies on whose Boards foreigners were in minority, the average holdings of the foreign directors came to Rs. 20,000, as against Rs. 37,000 of the Indian directors.

SECOND SHIPYARD

The Shipping Delegation from Mitsubishi Shoji Kaisha Ltd., which came to India a few days ago for preliminary talks about setting up the second shipyard at Cochin, concluded its discussions last week with the Union Minister for Transport and Communications, Mr.

Jagjivan Ram; the Minister for Shipping, Mr. Raj Bahadur; Planning Commission; the Controller-General of Defence Production; the Director-General of Shipping and other officers of the Union Transport Department.

The delegation has indicated that the proposed site at Cochin is easily the best location for the second shipyard. The delegation will be submitting a detailed report about the project later.

About equity participation and Japanese collaboration in the venture, the delegation has reserved its comments which it will express only after consultation with the principals in Japan.

MORMUGAO PORT

The Government of India has sanctioned the purchase of a dredger for the port of Mormugao. The dredger will be of motor-driven trailing suction hopper type and is estimated to cost about Rs. 80 lakhs. The contract for its supply has been placed with Messrs. I.H.C. Holland, a firm of ship-builders and engineers of the Hague.

The Department of Transport of the Central Government took over administrative control of the port of Mormugao from the Ministry of External Affairs last month. Proposals are now under study for providing improved shore facilities at the port for the export of iron ore and general cargo.

DISPOSAL OF DIPLOMATIC CARS IN INDIA

The procedure for the disposal of cars imported without payment of customs duty by diplomats and Diplomatic Missions/Organisations in India has been revised.

A diplomat leaving India, either on transfer or at the end of his assignment, may re-export his car or sell it to another diplomat or diplomatic mission in this country. Alternatively, he may offer to sell it to the State Trading Corporation. If the offer is accepted, the car would be purchased at the full c.i.f. price without deduction of any depreciation charges. If the State Trading Corporation is not interested in the offer, the diplomat will be informed accordingly and he will then be free to sell the car in the open market. Such a sale, however, will be subject to the fulfilment of customs regulations regarding payment of duty, procedure for sale, disposal, etc.

This revised procedure will also apply to cars and similar vehicles of diplomatic missions or organisations which are proposed to be offered for sale in India.

SUGAR EXPORTS TO USA

India can supply to the United States 20,332 tons of sugar during 1963. This amount would be India's guaranteed share of the US sugar market under the total US sugar quota of 9,800,000 short tons, raw value, proclaimed by Mr. Freeman for next year.

The quota awarded to India is unchanged from that tentatively suggested by the US Agriculture Secretary two weeks ago, when he proposed that the United States should acquire a large part of its sugar requirements from foreign countries.

India would also be free to bid by December 20 next to supply a part of the 750,000 tons of sugar USA would buy between January 1 and May 31, 1963, under the global quota plan. She would, however, have to agree to use the dollar proceeds from the sale of this sugar for buying US farm products.

EXPORT OF JUTE MANUFACTURES

The Government of India has introduced a scheme for voluntary registration of sale contracts for the export of jute manufactures. A four-member committee has been set up for this purpose.

All sale contracts for which registration is applied for under the scheme will be scrutinised by this Committee. The Committee will take into account such facts as the ruling prices at the time of the contracts, the normal recognised trade practices in regard to allowable variations from such prices, extensions of contracts, premiums and penalties for optional specifications rebate and trade discounts while scrutinising the contracts. The Committee will, if it is satisfied that the terms of the contract are acceptable, issue a registration certificate within seven clear working days from the date of application.

The production of the registration certificate at the time of shipment will ordinarily be accepted by the customs authorities as sufficient proof of the scope of contract prices and related financial terms.

PATIL ON CONSUMERS' Vs. FARMERS' INTEREST

Addressing a meeting of the Informal Consultative Committee of Parliament attached to his Ministry, the Union Food and Agriculture Minister, Mr. S. K. Patil, dwelt at length on the controversy of consumers' versus farmers' interest in so far as prices of various agricultural commodities are concerned. He is stated to have said that while it is necessary to ensure adequate supplies of foodgrains to consumers at reasonable prices, it should be done by cutting the profit margins of intermediaries and not at the expense of the farmers. He pointed out that only about 30 per cent of the population mostly living in cities was the consumer in the real sense of the term. The remainder 70 per cent population consisted of producer-consumers. He stressed that agriculture would not progress unless the farmer had the "surest guarantee" that he would get a suitable return for his labours.

For this reason, Mr. Patil added, the Government had initiated moves to support and protect the agriculturist as much as it could. To ensure a minimum price for his products, the Government had in the recent past attempted to fix support prices for wheat and rice, besides the prices fixed for purchase by the trade and industry of sugarcane and cotton. Rice procurement prices, Mr. Patil said, had been fixed between Rs. 14.50 per maund and Rs. 18 or a little more for different regions and different varieties.

For increased procurement of rice this year, in view of the emergency, Mr. Patil hinted that he would even give slightly higher prices than last year. With a view to step up rice production next year, he promised an increase in the current minimum prices.

CDFC TO SUBSCRIBE TO INDIAN ALUMINIUM DEBENTURES

The Commonwealth Development Finance Company Ltd., (CDFC), has agreed to subscribe to Indian Aluminium's forthcoming debenture issue to the tune of £500,000. A press statement issued in London by CDFC says: "This sum will contribute towards the total cost of £4,780,000 for expanding the company's existing aluminium smelter capacity at Alupuram, in Kerala, and building a new aluminium foil rolling and converting plant near Bombay."

COAL MINING

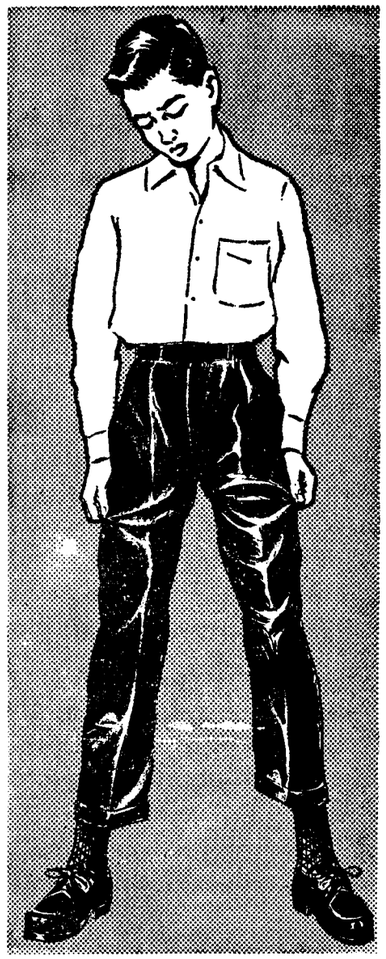
An agreement has been signed between the National Coal Development Corporation and CEKOP, a Polish for another deep shaft mine for the Corporation.

The equipment to be supplied by the Polish organisation will cost over Rs. 50 lakhs and will be part of the credit of Rs. 14.3 crores provided by the Indo-Polish Economic Co-operation Agreement of May 7, 1960.

Delivery of the equipment will start in about 15 months' time.

The Birthday Gift

Mother stitched a pair of trousers for his birthday and sent them to the laundry so that they would look fresh, crisp, new. But they shrunk—she had forgotten to look for the label 'Sanforized'!



If only she'd taken a little more care in the selection of the fabric, these trousers would have retained their immaculate fit even after many, many washings.

Make certain you get the full measure of value of the material you buy—

Look for 'SANFORIZED' REGD TO MK *on the label*

and your clothes will never shrink out of fit!

Issued by Cluett, Peabody & Co., Inc. (Incorporated in the U.S.A. with limited liability) proprietors of the registered trademark 'SANFORIZED'. The trademark proprietors use the trademark SANFORIZED, or permit the said trademark to be used by registered users authorized to use the trademark, only in respect of tested fabric which meets the trademark proprietors' strict requirements as to residual shrinkage.

For information: 'Sanforized' Service, 95 Marine Drive, Bombay 2

The trademark 'SANFORIZED'—registered and trusted in 129 countries of the world—is a vital force for the export of Indian textiles.

3rd VALUATION RESULTS

BONUS

WHOLE LIFE ASSURANCES
Rs. 16.00
per thousand per annum

ENDOWMENT ASSURANCES
Rs. 12.80
per thousand per annum

The Life Insurance Corporation has pleasure in declaring the above rates of bonus as a result of the third Valuation of its liabilities and assets as at 31st December 1961. These bonus rates are applicable to with-profits policies issued by the Corporation and which were in force for full sum assured as at the date of Valuation.

The total sums assured and bonuses under 85,81,367 policies in force on the date of the Valuation amounted to Rs. 2738 crores, and the total amount payable under 10,297 Life Annuities was Rs. 1,09,50,470 per annum. Out of the total profits available for distribution amounting to Rs. 34.45 crores, a sum of Rs. 32.73 crores has been utilised for allotting bonuses at the above rates to the policyholders. Government's share of surplus amounted to Rs. 1.72 crores.

The rates of bonuses on with-profits policies of the erstwhile insurers also remain the same as those declared under the Differential Bonus Scheme on the occasion of the first and second Valuations.

Bonus intimations in respect of the third Valuation will be sent out to the policyholders as soon as possible.

NEWS IN BRIEF

INDIAN

India's first space rocket launching centre is to be located in the Kerala State.

*

The Bihar Government proposes to set up a mining corporation to exploit mineral resources in the State.

*

A delegation of rubber goods manufacturers has left for a 40-day tour of West Asia and East Africa.

*

The Union Government has decided to take over the Hatti Gold Mines from the Mysore State Government.

*

India has applied for the membership of the 18-nation International Federation of Cotton and Allied Textile Industries which has its headquarters at Manchester.

*

The Government of Gujarat has decided to set up a mineral development corporation to undertake the exploration and development of certain key minerals in the State.

*

The deep-sea fishing scheme for Kolaba district, Bombay, was inaugurated on December 2. Two trawlers of a capacity of 5 tons each and equipped with "echo sound" equipment were launched on this occassion.

*

The first continuous casting plant in India is being set up at Canara Workshops, Mangalore, by Distington Engineering Company, a subsidiary of the United Steel Companies Ltd.

*

The Entomological Department of the State Agricultural Department, Ludhiana, has formulated a scheme for effective pest control through gamma-rays, x-rays and radio-isotopes.

*

The Nitrolime unit of Hindustan Steel's fertiliser plant at Rourkela went into trial production on November 30. The plant has a rated capacity of 580,000 tonnes of nitrolime per year, but will run at half the capacity till regular supplies of raw material are assured.

*

The first Indian plant for the manufacture of plastic injection moulding machines is expected to go into production in November, 1963. The plant is being erected by Engel India Machines and Tools Ltd., Calcutta, with Austrian collaboration.

*

The Nylon plant of Nirlon Synthetic Fibres and Chemicals Private Ltd., Bombay—the biggest of its kind in India—was inaugurated by Mr. Morarji Desai, Union Finance Minister, on December 2. It has at present a capacity of two tons per day A licence has been issued to this company to expand its capacity upto 5½ tons per day.

*

The factory of Synthetics and Chemicals Ltd., in Uttar Pradesh, is nearing completion and is expected to go into production in January, 1963. Built at an estimated cost of Rs. 20 crores, it has an annual capacity of 30,000 tons of synthetic rubber and will save foreign exchange to the extent of Rs. 10 crores per year.

FOREIGN

The United Nations Economic Commission for Africa will shortly open a demographic centre in Cairo.

*

West Germany has promised a credit of DM 20 million to Cambodia for various development projects.

*

The world's newest jet airliner, Boeing 727, is scheduled to make its maiden flight in January, 1963.

*

The United States, had at the beginning of 1962, 58,000,000 television sets, about half the world's total.

*

Large reserves of thorium have been reported in the White Mountains, New Hampshire, USA.

*

An official publication reports that today 98 per cent of the farms in the United States are electrified, as against 11 per cent in 1936.

*

The Swiss Foundation for Technical Aid will provide assistance to the tune of 550,000 Swiss francs to Nigeria for trainees schemes in engineering trades.

*

The United States and the Soviet Union will launch seven scientific satellites during 1963-65 under a recent bilateral pact for co-operative space research.

*

Chas Pfizer of USA has announced an extensive programme of production of lactic cultures for use in cheese and other fermented milk products.

*

A Soviet publication states that 23,000 part-time students from all over the country are enrolled in the Polytechnic Correspondence Institute of Leningrad.

*

It was officially announced that the United States has 286 nuclear reactors in operation or under construction, compared to 39 each in Britain and the Soviet Union.

*

Soviet geologists have reported extensive reserves of oil and natural gas in the Mangyshlak peninsula in the Caspian.

*

The Government of Ceylon has decided to establish two more "instant tea" factories. Already one such factory has been set up at Agrapatna.

*

An agreement providing for the supply of 300,000 tons of Australian raw sugar to Japan was recently signed in Tokyo.

*

Europe's biggest hotel, with 3,400 apartments, is being built on the bank of the Moscow River near the Kremlin. The construction is expected to be completed in 1965.

*

The daily output of coal per miner in the United States has gone up to 145 tons, more than twice the figure for 1952.

*

Mr. George Champion, Chairman of the Chase Manhatten Bank, has proposed the creation of a multi-national world aid organisation staged by businessmen "to make a completely new approach to foreign aid".

*

A new journal, "ULTRASONICS", covering the principles and practice of ultrasonics and allied technology, will be published in January, 1963, by ICIFFE press, UK.

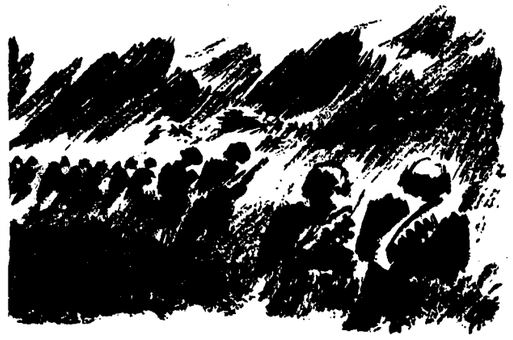
COMPANY AFFAIRS

INDIAN OVERSEAS BANK

The Indian Overseas Bank has completed 25 years of its service. It was a period full of significant events which brought the bank to its present stature. Starting in 1937, the bank today has spread its network in some 80 places of its operation. It was founded by the late Mr. M. Ct. M. Chidambaram Chettiar with the twin objectives of developing overseas banking and of handling foreign exchange business. It was in a way the first Indian institution of its kind and in 1937 itself it founded its overseas branches in Malaya and Burma. Today the bank has 5 branches in Malaya and a branch each in Burma, Ceylon, Thailand as well as in Singapore and Hongkong. The post-war period was a period of special achievements. The paid-up capital and reserves increased between 1945 and 1961 from Rs. 33 lakhs to Rs. 153 lakhs. Deposits increased from Rs. 3.2 crores to Rs. 31.2 crores. The bank's policy in India has been one of studied expansion and has nearly 63 branches all over the country.

K.C.P.

During the year to June 30, 1962, the KCP Limited, Madras, recorded a profit of Rs. 70.12 lakhs. This is a sufficiently larger figure than the last year's profit of Rs. 45.27 lakhs. This increased level of profits was a reflection of better performance in terms of sales. The overall sales at Rs. 571.7 lakhs was quite favourable as compared to Rs. 429.1 lakhs a year before. Sale proceeds of sugar were higher. Same was the case with confectionery, machinery and materials and cement. Sales of distillery spirit and manures were, however, lower. The Directors provided Rs. 6.32 lakhs towards bonus payable to cane growers, Rs. 27.5 lakhs towards Development Rebate Reserve, Rs. 1.85 lakhs towards General Reserve, Rs. 8.38 lakhs towards Rehabilitation Reserve and Rs. 18 lakhs towards a provision for taxation. Dividend was proposed to be paid at the rate of 15 per cent on equity shares which is subject to the sanction of the Industrial Finance Corporation of India.



The company's sugarcane factory continued crushing for 131 days. During the year 2.90 lakh tons of sugarcane was crushed and 29,967 tons of sugar was produced. The recovery of sugar for the season was 10.03 per cent as against 8.97 per cent in the previous season. The cement factory at Macherla produced during the year 91,815 tons of cement against 71,519 tons during the previous year. The second stage of the factory went into production in June 1962. The company has not been able to use electric power contracted for at Macherla. The Directors have reported that out of the issue of 1 lakh equity shares of Rs. 10 each offered to shareholders, in January 1961, 98,608 shares were allotted last year and a further 567 shares were allotted during the period under review.

PHOSPHATE COMPANY

The Phosphate Company Limited made a profit of Rs. 14.99 lakhs during the year to June 30, 1962. A sum of Rs. 1.51 lakhs was separated towards depreciation, Rs. 5.70 lakhs towards taxation, and Rs. 3.23 lakhs towards Development Rebate Reserve. A sum of Rs. 1 lakh was separated further towards General Reserve. The Directors recommended the payment of a dividend at Rs. 17.50 nP. per ordinary share of Rs. 100 each which will absorb a sum of Rs. 3.94 lakhs subject to deduction of tax.

During the year under review the price of superphosphate was increased by Rs. 11.10 nP. per ton by the Ministry of Agriculture to compensate the rise in the cost of production of superphosphate. Trial runs of new sulphuric acid plant were made during the year and normal production started from August 1962. This made the company self-sufficient for its sulphuric acid requirements. With a view to diversify the activities of the company, the Directors decided to set up a ferro-alum plant for which there is good market. The Directors are hopeful that the plant will start production early next year. With the installation of continuous superphosphate plant which started production from October 1962, the company's productive capacity has increased considerably.

OUR HUMBLE OFFERINGS TO THE DEFENDERS

OF THE MOTHERLAND

In view of the National Emergency The Punjab National Bank Limited offers the Armed Forces Personnel and their wives FREE OF ANY CHARGE the usual banking facilities such as remittances from one office of the Bank to another to the same or any other Account, collection of salary and other cheques, carrying out of standing instructions for recurring payments. No incidental charges will be levied on Current and Savings Fund Accounts. For particulars please contact our nearest office.

All contributions by the public to the National Defence Fund will be remitted by all offices of the Bank without any charge.

49 years ... not even a scratch

The rate of industrial accidents in India has increased from about 24 per thousand workers in 1938 to about 44 in 1959. Every year, over 93,000 workers are involved in accidents and 250 lives are lost. Also wasted annually are a million man-hours—enough to produce 170 broad guage locomotives or 700 coaches for the Indian Railways.

Safety has always been Tata Steel's watchword as efficiency is hardly possible without it. 'No-accident month' as an annual feature, safety exhibitions, training in safety, safety awards, safer working conditions, a continuing campaign under the direction of joint councils to turn safety into a habit ... these are some of the means adopted in Jamshedpur to prevent accidents in the Plant.

Safety, however, depends largely on the worker himself because about 75 per cent of industrial accidents are found to be caused by human negligence. This is where men like Jamuna Dube, the oldest employee in Tata Steel, come in. He has worked for 49 years without ever sustaining an injury, not even a scratch.

The importance of safety was one of the first things that Jamshedpur taught Dube when he arrived in the Steel City half-a-century ago ... a city where industry is not merely a source of livelihood but a way of life.

Arms Assessment

THE venue of consultations, having a profound consequence on India's defensive preparations, shifted this week outside the country. On Monday, December 17, the representatives of the American and British Defence Ministries met in conference in London to decide issues arising out of the arms aid for which agreements have already been entered into by India separately with each of the two countries. The significance attached to this conference may be gathered from the fact that Mr. William Bundy, Deputy Assistant Secretary of Defence, had been included in the American delegation. The purpose of these talks, however, has relevance to the short-term aspect of India's requirements of arms and other military equipment. It is to co-ordinate the supply of arms as envisaged in the two agreements concluded at New Delhi in November. Co-ordination is essential to ascertain how best and soon the types of arms required could be delivered to India. The supplies so far assured are restricted to automatic small arms and ammunition.

The size of this aid must be interpreted in the light of the fact that the supplies had to be provided and rushed on a basis of emergency. That phase has now passed and the larger problem that has cropped up is India's requirements for launching a programme of an adequate build-up of the defence system on the basis of acquisition of the most uptodate weapons which would answer the specific requirements of mountain warfare. Presumably, the London Conference was not intended to deal with this problem which belongs to the long-term category. But it is reasonable to assume that the general pattern of an approach to arms assistance to India for that purpose would be discussed in an informal and initial manner. It is surmised that a co-ordinated plan of military assistance to India would depend upon America sharing the major burden and it would be related to the principle of matching supplies by Britain and such of the Commonwealth countries as would participate in this. But it would be premature to be too positive in issues such as this.

Of much deeper and far-reaching significance was the meeting held between President Kennedy and Prime Minister Macmillan at the Bahamas on Wednesday and Thursday this week. This summit conference on defence issues of great importance to the two leading Atlantic powers has superficially little relevance to the problem of India's defence requirements. But it is no longer a secret, and on the other hand Sir David Ormsby Gore, Britain's Ambassador in Washington, has publicly affirmed, that the Sino-Indian war and the problems it has agitated constitute an important subject on the agenda for the talks. The composition of the personnel of the American team assisting the President lends full corroboration to the significance which is being attached to India's arms and other defensive requirements. Mr. Averell Harriman, Assistant Secretary of State for Far Eastern Affairs, and Mr. Philip Talbot, Assistant Secretary of State for Near Eastern and South Asian Affairs, were two high-level advisers attending the talks. It is also noteworthy that Mr. Galbraith, American Ambassador in New Delhi, was also summoned at the talks at the Bahamas.

The angle from which the aftermath of China's stunning invasion of the NEFA border ought to be judged forms but an integral part of the strategy of the Western allies in relation to the cold war and in particular the containment of Communist expansion in South-East Asia. It is in this larger context that America and Britain have valued the urgency and the scale of the assistance which should be rendered to India's full preparedness to meet any likely recurrence of Chinese aggression.

Mr. Harriman's public reference for the first time on the eve of the talks at the Bahamas to the settlement of the Kashmir issue has its own significance, but he has taken care to clarify that armament assistance to India will not be made contingent on a prior settlement of this highly complex problem. There is now a veering round to the view that plebiscite is not the sole solution. Other avenues will be explored. However, the very fact that ministerial talks on Kashmir are to commence on December 26 at Rawalpindi has brought a deep appreciation in this country that the real enemy which India has to face is China. And China's threat is common to the security of both the countries in the sub-continent. This fact urges adequate supply of military equipment to India.

The Cotton Cloth Crisis

WHATEVER may be the explanation—and there have been several explanations—for the present plight of the cotton mill industry, nearly every one is agreed that an effective tackling of the situation does not brook any further delay. Those who may not still be inclined to view the position as sufficiently serious to occasion concern and warrant official intervention are apparently misled by the fact that the present stocks of cloth with the mills of some five lakh bales are much less than the all-time high level of 6.6 lakh bales that was touched in December, 1957. But even this minority is bound to revise its opinion when it is told that today's stock of about five lakh bales is worth very much more than the 1957 stock of over six lakh bales. Due to all-round rise in costs —of cotton, labour, stores and other items—the average price of a bale of cloth today is as much

as Rs. 1,000-1,100 compared to about Rs. 800 per bale some five years ago. It should not be difficult for anyone to estimate the enormous locking up of funds that the mounting stock position entails.

While even in normal times the carrying of such heavy stocks would constitute an onerous burden, in the present circumstances when the cotton mill industry has hardly completed its investment of something like Rs. 150 crores in fixed assets—much of it by borrowings too—it would be intolerable. Moreover, the industry also needs funds for working capital, for purchase of raw cotton, and so on. In any case, it is neither prudent nor economic indefinitely to go on piling heavy accumulations of stocks, even from borrowed funds. Looked at from this point of view, the liberalised credit accommodation lately being provided by the banks is at best a palliative. A really satisfactory solution lies in prompt disposal of cloth stocks.

Have any effective measures been taken by the industry in this behalf? Even superficial inquiries go to show that the industry has attempted something positive. It may not be known to many, for example, that the industry has lowered its prices by about 15 per cent in the past few weeks. Notwithstanding this price reduction, it is said, the trade has not been lifting cloth freely, let alone in a greater measure. This is the result of a number of factors, although the most proximate has been the disturbed conditions in the border areas. Even the disturbed conditions, it is reliably assessed, have affected the demand only in Assam, West Bengal and UP, the consumer offtake in the other States continuing to be quite satisfactory, according to mill information sources. The other factors are perhaps more psychological, such as, for instance, the demoralising effect of falling gold prices and the debacle on the stock exchanges and in the commodity markets. The natural and understandable reaction of the trader to these is to restrict his purchases to only those items that sell quickly and that is precisely what has been happening. Even the relaxation of credit conditions by the mills and the wholesalers does not appear to have encouraged the traders to step up their purchases. This is proof of the unpalatable fact that confidence among traders is at a very low ebb, and, it is feared, this state of affairs may well persist for a time.

Meanwhile, as a solution to the problem, two suggestions have been made, one, to effect all purchases of defence requirements and, secondly, to increase exports. It would be pertinent to examine how effective these suggestions would, in fact, turn out to be. The requirements of defence for cotton goods are in the last analysis marginal and not all the mills in the country are capable of being geared to the production of defence needs of the given specifications. As for exports, though there is said to be scope for increase, say, by a further 200 million yards in 1963—this year, exports are estimated to aggregate only 500 million yards!—or 10 to 11 thousand bales per month, it should be noted that these additional exports cannot be arranged overnight. Besides being a long-term solution, even this much of additional export can have only a marginal impact on the stock position, in the context of an average total monthly production of 640 million yards—by mills 416 million yards and by the decentralised sector 224 million yards. Nor is it practicable for the authorities to purchase and keep a buffer stock—as suggested by some—on the scale required to relieve the situation, what with the large outlay that this would involve.

Although all this makes a bleak picture, it does not follow that the prospects too are equally gloomy. Considering the low *per capita* availability of cloth in the country, the increase in the population, and the rise in the standard of living, the present trend cannot—and ought not to—continue for long. No one can predict when precisely there would be a reversal of this trend, but the authorities can certainly expedite the process by doing everything in their power to hasten the return of confidence.

Farm Price Support

THE announcement by Dr. Ram Subhag Singh, Minister for Agriculture in the Union Government, at a meeting of the Prices Sub-committee of the Congress Parliamentary Party here last week, that the Government would buy jowar at about Rs. 10 per maund in certain areas, should its prices go below this level, and the directive issued by the Union Food and Agriculture Ministry to the State Governments to be prepared to procure rice at certain minimum rates varying from Rs. 15.50 to Rs. 17.37 per maund, if the prices of fair average quality white rice deteriorate at the next harvesting season below these levels, are indicative of the fact that in an effort to boost agricultural production, the Government has made up its mind to make use of the lever of support prices as a matter of practical policy. The shedding of inhibition on its part by the Government to take concrete steps to protect the farmers against undue depression of prices following a bumper crop in any year, is a step in the right direction. It will not be presumptuous to recall in this context that *The Eastern Economist* has advocated this policy in the past one year on appropriate occasions.

That support prices play a very vital role in providing an incentive to raise agricultural production has been demonstrated not only in this country, where minimum prices have, for a fairly long time, been in existence in the case of cotton and sugarcane but also on the Continent on both the sides of the Iron Curtain. The West European countries successfully employed this technique in rehabilitating their agrarian economies after the devastation caused by World War II and the East European countries, under the leadership of the Soviet Union, have been following a policy, since 1953, of progressively raising prices for compulsory quota deliveries. Two major hurdles had been there in the way of any large-scale introduction of this measure in the Indian economy—firstly, the difficulties of deciding on support prices of various agricultural commodities in the absence of any specific data being available on their cost of production, and secondly, the apprehension that large-scale purchases of farm products by the Government would require huge outlays which may not be available because of the pressing needs for funds from the other sectors of the economy.

To strike a balance between the support prices for various agricultural products is, indeed, a difficult job; it involves detailed calculations based on such diverse and contending factors as the cost of production (including a fair margin of profit), cost of raising competitive crops, the prices that the consumer (or the industry in the case of commercial crops) should be expected to pay and the prices of consumption goods which the farmer has to buy. The calculation of the price the consumer can be expected to pay for a farm product is an additionally onerous task especially when the consumer happens to be an export industry. But howsoever difficult this job may be, it has to be squarely faced, through a process of trial and error, if the growth of the economy is to be fostered at an accelerated pace and in a balanced manner, with self-sufficiency in agriculture as its pivot.

The fears that large-scale extension of this principle would involve massive investment by the State are without any real foundation in the present-day condition of our agriculture. Huge surpluses which depress farm product prices to uneconomic levels cannot be expected to accrue in all cases simultaneously. Further, in the interest of ironing out wide fluctuations in prices, there is the necessity to build up buffer stocks and they can be built only through the State (or, at its instance, the consuming industries) making purchases either from the indigenous market or from abroad. As between these alternatives, the choice is obvious.

Extension of the price support schemes to all the important agricultural commodities produced in this country—cotton, sugarcane, jute, wheat, rice and jowar have already been covered—is expedient if for no other reason than for avoiding diversion of area under a particular crop to some other, in case the prices of the former are artificially depressed or those of the latter arbitrarily fixed at higher levels. This is also essential from the point of view of insulating the agricultural economy from undue political pressures. If support prices are there only in the case of a couple of farm products, the pressures invariably would be for increase in these prices or for maintaining them, and at no time for lowering them. If the prices of the competing crops are also supported at reasonable levels, adjustments can easily be made even downward. Resort to this lever is as well warranted for bringing about higher specialisation in our agriculture; raising of crops on soils most suitable for them will help in increasing yields per unit-area. Side by side with the extension of price support for farm products, there is, however, the need to increase storage facilities. Construction of State warehouses must, on this account, be speeded up.

Clogs on Coal

THE Government's decision to postpone the implementation of the new scheme for the movement of coal from the mines to the points of consumption has been taken in deference to the consumers' criticism about its practicability. A conference of all the interested parties is currently taking place at New Delhi to eliminate all such impediments which tend to hamper instead of helping the movement of coal. It is feared that the impact of the new scheme on consumers in the "middle range" would be very heavy and their needs of coal may not be met fully and speedily, if the proposed scheme were to be implemented by the Government.

In broad terms, the new scheme is so designed as to reduce the piecemeal movement of coal by the railways. It is proposed that the consumer should be provided with full rakes of 70 four-wheeler-wagons with the carrying capacity of 1,500 tons. All bigger consumers should be asked to set up railway sidings at the points of consumption and, wherever necessary, the small consumers should pool their demands together so that they could be provided, like the bigger consumers, in bulk. For the benefit of the small consumers, the stockists would be asked to create dumps at those points where block rakes can be readily received.

Besides many other inconveniences that the new scheme may raise, it is likely to increase the cost of handling coal which will be directly reflected in the cost of fuel for most of the industrial products. At a time like this, when a national emergency exists in the country and the industrialists have taken a vow to keep prices restrained, it is necessary that no new scheme should be introduced which tends to raise cost, leading to price inflation. Efficiency in the distribution of coal is essential, but, at the same time, no additional burdens should be imposed on the manufacturers.

A healthy feature of the discussions has been the Government's recognition to accord the highest priority in road movement to essential commodities like coal. There is substantial scope in easing the movement of coal both by road and river. The riparian route between the coal fields in Hazaribagh district in Bihar and Allahabad in Uttar Pradesh has not been exploited as it should be in view of the emergency. There is no doubt that there are certain basic hurdles involving substantial capital investment for making extensive use of this route. The Ganga is notorious for its frequent change of course. Also, the silting which has taken place during the last few decades can be removed only with a determined policy of activising the route through extensive dredging operations. Keeping in view the difficulties through which the transport system of the country has passed in recent years, it is necessary that the speedy implemenation of the road-cum-river plan in this area should be undertaken. The choice now is between a higher outlay on transport and stultifying production. The bottleneck in transport which took a very acute turn in Assam did not involve the movement of coal. But it highlights the same pressing problem of transport.

The deliberations of the conference at New Delhi this week will indicate if the Government and the industry can, with their joint efforts, evolve a pattern in rail-road-river movement whereby the new challenges can be met, even if with hardship. The consumers are as much responsible in providing a solution to this knotty problem as the Union Government. Mere criticism of the Government will not suffice in a situation like the one we are facing today in this country. Positive suggestions designed to accelerate the movement of not only coal but all the other essential commodities will need to be evolved in a business-like manner. The country surely cannot await the verdict of the Neogi Committee's report which might complete its deliberations probably after decisions involving considerable outlays are made by the Government.

THE WEEK'S NOTES

U.P. Socialists

THE MERGER MOVE

THE MERGER of the Socialist Party and the Praja Socialist Party in the UP Legislature was announced without reference to the Party Executives and for this reason the SP leadership threatened to take disciplinary action against its members. But its second thoughts signified a softening and considerable modification in its attitude. Mr. Raj Narain has explained in terms of an assurance that no question of taking any disciplinary action would arise, if it was found that their intention in agreeing to the merger was to promote the cause of socialism in the State Legislature. Further concessions to the advocates of merger would seem to follow from this assurance. It is now agreed that the National Executives of the SP and PSP would hold a joint meeting for consultation on this question towards the end of this month. It may be that the question of merger will be conceived in the larger context of the nation-wide level. But it would be prudent not to indulge in speculation based on wishful optimism. Past experience utters a warning.

Earlier attempts for the merger of the two Parties foundered on the rock of disagreement because the SP leadership, and in particular its top leader, Dr. Ram Manohar Lohia, took a very inflexible stand that the PSP must endorse chapter and verse every single item of the policy and programmes of the SP. It will be recalled that the two parties are the offshoots of the Congress Socialist Party and their bifurcation has brought, if anything, a loss in the strength which they inherited from the parent organization. While the SP drifted into isolation by its insistence on extremism, the PSP found its internal structure slowly giving way in UP. The dominant younger element in the PSP began to move much towards the policies and particularly the tactics of obstruction adopted by the SP after the general elections.

Both the Parties were returned to the Legislature after the last election with diminished strength. It was probably a result of some heart-searching about the future of socialism that the merger move was inspired and stimulated. If the merger is to stand and give a lead to the two parties in more States, two things are necessary. The SP's chauvinistic fads, obscurantist opposition to the English language and tactics of filibustering, for instance, must be abandoned. What is more important, there should be a frank agreement on the principles, policy and programmes of action inside and outside the legislature. In such a course alone lies the hope of the socialists to halt the tide of the rising influence of the Communist Party and the Jan Sangh.

Dr. Adenauer

STEPPING DOWN

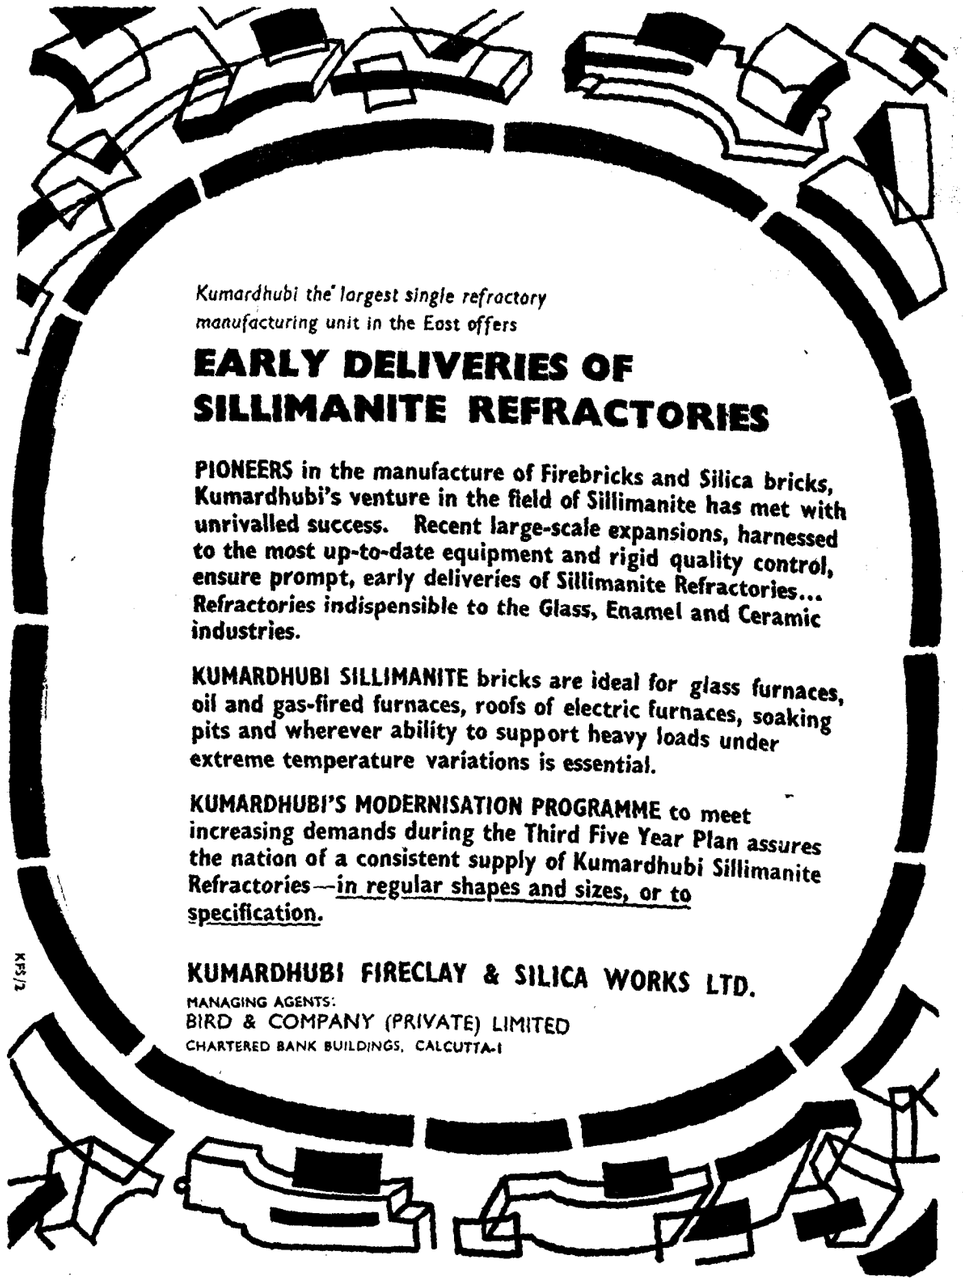
THE ACTUAL announcement of Dr. Adenauer to resign has come as a climax to certain precipitate developments, in the absence of which, it is safe to assume that the Adenauer regime may have been accepted for a longer time by the West German public. The Spiegel case no doubt made a sensational disclosure of a top secret about West Germany's military strength having been ranked low among the NATO powers at the last exercises, but the public gave its support to the editors and publishers of this paper, when drastic action was taken against them by the Defence Minister Strauss. In the wake of the public sensation came the resignation of Herr Strauss. Dr. Adenauer found his position shaky and after anxious moments to rally support for his Government, he had finally to fall back upon the co-operation of the Free Democratic Party. But the Free Democrats agreed to lend support to the coalition only after exacting a high price—a definite announcement by Dr. Adenauer of the date of his stepping down from the Chancellorship. Dr. Adeneaur has fixed September, 1963, as that date, for the time being, but the chances of his staying on in office longer are slight.

Too long a tenure of office usually detracts from the popularity and respect in which the incumbent is held as a national hero. But any assessment of Dr. Adenauer's contribution to the reconstruction of West Germany after the disaster of World War II must not be allowed to be vitiated by the recent tide that was steadily rising against him. He piloted the ship of the State at a very critical time and proved to be so dexterous at his job that in a span of about thirteen years he re-established Germany's status in the family of West European nations and gave it a new vitality. Easily his greatest contribution is to lay firmly the foundation of democratic institutions in a country where another political philosophy had a powerful appeal and had proved dominating. One of the reasons for Dr. Adenauer's hesitation to announce his decision to step down was his personal dislike for Dr. Ludwig Erhard. But present indications seem that it is Dr. Erhard who will succeed him. In that case he will bring a greater degree of realism, flexibility and adaptability in Germany's domestic as well as foreign policies.

Community Development

"REORIENTATION"

IT WOULD be a good riddance when, as Mr. S. K. Dey stated before the Congress Parliamentary Party's Executive Committee, the Community Development Blocks surrender to the Defence Ministry all their serviceable jeeps. It was but natural that the low priority which the Community Development Programme won by its performance (apart from its inherent place) should attract retrenchment of expenditure to provide funds for the defence effort. A number of economy measures have, therefore, been formulated for the CD programmes. Outlay on building construction for official purposes, curtailment in the travelling expenditure of the ministerial staff and retrenchment of superfluous hands are operations which can be performed without much loss to the nation in terms of constructive rural development work.



Mr. S. K. Dey has provided information of dubious value about the reorientation which is proposed to be given to the activities of the Community Development Blocks. The economy measures are expected to yield sufficient funds for allocating Rs. 1 lakh each to the 5,200 Community Development Blocks for intensifying the campaign for higher agricultural production. The actual selection of programmes for boosting production and allocating funds for them must, of course, be undertaken in consultation and with the approval of the Ministry of Agriculture. Mr. Dey has disclosed that an important plank in the reorientation is to create village volunteer corps for two purposes—to promote increased agricultural production and to undertake civil defence work. The second part of the scheme envisages the employment of 200 million able-bodied persons from the rural population to contribute 12 days' work, on a voluntary basis, in a year for the cause of civil defence. No extra expenditure at the Centre will be involved in the formation of these volunteer corps. Labour contributed in excess of 12 days per year would be paid for in cash at the local rates, while the value of the 12 days' voluntary labour would be credited by the village panchayats to their account in the defence labour banks. If the Centre is not to be saddled with this expenditure, it has not been clearly explained how the Panchayats would make the credits referred to. The funds so accumulated are to be applied to schemes of rural development. It would be rash to expect sound execution of the programme in its reorientated form. Is reorientation a synonym for perpetuation by a reverse process?

Quality-control Quality-control is a manufacturer's contract with himself. Quality-control is the voice of rectitude forever repeating "do not compromise". Quality-control is the essence of leadership. Shalimar Paint has progressively raised quality-control standards as finer raw materials have been discovered, improved processes evolved and new products developed. Quality-control—a decisive element in manufacturing—has made Shalimar paints the leading choice for use in India's homes and industries over the last sixty years. In every Shalimar paint you are offered the sum of four decisive elements—resources, research, know-how, quality-control.

WAGE POLICIES IN EUROPE

By

ODYSSEUS

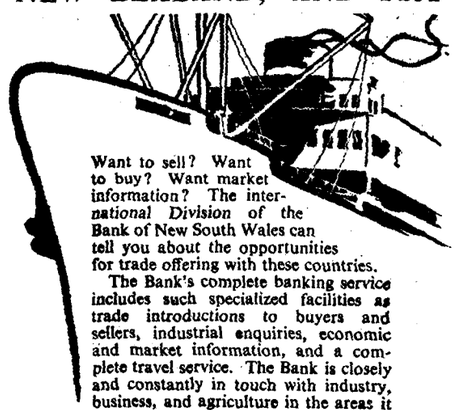
IF COUNTRIES with comparatively few working days lost in the year through strikes achieve their success because of effective machinery for preventing them, India might perhaps give her Five-Year Plan a boost by adopting them. Last week, I reproduced from the November "Westminster Bank Review" (41, Lothbury, London. E.C.2.) two tables showing the figures of working days lost in holidays and strikes in 18 industrial countries. Switzerland was top of these international "league tables" with 0.6 days in the year lost by stoppages per 1,000 persons employed in 1956-60; Sweden came next with 6.6 days lost, the UK was twelfth with 187 days lost, and Finland ingloriously came eighteenth with no fewer than 740 days lost. But, asks the "Westminster Bank Review" pertinently, do the "league leaders" owe their supremacy solely to their procedures for settling disputes? One answer is to point to those countries which have, on paper, good machinery for preventing stoppages, but which nevertheless have a poor record.

Take Australia. Although she is thirteenth on the list, with 226 days in the year lost by stoppages per 1,000 workers, her machinery seems better than that of the UK, which occupies the twelfth place. Collective agreements can be made binding on both workers and employers if they are ratified by the Commonwealth Conciliation and Arbitration Commission. Disputes over an agreement must be referred to the Commission, and the resulting award is binding. In some states stoppages are prohibited.

In contrast, the machinery in Austria and the UK is fairly similar and equally fails to explain why the UK is twelfth and Austria third (with only 21 days lost per 1,000 employed). It is true that collective agreements are binding in Austria and not in the UK, but since they are also binding in poor little Finland — bottom of the "league" — this by itself obviously explains nothing.

Although Switzerland and Sweden, proudly at the head of the "league", have efficient machinery for preventing unnecessary stoppages, this does not wholly explain their success. If a complete explanation for peaceful labour relations exists, it can be found only by taking a broader view of "Wage policy", described last week.

COST-PUSH INFLATION



A Wage policy in this sense is designed by a government to counter tendencies to cost-push inflation. The spiral of rising wages and rising prices results from a wage demand from workers, which employers grant if they know that they can pass it on in higher prices. A wage agreement, which may be claimed as a success if avoidance of strikes is the only criterion, may therefore be written off as a failure if the larger question of preventing inflation is, as it should be, the first consideration. I do not, of course, suggest that stoppages are desirable means of resisting inflationary settlements. As the "Westminster Bank Review" points out, a successful Wage policy would minimise both stoppages and inflationary settlements.

It is unfortunate for a government seeking to plan wages that one of its own departments, the Ministry of Labour, is likely already to be active in the field of wage negotiations, only too often with the aim of promoting agreements between workers and employers regardless of their possible inflationary effects. This departmental aim is apt to disrupt the work of the wages planner if the conflict of aims is not recognised. If it is recognised, peaceful labour relations — the ideal of a Ministry of Labour's conciliators — can be achieved as a by-product of a successful wages policy. If there is a clash between planner and conciliator, the planner should, ideally, have his way, since the problems of stoppages and inflation ought both to be capable of planned solutions.

Workers' and employers' organisations are likely to protest when a planner's decision counters their special interests, and, where either organisation has links with a political party, a government's action may easily lead to political opposition. This is presumably why the UK government has delegated responsibility to the National Economic Development Council and to the National Income Commission, two semi-independent bodies, which will concentrate upon themselves the critics' fire in the first place.

It is worth noting that, in other countries, there is little or no fire to draw. Norway and Austria are developing systems of planning more peacefully than the UK, or Germany, which has so far rejected planning. In other countries a formal, or informal, system already

AUSTRALIA'S LARGEST COMMERCIAL BANK CAN HELP YOU TO PROMOTE TWO-WAY
TRADE WITH AUSTRALIA, NEW ZEALAND, AND FIJI

Want to sell? Want to buy? Want market information? The international Division of the Bank of New South Wales can tell you about the opportunities for trade offering with these countries.
The Bank's complete banking service includes such specialized facilities as trade introductions to buyers and sellers, industrial enquiries, economic and market information, and a complete travel service. The Bank is closely and constantly in touch with industry, business, and agriculture in the areas it serves through more than 1,100 branches and agencies.

functions smoothly. The cool reception given to the two UK planning bodies reflects the state of UK labour relations rather than opposition to planning itself.

TRADE UNIONS IN EUROPE

The widespread belief that labour relations are bad in the UK is only partly true. Many firms have excellent relations with their workers, and reports of apparently innate hostility between workers and employers, and also between unions, refer to a limited number of firms. That such hostility is less in Europe is not due to national characteristics but to two structural differences.

In the first place, European trade unions rarely quarrel because their interests do not clash. In the UK, on the other hand, there are at least 20 unions concerned with engineering, each jealous of its own rights, and fearful of losing members, so that they find it difficult to agree on what the interests of the engineering worker are. Equally, a management obliged to deal with so many unions finds it difficult to negotiate with its workers. In other countries, these problems are solved in two ways. In Japan, unions consist of all the workers in a firm and are confined to that firm: inter-employee disputes are therefore rare, and employer-worker negotiations are easier. The objection to this system that unions confined to one firm may be in a weak bargaining position does not apply in Europe, where unions are fewer and often stronger than in the UK.

In some European countries, the unions group all the manual workers in one industry, e.g., engineering, in contrast to the UK, where the workers are usually unionised by occupation, e.g. the Screw, Nut, Bolt, and Rivet union. In Europe, there is usually only one union in any firm (excluding clerical workers, who even there are organised by occupation), and this helps to eliminate inter-union disputes within a firm and makes authoritative bargaining possible between one labour representative and the employer.

The second chief structural difference in Europe is the strength of the central organs of both labour and management. Good relations in the lower ranks of the union hierarchy make it possible for the top unionists to agree, within their equivalent of the UK trades Union Congress, without fear of a stab in the back. In negotiations with employers and government the labour movement can then speak with one voice for all its members. Such negotiations are, of course, essential to planning. The employers, similarly, have a central organisation which can speak for all.

These conditions exist in Austria, Norway, Sweden, and Denmark. Elsewhere, the effects of centralisation are lessened by religious differences inside the trade union movement, as well as by the existence of more than one employers' movement. The UK does not suffer from these divisions, but lacks cohesion within its labour and management organisations. Much of the UK's record of poor labour relations arises from friction within a movement, or the inability of a central organ to speak for its members. If it is too much to expect that the powers of the TUC and the employers' organisations will be increased, solutions to the UK's problems will be that much more difficult. It is, however, a hopeful sign that the TUC recently sent a delegation to study union and employer relations in Sweden. The TUC leaders were surprised and impressed by the close co-operation between representatives of Swedish employers and workers, but how far, and how fast, they may seek to follow the Swedish model in the UK remains a $64,000 question.

Apart from the problem of structural changes, the "Westminster Bank Review" suggests that the UK National Incomes Commission might be made more acceptable by extending its scope beyond wages to prices, since there are many informal understandings in Europe that if wages are controlled, so also should prices be. Neither workers nor employers can then easily initiate an inflationary spiral. In Austria, this concept is embodied in a Commission for Wages and Prices. The "Westminster Bank Review" does not explain the mechanism whereby prices are controlled in Austria. My curiosity is the more aroused in that I see that between 1950-60, the purchasing power of the Austrian currency fell by 40 per cent, whereas in the same years that of the £ fell by 33 per cent. How comes it that the poor old UK muddled along without price controls somewhat better than Austria with controls?

OUR HUMBLE OFFERINGS TO THE DEFENDERS

OF THE MOTHERLAND

In view of the National Emergency The Punjab National Bank Limited offers the Armed Forces Personnel and their wives FREE OF ANY CHARGE the usual banking facilities such as remittances from one office of the Bank to another to the same or any other Account, collection of salary and other cheques, carrying out of standing instructions for recurring payments. No incidental charges will be levied on Current and Savings Fund Accounts. For particulars please contact our nearest office.

All contributions by the public to the National Defence Fund will be remitted by all offices of the Bank without any charge.

DEAN ACHESON'S MODERN EUROPE

From Our Special West European Correspondent

PARIS, December 16.

THE hero of Evelyn Waugh's comic novel "Scott-King's Modern Europe" scarcely gave a more unfavourable or more caricatural impression of this continent than did the former U.S. Secretary of State, Dean Acheson, in his address at West Point last week. Mr. Acheson declared Britain to be a decadent power living on illusions and uncertain of her role, if any, in modern affairs; France, West Germany, Spain and Portugal were promised the direst of fates on the grounds that their present leaders are very old men; and Italy was, most obscurely, held to be heading for speedy disintegration. On the first point, Mr. Macmillan has compared Mr. Acheson, irreverently and irrelevantly, with Philip of Spain, Louis XIV, Napoleon and Hitler who are similarly believed in Britain's imminent decadence. On this side of the Channel, the Press has limited itself to chiding Mr. Acheson for being disagreeable and arrogant, without denying that some of the things he said were near the truth. This mild reaction was not due merely to a superior capacity for accepting criticism (superior to that shown by Americans when their complacency is challenged), but also to the conviction that Mr. Acheson might be right about details taken in isolation but quite wrong about the sum total.

In other words, he could be like that 19th century medical materialist who announced that he had dissected the human body but not found the soul. For it is possible to dissect contemporary Europe and miss the soul: the will to unification. And one will certainly miss it if, like so many people in Washington, one is as determined not to see it as the medical materialists were not to see the psychic factors that threatened to complicate their crude physiology. The fact is that many Americans do not want to recognise the force of the unifying ideal in Europe, because it is impelling this continent to independent forms of thought and action that threaten to complicate the simple idea those Americans have about world problems. It needs no recalling that Washington supported from the start the European unity movement, when it originated in "safe" hands such as those of Christian Democrat conservatives who were reconciled to living forever as the wards and proteges of the USA. Yet it is clear that the Americans saw in this organisation simply a convenient arrangement of their dependents, which would simplify their dealings with proteges who were destined to remain proteges — much as a paternalist employer might encourage his workers to form a trade union in order to simplify his labour relations.

Since this unifying Europe has begun to take on features unwelcome to Americans, and specifically to display velleities of independence in the fields of economic and military policy, Washington's ardour has cooled considerably. While continuing to favour the "good" sort of European unity, it has began to denounce the "protectionism" and "megalomania" that it sees in the "bad" sort of unity actually in progress. To explain the appearance of this latter and unwelcome development, Americans have opted for the simplest and most anecdotal of causes: it is all the work of several naughty old men who should already be in retirement and, happily, will soon be removed by death from the scene. Hence Mr. Acheson's regrets about the age of at least four European leaders, and his hint that there will be spectacular changes when they disappear. Hence too the absurd black-and-white caricature of "the two Europes" in Walter Lippmann's recent booklet, "Western Unity and the Common Market". On the one hand, Mr. Lippmann (who, to our regret, has fallen in his old age into just that silly jingoism that he thinks to see in de Gaulle) sets the "good" Europe: it is an open, liberal association that answers all American requirements, it includes Britain and is associated with the European neutrals and with the Commonwealth on terms that keep everyone politically happy while permitting vast American economic penetration into those regions, it fits easily into an Atlantic-wide free trade zone dominated by the giant U.S. corporations, and in short is a paradise on earth where all live content under the rule of the Pentagon and Wall Street.

On the other hand, there is the infernal vision of a Paris-Bonn axis (this abusive term being a way of disguising the plain fact that European unity began with and on the Franco-German reconciliation and is meaningless without it). Ruled by two sinister old monarchs, who are fortunately without heirs, this closed group is setting traps for Young America resplendent with good will — for example by practising a form of agricultural protectionism that palely imitates the USA's own and by refusing to sacrifice European industry to the American corporations. Worse, it is toying with the idea of an independent foreign policy that might one day interrupt the Moscow-Washington dialogue, of which the usefulness for American interests was shown during the Cuba crisis. And it has the germ of a third nuclear striking force, which if European prosperity and political unification continue at their recent pace, might one day be regarded by Europeans as adequate to their own immediate defence. It might never serve to enable Europe to practise a lone-wolf super-power policy all around the globe, and it might not even be sufficient alone for the defence of Europe in a showdown with Russia; but it would give European a sentiment of self-reliance, especially as the prospect of a showdown with Russia in Europe becomes less and less likely, and would undermine the American monopoly of modern defence weapons.

This last is the most serious, in plain business terms. For as long as the balance of terror depends entirely on American might, so that Washington exercises supreme political responsibilities, the cost of the American defence burden and aid programmes is everybody's concern in the West. American corporations must be permitted to over-export, U.S. goods must get freer access to Europe and the Commonwealth, because the U.S. balance of payments has to be surplus and the dollar has to be shored up — because, in turn, on that economic strength depends everyone's ultimate protection. In those conditions, an economically independent West Europe (baptised for the cause a "protectionist" Common Market) has no right to exist, for it is a military threat to Europe's own security. To put it less hypocritically, a militarily independent West Europe has no right to exist because it would be an economic threat to the USA's exports.

Faced with this unpleasant prospect of a united and self-reliant West Europe, the readiest form of satire is

to insist on the weaknesses of the European nations taken alone. Real or imaginary, these weaknesses might in fact be perfectly familiar to the Europeans who see in them, precisely, the reason why they must unite. That Britain can no longer play a world role on her own, that Italy is bedevilled by acute social problems, that the Portuguese empire is envaporating, that Spain's autarchy has become impossible to maintain, and that French and German nationalism have come to the end of the road — all these are less fresh discoveries that warrant mockery than they are familiar reasons pushing the Europeans toward unity.

It is easiest to show up Britain's present uncomfortable posture, because she has not yet negotiated her entry into Europe. London is obviously in two minds but we should save our irony until the painful decision is taken, as it must be in the course of next summer. Spain, too, is at the crossroads and the coming two years will be crucial for her orientation. Yet the predicament of these two countries stems just from the fact that they are offered membership of a greater unity, and against that unity Mr. Acheson cannot exercise his sarcasm so easily. In my ignorance of Portugal, I am ready to believe the worst. But the suggestion that West Germany and France are in the same plight as the Iberian states on the grounds that leaders of all four countries happen to be old men is stupid, and for that matter it is false that the disappearance of Adenauer and de Gaulle tomorrow would plunge their nations into instability. Some Americans want to believe this, because they think that the policies that Adenauer and de Gaulle stand for are personal inventions, so that their successors must inevitably be more docile to American instructions. Unfortunately for them but happily for the Germans and the French, this is not so. Messrs. Adenauer and de Gaulle, being singularly forceful personalities, have impressed European policy with their style, but that policy exists independently of them. Everything that Washington dislikes in France today dates from well before de Gaulle's return to office, except the general's prose style, and will just as surely outlive him.

Fascination with the stature of eminent leaders always produces the problem of what will happen after they go; one is familiar with this in India, a nation that people naturally find hard to imagine without the Nehru phenomenon. In France certainly, in West Germany too (though perhaps there after a brief and inevitable Erhard interlude) and I venture to add in Spain also, one has no difficulty in naming the men who will succeed existing leadership, and pursue similar policies. The "senile leaders" argument is on a level with Malcolm Muggeridge's ill inspired piece of a few years ago about "the sick men in Washington": because Eisenhower, Foster Dulles and Christian Herter were all in poor health, that former Calcutta journalist foresaw evil days for the America that was soon to pass into the firm hands of J. F. Kennedy.

The reference to imminent disintegration in Italy (Mr. Acheson was running short of argument, apparently) is just the reverse of the truth — unless perchance the former Secretary of State was referring ominously to the federal movement in the country, copied from the USA! Italy's future is full of promise, and most clearly just on the question of national integration, but of course it makes no sense outside the perspective of a uniting Europe. But then nor does the future of any nation in this region. If you refuse to envisage that unification because it has features that might prove awkward to American interests, then the European nations can be painted as in a sorry plight, i.e. they openly admit that nationalism is played out here.

HOW

KIND HEARTED

IS YOUR DIET?

Doctors now agree that heart ailments due to hardening of the arteries can be avoided by excluding saturated fats from one's diet. In fact, the use of an unsaturated cooking medium is highly recommended. Nature has provided such a medium in the form of safflower oil (kardi, in Hindi). Known as saffola, it is the ideal cooking medium for everyone and particularly for those over forty. Saffola is nutritious, palatable, easy to digest and so economical. For health's sake get a tin of Saffola from your nearest store.

PLANNED PROGRESS: A COMPARISON

THE November, 1962, issue of "Bulletin", a monthly issued by the Institute for the Study of the USSR, provides an interesting analysis by Stefan C. Stolte, on the planned economies within and without the Communist bloc. It provides an objective picture of the relative rates of economic growth in Eastern as well as Western Europe and the implications of integration plans in both the wings

The debate between the commentators of the two Europes has been carried in a spirit to show that the other parts of Europe have not been doing very well. The spokesmen of the East European countries have stressed the point that the establishment of the Common Market has in no way been responsible for accelerating its economic growth; its development had in fact gained substantial impetus even before the establishment of the European Common Market and, therefore, the present relative affluence does not originate with the integration of the economies of the Six. On the other hand, the Western commentators have charged the Council for Mutual Economic Aid (which includes the Soviet Union, Poland, Czechoslovakia, Hungary, Rumania, Bulgaria and Eastern Germany) for complete failure in its theory of "division of labour" between the participating countries. Even though this Council has been in existence since 1949, it has failed to reconcile the differences between the economies of the various member-countries with the result that no joint programme of economic development for the East European countries has been evolved so far.

Leaving aside this partisan debate, it is instructive to look at the performance of the economies so as to arrive at any fruitful conclusion. Abstract percentages of growth in the different economies of the Communist bloc tend to exaggerate the real picture (see Table I) and may be interpreted with caution. Even though the rate of growth in industry in the USSR has been far ahead of the USA, the EEC and the UK between 1958 and 1961, yet the Soviet industrial potential has been only a little above half of that of the USA. The best course would be to compare the absolute quantities of output; Table II on page 1177 in regard to trends in steel production in the United States, the Common Market, the USSR, the United Kingdom and the six Eastern European countries for the period 1952-61 throws light on actual achievement in the case of a strategic commodity.

At the end of 1961, the Common Market's output of steel at 73.3 million tons was higher than that of the USSR's at 70.7. The combined output of steel in the six East European countries was only a little higher than 20 million tons and was almost the same as in the United Kingdom. The United States remained the biggest producer of steel.

The progress in the Common Market countries and in the USSR in steel production has been phenomenal since 1952. In the Common Market countries, steel output rose by nearly 75 per cent from 41.9 million tons in 1952 to 73.3 million tons in 1961. In the USSR, production nearly doubled itself within a decade from 34.5 million tons in 1952 to 70.7 million tons in 1961. The six East European countries have also done well in the sense that they have doubled their output in the same period, though in physical volume their output of steel is less than one-third of the total output of steel in the Common Market countries. It shows that the East European countries are trailing much behind the industrial power of the West European countries and shall have to make substantial effort to catch up with the economic resurgence in the Common Market countries.

Expansion in industry cannot take place at a galloping rate at all times and at all stages of economic growth. After a certain critical point, every economy —capitalist or socialist—attains a degree of maturity and comes to acquire a broad base which slows down the rate of development. This has been proved by the economies of the United States and the USSR. It may have been possible for the USSR to double its steel production during the past decade, but it may not be possible to double it further in the coming decade. As

INCREASE PRODUCTION

RESTRAIN CONSUMPTION

ENCOURAGE SAVINGS

against this historical truth, the 22nd Party Congress of the Soviet Union proclaimed that the industrial production in the USSR would rise by 2½ times in the next 10 years and thus the level of industrial production in the USA would be surpassed by the USSR. It was further proclaimed that industrial output in the USSR would rise at least six times in 20 years leaving the total volume of industrial output in the US far behind. The previous record of industrial progress in the Soviet Union and other countries is a clear pointer that these ambitious targets cannot be realised and that they have been dangled before the Russian masses only for political propaganda.

The USA and the USSR are two outstanding instances of the progress of both the systems, though the United States is many times ahead of the USSR in

TABLE I.

PERCENTAGE INCREASE OF INDUSTRIAL PRODUCTION SINCE THE INCEPTION OF THE EEC

NEW FORTLOK CONSTRUCTION GIVES DUNLOP CONVEYOR BELTS AN EDGE OVER OTHERS

Conveyor belts are most vulnerable at the edges. The new Dunlop **FORTLOK** construction more than doubles the life of the belt edge by providing double edge cushioning capacity.

A common cause of belts wearing out prematurely is edge wear due to rubbing against the side of the structure, against the chute, against jammed abrasive loads, or by the excessive use of guide idlers. When the edge has been worn or torn away, further wearing of the edge and consequent belt deterioration is usually comparatively rapid.

Dunlop **FORTLOK** overcomes this problem. Note its construction as shown under the magnifying glass in this illustration of a conveyor belt section.

- The thickness of the edge protection rubber has been doubled as compared with the conventional conveyor belt edge.
- Note, too, that the edge rubber has been keyed into the carcass of the belt which produces an anchorage infinitely greater than in conventional belt edges. This permits the use of thicker edge protection of assured stability—especially important where guide idlers or trippers are used.
- The thicker, stronger edge protects the belt carcass from attack by moisture, grit, acids, alkalis or oils.

FORTLOK is a registered Trade Mark.

certain sectors. The East European countries which have been trying to follow the path charted by the Russian economy have failed so far and they have not been able to catch up with the Common Market countries. The technical skill, the availability of raw materials and a host of other factors come into play for a successful execution of these economic plans. The fact, however, remains that the West European countries had a lead over the East European countries in many respects and their free private enterprise system provided progressive channels through which the economies could continue their race.

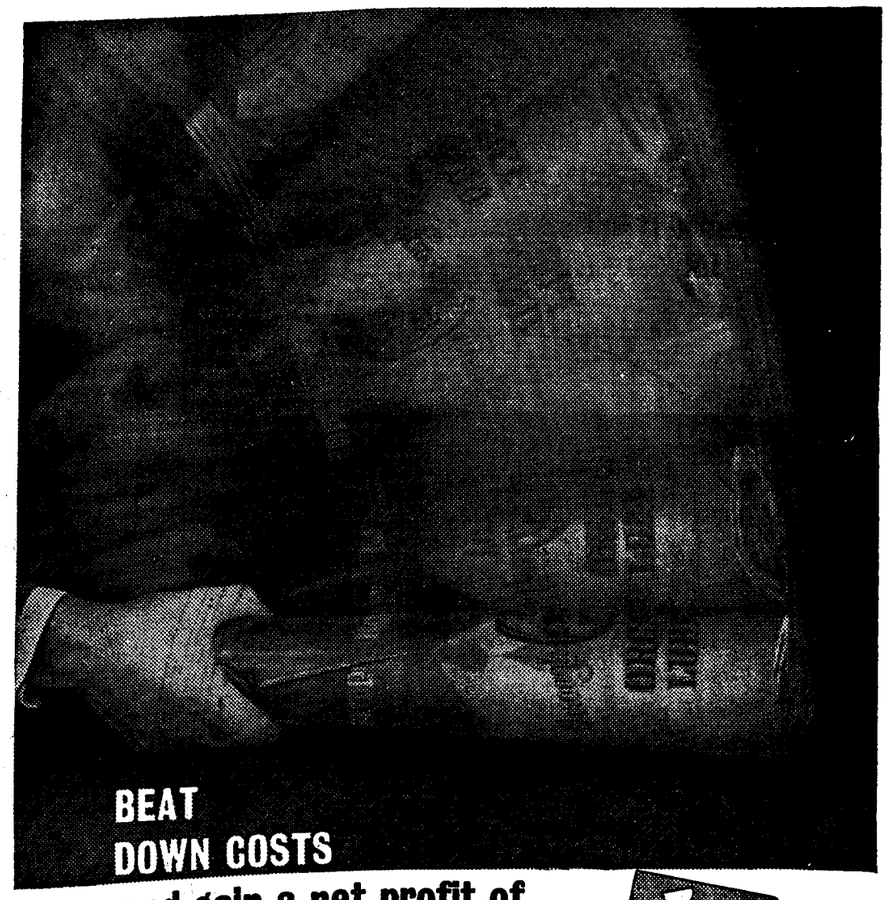
Financing Additional Defence Effort

By CROESUS



THE unanimity of opinion on the effects of the Chinese aggression on the economy of the country generally and on the Third Plan, in particular, is, indeed, amazing. An eminent British economist, a leading Indian business man, the President of the Associated Chambers of Commerce of India, and a prominent Indian economist are all agreed with the Union Finance Minister that war with China will be a prolonged affair, that the war effort will not come in the way of our economic development and so the Third Plan need not be suspended, and, what is perhaps quite significant, that the additional defence expenditure required must be primarily financed by increased taxation.

Miss Barbara Ward, the British economist, referred at some length to the defence efforts necessitated by the Chinese aggression and examined whether it would be inimical to the pursuit of India's Third Plan, in the course of her two lectures on "The Plan Under Pressure — An Observer's View", under the auspices of the Council for Economic Education, Bombay. Her considered conclusion was that defence effort at a very much higher level than at present, which the situation demands, need not necessarily frustrate the objectives of the Third Plan. Inasmuch as defence effort would speed up production of steel, coal, power and transport —all of these are admittedly lagging behind the targets today — and also release new types of skills, she said, it would also benefit the long-term objectives of the Plan. Miss Ward estimated that the defence effort required for facing the Chinese aggression would mean a search for an additional Rs. 350 to Rs. 500 crores in terms of foreign exchange. Although she feared that such enormous defence expenditure would lead to the growth of inflationary pressures, she felt that these pressures would be contained by draining out the purchasing power of the people by additional taxation. In her opinion, the present level of taxation, which is about 10 per cent of our national income, is not at all high and could go up to 20 per cent of the national income, and this, she added, should be done, besides exploring such "elbow room" as still exists for increasing excise.

In a thought-provoking article contributed by him to "The Hindustan Times" a few days ago — on December 4, 1962, to be precise -- Mr. G. D. Birla, made these very points, but even more emphatically. Indeed, he went a step further and said: "If the war has to be fought successfully, not only the Third Plan should be fulfilled, but all sorts of encouragement should be given to production to achieve much bigger targets than those envisaged in the Plan". He was categorical that the Plan should not be suspended but agreed that it might be necessary to make certain adjustments. Mr. Birla's estimate of the additional defence expenditure was Rs. 620 crores a year, and he assumed that about Rs. 300 crores would have to be found by this country. This, he said, has to come out of the national income through taxation and loans, and he had no doubt that the country could bear this new annual burden, if, as he rightly stressed, "we can achieve the targets of production envisaged in the Third Plan .... What is, therefore, needed is thinking in a new and bold way and the determination to implement policies and programmes which have been agreed upon." In other words, his plea was for a "new psychology in the Government in favour of realism and efficiency".

Addressing the last annual general meeting of the Associated Chambers of Commerce of India, Mr. H. Mackay Tallack, the President, expressed the belief that "Government of India have acted most judiciously by announcing that though it may be necessary, to some extent, to rephase the Third Plan and increasingly to concentrate on defence production, it is still their intention to pursue the Third Plan policies and targets". It is precisely, by pursuing the basic objectives of the Third Plan, namely to industrialise the country as rapidly as possible and to expand the output of the goods and services, he said, that we are most likely to promote the defence effort. But, he too conceded that "we shall have to accept a rather slower rate of progress and, as the emergency develops, to adopt a more flexible approach in the formulation of our economic policies". Mr. Tallack was of the view that "the present circumstances provide a unique opportunity for mobilising support on a truly national scale" and suggested that, although there has already been "an impressive broadening of structure of taxation, there are still large areas of the economy on which the tax burden falls, very lightly". While, therefore, he felt, the present was a very appropriate time to extend the fiscal net to these areas, he pointed out that the incidence of income-tax in India was the highest in the world, meaning thereby that there was not much scope for increase under this head. He was also of the same view as regards corporate taxes. As a matter of fact, he almost posed a problem to the Finance Minister by stating: "It may be more important to have more goods in the production line than to increase the Government tax receipts by the money which will provide for them". In other words, he was of the view that company revenues had been stretched to the limit by recent expansion and development programmes and any measure of taxation which would impinge on the capacity of the industry to increase production, which can be financed only by greater investment and fixed capital, would be self-stultifying. For these reasons, the Associated Chambers' President expected that the Finance Minister would obtain large sums through the medium of savings, especially by mobilisation of rural savings through agencies like the Life Insurance Corporation.

Prof. D. R. Gadgil, the noted Poona economist, estimated that the defence expenditure in the coming few years would be at least twice that provided in the current year of the Third Plan (Rs. 387 crores). He also said that the expansion of the defence forces would mean huge capital and investment, but, notwithstanding this extra burden, he warned the Government against any relaxation in the development effort. "Without sustained efforts at economic progress," to quote him, "the country would not be able to stand the increasing burden of defence expenditure in the coming years". Unlike Mr. Tallack, Prof. Gadgil felt that voluntary contributions to the Defence Fund (or saving) would not carry the country very far. He, therefore, suggested that there should be some compulsion to people to save, accompanied by some incentives. But, above all, he was for "a basic revision in the country's

taxation policy and taxation structure", so that the burden of increasing defenie expenditure might fall on all sections of people equitably.

Suggestions that at least a part of the additional defence expenditure be met by deficit financing also have not been wanting. For example, deficit financing to the tune of Rs. 150 crores has been specifically advocated in the latest issue of "Monthly Statistical Commentary of Indian Economic Conditions", published by the Indian Institute of Public Opinion. In view of the present fall in prices, it has been suggested that the economy could take the resulting inflationary pressure —an estimated rise in the price level of, say, about six per cent. However, Miss Ward and, even more emphatically, Mr. Morarji Desai have ruled out deficit financing as a means to meet the anticipated increase in defence costs in the present circumstances. Like Prof. Gadgil, the Union Finance Minister also wants to ensure a measure of equity in distributing the burden of additional defence expenditure among the different sections of the community and believes that, unlike voluntary savings, a measure of compulsion through taxation is unavoidable, inasmuch as taxation can also be designed to effect economy in the use of specific resources which are particularly likely to be in short supply.

There is, however, another school of opinion which argues that the so-called principle of equal sacrifice is being carried too far. While not opposing that there should be equality of sacrifice, this school urges that the authorities should also bear in mind the other equally important concept of "equi-marginal sacrifice". Also challenging the customary notions about ideal proportions as between direct and indirect taxation and facile assumptions, such as direct taxation being progressive and indirect taxation being regressive, it advances the thesis that it is possible even to make indirect taxation progressive. Yet another point made by this school is that mobilisation of resources not only implies imposition of additional levies but also studied efforts at effecting every economy conceivable. To sum-up now, if this country has to meet the additional annual increase in defence expenditure, which may well form a regular feature of our budgets in the coming years, as much reliance must be placed on effecting economies everywhere as on raising additional resources.

Business Notes

Agriculture

PROVISION OF TERM FINANCE

IT IS a pity that despite the current national emergency during which development of agriculture is being accorded priority next only to defence build-up, such a wholesome and uncontroversial piece of legislation as the one seeking to set up an Agricultural Refinance Corporation, for augmenting the facilities available for term finance to the agriculturist, could not be pushed through in the last session of Lok Sabha. That term finance is the Achilles' tendon of India's agrarian economy is evident from the fact that even during a decade of planning, only niggardly progress has been recorded in respect of such farm development activities as soil conservation, mechanisation of farming, extension of irrigation facilities through investment by farmers themselves and reclamation of agricultural wastes. The need for providing massive long-term credits to the Indian peasantry is there beyond any shadow of doubt, if the tired Indian soil is to recoup its fertility and enabled to yield anything near to what the farmers in the advanced countries of the West raise from their holdings.

Long-term finance to the Indian agriculturist today is provided only by land mortgage banks. But their success has been impeded not only by administrative weaknesses but also by inadequacy of funds. In some States, such banks are even conspicuous by their absence. The Agricultural Refinance Corporation, proposed to be set up with an authorised capital of Rs. 25 crores (Rs. 5 crores is to be paid up in the first instance) and with powers to borrow to the tune of 20 times its capital and reserves should help in making available adequate resources for term lending for agricultural purposes. It is heartening that to strengthen the term finance structure in the countryside, refinance facilities from the proposed Corporation would be available not only to land mortgage banks and co-operatives (presumably for medium-term credit) but also to scheduled banks subscribing to the Corporation's share capital. That scheduled banks, branching out into the countryside, can play a very useful role in agricultural development has already been demonstrated in Kerala. In exceptional cases, the Corporation would, with permission from the Reserve Bank, also lend directly to some co-operatives, presumably the ones which have a creditable record of working.

Since agriculture in India still remains, to a large extent, a gamble in rain and credit-worthiness of all the co-operatives and land mortgage banks is not invulnerable, it is in the fitness of things that adequate safeguards are proposed to be provided in the Corporation's statute for the safety of its funds. The Corporation is to be allowed to refinance the eligible institutions, for periods extending upto 25 years and for amounts upto Rs. 50 lakhs (higher accommodation, of course, would be allowed to be granted with specific permission from the Reserve Bank) only on unconditional guarantee being provided, for the repayment of the principal and payment of interest, by the State Governments, except in cases in which an eligible institution makes available other security (not the Corporation's own shares, bonds or debentures) to the satisfaction of the Corporation's Board. The Corporation is to be debarred from advancing any money to its eligible borrowers for the purpose of providing them working capital.

Even with all these safeguards, the Corporation will have to set up an organisation to supervise the use of the funds against which it would be providing refinance. This is necessary especially in the case of the loans extended by co-operatives and land mortgage banks which may not be having an efficient machinery of their own for this purpose. Instances have not been found wanting in the past of credits made available by co-operative societies to the agriculturists for a particular purpose being utilised for some unauthorised purposes, with the result that recovery of such loans has invariably fallen in default. Considerations of safety, it is however hoped, will not make the refinance operations of the Corporation too rigid. The commission the Corporation would be charging for extending its refinance facilities will also have to be kept modest — lower than what the Industrial Refinance Corporation charges — for the simple reason that agriculture is not as remunerative an occupation as industry.

Vegetable Oils

DEVELOPMENT COUNCIL'S DECISION

THE DEVELOPMENT COUNCIL for oils and plastics industries, set up in 1958, was constituted to include oils, soaps and paints and later on cosmetics and toiletries too. At the inaugural meeting of the Development Council held a few days back the state of vegetable oils, their actual output against targets as well as their demand, were considered. Against the requirements

of vegetable oils by the end of 1965-66 at 29.28 lakh tons, the output at present is nearly 18 lakh tons which includes five major vegetable oils—groundnut, linseed, rape, sesame and castor—along with coconut oil, cottonseed oil, and solvent extracted oils. It was pointed out that there should be more than 50 per cent rise in the vegetable oil production to meet the estimated demand by the end of the Third Plan. To meet the possible shortage the Ministry of Commerce and Industry has been paying attention to the questions of both increasing the availability of edible oils in the country as well as improving the recovery from the sources where there is waste.

Special attention has to be paid, it was pointed out, to the cottonseed oil in the country. Against the availability of the order of 18 lakh tons of cotton seeds only 3.5 lakh tons were being crushed. This was because cotton seed oil crushing industry is not sufficiently remunerative. For the Third Plan, therefore, a target of 8 lakh tons of seeds to be crushed every year has been fixed which will give something like one lakh tons of oil. At the moment there are 14 units with an installed crushing capacity of 2.2 lakh tons of cottonseeds per annum. The total licensed capacity however is much higher and is nearly 6 lakh tons. The Government of India has provided certain incentives for the development of this industry. These include (a) exemption from the payment of excise duty on the oil, (b) rebate on excise duty payable for vanaspati, in proportion to the quantity of cottonseed oil used in its manufacture and (c) the export incentive scheme for the export of cottonseeds. It was clearly laid down that the development of the cottonseed crushing industry was in the purview of the Government policy and it was considered to be a potential source for edible oils.

The Development Council has also suggested the setting up of a high level committee to examine the disorganised state of oil milling industry and to make recommendations so as to place this section of the industry on a sound footing. In order to take advantage of the lower excise duty, several small units have sprung up during the last few years. This has effected the supply of oil cakes of the requisite quality. The Council has referred to the need of having improved quality high pressure oil expellers to be manufactured in the country. The idea is to reduce the residual oil content in the oil cake to 4 to 5 per cent for economical operations. The question of improving the efficiency of the indigenously manufactured oil expellers within the country in collaboration with one or more of the foreign companies is also being examined. If the level of extraction is improved, it will be more economical to step up the export of de-oiled cakes which earn sufficient amount of foreign exchange. It is hoped that the Council is able to carry through its suggestions as early as possible.

Soap

RECOVERY OF GLYCERINE

AGAINST THE Third Five-Year Plan target of 5 lakh tons annual capacity, the present installed capacity of soap in the organised sector is 2.53 lakh tons. During the year 1961, the output was 1.50 lakh tons and for 9 months of 1962 it has been around 1.13 lakh tons. From these figures it appears that there still is a sufficient unutilised capacity and, perhaps, for that reason, the policy of the Government has been not to license any further capacity. The Development Council for Oil, Soap and Allied Industries that met recently made an estimate that output in the unorganised sector is quite large. Although no accurate figures are available, it is estimated around 2.5 lakh tons every year.

One effect of this large unorganised sector is that the recovery of glycerine resulting in soap manufacture has been very low. The Development Council pointed out that in view of the requirements of glycerine in the ordnance factories, it has a special significance in the present emergency. In has, therefore, been decided to restrict the export of crude glycerine. In the organised sector, it may be added, nearly 90,000 tons of oils and fats are consumed for the manufacture of soap. It is estimated that the glycerine potential from the fatty materials is about 10,000 tons of C.P. glycerine which in terms of actual recovery would be about 8,000 tons, valued at Rs. 3.5 crores per annum. It may be added that actual production has been about 6,000 tons in 1961 because 90 per cent of the glycerine is being recovered in the organised sector. It has been estimated that the loss of glycerine in the unorganised sector is of the order of 7,000 tons. It is, therefore, being suggested by the Development Council that regional fat splitting units should be set up so that the oils and fats which are at present being used in the small-scale sector could be split into fatty assets and glycerine and fatty assets made available for the manufacture of soap. As has been pointed out, this is a subject which requires considerable attention and it is hoped that this process of fat splitting units would materialise soon.

Industrial Finance

REFINANCING EXPORT CREDIT

THE SCHEME to refinance medium-term export credit for industry has at long last been finalised by the Refinance Corporation of India. This scheme is likely to come into operation from January 1, 1963. It may be recalled that the Study Group on Credit Facilities for exporters constituted by the Union Ministry of Commerce and Industry in April 1960, had recommended that the Refinance Corporation should extend the scope of its activities by taking up refinancing of medium-term export credit. The new facilities, it is gathered, will be available in respect of export credits for periods between six months and five years covering export of primarily capital and engineering goods. Preshipment credit will also be eligible for refinance when combined with post-shipment credit.

In order to get the facility, the exporters must be in the private sector and may be either manufacturers or recognized export houses or other exporters of standing. The minimum amount of loan against which refinance may be sought should not be less than Rs. 1 lakh and the maximum amount of all the loans refinanced in the case of any single exporter will not exceed Rs. 50 lakhs. The latter limit will apply separately in the case of industrial loans and export credit loans. The rate of interest charged by the Corporation will be 5 per cent as in the case of general scheme of refinancing. The procedures and conditions have been well laid down and the export houses or other exporters of standing should not have much difficulty in obtaining the new facility. The facility will ordinarily be extended in the case of exports of capital and engineering goods. This, however, does not mean that other goods will not be considered. The scheme is a sound one and should help fulfil the purpose for which it has been constituted.

Fisheries

A CORPORATION TO BE SET UP

THE CENTRAL BOARD OF FISHERIES has recommended the formation of an Indian Fisheries Corporation in the public sector to sponsor large-scale integrated projects primarily with a view to stepping up the export trade in fish and fish products. The Corporation, in collaboration with foreign countries, will engage itself in all aspects of the fish trade, including catching of fish, processing, marketing and export. The Board has also resolved to set up a technical committee to make recommendations for increasing the supply of fish seed to meet the needs of fishermen in the States.

Mr. S. K. Patil, Union Minister for Food and Agriculture, while inaugurating the meeting of the Board here last week, said that our annual requirement of fish to feed at least half of our population, would be about 20 lakh tons. Against this, the target during the Second Five-Year Plan was only 14 lakh tons output, of which only about 12.8 lakh tons production could be achieved. The target for the Third Plan has been tentatively fixed at 18 lakh tons which, even if attained, would still fall short of our actual requirements.

On the financial side, it may be pointed out that an outlay of Rs. 28.64 crores has been made for fisheries development schemes during the Third Five-Year Plan, out of which Rs. 21.92 crores are for State schemes and Rs. 6.72 crores for Central schemes. The amount set apart for marine fisheries is Rs. 14.29 crores and that for development of inland fisheries Rs. 7.42 crores. Another sum of Rs. 6.93 crores is meant for ancillary schemes like research, training, marketing, etc. Marine diesel engines for mechanising fishing crafts being essential for the industry, attempts are being made by the Union Government to overcome shortages in this direction. Five Indian manufacturers have already been licensed to produce marine engines in co-operation with foreign firms. Over 400 marine engines are being imported from Japan under the Yen Credit and a further 200 are being obtained from Yugoslavia under the Yugoslav Rupee Payment Credit.

The problem of deep-water fishing in the large reservoirs is being undertaken under the guidance of Russian experts assigned by the FAO for this purpose. In the matter of fishing development, the interests of the fishermen can hardly be overlooked. The question of organising fishermen's co-operative societies and giving them necessary incentives and facilities has been referred to the State Governments and also to a Working Group of Fishermen's Co-operatives which has been constituted to review the progress and functioning of the existing co-operative societies and formulate plans for their development.

There are certain types of fish and fishery products which have had until recently an export market. The fall in the export of dried fish has been partly due to the failure of some important commercial fisheries and also certain restrictions unilaterally imposed by the importing countries in matters of price, purchasing organisation etc.

Economy

MATERIAL MANAGEMENT AND RESEARCH

IT IS quite apparent that without commensurate investment in manpower, the required acceleration in economic growth cannot be brought about. Refreshingly this point was highlighted by Mr. R. L. Tuli in his Presidential address at the twelfth annual general meeting of the Delhi Chamber of Commerce. Now that there have arisen new employment opportunities as a result of the growth of the industries and developments in the transport, agricultural and power fields, it becomes essential that training programmes be given top priority. Industries require a large number of supervisors, engineers, accountants and managers and the training programmes could help acquire these skills. Technical institutes in this context will have to be set up on a large scale.

Another aspect on which Mr. Tuli dealt at length related to material management and research. He emphasised that scarcity and ever-increasing prices of materials coupled with inadequacy of financial resources in India should compel us to devote more and more attention to the study of the most profitable ways of handling materials so that our inventories can be cut down to the minimum consistent with the level of production. As there is paucity of resources in our country, the need to cut down wasteful use of material and the unnecessary variety of size and design of products becomes all the more greater. Mr. Tuli, therefore, rightly pleaded that research be carried out in these directions.

So far as the counteracting of inflationary pressures is concerned, "The Eastern Economist" has been putting forward its case that consumption in real terms must be curtailed and restricted. Realistically Mr. Tuli has come out with the same view. Reduction in consumption by even another 4 to 5 per cent could go a long way in stepping up the volume of savings. The current rate of savings in the country is about 8.5 per cent of the national income.

State Income

PITFALLS TO REGIONAL INCOME ESTIMATION

NATIONAL INCOME estimates have long since come to be recognised as an important tool in economic analysis. But, with the launching of five-year economic development Plans, however, the need to arrive at correct estimates of total national income, as also of the various States separately, has become supremely so. No less important in a large country like ours, with its vastly varying economic conditions and different degrees of political consciousness from region to region, is the need for a pattern of regional planning which should dovetail into the national Plan. Although economic activity within the different regions has been controlled and guided, to a large extent, by national policies and objectives, the need to study how these policies have, in fact, been translated into action and how they have influenced regional growth is imperative.

Indeed, this was the theme of the presidential address by Dr. N. S. R. Shastry, Statistical Adviser to the Reserve Bank of India, to the 3-day seminar on "ESTIMATION OF STATE INCOME" organised by the Indian Conference on Research in National Income, held in Poona last week.

Distinguishing between National Income and Income at regional level, Dr. Shastry observed, that in traditional income and product accounts approach, net domestic or geographical product at factor cost and net national product or national income at factor cost are estimated, the difference between income received and income produced in a region being equal to the net service and property income (i.e. earned income) received from outside the geographical region under consideration. At the national level, he explained, data for adjustment for net earned income from abroad were available and national income at factor cost was generally preferred for analysis. However, at the regional level (although it is realised that regions should be homogeneous with reference to social and economic conditions, for practical purposes, political boundaries are taken for estimation) it is very difficult to compute the net regional product due to difficulties in estimating inter-regional flows. It is this factor, Dr. Shastry said, that has been creating problems to econometricians in estimating regional incomes in any country. At the national level, domestic product and national income at factor cost may be estimated either by summing up various components of personal incomes (i.e. factor shares adjusted for transfer payments) and undistributed profits or by summing-up expenditure on consumption, investment and export surplus, excluding, for the present, the Government sector. But in constructing similar inter-related accounts at regional level, estimation of the components of personal income such as labour income, proprietor's income, property income, transfer of payments, etc., does not present any particular conceptual problems, only so long as the data are available from the recipients's record. But what is bound to cause difficulty is the allocation of undistributed profits, for any allocation adopted is bound to be arbitrary to some extent. On the expenditure side, again, if data on consumer as well as investment expenditure are obtained from the sellers' record, it becomes difficult to give regional break-up. Thus, according to Dr. Shastry, the main difficulties encountered in estimating regional income are mainly two, namely (1) estimating inter-regional flows and (2) allocation of surpluses of enterprises whose activities are extended over more than one region and of the Union Government accounts. In inter-State comparison of income levels, however, he pointed out that problems of a different type would arise and these, he said, are somewhat similar to those that we come across in international comparison of national income.

Cement

PANYAM CEMENTS PROGRESS

THE ANNUAL report of Panyam Cements and Mineral Industries Limited for the year ended August 31, 1962 reveals that the company recorded satisfactory results. The output of clinker was higher than last year. Out of a profit of Rs. 7.95 lakhs, the directors recommended the payment of a dividend at the rate of 8 per cent on equity shares which will absorb nearly Rs. 4 lakhs. The directors have reported that although the coal supply was not in shortage, the quality of coal allotted was not satisfactory, which retarded production to some extent. The company has continued to carry out its expansion programme. The construction on the kiln foundations, slurry basin and crane gentry were at an advanced stage. The consignments of machinery have started arriving at the factory site and the second plant is expected to go into production according to schedule. The results in the coming years are likely to be better.

Firestone
World's Leading Producer of Rubber

Nobody builds tyres like Firestone, world's leading producer of rubber. Nobody tests tyres like Firestone — and millions of punishing tyre miles each year prove it. In fact, no part of a car is more thoroughly proved than its Firestone tyres. Motorists everywhere in the world, trust the tyre that's built, tested and backed by the Firestone name. It's their surest sign of value. They know what they are getting when they buy Firestone.

FROM THE CAPITAL'S CORRIDORS

RE-SHAPING THE CENTRAL PLAN

RE-PHASING of the State Plans having been more or less completed, in the light of the suggestions of the National Development Council, which met here a few weeks ago, the Planning Commission is now understood to be engaged on re-shaping the Central Plan to suit the requirements of defence. Particular attention is being paid to strengthen the means of transport and communications to Assam and indications are that the conversion of metre-gauge railway line which connects Assam to the rest of India and which was not considered to be commercially feasible, may have to be taken up at an early date because of its strategic importance. Some of the Central projects which do not have a direct bearing on the defence effort, may have to be deferred for some time so as to make available adequate financial resources for accelerating the progress in the vital sectors.

PLEA FOR REDUCTION IN NON-DEVELOPMENTAL EXPENDITURE

Meanwhile, the Federation of Indian Chambers of Commerce and Industry has appealed to the Government to streamline the administration and to reduce non-developmental expenditure. In a communication to the Union Government, the Federation says :

> "Industrial development has to be accelerated, especially in those fields which are of strategic importance to the defence of the country and in branches in which further export is possible. Delays and red-tape which hitherto have unfortunately characterised Governmental policies and procedures must give place to speedy decisions and their clear and active implementation. Also during the last decade, there developed a trend for an increase in non-developmental expenditure of the Central and State Governments which actually doubled during this period. As defence effort would have to continue at a high pitch for a long time, and the present emergency is merely an indication of the situation that the country may have to put up with in the future, whatever expenditure that becomes necessary for defence must be incurred. At the same time, it is imperative that saving on non-developmental expenditure should be effected with very great determination as that would set free resources for defence purposes. Even a saving of 20 per cent would make available nearly Rs. 180 crores."

The Federation has also decided to approach the Union Government for assistance in the matter of making available additional transport for strengthening the supply position of essential commodities of civilian consumption in the vulnerable areas of Assam and North Bengal. It is felt that industry and trade in these places is being operated at present in very difficult circumstances and it is necessary to ensure that not only normal supply of commodities reaches these destinations, but also additional stocks are built up at strategic places which may be readily available for rushing to these areas whenever necessary.

PRICE SUPPORT FOR 1962-63 RICE CROP

With a view to step up rice output next year, the Union Ministry of Food and Agriculture has asked the State Governments to be prepared, if necessity arises, for giving support to rice prices in their areas at a certain minimum. These minimum prices are called procurement prices and have been fixed only for the common quality white rice. It is felt that if prices of this quality are provided necessary support and stabilised at suitable levels, the prices of other varieties will automatically find reasonable levels.

For Maharashtra and Gujarat, procurement prices of common white rice of fair average quality have been fixed at Rs. 16 per maund. In Andhra Pradesh, Madras, Mysore, Kerala, Bihar and West Bengal, the present procurement prices, in force since 1959, are to continue. These prices are Rs. 15.50 to Rs. 16.50 per maund in Andhra Pradesh, Rs. 17.37 in Kerala, Rs. 16 to Rs. 16.25 in West Bengal and Rs. 16 in Bihar.

The State Governments have been asked to give wide publicity to the effect that they would be purchasing rice at these prices in case prices tended to fall unduly after the harvest.

It has been also suggested to the State Governments that they should keep a close watch not only on the prices of rice but also on those of paddy. If in spite of the support that the State Governments would be giving to the prices of rice, the prices of paddy in any particular area tended to fall unduly, the State Governments would have to ask the mills in those areas to purchase paddy at prices corresponding to the procurement prices for rice. The mills may be given an assurance that the rice produced by them from the paddy so procured would be taken over by the State Governments at the stipulated procurement prices.

Any rice procured by the State Governments at the stipulated prices may either be retained by them for distribution during lean periods or delivered to the Central Government for building up a buffer stock.

ROURKELA PLANT'S PROGRESS

The Solveen team that studied the Steel Works problems at Rourkela early this year, had recommended the building up of adequate stocks of spare parts to improve maintenance. It had also recommended certain additions to workshop equipment and transport facilities as well as recruitment of 40 to 50 additional technical personnel from abroad. The spares and other equipment recommended by the Solveen delegation along with the heavy materials handling equipment considered necessary by the Rourkela Steel Plant were estimated to cost about DM 41 million (Rs. 48.79 million). The cost of employing about 50 German technicians for a period of one to two years was estimated at DM 15 million (Rs. 17.85 million).

The West German Government has agreed to offer to Hindustan Steel long-term loans to the extent of DM 41 million and DM 15 million for implementing the recommendations of the Solveen delegation expeditiously. The loan agreements are expected to be signed shortly. Orders for spares, equipment, locomotives and rolling stock valued at DM 25.30 million (Rs. 30.10 million) have already been placed by Hindustan Steel. Orders for the remaining items are expected to be placed shortly. Arrangements have been made for getting the services of about 40 additional German technicians. Seven of the technicians have already arrived at Rourkela and the remaining are expected to join shortly. Apart from these 40, there are about 184 German technicians, 25 American technicians and 15 Austrian technicians working at Rourkela at present.

Production at the Rourkela Steel Plant has been steadily improving for the last six months. The actual production figures for September and October 1962 given below reveal this improvement. October production, as these figures show, was about 95 per cent of the rated capacity at the pig iron stage and 76 per cent at the steel ingot stage. It is expected that 90 per cent pro-

duction rate of steel would be achieved by December 1962 and full capacity during 1963-64.

(Tons)

	September	October
Pig iron	63,073	72,523
Steel ingots	57,602	63,073
Plates	15,571	13,489
Hot rolled strips ..	28,076	29,015
Cold rolled sheets ..	9,310	8,048

Pipes	2,336	3,752

ALLOY AND SPECIAL STEELS PLANT

Messrs. Dastur and Co., consulting engineers, have prepared the report for the Alloy and Special Steels Plant proposed to be set up at Durgapur. As a result of the scrutiny of the Project Report by Hindustan Steel and Messrs. Atlas Steels Ltd., of Welland (Canada), the production advisers, certain additions and modifications were recommended. The tenders for the main plant and equipment have been invited from India and eleven foreign countries. Open tender enquiries have been issued in USA, UK, West Germany, Italy, Sweden, France, Austria, Canada and Belgium. In Japan, tender enquiries have been issued to the Consortium sponsored by the Japanese Consulting Institute. For electrical equipment, tenders have been issued in Switzerland as well. The tentative production programme as considered feasible for the production of finished saleable tool, alloy and special steel of acceptable quality is given below:

Initial Product-mix

(Metric tonnes per year finished saleable steel of acceptable quality)

Steels	Sections	Billets	Sheets	Forgings	Total
Tool	8,000	2,100	2,300	600	13,000
Constructional ..	12,000	3,000	1,000	1,500	17,500
Stainless & Heat Resisting ..	2,500	500	14,000	—	17,000
Die blocks ..	—	—	—	500	500
TOTAL ..	22,500	5,600	17,300	2,600	48,000

DEVELOPMENT OF PETRO-CHEMICALS

Dr. Henny of the French Institute of Petroleum, whose services were requisitioned by the Government of India, has made his report on petro-chemical industry. Dr. Henny, it is learned, favoured the Esso project of 200,000 tons as well as the Union Carbide project of 60,000 tons naphtha cracking capacity. The Government of India, it may be added, has approved of 200,000 tons naphtha cracker project in private sector with Esso, Union Carbide and Maffatlal and Company as participants. Whether the Planning Commission will modify this decision in view of Dr. Henny's Report is not yet known. Meanwhile, Shell International Chemicals, which has been permitted to set up a Solvent Plant with Burmah-Shell refinery feed stock, is planning its Rs. 1.7 crores project at an early date. In the first stage the plant will produce fifteen thousand tons of isopropyl alcohol to be converted into acetone and other solvents. This in its turn will be used in the manufacture of paints, varnishes, acetate rayon, hydraulic brake fluids and a new product in India, namely, polymethoyl methacrylate. Doctor W. Bernard Hawes of Shell International Chemicals, who is at present here, is also looking into the possibilities of manufacturing synthetic rubber and synthetic detergents in which his company has a world-wide interest. He is also examining the possibilities of producing other types of petro-chemicals. All these schemes, however, depend on the commissioning of the naphtha cracker unit for which final decision of the Planning Commission is being awaited.

OIL EXPLORATION IN GANGA VALLEY

An agreement has been signed between the Oil and Natural Gas Commission of the Government of India and the SNAM/Saipem, a group of companies under the E.N.I. of Italy, for contract drilling in the Ganga Valley.

The approximate cost of the project, including expenditure in foreign exchange is about Rs. 3 crores.

Under an agreement signed in August, 1961, the E.N.I. agreed to advance a credit upto a maximum of Rs. 46 crores to the Government of India for various petroleum projects. A sum of Rs. 3 crores was earmarked in this for oil exploration.

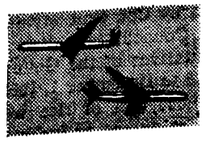
The present agreement covers half of the E.N.I. credit specified for oil exploration.

SURVEY OF POWER RESOURCES

The Government of India has decided to set up a high-level committee, including at least four foreign experts, to survey power and energy potential in India in order to prepare a 15-year plan for their utilization. The Committee will survey water, coal, oil and gas resources of India and inter alia examine economies of conventional versus atomic power stations. This committee is expected to draw up short-term and long-term plans for the setting up of thermal, hydro-electric and atomic stations.

The World Bank has agreed to set up a committee of experts to examine and make recommendations for effective transport of coal in India. Preliminary study of this problem was made by a two-man team of Messrs. Bell and Slater. This was followed by the Bank by setting up a Steering Committee of Mr. G. L. Bansal, Secretary-General of the Federation of Indian Chambers of Commerce and Industry, and Mr. Dean Mason of the World Bank to assist the Expert Committee in its task. Mr. Dean Mason is expected to arrive in New Delhi shortly.

Meanwhile, the Planning Commission in its latest appraisal of the power availability during the current Plan period has made the following estimates of the achievements of targets. The table show that power shortages are likely to continue right up to the end of 1964-65 financial year. It is only in the last year of the Third Plan that power situation is anticipated to improve to some extent.



(In million KW)

Year	During the year		At the end of the year

INDO - SOVIET TRADE

The Soviet Embassy in India has made it known to the press that the Soviet Union had every intention of fully implementing its trade commitments with India. Indo-Soviet trade has continued to increase during the last several years, and it was hoped that it would be stepped up by at least 25 per cent during 1963. In 1961, for instance, the Soviet exports to India totalled Rs. 250 million, of which machinery and equipment was 41.5 per cent, petroleum products 17 per cent., steel and iron rails 14.8 per cent. A feature of the 1963 plan, it was indicated, was a trial order for 1,000 tons of bananas from India and, in addition, some iron, steel and raw jute. In 1963, India had contracted for the import of 1 million tons of petroleum products, mainly kerosene and including 300,000 tons of furnace oil. A long-term agreement to this effect would be signed shortly. India has made no request as yet for the import of Russian

crude. A group of Indian manufacturers of footwear and handicrafts is expected to visit Moscow by the end of December to contract for the supply of their products in 1963.

The Soviet exports to India in 1963 will also include newsprint, cellulose, caustic soda, rails, medicines, machine tools, and tractors. Russia is likely to increase deliveries of machinery, capital equipment, including power generating and electrical equipment, asbestos and non-ferrous metals. These exports are expected to be balanced by a larger intake by the USSR of, among other things, tobacco, jute bags and footwear. The Soviet spokesman also added that his Government had offered two months ago to set up a factory to manufacture MIG 4 helicopters in India, but has had no reply as yet as to whether New Delhi was interested in the deal.

KHADI EXPORTS TO U.S.

With a view to promote the exports of Khadi to the United States, two ten-year contracts were signed by the Bombay Suburban Village Industries Association, on behalf of the Khadi and Village Industries Commission, with two firms in the United States. The first agreement on Khadi (cotton) exports provides for purchase by the US firms of between 4 lakh and 6 lakh metres in the period November 1962 to October 1963. The quantity will be increasing every year so that by 1966-67 between 20 lakh and 25 lakh metres will be exported. For the subsequent five years of the contract the 1966-67 level will be maintained. The second agreement also stipulates for an annually increasing scale of purchases by a US firm from India of Khadi silk fabrics. In the first year of the contract—June 1962 to May 1963—the company has agreed to buy between one lakh and three lakh metres of silk fabrics. The exports will increase annually and by 1966-67 between 3 lakh and 12 lakh metres of Khadi silk will be exported. This rate of exports will continue under the contract for the next five years also. The value of the Khadi to be exported in the first year of the contracts will be about Rs. 53 lakhs and from the fifth year onwards about Rs. 2.25 crores annually.

U.N. FUND FOR FOREST SURVEYS

The United Nations Special Fund is likely to assist in the Government of India's Rs. 140-lakh scheme for the survey of forest resources in the country on a scientific basis. This project, which has already been included in the Third Plan for meeting the requirements of the forest-based industries such as rayon, chip board and fibre board, has assumed importance in the present emergency when the timber resources will have to be utilised more rationally and scientifically. The Fund is expected to contribute about Rs. 40 lakhs mainly in the form of technical experts and equipment, including helicopters and aerial survey apparatus.

The project will include improvement of logging methods in accordance with modern developments. The survey will prepare a forest inventory, conduct an appraisal of industrial development possibilities and suggest a plan for industrial plantations, especially of the quick growing species. The pre-investment survey will cover about 12,000 sq. miles to begin with. The three regions intended to be covered are: (1) The Himalayan ranges in Uttar Pradesh, Himachal Pradesh and Punjab; (2) Central Zone consisting of Madhya Pradesh, Orissa, Andhra Pradesh and Maharashtra; and (3) Western Ghats consisting of Kerala and Mysore.

REGIONAL ADVISORY COMMITTEES FOR DIRECT TAXES

The Union Ministry of Finance has decided to set up Regional Direct Taxes Advisory Committees at the headquarters of the Commissioners of Income-tax on the model of the Central Direct Taxes Advisory Committee. The Commissioner of Income-tax concerned will be the Chairman of the Committee, which will include five non-official members, namely, a Member of Parliament elected from the region concerned, and two representatives each of professional tax experts, and commerce, industry and professions. The Committee will meet twice a year and will consider matters relating to income-tax and other direct taxes with a view to removing any administrative and procedural difficulties in the region concerned, and improving public relations.

DEFENCE LABOUR BANK

The Union Ministry of Community Development, Panchayati Raj and Co-operation has proposed that every Panchayat in the country should organise a Defence Labour Bank based on the donation of free labour at the rate of one day per month, or monetary contribution in lieu thereof, from every adult. With 150 million adults in the rural areas, the scheme, when in full operation, would contribute to the national defence effort a massive volume of labour valued at Rs. 200 to Rs. 300 crores per annum. This pool of labour is proposed to be utilised for building local *community assets* capable of yielding quick results.

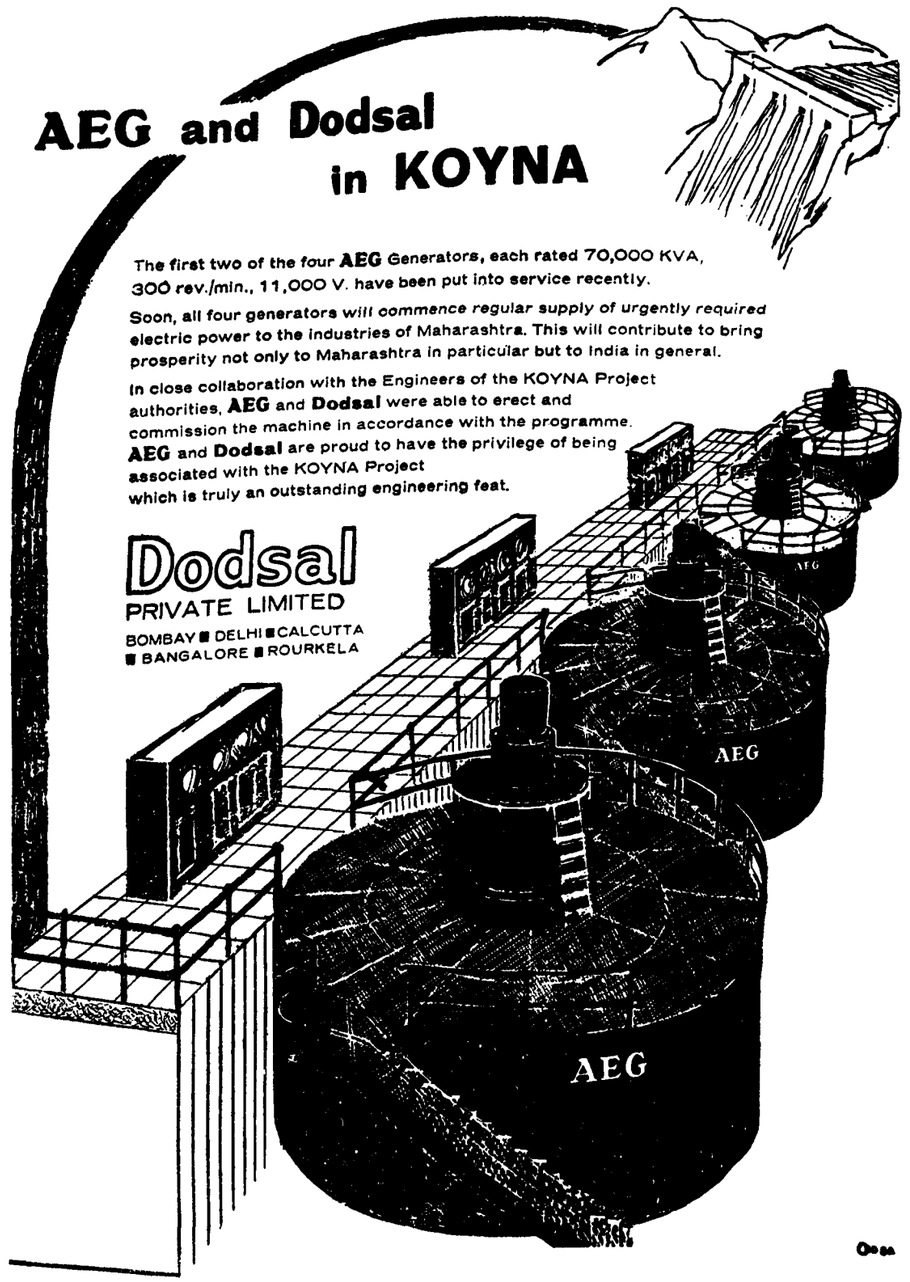
IN BRIEF ...

An agreement for the establishment of a heavy transformer factory at Ankamalai in Kerala with Japanese aid was signed recently. The authorised capital of the project, which envisages the setting up of a public limited company to be called the Kerala Heavy Electricals, Limited, is Rs. 2.2 crores. Electrical transformers, having a range from 1,000 KVA to 50,000 KVA are to be manufactured in the factory. The factory is expected to go into production in June, 1964.

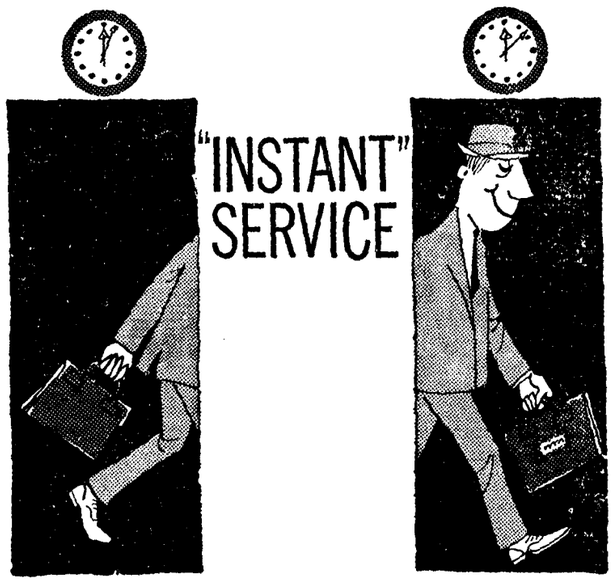
*

The import policy of the Government of India, it is expected, will be announced by the end of this month. In the nature of things, it will cover the period ending March 31, 1963. A further cut of about fifteen per cent over previous six months' cut is envisaged.

*



An official delegation, led by Mr. V. Shankar, Secretary, Department of Food, Ministry of Food and Agriculture left for Rangoon for talks with Burmese Government representatives for a long-term trade agreement. It may be recalled that a Burmese Delegation, led by Col. Chit Myaing, Member of the Revolutionary Council, had discussions in New Delhi with representatives of the Government of India from November 25 to December 1, 1962. It had then been agreed that 225,000 tons of rice would be made available by Burma for export to India in 1963. Information about the commodities which either country can export to the other was exchanged and it was decided that the talks should be concluded in Rangoon.



*

A new trade agreement between the Government of India and Iraq was signed here last week. The agreement will be valid for a period of two years initially and will come into force immediately on ratification by the two Governments. The agreement provides for increased trade between the two countries in traditional items as well as for trade in some new items. The main commodity of import from Iraq is dates. Iraq, which is a developing country, offers large opportunities for Indian engineering products. It is also an important market for tea, jute manufactures, textiles and spices.

*

The Government of India, in consultation with the Forward Markets Commission, has decided to ban forward trading in art silk yarn and staple fibre yarn with immediate effect throughout the country. All the outstanding contracts in these commodities have been ordered to be closed at the rates prevailing at the close of business on December 17, 1962.

NEWS IN BRIEF

INDIAN

The Orissa Government is considering a programme to set up coffee plantations in the cold regions of Koraput and Phulbani districts.

•

The Union Government proposes to set up marketing boards for sugar and agricultural commodities in an effort to regulate prices.

•

The Union Government has set up an Export Promotion Committee for Engineering, Chemical and Plastic Goods at Madras under the chairmanship of Dr. A. Ramaswami Mudaliar.

•

The Gujarat Government has decided to establish 13 wholesale stores and 360 primary stores in the State in an effort to check the rise in prices of daily necessities.

•

The foundation of the fourth blast furnace of the Bhilai Steelworks was laid on December 10. It will have an effective capacity of 1,719 cubic metres when completed and will be the biggest of its kind in Asia.

•

A preliminary survey conducted by the Geological Survey of India has indicated deposits of bituminous coal in Chingleput District, Madras State.

•

The National Productivity Council will sponsor four productivity study schemes in 1963 in hotel, instruments, agricultural machinery, plywood and coir industries.

•

India has been promised a gift of 8,000 tons of paper every year for the next five years from Sweden and 2,000 tons per year for a similar period from Australia, for printing and distribution of textbooks to poor children.

•

The Union Government is considering a proposal to amend the Constitution to protect land reform legislation.

•

A seven-mile-long ropeway system will be installed at a cost of Rs. 6 crores in the Raneegunge Coalfield, West Bengal, to carry sand for stowing purposes.

•

The Rajasthan Government has announced a programme for doubling the State's annual cotton crop by the end of the current Plan.

•

The Overseas Communication Service has expanded its existing radio-phone service to Afghanistan.

•

The Punjab Government has decided to appoint a registrar to be responsible for the management of cooperative sugar factories in the State.

•

An agreement providing for closer economic ties between India and Iraq was signed in Delhi on December 13.

•

The Union Government has decided to import 600 marine engines from Japan and Yugoslavia for the fisheries industry.

•

The cotton crop of 1962 has been estimated at 56 lakh bales as against 45 lakh bales in 1961.

•

An agreement recently signed at Trivandrum, provides for the establishment of a heavy transformers manufacturing unit near Alwaye, Kerala State, with the technical and financial collaboration of Hitachi Ltd., Japan. The factory, which is scheduled to go into production in 1964, will manufacture electrical transformers having a range of 1,000 KVA to 50,000KVA.

FOREIGN

The U.S. Army has developed a light-weight portable X-ray unit, weighing less than 100 lbs., for field use.

•

The Cuban Government has issued a decree nationalising all textile, footwear and hardware business.

•

President Kennedy has appointed a Special Committee to scrutinise the performance of United States Foreign Aid Programmes.

•

A new statutory body, the Australian Wool Board, has been set up to take over the functions till now performed by three separate organisations.

•

Foreign investment in Brazil from 1957 to 1961 has been estimated at $511 million. Of this, 43 per cent came from the United States.

•

The Swedish Agency for International Assistance has provided a technical assistance grant of $800,000 to the United Nations Relief and Works Agency for Palestine refugees. This sum will be utilised for a technical and teacher training institute to be built at Siblin, near Beirut, Lebanon.

•

The Saudi Arabian Airways plans to build a new airport at Jeddah on the Red Sea Coast.

•

Egypt will provide goods worth £6 million to Yemen under a recently signed agreement.

•

Japan's longest cross-country gas pipeline, 300 kilometers in length, constructed at a cost of about $14 million, was recently completed.

•

The Inter-American Development Bank has approved a technical assistance loan of $400,000 to Paraguay for the construction of a hydro-electric plant on the Acaray river.

•

Nigeria has announced a six-year development plan involving £676 million. Out of this sum, an amount of £412 million is earmarked for capital expenditure.

•

JAT, the Yugoslav Airline, will introduce "Caravelle", French jet aircraft, on its international services next year.

•

The Ethiopian Government will set up three cotton farm stations, covering 45,000 acres, at a cost of $14 million, in collaboration with a group of British companies.

•

The first commercial plant using a new wool scouring process developed by the University of New South Wales will be set up in Melbourne, Australia, early in 1963. The new process known as the "aqueous compression jet scour" simplifies cleaning, disentangling and preparing of wool, and is expected to effect a substantial reduction in manufacturing costs.

•

The Dawood Company of Pakistan has entered into an agreement with the Mitsubishi Shoji Trading Company for the supply of equipment worth $12.5 million for a bamboo pulp plant to the located at Chandrakana, East Pakistan. The factory, scheduled to go into production in 1965, will produce 18 tons of bamboo pulp per day, from which 10 tons of rayon pulp and 5 tons of cellophane are to be manufactured.

GOVERNMENT OF INDIA

PREMIUM PRIZE BONDS, 1963

PREMIUM ASSURED ON EACH BOND

AMOUNT OF PRIZES INCREASED

BONDS AVAILABLE FOR SALE IN DENOMINATIONS OF Rs. 100|- AND Rs. 5|- FROM 1ST JANUARY 1963

ISSUE: The Premium Prize Bonds, 1963, will be on sale with effect from 1st January, 1963, at:—

(i) Offices of the Reserve Bank of India at Bombay, Calcutta, New Delhi, Madras, Bangalore and Nagpur:
(ii) Branches of the State Bank of India and its Subsidiary Banks conducting Government Treasury business;
(iii) Treasuries and Sub-treasuries in India at places not covered by items (i) and (ii); and
(iv) Head Post Offices and Departmental Sub-Post Offices.

FORM AND DENOMINATION: The Bonds will be issued in two denominations of Rs. 100|- and Rs. 5|- and will be in the form of bearer bonds. No application will be required for their purchase.

REDEMPTION VALUE AND PRIZES: The Bonds will be repaid with premium of 50 nP. and Rs. 10|- for every bond of Rs. 5|- and Rs. 100|- respectively five years after the date of their sale. In addition to the premium, every bond sold will be eligible for participation in two draws for prizes to be held in the year 1964 on such dates as may be announced by the Government of India.

For every one crore of rupees of Bonds sold of each denomination, prizes as under, will be awarded in each of the two draws:—

Rs. 100|- DENOMINATION

1	Prize of Rs. 50,000	Rs.	50,000
2	Prizes of Rs. 25,000 each	Rs.	50,000
5	Prizes of Rs. 10,000 each	Rs.	50,000
10	Prizes of Rs. 5,000 each	Rs.	50,000
75	Prizes of Rs. 2,000 each	Rs.	1,50,000
150	Prizes of Rs. 1,000 each	Rs.	1,50,000
Total 243		Rs.	5,00,000

Rs. 5|- DENOMINATION

1	Prize of Rs. 15,000	Rs.	15,000
2	Prizes of Rs 10,000 each	Rs.	20,000
10	Prizes of Rs. 5,000 each	Rs.	50,000
25	Prizes of Rs. 2,000 each	Rs.	50,000
200	Prizes of Rs 1,000 each	Rs.	2,00,000
330	Prizes of Rs 500 each	Rs.	1,65,000
Total 568		Rs.	5,00,000

In respect of the sale proceeds in excess of round crore of Rupees, the prize-money will be increased proportionately and distributed in suitable number of additional prizes. Thus, the amount and number of prizes are not limited but will increase with every increase in the sale of the Bonds.

The draws for prizes will be held under the supervision of the Government of India and only **sold** bonds will be eligible for prizes. No bond will, however, be eligible for more than one prize in each draw. If an unsold Bond draws a prize, that prize will be awarded to the bond bearing the nearest lower number among the sold Bonds which has not, at that time, drawn or been awarded a prize.

PAYMENT OF PRIZE: The holder of a prize-winning-Bond may present his claim together with the Bond at any of the selling offices (except the Departmental Sub-Post Offices) mentioned above. The prize money will be paid at the office at which the claim is lodged after the claim is admitted by the Reserve Bank of India. The Bond will be returned with the prize money.

PUBLICATION OF WINNING NUMBERS: The particulars of the prize-winning Bonds will be published in the Gazette of India and the Press as soon as possible after the date of the relative draw.

TAX FREE CONCESSION: The prize-money and the premium on the Bonds will not be liable to tax under the Income-Tax Act, 1961.

SUPPLEMENTARY PROVISIONS: The Bonds will be on sale up to 31st December 1963 but the sale may, at the option of Government, be discontinued earlier.

COMPLETE DETAILS: For complete details a reference may be made to the Government's Notification F.No. 25 (41)—NS|62 dated the 1st November, 1962, copies of which are being exhibited at the Selling Offices.

Company Meetings

THE ASSOCIATED CEMENT COMPANIES LIMITED

SUMMARY OF CHAIRMAN'S STATEMENT

The following is a summary of the statement which has been issued to shareholders by Shri Dharamsey M. Khatau, Chairman, The Associated Cement Companies Limited, dealing with the Company's working for the year ended 31st July 1962. The Annual General Meeting of the Company will be held on Friday, the 18th January 1963 at 4 p.m. at the Sunderbai Hall, off Queen's Road, Bombay-1.

We are today under a grave national crisis caused by unprovoked aggression. Our policy and all actions affecting each of us as individuals and our business must therefore be governed by the overall consideration of the great and urgent task of repelling the invader. The Company's factories, collieries and engineering workshops will naturally be utilised to the fullest extent in the service of the country. Your Company has already donated Rs. 10 lakhs to the National Defence Fund and I am proud to say that the employees of the Company, numbering many thousands, are solidly behind the Government.

If, against this background, I appear somewhat critical of certain Government policies, I want to make it clear that such criticism is made both in view of the urgent need to stimulate the growth of the cement industry — a vital industry both in times of peace and war — and of the part which your Company can play in this great emergency.

During the year the most important event was the recommendation of the Tariff Commission for an upward revision in the retention price of cement and Government's action thereon. The Directors' report has mentioned the difficulties — operational and other — which prevented the Company from achieving better results than were actually obtained and why, despite higher profits it has not been possible to recommend a higher dividend.

PROSPECTS FOR THE FUTURE

PRICING AND INDUSTRIAL POLICY OF GOVERNMENT

As regards the profit-earning capacity of the Company and its future prospects, these are so largely dependent on the retention prices and Government's industrial policy and action, that there is very little I can say. I can only assure you that our efforts in increasing productivity and reducing costs are being ceaselessly pursued. As you are aware, Government arbitrarily scaled down the increase in price which the Tariff Commission had recommended. The retention price allowed to your Company was inadequate even by the Tariff Commission's standards; and in the absence of automatic escalator clauses, the relief afforded by such price increase is being rapidly reduced, since prompt adjustments to cover subsequent increases in the price of fuel and power, railway freight rates etc., are unfortunately not forthcoming.

It is a matter of deep regret that the Government should ignore the recommendations of a statutory body like the Tariff Commission — an independent body consisting of people, known for their capacity and judgment, who make their recommendations after scrutiny of all relevant facts and giving weight to all affected interests. It is therefore most disturbing that there is a tendency to dub this body as 'outmoded'. In the absence of an independent organisation of this kind, one fears that fixation of prices by Government could be completely arbitrary.

The incidence of the enhanced Tax on Corporations from 45 to 50 per cent is substantial. The heavy financial burden imposed by these and other charges has further reduced the profit element. One of the recommendations of the Tariff Commission was that the retention price should be revised if and when adjustments become necessary owing to increases in costs due to governmental action. A representation has been made to the Government through the Cement Manufacturers' Association.

CEMENT INDUSTRY IN THE NATIONAL ECONOMY

Cement is a key industry whose continued progress and prosperity are vital to the economic development of the country. The measure of work to be done can be seen from the fact that the target of installed capacity at the end of the Third Five-Year Plan, fixed at 15 million tonnes, has been considered inadequate, and it has been mentioned in authoritative circles that the figure should be 18 million tonnes. Even against a target of 15 million tonnes, the current capacity is only 10 million tonnes. The rate of growth is thus certainly not as vigorous as might be expected. Even conceding that numerous difficulties exist, it is difficult to escape the conclusion that this slow growth is largely due to lack of incentives, through the imposition of rigid Government controls on price, distribution and in the manner of licensing of new factories.

THE ROLE OF ACC

I would like to remind you of the role which ACC has played in building a sound cement industry and in developing a demand for cement in the country. ACC has a proud record of pioneering during the past quarter of a century. To serve consumer as also national interests, it has dispersed its factories carefully and has put to good use even substandard raw materials by employing beneficiation processes. The wisdom of such planned dispersal must be evident to the S.T.C. which, I have reason to believe, is deriving considerable monetary advantage by low freight leads on despatches from ACC factories, which helps it to subsidise the higher freights on cement despatched from factories belonging to other interests. ACC has been a pioneer in employing new processes and producing new products. The dry process of cement manufacture, the manufacture of white cement, blast furnace slag cement, oil-well cement, water-repellent cements, low-heat cement etc. have all been introduced by ACC after much study, research and development. The credit for manufacturing cement-making machinery at its own workshops and thus helping to lay the foundations of a sound heavy engineering industry in our country must also go to ACC. Our Engineering Works at Shahabad and the AVB Heavy Engineering Works at Durgapur, established in collaboration with Vickers and Babcock & Wilcox, will not only meet ACC's own requirements, but also serve the needs of the cement industry as a whole, thus helping India to conserve a great deal of foreign exchange.

Much foresight, money and effort have gone into these projects and products. ACC has therefore paved the way for other manufacturers to share in the benefits of its pioneering and developmental efforts. Far from discouraging new entrants in the field, ACC has, on several occasions, lent a helping hand to them.

I have dwelt on this somewhat pointedly as there appears to be a tendency, especially in licensing new factories, to consider a Company like yours as a monopoly, for which reason it must take a lower place in the queue!

During the year your Company's contribution towards the National and State finances was Rs. 27 crores in the form of Income-tax, Corporation Tax, Excise and other Duties, Sales Tax, Railway Freight, Import Duty etc.

These direct and indirect contributions to the national revenues, and the Company's record of progress and service are impressive. All this can continue to be harnessed to good use and I sincerely hope that Government will not stifle this by a doctrinaire approach. I believe that the 'know-how' we possess and our organisational vigour can help to expedite the expansion of the cement industry and make it easier to hold the price line.

COAL AND PACKING MATERIAL

Coal supplies continued to cause some anxiety in the early part of the year though, with special arrangements for the allocation and movement of coal introduced by Government, the position has considerably improved. The Company has also been able to draw about 30 per cent of its coal requirements from its own collieries. With increasing emphasis laid on regionalisation of the supply and movement of coal, the importance and utility of our two collieries have grown.

In the matter of packing materials the industry was looking forward to a continuance of the satisfactory position permitting the rational use of second-hand bags in reasonable proportions. However, its hopes were rudely shaken by Government's decision from the last quarter of 1962, insisting that producers pack 50 per cent of their production in second-hand bags — a condition physically impossible to fulfil in serviceable quality. The jute bag is a wasting commodity and cannot be re-used beyond a certain point. From the point of view of the consumers it is likely adversely to affect the standard of packing and will result in loss of cement by seepage by repeated use. The industry has made representations to Government to restore the **status quo ante** in this respect.

CEMENT DEMAND AND TRANSPORT

Demand for cement in the country is in excess of availability. Transport difficulties have aggravated the situation, creating artificial scarcity in some localities. Your Company has endeavoured to gear road transport to meet the situation. Substantial quantities of our cement were moved by road during the year.

EXPANSION AND REHABILITATION

The Company's planned programme of expansion and rehabilitation has made satisfactory progress. Your Board has taken the decision to resume work on the construction of a new factory at Porbandar.

ACC-VICKERS-BABCOCK LTD.

The Heavy Engineering Plant of ACC-Vickers-Babcock Limited at Durgapur, inaugurated in February last, has commenced production and has received orders for boiler plant, cement-making machinery etc. Full production will be reached by the end of 1963.

LABOUR-MANAGEMENT RELATIONS

The labour situation at our Cement Works continued to be peaceful. At the Katni Firebricks plant and Okhla Bulk Depot where the Wage Board's Recommendations did not apply, we entered into comprehensive wage settlements. The only factory, Madukkarai, where it was not possible to implement the Wage Board's Recommendations has also been brought into line and the settlement of implementation was signed on 31st July, 1962.

The question of bonus, unfortunately, continues to trouble us as it is troubling all industries, in spite of the fact that it has been the policy of the Directors to pay bonus to employees even though strictly according to the Labour Appellate Tribunal Formula no bonus may have been payable. We have four bonus disputes before Tribunals — National and Industrial. These proceedings cost a great deal of money, and drain away the time, energy and attention of personnel, including workers, from the productive side of the enterprise.

Here again, there are hopeful signs in the shape of the appointment of the Bonus Commission by the Government of India. It is earnestly hoped that the Commission will be able to arrive at an acceptable formula which will once for all bring peace in this sphere of industrial relations.

At our Collieries there was one major stoppage and quite a number of lesser dislocations — lightning strikes, go-slow, conciliation and adjudication. Kotma Colliery was closed for 133 days on account of a strike followed by closure. This strike was called on a completely extraneous non-industrial issue, and continued despite the advice of concerned Government Authorities, and was accompanied by violence.

The appointment of the Wage Board for the coal industry during the year to determine 'fair' wages, I hope, will bring peace and improvement in production in this sorely troubled industry.

APPRECIATION

I would like to express on your behalf our warm appreciation of the sustained hard work and wholehearted co-operation of your employees.

BOMBAY, 30th November, 1962.

DOODLE BUG

In the early days of oil, prospectors were introduced to an amazing invention which, it was claimed, would detect underground oilfields. The device appeared to be merely a tin suspended from a chain. Held above the ground it would whiz round and point out the place where oil was sure to be found.

Of course the whole thing was a hoax. Oil explorers have learnt better since then. Today, scientific instruments are in use which really *do* help the search, but the final answer always depends on the driller's test well.

The principal and most successful tools of the modern oil-seeker are the techniques of exploration geophysics. These cannot point directly to oil, but in favourable circumstances they can indicate places underground where oil *may* be found.

THE BURMAH GROUP OF OIL COMPANIES

BOC/S/64

THE MYSORE KIRLOSKAR LIMITED,
HARIHAR

Extracts from the Speech of the Chairman delivered on Saturday the 8th December, 1962 at Harihar at the time of the Twentyfirst Annual General Meeting of the Company.

It is my proud privilege to welcome you to this Twentyfirst Annual General Meeting of your Company. Unfortunately, we are meeting today after the sad and premature demise of Sri Rajaram Laxman Kirloskar on the 8th October, 1962 in Bombay.

Your Directors have duly placed on record their very warm and sincere appreciation of the meritorious services rendered by Sri Rajaram Laxman Kirloskar not only to the Company but also to the Machine Tool Industry in India as a whole.

From the Profit and Loss account of your Company you may have noticed that the net sales of the manufactured goods during the year amounted to Rs. 1.75 crores as against Rs. 1.57 crores in the previous year. Sale of stores and Sundries during the year amounted to Rs. 7.36 lakhs as against Rs. 6.05 lakhs in the previous year. Though the sales during the year under report are higher than the previous year, the profits of the Company are not however commensurate with the same. It will be observed that compared to the previous year, the proportion of salaries and wages to total revenues has increased from 23 per cent to 25 per cent on account of the revision of wage structure as a result of the agreement with the Labour Union. The proportion of provision for taxes to total revenues has also increased from 7 per cent to 9 per cent as a result of the increase in the rate of Super-tax with effect from the assessment year 1962-63 in respect of the companies. The Development Rebate provided for 1961-62 is Rs. 1,48,500 which is much less than that of the previous year. This has resulted in a higher provision for taxation for 1961-62. Raw materials, Stores consumed including Works-in-process and Transport charges account for 41 per cent of the total revenues whereas the proportion for the previous year was 42 per cent. The expenses on account of Fuel and Power consumed have increased from 2 per cent to 3 per cent. The proportion of Statutory Depreciation to total revenues remains unchanged at 6 per cent. Indirect Working expenses have reduced from 11 per cent to 10 per cent. The balance of profits which was 9 per cent for the year ended 30th June, 1961 has declined to 6 per cent for the year ended 30th June, 1962.

During the year under report, there has been an addition to the Plant and Machinery valued at Rs. 6.84 lakhs as against Rs. 18.14 lakhs in the previous year. Orders have been placed for the import of the Plant and Machinery required for the expansion schemes and the machinery is expected to be received during the course of the next two years. There have also been additions to the buildings valued at about Rs. 14 lakhs. These include the buildings for our Branch Factory at Hubli and Machine Shop No. 3 as well as the extension of Machine Shop No. 2 and the Packing and Painting Sheds.

As you may have seen from the Directors' Report, the Company's progress in the manufacture of Capstan and Turret lathes could not be according to our plans on account of the delay in receiving the imported components. The speed of development of these lines in future would depend upon the import policy of the Government of India.

At the time of the last Annual General Meeting, I had pointed out the difficulties faced by the Company in procuring quality Hard Coke and Pig Iron. This year the situation became even more difficult. The position of Coke had gone from bad to worse and the supply position of Pig Iron was perhaps at its worst. The timely help received from The Mysore Iron and Steel Works, Bhadravati, however, helped us to maintain the continuity production. The difficulties experienced in getting wagons have also increased because of the speed restrictions on the movement of trains.

I am happy to say that attempts are being made by your Company to export its goods to the South-East Asian countries and a proposal is under consideration to open an office at Kaula Lampur for this purpose.

Today we are facing a national emergency as a result of the border disputes with China. We are already facing an undeclared war. Under the circumstances, the Machine Tools Industry has a special responsibility to shoulder. The Minister of Heavy Industries has rightly urged that every Machine Tool factory should work round the clock to increase production and also to take up new lines which are urgently needed to meet the Defence requirements.

Your Company has already responded to the call of the Nation in increasing production. Your Company is also actively considering taking up new lines of production like Grinding machines, Milling machines, Automatics etc.

A certain amount of understanding and co-operation must exist between the workmen and the management to meet the demands on the industry. Now that a long-term agreement is recently concluded with the workmen, I hope, the workmen will appreciate the need of the hour and will not fail to continue to extend their unstinted co-operation in increasing production.

I am glad to inform you that your Board has agreed to donate a sum of Rs. 25,000 towards National Defence Fund.

THE DAY BREAKS BRIGHTER TOMORROW

MILK. Food. Children grow straight and strong.
Today's care. Gentle as with a flower.
Today's protection. The shelter of mighty effort.
Tomorrow...a little less of care, a little more of joy.
And for HINDUSTAN LEVER, too, tomorrow begins today.
In the milk plant and research laboratory,
in the factory and office. Work, patience, care
to serve tomorrow's homes and the nation's needs
with products that grow better and better.

TODAY AND TOMORROW...HINDUSTAN LEVER SERVES THE HOME
WITH SOAPS, FOODS, TOILET PREPARATIONS

This Age of Sillimanite

WITHOUT REFRACTORIES·

the WATER we drink  cannot be purified by lime and chlorine, both produced with the aid of Refractories.

FOOD  is obtained with the aid of potash, phosphates and nitrogenous fertilizers, none of which can be produced in adequate quantities without Refractories. CLOTHING  cannot be produced in sufficient quantities if Refractories are not available for the power plant. Power plants using Refractories provide your home with heat for COOKING,  LIGHT for comfort,  and power for essential domestic appliances. It would be impossible to construct FURNACES  to extract metal from ORES  or to operate  Rail Road LOCOMOTIVES. There will not be high octane AVIATION spirit nor LUBRICANTS  as suitable furnaces cannot be constructed. STEEL plates cannot be produced for building SHIPS.  It will be impossible to make LORRIES  TANKS  GUNS  SHELLS  Invasion BARGES  BATTLESHIPS even. ALUMINIUM and MAGNESIUM used in the manufacture of AEROPLANES  cannot be produced. CHEMICALS  used in explosives cannot be manufactured. The large POWERPLANTS supplying power, heat and light cannot operate.

A new role for the Sirens

TWELVE YEARS AGO, Murugappa & Sons of Madras joined efforts with Tube Investments of England to build a cycle industry in South India. The partnership has since been widening the scope of its activities year by year, and today embraces steel strip rolling, tube making, and cycle and cycle accessories manufacture. Possibilities of starting new ventures are being explored.

Industrially, India is well set on the road to progress and many a siren is singing the song of the happy co-operation between the two countries—co-operation which is helping to accelerate the pace of her development.

The Third Five Year Plan
Bird-Heilgers' part in it...

MADE IN INDIA

A SIMPLE PHRASE...
...VITALLY IMPORTANT!

"...special emphasis is being placed on... steel and machine-building and the manufacture of producer goods". The Third Plan very rightly stresses the need for rapid industrial development. Every new project for domestic production creates employment, saves foreign exchange, adds to the national striving for economic independence. The expansion of indigenous manufacture is critically important, and Bird-Heilgers is deeply committed to this decisive aspect of the Plan.

Steel for a solid industrial base

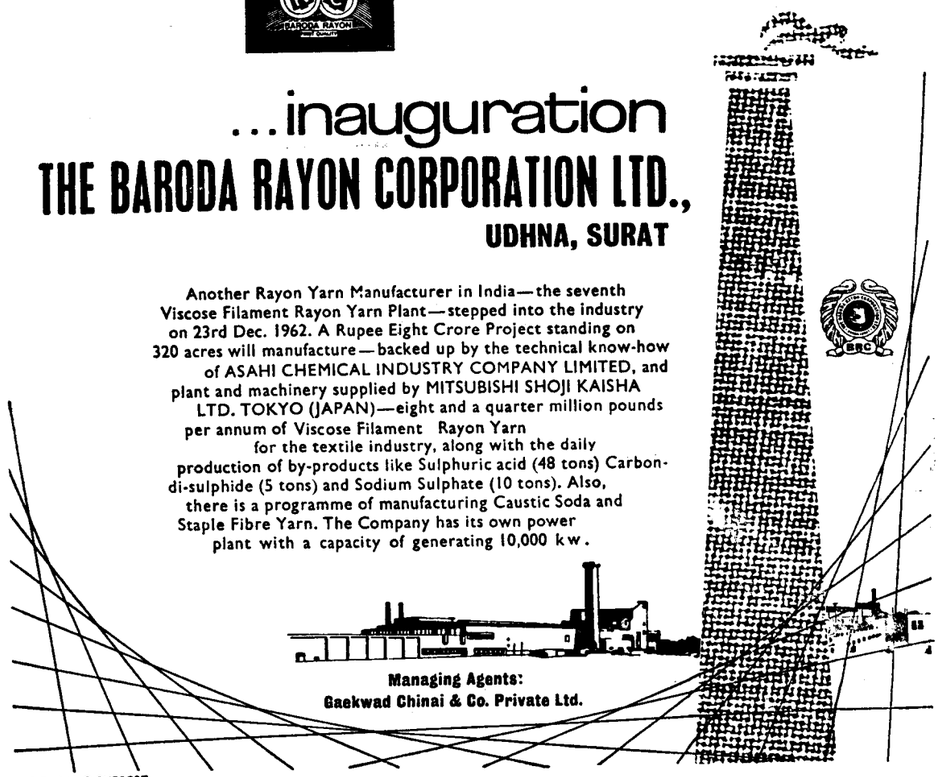
Steel is the very life-blood of an economy. Industries, utilities, homes, all depend on steel. Steady steel production depends, in turn, on the uninterrupted supply of minerals to the nation's blast furnaces. Bird-Heilgers supplies these minerals. Between 1957 and 1961, the group's output of minerals—coal, dolomite, iron and manganese ore and limestone—shot up almost 100% to well over 6,000,000 tons. The group will continue to help meet demand...to feed the blast furnaces with the minerals they must have

"Made in India"—by Bird-Heilgers

A vast range of products, hitherto imported, are now manufactured in India by Bird-Heilgers. The group produces jute goods, paper and board, water treatment equipment, air compressors and springs, castings and fabricated steel. The refractory manufacturing plant is the largest single unit in the East. A factory for the production of coal washeries was the first in India.

The group's engineering units are extremely flexible. They contribute, with equal facility, to projects as far removed as blast furnaces and ceramic plants. Planned diversification finds the group engaged in shipping, insurance, exporting and importing. The agency department handles everything from heavy capital equipment to light consumer goods.

Towards a self-generating economy



A phrase on everyone's lips. A phrase that finds concrete expression in the urgent activity of an economy on the move. Bird-Heilgers reflects the nation's striving. The group is alive to the problems of a growing economy. It deploys the full potential of a century's resources, technical knowledge and executive skill to broaden its activities...increase domestic production ..join in the national drive to economic independence.

...inauguration

THE BARODA RAYON CORPORATION LTD.,
UDHNA, SURAT

Another Rayon Yarn Manufacturer in India—the seventh Viscose Filament Rayon Yarn Plant—stepped into the industry on 23rd Dec. 1962. A Rupee Eight Crore Project standing on 320 acres will manufacture—backed up by the technical know-how of ASAHI CHEMICAL INDUSTRY COMPANY LIMITED, and plant and machinery supplied by MITSUBISHI SHOJI KAISHA LTD. TOKYO (JAPAN)—eight and a quarter million pounds per annum of Viscose Filament Rayon Yarn for the textile industry, along with the daily production of by-products like Sulphuric acid (48 tons) Carbon-di-sulphide (5 tons) and Sodium Sulphate (10 tons). Also, there is a programme of manufacturing Caustic Soda and Staple Fibre Yarn. The Company has its own power plant with a capacity of generating 10,000 kw.

Managing Agents:
Gaekwad Chinai & Co. Private Ltd.

PHILIPS RESEARCH SPELLS TECHNICAL EXCELLENCE

A great deal of thought and research goes into the design of every Philips product used every minute of every day to satisfy countless human needs.

Yet research work, conducted in the Philips laboratories, is only *one* of the responsible factors. To complete the picture, add to it the invisible *plus* of international experience and know-how. You will not wonder Philips products are of the highest technical standard, the last word in reliability.

PHILIPS
contributing today to India's future

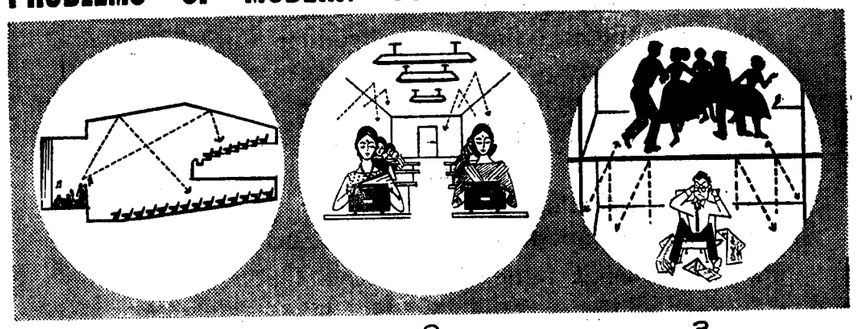
PHILIPS INDIA LIMITED

There's a Star in your future!

THE STAR THAT HAULS A FORTUNE

Babulal was once an ordinary truck driver, but it wasn't long before he followed his employer's example and saved enough to buy his first TATA MERCEDES-BENZ truck.

There were signs of prosperity soon after Babulal hitched his future to the three-pointed Star: a house in a new colony—full of shining happiness; a good education for his children; medical care...



Today, Babulal's fleet of T-M-B trucks hauls his fortune; many years hence they will continue to be Star performers for his children.

Is it any wonder that more and more operators choose to hitch their loads to the **TATA** MERCEDES-BENZ Star?

TATA
MERCEDES-BENZ
TATA ENGINEERING & LOCOMOTIVE CO. LTD.

PROBLEMS OF MODERN SOUND CONTROL

1. **ACOUSTICAL CORRECTION**

Auditoriums constructed without proper acoustical environment often annoy audiences with sound reverberations. Wherever good hearing conditions are important, great care must be given to the introduction of sound-absorbent or reflective surfaces to the right extent and in the right place. Such acoustical correction is therefore necessary in auditoriums, halls, theatres, churches and similar places, so that sounds are transmitted throughout the room and can be heard clearly, and with a natural quality by every listener in the audience.

2. **NOISE REDUCTION**

Hard, non-absorbing surfaces like that of smooth concrete, plaster or hard wood, cause sound waves to reverberate within a room. This results in overtones at high levels, which are disturbing and irritating to occupants. This problem is frequently encountered in offices, typing rooms, banks, factories, etc.

Acoustical materials should be used to reduce the reverberation time or the sound level within the room, thus reducing the level of annoying noise.

3. **SOUND TRANSMISSION**

The present trend towards construction of framed buildings as blocks of flats or maisonettes, in which floors and partitions have been reduced to the minimum thickness and weight, has created the problem of transmission of unwanted or irritating noise.

Acoustical materials should therefore be used (1) to form a barrier against sound passage to keep private office or room private; and (2) to prevent outside noise from disturbing other areas.

JOLLY INSULEX SOLVES THEM

the ideal cane-fibre insulating board in natural, white-face and flame retardant finishes, perforated Acoustic tiles, Decorative Ceiling tiles and Wall Panels.

Manufactured by:
ANIL HARDBOARDS LIMITED,

MBGC-1F

On the firm foundations of the First and Second Five Year plans, the task of successfully executing the Third Five Year Plan has began. Development work is taking place in eve.y village. There is activity in every farm and factory and in every small & cottage industry. From Rs. 72 crore and Rs. 155 crore spent respectively during the First and Second Plans, there is a significant rise in the Third Plan provision of Rs. 293.15 crore for West Bengal. Aiming at all-round progress, the Third Plan provides Rs. 53.60 crore for Agriculture, Rs. 63.86 for Irrigation & Power, Rs. 81.32 for Social Services, Rs. 26.50 for Transport & Communications, Rs. 17.43 for Co-operative and Community Development, Rs. 12.14 for Industry & Mining and Rs. 38.30 crore for other development works.

WITH PEOPLE'S PARTICIPATION ON THE ROAD TO PROGRESS AND PROSPERITY

In the past ten years food production increased from 39.7 to 54.5 lakh metric tonne ; Irrigation : 24.4 to 31.6 lakh acres ; Schools: 16,317 to 31,310; Students: 20.5 to 34.2 lakh ; Hospitals & Dispensaries : 1,284 to 1,912 ; Doctors : 18,336 to 20,834 ; Hospital Beds : 18,329 to 27,611 ; Nurses : 2,988 to 5,001 ; Handloom Cloth : 10 to 19 crore yds. ; Road (Surfaced) : 1352.9 to 5,888 miles ; Electricity : 1046.7 to 1803.7 million K. W. H. ; Jute : 13.5 to 18.0 million bales ; Factories : 2,530 to 3,943 ; and Co-op. Societies : 15,583 to 27,715.

Everyday, every hour work, hard work is going on
to build a BETTER BENGAL in a NEW INDIA

26th. JANUARY REPUBLIC DAY

GOVERNMENT OF WEST BENGAL.

POWER

Power is the business of 'ENGLISH ELECTRIC' – around the world and in India – the power that generates 225 MW of electricity at the Rihand Hydro Electric Scheme in Uttar Pradesh, the power which produces 6000 KW for reliable standby diesel electric supply at the Neyveli Lignite Corporation in South India, the power that drives the 3000 h.p. electric locomotives up the Western Ghats from Bombay and the power behind the steel rolling mills at Burnpur and Durgapur and countless numbers of looms, pumps, compressors and the like all over the country.

The Madras Works, which was established in 1958, has behind it the entire resources of the Company in the United Kingdom, the accumulated know-how of years of research and development and knowledge of the country through associations dating back to the turn of the century. The range of manufacture at Madras currently includes low voltage industrial distribution equipment incorporating High Rupturing Capacity Cartridge Fuse Links, Protective and Auxiliary Relays, and Control and Relay Boards.

INDIA AFTER THE EMERGENCY

"If we could first know where we are and whither we are tending we could better judge what to do and how to do it ..... The result is not doubtful. We shall not fail—if we stand firm, we shall not fail."

Abraham Lincoln

"A reluctance to face the full magnitude of our task and overcome it is a coward's part. Yet the nation is not in this mood and only asks to be told what is necessary. It is a fool's part too. For victory may depend on our making it evident, that we can so organize our economic strength as to maintain indefinitely the excommunication of an unrepentant enemy from the commerce and society of the world."

John Maynard Keynes

How to Pay for the War

"But I tell you, out of this nettle, Danger,
We pluck this flower, Safety ....
Can we identify the nettle? The flower?
Can we agree what Danger is?
Can we agree what Safety is? We must try ....."

Hotspur in Shakespeare's

King Henry IV

"Farthest from him is best
Whom reason hath equalled, force hath made supreme
Above his equals. Farewell happy fields
Where joy for ever dwells: Hail horrors, hail
Infernal world, and thou profoundest Hell
Receive thy new possessor: one who brings
A mind not to be changed by place or time.
The mind is its own place, and in it self
Can make a Heav'n of Hell, a Hell of Heav'n."

John Milton

Paradise Lost

India After the Emergency

Preface

IN the Annual Number 1963, as in the long series that has gone before, it might be truly said that the subject has chosen itself each year. The dramatic and, in many respects, agonising events since October 20, 1962, have decreed that the original subject planned for this Annual Number should become irrelevant to the great course of India's problems as they gathered feverishly towards the end of the year. Thus it has come about that "The Eastern Economist," no less than the country as a whole, has had rapidly to change its course. In some respects, as indeed is inevitable, many of the problems, dealing with economic affairs, in the difficult state to which they had arrived, independent of the Chinese invasion, overlap with older assessments. Nevertheless, the framework and the emphasis are entirely changed. Security, otherwise described as the Defence of the Realm, has become, for as long as we can see, the overwhelming condition of all our strivings. In a sense, wholly new to the Indian people, we have been brought into sharp challenge with our own philosophy and our own inadequacies in the context not of our own welfare but of our very survival.

Partly because the co-ordinates of our political and economic system have thus changed, it is necessary to recognise that the solutions for the Emergency must be different from those considered even barely three months ago. The old French proverb which says that the more things change, the more they remain the same, is at times such as these a momentous denial of the truth. Things have changed so deeply that the superficial resemblance that they have to previous events is apt to be a source of giant error. Mr. B. K. Nehru, our Ambassador in Washington, who has explained in a brilliant televised Press Conference the structure of Indian thinking, described the change as a "traumatic" experience in Indian political and economic thought. Now that the signs of normalcy are so abundant and that the indignant passion, which attended on the first attack has receded so considerably, we are very apt to feel that things can go on as before. One of the purposes of this Annual Number is to show that this cannot be done. In the first place, so far as foreign policy is concerned, our friends are now better seen with the absence of the great veil of ideology which often hid their true nature from their expressions of understanding. The word 'non-alignment' has now an undefined area of doubt. Again India's foreign policy, particularly her relations with the People's Republic of China, have been hammered on the anvil and have been beaten out of shape. In the great debate on the efficiency of India's defence system again history has swept, in one dramatic week, out of the arena not merely the Defence Minister, Mr. V. K. Krishna Menon, but also the Chief of the Army Staff and a Corps Commander who ranked in military reputation amongst the high in the country. These might be described as the debris of the volcanic eruption that has taken place in the body politic of the country. To say that the thread can be taken up where it was left on October 20 is to ignore the point that a permanent scar has been left on the minds of the Indian people. The solution for their problems at this time must take account of the fact that they are, in fact, sick and need a physician.

Something of the character of the operation is suggested by the quotations found on the opposite page. The quotation from Lord Keynes reflects the present mood of the Indian people and stresses how our defence is rooted in our economic strength. The quotation from Shakespeare indicates the change of direction in our policy and that from Milton the extent to which a psychological turn-around is required in order that we should live at peace with ourselves. It is probably true that the biggest burden which lies upon the Indian people at the present time is in respect of their own philosophy. This gives relevance to Abraham Lincoln's quotation set in a very different time, except that it was a time of overwhelming crisis for his own country. India is not clear as to where she is sailing and, indeed, this absence of direction and of firm rudder and compass, whether in the political or economic sphere, is a major challenge that we face at this time.

The pattern of this Annual Number follows that of the Annual Numbers of the fifteen years preceding. In the first place, there is 'A Politico-economic Prologue' which deals briefly with the problems of assessing the confused political currents and the psychological malaise as well as the challenge to the economy which now engage almost every thinking Indian. Secondly, there is an Economic Review which deals particularly with problems of production and mobilization of resources for the Emergency.

As in all previous issues, this Annual Number is dedicated to the Indian people. It is dedicated with some trepidation because "The Eastern Economist" is in no better position than the rest of India to prescribe a dogmatic counsel at this turning point of our history. All that is claimed is that it is a contribution to be thrown, as during every year, into the common pool. If there should come from these pages a new element in rethinking of our political and economic policies, we shall be rewarded beyond our hopes.

PART A

A Politico-Economic Prologue

The Chinese Invasion: Its Genesis and Aims*

By SIR N. RAGHAVAN PILLAI

(Formerly Secretary-General, Ministry of External Affairs)

THE question has often been asked, "Why has China chosen to alienate — mild word this — good-neighbourly India, who has from the first extended to China her warm and genuine friendship?" To this there has been no fully satisfactory answer, because, of a country seemingly so friendly as China, few in India and even abroad were prepared to believe the worst. Earlier transgressions by China, though they caused surprise, were seen as lapses on the part of a still suspicious and inexperienced revolutionary Government as yet unused to the ways of international behaviour, and these did little damage to the public image of China as a country bound to India by brotherly ties. But incident following upon incident in the different sectors of the long border between India and China shed an increasingly sinister light on the real aims and intentions of the Chinese Government; and the present massive Chinese aggression reveals with sufficient clarity China's grand design for India which she has set about to achieve with a ruthlessness and cynicism and a degree of deception unparalleled in modern times.

Communist China, at the time of its triumphal birth, must have exulted in its imagined destiny. China, vast in area, rich in resources, the most populous in the world; a country with an ancient civilisation which has made an impressive contribution to human thought, culture and achievement; a country inhabited by a people, hardy, industrious and amenable to discipline — that was the country whose fate lay in the hands of its new rulers. Vistas of limitless possibilities opened before their eyes. China had just got to its feet; in time it would draw itself up under communist care and tutelage to its full stature and when that time came, it would be the most powerful country in the world. An intoxicating thought; almost an over-fulfilment of the age-old Chinese dream! But first things first; the way had to be prepared for this delectable future.

The vast Eurasian land mass holds three very large countries, the Soviet Union, China and India; and by an irony of geography the three are grouped together in close juxtaposition. Big neighbours were always a nuisance, and should have their wings clipped at the earliest suitable opportunity. So Communist China must have thought, looking round its frontiers. The Soviet Union, however, was in a special position. It had had an earlier start, and had become the second strongest power in the world; there was, moreover, between the two countries an ideological bond, which enjoined a certain discipline on both countries in their mutual relations; and finally China was dependant on the Soviet Union for help in her material development. These considerations overrode others in the determination of policy towards the Soviet Union. This did not mean of course that problems did not exist, or that new ones would not arise, between the two countries. But these could wait until China had had time to build up its material strength and establish its ideological supremacy. Meantime, any cracks which appeared could be papered over with fresh protestations of fraternal solidarity.

With India the position, as Communist China saw it, was different. After China, India had the largest population in the world; it, too, had a long history and an ancient civilisation, and it had greatly enriched th religious and philosophical thought of the world Throughout the centuries there had been friendly intercourse between the two countries, and their cultures and civilisations had in the past spread to distant lands and had met and intermingled in some. Their contacts, wherever they occurred, had been peaceful in the past, but the same could not be confidently predicted for the future. Both countries had been victims of colonialism; but, while India had fallen fully under foreign domination, China, though humiliated and enfeebled, had not been conquered and had always retained the trappings of sovereignty. India, however, had won her independence two years before the Communists came into power in China, and had embarked on a long-term programme of economic development. Though still linked to Britain and the Commonwealth and steeped in the liberal traditions of the capitalistic West, she had declared for non-alignment in international relations and had set a socialistic pattern of society as the goal of her national effort and policy. She had in addition extended the hand of friendship to China, and had given China her support on major international issues. But this made little difference, in Chinese estimation, except to the extent of enlarging the scope for, and period of, deception. Capitalist or socialist, aligned or non-aligned, India, by reason of her size and her growing strength and importance, was a potential challenger to China who had set herself on a course leading to power and leadership. It was imperative, therefore, in Chinese interests that, as soon as China's preparations were complete and before India became too strong, India should be effectively cut down in stature; and no consideration, either of sentiment or even of honour, was to be allowed to deflect China from the pursuit of this objective.

It is a singular fact that communism, for all its vaunted universality, can graft itself on hoary nationalism in a way that makes the two indistinguishable. Through selective marshalling of facts and re-interpretation of historic events and movements, communism was presented to the Chinese people as the culmination of a historical process rooted in Chinese traditions and peculiar to the genius of the Chinese people. On this presentation, nationalism became the grand ally of communism; and communism underwrote even the baser aspects of nationalism. Thus was popular support won for the expansionist policies of successive Chinese Governments which had long been in cold storage and which the Communist regime for reasons of its own wished to resuscitate. Chinese maps had for years past shown large tracts of Indian territory as part of China, and the claims based on these maps, though long defunct, were seized upon by the People's Republic for use as the best means of enforcing their policy of expansion against, India. And for full measure they decided, as time went on, to add a few new claims of their own. Two ends were thus to be served: the realisation of Chinese expansionist ambitions with securing strategic command of the northern approaches to India and humiliating India in the eyes of the world, and of her neighbours in particular, and reducing her to a state of impotence.

There are those in our country who think that the Chinese attitude to India has been partly caused by

their delusion that, because India takes aid from the West, India must be regarded as "a virtual allay of the Western block". This is not only ridiculous but dangerously fallacious. The Chinese leaders can be under no such delusion, and for us to say that they are is not only to find a gratuitous excuse for the Chinese but to render a positive disservice to our country by encouraging our people to believe that we are also somehow to blame.

Let us examine the facts. It is true that the leaders of China, with the exception of Chou En-lai, have had little contact with the outside world. They are all, however, intelligent and experienced men, and well-informed on world affairs. They must be aware of India's stand on international issues, and more particularly of the help and support she has consistently given to China. If, in spite of this, they reproach India with being an ally of Western imperialism, they merely show themselves to be inimical to India for reasons which it would not be in their interests to disclose.

Nor is this all. On her southern frontier China has border claims against Burma and Nepal, and, because she holds a part of Kashmir, against Pakistan as well. All these countries are taking (or have taken) economic aid from the US; and Pakistan is in addition accepting massive military aid. With these countries, however, China has cordial relations, her cordiality increasing with the degree of estrangement of those countries from India. Does this not show that China's hostility is directed to India as such and not because she takes aid from the US? Even if we were racing headlong towards communism, China would still sternly prosecute her territorial claims against us; only, in that event, we would not fight a war, but be cowed into submission and "voluntarily" cede the territory claimed. To prove this, one has only to look to the examples of Poland and Rumania, both of which countries in the last war parted with territory to the Soviet Union.

The story of how China set about to execute her grand design against India is a depressing study in human cunning and deception. After the initial phase when the Prime Minister of India was still in Chinese eyes "a running dog of imperialism", there came a thaw and growing friendliness which found its first expression in the agreement between the two countries on the Tibet region of China concluded in April 1954 — an agreement under which India, true to her principles, renounced all her extra-territorial rights in Tibet. India had already announced that her policy was to be one of peace and non-alignment. As if to give India's unilateral declaration sacramental value and to prove her own devotion to peace, China proposed at the time the inclusion of the famous five principles in the preamble to this Agreement. As later events have shown, this was intended to do no more than bemuse and stupefy us. (The first Chinese intrusion into India at Barahoti took place in July 1954, less than three months after the signing of the Agreement. Not a word was said at the time that the Chinese had territorial claims against us; and to any suggestion for the discussion of a subject, other than they themselves brought forward, their invariable reply was, "the matter is not ripe for discussion". Experience has since shown that what they mean by this phrase is that they are prepared to discuss a matter in issue only at a time when they are confident that a settlement could be obtained on their own terms. Against this background one realises the utter hypocrisy of the frequent Chinese invitations to us to enter into negotiations over the border problem. They could have done so as far back as 1954, but they waited until they had illegally occupied large tracts of our territory and gained, by fradulent means, a military advantage.

The Prime Minister himself spoke to Premier Chou En-lai on more than one occasion about the inaccuracy of Chinese maps, and was given the reply that these were but reproductions of old KMT maps and that the People's Government had no time to revise them. Once Chou En-lai went to the extent of assuring the Prime Minister that the maps would be speedily revised. Ruefully we must admit that this was done; but the revision was to our further detriment.

Having lulled us into a feeling that all was well, China proceeded to conclude border agreements with Burma and Nepal, accepting the "watershed principle" for the determination of the boundary line—a principle which she has stoutly declined to concede in relation to her boundary with India. This was plainly done to isolate India—the only country which could become a formidable rival to China—and to win world sympathy and a general reputation for sweet reasonableness. And now Pakistan is about to enter into negotiations with China. Little do these countries realise that if China did have her own way with India, then their own agreements with China would be rendered quite worthless. We are battling not only for ourselves but for our neighbours as well.

The successive probings and intrusions carried out by the Chinese along the whole length of our northern border are well known and need not be recounted here. But a certain basis of settlement between the two countries which was never seriously discussed but which was thought to be acceptable to the Chinese calls for comment. That basis was the cession by India of the large area claimed by the Chinese in Ladakh in return for China's recognition of the McMahon line. It is unthinkable that public opinion in India would even in the early days have found any concession to China acceptable which went beyond some kind of perpetual lease of the highway across Aksai Chin connecting Sinkiang with Western Tibet and a belt of land on either side of the highway. That apart, to have traded in the greater part of Ladakh for formal recognition by China of a boundary which we regard a inviolate would have been a pussillanimous way of buying peace. Such a peace, moreover, would never have endured. As subsequent events demonstrate, the ultimate aim of the Chinese is to push the border to a line commanding the plains and valleys of North India and to establish a Chinese presence along that line which would be a constant menace and source of apprehension to India. In furtherance of this objective the Chinese would have, if an earlier settlement had been reached on the basis described above, resorted to every device and stratagem to subvert and foment disaffection among the inhabitants of the sub-Himalayan belt until India ceased to have any effective administration, control or influence in those areas. Better by far that they should come into the open, as they have now done, than pursue their clandestine, subversive activities.

In fighting their undeclared war on India, China is employing her customary techniques of falsehood and misrepresentation. After a long preparation for this surprise invasion the Chinese falsely accuse India of having made the first attack. Not content with this falsehood, they allege India's motive for so doing to be her desire to obtain more aid from the US. This is clearly an attempt, in view of the known Indian psychology, to raise a doubt in the Indian mind as to the wisdom of accepting military aid in any form from any Western country. Having thus tried in advance to

shame India into refusing foreign aid, China then proposes negotiations on terms which would put us at a serious disadvantage. The Government of India's rejoinder to such hypocritical overtures is clearly correct; and it has the added merit of not being likely to prove acceptable to the Chinese.

Is the war likely to develop into a total war between India and China? We must bear in mind that a total war between these two countries might easily lead to a global war. The indications are that China ould not like such a development, not because of the moral issues involved, but because it is her belief that she would be certain to win if it were a straight fight between the two countries. We, on the other hand, are equally confident, that, given the weapons and the equipment, we could drive the Chinese out of NEFA; and we in any case abhor the thought of involving other nations in this war and thus starting a world conflagration. The war is therefore more than likely to remain localised, and clearly it is better so.

If our victory is to be assured, it is essential that we should have the proper weapons and equipment and in sufficient quantities. It has long been known that in the event of an attack by the Chinese in NEFA, we should have to suffer initial reverses, because of the surprise nature of the attack, of the possible numerical superiority of the Chinese forces, and of the nature of the terrain. It was never thought, however, that Indian troops would be armed with inferior weapons; and the disclosure that such is the position has caused the country painful surprise. Clearly the first duty of the Government today is to correct this grave situation as speedily as possible.

Doubts have been expressed whether India could accept arms from other countries, consistently with her policy of non-alignment, except on payment of the full price. There is unfortunately much loose thinking on the subject. In the first place, what non-alignment properly means is abstention from entering into a military or similar alliance which would make it obligatory for a member-country to judge of an international issue as a member of a group rather than as an independent nation free to express its views on the merits of the issue. The acceptance of arms unconditionally offered by friendly countries during a defensive war would not therefore prejudice the position of a non-aligned country. If it did, non-alignment would cease to have any significance as a practical policy for any nation which wished to survive in this world. It must be remembered that, when Stalin turned his wrath on Yugoslavia, President Tito accepted military aid from the US; and no one can deny that Yugoslavia continues as a Communist country, except perhaps in Chinese and Albanian eyes.

Secondly, it should be possible to acquire arms otherwise than as gifts and on terms compatible with the principle of non-alignment, in howsoever narrow a sense it is interpreted. Our reported recent deal in MIGs with the Soviet Union seems a case in point. It is believed that the price quoted was low, much lower than that demanded by aircraft manufacturers in the West for less suitable types of aircraft. Even allowing for the high profits which Western manufacturers expect to make on military requirements, one cannot help thinking, in view of the Soviet Union's normal practice of charging world prices, that an excessively low price charged by them must necessarily include an element of subsidy. Moreover, the payment is to be made in rupees. The explanation that a transaction is concluded on the basis of payment in rupees and is therefore unexceptionable is sometimes merely a verbal evasion. What rupee payment means is simply this: instead of paying in foreign currency for a purchase made from the seller country we hope to have exported to that country by the agreed settlement date goods of the same value as those we have imported (including the goods covered by the transaction in question) from the same country during the period. If our export performance has not been adequate and the deficit against us is written off, it is tantamount to our receiving a gift, either wholly or partly; if, on the other hand, the settlement date is postponed, the effect will be the same as if there had been an extension of credit. With the precedent of the MIG deal before us, surely it should not be difficult to devise terms upon which we could accept arms from any friendly country without infringing the principle of non-alignment.

Faced with the present grave emergency, we cannot afford to be doubting theoreticians. Our conscience is clear; our hands are unsoiled. To repulse and throw back a ruthless and unscrupulous enemy, we need the best and most modern weapons which we can obtain from any of our friends willing to help us. If we fail to equip ourselves with the right tools through fear of being mocked by our enemies and ill-wishers and if in consequence India is humbled and despoiled by the Chinese, then the principle of non-alignment itself will lie with India's security in a heap of ruins.

Financial Implications of the Present Crisis

By H. V. R. IENGAR

(Formerly Governor of the Reserve Bank of India)

ALTHOUGH the position is at the moment rather nebulous, we have to proceed, as a working hypothesis, on the assumption that the increase in defence expenditure may have to be of the order perhaps of Rs. 400 crores per year, excluding the cost of equipment to be supplied by the USA and UK on lend-lease or similar arrangements. This expenditure will be wholly unproductive in the sense that it will not produce additional goods for consumption by the community; on the contrary, it may well result in shortages and varying cuts in consumption standards. What will be the effect of all this on the Third Five-Year Plan and succeeding Plans?

We may first examine whether expenditure of the magnitude now assumed, is 'per se', excessive, having regard to experience in other countries. The national income of India is at present running at the rate of something over Rs. 15,000 crores per year. The total defence budget, before the recent supplementary demand approved by Parliament, was of the order of Rs. 340 crores; as a percentage of national income, it was therefore a little over 2¼ per cent. With the supplementary grant recently approved, it would be still less than 3 per cent, and if we assumed that the total budget was of the order of Rs. 750 crores, it would be 5 per cent of the national income. To set the percentage against similar expenditure in other countries, we may note that in the United States, against a national income of approximately 428 billion dollars, the defence expenditure in 1961 was of the order of 45 billion dollars; that is, about 10½ per cent of the national income. The corresponding percentage in the United Kingdom was about 8 per cent. The Indian figure appears relatively modest. But it has to be recognised that a comparison with the UK and the USA is inappropriate because it is far easier for countries with a high standard of living

to appropriate a fair part of the national income to defence than it is for an underdeveloped country with a vast majority of its population living on the bare subsistence level. Perhaps a better method of assessing the dimensions of the problem in India would be to relate the additional defence expenditure to the total Plan expenditure each year. The total Third Five-Year Plan expenditure is a little over Rs. 10,000 crores, so that the average per year would be Rs. 2,000 crores. An additional Rs. 400 crores per year really means, therefore, some 20 per cent of the total plan expenditure each year. This is a very large amount indeed. If everything else remained equal, this means that Plan expenditure would have to be cut on the average by Rs. 400 crores per year, in order that the total expenditure of the country may be kept within the resources available, including credit by the Reserve Bank to Government as provided in the Plan.

It is, of course, not the case that everything is equal, changes have occurred since the Third Five-Year Plan was inaugurated, both favourable and unfavourable.

Let us take the unfavourable factors first. The foreign exchange situation has deteriorated to an extent even larger than was anticipated, and our balances have now reached a level barely adequate for even what may be called working balances. As a result of this and of the fact that the bulk of the credits we have received is tied to specific projects, there has been severe pressure on imports, particularly maintenance imports. This is one of the reasons why there is surplus capacity in quite a number of our factories, including factories whose output is essential for defence purposes, such as automobile plants. Exports have not picked up to the extent that was contemplated. In fact, on the basis of the average figure for the Third Five-Year Plan, the performance since April 1961 has been disappointing. The improvement that we anticipated in agricultural production has likewise not taken place. Altogether, on the production side, the performance of our economy has not been very satisfactory. At the same time, the resources side of the Plan has not been moving as well as we expected. The consequence is that the price level has started going up. In the last year of the Second Five-Year Plan the price level was 125 and it showed some tendency to drop last year and, in fact, came down to just below 123. The latest available figure, is however over 130, and, allowing for the seasonal character of the fall in the last few weeks and certain special factors such as transport bottlenecks in Assam, which have affected the price of jute, it does appear that the price level is again subject to a substantial upward pressure.

It is in the above context that we have to examine whether there are any possibilities of deficit financing to an extent larger than was contemplated in the Third Five-Year Plan. The effect of deficit financing for the maintenance of a large-sized increase in the defence forces may be briefly summarized as follows. On the one hand, there will be additional rupee expenditure for the payment of salaries and for the purchase of a variety of locally made goods and services. On the other hand, unless production is stepped up, and for this in many cases more foreign exchange will be required, the available volume of goods will remain static in terms of the whole country and actually will be reduced in terms of the civilian population. To the extent that deficit financing leads to an increase in Bank deposits, steps could, of course, be taken to sterilise it, but, in the present state of our economy, it is clear that the greater part of the money supply, created by deficit financing, will remain in the hands of the public as currency and will thus operate as an active agent in the increase of the price level.

I have used the qualifying phrase, "unless production is stepped up". What are the possibilities of this happening in the near future? There is a considerable volume of evidence to the effect that there is unused capacity in our industry and, prima facie, one would imagine that it should be easy to step up production. In fact, this is what happened during the First Five-Year Plan. There was a fall in prices during the First Five-Year Plan period in spite of some deficit financing, both because of good agricultural production and because of the utilisation of spare capacity in industry. To the extent that only local new material is necessary, there is no reason why this should not happen again, but the difficulty in quite a few cases is that some of the raw material and some balancing equipment have to be imported, and, for this, there is very little free or untied foreign exchange available.

The situation is not, of course, one of unrelieved gloom, for one favourable factor has come into play which no one had expected. It has hitherto been a legitimate criticism of the Indian Plans that they had lacked a great deal of popular backing and that, in fact, the bulk of the population is, as it were, watching the execution of the Plan from the side lines instead of considering that the Plan is part of the entire national effort. By and large, this criticism was true, but I believe the situation has radically changed with the surge of enthusiasm that has swept the country since the Chinese invasion. It is far easier now, than it was at any time since the First Five-Year Plan was inaugurated, to make the people actively interested in the Plan effort. In particular, appeals for small savings, are likely to be more successful now than in the past. Likewise, it may be assumed that subscriptions to Government loans will have greater backing than before. But, even so, popular enthusiasm cannot make up for the basic difficulty of the plan, viz, a relative shortage of resources arising out of the poverty of the country. People may be willing to save more, but the vast majority have not the ability to do so.

Government have made attempts to mobilise the gold resources of the country. It seems somewhat doubtful as to whether enthusiasm has reached limits where it is possible for people to respond to the appeal for gold as voluntary gifts or even in the form of gold bonds. We are dealing here with a matter of psychology arising out of long-standing social and religious customs. Something even more profoundly disturbing than what has recently happened would be required to wean people away from the habit of keeping gold. What I think is likely to happen is, that Government are likely to succeed, broadly speaking, in their effort to see that people do not buy more gold. But the task of actually getting people to hand over their existing gold is likely to prove a very difficult one in the absence of a somewhat drastic exercise of authority by Government.

Taking everything into account it appears to me that the purely psychological backing for the Plan is much greater than before.

The psychological stimulus created by the defence crisis would also be helpful in so far as additional taxation effort is concerned. Experience over the last ten years has shown that, broadly speaking, the Central Government has made vigorous efforts to impose taxation, but State Governments have shown some reluctance to do so, quite often for political reasons. It may be assumed that, to the extent that further taxation is called for—and there is no doubt that a substantive effort

Part A—A Politico-Economic Prologue

in this direction is called for—popular reaction will not be as resistant as in the past.

Taking both factors into account, namely, the unfavourable start of the Third Five-Year Plan together with the change in public psychology which is now evident, one has to assess to what extent the Third Five-Year Plan can stand the pressure of additional defence expenditure of the magnitude we have been discussing, without giving rise to serious inflationary pressures. This matter is not susceptible of any precise quantitative analysis at this stage. All that can be said is that it would be foolish to imagine that we can carry on with the Third Five-Year Plan as originally programmed, in the new circumstances, without an intensification of inflationary pressures, already existing in the economy. If this is to be avoided substantial cuts would undoubtedly have to be made. I am, of course, assuming that it is the policy of Government to avoid an intensification of inflationary pressures. In a broadcast which he delivered on November 28, the Deputy Chairman of the Planning Commission, Mr. Gulzarilal Nanda, stated: "If inflationary pressures consequent upon a full scale effort for national defence are to be contained, it will be necessary to take a series of measures for mopping up the surplus purchasing power". The obvious implication is that such measures will be undertaken. I think it is necessary that Government should reiterate in unequivocal terms that it is their policy to contain inflationary pressures. This means in effect that the price level of the necessities of life will not be allowed to go up and that the general price level will be maintained within reasonable limits. I have, from time to time, stated it as my view that in a developing economy such as ours, it will be impossible to maintain absolute stability of the price level; a 2 or 3 per cent rise per year may be unavoidable, but it should not be continuous. The public must be made to feel that the Government have the capacity to keep the level from rising when they want to and even perhaps to bring it down for a time. A clear understanding of this issue is necessary to preserve the health of the economy, to preserve public confidence in Government and also to ensure that our ability to export is not further hampered by an imbalance in prices.

In considering in what directions the cut can be applied, one has to take account of the fact that a good part of the expenditure particularly in the industrial field, is probably already committed expenditure in the sense that orders for plant and equipment have been placed, particularly overseas. To the extent that this has been done, it would not be possible to retrace our steps. Moreover, in the case of many of these industrial and power schemes, there can be no such thing as a proportionate cut. For example, if we have ordered a generating set designed to produce 50,000 KW, we cannot tell the manufacturers that they should produce a set capable of only 45,000 KW. No figures are available to show what orders have actually been placed abroad for industrial schemes included in the Third Five-Year Plan, but, prima facie, it appears that there would be serious difficulties in the way of making any sizeable cuts in major industrial and power projects.

But quite apart from the fact that our hands may already have been tied, we have got to consider what should be the main strategy on which we must base any action intended to reduce the total expenditure on the Third Five-Year Plan.

In the first place, it seems perfectly obvious that, whatever else we do, we must not take any steps which would come in the way of increasing our agricultural production to the extent contemplated in the Plan. There are two reasons for this. One is, of course, that when the whole economy is under a strain and cuts have to be made in the developmental expenditure, it is of special importance that at any rate the consumption standards in regard to food and clothing are not further reduced. The other reason is that increased agricultural production has a decisive anti-inflationary effect. Experience in our country during the last ten years has shown that where money supply is expanding, its effect is mitigated more by an increase in agricultural production than by any other factor. All this means that the fertiliser projects would have to go ahead; that agricultural research and development schemes would have to go ahead; and also that all measures intended to conserve water, provide good seed and distribute insecticides and the like should be maintained at full tempo. Whether administrative economies can be made in the planned expenditure in the agricultural sector is another matter. That is a problem which traverses the entire field of administration. But clearly there can be no reduction in the activities that have been planned for increasing agricultural production.

I suggest that, in the second place, there can be no scope, as a broad matter of strategy, for a reduction in the industrial bias given to the Third Five-Year Plan. It was a basic point in the Second and Third Five-Year Plans that, if we are ever to get out of our foreign exchange difficulties, it is absolutely essential that we must make in India the bulk of the machinery which is required for industrial projects in the country. This proposition is as true today as it ever was, and it continues to be of the highest importance that we should cease, as quickly as possible, to be dependent on imports of what may be called normal types of machinery and equipment. In other words, those parts of the Plan which deal with the manufacture of steel and the setting up of foundries, forges, heavy machinery, machine tools and chemicals, must go ahead. As a necessary corollary, plans for raising more coal, generating more power, and increasing transport facilities would also have to go ahead. There may be some scope for readjustment where final steps have not already been taken, but the magnitude of this is likely to be small.

It would not be altogether easy to carry out even an attenuated Plan confined, in the main, to the agricultural and industrial sections, together with the ancillary section dealing with transport. The lack of adequate foreign exchange is only one of the difficulties, although a major one: it seems essential that steps are taken to get untied credit or free foreign exchange which could be utilised for the import of essential raw material. I have little doubt the Government are doing their best to bring this point home to the Aid India group of countries, and one can only express the hope that these countries will take a more sympthetic view than they have done hitherto. In this context, it would also seem necessary that steps are taken to facilitate the inflow of foreign private capital. There are indications that, in spite of the crisis we are going through—possibly even as a result of the crisis—there are prospects of foreign private capital coming into India in a larger volume than hitherto, provided certain irritations and difficulties caused by our policies and procedures are eliminated or reduced. I do not propose at this stage to elaborate on this point beyond mentioning the possibility and merely adding that it is not necessary for this purpose that we give up basic principles. Some flexibility and understanding of the apprehensions of a foreign investor, however unjustified in our opinion,

Part A—A Politico-Economic Prologue

seem to be called for. Internal finance could also be a difficulty, particularly in the field of private enterprise. The behaviour of our Stock Exchanges has been such that the capital market has lost much of the vitality and enterprise it showed in recent years, and the immediate prospects of raising large-scale funds for industrial enterprise seem dubious. There seems also need for a more forthright and positive promise of bank credit to productive enterprise. This seems necessary because the psychology created by some of the recent announcements of the Reserve Bank is one of an all round curtailment of credit which, I am sure, was not intended.

The attempt to carry out the agricultural and the industrial parts of the Plan will itself involve a major draft on our financial resources, administrative ability and technical expertise. On the arguments about priority which I have put forward, a cut in the plan must inevitably fall on what may be called the social side, that is to say, education, possibly even public health except the prevention of epidemics, community development and welfare services. It is unfortunate that this should have to be the case, but I do not see how this can be helped. Undoubtedly, every department or organisation concerned would put forth strenuous arguments for being spared a cut. Surely it is essential in the interests of agricultural and industrial productivity, quite apart from other considerations, that we must have an educated population, so how can we make a cut in education? Surely it is necessary that, in a time of stress, people should be spared the rigours of illness in addition to other difficulties, so how can there be a cut in medical and public health schemes? Surely one way of providing some employment in rural areas without extensive capital cost is to subsidise village industries, so how can there be a cut in, for example, the subsidy for Khadi? But if each argument is accepted, the circle will never be complete. A revision in our order of priorities consequent on intensified defence expenditure together with a concentration on agriculture and heavy industries is bound to lead to a postponement of some of the more socially desirable consequences of the Plan. It might even well be that on balance, it may not be possible to achieve any substantial increase in the standard of living of the mass of people, during the period of the emergency.

This does not mean, however, that inequalities which exist, and which it was part of the Plan effort to reduce, should be intensified because of increased defence effort. On the contrary, if popular enthusiasm has to be maintained for the defence effort, it is more than ever necessary that conspicuous consumption should diminish and that the people should be made to feel that sacrifices are being willingly borne in appropriate measure by all sections and not merely by the poor. In the book published by John Maynard Keynes when the Second World War broke out, entitled "How to Pay for the War", the following passage occurs:

> "Courage will be forthcoming if the leaders of opinion in all parties will summon out of the fatigue and confusion of war enough lucidity of mind to understand for themselves and to explain to the public what is required; and then propose a plan, conceived in a spirit of social justice, a plan which uses a time of general sacrifice, not as an excuse for postponing desirable reforms, but as an opportunity for moving further than we have moved hitherto towards reducing inequalities".

What Keynes said about the need for reducing social inequalities in the UK is even more true of India, and it would have to become the policy of Government to take steps which will ensure that, as a result of the defence effort, the rich do not become richer, and the poor, poorer. This requires the most active co-operation from the sections of the community which are comparatively better off. I do not propose to spell out, at this stage, the concrete steps that would have to be taken either by Government or by the comparatively wealthier sections of the community to give effect to such a policy. But each element of consumption would have to be subjected to a fresh test from the point of view as to whether it is appropriate in the new context. Merely as an illustration it appears to me that the lavish scale on which weddings are celebrated by the well-to-do classes is a scandal. And if the present crisis should have the effect of reducing marriage expenses that would be of lasting benefit to the community. To take another example, is it necessary that we should produce so many varieties of textiles, more particularly when they involve the import of long staple cotton? I know that there are arguments both ways on this particular issue, but clearly this is the sort of problem that requires examination. The responsibility for thinking of ways and means by which, what may broadly be called conspicuous consumption, may be reduced, lies primarily on the wealthier sections of the community and in many cases voluntary action may be adequate to give effect to the reawakened social conscience. In some cases, however, it would be necessary to supplement this by Government decree. To the extent that fiscal measures are called for with a view to reducing the demand for scarce goods of a non-essential type, Government action would of course be essential.

The point of principle that requires emphasis is that if, as a result of increased defence expenditure and the consequent revision of Plan priorities, the mass of our people are subjected to additional burdens or deprived of social benefits which they have previously expected, it would be the height of folly for the better off sections of the community not to take steps and for Government not to enforce them wherever necessary, for equality of sacrifice. At the height of the crisis, this point was well understood. Already, however, there are indications that the emotional response is beginning to wear off. This appears to me somewhat dangerous. If everybody concerned, namely, Government, the well-to-do sections of the community and the mass of the people all play their due part, we might emerge out of the crisis better off than before. We would, at the end of it, have a sound agricultural and industrial base on which we can proceed rapidly to build; and what is more important, a reawakened social attitude without which no plan can really be a success.

Indian Foreign Policy and the Emergency: A Critique

ONE of the most vigorous criticisms of Indian foreign policy over the last fifteen years is that, when the Emergency arose India was bereft of friends on the basis of claims which foreign policy might have built create its own friends. The paradox of this situation is that the Emergency created friends whom we, over the last fifteen years, have done little to woo and to encourage. For the Emergency gave us friends in the

Part A—A Politico-Economic Prologue

hence, the problem posed is to raise the additional resources of Rs. 620 crores. How much of this would represent foreign currency expenditure and how much would consist of rupee expenditure, one cannot be precise. But it would be reasonable to assume that a good part of the expenditure on arms, which will take a big slice of the foreign exchange expenditure, will be met by assistance from the Western friendly countries in the form of lend-lease and other arrangements for supply of arms. Nevertheless, a herculean effort will have to be made to meet the residual defence import expenditure by our own resources — largely more export earnings.

The rupee expenditure in the enlarged defence budget may be more than half of the excess of Rs. 620 crores as presumed. Some of the components of the Third Plan will need pruning to conserve rupee resources for defence preparation. Already, in the first two years commitments have been made on the programmes in these components. Making allowance for this fact, it would be safe to suggest that in the remaining three years a saving of Rs. 50 crores should be made in education, of Rs. 85 crores in health programmes and of Rs. 50 crores in the community development programmes excluding specifically programmes of agricultural expansion. In the aggregate an amount of something like Rs. 185 crores or perhaps more could be diverted to defence expenditure. At an annual average rate this would give a relief of about Rs. 65 to 70 crores to the additional rupee finance. But the substantial balance that remains will have to be met by public loans and small savings (which must have priority in view of the urgency to mop up purchasing power to reduce pressures on prices) and taxation. How these resources are to be raised, consistently with the tax policy which has been evolved in recent years, will be a matter for pragmatic decision from year to year.

PART B

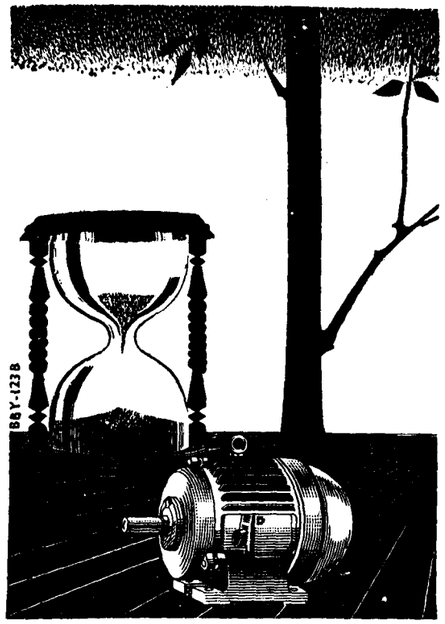
An Economic Review

Emergency and Economic Growth

Introduction

THE Sino-Indian war on our northern borders in October-November this year focussed attention on our unpreparedness in defence. This also blurred the economic picture to a certain extent and put the military demands of the country on top of all others. The instantaneous decision of the Government of India to take up the challenge of the totalitarian Chinese regime and arm the nation, necessitated some far-reaching changes in the economic plans of the country. Even though the Prime Minister as well as the Finance Minister repeatedly stated that the broad co-ordinates of the Plan would be retained and that the intensification of the war effort would in no way clash with the broad objective of speedy progress in the economic sphere, the underlying impression remains that the plans for arming the country so as to match the Chinese military strength cannot fail to bring about substantial alterations in the Third Five-Year Plan. In regard to the priorities of the Plan, some key military sectors will certainly take precedence over the less pressing sectors, especially the consumer goods.

At the moment of writing, hurried discussions are taking place among the various wings of the Government of India and the Planning Commission to determine the extent to which the Third Plan needs to be reshaped with the avowed objective of keeping up the rate of economic growth and preparing the country for a prolonged war with China. There is no doubt that up to a certain limit, the two objectives are compatible. But because the stress is likely to be enhanced on the production of guns, arms and ammunition, the projects for many consumer goods as well as consumer durables will have to be shelved for the time being leading directly to shortfall in consumption. An indication to this effect has already been given by the revision of the import policy in the third week of December, 1962 which has curtailed further imports of some of the semi-luxury goods. Undoubtedly, the war will create a sort of forced march of the economy in one particular direction leading to a diversion of all available resources to the top priority war industries.



How far can consumption be cut without diminishing the standard of living of the people? In other words, in the present peculiar circumstances, how far can the rate of saving be raised? Is there any possibility of curtailment in living standards if the agricultural crops fail in the way they did in the first year of the Third Plan? Can the rate of saving be stepped up with static national income? Even if production rises ahead of the rate stipulated in the Third Plan, how can savings and investment be increased? These are all relavent questions which need to be answered without loss of time. The emergency demands that investments urgently needed for the war effort must be met whatever their economic implications. 'The Eastern Economist' has in this Annual Number taken upon itself the task of presenting to the country a framework within which the co-ordinates of the Plan need to be recast so as to achieve the dual objectives in view.

It might be argued that the productive resources of the country are not so elastic as to be increased at will simply because an emergency exists in the country. There are, however, instances of nations which proved that the national resources were indeed highly elastic under conditions of stress and strain. This needs to be proved in the case of the Indian economy also. It needs to be demonstrated that under the compulsions of the present situation, the resources available in the country can be employed in such a manner as to yield the maximum return. Indeed, there are certain ways and means which could bring about miraculous achievement only if they could be pressed into efficient service under the altered circumstances. This fact may be illustrated with particular reference to the unutilised capacity which lies in almost all the sectors of the economy, not to speak of the organised industries. The reactivisation of unutilised capacity whether in men or machinery can be instrumental in giving rise to the total supply of goods and services in the economy which may belie many estimates. Coupled with a judicious exploitation of available capacity, attempts need to be made to make the best possible use of the new tools in management which must be employed effectively to increase productivity of land, man and machine.

A feeling exists in this country that proper utilisation of the available resources can raise output by about 20 to 25 per cent in the organised sector of industry at least without any extra use of capital. In the section on industry in this Annual Number, detailed figures have been set out to show that a very large number of industries have not, for one reason or the other, exploited all the available capacity in the past. It is the function of the entrepreneurs as well as the Government to leave no stone unturned for taking full benefit of the available installed capacity. Wherever it is possible to increase production by changing over from single shift to double shift it must be done because of the substantial saving of additional capital. Some of the units which are currently operating on two shifts and can safely be run on three shifts, must start working round the clock. Only in this way will the economy be able to produce both for the war effort and for the civilian population in volume sufficient to meet the demand from both.

This does not, howeer, mean that capacity to produce all our wants exists within the country. There are certain types of machinery particularly war machinery, aircraft, etc. in which we are technically deficient. Here we shall have to seek the assistance of friendly nations who have offered their hand of co-operation at this hour of the nation's need so as to fill up any gaps which may be there. We must make the best use of the friendly feelings which exist in the world towards India.

The corner-stone of Indian economic development since Independence has been the rapid pace of industrialisation for which the foreign exchange available has never been sufficient to match demand. In order to accelerate the tempo of our development projects, we must seek the assistance of our friends from abroad who are willing to participate in this gigantic effort to beat the ruthless enemy. Already, the first instalment of foreign aid for defence equipment equivalent to $100 million has been promised by the United States and the Commonwealth nations. At the same time, armament and equipment needs of the country are being studied

GROWING WITH THE TIMES...

This tree is a symbol of BATLIBOIS' development. It's been growing now for 70 years. During this period BATLIBOIS have sustained a continuous tradition of usefulness—supplying essential machinery, imported and indigenous, to the countless industries that needed it. Today, a chain of BATLIBOI offices extends its services all over India... upholds a lively tradition that makes BATLIBOI a leading name in the field of industrial supply.

both by the US and the UK so as to equip the Indian Union with up-to-date and modern sinews of war.

It needs to be re-stated that the Third Five-Year Plan can still attain its allotted rate of growth in national income despite the re-allocation of resources under the emergency. It may be recalled that the Third Five-Year Plan had set down the target of 30 per cent rise in national income till 1965-66. The failure in the first year of the Third Plan may not have any impact on future growth. The history of national income improvement during the last one and a half decades shows that the increases have occurred by fits and starts. There have been particular years when national income has risen by 6 to 7 per cent per annum. At the same time, there have been years of set-back when national income showed only marginal rise. The first year of the Third Plan looks like one belonging to the bottom of the trough. With the current year, the curve of progress seems to be rising to a crest and given the improved agricultural performance as even in normal years, the national income rise in the current year is likely to be very encouraging. It has been suggested in certain quarters—and rightly so—that under the increased inflow of foreign exchange from abroad and under the emergency which has come into operation since October 20, 1962, the national income target could even be raised from Rs. 19,000 crores to Rs. 20,000 crores in 1965-66. If national income takes a favourable trend, it does not mean that it should be diverted to increased consumption.

The exigencies of the situation demand that the rate of investment should be raised from the present level of 11 per cent to nearly 17-18 per cent in 1965-66. The Third Five-Year Plan had envisaged the stepping up of the rate of investment to 14-15 per cent and the rise to 17-18 per cent was stipulated only for the Fourth Plan. Under the altered circumstances, the rate of investment needs to be raised to 17-18 per cent ahead of schedule. In real terms, the stepping up of the rate of investment may mean no substantial rise in the consumption pattern of the people because bulk of the increases in national income is likely to be diverted to the defence effort. It is only the increased numbers of the army which will be better clothed, and better fed. In one way the Sino-Indian war may prove to be a blessing in disguise because it will force the nation to tighten its belt which in normal times it may not have been prepared to do. Thus stepping up of the rate of investment coupled with generous support from abroad and better husbanding of available resources is likely to hasten the progress of both agriculture and industry and will allow the Indian economy to continue its march even beyond the Third Five-Year Plan goals in all the major sectors.

There is no shortage of manpower in the country. In fact the economy has suffered in the recent past because of a plethora of manpower which was not fully employed. The spontaneous response to the call of the nation to swell the ranks of the army for defending the frontiers ever since the declaration of the emergency has shown that India has the means to match China in manpower even without conscription. On equipment also, the indigenous production machinery is competent enough to produce the requisite material to fight the enemy provided the western powers continue to lend the strategic armament and aircraft for which we do not have much capacity. In nutshell, the problems of the present emergency can be tackled successfully if consumption in the economy is restrained by increasing savings and investment, while all efforts are made to raise productivity of both men and machinery by hard work.

How to Pay for the War?

IN 1940, John Maynard Keynes brought out a stimulating pamphlet presenting a radical plan for consideration of the Chancellor of the Exchequer. He discussed in non-technical terms the steps which needed to be adopted for making the nation pay for the war. The Indian Union finds itself today in a somewhat similar situation wherein increased burdens have to be borne by the people for discharging obligations which in normal times would look extremely heavy and even unbearable. The solution offered by Keynes centres round curtailment in consumption. In his words, **"In peace time the size of the cake (consumer expenditure) depends on the amount of work done. But in war time size of the cake is fixed. If we work harder, we can fight better. But we must consume less".** It means that the people must not increase their consumption even if they are able to earn more in money terms because of the increase in expenditure on defence. The increased money earnings must find their way into the national borrowing programmes and therein lies the solution of the basic problems of national defence. If this money is let loose, it will not fail to exert its pressure on the available consumer goods whose prices will rise, causing misery to the less privileged sections of society.

The first place has to be accorded in the solution of the present problem to increase in production. Unless maximum production is organised from the available resources both in terms of men and machinery, there can be an increase in hardship to the civilian population. Now that the Indian Union has decided to increase its armed forces, it means that the highest priority will have to be accorded to all the needs of the fighting forces. If production does not keep in step with the demands imposed by the new situation, it is the civilian population which might have to suffer. There is not enough of foreign exchange, except for the assistance that the Government will be able to obtain from friendly nations to fall back upon. The country has to depend upon its own productive resources. While all attempts are being made to raise output, the fiscal and monetary machinery of the country must start functioning simultaneously in a feverish manner. The productive machinery will need to be oiled by additional capital and the Government will have to start its financial operations by undertaking deficit financing in small dozes; as and when more purchasing power is pumped into the system, steps need to be taken to mop up the increased buying power in the hands of the people either through increased taxation or through voluntary contributions. Voluntary savings would certainly be welcome provided they come forth in sufficient volume. All attempts currently being made to raise the volume of voluntary savings need to be praised, but according to the experience of the nations which have operated under similar circumstances, it has been found that substantial money remains in the pockets of the people which they wish to utilise for consumption and as soon as they take decision to make purchases, the prices start shooting up. This provides an opportunity to the trading class to cash on the popular demand for new goods and services. If the people had refrained from utilising this increased purchasing power and had instead invested it in government bonds, they would have served themselves well. That the nation would have benefited, there is no doubt, but they would have helped themselves as well. Deferment of consumption is to be encouraged along

with the attempts to avoid the initiation of an inflationary spiral; if it is found that voluntary savings are not coming forth in sufficient volume, the Government has no option but to impose fresh taxes which no doubt are obnoxious to the people. The Third Five-Year Plan needs to be re-oriented so as to revise means whereby the people are advised to keep consumption at the present level and any increase in their earnings is invested in bonds or any other saving schemes for deferred consumption. This is the only way to keep down the demon of inflation. Any attempt to raise consumption along with the rise in money incomes will be suicidal both for the individual and the nation. Keynes compared this voluntary restraint to what is popularly called the "road sense". He said, **"A comparison with the rule of the road is a very fair comparison. For the plan is intended to prevent people from getting in one another's way in spending money".**

Accent on Productivity

THE GALLOPING rise in living standards witnessed in the United States and other West European economies has been the outcome of a steep rise in productivity representing improvement in "output per-man-hour". In the United States particularly rising productivity has been the chief source of increased output. The average rate has been around three per cent per annum though in certain years it rose to 7 per cent per annum. The editors of "Fortune" magazine, while forecasting the future trend of the American economy during the sixties, have stated that the productivity rise will be about equal to the post-war average rate of 3 per cent a year. Fifty per cent of the increase in national output during the sixties is likely to acrue from increased productivity alone. It will result in increasing the earnings of every family in the United States. Under the present trying circumstances, the Indian Union has also to make the best possible use of human as well as material resources so as to maximise the production capacity of every worker.

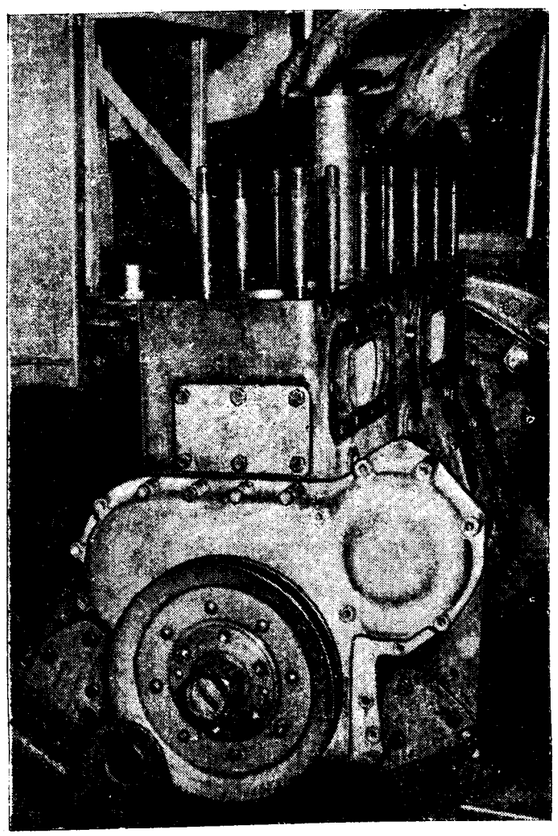
It is not true to say that improvements in productivity can be attained only through the installation of modern and up-to-date machines. The acquisition of automatic machinery is a necessary condition but not a sufficient one. The human factor is equally important in the sense that labour which is to operate modern machinery must be tuned to the spirit of the machine age and should be fully trained to take the best out of the new machines. Productivity techniques are not theoretical formulae which adorn the fat treatises on production but belong to the sphere of the practical sciences where the men operating the machines bring about a revolution in the use of the human labour. The crying need of the hour, therefore, is to initiate training programmes throughout the country, both in the large and the small industries, for educating the workers and the managements in adopting the new techniques for raising productivity.

The National Productivity Council which was set up as an autonomous organisation in 1958 has a positive contribution to make in the war effort. The range of productivity techniques is extremely wide and applies to all spheres of activity in the factory, in particular right from the purchase of the raw materials to the sale of finished products. The new productivity methods can be of great assistance in increasing the national wealth of the country. Within its ambit come the techniques of work study, cost accounting, inventory control, labour-management relations and a host of other aspects which have brought about a miraculous change in the economies of the West. The techniques are available; the people are to be urged to acquire the method of getting the best out of the available resources.

Some improvements have been witnessed in recent years in the Indian Union. The establishment of the productivity councils in all the major cities of India and the organisation of seminars and study courses is slowly developing a new consciousness amongst the entrepreneurs. The emergency should accelerate the tempo of dissemination of the new techniques so that without any increase in capital (which is deficient in the Indian Union) the skilled workers are able to produce more.

WORK STUDY

Instead of discussing productivity in the abstract, it is more pertinent to discuss some of the new tools which are available to top management for increasing productivity. Work study is one such tool which, according to Mr. R. M. Currie, is not a set of minor techniques but "the restless enquiring attitude of mind that acts as a catalyst to basic knowledge and puts it to work". The managements whether in the private sector or the public sector, have to make ceaseless search for new methods whereby savings in initial investment can take place and also the output at every level of work can be improved.



A usual observation made by all work study experts is that the attitude of management in any organisation is of great importance in the successful implementation of the work study techniques. If the management is willing to take decisions, however revolutionary they may be, and is prepared to execute all plans according to the methods suggested by the experts, savings on large scale can be made. In his address to the European work Study Federation Conference at Stockholm in May this year Mr. Currie gave instances of projects where savings on a vast scale were made possible because the top management had sought the assistance of work study experts. The technique is applicable in all spheres of economic activity whether in building a huge dam or a metallurgical plant or even an office. Canteens as well as workshops also come within the domian of work study for better working.

The Indian Union has to make greater use of work study methods because of the promise of savings in capital investment. In many cases, the enquiring approach of an expert in work study has resulted in reducing the cost of a new plant by as much as 50 per cent. Now that expansion for defence industries is likely to take place on a vast scale in the Indian Union it is essential that work study methods should be applied at all levels. A happy beginning was made in the middle of this year when every department of the Government of India was asked to have its own work study cell as a part of its O and M Unit. The same procedure also needs to be extended to the State level and the industries. Then and then alone, can the expected efficiency emerge from the old units as well as the new ones.

STUDY TEAMS

The National Productivity Council has, since its inception in 1958, sent out teams of experts for conducting productivity studies abroad. Some of these studies are very stimulating in the sense that they provide useful information for the benefit of manufacturers in this country. One such report deals with the techniques of stores and inventory control practised in th U.S.A., Japan and West Grmeany. This report high

The Ashok Leyland engine needs no re-boring- *all you do is replace the slip fit cylinder liners*

The shoulder-located cylinder liners of the Ashok Leyland engine are cast and pre-finished to a high degree of accuracy. They can be easily removed and replaced, together with the piston and connecting rod assemblies, with the engine *in situ*—another ideal feature of Ashok Leyland engines.

Heavy-duty chassis

The Ashok Leyland Comet is a heavy-duty chassis built for rugged performance. Every part is specifically designed for heavy duty. No other chassis offers 100 B.H.P. 255 lbs./ft. Torque Engine, Nitrided Crankshaft, Slip Fit Liners, 13" Diameter Clutch, 5-speed Constant Mesh Gearbox, 9"-deep Frame, 8-ton Rear Axle, 24-volt Electrical System and Individual Wheel Cylinder Brakes.

Fleet owners prefer Ashok Leyland Comets

Remarkably low fuel consumption and economy in maintenance and overhead costs make the Leyland Comet the choice chassis in India, just as it is in sixty other countries around the world.

lights the various methods which are practised in these countries for reducing the cost on inventories. It is common knowledge that the pipeline for any factory has to be kept full with raw materials, work-in-process and finished goods. The problems is how much of the accumulation of these goods is necessary for the efficient working of a unit. The team which worked under the leadership of Mr. A. K. Basak, of the Indian Oxygen Ltd. was much impressed by the ABC analysis adopted by General Electrics of the USA for the "maximum control with the least amount spent on controlling". On the average, the cost carrying inventory in the United States is placed at 25 per cent of the value of stock. With the methods elaborated in this report by the team, costs could certainly be sizably reduced in this country. Wide publicity needs to be given to this and similar reports which are being published by the Council.

PRODUCTIVITY IN AGRICULTURE

Agriculture in the Indian Union continues to provide nearly half of the total national income and employment to nearly 70 per cent of the population. The need for enhancing agricultural productivity in the Indian Union is of the highest urgency. A comparison with the productivity trends in the ECAFE countries shows that India suffers from low productivity in all the major crops, such as rice, wheat, maize and sugarcane. The graph on page 1256 and the table below bring out clearly the wide divergence between productivity in India and in most of the countries in the ECAFE region. Japan leads all the rest in the rate of output per hectare; every hectare of land under paddy in Japan yields 4.60 tons as against 1.31 tons only in the Indian Union. This wide difference of more than 300 per cent cannot be explained by variations in soil and climate alone. The methods of agricultural husbandry need to be revolutionised if productivity anywhere near that obtaining in Japan is to be realised in the Indian Union. The other countries which have a better record in rice productivity in the ECAFE region are Burma, Ceylon, China (Mainland), China (Taiwan), Federation of Malaya, Indonesia, South Korea, Pakistan and Thailand. Only the Philippines has a record which is poorer than that of the Indian Union. In the case of China (Mainland), the figure of productivity at 2.58 tons per hectare for the years 1957-58 to 1959-60 indicates that productivity in China lies at double the level prevalent in the Indian Union. The production figures for China need to be discounted because of the fact that China's statistics are not reliable. It is known that the statistical machinery in China subserves the political objectives as well. Even after discounting the extravagant production figures announced by the Communist rulers in China, the yield from land in China seems to be better than in India.

The Japanese method of agriculture which has been practised in many parts of the Indian Union has brought about some fruitful results. There is need to extend it to other areas as well so that the pressure on India's food resources may be reduced further.

In the case of wheat again, the average yield in the Indian Union does not compare favourably with Japan

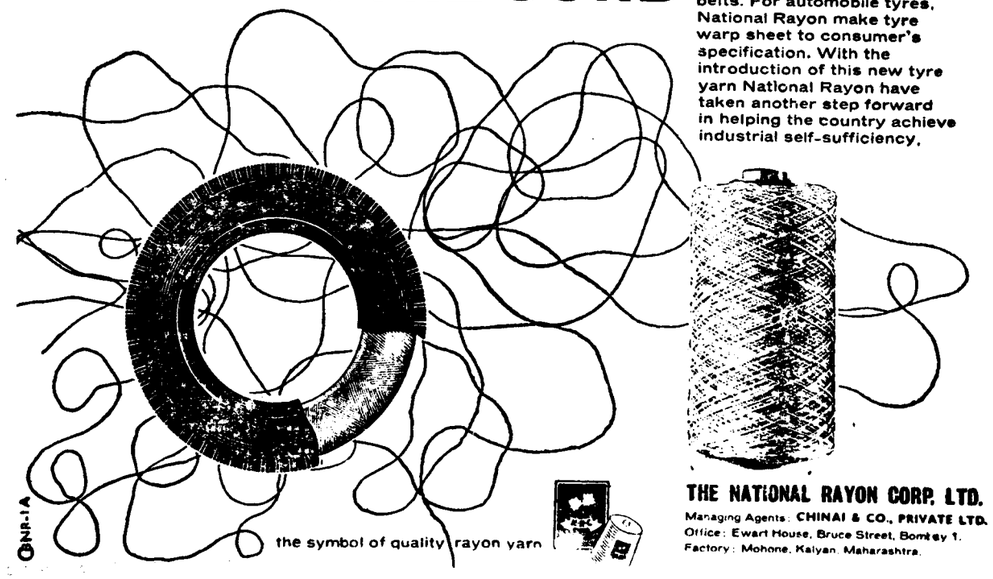
though the differential between yield in Pakistan and India is not large. The productivity ratio in China (Mainland) is slightly higher but here again it is seen that the Chinese are in no way superior to India in the art of cultivating wheat if their data are discounted for having been inflated for political considerations.

The conclusion is, however, irresistible that there is large scope in this country for raising productivity in the agricultural field. Under the present emergency, a liberal supply of fertilizers needs to be made to the farmer so that the output of crops does not suffer from shortages in supply of the vital salt. In fact, the production of fertilizers should be increased and all projects in the Third Five-Year Plan for fertilizer production should be hastened; no cut need be made in this strategic sector. At the same time, the supply of improved seeds should be increased and the programmes for training the Indian farmer in the utilisation of improved techniques should be intensified.

Activising Unutilized Capacity

A REFERENCE has been made earlier to the vast unutilised capacity which exists in this country in the various economic sectors. In manpower, we have resources which are not fully utilised because the economy has been incapable of providing opportunities to all the available labour force. This has consequently resulted in leaving a large unemployed sector in the economy. At the end of the Second Plan, the unemployed were estimated to be around 9 million. At the beginning of the Second Plan, the unemployed were estimated at 5.3 million. It means while the Second Plan succeeded in creating new employment of the order of 6.5 million, it far from succeeded in bridging the gap. In fact, the gap nearly doubled itself from 5.3 million men without work to 9 million men without work. On top of this high level of unemployment which exists both in the rural areas and the urban areas there are believed to be about 15 to 18 million men in rural areas who are not fully employed in the sense that for considerable time in the year they are unoccupied. Now that the tempo of the economy is to be accelerated and the defence expenditure is to be enhanced so as to raise the strength of the Indian army to that of the Chinese army, a pressure on the able-bodied manpower is likely to emerge. This will result in generating more employment and activising some of the idle manpower. Directly, the army may not employ all the 9 to 10 million people who are without jobs but even a doubling of the army will directly give jobs to half a million people, while indirectly it will place orders on the economy which might give employment to nearly two million people.

Urban unemployment gets speedy recognition because the press is always willing to espouse this cause. It is the vast rural manpower which being away from the seats of publicity gets known very little in official circles as well as in the Press. The Third Plan did pay attention to this problem of vast unutilisation of manpower available in the rural areas. It was believed that programmes of agricultural development, road development projects, village housing, etc., would provide some assistance to the unemployed manpower in the rural areas, though it was known that these programmes could not provide a lasting solution to this ticklish problem which has defied solution for the last two decades. Times out of number experts have made known their findings that without the diversification of the rural economy, the unutilised manpower cannot be economically provided. The farming class has to take to village and small industries in order to make the best use of the time available to it. In due course, the village economies would automatically get linked up with the urban economies. Though electrification of villages is likely to intensify this bringing together of the urban and rural areas, under the present emergency it is probable that the schemes of rural electrification would have to be slowed down for providing power to the priority industries.



the war effort, it is equally necessary that the agricultural sector should not be neglected. The programmes for scientific management of agriculture need to be intensified so that the vast rural manpower without work can be absorbed into the economic system. At the same time it will result in increasing the output of agriculture in order to cushion the rushing pressure of new money being poured into the system under defence expenditure. The re-activisation of these "men without work" will serve in two ways. On the one hand it will increase the output of the economy and will provide goods and services to match the new money which will be flowing into the system; on the other hand it will provide employment to the under-privileged sections of society who consist mostly of the unskilled workers in the backward areas. It will be a very big step in the direction of providing work to the unemployed in the rural areas.

It is a pity that the educated unemployed in the urban areas also constitute a big drag on the economy. Only rough estimates are available in regard to this wastage emerging solely due to lack of opportunities. Nearly a million young men and women with sufficient qualifications to be called skilled workers still remain unemployed in India's urban areas. While the defective educational system is by and large responsible for this state of affairs, the national emergency demands that a quick re-orientation should be made in the educational schemes of the country so that the skilled manpower can be utilised in those sectors where their services can be used profitably. A brake needs to be placed on the traditional education in the arts which has hitherto produced mere clerks. Stress needs to be laid on technical training so that the elementary knowledge of the three R's coupled with technical skills can earn the youth more and also can be of more use to the economy. Until opportunities are provided to the young men and women of this country, the expected revolution in production may not materialise. It is wrong to blame the youth of today for shunning manual work. The fact is that sufficient opportunities and guidance in this regard are not available in urban areas. The programme for the setting up of orientation and training centres embodied in India's Third Five-Year Plan should be accorded top priority so that the wastage in human effort which is currently taking place may be avoided.

Again, there is vast unutilised capacity in industries —both small and large. In many of the industries, it has not been possible to make full use of the installed capacity because of a lack of demand. The economy is likely to enter a booming period now that the production machinery has started working fast. A fuller utilisation of the available capacity is likely to be hampered by the non-availability of raw materials. In many cases, even if the raw materials are available, power shortage and transport are likely to emerge as big bottlenecks. How these three bottlenecks which have slowed the Indian economy in recent years can be countered is discussed in the sections on Industry and Trans

another first!
NATIONAL RAYON make Super-Two Quality high tenacity rayon TYRE CORD

Always in the lead, National Rayon are now the first to produce super-two quality high tenacity tyre yarn in the country. Conforming to the most rigid specifications of the transport industry this high-tenacity tyre yarn is now available to fortify the casings of tyres and give strength and longer life to a wide range of industrial products, such as transmission and conveyor belts. For automobile tyres, National Rayon make tyre warp sheet to consumer's specification. With the introduction of this new tyre yarn National Rayon have taken another step forward in helping the country achieve industrial self-sufficiency.

ERIC HELPS TO EXPAND EXPORT TRADE

Risks involved in exports on credit terms need not frighten or dishearten any exporter.

The Export Risks Insurance Corporation, which has been set up by the Government of India with the sole object of helping the exporters offers to cover the following risks involved in exports on credit terms:—

(i) Insolvency of the buyer;
(ii) Non-payment by the buyer;
(iii) Non-transfer of funds to India;
(iv) Loss due to sudden changes in import policy of buyer's country;
(v) Loss due to occurrence of war/civil war;
(vi) Additional expenses due to diversion of steamer;
(vii) Risks due to any other cause not being inherent in the nature of the goods and not being within the control of the exporter and/or buyer, etc., etc.;

INSURANCE OF EXPORTS WITH THE CORPORATION

(i) is likely to make export finance facilities more readily available to the exporter while negotiating the documents,
(ii) will enable the exporter to secure valuable guidance as to the standing of the overseas buyers.

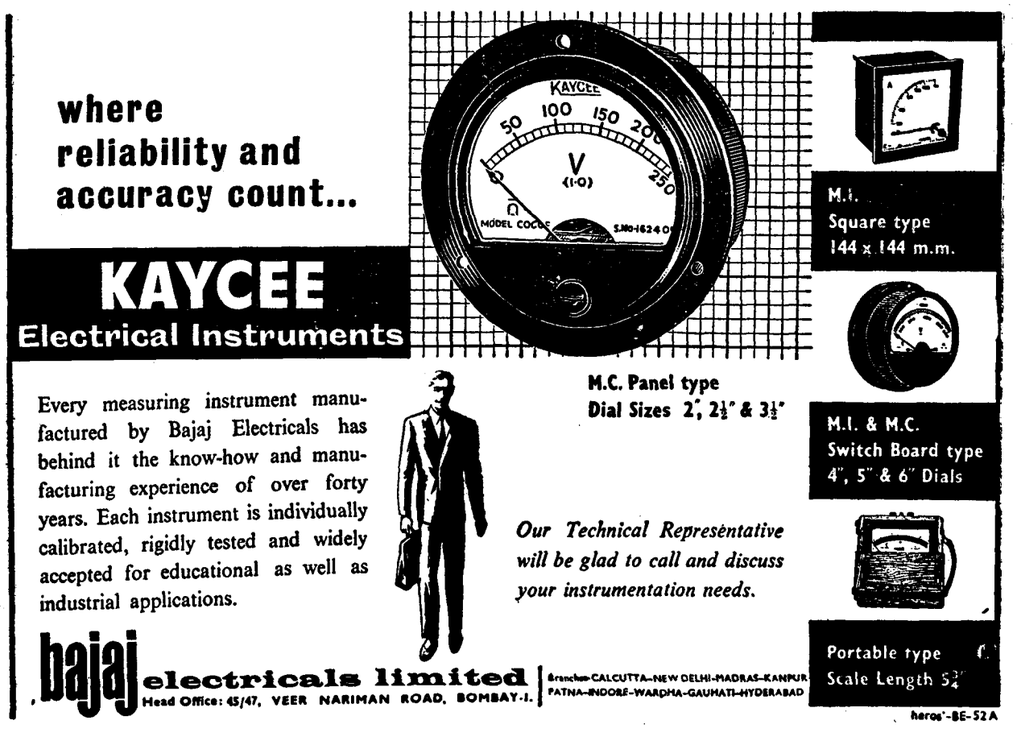
What is currently needed, however, is to make those industrial units work round the clock which are operating to fulfil the emergency orders. Those units which are working single shift, should turn to double shift and those which are working two shifts should change to three shifts. This happened in this country during World War II. Similarly during the First Plan most of the increase in production was brought about by better utilisation of available capacity and not by investment of additional capital. The emergency has provided an occasion for re-assessing the capacity in industry and putting a brake on investment in the non-essential industries so that the best possible u e is made of what is available in the country.

A graphic illustration of this aspect was provided by Mr. Morris J. Solomon in a Special Article in "The Eastern Economist" dated May 17, 1961. It was shown that only by reverting to multiple shifts could an industrial unit show substantial profits. Even in those industries where productivity per man or machne could not be increased because of the obsolescence of the machinery, the multi-shift basis could be a great gain. Under conditions of severe competition, prices may have to be reduced while productivity remains unchanged because of the condition of the machinery; here also the multi-shift operation is the key to economic working of a unit.

Considerable time is lost in some of the machines in the process of loading. This is another disguised form of under-utilisation of machinery which could be overcome by re-organsation of the available machinery and as well as the schedules of working. It was estimated by Mr. Solomon that nearly 41.1 per cent of the total time was wasted in the various parts of an industrial unit when various components lose time while waiting to be loaded. There is no doubt that corrective measures need to be taken by the management of these industrial units once these defects are brought to their notice. In some industrial units, the equipment is underutilised because the operator is not available after the unit has been loaded. In such circumstances, the machine time is lost because of the absence of operators. This type of defect can be remedied by increasing the number of operators. It is not necessary to double the number of operators but even having three operators for two machines can be of great help in getting the best out of the machines. By and large, the impression remains that the machines available in this country are not as intensively used as they should be.



Figures given in the section on industry show that there are some industries—vital from the point of view of the war effort—which are not able to work effectively because of the paucity of foreign exchange. Substantial cuts have been made in India's import bill because exports for the last five years have never matched the total bill of imports. The yawning gap has been growing from year to year and has been filled only by loans from abroad and by private foreign investment. The latest import policy statement issued by the Ministry of Commerce and Industry states that, by and large, the needs of the war machinery have been taken into account. Even with all the caution which might have been exercised, it is feared that some of the war industries cannot fail to be affected by further tightening of imports.

AUSTERITY

Utilisation of idle capacity should be accompanied by austerity in consumption and elimination of waste. Because all available capacity needs to be utilised does not mean that there should be any extravagance in nation. In fact, there seems to be a case for mounting massive propaganda for educating the people in regard to judicious employment of the goods and services which are currently available. Austerity in consumption of food, cloth, kerosene and even transport needs to be advocated. People must restrict their travel—just as they did in the World War II—to only to the barest minimum. In the case of stationery, paper, woollen clothing and even drugs, some restraining influences need to be imposed. This will result in releasing the pressure on these goods so that they may be used for the war effort. Any piece of land which has not been cultivated and any machinery which has not been fully exploited and any man who is sitting idle is a drag on the economy of this country which is fighting a life and death battle. It is the duty of every patriotic Indian to see that a new life is infused in every sector of the economy and every individual is infused with a new spirit to rekindle the flame of energy. The age of plenty has not come to an end. The age of scarcity may take over for a short period. It will indeed be unfortunate if immediate steps are not taken to make proper use of unutilised capacity (or under-utilised capacity) in the Indian economy, wherever it may exist.

While public donations to the National Defence Fund are steadily mounting and the public is also generously contributing towards the Defence Bonds and Defence Certificates, it is imperative that all essential economies should be applied for avoiding wasteful expenditure of national resources. In the Government offices particularly a considerable waste takes place in the shape of cyclostyling of unnecessary circulars. This tendency needs to be curbed in order to conserve both paper and ink. It will also lessen the burden on the staff because preparation of these circulars also needs distributing staff. Suggestions have also been made that during the emergency a ban should be imposed on all exhibitions, ostentatious conferences, celebrations, nairs, melas etc. which tend to dissipate national resources. Just as during the Second World War complete austerity was imposed because of the paucity of some of the essential goods, the Government should now take up the initiative and impose curbs in this regard well in advance of the shortages raising their head. It is true that currently the food supplies in the country are sufficient for our domestic needs but restrictions should also be imposed on the number of guests to be entertained at marriage and other parties. Numerous other suggestions could also be thought out both at the level of the State as well as the Centre for economising consumption of essential commodities.

Attention has recently been invited to what is popularly described as "intellectual waste". This refers to the high percentage of failures at schools and colleges. At the college level the failures in most universities are reported to be around 50 per cent. This is indeed a stupendous wastage of effort and needs some speedy solution. The University Grants Commission had better suggest some screening programmes whereby all and sundry who can afford are not allowed admission to the college. Admissibility tests need to be evolved as to avoid unnecessary wastage of effort in imparting college education to boys and girls who do not have any aptitude for higher education. Already a cut is being suggested in the case of expenditure under education. It will serve the national purpose to keep the number of universities at its present strength. But if the quality of education could be improved it will be a substantial gain. Again, the facilities available at the colleges can be availed of in such a way that more aspiring young boys and girls can get education without the establishment of new colleges. The timing of the colleges could be so arranged as to provide education

in double-shift. Similar experiments in multiple shift have been tried in Delhi and elsewhere since 1947. Many youngmen from West Pakistan could not have attained education but for the special arrangements in running evening colleges. Under the emergency, similar measures should also be taken without any loss of time.

While there is expected to be a cut in the educational grants because the total expenditure on education is likely to be curtailed during the period of the emergency, it is necessary that the cut should be made judiciously. Currently, the country is very much short of technical hands. Engineers are particularly in short supply. In order to meet the defence requirements of the country and co-ordinating economic development, the engineers have a very important role to play. There should, therefore, be no curtailment in the scheme for setting up of new technical colleges or in providing adequate equipment to these colleges so that education of the requisite level may be provided to the students.

In another sphere, some immediate remedial measures have become necessary. India is short of not only engineers but also of doctors. The fault lies with the system of examinations which enforces a course of not less than five years for becoming a full-fledged M.B., B.S. doctor. What the Indian Union needs at the present moment is short-term courses whereby in two to three years every student is in a position to provide help in the particular sphere for which he has been trained. The demand for doctors is likely to multiply manifold during the emergency. If hostilities start once over again on India's border, an increased number of doctors and nurses will be essential to cope with the problem of the wounded. Without any loss of time the Government must move in the matter and evolve short-term courses and train doctors in particular branches of medicine or surgery so that they may become useful for the country without undue delay which usually accompanies the education which is being imparted currently.

India and China: A Comparison

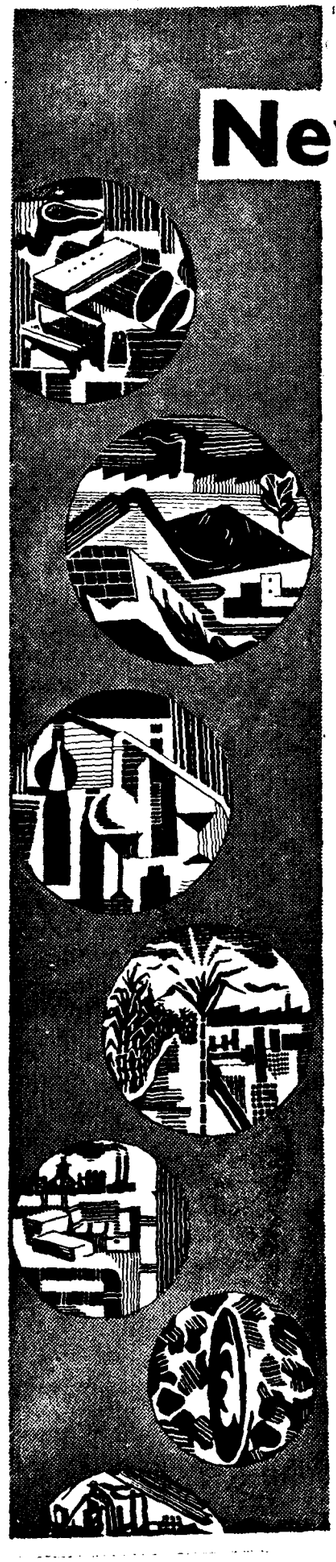
THE EASTERN ECONOMIST in its Annual Number, 1957, had attempted a comparison between the economies of India and China. The present emergency has perforce diverted attention to a comparison of the economic strength of the two countries. It is not an easy task to compare the economic gains made by both India and China because the political machinery in China is unscrupulous and non-objective in its presentation of economic facts. The statistical machinery in China is so designed as to subserve the political machinery and hence the task of finding out the truth from the information published by the Communist Government in China becomes a formidable job. The research student has no independent sources of information; he has to fall back upon the official figures as put out by the Chinese Government. The Economic Commission for Asia and the Far East in its Economic Survey for 1961 has presented data in regard to real net product and per capita material product in China between 1949 and 1957. These figures show that the rate of recovery in mainland China immediately on the acquisition of power by the Communists showed substantial improvement. This was indeed expected because the standard of living in China had perhaps slumped to the lowest level in the world because of the continual civil war. Between 1949 and 1955, per capita product nearly doubled itself. This was easy because it meant only recovering the ground which had been lost during the turbulent years.

From 1956 onwards, the economy started facing difficulties originating from the "iron laws of economics." The per capita product in China (mainland) was 143 yuan in 1956; it rose marginally to 144 yuan in 1957. Taking the yuan equivalent to two Indian rupees, it means that per capita product in China in 1957 was around Rs. 288—almost the same as in the Indian Union. Beyond 1957, the ECAFE Secretariat has not presented any estimates of growth in the economy either on the aggregate basis or on per capita basis. In fact, ever since the bubble of the "big leap forward" burst, the Chinese have ceased publishing their statistical figures in regard to production in the major sectors of the economy. No national totals are publicised any longer which has made the research workers sceptic even about the data upto 1957. By and large, it can be stated that the Chinese had come up to the Indian level by 1957, but whether they have scored over India in the years which followed remains a debatable point.

The table on page 1261 gives the aggregate product of the Chinese economy between 1949 and 1957. In a period of nine years, the total national product in China rose from the pitiable low level of 35.8 billion yuan in 1949 to 92.9 billion yuan in 1957. In Indian rupees, the total national product of China (mainland) in 1957 was Rs. 18,600 crores—almost equivalent to the target of India's National income in 1965-66. It may be noted here that China's figures of national income are in terms of 1952 prices, while the Third Plan national income figures for India relate to prices in 1960-61. It is not possible to correct the Chinese figures for any differential in prices because detailed Chinese price statistics are not readily available. Even if the Chinese figure of national product were assumed at Rs. 18,500 crores in 1962, (meaning that since 1957, the Chinese economy had not made any progress) it is reasonable to infer that the Chinese defence expenditure at about 5 per cent of the national income comes around Rs. 1,000 crores a year. The recommendation, therefore, has been made by all commentators (here or abroad) that India's defence expenditure must be raised to Rs. 1,000 crores a year, or from the present level of 2.5 per cent to 7 or 8 per cent of the national income.

CAPITAL ACCUMULATION

The economic resurgence in China was brought about by speedy accumulation of capital between 1950 and 1957. The percentage of net investment to net material product was a little above 5 in the rehabilitation period extending from 1950 to 1952. During the First Five Year Plan which ranged from 1953 to 1957, the rate of capital accumulation was raised to 11 per cent of the total material product. In 1956, it had been raised to even 17 per cent of the total material product. It must also be noted that these estimates do not include the voluntary labour contributed by people who were forced to work on such projects as "water conservancy construction," "afforestation," etc. either without any monetary gains or nominal payments. This voluntary effort when computed on the national scale would have certainly been a sizeable amount.



The distribution of government expenditure into the various economic heads shows that China allocated a substantial proportion of its expenditure to national defence. Table I below shows the distribution of Government expenditure, in percentage terms, between economic development, social development, national defence, administration and others. It will be seen that the proportion on national defence in percentage terms fell from 34.5 per cent in 1950-52 to 22.3 per cent during 1953 to 1957. This drop in percentage is, however, misleading in the sense that by 1957, the total national product in China had more than doubled and, therefore, in absolute terms, the expenditure on defence had increased and not decreased. Economic development took away nearly half of the total expenditure and, here again, as will be shown later, the emphasis was mostly on rapid industrialisation in the heavy industry section. In the period 1953 to 1957, the distribution of investment between light industries and heavy industries was 1 : 6, meaning for every yuan spent on light industry, six yuans were spent on heavy industry. Special emphasis was placed on new branches of industry such as manufacture of aircraft, motor vehicles, modern machine tools, power generating equipment, metallurgical and mining equipment and equipment for smelting high grade alloy steels and important non-ferrous metals. In the order of priorities, industry was followed by transport and communications; agriculture occupied the third place.

TABLE I

(Percentages)

	1950-1952	1953 1957
Economic development	36.3	49.4
Social development	12.3	14.5
National defence	34.5	22.3
Administration	13.5	8.6
Others	3.4	5.2
TOTAL	100.0	100.0

In the case of the Indian Union, accumulation has been slowly stepped up from 5 per cent of the national income in the beginning of the First Plan to about 10 per cent of the national income at the end of the Second

New Horizons

In pre-Independence era, India had plans and programmes for social and economic betterment of the people. But there was a fundamental weakness – the weakness of their belonging more to the Government than to the people.

Independence came, and with it a new awakening, and people's plans, for the people by the people. The results were tangible – more and more of better and cheaper things ; a better way of life for more and yet more people of our land.

We of DALMIA ENTERPRISES have been constantly endeavouring to produce more and more of such goods that contribute towards improved living standards of our people. We are doing this not only since Independence but almost for a quarter of a century. The task is not so easy. Yet we are going ahead, undauntedly, in the hope of seeing a brighter tomorrow .... a new dawn .... along the new horizons.

Plan. Table II below gives India's aggregate savings, as well as sectorial break down by use and sources for the years 1951-52 to 1960-61. The highlight of the analysis presented in this table is that the household sector continued to be the largest contributor to national savings. Whereas 79 per cent of the net domestic savings during the First Plan period came from households, both in the rural and urban areas, the percentage rose to 84 during the Second Five-Year Plan. The urban sector of households has during both the plans contributed roughly double of the rural savings. In other words, the capital accumulation which has occurred in the Indian economy during the first two Plans has come by and large from the urban households.

AGGREGATE SAVING, SECTORAL BREAKDOWN BY USE AND SOURCE, 1951-52 — 1960-61

	First Plan 1951-52 — 1955-56	Second Plan 1956-67 — 1960-61*
Users (per cent of gross aggregate savings):		
Government	24	34
Corporations	8	10
Households	68	56
Composition (per cent of gross national product at constant 1958--59 prices):		
Gross domestic saving	14.0	16.3
Foreign saving	0.4	2.9
Gross aggregate saving	14.4	19.2
Savers (per cent of net domestic saving):		
Government	16	12
Corporations	5	4
Households:	79	84
Rural	28	24
Urban	51	60
Saving-income ratios (per cent of sector income):		
Government	10.3	8.2
Corporations**	37.0	32.4
Households***	5.3	6.7
Rural	2.5	2.7
Urban	12.6	16.9

* The classification of savers and saving-income ratios refers to only three years, 1956-57 to 1958-59.

** Saving from income after tax.

*** Saving out of disposable income.

Saving as a percentage of income was the highest for corporations, as represented by the organised sector of industry, commerce and trade. These savings were computed after allowing for taxes. The urban households took the second place followed by Government savings and savings of the rural households. Even national product seem high, it does not compare favourably with the high net rate of accumulation which has currently been recorded in China. (Even though there is wide divergence between the figures put out by the Planning Commission and the Central Statistical Organization, it is believed that India's current net rate of savings is around 10 per cent of the net national product.) It must rise at least to 15 per cent during the Third Five-Year Plan, if the ambitious objectives of simultaneously pushing the economic plans and arming the country against the Chinese aggression are to be realised.

It is a pity that rural India has been slow in picking up the virtue of thrift and austerity so as to raise savings. If and when the rural households are in a position to save, they have unfortunately taken to unproductive means of savings such as accumulation of gold and jewellery. The measures initiated by the Union Government since the declaration of the national emergency, especially the issuance of gold bonds, did not have a very encouraging response. It seems that a vast and imaginative campaign needs to be started to educate the people in the futility of keeping their savings in the shape of bullion. Then and then alone can any Government policy of dehoarding of bullion be successful. The dilemma in the rural areas is not whether to save or not to save but in what manner the savings should be kept. There are, for the Government, limitations in raising the volume of national effort through taxation. While some tinkering with the taxation machinery here and there may yield more revenue but by and large the present rate of taxation is extremely high. What is needed is tightening of the taxation machinery in the country so that even at the current level of taxation, additional revenue should accrue.

The ECAFE secretariat has also attempted a sectoral distribution of the national product of Mainland China and India for the years 1952 and 1956. The results are presented in Table III below. It will be seen that in both

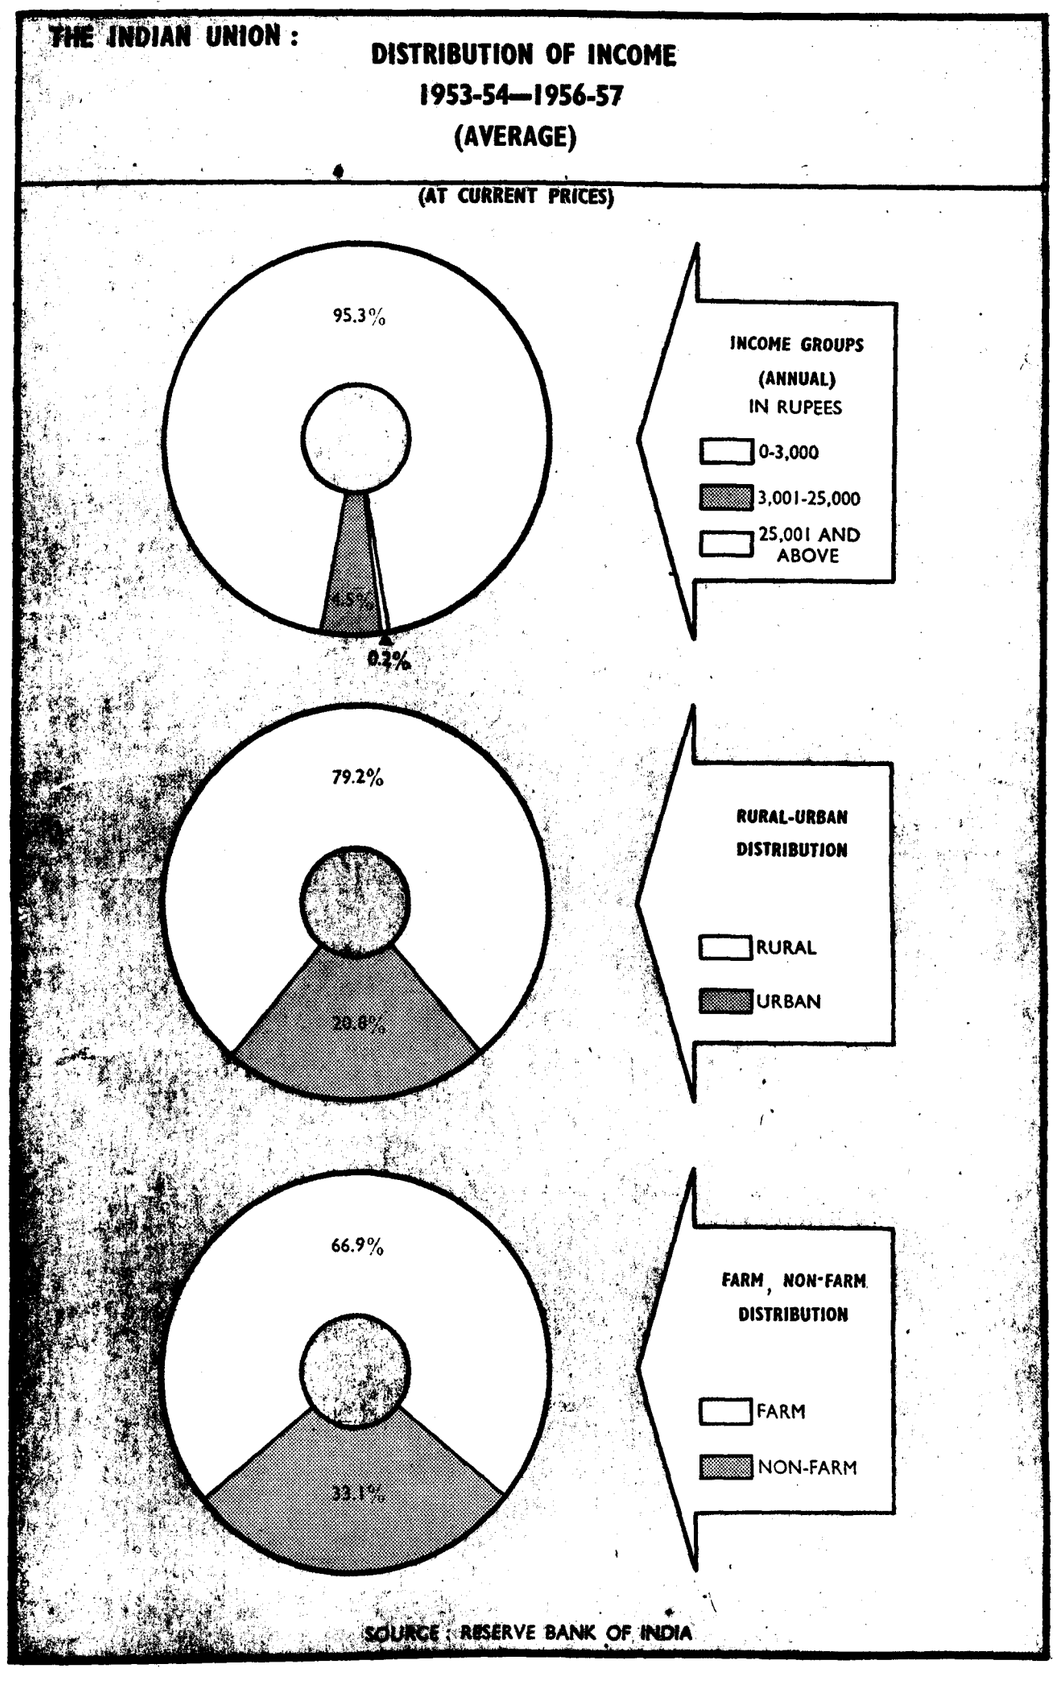

TABLE III

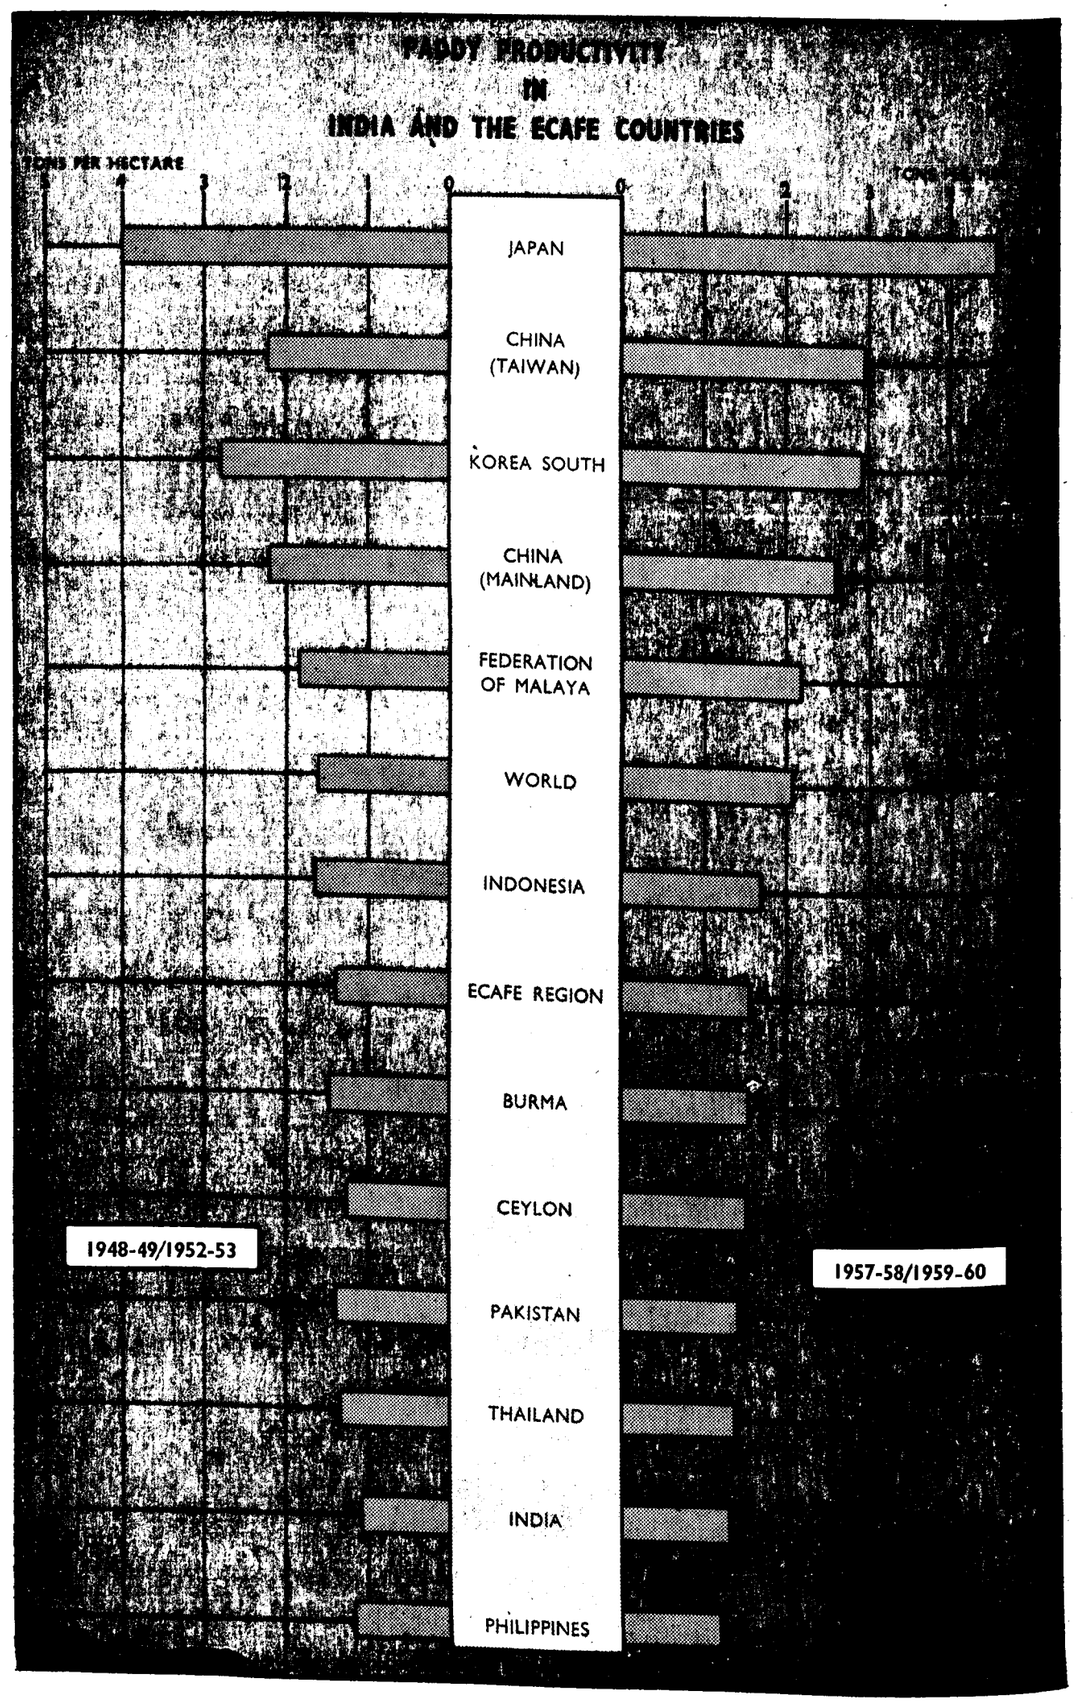

(Percentages)

the countries, agriculture commanded the highest proportion of the national product. Strangely enough, the percentage was the same (that is, 48) for both India and China in 1956. It was in industry and construction that mainland China scored over India. As much as 32 per cent of the national product in mainland China was allocated to industry and construction as against 17 per cent only in the case of the Indian Union. For commerce and transport, the allocation was almost the same for the two countries, it being around 20 per cent in

Indian Union had allocated about 16 per cent of the national product to the services, no details are available in the case of mainland China. Even if it is assumed that the services in China were provided in the same manner as in India, the absolute level of the national product of China will need to be marked up. These percentages by no means demonstrate that China has neglected its agriculture. It is only the unfavourable natural factors since 1958 which have turned the apple cart and slowed down the progress of its economy.

The Army and the Manpower

THE DETAILED reports of the fighting in NEFA highlighted the numerical superiority of the Chinese forces over the Indian fighting forces. It was reported that the Chinese technique of fighting was to throw wave after wave of soldiers in order to keep up the pressure on a particular front regardless of the number of casualities. An impression was created that the Chinese cared the least about the number of soldiers they lost on the battlefield. In other words, the enemy seems to have abundance of "cannon fodder." Estimates of Chinese army vary from 2 million to 5 million soldiers as against the reported strength of the Indian army at half a million.

The army of a nation has some relationship to its total population. In the case of the Indian Union, it may not be difficult to raise an army equal in strength to that of the Chinese. This will be a slow process, though currently efforts are being made to double the present strength of the Indian army.

The total population of the Indian Union provides sufficient background from which an army of 4 to 5 million can easily be drawn. The age distribution of India's population shows that 42.4 per cent of India's total inhabitants in 1961 belonged to ages between 20 and 54. If the 40 million people belonging to the age-group of 15-19 years are also included, then the percentage may rise to 51.6 meaning more than half of India's population of 442 million belongs to the age pattern which can provide soldiers for India's army. In the case of China, Mr. S. Chandersekhar has estimated that in 1958, 45 per cent of the total population belonged to the age-group between 18 to 48 years. Currently, the Chinese population is estimated at 686.4 million with a rate of rise at more than 3 per cent per annum as compared to India's rate of 2.2 per cent.

Explosion in Population

ESTIMATES PREPARED by the United Nations in regard to the probable growth in population in India and China show that rise in China is likely to be much faster than in India. The present strength in numbers of the Chinese is not to be matched by the Indian Union even by 1980. Currently, the differences between the populations of the two countries is around 250 million. By 1980, this difference is expected to rise to more than 450 million. These projections assume that no unforeseen catastrophe will overtake India or China during the next two decades, even though historical growth of population in China shows a different trend. Whenever China has had a period of political peace, it tended to multiply in numbers. The last decade seems to have provided a similar period. At the end of every such cycle, the pressure of population invariably tended to acquire relief either through famine or war, meaning if widespread havoc is not caused by disease or famine, China attempted to seek relief by waging a war under one pretext or the other. Has that saturation point been reached in China today? Has China reached its limit of over-population? Is it because of this pressure of over-population and because of intolerable pressure from within that China has launched the present prolonged war with India It may not be possible to answer these questions with the evidence that is currently available. It is, however, a fact that continued destitution in the agricultural sphere since 1959 has been responsible for changing the course of political events in China.

The Indian Union cannot follow the suicidal course of letting its population increase in such a manner as to slow down the standard of living of the people. The Indian Five-Year Plans have been so designed as to bring about a substantial rise in the living standards. Planned growth in population is essential for avoiding economic stagnation. The Indian Union need not imitate the Chinese is swelling her numbers but should concentrate on improving the quality of the population. Greater attention needs to be paid to improving the health standards. People need to be widely educated on the benefits of "planned parenthood". The family planning programmes which have been initiated under the Third Five-Year Plan need not be slackened. In manpower the Indian Union is sufficiently strong to raise an army more efficient than that of the Chinese and even more than theirs in numbers.

The Census Commissioner in India announced in July this year that India's population inclusive of Goa,

Daman ad Diu and the areas in North-East Frontier Agency came to about 442 million. It means the rise of a little more than 2 per cent per annum as against rate of rise at 1.3 per cent only during the fifties. Presumably, this improvement has been caused by the widespread health services, speedy control over widespread diseases such as malaria and the availability of medicines and medical services at cheap cost. While this is in the national interest to provide all these medical facilities, it is also imperative that a check on new births should be propagated. There was some talk during the current year in regard to providing the people with cheap contraceptives. This may not be possible during the Emergency, but no attempt should be made to shelve all those programmes which have already been finalised for this purpose.

Family Planning

IT WILL be a fatal mistake if the family planning programmes initiated after great deliberations during the last 15 years are shelved because of the emergency. Dr. Sushila Nayar, the Union Health Minister, rightly pointed out in a recent speech in New Delhi that the need for well-nourished and educated children was greater today than ever before. It is better to have fewer but well-nourished children than to have many ill-nourished ones. The decision of the Government to lay more stress on the educational campaign in favour of the family planning needs to be commended. The propaganda machinery of the Government needs to be re-oriented so that people automatically feel the necessity of resorting to better techniques in "planned parenthood"; even the expenditure that is currently being incurred on the distribution of free contraceptives may have to be dropped. Once the people understand the implications of family planning, they would be prepared to spare money from their own budgets for this essential expenditure. Recently a family planning institute has also been set up to study the educational, social, biological and other aspects of family planning. This institute is expected to advise the Government on medical and biological methods and to advise the scientists in this particular field. It will also provide special courses to train workers and will be in a position to test indigenous drugs and plants and will also provide other laboratory services.

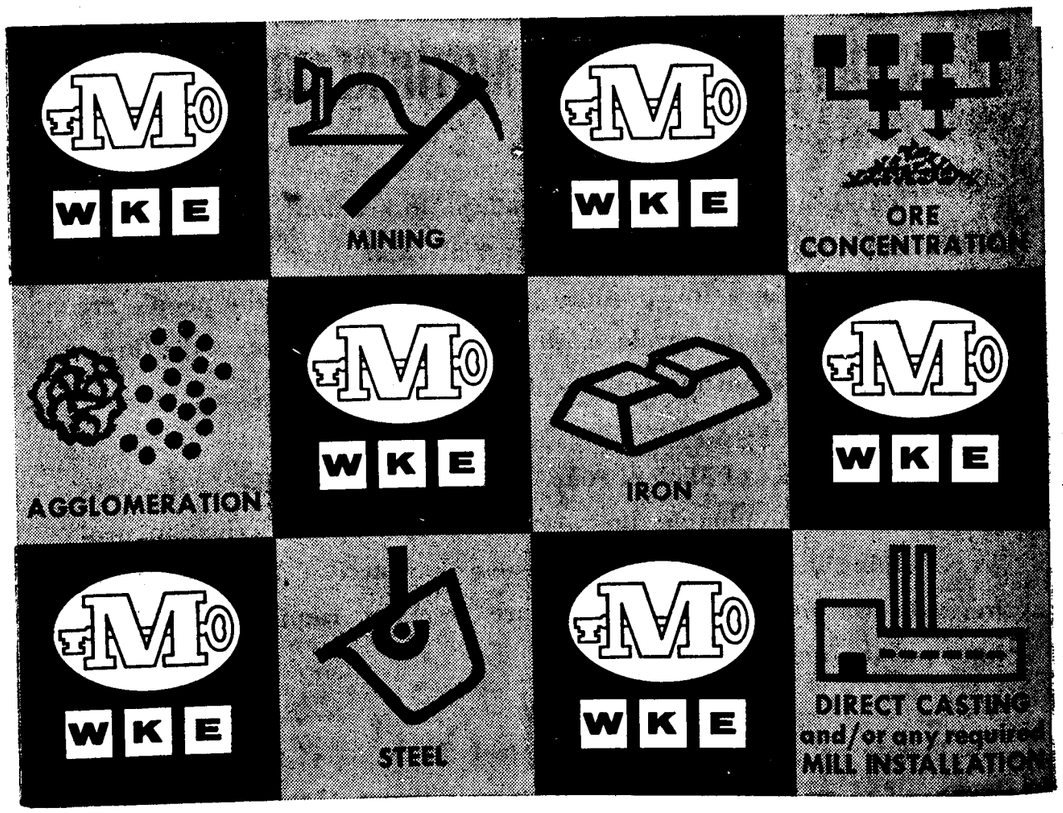
IN DEFENCE OF OUR MOTHERLAND.....

There is a new turn and a new tempo to economic activity in the State. All the units in the industrial and agricultural set-up which were geared to produce peace time needs of the people are being switched on to produce all that is necessary to meet the threat to our freedom from the ruthless Chinese invaders.



In the villages of Madras State, the peasants are awake to the danger and are at the plough, the network of power and irrigation projects helping them to get all the water they need. The workers in the industrial units, big and small, are working round the clock to increase production.

People of Madras who have tasted the fruits of fifteen years of independence—good roads linking every village and town, a school in every village with a population of 300 and a Panchayat in every village are responding magnificiently to the call for toil and sacrifice in defence of our Motherland and are falling in line with our brothers and sisters in other States.

Who lives if India dies and who dies if India lives?

SPECIALIZED DESIGN, ENGINEERING AND CONSTRUCTION SERVICES — FROM MINE TO FINISHED STEEL

McKee can bring to your project, in a single world-wide organization, all the time- and cost-saving advantages of specialized, up-to-the-minute knowledge and long, practical experience in every branch of iron and steel production from raw materials to finished steel.

A large share of the important advances in mining methods, ore beneficiation, production practices and plant design and construction have originated in the Metals and WKE Divisions of Arthur G. McKee & Company.

Qualified technical experts for your specific project, as well as the diversified services of our entire staff are available to your company to any extent you require. Let us show you how they can produce results for you.

Agriculture
After the Emergency

DEVELOPMENT of agriculture in an under-developed democratic country in peace times is sought to be fostered with three ends in view; firstly, to provide for the growing food requirements of the population and the expanding demands for raw materials from the industrial sector; secondly, to increase the investible economic surplus, both in the form of domestic capital and in foreign exchange; and thirdly, to create an internal market for the manufactured goods which an expanded industrial sector starts turning out. All these three objectives have been the focal points of agricultural development in India since 1947, particularly during the era of planning after 1951. And India's agrarian economy has, inded, made some fairly rapid strides all these years, notwithstanding the occasional setbacks caused by vagaries of weather.

But, today, following the unscrupulous invasion by China on our northern frontier — a frontier on which peace had reigned supreme for over 2,000 years — a new situation has emerged which calls for an accelerated growth of our economy, particularly of the agrarian sector. The need to make the country self-sufficient in food and self-reliant to a large extent in agricultural raw material requirements is all the more great today in the interest of saving foreign exchange for the more pressing needs — for purchase of armament and other sinews of war. Exportable agricultural surpluses have also to be increased without any limit to earn as much of the precious foreign exchange as possible.

There is yet another consideration for stepping up our farm output today — a political one, of course. China has ambitions to emerge not only as the undisputed leader of Asia but also as the torch-bearer of communism in the world. Her these dreams, she conjectures, rather fears, would be frustrated if India's rate of economic growth outstrips her own. The setbacks China's economy by and large, and agriculture in particular, has suffered since 1958 when she proclaimed a "Great Leap Forward" in her economic growth, in the face of a steady development in India, have according to economic experts the world over, prompted her to embark on an adventurous course, which, besides diverting the attention of her discontented masses from their economic travails, would help in implementing her grandiose expansionist plans. A recent comment by the New China News Agency to the effect that the Sino-Indian "border conflict" has forced India to spend more on defence, at the expense of her economic development, gives a good deal of substance to this analysis.

By forstering agricultural development through democratic means, despite the new burdens placed on her economy by the Chinese invasion, India has to show to the newly independent nations of the Asian and African continents that her ways of economic development are in no way less effective than, if not superior to, the Communist mode of development through regimentation and dictatorship. India's triumph in the Sino-Indian war, thus, would be of historic significance in world politics, inasmuch as it can be instrumental in changing the course of events in Asia and Africa.

Against this background, an attempt is made in this section to spotlight the weaknesses of our present-day agricultural development, the new tasks enjoined on the peasantry by the current emergency and to suggest ways and means of strengthening our agrarian economy. The emergency is not going to end soon. Even if it does owing to some wise counsels prevailing on China's warlords, India can never be complacent now about strengthening of her vulnerable northern border.

The current weaknesses of our agrarian economy have been sought to be spotted in the light of the past experience. The first article, thus, traces the growth of our agriculture under the first two Plans. Next comes an appraisal of its development in the first year of the Third Plan and the likely achievements in the current year. This is followed by an assessment of the agricultural development in China, the failings of our agrarian economy and the task ahead. Some measures to redeem the situation have been suggested in the end.

Development Under First Two Plans

AT THE time of regaining independence in 1947, the present regime in India inherited from the British a stagnant farm economy, more oriented towards providing agricultural raw materials to feed the industries abroad and saddled with feudal landlords whose predominant concern was to provide a prop for the alien rule. This class was not so much interested in improving the soil or agricultural practices and remained content as long as it could derive enough by way of exactions from the tenants to satisfy its needs. Some sporadic attempts, of course, were made by the then authorities to cater to the development of agriculture through enactment of legislation to protect the tenants from gross high-handedness of the feudal landed aristocracy, through provision of credit by encouraging the establishment of co-operative societies and through extension of the canal systems. But these benign measures, by and large, were pursued with some vigour only in the States (then Provinces) which provided the Crown with faithful sepoys for the armed forces. The result was that since the turn of the present century to the time of the setting up of the Interim National Government in 1946, while the population of India increased by nearly 38 per cent, the food output remained practically stationary and the agricultural output as a whole recorded an increase of only about 12.6 per cent.

The first task to which the National Government, therefore, addressed itself was to activate the farm economy through initiation of measures which slowly, but steadily, could bring about a healthier state of affairs. With a view to vest the land-ownership in the actual cultivator, land reforms were undertaken and for the transitionary period, interests of the tenants were sought to be protected by rigorous tenancy legislation. Agricultural development was made the pivot of all economic activity and by far the greatest emphasis was laid on it in the formulation of the First Five-Year Plan. Although greater stress came to be put on industrial development under the Second and the Third Plans, agricultural content in them still remained impressive.

Despite some serious setbacks occasionally, as in 1954-55, 1957-58 and in 1959-60, due to vagaries of weather — farming in India even today remains to a great extent a "gamble in rain", notwithstanding the assurance provided by extension of irrigation facilities over the decades — Indian agriculture during the

'fifties recorded a fairly rapid and steady growth (see table Agri.-1). The index number of total agricultural production, excluding livestock output, (with base 1949-50 = 100), went up from 95.6 in 1950-51 to 139.9 in 1960-61, showing a linear rate of growth of 4.6 per cent per annum. Even if allowance is made for the slightly more favourable weather conditions in 1960-61 and the influence of fortuitous circumstances is ironed out by calculating the average rate of growth over a period of three or five years, the annual growth does not come to less than 3.5 per cent per annum. Whether this rate of growth has been commensurate with the growing needs of the Indian population, expanding at a strident rate of 2.1 per cent per annum, or with the requirements of her industrial economy, developing at a rate of 7 to 8 per cent per year, is, however, a different question. The implications of this are discussed at a later stage.

Sceptics may raise the bogey of unrealiability of farm statistics in India in an attempt to belittle the achievements on the agricultural front under the first two Plans, but this does not amount to a denial on their part of the fact that Indian agriculture after its development in the 'fifties did regain some measures of dynamism. This is evident from the improvement in unit-area yiedls of various crops (see Table Agr-11), though again not commensurate with the tasks enjoined on the peasantry.

The growth in Indian agriculture between 1950-51 and 1960-61 could be fostered only through massive investments both by the State and the cultivators themselves. An estimated investment of over Rs. 1,400 crores (see Table Agr.-2) was made during this 10-year period by the State alone. No data are available of the investment effected by the agricluturists themselves, but an idea of it can be had from the growing demands put by the peasantry on the co-operative credit societies and the increasing use they have made of farm machinery, chemical fertilizers, improved seeds, irrigation facilities etc.

This massive input of capital in Indian agriculture in the 'fifties helped in not only increasing the area under cultivation, but also in greater application to it of modern scientific knowledge and technology. The net area sown increased from 118.8 million hectares in 1950-51 to 131 million hectares in 1958-59. There must have been effected some further additions to the cultivated area after this year, but no data are yet available in this respect. Gross area sown during these years presented even a slightly better picture, implying thereby that greater resort was had to multiple cropping than had been the case previously. Area sown more than once

TABLE AGR-1

A car without springs...

a car fit only for divine amble
a car for gods!

This is a temple car—a car made of seasoned wood and pieces of iron—a car in which Gods travel once a year—a car dragged by devotees—just a mile in 24 hours—a car steered by triangular wooden pieces at the wheel on the ground! A car fit to be a museum piece but still road - worthy and sacred—a car that has no engine, no clutch, no battery, no gasoline and no springs!

That is the car of today—the car that has to take you places—the car that has to hold pace with time—the car that has to travel hundreds of miles a day on roads and ruts—the car of Man—this car has got to have springs—CANARA SPRINGS, of course, for comfort, safety and reliability. That's why fastidious car owners choose CANARA for carefree carriage.

CANARA SPRINGS

THE CANARA WORKSHOPS LIMITED
Factories at: Mangalore & Nagpur

The Integral Coach Factory established to manufacture light-weight, all welded steel coaches has so far manufactured more than 2,500 broad gauge coach shells during the last seven years. The future production will also include Diesel Cars, Electric Multiple Units and Metre Gauge coaches.

So far all the shells could not be furnished in this Factory itself as the factory did not have enough capacity. A new Factory at the cost of about Rs. 3.7 crores has been built for this purpose.

Integral coaches mean better travel, cheaper costs, very little foreign exchange expenditure.

INTEGRAL COACH FACTORY,

Huddled in a tiny capsule, hurtling through space...
braving the howling blizzards of the Antarctic...
exploring the depths of the mighty oceans...
probing the secrets of the atom...
mankind is constantly endeavouring to extend
the frontiers of knowledge,
to make life more purposeful and rewarding.

At Advani-Oerlikon, scientists wrestle
with the secrets of metals,
lay bare the hidden components of weld deposits,
stress them and snap them, and
thereby evolve
better welding techniques and electrodes...
motivated by the same
urge to know and the desire to excel.

ADVANI-OERLIKON

in a year registered an increase of 6.6 million hectares in the course of these eight years, from 13.1 million hectares to 19.7 million hectares. The rate of progress in this regard can only be expected to have recorded further improvement with the extension of community development services and spread of scientific knowledge to a greater degree.

TABLE AGR-2

EXPENDITURE ON AGRICULTURAL PROGRAMMES IN INDIA

(Public Sector only)

(Rs. crores)

Head of Expenditure	First Plan (Actual Outlay)	Second Plan (Estimated Outlay)
Agriculture, Community Development, Co-operation and Irrigation	487.3	950.3
(a) Agricultural Production*	176.1	193.0
(b) Major Irrigation Projects	197.4	420.2
(c) Animal Husbandry**	15.5	33.5
(d) Forests and Soil Conservation	11.5	36.9

(f) Co-operation and Warehousing etc.	5.0	38.8
(g) National Extension and Community Development	79.0	194.1
(h) Local Development Works and Village Panchayats	..	24.7

* Including minor irrigation.
** Including dairying and milk supply.

Increased application of scientific knowledge and modern technological methods to Indian farming has taken various forms, the most important of them during the 'fifties being extension in irrigation facilities, use of chemical manures, pesticides, improved seeds and farm implements. As between these, owing to the peculiar conditions obtaining in this country, greater stress has obviously been placed on the former two.

The net area under irrigation increased from 20.9 million hectares in 1950-51 to 28.3 million hectares in 1960-61. The gross area irrigated during this period went up from 22.6 million hectares to nearly 34.1 million hecres (see Table Agr.-3).

Application of chemical fertilizers, which upto 1950 was mainly confined to aiding the production of plantation and commercial crops like tea, coffee and cotton, picked up appreciably during the 'fifties. So much so that in the late 'fifties demand outstripped supplies by a fairly big margin. In 1960-61, only about 45 per cent of the estimated demand for nitrogenous fertilisers — the chemical manure most popular with the Indian peasantry due to nitrogen being the limiting factor of soil fertility in large parts of India — could be met because of their still low indigenous output and difficulties of importing them from abroad owing to tight foreign exchange situation. Even then, total consumption of fertilizers (see Table Agr.-4) improved from about 58,000 metric tons (N) in 1950-51 to 313,600 metric tons in 1960-61. Application of phosphatic fertilizers (P2O5) and potash fertilizers increased from 6,900 metric tons and 7,700 metric tons in 1951-52 to 63,000 metric tons and 30,400 metric tons in 1960-61, respectively.

TABLE AGR.-3

GROSS AND NET AREA IRRIGATED DURING THE 'FIFTIES IN THE INDIAN UNION

(Million hectares)

Year	Net Area Irrigated	Area Irrigated more than once	Gross Area Irrigated
1950-51 ..	20.9	1.7	22.6
1951-52 ..	21.0	2.1	23.1
1952-53 ..	21.1	2.2	23.3
1953-54 ..	21.9	2.5	24.4
1954-55 ..	22.1	2.9	25.0
1955-56 ..	22.8	2.9	25.7
1956-57 ..	22.5	3.2	25.7
1960-61* ..	28.3*	5.8	34.1

Along with increased use of chemical fertilizers, development and application of organic manures — urban compost and rural manuring resources — too showed some improvement. It is estimated that urban compost output increased to about 3 million tons by 1960-61 and that of rural compost to nearly 73 million tons. Green manuring practices were also developed to a fairly large extent — by 1960-61, 4.8 million hectares were estimated to have been brought under green manuring.

The use of improved seeds also went up by an appreciable degree, especially in late 'fifties, when the sporadic attempts being made earlier were converted into concerted efforts. Over 3,600 new seed farms (about 10 hectares each) were set up under the Second Plan, bringing their total to about 4,000. Approximately 22.3 million hectares of agricultural land were estimated to have been brought under improved seeds by 1960-61.

TABLE AGR.-4

CONSUMPTION OF NITROGEN, PHOSPHATE AND POTASH FERTILISERS IN INDIA

(Agricultural Year)

(Thousand Metric Tonnes)

Year	Fertilisers			
	Nitrogen (N)	Phosphate (P2O5)	Potash (K2O)	Total
1937 ..	10.7	1.2	2.7	14.6
1945 ..	13.9	0.1	0.9	14.9
1947 ..	4.3	0.9	1.8	7.0
1949 ..	56.0	8.5	2.4	66.9
1951 ..	58.7	6.9	7.7	73.3
1953 ..	85.5	8.1	8.5	102.1
1955 ..	111.0	12.8	10.2	134.0
1957 ..	150.0	21.6	15.5	187.1
1959 ..	220.0	38.9	21.6	280.5
1961 ..	313.6	63.0	30.4	407.0

Some improvement was also registered in the use of improved farm implements and agricultural machinery such as tractors, electric pumps for irrigation, oil engines with pumps (also for irrigation), cane crushers, etc., although difficulties of importing steel for their manufacture, in the absence of adequate quantities being available from indigenous sources, continued to act as a drag in this regard. As many as 34,000 tractors were stated to be in use in Indian agriculture in 1961, as against about 9,000 in 1951. Mechanical cultivation had been extended to nearly 0.21 million hectares by the end of 1960-61 agricultural year. Figures for 1961 in respect of the other farm machinery and improved agricultural implements in use in India are not available. But in 1956 as many as 1,367,000 iron ploughs were said to be being used by the agriculturists in this country, as against 931,000 in 1951. The number of sugarcane crushers worked with power went up from

viding irrigation facilities in 1956, as against 82,000 in 1951. The number of electric pumps used for agricultural purposes went up from 26,000 in 1951 to 47,000 in 1956. There must have been registered substantial improvements in the use of all these under the Second Plan.

Some progress was as well registed in the adoption by the Indian agriculturists of improved farm practices such as crop rotation, line sowing, proper spacing, eradication of weeds, etc. The most notable fact in this connection, however, has been the introduction in Indian agriculture of the Japanese method of rice cultivation. It is estimated that nearly 3.1 million hectares of land under rice cultivation had been brought under the Japanese method upto 1960-61.

Increased use was also made of pesticides, insecticides, and herbicides, especially in the late 'fifties, with a view to cut down losses to crops by pests, insects and plant diseases. The plant protection programme covered approximately 6.5 million hectares of cultivated area at the end of the Second Plan.

Some concerted efforts as well came to be made under the Second Plan for soil conservation on agricultural lands. The progress registered in this respect, however, was only slow. At the end of the Second Plan in 1960-61, slightly over one million hectares of agricultural area were covered by soil conservation measures.

A good deal of help was provided in the propagation of improved farm practices and utilization of the modern prerequisites of agricultural production by extension of the Community Development Programme and co-operative credit facilities. By the end of 1960-61, about 3,70,000 villages, containing well over half the country's rural population, had been brought under the Community Development Programme. It was estimated that in many of these intensive development blocks, unit-area yields of various crops had gone up by 20 to 25 per cent. There were in existence in 1960-61 as many as 2,10,000 primary agricultural co-operatives — approximately double the number in 1950-51 — to provide credit facilities to the peasantry and about 1,870 engaged in marketing of agricultural produce.

Side by side with the stepping up of farm output, some concerted efforts were also made, especially after 1955-56, to improve the production of protective foods. For this purpose, attempts were made at the development of animal husbandry, poultry, dairying, fisheries and forestry. Nearly as many as 260 key village blocks were set up for cattle improvement during the five years to 1960-61. Another 72 extension centres were also established for animal husbandry. Over 31,000 superior calves were reared, 5.7 lakh scrub bulls castrated and 83.4 lakhs inoculations given for prevention of cattle diseases in these five years. Under a scheme for better utilization of superior calves from milk centres, over 800 calves were purchased from Aarey and Haringata and distributed free to bonafide breeders. Poultry population during the Second Plan period was stated to have increased by about 20 per cent over the 1956 level. For the development of fisheries, greater resort was taken to mechanisation of fishing craft — over 17,000 mechanised boats were there in the country at the end of the Second Plan period. A start was also made to provide refrigeration facilities with a view to improve fish marketing practices.

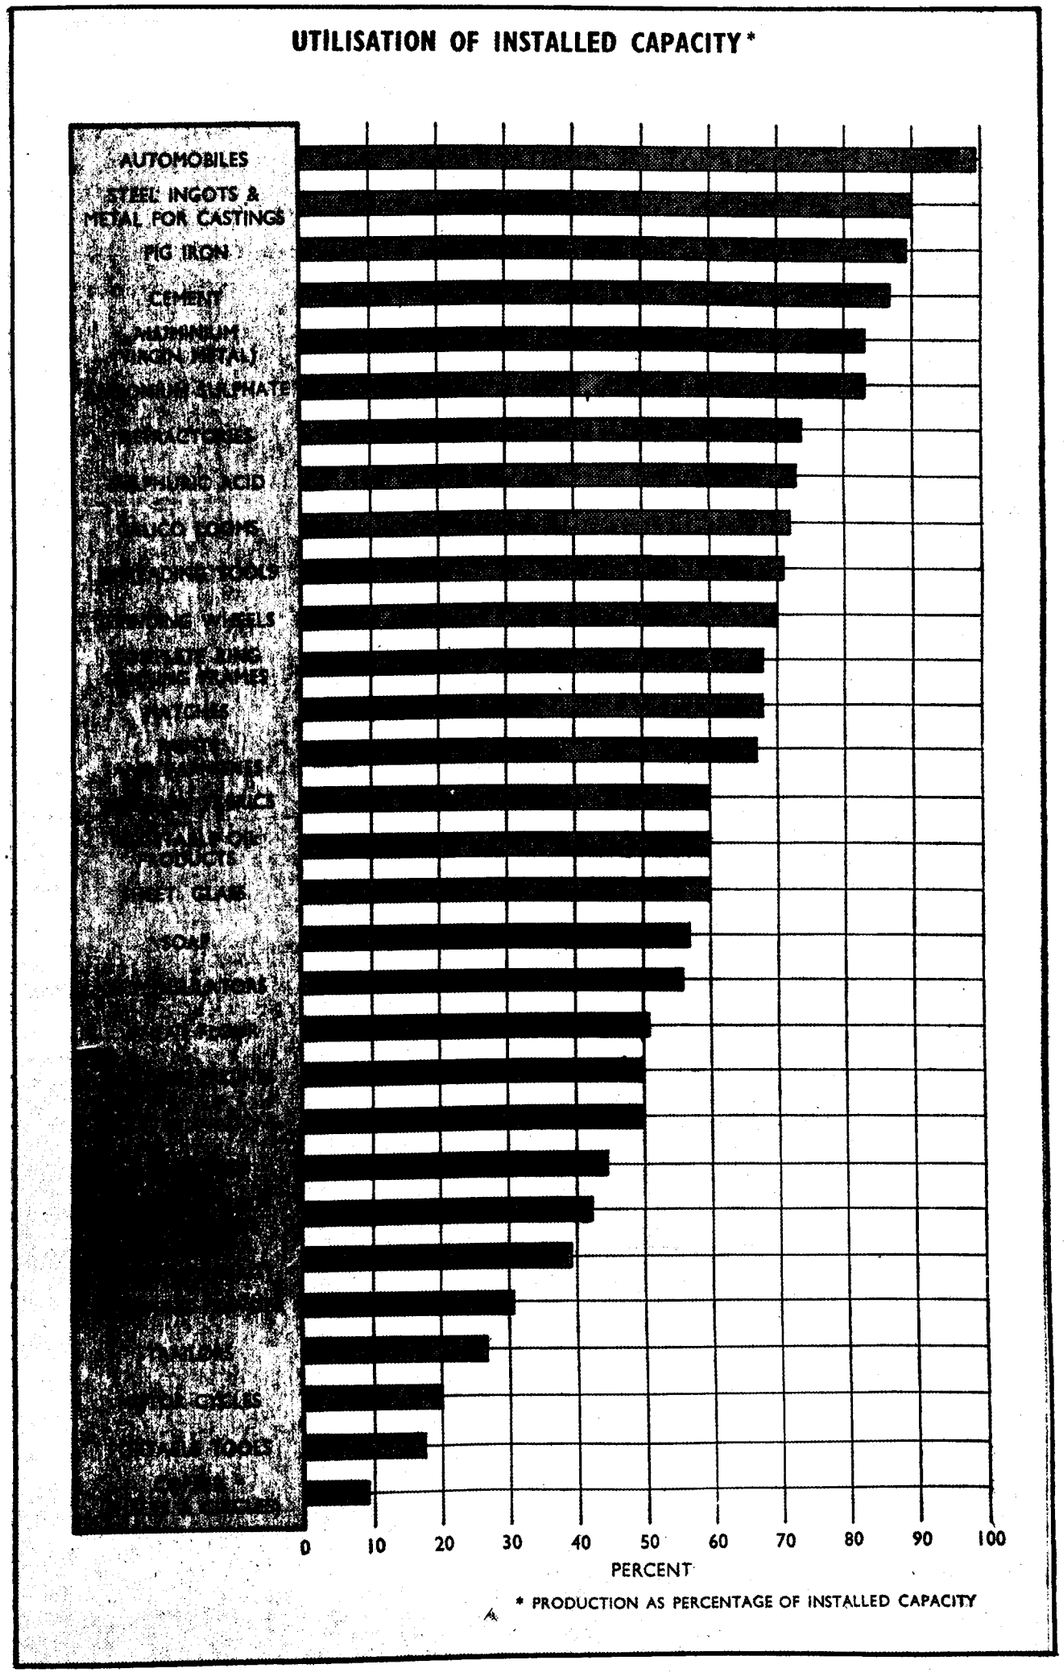
The growth of Indian agriculture in the 'fifties obviously would have been better if the targets laid down for various farm developmental activities under terms, the actual outlay on agriculture, community development, co-operation and major irrigation works at Rs. 487.3 crores fell short of the First Plan provision by as much as Rs. 180 crores. Similarly, under the Second Plan, about Rs. 950.3 crores could be actually spent, as against the planned outlay of Rs. 1,028 crores.

In physical terms, the achievements in regard to the various agricultural development programmes under the first two Plans were as follows:

TABLE AGR.-5

PROGRESS IN AGRICULTURAL PROGRAMMES: FIRST FIVE-YEAR PLAN

Programme	Target	Estimated Achievement
Major and Medium Irrigation (Gross) (Million hectares)	3.4	1.3
Minor Irrigation (Gross) (Million hectares)	4.5	3.8
Land Reclamation (Million hectares)	1.5(a)	1.1
Consumption of Nitrogenous Fertilizers (N) (Lakh tons)	1.2	1.05*
Consumption of Phosphatic Fertilizers (P2O5) (Lakh tons)	0.29	0.13*
Area under improved seeds (Million hectares)	N.S.	1.9+
Soil Conservation on Agricultural Lands (Million hectares)	N.S.	0.3



(a) Includes land reclamation by CTO, STO, and private parties with State help.
* Level reached in 1955-56.
\+ Provisional estimate of level reached in 1955-56.
N.S. Not specified in the Plan.

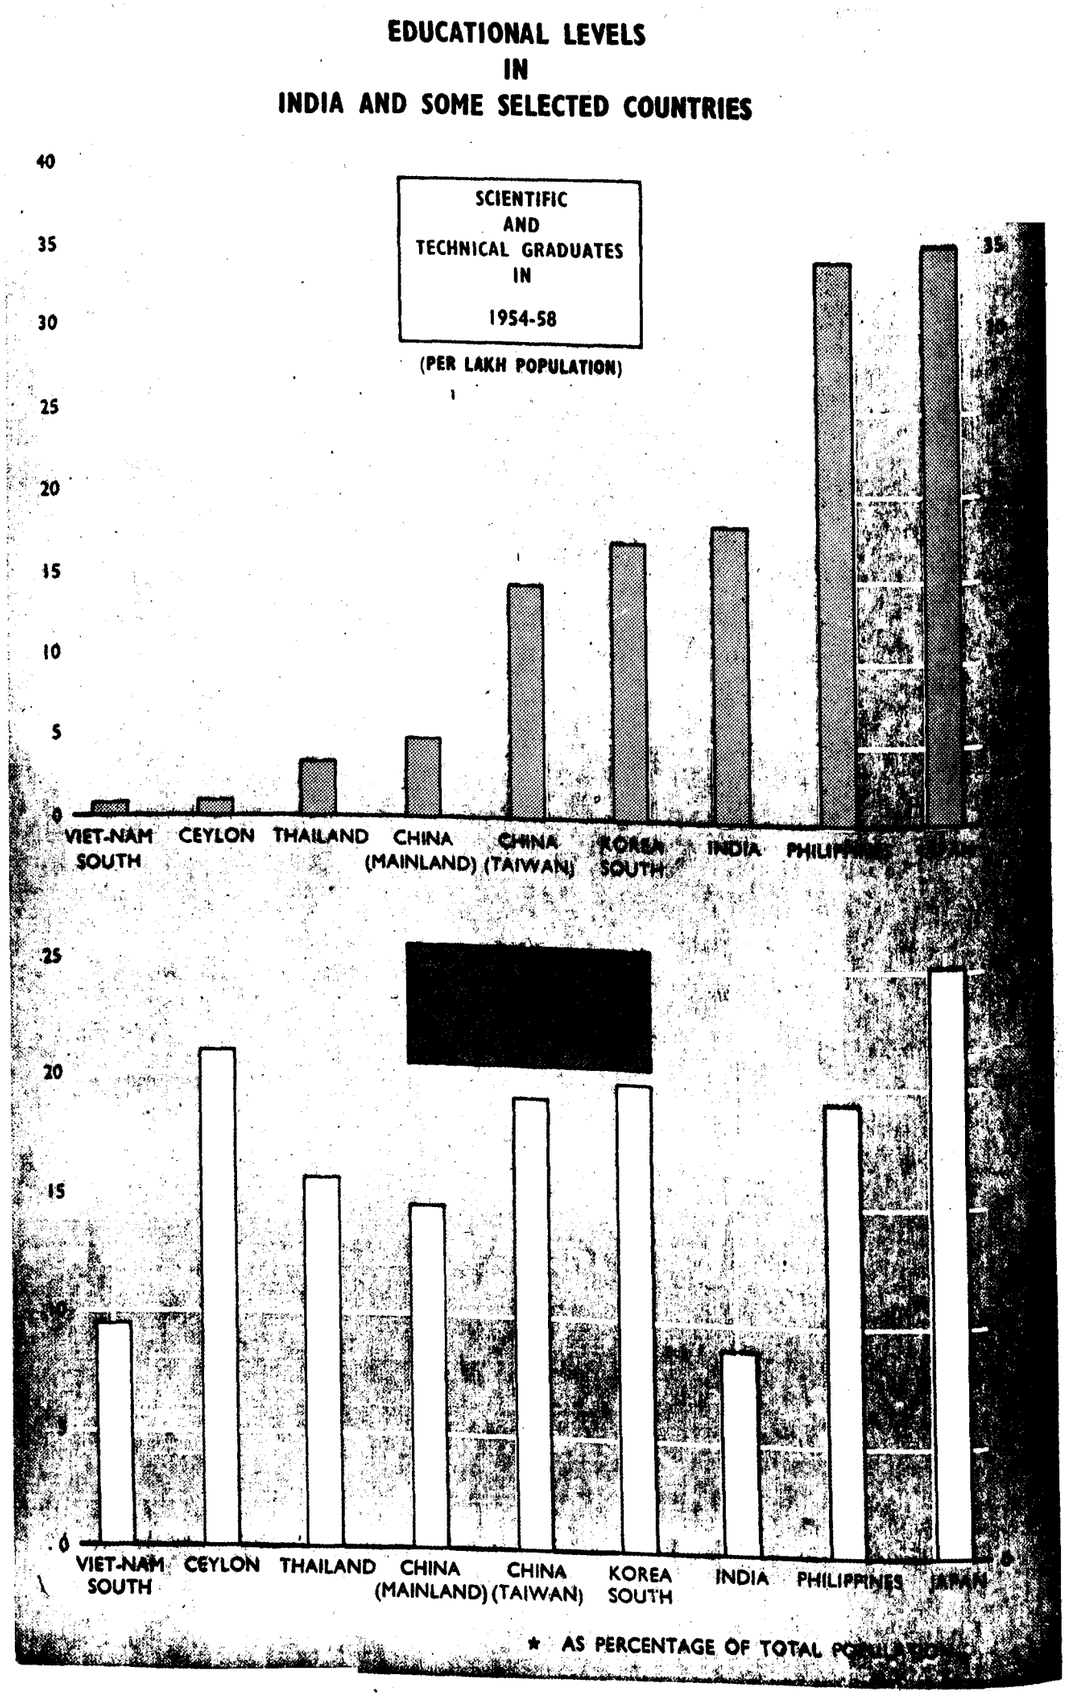


TABLE AGR.-6

PROGRESS IN AGRICULTURAL PROGRAMMES: SECOND FIVE-YEAR PLAN

Programme	Target	Estimated Achievement (P)
Major and Medium Irrigation (Gross) (Million hectares)	4.2(a)	2.8
Minor Irrigation (Gross) (Million hectares)	3.6	3.6
Land Reclamation (Million hectares)	0.6	0.5
Consumption of Nitrogenous Fertilizers (N) (Lakh tons)	5.0(a)	3.1*
Consumption of Phosphatic Fertilizers (P2O5) (Lakh tons)	1.5	0.7*
Urban Compost (Million tons)	3	3*
Seed Farms (Gross) (Numbers)	4328	4000
Area under Improved Seeds (Foodgrains) (Million hectares)	N.S.	22.3
Soil Conservation on Agricultural Lands (Million hectares)	0.8	1.1(b)

(P) Figures are provisional and subject to revision.
(a) Revised Target.
(b) Revised Estimate.
* Levels reached in 1960-61.

Under both the First and the Second Plans, there was, thus, left quite a good deal of leeway in respect of provision of irrigation facilities through major and medium works, as also in the field of application of chemical manures. Land reclamation work also d.d not proceed according to the chalked-out programme.

Development Under Third Plan

Against registering a fairly rapid progress in the 'fifties, agricultural output in the first year of the Third Plan, however, did not show any improvement. Production of wheat and jute, of course, revealed considerable advance, but it was all negatived by shortfalls elsewhere, the net result being that the index number of overall farm output remained unchanged at 139.9 (see Table Agr.-1).

This brake to agricultural growth may have been brought about by adverse weather conditions, but that cannot be held to be the sole factor responsible for it. The tempo of development also slackened appreciably, may be owing to a sense of complacency being induced by the slightly comfortable supply position that came to prevail in this year, particularly on the food front, or due to delays in gearing up the administrative machinery to the new tasks. Both the sense of complacency and the administrative delays, however, were unwarranetd in view of the fact that the Third Plan envisages an outlay of over Rs. 1,750 crores on agricultural development.

How the various agricultural development activities slowed down in 1961-62 should be apparent from the following facts:

(1) Supplies of nitrogenous fertilizers, both from indigenous sources and imports, amounted to nearly 2.9 lakh tons (N), as against the planned target (for this year) of 4 lakh tons and an estimated demand of 5.3 lakh tons. The five-year target is for stepping up consumption of nitrogenous fertilizers to 10 lakh tons.

(2) Urban compost output could be stepped up only marginally to 3.1 million tons, as against the five-year target of 5 million tons. Rural compost output, similarly, could be raised to only 76.7 million tons, as against the 1965-66 target of 150 million tons. Green manuring was extended to an additional area of about 1.13 million hectares, while the five-year target is its extension to an additional area of 11.75 million hectares.

(3) Minor irrigation facilities could be extended to only about 0.7 million hectares, as against the original 1965-66 target of their extension to 5.2 million hectares and the revised target of 7.8 million hectares.

(4) Area under improved seeds could be increased by only 6.1 million hectares, while the five-year target is to increase it by 37.6 million hectares.

(5) As against the original Third Plan target of covering 4.5 million hectares of agricultural land under soil conservation measures and the revised target of 6.7 million hectares, soil conservation programmes could be extended to only 0.4 million hectares.

(6) Dry farming techniques could be popularised on an area of only about one million hectares, as against the original 1965-66 target of 8.9 million hectares and the revised target of 13.4 million hectares.

(7) Land reclamation work too progressed at an equally slow pace. Only 0.3 million hectares of culturable wastes were reclaimed in 1961-62, as against the five-year target of 1.5 million hectares.

(8) Steel shortages must have continued to hamper the progress in respect of manufacture and supply of improved farm implements.

The first year of the Third Plan, however, witnessed a notable development in the launching of what is known as the Intensive Agricultural Development Programme, popularly styled as the Package Programme, on a fairly wide area. But the original schedule in this respect of extending this Programme to one selected district in each of the fifteen States in the Indian Union, could not be kept up. The Programme envisages provision to the agriculturists in these districts, chosen carefully on considerations of availability of irrigation or assured rainfall, enlightenment of the peasantry etc., (implying that they have the greatest increase potentialities in a short period) of all the aids to farm production (chemical fertilizers, pasticides, insecticides, improved seeds and implements etc.) in adequate quantities and at the appropriate time. Scientific demonstrations are to be staged compositely in these districts to educate the peasantry in modern techniques of production. Some of the districts where this Programme had been launched were, however, passing through teething troubles in 1961-62.

The tempo of agrarian development activity has been sought to be stepped up somewhat during the current year. The following targets were fixed in the annual Plan now being implemented:

(1) Consumption of nitrogenous fertilizers is envisaged to be stepped up to 4.75 lakh tons (N) and that of phosphatic fertilizers to 1.53 lakh tons.

(2) Output of urban compost is to be increased to 3.5 million tons and that of rural compost to 90.5 million tons. Green manuring is to be extended to a total cultivated area of 9.1 million hectares.

(3) Gross area under minor irrigation is envisaged to be extended by at least one million hectares and the potential created by the major and medium irrigation works is to be utilized to a greater extent.

(4) An additional 7.5 million hectares of area under foodgrains cultivation is proposed to be sown with improved seeds.

(5) Soil conservation measures are to be extended to at least another 0.5 million hectares and dry farming methods to at least an additional area of 1.75 million hectares.

(6) Attempts are to be made to reclaim nearly 0.28 million hectares of agricultural wastes and 125,000 hectares of saline and alkaline lands.

(7) The Package Programme is to be extended with a view not only to make up the leeway left during the first year of the Plan, but also to some other areas growing cotton and oilseeds. The teething troubles are to be overcome expeditiously.

This tempo of developmental activity was envisaged to raise the production, during the current year, of foodgrains to 87 million tons, of cotton to 57 lakh bales and of oilseeds to 83 lakh tons, from 79.8 million tons, 45 lakh bales and 73 lakh tons, respectively, in 1961-62. Jute (including mesta) and sugarcane output, however, were sought to be curtailed from 80 lakh bales and 97 lakh tons in 1961-62 to 70 lakh bales and 93 lakh tons.

How far all these targets would be fulfilled, it is anybody's guess. Indications upto September-end were not so heartening. Supply of nitrogenous fertilizers, for instance, at that time was feared to be deteriorating primarily because of expectations of lower imports at about 2.04 lakh tons as against the original

FACT has a host of products to offer

...in the service of agriculture

Factamfos (Ammonium Phosphate 16:20). Ammonium sulphate. Super phosphate and NPK fertiliser mixtures

...in the service of industry

Anhydrous ammonia, Sulphuric acid, Sulphur dioxide and Ammonium chloride

In 1960, the company completed the first stage of its expansion programme involving a capital outlay of Rs. 3 crores. And quickly, in its wake, followed the Rs. 2 crore-second stage which has, also, been completed—the highlight of which is the installation of a 'Texaco' oil gasification plant using naphtha as feedstock. Now, the much more ambitious third stage involving an outlay of around Rs. 11 crores is on!

Note: Variations in coverage and refinements in methods of estimating the area and production of crops during the last decade have introduced an element of non-comparability.

1. Production of Rice is in terms of cleaned rice.
2. Production of Sugarcane is in terms of cane and not gur.
3. Production of Groundnuts is in terms of nuts in shell.
4. Production of Cotton is in terms of lint cotton and in thousand bales of 177.8 kgs. each.
5. Production of Jute and Mesta is in terms of dry fibre and in thousand bales of 181.4 kgs. each.
6. Figures of Tea and Rubber relates to calendar year.
7. Production of Coconuts is in million nuts.

In this age of all powerful machinery and of mass production, lovers of beauty and art still yearn for hand-made individual creative crafts in which design is the first and primary concern.

Realising the needs of changing times and of the modern man, the All India Handicrafts Board opened four Regional Design Centres at Delhi, Bangalore, Calcutta and Bombay. Articles produced at these Centres keep to the spirit and beauty of the traditional designs, which are less elaborate but more simple, less expensive but more useful. Research is made here in new directions for the improved methods of treating materials and in new processes. These Centres, not only help the manufacturers in the marketing of modern designs but also assist the craftsman to understand the needs and tastes of the modern public and yet remain true to his tradition.

Thus, a happy beginning has been made and in the near future when more and more trained craft designers become available, the country can look forward to an era of greatness in our crafts which will reveal to the world the glory that was, *and is*, India.

The world over people of taste prefe

INDIAN COFFEE

for its distinctive aroma

From the world's finest Coffee Plantations in India, where ideal conditions for growing superior Coffee exist, INDIAN COFFEE goes to cheer up millions of Coffee lovers in France, Italy or Germany, in U. K., U. S. A., or U. S. S. R. — in fact all over the world!

The expansion of Indian Coffee industry has been rapid in the last decade as can be seen from these figures:-

PRODUCTION HAS NEARLY TREBLED in the last eight years, from 23,943 tonnes in 1952-'53 to 67,925 tonnes in 1960-'61. The target of production by the end of the Third Five-Year Plan is 80,000 tonnes

CONSUMPTION IN INDIA HAS INCREASED from 26,000 tonnes in 1955-'56 to over 35,523 tonnes in 1960-'61.

EXPORT HAS GONE UP FIFTEEN TIMES since 1952: from only 2,200 tonnes in 1951-'52 to 32,271 tonnes in 1960-'61.

SYMBOLS OF PROGRESS

COOLING TOWERS AT SABARMATI

Fourteen of these Hyperbolic Natural Draught Cooling Towers, which serve the Ahmedabad Electricity Company's power station, have been constructed to-date at Sabarmati since 1934. Some 40 towers have so far been constructed in India by the pioneers of this facility in Asia:

Progress takes different shapes at different times. These shapes keep on constantly changing in the minds of planners who design and build the symbols by which progress can be perceived.

For nearly fifty years, engineers at Gammon India Limited have actively engaged themselves in building large numbers of these symbols—bridges, harbour works, aircraft hangars, industrial cooling towers, water storage tanks, factory sites, materials storage facilities etc. —which serve as massive milestones in concrete along India's road to progress, contributing in a large measure to the country's industrial advance and economic well-being.

estimate of 3.26 lakh tons. With the proclamation of emergency, the tempo of activity can be expected to have risen and more indigenous supplies of chemical fertilizers may now be forthcoming than estimated earlier.

Although delayed rains in vast tracts of the country in July last and the havoc played subsequently by floods in not a few States can be construed to have marred to some extent the outlook of Kharif crops—and these crops may not have been upto the original expectations—the increased efforts being made under the emergency in regard to the rabi crops should help in the near-acheivement of the targets in a number of cases. Some shortfalls, however, cannot be ruled out.

Although, the agricultural development activity is, thus, picking up, the progress that would have been registered during the first two years of the current Plan will only be modest compared to the ambitious (from the point of view of implementation)—but somewhat rather low from the point of view of requirements —targets fixed in the Third Plan document and subsequently revised upwards by 50 per cent in the case of soil conservation, dry farming and minor irrigation programmes.

Agricultural Development in China

HAVING TRACED briefly the growth in Indian agriculture since 1950-51, it should not be out of place to devote some space for an assessment of the development of China's agrarian economy under Mao's regime, if for no other reason than for the fact that agricultural developments in India and China—the two dominant countries of Asia by virtue of their population and area—are being watched with great interest by all the newly independent nations of the Asian and African continents with a view to looking for guidelines for the development of their own agrarian economies. The agricultural growth in India and China is being attempted through two opposite modes — in India through democratic means, the State assisting the peasantry in diverse ways but not usurping from it the title to land, and in China through the Communist ways of regimentation and collectivisation which aim at State ownership of all the means of production—agricultural as well as industrial.

In 1959 China sprang a big surprise on the world by claiming that her agricultural output in 1958 had staged a "Great Leap Forward". It was claimed that production of foodgrains had gone up to 375 million metric tons and of cotton to 3.35 million metric tons, from 185 million metric tons and 1.64 million metric tons, respectively, in 1957. Output of soyabeans it was stated, had increased in the course of one year by 24 per cent, of hemp by 8 per cent and of cured tobacco by as much as 115 per cent. These fantastic figures were subsequently scaled down drastically and the 1958 output of various farm products was put at: foodstuffs 250 million metric tons, cotton 2.1 million metric tons, soyabeans 10.5 million metric tons, groundnuts 2.8 million metric tons, cottonseeds 4.2 million metric tons, tobacco 0.38 million metric tons, and tea 0.14 million metric tons, compared to 185 million metric tons, 1.64 million metric tons, 10.25 million metric tons, 2.57 million metric tons, 32.8 million metric tons, 0.39 million metric tons and 0.11 million metric tons, respectively, in 1957.

Even these severely downgraded estimates of China's agricultural production in 1958 were received by the discerning observers with no small suspicion. Later events have made them more suspect.

For over two years now alarming reports have been emanating from Hong Kong—the Free World's window on Mainland China—of the travails that the Chinese masses have been going through because of food shortages. They provide an indication of how the Chinese farm output figures had been inflated. According to the data made available by the ECAFE Secretariat, (see Table Agr.-9), China's rice output in 1959-60 fell short of the 1958-59 production by 8 million metric tons. But wheat output showed an increase of 2.34 million metric tons. The net shortfall in the production of these two staple foods in 1959-60, thus, amounted to only 5.66 million metric tons compared to the 1958-59 year, claimed to be of bumper crop. Exports of rice in 1959 were approximately of the same order as in 1958, but the food supply position deteriorated to such an extent that despite an increase in rice output in 1960-61 by no less than 5 million metric tons (wheat output figures are not available), China had not only to cut down her rice exports but also take resort to imports of wheat and barley from abroad, mainly from Australia and Canada, to the tune of nearly 5 million tons. There might have been experienced some shortfalls in 1959-60 and 1960-61 in the output of other foodgrains, but all this is, indeed, hard to reconcile with the widespread hunger that is stated to have prevailed in China in 1961.

No detailed data have been published by China of her agricultural production after 1959-60. But enough reliable information, inevitably of a circumstantial nature, is available which shows that China today, owing to decline in her food production, has become a net importer of foodgrains, from a net exporter, in the course of two years. Chinese rice exports to destinations other than the Soviet Union are reported to have gone down from one million metric tons in 1959 to as low as 0.35 million metric tons in 1961-62. Her these exports to

TABLE AGR.-9

the USSR too have progressively declined. Against this, her food imports amounted to nearly 5 million metric tons in 1961. During the current year, China had signed upto September-end contracts for the import of foodgrains from abroad to the tune of 3.1 million metric tons. In the last weeks, two more contracts are reported to have been signed with Australia and Canada for total wheat imports of 8.27 million metric tons.

A major portion of the rice exports made by China today, apparently, is being effected for considerations other than economic. There is politics in China's continuing exports of her rice, though on a limited scale. This can deceive no one except only the gullible. A clear evidence of this fact was available in October last when just on the eve of Prime Minister Nehru's visit to Colombo, China entered into a trade agreement with Ceylon, involving exchange of 33,000 tons of Ceylonese rubber for 2,00,000 tons of Chinese rice.

Compared to India, it is claimed by the Chinese that their programmes of agricultural regeneration are far more effective. But is it so? Except for one fact that there is regimentation in China and the Government there can compel the people to do whatever job it wants them to perform, while in the democratic set-up in India the element of compulsion is conspicuous by its absence, the various methods adopted to improve agriculture in the two countries are more or less the same—abolition of landlordism (by its substitution by State ownership in China and peasant proprietorship in India), extension of irrigation facilities, increased application of modern scientific knowledge and technology, etc.

The table in the next column sets out the rate of growth in various agricultural commodities produced in India and China, on the basis of the figures supplied by the ECAFE Secretariat, during the late 'fifties. Average output has been taken for the three years—1957-58, 1958-59 and 1959-60. Incidentally, these years contained in the case of China two more or less normal years for agricultural production and the third one of exceptionally good harvest, while in the case of India only one of these years was of slightly above normal weather conditions and the other two of below normal circumstances. The growth has also been calculated for 1960-61 in the case of the four commodities whose production figures are available from China and for 1960-61 and 1961-62 in the case of the various farm products in India.

The table reveals that the growth in the average output of the commodities listed here in the three-year period 1957-58 to 1959-60, over the average production in the four-year period 1948-49 to 1952-53, was slower all along the line in India. But as explained above, these three years were of comparatively far less favourable weather conditions for farming in this country than in China.

The 1960-61 and 1961-62 growths in India should provide a better index of the development of Indian agriculture, for both these years were comparatively normal years. The 1960-61 and 1961-62 rice crops in India were higher than the average output from 1948-49 to 1952-53, by over 53 per cent. The increase in rice output in China has been of the order of 46 per cent. The percentage increase in wheat and groundnuts production has also been higher in India than in China.

Production of other commodities in India, has, however, progressed at a slower pace. But one important factor that should not be lost sight of, particularly in regard to tobacco and tea, is that their cultivation here market. Further, some allowance has to be made for the exaggeration injected by the Chinese authorities into their farm output figures. Her food production today is claimed by China to be slightly over 185 million metric tons, but critics of China's economy place it no more than 150 million tons (or about 105 million tons if cleaned rice is taken into account in place of paddy and potato production is excluded as in Indian Food Statistics). In cotton production, India, indeed, has lagged behind.

A very pertinent point that needs to be taken note of in this comparison, however, is that Indian agriculture today—after heavy investments having been effected into it during the 'fifties—has developed a certain amount of dynamism, notwithstanding the pause in its growth in 1961-62. The Chinese agriculture, on the other hand, has suffered successive setbacks since 1958-59, which

have resulted in its virtual stagnation. How far the slight improvement in China's agrarian economy during the current year can be sustained in the near future, in view of the famished state of health of her peasantry, is anybody's guess. In India, some spectacular results can be anticipated to follow from the increase in the tempo of developmental activity in the remaining three years of the current Plan.

The decline, or stagnation, in China's agricultural output since 1958-59 is said to have been brought about by natural calamities. But the real reasons for this apparently are to be found somewhere else—in the regimentation and coercion resorted to to form communes and extension of irrigation in a haphazard manner resulting in alkalisation of large tracts of cultivable land. The smoke-screen of widespread droughts, floods and storms in three years in succession—something unheard of in the agrarian history of any country — has most probably been contrived (or at least the effect of these natural calamities has been grossly exaggerated) to camouflage the failure of the agricultural policies pursued by the Communist regime and to divert the attention of the Chinese peasantry, as also of the outside world, from the real causes of the stalemate.

That this is just not a mere conjecture should be evident from some oblique references made by the Chinese authorities themselves to the fact that their agrarian policies have not been an unqualified success. Nearly two years ago, the communique issued at the end of the 9th plenary session of the Eighth Central Committee of the Chinese Communist Party, while calling for increased efforts to raise farm output, stated: "In view of the serious natural calamities that affected agricultural production for two successive years, the whole nation in 1961 must concentrate on strengthening the agricultural front, must carry out the policy of taking agriculture as the foundation of the national economy and of developing agriculture and grains production in a big way. The whole Party and the whole people must step up support for agriculture by all sectors and occupations and must exert the utmost effort to win a better harvest in agricultural production."

Following this declaration, millions of people from all walks of life were sent to the countryside to help raise farm output. Industry too was geared to this end. But the results are well-known—hunger did not stop. Why? Agricultural output failed to look up by any substantial degree.

Some of the steps taken in the last two years by the Peking regime to reorganise agriculture are all pointers to the fact that the Commune system and the wholesale application of some experiments which had proved successful in particular areas under particular weather conditions are not now trusted by the authorities as sufficient for delivering of goods. The number of Commnues decreased to 24,000 in 1959 and is reported to have gone down further since then. There have also been effected relaxations in the rigid Commune regulations. The members of the Communes have been given marginal lands to give them incentive to raise subsidiary foodstuffs by following sideline occupations like poultry farming, vegetable growing and pig rearing —revival of the "free market" economy, though on a limited scale? Greater flexibility has also been imparted to the production programmes. Regional advisory centres have been set up for drawing up production plans taking into consideration the local conditions. The production squads (groups of about 10 workers) have been given successively more powers to make their own decisions on the sowing of crops, rather than to follow the directions from the Commune headquarters or from the brigades, as was the case previously. The Central control in all these matters has been relaxed to a very large degree.

The 10-point programme of economic development during the current year, enunciated by Mr. Chou En-lai, the Chinese Premier, recently, is a clear enough manifestation of the fact that despite some improvement recorded in Chinese agriculture this year, all is not yet well with it. One of the primary objectives of this programme is to step up farm output. With this end in view the supply of various pre-requisites to agricultural production are sought to be augmented by placing greater stress on the manufacture of farm machinery and chemical fertilizers. Irrigation facilities are also being extended. But with all this, can the Chinese farm output be stepped up expeditiously without some major shifts in policy to induce the peasantry, in its present famished state of health, to put in its best? Very doubtful! The experience of the Soviet Union in the past few years is an unmistakable pointer in this respect. In spite of successive increases having been effected, since 1953, in the prices of compulsory quota deliveries of all the agriculture commodities produced on the collective and co-operative farms, reduction (or even abolition in some cases) of such deliveries and the massive investment being made in the agrarian economy, Mr. N. S. Khrushchev, the Soviet Union Premier, still continues to complain of a lack of upsurge in Russian agriculture. The Chinese experience can be no better.

India's Agricultural Growth Impressive, But Not Enough

THE FOREGOING analysis of agricultural growth in India and China during the 'fifties suggests that India has in no way fared badly in boosting her overall farm output in comparison with China. In certain respects, development of Indian agriculture, in fact, has been faster than that of the Chinese. But it does not imply that our agrarian economy is in that sound state of health in which we would like it to be seen. Although the inflationary tendencies witnessed in the prices of our various farm products in the late 'fifties have been contained successfully in the last two years, any slackening of efforts on the agricultural front can lead to their re-emergence, with disastrous consequences on our defence build-up against the unscrupulous Peking regime.

Indian agriculture even today continues to suffer from various weaknesses, the most important of them being its vulnerability to weather conditions and the pitifully low yields per unit-area. Although some improvement has been witnessed in regard to the latter during the 'fifties, as is evident from Table Agr.-11, yields of various agricultural crops per hectare in this country compare very unfavourably with those in the advanced countries of the world (see Table Agr.-12). Productivity in Indian agriculture in general has progressed at none-too-flattering a rate; only half of the additional production secured in the past decade is stated to have accrued from increase in productivity, the other half having resulted from increase in area under cultivation.

Moreover, growth in productivity has been very lopsided as beween different crops (see Table Agr.-13). Among cereals and pulses, productivity of rice and wheat has shown a relatively higher upward trend than that of coarse grains. Increase in productivity in the case of pulses generally has been only meagre. In most cases it has even deteriorated; the productivity index for "other pulses" has remained invariably below the

base level. Similar has been the progress in respect of oilseeds. In this group, only productivity of castorseeds has shown some improvement. In regard to others, the progress has been very slow and uneven with the index generally remaining below the base level and fluctuating quite widely. (This phenomenon is perhaps explained by the fact that greater stress has been placed hitherto on boosting the output of staple food which has led to the growing of these crops — oilseeds and pulses—only on marginal lands.) Among fibres, productivity index for cotton has fluctuated very widely (presumably because of heavy dependence of this crop on weather conditions). Productivity in jute has increased only at a slow pace. In the miscellaneous group, productivity of sugarcane has shown some improvement, but that of tobacco has generally gone down.

This uneven progress in the productivity of different crops has led to quite a few unnecessary imbalances being developed in Indian agriculture. High prices of some crops in some years have resulted in diversion of area under cultivation to these from under the competing crops. Jute output, thus, got a big fillip in 1961-62; prices of raw jute in the previous year had ruled unreasonably high owing to failure of crop both in India and in Pakistan. But this increase in jute output was

a wild and woolly tale

It was the strangest crop that ever grew!
One which perplexed Herodotus the historian hundreds of years ago. It was the fine and unusual *wool*, as he called it, which certain wild trees in India bore instead of fruit!
We know that this miraculous wool—cotton to us—was later spun and woven into fine and delicate cloth. Cotton cloth whose beauty amazed succeeding ages of Roman and Arab tradesmen— and made Indian cotton fabrics the choicest of luxuries in every country they reached.

For over two thousand years, Indian cottons have been prized the world over. Today at Rohit, inherited skills combine with modern methods of manufacture—to make our cotton fabrics among the best in the world.

brought about to a great extent by diversion of land from under paddy cultivation. Sugarcane output in the past two or three years, similarly, has gone up at the expense of wheat. The net result of all this has been that not only the goal of achieving self-sufficiency in food has proved elusive, but supplies of agricultural raw materials to the industrial sector have also shown an erratic trend.

The increase in productivity as well as in the total physical output has also been uneven as between the different States of the Indian Union. Agricultural growth in Punjab, indeed, has been phenomenal (This State suffered heavily from Partition and lost a major portion of the canal irrigation area to Pakistan, thus becoming deficit in food production. But in the course of barely fifteen years, it has again emerged as a big food surplus producing State, besides as a material contributor to the output of various other important crops like gram and cotton). It has been fairly moderate in Andhra Pradesh, Madhya Pradesh, Madras and Mysore. But Assam, Orissa and West Bengal have registered only meagre progress, notwithstanding some increases in yields witnessed recently in the latter two.

Low productivity in India obviously can be attributed to a number of factors, the most important of them being (1) the general poverty and uneconomic holdings of the majority of peasantry, (2) lack of education, (3) inertia and fatalistic attitude of the farmers at the lower rung, etc. But not a small role is played in this matter by lack of adequate specialisation in our agriculture and it still not being treated, by and large, as an industry. The unit-area yields of various food crops in different States show wide disparities, but still they continue to be grown in almost all the States. Some specialisation has, indeed, been effected, over the ages, in respect of commercial crops. But here also there is some further scope for it, as is apparent from the wide disparities in sugarcane yields per acre between U.P. and Bihar, on the one hand, and Maharashtra and Gujarat, on the other. Farming is taken as an industry only by the educated middle class which has taken to it after the implementation of the land reforms or in the absence of other suitable avenues of employment open to it. The difference to farm yields that efficient management can make hardly needs any emphasis.

There are two other weak links in the agricultural development in India — (i) comparatively lower emphasis placed under the first two Plans on fostering the production of protective foods; and (ii) the drag that surplus cattle population exerts on farm output. An average Indian today consumes far less quantities of oils, vegetables, fruits, milk and milk products, meat, fish and eggs per day than he used to consume some two decades ago. This is an unmistakable proof of output of these protective foods not keeping pace with the staggering growth in population. An important point that needs to be taken note of in this connection is that livestock yields in this country in the last decade or so have gone up only marginally. The total milk production, for instance, is estimated to have gone up from 17 million tons in 1950-51 to about 22 million tons in 1960-61. But how much of this is due to increase in the number of milch cattle and how much owing to improvement in yield per head-cattle it is difficult to say. During the past couple of years the tempo of development activity in regard to protective foods has been stepped up. But to what extent it can succeed in the case of livestock output in the face of surplus cattle continuing to be a drag on, and in competition with the useful livestock for, the available feed is anybody's guess.

The Task Ahead

THE WEAKNESSES of Indian agriculture pointed out in the last article are mostly structural and will obviously require a long time to be remedied. But the unprovoked aggression committed on our soil by the unscrupulous Peking warlords has created a situation in which the strengthening of the agricultural base of our economy has assumed a heightened significance. The need to make the country self-sufficient in food and various agricultural raw materials required by our industries is all the more great today in the interest of saving every naya paisa in foreign exchange for strengthening the war effort. With the same end in view, exportable surpluses of agricultural commodities have to be increased to earn as much of the precious foreign exchange as possible. This implies that the Third Plan targets for various agricultural commodities must not only be achieved but even exceeded, by say about 10 per cent, particularly in the case of some commercial crops like cotton, oilseeds, coffee and rubber.

The magnitude of the task ahead has been increased by the negligible progress made in augmenting farm output during the first year of the Third Plan and the not-so-satisfactory (from the point of view of additional production) outlook for the current year's harvest. This should be evident from the following table:

TABLE AGR.-14.

TARGETS FIXED FOR VARIOUS AGRICULTURAL PRODUCTS IN THE THIRD PLAN AND ACHIEVMENTS IN THE FIRST TWO YEARS

Commodity/Unit	Estimated Production in 1965-66	Production in 1961-62	The Gap between Target and Achievement	Anticipated production in 1962-63
Foodgrains (million tons)	100.0**	78.6**	—21.4	84.0
Oilseeds (million tons)	9.8	6.8	—3.0	..
Sugarcane (gur) (mil. tons)	10.0	9.7	—0.3	9.2
Cotton (million bales)	7.0	4.5	—2.5	5.7
Jute (million bales)	6.2*	6.3	+0.1	5.5
Coconut (million nuts)	5,275	..	..	..
Arecanut (thousand tons)	100	..	..	..
Cashewnut (thousand tons)	150	..	..	..
Pepper (thousand tons)	27	27.9	+0.9	..
Cardamom (thousand tons)	2.62	..	..	..
Lac (thousand tons)	62	..	..	..
Tobacco (thousand tons)	325	339	+14.0	..
Tea (million lbs.)	900	779	—121.0	..
Coffee (thousand tons)	80	49	—31.0	..
Rubber (thousand tons)	45	..	..	..

* Excludes mesta which may provide an additional 1.3 million bales in the Third Plan.

** It is estimated that the production of rice in 1965-66 may be about 45 million tons, of wheat about 15 million tons, of other cereals about 23 million tons and of pulses about 17 million tons.

** Production of rice in 1961-62 is placed at 33.6 million tons, of wheat 11.6 million tons, of other cereals at 21.9 million tons and of pulses at 11.5 million tons.

If the Third Plan agricultural targets are to be merely fulfilled, the rate of growth in our agrarian economy has to be stepped up in the remaining three years of this Plan to not less than 8 per cent (linear). And that too by effecting some saving in the outlay on agriculture and the related rural uplift activities such as community development, co-operation and establishment of Panchayats, so as to make available funds for increasing the strength of our armed forces. The maximum achievement so far (between two normal years of production) has been not more than six to seven per cent. But a higher rate of growth is not something impossible to attain if the experience of some foreign countries, particularly Yugoslavia, and of one or two Indian States themselves, e.g. Punjab, is any guide. If we fail to achieve this high rate of production in our agrarian economy even in a national emergency, there should, indeed, be something grievously wrong with our developmental efforts.

The current emergency obviously calls for concerted moves by the State Governments, the primary administrative agencies connected with agricultural development in this country, on short and medium-term development activities. Some slowing down of the long-range and diffused development programmes such as spread of farm education, community development, ushering in of Panchayati Raj and even a few fundamental research projects (excluding, of course, the plans to evolve improved strains of seeds) may have to be reconciled with. A saving of approximately Rs. 50 crores over the three-year period to 1965-66 can conveniently be effected this way for augmenting the rupee resources for meeting the growing demands of the Defence Ministry, without in any way impairing the immediate and near-term agricultural development effort. Community development programme is envisaged to be extended to the entire rural population by 1963. Instead of going whole hog with it, it should be only prudent to attempt during the next one or two years a consolidation of the work done in this field.

Agricultural development in the short-term can only be stepped up by such methods as extension of multiple cropping in areas which get assured rainfull every year, fuller utilization of the irrigation potential created already (or to be created in the next two years) by the construction of major projects, accelerating the implementation of the minor irrigation, soil conservation and dry farming programmes, and increased use of fertilizers (both organic and inorganic), improved seeds, farm implements and pesticidse, insecticides, etc. Along with all this, efforts have to be concentrated in selected areas which have a good potential for yielding more quickly than wasting them in diffused attempts over the entire countryside.

The Union Ministry of Food and Agriculture is understood to have drawn up an emergency plan for agricultural development more or less along these lines. Implementation of the minor irrigation, soil conservation and dry farming programmes, for instance, is envisaged to be speeded up not only with a view to achieve the Third Plan targets, but even for going upto 50 per cent above them. In respect of supply of improved seeds, the programme is to consolidate the work being done on the nearly 4,000 seed forms already in existence, besides expediting the setting up new farms envisaged under the Third Plan. A Central Seeds Organisation is to be established to undertake the distribution and multiplication of improved seeds. Larger supplies of hybrid maize and jowar seeds, are envisaged to be made available with the passage of time.

Nitrogenous fertilizers supplies next year are proposed to be stepped up to 5 lakh tons (half of these will have to be imported). The Package Programme, which today covers nineteen wheat and rice producing districts, is to be extended to some selected areas growing

cotton and oilseeds as well. The reliance placed on this Programme obviously is not misplaced; the yields in some of the districts covered by it for nearly two years now have registered quite an encouraging uptrend—15 to 20 per cent. Further progress necessarily has to be slow, but expectations of 40 per cent increase in unit-area yields in these areas are not beyond fulfilment. If this Programme is implemented according to the plans—and there is no reason why it should not be done after the appointment of a Senior Joint Secretary of the Union Ministry of Agriculture as Commissioner for this Programme—on all the cultivated area in the selected districts, that should materially help in the realisation of the goals set for rice, wheat, oilseeds and cotton production. The directive issued by the Central Government to the rice-producing States to concentrate efforts, by way of provision of the modern prerequisites to farming, to the extent possible, and arranging large-scale demonstrations, in some fifty districts, besides those covered by the Package Programme, is also a step in the right direction. Rice is the Achilles' tendon of our food economy and sparing of any efforts to boost its output means added strains on our foreign exchange resources so directly needed for the more pressing puposes.

If the short-term plans of agricultural development are not to be thwarted, the Government will have to exert extraordinarily in three crucial fields. The first of these obviously is the augmenting of chemical fertilizers supplies and spreading their use to the maximum extent possible. Despite the assurances held out by the Union Minister for Steel and Heavy Industries, Mr. C. Subramaniam, to the effect that indigenous output of nitrogenous fertilizers would be stepped up to 800,000 tons by 1965-66, misgivings continue to be entertained in this respect in not a few quarters. The Fertilizer Association of India has estimated that, owing to the delays that have already occurred in the execution of various fertilizer projects, domestic production of various nitrogenous fertilizers in 1965-66 may not exceed 5.5 lakh tons. The Planning Commission, some time ago, had expected that it would rise to around 6.5 lakh tons. No doubt, the tempo of activity in this regard has been stepped up during the emergency, how far commissioning of fertilizer plants for the production of some strategic materials required by the Defence Ministry will affect manufacture of fertilizers it is difficult to say.

To spread the use of inorganic manures in the States like Assam, West Bengal and Orissa where their application has progressed in the past at none-too-encouraging a rate, the State Governments concerned may think in terms of providing some subsidy to bring their prices within reach of the economically weak peasantry there. Consumption of fertilizers, of course, has gone up fairly well in Madras, Andhra Pradesh, Mysore, Maharashtra, Gujarat and Punjab, the first two being in the lead. In U.P. and Bihar too agriculturists are now said to be making increasingly greater use of them.

The second field in which increased efforts have to be put in is irrigation. Even today the potential created by the major and medium irrigation works is not being fully utilized; nearly 3 million acres potential created is stated to be still going waste. Partly it is due to the fact that the channels to carry water to the fields are not there and partly owing to the water rates being high. Here also some concessions might be offered to the agriculturists in the interest of better utilization of the irrigation facilites provided by the major and medium works. Minor irrigation suffers from another defect—these works after being completed are not properly maintained and looked after, with the result that the irrigation potential created with their aid suffers decline with the passage of time. Panchayats and voluntary agencies like the Bharat Sevak Samaj can perform a useful role in this respect. Maintenance of minor irrigation works, in fact, needs to be made a specific responsibility of Panchayats.

The third crucial field on which increased attention requires to be bestowed is the reduction of loss to crops by pests and insects. The damage done to agricultural commodities both at the growing stage and at the time of storage is immeasurably higher in India than in the advanced countries. While the State can help in mitigating these losses by increasing the supplies of pesticides, insecticides, herbicides, etc., the voluntary agencies can assist in rodent control. Damage to farm products by faulty storage can be reduced by provision of improved warehousing facilities. Construction of both the Central and State warehouses of modern design apparently needs to be accelerated.

Some of the inadvertent imbalances brought about in our agriculture in the recent past should be attempted to be rectified by the extension of the principle of price supports to all the major agricultural commodities. Support prices for the five most important farm products in this country — rice, wheat, jute, cotton and sugarcane—have already been fixed. But, by a process of trial and error, a reasonable relationship between them has yet to be brought about. This should be attempted in the coming years in the interest of fostering the growth of our agriculture in a balanced manner. Extension of the price supports principle to some other major crops like barley, jowar, gram and some important oilseeds, would help in insulating the agricultural economy from undue political pressures. If support prices are fixed only in the case of a couple of farm products, the pressures invariably would be for increases in these prices or for maintaining them, and at no time for lowering them. If the prices of the competing

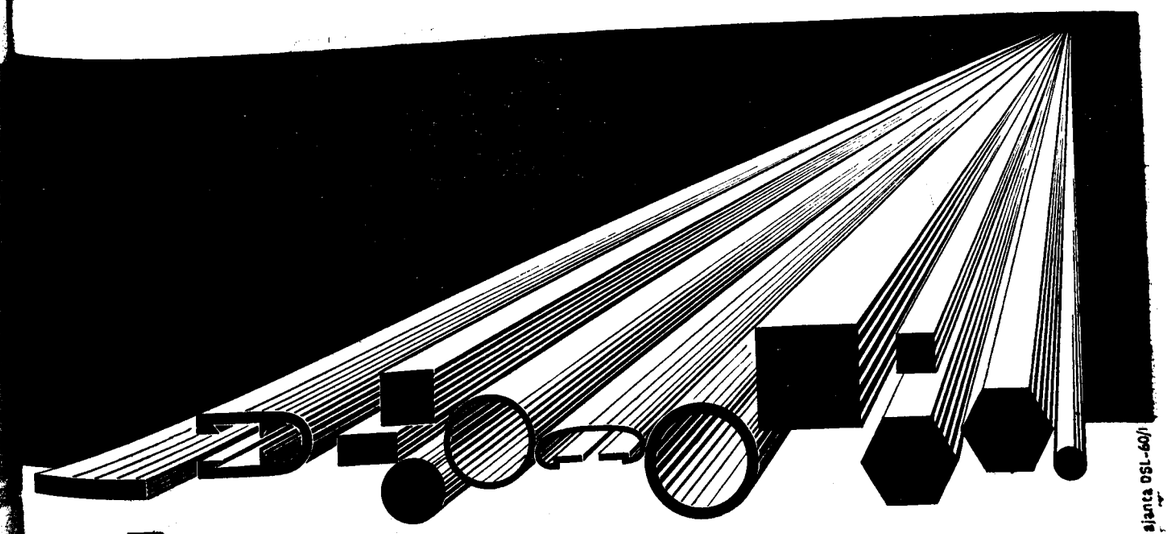
FERTILIZER CORPORATION OF INDIA

PLAYS AN IMPORTANT ROLE IN INDIA'S EXPANDING ECONOMY

The Corporation is the nation's biggest producer of chemical fertilizers.

The constituent units of the Corporation at present are the two operating factories at Sindri (Bihar) and Nangal (Punjab) and three new projects under implementation, namely, Trombay in Maharashtra, Namrup in Assam and Gorakhpur in Uttar Pradesh. The Government of India has entrusted another project to the Corpn. for location in Madhya Pradesh.

Chemical fetilizers are one of the best and quickest means of increasing agricultural production. In the forefront of indigenous production of chemical fertilizers, the Corporation serves agriculture and helps farmers to grow more food and cash crops.



CHEMICAL FERTILIZERS ARE THE FARMER'S BEST INVESTMENT.

crops are also supported at reasonable levels, adjustments can easily be made even downwards.

Fixing of support prices for various farm products, however, will not make much difference to our agricultural output, if effective measures are not taken to enforce them. A suitable machinery, thus, requires to be set up for this purpose at an early date. Besides, the use of this lever has to be made more purposive than hitherto. Support prices should be fixed quite in advance of the sowing seasons so that the farmers may be in a position to decide in time whether they should go in for the production of one crop or another.

Farm output in the short-term can also be substantially stepped up if the agricultural wastes requiring only moderate expenditure for reclamation are harnessed to production. A survey has already been undertaken in this regard in various States. It is only now a question of doing the job in the right earnest. The establishment of the Agricultural Refinance Corporation should come in handy for this purpose. Setting up of some more State farms on the pattern of the Suratgarh and Jetsar farms can also help materially, though not in the immediate future, in a few years.

Long-range problems of our agriculture, however, can only be solved by making relentless efforts for reclamation of all the cultivable wastes, extension of irrigation facilities to the extent possible, progressively increasing the application of modern scientific knowledge and technology, changing the mental outlook of our peasantry through spread of literacy, and making their economic position better. The last goal can be achieved only by siphoning off the surplus labour force from the countryside, through concerted efforts at industrialisation. A useful role can, of course, also be played in this regard by introduction of crop insurance. That will help in overcoming the resistance that farmers still offer in many areas to use of chemical fertilizers. Crop insurance, per force, has to be made compulsory for all the farm lands in an area where it is introduced. The hazards which Indian agriculture faces are far too many and unless crop insurance is made compulsory, the cost of its introduction on any large-scale will obviously be beyond our present resources.

The imbalance in our diet can be removed only slowly and through stepping up the output of protective foods appreciably. Vegetable growing has been practised so far primarily with an eye on the city markets. The rural population needs to be made more conscious of the utility of vegetables. Fruit production, indeed, has got some fillip after the implementation of the land reforms; fruit orchards being exempt from land ceilings, quite a good deal of the land surplus with the erstwhile landlords has been diverted to setting up of orchards. Fruit growing is also being encouraged in many a hill area. But a good deal yet remains to be done in this regard.

Milk supplies can only be increased by raising livestock yields through improving the quality of our milch cattle. But the biggest hurdle in the way is the disproportionately large population of cattle we have. Religious sentiments of the majority of Indians do not allow the slaughter of even the useless and unnecessary cattle, especially cows. Their number can only be decreased and that too gradually, by such measures as compulsory confinement of studs kept for natural service, mandatory castration of young ones not required for breeding and sterilisation of surplus cows and heifers. To step up eggs, meat and fish supplies, the energetic efforts that have come to be made in the recent past need to be continued and even redoubled.

All the long-term plans for the development of our agriculture have to be continued, although there might be slowing down during the current emergency of some not-very-emergent programmes, requiring heavy investment.

Industry

Iron and Steel

IF industrial expansion during our Second Five-Year Plan was considered to be satisfactory, it did not take long to realise under the pressure of the Chinese invasion that not much had been achieved yet. It is a sad realisation that the country still has to go a long way to build an industrial structure which is necessary today for any self-respecting country to safeguard its security and territorial integrity. It is true that indusrial production has been moving at a pace which was something like 7 to 8 per cent every year. But if the Indian economy is to be prepared for shocks like the one we experienced late in October last, we definitely have to alter the pace of industrial expansion. It appears that nothing less than between 12 and 15 per cent increase in industrial production every year should be considered satisfactory.

The Third Five-Year Plan envisaged a rise of 70 per cent in the Index of Industrial Production with base 1951=100 during the five years. The performance of the organised sector of industry during the two years of the Plan indicates, as stated above, a rise of 8 per cent per annum on the average, showing that only 16 per cent out of a total of 70 per cent has been achieved so far. It also means that during the remaining three years of the Plan the stipulated target can be attained only if the rate of rise is stepped up to 18 per cent per annum. It may look a herculean task to raise the tempo of production from 8 per cent to 18 per cent per annum. Here it may be stressed that there is an element of under-estimation in the Index of Industrial Production with base 1951=100. During the last 12 years a large number of new industries have developed which have not been taken account of in the old index. If these industries are also given their due weight and a new index is constructed with 1961 as the base, it will be found that the rate of progress would be stepped up by 50 per cent, meaning that even the 8 per cent rise recorded in the first two years of the Third Plan will work out to nearly 12 per cent per annum. On the basis of this analogy it may be assumed that the stipulated target of 18 per cent per annum will not be difficult to achieve, especially when all efforts are being made to accelerate industrial expansion. In real terms it will require stepping up of the rate of rise from 12 per cent to 18 per cent per annum which should be within our reach.

In fact an overall rate of expansion is not the only measure of real growth. What is necessary is that the industrial expansion should proceed on a pattern that will be in line with the dictates of the emergency. This clearly means that added stress will have to be laid on the heavy and medium group of industries which directly strengthen the country's defence potential and fulfil those requirements, which are listed among the essential services like transport, power, communications, etc.

Iron and steel forms, the hub of heavy industry. It is quite justifiably maintained that steel production in any economy is the index of its level of advancement. The size and rate of expansion of the demand for steel indicates the relative strength or weakness of an economy. Taken in that context, Indian industrial development presents a picture of progress and promise. Within a period of five years, the three steel plants in the public sector were brought into existence to raise the installed capacity to 5 million tons. In another five years of the Third Plan, the steel output is planned to be doubled. The largest single item of fixed investment — Rs. 640 crores — is in the iron and steel industry alone. This investment is something like 25 per cent of the total fixed investment of Rs. 2,454.6 crores earmarked for industrial projects in the period of the Third Five-Year Plan.

To assess the nature of expansion of steel output, it is necessary to go through the detailed pattern of production in the various plants, the expansion schemes already earmarked in the Third Plan and the likely pattern of production in terms of individual items that will emerge after the realisation of these expansion schemes.

The steel plants in the public sector with the exception of the Bhilai plant, were confronted with a period of not only stagnation but a set-back and confusion which, it seems, have been overcome. Recently, the Minister for Steel gave an account of the latest, performance of various steel plants, which, though it was not uniformly reassuring, could not be considered discouraging at all. For instance, the Bhilai Steel Plant has already started working at 108 per cent of its installed capacity in terms of ingot steel output and to the extent of 103 per cent in terms of saleable steel. Having reached this level of production now, the Bhilai Steel Plant is ready to take up the expansion programme, which has been outlined in the Third Five-Year Plan. The Soviet Government has offered the necessary credit for the expansion of the Bhilai steel works from the present one million capacity to a level of 2.5 million tons of steel ingots per year, with corresponding expansion of power, mining and limestone quarrying capacities. The additional units to be set up under the expansion scheme would be three coke-oven batteries, two blast furnaces, four open hearth furnaces and a wire mill. A general plan to execute this expansion scheme has already been drawn up and the end products are likely to yield the following saleable products.

Rails	..	500,000 tons
Heavy structural sections	..	250,000 tons
Merchant sections	..	500,000 tons
Wire rods	..	300,000 tons
Pig iron	..	300,000 tons
Billets	..	400,000 tons

The performance at Durgapur and Rourkela public sector steel plants bears no comparison whatsoever with Bhilai although these plants, too, are gradually recovering from the set-back and progressing towards a high-level of utilisation of capacity. At Durgapur, the present level of achievement has been something like 90 per cent in terms of steel ingots output and 61 per cent in terms of saleable steel. The output at Rourkela was around 90 per cent and 72 per cent respectively. Rourkela's present capacity of one million tons is to be expanded to produce 1.8 million tons of steel. This expansion will mainly use the inbuilt facilities already existing. The product-mix of the works after expansion will be:

	Items		(Tons)
1.	Wide and Heavy Plates	..	280,000
2.	Hot rolled sheets, narrow light plates and strips	..	300,000
3.	Cold rolled sheets	..	300,000
4.	Hot dipped tinplates	..	50,000
5.	Electrolytic tinplates	..	100,000
6.	Galvanized sheets	..	160,000
7.	Electrical steel sheets	..	50,000
	TOTAL	..	1240,000

Similarly, at Durgapur, the expansion from the present one million ton capacity will be expanded to the level of 1.6 million tons of steel ingots. The project report, which was finalised recently envisages attaining the following pattern in addition to 300,000 tons of pig iron.

Products	(Tons)
Medium and Light Structurals ..	200,000
Merchants ..	240,000
Sleepers ..	75,000
Wheels and Axles ..	9,300
Fish Plates ..	11,000
Forging Blooms and Billets ..	70,000
Billets for Sales ..	300,000
Skelp ..	250,000
TOTAL ..	**1239,000**

Considerable effort will have to be made if the expansion schemes are to be achieved. If the experience of the last few years is any guide, a variety of hurdles will have to be overcome, and, perhaps the one of the shortage of trained personnel is going to be difficult to surmount. Even while the blueprints were being finalised for the setting up of the three steel plants in the public sector, considerable attention was paid to this problem. Gradually, a change-over to Indian hands was planned and for that a pool of technical men was created and many of them were sent for overseas training in various institutes in countries like the U.S.A., the U.K., Germany and the U.S.S.R. The Hindustan Steel set up technical training institutes at Rourkela and Bhilai and is organising one at Durgapur also. Even then the problem has continued to remain unsolved. Owing to the paucity of experienced steel experts to man the higher supervisory posts for the operation as also for the maintenance of the plants, a high proportion of foreign personnel had to be pressed into service. It is time that this problem was tackled in a more imaginative way and a bolder programme was followed.

The top management of the Hindustan Steel, too, has not been above reproach. Even since the formation of Hindustan Steel towards the end of 1956, the constitution of its Board of Control has remained in a state of flux. This is not in any way a reflection on the capacity of the senior civil servants who have been handling the affairs. It only has to be highlighted that the Board of Control of a company which has three steel plants under it can hardly be expected to be an ever-changing body. In commercial organisations the Managing Director, who has to manage the affairs of a company continues to stay at the top for a long time so that the knowledge of details of the complex problems of control as well as of problems of production like targets and achievements is mastered. The Chairman in a company, on the other hand, looks after the broad policies and broad pattern of expansion. In the case of Hindustan Steel, the Minister of Steel is there who lays down the broad outlines of policy. Effort ought to be made to evolve a pattern so that the top management of the Hindustan Steel is allowed to acquire steady experience.

The performance of the two private sector plants has been comparatively more satisfactory and in this the long experience of their management and technical cadre has been helpful. Tata Iron, for instance, has shown that its output was 96 per cent of its installed capacity in terms of steel ingots and 97 per cent in terms of the capacity for saleable steel. In the case of Indian iron also the achievement was to the extent of 102 per cent and 103 per cent respectively. In Tata Iron, where the present capacity is to the extent of 2 million tons, it has to be expanded marginally so that it will be raised to 2.2 million tons. In Indian Iron, where the present capacity is 0.8 million tons, it is to be expanded to achieve a capacity of 1.0 million tons. Thus the real expansion of capacity is concentrated in the public sector. This is in conformity with the statement of Industrial Policy.

The physical target of steel production for the Third Plan after the execution of the various expansion schemes is 10.2 million tons of ingots. 3.2 million tons to be produced in the private sector and the remaining bulk of 7.0 million tons in the public sector. In this target there is a provision for the establishment of a new steel plant at Bokaro. In addition, there is included in the plan a project for a pig iron plant based on low shaft blast furnace techniques and use of coke from Neiveli lignite. The break-up of the level of capacity in the public sector, in terms of ingot steel will be: Bhilai 2.5 million tons, Rourkela 1.8 million tons, Durgapur 1.6 million tons, Bokaro 1.0 million tons and Mysore Iron and Steel Work 0.1 million tons. For Neiveli the target may be around 0.5 million tons.

The Bokaro plant is expected to produce flat products like plate sheets and strips which are considered to be in short supply. This plant, therefore, is not there to add to the total production capacity alone. This is a "must" from the angle of the pattern of output also. Various preliminaries have already been going on for a long period. The Government reports also indicate that consultations are proceeding with the U.S. agency for International Fund on the question of U.S. finance for Bokaro. It seems, however, that the Government of India is finding difficulties on the score of its industrial policy. It is time that the urgency of the need to set up another steel plant is realised and consideraions of ideology are not allowed to hamper the project. But the unhappy indications now are that Bokaro will be postponed until after the end of the Third Plan.

In the context of the present emergency it would not be proper to consider the target of 10.2 million tons as one that could be achieved at leisure. Instead, no effort should be spared to make this target a reality and a success and for that a special priority of execution should be allocated. It must be recognized that the capacity of the Indian economy to absorb steel is increasing rapidly during the last few years. For instance, in 1959-60, the demand was assessed at around 4.1 million tons, in 1960-61 it was raised to 5.6 million tons and in 1961-62 it was pitched still higher at 6.1 million tons. Thus between 1959-60 and 1961-62, the demand has increased by something like two millions tons. This increase in demand was due to the growth of the steel-using industries. In fact, steel availability has been lagging and even today there is a gap in output to the extent of 2.5 million tons. The target output by the end of the Third Plan will only be just sufficient to satisfy the increasing demand.

Non-Ferrous Metals

LIKE OTHER heavy industries, the non-ferrous metals group provides raw materials for an important section of products which have assumed added significance due to the emergency. Aluminium, copper, zinc and lead provide various alloys and amalgams which have a wide variety of uses. These metals go to produce most of the cables and conductors and various crucial components in machinery as well as armaments. In this manner this industry is interlinked with several important sections of defence requirements as well as civilian necessities and at present the total value of the output in this industry approximates to Rs. 100 crores every year.

I is, however, to be kept in mind that to a large extent these metals for indigenous consumption are imported and this is acutely true about copper, lead and zinc because, comparatively, indigenous aluminium output has been increasing. During the last few years significant efforts have been made to raise the output of each non-ferrous metal, but the real hope centres round the programmes that have been earmarked in the Third Plan.

The Planning Commission has set a target for aluminimum for the Third Five-Year Plan at 87,500 tons, but currently there have been some talks regarding its upward revision to over 120,000 tons. At the beginning of the Plan, however, the production capacity of aluminium was around 18,000 tons per year. The installed capacity at the moment is estimated to be around 53,000 tons.

The upward revision of the target is based on the estimated requirements which were assessed by the Tariff Commission in its Report on Aluminium Industry by 1963 at 74,000 tons per annum. Another estimate made by a committee set up by the Ministry of Commerce and Industry placed their requirements by 1965-66 at 115,000 tons, the break-up of which is given below:

	(Tons)	
Electrical grade		
Transmission and distribution lines	40,000	
Bus bars and die-castings	6,000	
Substitution in power cables and house-wiring	5,000	
Miscellaneous	4,000	
		55,000
Commercial grade		
Domestic utensils	25,000	
Transportation and aluminium alloys	12,000	
Packing (foils)	7,500	
Building construction	4,000	
Food, Farming, Sugar industries etc.	4,000	
Miscellaneous, including the requirements of steel industries and normal exports	8,000	
		60,500
TOTAL		**115,500**

It may be noticed that the estimates of "transmission and distribution lines" and "domestic utensils are more prominent in the demand structure. On the assumption of this demand, it seems the output target will have to be revised upward which, according to the present scheme outlined in the Third Plan, is something like 69,205 tons. The Indian Aluminium Company had made satisfactory progress in its expansion programmes of smelter at Hirakud. Messrs. Hindustan Aluminium Corporation also has made reassuring progressed in its scheme in the establishment of an integrated aluminium plant at Rihand, Uttar Pradesh, in collaboration with Kaiser Engineers of the United States of America.

But if the new target is to be made a reality, it would be necessary to eliminate some of the problems faced by the aluminium producers. Their main grievances are that the supplies of electricity with regularity and at reasonable costs is a very important factor in their ability to work to full capacity. Electricity accounts for roughly 20 per cent of the cost of production in the aluminium industry. It is necessary that the State Governments refrain, as far as possible, from increasing levies and surcharges in power rates and help the producers in making arrangements for long-term supply of bauxite, the basic raw material. Although India has abundant supplies of this item, sufficient quality material is not available. Aluminium producers should also be given preference in the matter of prospecting licences.

India is extremely deficient in copper resources. This does not in any way mean that the possibility of improving the indigenous production is bleak. At the moment, however, the output is just 9,000 tons, while the demand is estimated at something like 100,000 tons. By 1965-66, the demand is expected to rise to something like 170,000 tons. The present imports naturally are very high and are recorded at about 75,000 to 85,000 tons.

At the moment the Indian Copper Corporation is the only important company engaged in copper production and has been producing something like 8,000 tons to 9,000 tons. The Development Council for Non-ferrous Metals has recommended the establishment of some more units. On the basis of reserves proved in Khetri and those in Daribo in Rajasthan, a project has been prepared for the establishment of a smelter in the public sector with the capacity of 11,500 tons of electrolytic copper per annum at Khetri. The Third Plan also includes a project with an estimated capital outlay of Rs. 12.5 crores for the mining and concentration of the ore at Khetri and Daribo and smelting concentrates at the above mentioned smelter. On present indications, it is likely that this unit will be established by the middle of 1964.

The lead output capacity in 1960-61 was around 6,000 tons. During the Third Plan it is expected to be raised to 8,500 tons. Against this output, the current demand has been estimated by the Development Council at 35,000 tons per year. Naturally, therefore, imports are essential to the extent of 24,000 tons or a little more every year. The demand for lead by 1965-66 is envisaged at 60,000 to 65,000 tons and indegenous production by that time may be something like 9,000 tons. This target does not, however, take into account the scheme of one unit for the manufacture of 12,000 metric tons of lead per year from imported concentrates. Comparatively, therefore, there will be some relief in the imports of the metal.

The production of zinc for the first time in India is expected to be achieved by the middle of the Third

Plan with the commissioning of the zinc smelter based on zinc concentrate from mines in Rajasthan. The installed capacity of the plant is to be 15,000 tons. The demand for the metal is considered to be around 85,000 tons at the moment and is likely to go upto 185,000 tons by 1965-66. A major portion of the domestic consumption is still met by imports.

The above review of the four important non-ferrous metals leads us to the conclusion that in most of the cases the advance in output has been determined by the availability of raw materials. It is true that it would be possible to enhance the prospecting of mines, but at the present rate it seems that sufficient attention has not been paid to this problem. Taking the typical instance of Japan, small and medium scale miners should be subsidised by payment of half the expenditure incurred on prospecting and their expenditure on prospecting should be allowed to be appropriated to the loss account. It is time that such a scheme of financial relief is finalised and specific expenditure is earmarked for this project so that mining is expedited. Keeping in view that the Third Plan expenditure in terms of fixed investment on these industries is likely to be of the order of Rs. 65 crores in the case of aluminium, Rs. 0.6 crores in the case of copper and Rs. 7.3 crores for lead and zinc, it is recommended that an upward revision of this expenditure is provided for so that the total fixed investment is raised to something like Rs. 80 crores instead of Rs. 73 crores.

Cement

THE CEMENT industry has assumed added significance in the face of national emergency. Even in periods of peace, construction activity for industrial and a variety of other purposes is an essential feature of a developing economy. But now to meet a special type of demand which is detailed in the following paragraphs, it is essential that the target of cement production is revised upwards.

The cement industry has a long history, but even after 50 years of its working, its production capacity in 1951 was just 2.6 million tons. It was raised to 4.6 million tons during the First Plan and to 9 million tons during the Second. It was towards the latter part of the Second Plan that suddenly the demand for cement increased, perhaps, as a consequence of increased purchasing capacity with the people in general, construction activity for the Plan and larger availability of steel items. It is interesting to observe that in the third quarter of 1960 indents were placed by the consumers to the extent of 7 lakh tons every month against which the production was 6.1 lakh tons. There was, therefore, no really serious shortfall. During the next quarter, October to December 1960, against the monthly output of 6.9 lakh tons, indents placed by the consumers shot up to 9.11 lakh tons. It was in the first quarter of 1961 — incidentolly, the last quarter of the Second Plan — that indents were recorded at a peak level of 12.7 lakh tons against production of 7 lakh tons, thereby creating a gap of about 5 lakh tons per month. It was interpreted, however, that the real gap must have been narrower, taking into account the inflation in demand due to a phychology of keeping stocks generated by shortages.

Even the conservative estimates put the average rate of annual increase in the consumption of cement at about 7 per cent. On that basis the requirements of about 13 million tons in 1965-66 were estimated. It was proposed in the Third Five-Year Plan, therefore, that the target of 13 million tons of actual output from 15.0 million tons installed capacity might have to be revised and for that it was proposed to review the entire question after watching the trend during 1961-62. The possibility of export of cement was also kept in view.

The capacity expected to be achieved on the basis of the schemes covered so far by the import licences, and those schemes selected for implementation based mainly on indigenous machinery, would be of the order of 12.66 million tons. The gap between the availability of capacity on the basis of the target of 15 million tons would, therefore, be about 2.34 million tons.

As far as investment to achieve this increased installed capacity was concerned, it was assumed that on an average for every ton of annual cement capacity, financial investment was of the order of Rs. 140 to Rs. 150 for new units and about Rs. 100 to Rs. 120 on the basis of expansion of the existing factories. The expansion of the industry during the Second Plan, for instance, from a capacity of 4.8 million tons to 9.3 million tons involved an investment of approximately Rs. 50 crores. It is consequently laid down in the Third Five-Year Plan that the investment in the present rise in capacity to 15 million tons would involve an expenditure of the order of Rs. 60 crores out of which Rs. 12 crores would be in terms of foreign exchange.

To assess the possible increase in the demand of cement, due to this emergency, it would be interesting to study the two tables reproduced from a recent publication on page 1298. Table I gives a detailed sector-wise consumption of cement during the Second Five-Year Plan. It also gives the possible demand structure of cement during the Third Five-Year Plan. It may be noticed that housing, schools and hospitals and other buildings alone involved cement consumption of nearly 34 million tons during the five-year period of the Third Plan. This means that more than 8 million tons of the increased annual capacity by 1965-66 would be utilised by this sector alone. Defence consumption involved only 1.1 million tons during the Second Five-Year Plan. Similarly, other sectors, associated with defence, involved only a small quantity. It is important to remember that a significantly large quantity of cement will have to be diverted to various types of defence programmes like embankments over long distances; road construction, temporary buildings to house increased defence personnel etc. It is quite relevant that other sources of consumption like railways, bridges and industries as well as irrigation projects will continue to have the top priority, leaving a low priority for civilian housing etc.

The net effect of this change in priorities would be that two of the biggest consumers, namely, "housing" and "schools, hospitals and other buildings," will have to rest satisfied with smaller quantities. The housing problem which at the moment is quite acute may have to be deferred for some time more and it is quite likely that the quota for this sector is reduced by something like 25 per cent. In fact already the tempo of housing activity has slowed down and various State Governments are contemplating stoppage of loans for building of new houses. This in itself will slacken the demand for cement and will allow certain quantities of cement to be transferred to the defence-oriented sectors. In fact the West Bengal Government has already given a lead by imposing certain restrictions. According to the directives issued by the West Bengal Government, no cement would be provided for the construction of luxury buildings such as cinemas and hotels, and for

TABLE I.

or half full?

There's an old saying that goes, 'A pessimist calls half empty what an optimist calls half full.' Which are you, a pessimist or an optimist? If you were closely associated with research, you might be a little of both. You would be sceptical about tests that didn't stand up to a severe critical examination; cautious of information that was inconclusive and vague. But you would be optimistic, too. You would persevere despite initial disappointments and failures because you'd feel certain of ultimate success.

Now with the completion of the CIBA Research Centre at Bombay, there will be exciting developments that will have a far-reaching influence on our lives. In its 80 modern laboratories, chemical and biological research will be conducted on a scale never before attempted in the country.

CIBA

HERE AND ABROAD

BOMBAY DYEING FOR COTTON FABRICS!

For over 20 years, BOMBAY DYEING have been exporting their wide and fast-colourful range of cotton fabrics to U.K., Europe, U.S.A., Canada, West Indies, East and West Africa, Sudan, Middle East, Australia, New Zealand, Burma and the Far East. That's how BOMBAY DYEING came to be one of India's first and largest single exporters of cotton fabrics!

The BOMBAY DYEING range of cotton fabrics includes Bedsheets, Sheetings, Mattress Materials, Casement, Upholstery, Damask Table Linen, Shirtings, Drills, Coatings, Poplins, Cotton Blankets, Towels and Towelling Materials. These are now available in the Indian market. And, for their price, they are all excellent value for your money!

GENERAL INSURANCE AND

THE NATIONAL ECONOMY

GENERAL INSURANCE is essential to the national economy. It cushions unforeseen losses due to accidents . . . and thereby makes for a smooth and orderly progress of modern industrial society.

The 'NEW INDIA', with its fine record of solid security and efficient service, occupies a premier position in the field of general insurance in India. As in the past, so in the future, the 'NEW INDIA' will continue to serve the national economy in general and Indian industry in particular.

the construction of other buildings beyond two storeys. Although these new curbs in that State do not apply to the public and charitable institutions like schools and hospitals as well as industrial housing schemes, it is quite likely that this measure would work as a damper on general demand. It is time that other States also followed suit.

In fact, at the State level the distribution machinery will have to be geared up so that certain hardships which can be got over with better processes of supplies, are avoided. The administrators will have to show a greater awareness and will have to cut down the red-tape and inefficiency in eliminating waste which might result from their slackness.

In the ultimate analysis, the picture of the cement industry is that the Third Five-Year Plan target will have to be revised upwards to something like 17 million tons against the present target of 15 to 16 million tons. In that case, the actual output will be something like 15 to 15.5 million tons. Here it is necessary to emphasize that the industrialists should put in their best efforts to work their units upto the maximum capacity. It is also necessary that there is a regular flow of raw materials like coal and at the same time sufficient wagons are available for the carriage of raw materials as well as the finished products. In terms of expenditure, it is quite likely that the Plan will have to be revised so that the additional fixed investment in the cement industry will be Rs. 70 crores instead of Rs. 60 crores envisaged at the time of finalisation of the Plan. The foreign exchange component may be Rs. 14 crores as against Rs. 12 crores.

Other Heavy Industries

APART FROM the above three important industries dealt with at some length, namely, iron and steel, non-ferrous metals and cement, there is a large variety of engineering and chemical industries which constitute part of heavy industries. It is not possible to enumerate the development features and possible readjustments necessary in the face of emergency in all the detailed lists of engineering and chemical industries. This is a matter essentially of ad hoc reviews and decisions. Nevertheless, an effort has been made to touch the outlines of some of the important constituents of these two groups.

The significance of industrial machinery manufacture was realised quite early and the establishment of a heavy machine building plant was a major industrial complex which has been planned on the model of the huge works established in the Soviet Union for the production of machinery and equipment in the integrated steel plants. The production is envisaged at 5,000 to 8,000 tons in 1964-65 and 15,000 tons to 20,000 tons valued at Rs 7.5 to Rs. 10 crores, in 1965-66. The Corporation will have to adjust its production to the requirements of the Hindustan Steel and other establishments operating in the field of iron and steel.

The mining machinery project with Soviet assistance will produce coal mining machinery plant. The private sector programmes include production of cotton textile machinery, jute mill machinery, sugar mill machinery, cement machinery, paper machinery, dairy machinery and cranes, to site some of the important items. Most of these items of machinery would be sufficient for indigenous requirements for expansion as well as the establishment of new units.

The Third Plan will also see the indigenous production of various earth-moving equipment like crawler tractors shovels, etc. as well as road rollers. Mention must be made here of the progress made with the railway rolling stock construction at Telco and Chitaranjan Locomotive Works. The railway plan, it may be added, provides for the manufacture of electric locomotives at Chitaranjan and diesel locomotives at Varanasi.

Electrical engineering industries will also have to be given more attention and resources because the Third Plan provides for increasing the power capacity from 5.7 to about 12.7 million KW — an addition of 7 million KW in five years. During the remaining period of the Third Plan, therefore, the manufacture of transformers, heavy industrial motors, high-tension switch gears and other heavy items used in the transmission and generation of electricity will have to be increased. It is estimated that after the end of the Third Plan, the value of such equipment produced every year would be of the order of Rs. 80 crores.

A word about machine tools is essential, considering the stress on industrialisation in the coming years. A detailed study of the demand for machine tools by 1965-66 was undertaken by a Sub-committee of the Development Council for Machine Tools. On the basis of this estimate of demand, a target was fixed at Rs. 30 crores worth of machine tools, of which Rs. 16 crores worth would be manufactured in the public sector and the remaining Rs. 14 crore worth in the organised private sector. Apart from raising the capacity at the Hindustan Machine Tools at Bangalore, a new machine tools plant in Punjab in collaboration with the Limex of G.D.R. Government was approved by the Government. This plant will have an annual capacity of 1,000 machines and will involve an investment of Rs. 7.5 crores. Then with the assistance of the Czech Government a heavy machine tool factory is to be established at Ranchi. The Praga Tools Corporation at Sikandrabad also proposes to carry out an expansion programme with the technical collaboration of three British firms.

As far as chemicals are concerned, fertilizers constitute an important item for which the capacity had to be increased. During the Third Plan, in view of the higher targets in the agricultural sector, the demand was estimated at 1 million tons of nitrogen, 400,000 tons of phosphate and 200,000 tons of potash fertilizers. Various public sector projects at Trombay, Assam, Gorakhpur and the expansion at FACT (Fertilizers and Chemicals Travancore) as well as private sector schemes at Kothagudium, Visakhapatnam, the Madhya Pradesh Fertilizer project and Rajasthan fertilizer project are likely to achieve their individual targets.

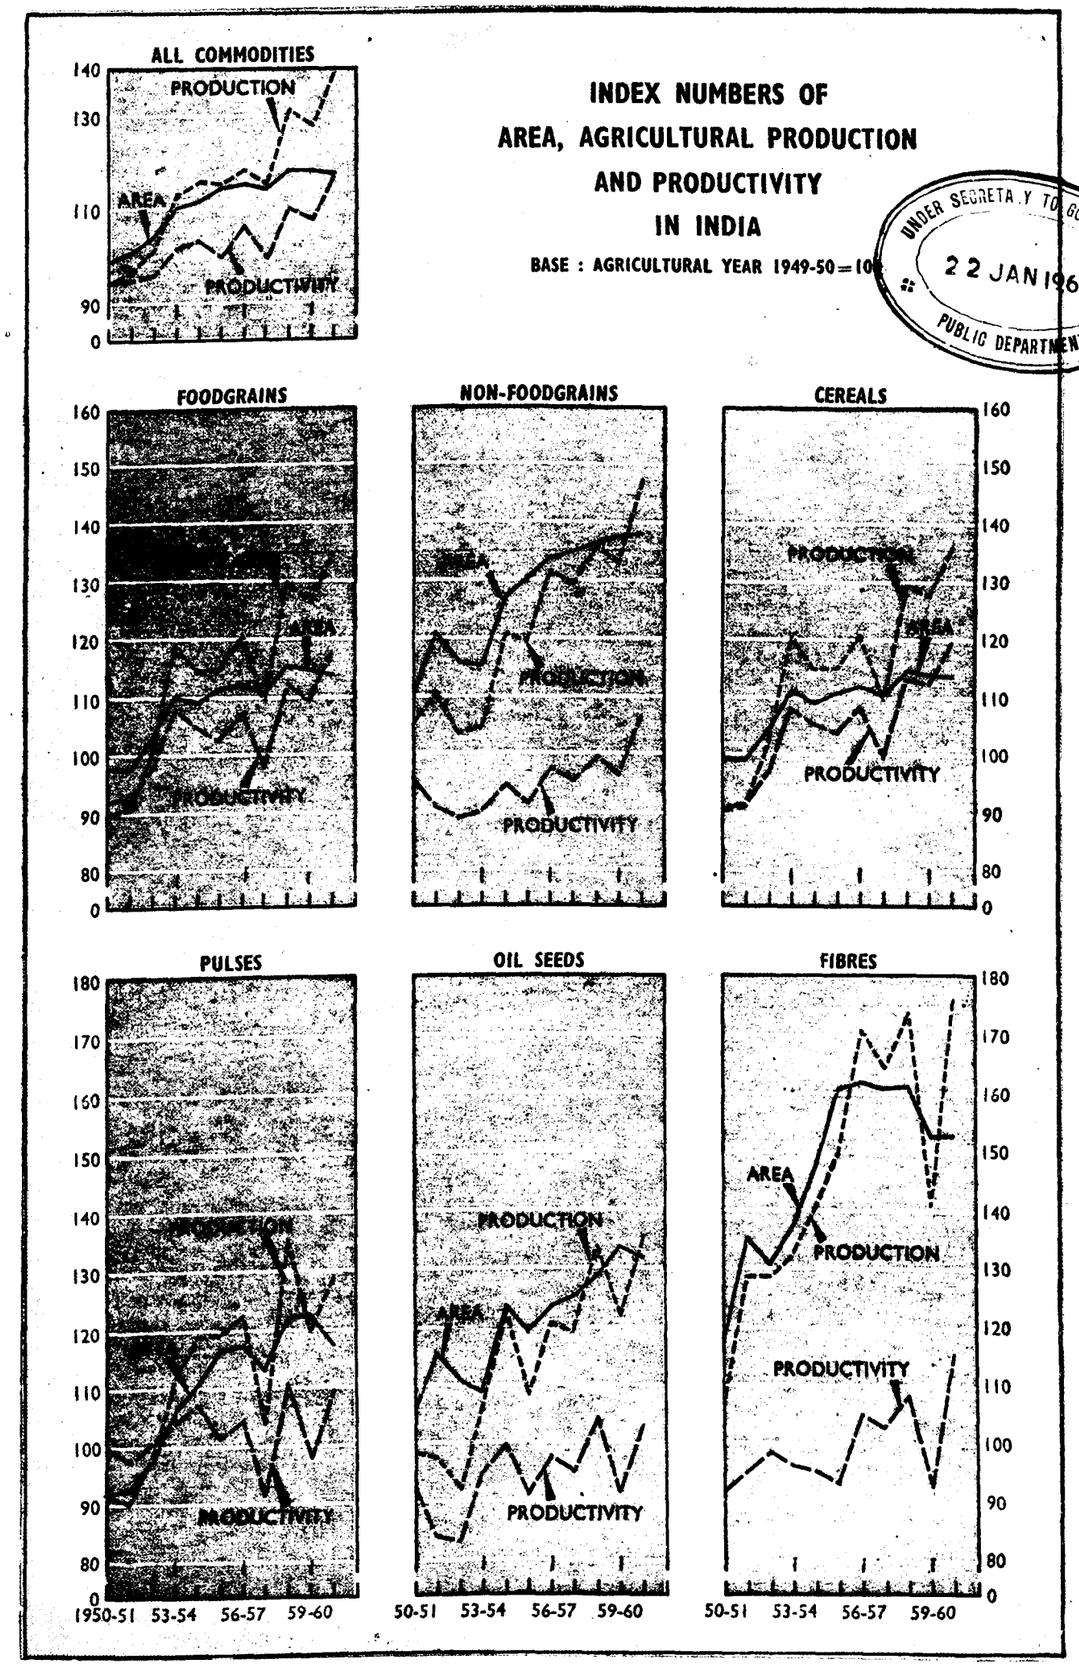
Various inorganic chemicals like sulphuric acid, soda ash, caustic soda, calcium carbide as well as several organic chemicals, which produce dyes and drugs, antiseptics and insecticides have also been given attention in the Third Plan. It may be remembered that certain strategic chemicals are used in the production of explosives for which additional investment must be provided for. It is obvious, therefore, that both the engineering goods and chemicals will have to be treated on a special priority and a larger investment provision will have to be available for their enlarged expansion.

Ball & Roller Bearings

THE MAIN concern manufacturing ball and roller-bearings at present is M/s National Bearing Company, Jaipur. There is no unit in the public sector at the moment, but the Government have under consideration a plant for the manufacture of ball and roller bearings of different types including those required for motors, machine tools, pumps, coal mining machinery, power machinery, automobiles, railway boxes etc. The capacity for this project has provisionally been envisaged at two million bearings per annum. The cost of the

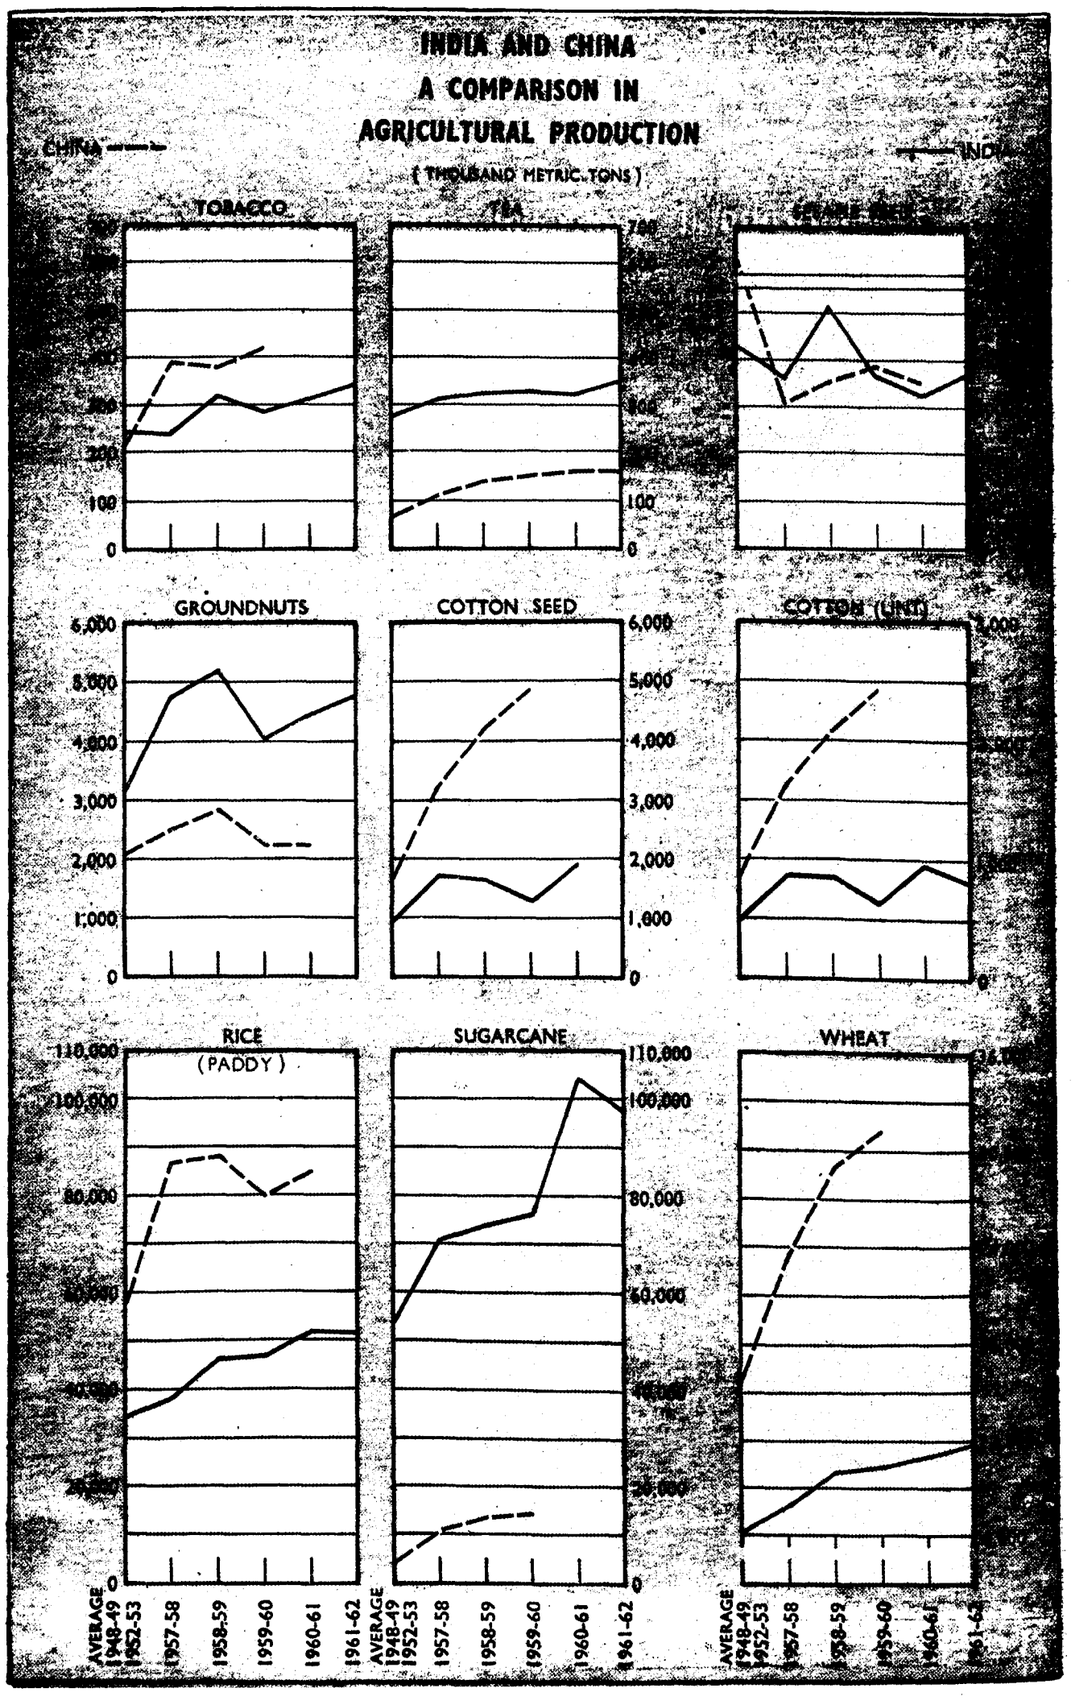
project is estimated at about Rs. 8 crores, the foreign exchange element of which would be Rs. 6 crores. A number of schemes have been licensed and they can be categorised as those covered by foreign exchange and those not covered by foreign exchange. Amongst the new units covered by foreign exchange are Messrs Investment Corporation of India, Bombay (Indian S.K.F Manufacturing Company), Messrs. Antifriction Bearing Corporation, Lonavala, Maharashtra and Messrs Bharat Ball Bearing Company, Ranchi. The units not covered by foreign exchange, but for which additional capacity has been licensed are Messrs Pioneer Bearing Company, Coimbatore, Messrs Hindustan Ball Bearing Company, Agra, New Commercial Bearing Corporation, Ahmedabad, Indian Bearings Limited, Ahmedabad, Kamla Shanker P. Joshi, Bombay, New Haven Steel Balls Corporation, Bombay.

With the working of industry on three shift basis, the production of ball bearings has increased considerably. The output of ball bearings below 2 inch bore diameter was 8,65,000 in 1955-56 and 2,060,000 in 1958-59. The production declined to 1,823,000 in 1959-60 because of labour trouble, but again jumped to 3,784,000 in 1961-62. The range of sizes of ball bearings produced in this country varies greatly and in 1960 it was 159 in ball bearings and 27 in roller bearings. The industry continues to enjoy tariff protection which was granted to it in 1952. At the last enquiry the Tariff Commission recommended that protection to the ball bearing industry should be continued till 31st December, 1962. This was accepted by the Government. Since demand is much greater than supply, the impoprt of ball and roller bearings continues to be high. The import of ball and roller bearings was to the tune of Rs. 329.40 lakhs in the year 1960-61, whereas it was only Rs. 113.69 lakhs in 1956-57. The bulk of the bearings imported were above one inch diameter bore. In fact, the entire requirements of double taper roller bearings for automobiles and roller bearings for some other industries were met mostly by imports. Under the recent import policy announcement, the imports of ball bearings in future will be canalised through the State Trading Corporation. The established importers obviously are not happy over this move. It is really doubtful if the State Trading Corporation will be able to arrange imports from abroad to accord with the wide variety of requirements and ensure their expeditious distribution to the small-scale consumers all over the country.



The raw materials required by the industry are high carbon chromium (H.C.I) steel bars, tubes and wires. Some of the raw materials are available within the country and it is considered that the import of H.C.I. bars may be dispensed with when the proposed Alloy and Steel Plant goes into production. Expensive electronic machines have also been installed for the analysis of bearing noise, checking of roundness and shape, sphericity of balls, surface finish, vibration etc. This has led to a considerable improvement in the quality of bearings, but still much remains to be done. The methods followed to improve the quality need to be studied in other countries, so that the ball and roller bearings produced by our industries could stand well in competition with the ball and roller bearings produced by the industries in other parts of the world. Ball bearings are used in a number of industries like electric fans, electric motors, power-driven pumps, automobiles, railway wagons including coaches and locomotives, tractors, earth moving machinery and textile industry. In view of the large-scale developments envisaged under some of the industries during the emergency, the demand is bound to rise considerably. So, while framing targets for the emergency period, it is very essential that we should not only take into consideration the requirements of these developing industries but also the replacement aspect and the demands from the new industries that might be set up during this period. The average life of bearings is estimated to be around seven years.

The table below gives the annual requirements for 1965-66 for various industries and also the increased targets as a result of at last 25 per cent increase in demand from the various industries and the Army.



The foreign exchange element involved in the industry is quite considerable, and rightly the Govern-

PUBLIC DEPARTMENT

ment is giving due consideration to it. The most important thing now is that the schemes be watched carefully and assistance rendered wherever it is needed the most. It is considered that if the industry is to operate on a three-shift basis, the estimated requirements of 15 million can be taken care of by the end of 1965-66. On the progress of this industry hinges the development of many other industries in the country. On the basis of rough calculation, the foreign exchange demand can be estimated to be around Rs. 13 to 14 crores during the Third Plan period. The total investment in this industry during this period would be about Rs. 20 crores. The additional employment that might be created during the Third Plan period is estimated at about 8,000. The number of persons employed at present in the industry is about 2,000.

Agricultural Implements and Machinery

A MODERN mechanised army cannot be maintained without a strong agricultural base and in this task the agricultural implements and machinery industry has an effective part to play. To strengthen the agricultural base it has been stressed, time and again, that there should be intensification of agricultral programmes. And to bring about that intensification, it is very essential that the right types of tools and machinery be manufactured. It is clear that more areas will be brought under irrigation and cultivation, and improved agricultural practices will be developed during the Third Five-Year Plan period. The demand for agricultural implements will also rise in view of new methods of cultivation to be introduced through the Community Projects and the National Extension Services. The Government have taken the right step in appointing a Committee to assess the Third Plan needs of agricultural implements. The report of this Committee is anxiously awaited.

A look at the production figures would reveal that while the production of agricultural implements by the organised sector of industry in terms of steel was 13,875 tons in 1955, in 1960, it was 17,400 tons. The agricultural implements industry is mostly concentrated in Maharashtra, where the number of factories is 12 and the annual rated capacity in terms of steel is 4,796 tons. The total number of units in all the States are 60 and the annual rated capacity in terms of steel is 30,900 tons. These 60 units include two units in the public sector, viz, the Nahan Foundary and the Mysore Implements Factory. The types of improved agricultural implements which are being produced by the industry are field implements, such as, ploughs, cultivators, seeding, planting and threshing machines, agricultural hand tools, such as, persian wheels and manually-operated water pumps, machinery for processing agricultural products, such as, oil ghanies, cane crushers, chaff cutters, and tobacco barns; dairy and poultry farm equipment, such as, churns, cream separators and honey extractors; plant protection equipment, such as, sprayers and dusters; farm transport equipment, such as, wheel barrows, farm carts and hand-push carts.

The value of imports of agricultural implements in 1956 was Rs 92.22 lakhs and in 1960, it was only 38.99 lakhs. The decline in imports is due to the fact that the Indian Union has capacity to manufacture many of those implements that were being imported previously. Our exports of agricultural implements are limited and were valued at Rs 0.73 lakhs in 1960.

In addition to the organised industry, agricultural implements are being manufactured in the small-scale units also. A number of measures have been taken during the Second Plan for the healthy development of the small-scale units. Mention needs to be made of blacksmith units, Regional Research-cum-Testing Stations, the Small Industry Service Institutes and Extension Centres that have been set up for technical guidance. A scheme has also been accepted by the Ministry of Community Development and Co-operation for setting up 1000 servicing-cum-common facility workshops in rural areas, preferably in community development blocs for servicing, repair and maintenance of agricultural implements.

The production of power-driven pumps has also increased in recent years. While the production of power-driven pumps in 1955-56 was 37,000, it increased to 132,000 in 1962. Even specialised pumps, such as, submersible type of pumps, petrol dispensing pumps, pumps requiring fractional horse-power motors for their operations etc. are now being manufactured in this country. We are also now exporting these pumps to other countries. (The imports, also, continue and they were of the value of Rs 126.38 lakhs in 1960). It is because of the fact that we have not been able to manufacture all types of specialised pumps that we are forced to import quite a big slice of our needs. Our consumption of power-driven pumps in 1960-61 was 106,696. Since the demand for power-driven pumps is linked up with the progress of irrigation programmes and with the development of various industries, like chemicals, paper and sugar, which need pumps, many new schemes have been licensed. It is estimated that to achieve a production level of 150,000 pumps per annum by 1965-66, a capacity of 184,000 pumps will be required on double shift basis. The expectation is that the target will be achieved in the Third Five-Year Plan, particularly when it has decided to set up a project for the manufacture of heavy compressors and pumps. There is available in the Indian Union unutilised capacity in regard to power-driven pumps, diesel engines and tractors. While the estimated capacity for power-driven pumps in 1960-61 was 184,000, the production was only to the tune of 90,000. The case of diesel engines and tractors falls in the same category. The estimated capacity for diesel engines in 1960-61 was 62,000 units and production was 40,000 units and for tractors the capacity was 1000 units and production only 600 units. It is obvious that if the rise in demand is to be met, the industry will have to work on multi-shift basis. But to work on a multi-shift basis, adequate supply of raw materials will have to be ensured.

The diesel engine industry is at present concentrated in Maharashtra. There is a potential demand for Indian manufactured diesel engines in the Middle East and Far East countries. Every effort, therefore, must be made to hold these markets.

Tractors are required for two purposes, viz. reclamation of land and ordinary cultivation. Their demand

	1960-61 ('000 Nos.	1965-66 ('000 Nos.)

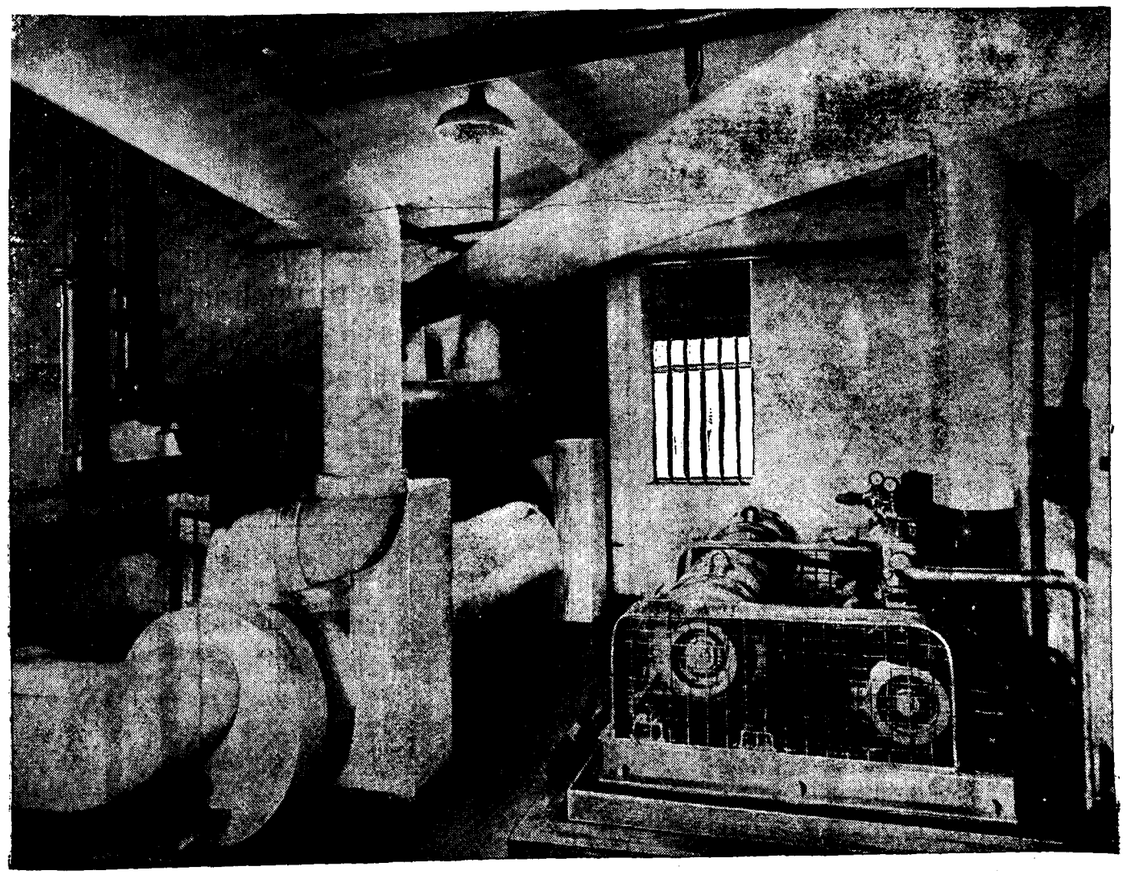
Production ..	Nil	10

will depend upon the future patern of mechanisation in agriculture. For meeting the domestic requirements of 10,000 units of tractors within the range of 12-45 DBHP envisaged by 1965-66, a production target of 10,000 numbers within this range has been fixed. To achieve the production level of 10,000 by the end of the Third Plan period, a capacity of 12,000 on double-shift basis has been proposed for the establishment by the same period. The target in regard to tractors can be achieved if the foreign exchange is made available. But it is difficult to say at this time how much foreign exchange may be spared in view of the pressing demand from other high priority industries. The fact, however, is taken into account that the agricultural implements and machinary industry is vital for the economy and steps, therefore, must be taken for its speedy growth. An idea of the development of the industry can be had from the table

on the previous page.

Drugs and Pharmaceuticals

IN A developing country like India where the people are under-nourished and incidence of sickness is high, the pharmaceuticals and drugs industry has a vital part to play. During the emergency, it will not only have to meet the demand originating from the civilian population, with the increasing standard of living but also from the army as a result of the war effort. The increase in population and extension of the Employees State Insurance Scheme to more and more families of the workers, will also have to be taken into account when framing targets for this industry. In another section of this Annual Number, it has been argued that because of the emergency and the priority accorded to other sectors of the economy, a 25 per cent reduction in the health programmes will have to be brought about. With a reduction in the health programmes, a scaling down of 10 per cent in the Third Plan targets of some of the important drugs, therefore, seems inevitable. While scaling down the targets, the increase in demand from the army by at least 15 per cent has been taken account of. The table below gives the production targets for 1965-66 for some of the important drugs and the revised targets:



Items	Production Targets for 1965-66	Revised Targets
Sulpha drugs (Tons) ..	1,000	900
Penicillin (Million mega units)	120	108
Streptomycin (Tons) ..	150	135
P.A.S. (Tons)	400	360
Anti-dysentery drugs (Tons)	75	67.5
I.N.H. (Tons)	100	90
Phyto-chemicals (Tons) ..	76.4	68.8
D.D.T. (Tons)	2,800	2,520
B.H.C. (Tons)	15,000	13,500

The pharmaceuticals and drugs industry in the country has progressed by leaps and bounds in the recent years. The production of sulpha drugs, for instance, went up from 98,000 kgs. in 1956 to 1,48,000 kgs. in 1960. Production of penicilline increased from 4 million mega units in 1955 to 50.18 million mega units in 1961. In case of DDT the production went up from 172 tons in 1955 to 2,786 tons in 1960. And similar is the story of increases in the case of streptomycin, phyto-chemicals, PAS, BHC, etc. The industry has sought collaboration from some of the well-known firms in Germany, Switzerland, Italy, Britain, etc. The firms which need special mention are Messrs. Squibbs & Sons, New York, Messrs. Merk Dermstadt of West Germany, Messrs. May and Baker of England, Messrs. Ciba Limited of Switzerland. The USSR has promised help in the public sector. The projects that will be set up with the Russian aid are a synthetic drugs project, a phyto-chemical project and the antibiotics project. It is expected that the synthetic drugs project will involve an outlay of Rs. 8.5 crores (exclusive of townships and working finance) and will provide employment to about 1,700 persons of all categories inclusive of 1,200 engineers and 250 technicians. The antibiotics project is estimated to involve an outlay of Rs. 10 crores and the phyto-chemicals project is estimated to cost Rs. 6.2 crores. In all a sum of over 80 million roubles (Rs. 95.20 crores) credit has been made available by the USSR Government, for drug projects. The synthetic drugs project will be located at Sanatnagar, Hyderabad (Andhra Pradesh), antibiotics project at Rishikesh, (U.P.), phyto-chemicals project in Kerala, and the surgical instruments project at Guindy near Madras. The production of penicillin and insecticides is also making good headway in the public sector.

The private sector has done extremely well and during the Second Plan period increased facilities for the processing of drugs apart from making a beginning in the monufacture of some of the essential drugs. The bottling facilities for antibiotics, e.g. penicillin and streptomycin have been expanded. Major schemes for the manufacture of bulk drugs have also been implemented in the private sector between 1956 and 1961. In some cases such as the manufacture of vitamin 'C' by Messrs. Sarabhai-Merk Limited, Baroda, the scheme so for implemented is based on the use of imported sorbitol, but the manufacturing programme approved by the Government provides for the production of sorbital also in the next phase so that in the initial years of the Third Plan, the vitamin 'C' manufacture in the country would be linked with indigenous glucose via Sorbitol. There is no production of DDT in the private sector.

Exports of drugs have been of nominal value; they were valued at Rs. 0.98 crores in 1961. The imports of drugs during the same year were of the value of Rs. 11.17 crores. Imports have been declining with increase in indigenous production and came down from Rs. 16.31 crores in 1957 to Rs. 11.17 crores in 1961. In the import policy announced recently, no further cut in the import of drugs has been made. Imports of only a few specific items like chloramphenicol, chlortetracycline, oxytetracyline, tetracycline and vitamin 'C' which were produced indigenously in adequate quantities have been banned. Care has been taken to allow more raw material for the indigenous manufacture of drugs and medicines during the current half-year. The industry has been facing some difficulties on account of the raw materials, but efforts are now being made to manufacture the intermediates so that the industry may not have to suffer on that account.

The pharmaceuical industry helps the growth of many other industries also. Besides chemicals it requires many other materials like paper, cardboard, glass bottles, plastic articles, caps, tubes and containers, and rubber plugs for putting their products in the hands of the consumers and medical practitioners in a form ready for use. So that the targets may be achieved, it is important that the capacity be utilised fully. At present anti-dysentry drugs industry is being utilised only

THE CALCUTTA ELECTRIC SUPPLY CORPN. LTD.

Ask your supplier to give you details

to the extent of 65 per cent while Nikethamide to the extent of only 10 per cent. Similar is the case in regard to some of the other important drugs like penicillin, streptomycin, P.A.S., I.n.H. d.d.t. and petrochemicals. These drugs are needed not only to save human lives but also to prevent the spread of diseases like cholera, typhoid, T.B. etc.

Research on the development of the industry is essential because the research carried out will not only be helpful for the maintenance of quality and improvement of products, but also assist in keeping abreast of the developments in other parts of the world. By producing better quality drugs we will also be able to increase our exports for which there is a great need at the moment. The research facilities available in this country are quite meagre and barring a few institutions like the Hopkins Institute and the Central Drug Research Institute, there is hardly any laboratory where research work on new drugs can be carried out.

Rubber Industry

A HEAVY demand is likely to be placed on the rubber goods industry during the period of the emergency with the increase in the demand for vehicles such as jeeps, trucks, motor cycles, station wagons etc. The demand would not only be confined to tyres and tubes, but to other rubber goods too, an increasing use of which is being made for various purposes. So far the industry has been able to meet the domestic demand successfully but whether it will be able to do so in the future also would depend to a great extent on how its problems are tackled and to what extent an increase in the production of natural rubber is brought about. Given proper encouragement and facilities, the rubber industry in India is capable of rising to the occasion and can play its part well in the economic development of the country.

A look at the production figures of raw rubber would reveal that in 1955, the Indian Union produced 22,481 tons and in 1960, 24,690 tons. India is not only a producer of raw rubber but unlike many other countries is also a consumer. With the increase in the standard of living, the consumption of raw rubber has gone up. While its consumption was 16,000 tons in 1950, the requirements went upto about 58,000 tons in 1961 including about 6,000 tons of reclaimed rubber and about 10,000 tons of synthetic rubber. It has been estimated by the Working Group on Rubber Plantation Industry that the demand for rubber will increase to 1,10,000 tons by the end of the Third Plan, while the production of natural rubber would be only 45,000 tons. It seems fairly certain that the Third Plan's estimate will have to be changed as a result of the new demand from defence for various goods. To meet the gap in production, it would be a good idea to open up rubber plantations in Nicobar and Andaman Islands. Since there is no short cut to self-sufficiency in natural rubber, imports will necessarily have to be increased. If earnest efforts are made in the country by the estates, the production of existing rubber plants may be increased by 10 to 15 per cent at least. A programme has been laid out for replanting rubber trees, with high yielding seedlings at the rate of 7,000 acres a year and this would be completed by 1966. In order to intensify the programme, it has been decided to raise the amount of subsidy from Rs. 240/400 to Rs. 1,000 per acre for replanting. Loan assistance to the tune of Rs. 750 per acre is also to be given for new plantation during the period of the Third Plan.

Since the demand for consumption would go up and production may not come up to the required expectations, a large gap would be left by the end of the Third Five-Year Plan period. This would mean that the country will have to import a good deal of natural, synthetic and reclaimed rubber. Since much foreign exchange may not be spared for these imports, it becomes necessary that we should try to tap our own resources fully. In this context, it would be worthwhile to assess the probable consumption of butyl rubber which is being used for the manufacture of inner tubes and other miscellaneous items and see whether licences for the manufacture of butyl rubber in India itself would be an economic proposition. The chief raw materials required for the rubber goods industry are natural and synthetic rubber, reclaimed rubber, carbon black, rayon and nylon tyre cord, sulphur, zinoxide, beadwire, pigments rubber auxiliaries etc. So far as carbon black is concerned, the Government have already given licenses to two units. With regard to the rubber auxiliaries also, the two plants which have already been licensed and which between them would be producing about 4,000 tons of rubber chemicals would take care of the requirements of the country for the next 5 to 10 years. Pigments are also being manufactured indegenously though in this case some of the special types of pigments are still being imported. It is considered that by 1965-66, the Indian Union will be self-sufficient in most of our raw material requirements with the exception of raw rubber, the basic material of the industry. In this context, it would be worthwhile negotiating with countries where we can have rupee payments agreements so that we may not have to spend scarce foreign exchange.

The production of automobile tyres in 1960-61 was 1,491 million, and a target of 3 million has been fixed for 1965-66. In regard to automobile tubes, the production was 1,411 million and a target of 3 million tubes has also been fixed for 1965-66. The annual rated capacity for automobile tyres and tubes in 1961 was 1,608 million and 1.661 million respectively. For 1965-66, it has been fixed at 3.7 million each. The table below gives a picture of production targets of various types of vehicles for 1965-66 and the requirements of tyres and tubes.

	Production target for 1965-66 (Nos.)	Type of tyre	Requirements of tyres & tubes for 1965-66 (Nos.)
Cars & Station Wagons	30,000	Passenger	150,000
Trucks	60,000	Giant	420,000
Jeeps	10,000	Jeep	50,000
Tractors	10,000	Tractor	40,000
Motor cycles & Scooters	50,000	Motor cycles & Scooters	100,000
		TOTAL	760,000

There is need to increase production by at least 25 per cent immediately. And for that full capacity will have to be utilised. It may be noted in this connection that while the capacity fixed for automobile tyres in 1960-61 was 1.61 million Nos., the production was 1.35 million Nos. If the indigenous production and sales are to keep to the schedules and prices are to be maintained at a reasonable level, it is quite necessary that disincentives to production be done away with. The rubber industry is today subjected to a series of taxes and duties. It

is a well-known fact that owing to rising labour costs and costs of raw materials, the production costs of rubber goods have been rising. Although the excise has been reduced from 25 nP. to 10 nP. per square metre for fabrics on average count of below 26s and 15 nP. per square metre for fabrics having higher average counts, it is not understood why no relief has been granted on excise duty on camel black and foam rubber. Since production is to be stepped up, it is necessary that these grievances of the industry are looked into. At present, research facilities are inadequate to meet the vast growing requirements of this developing industry. Today the consumers want more and better products, and it is only through research that better products can be made. It is high time that service institutes in major rubber industry centres are established during the emergency so that even the smallest manufacturers can take their problem to these centres for speedy solution.

Cotton Textiles

IF DEFENCE and development programmes are to proceed hand in hand at a rapid pace in the present state of emergency, restraint in consumption propensity is obviously warranted. This would have to be more on voluntary than on obligatory basis, since physical controls and fiscal measures may not be panacea for all shortages. The restraint in consumption is needed to meet increased defence needs, on the one hand, and to step up expoprts, on the other. It must be conceded that the development programmes of the Indian economy are not so spacious as to accommodate the defence programme of the present magnitude and the entire unproductive expenditure consequent thereon, without taking resort to extra doses of deficit financing and additional taxation. But, since the extent to which these measures can be resorted to is limited on account of the inflationary pressures that they would create, it is increasingly felt necessary to promote voluntary restraint in consumption.

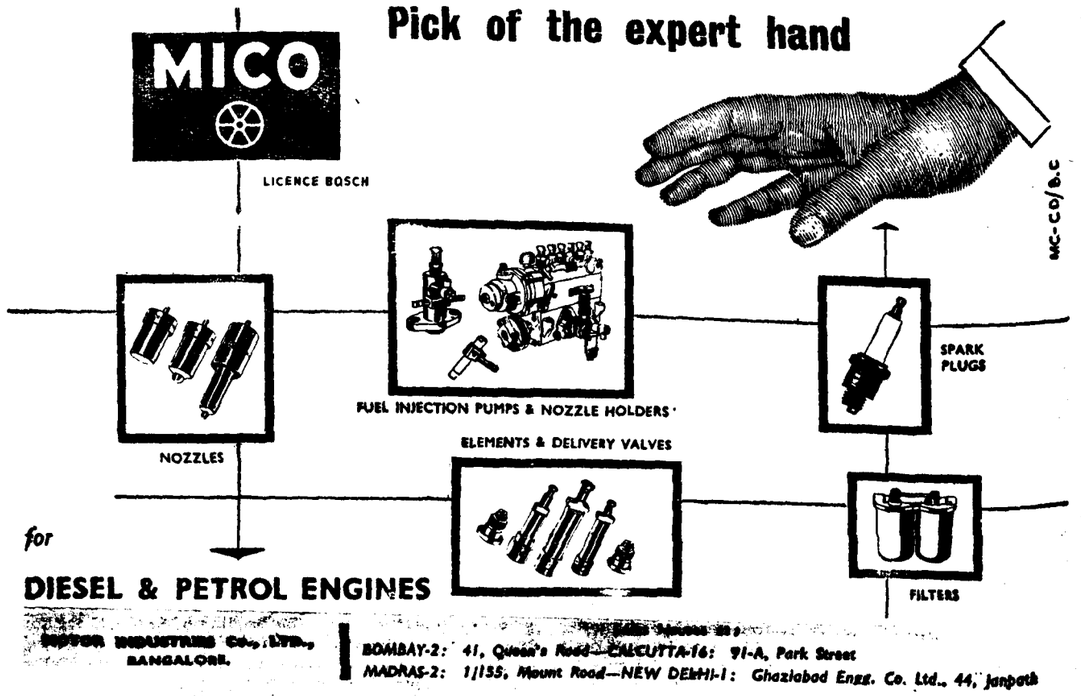
The Indian cotton textile industry which has had a long record of creditable performance in the past is at present eclipsed under a shadow of glut. But its future though threatened much by Britain's entry into the E.C.M. and by the heavy inroads made by synthetic fibres in the world market, is by no means bleak. The problems of the industry may be pinpointed as: (a) inadequacy of good quality cotton crops, (b) dwindling exports, (c) insufficiency of indegenous textile machinery production to meet the increasing needs of modernisation, and expansion and (d) the slowing rate of increase in per capita consumption as a sequel to rising cost of living.

The overall target for cloth production in the Second Plan was 8,500 million yards and accordingly the requirements of raw cotton were calculated at about 6.1 million bales. The export target was set at 1,000 million yards. The internal demand for cloth was calculated on the basis of an estimated per capita consumption of 18.4 yards in 1960-61 (as against an estimated actual per capita consumption of 16 yards in 1955-56) and an expected population of 408 millions. The cloth production for the handloom and powerloom sectors were, therefore, envisaged at 3,000 to 3.500 million yards (being the residual amount depending on the precise targets to be decided upon for mill cloth) as against an actual production of 1,753 million yards in 1955-56. Subsequently, the targets of capacity and production for cotton textiles were reviewed by the Government and accordingly it was decided to plan for per capita consumption of 18.5 yards of cotton cloth for an estimated population of 400 millions at the end of the Second Plan, which was again subsequently revised downwards to 17.5 yards on the basis of the Joshi Committee's (1958) recommendations.

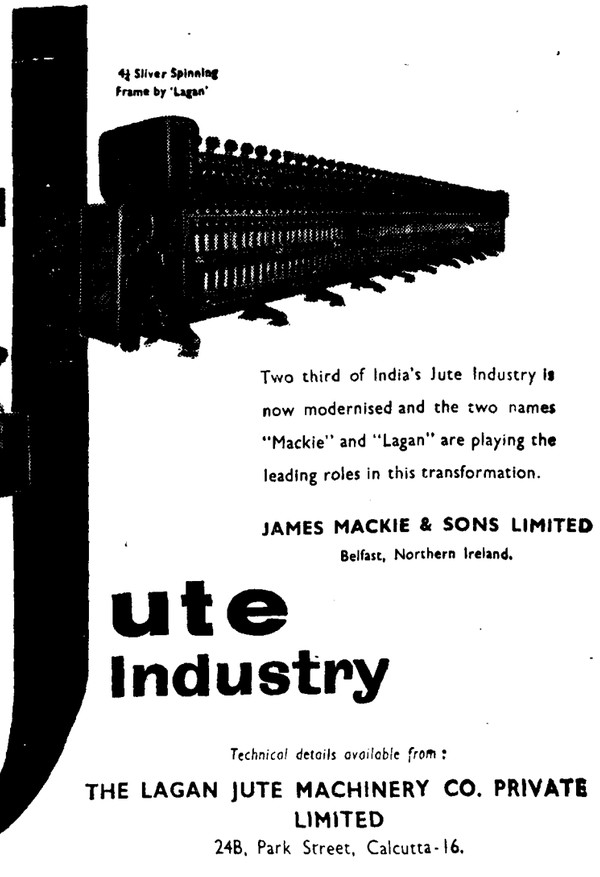
On the same basis, the requirement of about 6.1 million bales of cotton for meeting the production target of 8,500 million yards of cloth envisaged earlier was revised downwards to 5.5 million bales. In November, 1956, the target was again revised upward to 6.5 million bales of cotton. Against the forecasts thus made, the production of cotton increased from 4.5 million bales in 1955-56 to 5.4 million bales in 1960-61.

The figures quoted below give the production according to staple length groups during the Second Plan period:

Year	Superior Long Staple (1" & above)	Long Staple (7/8" to 1")	Medium Stple (23/32" to 27/32")	Short Staple (11/16" & below)	Total
1950-51	47	637	1,448	839	2,971
1955-56	305	1,305	1,692	699	4,001
1956-57	329	1,689	1,950	767	4,735
1957-58	338	1,442	2,122	857	4,739
1958-59	382	1,386	2,088	830	4,686
1959-60	451	1,382	1,350	652	3,835
1960-61**	517	1,924	2,212	741	5,394



*Bales of 392 lbs. each. **Provisional.



Against the envisaged production of 6.5 million bales of cotton at the end of the Second Five-Year Plan, the actual yearly output was as follows:

Year (September-August	In 1000 bales 392 lbs. (net)
1955-56	3,998
1956-57	4,735
1957-58	4,739
1958-59	4,686
1959-60	3,678
1960-61	5,394
1961-62	4,500

It is estimated that the output in 1962-63 will be of the order of 52 to 54 lakh bales. During the last three years the average consumption of cotton by mills has been of the order of 52.5 lakh bales and as such the shortfall has had to be made good by importing on an average 9.5 lakh bales during the same period. The need for importing a certain quantity of long-staple cotton will persist in order to enable the mills to manufacture fine and superfine fabrics. During the season ended August 31, 1962, over 9 lakh bales were licensed for import.

On the basis of estimated increase in population and the likely increase in demand due to the expected rise in national income during the Third Plan, it has been assumed that the increase in the total requirements of cloth during the Third Plan period will be of the order of 20 per cent. Thus, the total requirements of cloth in 1965-66 have been taken as 8,450 million yards of cloth assuming per capita requirement of about 17.5 yards in 1965-66 on the basis of a population of about 486 millions expected at that time. The export target for cotton cloth is envisaged at 850 million yards most of which is

expected to be accounted for by the mill sector. Taking the export and annual requirements together, the total demand for cloth at the end of the Third Plan has been placed at 9,300 million yards in 1965-66.

The export target of 850 million yards envisaged in the Third Plan, though not as ambitious as in the Second Plan, may yet be difficult to achieve. The export incentives scheme introduced in 1958 and the Scheme for compulsory exports introduced in July, 1962, enjoining upon each textile mill to export cloth equivalent to 12½ per cent of the total value of its output in one year may at best push up exports marginally. The export obligation in regard to yarn is 3 per cent of the value of its production in one year. The following figures show the trend of exports (including handloom) over a period of years:

Year	Cloth exports million yards	Yarn exports million lbs.
1957	881	17
1958	622	31
1959	851	21
1960	724	14
1961	575	13

It is estimated that cloth exports this year are not likely to be more than 650 million yards. It seems to have been realised by the industry in general that if India's export goal in textiles is to be attained, there is no substitute for modernising its productive equipment, for attaining higher levels of productivity and for achieving a general reduction in costs.

This, then, naturally leads us to the question of producing in sufficient quantities textile machinery for modernisation and expansion. But, before entering into the question of textile machinery production, it would be worthwhile to consider the spindles position for producing 9,300 million yards of cloth under the Third Plan. To reach the level of production of yarn estimated to be about 2,250 million pounds, it has been envisaged in the Third Plan that 16.5 million active spindles will be required as against an average level of 12.7 million active spindles during the last year of the Second Plan. Subsequently, an official group, which examined comprehensively all aspects of the installation of additional spindlage during the Third Plan, expressed its views that about 5 or 6 lakh idle spindles were to be re-activated during the Third Plan. On the basis of this report, it was further envisaged that the installation of about 3.3 million additional spindles should be required under new units and expansion of existing mills to reach the target of 16.5 million active spindles laid down in the Plan. The average number of spindles worked in the first shift during 1961 was 12.08 millions. This level of working appears to be the probable optimum reached with the existing capacity at the present working condition of the machinery.

In view of the tight foreign exchange situation, increasing reliance has of necessity to be placed on supplies of textile mechineries inside the country. In the following table is shown the progress made by the textile machinery manufacturing industry in terms of the value of its output.

Year	(Rs. crores)
1955	5.38
1956	7.30
1957	9.90
1958	7.30
1959	8.10
1960	10.40
1961	12.94

But it would be admitted that the present rate of textile machinery output is not enough to meet the enormous requirements of the mills for purposes of both modernisation and expansion. The figures quoted below, showing the production of various items of spinning machinery in India, makes this point clear.

Items	1955	1956	1957	1958	1959	1960	1961
Carding Engines	649	726	1023	1148	763	1075	1308
Drawing Frames	44	24	34	9	41	47	75
Speed Frames	28	29	33	28	16	45	70
Ring Frames*	863	1110	1364	877	1077	1127	1340
Reeling Machines	607	1158	1965	804	435	50	14
Doubling Frames	..	..	..	..	..	156	113

*Each ring frame consists of about 400 spindles.

Besides, the production of automatic looms by Indian manufacturers has not been able to keep pace with the demand. The following table shows the trend of production since 1958.

Year	Looms: Plain	Looms: Automatic	Total	Imported Automatic Looms
1958 ..	3187	36	3223	844
1959 ..	4231	356	4587	159
1960 ..	5177	374	5551	649
1961 ..	7534	67	7601	1943

The country has yet to go a long way in attaining self-sufficiency in the production of textile machinery.

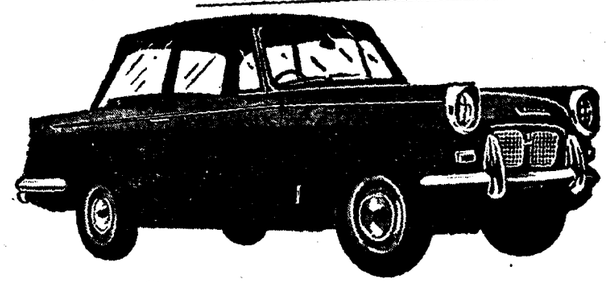
All in all, the problems of Indian Cotton textile industry pinpointed here are inter-dependent against the background of foreign exchange shortage. The reported accummulation of stocks to the extent of 5 lakh bales which is only slightly below the 1958 level, is certainly heavier in its impact because of an all-round rise in costs. The sluggish character of textile exports and a rather slack domestic demand are both responsible for the present crisis. Will defence requirements give a push to demand? There do not seen to be very bright chances for that as well. As things stand, only an increase in the purchasing capacity is likely to relieve the pressure on stocks.

Rayon and Staple Fibre

OWING to the increasing popularity gained by the man-made fibres industry on account of the durability and price—two very distinct advantages over cotton—a ambitious programme for expansion of its capacity has been envisaged in the present context of emergency because of its use in making a wide variety of military requirements, such as, parachutes and protective clothing, apart from its extensive uses in other forms viz in tyres, conveyor belting and other industrial purposes. The target for production in the Second Plan was set at 100 million lbs., consisting of 52.3 million lbs. of rayon filament and 48 million lbs. of staplefibre. Later on the Development Council for the Art Silk Industry has estimated that the demand would be 80 million lbs. per annum in 1960-61. As against this estimated demand, the Planning Commission recommended a provisional target of 68 million lbs., but subsequently raised it to 100 million lbs. on the condition that satisfactory arrangemens would be made by the prospective entrepreneurs to import at least 80 per cent of the capital equipment on defered payment loans. However, with the worsening of the foreign exchange situation the original target of 68.3 million tons could not be reached by 1960-61. For the same reason, the production target for staple fibre could not be reached as estimated earlier and hence a target of 32 million lbs. was envisaged. In the Third Plan period the capacity is expected to be expanded to 215 million lbs.—140 million lbs. rayon filament and 75 million lb. staple fibre. This expansion programme provides for an increase in the per capita consumption of rayon fabrics from 1.3 yards in 1960-61 to 1.8 yards in 1965-66. The overall target for rayon filament comprises 20 million lbs. of tyre cord yarn required for the automobile tyre industry, 76 million lbs. of viscose filament, 24 million lbs of acetate yarn, 10 million lbs. of cuprammonium and 10 million lbs. of synthetics.

In the family of man-made fibres, viscose rayon is by far the most important. In 1951 the national output of viscose rayon was a little under five million lbs., but within a period of ten years, it has increased to 45 million lbs. Wood pulp being the basic raw material for viscose yarn production, it is likely to accentuate the shortage of bamboo for the paper industry. Since from the defence point of view synthetic fibre is more important than paper, the expansion programme for paper and newsprint will have to depend increasingly on the use of bagasse which is presently being used as fuel by the sugar mills.

Staple fibre production did not exceed by 7 million lbs. in 1954, but rose to 57 million lbs. in 1961 and made a substantial contribution of Rs 150 million to the foreign exchange resources. The licensed capacity of man-made fibres in India as at present is shown in the following table.



(In million lbs.)

Cellulosics	
Viscose filament	86.4
Acetate yarn	8.8
Cuprammonium	5.0
Staple fibre	64.0
Tyre cord	33.0
Non - Cellulosics	
Nylon filament	11.7
Nylon staple	0.65
Nylon tyre cord	1.6

Synthetic fibres can be good substitutes for long-staple cotton which is in short supply in the country.

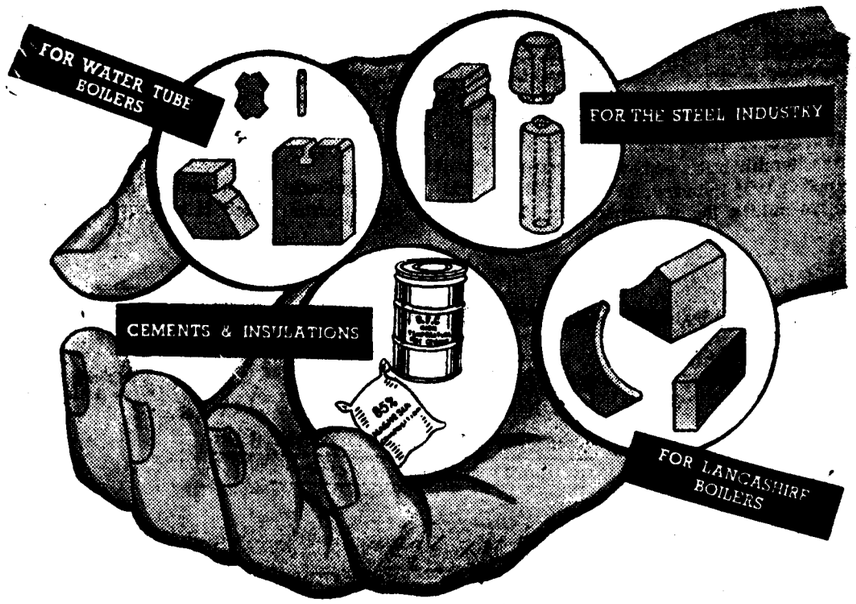
It's a new experience in motoring with the STANDARD Herald !

A thoroughly practical car that is designed to give trouble-free motoring under any conditions.

- Easy to handle
- Independent suspension on all four wheels
- Twentyfive feet turning circle.

Manufactured by:
THE STANDARD MOTOR PRODUCTS OF INDIA LTD.,
MADRAS-7

E241118A



Low denier acetate filament has been found to be an excellent substitute for longstaple cotton and viscose staple fibre for medium and short-staple cotton. One of the handicaps of industry is its present dependence upon the import of yarn to the extent of about Rs 13 crores. But because of the rising demand for parachutes and other military requirements, the production of synthetic fibres has got to be maintained even if the burden on India's foreign exchange is increased.

Woollen Industry

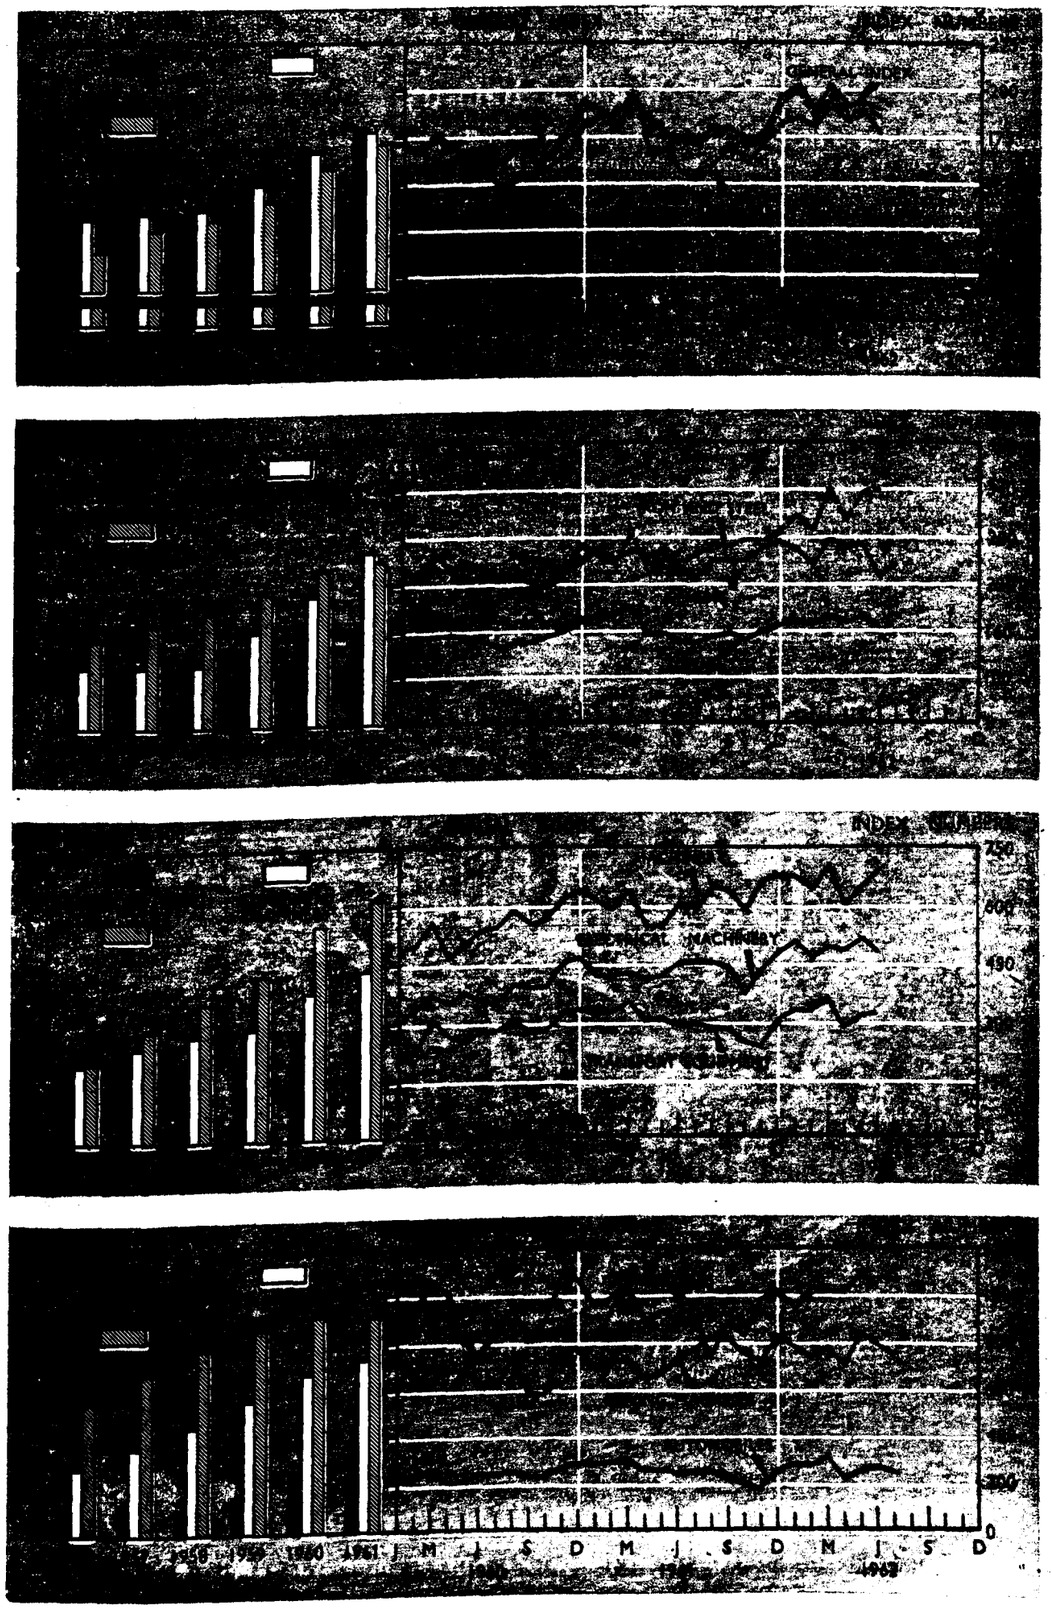
THE PRESENT state of emergency in the wake of the Chinese invasion has set the Government athinking on the problems of woollen industry consisting mainly of the under-utilisation of the rated capacity on account of the industry's dependence on imported wool. When the present emergency arose the country had almost very small quantities of woollen goods available. About Rs 5 crores extra foreign exchange allocation has been made and a special purchase mission has lately returned after a hurried visit to Australia, Newzealand, and Bradford. The Government had appointed a Controller of Woollen Textiles with wide powers and a Woollen Goods Production Advisory Committee has been constituted of leading business men to assist the Controller.

No fresh capacity was sanctioned to the industry in 1962. In the following table is shown the present licensed capacity and actual installed capacity with production capacity on three-shift basis.

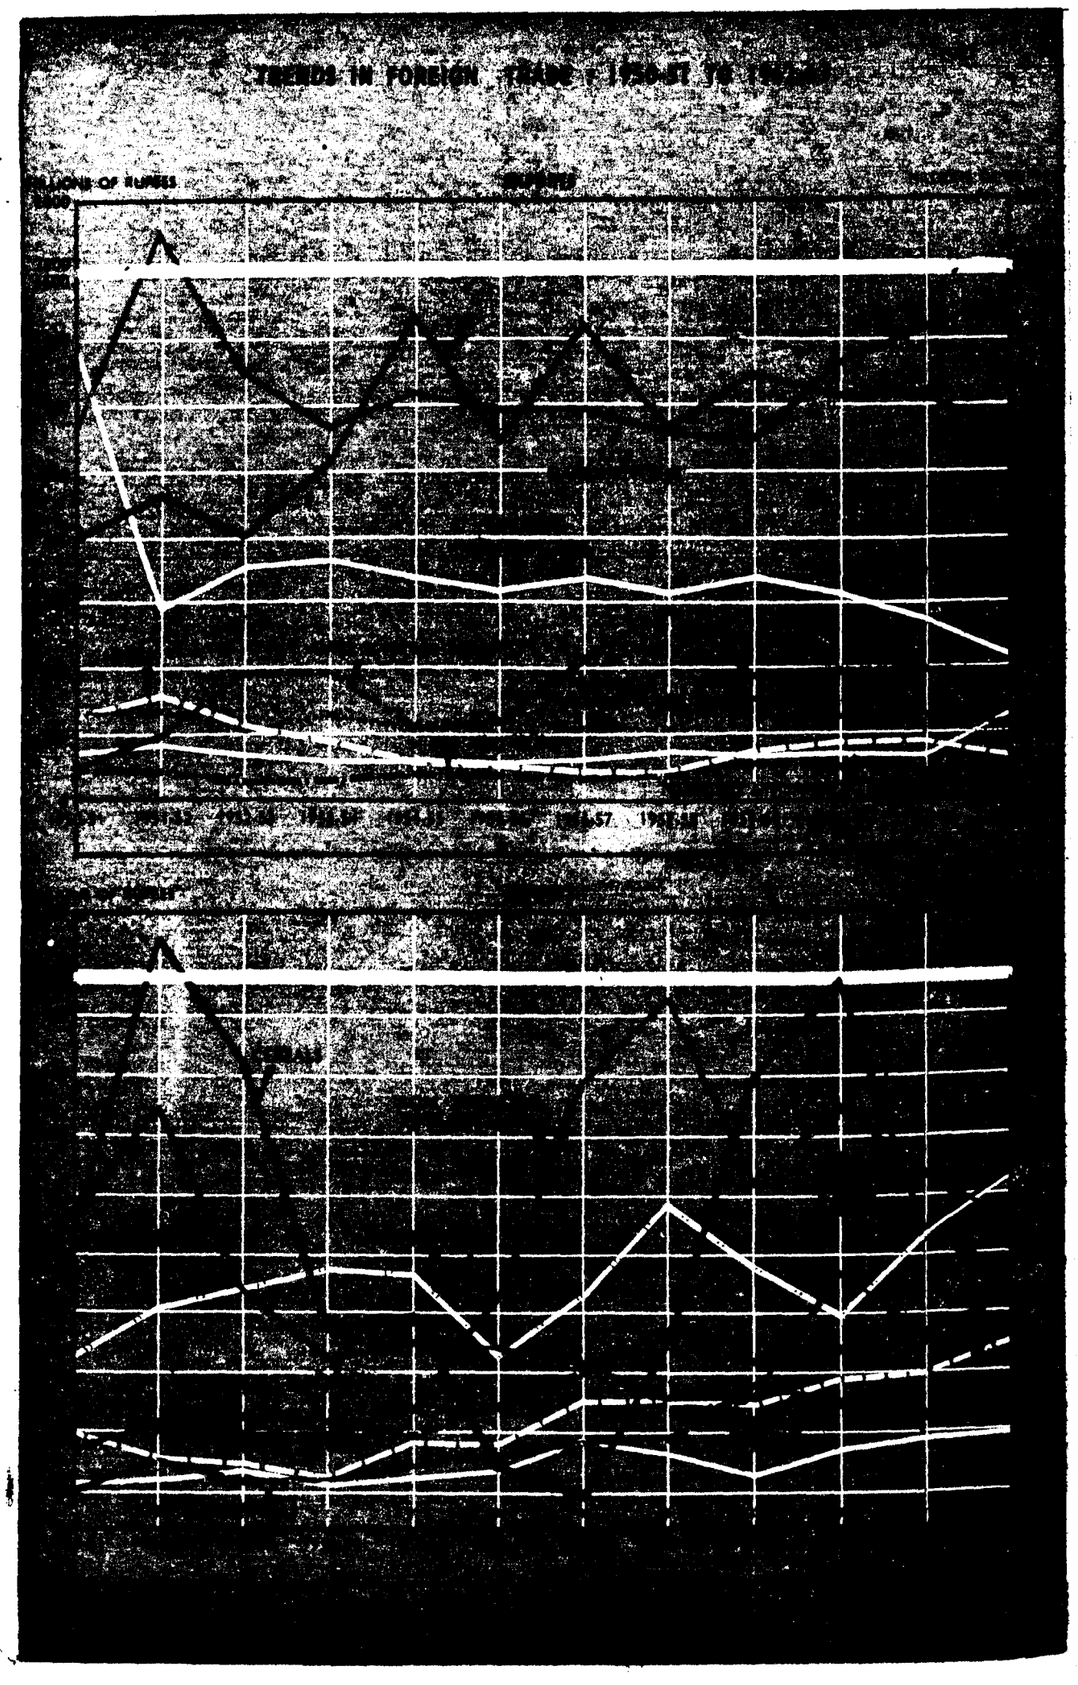
Items	Licensed	Actually installed	Production of three-shift basis
Wool Tops	24.3 m. lb.	11.3 m. lb.	11.3 m.lb.
Woollen Yarn	50,129 spindles	40,404 spindles	37.5 m. lb.
Shoddy Yarn	19,471 spindles	16,271 spindles	12 m. lbs.
Worsted Yarn	140,880 spindles	140,880 spindles	42.2 m. yds.
Woollen Fabrics	..	3,130 powerlooms	46.5 m. yds.

FIREBRICKS, FIRE CLAY AND HIGH TEMPERATURE FIRE CEMENT
in the service of the INDIA'S INDUSTRY

With half a century's experience at our back we serve our customer's individual requirements. **REFRACTORIES OF HIGH QUALITY**, for reliable service can now reach you swiftly from our Factories at Ishwarnagar, New Delhi & Niwar (Dist. Jabalpur).



We serve the Industry with Fire Bricks of all types, sizes and grades, with Alumina ranging from 30% to 76%, Fire Clays, High Temperature Fire Cements, 85% Magnesia Composition, etc., etc. We also manufacture complete requirements of Refractories for the Iron & Steel Industry, Railways, and Ordnance Factories.



THE ISHWAR INDUSTRIES LIMITED

FACTORIES AT:

ISHWARNAGAR, NEW DELHI * NIWAR, DISTT. JABALPUR.

INDIAN INDUSTRY

The Third Plan targets of production vis-a-vis the individual targets for 1961-62 in each sector are indicated in the following table:

Items	Third Plan Targets	1961-62 Plan Targets
Wool Tops	31.5 m. lb.	24.3 m. lb.
Woollen Yarn	14 m. lb.	—
Worsted Yarn	28 m. lb.	20.06 m. lb.
Shoddy Yarn	10 m. lb.	8 m. lb.
Fabrics	35 m. lb.	20 m. lb.

Against this target the actual production during 1961-62 has been much below the installed capacity and targeted production for the same period. The figures of actual production during 1961-62 and 1962-63 (April-August) are shown in the table below:

Items	1961-62	1962-63 (April-August)
Wool tops	7.2 m. lb.	4.0 m. lb.
Woollen and shoddy yarn	16.3 m. lb.	5.4 m. lb.
Worsted yarn	15.5 m. lb.	6.7 m. lb.
Woollen fabrics	15.8 m. lb.	8.6 m. lb.
Carpet yarn	2.9 m. lb.	1.1 m. lb.

It is evident from the figures quoted above that against the targeted production of 20.06 million lbs. of worsted yarn for 1961-62, the actual production for the same period was only of the order of 15.5 million lbs. and against the targeted production of 20 million yards of woollen fabrics for 1961-62, the actual production turned out to be only 15.8 million yards. In view of the substantial defence requirements for woollen goods, it is likely that existing unutilised capacity will be fully utilised. Until the quality of indigenous wool is improved to a level suitable for combing purposes, it might be necessary to meet the entire requirements of wool for manufacture of wool tops (which in turn is raw material for worsted spinning) from imports. In order to minimise such imports, the potentialities of the semi-worsted spinning system, which is able to produce fine yarn from wools unsuitable for combing, need to be explored. In view of the fact that the Sino-Indian war is to be fought at high altitudes, there can be no question of keeping any capacity idle in the woollen industry. Imports of wool tops have to be arranged, no matter at what cost, if our jawans are to be provided with adequate warm clothes.

In the consumer industries in general more and more stress is to be laid on fuller utilization of the present installed ctapacity. Some slowing down of the grant of new licences has to be resorted to to make foreign exchange resources available for purchase of essential raw materials for the existing industrial units and for the pressing demands of the armed forces. Even if, because of this, shortages develop in some consumption goods, they have to put up with. Some of the consumer goods industries, assured of indigenous raw materials, have to make extra efforts to step up their output not only for making available adequate quantities to the civilian population and defence personnel, but also for earning more foreign exchange through additional exports.

ALLAHABAD BANK LTD.,

The Oldest Joint Stock Bank in India

Established 1865

Reg. Office: 14, India Exchange place,

CALCUTTA—1

Branches and correspondents throughout India. Agents in all principal cities of the World.

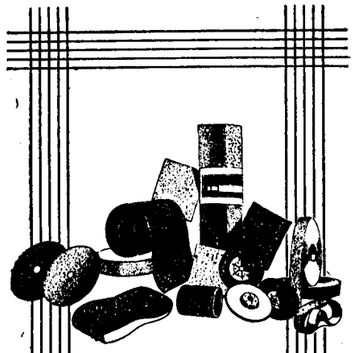
Your NEW SIGN of Petroleum Energy



ESSO

This is the ESSO sign—world-recognised symbol of outstanding petroleum products, true research! This is your ESSO sign—backed by the world's greatest resources of petroleum knowledge and experience.

ESSO brings better standards of living, serving industry, transportation, agriculture, the home.

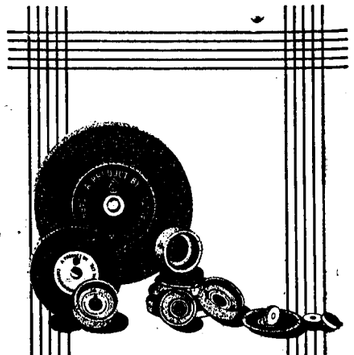
Esso research works wonders with oil!

ESSO STANDARD EASTERN, INC. (INCORPORATED IN U.S.A. WITH LIMITED LIABILITY)

COATED ABRASIVES

Flint (Sand), Garnet, Emery, 'Aloxite', Silicon Carbide, Rolls, Belts, Discs, Converted Shapes, Reamstock in paper and cloth, Silicon Carbide Water proof Abrasive Paper, etc.

CARBORUNDUM UNIVERSAL



COATED AND BONDED

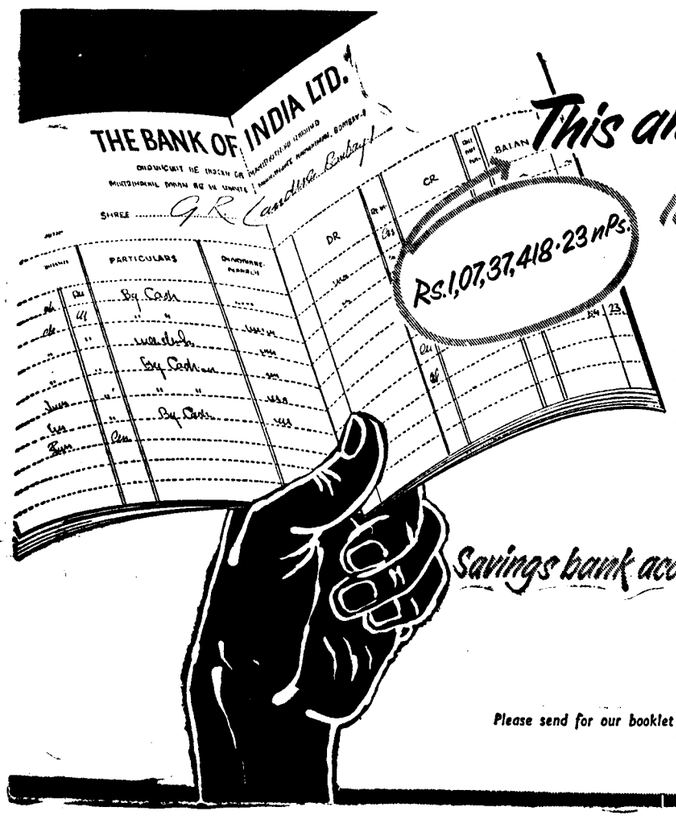
ABRASIVES

CARBORUNDUM UNIVERSAL manufacture a comprehensive range of Coated and Bonded Abrasive products required by modern industries.

Made by most up-to-date manufacturing methods, under expert supervision, using the highest quality raw materials, Carborundum Universal Abrasive products have been found to be consistent in quality, ensuring quicker stock removal and better finish.

By constant research and development work, and quality control at every stage of manufacture, Carborundum Universal Abrasive products have proved themselves to be equal to the best manufactured anywhere else in the world.

BONDED ABRASIVES



Grinding Wheels, Segments, Cut-off wheels, Sharpening Stones, finished and unfinished sticks and bricks, floor polishing blocks, valve grinding compound etc.

CARBORUNDUM UNIVERSAL LTD.

Head Office: 52/53, Jehangir Street, Madras-1. *Telephone:* 29141 (8 Lines)

CHEMIEAUSRÜSTUNGEN

Deutscher Innen-und Aussenhandel

OUR SPECIAL OFFER INCLUDES

Factories for the Production of Soda Ash (Anhydrous Sodium Carbonate) according to the ammonia-soda process, as standard types with 150, 300, 600, 800, 1,200 or 1,600 metric tons daily capacity. The location of the soda factory is dependent on occurences of salt, limestone and coal. Owing to the high cooling water consumption it is preferable to install the plant near to a sufficiently water-bearing river. A siding track is essential to the supply of raw materials and the dispatch of the finished product. Projects of soda ash factories designed by our engineering department are based on latest developments and make allowance as far as possible for special customer's requests. Experience attained in numerous factories installed at home and abroad are fully utilized in designing soda ash plants.

Electrolysis of Alkali Chlorides Plants for 3,000 to 50,000 metric tons of Na OH - 100% - per year as standard plants comprising the following production departments: salt solution | brine cleaning | electrolysis | chlorine cooling and chlorine drying | chlorine liquefication | chlorine storage and cask filling | soda lye store | hydrogen cooling and cleaning - and the subsidiary departments:

Salt store | switching station and rectifier station | electrode shop | chemicals magazine | mechanical workshop | laboratory and staff facilities. Particularly worth mentioning is the heart-piece of the plants, the alkali-chloride electrolytic cell - for 25,000 or 50,000 Amp. Operating according to the mercury process, the plants are suitable to be used in chemical industries for the production of chlorine, soda lye and hydrogen. The mercury process involves the advantage of attaining excellent degrees of purity of the product as well as a high concentration of the soda lye of appr. 50%. For engineering specification, please, ask for inquiry sheet.

HIGHLY ACIDPROOF AND HEAT-RESISTANT ENAMELLED APPARATUS AND VESSELS OF SPECIAL CAST IRON such as stirring and agitating machines | evaporators | autoclaves and digesters | tilting kettles | laboratory apparatus etc. for the use in the chemical and pharmaceutical industries; "ultra-thermally enamelled" construction for especially high thermal-shock resistance; "ultra-vitreously enamelled" construction for uses involving alkaline attacks.

VITREOUS-ENAMELLED VESSELS AND APPARATUS OF STEEL such as autoclaves and digesters | stirrers and agitators | storage tanks | graduated vessels | condensers | dephlegmators | filtering flasks | filters | distilling apparatus etc. for laboratory uses, for full-scale tests, and for the full-scale production in all branches of industry.

'KOROBON" - HEAT-EXCHANGERS, APPARATUS AND COMPONENT PARTS The material "KOROBON" is an electro-graphite impregnated according to a special method with synthetic resins being resistant to chemicals. Due to its excellent chemical and technological properties the "KOROBON" is particularly suited for the construction of corrosion-resistant apparatus. Particular features of "KOROBON" are: high chemical resistance | resistance to high temperature up to 200°C | thermal-shock resistance | excellent thermal conductivity | good electric conductivity.

"KOROBON" — heat-exchangers are mainly used where the chemical aggressivity of the moved media excludes the use of the usual metallic materials and where an increase of effeciency with simultaneous high economy in operation are aspired to: for heating or cooling of liquids and gases | for concentration and evaporation | for condensation and for other processes.

MIXERS AND TRIPLE ROLLER MILLS for the dye-stuffs industry. Our planetary mixing and kneading machines are especially suited for the preparation and mixing of thin to stiff paints and for the thinning of pasty materials to be mixed. Both the kneading machine and the triple roller mill are tuned to each other. After the mixing process has been completed, the mixing part is hydraulically lifted so that the vessel can be rolled to the roller mill, introduced there in the lifting fork of the charging equipment and hydraulically lifted. This charging facility is first of all for the benefit of such works which owing to their one-story construction have to abandon to crane equipment.

Besides smaller roller mills with horizontal arrangement of rollers and mechanical adjustment of rollers, we deliver modern high-efficiency triple roller mills with automatically hydraulic adjustment of rollers. The reliable hydraulic system allows an unobjectionable control and reproducibility of the optimum grinding pressures independent of variations in temperature. Two roller speeds enable an extended applicability of the machines.

HIGH-VACUUM FREEZE-DRYING PLANTS and other vacuum equipment — System Holland-Merten. High-vacuum freeze-drying plants are used for the production of high-grade drying products from aqueous substances in frozen state such as substances of high molecular weight and biological or pharmaceutical origin, e.g. serums, plasms, antibiotics, micro-organism cultures, etc. The apparatus which are constructed both for the use in laboratories and institutes as small-scale units and for the industrial large-scale production comprise always the actual fine-vacuum drying space, one fine and high-vacuum pump set as well as one freezing compartment for the condensation and freezing out of the humidity driven out. Whilst the drying space for the smaller apparatus is formed by a suitably designed vacuum receiver, the plants for larger capacities are preferably designed as cabinets for the charging with receivers for ampoules, plasm flasks etc.

COOLING PLANTS AND CONDENSING UNITS operating with greatest reliability and optimum efficiency have been already delivered by our manufacturing works to a great number of countries. More than 50 years of practical experience and latest technological knowledge from the fundamental concepts of design, manufacture, and erection of cooling and refrigeration plants for refrigerated warehouses. slaughter houses, breweries, dairies, textile mills, chemical works, ice mills, freight and passenger ships as well as air-conditioning plants. Our production programme includes also frozen-food and cooling cabinets for foods and beverages.

PLANTS FOR THE DEXTRIN PRODUCTION according to the continuous production process Dextrins (polysaccharides) can be extracted from all sorts of starch, but especially from potato or maize starch. In our plants the batch process usual in the beginning in the dextrin production has been replaced in the course of development by the continuous working process. In this way the several production processes become economically and at the same time an equally good final product is attained. Compared with the customary batch operation with the same capacity, our standard dextrin production plants rated with 10 metric tons | 24 hr. require smaller initial cost, smaller energy consumption, and smaller labour employed.

PLANTS FOR THE PRODUCTION OF KITCHEN SALT FROM SEA SALT That equipment is an economically operating small type plant with a standard output of 2 metric tons edible salt (kitchen salt) per hour. Therefore, it is suited for many interested parties, and due to the low original cost of the raw salt a rapid amortisation is also ensured. The process comprises a washing, centrifugalling, drum-drying, crushing, screening, sacking and weighing process, consequently the raw salt is not subjected to any chemical modifications. If particular requests are put with regard to the chemical purity of the salt, we recommend to install our vacuum evaporation plants with a standard output of two metric tons per hour, as well.

PLANTS AND SINGLE MACHINERY FOR THE PEELING MILLS AND FLOUR MILLS The construction of mill machinery and mill equipment as well as projects of complete up-to-date mill plants are done with greatest care in the GDR. High yield from the material to be ground combined with economic operation ensure an optimum profitableness of the mill enterprise. Our manufacturing works dispose of traditional experience, a creative engineer team, and excellent skilled workers. Numerous mill plants in the Union of India and other countries have been delivered by our works and are operating to the fullest satisfaction of their owners.

STANDARD RICE MILLS manufactured in a special works, are the result of an exact scientific-technical development and many years' practical experience. The design of the single machines takes into account the urgent demands for economical operation, beauty of form, and ease of operation. The standard rice mills are in all-steel construction with detachable steel framework. Within a short time, they can be installed on a relatively small floor space. Compared with the small floor space required and the power consumption, the capacity of 20 metric tons paddy per 24 hours is exceptionally high. But, we deliver also standard rice mills with still higher capacities.

STANDARD RICE HUSK OIL EXTRACTING PLANTS Rice husk, the by-product of the rice grinding process, is in many countries still considered to be waste. Rice husk has a crude fat content from 12 to 18%, a raw protein content from 10 to 14%, carbohydrates, in addition calcium, phosphorus as well as tracer elements and furthermore vitamines of the B-group. By processing the rice husk in our extracting plants, a material of great value is produced from the "waste." The oil extracted is suitable for technical purposes. Under certain suppositions, it can be processed to a high-quality edible oil. The extracted rice husk freed from the oil represents a high-grade fodder.

Our standard rice husk oil extracting plant has a capacity of 25 metric tons normal raw rice husk (normal bran) in 24 hours. The use of rotating extractors guarantees optimum extraction efficiency; they have proved their excellency in a great number of tropical countries.

Export Programme: Plants, machinery and equipment for chemical industries and food and semi-luxuries industries, packing equipment and machinery, cooling plants, condensing units, frozen food and cooling cabinets, air conditioning plants, armatures, mountings, and fittings for all branches of industry

Please, attend our exhibition stands at the Leipzig Fairs 1963

TATA INDUSTRIES PRIVATE LTD.

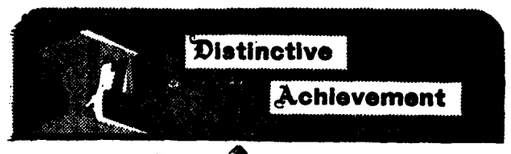
a clean, bright, spacious look with

Glass

Office space seems to grow when cumbersome partitions are replaced with glass. Rooms look lighter, brighter and so much more elegant. It's not surprising glass is finding its way into more and more homes, stores, schools and restaurants—wherever light and space are important considerations.

Glass is so practical too. It keeps out noise and dust and lets in natural light. And keeping glass clean is the easiest thing in the world.

Available in a wide variety of sizes and thicknesses, and quality tested at every stage of manufacture, there's an HPG sheet glass to suit every purpose.



For the finest, most durable glass you can depend on HPG

Energy Pattern

Power Shortages

IT is admitted at all hands that apart from raw material shortages, a great drag on our industrial production in the recent past has been exerted by paucity of power. Dearth of power for industrial uses started developing in 1959-60, primarily as a sequel to the pruning of some power projects in 1957-58, necessitated by foreign exchange difficulties. This cutback in power development programmes resulted in a net shortfall of nearly 98 MW. in the additional installed capacity that was envisaged to be set up in the ten years to 1960-61. With the launching of the Third Plan in April, 1961, expectations came to be entertained that efforts would be redoubled to augment the power generation capacity in the interest of the ambitious industrial programme chalked out. But the experience of the first year and the eight months to November of the second year of the Plan has been none-too-happy.

As against the target of increasing the installed power generation capacity to 6.3 million kW. by the end of 1961-62, the capacity brought into being by that date, according to the latest appraisal by the Planning Commission on the progress of the Third Plan power development programmes, is stated to have been only 6.17 kW. At the end of the current financial year, expectations are that the installed capacity would be raised to 6.88 million kW., as against the target of 7.03 million kW. The prospects held out for the next year too are not so bright. Installed capacity at the end of 1963-64 is estimated to go up to 7.82 million kW., as against the Plan target of 8.08 million kW. It is only in the last two years of the Plan that the situation is anticipated to ease somewhat as a result of installed capacity increasing at a faster rate, by 2.18 million kW. in 1964-65 and by 3.28 million kW. in 1965-66. The total installed capacity expected to be established by March 31, 1966, is 13.28 million kW.

Availability of power to this order towards the end of the current Plan period may suffice for stepping up industrial production by about 12 per cent per annum, on an average, during the remaining three years of the Plan, as required by the present emergency, if demand increases according to the conservative relationship of power requirements growing at about 1.7 times the rate of growth of industrial production. But if it grows at the fast rate at which it has gone up in the recent past—2.3 to 2.5 times the rate of industrial growth—power requirements in 1965-66 may well be in the neighbourhood of 15 million kW. installed capacity. The anticipated installed capacity, thus, may fall short of the needs by nearly 1.7 million kW. Unless, therefore, strict priorities for power use are laid down as between the various consumers, development of our economy may continue to suffer from power shortages even after 1965-66.

There is, indeed, no short cut to augmenting power generation capacity immediately or during the next few months except expediting the erection of the power plants nearing completion and commissioning in the plants lying idle through negligence in repairs work. That there should be some unutilized capacity in this field was brought to light during the unprecedented power shortages experienced in Delhi some time ago. The current emergency demands that if there is lying any power plant idle for want of repairs, it should be hunted out and put in working condition. Strengthening the spares position of the existing plants also is urgently called for because in our anxiety to accelerate industrial growth, there is every danger of the power plants being overworked. These plants having been purchased in the past from a large number of countries, procurement of spare parts for them invariably is not an easy task.

Some improvement in the power supply position even during the immediate future can also be effected through making available to the thermal power plants regular supplies of coal of the right quality. Most of the old plants were designed to work on superior grade coal supplies of which were abundant in the past because there were no restrictions on mining of such coal. With the setting up of the new steel plants and certain other industries requiring high grade coal, the coal supplied to thermal plants is now of only very inferior quality. Reversion to supply of high grade coking coal to the old thermal plants—some of them have been adapted to the changed circumstances—is obviously out of question. But some improvement in the situation can certainly be effected by supplying to these plants the slightly better qualities among the inferior coals.

Some relief from power shortages may as well accrue in the near-term if increasing use is made by industrial units, especially in areas where voltage fluctuates erratically, of capacitors manufactured by the Heavy Electricals in Bhopal. By evening out fluctuations in power loads, these capicitors help in better utilization of the available energy; excessive loads are stored for a few hours and they supplement the electric current when voltage falls. Greater self-discipline by the industry in matters of power consumption should also go some way in alleviating the distress caused by power paucity.

So far as the next five years are concerned, attempts need to be made to ease the power supply position in a greater measure than anticipated currently by the Planning Commission. Despite the difficulties being encountered in the procurement of power plants equipment from abroad through tied loans made available by the friendly countries or from the Bhopal Heavy Electricals indigenously, a higher rate of progress in power development should be possible of achievement if only the unnecessary delays caused by the bureaucratic methods of our administrative set-up are obviated. The meticulous care currently being exercised in ascertaining the supply of various power generation equipments from domestic sources, before placing orders abroad, needs to be relaxed in some measure in order to avoid the unwarranted official delays. This, no doubt, will involve a slightly greater strain on our already hard-pressed foreign exchange resources. But the benefits resulting from it in the form of accelerated development of the industrial, agricultural and transport sectors of the economy should far outweigh this additional burden. Foreign exchange earnings themselves may go up with the availability of greater exportable surprises and the overall strain may, therefore, turn out to be only marginal.

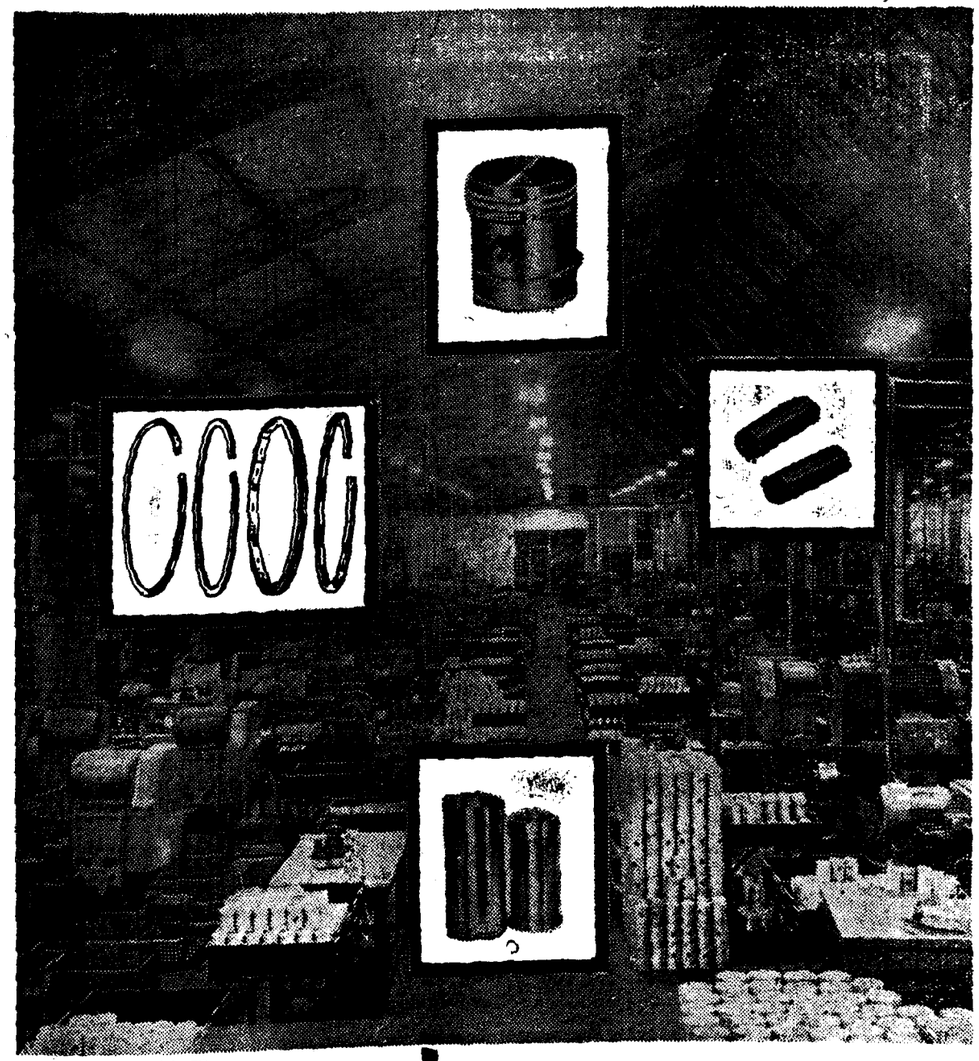
With a view to stepping up the indigenous supply of power equipment, it is also desirable that the planned schedule for setting up the two new electrical plants—one with assistance from the Soviet Union and the other with aid from Czechoslovakia—should be enhanced. The Bhopal Heavy Electricals as well should be made to improve its performance further; recently, its working, indeed, has shown a slight improvement. If the Union Minister for Steel and Heavy Industries, Mr C. Subramaniam, shows the same amount of dynamism here as

he has displayed in regard to steel (the current annual Plan target of 4 million tons steel ingots is not now considered to be beyond reach), quite wholesome results can be expected from the Bhopal Heavy Electricals. The throwing open of the field of manufacture of heavy and medium electrical equipment to the private sector recently has been a step in the right direction. The private sector capacity in this field now should be augmented in view of the huge task lying ahead.

During this crucial five-year period the pattern of energy generation obviously cannot be expected to change very much. By far the greatest reliance will have to be placed on thermal power. This means that coal supplies to the thermal power stations will have to be kept up in adequate quantities without interruption. The implications of this are discussed at a fuller length in the succeeding article. Suffice it to say here that the faltering increase recorded in our coal production during the first twenty months of the current Plan does not evoke much optimism about the slightly over 100 million tons target being achieved. In view of this, greater resort may have to be taken to the use of furnace oil as a source of energy in indutrial units situated at places distant from the main coal-belt. In May last, the Union Finance Minister, Mr Morarji Desai, gave some incentives for increasing the use of furnace oil by industrial units, but these incentives apparently have not gone far in stepping up its use. The main hinderance in the way of increased use of furnace oil as a source of power generation is stated to be its high cost which contains a large dose of excise duty—about Rs. 60 per metric ton on the average price of Rs. 170 per metric ton, inclusive of sales tax and octroi duty, at inland centres. If in the coming years the industries starved of power have to take greater resort to furnace oil, it is just appropriate that the Union Finance Ministry should reduce the burden of the excise duty.

Another aspect of the problems that has to be taken note of in the next few years is the evening out of power shortages and surpluses in the adjoining States. The States like Gujarat, Madras and West Bengal today suffer acute power shortages, while power is available in surplus in the neighbouring States of Maharashtra, Kerala and Uttar Pradesh. Some ad hoc arrangements have been made in the past few months to remedy this situation (the surplus power from the Rihand Dam in U.P. has been made available to the areas served by the Damodar Valley Corporation and similar arrangements are stated to have been made between Madras and Kerala), but a permanent solution to this imbalance in power supply can only be found in setting up inter-State electricity grids with the ultimate objective of establishing an all-India grid. Some progress has been made in this direction in the recent past, but it is obviously not enough. The work on these projects has to be stepped up appreciably.

From the long-term point of view, the power problem in India has two components—(1) stepping up of power resources in advance of the demands cropping up, and (ii) bringing down the power costs charged to the various consumers. The Government of India, this week, set up two high-level Committees (which have on them some eminent experts from abroad as well) to assess the power requirements of the country right upto 1981 and to suggest ways and means to meet the situation. The deliberations of these Committees will obviously be watched with great interest. A few suggestions, however, may be offered here.



The power requirements of India are bound to grow at a staggering rate with the development of the economy. This implies that all the sources of power—whether conventional or unconventional—have to be harnessed into use in an integrated manner. In areas where natural gas is available in exploitable quantities, e.g. Assam and Gujarat, its utilization has to be speeded up. Similarly, possibilities of power generation in Kutch area and Rajasthan from lignite have to be expeditiously explored, besides stepping up the tempo of development at Nyveli where lignite resources have already started to be made use of. In areas where hydro power potential is not so great and which are also situated far away from the main coal-belt, nuclear power may have to be taken resort to in an increasing measure. The beginning made by the Union Government in setting up two nuclear power stations—one in Maharashtra and the other in Rajasthan—has, thus, been a step in the right direction even though it involves a strain on our foreign exchange resources.

With a view to keep electricity costs to the various consumers at the low side, generation of hydro power

All under one roof

India Pistons has attained self-sufficiency from the raw material to the finished product, manufacturing under one roof, all the components that go into the piston and liner assembly. The range includes the Chromium plated, Duaflex and Expander rings; single cast and centrifugally cast piston rings; wet and dry centrifugally cast cylinder liners; die cast and forged pistons to any specification, drawing or design.

India Pistons Quality Products cover, the most exhaustive range in India with a wide application.

INDIA PISTONS LIMITED. SEMBIAM, MADRAS-11.

IP-12 6/5

What's on the other side of this hexagon?

Although the world is familiar with this hexagon as the corporate symbol of an international company, most people have little idea of the many-faceted activities in the exciting universe of Union Carbide.

The starting points of nearly all the products of Union Carbide are the simplest tangible substances...the basic chemical elements. From the air, earth and ocean the scientists of Union Carbide extract gases, wrest minerals and ores, the "building blocks" of nature, to create thousands of new products...chemicals, plastics, carbon products, industrial gases and metals.

In this country, too, Union Carbide India has kept pace with the changing times. Beginning with a small plant in Calcutta 27 years ago, the Company today has large factories in Calcutta, Madras and Lucknow making it India's largest manufacturer of dry cells and flashlights. The Company's zinc rolling mill in Calcutta is the only one of its kind in India and serves the nation's industrial requirements of zinc strip. And now Union Carbide India has spent Rs. 4.5 crores on a plant at Trombay Island, Bombay which is producing chemicals and polyethylene resins and compounds that serve as raw materials and intermediates for numerous end products for industry and the home.

Yes, on the other side of the Union Carbide hexagon is a world of scientific endeavour sparked by man's imagination... endeavour which has created hundreds of useful products that did not exist before, a world in which scientists are seeking the wonders yet to come, the completely new things of tomorrow.

has to be taken resort to to the maximum extent. But hydro-electric projects take appreciably longer time to build than the thermal power stations. This warrants bringing down of the generation costs of the latter by enlarging their size. All the big-sized thermal power stations which may be set up in the future will have to be built near the coal mines so that they may be worked on inferior type coals and washery middlings and rejects the movement of which is a costly proposition and entails great strain on the transport system.

Coal Supplies

AS STATED in the last article, coal is to continue as the most important source of power generation in India during the next five crucial years. If power shortages, therefore, are to be obviated or the situation in regard to power supply is to be eased to any appreciable degree, coal will have to be made available in various parts of the country in adequate quantities and without interruptions or delays.

The acute situation that came to develop on the coal front towards the close of 1960, apparently, has eased to a very great extent in the last few months, thanks to some balance being restored in the output and movement of coal. Stocks at pitheads in October last fell to barely 2.93 million metric tons, as against the irriducible average of nearly 2.7 million metric tons at any time since 1951. But how far this somewhat happy state of affairs will continue, it is difficult to say. With the onset of the busy season and the railways coming under great stress due to the emergency movement of troops and war materials, coal transportation must have suffered to some degree. But this does not cause that much concern as the fact that the balance between coal production and its movement has been brought about at not-so-high ranges of production.

PITHEAD STOCKS OF COAL IN INDIA
(In Million tonnes)

Coalfields	October, 1962	September, 1962	October 1961
(1) **Bengal-Bihar Fields**			
Public Sector	0.33	0.37	0.50
Private Sector	2.33	2.57	2.60
(2) **Outlying Fields**			
Public Sector	0.14	0.14	0.09
Private Sector	0.10	0.10	0.12
(3) **Singareni**	0.03	0.02	0.01
TOTAL	2.93	3.20	3.32

Coal output during the first nine months of the current calendar year amounted to 44.89 million metric tons. At this rate, the 1962 production is estimated around 59.85 million metric tons, as against 56.04 million metric tons in 1961. As a result of the suspension of the mining regulations during the emergency, enabling the collieries to work for more hours per week, some further improvement in output must have been effected. But it is very unlikely that the current year's production would go up to beyond 62 million metric tons. This means that coal output in the major part of the second year of the Third Plan has not been much above the Second Plan target of 60 million tons.

LATEST OFFICIAL ESTIMATES OF COAL PRODUCTION IN 1962
(In Million tonnes)

	Bengal-Bihar Area	Outlying Areas	Total
1. Target for 1962-63	47.30	13.80	61.10
2. Target for Jan.-Sept., 1962	35.48	10.35	45.83
3. Actual Production during Jan.-Sept., 1962	35.60	9.29	44.89
4. Annual Production (based on item 3)	47.47	12.38	59.85
5. Shortfall or surplus (Item 2—Item 4)	+0.17	—1.42	—1.25

If the Third Plan target of a little over 100 million metric tons output, or even rated capacity, is to be achieved, coal production during 1963 will have to be stepped up at least by 10 million metric tons and in the succeeding two years by 12 to 16 million metric tons. The task is stupendous, indeed. How should we go about in handling this arduous job?

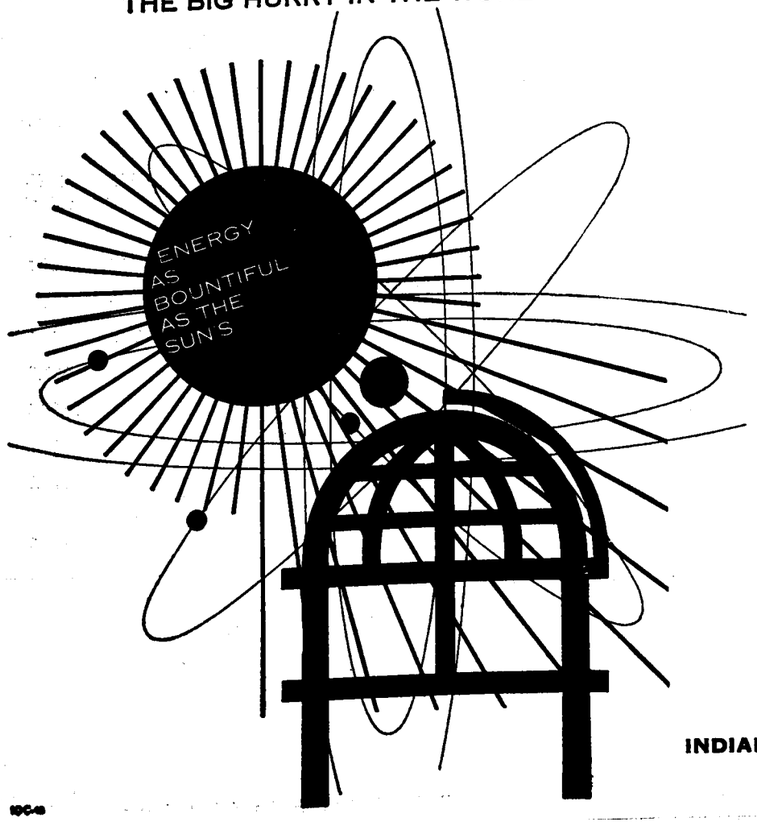
The past experience shows that even if the potential is created to step up coal output, a high level of production cannot be achieved unless stock accumulation at pitheads is avoided. The public sector in coal achieved its target rate of production in the beginning of 1961, but this level of output could not be maintained subsequently for quite some time because of piling up of stocks at the pitheads. Even otherwise, no amount of production is of any use unless coal can be made available at the consuming centres. This, obviously, implies that before efforts to step up coal output are redoubled, attempts have to be made to strengthen the transport system.

By far the greatest reliance has been placed uptil now on movement of coal by rail. The experiments with shipment of coal by sea or its haulage by road have not proved an unqualified success as yet. But efforts have to be continued in this direction in the interest of removing coal transport bottlenecks. The railways, despite their expansion envisaged under the current Plan, can move only the planned quantities of coal from the main coal-belt in east India. They, of course, are in a position to move as much of coal traffic from the outlying coalfields as offered. The production programme in the outlaying collieries needs, therefore, to be stepped up even though the quality of coal here is only poor.

Quite a good deal of strain on the transport system can be mitigated by moving to the far flung areas only coal with comparatively low ash content. This calls for expediting the setting up of the proposed coal washeries and for improving the performance of the existing ones, especially the Kargali washery where current output of about 97,000 metric tons can be stepped up by another about 20,000 to 25,000 metric tons only if adequate power supplies are ensured. Augmenting the supplies of materials for coal stowing should also help in reducing the ash content. This is warranted in view of the fact that as an incentive to improve the quality of coal, the Union Government a few months ago announced some increases in coal prices.

Some improvement in coal transport from the collieries to the consuming centres should also follow the rationalisation being attempted in coal distribution under the block-rake scheme. According to this plan, bulk consumers of coal, individually or jointly in groups of two or three, requiring 1,500 tons a month, would be supplied their requirements once in thirty days through a rake of seventy wagons. For the smaller consumers, dumps will be created by the State Governments at suitable places in their areas from where supplies will be effected by road. Originally, this scheme was to be put into operation from January 1, 1963. But following objections from various consuming interests, to the effect that it would enhance their coal costs and that adequate siding facilities were not available everywhere, its implementation has been deferred to February 1, 1963. A Committee has been set up to go into these and the other possible objections and suggest ways and means to tide over the difficulties. In all probability, the scheme would have to be phased out for implementation, since the setback suffered by the truck manufacturing programme, from the civilian use point of view, would involve delaying all plans to harness road transport for movement of coal on any large scale. Use of inland waterways for coal shipment, however, can be stepped up if the initial difficulties of obtaining barges, motor boats etc. in adequate numbers are overcome.

Implementation of the coal production programmes, now being executed both in the private and public sectors with assistance from various friendly countries and the World Bank and its affiliates, would, indeed, be facilitated by removal of movement bottlenecks. But any substantial increase in output can come only through assuring to the collieries adequate quantities of power, explosives, spare parts and the other prerequisites to coal mining. The aliveness of the Union Ministry of Mines and Fuel to this fact is welcome, but it is very unlikely that the Third Plan coal target would be achieved in view of the delays that have already occurred, especially in stepping up the tempo of activity for raising high grade coking coal. Development of deep mines is necessarily a time-consuming process.



With steel production picking up now more or less according to the schedule, further progress in this regard is very largely dependent on fulfiling the targets fixed for coking coal output or, alternatively, arranging for supplies of high grade coal from abroad. The fact that coking coal output indigenously is not keeping pace with demand apparently has prompted the Union Government to think in terms of metallurgical coal imports. Trials with some samples of imported coal, it is stated, are already being conducted. Finalisation of the various proposals in regard to high grade coal imports for steel works obviously is urgently called for. Incidentally, this will help in greater quantities of indigenous coal being available for not-so-high priority users. Consideration may also be given to import of superior quality coal for some export industries situated far away from the main coal production centres. This should help in strengthening the export effort.

In view of the likelihood of coal production lagging behind the planned scheduled, it is also imperative that all wastage of coal is avoided scrupulously. Owing to defects developed in heat measurement instruments at many a thermal power plant, excessive quantities of coal are said to be being used to generate heat in quantities more than required. In many cases, heat control has today become a hit in the dark. Spending of some foreign exchange on replacement of the heat measurement instruments should pay rich dividends by not only bringing down production costs but also by helping in striking a better balance between demand and supply of coal.

THE BIG HURRY IN THE WORLD OF NUCLEAR PHYSICS

The hurry is to find a compact source of energy that will be as prodigious as the sun and will not exhaust though the world live a million years. ■ Closest to the ideal is Uranium 235, a scant one milligram of which, when fissioned or 'exploded', releases more energy than that obtained by burning millions of tons of coal. This great world of power will keep all of us going, and going well, when the present natural sources such as coal give out. Already atomic power stations are an actuality in many countries including India. ■ Shaping the giant pressure vessels enclosing the reactor cores demands a very specialised knowledge of welding. ■ It is this specialised knowledge and application of industrial gases that Indian Oxygen affords Indian industry.

EXPORT?

AIR-INDIA!

Export your goods the modern way—on Air-India's Boeings! Here's how we can help you earn valuable foreign exchange:

SPEED We jet-speed your cargo at 600 m.p.h., reaching foreign markets in a matter of hours. This means less tied-up capital for you! Also you can safely export perishable goods—be sure they'll arrive fresh and unspoilt!

FREQUENCY We have a frequent network of flights direct to the business centres of the world.

CAREFUL HANDLING Whatever your product it is handled with care by specially trained staff, eliminating loss through damage and pilferage.

REDUCED COSTS Because of our special handling facilities, expensive crating becomes unnecessary. Only light packing is needed. And the time factor reduces insurance rates and eliminates warehousing charges.

DISCOUNTS The larger your consignment, the lower our freight charges. And we also offer special reduced rates on certain commodities!

Let us assist you in promoting your exports. Please contact our local office for free service.

Oil in India

IN the modern world, oil consumption in a country is taken as an index of its industrialisation and the standard of living of its people. In a war, oil plays a very prominent role; it not only helps in keeping the wheel of economic progress moving, but also provides strategic materials for many a combat activity. Every independent country, therefore, attaches great importance to the development of its oil industry.

The Indian oil industry has, indeed, made a very commendable progress during the last decade. Before 1953, India had only one oil refinery at Digboi having a capacity of not more than 4.5 lakh m. tons, the rest of the petroleum products requirements were met by imports. Today, after the increased throughput allowed recently to three refineries, we have a refining capacity of over 8 million m. tons—Burmah-Shell Refinery 3.75 million tons, Esso Standard Refinery 2.5 million tons, Caltex Refinery 1.2 million tons, Digboi Refinery 0.45 million tons and Nunmati Refinery 0.75 million tons. Another 2 million m. tons capacity is currently being created at Barauni and is expected to be commissioned by the middle of 1964. Plans are also afoot to augment the refining capacity further by 7 million m. tons by the end of the Third Plan, through expansion of the Nunmati and Barauni Refineries to 1.25 million tons and 3 million tons, respectively, and by setting up two more refineries, one at Koyali with a capacity of 3 million tons and the other somewhere in South India with a capacity of 2.5 million tons. Opinions may differ whether this 7 million m. tons additional capacity would be brought into existence according to the programme, but there is little doubt that a substantial portion of it would be in production in the early years of the Fourth Plan.

Along with the stepping up of the refining capacity, India has recorded during the 'fifties significant achievements in oil prospecting and exploitation. Two fairly rich oilfields have been discovered, one in Nahorkatiya-Moran containing crude reserves to the tune of 46 million metric tons and the other in Ankleshwar having a potential yielding 48 million metric tons crude. By the end of the current Plan period, expectations are that the crude oil production from these two oilfields would be at the rate of about 6 million metric tons per annum.

Oil exploration at some other places also has yielded results — at one place, Sibsagar area, oil has been struck in two of the four wells drilled so far and at another, Cambay, a gas-field has been established. Oil has as well been found at Kalol near the Ankleshwar horizon.

A significant role has been played in this rapid development of our oil industry by both the private and the public sectors—at some places working jointly as in Nahorkatiya and Moran, through Oil India Ltd. (a fifty-fifty partnership between the Union Government and the Burmah Oil Company) and at others individually.

Howsoever heart-warming the development of our oil industry might have been uptil now, the exigencies of the Sino-Indian border dispute developing into a full-scale war between the two countries — a limited war has already been fought on this front a month and a half ago — warrant that we should shed all sense of complacency and develop our oil industry at the fastest rate possible. Currently, we are not in a position to meet even our normal requirements fully and have to depend on imports of refined products from abroad to the tune of about 2 million m. tons. In war times, the demand for petroleum products is bound to increase at a rapid rate and there will also be a marked change in the demand pattern of oil derivatives. This implies that we should not only aim at achieving self-sufficiency in the demand for various oil products in peace-time, but think also in terms of some surplus which should stand us in good stead in times of emergencies. In normal times this surplus output can well be exported to earn some extra foreign exchange.

Today our refining capacity plans do not appear to be even fully catering to the peace-time requirements by the end of the current Plan. On the basis of the rate of growth in petroleum products consumption registered in the recent past, the Steering Committee of the Oil Advisory Council has placed the demand pattern for various products as follows:

(Million metric tons)

End-Product	Anticipated Demand in 1965-66
1. Light Distillates ..	2.70

* The Oil Advisory Council, at its last meeting, brought down this estimates to 16.67 m. metric tons as it thought that fuel oil figure included in heavy-ends was rather on the high side and because increased consumption of coal will keep down kerosene consumption.

The dramatic announcement made by the Union Minister for Oil, Mr. K. D. Malaviya, a few days ago, on expansion of the public sector oil refining capacity to 10 million metric tons by 1965-66 (by stepping up the capacities of the Nunmati and Barauni refineries from the present capacities of 0.75 million metric tons and 2 million metric tons to 1.25 million metric tons — with provision to raise the capacity ultimately to 1.5 million metric tons—and 3 million m. tons, respectively, and by setting up the proposed refinery at Koyali with an initial capacity of 3 million m. tons and another one in South India with a capacity of 2.5 million m. tons) would give to the lay man the impression that India would achieve self-sufficiency in petroleum products requirements by the end of the current Plan period. But will it be so? In the absence of the availability of the product pattern of these refineries, it is difficult to say in which particular petroleum products self-sufficiency would be attained. But in view of the fact that gasoline surplus will go up from the marginal level of today to a substantial extent, even if through modern techniques its production is kept at the lowest minimum, the output

of some other products, mainly middle distillates, is bound to be less than the demand for them. We will have to continue to import these even after 1965-66 if the refining capacity is just raised by then to 17.1 million metric tons.

"The Eastern Economist", however, has its own doubts about the proposed expansion of the public sector in oil refining coming through according to Mr. Malaviya's expectations. There are various reasons for it. The obvious limitation in so far as the expansion of the Nunmati and the Barauni refineries to a combined capacity of 4.5 million metric tons is concerned, is the availability of crude. All along till now the expansion of these two refineries has been talked about to a combined capacity of 4 million m. tons. Even the crude supply pipeline from Nahorkatiya to Nunmati and Barauni has been designed to carry only this much oil. It may be possible to step up the capacity of this pipeline slightly or even to 4.5 million metric tons, but where from are the crude supplies in excess of it to come when as a result of improvement in the operational efficiency the throughput of these expanded refineries goes up from 4.5 million metric tons to say a minimum of 5 million metric tons.

As regards the Koyali and the South Indian refineries, even if these two are set up by 1965-66, it is anybody's guess whether they will be in full operation by that time. The experience with the Nunmati Refinery so far has been none-too-happy. Although this refinery was commissioned into production full one year ago, it is yet to turn out production at the rated capacity of 0.75 million metric tons.

The emergency through which the country is passing today demands that the expansion of our refining capacity should be achieved in the quickest possible time and not merely just to the tune of the anticipated peace-time demand. And this can only be done by allowing expansion of the private sector refineries, which can be executed in a period of about 18 to 24 months, as against the minimum 3 to 3½ years required to build a new refinery from a scratch. The possibility of dislocations in the flow of crude oil from Assam as a sequel to damage to, or loss of, the Nahorkatiya oilfield, situated within the immediate danger zone in the event of a wholesale attack by China, is also a factor which has an important bearing on the private refineries expansion issue. One need not dwell upon it at any length.

In view of the present emergency, two more aspects of the oil problem need to be taken care of. They are (i) the production of lubricants in the country, and (ii) oil prospecting and exploration. Our peace-time demand for lubricants at the end of the current Plan period is placed around 5 lakh m. tons per annum, of which we produce only a little at present. Plans have been prepared to augment this capacity by another only 3 lakh m. tons. Why the Government is hesitant to allow installation of further capacity for the manufacture of lubricating oils, is something not comprehensible.

So far as oil exploration is concerned, this programme has to be stepped up appreciably in view of the staggering rate at which our oil requirements are expected to grow. The Oil and Natural Gas Commission is doing a commendable job in this respect, though not so very economically. Its efforts need to be supplemented by those of others. Since oil prospecting is a very hazardous activity, no loss but only gain can accrue to the country if private oil interests undertake exploration work here, not merely as contractors to the ONGC but also at their own expense. If need be, some flexibility might be effected in the policy in this regard so that the interest of the experienced foreign oil companies may revive in the exploration work in this country.

Foreign Trade

The Dimensions of the Problem

THE scale on which the Third Plan has been conceived has naturally produced its immediate impact on the problem of foreign trade. In the two components of the financial resources for the Plan — the rupee component and the foreign exchange component — the outlook is no doubt one of tightness, but in regard to foreign exchange it goes beyond that and assumes a critical character. The stress in the current Plan is on the expansion of heavy and basic industries and next on the expansion of the industrial sector in general. The urgency to achieve self-sufficiency in the production of foodgrains at the end of the Third Plan has created priority demands on indispensable imports like fertilizers. All these pressures on the foreign exchange expenditure on the Plan have a direct and vital bearing on the foreign trade.

The dimensions of the problem which has been posed for the expansion of our foreign trade in the Third Plan are quite apparent from the approach with which the scheme of foreign exchange resources for the Third Plan has been drawn up in the Plan. The final scheme as it appears in the text of the Plan conceals many stresses and strains which the demands of the foreign currency expenditure produce on the foreign trade. A fair idea of these stresses can be obtained by a comparison of the estimates of these resources in the Draft of the Third Plan and the estimates accepted in the final version of the Plan. But in interpreting these strains there is an important consideration which ought to be taken into account. The assumption about prices on which the estimates are based will inevitably prove somewhat wide of the mark when the actual contracts of purchase or agreements of procurement are made. It is easy to appreciate that international prices would move upwards rather than downwards with the passage of time.

The import bill for the Third Plan has been pitched at a high point consistently with the targets which have been prescribed in the different sectors of the economy. Broadly, the classification of these imports falls into two categories — development imports and maintenance imports. The planners estimated in the draft that imports of machinery and equipment for executing the projects of expansion in the Third Plan would be of the value of Rs. 1,900 crores. Then comes a border-line item, which some may be prone to classify as maintenance import but which in reality belongs to the development category and it has been accepted as such by the foreign governments which have extended their hand of co-operation and economic assistance for the Third Plan. There is a part of our imports of components and balancing equipment which would be required for the existing plants or factories, but which, in fact, is intended for the expansion of their capacity in order to enlarge the base of industry. The value of imports for such balancing equipment and components has been placed at Rs. 200 crores.

Then comes the maintenance imports which include all the replacement equipment, raw materials and intermediates or semi-manufactured products required to consolidate and maintain the production of the industrial capacity which has been already built. To this must be added the claim of imports of essential consumer goods. The total bill of maintenance imports according to the Draft of the Third Plan added up to Rs. 3,650 crores. In the aggregate, therefore, development and maintenance imports rise to Rs. 5,750 crores. These exclude Rs. 600 crores worth of supply of surplus commodities (particularly foodgrains and raw cotton) under the P.L. 480 agreement with the USA. This item of Rs. 600 crores, which would normally be classified as a commercial transaction has been integrated with the external credits. For a fair comparison between the import bills of the Second Plan and the Third Plan it would be necessary to merge this P.L. 480 amount in imports. On this basis the annual average imports during the Second Plan were of the order of Rs. 1,072 crores from which they will now shoot up to an annual average of Rs. 1,270 crores in the Third Plan.

On the basis of these estimates the Draft Plan devised a scheme of resources to meet the liabilities of maintenance imports which cannot be discharged from foreign assistance. The estimates made are significant for a reason which will be quite apparent from the discussion that immediately follows. Export receipts in the Draft Plan were placed at Rs. 3,450 crores and receipts from net invisibles were assumed to be Rs. 120 crores. In all Rs. 3,570 crores were expected to defray the bill of maintenance imports. There could be no rigidity or precision about these estimates and it was presumed that on considerations of flexibility a figure up to Rs. 3,700 crores might be taken as our external earnings during the Plan period.

But the foreign exchange earnings (coupled with the marginal net invisible receipts) left the problem of financing development imports and the balancing equipment and components altogether unsolved. The only solution for this lay in the procurement of external assistance. But here another problem was posed. The payments of interest on the foreign loans and the maturing instalments or obligations of some of them will total up to Rs. 500 crores during the Third Plan period. In the normal situation foreign debt should be serviced out of our current earnings. But the very nice balancing of the maintenance import bill left no surplus out of the current foreign exchange earnings which could be applied to meet the debt service obligations. It was, therefore, estimated in the foreign exchange requirements by way of external assistance that Rs. 500 crores should be made available to us for what is termed as "refinancing maturing obligations" in the Plan text. Rs. 1,900 crores for development imports and Rs. 200 crores for the border-line item raise our requirements of foreign aid to Rs. 2,600 crores. This is, of course, exclusive of Rs. 600 crores via the P.L. 480 agreement with the USA.

The foregoing narration of the scheme of foreign exchange resources has been dilated upon in some elaborate detail to highlight the real magnitude of the problem of foreign trade in general and of its export component in particular and to put it in its real perspective.

After the Draft very significant changes in the estimates had to be made and finally incorporated in the Plan. This is apart from the element of a possible increase in world prices. On a revised consideration, the requirements of development imports were raised by Rs. 130 crores. Subsequent investigation made after the Draft showed that for a variety of reasons the net invisible receipts of Rs. 120 crores, which were relied upon as a means to meet the partial cost of maintenance imports, were totally wiped out and to that extent a gap was created in

the original estimate of our foreign exchange earnings. The two items taken together enlarge the margin of shortfall in the requisite amount of foreign exchange to the extent of Rs. 260 crores. A re-examination of maintenance imports disclosed that an increase of Rs. 150 crores would be necessary to meet their full quantities. Thus the total gap was Rs. 410 crores. Wisely, there has been no attempt made to raise the export target and provisionally this gap of Rs. 150 crores is left uncovered. The only way in which the gap could be reduced (the question of its complete elimination was not deemed feasible) was to raise our sights and make a determined bid to push up exports. This was for two obvious reasons. A higher expectation of external assistance above the original estimate of Rs. 2,600 crores and raising exports to cover the whole gap were both considered as apparently not too practical propositions.

The relevant point, however, is that between the publication of the Draft in May 1960 and the publication of the text of the Third Plan in August 1961, the estimate of export earnings was stepped up from Rs. 3,450 crores to a minimum of Rs. 3,700 crores. This step-up of Rs. 250 crores was, of course, based on a revision of export targets and hardly on any positive new avenues for our exports. Flexibility is the essence of planning and on this score there should be no quarrel with pitching our ambitions somewhat high. But the point of emphasis is that they impose a heavy liability on the conventionally difficult export promotion effort.

Now in the wake of the defence emergency, it has been tentatively assumed that our import bill for outlay on arms and ammunition may very likely go up by something like Rs. 300 crores. The primary means of meeting the cost of imported arms is practically well-known and a very reassuring initiative has been taken by the USA and the UK in relieving our almost insoluble problem of prompt payment for armament imports. Lend-lease and similar arrangements of deffered payments would help us overcome this fresh liability of foreign exchange outlay. Nevertheless, some part of this expenditure will need to be met out of our own resources. And these resources substantially mean export earnings. It will thus be seen that the shortfall in the foreign exchange earnings as envisaged at the moment poses a very serious challenge to the export trade.

Any consideration of the foreign exchange resources must inevitably be related to the state of the balance of payments of the nation. Our balance of payments on current account has revealed an uninterrupted and aggravating trend towards an enlarged size of the deficit from the third year of the First Plan. The half-yearly figures for the financial years 1953-54 to 1961-62 reveal that, although the payments deficit is not increasing with a strict progressive regularity and there are the usual fluctuations, nevertheless, the gap is widening. In the first half of 1957-58 the adverse balance reached the peak during the afore-mentioned period at Rs. 238 crores. It would appear that seasonal factors explain the high level of the deficit in the first half of the financial year and its relatively small size in the second half. But it is significant that in the fifth year of the Second Plan in both the halves the deficit was a little below Rs. 195 crores. In the two half-yearly periods of the first year of the Third Plan it stood at Rs. 159 crores in the first and at Rs. 120 crores in the second. These latest trends reveal a considerable cancellation of the possible seasonal factor.

Side by side with this continuous adverse balance of payments on current account (which is, of course, openly taken for granted as an inevitable concomitant

of a fast developing economy), one has to cast a glance at the deteriorating state of our sterling balances. The monthly figures for the period 1958-59 to 1962-63 (April to mid-December) sharply bring out the fact that the balances have not only been exhausted (above the statutory minimum line) but any expectations of additions to them would be due only to some fortuitous causes. Since August 1962 the sterling balances have been hovering around Rs. 94 crores and if the mid-December position shows a fractional improvement at Rs. 97 crores it should be practically ignored. The conclusion from the trend of the sterling balances is that we have lost the cushion against any abrupt emergence of the liability of external payments. This position places all the greater responsibility on the contribution of the export trade to the financing of the Plan and now the financing of the extra defence import bill in a partial degree.

Austerity Imports

AT THE time of writing, the official Press Note on the Import Policy for the current half year October 1962 — March 1963 highlights two facts. Commercial imports have been subjected to a drastic cut of 6.25 per cent. The axe comes heavily on the established importers and the overall pattern of the permissible imports raises a question of fundamental importance whether the legitimate pursuit to keep the balance of trade within minimum limits of disequilibrium will not create another wave of shortages in industry. In that situation the intractable problem of holding the price line would be put to further strains. This austere policy has been imposed as what would now appear to be a matter of convention that has come to be established practically since the middle of the Second Plan period. Progressive doses of austerity in imports have already manifested themselves in the enforced under-utilization of industrial capacity. How large the magnitudes of that under-utilization are over a wide range of industries will be quite obvious from a detailed table on this specific phenomenon which has been published elsewhere in this Annual Number. The moral of these strenuous trends is that further economies in foreign exchange outlays by cutting back imports have an extremely limited scope. This, however, does not affect the harsh practical problem that austerity has got to be resorted to when the resources position at the relevant time leaves little room to explore an alternative. This consideration underscores the new character of import policy — imports being held to the minimum that is essential.

In Table TRD-No. 1 set out alongside the course of India's foreign trade since the inception of the First Plan has been shown for ready comparison. The absolute value of imports is no doubt the correct criterion to judge how the development needs of the economy are progressing and the balance of trade provides an index of how they are being met. Throughout this entire period there has been not a single year in which our trade balance was in surplus. If the first year of the First Plan is left out of account owing to the heavy draft of food imports on foreign exchange, it would be apparent from this table that since the start of the Second Plan the trade deficit has been widening. If it was Rs. 449 crores in 1957-58, it rose still higher to Rs. 479 crores in 1960-61.

There is something positive to be said about the lower levels below these peaks at which the trade deficit has been held since the start of the Second Plan. Normally, in consonance with the targeted tempo of industrial expansion, imports should be heavy in the second half of the plan period. Actually they were held to somewhat lower levels in these two years. Between 1960-61 and 1961-62 one finds a remarkable decline of Rs. 50 crores in the import bill of the latter year. There are, of course, certain special factors, such as food imports, which could explain part of the erratic nature of these trends. But they do not affect the general conclusion that at a time when the requirements of development would necessitate higher values of imports, those value levels have been held by means of austerity curbs even on urgent maintenance imports and some development imports.

By contrast the trends in exports between 1950-60 and 1961-62 do not show a high rate of increase. This is one of the major causes which urge the necessity of putting restraints on imports — a policy which on the face of it is inconsistent with the legitimate requirements of a developing economy. Another factor which has created the strains resulting in the adherence to a policy of minimum imports is the recent fast emerging policy of most of our friendly governments to offer aid on the basis of a tie to particular projects. While, therefore, the development needs as envisaged in the Plan are assured by the flow of assistance from foreign governments, the actual requirements of maturing obligations to pay for the shipments of imports always create immediate strains. These strains explain a good part of the reason why a resort has to be taken to this policy of austerity in imports.

Table TRD- No. 6 included in this Section is of great significance. It brings out the break-up by broad categories of imports and again underlines the fact that imports are overwhelmingly related to the consolidation of industrial growth already achieved and the expansion that is taken in hand. This table divides all

TABLE TRD-NO. 1

(Rupees crores)

Period	Imports	Exports* (Incld. re-exports)	Balance of Trade
1951-52	970.8	733.0	—237.8
1952-53	701.8	577.3	—124.5
1953-54	610.2	530.6	— 79.6
1954-55	656.4	592.5	— 63.9

* Less Transit Trade

imports into three classes, namely, capital goods, industrial goods and consumer goods. It would be obvious that the consumer goods referred to there are the essential consumer goods. Their share has normally been below 20 per cent during the period 1958-59 and 1962-63 (April to September). But even in this class of consumer goods it is the imports of foodgrains (primarily wheat and rice) which take away the substantial share of the foreign exchange allocation.

The pattern of imports of capital goods and industrial goods shows that their shares have now come to be very nearly fixed. Capital goods get a slice of something around 15 per cent of the total imports by value and industrial goods get the lion's share of something around 65 per cent. Industrial goods include raw materials, intermediates, replacement components and equipment as well as semi-manufactures which cannot be produced in the country. It would thus be seen that maintenance of the economy and execution of the development plans at a restrained rate below what is envisaged in the Plan exhaust two-fifth of the import bill. This break-up again underlines the conclusion that imports are being maintained at the minimum level, but it would be more correct to say that they are being so maintained at the cost of leaving industrial capacity idle in varying proportions.

The composition of our import trade which has been described in detail in Table TRD-No. 5 gives the trends during 1951-52 to 1962-63 (April-September). A scrutiny of this table would conspicuously bring out the fact that particularly in the last four years, 1959-60 to 1962-63, the items of imports which have claimed sizeable shares in the import bill are iron and steel, mineral oils, chemicals, electrical machinery, power generating machinery, transport machinery and, above all, the omnibus category of "other machinery" of which details are not possible to be given within a short space but which are indispensable both for maintenance and development. These items once again emphasize the operation of the policy of austerity imports. Of course, there have been heavy imports in some years, as will be noticed from the actual figures in this table, of raw cotton, wheat and fertilizers, for instance. These imports are again absolutely essential for industry, agriculture and every-day consumption needs.

Stretching the Exports

IT WOULD be no exaggeration to state at the very outset that the task which has been thrust upon the export trade of the country literally calls for a herculean effort. This should be quite apparent from the dimensions of the problem of foreign exchange resources discussed in some detail in the introductory part of this Section. But the basic facts need restatement for emphasis. Between May 1960 when the Draft Plan was prepared and August 1961 when the final version of the Third Plan was released, a reconsideration of the foreign exchange budget of the Plan involved very vital changes. The requirements of development imports were raised by Rs. 130 crores above the original estimate in the Draft, in the case of maintenance imports they were stepped up by Rs. 150 crores, while the credit taken for invisible receipts of the order of Rs. 130 crores was found to be totally cancelled out by invisible outgoings. All told, a gap of Rs. 410 crores was created in the availability of foreign exchange.

On a liberal reconsideration of the export potential it was agreed upon between the Planning Commission and the National Development Council that exports should be maximised and on this score allowance should be made for higher earnings of Rs. 250 crores so as to raise the target of exports from Rs. 3,450 crores to Rs. 3,700 crores. This step-up of Rs. 250 crores is not claimed to be a matter of easy achievement and it has been prescribed as a target for which the country must strive. Thus there is nothing sacrosanct about this figure and variations from it (possibly downwards) need not come as the result of any unpardonable failure in export performance. Even so, a gap of Rs. 150 crores has been left unprovided. On top of this comes the first priority claims of such imports of armaments as we will need to finance out of our own resources. It would be hazardous to venture at this stage the size of this fresh liability, since the total amount of imports of armaments that would be required annually as well as the credit facilities which will be available from the United States and the Commonwealth countries via lend-lease and similar arrangements are both indeterminate factors. But this general setting of the problem of the foreign exchange budget would suffice to stress the fact that exports will need to be stretched to the utmost.

The trends in exports since the start of the First Plan and upto September 1962 have been put together in Table TRD-No. 7 in respect of all the major and certain medium export commodities. A study of these trends would serve as a guide to assess the possibilities of stretching the export trade. It is not necessary here to enter into an elaborate comparison of the statistics contained commoditywise in this table.

But the major conclusions relating to the magnitude of earnings that can be acquired by means of different export items need to be set out briefly. Whether it is the composition of the exports or the destinational direction of exports, both the aspects of this trade need a persevering and consistent effort for their development for a number of years. Then again the export markets where they have to acquire a strong foothold are subject to two major influences—the local consumer preferences and the competition from other exporting countries. It should thus be clear that expansion of exports depends as much upon the effort of exporters as upon the international factors prevailing from time to time. This situation explains why each country takes special care to safeguard and develop its conventional exports.

This strategy, however, is subject to one qualification. If the items of conventional exports begin to lose custom in the traditional markets or there is an aggressive onslaught of competition from other countries, the strategy is changed to another aspect of export trade, namely, its diversification by an increasing resort to new items of exports. The capacity for diversification depends essentially on the level of the industrialisation of the country inasmuch as the new demand that is arising in the export markets makes its impact more on new types of goods than on primary commodities, raw materials, etc. The fact must be confessed that India, which has just started laying a modern base of industry for her economy, does not possess this competitive potenial to diversify her exports within a reasonably short time and over a wide range of new manufactures now being undertaken.

These handicaps and pains of the growing economy explain the present pattern of the composition of our exports. It will be observed from Table TRD—No. 7 that jute manufactures, tea and cotton piecegoods have maintained their traditional three top positions. The first rank in respect of export earnings has changed places in different years between jute and tea, but cotton piecegoods have always come third. An important fact about these three major exports is the wide degree of

fluctuation in their earnings over the decade covered in the table.

Leather and leather manufactures are looking up and they typify an example of traditional exports expanding somewhat fast. The same position holds good about unmanufactured tobacco, but spices in which India had built a dynamic export market since the war are unable to keep their high level possibly because of the resumption of Indonesian exports. Cashew kernels typify an example where the market is being very carefully and progressively built up. In iron ore we have made sufficient progress largely because of the bilateral trade agreement with Japan. But in respect of manganese ore and mica, which used to be considered as our trump cards, there are declining trends in export earnings. The non-conventional or new items of exports are not many and they find place among engineering goods, machinery and transport equipment. Their impact on the export earnings will take time to be produced in a significant measure. But as industrial expansion proceeds ahead and we realize the need to give a separate and distinctive place to export industries in our future planning, it should be possible, say, in about eight to ten years, to raise substantially the share of manufactured goods in the total exports.

The experience of the first two years of the current Plan tends to show that the export promotion effort has not been taken up in a mood of a determined struggle. In the first year export earnings increased to Rs. 662 crores, but they were short of the target for the year by about Rs. 20 crores. On the basis of the actuals up to September in the current financial year, the apprehension is that there would be a shortfall of Rs. 30 to 40 crores in the export earnings below the target of Rs. 720 crores set for 1962-63. In Table TRD—No. 2 will be found the export performance of the different items in relation to the targets fixed for them. No targets were fixed for the first year of the Third Plan for the three ace exports, jute, tea and cotton textiles. But the other items enumerated in the table show that, while there have been some shortfalls in the commodities of lesser importance, the performance of about eight new items has been encouraging and it shows an excess over the targets prescribed for them.

One of the assumptions accepted by the planners is that a step-up in the export trade would be helped by some restraint on domestic consumption with a view to creating a larger volume of export surplus. But this assumption is dependent upon another assumption that markets exist to absorb our increasing surpluses of exports, which is not at all true in the case of most of our export items. The correct approach should be to explore and cultivate an export market first and in order to consolidate and develop that market make a call upon the people to tighten the belt and not vice versa. The planners again state that if the domestic market offers lucuraive profits, the temptation to sell at home ought to be countered by raising the profitability of exports. In the first place, it should be remembered that since it is the basic policy in our planning since the Second Plan to expand the base of the heavy sector of industry, there is a pressure on most of the goods in the domestic market, heightened by a higher purchasing power. This has created a seller's market and domestic profits are bound to range at high levels.

The profitability of exports, in the first place, has been cut down by us because of our high cost of produc-

14. Lemongrass Oil	150.00	236.03	+86.03	N.A.
15. Other Essential Oils	90.00	21.83	—68.17	N.A.
16. Iron Ore (Excluding Goa)	..	17,45.00	..	21,00.00
17. Manganese Ore	..	945.00	..	12,00.00
TOTAL EXPORTS (Including Others)	68,000.00	66,199.00	—18,01.00	700,00-720,00

tion, and secondly, the level of that profitability is not a matter within our exclusive control. The correct approach should be to provide incentives to the export trade and all facilities and even subsidies in certain cases to take to the more arduous course of establishing regular export markets. Productivity has been very badly neglected in our industrial production and there can be little doubt that the Muranjan Committee, which has been recently set up to investigate the problem of the cost structure of export industries and to make appropriate recommendations to bring it down, will lay accent on this neglected problem of productivity. How far different aids, incentives and encouragements really need to be given to the export trade has been thoroughly discussed by quite a number of enquiry committees and Government on its own part has not been lagging in providing some of them.

But what is essentially required in the promotion of exports is a courageous display of what the Ramaswami Mudaliar Committee has stressed as the crusading spirit. Challenges to the export trade have been posed to all the countries in the post-war period and since the emergence of regional economic integration as evidenced by the EEC, these challenges have been felt even by the industrially advanced countries like the UK and the USA. The problem posed for the UK is one of changing the whole structure of its export industries in order to reorientate it for the manufacture of sophisticated goods in which alone there lies the hope of the progress of her exports. Even in the USA opinion is now veering round to the dismantling of the tariff walls, although this strategy would involve great stresses and strains in the period of transition. India's problems of exports are far more acute than those of these economically advanced countries, but, if those problems are to be successfully met, a determined effort must be made to adopt aggressive marketing techniques which may involve sacrifices and burdens at home. In the last resort, if development finance is not adequately raised by exports, the inevitable consequence would be a slowing down of the pace of development.

Shifts in Direction

THE FOREGOING discussion of our foreign trade since we entered upon the momentous phase of planned development of our economy makes it vividly clear that we have to make a strenuous effort to keep the disequilibrium in our import-export trade within as narrow limits as possible. In a developing phase this objective cannot be easily achieved by pushing up exports and in consequence import policy has to assume an austere character. Both the sides of the balance bear a profound imprint of development programmes on the trade flows. While, therefore, imports are sought to be kept within strictly reasonable limits of development and maintenance needs and the needs of essential consumer goods, exports, in the absence of rapid diversification, leave a modest scope for manipulation and enlargement

The trends in the direction of India's foreign trade during the period 1951-52 to 1962-63 (April-September) have been shown in detail in Table TRD—No. 8 in this Section. At the outset one important observation needs to be made about our efforts and the success they have achieved in consolidating our export markets or expanding them in the neighbouring countries of South-East Asia, the Middle East and Africa. It cannot be

FOR INDUSTRIES AND PROJECTS

YUGOSLAV MANUFACTURERS OFFER

RADE KONCAR :—Generators - Transformers - Switchgears - Motors - Circuit Breakers.

LITOSTROJ :—Water Turbines - E.O.T. Cranes - Valves - Forklifts - Cranes for Steel Mills - Pumps.

METALNA :—Hydraulic equipments - Steel Railway Bridges - Tower & Port Cranes - Gates.

DURO DAKOVIĆ :—Complete Boiler Plants - Steel Railway Bridges - Locomotives.

JUGO TURBINA :—Steam Turbines - Diesel Engines.

RADNIK :—Escalators - Lifts.

We also undertake complete erection of Power Plants and Industrial Plants.

said from the evidence of the statistics in this table that we have gained any mentionable success in the Asian markets. The decline in our export trade with Pakistan is largely to be explained in political terms, but the figures show that even after 1955-56 (which was a normal year unlike the abnormal year of 1951-52 in respect of the import trade) our imports from Pakistan have remained at a much higher level than our exports. This is clearly reflected in our trade deficit with that country in a majority of the years during the period. With Burma we are steadily losing ground in so far as exports are concerned. Even if years of heavy rice imports are left out of account as in 1958-59, we import in larger amounts than we export to that country. With Singapore we continue to have an adverse trade balance, but the decline in exports has been more marked than that in imports. Another case to be cited from South-East Asia is that of Ceylon. With the exception of one year, 1959-60, we continue to maintain a surplus trade position with this island. But the more important aspect of this trade is the marked decline in the last two years in our exports. Indonesia comes in a somewhat similar category.

But the countries of the Middle-East and Africa are emerging as our stabilized markets for exports as well as sources of imports, particularly of essential commodities like raw cotton. If our imports from the Sudan and Egypt are relatively stable or rising in certain years, that is largely due to our offtake of long-staple cotton from these two countries. But it is a gratifying feature that our exports to these two countries show a steadily rising trend. Tanganyika and Ethiopia are other two instances where we are stabilizing our exports; but in Kenya, to whose economic development the Indian community has contributed a good deal over the years, we are progressively losing ground in exports. Imports from Kenya, though declining, are ranging at higher levels. In the aggregate of our external trade by value, the share of these three neighbouring regions is quite modest. With Afro-Asian economic co-operation, there should be room for expanding it on a basis of reciprocity.

But the most dominant feature highlighted by the direction of our trade is the significant shifts in the direction of our external trade. During the post-war period its geographical pattern has continuously gone on changing and the UK does not enjoy the position of being our premier trading partner that it was before the war. These shifts are quite easy to explain and they were but inevitbale. The pressures of development imports and maintenance imports for the expanded economy have made it incumbent upon us that our development programmes and the strategy of procuring financial resources for them should produce a decisive and substantial influence on the direction of our trade. Similarly, it follows as a logical sequence that our exports should be directed to those destinations wherefrom we import for development.

Table TRD — No. 3 set below brings out the conspicuous shifts in the direction of our trade. Normally the comparison ought to have been made between the first year of the First Plan and the first year of the Third Plan. But such a basis would be more misleading than it would appear logical. In the First Plan, there was, in fact, no scientific integration of the expansion programmes or a centrally determined scheme of the development of the different sectors of the economy. That Plan was more or less a string of schemes most of which were already formulated before its conception and on which either blueprints were ready or financial commitments were already made. Furthermore, industry had a modest place in this Plan. The correct basis would be 1955-56, that is, the last year of the First Plan, and the following years upto 1961-62 for the obvious reason that industry was then given a deliberate and pronounced bias in the allocation of financial resources as well as of physical targets. Once we embarked upon the phase of the accelerated growth of our industrial sector it became necessary to import high cost capital goods and equipment as well as industrial materials in large quantities. The direction of the trade, therefore, could not but be decisively influenced by the countries supplying our developmental imports. Already the bulk of our exports went to the industrialized countries, in particular, the UK.

TABLE TRD — No. 3

SHIFTS IN DIRECTION OF TRADE

(Percentages)

Country	Imports		Exports	
	1955-56	1961-62	1955-56	1961-62
1. U.S.A. ..	13.15	21.80	14.61	17.64
2. E.E.C. ..	17.51	16.98	9.40	7.88
of which: Germany, West ..	8.88	11.04	2.50	3.12
3. U.K. ..	25.44	18.16	27.86	24.34
4. Eastern Europe	1.56	6.89	0.85	8.69
of which: U.S.S.R.	0.91	3.30	0.55	4.85
5. Japan ..	4.92	5.47	5.07	6.09
6. Australia ..	1.98	2.12	4.16	2.42
7. Canada ..	1.01	1.55	2.35	2.63

There is another vital reason which explains why the shifts in the destination of our external trade took place in the manner they did. All the seven regions or countries included in this table are also our suppliers of credits for financing the Five-Year Plans. Since the start of the Second Plan, but more particularly in the recent past, external aid is based very largely on the principle of a tie-up with specific projects. In simple terms it meant that we had to import at least our development goods from the countries supplying us credits for particular projects. Then in the case of the East-European countries the emergence of the rupee payment facility for imports gave a positive mould to the direction of our trade. In a situation of foreign exchange tightness, this facility came in handy for us and we imported from these countries primarily because of the medium of payment. But here there was a corresponding and equally important change in the direction of our exports. The rupee balances accumulated by these countries were used for purchasing goods in our country for shipments at home. Thus it was that for the rupee imports there was the counterpart of rupee exports, although not in a precisely balancing manner. But both the components of the trade showed an increase in the direction of these countries.

In interpreting Table TRD — No. 3, one important consideration ought to be kept in view. This table shows the percentage shares of imports and exports. But in terms of absolute value our imports have risen to very high levels, while exports have achieved only a modest rise. It is, therefore, the import side of this picture which is important and which creates all the problems of trade deficit and, therefore, of the payments deficit.

The USA has now emerged as our premier partner in trade. Its share in our imports has jumped from

13.15 per cent in 1955-56 to 21.80 per cent in 1961-62. The percentage share of the EEC shows a marginal decline in 1961-62 and the share of the UK shows a steep fall. In the EEC region, West Germany has improved her position as our supplier of imports as will be seen from her bulk share of 11.40 per cent out of our total imports of 16.98 per cent from the EEC. Very nearly the same position obtains in the case of the share of the USSR in our total imports from Eastern Europe. Japan and Australia have recorded sizeable improvements as our suppliers of developmental goods and Canada, despite her nebulous trade tie with us in the pre-war period, has also become a valuable partner.

The export side of the picture reveals the inflexibility of our trade except in the case of Eastern Europe for reasons which are elaborated above. Our exports to the USA improved by 3.3 per cent in 1961-62, but the source of the greatest worry is the decline in the share of our exports to the EEC in our total exports from 9.40 per cent to 7.88 per cent. In the case of West Germany, there is some improvement, but since most of the EEC Six constitute our vital providers of credit, the declining exports in terms of percentages are producing greater strains in our balance of trade with this region.

While our needs of planned development are being progressively met, as indicated by the shifts in the direction of our import trade, the problem of discharging our obligations of credits from the supplying countries has posed another and pressing challenge to our exports. It is true that the competitive efficiency of our exports does not match that of some other exporting countries trading with these regions. But if aid is being extended on the basic and long-term principle of sharing prosperity and assisting economically backward countries to rise, a corresponding principle also should be translated into practice. So far it is being approved as a matter of enlightened mutual interest. That principle is that aid ought to be followed by trade in the case of the underdeveloped countries. Unless, therefore, a deliberate policy is adopted by the credit-supplying countries to encourage the exports of the credit-receiving countries like India, the strains on the balance of payments of these countries will reach a point of intolerance. It is primarily the function of the developing countries to resist the emergence of this saturation point, but they can succeed in their efforts only with a liberal policy of trade to be adopted by the aid-giving countries.

E.C.M., Britain and India

By Neil McInnes

THE prospect of Britain joining the European Common Market has awakened anxiety in India, as in various other overseas Commonwealth countries — and, for that matter, in developing countries outside the Commonwealth, as in Latin America. It is feared that the re-organisation of traditional trade patterns must endanger the export earnings of countries like India, and hence their ability to finance their development. These apprehensions are usually met with two general arguments. Firstly, it is pointed out that there are no "traditional" trade patterns, in the sense of static channels that do not vary from decade to decade. Change is constant, and where it undermines old arrangements, it simultaneously creates new opportunities. The existing pattern of Commonwealth trade was evolving fast, even when Britain had no intention of joining the Six; her entry into the Common Market will constitute one big, abrupt change that concentrates inconveniences into a short space of time but also concentrates opportunities. On this view, Indian exporters who fear the consequences of loss of old facilities are being unenterprising, when they should be looking for the new trade openings that European unity will create. They are being asked to sacrifice something that could not last anyhow, and offered in return a new dispensation that contains challenges to their trading ability and to innovation.

The assertion that the new arrangement will, on balance, be less advantageous to India than the old is met with the second general argument, to which we will turn shortly. Before that, however, it is necessary to note that this argument that Indian trade tomorrow, as yesterday, will depend on what Indian traders make of it contains very cold comfort but also a large grain of truth. Whatever new arrangements emerge, be they unexpectedly favourable or apparently disastrous, markets are not to be regarded passively as something created by tariffs, but actively as something created by trading ability, by business acumen and by enterprise. It has been shown repeatedly (the latest demonstration was British trade success in the Common Market in 1959-62) that when business men are galvanised into aggressive market activity by a deeply resented "tariff discrimination", they have found that new customers could be won on the other side of a higher customs-duty barrier.

One must not exaggerate this point. It would be the merest hypocrisy to pretend that India's future export earnings depend entirely on her traders' efforts regardless of tariff obstacles. If customs unions did not discriminate against outsiders to some extent, then people would never bother to form them. Yet no discussion of India's likely trade position in the coming decade would be complete if it omitted emphatic reference to the vital need of more aggressive overseas marketing, far beyond anything that has been attempted to date, and especially in Continental West Europe. India's trade effort, or rather lack of it, in the Latin and Germanic countries of Europe is frankly deplorable. If the shock resulting from loss of the "safe" British market (which in reality was being eroded insensibly and yet was scarcely less neglected by Indian traders) produces more aggressive trade policies covering Europe as a whole, it will be a great good. The point is that the tariff obstacles set up by a new customs union are never as bad as they look at first, especially when (as is the case in the Common Market) the common external tariff of the new unit is low, in absolute terms. At all events, tariffs are only one—and by no means the most important—limitation on trade. If, in spite of really vigorous selling efforts in Europe, it appeared that India's exports were encountering insurmountable barriers, it is sure that the reason would not be tariffs but technological changes leading to the substitution of man-made products for natural materials. The progress of synthetics is certain, and so far is to India's disadvantage, but that has nothing to do with the formation of European trade groupings.

The second general argument used against Indian anxieties is that the enlargement of the Common Market to cover Britain and a few other countries will stimulate an advance of industrial activity and a rise in living standards in all Europe that must be reflected in bigger demand for Indian goods. Indeed, this answer is given to all non-members of the Common Market. It is economically sound. The volume of effective demand depends both on the price of the goods demanded and on the purchasing power of the demanders. If membership of a trade zone, protected on the outside by a tariff wall, makes goods from within that zone cheaper than goods from outside, it is also true that a rise in incomes in that zone can cancel out this negative effect on goods from outside. Supposing that incomes inside the zone rise by 1 per cent annually for ten years, then the effect of a 10 per cent tariff duty is cancelled out. Now in fact demand is more elastic in relation to rising incomes than in relation to rising prices. That is, the relative dearness of goods from outside (due to tariff discrimination) is very quickly counterbalanced by increased spending power. This argument is accepted in the main by North American manufacturers, who realise that they will do more business with a protected but more prosperous West Europe. It is not accepted by North American farmers, because demand for food is inelastic, i.e., will not increase much no matter how much richer the Europeans get.

This argument is extremely general, in fact abstract. One culd not apply it to specific Indian goods until one knew something about the elasticity of demand for them in relation both to higher relative prices and rising incomes. But before accepting it even as a general proposition Indians would be entitled to ask why Britain was not convinced by it. If rising standards on the Continent were sure to generate greater demand for goods from outside, despite tariff discrimination, Britain would naturally have been the first to gain, as the nearest major industrial power. Yet Britain refused to rely on that prospect and sought to get inside the Common Market. So why should remote India be satisfied with the vague general proposition that economic expansion in the Common Market will maintain, or even expand, demand for her goods despite the details of tariff arrangements?

The only answer to that is that, in so far as Britain was thinking merely of the volume of her trade across the channel, the decision to enter the Common Market was unnecessary — as about half the Britain people still believe at this moment. Staying outside the Common Market, Britain was assured of doing immensely more trade with the Continent in the years to come, in spite of the fact that the common external tariff would discriminate against her goods as compared with German, French or Italian goods offered for sale on the Continent. Indeed as an exporter of certain goods that are extremely sensitive to rises in living standards (superior grade cloth, whiskey, sports and luxury cars) and as a provider of capital equipment, Britain could consider the trade prospects with the Common Market as excellent; she had in fact already begun to benefit in these ways after 1958, incipient tariff discrimination notwithstanding. So Britain's application for admission to the Common Market does not show disbelief in the argument that economic expansion on the Continent will benefit outside traders.

It was simply that Britain had the opportunity (not available to non-European countries) of actually getting inside the Common Market, whereupon her trade would increase even more — for it is not denied that internal Common Market commerce is expanding faster than the region's rising foreign trade. Yet that consideration was not decisive either. Considered as a purely commercial question, it is not yet proven that Britain did the right thing in seeking admission to the Common Market. Her gains will have to be counterbalanced with serious sacrifices, for example in regard to agriculture, and at the present moment those sacrifices seem so immense that Britain's decision was not primarily commercial but political. Her international status was threatened by the rise of a European political union from which she would be excluded. And even if her trade with that union increased mightily, the concentration of Continental industries into firms of American size would jeopardise Britain's exports to countries outside Europe, notably in the case of capital equipment. On the contrary, by participating in that process of concentration, British industry will receive a much needed technological stimulus.

Thus, after disposing of that objection based on the British decision, we are left with the argument that the Common Market's expansion will stimulate its imports from countries like India. And now that argument is much stronger, for the unit in question is no longer just the Six but the Six plus Britain. They together constitute a unit of unequalled economic potential and — more important from our present point of view — a unit that depends on imports much more than the USA, the only other comparable economic power. Without launching into calculations about the likely increase in the imports of the enlarged Common Market (and such calculations have been attempted by the OECD), I think it is obvious that the prospects for Indian exports in this vast expanding market are so considerable as to outweigh the loss of preferences in the British market alone. In particular, the value of trade concessions made by this large unit (for example, duty-free entry for tea) is immense when one remembers that living standards within it are to rise to present American levels within a few decades.

Rather than labour that familiar point, I would draw attention to something that is usually overlooked in this discussion. It is this: the increase in imports that is bound to be caused by higher living standards and more intense business activity in the rich countries of West Europe (Britain, France, Germany and Benelux), is actually smaller than the increase that must follow the spectacular economic progress of the poorer European countries: South Italy, Spain, Greece, Portugal, Ireland. This progress is directly related to the Common Market (in the case of South Italy and Greece) and to Britain's admission to that association (for Ireland and the Iberian countries followed Britain's lead). Altogether, these regions contain about 70 million people, who, thanks to the Common Market, have entered on a revolutionary phase of their economic development. Because of the familiar fact that there is a higher import-content in an increase from very low to moderate living standards, than there is in an increase from rich to very rich living standards, the development of these peripheral regions of Europe is of prime importance to overseas countries. Instead of musing on the consequences for foreign trade of the fact that rich Europeans will soon enjoy American standards, one might reflect on the consequences of the fact that 70 million poor Europeans will soon enjoy standards now taken for granted in Britain and France. This has an evident commercial corollary: the peripheral regions of Europe, be they members or associates of the Common Market, will be a market to watch, or rather explore, in the years immediately ahead.

Up to this point, the drift of the discussion might seem to be optimistic: there are trade advantages in the enlargement of the Common Market that did not exist in the combination of a six-power Common Market and Commonwealth preference. But we started out talking about the need of export earnings to finance Indian development. Now, in that context, I think that any discussion of India's trade prospects must lead to pessimistic conclusions. In other words, I do not believe that any trade arrangements that we can conceive at present will guarantee that India will earn enough from her exports to finance her development at the pace desired. Britain might stay out of the

Common Market and continue, even intensify, preference for Indian exports; or she might join the Common Market and touch off an economic expansion in Europe that will greatly stimulate demand for Indian exports — but in neither case will the volume of Indian export earnings suffice to finance industrial development.

The most favourable trade and tariff arrangements imaginable will still leave India with an unmanageable trade deficit. It does not follow from this that foreign trade is of marginal importance, since it will not by itself solve the whole problem. There are excellent reasons for trying to keep the deficit as small as possible, and there are dozens of sound reasons for promoting Indian industries that are good enough to be able to export some part of their product, even if they cannot make the nation economically independent, in the sense of balancing her trade. It is necessary to get the best trade terms possible; it is vital to promote exports and seek new markets; it is even more important to control prices and modernise production in such a manner that Indian goods are competitive with foreign whether they are sold outside the country or within. But some Indian politicians have been connecting the Common Market debate with India's development in a way that suggests that there exists some trade dispensation that would enable India to balance her trade and payments during the development phase. It is better to be clear on the fact that, on present indications, there exists no such trade dispensation. No manipulation of tariffs and preference within the present world trade pattern is going to enable India to balance her trade. For that balance to be achieved, there will be required nothing short of a revolution in the international trade nexus. The question then would be whether Britain's admission to the Common Market is a step toward that complete re-thinking of trade between the industrialised and developing nations.

That an increase in Western imports (even on the optimistic assumption made above) will not serve to balance India's trade can be seen in trade forecasts made by the Economic Commission for Europe; we can extend the argument to all the developing countries while we are about it, because it is world trade and not just Indo-Western trade that is in question. The pace at which developing countries would have to boost their export earnings in order to achieve trade balance while raising per capita revenues by three per cent annually may be read off from the table below (India belongs with the ECAFE group of developing nations).

If the developing nations are to increase their per capita revenues by three per cent yearly, their combined net national product will grow from $132,000 million in 1958 to $416,000 million in 1980, taking account of the concomitant rise in populations. Now, every one per cent increase in net national product entails an increase of 0.85 per cent in import needs, because development requires imports of capital equipment and even of some consumer goods and food. It follows that the combined import bill would rise from $22,500 million to $60,000 million. To pay for those imports, these nations have their exports and their capital imports. Take the latter first. They amounted to $3,500 million yearly in 1958-60. (In this discussion as in the right-hand columns of the table, we leave out of account the oil-producing nations: the Middle East, Venezuela, Sarawak and the Dutch West Indies, for their foreign trade and capital imports are quite exceptional.) If we are optimistic, we can assume that capital imports will continue to grow in phase with rising import of merchandise. That is an optimistic assumption because, naturally, we are talking about net capital imports; so gross capital imports will have to rise much faster in order to finance the servicing of external long-term debt, which is rapidly becoming onerous. Given this, we may forecast that capital imports could grow from $3,500 million in 1958-60 to $9,300 million in 1980.

We have now to subtract from the cost of imports c.i.f. this figure for capital imports, to get the value of

TABLE TRD—4

USHA
HELPS NATIONAL PROGRESS

Usha is playing a vital role in actively assisting the country to earn valuable foreign exchange. The largest exporters in the light engineering field, Usha sewing machines and fans are warmly welcomed in about 50 countries around the world. Besides giving technical know-how to other countries, Usha have taken a major step forward in export promotion by setting up sewing machine assembly plants in Saigon and Colombo.

We look to the future with confidence and in a spirit of dedication to serve the country well.

exports f.o.b. required to balance the account. In 1958-59 we know that this was $19,000 million for the group of developing countries considered. *In 1980 it will have to be $50,700 million.* In twenty years, then, the developing countries will have to increase their exports by 250 per cent. The ECAFE countries (excluding Japan) will have to boost their exports from $6,900 million to $17,900 million in that same period, or by rather more than 250 per cent. Perhaps these percentage figures mean little to some readers, so I should point out that there is nothing improbable about them; various nations have doubled their exports, or better, within a generation — France is a recent example. Theoretically, there is no impossibility in multiplying exports by two and a half in twenty years, but our problem is whether this is conceivable for developing countries like India in their present circumstances, and given the goods that now make up their export catalogue. More specifically, we are asking whether the tariff changes consequent on Britain's joining the Common Market would affect the issue noticeably.

It seems we have to answer 'No' both times. Of the $19,000 million worth of exports shipped by these developing countries in each year from 1957 to 1959, on average, $12,000 million were bought by West Europe, the USA and Japan. Prospective studies have been made of the likely evolution of demand in those industrialised countries for the goods concerned, and they suggest that between now and 1980 that demand will rise by only 70 per cent. Instead of selling $12,000 million worth of goods in those markets, the developing countries in question could hope to sell $20,000 million. Highly favourable tariff arrangements and spectacular economic expansion in the enlarged Common Market might raise that latter figure somewhat — but, on the most sanguine hypothesis, it would still fall far short of the $50,000 million target for exports. At this point, one thinks of the potential market constituted by Soviet Russia and her allies. It is indeed promising, but it is easy to see its limits: one just has to assume that consumption of "tropical goods" and "colonial produce" in the Soviet world rises to the same per capita level as in the West — whereupon new export markets worth several thousand million dollars would have been won by the developing countries. But one would still be well short of the export target we have calculated from the import content of development.

The conclusion is that in the existing structure of world trade, however modified by changes in tariffs and preferences such as are being discussed by Britain and the Six in Brussels, it will be impossible for countries like India to come anywhere near financing their development out of their export earnings. What implications this has for the problem of development as a whole is a large question that lies outside our scope, which is limited to India's trade with the West. We do not have to conclude that the Brussels negotiations are of no interest, on the grounds that trade prospects are poor no matter what is decided there. We are forced to the conclusion, rather, that the existing pattern of world trade is incompatible with development in countries such as India, and then we are led to ask whether British membership of the Common Market might produce new thinking about that pattern.

Here, we do not have to speculate, because the facts are plain even before Britain's admission is negotiated. The American Government has proposed, exactly because the Common Market is being enlarged and is growing rapidly, an ambitious plan of tariff disarmament which would lead to abolition of customs duties on various present (and other future) exports from India to the West, and the halving of duties on many others. At the same time, the French Government has proposed, exactly, because Britain is seeking entry into the Common Market, a scheme for the reorganisation of world markets in foodstuffs, which could have similarly welcome results for India. I do not want to suggest that either or both of these schemes are certain to be adopted, nor that if they were they would resolve the trade dilemma outlined above. But they both surely constitute imaginative efforts to revolutionise a pattern of world trade that is obviously unfavourable to the developing countries. Both those schemes were put up when Britain sought to enter the Common Market, and their implementation is dependent on her actually being admitted. This is so because the enlargement of the Common Market to cover Britain and sundry smaller West European nations would simplify one side of the world's trade problems enormously: there would be two Western authorities, in Washington and Brussels, capable of collaborating on tasks that become manageable then, in a way they would never be, when the West is fragmented into unco-ordinated and often rival centres of decision. The forthcoming admission of Japan to the Organisation for Economic Co-operation and Development would complete this unity, by bringing together in the one committee virtually all the world's non-Communist industrial powers.

Whatever we think of this prospect, it is surely in that perspective that we should set Britain's admission to the Common Market, instead of considering it in parochial terms — as when we deplore the loss of Commonwealth preference. Mr. Kennedy's Grand Design and the Baumgartner-Pisani Plan for foodstuffs may be taken as foretastes of the sort of new thinking about world trade that will become possible when West Europe has some measure of economic unity and continues collaboration with the U.S.A. There are other matters that could then be taken up: fluctuations of commodity prices, for example, and the opening up of Western markets to the manufactures of developing countries. It is not promised that on such issues the enlarged Common Market will necessarily take a progressive attitude, or even reach unanimity; but the point is that such matters cannot even be usefully discussed until Britain is inside the Common Market and is working towards a common commercial policy for all West Europe. The same applies to a co-ordination and significant increase in the volume of development assistance — "significant" meaning that it be carried to the point where it really hurts Westerners and entails noticeable sacrifices. In all such affairs, British membership of the Common Market is an essential first step. European commercial and monetary rivalries are an obstacles to any rational approach to trade with and aid for the developing nations.

To suggest that European trade groupings might have welcome effects on India's development is not by any means to imply that they are of decisive importance. (It is the pessimists who imply that, when they say that loss of Commonwealth trade channels will be a disaster). Nothing is less true than that India's progress depends on the greater or less goodwill of the industrialised democracies. The key to Indian development is not in the West but in India. The trade and payments balance is just one of the possible points of breakdown, among many others no less vital; it is a particularly interesting point because there will be reflected the failures and successes in many of those other sectors of activity. You watch a sensitive reflector of that kind in order to know when things have gone wrong, but you do not set them right again by acting on the reflector.

Our activities

1. Coal Crushing, Mixing and Handling Plants
2. Coke Oven Plants
3. Low Temperature Carbonization Plants
4. Coke Preparation, Handling and Loading Plants
5. Recovery and Processing of By-Products from Coal-tar
6. Gasification Plants
7. Synthesis Gas Production by continuous gasification of all types of fuels
8. Ethylene and Propylene Plants
9. Distillation Plants of all types
10. Phthalic and Maleic Anhydride Plants
11. Sintering Plants for Iron Ore
12. Automation, Measurement and Control
13. Refractory Materials including pyrometric tubes
14. Industrial Furnaces for metallurgical and ceramic industries
15. Oil & Gas Burners
16. Water Treatment Plants

KOPPERS INDIA LTD

CALCUTTA

36, GANESH CHANDRA AVENUE. TELEPHONE 24-4493 (3 LINES)

INDUSTRIAL FINANCE CORPORATION OF INDIA

(Incorporated under the Industrial Finance Corporation Act, 1948 (XV of 1948)

HEAD OFFICE:

Reserve Bank Building, Parliament Street, New Delhi.

BRANCH OFFICES:

Liberty Building, 8, Marine Lines, BOMBAY. | **P-11, Mission Row Extension, CALCUTTA.** | **38, Whites Road, Royapettah, MADRAS.**

AUTHORISED CAPITAL: Rs. 10,00,00,000
ISSUED AND PAID-UP CAPITAL: Rs. 7,00,00,000
TOTAL LOANS OUTSTANDING (As on the 30-6-1962) Rs. 49,61,58,295

AUTHORISED BUSINESS:

(a) (i) Granting of medium and long-term loans and advances in Rupees to or subscribing to the debentures of public limited companies or registered co-operative societies engaged in or proposing to engage in the manufacture, preservation or processing of goods, or the generation or distribution of electricity or any other form of power, or mining, or shipping or hotel industry with an option to convert at its discretion the loans and/or debentures into stock or shares.

(ii) Granting of loans in foreign currency under arrangement with the Development Loan Fund of the U.S.A. to industrial concerns.

(b) Guaranteeing of loans raised by industrial concerns (i) which are floated in the public market and are repayable within a period not exceeding twenty-five years and (ii) from scheduled banks or state co-operative banks.

(c) Guaranteeing loans raised from or credit arrangements made with any bank or financial institution in any country outside India by industrial concerns in foreign currency.

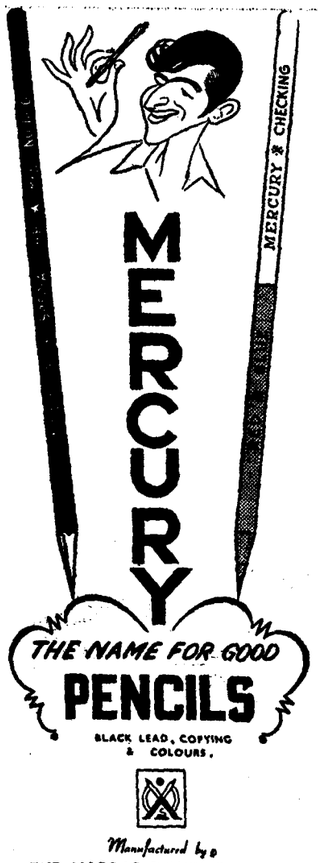
(d) Underwriting the issue of stock, shares, bonds or debentures by industrial concerns;

(e) Subscribing to the stock or shares of industrial concerns;

(f) Guaranteeing of deferred payments in respect of import of capital goods from abroad or their purchase in India by industrial concerns;

PURPOSES FOR WHICH LOANS ARE SANCTIONED:

Purchase of new or second hand machinery, renovation or modernisation or replacement of worn-out or obsolete machinery, purchase of land for factory site, and construction of factory buildings.



IMPORTANT TERMS AND CONDITIONS OF LOANS:

(i) SECURITY: First charge of all the fixed assets such as land, buildings, plant and machinery and fixtures. Raw materials, stock-in-process and finished goods will not be mortgaged and will, therefore, be available for raising working capital from elsewhere.

(ii) MARGIN: Generally 50% of the value of total assets including those to be acquired with the loan. This margin may be reduced to 40% in case of industrial concerns importing plant and machinery under the U.S. Export-Import Bank Loans or other foreign currency loans (tied credits) taken by Government from foreign governments or financial institutions abroad where the cost of imported plant and machinery is 60% or above of the total capital cost of the project. The margin may be further reduced to 35% in special cases.

(iii) INTEREST: The current rate of interest for rupee loans is 7½% per annum subject to a rebate of ½% for punctual repayment of instalments of principal and payment of interest. D.L.F. loans carry interest at 8¼ p.a. less a rebate of ½% p.a. for prompt payment (net 7¾%) **plus** an extra ¼% p.a. to provide for incidental expenditure.

(iv) REPAYMENT: Rupee loans are repayable within a period not exceeding 25 years to suit borrower's convenience. D.L.F. Loans are repayable within a period not less than 5 years and not more than 15 years from the date of the disbursement of the final-instalment of the loan. Repayments shall not however, commence earlier than one year from the date of the final

Transport

Grappling with Shortages

SHORTAGES with frequent recurrence are writ large on the performance of the nation's transport system, in spite of the fact that its custodians, and of the giant-sized railway system in particular, have some reason to be proud of their achievement in providing transport capacity in a period of a spectacular expansion of freight traffic. The magnitude of the shortages has now started making its impact severely felt on production and critical situations arise when industrial units have to face the prospect of partial or complete temporary closure for want of transport for strategic goods, coal in particular. It is not always possible to overcome these situations by stop-gap arrangements of one industrial plant placing at the disposal of another its stocks of coal as was done this year. The crux of the problem which immediately faces the transport system of the country is to what extent and when will the shortages, whose frequency is now becoming quicker, can be eliminated or at least minimized. This is the task to which the planners and the managers of the transport industry have to address themselves in the immediate context of the remaining part of the Third Plan. Difficulties of finance cannot be allowed to stand in the way of any solutions because it is possible to seek alternatives to the plans of marginal potential, if any, of the expansion of rail capacity.

The root of the recurring shortages of transport is to be found in our approach to planning for this important component of the infra structure of the economy. A survey of the first decade of planning would show that expansion of the capacity of the railways has not been conceived or executed on a restricted scale. But in the case of roads, ports and coastal shipping, however, the verdict would be that parsimonious allocation of funds and policy of restrictions on operation, which was devised to meet the exigencies of coordination in an altogether different situation years ago, have prevented their development, in particular road development, except on a very modest scale. But the railway system has traditionally come to be regarded as the almost exclusive mode of modern transport, whereas road transport and coastal shipping have been assigned a minor role.

During the ten-year period the rates of growth in the volume of freight traffic carried by the railways and the roads show a sizeable increase. But this increase falls considerably short of the volume of traffic offering and, therefore, it cannot but be regarded as much below the requirements of the developing economy. The ton-miles operated by the railways during the decade, 1950-51 and 1960-61, increased from 26,980 million to 54,700 million. On the roads the ton-miles operated shot up from 3,358 million to 10,600 million. The most significant disparity in the growth rates is thus to be seen in the fact that, while the railways increased their effort by 100 per cent, roads raised it by 200 per cent and it ought to be emphasized that road transport continued to be hamstrung by various restrictions imposed by law. These rates of growth have a definite bearing on the planning for transport to meet the full requirements of the traffic which is bound to arise during the Third Plan.

The planners expect the volume of freight traffic to increase on the railways from 154 million originating tons in 1960-61 to 245 million originating tons in 1965-66, representing the emergence of an additional volume of 91 million originating tons. It must be stressed in parenthesis that this additional traffic of 91 million tons does not in any sense represent the actual volume of extra traffic that will be generated as a result of the economic growth in the Third Plan. In the first place, traffic in terms of originating tons gives no idea whatsoever of the demand that will be created for transport capacity. The correct measure is ton-miles which has not been estimated in the plan. In the next place, 91 million originating tons is the estimate related to the railway transport system, rather what it can take additionally. Even so, the programmes prescribed for the allocation of the traffic bring out the significant fact that coal, iron ore and other materials required by the steel plants and some priority traffic like cement will claim 88 per cent share of the total additional traffic envisaged for the railways. It goes without saying that, of the remaining 12 per cent, priority must be assigned to the movement of foodgrains, when required. As a consequence, therefore, the requirements of general industry and other traffic requirements will be compelled to go on short rations.

Then a very serious question is now posed before the organizers of the railway system. The war emergency and the large arrivals of shipments of arms, ammunition, etc., will naturally claim the top priority on wagon capacity. Since these arms are required for defence on the Himalayan border, the rail freight capacity will be put to unusually severe strains on account of the exceptionally long hauls required for the defence traffic. This prospepct at least should now bring about a transformation in the policy and thinking on coordination of the different components of transport and the relative magnitudes of growth which should be assigned to them. In plain terms it means that the other modes of transport than the railways will require a liberal policy of expansion.

Sound planning for an economy requires perspective planning for transport, power and other basic requirements in advance of and on a much larger scale than the projected expansion of the other sectors of the economy would indicate. This is for two reasons—to place transport capacity at the disposal of the other sectors when they would need it and to stimulate their expansion because of the availability of transport facilities. But this type of scientific planning pre-supposes a command over sufficient financial resources which it would entail. Precisely because this is our handicap, our planners were constrained to fall back upon what must be regarded as an improvised technique of planning that takes into account short periods of five years on very conservative estimates of the growth traffic and then again makes for it tentative provisions which mean provisions below the anticipated demands.

So far, in spite of our experience of the last ten years of acute shortages of transport, there is no evidence that the system in general and the railway system in particular is being brought within the purview of perspective planning. How improvised or a short term view of planning is taken by force of habit is very graphically illustrated by an interesting example. The Neogy Committee has been charged with the critical job of drawing up a blue-print for transport policy and coordination. But significantly enough, the Committee's terms of reference prescribe that this policy should be chalked out for the next "five to ten years," as if the two periods of five and ten years do not make any difference at all, apart from the fact that they do not satisfy the requirements of perspective planning. In its interim report the Neogy Committee has placed at the disposal of the Planning Commission copious statistical data of basic value on the strength of which it should be possible to formulate fresh policies in the wake of the war emergency without waiting for the Committee's final report. The war emergency has highlighted many of the serious draw-backs in our transport system in the northern and eastern regions. This applies to the railway system as well as to roads and inland water transport.

In one sense the delay in the Neogy Committee's preparation of the report is a boon, because that Committee can now rehaul its approach and thinking in the context of this emergency whose duration cannot be predicted. How the pre-emergency ideas have become somewhat out-moded may be exemplified with reference to one instance. It was argued that strategic and unremunerative railways and roads continue to be a drag on the exchequer, but now the stage has been arrived when the users who benefit from these transport facilities should be called upon to bear, if not the whole, a substantial burden of subsidising these strategic systems. Actually we are now face to face with a condition in Assam and NEFA where strategic roads, admittedly unremunerative, will have to be built. Moreover, railway lines will have to be laid in Assam which may take decades to pay their way.

At the end of the first decade the railways carried 100 per cent more traffic than at its beginning. This performance was exhibited in the face of the unsatisfactory and somewhat dilapidated condition of the rolling stock which continued to be retained in service. Towards the end of the First Plan, however, the situation in respect of rehabilitation of the rolling stock and additions to it began to record improvement. Between 1951 and 1961 the number of locomotives was raised from 8,461 to 10,554, showing a good increase of 24.8 per cent. Most of the new locomotives possess a higher potential of tractive effort and, therefore, their capacity and efficiency must be rated high. During the same period the number of freight wagons (in terms of four wheelers) increased from 220,441 to 341,041. The additions through the decade in the wagon stock were thus of a poor order of 53.3 per cent as against an increase of 100 per cent in traffic. Many of the wagons still in use are in a bad physical condition which means that loadings are reduced in quantities to suit their declining capacity. Inadequacy of wagons, however, has continued to be one of the major pitfalls in the railway transport system.

The Crisis of Coal

NOTHING ILLUSTRATES more graphically the chronic shortages of transport than the case of that key material—coal. The factual position for the first half of 1962 may be taken as typifying the shortages of wagon capacity for carrying coal, although there have occurred worse crises before. During this period the requirements of the daily average of wagons for coal were estimated by the Coal Controller at 8,127 out of which 6,503 were attributed to the coal-fields in West Bengal and Bihar. The railways had their own considerations on the basis of which they fixed their feasibility target at 6,925 as the daily average supply of wagons. Out of this, 5,496 were allocated to the Bengal-Bihar coal-fields. But on verification after the period was over, the startling fact which came to light was that the railways were unable to adhere to their target and actual loadings were of the order of 6,049 as a daily average, the share of the bulk producing coal-fields of Bengal and Bihar being 4,855. Thus between the Coal Controller's estimate and the actual loadings there was a wide gap of 2,078 wagons or roughly more than 33 per cent of his recommended target. Here it should be noted that the Coal Controller's estimates come somewhere near the real requirements of the collieries. Coming to the target set by the railways, a gap of 876 wagons per day is revealed between their plan and the actual loadings. A marginal allowance may be made in this shortfall for reasons for which responsibility cannot be fixed on the railways. But this margin is much more than cancelled out by the fact that the railway estimate includes 300 wagons for the washeries and not for transport to the destinations of actual consumption. This performance is typical of the conditions which normally prevail, although it is possible to argue that during the slack season after June the shortages are not of that high order.

One of the basic and permanent impediments which have been created for the transport of coal is the concentration of the collieries in one part of the country and the location of the industrial consumers in several directions at very long distances. This fact makes it all the more necessary that the problem of coal transport should be tackled with a bold and imaginative approach. Traditionally the railways are the almost exclusive carriers of coal. The pressure on their capacity generated by the coal traffic can be gathered from the absorbed by coal. As our consumption of coal is bound to increase at a steep rate with the development of industries, particularly in the areas which are remote from the coal-fields and in some of which alternative power like electricity will not be available on any significant scale, the problem of coal transport will certainly compel attention to diverting it to the maximum extent practicable from the railways. During the Third Plan the output of coal is to be raised from 60 million tons to 97 million tons out of which 90 million tons will make a demand on rail transport capacity, after allowing for quantities consumed in the collieries and marginal quantities carried by motor transport. If the revised target of 104 million tons is achieved in fact, it is safe to assume that the draft on the rail capacity will be to the extent of 95 million tons at least.

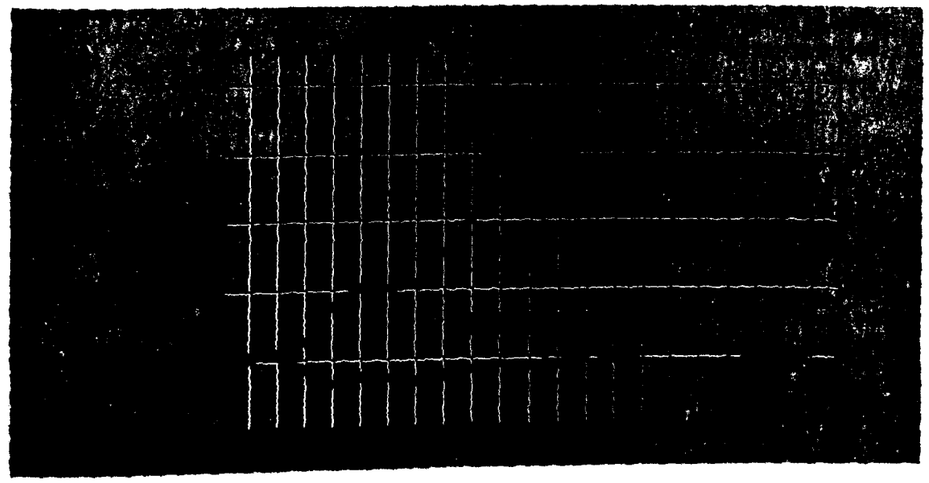
Are the railways in a position to provide the capacity which will progressively reach this peak in 1965-66? It appears threateningly certain that there will be critical shortages of wagon supply for the movement of coal. If the annual targets of the daily average supplies of wagons fixed by the Coal Transport Advisory Committee are taken as reasonable guides — which they ought to be — the supply in the first year of the present Plan should be 7,183 wagons per day and 8,561 wagons per day in the current year. The current year's estimate is a far cry from the actual daily average loadings of 6,049 wagons during the first half of the calendar year 1962. This is a position which underlines the fact that the strains generated by the fast developing economy are bound to create bottlenecks in rail transport. The adverse effect produced by the bottlenecks in coal movements is translated in terms of depressed levels of coal raisings and the estimate has been ventured that the raisings could be increased by one-fifth if the wagon supplies matched the demand from time to time. At any rate, it may be assumed that railway bottlenecks have held coal production level lower by at least something like 15 per cent. The accumulation of coal at the pit-heads puts immediate restraints on further raisings and this feature creates conditions of lower supplies of coal.

reflected in the utilisation of industrial capacity. Side by side with lack of imported materials, bottlenecks in transport and the resulting short supplies of coal are responsible for keeping a high ratio of installed industrial capacity compulsorily idle. A solution to ease this tight position, if not to wipe it out, must be found. The railways have not shirked their responsibility, but they cannot disown many of the shortcomings of their planning in coal movements. One particular solution they devised had to be dropped on the ground of non-feasibility. Recently they evolved a scheme whereby they undertook to supply rakes of 70 four-wheeler wagons with carrying capacity of 1,500 tons for the transport of coal. The other part of the scheme was that the large-scale consumers should construct their own railway sidings and stock coal instead of making costly and difficult demands for less bulky consignments. Then the small-scale consumers were called upon to pool their demand and ask the stockists to create dumps for supply to them according to their needs. This was to enable the railways to utilise whole train loads over long distances and at the same time arrange loadings on return journeys. But the entire scheme was jejune. The arrangement of pooling for small consumers would have created worse problems of distribution and construction of sidings, etc. would have entailed heavy costs for the large consumers. Then there is also the safety factor in the safeguarding of the dumps. The widespread opposition to the scheme was appreciated in its genuine spirit and the scheme was abandoned. Similarly, the oft-repeated plea of the railways requiring coal consumers to accept whole train loads during the slack season has also proved impracticable for reasons of looking up working capital as well as of huge stocking.

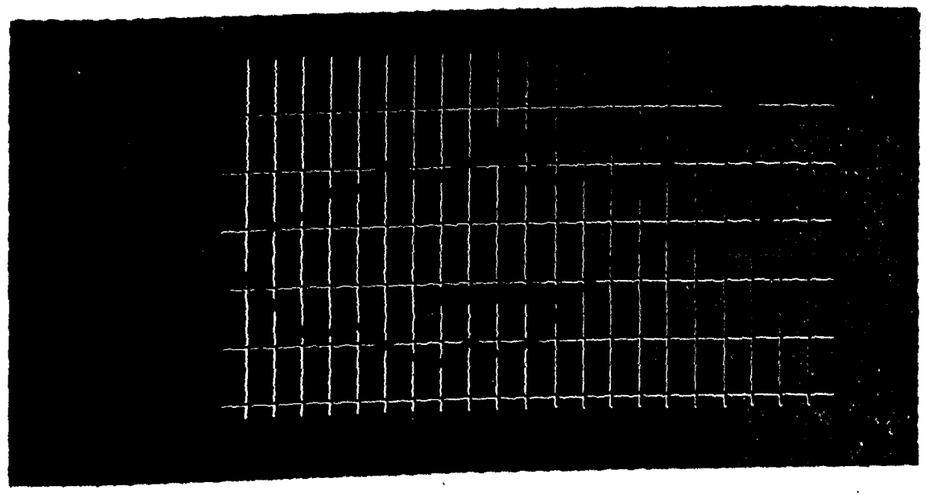
These propositions, therefore, direct attention to alternative solutions. The railways themselves are the major consumers of coal for steam locomotives and it has been urged that diesel locomotives should be used on the distant railway lines in South, West and North India. But the limits to dieselisation are set by our scanty production of this fuel and the foreign exchange involved in imports as well as the serious risk run in reducing our rail transport system to vulnerable dependence on an imported fuel. Electrification is feasible within limits, but it is a matter of time and outlay. The Federation of Indian Chambers of Commerce and Industry recently held a very useful conference to discuss the problems of transport and power. The papers read and discussed at that conference have made a positive contribution to these two problems. One of the suggestions made at this conference was that thermal power stations should be located in the neighbourhood of collieries so that they may save long-distance movements of low-grade and high-ash content coal to areas like South and West India, and the thermal power generated at these stations should be transmitted to the points where coal is now carried to create it. This imaginative suggestion, however, will need implementation in phases for the reason, among others, of foreign exchange outlay and the delays required in laying the transmission channels.

Still another solution is road-cum-river transport for coal which has got a very limited scope on account of the extremely deteriorated state of our inland waterways. Its feasibility is confined possibly to some areas of the north and the south. Carriage of coal by sea has brought in its wake problems of higher freight rates and the difficulties constantly experienced because of the low draft of the Hooghly river. As a partial solution it has been suggested that the scheme of rail-cum-sea transport should be implemented. Coal in whole train loads composed of BOX wagons should be specially arranged up to Visakhapatnam and from that point coastal shipping should take care of the carriage of coal to the consuming destinations. It is possible to pick holes in any alternative scheme suggested. But the stark prospect before the country is either to enter into any such schemes (disregarding nice estimates of cost accounting) or to starve industry of this fuel and face the consequences of stultifying production. The decision ought to proceed on the lines of the lesser evil.

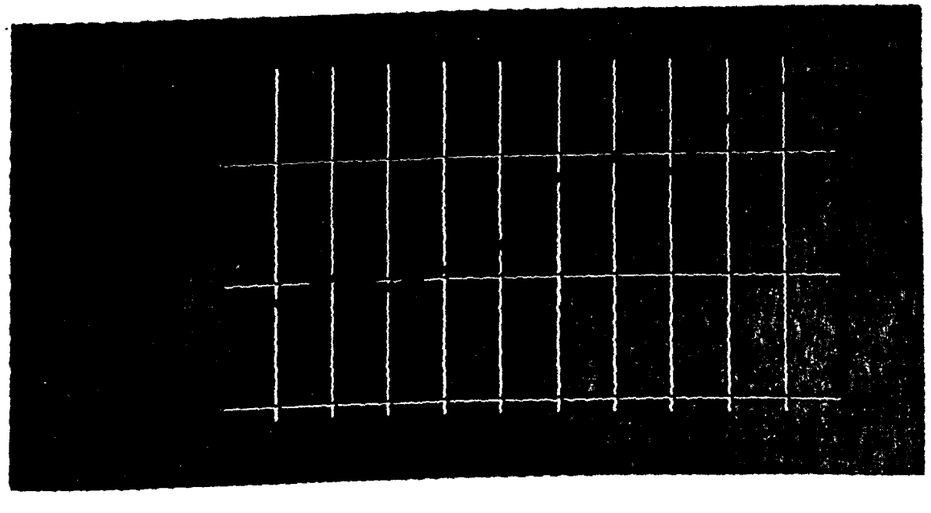
Intensive Use of Rail Capacity



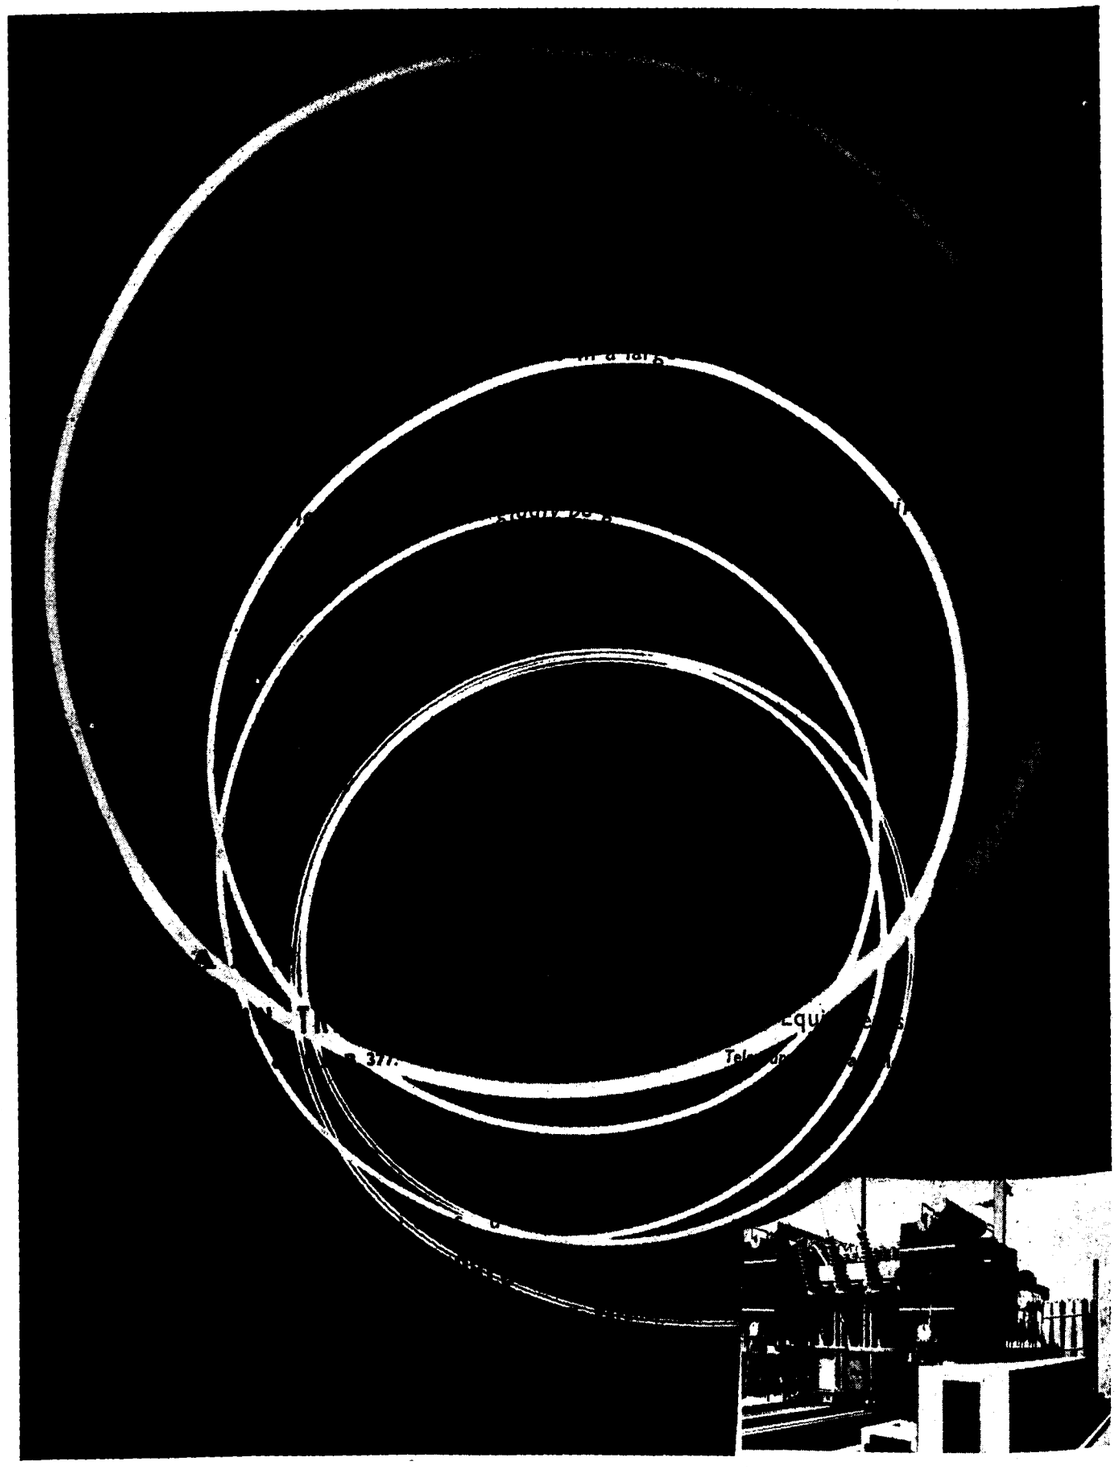
PLANNING FOR transport for the Third Plan proceeds on the recognition of the fact that the financial allocation is inadequate and, considering the role of a premier carrier which the railways have to play, a constant review will need to be made in order to provide more rolling stock and other physical capacity to the railways.



This approach of flexibility in railway planning will have scope within certain limits. The programmes of steel production as now assessed reveal that it would be at the end of the Third Plan and not before when steel plants will be in a position to supply all the steel requirements of the railways. But during the remaining three and a half years the fulfilment of the demand of the railways for steel will have to be met partially by imports. This will depend upon the foreign exchange which can be allotted to the railways from time to time. But it would appear that, since the railways will have to comply with the pressure demands of the Defence Ministry, priority in the allocation of foreign exchange may be taken as practically assured. But here another issue that arises is that the higher capacity so arranged will be absorbed by the military traffic, leaving the problems of the civilian sector as they are at the present time.



It is, therefore, vitally important that in the new situation created by the war emergency attention should be directed to maximizing railway transport capacity isation. Experience in India, as in most other countries, both economically backward and industrially advanced, establishes the proposition that the rate of increase in freight traffic far out-paces not only the rate of increase in the national income or of agricultural production but even that of industrial production. This is rightly stressed in the text of the Plan where the trends have been put in their relative terms. During the first decade of planning our national income increased by something like 42 per cent and the index of agricultural production recorded an increase of 41 per cent, while industrial production rose by 94 per cent. But freight traffic as measured in ton-miles rose by 100 per cent on the railways and by 200 per cent for road transport. This disparity in the increase of freight traffic, on the one hand, and the other increases, on the other hand, is not at all surprising. A closer examination would show that it is industrial production which makes a heavy demand on transport capacity. The increase in the volume of traffic and the distance over which it is carried (in other words, the ton-mile increase in freight traffic) jumps much higher than the other indices of economic progress because freight traffic involves multiple movements. As industrial expansion proceeds apace this disparity is bound to widen and larger calls are bound to be made on the capacity of the railways as also on the other modes of transport.



One way in which this capacity can be met is to

INDIAN LABOUR

either to serve neglected areas or to set up direct links between points where they do not exist at present. But the Neogy Committee has brought to light one wasteful flaw in the construction of new lines. It has quoted the evidence of traffic statistics to show that in the case of several new lines the traffic carried is very much below the estimates—after the permissible preliminary period of new opening of the lines. This could not be because of misleading data, but it would appear that political pressures from the State Governments and in some cases the ideological pursuit of paying special attention to backward areas have been responsible for outlay on new lines, which could very well have been spared or utilized in areas of potential concentration. The plea for redressing imbalances in regional growths is quite sensible, but when resources are scarce and the emergency has created acute pressures on transport, attention in future ought to be paid to avoiding the waste that is involved in undertaking construction in wrong areas.

Intensive utilisation of rail capacity has now become an urgent need because experience since at least the last year of the Second Plan has demonstrated that transport may hold up the progress of the Plan programmes and even the full working of the industries already set up. There are various directions in which intensive use of the capacity of the railways for carrying freight traffic can be made from time to time. But attention needs to be rivetted where concrete results in terms of higher physical performance can be obtained because the crying need of the hour is lifting as much traffic as possible. First attention by technical planners in railway planning is paid to the improvement of the line capacity. Here various ingredients of capacity may be available for intensive exploitation. It always pays the railways to have broad gauge lines and double-track rather than metre gauge and single track lines. The question of converting metre gauge into broad gauge lines was given thorough consideration about a decade ago and for obvious reasons of outlay and the prospect of availability of sufficient traffic it was thought advisable not to make any wholesale decision on eliminating the metre gauge lines altogether. But the benefits of laying double lines where single line sections are operated are quite clear. On single line sections (and the normal length of a section on the railways is currently fixed at 100 miles) the capacity is 150 per cent more on the double line than on the single line. It would, therefore, be desirable to lay double lines to maximise traffic movements.

Then comes the rolling stock where intensive use is possible with rationalisation that can be taken in hand on our railways. It has always been argued that locomotives should be dieselised for two reasons—to reduce the consumption of coal for the railways and to increase the speed of trains. But, as pointed out in a foregoing paragraph, dieselisation has its obvious and particularly strategic limitations. The railways have wisely decided to maintain a pool of diesel locomotives to be commissioned into service wherever the saturation point is reached in traffic. A diesel engine does not require refuelling until it has done 800 miles of running and furthermore it dispenses with delays involved for watering. Aside from points of congestion of traffic, it could be used in the hot season in areas like Rajasthan where water supply is scanty and cases of whole trains being detained for want of water for locomotive tanks have developed into a notorious feature in the summer season. Electrification is a matter of outlay and time. It has been estimated that if about 10,000 route miles are to be electrified it would take us a quarter of a century to complete this programme.

The choice, by and large, falls upon the rationalisation of the wagon stock .At the present time our longest goods trains consist of 70 four-wheeler wagons. They are now being normalized to this standard. But the preferable course is indicated in a switch-over to the BOX wagons. Their speed of 50 miles an hour, as contrasted with 35 miles operated by the four-wheelers, would go a good way towards improving wagon turn-round. But easily the most outstanding feature of the BOX wagons is their ability to increase carrying capacity by as much as 70 per cent. Thus a switch-over to the BOX wagons would result directly in an increase of 70 per cent of the freight-carrying capacity of the railways. But these wagons require the centre buffer coupling and experience in the past short period has proved that they raise definite technical difficulties for the transport user. It would be highly desirable, therefore, to allocate, as the Federation of Indian Chambers of Commerce and Industry's Transport Conference has strongly urged, to confine their use to large-scale consumers in the public sector as well as in the private sector. At the present time about 2 per cent of our wagon stock consists of the BOX wagons—a ratio which should give an idea of the time and expense that will be involved in bulk conversion of the wagons stock to this type. But one need not wait for this large-scale conversion and it must be the first aim of the railways to expand the manufacturing capacity for the building of the BOX wagons. This alone would result, as pointed out above, in the stepping up of rail capacity by as much as 70 per cent with a relatively small investment.

But any such methods of rationalisation involving longer trains and higher speed would require the precondition of a large-scale programme of the strengthening of the track and pitching the efficiency of the permanent way inspectorate to a high point. Whatever the difficulties, they certainly are in no sense insurmountable. Automatic signalling rationalisation of marshalling yards, improvement of deficiencies of the railway repair workshops to minimize the period of immobilization of locomotives and similar programmes have already been included in the railway development plan. How far they are being intensively pursued it is difficult to judge until the detailed reports about their working are made available.

INVEST IN FREEDOM

BUY DEFENCE BONDS

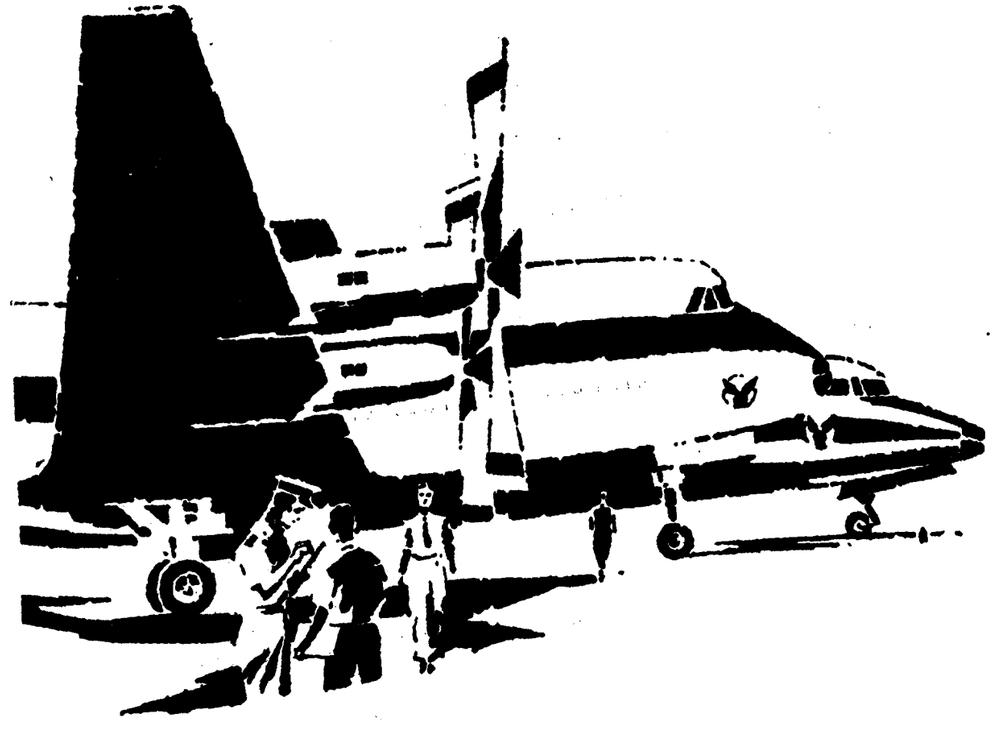
The Plan rightly recognises the fact that the supply of wagons at the present time and the schemes prepared for their manufacture will not fully satisfy the demands which would be created in the near future. To overcome the inadequacy of wagon supply, at least in a partial degree, it is of the utmost importance to shorten the number of days of wagon turn-round, thereby making it possible to intensify their use on the track. The planners believe that it is quite feasible to improve the wagon turn-round on the broad gauge lines from 11 days at the end of the Second Plan to 9.5 days at the end of the Third Plan and on the metre gauge lines from 8 days to 6.5 days. To aim at a still higher improvement should be possible now that the emergency has introduced an element of war-footing in the economy. The intensive use of physical assets should facilitate this objective. And finally, the efficiency of the railway traffic staff can always be improved either by creating a greater sense of duty during this critical situation or by the award of incentives for meritorious performance. The railways have to reckon with the obvious fact that, if they falter in their determination to break the bottlenecks, they will bear a good deal of responsibilty for giving a set-back to the progress of production.

The Inescapable Accent on Roads

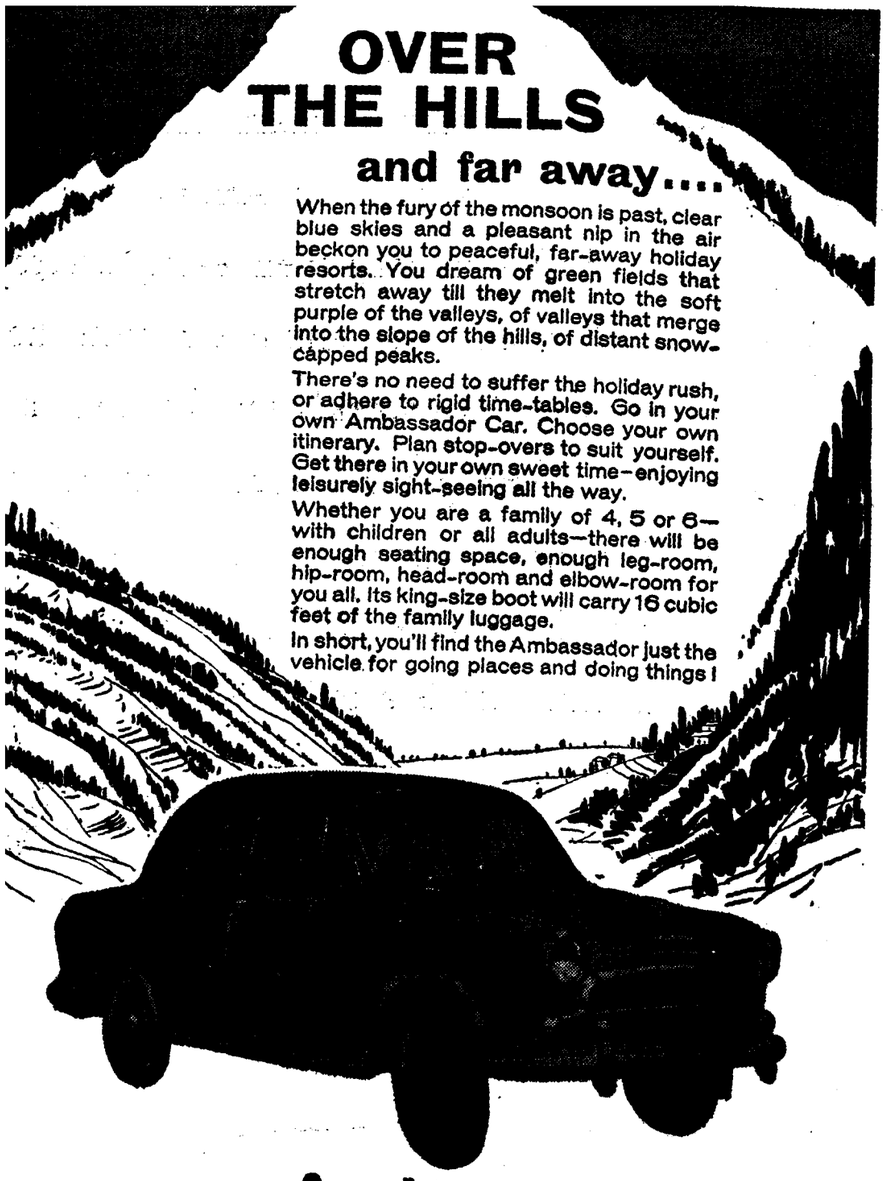
THE CAUTIOUS attitude of maintaining the conventional primacy of the railways in the nation's transport system, adopted by the Government and the Planning Commission under the powerful inspiration of the Railway Ministry, is understandable mainly in the light of high financial stakes which are involved in this gigantic system. So long as the end of planning for transport was to subserve the export-import trade, as in the pre-independence period, railways no doubt acquired a place of over-riding importance to the neglect of roads, inland waterways and, in a lesser degree, coastal shipping. But experience in all the countries similarly situated like India—with a huge land mass and a large scope for expanding the network of roads and available inland waterways—has demonstrated that the plateau is reached in the expansion of the railways not long after industrialization has made a headway. The dispersal of the location of industries and the mounting pressure of freight traffic reveal the inherent weakness of the railways to cope with the demand for transport capacity emanating from various transport users. Railways involve heavy investment outlays and also heavy outlays on maintenance, up-keep and traffic operations.

The flattening out of the dynamism in railways is best exemplified in the financial deterioration of the working of the railway systems of the United States and the United Kingdom. In India this point of financial stagnation has not been reached, but it is not at all reasonable to presume that indiscriminate expansion of railways must proceed until this cruicial point cries a halt to it. In an economically backward country, where financial resources are limited, while the pressures of the rapid development of the economy put heavy strains on them, expansion of the transport system must be planned, among other considerations, by the test of economic operation. Before economic planning was undertaken, the railway system was quite equal to the task of satisfying the port oriented or port-originating traffic of the country. But with the exploitation of the economic growth potentialities in all the interior of the country, the inadequacy of the railway system to cope with the traffic became quite apparent.

When after World War I motor transport and in particular truck transport began to grow rapidly and assumed unwieldy proportions, the unplanned and unregulated manner in which it was allowed to develop inflicted considerable injury on the operating and financial interests of the railways. Co-ordination between rail and road transport was essential in that situation, partly to harmonize the growth of both, but essentially to put restraints on the wayward development of motor transport. The restrictions on road transport were thus intended more to safeguard the interests and financial stability of the railways than to promote the object of transport co-ordination as such. But one outstanding result of this policy was that the railways became accustomed to an overall transport policy in which they enjoyed something of a sheltered position of a monopoly by reason of protective regulations which operated adversely against the roads. This sense of security was in a great measure highly detrimental to the efficiency of the railways which lost much of their capacity for competition and over the years developed an unconcealed fear of loss of traffic even due to fair competition from road transport. A number of enquiry committees in the post-independence period have proved chapter and verse that the operating restrictions and the burden of taxation on road transport are measures of discrimination against this dynamic system and they ought to be removed. The Age of Roads has actually dawned long since, but the fear on the part of the railways of encroachment by road transport on a good deal of traffic which flows to them for want of fair scope for consumer choice has been hampering the expansion of the road system which possesses all the ingredients of an efficient mode of transport.



Let it be conceded at the outset that the railways are not functioning exclusively on the basis of commercial operations. They are operating also as a public utility and, besides their position as the principal system of transport in the country ought to be preserved. Bulk traffic over long hauls can be carried essentially by the railways, although road transport too has demonstrably developed this potential. But this type of traffic is low-rated in the scheme of railway freight charges and some of the bulk traffic like coal is carried at rates which are below the cost of their carriage. The railways have to adopt this policy of charging low rates for certain vital commodities in the interest of the national economy. It, therefore, stands to reason that they must have the assurance that they are also enabled to carry high-rated traffic in lesser bulk and over short distances. Such a combination alone will enable the railways to function as a public utility-cum-commercial enterprise. If the role of the railways as a public utility is basic for their justification to be maintained on a gigantic scale, their role as a commercial enterprise is perhaps more important now in order to raise for the exchequer sufficient revenue. It would, therefore, be unreasonable to maintain the position that open and indiscriminating competition between the railways and the roads should be let loose in the emerging importance of the Age of Roads. The strategic function which the railways perform by carrying military passenger and freight traffic cannot be discharged by any other mode of transport. This is another reason why the relative position of the railways must remain what it is for several decades to come.



A definite scheme must be evolved in order to make sure that the railways are not left, as a result of competition from motor transport, to carrying unremunerative or less remunerative bulk traffic. High-rated commodities should always be made available for the railways in a reasonable proportion in order to maintain their financial stability. To that extent a certain amount of regulation of traffic is indispensable and there can be no such thing as open competition without regulation whatsoever. When this basic principle is fully recognised, all the current opposition of the railways to the dismantaling of the present restrictions on roads can be explained on no other hypothesis than that of a fear complex which creates apprehensions for them that they would be unable to withstand the competition from truck transport in particular. What is now actually happening is that the railways are physically incapable of carrying all the traffic that is offering. This is a statement of fact which cannot be controverted and, if any doubts are raised about it at all, the sceptics have only to recall the oft-emerging and acute rail transport bottlenecks in the country, creating not only shortages of transport but critical situations to the point of deadlocks in production.

This stage, when the railways have reached the maximum point of capacity within the allocable resources to carry the traffic that is offered, must compel loud thinking in real earnest whether the time is not long overdue to allow road transport to rise to its legitimate stature. There have been some periods even in the midst of the high tempo of economic development since 1951, when railway finances have touched the low point of profitability and the position of their reserve funds has shown their inability to provide even fractional amounts to finance their development. The recur-

FLYING TO AIRLINK INDIA Today, IAC is operating an air route mileage of over 24,000 to cover the entire sub-continent of India. It maintains 70 stations —some in remote hilly regions of Assam, Kashmir and Himachal Pradesh—making them easily accessible to air passengers. Not all these stations handle heavy traffic; some indeed are on a weekly schedule, yet a full complement of staff and ground equipment must be maintained at all times to ensure peak efficiency. IAC owes it to the people to offer the most because it is more than an airline...it is a public service.

rence of these downward fluctuations in their financial fortunes are responsible for producing high pressures from the railways to restrict the expansion of road transport. But certainly it would be absolutely wrong on the part of the Planning Commission and the Government to formulate a policy for perspective planning on the basis of what happens to the railways occasionably to the detriment of their financial interests.' A long-term policy must be determined by overall long-term considerations and not by the difficulties emerging in railway operations owing to seasonal influences. The fact that the railways have exerted their influence under these situations to continue the restrictive conditions on the operation of road transport is not at all a figment of imagination, but as will be shown subsequently it is a hard reality.

What precisely are the lines on which policy for road transport should be re-oriented, so that this system of potential growth and ever-growing capacity to carry traffic can provide the much-needed balance in the transport system and help to avert the recurrence of bottlenecks? The answer to this fundamental question can be given from two specific and important angles. First, in the order of actual operation of road services, come the manifold restrictions which have been imposed on motor transport services. When one ponders over the difficulties in procuring transport capacity, one wonders how these restrictions are still allowed to be clamped in spite of legislative provisions and other agreements for following an enlightened policy to the contrary. The limit of distance—normally 300 miles—which is imposed on the operating permits granted to road transport operators is certainly an anachronism in the present-day situation. It has been agreed in principle by all the State Governments that a permit should be available for the operation of the vehicle throughout the State. But while this agreement has been obtained in principle, in actual policy a number of States are continuing to impose restrictions of route mileage on the public carriers operating intra-State services. This agreement was obtained in pursuance of the recommendation contained in the Masani Committee's report. But its operation has been deferred indefinitely because of the objection raised by the Railway Ministry that it should not be put into force and should await the result of the Neogy Committee's report on this specific point.

To obtain a permit which is obligatory for every single vehicle owned by an operator is a time-consuming, vexatious and harrassing process. Something like half a year is required before a permit can be obtained and exceptional cases of States like Orissa and Bengal have been cited, where, in the absence of full-time Regional Transport Officers, the delays in the issue of permits extend as long as upto one year. Since the validity of the permit is restricted to only one transport region comprising different numbers of districts, counter-signatures of the Regional Transport Officers are essential for their operation outside the region in the same State. Curiously enough, the process of counter-signature also entails considerable delays. The obligation to obtain an operating permit in the case of each single vehicle puts a brake on the expansion of the fleets of the existing enterprises. Any motor transport enterprise which wants to enlarge its fleet either to serve the growing traffic needs in the same area or to undertake the operation of new routes has to pass through the same dilatory process of permit procurement. This is contrary to the practice of most other countries where such a narrow and irksome interpretation is not put on the validity of permits.

It is true that over large route lengths railway lines and roads have developed parallel to each other. The mistake originally committed in not avoiding this sort of duplication can be attributed to the road planners, but it is hardly correct to say that traffic for both the systems is not available in sufficient volumes in a majority of such parallel rail and road routes. The practical difficulties in bookings on the railways and the quantities of traffic available make it necessary for the transport user to opt for motor transport. It stands to reason that the consumer's choice to use the mode of transport which he considers economical or convenient should not generally be interfered with. When the Motor Vehicles (Amendment) Bill was being debated in Parliament, the clause seeking to impose length restrictions on trucks in such areas of parallel routes was thrown out because of the overwhelming opposition from the House. In the result, there is no statutory restriction now in the Act preventing truck operators to operate services in such regions. But it is noteworthy that the principle of fair competition which Parliament wrote into the legislation by throwing out this clause appears to have been flouted by the Railway Ministry. Under its inspiration the Ministry of Transport and Communications has officially intimated the State Governments to refer to the Railway Ministry all applications for permits for distances in excess of 300 miles to ascertain whether the railways have any objections to raise to the issue of such permits. Wherever the railways raise objections, the issue is referred to the Inter-State Transport Commission and the delays of several months involved in this irritating and dilatory process serve the purpose of defeating the applicant's project of strating the service. This is how legislation is circumvented in practice, if only because competition is to be evaded.

There has been so much talk of encouraging through truck transport services crossing the frontiers of different states in the interest of long distance speedy and economical transport. But arrangements between different States have not developed so as to encourage this through inter-State traffic. Even between two contiguous States agreements to allow operations of permits in both are based on the principle of reciprocity. But in practice the utility of these agreements has been nullified by the emphasis on the policy that the number of vehicles allowed to operate inter-State services should be equal from both the sides. On the face of it, this principle of parity may appear sound, but in practice, when there is a gross disparity between the levels of the development of motor transport in the two States, involving a substantially large vehicle strength in one State and a small vehicle stock in another, the principle of parity practically makes nonsense of the agreements. The development of inter-State motor transport continues to be hampered even now after the establishment of the Inter-State Transport Commission for no other reason than that the Commission does not yet possess powers to issue permits for inter-State operations.

But easily the more important angle from which the limitations on the growth of motor transport ought to be considered with a view to liberalising their operations is the current polcy of taxation which impinges sharply on them. This subject has been discussed threadbare by the Motor Vehicles Taxation Enquiry Committee, but action on its plain recommendations has not been taken in earnest so far. In brief, the position is that about 30 per cent of the inflated cost of a new vehicle is attributable to the import duties on components, excise duty on tyres and again an excise duties on vehicles, tyres, batteries, the sales-tax on vehicles, tax on passengers and that irksome levy at several points of octroi on vehicles plying the routes. Coming to the motor transport industry, over 30 per cent of its operating revenue is eaten away by various taxes. This order of taxation is pitched at a prohibitive level as would be apparent from the fact that it is two to three

times as high as that imposed in other countries. Then taxation of petroleum and diesel oil is also prohibitive. It is estimated that the tax on petrol is almost equal to the rail freight on the basis of per ton-mile unit, while the tax on diesel comes to 75 per cent of the railway freight. The result of this heavy incidence of taxation on motor transport has been to discourage investment in this industry.

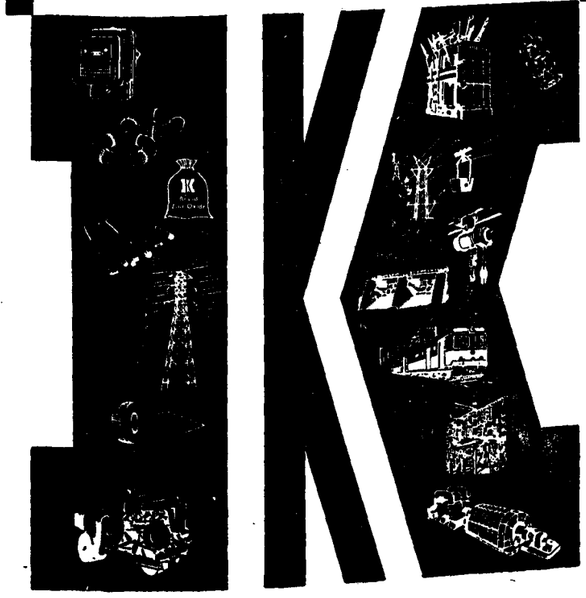
In the industrialized countries large-scale enterprises often find it convenient and economical to maintain their own fleets of private carriers. Such fleets dispense with the delays and the higher costs involved in requisitioning the services of rail transport or public road operators. In India transport costs for manufacturing industries would be reduced in no small measure, if it were possible for the enterprises to maintain their own private carriers. But the burden of taxation and the permit restrictions have been responsible for the almost total absence of such fleets.

The extent to which the State Governments in particular have come to acquire a stake in motor taxation to finance their general needs in the budget is easy to find. In 1960-61 the combined revenue of the Central and State Governments from vehicle and motor transport taxation was Rs. 170 crores, as against which expenditure on roads was Rs. 95 crores, leaving a surplus of Rs. 75 crores that could be appropriated to general expenditure. It is undoubtedly true that the principle of applying revenue precisely to meet the expenditure requirements of the same source cannot be accepted in budgeting for the simple reason that a large number of items of expenditure would be starved in that case. But in a stage of rapid economic development, when transport capacity is in ever-growing demand and under high pressure the correct policy should be to divert a high proportion of the revenue from motor vehicle transport taxation to road development. Government cannot in one breath plead lack of funds for undertaking a restricted programme of road expansion and in another divert motor taxation revenue to financing other projects. This position is certainly incongruous and the incongruity is highlighted by the fact that transport shortages are assuming grave proportions now.

In tables TRNS-1 & 2 in this Section will be found the details of the expansion of motor vehicles according to their different categories for the whole of India as well for the individual States separately. One point bears mention here. During 1950-51 to 1960-61 the number of trucks doubled from 81,900 to 165,700. Considering the enormous expansion of freight-traffic and the inability of the railways to carry all that was offered to them, the number of trucks ought to have increased still higher. But because of the route and taxation restraints it remained at this level. Even so, the high potential of motor transport to lift traffic is clearly demonsrated by the fact that between 1950-51 and 1960-61, the traffic carried by it in terms of ton-miles was trebled in spite of only a doubling of truck capacity. If the restrictions on truck transport which have now become unreasonable are removed, the bottlenecks in transport can be eliminated or at least reduced to the minimum extent. The argument for allowing motor transport to take its ligitimate place in the transport system of the country, unhampered by rail-biased restrictions, rests on sound grounds.

At the present moment 84 per cent of the freight traffic is carried by the railways while a mere 16 per cent is lifted by truck transport. This is the reason why a considerable volume of industrial freight traffic stagnates for want of transport capacity. The speed of a truck is estimated to be three times as fast as that of a railway train which would thus help a much more rapid turnover of traffic when carried by trucks than when it is transported by railways. It is estimated by the Neogy Committee that during the Third Plan period the increase in road freight traffic would be of the order of 120 per cent from 10,600 million ton-miles in 1960-61 to 23,350 million ton-miles in 1965-66. There is no reason why a larger volume of traffic should not be carried by motor transport, if only the automobile manufacturing capacity could be raised to the adequate level. Considerations of foreign exchange, however, may set the limits to the enlargement of truck fleets. But these considerations also apply to the expansion of some of the railway rolling stock. If the common limitation is taken into consideration, the correct policy would be to release motor transport from its present shackles and to allow it to find higher levels of which it is demonstrably capable. If the accent on motor-transport is not excepted as a compelling necessity in the present situation, the question of acute transport shortages will continue to remain intractable.

Coastal Shipping



THE SCOPE of the disussion on transport in this Annual Number is deliberately confined to such aspects of this system of communications as have a direct bearing on the existing shortages as manifested in the recurring bottlenecks. The conventional policy of treating the nation's transport system virtually co-extensive with the railway system may have had some justification about two decades ago. But the experience of the war and particularly the experience of the post-planning era have forced much agonising reappraisal of this tough problem of inadequate transport. Even so, the slow-moving, inward-looking, but not altogether inexplicable, attitude of the Railway Ministry has been responsible for the grudging manner in which policy for transport is being liberalised so as to make room for expansion on a large scale for the other modes of domestic surface transport. In the foregoing Section it has been pointed out how in the new Age of Roads a much freer scope ought to be given to the motor transport system which actually possesses a high potential of growth. Inland waterways possess, as will be pointed out at the end of this discussion, only a limited scope at the present time, although it is significant to remember that that scope relates to the strategic area of Assam.

The question now remains to be examined to what extent coastal shipping can be enabled to develop with the object of relieving the inadequacy of transport. He would be an adventurous optimist who would assert that coastal shipping can step forward to relieve in a considerable degree the pressure now being exerted on the capacity of the railways. The unpalatable truth of the situation is that coastal shipping is the anaemic child of the Indian transport system. At the present time it is being nourished on artificial food or tonics provided in the form of aids by the State. The real sustenance for the growth of coastal shipping must come from its natural blood, which is the expansion of cargo that can flow in progressively increasing volumes only with the development of agriculture and industry in the hinterland. In many of the maritime States the sea board offers facilities for good harbours and navigation, but the level of the economic development of the hinterland is low on account of the influence of natural resources. The development of this hinterland will be a steady and not rapid process.

The heroic struggle which Indian-owned shipping companies had to wage to find at least some foothold in

66 The provision of sufficient quantities of the required products in the right place and at the right time often produces serious problems and to solve these necessitates a careful but flexible organization, an elaborate system of transportation, storage and distribution. There are more than 3,000 Burmah-Shell petrol dealerships and over 1,600 kerosine agencies, besides nearly half a lakh kerosine sub-dealers in India's 5½ lakh villages 99

...and BURMAH-SHELL deliver the goods

the coastal operations is now a matter of history. Nevertheless, the fact must be recorded that the Government of India's action in reserving coastal shipping for the national bottoms by the declaration of its policy to this effect in 1950 is in no sense chauvinistic. It is an accepted policy of all the maritime countries, including the advanced and the industrialized ones, to reserve coast-wise shipping to national-owned enterprises. What is reserved on the Indian coast is the dry cargo trade and, although a tiny beginning has been made in setting up the nucleus of the national tanker tonnage, the wet cargo, which is now becoming available in large quantities with the progressive output of the oil refineries installed in this country, is taken care of by the refineries with the help of foreign-owned tankers which alone are available to them.

But even in the sphere of the dry cargo trade, from which theoretically foreign ships—even tramps—can be excluded, is not 100 per cent operated by Indian ships. There were some intermittant seasons when foreign tramp ships were pressed into service to cope with the increasing volume of the cargo trade on the coasts, in spite of some diversion of deep-sea going ships to the coast by the Indian companies. Outwardly it would appear paradoxical that despite coastal reservation foreign ships were invited to participate in the trade during periods of peak cargo offerings. But the paradox is not difficult to explain. It is one of the chronic handicaps of the coastal ports that the flow of cargo is not large and it is not expanding at a sufficiently fast rate to warrant the kind of targets that were fixed for the expansion of the coastal tonnage in the five-year plans.

One has only to compare the Indian tonnage employed on the coast with the target of tonnage fixed in the Plan. The target for the end of the First Plan for coastal tonnage was 3.12 lakh GRT. As against this, at the beginning of the Second Plan the tonnage actually in operation was 2.40 lakhs, showing a shortfall of 0.72 lakh tons. Between the beginning of the First Plan and the beginning of the Second Plan, the tonnage on the coast increased nominally from 2.17 lakh gross tons to 2.40 lakh gross tons. The target fixed at the end of the Second Plan (or the anticipated tonnage at the beginning of the Third Plan) was 4.12 lakh gross tons. As against this, the tonnage in actual employment at the start of the Third Plan was only 2.68 lakhs. Thus there was a wide gap of 1.44 lakh tons between what was actually employed and what was targeted.

The necessary lesson from this wide disparity was drawn in fixing the target for the Third Plan and it is significant to note that the target for the end of the Third Plan is 3.0 lakh tons, which is to be compared with the Second Plan target of 4.1 lakh tons. In terms of theoretical target-fixing, this is planning in the reverse. But it is realistic planning. The National Shipping Board has suggested that the Third Plan target should be revised upward to 3.4 lakh tons and the suggestion has been accepted by the Government. But, even so, it is to be compared with the higher Second Plan target of 4.12 lakh tons.

The tonnage statistics have been dealt with in the foregoing paragraph in somewhat great detail in order to draw attention to the basic reason which has kept it at low levels. That reason is that there is a chronic inadequacy of dry cargo on the coasts, which does not justify the coastal operators to incur heavy investment outlays on expansion, because unutilized tonnage entails a serious drain on their finances. Until 1960-61 the dry cargo volume offering for the coastal services was somewhat static around 25 lakh tons per annum. From time to time the coastal operators made demands, and quite reasonably, for the Government to make active intervention in this matter and to divert bulk cargoes, like coal and salt, to them from the railways. Salt has not received Government's approval as a matter of policy for diversion, but the recent acute transport shortages for the movements of coal brought the windfall availability of fresh cargo on a more or less permanent basis for the coastal shipping services. It is now envisaged that for the next three Plan periods at least the railways will not be in a position to lift all the coal that will be produced by the collieries in progressively increasing quantities, and therefore, the coastal services stand assured of the diversion of the coal traffic.

To what extent the diversion of coal from rail to sea has eased the problem of the normal shortage of cargo for the coastal operators is remarkable. In May 1961 the Government made a decision that 20 lakh tons of coal should be carried by sea, thereby doubling the quantity of 10 lakh tons which was already diverted to it earlier. If it is again recalled that in 1961 the cargo carried ranged in the neighbourhood of 25 lakh tons, the movement of the additional 10 lakh tons must make a significant impact on them. But the fleets under the coastal operators were certainly not adequate to the task of moving this additional coal cargo. It is here that foreign tramp ships were requisitioned. At the present time there are seven time-chartered foreign ships and six trip-chartered ships commissioned in the coastal trade.

If diversion of coal by the sea route is now assured and will be normalised after 15 years, the question that is posed is to increase the fleets owned by the Indian operators. This, however, is a difficult problem because the coastal operators have always had to face grossvicissitudes of short periods of prosperity and long spells of recession in the trade. The strains have left their scars on their financies. The question of acquisition of new ships is ultimately sought to be solved by buying second-hand foreign ships which, in spite of their shorter life, will prove economic propositions. Buying foreign ships requires inevitably an outlay of foreign exchange. Shipping is the one industry in which investment of foreign exchange for the acquisition of additional tonnage ought not be grudged inasmuch as operators can earn foreign exchange and pay back the purchase price in about eight years or so. But this special feature strictly applies to ships which operate the distant deep or ocean-going services on the international routes where the freight charges are paid in foreign currency. It does not apply at all to the coastal operators. They earn rupee revenue.

The question, therefore, is to raise foreign exchange for coastal tonnage on the same basis as it is to be raised for so many plants set up inside the country by importing capital goods. The first problem is to dispense with the thirteen chartered foreign ships. A solution has been found by allowing a private shipping company to acquire seven Liberty ships from America—of course, second-hand—at an economical price. Since the volume of coal cargo which will be diverted to the coastal services is bound to expand in the future, more ships will be required. It has been rightly pressed by the shipping industry that the possibility of acquiring a loan from the International Development Association should be fully explored as its terms of payment, maturity and interest are most convenient.

The carriage of coal draws attention to the question of the state of the freight rates prevailing in the coastal trade. The rates charged for coal by the coastal operators are certainly not unreasonable in relation to the cost of operation. But in comparison with what is charged by the railways they are high. Here the argument

of the coastal operators is logical and convincing. They point out that coal is carried as a special case at freight rates below the actual cost of carriage incurred by the railways. But the railways, on their part, have adopted this particular policy as a public utility and also because coal is an important fuel on which Indian industry is leaning heavily. The various ingredients of cost which enter into the operating cost structure of coastal shipping have gone on increasing partly because of the increases in the world prices of imported materials, the costs of ships, labour charges and additional taxation imposed by the Government. This makes their financial equilibrium precariously poised because of the low level of the cargo offering and its sluggish tendency to increase. But the coastal trade cannot be expected to operate continuously at uneconomic rates. There is, therefore, every sense and justification in its demand for an increase in freight rates.

The first increase that was allowed by the Government was of the order of 15 per cent overall and introduced in 1957. As costs began to mount up, another dose of increase was again permitted by the Government effective from June 1962 and this also was of the order of 15 per cent. In a poorly developed hinterland, higher rates for cargo carriage are likely to add to the pressure of regional inflation. But there is little reason to suppose that the higher freight rates would prove regressive because the hinterland does not have any mentionable alternative to shipping for its transport requirements. However, progressive increases in the rating structure are not in the least a distinctive feature of coastal shipping alone. On the road services, but more specifically in the recent years on the railways, freight rates have been significantly enhanced. Furthermore, it ought to be noted that, while enquiry committees were busy with their investigations into the railway freight rate structure, the Government surmounted the immediate difficult problems of revenue by levying what was called as an interim surcharge on freight, but subsequently merged in the regular rates after the committees reported.

Inland Waterways

INLAND NAVIGATION fell into such a serious neglect, particularly in the second half of the last century after the advent of the railways, that in most parts of the country, except in Assam, Bengal and Kerala and to a small extent, Madras, a start has to be made with the resuscitation of the waterways, which were in constant use as a normal mode of internal surface transport in the country. The Inland Water Transport Committee was the only organisation which was officially appointed since independence to make an all-India survey of the potential of this mode of transport, to make recommendations on the regeneration of such of the traditional waterways which have completely gone out of use and to consider their problems in relation to their impact on the railways in particular. This Committee has produced, after a commendable and exhaustive enquiry, a very useful report. Its approach has been objective and it has made recommendations by setting out a long enumeration of priorities which the Government can phase over a convenient period of time. If the necessary attention, resources and particularly finances are devoted to implement the objective recommendations of this Committee, inland waterways will be revived on a scale warranted by the availability of navigable sections of the bigger and medium rivers. To this may be added the navigation component of the multipurpose river projects which have been executed or are under the process of execution since the era of planning. So far little action has been taken on the report of the Inland Water Transport Committee. Now that domestic surface transport is posing a continuous and serious problem, in the Fourth Plan at least a sufficient allotment should be made to the initial phase of the revival or new construction of navigable ways.

At the present time, inland water transport has been developed to a high degree in North-East India alone. The existence of inland water transport services in Kerala covers the two systems of freight and passenger services with an emphasis on the latter. But the isolated position of Assam, its topography and the high external-trade-intensity of that State have made the use of inland navigation routes a matter of urgent necessity. At the present time two major routes are operated between Calcutta and points of Assam by water transport. They are the Calcutta-Assam and Calcutta-Cachar water routes. The Calcutta-Assam route is the biggest of all including the minor service operated by the State-owned Ganga Brahmaputra Water Transport Board and another minor service run by a Pakistani company primarily for the jute traffic between East Pakistan and Calcutta. This premier route between Calcutta and Assam is served by a fleet of vessels, mostly powered vessels, whose total carrying capacity is 156,000 tons. Between both the destinations the volume of cargo carried on this route per year is of the order of 914,000 tons. Over 66 per cent of this cargo is carried by the Joint Steamer Companies. The Calcutta-Cachar route has a fleet of vessels with a combined capacity of 7,400 tons and its annual average of cargo carried is 125,000 tons. In the downward direction there is still a surplus capacity on the waterways from Assam which is estimated at somewhere in the neighbourhood of 2,000 tons a year. This capacity will remain unutilized until demands of additional cargo are created by a higher productive activity in Assam which means particularly the growth of its plantations and the export of their output.

The development scheme of inland waterways in this region aims at the integration of the principal river and canal navigable routes. That scheme is known as the Farraka Barrage scheme which will integrate also the navigable sections of the Bhagirathi over a distance of about 180 miles. One of its most outstanding benefits will be to help the problem of the highly accumulating silt in the Hooghly at its mouth. The other schemes of inland waterways in the eastern region possess a modest scope and among them mention may be made of the Durgapur Barrage, taking the link to Tribeni on the Hooghly. The Durgapur Barrage is to be developed mainly for the transport of coal.

Considering the intensity of the pressure of the seaborne traffic after the partition of the country, due appreciation must be given to the imaginative manner in which the problem of the major ports has been tackled by the Government of India. It has every reason to be proud for setting up the major port of Kandla as a substitute for Karachi which has been lost to Pakistan. It is true that the condition of berths, handling facilities and the lack of mechanization at the major ports like Calcutta and Bombay resulted in critical situations of congestion, resulting on some occasions in the penal imposition of a special surcharge for detention time. But here it must be pertinently stressed that this problem of port congestion has plagued even that intensely developed maritime country of the United Kingdom and the liner services imposed penal surcharges on the British ports also for detention due to congestion. The five-year plans have made, within the limits of finance, a good provision for the improvement of ports. But this development and outlay are undertaken positively with

Education

EDUCATION has its fundamental role to play in the context of the emergency facing the country today. The situation that has now been created is bound to affect in various ways the progress of educational programmes contained in the Third Five-Year Plan. In fact, it is quite clear that under the pressure of this crisis several vital aspects of the system of education have to be reoriented and previous failures corrected without any delay. To understand the new role of education and the extent to which readjustment is necessary, we have to assess the pattern of education that has emerged during the previous decade.

It must be recognised that during the years of planning, the level of education has definitely improved. It may be added that the limited meaning that is attached to education is essentially due to the reason that we retained by and large the system that we inherited from the British regime. Adjustments to an economically and technologically activated state were slow. It is the present crisis that has made us sorely conscious of this fact. The stress in education has been primarily on the expansion of literacy as well as the creation of graduates in arts and in the classics. In this sense, therefore, the level of education has improved. But in terms of diversification and the quality of education which can be assessed only from the out-turn of the trainees, we have to apply various other norms of judgement.

Nevertheless, it is not a mean achievement that more than 62 per cent of the children in the age-group 6-11 are already going to school. It appears really magnificent when we see that in actual terms it means that of the total population in that age-group, quite over 80 per cent of the boys are already being provided with school education, which in most cases is free. Girls, on the other hand, are not attending schools to the same extent. But that is due to the grip of conservative traditions. As many as 40 per cent of them are going to school in the age-group 6 to 11. There are certain States where the number of girls going to school is very low. For instance, in Rajasthan, it is just 15 per cent, in Madhya Pradesh also it is 19 per cent, in Uttar Pradesh 20 per cent, in Orissa 24 per cent and in Punjab 36 per cent. In other States, however, in terms of elementary education of girls, the performance has been good, though not very flattering. If the Third Plan in the present form is allowed to proceed (which perhaps is not certain), it will mean that by 1966 as many as 90 per cent of the boys and over 60 per cent of the girls in this age group will be going to schools.

Similar is the state in the case of education at slightly higher levels. In the middle school category, the improvement has been quite marked. During the decade against 12 per cent at its beginning, at present more than 23 per cent of the children in the age-group 11-14 attend the schools. Children between the age group 14-17 who go to school are nearly 12 per cent of the total age-group population. The Third Plan target for this group is 16 per cent.

It is true that the problems that face the educationists at this level are substantial because in the rural areas there is a double disadvantage. It is very difficult to convince the parents or guardians to let the children stay in the schools because in this age-group many children are helpful in eking out a living. At the same time, it is difficult to equip the schools with teachers who would be prepared to live in the villages. Teachers with a background in the rural areas are not sufficient in numbers at the moment. The performance has, however, not been altogether discouraging. The number of teachers' training colleges was increased from 53 in 1950-51 to 236 in 1960-61. During the Tnird Plan period, the training colleges were expected to increase to 313. In addition to this the present training colleges were expected to be strengthened and expanded to increase the capacity so that a sufficient number of trained teachers was available. Then, in the case of female teachers, who even in urban areas were in short supply, arrangements had to be made to encourage women students to study teaching courses which were of special interest to girl students, such as, home science, music, drawing, painting, nursing etc. For these schemes scholarships were provided and the University Grants Commission also advanced liberal assistance for womens' colleges and womens' hostels.

What is of major significance is the training of students in technology, engineering and other professions, like, medicine, law, business administration, etc. It may be observed here that in certain States, professional colleges were very small as compared to the number of arts and science colleges. In some States, on the other hand, the progress had been quite marked. For instance, in Madras, Maharashtra, and Mysore, the number of professional colleges was nearly double the number of arts and science colleges. This, however, does not mean that the number of students that were being trained at these colleges was, in any way, double the number of the arts and science tudents. A professional training college always has a small number of students. It shows nevertheless that the institutions were there and special efforts had been made during the previous decades to establish them. But in sharp contrast, it can be seen that in Punjab, Rajasthan, Uttar Pradesh and West Bengal, the number of professional colleges was everywhere less than half that of arts and science colleges. Effort, however, was being made by the planners to correct this tardy growth. In fact, during the formation of the Third Plan, when this problem came to the fore, it was believed that expenditure on technical education should be increased, so that the bias was sufficiently shifted in favour of such education. As against 13 and 19 per cent expenditure on technical education during the First and Second Plans, the Third Plan provided for something like 25 per cent out of the total outlay on education. Consequently the number of engineering colleges to be newly established in Punjab, Rajasthan, and Bengal, has to be quite substantial, especially the industrial training institutes. Against 15 in 1960-61, there are likely to be 48 industrial institutes in Uttar Pradesh alone by the end of the Third Plan. Similarly, in Punjab, the industrial training insitutes will increase from 17 to 32. The bias is visible in polytechnics too. In 1960-61, for instance. Madras and Mysore were the States with the largest number of polytechnics — i.e. 24 each. In 1965-66, it would be Uttar Pradesh, which at the beginning of the plan had only 18, that would have 31 polytechnics. Thus it is the Third Plan which is likely to correct this regional imbalance to some extent.

It appears that the overall growth has been satisfactory and the long delayed shift in emphasies on technical education is under way. But keeping in view the short-term purpose of education, we have to assess the real pressure of emergency in this sector. Broadly, education is required to perform three basic functions

during this period. First of all, it has to create a sufficiently large number of technically qualified students. These students will be required to operate the technical jobs to be created in the defence production establishments, heavy industries and war-oriented other industries. The pace of their expansion is sure to produce strains on the supply of technicians. It is for this type of know-how, the supply of which cannot be expanded at short notice, that imaginative planning as well as improvised arrangements will be necessary so that a large increase is realised in terms of engineers, technicians, medical students, nurses, administrators etc. As a consequence, it is necessary that immediately all the technical institutes should operate, as far as possible, to their maximum capacity. This can be achieved, among others, by the following means:

(a) Wherever possible, the technical institutes should run two shifts. It should be obligatory for teachers to put up with longer teaching hours because the burden they bear cannot, after all, be shifted on to other shoulders. There is really no strict limit to human capacity in the face of a challenge to survive as a free nation. If they are not able to stand the strain in this hour of crisis, there is something radically lacking in them. Their services will never be required more urgently than now.

(b) In the second place, in certain institutions, the courses should be reduced in duration so that the outturn of the technical personnel can be rapid. A representative instance can be cited of medical graduates. It is true that under normal conditions, it is good for the students to go through long courses of anatomy, physiology, materia medica and specialisation of advanced courses in pathology, surgery, etc. But under the present conditions of emergency, it should be possible to reduce the five-year medical course to three and a half years or so, so that physicians, surgeons and gynochologists can be trained in larger numbers to work in the remote areas of the country. It is more desirable to have one hundred medical men who would go to the villages with three years training than to have thirty medical men who cannot move out of the city and are apt to attach first consideration to the remuneration they earn in the towns after a heavy investment of over five years. This is applicable even more vividly in the sphere of engineering. The students who get their short-training diplomas can be multiplied fast s that they can close the gap between the demand fo their services and their supply. Even, otherwise, thi policy is dictated by pragmatic considerations in a fas expanding economy. After all, in this country, whic has such remote areas, which at the moment are no reached by the trained personnel, stress ought to be lai on numbers.

(c) In the third place, the institutions which a the moment do not come under the purview of training centres should be brought into that sphere. For instance there are several factories, where technicians can b trained after a short course of theory. These factories accepted the principle of offering their services for the practical training of technicians. Now is the time when they should really honour their pledge and invite the maximum number of technicians that can be trained in their units.

The second most important purpose in this reorientation of education in the face of the emergency

INDIANOIL-

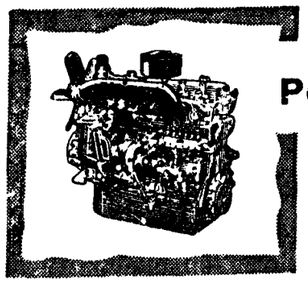
DRIVING POWER FOR INDIA'S INDUSTRY

The ceaseless roar of the turbine, the generator, the engine — the seething silence of the transformer, the breaker, the condenser — the simmering boiler, the flaming furnace — the clanging rollers and the crushers — the gnashing cranes and excavators — these and many more mark the growth and progress of the Indian Industry.

The complex assortment of the machines and equipment which build our Industry have one need in common — OIL. They all depend on oil for their operation and performance.

Today, INDIAN OIL — the country's own first nation-wide oil marketing organisation — provides the power-packed prime-movers, the Driving Power of India's Industry.

INDIANOIL



Indian Oil *lights lamp of our progress*

is the inculcation of the spirit of discipline and loyalty in the minds of the students. The history of the previous decade is sufficient to convince us that, after all, respect for discipline in our schools and colleges is scanty. One does not have to meet every student to understand the working of his mind or to know the amount of respect he has for his teachers and the ideals of knowledge and service that is expected of him. The day-to-day behaviour of students, as it is visible at various centres in India, provides us with distressing evidence that in this sphere, the students are lacking miserably. It is not without reason that in one of the colleges in Delhi, 50 per cent of the students wanted to remain away from rifle training on the plausible plea that their eye-sight was not good. It is not a reflection on that one group alone. It is the whole generation, the mind of which has to be reoriented qualitatively. For this, a multi-focal transition has to be brought about. The problem of discipline involves in the first instance, a proper education in social and national ideals. In this, the effort is already being made through the National Discipline Scheme. It is to be trusted that this Scheme is comprehensive enough in practice, so that it teaches the students the fundamental needs of orderly conduct as well as respect for those who teach them. It is very strange that even increasing serious misbehaviour of the students in various universities did not shock the people in higher responsible quarters. One only wonders if sufficient results can be achieved through larger expenditure alone. We definitely need leaders infusing inspiration to come into the field and train a cadre which can handle this problem in a reasonably short period. It may be added that schemes like physical education and N.C.C. which improve the level of discipline should be made compulsory in all schools and colleges and at all levels. These schemes should be executed in earnestness so that the students do not take them lightly.

The third important puprpose to which education can be put is in increasing the level of understanding that can be spread through the educational institutions. It has to be remembered that people connected with the educational institutions and, in fact, all educated individuals are important opinion media. It is they through whom information, knowledge and understanding permeates into the various strata of the population where it does not touch directly. Unless they understand themselves the problem of emergency, they definitely cannot be expected to transmit it competently. Therefore, special literature should be prepared for the guidance of the teachers. To this end the Ministry of Education has already planned that it will try to equip teachers and their students with intelligent understanding of the course of the national emergency, so that they can help in the building up of a sense of confidence and faith in the general public.

The most important manner in which the educational institutions can help the nation in this hour of emergency is by providing a sufficiently large number of trained volunteers, who should be able to face any exigency both on the front as well as in the civil defence schemes. For this, precise schemes are already being finalised so that N.C.C. and rifle training is extended to cover all eligible students in colleges. A combined programme of physical education is being introduced to cover all students in the middle, high and higher

Proven Performance

Perkins DIESELS

Diesel Economy is a by-word. And coupled with reliability, long life, low depreciation, easier maintenance PLUS proven performance, the economics become absolute.

The more you know about Diesels the more you'll choose Perkins. They give you FAR MORE FOR FAR LESS.

secondary schools. To meet the demand for instructors, new training centres for the National Discipline Scheme are being set up. It is also planned that five regular hours every week will be set apart in the middle and secondary schools for physical education and national discipline activities. It may be added, however, that this may not be sufficient at all. Something like a three-fold increase in such programmes will be necessary to inspire the minds of the students. Unless they are absorbed fully in such programmes, we cannot expect to bring out a change in their fibre and thinking. Once their minds are geared to such physical programmes, they will automatically spend their remaining time in useful educational pursuits. Five hours a week is not going to hinder their normal studies. It must be at least 2 hours daily which should include just the army drill extending to an hour every day. At the moment, National Cadet Corps has a strength of the order of nearly 3 lakh students. This is very low for the present requirements. It is time that ex-armymen and disabled armymen who can train the students are rapidly drafted and the number of N.C.C. is increased several-fold immediately.

In terms of plan expenditure, it is imperative that the reorganisation will require an out-right reduction of expenditure to the extent of Rs 50 crores. As against an outlay in the Third Plan of Rs 560 cores, the actual outlay should be nearly Rs 500 crores to Rs 510 crores. The extent of expenditure on elementary education, which is expected to involve about Rs. 209 crores should be reduced to at the most Rs. 125 crores. This reduction of nearly 85 crores can be diverted to technical education. This does not mean that elementary education can, at the moment, be scrapped. But certain priorities must prevail. The Social Welfare Board is supposed to have sufficiently large contacts with the people and should be able to inspire social workers who should come forward to teach the children in the remotest corners of the country. At the moment, there are many voluntary organisations that have established a number of 'balwadies'. This experiment should be multiplied and extended so that the children from the age-group of 6-11 are taught by as many social workers as possible. In the present hour of emergency, it is only the avenues which appear to be lacking. There are sufficiently large number of people who would be willing to perform the jobs. In this connection, it will be added that the students who pass their intermediate or degree examinations should be asked to teach in various schools without any remuneration or with a nominal remunerations for at least two months. The period of holidays for college students should also be reduced as well as staggered so that the students can function as teachers for short intervals. This scheme, if properly organised, can provide a sufficiently large number of teachers for the students of lower classes.

The expenditure on secondary education and university education level, which is expected to be around Rs. 88 crores and Rs. 82 crores respectively, also has to be pruned and readjusted in a manner that a greater stress in laid on the teaching of science. Programmes, like, cultural and youth welfare, which entail an expenditure of Rs 30 crores can straight away be eliminated. Thus technical education which has to involve immediately higher expenditure will have something like Rs. 100 crores additional and there will be a saving of something like 50 crores which can be diverted to other sectors of the plan.

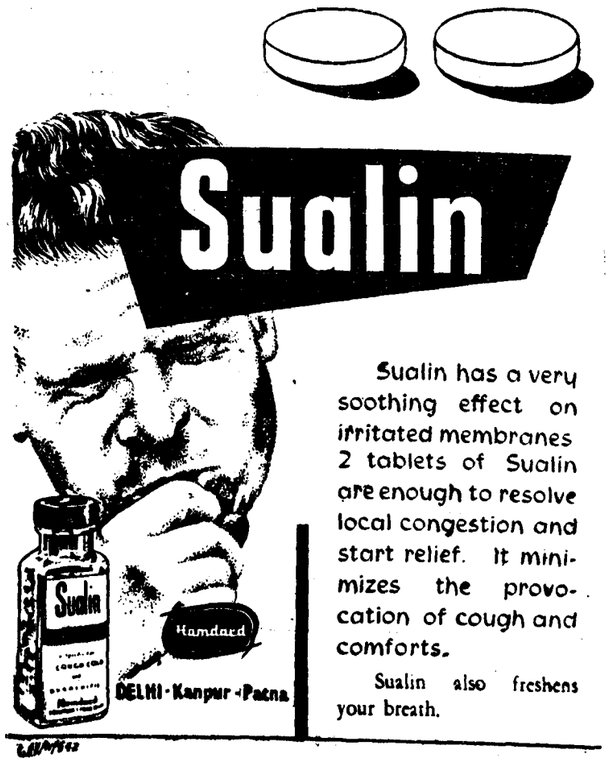
Health

THOSE who are prone to see good out of every evil would seek for some benefit that has been done to the country by the Chinese aggression. It is, indeed, the sudden widespread awareness of our deficiencies on which the national mind now, under compulsion, tends to concentrate. The entire economic landscape of the country has assumed a new sense of realism and the eternal struggle between scarce means and alternative uses is more keen than ever before. A new order of priorities in the context of the national emergency has to be drawn up, without, however, upsetting or impairing substantially the major Plan programmes which are already afoot. The question posed before the country is precisely the question of maintaining the Plan and yet financing the war without taking recourse in any large measure to deficit financing. This is a difficult question and as there is no other alternative to get over this difficulty, extreme caution and economy in the distribution of scarce means to the more immediate uses must need be exercised, the guiding objective in this task all along being to meet the defence requirements first and to exercise utmost austerity in meeting the civilian needs.



Those who have been awakened by the recent pictures in newspapers depicting the sad faces of numerous men fervently willing to be enlisted in the army but rejected on account of their poor health must have considered the present allocation of 4.25 per cent of the total Third Plan outlay on health as inadequate. But what was considered decidedly inadequate in peace time planning, must have been rendered more than adequate in wartime when additional resources have to be found to finance the brisk war efforts.

One of the visible signs of prosperity, it is said, of a country is demonstrated by the general level of health and the extent of medical care facilities enjoyed by its population. Since the extent of health services offered by any Government is dependent, apart from resources, on the magnitude of the population covered, it becomes necessary that while attempts should be made to expand health services and increase per capita expenditure on health, a vigilant eye should be kept on the rise of population. It can be argued the other way that expansion of health services will automatically act as a deterrent to the rise in population. In its report, the Health Survey and Planning Committee (1961) observes that the estimated death rate in India has come down to 21.6 per 1,000 for the period 1956-61 as against the corresponding figures of 31.2 for 1930-41, 27.4 for 1940-51 and 25.9 for 1951-56. The rate of infant mortality for the quinquennium 1956-61 was on an average 135. The expectation of life at birth has gone up to 42 years approximately and deaths due to cholera and small-pox have reduced considerably.

In 1950, the total number of hospitals and dispensaries in India was 8,600 and of beds 1,15,000. In 1960, their number increased to 12,600 and 1,85,600, respectively. This increase is certainly appreciable and with the increased arrangements for the medical care made in the hospitals, they should at present be sufficient to cope with the immediate demand. The allocation under this head in the health programme may in part be utilised towards meeting the requirements of the army.

Health programmes in Third Plan involve a total outlay of about Rs. 342 crores, of which Rs. 297 crores are to be spent by the States and the rest by the Centre.

Just 2 tablets

Sualin has a very soothing effect on irritated membranes 2 tablets of Sualin are enough to resolve local congestion and start relief. It minimizes the provocation of cough and comforts.

Sualin also freshens your breath.

THE HINDUSTAN CONSTRUCTION CO. LTD.

THE CHAIN SETS A CHAIN REACTION....

Have you ever considered the consequences of alarm chain pulling? Perhaps not.

When an alarm chain is pulled, it throws out of gear for some moments the entire life-line of the Nation. Trains arrive late at their destinations. Many a passenger is inconvenienced and 'misses the bus' and the Railways in their turn incur heavy losses. The alarm chain is an emergency device. If anybody misuses it for trivial reasons, please hand over the culprit to the authorities. You will be doing a National Service.

SOUTHERN RAILWAY

VISIT GUJARAT

PALITANA

PALITANA, a picturesque city of over 860 temples, open to everybody and a place of pilgrimage mainly for the Jains, is situated at a distance of 33 miles by road and 31 miles by rail (via Sihor) from Bhavnagar, in Gujarat State. Over and above their sculptural beauty the temples of Palitana, also attract the tourist from the scenic point of view.

A mile to the south of Palitana, is the hill of SHETRUNJAYA, the most sacred of the five hills of the Jains.

Alpers P.80BC

The amounts distributed under different heads are as follows:—

DISTRIBUTION OF OUTLAY

	Rs.
Water supply and sanitation (rural and urban)	105.3 crores
Primary health units, hospitals and dispensaries	61.7 ,,
Control of communicable diseases	70.5 ,,
Education, training and research	56.3 ,,
Indegenous systems of medicine, homeopathy and nature cure	9.8 ,,
Other schemes	11.2 ,,
Family Planning	27.0 ,,
Total	341.8 ,,

It should appear from the above distribution of outlay that both the positive and preventive aspects of health have been suitably emphasized and since the pace of various programmes in both these aspects can either be delayed or slowed down, the question of choosing the particular items for this purpose will have to be tackled in their particular relation to war efforts and not on any extraneous consideration.

Against this perspective, the total outlay on health could be brought down to around Rs 260 crores, thus making a cut of 25 per cent in the total outlay on health. At present, there exists a wide variation in the scale of efforts made by different States to tackle health problems and to control diseases.

In the Third Plan a provision of about Rs 67 crores has been made for rural water supply—Rs 35 crores for the village water supply programme, about Rs 16 crores under the State Plans for health, about Rs 12 to 13 crores under community development and about Rs 3 to 4 crores under the programme for the welfare of backward classes. If experience during the First and Second Plans is any guide, it is necessary to take great care in making surveys to ascertain the present state of rural water supply in different States and also in preparing technical designs and estimates of rural water supply schemes and in keeping down their cost. Since the village water supply programme is under long-term planning, it can be staggered in between the Third and Fourth Plans.

Similarly, urban water supply and sanitation schemes which have been partly carried over to the Third Plan due to shortages of trained personnel, inadequate organisation and planning and lack of materials, particularly galvanised iron pipes, pump sets and related accessories, can possibly be spread over to the Fourth Plan. This may apply particularly to those larger schemes which need to be carefully phased, so that different parts of a project are in correct sequence with one another and at each stage certain returns on the outlays incurred are realised.

The outlay of Rs 70 crores earmarked in the Third Plan for the control of communicable diseases, including malaria, filariasis, tuberculosis, small-pox, venereal diseases, leprosy and cholera, may also be cut down to a little below 50 per cent, since all these programmes are necessarily of long-term nature and after the expenditure of Rs 64 crores during the Second Plan a good deal of resistence has been developed to these diseases. The existing programmes, however, have to be continued. New programmes may be staggered.

The idea of offering medical care on a co-operative basis needs to be given a further fillip. The economic aspects of the question were taken up by Dr. Ralph G. Victor at the instance of the All-India Cooperative Union about three years ago. He made some valuable observations. The factors that appeared to him to be strongly in favour of the setting up of medical cooperatives are as follows:

(1) The Government cannot provide the level of medical care that most people want;

(2) At the same time most people cannot afford the fees charged by private practitioners;

(3) Medical care cooperatives may help in weaning many a doctor away from the urban areas and may also solve other problems of medical care. The medical care cooperatives need not try to include hospitalisation within the services offered at the initial stages.

On the positive side of health, which, inter alia, includes protective foods like eggs, milk, vegetables etc., there is a marked insufficiency. The result of surveys carried in different institutions shows that diet served to growing children and adolescents in hostels is inadequate and ill-balanced. A scrutiny of the diet survey reports available for the last 15 years indicates that there were no appreciable changes in the general food habits of the people or in their dietaries. This suggests that there is yet to be effected considerable increase in the production of protective foods so as to bring down their prices within the reach of the ordinary men. Nutritional research has shown that vegetable protein is as good as animal protein, and this being so, the dietary habits of the people could possibly be directed to that end. It would not, however, be inappropriate to mention in this context adulteration which frequently occurs in such articles of common consumption as ghee, milk, oils and fats, spices and condiments, flour, pulses etc. The arms of the Prevention of Food Adulteration Act, 1954, should be tightened further and the machinery for inspection of foodstuffs strengthened. It should be constantly hammered on the public mind that such food offences would be strictly dealt with.

Various studies suggest that there is already considerable awareness of the need for family limitation and desire for practical help and guidance. In the context of present national emergency, this awareness, which is already widespread, should assume a new sense of realism. Obviously, the limitations of a programme of the nature of the family planning arise not from finance, but essentially from considerations of organisation and personnel which affect the scale and intensity at which the programme can be implemented. The Third Plan accords a high priority to family planning programmes and accordingly the number of family planning clinics is to increase from 1649 to about 8200. It may be suggested that without increasing the number of clinics, greater use should be made of private medical practitioners in providing advice, distributing supplies and, to the extent possible, undertaking sterilisation. The Government of India's reported decision to manufacture certain types of contraceptives in the public sector with a view to bringing down their present prohibitive prices is welcomed. The project has to be implemented vigorously.

A substantial increase in the production of drugs in the country and replacement of imported drugs and new materials by indigenous manufacture are envisaged in the Third Plan. Four units of drugs and pharmaceuticals in the public sector proposed to be set up with Soviet collaboration are expected to go into production before the end of the next financial year.

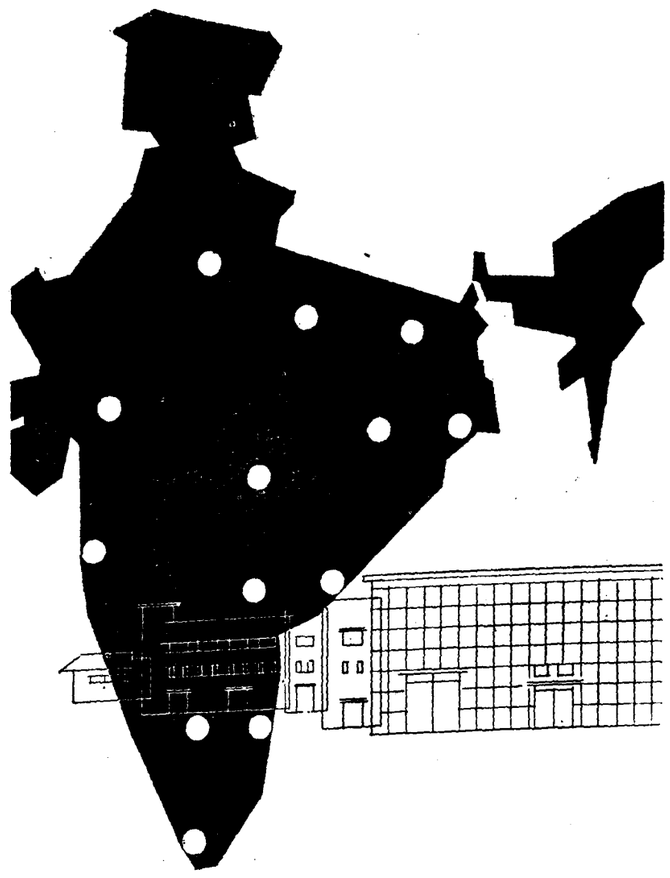
The quality of drugs, both imported and manufactured, is controlled under the Drugs Act, 1940, since amended. This law is in force in all the States, but generally is not being adequately implemented due to inadequacy of staff and want of proper facilities for analysing samples of drugs taken from manufacturers and traders. A well-implemented Drugs Act will go a long way in ensuring standard quality drugs. The recent inter-State racket in spurious drugs could not have been hatched without the knowledge and cooperation of some in the medical and pharmacists profession. There have recently been reports from Maharashtra and Gujarat of sub-standard drugs. The announcement by the Government of India that a Drugs and Equipment Standards Committee has been set up to look into the question of spurious and sub-standard drugs is most welcome.

Industrial Relations

IN discussing the economics of emergency, the problem of Industrial Relations assumes great urgency, because labour has a vital part to play in the war effort. One of the latest and the most crucial developments in the sphere of industrial relations has been the adoption of the Industrial Truce Resolution at a joint meeting of the Central Organisations of Employers and Workers held in New Delhi on November 3, 1962. It was resolved by the employers and the workers that no effort would be spared to achieve maximum production. In respect of their economic interests, both the workers and the employers offered to exercise voluntary restraint and accept the utmost sacrifices in an equitable manner in the broader interest of the nation. A provision under the Truce Resolution specifies that all complaints pertaining to dismissal, discharge, victimisation and retrenchment of individual workemen, not settled mutually, would be settled through arbitration. For this purpose, the officers of the conciliation machinery may, if the parties agree, serve as arbitrators. Also, there is to be the maximum recourse to voluntary arbitration, and adequate arrangements are to be made for that purpose. According to the old saying, "where there is a will, there is a way," it should not be difficult to find arbitrators acceptable to both the parties. It cannot be denied that the Industrial Truce Resolution is a step in the right direction.

One of the necessary conditions for a peaceful observance of the terms of the industrial relations relates to the trend in prices of essential commodities. If under the impact of mounting defence expenditure the prices of foodgrains and other essential consumer goods also take an upward course, the workers are likely to ask for higher wages in those industries particularly where the dearness allowance is not linked to the cost of living index. It is the duty of every worker to discharge his obligations faithfully and assist in raising productivity all round, but he is to be assured at least the minimum necessities so as to keep himself fit. The responsibility lies on the Government as much as on the industry to see that labour is not forced to undergo unnecessary hardships due to rising prices. Wages should be revised if the price line gets out of control. If the price level remains unaltered, even then labour should be allowed to participapte in the increased prosperity of industry through rising productivity. Therein lies the key to smooth industrial relations and accelerated production in all sectors of industry.

Another element which must be borne in mind while discussing the question of wages is the continued failure of the Indian Union to raise its sales abroad. By and large, the Indian industrial products are not able to compete in the international markets because of the high price structure which prevails in this country. It is only by reducing costs that we can increase our exports further and thereby earn extra foreign exchange the need for which is greatest at the moment. A restraint on wages is necessary in order to keep the prices of our industrial goods competitive. It is sometimes forgotten that the fringe benefits made available to the workers in this country are steadily mounting and are in some industries as high as 20 to 25 per cent of the wage bill. While the welfare of the working classes is a national responsibility, the burden should not be raised to such an extent as to inflate costs disproportionately. Under the emergency particularly, considerable self-imposed restraint is required. 'The Eastern Economist' is not suggesting a wage freeze of any manner. As stated above, the cost of living index should be a guide in this direction. A look at the all-India consumer price index for working class would reveal that during the last decade, it has almost risen by 100 per cent. It is true that wages have also gone up during the same period and in some industries even ahead of the cost of living index, yet the all-round effect has been to put an unbearable restraint on the cost of industrial products with the result that the Indian Union has failed in its objective of earning more foreign exchange by pushing up exports. Under the present circumstances, it is imperative that the cost of our defence industries as well as the consumer industries should not be allowed to rise in such a manner as to affect unfavourably the export industries as well. The Indian Union can ignore this fact at its own peril. Another danger in granting increase in wages to industrial labour only will be that it will accentuate further the already existing disparities between the rural labour and the industrial labour. Here it is to be noted that industrial labour force constitutes only 5% of the total labour force



It might be argued that the worker will be prepared to make sacrifices upto a certain extent. He will certainly take into consideration the sacrifices being made by other elements of society around him. He may, under the first impulse, be inspired to make "any sacrifices" but in the long run, he is likely to insist on "equality of sacrifice". This aspect of the problem was the subject of a seminar on industrial relations organised in December 1962 by the Congress for Cultural Freedom. The paper on industrial relations prepared by Prof. W. Ellison Chalmers of Illinois University narrated the American war experience in labour relations. The learned professor stated that the United States avoided a wage freeze of any kind and was guided by a set of regulations for doing justice both to industry and labour. A similar set of rules and regulations would become necessary for the Indian Union as well.

To face the emergency created by World War II during 1939-45 and to secure uninterrupted production of war material, certain stringent measures were introduced under Rule 81-A of the Defence of India Rules. The rule was intended to provide speedy remedies for industrial disputes by compulsory conciliation or adjudication of all disputes by making the awards of adjudicators legally binding on the parties, by prohibiting strikes and lock-outs during the pendency of conciliation or arbitration proceedings and for two months thereafter, and by banning all strikes which did not arise out of genuine trade disputes. These measures were in line with those adopted in the United Kingdom and in the United States of America during the war. Some of the provisions of the Defence of India Rules were incorporated in the Industrial Disputes Amendment Act, 1947. Although the Defence of India Rules are fully in force now, in the present emergency it seems, in view of the Industrial Truce Resolution, much use may not be made of it.

To settle disputes, we have at present three tier machinery, i.e. Labour Courts, Industrial Tribunals and National Tribunals. The function of the Labour Courts is mainly to adjudicate upon certain minor matters. The jurisdiction of the Industrial Tribunals is wider and extends to more important matters like wages and allowances, hours of work, leave and holidays and bonus. The National Tribunals can be appointed by the Central Government to decide disputes which involve questions of national importance and those which affect establishments situated in more than one State. A provision has been made in the Industrial Disputes Act for voluntary reference of disputes to arbitration by parties themselves by written agreement and for the enforcement of voluntary agreement reached between the parties. There is a provision in the Code of Discipline that

SIEMENS
INDIA

Made in India

The range of products now manufactured in India by independent Indian enterprises – under licence Siemens Germany – include:

Motors and Transformers
Tropodur Wires and Cables
Paper Insulated Cables
House Service Meters
Switchgear and Switchboards
X-Ray Equipment
Railway Signal Equipment
Radios

Thus, over 100 years' experience gained by the Siemens Organisation in Germany contributes to the progress of Indian Industry.

managements and unions will avoid litigation, and the observance of it has fortunately helped in the decline of disputes. But whether it will be observed fully in the emergency, it is difficult to say as a good deal will depend on the attitude of the AITUC which can never be taken for granted.

The Second Plan recommended the setting up of Wage Boards as the most suitable method for settling wage disputes. In the industries, where these Boards have been set up are: textiles, cement, sugar, jute, coffee, tea, rubber plantations, and coal. More of these will have to be set up during the war period. These Boards, of course, will not have to concern themselves with minimum of wages but the whole structure of wages. The question is not only of fixing minimum wages but the whole grade of wages as such for each class of labour. The existing joint consultative machinery, namely, the Joint Consultative Board, would also have to be more effectively utilised. Though its specific achievements have not been spectacular, it has produced a climate in support of the system of mutual consultation and negotiations.

For implementing the programmes quickly during the emergency, increased association of labour with management will have to be brought about. Such a measure could help in promoting increased productivity for the general benefit of the enterprise, the employers and the employees and the community, giving employees a better understanding of their role in the working of industry and of the process of production and satisfying the workers' urge of self-expression, thus, leading to industrial peace, better relations and increased co-operation. Although 29 Joint Management Councils are functioning at present 11 in the public and 18 in the private sector they are by no means adequate. The progressive expansion of the scheme of joint management councils to new units and industries is the need of the hour and early steps, therefore, must be taken in that direction. It is only through this method that industrial democracy can be brought about. In view of the fact that the public sector will grow in the emergency, the manner of administration of industrial relations in public enterprises is of great importance for the success of the undertaking, and for the fulfilment of the aspirations of labour. Special measures, therefore, will have to be adopted to extend the scheme widely in the public sector.

There is no doubt that great need would arise for providing incentives to workers so that they may help in raising production at this juncture. But it seems that schemes like building of houses for the industrial workers will have to be put in cold storage because of cement and shortage of other materials. There ex...s at present a plethora of labour legislation providing all sorts of welfare facilities to the labour force. So now there is not much of question of providing welfare facilities but of training facilities so that our industries may not fall short of technicians. The need for vocational training and apprenticeship schemes would become all the more greater during the war period. During the World War II, training facilities were provided on extensive scale. Bottlenecks are likely to arise in the training programme, because of shortages of competent instructors. So efforts will also have to be directed for setting up additional institutions and expanding the ones which already exist. Until or unless, these institutions are expanded and more are set up, it will be difficult to cater to the needs. For the training of craft instructors in vocational trades and programmes for training craftsmen in industrial training institutes and elsewhere, three central training institutes had been set up by the end of the Second Plan at Calcutta, Bombay and Kanpur. These bring the total admission capacity to over 500. In addition, for the training of women instructors, there is a Central Training Institute at Delhi. In the Third Plan, these institutes will be extended to an admission capacity of over 1,000 seats. In addition to this, 3 new institutes are to be established at Madras, Hyderabad and Ludhiana so that at the end the Third Plan, there would be about 1,800 seats for training instructors in different trades. The out-turn from these institutes during the Third Plan is estimated at about 7,800. In the Third Plan, it is also envisaged to bring about an increase in the training centres to 380 and additional training facilities for about 57,850. Under the National Apprenticeship Scheme, arrangements for trainig of about 12,000 persons are also expected to be made. This is good in as far as it goes. Now it is only to be hoped that quick action would be taken in this regard.

The greatest problem that would arise during the emergency period will be the training of unskilled and untrained workers which would migrate from the rural areas to the industrial areas to work in the industries. With a view to fit them into the industrial structure, it would be proper to place greater emphasis on workers' education. It is a problem of no small magnitude to educate the existing adult population of workers in the three R's and in their civic responsibilities, Their rights and responsibilities in relation to their employers and the community at large must be brought home to them. The trade union membership would be rising because of the migration of these workers from the rural areas. So now is the time to educate them on the line that they might realise their responsibilities and play an effective part in furthering the war effort. The Central Board for Workers' Education has so far set up 14 regional Workers' education centres, three of which are residential. This programme will need further intensification because labour must be kept well-informed about the political developments and the vital role that it plays in fighting back the enemy.

The record of Indian Labour during the last decade has been praiseworthy in the sense that the curve of productivity has continued to rise. Labour has learnt the new skills readily and efficiently. Under the emergency, labour will have to learn further new skills and face new challenges. The country has faith in its workers who would not be found wanting in this hour of national need.

ANNOUNCEMENT REGARDING THE ISSUE OF 1,00,000 EQUITY SHARES OF RS. 10 EACH at par and 5,000 Cumulative Redeemable Preference Shares of Rs. 100 each (Free of Company's Income-tax but subject to deduction of Tax at the prescribed rates.

BY

HINDUSTAN DOWIDAT TOOLS LIMITED

(Incorporated under the Companies Act, 1956)

Registered Office: NEW ASIATIC BUILDING, 'H' Block, Connaught Circus, New Delhi-1.

PROPOSED ACTIVITIES

The Company was incorporated on the 25th January, 1962. The formation of the Company is the result of collaboration between Messrs. Dowidat-Werke of West Germany who are one of the largest and most reputed manufacturers of Hand Tools in Germany, and the Indian Promoters.

The object of the Company, with reference to the proposed issue, is to carry on the business of manufacturing and dealing in different types of Hand Tools — namely, Spanners, Pliers, Adjustable Wrenches etc. Industrial licence, for setting up new undertaking of an installed capacity (on single shift) of 360 tons per annum of Hand Tools, earlier granted to the Indian Promoters, has also been endorsed in favour of the Company.

The aforesaid industrial activity is being undertaken in technical collaboration with Messrs Dowidat-Werke of West Germany in terms of the Technical Aid Agreement entered between the Company is given the right to manufacture, in India, different types of Hand Tools under the brand "DOWIDAT". The technical collaborators will make available to the Company all technical advice, from time to time, with regard to purchase of plant and machinery, erection and construction of the Factory and progress manufacture of all the Tools.

The Company has received Import licences for an aggregate value of Rs. 18.94 lakhs covering the cost of plant and machinery to be imported against the loan in foreign currency from Industrial Credit and Investment Corporation of India, and capital participation of foreign collaborators.

The Company has also a right to export these Tools to Iraq, Viet Nam, Iran, Afghanistan, Burma, Cambodia and Nepal, and such other country as may be mutually agreed upon between Company and the foreign collaborators.

LOCATION OF THE INDUSTRY

The location of the Factory is about 5 Furlongs off the 20th mile-stone on Grand Trunk Road (Delhi-Ambala), aod the construction is in progress.

in tune with the progress of trade and industry

Serving a hinterland of 5,00,000 square miles with 180 million people, The Calcutta Port has to live up to the increasing demands of our national plans and progress. With the aid of over 42,000 workers and the best possible equipment, the Port helps the country to earn 50% of the foreign exchange from export. The task and target of the vital cause that this Port serves are as complex as they are extensive. By 1971, the traffic capacity has to be geared up to about 14 million tons from nearly 10 million tons in 1960. To be an active participant in the gigantic national programme of progress is the proud privilege of

CALCUTTA PORT COMMISSIONERS

Company Meeting

THE SCINDIA STEAM NAVIGATION CO. LTD.

Summary of the Statement of Shri Dharmsey M. Khatau, Chairman, The Scindia Steam Navigation Co. Ltd. made at the 43rd Annual General Meeting of the Shareholders on Wednesday, the 26th December, 1962, at Scindia House, Ballard Estate, Bombay.

In his opening remarks the Chairman observed :

"This statement comes to you at a time of national emergency created by the Chinese invasion of India. The shipping industry as a whole has pledged its wholehearted support to the Government of India in their present stupendous task of successfully facing this emergent situation. Our Company has donated a sum of Rs. 5 lakhs to the National Defence Fund. I deem it my duty to assure the Government, on behalf of you all and of myself, of all the assistance and co-operation that we can give in this hour of crisis."

He referred to the drop in the quantum of cargo carried and corresponding drop in freight income, despite which the Company made a profit of nearly Rs. 48¾ lakhs as against approximately Rs. 4½ lakhs in the previous year. The Company declared a dividend of 60 nP. per share after transferring Rs. 48 lakhs from General Reserve and providing for a further proportion of the Statutory Development Rebate of 1960-61.

Regarding Overseas trades, the Chairman attributed good results to rationalisation of services and partial effect of 10 per cent increase in the rates of freight in the eastbound services from U.K./Continent. He expressed the hope that the Company would secure the co-operation of the shippers in maintaining rates of freight at a reasonable level. The Chairman referred to the increase in the share of the Indian Lines from 30.25 per cent to 39.475 per cent in the India/U.K. trade as from 1-9-1962 and a provision for an annual increase of 1 per cent ensuring ultimate parity between the three Indian Lines and the U.K. Lines. He also referred to the equal sharing by the three Indian Lines of the trades, on a pool basis, between India and Poland, India and East Germany, India and Soviet and Rumanian ports, India and Egypt and Adriatic ports.

Regarding Coastal shipping, the Chairman endorsed the request of the industry for examination of its case by the Tariff Commission to enable Coastal steamer tonnage to remain at the level of current and future national need. He pressed for restoration of the cut of 5 per cent in freight rate on coal from Calcutta to ports upto Cochin.

The Chairman specially urged the extreme urgency of introduction of a war risks Insurance Scheme by the Government of India so as to ensure adequate insurance protection to Indian vessels against war risks.

Regarding tonnage position, the Chairman observed that the Company was facing difficulty in its replacement and new construction programme because of acute foreign exchange position and other factors.

The Chairman referred to the increase in operating expenses as a result of changes in conditions of service of crew members of the floating staff, and of a fresh Agreement concluded between the Company and the Maritime Union of India representing the Officers of the Floating Staff.

Regarding future prospects, the Chairman said that it was difficult to visualise any improvement in the freights sufficient to cover the costs and to provide a reasonable return on capital. The Company is, however, continuing its efforts at rationalisation and economy in operations and is taking steps to improve the level of freight rates.

The Chairman referred to the Konkan services of B.S.N. (1953) Ltd. in the following terms:

"Subsequent to our negotiations with the Government of India, they agreed to pay for the years 1961-62 and 1962-63 a subsidy in lieu of 8 per cent increase in fares as also a subsidy of about Rs. 6 lakhs being the excess of repair cost over Rao Committee's estimates; they further agreed to reimburse the excess repair cost for the year 1961-62, subject to a maximum of Rs. 14.50 lakhs, all these payments being subject to scrutiny of the Government Department. The Government had also agreed in October 1961 to grant an interest-free loan to cover the entire cost of the three new ships and an annual subsidy in this behalf. While the Company has been writing to the Government from time to time regarding new tonnage, it was not until October 1962, when the Government advised the Company, that in view of certain offers received by them for the operation of the Konkan services with new ships without increase in fares and without payment of loan or subsidy, the Government saw that no useful purpose will be served by permitting the Bombay Steam (1953) to build new ships. It may be noted here that the Rao Committee had recommended an additional subsidy as also an interest-free loan to acquire new ships to maintain the services on th same pattern as before on the basis of Rs. 40 lakhs as the cost of each ship. It is, therefore, not understood how these very same services could be operated without any increase in fares or other assistance when the cost of these new ships has gone up to Rs. 60 lakhs each and when there have been further increases in cost of operations. The Company has replied to the Government that it would continue to run the Konkan services with the existing ships till 31st May, 1966 if the present terms of the Government assistance are continued till, then whereafter the position will be reviewed in the light of the Government giving permission for new tonnage."

Shri Khatau thanked Shri Jagjivan Ram, Minister of Transport and Communications, Shri Raj Bahadur, the Minister of State for Shipping and other officials of the Transport Ministry for the interest shown by them in promoting the cause of Indian Shipping. He also appreciated the services rendered by the Officers and staff and the Company's Agents abroad and in India and thanked the shippers and consignees for their continued support.

PANYAM CEMENTS & MINERAL INDUSTRIES LTD.

CEMENT NAGAR

SUMMARY OF CHAIRMAN'S ADDRESS

The following is a summary of the Address to Shareholders by Shri T. S. Sundaram, Chairman of the Company, dealing with the Company's working for the year ended 31st August, 1962. The Annual General Meeting of the Company was held on 24th December, 1962 at 3-30 p.m. at Cement Nagar.

I have great pleasure in welcoming you all to this Seventh Annual General Meeting of the Company.

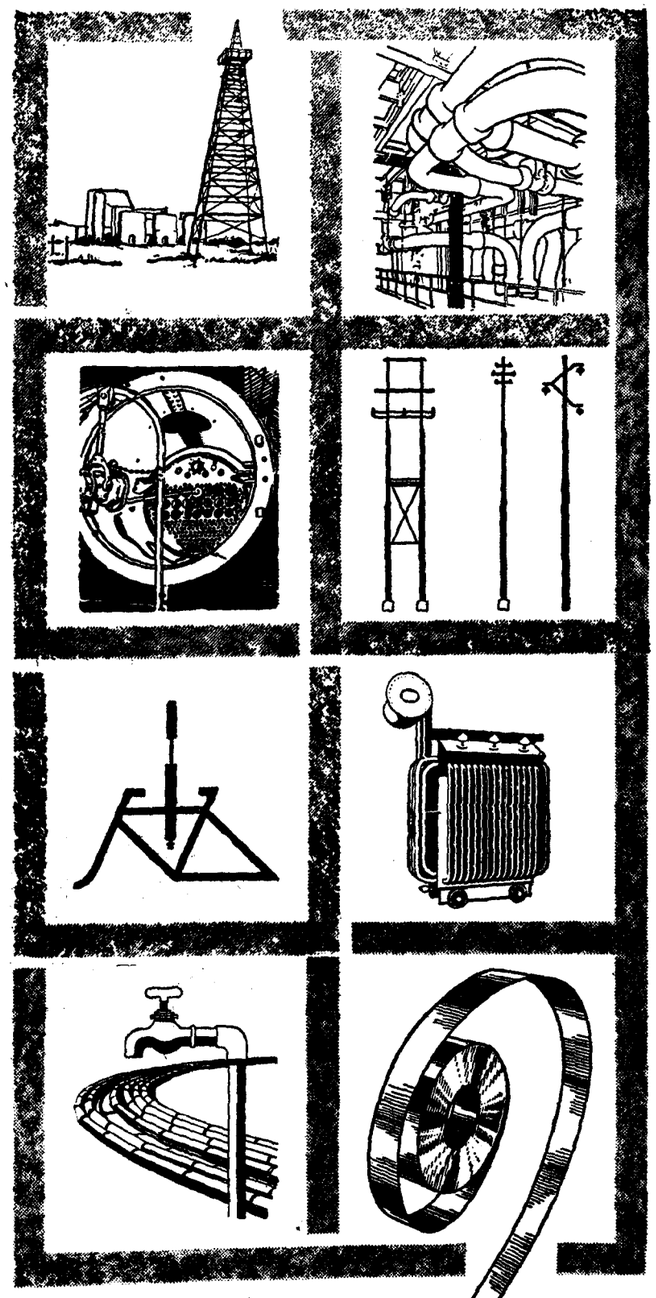
The Directors' report and Statement of Accounts for the year ended 31st August 1962 are already in your hands, and they would have given you all particulars for a proper understanding of the working of the Company during the year.

Before offering my remarks further to the Directors' Report submitted to you all, I must recall to you the fact that we are meeting at a time of National Emergency created by the Chinese Invasion of our Himalayan Borders, when our own problems and the difficulties of our Industry must be viewed against this background of war and peril to our Country. Let us all firmly resolve to protect our Country to the last of our blood and money, and help our Government to preserve our freedoms. Let us pledge ourselves to support and enable our Army to drive out the Invaders from our borders. Inevitably, therefore, our Industry should place itself on a war footing, with due priority and importance given to the needs of the War.

The capacity target for Cement Industry fixed for the Third Plan at 15 million tons was, during the year, reviewed: and was revised upwards at 18 million tons; that is, double the present capacity. Licences have been granted for this additional capacity. What with the absense of incentives in the price policy adopted by the Central Government on the basis atleast of the last Report of the Tariff Commission, the difficulties for obtaining machinery except with a delay of 3 to 4 years and other operational difficulties which the entrepreneurs undertaking New and Expansion programmes encounter, it is left to be seen whether all the additional capacity licensed for will get actually installed. If not by the end of the Third Plan period, at least 2 or 3 years later, we are sure to reach the target of 15 million tons production, to meet the increasing needs of our Country as a result of the allied programmes of the Plans in the Irrigational and Industrial fields.

Apart from the discouraging attitude of the Ministry for Heavy industries to the recommendations of the Tariff Commission in general, the Quarterly fixation of Packing charges continues to be disappointing as ever, without any agreement whatsoever, with the prevailing trends of the Jute Market.

In the Directors' Report, reference has been made to our Scheme of Expansion by another One Lakh tonnes. I am glad to inform you that all orders for the Main and Ancillary items of machinery have been placed and the Central Government has granted Import Licences for all importable items. Barring anything unforeseen, it should be possible to complete the expansion programme by about the end of next year, although it is too early to make any definite assessment, due to various uncertain factors caused by the Indo-Chinese War.



To finance the Expansion programme, the Company issued Additional Capital of 11,360 Redeemable Preference Shares and 35,000 Equity Shares. Of this, 975 Preference and 10,000 Equity Shares were taken by the Existing Holders as their Right Shares. The balance of 10,385 Preference and 25,000 Equity Shares were issued to the Public by a Prospectus on 14-6-1962. The entire balance was taken by the Public, besides the Life Insurance Corporation of India and the Andhra Pradesh Industrial Development Corporation Ltd., Hyderabad I am glad to announce to you that all the Additional Capital has thus been subscribed and collected. Calls have not yet been made on the Shares covered by the Prospectus.

Despite the retention price granted being lower than that recommended by the Tariff Commission, and higher working expenses, coupled with the fact that, producing at rated capacity, we could not increase our production further, we have been able to declare a maiden dividend this year on Ordinary Shares after paying off arrears of Dividend on Preference Shares and current Dividend on Redeemable and Non-Redeemable Preference Shares. The results could have been better, but for the illegal strike resorted to by the Workers, lasting for ten days. We feel confident that we will be able to keep up this dividend in the coming years, as the demand position is quite encouraging and our Machinery is responding in a due measure, for production at rated capacity.

I would like to thank, on your behalf, our Workers, Staff and Officers of the Company for their sincere services and would appeal to them to improve the Factory's production to the maximum. Thanks are also due to the Managing Agents for the careful way in which they have been looking after the affairs and growth of the Company, all these years, despite difficulties encountered from time to time.

Cement Nagar,
24th December, 1962.

The above is not a document purporting to be a report of the proceedings of the Annual General Meeting.

VISADEX

THE DASHBOARD OF BUSINESS

Work the VISADEX way to get the best out of your men, machines and materials.

VISADEX can tell you what you need to know at a glance. VISADEX offers you a fluent indexing system by which records are kept on cards, while colour signals spotlight what things are in stock or needed, whether production is ahead of or behind schedule, sales are increasing or decreasing, where to intensify advertising, which department requires more personnel, who owes you and how much... VISADEX, in short, affords greater control at less cost, besides keeping records secure.

Our VISADEX Representative will be happy to show you, without obligation, how simple VISADEX is to operate—either with Card Pockets or Brass Card-holders—and how easily it can meet your specific requirements.

PEOPLE ARE TALKING ABOUT LIC

LIC's new business in 1961 totalled Rs. 608 crores — an increase of 22% over the 1960 figure of Rs. 497.5 crores. A good record, by any standard. Especially so because 1961 was a bad year for field activity, with vast areas affected by floods. Greater reliance on Life Insurance as a means to safeguard the financial security of the individual and the family, and confidence in LIC as a stable organisation devoted to the welfare of the nation and its policy-holders, have been the main reasons for the phenomenal growth of LIC's business year after year.

Wool DIGJAM

IMPORTANT ANNOUNCEMENT!

HELP US KEEP PRICES STABLE

✳ Wool is an essential commodity in the life of the Nation.

✳ Wool, in every form, is needed for our Jawans fighting on the borders.

✳ We need the cooperation of all our Agents and Stockists to sell our products only at the prices fixed by the Mills as per our printed price-list available with every dealer.

✳ Our customers are requested not to pay more.

✳ Prices in the printed list are inclusive of excise duty and all other levies.

✳ In view of the woollen goods required for the Defence, we request our patrons to purchase only the bare minimum during the present emergency period. This will help us to equip our Jawans quickly.

Surplus Foods and Economic Development

FOR well over a decade, the world has seen a spacious prototype largely sponsored by the US Wheat loan to India in 1951 and by successive P.L. 480 agreements between the United States and many receiving countries of surplus foods and fibres, particularly wheat, corn and cotton. In one sense, this spacious programme culminating in the great agreement of May 1960 under which the United States sold to India 17 million metric tons of foodgrains represents a new massive and strikingly original pattern of financing economic development. Not, indeed, that they were so conceived when they were originally contemplated. Much of the original problem was the sale of true surpluses which, if cast upon the free market, would have wrecked internal prices in the United States and even international markets, disorganising the trade of leading exporting countries, particularly Canada and Australia. There was a tendency then to concentrate on the use of this wheat to combat famine or malnutrition largely as a humanitarian project and not as basic economic instrument in promoting development. Even when P.L. 480 came of age with the passing of the Act which brought it formally into being in 1954, the possibility that the surpluses would rise to billions of tons for export was not fully envisaged. But American technology, always prolific, continued to develop to offset the restrictions provided by Government grants for restriction of acreage and price supports for grain. Paradoxically, restriction of acreage almost defeated itself by the capacity of the acreage almost as much and, indeed, in some cases many times more, than he did previously. The surpluses have continued to become embarrassing to the United States, but have proved a tremendous boon to countries needing additional supplies, and also financial resources in their own currencies for their own economic development.

India has been the main testing ground of the remarkable new pattern of economic development, based upon the great advances of technology and of organisation in the United States. P.L. 480 first demonstrated how an agricultural revolution in one country could become the means to provide both vast additional consumption and massive additional investment resources in another. This prototype, well proved in the fifties, is gathering strength in the sixties. Nothing has been more flattering to its success than the framing of "Development Through Food" programme of the Food and Agricultural Organisation of the United Nations fully described in Basic Study No. 2 recently published by the FAO and now available in the country. The campaign of the Food and Agricultural Organisation for the Development Decade is described in outline in the following article which the Director-General of the Food and Agricultural Organisation, Dr. B. R. Sen, has very kindly permitted to be published in the Blue Supplement. It represents the substance of his address delivered this month to the Economic and Social Council

Nations Development Decade proposals for action. It is hoped that this inspiring programme which an Indian has done so much to frame and sponsor will awaken its due share of interest in a country, which has hitherto been notoriously ignorant of its own opportunities in the field of agriculture and its relation to development as a whole.

The Food and Agricultural Organisation of the United Nations many years ago prepared what might be called the theoretical framework of the thinking on the subject of Development Through Food. A series of articles based upon the consumption patterns in this country, notably in Faridabad, and elsewhere, showed how the use of additional food thrown into an expanding system can reduce inflationary consequences of development expenditure not immediately productive, that is, not immediately capable of cushioning new money thrown into circulation to secure this development. Surplus foods coming in from outside the country could provide the cushion wherewith the tide of inflation could be stemmed. More technically, and in the jargon of text-book economics it was shown in these FAO studies that the multiplier—the famous villain of Keynesian economics, the accelerator of consumer expenditure following on any given unit of investment—could be "damped" almost to any level consistent with the maintenance of prices if the processes of development and the volume of surplus foods could be kept in balance. This is, in fact, also the largest service which great P. L. 480 reserves of wheat in this country have performed over the last two years. It is now certain that the Wheat Loan of 1951 played a central part in stabilising prices of foodgrains in the period from 1952 to 1955. A reserve even of the order of a million tons can be almost decisive in the field of wheat. A reserve of two to three million tons, composed partly of wheat and partly of rice and coarse grains, is probably sufficient to even out fluctuations so disturbing to producer and consumer alike. In other words, the use of surpluses can develop a policy of withdrawals and issues which can remove one of the most disturbing factors in agricultural prices, namely, the capacity at times of harvests for incentives to be reduced so greatly that the agriculturist is left at the mercy of buyers with no power of holding against their superior monetary capacity. Similarly in the off-season consumers can be protected against middlemen.

The whole programme of P.L. 480 which was the inspiration of the FAO programme,—just as in a sense FAO theory was a justification for P.L. 480—has been little understood in most of the countries of Asia which have already benefited, and stand most to gain from these programmes. It is because the manysided operations included in P.L. 480 are so misunderstood that there is sometimes resistance to the idea that India should import these large reserves of foreign grain strengthening her financial resources by their sale and cushion development expenditure by the 'damped' multiplier which follows on the use of surplus food. But there are other aspects of P.L. 480 which have a much more direct and human appeal. One of these, for example, is the fact that a substantial quantity of foods—perhaps 50,000 tons in all, in the Indian Union alone—is being distributed under the auspices of CARE, the Co-operative for American Relief Everywhere, to school children for mid-day meals and for the protection of communities badly supplied with essential food such as milk and butter. Gradually, in many schools so assisted, absenteeism is being kept down and wastage due to ill-health and malnutrition reduced. Slowly, but nonetheless, surely, the largest investment of all—investment in India's children and their education—is finding its powerful place in the programme of the use of surplus foods. In the long haul, this may prove the most productive use of all.

In the Indian Union the programme of reception and distribution has now acquired a massive character; one of the articles in this issue attempts to estimate the volume of employment which is generated over the whole country counting in all the activities to which P.L. 480 directly or indirectly contributes. The figure now appears to be of the order of 4,00,000 which in itself is a substantial addition to Indian employment greater than that given by any single business in the country, including all the steel plants together.

The purpose of this Blue Supplement has been to set out in as comprehensive a manner as possible the subject of development through food in the particular light of India's recent experience and of the operations which lie behind the programme which is working now with a substantial measure of success. 'The Eastern Economist' has been given facilities for study in the United States and can thus present both the transmitting and the receiving ends of this picture. It is hoped that this Blue Supplement will contribute in some small measure to a major understanding of the large contribution that the programme is making to Indian economic development and, happily, at the same time to Indo-American partnership in an absorbing enterprise, in which the purpose is human welfare above everything else.

FAO and the Development Decade*

By Dr. B. R. SEN, Director-General of the Food & Agricultural Organisation.

THE PROPOSAL TO designate the 1960s as the United Nations Development Decade has received the unanimous support of the General Assembly. We must, therefore, assume general concensus among the member-nations regarding the basic ideas of the Development Decade and also acceptance of its implications. The resolution calls the Development Decade a programme for international economic co-operation. While it asks the developing countries to intensify their own efforts towards self-sustaining economic growth, with each country setting its own target, taking as the objective a minimum annual rate of growth of aggregate national income of 5 per cent at the end of the Decade, it also urges the developed countries to provide sustained support for accelerated growth in the under-developed countries, specifying the broad measures which they should follow for this purpose. At the same time, it calls upon the United Nations and its Specialized Agencies to aid the member-countries in achieving the goals of the Development Decade, and to develop proposals towards that end.

Since F.A.O. collaborated actively in formulating the basic approaches and proposals of this report, I wish to confine myself here mainly to the implementation of the proposals. Indeed, if the Development Decade is to be more than a mere slogan, it must call for a greatly increased effort, both by governments and by international organizations, along the lines suggested in these proposals. The essence of the development process in under-developed countries is putting more people to productive work, through capital investment, organization and incentive. Progress to be real, therefore, implies that the governments and peoples of the developing countries must themselves be thoroughly involved in the process of growth. In fact, without such involvement external aid cannot be of much avail.

*This article incorporates the substance of Dr. B. R. Sen's address to the 34th session of the Economic and Social Council at Geneva on July 9, 1962.

The contrast in the levels of human welfare between the developed countries of the world and those where the development process has barely begun is strikingly reflected in the annual income levels per head of these countries. These international inequalities are not being reduced. In fact, the gap is widening. Gross income in the under-developed regions of the world grew at the average rate of 3 per cent per year between 1950 and 1959. Because of the growth of population, the increase in income per person was only about 1 per cent per year—that is, about $1 per year. In the United States and in the six countries of the European Economic Community, average incomes during the same period rose by over $20 per head per year.

The net capital flow and assistance from developed to developing countries over the last decade remained less than 1 per cent of the combined national income of the wealthier countries, in spite of considerable increases in the latter part of the decade. This current flow of capital and assistance is simply too low. It is below what the developed countries can and should afford in their own best interest and it is far below the needs of the less developed countries. The unanimous re-affirmation by Members of the United Nations of the idea of international economic co-operation and their determination to intensify action during the Development Decade will, it is hoped, lead to a substantial increase in this flow of capital and technical assistance.

The Freedom from Hunger Campaign, launched by FAO in 1960, had all these needs broadly in view. Entrusted by its constitution with the task of promoting common welfare by raising levels of nutrition and standards of living of the people and bettering the conditions of rural populations, FAO, more than any other international agency, stands face to face with the greatest human problem of all—the problem of ensuring food for the growing world population.

A study recently made shows that nearly one-sixth of the world's population, or roughly 500 million people, suffer today from active hunger, that is, lack of sufficient calories, while another one billion suffer from malnutrition or diet deficiencies. Add to this the relatively high rates of population growth in the developing regions over the last decade (between 2 and 2.5 per cent per annum), which are expected to go even higher (2.5 to 3 per cent) during the current decade, and there can be no mistake about the seriousness of the problem. There could well be a doubling of the population in Africa, a trebling in Latin America, and an increase in the Far East and Near East by two and a half times by the end of this century. **On such a rate of population growth, world food supplies would have to be doubled by 2000 A.D. just to maintain the current level of nutrition which is very inadequate, and in many of the under-developed regions, it would have to be trebled to provide only a moderate improvement.**

The magnitude and gravity of the situation, therefore, calls for urgent world attention. By its very nature, this problem cannot remain stationary. Either we face up to it with all the material and technical resources that man has at his disposal, as has been done in the relatively few advanced countries, or it becomes worse and reaches the "explosion" stage. There can be no question which alternative is to be preferred.

The target of an overall growth of national income of 5 per cent per annum proposed by the Development Decade is certainly the minimum that the developing countries should aim at during the current decade. It should be realized that this would represent an increase of little over $2 per head per year for most of the under-developed countries—a very small increase indeed. As I have already indicated, even such a modest increase would require substantial additional financial resources, and many supporting measures at both national and international levels if it were to be attained. Assuming that such resources will be forthcoming, one immediate question which arises is how the investment funds are to be allocated between different sectors of the economy. Granted that the investment allocations to the several main economic sectors must be based on well-integrated development plans, my own answer is that these plans must assign a major role to agriculture in the attainment of the target rates of growth. We should realise that successful economic development requires, as the distinguished delegate of the United States, Mr. Adlai Stevenson, has stated succinctly, "a **breakthrough** in agriculture". In the developing countries, agricultural progress must supply the food for better nutrition of an increasing population; agricultural progress must release the labour for industrial development; agricultural progress must supply in terms of export returns and internal revenues, much of the foreign exchange and capital to finance needed imports and capital investment. This, we know, was the role which agriculture played in the economic development of the most advanced industrial country in the world today, viz. USA, in the 19th century. This is the role which agriculture must play in most of the developing countries in this decade and in the decades immediately ahead. Our estimate is that to achieve an overall national growth rate of 5 per cent per annum, agriculture should be developed at a rate of approximately 4 to 4.5 per cent.

It is essential to set specific targets both for improvements in nutrition and for agricultural production, which will be consistent with the overall target of 5 per cent per annum growth proposed by the Development Decade. In sections of the Secretary-General's Report dealing with "Food and Agriculture in the Development Decade" there are indications of certain broad targets of nutritional requirements and food supplies to be attained over the current and the subsequent decades, to which I would like to draw the attention of this Council. Broadly speaking, the rate of improvement in per capita food supplies in the developing countries need to be doubled, that is, to be increased by 2 per cent or more per annum over the decade as against the past increase of 1 per cent per annum.

Since FAO is concerned primarily with the problem of hunger and malnutrition and with its solution through increasing the supply of basic food and agricultural products, its role during the Development Decade will be vital. The UN General Assembly, by its resolution of October 27, 1960, has endorsed FAO's Freedom from Hunger Campaign and urged all States, members of the United Nations and members of the Specialized Agencies, to support the Campaign in every appropriate way. Further, the UN/FAO experimental World Food Programme for the use of food aid as a means of promoting economic and social development is, it is hoped, only a beginning of a much bigger effort in the years to come.

FAO will, of course, continue to work on many fronts with the UN and the other specialized agencies; but its main contribution to the Development Decade will be through the Freedom form Hunger Campaign. I may add that in pursuing the Campaign, FAO is reorientating its whole range of activities so as to be able to render the greatest possible service to the developing countries. This includes greater emphasis on education and training, assistance in establishing effective admin-

istrative services, emphasis on basic institutional changes such as land reform. FAO is also giving greater attention to planning agricultural development in its overall context, both for the medium and for the longer term, in order to devise policies which will make it possible for the developing countries to attain higher standards of living.

A specially important field of FAO's endeavour over the decade will be research and analysis directed towards finding the optimum patterns of utilization of the limited resources of land and water. This is necessary in order to lay a sound foundation for meeting the much greater needs for food and raw materials of the decades still further ahead. Our Ganges - Brahmaputra Resource Survey (for India and Pakistan), for example, indicates that potential four-fold increase in production is dependent on directing development away from concentration on rice during the monsoon season towards a system of mixed farming and triple-cropping based upon perennial irrigation wherever possible.

Our recent Commodity Projection Study does not yield an optimistic picture for the export returns from agricultural commodities of the under-developed countries over the next decade, assuming that the current trends and policies are continued. The Development Decade will be meaningful only if in addition to other efforts within its frame work, member-nations give special importance to devising international commodity agreements or compensatory payment arrangements for commodities of primary interest to the developing countries. Fortunately, multilateral arrangements for looking into these problems already exist within the UN family. In fact, the UN Commission on International Commodity Trade is already engaged in a study of possible general compensatory arrangements; while the FAO Committee on Commodity Problems and its special study groups or working parties provide a convenient machinery through which the exporting and importsing countries, or the developing and the developed countries may, on equal footing, deal with these problems. Where necessary, these bodies can recommend and prepare draft commodity agreements which may then be formally negotiated at conferences called by the Secretary-General. In conclusion, let me plead that the Development Decade be conceived not so much in terms of statistics or percentages, but in terms of human needs—food, shelter and clothing for all everywhere in the world. Let this be a decade of truly co-operative effort, over-riding narrow economic considerations and ideological and political differences, to bring hope and promise of a better life to millions of our fellow beings.

Operation PL 480

ONE of the great gaps in understanding of the operations involved in the agreements under P.L. 480 concerns the volume and the many-sided character of the business operations following in the wake of the programme. There are, in fact, six major operations each of which makes substantial demands on planning, finance, and organization. The first of these is the reusing of the grain under conditions controlled by special Acts of the United States Congress involving both restriction of acreage and price supports. There are a vast number of regulations which involve inspection and operation of these orders of the United States Agriculture Department. Following upon the growing of the grain, there is the problem of the sale and surrender of that portion of the grain on which the United States Government has a lien after purchase. The problem of storage, particularly in case of wheat has run into spectacular dimensions, and, in every case, instructions have to be issued, transport arranged, and storage arrangements made to keep the grain in good condition. Thereafter, if another Government (or in special cases, private purchasers) wishes to arrange purchase of grain, they are free to inspect and make their choice at various centres in the United States and to fix prices according to circumstances, but generally on the basis of competing tenders. Thereafter, it is the purchaser's responsibility to take possession of the grain and despatch it. Fourthly, there is the receiving of the grain at the point of unloading in a foreign country. Fifthly, there is distribution by the receiving Government and then the handling of that grain by warehousing, despatch to local bodies and so on. Finally, there is the end-use of the grain whether as direct sales to the consumers or for free distribution for humanitarian ends such as the distribution by CARE for mid-day meals in schools.

Two immediate observations need to be made in regard to the character of these operations. In the first place, the total operation is considerably more in value than the original figure paid to the farmer in the United States for this produce. This is because transport, storage, and shipping costs are a substantial portion of the cost of the product to the consumer. Secondly, as a problem in organisation it calls at every stage for the co-operation of nationals of the receiving country with those of the United States. Thus in the case of India it is the Indian Supply Mission in the United States which calls for tenders, purchases grain and directs from which port they are to be despatched and where they are to be received. It is again the Indian Supply Mission which arranges the ships and from the moment the purchase takes place, ownership belongs to the purchasing Government. And it is the purchasing Government's directions which control the movement of commodities even while they are in the United States. In other words, United States nationals carry out the instructions of the foreign Government which has purchased the grain. The ships under certain limitations of flags provided by Acts of Congress can also be chosen subject to quotas by the concerned Missions abroad and there is room for the utilisation of the home country's ships to a very significant degree. In the case of the Indian Union, the real difficulty is that India has not enough ships to carry P.L. 480 supplies upto the full limit which the quota provides. In the Indian Union receiving and distribution are entirely in the hands of Indian nationals and a most elaborate organisation exists throughout the country for this purpose.

Much the most important point of reception is the port of Bombay which controls about half the P.L. 480 supplies under the May 1960 agreement—the largest single transaction ever completed in the history of the world—amounting to over Rs. 1100 crores. The office of the Regional Director of Food in Bombay employs five thousand persons responsible for reception, despatch, storing and so on, and this is only a figure for direct employment. In a following article some reflections are presented on the total volume of employment provided so far as other factors are concerned. One of the most interesting and perhaps, in the long run, educative factors in the distribution is the association of Panchayats in many cases with operation of the P.L. 480 programme. Thus, where there are mid-day meals for schools in villages, the consignments are directed to the Block Development Officer, who in turn makes supplies over to the Sarpanch in the villages where the schools are operated. It is the local authorities that

are responsible for the distribution and the control of these supplies. A high sense of responsibility is said to have been exercised in the areas which are being served under the overall supervision of the CARE, in some cases, under the Block Development Officer. In other words, Community Development and other local self-government have been pressed into service in the operation of the P.L. 480 programme and are fulfilling themselves in many ways.

By whatever standards the operations are regarded, whether it is growing of millions of tons of wheat and other commodities in the United States, or the transfer of these to ports, in some cases, well over 1,500 miles from the point of raising, storage at numerous points in the country after careful inspection and control, or the great shipping operation involved, or the distribution in the receiving country, the dimensions of the operation are massive and constitute an impressive business on their own. It is not generally known that in the last May 1960 agreement the operations involve the equivalent of a ship with a load of 8,000 tons arriving every day, at Indian ports for a period of about four years. Sometimes there are many ships at the ports with full loads of P.L. 480 commodities. The receiving, apart from a vast amount of clerical employment, is only one fact of a major operation in terms of the economy as a whole. The additional grain has to be bought and sold entering the free marketing competition with local grains, and a vast organisation controls issues, stocks and accounts in all the areas of consumption. At the same time, the Central Warehousing Corporation in India bases almost its entire business on this operation and from the sales of these commodities a vast chain of projects, to which reference has been made in another article, is financed. The consequenses reach out at one end in the supply of food to needy people to the accumulation of vast balances which assist the Government of India in its ways and means position. When sales of grains are made from P.L. 480 funds nominally the proceeds stand in the name of the United States, but are constantly being placed at the disposal of the Government of India both by way of loan and grant. A tremendous financial operation has thus been set in motion in which, apart from the control on prices brought about by the availability of supplies, the Government of India has a major interest in finding sources of revenue alternative to direct taxation or its own loan floatations. It has thus been possible to relieve the Indian economy from financial stringency at a time when otherwise this situation would have been intolerable either by the volume of new taxation or by the demands made by the Government for its loan programme on available rupee resources.

It is difficult to believe that there exists any other business in the country of equal size or importance for the economy as a whole. In the last five years P.L. 480 operations have probably exceeded those of any single business firm almost anywhere in the world.

The Structure of PL 480 Assistance to India

INDIA has been one of the most important recipients of assistance from the United States, in the form of farm products, under the US Agricultural Trade Development and Assistance Act, popularly known as the Public Law 480 by virtue of it being the 480th Act to be enacted in that country. The genesis of this Law, which presumably gave rise to the FAO ideas of fostering economic development in under-developed countries through provision of food, are, in fact, to be found in the second decade of the present century when the United States, surplus as it was in food even then, came to the succour of millions of people in Belgium and Northern France who faced starvation as a sequal to the German invasion of these countries in 1914. Since then, its surplus food has been utilised by the US Government to provide relief in various countries of the European continent, not excluding the Soviet Russia, when famine visited them, or the strains of war (which upset their agricultural economies) made them look to the United States for provision of foodstuffs. Today, however, the pattern of this assistance has changed appreciably. Apart from these food surpluses being made available for humanitarian purposes, large supplies of food are being effected by the United States for fostering economic growth in developing countries. The mechanism followed is sale of US surplus farm products to the needy under-developed countries on easy terms and allocation of the sale proceeds of these products, in the form of grants or loans, to them for their economic development.

India has uptil now received US farm products under this Law to the tune of $2,525.5 million. This does not include the Wheat Loan of $189.7 million which the United States extended to this country in 1951.

The US Public Law 480 has three titles (or chapters) under which assistance is granted. Title I authorises the US President to sell agricultural commodities for foreign currencies and provides for the use of the proceeds. Purchases under this Law do not involve expenditure of the dollar holdings of the foreign countries. Title II enables the President to furnish emergency assistance on behalf of the people of the United States to foreign countries for meeting famine or other urgent or extraordinary relief requirements. Supplies made under this title constitute donations and do not involve any payment. Title III permits the US Administration to barter American agricultural commodities with foreign countries for strategic or other materials and also the donation of food commodities to non-profit voluntary agencies for use in the assistance of needy persons both in and outside the United States.

ASSISTANCE TO INDIA UNDER TITLE I

Total assistance already made available or promised by the United States to India under Title I of the Public Law 480 amounts to $2,376.6 million (Rs. 1,131.7 crores). This has been authorised under five agreements, the first of which was signed on August 29, 1956, covering approximately supply of 35 lakh tons of wheat, 2 lakh tons of rice, 60 lakh lbs. of tobacco and a small quantity of dairy products. The total value of commodities actually imported under this agreement was $354.55 million. The agreement was for a period of three years, but in view of the unfavourable weather conditions in India, which led to serious food deficits in 1956 and 1957, the supplies of wheat, rice and dairy products were completed in less than two years.

The second agreement, covering 5.8 lakh tons of wheat and 2 lakh tons of coarse grains, valued at $55.28 million, was signed on July 23, 1958. Soon after this agreement, the third pact was signed on September 26, 1958, under which India was supplied 28 lakh tons of wheat and 3 lakh tons of coarse grains, worth about $259.81 million.

The fourth agreement under this title was signed on November 13, 1959. Under this pact, India received 29.97 lakh metric tons of wheat, 2.1 lakh metric tons

of rice, 3.5 lakh bales of cotton, 226 metric tons of tobacco and one lakh metric tons of coarse grains, in all worth $297.87 million.

Then came the agreement of May 4, 1960, signed by Mr. S. K. Patil, India's Food and Agriculture Minister, under which India was to be made available 16 million metric tons of wheat and one million metric tons of rice from the U.S. surplus stocks. Some supplements to this agreement were negotiated at a later date, providing for import by India of a large quantity of cotton, corn and soyabean oil. Both in terms of the quantity of agricultural products involved and the financial terms, this agreement has been the biggest which the United States has entered into with any country in the world. In terms of financial commitments, this agreement made available to India assistance to the tune of $1,369.8 million (Rs. 652.3 crores). Supplies of wheat under this agreement are still continuing and will come to end in 1964. But the other commodities have been already supplied by the United States.

By 1964, when the current—the fifth—agreement under Title I of the US Public Law 480 comes to a conclusion, India would have received, among other commodities, a total of 26.4 million metric tons of wheat and 1.58 million metric tons of rice.

UTILIZATION OF SALES PROCEEDS

The sale proceeds of the commodities supplied by the United States to India under the above five agreements, totalling Rs. 1,131.7 crores ($2,376.6 million), are to be utilised as follows :

1. For grants to Indian government for economic development	Rs.	375.3 crores
2. For loans to Indian government for economic development	Rs.	533.8 „
3. Cooley Fund for loans to private enterprise	Rs.	77.6 „
4. For U.S. government use	Rs.	145.0 „
TOTAL	Rs.	1,131.7 crores

The repayment of loans envisaged under (2) is to be made in Indian rupees.

Upto February last, by which time a total sum of Rs. 595.9 crores had accrued from these sale proceeds, the following allocations had been made :

1. For grants to Indian government	Rs.	150.8 crores
2. For loans to Indian government	Rs.	280.0 „
3. Cooley Fund for loans to private enterprise	Rs.	75.4 „
4. For U.S. government use	Rs.	89.7 „
TOTAL	Rs.	595.9 crores

Out of the total Rs. 150.8 crores made available to the Indian Government from the sale proceeds as grants, agreements have been concluded with the U.S. Government for utilising them for financing part of the rupee expenditure on the following projects:

(Rs. crores)

Project	Amount
1. River Valley Development (Chambal, Hirakud, Damodar Valley, Mahi Right Bank Canal, Kakrapar, Nagarjunsagar, Kosi, Bhadra, Tungabhadra, Mahanadi Delta Irrigation, Kundah and Koyna Projects)	5.9
2. Malaria Eradication	16.0
3. Indian Institute of Technology, Kanpur	0.5
4. U.P. Agricultural University	1.0
5. All-India Institute of Medical Sciences, New Delhi	2.9
6. Indian Investment Centre	0.2
7. Dairy Development	3.6
8. Soil and Water Conservation	2.0
9. National Highways	20.0
10. Exploration of Groundwater Resources	0.8
11. Craftsmen Training	1.0
12. Modern Storage of Food Grains	10.3
13. Higher Technical Education	2.0
TOTAL	66.2

The following projects have been authorised to be financed through loans made available to the Indian Government out of the sale proceeds of the agricultural commodities received so far:

(Rs. crores)

Project	Amount
1. Refinance Corporation	26.2
2. River Valley Development (Chambal, Hirakud, Damodar Valley, Mahi Right Bank Canal, Kakrapar, Nagarjunasagar, Kosi, Bhadra, Tungabhadra, Mahanadi Irrigation, Kundah and Koyna Projects)	124.1
3. Sharavathi Hydro-Electric Projects (First Stage)	7.0
4. Industrial Credit and Investment Corporation of India	10.0
5. Industrial Finance Corporation	10.0
6. Chandrapura Thermal Power Project	20.5
7. Barauni Thermal Power Project	1.3
8. Durgapur Thermal Power Project	3.4
9. Kanpur Thermal Power Project	1.0
10. Exploartion of Groundwater Resources	0.8
11. Trombay Fertilizer Plant	13.4
TOTAL	223.3

Commitments have been made for the following additional projects to be financed from these loans.

Agreements in regard to them are expected to be signed shortly.

(Rs. crores)

Project	Amount
1. Talcher Thermal Power Project	8.5
2. Birsinghpur (Amlai) Thermal Power Project	6.6
3. Sharavathi Hydro-Electric Project Second Stage	17.2
4. Cambay Thermal Power Station	9.0
5. Pamba-Kakki (Sabarigiri) Hydro-Electric Project	15.3
6. Bandel Thermal Power Project	7.7
TOTAL	64.3

Some more projects to be financed from these funds are being discussed between the Governments of India and the United States. They are expected to be announced shortly.

ASSISTANCE UNDER TITLE II

The total assistance received by India from the United States under Title II of the Public Law 480 amounts to $5.2 million. This came in 1956, 1957 and October, 1961 when several parts of India were visited by natural calamities. In 1956 and 1957, the US Government made available 10,000 tons each of wheat and rice and 3,000 tons of non-fat dry milk powder worth $4.9 million. In October, 1961, the US Government made available 1,250 short tons of milk powder for providing relief to food victims in this country.

ASSISTANCE UNDER TITLE III

The total assistance that India has received uptil now under Title III of the U.S. P.L. 480 amounts to $143.7 million. The only barter deal that has been transacted under this title between the United States and India was in March, 1959, which involved supplies by India of manganese, ferro-manganese and other materials in exchange for 4.5 lakh metric tons of foodgrains from USA. The rest of this assistance has been received in the shape of rice, milk powder, corn meal, vegetable oil and wheat for supplying mid-day meals to school children in four States—Madras, Kerala, Punjab and Andhra Pradesh. As many as 27 lakh children are stated to be provided lunch in their schools under this scheme operated by the State Governments concerned in collaboration with CARE.

The assistance made available out of the Cooley Fund created from the P.L. 480 counterpart resources has been discussed in the following article and need not be repeated here.

Cooley Funds

AN interesting feature of the US Public Law 480 Funds is their incentive for development. According to an amendment of P.L. 480, upto one-fourth of the local currency proceeds from the sale of American agricultural commodities may be made available for lending in the private sector. This amendment came to be popularly known as Cooley Amendment after the name of Mr. Harold D. Cooley who was the Chairman of the Committee on agriculture of the US House of Representatives.

Two categories of borrowers are covered by the Cooley Funds. They are:

(a) American firms or their subsidiaries operating in India or Indian firms having affiliation with American firms.

(b) Indian firms with no American affiliation which facilitate the disposal of American agricultural products.

So far, a sum of Rs. 75.4 crores has been made available to the Cooley Funds. The loans which have been sanctioned so far total upto Rs. 12.68 crores. The names of the recipients along with the volume of loans are given in the table below.

LOANS FROM COOLEY FUND

(Rs. Crores)

Firm	Amount	Firm	Amount
1. Otis Elevator of India Ltd.	0.10	8. Premier Tyres Ltd. (Joint enterprise with Dayton Rubber Co. Inc.)	0.30
2. Goodyear Tyre & Rubber Co. of India Ltd.	2.25	9. Seshasayee Paper & Board Ltd. (Ms. Seshasayee/Parsons & Whittemore Inc.)	2.00
3. Mysore Cements Ltd. (Ms. Sarangapani Mudaliar/Kaiser Inc.)	0.55	10. Lederle Laboratories (India) Pvt. Ltd.	0.25
4. Hindustan Aluminium, Ltd. (Ms. Birla-Kaiser Inc.)	1.00	11. Gabriel India Private Ltd. (Ms. D.C. Anand/Gabriel of Detroit)	0.05
5. Synthetics & Chemicals, Ltd. (Ms. Kilachand/Firestone Inc.)	3.92	12. Carrier Air Conditioning & Refrigeration Pvt. Ltd. (Ms. Voltas/Carrier Air Conditioning Inc.)	0.38
6. Merck, Sharpe & Dohme Private Ltd.	0.50	13. Madras Rubber Factory Ltd., (Factory is being set up in collaboration with Mansfield Rubber Co. of Ohio)	0.25
7. Ex-Cell-O (India) Pvt. Ltd. (Ms. Amerind Engineering Co./Ex-Cell-O Inc.)	0.20	14. East India Hotels Ltd. (Ms. Oberoi/Intercontinental Hotel Corporation Inc)	0.76
		15. Wyeth Laboratories, Pvt. Ltd. (American Home Products Corporation)	0.17
		TOTAL	**12.68**

Negotiations are being completed in respect of many other loans in order to finance the development of other industries. Indo-American co-operation will flourish further when the balance of Rs. 62.7 crores is made available.

Amongst the loans which have already been provided from the Cooley Funds, the Synthetics and Chemicals Ltd. has obtained the highest allocation of Rs. 3.92 crores. Goodyear Tyre and Rubber Company of India Ltd. has obtained Rs. 2.25 crores by way of loans. Next in the scale is Seshasayee Paper and Board Ltd.

As soon as the political climate in Washington clears and the Senate appears in a better mood, the administration is likely to announce the completion of many Indo-American collaborations.

PL 480 Funds: Direct and Indirect Employment

THE import of foodgrains and other agricultural commodities from the United States under the US P.L. 480 programme is a vast employment giving operation. On the average, one ship with 10,000 tons of agricultural commodities is unloaded every day in Indian harbours. No one has kept a record of the number of people employed in taking delivery of the P.L. 480 products and transporting it to the various warehouses in the country for purposes of storage. During the lean months, when shortages appear in various parts in the country these stocks are once again moved to areas of deficit, thus providing work to more men. Throughout these operations, the number of men directly linked with the project is something like 100,000. This may look a staggering figure. It is not often realised that most of these operations in India are completed without the assistance of automatic machinery which is readily available abroad. In almost all cases, the burden is borne by human labour. The process of bagging 10,000 tons of agricultural produce at a port needs no less than 1,000 labourers and, then, there are others who have to put these bags into wagons for conveyance to upcountry centres. Unloading and loading in itself are big tasks both at the ports and the warehouses. In between, there are the railway stations where the same process has to be gone over. Thus the estimate of 100,000 jobs created directly by P.L. 480 imports is a conservative one.

There are no less than 37 stations in India where warehouses are located for storing the agricultural produce. A comprehensive administrative machinery is needed to decide about the distribution of the produce to the various warehouses. The lists of these warehouses along with their capacities is given at the end of the article. It will show that the only States where no warehouses are provided are, Mysore and Himachal Pradesh. Broadly, the location of these warehouses has been governed by the dictates of the demand for wheat —the most important component in P.L. 480 imports.

The volume of indirect employment generated by these imports is much larger than the direct employment. An estimate of indirect employment can be made by employing capital—labour ratio prevalent in Indian industry. The total aid under P.L. 480 to be received is Rs. 1131.7 crores. This will, however, continue to be received till 1964. A sum of Rs. 595.9 crores has already accrued as sales proceeds of commodities supplies to India. The amount has been allocated as under:

(Rs. crores)

(i) For grants to Indian Government ..	150.8
(ii) For loans to Indian Government ..	280.0
(iii) Cooley Fund for loans to private enterprises	75.4
(iv) For US Government use	89.7
TOTAL	595.9

It is true that all these funds have not been utilised. For example, out of Rs. 150.8 crores which have become available by way of grants to the Indian Government, agreement had been reached only in regard to projects for Rs. 66.2 crores. This applied to other categories as well. In all the actual investment of Rs. 250 crores has already taken place out of the proceeds of P.L. 480 sales. On the assumption that every investment of Rs. 7000 results in providing employment to an additional hand in the Indian Union, it is estimated that the total employment generated indirectly comes to nearly 350,000 people. Undoubtedly, this is a rough estimate based on the data provided by the census of manufactures. Even the most conservative co-efficient of Rs. 10,000 investment for every additional job will yield a figure of 2,50,000 additional employment. In the case of certain irrigation projects, the volume of employment generated is much larger. After the completion of these projects, the multiplier effect of investment continues to raise employment by either putting more area under irrigation or by providing power to new industries. In the case of Cooley Amendment funds, wherein loans have been made available to private enterprises, the volume of new employment is likely to be much larger. All in all, it might be stated that P.L. 480 funds have indirectly created nearly 3,00,000 new jobs. Thus in addition to feeding the hungry, assisting in the setting up of new industries and building new irrigation projects, the P.L. 480 scheme has produced a far-reaching impact on the economy by providing work to a large number of additional men and women—estimated to be around 4,00,000 in all.

PL 480: The Transport Complex

THE basic fact to be noted about the transport of food grains and other commodities under the P.L. 480 Title I Programme is that it is the exclusive responsibility of the Government of India right from the point of despatch of ships from the United States. Under the P.L. 480 Agreements, although the quantities of the commodities agreed to be supplied are indicated, the actual loan assistance is given in terms of U.S. dollars and it is with these dollars that the stipulated quantities are purchased by the Indian Supply Mission in America. The responsibility for sending the shipments to the different ports of India devolves on the Supply Mission. The real impact of these shipments on India's transport capacity begins to make its impression when the ships arrive at the Indian ports. It is this impact which needs to be assessed here.

The different stages of transport involved from the point of unloading of the ships to their consignment at the consuming centres are not as complex as they are supposed to be. Practically all the food grains (and other commodities) are moved from the port towns, except for such quantities as are retained in those towns for local consumption or for consumption in the proximate region. In this case what happens is that the stocks unloaded are removed to storage houses located at a distance of not more than 15 to 20 miles from the ports. This short distance requires truck transport. But considering both the quantities of stock and the distance, this truck movement forms a negligible proportion of the aggregate traffic movements. Essentially the P.L. 480 imports are transported by rail into the interior at different destinations where the storage capacity is located. From these storage centres the stocks are despatched to the main distribution points in the States and here again movement by rail is involved. There are at the present time about 275 storage centres specially constructed for the preservation of food grains out of which well over 200 are occupied by the P.L. 480 food grain stocks. The location of these storage centres is invariably planned in the close vicinity of railway stations, so that the employment of truck transport in the course of movements for distribution for consumption is reduced to a nominal proportion. But a more significant feature of these storages is that they are so devised as to avoid cross-movements of food grains conveyed to them from the port towns. This planning of location has helped to reduce the strain on the rail capacity which otherwise would have been involved in multiple movements.

In the order of geographical direction, the ships are unloaded at Kandla, Bhavnagar, Bombay, Madras, Visakhapatnam, Haldia and Calcutta. But the heaviest brunt of the shipments falls upon Bombay port, where, it is estimated, not less than 50 per cent of the cargo arrivals are unloaded. Madras is the next to bear the burden of the arriving ships, then comes Calcutta, while the share of the remaining ports is much smaller in comparison. Ships bound for Calcutta involve a double unloading arrangement. This is for the reason that the draft at Calcutta port is shallow, about 27 feet, which necessitates the limitation of the capacity of ships to 6,000 tons. The quantities actually loaded in the ships in excess of this limitation are required first to be unloaded at other earlier ports, particularly Madras and Visakhapatnam. A question may be posed here. How much additional load is thrown on the capacity of the ports in view of the fact that under the P.L. 480 Title I Agreement of May 4, 1960, the average arrivals of ships over the four-year period come to one ship a day? This question in reality does not require an answer at all. One ship per day is only an arithmetical estimate. Actually what is happening is that the element of time-lag is operating in a very impressive manner and the quantities that are actually unloaded since the signing of the prevailing agreement do not relate exclusively to the food grains stipulated in it. A good part of this quantity represents the back-log or throw-forward from the stocks due under the earlier P.L. 480 agreements.

The actual incidence of the demand of the P.L. 480 food grain imports on rail capacity is extremely difficult to estimate. The statistics of the Railway Ministry relate to the aggregate qualities of grains and pulses loaded in terms of four-wheeler wagons on the broad-gauge and the ordinary wagons on the metre-gauge. For instance, in 1960, 454,800 wagons were loaded on the broad-gauge and 381,600 wagons were loaded on the metre-gauge. The corresponding figures for 1961 are 429,600 four-wheeler wagons and 373,200 wagons. These loadings represent all manner of movements. They include P.L. 480 imports, imports from the traditional sources of supply, intra-State movements from the country-side to the towns and movements from the surplus regions to the deficit regions. This variety of classification makes it well-nigh impossible to isolate the shares of the movements of domestically produced food grains, P.L. 480 import movements and movements of other imports. The estimate of rail capacity absorbed by P.L. 480 imports cannot be dismissed is of little practical value. It is to be taken in relation to roughly 20 million metric tons of domestic food grains which involve transport from the growing areas to the markets. Another, though less important, factor to be regarded relates to the length of the haul. Over 200 storage centres holding P.L. 480 food grain imports are obviously far-flung. But depending upon the location of the consuming centres, the movements might involve long or short hauls and this has a definite bearing on the transport capacity occupied.

In the table below are set out the details of the arrivals of shipments of wheat from 1956, when the first P.L. 480 agreement was signed up to June 1962. In parenthesis, it ought to be mentioned that out of the total 17 million tons of food grains

WHEAT ARRIVALS IN INDIA UNDER P.L. 480 TITLE I

Total up to June, 1962.

UNDER SECRETARY TO GOVERNMENT 3 AUG 1962 PUBLIC DEPARTMENT

which have been stipulated in the agreement of May 4, 1960, as high a proportion as 16 million tons represents wheat. Out of the balance, more than four-fifths is rice and the rest other grains. An idea of the pressure of P.L. 480 imports on the transport capacity can be fully gathered from the quantities of wheat alone. The capacity that is demanded by other types of commodities is quite small.

The outstanding fact which emerges from this table is that it was in the calendar year 1960 that the largest quantity of wheat shipments arrived in this country. It was of the order of 4.05 million metric tons. Quite a small part of it could be related to the Agreement of May 4, 1960, the bulk representing the food grains procured under the previous agreements. This observation applies in some measure to the arrivals of the quantities in 1961 also. The fact that arrivals of ships were nearly halved in 1961 to those in 1960 is explained by the good harvest enjoyed by this country in the agriculture year 1960-61. Nevertheless, the 1961 quantities compare well with those in 1957 and 1958, although not with those of 1959. The agricultural year 1961-62 is again bringing a plentiful harvest, but it is interesting to note that the arrivals of ships are keeping to the pace of arrivals in 1961. The estimate of 1962 is, of course, based on the actual unloading during January-June. The significance of the actual procurements in 1961 and the first half of 1962 lies in the build-up of reserve stocks whose key role has been described elsewhere in the articles in this Supplement. On the quarterly basis also, 1960 show the high water-mark of imports in the fourth quarter and in the second quarter of the year. It is only after these two quarters that a high level of quarterly imports is revealed in the first quarter of 1959.

The imports of stocks revealed in the table do not give a clue to the quantities that have been procured under the latest Agreement of May 4, 1960. But this class of imports are presumably much less than 3.17 million metric tons imported in 1961 and the first half of 1962. To this needs to be added a small quantity that was bought in 1960. It is, therefore, problematical whether the balance of something like 14 to 14.5 million metric tons of food grains would be shipped during the remaining period of this Agreement. The presumption is that the position will need fresh consideration at the end of the period of the Agreement.

U.S. AID TO INDIA

(From June 1951 to July 23, 1962)

Source of Aid	Dollars (Million)	Rupee equivalent (Crores)
1. U.S. Agency for International Development Mission's Technical Co-operation Programme: (a) Developmental grants (not repayable)	351.9	167.6
(b) Loans (repayable in rupees or dollars)	156.1	74.3
2. U.S. Agency for International Development: Developmental Loans (repayable in dollars)	363.8	173.2
3. U.S. Development Loan Fund credits (repayable in rupees) ..	513.4	244.5
4. **Public Law 480, Title I (grants & loans repayable in rupees)** ..	2,376.6	1,131.7

India and Rumania

INDIA'S policy of casting her net wide in the matter of trade and economic aid has stimulated her contacts with a number of countries, big and small, on a scale and in a brief span which otherwise would not have been deemed feasible. Rumania is one of those countries with which India has developed closer economic ties even while both the countries have recently started on the difficult road to economic progress. India's trade with Rumania on the basis of a bilateral agreement falls into the pattern of her post-independence policy for foreign trade. Apart from this vital development, much interest has been evoked in the economic march of Rumania as a direct result of the agreement of collaboration for the Nunmati Oil Refinery. Rumania's capacity and readiness to extend collaboration to this country by furnishing upto-date refinery equipment is a significant indicator of the manner in which she is diversifying her economy. There is certainly something to be studied with profit in the recent growth of Rumania's economy.

Among the natural resources with which she is endowed, Rumania can easily give the pride of place to **oil.** Both in respect of output and export of oil she stands second in the whole of Europe. Natural gas and coal stand out as among her rich natural resources and then there is a considerable potential of hydro-power. Altogether, Rumania's power potential is plentiful and this is one of the basic factors which has facilitated her rapid industrial development.

India and Rumania follow different patterns of industrialisation based on their patterns of economy—India's mixed economy and Rumania's state-owned economy. This explains the lack of any profound similarity between the lines on which the industries in the two countries are being developed. The distinctive feature of Rumania's industrialisation is no doubt her emphasis on heavy industry and in this basic sector top priority has been assigned to machine-building industries. This accent on machine-building is important

As in industry, so in agriculture, is to be found the conventional Communist pattern of economic planning. Rumania's first emphasis on agriculture was to take away the land from the minority of landlords for distribution among the landless peasants, but this was only an interim phase. The socialist transformation which was started in agriculture early in 1949 (and has now been completed) was based on the principle of collectivisation or state-ownership of farms. The underlying object was to raise the productivity of agriculture by mechanization. It is one of the important achievements in Rumania's agricultural development that tractors and other types of machinery are introduced on a country-wide scale. In parenthesis it may be added that tractor manufacture in Rumania has proceeded rapidly enough to enable her to undertake an expanding programme of exports of tractors. India however, can go in the direction of mechanized large-scale farming only to a very limited extent.

State monopoly of foreign trade has enabled Rumania to change its structure rapidly, particularly in respect of its composition. With the progress of industrialisation, there is now a transformation of the foreign trade with an emphasis on the exports of semi-processed or manufactured products, engineering goods, refined oil and products, chemicals, pharmaceuticals, etc. This range of exports is rapidly replacing the conventional pattern based on exports of raw materials. It follows as a corollary that in the sphere of imports raw materials and semi-manufactured goods should find an increasing place, and today their share in Rumania's total imports ranges between 50 per cent and 66 per cent.

Indo-Rumanian economic relations first found a fruitful channel in trade. During the decade ended 1961, the volume of trade between the two countries has gone on expanding, India's exports to Rumania last year being of the order of Rs. 1.95 crores and her imports Rs. 4.55 crores. During the decade India had recorded a trade surplus with Rumania in several years. But since 1960 the situation has changed and India's trade deficit with Rumania has gone up to Rs. 2.40 crores and Rs. 2.60 crores. This is explained largely by the scheme of collaboration in which Rumania has undertaken to assist this country to set up the oil refinery at Nunmati. One of the articles in this Blue Supplement explains the broad outline and significance of this project of collaboration. The closer ties of economic relations which India and Rumania are developing and will develop with a greater accent in the future ought to be assessed not so much in terms of value as in terms of the opportunities that will be explored for cooperation between the two developing countries.

The Pattern of Economic Growth

THE impressive strides made by the economy of Rumania in its various sectors are the result of a co-ordinated policy of development carefully chalked out and meticulously executed. That Rumania's economy ranks among the dynamic economies of Europe is a conclusion endorsed by the United Nations too. The comparisons of the levels of growth achieved in agriculture and industry as well as in workers' wages are usually given, in the official statistics, in terms of percentages. In some cases the base of comparison is a pre-war year, 1938, which is far from being representative in view of the backward and stagnating condition of the economy at that time. But even where the base year is a post-war year, under the impetus to economic growth given by the Communist regime, a full assessment of the advances made and their international comparison is not readily practicable. With this reservation, the fact stands out that since Rumania launched her Six-Year Plans in 1948, the rate of economic growth has been fast enough. The current Six-Year Plan started in the year 1960 and it is placing a pronounced emphasis on the further execution of the growth of machine-building industry in the first instance, and heavy industry in general.

Consistently with the co-ordinated pattern of growth, agriculture came in for early attention under the Communist regime. The traditional distribution of ownership of cultivable land, with concentration in the hands of a small number of landlords (in most cases absentee landlords), existed in Rumania also. In 1945, 0.8 per cent of the total number of land owners had 32.2 per cent of the cultivable land, while 12 per cent of the arable land was distributed in ownership over small owners and the size of the holdings was 5 hectares, their total adding up to something like 2.5 million holdings. The uneconomic scale of operation of farming is quite obvious from this pattern of ownership. As many as 700,000 peasants were landless.

Agricultural transformation was spread over two distinct phases. To begin with, a mild form of land reforms was introduced in 1945 in which there was a substantial re-distribution of land which aimed at eliminating the class of landlords as well as that of landless peasants. But the ownership and cultivation of the farm holdings remained in private hands and the State did not come into the picture during this phase. The second phase which was launched in March 1949 was crucial to the revolution in agriculture. It was completed early in 1962, four years ahead of the original schedule. This advance completion gives an idea of the extent to which mechanization was pushed with vigour. The abolition of small holdings and putting agriculture on the basis of collective or State-owned farms facilitated the rapid mechanization in the methods of cultivation. In 1961, there were as many as 52,000 tractors, 48,000 sowing machines and 23,000 grain harvesters which give a clear idea of the extent to which the traditional methods of agriculture were transformed into the most modern. The current Six-Year Plan aims at nearly doubling the number of tractors and trebling the number of the other two categories of machines. Along with improved seeds and irrigation facilities, mechanization has been responsible for a spectacular increase in agricultural output as well as in the productivity of this basic sector.

It was in the Second Six-Year Plan that the Government of the People's Republic of Rumania turned its attention in all earnestness to a radical approach to the exploitation of its mineral wealth. This pre-supposed extensive and careful geological surveys. In the Second Six-Year Plan, 8,000 million Lei were allocated for geological surveys and in the current Six-Year Plan this allocation has been stepped up by 50 per cent to 12,000 million Lei. These surveys have brought significant results, particularly in the realm of the discovery of the rich wealth of non-ferrous ores. Iron ore as the base material for steel, and manganese ore which is indispensable for the manufacture of steel were already known facts, but the surveys under the Six-Year Plan have succeeded in bringing to knowledge greater resources of ferrous ores and manganese ores. It is the extensive discoveries of zinc, bauxite, antimony, etc. that indicate the achievements of the large outlay on geological surveys. There can be no doubt that a new direction will be given to industrial development for the purpose of diversification in the light of these new finds and the discovery of large non-ferrous ores in the recent past. Most of these ores are used for domestic industry and in place of the traditional practice of exporting ores, the accent now is on exporting processed ores or semi-manufactured materials out of this natural wealth.

In the realm of industry one comes across a volume of statistics many of which give an objective idea of industrial expansion in terms of quantity or value. Elsewhere in this Blue Supplement will be found particular attention drawn to the special progress made in specific industries of which the chemical industry is the most representative illustration. The Statistical Section of the Blue Supplement, setting out the exports of Rumania, gives a positive idea of the surplus industrial manufactured goods which Rumania is now producing. This is to be contrasted with the heavy imports of manufactured goods under the old dispensation.

In view of the marked progress achieved in agriculture, it is apparent that the continuous achievements of the higher levels of industrialisation were achieved without neglecting the basic interests of agriculture. Rumania has changed the face of her economy with a sharp accent on industrialization. Industry has now become not only its dominant part but a major component of the national income.

One of the interesting features of the growth of Rumania's economy is the contribution made to it by labour productivity. The tempo of increasing labour productivity, starting with a low base, was naturally high and thus it is that between 1950 and 1961 there was an increase in labour productivity of the order of 133 per cent. But an official assessment brings out the important fact that between 1955 and 1960 labour productivity increased by 48 per cent. This is as it should be in view of the solid base of modernization very largely laid in the years prior to 1955. There is a frank recognition that this impressive increase in labour productivity has been rendered possible by the employment of the most up-to-date and modern machinery and equipment, new techniques of production, facilities for training of workers and a thoroughly planned and minutely executed industrial organisation under a vigilant State management. In fact, labour productivity has been one of the important levers in raising the industrial output in Rumania.

Rumanian Agriculture

ALTHOUGH crop production in Rumania during the past two years has not shown much improvement over the level reached in 1959, this sector of Rumania's agrarian economy has traversed a long way since 1949. The total crop output in Rumania today is also substantially higher than the immediate pre-World War II average. Gross livestock output, however, has been showing a near-persistent upward trend since the end of the World War II. Rumania's gross agricultural output index (base 1938 = 100) which stood at 71 in 1950, went up to 119 in 1955, 123 in 1959, 125 in 1960 and 131 in 1961. Crop production index went up from 64 in 1950 to 119 in 1955, 121 in 1959, slipped back to 119 in 1960 and forged ahead again to 123 in 1961. The livestock output index showed a steady increase from 88 in 1950 to 150 in 1961.

Part of the increase in the total crop output may have come about as a result of some increase in the total area under cultivation, but most of it has resulted from increase in unit-area yields. The acreage under foodgrains (wheat, rye, maize, barley, rice and oats) has, in fact, gone down by nearly 1.1 million hectares from an average of 8.19 million hectares in 1934-38. But despite this, Rumania today produces nearly 9.8 million tons of foodgrains, as against 8.02 million tons (average) in 1934-38. Unit-area yields of the principal crops in Rumania have gone up as follows: wheat from 10.3 quintals per hectare in 1934-38 to 12.8 quintals per hectare in 1959-60; rye from 9.2 to 10.65; barley from 7.2 to 15.35; maize from 10.4 to 15.75.

The Rumanian Government gives credit for this fairly rapid development of Rumanian agriculture to the system of collectivisation (after the Soviet Union pattern) practised in this country during the last twelve years or so. Today the socialist sector of agriculture in Rumania covers nearly 96 per cent of the arable land and 93.4 per cent of the country's total agricultural area. But collectivation or co-operative farming has only made possible reorganisation of the Rumanian agriculture on more modern lines through making the holdings abundantly larger. The credit for this socialist pattern has to end there. The real reasons for the increase in the unit-area yields of various crops have to be found in the utilisation of the modern methods of agriculture, including mechanisation which has been fostered at a strident pace through massive investments diverted by the State to this sector. Since 1949, the Rumanian Government is stated to have earmarked as many as 23,000 million lei (Rs. 1,828.3 crores) for agricultural development. Today the Rumanian agriculturists have at their disposal as many as 54,000 tractors, 50,000 mechanical seeders, and 25,000 cereal combines and other agricultural machines. Consumption of fertilisers too has been stepped up though not at a very attractive rate. Another important aid to agricultural production that has been made use of is the use of improved seeds, especially hybrid maize. But far more crucial role appears to have been played in the development of Rumanian agriculture, as in the case of the U.S.S.R. agriculture, by the institutional changes brought about in this sector after 1953. Under these, compulsory delivery quota system for co-operative and collective farms was modified with a view to giving incentive to the farmers to put in their best.

Along with fostering the development of crop farming in Rumania, energetic steps have been taken by the Government to encourage animal husbandry and vegetables, vine and fruit growing. This has resulted in the total livestock output index (base 1938 = 100) going up to 158 in 1960; that of milk to 149; of wool to 145 and of eggs to 166. Total vineyard area in Rumania today has been raised to 306,000 hectares from 206,000 hectares (average) in 1934-38 and 220,000 hectares (average) in 1951-55. (Total grapes output today is over a million tons). Fruits production went up from 590,000 tons in 1951-55 (average) to 1,170,100 tons in 1959. It, however, slipped back to 829,300 tons in 1960.

Ambitious targets for the agricultural sector of the Rumanian economy have been fixed under the current Six-Year Plan. Foodgrains output, for instance, is to be raised to 14—16 million tons by 1965, that of meat (live-weight) to 1.70-1.80 million tons, of milk to 5 billion litres and of wool (greasy) to 37,000 tons. Unit-area yields under normal weather conditions are envisaged to be stepped up to 18 quintals in the case of wheat, 25-28 quintals in the case of maize, 250 quintals in the case of sugar-beet, 15 quintals in the case of sunflower seeds and 150 quintals in the case of potatoes. On some collective and State farms, these wheat and maize yield targets are stated to have already been achieved. But how far will the overall output targets be accomplished by the end of the current Plan period depends on the benign smiles of nature which being not plentiful in the last two years have retarded the pace of development.

Rumania's Petroleum Industry's Progress

THE use of Rumanian-made 5D and 4LD drilling rigs in Cambay, Jwalamukhi and Hoshiarpur and the commissioning of the Nunmati Refinery, constructed from the equipment supplied by that country, have not only added a new dimension to the Indian oil industry in that it has helped in building up quite an impressive edifice of the public sector in this vital industry in this country, but has also created an image in the Indian public's mind of the progress that Rumania has made in the oil field. From the primitive refinery set up in 1857 by Theodor Mehedinteanu near Ploiesti — this marked the beginning of the modern oil industry in the world, although Americans claim this development to have taken place in 1859 — the oil processing industry of Rumania has travelled over a hard and long road. But the major developments in this field have come about only since 1948 when the Rumanian oil industry stepped into a new phase; although a certain number of refineries had been put up in Rumania after the turn of the present century, for decades on end their progress was extremely slow and most of it was nullified by the havoc played by the two world wars, particularly the World War II. During the last thirteen years, Rumania has been able to build up a huge oil processing complex by reconstructing and modernising the old units as also by setting up new modern plants. This has been made possible by the powerful oil equipment manufacturing industry that has been established here during this period. This industry, while fully caters to the domestic requirements, has as well built up a lucrative export trade.

Today the whole of the crude oil extracted in Rumania is processed by her own refineries. The phenomenal progress achieved by Rumania in oil processing since 1948 is vividly reflected from the table on the next page.

In Rumania, increasing accent is now placed on improved crude processing through setting up not only installations for primary, atmospheric and vacuum distillation, but also plants for thermal and catalytic cracking, installations for absorption and fractioning of gas, retarded coking, etc. The modern plants that have or are coming up in Rumania use such new technological methods as catalytic flavouring, hydro-cracking and hydro-refining. A typical example of this is provided

by the Brazi complex of catalytic flavouring of crude. This plant is provided with two technological lines, one for turning out gasoline with high octane number and the other for manufacturing aromatic hydrocarbons which would yield such useful materials as benzenem (used in the manufacture of synthetic fibres and yarns and also for producing synthetic rubber), toluene (a solvant used in oil and chemical industries), zyleno (a material used in the synthetic materials industry), gas for petro-chemical industry and high quality fuel for diesel engines. Some of the new crude processing installations that are being put up in Rumania include a unit for electric dieselinization of crude oils, a coke calcination plant, a unit for refining crude oil by adding to it sulphur dioxide, a plant for deparaffination of gas oils, an installation for acid refining of oils, a unit for manufacturing depressing substances to be added to oil in order to lower its congealing ploint, an installation for manufacturing paragel and a petro-chemical complex for the pyrolisis of refinery gases to yield polythelene, ethylene, amyloglycols, plastics, methyl-ethyl-ketone, acetone and other valuable chemical products. India can obviously draw upon the experience of Rumania in these matters for building up her public sector oil complex.

The current Six-Year Plan of Rumania envisages allotment of increasing funds by the State for the progress of the country's oil processing industry with a view to obtaining more and more petroleum products from a ton of crude. Although Rumania's crude oil production by 1965 is expected to go up by only 7 per cent over the 1959 level, the gross output of the industry is envisaged to increase by 40 per cent. The value of the products obtained from one ton of crude oil will increase by 40 per cent, the turning to account of gas by 17 per cent, gasoline output by 44 per cent and the total value of oil products by 50 per cent.

Topical Notes

Rates of Economic Growth

THE main aim of economic development programmes is to transform the national economy, which has been characterised by low levels of productivity, capital formation and technology, into a self-generating and self-sustaining economy in the shortest possible time. Like every developing nation, India and Rumania are currently engaged in maximising their economic growths, leading to further improvements in the standard of living. An attempt is made here to compare the rates of growth of the two economies since 1950.

Of all the indicators, national income has generally been accepted as the best index to measure the economic progress and prosperity of a nation. The concepts and methods used by the "Centrally Planned Economies" in the computation of national income are quite different from the "definitions" adopted by the non-Communist countries. Hence an exact comparison is extremely difficult. Still it is quite interesting to study the rates of growth in the two countries having entirely different political and economic systems.

During the period 1950-60, the national income of Rumania advanced at a spectacular rate of 16.8 per cent per annum (simple). The high rate of increase of output in all branches of industry — which accounts for a little over 44 per cent of the total income — speaks for the substantial rise in national income. The income per head too shows a remarkable growth, increasing at the rate of 13.8 per cent per annum—nearly seven and a half times the rate of growth of per capita income in India.

GROWTH OF NATIONAL INCOME AND PER CAPITA INCOME

(At constant prices)

(Base: 1950 = 100)

	India			Rumania		
Period	National Income	Population	Per Capita Income	National Income	Population	Per Capita Income
1950	100	100	100	100	100	100
1955	118	109	108	183	107	181
1959	134	119	113	242	112	217
1960	143	121	118	268	113	238

During the past decade, the rise in the case of the Indian Union was of the order 43.4 per cent in national income and 18.2 per cent in per capita income. The rather slow and hesitant growth in agriculture—which accounts for nearly half of the national income—46 per cent in recent years to be exact—, is keeping the overall rate of rise in national income at a very low figure. The organised industry, on the other hand, has advanced in the past decade at the average rate of over 10 per cent per annum, which compares favourably with the rate of growth of industry in the highly industrially advanced countries of the world.

Then again, the moderate rise in national income does not fully reflect the "growth potential" which has been created in the Indian economy during the Second Plan period. The impact of the sizable investments made in the Second Plan, on production is likely to be felt during the Third Plan period and the national income is anticipated to advance at a faster rate of over 6 per cent per annum during the next five years.

The importance of industry—heavy industry in particular—can hardly be overemphasised in the process of economic growth. It is significant to note in this connection that the contribution of the Rumanian industry to the national income in 1961 is tantamount to the whole national income of the year 1938. The emphasis of the new Six-Year Rumanian Plan is again on industry can be clearly seen from the allocation assigned for each sector of the economy. Of the total allocations to industry, nearly 90 per cent of the investments will be spent on producer goods like machine-building industries, engineering, chemicals, and metallurgy.

It is increasingly being emphasized in India that the Industry holds the key to economic prosperity and hence particular emphasis has been placed in the Third Plan on the development of basic industries like, steel, coal, oil, electric power, machine-building and chemicals.

Progress of Plan

RUMANIA'S Six-Year Plan — 1960-65 — is already in its third year. During the first two years completed, the achievements are quite significant. It is to be recognised that the socialist economies lay great emphasis on the proper achievement of their year to year targets. It is not without reason, therefore, that their progress is recorded mostly in terms of percentages than in physical terms — not that actual output figures are not available.

In the field of industry, the average annual rate of increase of overall output during 1960 and 1961 was over 16 per cent which was considered quite on the higher side of the envisaged 13 per cent during the six years of the plan. Evidently the year shows an overfulfilment of targets in the case of most of the industries. Steel output during 1961 was 18 per cent more than 1960, raw coal about 7 per cent, crude oil 10 per cent; electric power 13 per cent, tractors 17 per cent and caustic soda 73 per cent.

The official sources reveal that successes scored in 1961 were essentially the outcome of improvements in the technological level of equipment. This is quite true because under a socialistic economy the introduction and extension of modern technical methods and the continued modernisation and automation of production processes is comparatively easier. In general the problem of costings is not so acute and any degree of replacement at all levels in an accepted norm. During the year a number of new industrial projects too were commissioned which included a 700 cubic meter blast furnace at the Resita Metal Works, an additional open hearth furnace with an annual capacity of 270,000 tons of steel at Hunedoara Iron and Steel Combines, a formaldehyde factory at Victoria Chemical Combines and timber processing combines at Blaj and Gherla, apart from several others.

In the field of agriculture, total cereal output was nearly 10.6 million tons in 1961 which was about 750,000 tons more than in 1960. As far as individual agricultural items were concerned, compared with 1960, increases during 1961 were: wheat 13 per cent, maize 10 per cent, vegetables 21 per cent, milk 25 per cent and wool 15 per cent. In 1961 their agricultural sector received 12,000 tractors, 14,000 tractor ploughs, 15,000 mechanical seeders and various other types of farm equipment. It is revealed that towards the end of 1961 the Rumanian agriculture had at its disposal 52,000 tractors, 48,000 mechanical seeders, 23,000 cereal harvesting combines. This shows that the pattern of their agriculture is essentially socialistic where major part of the output is from collective farms.

In the field of transport too the plan was a success. The total capacity of the railways grew by the expansion of the rolling stock, as well as its utilisation. The plan for motor transport also was implemented to the extent that freight carried increased considerably and increases in the passengers carried were to the extent of 20 per cent.

The achievement in physical terms as recorded above justified an investment of 28,000 million lei during 1961. This investment was nearly 5,000 million lei more than in 1960. This is not supposed to include the investment made by the collective farms. The investment made during the first two years of the plan comes to nearly 51,000 million lei which is 55 per cent more than the previous two years.

Trade

TRADE at present between India and Rumania is being carried on in keeping with the 1959 trade agreement and the arrangements signed in New Delhi in 1960. All payments between the Rumanian People's Republic and Republic of India are effected in non-convertible Indian rupees. Merchandise ships of both countries while entering, staying in or leaving the ports of either country enjoy the most-favoured facilities granted by their respective laws, rules and regulations to ships under the third country's flags.

Trade, as a result of this bilateral agreement has continued to expand. While exports from India were of the value of Rs. 2 lakhs in 1952, they were of the value of Rs. 195 lakhs in 1961. Imports on the other hand from Rumania in 1954 were of the value of Rs. 20 lakhs and in 1961 of Rs. 455 lakhs. While there was a favourable balance of trade in the year 1958 and 1959, the adverse balance of trade came in 1960 and 1961. In 1961 the adverse balance of trade was to the tune of 260 lakhs of rupees. This adverse balance of trade came in mostly because of India's imports of equipment meant for the Nunmati Refinery and drilling equipment for other areas. The table overleaf is self-explanatory.

The major items of export from India were coffee, tea, cocoa and spices, metalliferous, ores and metal scrap, hides and skins, fur skins, vegetable oils, fats, greeses and derivatives, textiles, yarn fabrics, made up articles and related products. The chief items of import were machinery (other than electric), base metals, chemical elements, and compounds, electric machinery, apparatus and appliances. The rupee balances of Rumania are likely to be used, after meeting embassy and other minor expenses in India, for further purchases of Indian goods as it is not in the interest of Rumania to allow the balance to mount. So the exports of Indian goods to that country are likely to increase, but they will be paid for in rupees.

INDO-RUMANIAN TRADE

(Rs. lakhs)

	Imports	Exports	Balance of Trade
1952 ..		2	+ 2
1953 ..		2	+ 2
1954	20	3	—17
1955	35	2	—33
1956	23	7	—16
1957	52	52	Nil
1958	40	52	+12
1959	1,51	2,01	+50
1960	3,82	1,42	—2,40
1961	4,55	1,95	—2,60

It will be interesting to note that Rumania supplied the drilling rigs at Jwalamukhi and Cambay. This steadily expanded and there are at present 7 rigs. Under the 1958 Indo-Rumanian Agreement, Rumania undertook to supply India with an oil refinery of 7,50,000 tons annual capacity to be erected and commissioned at Nunmati with the assistance of Rumanian experts. The refinery was inaugurated in January 1962 before the date laid down in the agreement. Talks are now in a fairly advanced stage for setting up some power plant in the coalfields in U.P. and Kashmir and this collaboration is expected to increase as the years go by.

Chemical Industry

THE chemical industry in Rumania plays a significant role in its economy. It forms an essential element in metallurgical and engineering industries, the oil industry, the building material industry, textile, rubber processing pharmaceutical and footwear industries. It plays an important role in its agriculture by providing fertilizers. Apart from the domestic consumption, chemicals are exported from Rumania to several countries which include Albania, Argentina, Austria, Bulgaria, Czechoslovakia, France, Germany, Britain and many more countries. The Rumanian chemical industry produces nearly all possible items but petro-chemicals, fertilizers and pharmaceuticals do dominate this scene.

The mineral fertilizer industry is one of the most important branches in the chemical sector. Nitrogen fertilizers like ammonium nitrate and other fertilizers like super-phosphates, are among the more important ones in use. During the recent few years more attention has been paid to this branch and by 1965 the output of nitrogenous and phosphatic fertilizers will be to the extent of two million tons.

Rumania is known for its oil resources and as a natural consequence, petro-chemistry is advancing in the country quite rapidly. This section of chemical industry has great potentialities because it leads to the production of synthetic rubber, plastics, synthetic fibre, detergents, solvents, carbon black, pest killers and nitrogen fertilizers. Considerable amount of research has been conducted in this field of industry with the result that by 1965 petro-chemicals production capacity expressed in terms of carbon content will be about 880,000 tons. This will lead to a fuller utilisation of crude oil and natural gasses. For instance in 1965, the output of plastics may be around 95,000 tons. Then chemical fibres may be produced to the extent of 47,000 tons. It may be interesting to add that one thousand tons of synthetic fibre yields some 35 million sq. meters of thin fabrics or 4.6 million meters of suiting. Petro-chemicals raw materials will also be used for the 50,000 tons synthetic rubber plant at Borzesti. Another large capacity unit will be built to produce a new type of synthetic rubber. This in a way will eliminate the need of natural rubber in the country.

Output of other chemicals like soda ash and caustic soda is also increasing rapidly. In physical terms, against an output of 171,000 tons of soda ash and caustic soda in 1959 the output in 1965 will be 500,000 tons. Dye-stuffs and medical drugs are also receiving sufficient attention. All in all the picture that emerges in respect of chemicals industry in Rumania is fairly bright.

COMPOSITION OF INDIA'S TRADE WITH RUMANIA

(Rs. lakhs)

	1957	1958	1959	1960-61
(Exports)				
Coffee, tea, cocoa, spices and manufactures thereof	8,72	5,31	20,89	45,53

Tea: The Current Challenge

THE problems of the Indian tea industry over the last decade have been problems of both surplus and abundance. The crisis of 1952 is still a bitter memory, even though today, with costs rising as much by public pressure as by Trade Union agitation, the problems of 1952 look as though they have been forgotten. The essence of the problem of 1952, although it proved in the event happily transient, was that the tea industry is exposed by its predominantly international character to dangerous surprises in terms of fluctuating prices that prevail abroad from time to time. The fluctuations of the price of tea are almost as notorious as those of rubber and tin. The essential basis of stability is, therefore, lacking in the foreign market and, by consequence on the whole pattern of finance inside the industry. Almost all attempts to introduce stability in wages thereby only result in introducing a rigidity in costs making the industry less capable of adjusting itself to adverse events abroad.

This particular theme, namely, that the Indian tea industry, now one of India's greatest export industries, is not free to prescribe its own rate of costs to the world needs to be reiterated hundred times not merely to the Indian general public, but even more often to the Ministry of Labour and to the Planning Commission. Undoubtedly, there have been cases of exploitation in tea plantations in the past; undoubtedly, a social conscience then needed to be aroused in the public, no less than in the plantations, against this exploitation by the prescription of wages which had no relation to a proper level of subsistance. On the other hand, at a time when the earning of foreign exchange is the dominant note in the economy, what might be described as humanitarian or even welfare aspects of industry must give place to a somewhat hard and cold appreciation of their actual competitive handicaps. Much of this Blue Supplement is addressed to this particular theme. It is believed that for an international industry with the targets of foreign exchange earning set before us at the present time the costs of the Indian tea industry are, by and large, excessive. The costs are not only labour costs; they have been affected by local taxation, sales tax, unwarranted transport costs and so on providing a motley series of unreasonable burdens on an industry which is not equipped in many cases to bear these burdens. The small gardens, the under-financed gardens and ineffective management are again sources of weakness in terms of the broad objective of exports which the country should have primarily in mind.

If this Blue Supplement had appeared when it was originally intended in May, there would have been one additional cause for uncertainty. This would have been the attitude of the [illegible] in respect of tea imports into the United Kingdom if Britain entered the European Common Market. For a long time it was believed that Indian tea exports would be the first calamity if Britain's entry was decided upon. Happily in the month of August the decision was reached that there would be no external tariff on tea and thus, so far as this particular element is concerned, a major fear has been removed. This does not, of course, imply that there will be no fiscal duties, so far as the other countries are concerned, particularly Germany, where fiscal duties have been worked much to excess in respect of both coffee and tea. But fiscal duties are unlikely to be imposed in the British market and, therefore, so far as the major market for Indian tea is concerned, the country can reasonably say that it is not being inflated by the Treaty of Rome.

The problems of Indian exports are not, however, only problems of tariffs. They are largely problems of promotion and selling in areas where, notwithstanding the long history of the Tea Board, only moderate success has been recorded. Obviously, a much greater effort is required if this industry is to do in the next 20 or 25 years all that is expected of it. Here there is much room for marketing research and more than marketing research of motivation studies particularly in most of the countries in the European Continent and in the United States where coffee dominates the beverage scene.

It is hoped that by this Blue Supplement, presenting in what might be called the current context, problems of cost of this industry and its export challenge, some additional interest in its problems will be created amongst the public at large who are too often convinced that the profits in this industry are easy and its course is smooth. This is the opposite of the truth; while the industry has had good years, there is no indication that the future is likely to be anything as happy as its recent past.

Trends of Tea Production Costs

THE cost of production has been going up steadily in almost all industries for the past several years and the tea industry is no exception. Where the tea industry does provide an exception, however, is in the peculiar phenomenon that with rising costs, the sale prices have not been keeping pace and for some types have actually receded. Perhaps no other industry in the country suffers so acutely from this double-edged attack.

The Indian tea industry, more than ever, is in direct competition with other tea producing countries of the world. Production everywhere has been rising steadily while consumption shows little change. In this situation prices of Indian tea should be competitive, and if possible, quality for quality, lower than other producing countries.

The ability to compete on this basis depends on production costs in the tea industry. If the industry is to prosper and retain its position in the world markets, prices must remain competitive. In the tea industry, unlike in other manufacturing ventures, the main cost is wages and amenities to labour. This one item makes up such a large proportion of the total cost of production, that even small increase in the daily wage or other perquisites adds very considerably to the unit cost.

According to the report of the Plantation Inquiry Commission, submitted in 1956, the average cost of production for 100 lbs. of tea in 1950 was Rs. 118.15. By 1953, it had risen to Rs. 131, registering a rise of 11 per cent in four years; and by 1960 it was as high as Rs. 215.81, which represents an increase of 82.66 per cent over 1950.

The largest single item of cost in the production of tea, as already stated, is the cost of labour. Thus, over the years, wages have form[illegible] upwards of 32.5 per cent of the production costs in North India while in the South the proportion has been as high as 35 per cent. These are merely wages. Benefits, of which the tea industry has to provide numerous, are extra. A conservative estimate of these places them at upwards of 5.5 per cent in the north and 10 per cent in the south. Total wages, it would thus be seen, form 38 per cent of the cost in North India and as high as 45 per cent in the South.

Matters hardly rest here, however, because neither labour nor its accredited spokesmen, are happy with the present wages structure. A Wage Board for the industry has been constituted. Its report is expected soon; in the interim it has already recommended a 5 to 7 per cent wage boost. This, by way of being an aperitif, with more substantial fare to follow.

How then, the question arises, will the tea industry bear this addition to its cost of production? Specially when the industry has to contend with numerous burdens already. Taxation in the industry has reached a dangerous level. There are Central levies such as the income-tax, excise duty, export duty and cess (lately reduced somewhat by an export oriented administration) and licence fees.

State Governments take their slice by way of agricultural income-tax, sales tax, West Bengal entry tax and the Assam road and waterways tax. The incidence of taxation on an average over the years 1950-53 was of the order of 21 per cent. Of course it was less in 1962 when certain remissions were granted to the industry and far higher in 1954 when an effort was made to catch the industry in a year of prosperity.

Besides these major taxes, State Governments and local bodies have a happy source of revenue in the industry as and when their fancy dictates. There is the land tax; licence fees on factories, vehicles and many other things; land cess; education cess; health cess; vehicle tax; profession tax; panchayat tax; district board tax; road cess; conservancy rates; water and lighting rates; octroi; house and building tax and a chawkidar tax.

For an industry which exports over 500 million lbs. of tea every year, earns some 140 crores of rupees in foreign exchange, contributes vast sums to the national, state and district exchequers, supports a number of subsidiary industries like plywood and transport and employs almost a million agricultural labourers, tea is certainly not receiving the care and attention it deserves.

Lately there has been evidence of the realisation in Government circles that properly nurtured and adequately encouraged, tea can perhaps play a far greater role in meeting the nation's requirements of foreign exchange. At the first meeting of the newly constituted Board of Trade in New Delhi, the Minister of International Trade hinted at this and included the tea industry among those which will receive special attention as being capable of earning more foreign exchange.

The future of the industry, however, is closely linked with its cost of production. India must produce good quality tea at reasonable cost in order to face successfully the growing competition in international markets and to develop as quickly as possible a much larger internal market. Naturally, the question of reduction of wages does not arise — but freezing them at the present levels till such time as the health of the industry permits of further increases, seems to be a necessary step. Reduction in the incidence of taxation, however, should be immediately and speedily possible. Since there is so much talk of export incentives around, perhaps the tea industry too could qualify for some.

Any further rise in the cost of production can be checked and some marginal reduction made possible by increased productivity. This, however, involves the whole-hearted co-operation of labour. When government, industry and other sectors of national life are seized of the necessity to increase productivity all-round, it should be possible to enthuse workers on tea plantations also to do their bit in meeting a national emergency. Labour should, of course, be entitled to a fair share of increased profits as a result of such concerted action.

A study of the most economical size for a tea plantation and labour force to go therewith from the point of view of minimum cost and maximum productivity, should be made immediately under joint industry-government sponsorship. For a long time, it was thought that the bigger the estate, the smaller should be the cost of production. But most of the operations relating to the cultivation and gathering of the tea crop being performed by hand, the possibilities of any significant reduction in cost by increasing the size of the estates and, perforce the number of labourers, are limited.

Rising costs in the tea industry are, in a certain measure, also due to increased selling expenses, higher manufacturing costs and the higher prices of fertilisers, insecticides, machinery spares, transport and all the myriad things that contribute to the efficient working of a tea estate. In order to offset the effects of these all-round price rises, it is essential to attack this problem on many fronts.

Increased productivity, decreased taxation and a more intense nurturing of the markets, both foreign and domestic, are the urgent and immediate needs of the Indian tea industry, if it is to compete with other producing countries in the markets of the world and retain its pre-eminent position as the major tea supplier to the world.

A Fair Wage in the Tea Industry

SINCE the Committee on Fair Wages submitted its report in June, 1949, the country's Industrial Courts, Tribunals and even the Supreme, Court have treated this as the sheet anchor of wage policy. The Indian Labour Conference and the Union Ministry of Labour have placed full faith in the recommendations of this Committee. Although two members of the Committee submitted notes of dissent, for all practical purposes, its report is regarded as the final word on wage policy.

It would, therefore, be in the fitness of things to keep the important recommendations of this Committee in view for an examination of the question of a fair wage in the Tea Industry. These recommendations were taken up by the 15th session of the Indian Labour Conference in 1957 and certain norms were laid down for the guidance of wage boards and other wage fixing authorities. These, form the guiding principles of wage fixation in the country today, though they have yet to be established in respect of Tea.

One of the most important and sweeping recommendations of the Fair Wages Committee lays down that "the standard family should be taken as one requiring three consumption units and providing one wage-earner". We shall examine the implications of this recommendation in its application to the Tea Industry.

The Committee itself has reported that "while there is complete agreement that the fair wage of a worker should be such as to enable him to maintain a standard family, there is not the same measure of unanimity of opinion as regards the size of the standard family". The report goes on to say: "The Committee examined the figures given, which were collected in the course of certain family budget inquiries made in the past. The figures showed that though the number of persons per family frequently exceeded the figures warranted by three consumption units, the total number of earners in the family was well above one."

The figures to which the Committee refers are taken from the Family Budget Inquiries conducted during 1943 — 46 by the Government of India. Following are the figures relevant to Tea plantations:

Area	Number of persons per family	Total number of earners	Average equivalent adult consumption units per family
Surma Valley	4.57	2.29	3.59
Assam Valley	4.15	2.44	3.28
Bengal	4.16	2.52	3.34
Madras	3.80	2.41	2.99

The pattern shown to have existed on Tea plantations in the middle forties by these figures, still persists. If anything, with the coming up of various other industries and projects in tea plantation areas and the permanent settlement of workers, particularly in the Assam Valley, the number of wage earners has risen. It is therefore patently absurd that fair wages in the Tea Industry should be determined on the basis of each adult male worker being responsible for the satisfaction of the needs of three consumption units.

There can be no objection to the average family being treated as one of three consumption units, but it is to be remembered that in the Tea Industry, both the man and the woman are earners. The industry is already on the way to taking steps to equalise women's wages with those of men wherever they are performing the same tasks.

To give the adult male worker a wage sufficient to satisfy the needs of three consumption units and at the same time to give his wife and children a similar wage would be to treat not only the wife and children as dependents of the husband but the husband also as a dependent of the wife—clearly a case of providing at least two wages where only one is justified.

According to the figures quoted above, the average number of consumption units per wage earner works out to 1.5, 1.3, 1.3, and 1.2 in the four areas. The Government itself has issued figures which take the highest of these, 1.5. There is therefore no reason why the standard fair wage should be based on three consumption units. In fact adolescents, who may be presumed to have no dependents, should be given a wage sufficient just for their own needs and working children under the age of 15, half the adult wage. In the Tea Industry manifestly there are only half as many consumption units per wage earner. This family basis of employment in this industry should be ample justification for departing from the so-called 'norms'. Taking the actual fact in the Tea Industry of there being 1.5 consumption units per adult wage earner, it would be possible to calculate a fair wage according to the principles laid down by the Fifteenth session of the Indian Labour Conference.

Since consumption units are the basis of ascertaining the fair wage, it would be fruitful to study the various items that form the pattern of consumption of the working family in the Tea Industry. The Indian Tea Association has calculated that a family of three consumption units will spend Rs. 15.08 per week on food. This includes cereals, pulses, vegetables, milk, sugar, oil, fish and meat and fruits. The cost of clothing, based on the resolution of the 15th session of the Indian Labour Conference, at the rate of 72 yards per family per year works out to Rs. 1.38 per week. Expenditure on 'other items' has been calculated at Rs. 1.86 per week. The Tea Industry provides free educational and medical facilities as well as agricultural land and firewood.

The total weekly expense for a family of three consumption units, thus, comes to Rs. 18.32 or a daily expense of Rs. 3.05. Since the worker in the industry has to maintain only 1.5 consumption units, the daily fair wage should be Rs. 1.53. In districts where cereals are supplied at concessional prices much below market rates, the wage would come down still further. Thus in parts of Assam and Darjeeling, it would be Rs. 1.46 per day while in Dooars and Terai, where the concession price of cereals is Rs. 15 per maund as against Rs. 20 or more in the market, it would be Rs. 1.41 per day.

The following comparison of the fair wage against the current wage establishes the fact that current wages are fair wages or somewhat higher:

	Fair Wage	Current Wage
Assam Zone A	1.53	1.89
„ Zone B	1.46	1.82
„ Zone C	1.46	1.76
Cachar	1.53	1.53
Dooars	1.41	1.84
Terai	1.41	1.81
Darjeeling	1.46	1.45

It would be of interest to note that in the Assam Valley there were 37,400 individual workers as against 121,747 families employed in tea gardens during 1960. If the average number of workers per family is about three, then it would be seen that 90 per cent of the workers are employed in families of more than one earning member.

These wages relate to workers employed on time-rates. The vast majority of tea plantation workers are switched to piece-rate system during the plucking season, giving them an opportunity to enhance their wages by

diligent work in the same hours that they are used to keeping.

The Indian National Plantation Workers Federation has said in its reply to a questionnaire issued by the Wage Board: "The cost of producing tea varies considerably as between different tea producing regions in India. The costs are generally higher in the North than in the South. Darjeeling is the highest cost region for tea production in India,"

The question of higher wages ultimately is tied up with the question of higher productivity of labour. The Tea companies have taken a number of steps to improve productivity, such as the steadily increasing use of fertilisers, improved selection of seed and clonal material, replanting of bushes and and improved methods of planting, improved machinery and improved factory design, improved tools for cultivation work, scientific methods of protecting bushes against pests and blights, improved measures for workers' health and housing and institution of the incentive of a profit bonus. The workers on the other hand have shown no interest in increasing productivity nor have the unions given any assistance in this respect.

The number of workers per acre of planted tea has remained steady since 1950, with wages having more than doubled during the same period. But for the measures taken by the plantations, productivity would have lagged far behind costs and tea growing would have become a losing proposition.

The Tea Industry is now the most important export industry in India from the point of view of earning foreign exchange. In 1959-60 it earned foreign exchange worth Rs. 129.50 crores. If the industry is to expand and to increase its exports from 500 to 600 million pounds a year, it is essential that its costs should not be raised by an increase in wages at the present juncture.

Nevertheless if the industry's viewpoint is accepted that the actual practice and circumstances of the industry are such that each adult worker has only to satisfy the needs of 1.5 consumption units, in the greater part of North-East India the present level of wages fully satisfies the just criteria for a fair wage. Moreover, it is not a question of exports only that has to be considered when judging the effect on the national economy. Any increase in wages leading to additional unemployment in marginal areas will undoubtedly have an adverse effect on the economy as a whole.

As the country's largest foreign exchange earner and as an industry that is subject to economic pressures from far off parts of the world, the Tea Industry today needs careful nurturing. If the cost structure, which is mainly the wage structure, is made so rigid as to make the industry vulnerable to the slightest fall in overseas demand, then it will become nervy and unsure of its future. This nervousness is bound to bring harm to the very wage earners in whose behalf these efforts to boost wages are directed. If, however, the industry is allowed to function on such a cost structure as would allow it to develop shock absorbing qualities, then there would be greater security and almost permanency of employment and earning for the million plus wage earners dependent on Tea.

Labour-Management Relations in the Tea Industry

THE large labour force in the tea industry today is among the most highly organised and vociferous group of workers in the country. This is a development of considerable significance. The original workers who came from the villages of Bihar and Orissa to work in uninhabited and dangerously malarial virgin forests of Assam under conditions primitive, would hardly recognise in today's militant worker a direct descendant. During this century of its existence, the tea industry has grown into a giant of magnificent proportions. Also during this period, the concepts of employer-employee relations throughout the world have undergone a complete metamorphosis. The worker is considered a partner in industry rather than a mere cog in the production machine. In more and more parts of the world, he is being increasingly associated with the functions and responsibilities of a participant in production. In the tea industry too labour participation in management has made a beginning.

When organised production began in this country in the latter half of the last century, more often than not the employers were British. Coupled with the general concept of labour in those days —even in Britain itself — and the overtones of the ruler and the ruled relationship introduced in the situation, some companies were inclined to be indifferent towards their workers. The fact that the first efforts to legislate on behalf of tea labour were made as far back as 1863, however, indicates the awareness on the part of the then Government of this indifference and the need to watch it.

But those were the days of labour shortage. Wages on tea plantations, then as now, were far better than in other agricultural pursuits. Once brought to the plantations, the workers were housed, fed, paid for work and generally taken care of — not always out of humanitarian considerations perhaps, but because by then the plantations would have invested quite a sum on acquiring and transporting them and needed them to perform the various jobs on a plantation.

This system worked well for the first few years of the existence of the plantations. Later, a sudden expansion of the industry created a class of contractors who began to supply labour to the tea gardens which were being established very rapidly. This brought to an end the direct contact between the planter and his workers. He began to rely more and more on the contractor. Competition among contractors led to some shameful disasters over the years and the Government instituted an inquiry in 1861. This in turn led to the passing of the Inland Emigration Act of 1863.

This system of recruitment with slight modifications here and there, persisted up to 1915. It was then represented on behalf of the planters that a better system should be evolved so as to ensure an adequate supply of labour. By the time the planters could take any effective steps in this direction, the Royal Commission of Labour in India was appointed in 1928. As a result of the findings of this Commission, the Tea Districts Emigrant Labour Act was passed in 1932 to regulate the entire emigration of labour to tea plantations.

It is interesting to note that the T.D.L.A. is now being wound up, for it is no longer needed: adequate workmen can now be recruited in the locality. As a result, it was possible for India's representative at the 1961 December meeting of the I.L.O. Committee on Plantations at Geneva to speak of the closing down of recruitment as the word is generally understood, while many other plantation countries were still involved in the arguments and difficulties to which "recruitment" has so often given rise.

A Labour Investigation Committee appointed by the Government of India in 1944, said in its report: "That the planters have done a lot for their labour cannot be denied. The plantation industry has provided employment to lakhs of aboriginal people and has improved their standard of living, even if to a small extent. It must also be admitted that generally labour conditions in Indian-owned estates are worse than in the European-owned".

Such then were the conditions till the advent of independence. The growth of trade unionism and collective bargaining had been very slow. The development of plantations in scattered and isolated places, the poverty and illiteracy of workers, their migratory character and the nature of plantation work were hardly conducive to trade unionism. The fact that the then government did not look too kindly on any trade union activity, added to the weight of other factors.

In the post-independence years, however, trade unions came into being rapidly and began representing the workers somewhat aggressively. Since the employers were already organised in the Indian Tea Association, the United Planters Association of Southern India, the Indian Tea Planters' Association, the Assam Tea Planters' Association and others a new era of collective bargaining began in the tea industry.

There is no denying the fact that the cash wages of workers in the industry then were low. The employers were of the view that the more cash was put into the possession of the workers and more of it would be wasted on liquor, gambling and other similar pursuits. On the other hand the employers provided cheap foodgrains and other necessities of life to the workers in order to keep the level of real wages high. This was particularly true of the war years when prices were soaring all round. Even after the war, in 1951 for instance, the Indian Tea Association spent some seventy lakhs of rupees on airlifting supplies of rice for workers on tea plantations.

However there was a phychological change in the air. With their organisation into trade unions, the workers began to think of higher wages. The post-war period was not a very happy one for the industry. Managements were harried by the absence and accelerated retirement of experienced administrators, rising costs, uncertainty of markets and continuing shortages of necessary materials. Into this medley came the unions with their demands for higher wages, bonus, better housing, more medical facilities and many other amenities.

It was but natural that disputes should ensue. Some managements resented the intrusion of a third party into the affairs of their workers; others were upset by the post-war conditions. In this atmosphere of suspicion, strikes and disputes became the order of the day. Thus in 1949 the industry faced 20 disputes, in 1950 just 10 and thereafter the number rose to 35 and 37. So much so that in 1955, following the recovery of the industry from the slump of the early fifties, the number of disputes arose to 217 involving 94,257 workers and causing a loss of 611,812 man-days.

Although the figures of disputes declined in 1957 to 146 and in 1958 to 99, lightening strikes and disputes on account of bonus — wages having been more or less rigidly fixed by legislation — continued to form the pattern of disturbed labour-management relations in the industry. This, in spite of the fact, that plantations are covered by the definition of the term 'industry' in the Industrial Dispute Act, 1947, which makes provision for the investigation and settlement of industrial disputes through prescribed channels. The Act provides for conciliation machinery and for a three-tier system of original tribunals, namely labour courts, industrial tribunals and national tribunals. The industrial Committee on Plantations is also designed to mitigate by tripartite agreements, the sources of conflict and to initiate labour reforms and legislation by consultation and agreement.

The Industrial Disputes Act, moreover, provides for the constitution of works committees in undertakings employing 100 or more workers. These committees are serving a useful purpose on the estates where they have been established. The Code of Discipline for industry, prepared by the Central Ministry of Labour, was adopted by the plantation industry in 1958. This too has had a beneficial effect on employer-employee relations in the industry.

It is certain that the comprehensive and sometimes irksome labour legislation has played on effective role in protecting the interests of plantation workers though the same cannot be said always of the intrests of employers. The effectiveness of legislation has been to a great extent dependent on the management's understanding of the spirit rather than the letter of the law. It speaks volumes for the liberal views of the management when it is found that generally, the conditions of life and work on tea plantations have improved enormously during recent years. The earlier problems in the field of recruitment are no more and permanent working populations are now living near the estates.

The Chairman of the Indian Tea Association reported last year: "We have continued to give annual employment in our own Association to nearly three-quarters of a million men, women and minors and to house them and their dependents free of cost. We have increased our wages in every area; each worker is now a member of a Provident Fund to which the employer subscribes, and, in Assam alone, there already stands to the credit of the workers the sum of over Rs. 13 crores. We give annual holidays with pay, and, in addition, we pay a daily wage which allows for one paid holiday each week. Our standards of medical attention are such that the death rate on tea estates is as low as that in the United Kingdom, while our live birth rate is exceeded in only one country in the world. Our labour relations are good, and the strike weapon has been used by each of our workers on an average on only one day in every four years: a remarkable average for which resourceful managers, our labour and wise union officials may share the credit."

The most overwhelming fact about the tea industry is that it provides steady employment for a million agricultural workers on a steady basis on remuneration that is adequate and perquisites that are far beyond the reach of other agricultural workers in the country. In the past there might have been unsatisfactory conditions on account of the need to bring in large numbers of workers from far off places; this is no longer so and today the workers are settled, the trade unions are strong and active and the majority of the employers willing to share with the workers the fruits of joint capital-labour enterprise.

It is also true that no group of workmen has such comprehensive and protective legislation to ensure its well-being. The Plantation Labour Act — providing as it does for housing, medical attention, education and a host of other benefits — embodies in the Statute Book all those past practices which were the custom on the better estates, and though it is true that financial and

other considerations have not always enabled all companies to maintain the same level, progress has been steady and impressive.

In 1956 a Bonus Agreement was signed between the employers and the workmen which covered the years from 1953 to 1956, and which, in modified form, was renewed in 1959 and in 1961. As a result of these agreements — probably the biggest voluntary settlements made in the history of Indian Labour relations — over fifteen crores of rupees has already been paid to the workmen in North-East India, while in the South an even earlier agreement guarantees 4 per cent of the year's earnings as an additional bonus payment.

The original drafting of the Plantation Labour Act and the preparation of the Bonus Agreements were the work of tripartite bodies, and reveal the remarkable co-operation which now exists in the Tea Industry between management and labour: an understanding which has found tangible expression not merely in these and other agreements but also in the fact that the number of man-days lost through disputes in Tea is lower than in any other Industry.

Tea Prices

IN the context of India's export trade, tea prices in the foreign market dominate the overall picture of tea more than other aspects like its total output and consumption at home. This is because tea for the Indian economy is a major item that earns foreign exchange. World tea prices have been fluctuating considerably. There has been a substantial increase in the world output of tea which has touched a peak figure of 2,280 million lbs. in 1961 against 2,130 million lbs. a year before. This advance in world output has to be seen in terms of the share of the exporting countries of which India and Ceylon are the leading ones. Between them, India and Ceylon exported nearly 900 million lbs. of tea, against world exports of 1,240 million lbs. Naturally, therefore, in a year when the world output is higher the prices in the foreign market get depressed, and it is the major exporters that suffer. That is what happened in 1961.

Production of tea in India in 1961 reached a record figure of 779 million lbs. against 708 million lbs. in 1960 and 718 million lbs. in 1959. This substantial increase in output during 1961 ultimately leads to a fall in prices and consequently the earnings during the first part of 1962 were lower. The table below gives the quantity exported and value earned during January-June 1962, along with the figures for the corresponding months of 1961 and 1960. It may be noticed that the quantity exported has risen from 132 million lbs. during January-June 1960 to 156 million lbs. in 1962 — an increase of nearly 18 per cent. Against this the value earned during the same period went up from Rs. 35.5 crores to nearly Rs. 39 crores, which is less than 10 per cent. In fact between 1961 and 1962, the quantity exported has risen while the total earnings have actually dropped by nearly Rs. 1.5 crores or 4 per cent.

EXPORTS OF TEA

	Quantity (Million Kg.)	Value (Rs. Crores)
January - June 1960 ..	132	35.5
January - June 1961 ..	145	40.4
January - June 1962 ..	156	38.9

The table at page xi in the Statistical Section of this Supplement gives the prices of tea exported from India and Ceylon as they prevailed in the principal importing countries in 1959, 1960 and 1961. It is interesting to observe certain variations. Between 1960 and 1961, for instance, the price has had a fall all through the year, so that the total comes to Rs. 2.37 per lb. in 1961 against Rs. 2.81 per lb. in 1960. In the case of Ceylon, the fall was much lesser. The price had moved to Rs. 2.62 per lb. in 1961 from Rs. 2.61 per lb. in 1960. Some very significant factors must have operated in the case of certain individual markets because Ceylon tea was actually sold at a premium in the Netherlands where it earned Rs. 2.61 per lb. in 1961 while it earned Rs. 2.46 per lb. in 1960. Against this performance of Ceylon tea, Indian tea lost in price, though only marginally. Similar was the record of the two exporting countries in Iran and Australia, where Ceylon actually sold at a premium. In the London Market, which is the most important both for Indian and Ceylon teas, the prices in 1961 were lower than in 1960 for both the countries. The fall, however, was steeper as far as Ceylon tea was concerned. The latest figures that are available for the week ended August 17, 1962, also show that North Indian tea in the London Market was sold at lower prices at 4 sh. 2d. per lb. against 4 sh. 6d. per lb. a year ago. But similar was the performance of Ceylon tea during the week ended August 17, 1962. It was sold at 4sh. 1.5d. per lb. against 4 sh. 5d. per lb. a year before.

It may be added here that the demand for Indian tea, or for that matter tea from other countries, is increasing in the foreign markets steadily. This is explained by the fact that during the last several years the exports from the surplus countries have been increasing and they are likely to go up further in years to come. The output of Indian tea in 1962 was estimated by the Board of Trade to be only marginally higher than it was in 1961 which in turn was considered to be a bumper crop. Naturally, therefore, the prices in the foreign market for the whole year 1962 are likely to level off to some extent unless exports from other countries like Ceylon do not push up further. Besides this there is another factor which has strengthened the competitiveness of Indian tea in foreign markets. This is the fiscal concessions granted by the Finance Minister in the last budget presented to the Lok Sabha in April 1962. The Finance Minister had reduced the export duty on tea from 44 nP. to 25 nP. per kg. Also a refund of excise duty of 15 nP. per Kg. is allowed. These two measures have made Indian tea more competitive in terms of prices in the international market.

The output for 1962 was estimated by the Board of Trade at around 800 million lbs. The latest indicators that are available show that the output may not be stepped up to that extent because crop figures up to mid-August 1962 are lower than 1961 by something like 3 per cent. Under these conditions the actual output may not even reach the 1961 level. Internal consumption being higher, exports also may not touch the 1961 level. The estimates outlined in the Board of Trade papers, therefore, may not materialise. Under these conditions the prices earned by the Indian teas in the London Market and elsewhere may also take a turn for the better if the law of demand and supply is to operate, although there are, of course, several other factors that operate in the determination of prices. It is time that due attention is paid to consumer sovereignty in the foreign markets. What is necessary at the moment from the point of view of prices is that sufficient propaganda is carried on so that the Indian teas become more and more popular with the consumers. The problem of exports will need to be faced by Indian tea in the foreign markets with more energetic efforts if the target of an output of 900 million lbs. to be achieved by 1965 — is to be absorbed with an emphasis on the foreign exchange earning potential of this key item.

South Indian Tea: Special Problems

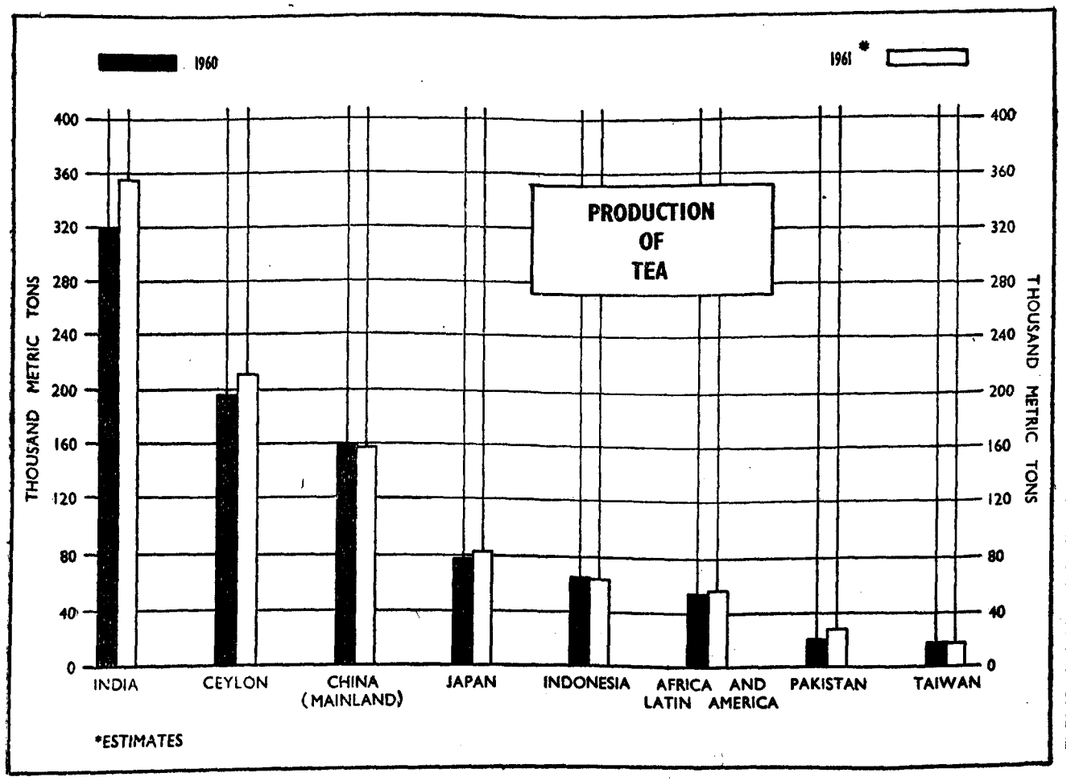
THE South Indian tea industry's output being a small percentage of the all-India production and the diversification of the plantation industry there having a preponderance of the other plantation crops, namely, coffee, rubber, spices, and cashewnuts, the problems of this industry are invariably camouflaged in the travails of the other plantation crops in this area. An attempt is made in this article to spotlight some of the particular issues that the South Indian tea industry faces today, apart from the general problems which it shares with the industry in the North, particularly the problem of exports arising out of keen competition from Ceylon and East Africa since the South Indian tea is of superior quality and high grade, and the likelihood of high internal tariffs being raised by the members of the European Economic Community even though tea imports into the ECM, in the event of Britain's joining it, would be permitted on a duty-free basis.

The South Indian tea, like its counterpart Northern Indian tea, is today subject to a heavy burden of taxation. But its position appears to be slightly worse, particularly in the Kerala State, thanks to the diverse policies followed by the State Governments. A clear indication of lack of uniformity in the policy regarding the plantation industry among the Southern States is available in the treatment meted out to the Kerala rubber plantations. The Kerala Government has been postponing the decision, for nearly two years now, on one of the most important recommendations of the Tariff Commission which allowed for a provision in the rubber price structure of Rs. 9 per 100 lbs. of rubber to represent the depreciation element in the wasting asset of the rubber trees. This recommendation has been given effect to by the neighbouring States of Mysore and Madras. Although an instance of the sort of discrimination in regard to South Indian tea is difficult to cite at present, under the Communist regime in Kerala it was not a myth. Since, however, all the stringent measures affecting this industry have not yet been liberalised and brought at par with the neighbouring States by the Congress-PSP coalition Government, there is reason to believe that the tax structure in the three tea-growing States of South India varies to no small extent.

These variations in the tax structure of South Indian tea were brought about by the levy of the agricultural income-tax, particularly in the Kerala State. The procedure followed in assessing this tax is also said to be very often quite different from the method adopted by the Central Government Income-Tax Authorities. This, according to the industry, also leads to disproportionately higher tax at the State level. To obviate all these difficulties and to make the South Indian tea more competitive in the international market, particularly in comparison with the Ceylon tea, which in quality is not very much different from the South India tea, an eminent suggestion has been put forth by Mr. M. M. Varghese, Chairman, Planters' Association, Kerala, to the effect that all the taxes on tea should be centralised and tea should be subject to one standard tax to be levied by the Central Government. This, Mr. Varghese says, would lighten the burden on the South Indian tea industry or at any rate will decrease the weight of the burden to a considerable extent. According to Mr. Varghese's scheme the States may be reimbursed with the revenue accruing to them at present from this source by the Central Government, wholly or partly, on the basis of sharing the proceeds of the tax collected by the Centre, either on the population basis or as subvention, as is done in the case of various other Central excise levies. This suggestion needs to be studied carefully by the Union and the State Governments, particularly by the latter, for the South Indian plantation industry, labour-intensive as it is, provides large-scale employment which, if rationalised, would create no minor headache for them.

Another element has recently been added to this irrationality of the tax structure of the South Indian plantation industry by the powers granted to Panchayats to levy full taxation forming part of their jurisdiction on plantations even though the Panchayat Boards are unable to use their revenue for affording any benefits to plantation labour. The majority of the welfare services such as housing, educational and medical facilities for plantation labour remain the legal liability of the plantations under the Plantations Labour Act. There is also reported to be developing intense rivalry between the various trade unions in the industry for the control of the Panchayats which makes the discharge of various functions of the plantation management more difficult. The plantation managements in numerous cases have to seek the permission of the Panchayat Boards for installing or moving machinery from one place to another and for building houses etc. This anomalous state of affairs — Panchayats having unwarranted powers of intervention without corresponding responsibility in the working of plantations on the pretext of the latter being more agricultural in their character than industry—obviously needs to be rectified at the earliest. The denial of any subsidy to the plantation industry for labour housing—various manufacturing industries receive assistance from the Government by direct financial aid for labour housing—is another matter which is not easily comprehensible, especially in the present days of rising housebuilding costs.

On the labour front, the South Indian plantation industry, not excluding tea, suffers from the handicap of multiplicity of trade unions, besides the high percentage of absenteeism and only five-hour working day in many cases. This necessitates the industry to carry 20 to 25 per cent more labour than is actually required. When the wage structure for the South Indian tea industry is finalised by the Tea Wage Board, it is hoped that this peculiar phenomenon in South India would be taken cognizance of. This is essential if the cost of production of South Indian tea is to be brought down.



If the South Indian tea industry is not to be allowed to stagnate and the Third Plan target fixed for it is to be achieved it is obvious that the industry should be given access to the necessary equipment and finances with which to purchase this equipment. A vital role in this respect is to be played by the industry's own earnings and the surplus which is left with it in the form of profits—the State Financial Corporations of Madras, Mysore and Kerala can make available finances to this industry only to a limitd extent. Whereas thought is to be given to reduce its cost of production to the extent possible, the unnecessary and undue taxation burden on it requires to be removed. The hindrances experienced by this industry on account of the operation of the agricultural lands ceilings Acts in the three States, particularly in matter of replantation, also need to be obviated. Quality tea production is called for if the Indian tea is to hold its own in the world market. Replantation has an important role to play in this.

The United Nations and the Development Decade

"THE Eastern Economist" has decided to devote the current month's Blue Supplement to 'The Development Decade' because it believes that the Indian people, although they are most intimately concerned with every aspect of this matter, are pitiably unaware of its tremendous importance to them as an instrument of their own progress. Indeed, it seems difficult to believe, yet it is true, that Indian newspapers are largely unaware of the spacious programme of integrated development contained in the United Nations' presentation of the Development Decade in June this year. The many-sided approach of the Specialised Agencies of the United Nations needed co-ordination and the Development Decade might be described as the concerted effort of the United Nations to present in one programme all aspects of its tremendous operations to be of special service to the developing countries of the world. In this programme, India, by democratic right as well as by the claims of population, should have the largest place. This in fact does not currently obtain, largely because the Indian people and the Government of India and State Governments have not seen the opportunities this spacious programme provides both for explaining to the world India's case for obtaining those strategic resources both in men and material which the United Nations might be able to sponsor. By and large, the Development Decade is a fortunate windfall which has come to us at a time when we are poised on the threshold of what is sometimes called a "take-off" for the economy. Guesses — not very reputable — suggest the take-off will come in this decade.

Because the Development Decade belongs to the United Nations, and is, therefore, free from suspicion that it is overcast with national political strings, because it is already accepted, and, in a larger sense, because it has a universal appeal, it is more likely to succeed than would an individual approach or one sponsored bilaterally or by individual national agencies in various countries. In any case, we are coming after the last Aid-India Consortium meeting, very near to the ceiling of the capacity of the existing institutions to finance and to sponsor our projects even in the Third Plan. It is something that the United Nations should lay out, in the context of the Development Decade, a plan for the developing countries for a rise of 5 per cent per year in national income, and suggests necessary support in financial and manpower terms to bring it about. We can, therefore, readily take our place inside the Development Decade, which has a plan akin to our own. It is not too exacting or too timidly conceived. Its dimensions and our own run on parallel lines.

While taking advantage, therefore, of our association with the Development Decade, we must not forget that our purpose is not selfish in the sense that we are entering only for our own national needs. We have to give as well as receive. We cannot give as much as we have to receive, because of our pitiable poverty and our shortage of manpower in almost every field. Nevertheless, the Development Decade comes to us as a challenge to give and not only as a challenge to participate.

The directions in which India can participate in the United Nations Development Decade are set out in the articles which follow. Particular attention is devoted to the Specialised Agencies, United Nations Special Fund and the work of FAO and UNESCO. One must not, however, forget that WHO, ECOSOC and Communications and Information are vital elements in United Nations' programmes of development. India has always done less than justice to the Information Services of the United Nations, which are now being expanded and developed under the inspiration of the Secretary-General himself.

All in all, the picture of the Development Decade in India is scanty and incomplete. The Development Decade is a spacious canvas on which the people of developing countries themselves will have to paint. It is, therefore, time that the people themselves realise that they must take inspiration for themselves, and utilise the magnificent canvas which is presented to them to paint a picture of their own wants and their fulfilment. It is hoped this Blue Supplement will contribute to that end.

UNESCO and the Development Decade

THE pride of place in the UNESCO programme for the Development Decade has been accorded to "intensified action for development of education". Special studies have been made of the educational needs at both the national and regional levels and decisions have been taken in regard to the targets for the decade ending 1970-71. The various targets to be achieved are:

IN AFRICA :

Seventy per cent of the children of age group 6-12 will be in primary schools (present level 40 per cent); 15 per cent of the appropriate age group in secondary schools (3 per cent); and 0.4 per cent of the appropriate age group in universities (0.2 per cent);

IN ASIA:

Fifty per cent of children of primary school age will be in primary schools. On the basis of incomplete information on national plans it is further estimated that 50 per cent of primary school graduates will go to secondary schools, plus a further 20 per cent to trade and agricultural schools. In the area of higher education the present percentage of 2 per cent is expected to move towards a target of 3 per cent of the appropriate age group being enrolled in higher education institutions;

IN LATIN AMERICA

All children of primary school age will be in 6-year primary schools (implying an increase in the primary school population from 26 million children in 1960 to 45 million children in 1970); 30 per cent at the appropriate age group in second level schools; and 4 per cent of the appropriate age group in universities.

The attainment of these goals will need an annual outlay equivalent to 4 per cent of the gross national product. The external assistance needed for these ambitious targets lies outside the national investment. A special feature of the programme is that even I.D.A. which has previously never delved into these spheres will start allocating funds for the propagation of education.

In the immediate future, the goals of the Development Decade will need to be translated into national educational plans for which technical assistance is being provided to each participating country by UNESCO. In Africa, Asia and Latin America, for planning of education only no less than 500 experts are required. All efforts are being made to increase the supply of these experts so that planning of educational schemes is in no way hindered. Experts in economics and statistics are being recruited by UNESCO from all over the globe in order to set up educational planning institutes in the developing countries and for providing assistance in the establishment of units furthering economic development. I.L.O. as well as F.A.O. are also assisting in these schemes and are actively participating in the technical long term studies for forecasting demand for man-power.

Great stress is also being laid in agricultural training and education — programmes in which F.A.O. is also intensifying its efforts.

In the fields of primary and secondary education as well UNESCO has plans to extend its activities with regard to the training of teachers. The following concrete steps are proposed to be taken :

(i) The establishment of national colleges for the training of secondary school teachers to meet the priority goals of expansion of secondary education, with special emphasis on the training of science and language teachers.

(ii) An intensified programme for training instructors in teacher-training institutions for primary school teachers, to match the goal of universal primary education by 1980.

(iii) Research into the reform of teaching methods in primary schools and the establishment of pilot projects in the use of new techniques.

(iv) Attention will also be given to the need to revise secondary school curricula in the light of national conditions and economic needs.

Simultaneously, efforts are being made to eradicate illiteracy by adopting extensive adult education programmes. A number of countries are actively participating in these programmes with the support of UNESCO. The programme for adult education will include the following important aspects of planning and administrative training of staff, studies and research, employment of mass media and utilisation of voluntary and local sources:

(i) **Planning and Administration :** Special attention is needed during the decade for planning literacy and adult education programmes within the framework of community development and other national development plans and establishment of administrative machinery to conduct these programmes which is weak or non-existing in many countries;

(ii) **The training of staff:** At regional and national levels, assistance in training could be provided, and training projects established in certain specialised fields;

(iii) **Studies and research,** including research into teaching methods, the use of new media (their testing in pilot projects), etc.;

(iv) The use of mass media for educational purposes and the large scale production of reading materials;

(v) New and additional measures of financing educational programmes from voluntary and local resources must be developed during the decade.

UNESCO is also laying adequate stress on higher education and on the supply of highly qualified personnel. Stress is laid on the principle that "those who have the ability and aptitude to pursue higher education should have an equal opportunity of access to it." UNESCO will extend its assistance for the development as well as the improvement of the standards of the universities and other centres of higher learning and research. Specialists in the various scientific fields are also being trained.

In addition to extensive plans in regard to the spread of education, UNESCO is planning to widen the network of media of communication. According to estimates made by UNESCO nearly three-fourths of the total population of the world lacks mass communication facilities. During the Development Decade, the level of communication will be raised to such an extent that "for every 100 inhabitants in any country there should be at least ten copies of a daily newspaper, five radio sets and two cinema seats". These targets will demand a financial investment of more than $2,800 million. If programmes of educational television are also included the cost may rise to $3,400 million.

Development Through Food

IF the 1950s are remembered in the world annals as the decade during which new ideas about international economic co-operation flowered, the sixties will perhaps go down in history as the decade in which concerted action on a global scale for the economic uplift of what are called the under-developed or the developing countries, is being taken for the first time. During this decennary, known as the Development Decade, the pride of place has been given to economic rejuvenation of the backward nations through development of the human personality. In this, agricultural development has obviously to play a vital role. No wonder the slogan has gone up: "Development Through Food".

Fostering of the economic development of the less-developed countries at the rate of 5 per cent per annum — the goal of this Decade — is appropriately sought to be spearheaded by the development of their agrarian sectors' output at a rate of 4 to 4.5 per cent. This is at it should be; firstly, because a successful development of the economy of any country requires a "breakthrough in agriculture", and secondly, owing to the fact that in the three largely under-developed continents of the world, namely, Asia, Africa, and Latin America — which contain amongst themselves a major portion of the world population — according to a recent authoritative estimate, roughly 500 million people suffer from a lack of sufficient calories and approximately twice that number from malnutrition or diet deficiencies in terms of vitamins, minerals and proteins. Shortened life-spans, retarded physique, impaired health and lessened energy are the dark side of the human picture in the less-developed countries and are primarily responsible for their economic backwardness.

To raise large segments of humanity in these three continents from the morass of poverty and squalor, the United Nations envisage during the sixties the raising of nutritional levels in the four major under-developed regions of the world in terms of per capita calories and animal proteins in grammes as follows: Far East, 2,300 and 10g., Near East 2,740 and 20g. Africa 2,420 and 15g. and Latin America 2,400 and 25g. The disparities in climatic conditions, which have a vital bearing on the food habits of the people, presumably have been taken into consideration in fixing these targets. If these targets are to be achieved, per capita food supplies will have to be increased at the rate of 1.5 to 2 per cent per annum (1.8 per cent in the Far East, 1.6 per cent in the Near East, 1.4 per cent in Latin America and 1.3 per cent in Africa).

One of the ways to feed the semi-starved population in the under-developed countries is the diversion of surplus food from the advanced countries of the world. But, as an old Chinese proverb says. "If you give a man a fish you feed him for one day. If you teach him to fish you feed him for many days." Thus, a lasting solution to the present-day low nutritional levels in the under-developed countries involves the more prudent policy of helping them to raise their indigenous output.

The challenge of the Development Decade in the field of agriculture is three-fold. In the first place, food and other agricultural commodities have to be produced in larger quantities by extensive use of scientific methods and modern technology that have been harnessed successfully so far only in the advanced countries of the world. In the second place, arrangements have to be made for proper distribution, both within a country and between countries, of the increased output so as to help solve the problem of agricultural surpluses as and when they arise in various countries. The third challenge is to expand the employment opportunities in rural areas with a view to make the farm life more attractive and to counteract the drift to towns.

The Food and Agriculture Organisation of the United Nations will be helping the under-developed countries in all these matters in diverse ways. It will afford assistance in developing their nutritional goals, preparing of targets of production for them and inducing them to taking to the modern techniques of agriculture, animal husbandry and fishing. It will also help them in improving storage, processing and marketing of their agricultural products and undertake on their behalf pre-investment surveys in various agricultural fields. Some of the other activities of F.A.O. will be rendering of advice to the developing nations on matters of land reforms and co-operative movements, assisting in the training of technicians in various fields of agriculture (including forestry, fisheries, veterinary services, nutrition and home economics) and arranging for an orderly distribution of their surplus agricultural commodities in the world markets. Another significant role that this Organisation is envisaged to play in improving the agrarian economies of the under-developed countries is helping them in the supply of capital goods through the creation of some sort of fund from which these supplies could be effected.

All this assistance programme of F.A.O. is to be channeled through two principal agencies, one dealing with the Freedom-from-Hunger Campaign and the other with Food Aid. While the former would envelope all its activities for increasing food production, improving nutrition and raising both incomes and standards of living of the rural population, the latter would work through setting up of pilot projects which will act as catalytic agents for fostering the overall economic development. For setting up these pilot projects an experimental programme has been drawn up for a period of three years in the first instance, during which $100 million in food and cash are to be expended. A few instances of the projects to be financed under this programme are: (i) paying workers employed on construction jobs partly in the form of food made available by F.A.O.. (ii) provision of food supplies in the initial stages for those employed on reclamation of land for cultivation; (iii) assisting in the migration of people from thickly populated areas to new settlements within a country and meeting their food requirements for a short initial period from the reserves created by F.A.O. under this scheme.

For countries like India, the Development Decade programme of the U.N. is of immense importance. More so in the agricultural field. Although through massive investment and herculean efforts — which at times, of course, have tended to slacken down, especially after bumper crops in a year — India over the past decade has been able to achieve a gross rate of growth in her agrarian economy of 4.5 per cent per annum, it has been hardly commensurate with the growing raw material needs of her industry and the food requirements of her explosively expanding population. The progress recorded in the case of protective foods has been, however, much slower. Here F.A.O.'s assistance can be of vital importance, and it is encouraging to note that this fact is by and large appreciated. A clear evidence of this is available in the assistance provided by this Organisation in the fields of poultry and fish-

eries development. F.A.O. is already understood to be engaged in chartering out the fish resources of the Arabian Sea and its assistance, both in the shape of men and materials, to modernise India's fishing industry can be of invaluable help in raising the nutritional standards in this sub-continent. There are also various other fields in this country's agrarian economy such as milch cattle development, sheep rearing, poultry development etc., in which we should look forward to greater assistance from F.A.O. during the Development Decade. One only hopes this august body's resources to help the under-developed countries would be strengthened adequately by contributions from the U.N. members, especially those that are affluent.

The Development Decade: The Growth of Industry

THE global strategy proposed to be evolved for raising standards of living in the developing countries during the sixties under the programmes being evolved by the Economic and Social Council of the United Nations will require a very fast rate of growth in industry. In overall terms, it has been estimated that the national incomes of the developing countries would be raised from the present level of 3 to 3½ per cent per annum to 5 per cent per annum at the end of the decade. It will need raising of the manufacturing output in the developing countries by at least 130 per cent in 10 years or 13 per cent per annum, on the average. The ambitious programme of industrialisation will naturally increase the bill of imports by a wide margin. The present estimates show that the demand for imports of industrial equipment alone will be doubled from the present level of $3 billion to more than $6 billion.

The achievement of these objectives will involve various stages of development such as the preparation of industrial plans, extension of industrial advisory services, promotion of small industries through industrial estates and extensive programmes in industrial training. The pride of place in this programme must be accorded to industrial planning. It is proposed to encourage the study of project programming of those industrial problems which are associated with the organisation of planning. Comprehensive studies are proposed to be undertaken to accord priorities for various industries and attempts will be made to forecast the probable levels of demands for various industrial products. It is true that in the past these studies have been made rather difficult because of the paucity of data, but during the last 15 years the United Nations has already amassed sufficient statistical information to warrant the initiation of such studies.

The extension of Industrial Advisory Services will be launched with the assistance of groups of experts taken from various countries. Care will be taken to select specialists who are conversant not only with the problems of industrial programming in general but who have also specialised in particular sectors of industry. Assistance of technical knowledge residing in the private consulting organisations and firms will also be acquired. It will naturally need strengthening of the staff and other resources of the United Nations Secretariat in the industrial field. If the objectives of the development decade are to be realised, additional recruitment of staff will become absolutely necessary.

Industrialisation in the developing countries on the gigantic scale witnessed in the Western nations may not be possible in the short span of 10 years and that is why the United Nations Development Programmes have advocated the establishment of small-scale units in the Industrial Estates. An Industrial Estate represents "a developed tract of land" which provides common facilities and services for all the units in the Estate. This mode of encouraging industrialisation has made rapid progress in many of the developing countries including the Indian Union where no less than 70 Industrial Estates are humming with activity. Technical Assistance through the Special Fund is also being provided. Very soon I.D.A. will also lend a helping hand. The establishment of a network of industrial estates will encourage the emergence of a new industrial community in the developing countries.

The United Nations, as well as the Special Fund will provide technical assistance only in the sense that they will help in the selection of the site, preparation of the feasibility reports of the various projects, technical knowledge in regard to the basic requirements and estimates of the total cost of such projects. As these new ideas catch up in the developing world, experts would be sent out to advise on the planning, construction and initial operations of the Estates.

What the developing countries lack most is technical knowledge and the best mode of communicating technical knowledge would be to encourage the establishment of institutes of technology. The Special Fund of the United Nations has provided assistance for the setting up of 22 institutes. They are already working successfully in the developing countries and are providing general information as well as knowledge on specific industries. They are undertaking investigation, research analysis, and testing. There are some centres which provide management services such as guidance, advice and technical services to industry. This applies particularly to small-scale industries which do not have financial and technical resources to employ specialists.

The financial institutions run by the United Nations will face the more challenging problem of providing finance to these small-scale industries. The privately-owned development banks will indirectly finance small-scale industries while the International Bank, is, and will continue, to provide finance to the large-scale industries. The International Finance Corporation has also been authorised to make equity investment. Certain countries have through their own funds given encouragement to small-scale and cottage industries and the United Nations will also lend a helping hand to encourage further action in this direction. With the increase in the resources of the United Nations, special funds would be provided for the financing of industrial estates and other small scale enterprises. It is believed that on the average, a 10-acre industrial estate may cost about $2,50,000 for land development, basic utilities and factory and building. It shows that even the development of small-scale industries will be a big draw on the financial resources available with the United Nations.

Successful industrial development in the poor countries cannot break through the multiple barriers without much more ambitious programme of "industrial training." The skilled worker, the technician or the foreman can certainly be more useful in the establishment of the industries than the unskilled one. A special role of I.L.O. will be to chalk out programmes of industrial training so that the broad objective of setting out a net work of industries in the developing countries may be readily achieved. The training programmes to be initiated by I.L.O. will include guidance under experts from all future managers and scientists to be associated with the industries. It is proposed that the I.L.O. units in every developing country will work in association with the National Productivity or Management Development Centre. More stress will be laid in these programmes on the management of the enterprises rather than with the industrial policies, the location of industry or even the separate problem of industrial development. The latter would be tackled by a separate machinery set up for the purpose.

All these steps proposed to be undertaken by the United Nations under the Development Decade programme will not be deemed very ambitious in view of the miserably low standards of living prevailing in these countries at the moment. Even with these large-scale programmes of industrialisation the levels of living would not compare very favourably with those of the advanced nations. Even the tempo of industrialisation hastened in the manner outlined above in the present decade will accelerate the economies of these countries to such a level as to double the personal incomes at the end of the present century which certainly is not a very high standard as compared to even the present standards in the industrially advanced nations. But it is certainly worth attempting because, otherwise, the gap between the developing and developed nations would widen so much as to keep two-thirds of the population of the world in perpetual misery.

The Expansion of Trade in the Development Decade

THE pace of the economic development of the underdeveloped countries is no doubt conditioned in the first instance by their capacity to mobilise the internal manpower, physical and financial resources. Granting that they give a good performance on this score, the crux of the problem still remains to be faced — raising the external purchasing power in order to meet the progressively mounting bill of development imports. External purchasing power can be strengthened in two ways — by an intensification of exports and by external assistance. The question of external financial assistance is discussed in the next article in this Blue Supplement. The present discussion centres round the acquisition of foreign exchange by means of exports.

An analysis of the trends in the availability of total external foreign exchange resources in the underdeveloped countries during the years 1956 to 1959 has brought out the all-pervading importance of exports. During this period the export earnings of the less developed countries of the world were six times as high as their receipts of long term capital inflows and official donations. Exports went to satisfy 90 per cent of the costs of imports, while 10 per cent of the imports were met out of external assistance. This is apart from the liability of the underdeveloped countries to meet the obligations of payments on account of external debts. It must be observed that this ratio between export earnings and external assistance in the total pool of external purchasing power cannot be regarded as normal even during the development decade. The fact to remember is that as the development programmes gather rapid momentum during the decade, the gap between the earnings of foreign exchange and the total import bill will become wider and wider. It will be the function of the underdeveloped countries to strain every nerve, in co-operation, of course, with the economically advanced countries, to minimise it.

But this function poses difficulties. The variations in the terms of trade make or mar the chances of an effective drive to close the gap of trade deficit. During the 1950's the terms of trade of the primary producing countries, or less developed countries, went on deteriorating. Furthermore, the intake of the imports of the less developed countries, by the industrially advanced ones, also declined and failed to keep pace with the rate of growth in their trade in other directions. The IMF's latest report for 1961-62 highlights the fact that the consequences of the recession of 1958 were quite marked in so far as they related to the less developed countries. Between 1958 and 1961, the increase in the trade of the advanced countries among themselves shot up by 50 per cent, while, by a telling contrast, their imports from the less developed primary producers recorded a bare increase of 15 per cent. This factor of a worsening in the terms of trade and a tardy rate of growth in the exports of less developed countries to the advanced countries is a major problem which policy for the expansion of the trade in the development decade has to reckon with as one of the main challenges.

One of the ways in which this challenge of the widening gap of trade deficit and the consequent necessity to rely increasingly on external assistance for foreign exchange can be met is to give a positive orientation to the export trade with a deliberate accent on the non-traditional exports. The Economic Survey of Europe in 1960, in its analysis of the trends in world trade in the decade, records the significant finding that the developing countries will have to intensify their efforts to raise the share of their non-traditional exports in the total foreign exchange earnings to one-third. The non-traditional exports in simple terms signify manufactured goods and semi-processed or highly processed products — agricultural and mineral.

An argument is advanced some times that the internal trade pattern of the advanced countries is disturbed by the offtake of low wage-based manufactures from the back-ward countries. There may be some truth in this grievance. But obviously the basic fact seems to have been overlooked that the supposed advantage of low wages is practically nullified by the low productivity of labour and the consequent high wage cost per unit of product in the underdeveloped countries. However, it is heartening to find that enthusiastic co-operation from the advanced countries to encourage the inflow of imports from the backward countries is forthcoming and it is expected to render the task of the export promotion effort of the developing countries easier. To quote a conspicuous example, the long-term arrangement for the import of cotton textiles from the major less developed producers to the advanced countries is conceived on liberal principles and it already took effect in September 1962.

The new trend in the form of regional economic groupings and integration, particularly as typified by the European Common Market, has been misunderstood by most of the underdeveloped countries both for its basic purpose as well as for its impact on the trade of these countries. Regional integration in economic matters, of which trade is an inseparable and vital part, is only a camp follower of the onward march of economic progress towards the goal of the mass consumption market. In the short transitional period, it may appear that the members of the European Economic Communty are following an inward-looking policy as illustrated by progressively and rapidly reduced rates of intra-regional tariffs and the comparatively higher common tariffs. But once free trade within the Community is establish-

ed the economies of scale and division of labour are bound to be reflected in the demolition of the higher tariff wall against imports from external sources. The rapid rate of economic growth and the expanding demand for imports in the Community are offering an ever-increasing scope for the exports of the outside countries, including, of course, the less developed ones. The difficulties of the transitional short period must be borne, but their magnitude is perhaps being exaggerated. What is of abiding importance is the large market that will be available for exports after the transition.

The Economic Commission for Asia and the Far East, the Economic Commission for Latin America and the Economic Commission for Africa, the three regional economic commissions set up by the UN for less developed parts of the world — can be used, it is urged, as effective agencies to bring about the integration of the regions within their jurisdiction, albeit on a modest scale. The purpose of this integration would be to co-ordinate and, to the extent it is practicable, to unify their economic policies. In this integration and co-ordination, the flow of trade will naturally occupy an important place. Intra-regional trade can be promoted and the prevailing compulsion for each individual counto make a frantic search for foreign export markets anywhere can be mitigated within limits. Similarly, their concerted price policies in key commodities may be effective in obtaining suitable schemes of international commodity agreements by negotiations with the industrialised importing countries. The policy of regional integration for the backward countries, under the auspices of the UN regional economic commissions, it must be stressed, is not being advocated in a spirit of retaliation. Its aim, pure and simple, is to maximise the benefits of regional trade by the elimination of competition and a resort to co-ordination. When all this is granted, the overriding fact remains that the scope for such intra-regional promotion of trade can but be limited. The countries of these regions are desperately in need of developmental imports which can be obtained primarily from the advanced countries. It is, therefore, of the utmost importance that the less developed countries should constantly keep in view the economic urgency to increase the proportion of their exports to the advanced countries to pay for these imports as well as for servicing the credits which they receive from them.

A lowering of tariffs on a basis of reciprocity and encouraging the exports of the backward countries, both conventional and non-conventional, is being achieved steadily through the agency of GATT. This fact has perhaps failed to receive proper recognition. Furthermore, participation in GATT gives the backward countries the automatic benefit of the principle of the most-favoured-nation-treatment. Since November 1958, particular attention is being paid by the contracting parties to GATT to the problem, among others, of stimulating the trade of the backward primary producers. The Committee of expert economists, set up in 1957, tendered its findings towards the close of 1958 and those findings provided the basis for preparing a scheme in removing the obstacles to the promotion of their trade. On the basis of these findings a report was prepared in 1961 and the Ministers of the Contracting Party endorsed the Declaration of Promotion of Trade of the Less Developed Countries. The non-tariff policies which directly affected the flow of trade have been appropriately dealt with in the guiding principles incorporated in the Declaration. They relate to quantitative restrictions, subsidies, disposal of commodity surpluses, preferential tariffs and similar trade policies at present prevailing in the advanced countries. The Declaration is in the nature of a recommendation, but this character of the Declaration will not detract from its practical utility. It is of the essence of international co-operation that constant consultation and advocacy of liberal multilateral trade policies be designed to produce within a reasonable time a climate receptive to the requirements of the underdeveloped countries in the matter of trade as a logical essential concomitant of aid.

External Finance in Development

THE basic financial scheme of the development decade is to induce the advanced countries to earmark one per cent of their national incomes to provide the external finance required for the development programmes of the underdeveloped countries. It is assumed that the national income of the advanced countries will increase during the decade at the annual rate of around 5 per cent, but not above, in view of the fact that the high tempo of this growth in recent years can hardly be maintained. On this assumption the incomes would be doubled by the end of the decade in 1970. It is reckoned that something like $4 to 5 billion would be available each year in this manner. The allocation of 1 per cent of the national incomes of the advanced countries will be available for financing development at the different levels and under different auspices of which the UN would constitute an important channel. In what proportion the flows from this fund would be directed through the UN system or through the national systems or by means of bilateral or multilateral agreements and for investment and other purposes cannot be predetermined with reference to any targets which are the outstanding feature of the national development plans.

But the basic aim of this grand movement of the development decade is to create ramified patterns inside the UN, as one of the vital channels for development, to provide funds and technical assistance which the individual countries cannot adequately obtain by their own efforts. The contributions to the fund contemplated in the scheme of the development decade are to flow from Government sources. But apart from these, there will be all the urgency for the individual countries to induce the flow of foreign private investment. It is not necessary in this context to consider the incentives and the climate which would be necessary for attracting the flow of foreign private investment. Attention is here focused on the international agencies and the manner in which they can be geared to the task of obtaining larger funds to meet the requirements of external assistance for these countries.

The existing financial institutions will undoubtedly remain the mainstay of the flow of these funds. This gives added importance to the operations of the International Bank for Reconstruction and Development, the International Monetary Fund, the International Finance Corporation and the latest addition to the family — the International Development Association. The role of the IBRD has not only been that of a leader in providing finance but in supplying other essential resources of development. The technical assistance which is available through the agency of the IBRD is now assuming greater importance and it is noteworthy that there is a close relationship between the UN and the IBRD in providing this assistance. A liaison committee of the IBRD is now formally established to function in intimate co-operation with the United Nations Special Fund. In fact the IBRD functions as the special agency to administer allocations of aid made by the UN Special Fund. This aspect of the developmental function of the IBRD has probably received very little attention in the almost exclusive preoccupation with the generous loan assistance which it provides. There is yet another interesting aspect of the IBRD's technique of functioning which serves the two-fold purpose of augmenting capital resources for the development of the backward countries and integrating foreign private investment with the financing of projects initially assisted by the IBRD. The IBRD's loans or bonds are sold to private investors as a result of which private capital goes to finance projects in the developing countries releasing the IBRD's resources for additional provision of credit. During the last six years the one billion mark has been crossed in this technique of sale of bonds to private purchasers.

The International Finance Corporation arrived on the scene to fulfil a function, which the IBRD could not, owing to the limitations of its charter. Unlike the IBRD, the IFC, which provides credit exclusively to the private sector, does not require the guarantee of the national Government concerned. With experience and confidence acquired, larger responsibilities are being cast on the IFC. Its charter was amended in September 1961 with the specific purpose of enabling it to undertake equity investment as well as to underwrite issues of shares. One of the difficulties which has limited the expansion of the volume of the IFC's business is created by the high rate of interest or the return which it claims, in addition to or without interest, in the form of participation in profits etc. If a way can be found to lighten the burden of the cost of the IFC's credit assistance, greater benefit can be derived from its resources by the borrowing countries during the decade.

The International Development Association addresses itself to the specific task of providing soft loans to relieve the strain on the balance of payments of the borrowing backward countries created by the obligation of servicing their debts. IDA allows a period of maturity of 50 years with a period of grace of 10 years and there are more liberal terms. During the first 10 years of amortization the charge of interest does not exceed 1 per cent and any increase in it that is agreed in the terms of the credit is permissible in the last 30 years. The interest is in some cases nil, but where it is charged, it is low. Only a charge of ¾th of 1 per cent is levied to cover the administrative cost and it is calculated on the amounts actually disbursed. Another distinctive feature of the loan facilities provided by the IDA is that non-productive but vitally important development projects do qualify for its assistance. In this category may be mentioned credits to underdeveloped countries to expand schemes of sanitation, water supply, housing, technical training, education, printing of text books, and so forth. IDA's initial funds of about $770 million will be practically exhausted by the middle of 1963 and accent was placed at its recent annual meeting on replenishing these funds on a substantially large scale.

Apart from these widely known international financial institutions, the UN has set up specific agencies to provide investment and technical co-operation. The chief agencies are the UN Special Fund, set up in 1957, and the Expanded Programme of Technical Assistance. The initial resources of the Special Fund were aimed at the figure of $100 million on the basis of the pledges of annual contributions given by the member nations while approving its establishment. The General Assembly now expects, in view of the rapid growth in the national incomes of the advanced countries, a step-up in the resources to $150 million and the goal is to carry the figure to $300 million at the end of the development decade. The volume of these resources is obviously modest — a fact which can be easily gathered from the estimate that, at the figure of $300 million, only 20 per cent of the requirements of the pre-investment work on which the UN lays emphasis will be met by it. Yet another source of finance is contemplated in the UN Capital Development Fund. In 1960 its scheme was voted in principle by the General Assembly and further acceleration to this idea was given by the appointment of a special committee to draft its statute. The Capital Development Fund is thus nearing the end of the preliminaries, but the flow of resources needed to set it afoot will take some time. Under the new impact of the grand design of the development decade this Fund is expected to take a concrete shape in the near future.

Peace and prosperity on earth are the goals for which the UN has been brought into existence and both are indivisible. The major plank in the programme of winning perennial peace by abolishing war is disarmament. No one entertains any idle dream that disarmament can be achieved in a single stroke or within a short span. Fears and suspicions and animosities which have combined to give armament its present staggering and dangerous proportion can be eliminated by patient and persevering efforts at the level of the Disarmament Conference and also by educative propaganda outside. Disarmament, it goes without saying, will release large volumes of funds now locked up in unproductive investment with a great destructive potential. But as disarmament comes in stages, larger slices from the funds thereby unlocked will be claimed for financing the effort of the developing countries for economic prosperity. All in all, the multi-pronged programme of the development decade depends for its success in a significant sense on sustaining and expanding the new climate which has already been created.
