THE EASTERN ECONOMIST

JULY 6, 1962

Bidhan Chandra Roy

SLOWLY — as with the stateliness of a funeral procession which, indeed, it is — the heroes of the Indian Revolution are leaving the scene of their glorious, even if somewhat prolonged, labours. The departure of Dr. Bidhan Chandra Roy, at the ripe age of 81, is one of the saddest because he was one of the most attractive figures in a great firmament. He represents, in a dashing and dramatic way, the wonderful appeal the nationalist movement made to men with superbly versatile talents. A great medical practitioner, he became a great organizer in private life before he became the Chief Minister of Bengal, where he showed supreme capacity as a political leader and administrator. Perhaps even more, he became an image of West Bengal, a man who was, in some sense, the State.

He was not less distinguished in the remarkable courage with which he threw himself into his task. With failing health and, indeed, after two heart attacks, apart from the stroke which finally laid him low on June 23, he clung relentlessly to his duties, working hours which would have wrecked men of nearly half his age. There was thus demonstrated anew the tremendous capacity of India's great national leaders to maintain for themselves standards well beyond the endurance of normal men. They seemed born in an age of giants, and their average norms steadily grew with the challenges which faced the nation. That was truly, as a result of this collection of greatness, a heroic age. This is the time — at the passing of one of the most notable of that group which it has been India's great fortune to bear in the last hundred years — that one should sigh for the past. But this is also the time to sing its praises. There are few countries in the world which have so wonderful a galaxy to show of men of character, intellect, courage and dedication, placed unrelentlessly for half a century at the service of their countrymen. When one salutes Bidhan Chandra Roy at this hour of his elevation to the highest ranks of India's leaders, one must lower the flag not only to him, but also to the passing of this Heroic Age, to which he gloriously belonged.

While he was of the same quality as the great heroes of the Revolution, Bidhan Chandra Roy was great enough to be different. He did not have need, as they did, to live very keenly in the hurly-burly of Indian political life, going frequently to jail and sustaining, by his example, the doctrines of Satyagraha and resistance to foreign rule. Nevertheless, he could maintain in public life a character of service with the best of those who spent much time in solitary confinement. For during this period he was available continuously in the service of suffering and, indeed, almost until his dying days, he contributed freely to the treatment of those who were unable to pay for his services. He became not merely a servant of the sick; in his concept of service, he reached out into every aspect of the life of West Bengal. He touched education no less than health; he adorned industry no less than agriculture; and he became a monument to manysidedness in public life which has no equal in the India that we have known.

He was in almost all things that he handled a student, and yet a master; a leader who could take wise counsel whilst never declining the power of decision. Therein lay his weakness. His tremendous ascendancy over his fellows often persuaded Bidhan Chandra Roy that the power of decision was his, and belonged not to a group but only to himself. Thus there was generated in West Bengal — as it has been, in somewhat different circumstances, generated in Delhi — an unwise dependence upon one man's claim to wisdom. Knowing that age was descending on him and, indeed, that warnings had been sounded that his physical frame could not endure incessent strain, he nevertheless lacked the capacity to delegate authority, and to build round himself a group of independent thinkers who could correct his own judgment, and abate his enthusiasm where it was misdirected. There came thus to be in his immediate entourage an unworthy acceptance of the Chief Minister's preferences even when they were in error. His very greatness was thus the source of a major defeat. Put more charitably, one might say that he carried the defects of his abundant qualities.

At this moment of deep emotional feeling throughout India at the departure of one of our greatest sons, we would do wrong not to remember the special place that Bidhan Chandra Roy occupied in the life of West Bengal in the period after 1948, when, with consummate skill he gathered to himself the threads of power and became the symbol, as well as the substance, of the pulsating life of India's most difficult State. To the people of Bengal we in India should now pay tribute; for Bidhan Chandra Roy was, if anything, a great son of Bengal. But we should extend to them even more, at this hour of their deep bereavement, our assurance that the terrible scars that West Bengal bears, which even Bidhan Chandra Roy has been unable to heal, are scars which lie on India's face; that we accept for all time the responsibilities which her favourite son had taken fully unto himself and was unable, although he died in full harness, to discharge fully.

We ourselves are not so happily placed in terms of great leadership that we can throw anything that is great and new into Bengal's pool. But, perhaps, this is the time to remember that the leadership of the very few in the Heroic Age of India has ended. Indeed, each tragic passage of a hero reminds us that both the Revolution and the Heroic Age are dying before our eyes. We will need to broaden the shoulders of normal men to take the burden of giants; but at least a new partnership can be born in the process of this sharing. And, indeed, India might even be a better world when the succession is clearly demarcated, and the heroes of the Revolution throw upon the people of India what, in the last analysis, must be their own challenge and their own responsibility. Let us, in laying Bidhan Chandra Roy to rest, raise him for ever in our hearts. Greatness, while dying, begins to live forever. That must be the consolation of Bengal and, indeed, of all India at this time of deep, yet elevating, sorrow.

India and the West

THERE has been increasing evidence this week in India and in Western capitals, notably London and Washington, that the relations between India and the West are under a temporary cloud. The immediate reason given for misgivings on both sides is the controversy over Russian MIGs which India has proposed to purchase, although a final decision has not yet been made. But those who imagine that the present controversy is the sole element in the current difficulties are greatly understating the procession of recent events culminating in the current crisis. The word 'crisis' has been deliberately used; a crisis atmosphere surrounds those, in Washington and London at least, who are currently dealing with these problems. Delhi, it seems, for reasons which are still not adequately explained, is out of touch with the extent to which bonds with the Western world are under strain.

There is widespread feeling in the West—and, unfortunately, the preference for Russian MIGs has lent it some countenance—that Indian neutrality is leaning increasingly towards the Soviet Union. One element in the case is displayed in a frequently quoted statistic that out of 25 recent votes in the United Nations, 21 of India's votes have been cast on the side of the Soviet Union and only four on that of the Western world. There are other less happy complaints; one of the most curious is a powerful personal equation, which cannot be adequately explained to the Indian people. This is no other than the widespread feeling in the West that Mr. Krishna Menon, who is India's main spokesman in the United Nations as well as elsewhere, cannot be trusted to be neutral because he is strongly prejudiced in favour of the Communist world. In the Indian Union, while there is lively controversy on Mr. Krishna Menon, it has not happily degenerated into glaring resentment on any universal scale. There are many who consider that Mr. Krishna Menon is, indeed, a liability to the Indian Union's international interests and, to some extent, to her domestic policies. But it is an undoubted fact that the receiving end in the West, so far as Mr. Krishna Menon is concerned, has been damaged beyond repair. We may consider this wildly unjust; but it is a fact.

One of the reasons why apprehensions have been entertained that Mr. Krishna Menon is exerting undue influence on policy is the currency given, perhaps erroneously, to the setback in the Prime Minister's health. But the point that the Prime Minister has in the last three months gone on three holidays is itself a little indication that his state of health cannot be without concern. And it is becoming increasingly clear that the Prime Minister, at least in his recent Press conferences, tends to show a larger degree of irritation with the Western world than it would seem, in present circumstances, it is either wise or statesman-like to display. In the net result there is an undoubted feeling that the Prime Minister and Mr. Krishna Menon are a little thoughtless in their criticism of the West at a time when the West has its own problems of persuasion, particularly with the Congress in the United States and with the numerous Governments in the Aid-India Consortium.

There is probably ground for considerable complaint on our side. Whether or not we recognise the point that Goa was a departure from Gandhian policy, there is no doubt that the Goa episode has detracted considerably from the courteous and invariably appreciative hearing that Indian statements of the case receive in the Western world. To an extent which is quite alarming the grand image of the Prime Minister as the embodiment of the Gandhian legend has suffered not a little. And thus a combination of both tangible and intangible forces prevents Indian explanations, as on Goa and Kashmir, from receiving their due. We may justly complain of the severity of the tone of the criticisms of India on both the Goa and Kashmir debates in the Security Council. But if Mr. Adlai Stevenson has erred in excess on both occasions—*The Eastern Economist* certainly believes he has — can we claim that the Prime Minister's utterances at his last Press Conference have been more balanced, tolerant and in the long run conducive to better understanding? Mistakes have been made on both sides. It is probable that there is, indeed, a substantial difference of opinion which cannot in the short period be bridged. This is no reason for a counsel of despair; still less for Mr. Menon's recklessness.

The essence of the democratic approach is that it should provide for differences. Indeed, its glory is that friendships, under democracies, go so far beyond differences that discussion of these differences can be free and eventual decisions readily accommodated, however distasteful they may first look. India claims the right to speak out her mind. She cannot deny an equal right to other democracies, whether large or small. It is not incumbent on them to accept our view on Goa or Kashmir any more than we accept theirs on the cold war or nuclear explosions. Intolerance on our part will only call forth intolerance on theirs; and the creation of illwill makes eventual removal of differences more difficult, as we are beginning to find, all too tragically, on Pakistan. It is the path of wisdom for us, as well as of our friends abroad, to recall the path of moderation and good sense. The world, as well as India, has everything to lose by a break in continuous understanding of India's needs. For India great national interests are being imperilled; has the Ministry of External Affairs measured accurately the incidence of its present unguarded utterances on our long-term political and economic interests? There is to be sensed very clearly amongst non-officials in Delhi that we, no less than our friends abroad, are responsible for these tensions that have unhappily come on us at a critical time. Acerbation of present differences will only suit the Communist world; it would be folly even otherwise.

The Enlarged Common Market

By Our Special West European Correspondent in Paris.

NEW DELHI's failure to secure from Mr. Duncan Sandys the "guarantees" hoped for, and Mr. Morarji Desai's decision to go to Brussels to argue the Indian case to all the West Europeans together, typify the shift that occured this month in discussions of Britain's admission to the Common Market. Not only in this matter, but in every other from wheat and butter to nuclear weapons, it has been realised that the procedure of negotiating specific guarantees before Britain joins is fruitless. The only workable solution is for Britain and the Six to resolve to unite, first economically and later politically, and then face up jointly to their new responsibilies: their responsibilities to the Commonwealth, to the developing nations as a whole, to the European neutrals and to the USA and its dependents. There is still talk of prior guarantees and preliminary assurances on which the upshot is supposed to depend; London has been saying for so long "we won't join unless this, unless that and unles the other", that she cannot afford to appear to be dropping all her demands and deserting her freinds outside Europe. Yet the method has changed radically. What were previously presented as conditions to be fulfilled before a hypothetical British entry are now taken as tasks to be tackled by the enlarged Common Market after Britain's certain entry.

This is in no sense a defeat for Britain, though it might appear at first glance that she has been obliged to abandon the quest for specific guarantees and to join the Six without making conditions. On the contrary, she has succeded in persuading the Six that the conditions she set reflected international realities of the highest importance, to which the enlarged Common Market will have to apply itself. She has convinced them that the addition of Britain to their number is not simply an enlargement such as would result from another West Germany appearing among them, but a radical transformation of their whole enterprise, because of Britain's multifarious connections with the Commonwealth, with the English-speaking world and with the small nations of Europe. In return, the Six have proven to London that it is impossible to work out beforehand detailed means of respecting all these connections (despite the hasty promises made by the British Government last year) and that the only solution is for the Seven to re-think the whole problem on a higher plane after Britain's entry. Thus, instead of trying to guarantee beforehand, by tariffs and quotas, outlets for so many pounds of New Zealand butter or Australian wheat, the enlarged and transformed Common Market would have to find global solutions to the chronic excess of cash-exports of food. Instead of hoping to assure India her traditional textiles markets, the West Europeans would have to find ways of maintaining and expanding India's exchange resources.

This change in method was foreseen as early as last January by many people in Brussels and Paris. It was in echoing their views that I wrote here on Febraury 2, after recalling that numerous questions of detail had been left unsettled by the Rome Treaty: "Inevitably, if there are difficulties in Brussels, people will suggest doing the same thing in Britain's case: admit her after she has sworn a mighty oath to work for European integration and then settle the rest inside the club. Unfortunately, London's public insistence on specific guarantees for Commonwealth interests before she signs on the dotted line could make impossible adoption of this sensible method. As long as Britain demands detailed arrangements in favour of her present camp-followers, the Six will reply by demanding specific counter-guarantees, and matters could drag on indefinitely — because at that level of *quid pro quo*, many problems are simply insoluble. It is by taking a larger view, with the risks it entails, by agreeing on a general line of policy that all seven nations will follow and then filling in the details later, that Commonwealth interests would probably be best protected in the long run."

Already at that time, these people were forecasting the general sort of approach that is now being used in Brussels: "The common feature of all these solutions is that the method of bargaining Britain's entry by an impossible exchange of detailed guarantees should be abandoned as soon as its infinite complexity is recognised. Instead, Britain will join the Common Market after subscribing to general principles which will not be dictated by the Six but which will represent an effort to solve European problems at the European level. The details would be worked out later in a community spirit; this is the only way the Six have solved any of their problems because, although there was some elaborate horsetrading before the Rome Treaty was signed, most of the guarantees and escape clauses written at that time have never been invoked — they proved to be dead letters once the association faced up to its problems as an association. Give the Brussels talks a few more months to lose themselves in the labyrinth they are heading for, and you can expect to see the Gordian-knot cutters get a good hearing for proposals of this kind."

The conversion to this point of view may be dated from the start of this month. By then it was clear that it was false to present the situation in these terms: "Britain will not join if they are not met before hand; but she will not join if they are not met". This was false, firstly because it had turned out to be impossible to meet those conditions, but secondly because it had become apparent that there could be no question of Britain not joining. For the talks to fail and Britain to withdraw her application would have meant the end of the Common Market, even as a six-nation enterprise, for it could not survive the responsibility of shutting the door in Britain's face. It would also have meant, at a later date, the dislocation of the Commonwealth, for the trust that has been shaken by Britain's attempt to enter Europe would not have been restored simply because she failed to get in. At this moment, both the Common Market and the Commonwealth are out on a limb. The only prospect of saving both is to go forward, for there is no going back; Britain will have to join the Common Market and that association will have to make generous arrangements with the Commonwealth that safeguard its interests. Those arrangements, naturally, will have to be made by the enlarged association as a group; they cannot take the form of unilateral assurances dispensed by Britain before her entry and then accepted by the Six.

The Gaullist Cabinet may have been the last to recognise the new situation, but it was the first to declare it publicly. The last: because as lately as last month Paris seemed to imagine that Bri-

tain's admission could be made conditional on a prior bargain about atomic defence. The first: because there was some heartburning in London after the Champs meeting between de Gaulle and Macmillan when inspired reports from Paris stated that Britain's entry was now a foregone conclusion. Critics of the Premier took this to mean that at Champs he had abandoned all his preconditions and virtually surrendered to de Gaulle. On the contrary, the surrender, if any, was on the other side: the French President realised that there could be no refusing Britain on this pretext or that, and that the only solution to the problems he had created (a propos European unity and defence, for example) was to press forward: admit Britain and then treat those questions at the wider European level.

For it should be clear that de Gaulle was as much out on a limb as anybody, and Mr. Macmillan was his only hope of salvation. He had led the European unity movement into an impasse, by refusing the suprantionality that was the ambition of its inventors while seeking to build a looser federation without Britain as founder-member. The only way out of this dead-end was to disarm all his European Unity critics by admitting Britain, who favoured his idea of a loose federation. Equally serious if less widely recognised is the impasse to which his independent atomic defence policy is heading. Its realisation supposes, not only an open breach with the USA, but the building of an isotope separation plant at Pierrelatte for which the first estimates were 100 million francs, but which is now seen to cost 400 million francs. All his opponents from Left to Right would rally to a motion of censure or a refusal to vote these credits: the European Unity fanatics, the friends of Britain, the NATO loyalists, the critics of a national nuclear force, and the defenders of sound money. The present French Government could be brought down tomorrow — or rather next week, after the Algerian affair is formally settled; a trial run, in the shape of a platonic censure resolution, has already gathered more than the necessary majority. A European federation including Britain, which could devise a joint defence policy within which France's nuclear force would be less of an absurdity, is the only way forward for de Gaulle. On the political and military level, too, as well as on the economic, the solution is to unite with Britain and work out the details later. No one can impose pre-conditions which, if not met, would lead to rejection of Britain's application.

Mr. Sandys's inability to guarantee the things Delhi wanted reflects the obverse side of this situation. Ultimately, the Australian and New Zealand Premiers, who went to London to take a more aggressive line, got little more. Mr. Heath has realised that he would be misleading them if he repeated the firm promises made incautiously last year, for it has emerged that there is no way to devise formal arrangements with the Commonwealth without cutting across the obligations that the enlarged Common Market has contracted toward its own industry and agriculture, toward the USA and Latin America, and toward Africa and the other developing regions. There is no way of adding up everybody's preferences and merging everyone's protected markets and guaranteed outlets, because they are all basically incompatible. Fresh global solutions will have to be sought, in which international agreements covering all the producers and consumers of various products (textiles, wheat, etc.) replace the mutually conflicting protected areas that survive from the age of European empires. Only the enlarged Common Market including Britain will be capable of that

GOVERNMENT OF INDIA

3¾ PER CENT. NATIONAL PLAN BONDS — FIFTH SERIES (3¾ PER CENT. 1968) ISSUE PRICE RS. 99.20 PER RS. 100 (NOMINAL).

REPAYABLE ON 12TH MAY, 1968.

4 PER CENT. LOAN 1972 ISSUE PRICE RS. 99.20 PER RS. 100 (NOMINAL) REPAYABLE ON 1ST AUGUST, 1972.

4½ PER CENT. LOAN 1985. ISSUE PRICE RS. 100 PER RS. 100 (NOMINAL) REPAYABLE ON 12TH JULY, 1985.

Subscriptions to the above bonds and loans will be received simultaneously and will be limited to a total of Rs. 250 crores (approximately). Subscriptions may be in the form of (i) cash/cheque or (ii) securities of the 2¾ per cent. Loan 1962 or 3¼ per cent. Bonds 1962 which will be accepted for conversion at Rs. 99.50 and Rs. 100 per Rs. 100 (Nominal) respectively.

Interest on 2¾ per cent Loan 1962 tendered for conversion will be paid upto 11th July, 1962. Interest on 3¼ per cent. Bonds 1962 tendered for conversion will be paid for the full half-year ending 15th July, 1962.

Interest on the new bonds and loans will accrue from 12th July, 1962. Interest on the 3¾ per cent. National Plan Bonds — Fifth Series (3¾ per cent. 1968) will be paid on the 12th November, 1962, for the period 12th July to 11th November, 1962, and thereafter half-yearly on the 12th May and 12th November. Interest on the 4 per cent. Loan 1972 will be paid on the 1st August, 1962 for the period 12th to 31st July, 1962 and thereafter half-yearly on the 1st February and 1st August. In the case of 4½ per cent. Loan 1985 interest will be paid half-yearly on 12th January and 12th July.

Subscription lists will open on 12th July, 1962 and close on 14th July, 1962 or earlier without notice.

Applications for the bonds and loans will be received at:-

(a) Offices of the Reserve Bank of India at Bangalore, Bombay, Calcutta, Madras, Nagpur and New Delhi.
(b) Branches of the Subsidiary Banks of the State Bank of India conducting Government business; and
(c) Branches of the State Bank of India at other places in India.

For full particulars apply to any of these offices or branches.

THE WEEK'S NOTES

Obituary

P. D. TANDON

WITH THE passing away of Mr. P. D. Tandon on July 1, 1962, the Indian Union has lost one of her foremost freedom fighters. For his selfless and dedicated work, and for his uncompromising attitude in all matters wherein he did not agree with his colleagues, he will always be remembered throughout the country. Only a year ago he was awarded the Bharat Ratna — the highest award for service to the motherland — which described him as "the doyen among the fighters of the national movement".

Early in his political career he had realised that the economic progress of the country through expansion in both industry and trade was as essential as the political freedom. To encourage industry and commerce in northern India he did valuable work in consolidating and popularising the Punjab National Bank. He was associated with the Bank as its Secretary long before the realisation dawned upon the political leaders of his standing that an industrial revolution was essential in order to raise the level of living of the people.

His performance as the Speaker of the U.P. Assembly will go down in the history of the State because of the extreme impartiality with which he conducted the affairs of the Assembly. He was also elected to the high office of the Congress President in 1950 but his unyielding attitude again forced him to give it up before the completion of his tenure. He was a lover of Hindi and one of the founders of the Hindi Sahitya Sammelan. Unfortunately, his love for Hindi was wrongly interpretted in certain quarters so as to paint him as a communalist. This was indeed unfortunate because he was a nationalist of the highest order and a follower of Kabir who preached communal harmony. He was a man of saintly aptitudes and had great faith in nature cure. He avoided the use of medicines as far as possible. The country will always remain in his debt for his dedicated service.

Central Borrowings

NEW LOANS

THE UNION GOVERNMENT has floated three fresh loans for Rs. 250 crores, the outstanding feature of which is that the terms offered to the investors are more attractive than those of any loans floated previously. This may be illustrated with reference to the yield on the new and the old loans. The interest on the new 1968 National Plan bonds which will be issued at Rs. 99.20 would work out to be 3.90 per cent as against 3.78 per cent on a similar loan maturing in 1968 floated earlier. Again the interest on the 1972 loan would work out to be 4.10 per cent as against 3.98 per cent on a comparable old loan. This also applies to the third long-term loan maturing in 1985 whose yield will be 4½ per cent as against 4.11 per cent, available on an old loan maturing in 1981. The Union Government has also consented to accept the old maturing loans for conversion. Two such previous loans are to mature this year, one on July 15 and the other on November, 15.

The yield on the new loans is certainly tempting for all investors. The simultaneous action taken by the Reserve Bank to restrict the subscription to these loans by the scheduled banks by withdrawing money from the Reserve Bank is designed to mop up the true savings of the people. The normal quota of withdrawal of the banks has been reduced by half which will force them to fall back upon their own resources for subscription to the new loans.

There are clear indications that the new loans will be fully subscribed as ample funds are available in the domestic market which are not getting utilised because of the paucity of foreign exchange. Many industrial projects have failed to attain maturity because the much-needed foreign exchange resources to match the domestic funds are not available. If and when foreign exchange position becomes easy, the surplus funds will certainly get absorbed, creating tightness once again in the market. Currently there is a plethora of funds which makes the task of the Union Government in raising loans comparatively easy.

The increase in the interest rates of the new loans will naturally depress the market prices of the old, long-term securities. This is the price of the dear money policy which the country must pay. The advantages accruing rom the dearer money policy will certainly overweigh the disadvantages since the saving habit in the country will receive a genuine stimulus. The chain-reaction of rising yields on gilt-edged securities will also communicate pressure on the deposit rates leading to higher cost on credit. To the extent that the burdens on the industry will increase so as to make the Indian manufactures non-competitive in the international markets, the impact of the new money policy will be harmful.

Central Africa

RWANDA AND BURUNDI

IN RECENT years the wind of change has been blowing fast over the African continent. One after the other many new nations have regained their sovereignty and have joined the brotherhood of free nations. The latest to regain independence are the twin States of Rwanda and Burundi, situated in Central Africa and surrounded by the republic of Congo, Tanganyika, Kenya and Uganda. Jointly, the two States cover an area of 20,916 sq. miles and have a population of 4,85,000. From July 1, Burundi will be a monarchy while Rwanda will establish a republic.

Keeping in view the smallness of the two states, could they not be united after independence? The explanation for the cleavage lies in the historical growth of the two countries—first under the Twa, then under the Hutu and lastly under the Tutsi—which resulted in the establishment of two kingdoms. The mandate of 1919 which entrusted these countries to Belgium brought them together under the name of Rwanda-Urundi. Even though the mandate imposed political unity, the Belgian administrators did not abolish the traditional forms of organisation with the result that the two countries kept apart socially as well as emotionally. Political separation will also force economic segregation which may have serious repercussions on the economic development of the two lands. This is indeed unfortunate but there is no doubt that "enforced unity" may prove still worse.

Except for 900 soldiers, the Belgians have withdrawn all their forces. The UN passed a resolution in the last week of June according to which Belgium was asked to withdraw the remaining soldiers from Rwanda-Urundi before August 1, 1962. The Soviet Union amendment to bring forward the date of withdrawal to July 1, 1962 was defeated. The resolution, however, insisted that the Belgian forces "will no longer have any role to play". Lest the history of Congo be repeated in these twin States, the United Nations has authorised an emergency aid of $2 million. A special UN representative and a team of experts have also been appointed for supervising the evacuation of Belgian troops and to provide assistance to the new Governments in administrative matters.

China

TENSION IN TAIWAN

SOUTH-EAST ASIA seems to be in the grip of a bellicose spell. Hardly had the Laos tangle been resolved when reports appeared in the press that the Chinese Communists were amassing their troops along the Taiwan Straits. Only four years ago, the off-shore islands of Quemoy and Matsu, which are under the control of Nationalist China, were shelled heavily by the mainland Chinese. Beyond wasting the shells, the Communists gained nothing—strategic or otherwise. Communist China's renewed militant activities at this hour when the country is plagued by food shortages are indeed intriguing. Ostensibly the moves are prompted by the fear—real or imaginary—of an offensive from Chiang Kai-Shek's forces to overpower the mainland.

An immediate outcome of these developments has been to prompt President Kennedy and Premier Khrushchev to make the position of the USA and the USSR clear in case of a flare-up in this area. In a news conference in Washington on June 27, 1962, Mr. Kennedy is reported to have said: "It seems important that the position of the United States Government be clearly understood. Our basic position has always been that we are opposed to the use of force in this area. In the earlier years, President Eisenhower made repeated efforts to secure the agreement of Communist China to the mutual renunciation of the use of force in the Taiwan area; our support for this policy continues.

"One possibility is that there might be aggressive action against the offshore islands of Matsu and Quemoy. In that event, the policy of this country will be that established seven years ago under the Formosa Resolution.

"The United States will take the action necessary to assure the defence of Formosa and the Pescadores. In the last crisis in the Taiwan area in 1958, President Eisenhower made it clear that the United States would not remain inactive in the face of any aggressive action against the offshore islands which might threaten Formosa.

"Exactly what action would be necessary in the event of any such act of force would depend on the situation as it developed. But there must be no doubt that our policy, specificaally including our readiness to take necessary action in the face of force, remains just what it has been in this matter since 1955."

Again, according to a press report from Moscow, Premier Khrushchev declared on July 2, 1962 that the Soviet Union would back mainland China in any military crisis in that zone. If Chiang Kai-Shek launched an offensive on the mainland, the Russian army would fight shoulder to shoulder with the Chinese forces. "This is not the first time the friendship of the Soviet and Chinese people has been tested" said Mr. Khrushchev.

Will Mao or Chiang Kai-Shek take initiative in raking up trouble when such firm statements have been made by the leaders of the two camps? If anyone of them does make a military move, the outcome is a foregone conclusion. There may be loss of lives on both the sides and some wastage of armaments, but in terms of territorial gains no one would gain. It would be a futile tussle.

A Letter to the Editor

GANDHI AND THOREAU

[We reproduce below the relevant portion of a letter addressed by Mahatma Gandhi to Mr. Kodanda Rao. Its significance lies in the fact that it gives a fuller amplification of the following quotation from Mahatma Gandhi, appearing at the end of the second paragraph of the Special Article, under the above caption, published in our issue of June 8, 1962: "You have given me a teacher in Thoreau who furnished me through his essay on 'The Duty of Civil Disobedience' scientific confirmation of what I was doing....." .

We are thankful to Mr. Kodanda Rao for providing us with this interesting letter. —Ed.]

WARDHA,
10th September, 1935.

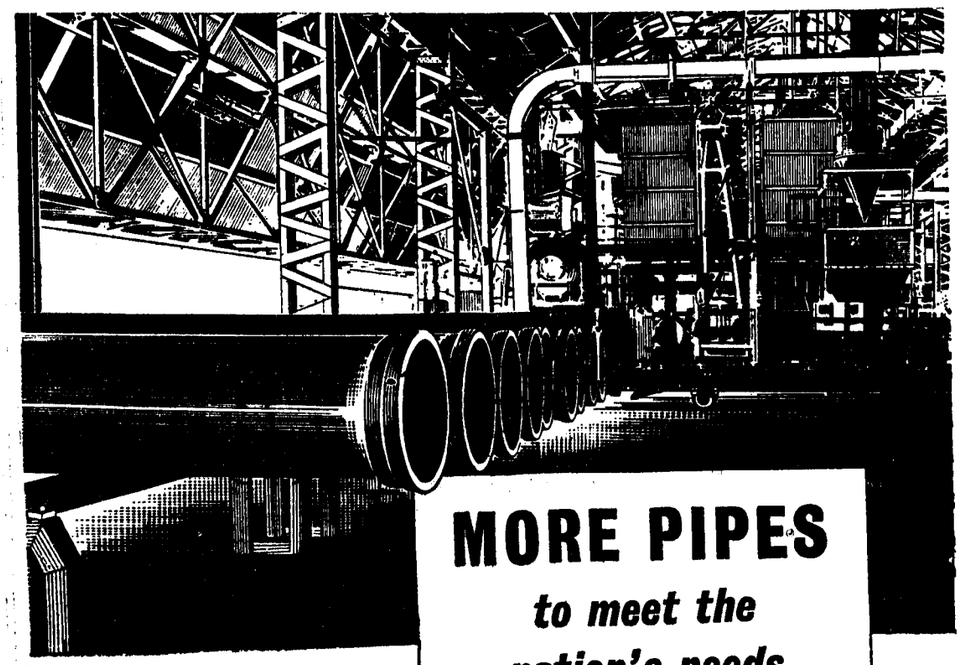
Dear Kodanda Rao,

The statement that I had derived my idea of Civil Disobedience from the writings of Thoreau is wrong. The resistance to authority in South Africa was well advanced before I got the essay of Thoreau on Civil Disobedience. But the movement was then known as Passive Resistance. As it was incomplete I had coined the word Satyagraha for the Gujarat readers. When I saw the title of Thoreau's great essay, I began the use of his phrase to explain our struggle to the English readers. But I found that even 'Civil Disobedience' failed to convey the full meaning of the struggle. I therefore adopted the phrase Civil Resistance. Non-violence was always an integral part of our struggle.

Yours sincerely,
Sd/- M.K. GANDHI.

Tata-Ebasco

CONSULTING ENGINEERING SERVICES



Tatas have pleasure in announcing the establishment of an Indian consulting engineering firm in partnership with Ebasco Services Incorporated, New York, the internationally renowned consulting engineers.

The firm will direct its efforts towards providing complete engineering services for India's fast growing electric power systems. These will range from making preliminary studies and feasibility reports to preparing complete designs and, where necessary, providing construction supervision of generating plants and other facilities for the production, transmission and distribution of electric power for large inter-connected systems as well as for industrial units. Technology in higher pressure and temperature ranges of the most modern and efficient large-capacity thermal plants will be made available, particularly through the American partner's extensive experience in that field.

This new partnership will help in conserving substantial amounts of foreign exchange normally required for consultant services of this nature.

MORE PIPES

to meet the nation's needs

With the addition of a second plant at the Kulti Works of The Indian Iron & Steel Co. Ltd., the production of spun iron pipes has increased from 60,000 to 150,000 tons per year. Besides helping to satisfy India's growing demands for large diameter pipe mains, the increased tonnage saves India many crores of rupees annually in foreign exchange. Employing latest techniques, the Kulti Works of IISCO is the first to produce 3" to 30" diameter spun iron pipes in the country.

THE SEARCH FOR TRUTH

By ODYSSEUS

IN HER NEW BOOK, "From Fear Set Free" (Gollancz. London,. 1962. 25 sh.), Mrs. Nyantara Sahgal reveals herself as a domesticated woman, who centres her life on her family and children, but who yet manages to cultivate the intellectual interests that she acquired at college and from the Nehru and Pandit families into which she was born.

Whereas centuries ago it was possible for continents to lead, like mediaeval China, India, and Europe, isolated lives, unconscious of each other's existences, today modern communications — radio and jet air travel — have made us all conscious of each other. This would be all to the good were it not that modern weapons — the H bomb and inter-continental missiles — have at the same time made us all afraid of each other. The fluctuating major tensions between the USSR and the USA, criss-crossed by threats over Tibet, Nepal, Ladakh, Berlin, Laos, and elsewhere, together with rising unrest in Africa which has extended the cold war to that unhappy continent, spread anxiety in all corners of the world. This anxiety impinges less on the ordinary man in the Asian village or the European street, because these matters are, for the most part, and happily, beyond his grasp. But the intellectual shares Mrs. Sahgal's sense of individual helplessness before the knowledge that the decision to let loose a war which would end civilisation as we know it, rests with a handful of ministers and generals in Moscow and Washington, DC.

West Europeans and North Americans hold that the short term solution lies in maintaining a balance of nuclear power between the USSR and the USA so that both are deterred from using it by knowing that to start a war would mean the destruction of both. The long term solution, in their view, is to work for phased armaments reduction, controlled by inspection.

Mrs. Sahgal questions this global security system. At what stage does one feel really secure and what are all the bombs worth if they bring no peace of mind to their possessors? Mrs. Sahgal does not say so in so many words but the context of her argument suggests that the solution for her lies in Gandhi's code of non-violence. On learning of China's aggression against Ladakh, Mrs. Sahgal felt that if India had to defend its freedom, military strength would not satisfy her. She rejects "wanton destruction" and clings to non-violence. She would want to bar the way with her body, knowing that she might die, but that four-hundred million other, similarly pledged, would not all die. This, she says, was what Gandhi meant by sublimating physical to moral force. It had suffered setbacks but never for long. Great good is sometimes eclipsed but a thin stream of it continues to flow, enduring evidence of the creative principle that survives all disaster.

WHEN SATYAGRAHA WILL WORK

My sympathies are deeply with Mrs. Sahgal in her conviction of the vital importance of upholding moral values, but I believe that she confuses the argument by seeming to imply that satyagraha is the supreme and sole practical application of these values.

There are circumstances in which satyagraha will work, and where it is, therefore, infinitely preferable to violence, but there are others in which it will not work, and in which, I suggest, the highest morality consists in readiness to fight physically in defence of threatened values.

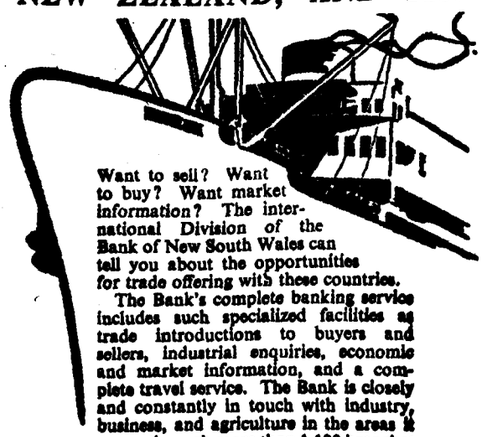
What did satyagraha in India prove? That it is a weapon which unarmed masses can use in a rebellion for political freedom against rulers who, sooner or later, respond to their consciences and to public opinion, their own and that of other countries. General Dyer's shooting at Amritsar in 1919 was a turning point in Indo-British relations, precisely because it shocked public opinion in both countries so deeply. In a Hitlerian or Stalinesque dictatorship, censorship would have prevented public opinion from hearing about Amritsar, and such a shooting of a "mere" 379 people would have meant nothing to the Nazis who reduced the Jews in Germany from several millions to a few thousands. There is no answer to a gas chamber or a machine gun if you are ready to use them ruthlessly.

In contrast, the Duke of Connaught, when opening the new Indian legislature in 1921, went out of his way to say "the shadow of Amritsar lengthened over the fair face of India". Note that he spoke as representative of the rulers and that his speech must have been approved as official policy. On the other hand, could India's Himalayan frontier be defended by satyagrahis? Mrs. Sahgal urges that four-hundred millions, pledged to satyagraha, would not all die. But first, the idea of persuading four-hundred millions to give up their lives as satyagrahis is wholly unreal: it is a physical impossibility. Even under Gandhi's leadership complete non-violence was never attained, as the killing of 21 policemen at Chauri Chaura in the U.P. in 1922 and around 600 acts of terrorism by Bengali and other terrorists between the wars testify. Nevertheless, supposing that four-hundred million were (a) capable of grasping the idea and (b) of carrying it out, the survivors would be free only as long as there existed an undefeated Indian army, aided by the soldiers of friendly countries. The satyagrahis might be a great help to these armies, but if the armies were defeated nothing could prevent the satyagrahis from losing their freedom. That 27 per cent of India's budget is spent on arms suggests that Mrs. Sahgal's uncle does not agree with her.

An idea, such as non-violence, only works with people sufficiently morally developed to respond to it. This does not dismay Mrs. Sahgal, who says that it has after all taken millenia for men to learn to walk upright, why, then, do people imagine that non-violence, the final stage of the process of refining human beings, can be arrived at quickly? This is to take a philosophical view of such extraordinary extended length as to be meaningless to you and me who have only a few score years to live on this earth. What matters to the Tibetans, for example, is what has happened to them here and now, in their present lives, not what may be possible fifty thousand years from now. What did happen to them?

YOU CAN'T LIVE IN ISOLATION

In 1950, without warning, Chinese armies invaded Tibet, which appealed to the UNO for help. To those who are always telling us that foreign policies should not be based on armed strength but "on the UNO", the outcome must have been a shock. The UNO de-



cided not to intervene on the excuse that the "legal position was not clear." Of India's attitude towards Tibet's appeal to the UNO, the Dalai Lama quietly writes in his book "My Land and People" (Weidenfeld & Nicolson. London. 1962) that it was "disappointing. We felt abandoned to the hordes of the Chinese army. Now we had to learn the bitter lesson that the world had grown too small for any people to live in harmless isolation." Within a few weeks the Chinese garrison in Lhasa rose to 13,000, requisitioning supplies on a scale which led "our simple economy to break down ..... the people of Lhasa were reduced to the edge of starvation ..... In this period of mounting tension," continues the Dalai Lama, "in which opposition merely angered the Chinese, I reasoned that violence was useless. The Chinese would always win if we fought ..... Our only hope was to persuade the Chinese peaceably to fulfil the promises made in their agreement. That meant co-operation whenever possible and passive resistance whenever it was not. For violent opposition was not only impractical, it was unethical." The Dalai Lama and Mrs. Sahgal see eye to eye. The outcome has been that the Tibetans are subject to alien rulers and an alien philosophy of life.

I do not suggest that the Tibetans could have resisted the Chinese by force. By then, it was too late. The fact is, as the Dalai Lama sadly recognises, the world has grown too small for any people to live in isolation. The solution is to cultivate the friendship of countries with like interests to one's own and to form part of a system of security, regional or global. This is a counsel of despair to the perfectionist, like Mrs. Sahgal. I feel, however, that what she leaves out of account is that evil as well as good exists in the world. Mrs. Sahgal's faith in non-violence is equivalent to faith in the ultimate triumph of good. I submit, however, that while evil can be held at bay, it can never be eliminated. Why? Various philosophers have given various answers, but only the materialists, like the Marxists, reject this view, because they reject free will. Unfortunately, one half of the world is subject to Marxist Determinism and the other half is either so well off materially, or so intensely pre-occupied with seeking material advance, that it is becoming indifferent to spiritual values.

Those who have striven to uphold spiritual values have, in all ages, been few. The masses are always average sensual men. In the past, however, the influence of the few has been sufficient to colour popular ideals. Exceptions to the spiritual leadership of the elite have been a few periods of history of striking increases in material prosperity when man has seemed to be rapidly attaining command over the universe. Then (as today) spiritual values are at a discount. C.E.M. Joad defines such a period of material prosperity and increasing spiritual indifference as decadent (see his "Decadence". Faber. London. 1948). In the past, such ages have ended in disasters, usually through barbarian invasions which have opened up "dark ages." Thereafter, there gradually emerges a renaissance of interest in spiritual values. In times of storm men are humble and remember God. But the advent of democracy has created a new factor, which may break the old circle of decadence and renaissance. Political flattery of the masses in democracies substitutes adulation of the lowest common denominator for respect for the culture of an elite and could render impossible the spiritual renaissances which have recurred in the past, and could ensure the permanent triumph of materialism.

There is no easy solution. Clearly, educated people have a tremendous obligation to perfect their understanding of eternal values and to persist in trying to influence popular thinking by their deeds and words. If, in addition, they have, like Mrs. Sahgal, a gift for writing, their opportunities for influence are wider and their responsibilities greater still. I may disagree with Mrs. Sahgal's belief that non-violence solves all problems, but in her search for the truth, and propagation of it, as she sees it, I am her devoted admirer. In the clash of argument between searchers, the truth becomes clearer.

AUSTRALIA'S LARGEST COMMERCIAL BANK CAN HELP YOU TO PROMOTE TWO-WAY
TRADE WITH AUSTRALIA, NEW ZEALAND, AND FIJI

Want to sell? Want to buy? Want market information? The international Division of the Bank of New South Wales can tell you about the opportunities for trade offering with these countries.
The Bank's complete banking service includes such specialized facilities as trade introductions to buyers and sellers, industrial enquiries, economic and market information, and a complete travel service. The Bank is closely and constantly in touch with industry, business, and agriculture in the areas it serves through more than 1,100 branches and agencies.

Economic Report from the U.S.

U.S. CREDIT TO CANADA

By GUY SIMS FITCH

WASHINGTON, July 2.

ANOTHER convincing demonstration of the shared determination of five nations to help one another withstand capital outflows that threaten international monetary stability is provided by the extension of external credits to Canada. The assistance is truly massive in size and scope, involving more than $1,000 million from the United States and the United Kingdom, plus France, Germany, Belgium and the Netherlands—the latter four countries via Canada's first International Monetary Fund drawing.

The United States is making available $650 million to help its northern neighbour and long-time friend, despite its own balance-of-payments difficulties. This is nearly two-thirds of the total aid package, and underscores the key US role in world financial affairs. At the same time, the Canadian government has announced a number of unilateral steps to help defend the stability of its currency and reinforce its sagging fiscal and balance-of-payments positions. Admittedly, many of these could affect adversely the United States and other countries.

The projected increase in Canadian interest rates, for instance, could draw funds from and lead to increased borrowing in the United States, where interest rates would be lower. Also, while the Canadian government has given assurance that new surcharges, or added tariffs, on about half of Canada's imports are temporary, they could—especially if allowed to stand for long—have an unfavourable impact on the $9,200 million US-Canadian trade. These developments might tend to increase the US payments imbalance. The United States cannot help but recognize this risk, but it also recognizes its traditionally close ties with Canada and its interest in international efforts to stabilize and strengthen the free world's financial mechanisms. Moreover, the Canadian and US positions differ significantly, both in kind and degree.

While Canada has been running huge trade deficits, the United States has a healthy surplus in its trading accounts—its excess of exports over imports. The overall Canadian payments deficit, furthermore, is much larger than that of the United States in relation to the size of its economy, and it has been growing in an alarming fashion. The US payments deficit on the other hand, has been declining steadily in these past two years, and appears to be well under control.

In contrast to Canada's marked domestic inflation, the current US economic expansion has been largely non-inflationary in charactr, with price levels generally stable. This underscores the fact that every country mus approach its problems in the light of its own circumstances and its own international position. For the United States, with an economy and a currency that are basic to the free world's economic and financial progress, this has meant no general import restrictions, but rather an emphasis on increasing its trade surplus through an ambitious export expansion programme. The United States has no intention, of course, of retreating from its international responsibilities. It has been attempting, however, to cut back on its military outlays abroad and to curtail the net loss of dollars under its vast foreign economic aid programme—both major causes of its balance-of-payments troubles. Its goal is to have about 80 per cent of its aid outlays spent for the purchase of American goods and services.

In these efforts, the United States has been working with the Organization for Economic Co-operation and Development and other international bodies to have other industrial nations—particularly those with strong payments positions—assume agreater share of the common aid and defence burden. In addition, West European nations are being urged to widen their capital markets so as to reduce the drain on US dollars sustained through the constant tapping of US markets. Above all, the United States is demonstrating that its economy is competitive and that it can further accelerate a growth rate which, while commendable, has still to fully utilize the nation's vast productive potential. In view of the prominent international position of the United States, continued US economic growth in the present non-inflationary climate could contribute immeasurably to the economic strength of all free nations.

ANNOUNCEMENT

The following Annual Numbers of THE EASTERN ECONOMIST are available for sale. Special concession may be given to educational institutions, libraries and students, if a single order exceeds Rs. 50|-.

1. India & the World and India in 1950 — Rs. 5|-

ECONOMIC GROWTH OF DEVELOPING COUNTRIES: 1950-51—1958-59

THE depressingly low rate of growth in gross domestic product of the developing countries is the central theme of the World Economic Survey, 1961. Pakistan, Honduras, Peru, Thailand, Portugal, Tunisia, Morocco, India, Chile, Indonesia, Ireland and Argentina all have growth rates of less than five per cent from pitifully low bases in many cases. India's place in this group should temper our enthusiasm and disturb our complacency. The growth of these countries has been hampered by the slow rate of industrialisation consequent upon shortages in foreign exchange. Their salvation lies in the expansion of the industrial sector and the promotion of the export trade. Will they be able to pursue their planned path to prosperity?

The analysis made by the UN Survey indicates a close correlation between the rate of growth in manufacturing production and gross domestic product. In almost all the underdeveloped countries the annual rate of growth in gross domestic product has lagged because of the slowness of the manufacturing sector; wherever an exception occurs when the rate of growth in manufacturing production has raced ahead of the gross domestic product, the results are to be interpreted with caution. This may be illustrated with reference to the case of Pakistan. Whereas the annual rate of growth in manufacturing production in Pakistan during 1950-51 to 1958-59 was 9 per cent, the rate of growth of gross domestic production was one-third at 3 per cent per annum. This is because in 1950-51 the industrial base in Pakistan was extremely small. Whatever increase occurred during the last decade, it tended to exaggerate the gains in percentage terms.

In almost all the developing countries the industrial sector constituted only a "minor segment" of the economy. In no case was industry more than one-fourth of the total economy. On the other hand, the advanced countries enjoy the privilege of having transformed their economies to such an extent as to claim more than half of the total output from the industrial sector alone. That shows the gap which needs to be bridged in order to industrialise the developing countries. Capital goods industries in particular need special attention. Currently in some of the advanced under-developed countries emphasis is being placed on this vital aspect.

The table below shows the relationship which exists between the growth in manufacturing production and

RELATIONSHIP BETWEEN GROWTH OF MANUFACTURING PRODUCTION AND OF GROSS DOMESTIC PRODUCT: 1950-1951 TO 1958-1959

Country	Annual rate of Growth (Percentage)		Manufacturing Production as percentage of Gross Domestic Product	
	Manufacturing Production	Gross Domestic Product	1950-51	Change from 1950-1951 to 1958-1959
Republic of Korea	19	5	7	6
China (Taiwan)	15	8	17	3
Venezuela	12	8	9	2

Indonesia	2	4	9	—1
Ireland	2	1	27	2
Argentina	1	2	23	—1

gross domestic product from 1950-51 to 1958-59. In the case of the Indian Union the rate of growth in manufacturing production as well as gross domestic product is the same at 3 per cent per annum. It may be asked as to why the manufacturing rate of growth has been so small while industrial investment has taken place on a wide scale since the beginning of the First Plan in 1951-52. The data used by the World Economic Survey is based upon the national income estimates prepared by the Central Statistical Organisation of the Government of India. While the share of the factory establishments has been steadily rising and has more than doubled during the last decade, the share of the small enterprises has been almost stagnant. The fact is made clear by a study of the table below. In the overall picture of industrial growth including both small enterprises and factory establishments, the rate of rise tends to be on the lower side. The index of industrial production relating to the organised sector of industry has, however, recorded a rate of rise of 7 to 8 per cent per annum on the average, while in the case of power generation the increase has been much higher at more than 15 per cent per annum.

INDIAN UNION: NATIONAL INCOME ORIGINATING FROM

(Rs. Abja)

	(a) Factory Establishment	(b) Small Enterprises
195-051	5.5	9.1
1951-52	6.4	9.5
1952-53	6.4	9.7
1953-54	6.9	9.8
1954-55	7.5	9.6
1955-56	7.8	9.7
1956-57	9.0	9.8
1957-58	9.8	10.0
1958-59	10.0	10.3
1959-60	11.1	10.8
1960-61	13.4	11.4

Abja=100 crores=1000,000,000.

One of the major limiting factors in the economic development of the under-developed countries arises from the balance of payments. Most of these countries have always depended upon their primary products for earning foreign exchange. The developing of export trade in manufactures has not increased significantly in recent years. Whenever the developing countries have attempted to compete with the advanced countries in manufactures, a number of obstacles arose—mainly of quality and price. In the case of those manufactures where even these hurdles were overcome, new problems appeared in the shape of economic grouping of industrially advanced countries. The Economic Survey particularly draws attention to the apprehensions of the developing countries in regard to the impact of the E.E.C. and the E.F.T.A. on their exports. If the developing countries are to march on the road to progress they must be assisted in the expansion of their export trade. Aid, on whatever scale, can only supplement their resources. Any steps taken to limit the foreign exchange earning capacity of these countries will nullify the impact of even the financial assistance offered by the industrially advanced countries.

The performance of the centrally planned economies in the sphere of foreign trade is encouraging, in percentage terms, as compared with the developing countries as well as the developed countries. During the past decade, the foreign trade of the centrally planned economies increasd at an average annual rate of 12 per cent which is nearly three times the rate of growth in foreign trade of the developing countries and nearly one-third faster than that the industrially developed economies. The less developed countries amongst the centrally administered economies have a happy record in expansion of foreign trade. They could not have achieved this vast rate of growth without speeding the process of industrialisation. Also, the economic co-operation between the centrally administered economies was one of the reasons for expansion in trade.

The fate of the under-developed countries is intricately linked with the developments in the advanced countries. According to the Survey, the current year may be another year of overall stability. The world economic indicators, however, show a different picture. It seems the halting progress witnessed in the United States in the first qurater of 1962 and the rather weak growth of the domestic demand in Western Europe and Japan are likely to slow down the tempo of development in the industrially developed countries which in turn will have their impact on the under-developed countries. The year 1962 may not give the necessary push for development to the under-developed economies because of the readjustments which are taking place in the industrial countries. There are clear indications of slackness in business expenditures and as a consequence the foreign exchange earning capacity of the developing countries will stand reduced. It may also reduce the volume of aid, thus further hitting the advance of the developing countries.

How ISI Helps the Manufacturer

BY PROVIDING THE SEAL OF INTEGRITY

The ISI Certification Mark may be given to any manufacturer whose products are made to the relevant Indian Standards. It is a recognition of his business integrity and trustworthiness.

Modern methods of quality control, an essential part of any scheme of certification, bring about many economies in production through elimination of defectives, increase in productivity, and securing of uniform quality of output. These benefits far outweigh any additional cost involved in instituting continuous inspection and testing.

Periodical check-up by ISI of manufacturers' own quality control systems constitutes an invaluable service to ensure top management of the high efficiency of production and maintenance of quality.

Consumer satisfaction and competitive marketing position are the obvious advantages enjoyed by all ISI Mark users.

Enquire for details NOW how you too can join the distinguished company of manufacturers who already hold the ISI Certification Mark Licence.

THE BUSINESS WORLD

Costlier Credit Again

By

CROESUS

CALL it a process of trial and error, or a case of becoming wiser with experience, the credit control policy of the Reserve Bank of India has been undergoing changes from time to time, which is only as it should be. The first really stringent measure of monetary control to be imposed by the Reserve Bank of India was introduced in September, 1960 — to be precise, on September 21, 1960. It was from that day that the system of quotas and penal rates governing the borrowings of scheduled banks from the Reserve Bank of India has been in force. Actually, prior to this rather drastic move, the Reserve Bank had asked all scheduled banks to bring down bank credit during the slack season of 1960 by Rs. 110 crores. Although, in the event, the decline in bank credit was not even remotely anywhere near this figure, it must be conceded that the curb had a measure of success.

At any rate, the psychological impact of this drastic measure was so great that the Reserve Bank was obliged, within two months, to relax the rule regarding additional reserve requirement, and it was reportedly admitted by the authorities themselves that this was done with a view to assisting banks to meet the seasonal demand for credit against the background of the stiffening of the terms of access to Reserve Bank credit as per the Reserve Bank directive of September 21, 1960. An appeal was made to the scheduled banks last year also to bring about a normal seasonal contraction of credit with the same end in view as in the previous year, namely the enable the banks to take on the credit load of the succeeding busy season. The response in 1961 was better than in 1960 and it seems to be the intention of the Reserve Bank to bring down the bank credit this year even more sizeably than last year. "This year," says a Reserve Bank press communique accordingly, "the need for banks to secure normal seasonal return of funds is all the greater, in view of the pressures which have been in evidence on the price level and the necessity to hold the price-line in the interest of the exports in our external payments situation."

The fear of inflation that is implied here would appear to be certainly justified with the unpredictable effects of the reduction in imports and the fall in industrial production (may be also in agricultural production) on the country's price structure. It may be argued that these very two factors, namely, the reduction in imports and the fall in production will themselves contribute to a fall in the demand for funds from banks or bank credit. But, even so, financial circles feel, there is need to impound as much purchasing power as possible in the prevailing circumstances, and one of the sure ways in which this could be done is by tightening the scheduled banks' access to the Reserve Bank. This is precisely what the Reserve Bank's scheme of slab rates of lending (which has been transformed into a four-tier system in the place of a three-tier one that obtained hitherto) seeks to achieve by reducing the quota, on the one hand, and raising the penal rates, on the other.

The details of this system may be noted here for purposes of record. With effect from July 2, 1962, the size of the individual quotas of scheduled banks, which represent the amount which they can borrow at Bank Rate has been reduced to half of the amount in force till now; from now on, for each quarter, it will be the equivalent of 25 per cent (instead of 50 per cent) of their average statutory reserves required to be maintained by them with the Bank in the previous quarter. Thus, on borrowings upto 100 per cent of the quota, the Bank Rate (i.e. 4 per cent) will be charged. On borrowings over 100 per cent and upto 200 per cent, an additional rate of one per cent over the Bank Rate (i.e. 5 per cent) will be charged. On borrowings, over 200 per cent and upto 400 per cent of the quota, the additional rate will be two per cent above the Bank Rate (i.e. 6 per cent) and on borrowings in excess of this, it will be 2½ per cent above the Bank Rate (i.e. 6½ per cent).

These measures, it is stated, "are designed to induce banks to achieve a greater measure of self-reliance and reinforce their efforts to meet the growing credit needs of the private and public sectors through more effective mobilisation of financial resources." The banks are undoubtedly in a better position today than they were in 1960, thanks to the successful efforts of the Reserve Bank in persuading all banks to raise their paid-up capital and build up more reserves so as to bring about a better credit-deposit ratio. Many banks have ere now acted on this advice. Fortunately for the banks, their deposits also have been steadily increasing, partly due to the higher rates of interest now offered on deposits and partly due to the aggressive publicity campaigns of the banks. Thus, on June 2, 1962, the aggregate deposits of scheduled banks amounted to Rs. 2,005.54 crores, as against Rs. 1,766.15 crores on June 23, 1961, or an increase of nearly Rs. 240 crores. The relatively more comfortable position than in the previous years in which the scheduled banks find themselves today is evidenced by the fact that their borrowings from the Reserve Bank have fallen to the negligibly low level of Rs. 2.59 crores (as against Rs. 11.59 crores for the corresponding period in 1961) and their portfolio of investment in Government Securities has improved from Rs. 543.36 crores on June 23, 1961, to Rs. 583.36 crores on June 22, 1962.

What exactly the effects of the Reserve Bank's latest move would be remains to be seen. However, on the point that it would arrest the rising trend in prices, opinions seem to differ. For, as was maintained by this writer in September, 1960, in these columns, inasmuch as the borrowing from the banks will henceforth become more costly, there is bound to be an increase in industrial costs to a corresponding extent. It may be recalled that it is mainly the rise in industrial costs (brought about by the rise in prices of industrial raw materials and manufactures) that accounted for the perceptible rise in the commodity prices index in 1960. One can only hope that this would not be the outcome of the latest move.

Business Notes

Foreign Exchange Crisis

MULTI-PRONGED ATTACK

SOME FEVERISH thinking is apparently taking place in New Delhi for devising measures to overcome the current foreign exchange crisis shadows of which appear to be lengthening after the non-commitment by the Aid-India Club of its assistance for the current year of the Third Plan. The key role in this activity is envisaged to be played by the Union Minister without Portfolio, Mr. T. T. Krishnamachari, the Finance Minister, Mr. Morarji Desai, and the Minister for International Trade, Mr. Manubhai Shah. While Mr. Morarji Desai is at present on a tour of the West European countries which are members of the Aid-India Consortium, presumably with the object of prevailing upon them to finalise their commitments at a higher level so as to make available a matching assistance to the aid that has been promised by the USA for the second year of India's Third Plan, opinion here appears to be veering round to the view that any lasting solution of the current foreign exchange crisis lies in cutting down maintenance imports to the bare minimum and even freezing them at the level of the current export earnings of the country. This is considered to be absolutely necessary (though it will entail appreciable hardship and somewhat slowing down of the industrial tempo of the country) as India would thereby free herself from relying on foreign aid which should be exclusively reserved for import of capital goods that can be expected to yield returns without much time-lag. Utilisation of foreign exchange for import of capital goods too, it is thought, may have to be on a decreasing scale.

One should, therefore, not be surprised if further cuts in maintenance imports, over and above those announced last month, are resorted to. Low-priority imports, it is suggested in official circles, can be pruned further say by Rs. 25 crores per annum, especially by cutting down drastically the import bill of such industries as can be placed in the "non-essential" category. This may cause some unemployment in these industries, but opinion seems to be growing that this course should be preferred to the present device of keeping most, if not all, of the industries at the semi-starvation level. Further tightening of the licensing of new units is also not ruled out, for the grant of a licence to set up a new unit implies an obligation on the part of the Government to allocate foreign exchange required for its working. A fresh look on the Third Plan is as well envisaged (as was done in the case of the Second Plan in 1957-58) in order to determine the irreducible hard core of this Plan.

While the recent loans made available by the United States, the United Kingdom and West Germany and the $100 million fresh accommoration sought from the International Monetary Fund are expected to provide some elbow room for maneouvres on the foreign exchange front, it is just appropriate that the Ministry of International Trade has been asked to strive every nerve to step up export earnings. The forthcoming meeting of the Board of Trade at Calcutta on July 6, thus, assumes great significance, inasmuch as the crucial problem of cutting down industrial cost in the country is to be deliberated upon at this meeting. The fixing of targets for the country's principal exports, namely tea, jute manufactures and cotton textiles, is obviously a step in the right direction. A target of 231 million kgs. (Rs. 140 crores worth) for tea exports, of 8,30,000 tons (Rs. 150 crores worth) for jute manufactures and of Rs. 65 crores for cotton textiles are not beyond achievement, provided the industries concerned go all out in improving their present export performance. Fortunately the gravity of the situation is realised by these industries.

Banking

CREDIT CURBS HELP BANK DEPOSITS

IN THE year 1961, aggregate deposits of scheduled banks (excluding P.L. 480 deposits) increased by Rs. 180 crores (to a peak of Rs. 1,757 crores), as compared with a rise of only Rs. 102 crores in 1960. This expansion is the largest rise in scheduled bank deposits recorded in any year so far — the previous maximum increase was Rs. 163 crores in 1959. Time deposits made a major contribution to this growth, in that they rose by as much as Rs. 144 crores, while demand deposits increased by just Rs. 36 crores.

According to the "Report on the Trend and Progress of Banking" during the year 1961, just released by the Reserve Bank of India, the pressure on the resources of banks noticed in the previous year (1960) eased considerably during the year under review, as a result of a large accretion of bank deposits, coupled with only a moderate expansion in the volume of bank credit. This has brought about a noticeable improvement in the liquidity position of our scheduled banks. It may be noteworthy that this improvement has happened against the background of a higher economic activity in the country, but the forced improvement in liquidity position — for it is mainly due to the Reserve Bank's measures — may have also acted as a check to a still higher economic activity!

The reduced pressure on the resources of banks and the improvement in their liquidity position was naturally reflected in the reduction in borrowings from the Reserve Bank. Thus, according to the Report, the banks' borrowings from the Reserve Bank fell by Rs. 43 crores, as compared to a rise in these borrowings of Rs. 50 crores in 1960. For the same reason, and also by reason of the fact that the growth of advances was at a pace lower than that of deposit resources of scheduled banks, it became possible for the banks to increase their investments in Government securities by Rs. 39 crores to Rs. 439 crores in 1961; in sharp contrast to this, investments were actually liquidated to the tune of Rs. 96 crores in 1960 in order to meet the sizable rise in the demand for credit. Notwithstanding this, as the Report has pointed out, the investment-deposit ratio in 1961 still stood fractionally lower at 29.2 per cent — it was 29.4 per cent a year before — on account of the relatively greater pace of the increase in deposits during the Report Year.

The Report further goes on to observe that the three-tier system of overall restraint was continued throughout the year. Out of the two measures of general-credit restraint, introduced in 1960, namely, the additional reserve requirements and the system of quotas and slab rates on lending to scheduled banks, the former was withdrawn in January, 1961, in order to facilitate credit expansion by banks for seasonal purposes, as also for relieving the acute monetary stringency that had developed then. The Reserve Bank also sanctioned additional specified quotas to enable scheduled banks to borrow at the Bank Rate, and this was done, it is pointed out, to serve as an incentive to them to increase their lending to small-scale industries and co-operative institutions.

Woollens

HOW TO IMPROVE EXPORTS?

THE ONE problem that has been exercising the mind of Government spokesmen, as also of the business community, is the foreign exchange crisis that the country has been passing through. It is not surprising, therefore, that this subject should have claimed the particular attention of Mr. G. K. Singhania, Chairman of the Federation of Woollen Manufacturers in India. (F.W.M.I.).

Speaking at length on the present foreign exchange situation vis-a-vis the woollen exports and the future possibility for their expansion, at the 21st Annual General Meeting of that body, recently in Bombay, Mr. Singhania observed that the problem of promoting exports was basically linked with that of the effective utilisation of idle capacity of the industries, which, as is well-known, ranges from 40 per cent to 50 per cent, thanks to the shortage of foreign exchange. It was Mr. Singhania's view that, though the activisatiion of the idle capacity of the industry did not require capital investment, any initial expenditure of foreign exchange on the industry could be more than made up by compelling the recipiant units of the industry to export a certain percentage of their products. The issuing of additional installation spindles in the industry, at the time, when there is an acute shortage of raw materials, on account of the foreign exchange difficulty, he said, had forced the industry to run no more than 1½ shifts. In this connection, the F.W.M.I. Chief recalled the observations made by the Estimate Committee of the Second Lok Sabha that "the over-licensing of spindles in such excessive numbers has accentuated the problem of raw materials and worsened the already low utilisation of the existing productive capacity."

The F.W.M.I. Chairman also drew attention to the the fact that when an increase in export entitlements from 75 per cent to 85 per cent in 1960-61 was given to improve exports, the exports of fabrics, piece-goods hosiery and other items had actually declined. He felt that, even if the industry were given a cent per cent export entitlement instead of the present 85 per cent, the incentive would not be adequate for the industry to enable it successfully to compete in the world markets by reason of its worn out and out-moded machinery. Although the industry may not be in a position to increase its exports in view of the present exchange position, Mr. Singhania was sporting and imaginative enough to suggest that at least 10 per cent of the annual production would have to be earmarked for export and also that all manufacturers and/or exporters who received Actual Users' Licence for wool tops should deposit a part of the value every year and a pool, which should be under the control of Export Promotion Council, should be set up out of these deposits.

Two important factors, namely, high cost of production and low quality of products have been retarding the export promotion not only in this industry but in all the industries generally, stated the F.W.M.I. Chief, and without modernisation and rehabilitation of machinery, he added, there could be no other practical solution to the prsent impasse.

Non-ferrous Metals

INDUSTRY'S PLEA FOR CONTINUANCE OF PROTECTION

FOLLOWING THE Tariff Commission's recommendations of 1957 and 1959, protection to the non-ferrous metals industry was discontinued in all cases, but for a few items of semi-manufactures of non-ferrous metals and alloys, such as lead sheets, zinc sheets, zinc strips, copper rods (other than electrolytic copper rods), copper pipes and tubes, brass rods and brass pipes and tubes. Interests representing these items of manufacture recently again approached the Tariff Commission for continuance of protection. The Chairman of the Tariff Commission, Mr. K. R. P. Aiyangar, stated that this section of the non-ferrous metals industry had prayed for continuance of protection for a further period of three to five years. The case of the indigenous industry is that it is still suffering from several handicaps, such as inadequate supply of raw materials and shortage of qualified technical personnel, among others. Although the consumers of manufactures of this industry too are in favour of continuance of protection generally, they have also complained that the prices charged by the manufacturers are higher than the landed costs at which imports are made, or could be contracted.

Referring to the question of the capacity of the industry, Mr. Aiyangar noted that, at the time of the last inquiry, there were seven units engaged in the manufacture of one or the other item of non-ferrous semi-manufactures still in the protected list. With the establishment of three more units, the total has risen to ten. (However, only eight units, it would appear, have been registered with the Development Wing). The present aggregate capacity (on single-shift basis) has been estimated at 4,156 tonnes for copper or brass rods (three units), 4,121 tonnes for copper or brass pipes and tubes (three units) and 3,840 tonnes for lead sheets (three units) and 2,650 tonnes for zinc sheets or strips (two units). These are, of course, exclusive of the capacity in ordnance factories. Besides these, it is stated, there are also as many as twenty-eight small-scale industries engaged in manufacturing these items.

As against this, the current domestic demand has been estimated at 4,000 tonnes for copper or brass rods (other than electrolytic) 1,500 tonnes for copper pipes and 4,000 tonnes for copper and zinc tubes. The demand for zinc sheets and zinc strips has been estimated at 4,000 tonnes and 5,000 tonnes, respectively.

Barring a small indigenous production of copper, zinc concentrates and lead for the production of semi-manufactures, Mr. Aiyangar pointed out, the requirements of the non-ferrous metals industry for these virgin metals had to be imported. The current production is stated to be: copper (8,330 tonnes), lead (3,664 tonnes), and zinc concentrates (9,253 tonnes). As the Tariff Commission Chief pointed out, the production of copper, lead and zinc is expected to go up to as much as 32,000 tonnes, 18,000 tonnes, and 8,000 tonnes, respectively, by the end of the Third Plan period. But, even then, to quote Mr. Aiyangar himself, the indigenous production will fall far short of the domestic demand, which is rising at a very fast rate. Consequently, the bulk of the country's requirements will have to be met, perforce, by continued imports. This cannot be helped. But as the industry is not only to be assured of protection but also of supply of raw materials, involving expenditure of our precious and scarce foreign exchange resources, the indigenous industry owes it to the country to economise the use of imported raw material as much as possible by resort to practices such as reclaiming from waste that are adopted in other countries. Indeed, this must be insisted upon by the authorities as a pre-requisite not only to the continuance of protection, but also to the grant of import quotas and releases of indigenous raw materials.

New Issues

KIRLOSKAR - ASEA

TWO MORE companies are reported to have finalised their plans for securing public subscriptions for their capital.

Kirloskar-Asea Ltd., Bangalore, is approaching the public on July 9 for subscription to its 8,575 equity shares of Rs. 100 each. The subscription list closes on July 11, or later at the discretion of the directors.

The authorised capital of this company is Rs. 1 crore, all in equity shares. The issued capital is Rs. 25 lakhs. Of this, capital worth Rs. 8.5 lakhs is being subscribed by the Swedish collaborators, Messrs. Allmanna Svenska Elektrisa Aktiebolaget.

The company has been floated to undertake the manufacture of all kinds of machinery and motor control gears and switchgears (HT and LT), lighting arrestors and other electrical and mechanical equipment. It will be setting up its factory near Bangalore.

The total capital outlay on the project is estimated at Rs. 35.50 lakhs. The foreign collaborators have agreed to lend the company a sum of Rs. 10.5 lakhs to meet the foreign exchange expenditure on purchase of machinery in the E.P.A. area.

SANDVIK ASIA

SANDVIK ASIA LTD., a new company floated by the Swedish firm Sandvikens Jernverks Aktiebolag, Sandviken, in association with some Indian interests, to undertake the manufacture of the parent company's patented coromant tungsten carbide products, is expected to enter the capital market in the near future with an offer of 12,000 ordinary shares of Rs. 100 each. The authorised capital of the company is Rs. 1 crore, all in equity shares. Of this, capital worth Rs. 60 lakhs, is being issued in the first instance. Capital worth Rs. 36 lakhs will be held by the parent Swedish company and worth Rs. 12 lakhs by the Indian directors of the new company and their friends. The offer to the public is the residue of this initial issue.

The company has already set up its factory at Poona where the manufacture of rock drill steel, used in mining, dam and road construction, commenced a few months ago. Production of tungsten carbide tips, used for cutting tools and parts for wire drawing dies, is expected to start soon. The initial production of these tips will be from mixed powder imported from Sweden. It is, however, proposed to use ore from next year.

Chemicals

F.A.C.T. ACHIEVES A NEW HIGH

AT THE eighteenth annual general meeting of The Fertilisers and Chemicals Travancore Limited, the Chairman, Mr. T. A. Joseph, made a reference to the large-scale expansion that awaits the company in the coming few years. Having achieved the first stage of expansion, the company is preparing for the second one which also involves the installation of an oil gassification plant which is likely to be commissioned towards the end of August. With the introduction of this plant, the factory will not use wood gassification plant and, therefore, will no longer utilise firewood as raw material. This improved plant will be fed by raw neptha and is likely to achieve higher efficiency. With the completion of the second stage, the company's capacity would have risen to 30,000 tons of nitrogen per annum, the end-products being one lakh tons of ammonium sulphate, 33,000 tons of ammonium phosphate, 8,000 tons of ammonium chloride and 44,000 tons of superphosphate. The company also is engaged in the planning of third stage of its expansion for which the Government of India had sanctioned Rs. 4.27 crores worth of foreign exchange and credit facilities in UK, USA, West Germany and Switzerland. The capital investment involved in the third stage of expansion is nearly Rs. 10 crores. On the completion of the third stage, which is expected by the end of 1964, the output capacity of the company will be 200,000 tons of ammonium sulphate, 135,000 tons of ammonium phosphate and 25,000 tons of ammonium chloride. No further expansion of superphosphate is envisaged.

An important feature of this expansion plan is that the production of ammonium phosphate is to be expanded to the maximum extent. The by-product gypsum obtained in the production of ammonium phosphate will further be utilised to enhance the output of ammonium sulphate. This will result in substantial reduction of cost.

Another measure of higher efficiency achieved by the company is that it has already entered the foreign market for the export of ammonium chloride. In the years to come with higher output capacity all-round, the company would be in a position to export larger quantities. In addition to this entry in the foreign market, the company has started selling its superior know-how to various indigenous producers. For instance, some time back the company signed an agreement with Messrs. Project Engineers Private Limited, (engaged in the Planning and designing of chemical plants) to impart technical know-how on payment of royalty for the designing of plants for the manufacture of ammonium sulphate using direct neutralising process of ammonia and sulphuric acid. These are no minor achievements. They indicate that the company is going from strength to strength and in the years to come is likely to touch various other fields.

General Insurance

INSURANCE COUNCIL AND MR. KILACHAND

MR. TULSIDAS KILACHAND, Chairman of the New Great Insurance Company of India Limited, at the annual general meeting of the company, utilised the occasion to express his differences with the recent decisions taken by the Executive Committee of the General Insurance Council. He said that the Council was every time stressing the significance of the Code of Conduct and this time had introduced far-reaching changes in the Code and the Administrative Machinery. Instead of persuading the general insurers to abide by the regulations of the conduct, he believed that the Council should raise the issue of the revision in the Insurance Act. Various provisions of the Act originally applicable to life business had become obsolete ever since the nationalisation of that section of insurance. Naturally, therefore, many of the provisions included in the Insurance Act are unrelated to the real facts. This is the time that the Act is simplified to be made more effective and constructive.

Another point of difference with the Council was in respect of reduction in the fire premium rates. He said the Council wanted the insurers to believe that there was a substantial margin of profit at the present fire rates which ultimately provoked the companies to indulge in several unhealthy practices. Mr. Kilachand pointed out that this being the third reduction during the last eight years, might not really eliminate such practices if the past two reduction failed to do so. He quoted the instances of marine and miscellaneous accident businesses where the margin of profit was very low. Even in these businesses these practices did prevail. The lower margin, therefore, could not be a guarantee of the elimination of such practices. He further indicated that these comparatively attractive margins of profit in fire business did compensate to some extent the losses sustained by the insurers while they catered to their clients' requirements for business in marine and miscellaneous departments. He, therefore, rightly urged that the authorities should refrain from any further reductions which would only weaken the Indian insurance and impair their healthy growth.

FROM THE CAPITAL'S CORRIDORS

HINDUSTAN STEEL REORGANISED

THE main features of the reorganisation of Hindustan Steel Limited—Government of India's undertaking entrusted with the responsibility of constructing and maintaining steel plants in the public sector—were announced this week by Mr. C. Subramaniam, the Union Minister for Steel and Heavy Industries.

The main object of the reorganisation, which has been introduced with effect from July 1, 1962, is to ensure that the General Managers at the plants are treated as the effective operational heads and are squarely charged with the responsibility for the efficient functioning of the plants. To enable them to do so, it is clearly necessary that they should have adequate powers to take important decisions in the interest of operations and should have the necessary authority to vary general policy decisions to suit special circumstances.

Under the scheme it will be the General Managers at the plants who will be responsible for their effective operation. The responsibility of the Board of Directors of Hindustan Steel will be limited to general policies, supervision, planning and co-ordination. In consequence, reference from the plants to the Head Office on matters of detail will be drastically curtailed, if not entirely eliminated.

FULL POWERS TO GENERAL MANAGERS

The General Managers will have almost full powers within the budget which is allotted to them, so that itemised control from Head Office should disappear. The main responsibilities of the Board of Directors will be exercised through control over the budget, through a system of reports and returns and through inspections.

For the delegation to the General Managers to be effective, it has been simultaneously provided that the General Managers must in their turn sub-delegate their powers to appropriate officers within the plants. They are required to prepare schemes in this regard by the beginning of the next month.

The General Managers are also being advised to constitute appropriate committees in the plants to ensure that the powers conferred on them are exercised in a regular and un-exceptionable manner.

Opportunity has been taken of this reorganisation to examine also what further powers can be delegated by Government to the Board of Directors of Hindustan Steel. The present procedure is that even though a large project may have been approved by the Government, detailed approval of the Government is also needed for all expenditure by HSL in excess of Rs. 40 lakhs. This has sometimes led to avoidable delays and it is, therefore, now being provided that where a proposal regarding capital expenditure has already been accepted by the Government in its broad details, it will no longer be necessary for HSL to refer to the Government for approval any components of the project even though those components may cost over Rs. 40 lakhs.

No limit is being placed on this amount, the only limitation imposed being that if the cost of the components exceeds by more than 10 per cent the original estimate, revised approval of the Government will be necessary. For other schemes which have not been approved by the Government, the powers of HSL to incur capital expenditure are being raised to Rs. 50 lakhs from Rs. 40 lakhs.

POWERS OF APPOINTMENT

At present, HSL is authorised to make appointments on salaries up to Rs. 2,000 a month without reference to the Government. This limit is being raised to Rs. 2,500 a month.

It has also been decided that the provision in the Articles of Association that a Director may reserve for the approval of the President any matter which he considers important enough to be so reserved should be removed. This takes away veto powers from the Directors. The Chairman, however, will be authorised to reserve important matters for Government's approval if he considers this necessary.

A provision in the rules requires that the General Manager must consult the Financial Adviser of the Plant in almost all matters in which financial outlay is involved. In practice, the working of this rule has not been satisfactory, leading to delays. It is felt that the procedure at present is somewhat rigid. The General Managers are, therefore, being asked to lay down their own rules of business regarding matters on which they may consult the Financial Advisers. These proposals are to be submitted within a month and will be considered by the Government then.

PERSONNEL MATTERS

On personnel matters, practically full powers are being given to the General Managers except that recruitment and promotion to the grades of the Assistant Superintendent and above, e.g., the higher managerial grades, will still require a reference to the Board of Directors. This is considered necessary to ensure that in promotion to these higher grades the claims of suitable persons in all the three plants are duly considered. A standard force has been laid down for each plant. The General Managers will normally be expected to work within the standard force laid down. For provision of incentives to the workers, each plant management will be preparing its own scheme.

On the construction side, the General Managers will be made fully responsible for their expansion programmes.

For purchases, it is proposed to have a Central Wing to deal only with certain important raw materials, such as iron ore, coal, limestone, manganese, dolomite and refractories on which a common purchase policy is necessary. For other purchases, the responsibility will be that of the plants. But there will be only one Chief Controller of Purchases in charge, both of the Central Wing and the three separate wings.

In respect of the separate wings, the Chief Controller of Purchases will act as the agent of the General Managers and take instructions from them. In respect of the central purchases, the Chief Controller of Purchases will, however, act under the Board of Directors of HSL.

The best organisation for sales still remains to be settled. The point for examination is whether a centralised system or a decentralised system or a system which is partially centralised and partially decentralised is the best. A decision on this important matter is expected to be arrived at shortly.

NO ITEMISED CONTROL

The control of the Board of Directors over the General Managers will be exercised through the budget and also by way of periodical reports and statistics, of production and costs and by inspections.

Control through the budget means that the General Managers will be expected to function within their budget and where the budget is related to production, if production varies from that estimated earlier, suitable

alterations in the budget will have to be made by reference to the Head Office.

As a result of the disappearance of itemised control of the Head Office, it is intended to change the methods of working at the Head Office with a view to avoiding filing and noting drastically. Reduction of staff at the Head Office would also necessarily follow. The objective will be to see that this staff is absorbed in suitable vacancies either at the plants or in sister companies and corporations.

No immediate change is being made in the composition of the Board of Directors. It is considered necessary to wait and see the results of the revised system in practical operations before a decision is taken whether any change in the set-up of the Board of Directors is needed.

The reorganisation effected in the HSL set-up is expected to result in healthy competition among the three public sector steel plants.

ALLOY STEEL

The following capacity, category-wise, is planned for the Alloy and Special Steel Plant, to be set up at Durgapur:-

(Metric tons per year — finished saleable steel of acceptable quality)

Steels	Sections	Billets	Sheets	Forgings	Total
Tool	8,000	2,100	2,300	600	13,000
Constructional	12,000	3,000	1,000	1,500	17,500
Stainless and Heat-resisting	2,500	500	14,000	..	17,000
Die Blocks	—	—	—	500	500
TOTAL	**22,500**	**5,600**	**17,300**	**2,600**	**48,000**

RESOLVING COAL SHORTAGES

The Railway Ministry has decided to provide another 120 wagons per day for moving coal from Bengal-Bihar coalfields. The additional wagons were to be made available with effect from July 1. This was disclosed by Sardar Swaran Singh, the Union Minister for Railways, at a Press Conference here last week.

The provision of additional wagons, the Minister added, had become possible due to increased production of railway wagons in the country. Hitherto, the Railways were making available 4,800 wagons a day for moving coal from the Bengal-Bihar coal belt.

Some relief on the coal front is also likely to accrue because of recommissioning of the Kurasia coal-mines in Central India which had to be shut down last year as a sequel to out-break of fire there. The Railways are providing 130 wagons a day to move coal from these mines whose output is estimated at nearly one million tons per annum.

The distress caused by coal shortages in Western India and some parts of South India may also be alleviated to some extent if the planned target of two million tons coal movement by sea materialises in the near future. At present, movement of coal by sea is of the order of 1.5 million tons. The Railways, according to Sardar Swaran Singh, are in a position to supply wagons for moving this additional 5 lakh tons of coal from the collieries to the ports from where movement by sea is to be effected.

Meanwhile, The Coal Council of India, which met here last week under the Chairmanship of Mr. K. D. Malaviya, the Union Minister of Mines and Fuel, urged upon the Planning Commission and the Union Ministry of Irrigation and Power to study jointly with the Ministry of Mines and Fuel the problem of power shortage which is hampering coal production. This is considered to be essential in the interest of achieving the Third Plan coal target.

The Council felt that because of the strain on the railway system, attempts should be made to carry power instead of coal. With this end in view, the Council resolved: "Considering that transport of coal is mostly done by railways which are already overstrained in this respect, this Council is of the opinion that unless unavoidable, no additional transport burden should be placed upon them in respect of coal for short distances. This Council is, therefore, of the view that where thermal power stations or coal washeries are planned for short distances, these must as a rule be located at the coalfields from which the supplies of coal are to be obtained. Consideration of State requirements of power and coal should not come in the way of economic location."

The Council was also of the view that even in respect of thermal power houses and washeries already planned, their exact location may be further reviewed to avoid placing additional burden on the Railways.

At the Council's meeting, Mr. K. D. Malaviya also held out an assurance to the private sector coal industry that "although under the Industrial Policy Resolution, the development of coal was envisaged in the public sector, he would like to ensure profitability and prosperity to the private sector so long it was there."

Some new light is now available on the marginal increases allowed by the Government in coal prices a few days ago. The Government, it is stated, took the decision of effecting ad hoc increases in prices in order to avoid delay that would have been caused if the colliery-owners' plea for higher coal prices had been referred to a Price Enquiry Committee for analysis and advice. It was felt that any delay in granting an increase in coal prices, however small, would have removed the feeling of urgency for stepping up coal output. Fall in the production of superior quality coal from 17.6 million tons in 1960 to 16 million tons in 1961 is also understood to be a motivating force behind Government's decision to grant a comparatively greater increase in the prices of high-grade coals. The price increases announced on June 13, official sources think, should help in stepping up coal production.

With a view to making available to the private colliery-owners additional funds for stepping up coal output, arrangements are being made to provide loans to the industry. The Industrial Finance Corporation and its counterparts in the States are stated to be taking keen interest in this matter. It is also envisaged to utilise the services of the National Industrial Development Corporation for giving loans to the coal industry; conditions are proposed to be created by which the grant of such loans would be made easy.

The Government is also understood to be considering some prompt measures to remove the other difficulties that are being faced by the coal industry. Power supply to collieries is envisaged to be stepped up in the near future. Similarly, supply of explosives is also proposed to be made adequate.

To facilitate movement of coal from collieries to the consuming centres, methods are being devised to open up the river and canal systems in the country. It is hoped that coal would soon be moved on the Ganges and the Gaghra rivers to certain centres of consumption in North India. Special types of boats, it is stated, are being built for this purpose. Road transport is also being strengthened with a view to relieving the pressure of coal movement on Railways. It is hoped by official circles that by October next, road transport will start moving coal in a far greater measure than at present.

Thought is also being given by Mr. K. D. Malaviya for moving coal by pipeplines. But how far this will materialise in view of the high cost of constructing pipelines and the lack of facilities at the consumption centres to make use of powdered coal, it is difficult to say.

INDIA AND E.E.C.

Advices from Brussels suggest that the three-day Ministerial Conference of the European Economic Community, held last week, has acceded to India's request that the consideration of the issue of textile exports from India, Pakistan, and Ceylon to the Common Market, after Britain joins it, should be postponed till India's Finance Minister, Mr. Morarji Desai, who is reaching Brussels on July 5, has had discussions with them. Agriculture, nil tariffs, association and trade problems of India, Pakistan and Ceylon were the main topics of discussion at this Ministerial meeting.

The principal features of the scheme that is understood to be under discussion in regard to above are:

(1) Declaration by the E.E.C. recognising the importance to India, Pakistan and Ceylon of trade with a view to their earning foreign exchange and developing their economies.

(2) Intention of the E.E.C. to co-operate in the development of these countries.

(3) Intention to negotiate a general trade agreement with India and with Pakistan (and with Ceylon if it wishes) to achieve the above objects.

(4) Provision for consultation with the three countries about the operation of new arrangements when operating.

(5) ***Cotton Textiles:*** (a) Decalage until 1970 in application of the common tariff to Indian and Pakistani cotton textiles; (b) Provision for remedies if the effect of the common external tariff is to reduce exports of cotton goods (from India and Pakistan) below a stated base level for each country and in particular for the Commission to keep a watch on the level of imports and to be able at any time to propose remedies; (c) Provision for remedies to be applied by Britain alone in default of agreement on community remedies within three months of a report by the Commission; (d) Maintenance of Voluntary limitation at levels covered by present agreements.

(6) Instead of duty-free quotas for a limited number of industrial products, provision for a very gradual application of common tariff over the period up to 1970 on all or substantially on all products.

(7) Reduction of common tariff by amounts still to be negotiated on tea, East India kips, hand-knitted carpets, coir mats and minor items such as cricket bats.

(8) Some provisions still to be negotiated for tropical products other than tea, and for processed agricultural produce.

As already reported in this column, India would like the Indo-British Trade Agreement to be extended to the E.E.C. after Britain joins it. The United Kingdom, it is believed, is fully aware of India's desire to have duty-free access to the Common Market in respect of her major exports, preferably for an indefinite period or, at any rate, till the trade agreement is negotiated between India and the European Economic Community. The E.E.C. authorities are reported to be against both of these alternatives. They are insistent that some part of the common tariff should be made applicable to Indian imports into the Community after Britain's entry into it.

So far as textile exports from India are concerned, the opposition of the British textile industry to duty-free imports of the so-called cheap textiles from the East, namely India, Pakistan and Hong Kong, is well-known. The textile industry of the E.E.C. similarly is understood to be nervous on this account. Against this background, Britain obviously faces an uphill task in securing favourable terms for Indian textile exports to the Common Market.

The E.E.C. has already agreed to reduce the common tariff on tea from 18 per cent to 11 per cent.

On industrial products other than cotton goods and jute manufactures, there seems at present little prospects of persuading the E.E.C. to agree to duty-free quotas except possibly on a tapering basis for a limited number of items. This question is understood to be under close study by the Government and India's reaction to it is likely to be communicated to Brussels by Mr. Morarji Desai and Mr. K. B. Lall.

CENTRAL GOVERNMENT'S NEW LOANS

The Government of India has announced its borrowing programme for the current year. It is to raise Rs. 250 crores and is floating the following three loans on the terms and conditions stated against them:

(i) A further tranche of the existing 3¾ per cent National Plan Bonds—Fifth Series (3¾ per cent 1968)—at Rs. 99.20 per Rs. 100 (Nominal), repayable at par on May 12, 1968.

(ii) A further tranche of 4 per cent Loan 1972—at Rs. 99.20 per Rs. 100 (Nominal), repayable at par on August 1, 1972.

(iii) 4½ per cent Loan 1985—at Rs. 100 per Rs. 100 (Nominal), repayable at par on July 12, 1985.

Subscriptions are to be invited in the form of cash/cheque or securities of 2¾ per cent Loan 1962 or 3¼ per cent Bonds 1962. They will be received from July 12 to July 14, but the subscription lists may be closed earlier without notice as soon as the total subscriptions amount to Rs. 250 crores. The Government reserves the right to retain subscriptions upto ten per cent in excess of the notified amount.

The securities of 2¾ per cent Loan 1962 and 3¼ per cent Bonds 1962 will be accepted for conversion at Rs. 99.50 and Rs. 100, respectively, per Rs. 100 (Nominal). Interest on 2¾ per cent Loan 1962 will be paid upto July 11, 1962. Interest on 3¼ per cent Bonds 1962 will be paid for the full half-year ending July, 15, 1962.

Interest on the securities to be issued will accrue from July 12, 1962. Interest on the 3¾ per cent National Plan Bonds—Fifth Series (3¾ per cent 1968)—will be paid on November 12, 1962, for the period July 12, 1962, to November 11, 1962, and thereafter half-yearly on the 12th May and 12th November. Interest on the 4 per cent Loan 1972 will be paid on August 1, 1962, for the period July 12, 1962, to July 31, 1962, and thereafter half-yearly on the 1st February and 1st

August. In the case of 4½ per cent Loan 1985, interest will be paid half-yearly on 12th January and 12th July.

Interest on the securities will be liable to tax under the Income-Tax Act, 1961.

IAC's BUDGET ESTIMATES

The Indian Airlines Corporation expects to earn an overall profit of approximately Rs. 81 lakhs during the year 1962-63. According to the budget estimates prepared by its management, the operating revenue is anticipated to be of the order of Rs. 1,748 lakhs and operating expenditure in the neighbourhood of Rs. 1,679.93 lakhs. This will leave a surplus of Rs. 68.07 lakhs, which coupled with the non-operating revenue, estimated at Rs. 13 lakhs, makes the overall profit of Rs. 81.07 lakhs.

These budget estimates are based on a series of assumptions, which, according to the Corporation, may not hold good till the end of the financial year. One uncertain factor is the periodic foreign exchange allotments for the import of equipment and spares. Any cuts in these allotments will undoubtedly have their impact on the total capacity produced. As a result, the actual performance may be at variance with the estimates.

The increased yield expected in the revenue of the Corporation during the current financial year—1962-63—is expected to result from fleet augmentation and more intensive aircraft utilisation. The Corporation added to its fleet early this year four Viscounts. A second batch of five Friendships is envisaged to be phased in before March next year.

The budget assumes that the utilisation of Viscounts will top the 3,000-hour mark per aircraft, against 2,594 hours estimated for 1961-62. Increased utilisation has also been planned for the Friendships, Skymasters and Dakotas. But since these estimates were prepared, the Skymaster utilisation is likely to go down in view of the damage sustained recently by two aircraft of this type.

The capital budget of the Corporation takes into account the possible purchase of jet equipment, at a cost of nearly Rs. 900 lakhs, to replace Viscounts on trunk routes. A Friendship Type trainer, costing about Rs. 14.52 lakhs, has also been provided for in the capital budget for the current financial year. The Corporation has a Viscount Type trainer installed at Hyderabad.

The Corporation's cost per available tonne-kilometre is envisaged to go down from Rs. 1.22 (revised estimate) in 1961-62 to Rs. 1.15 in 1962-63. The actual cost per available tonne-kilometre in 1960-61 was Rs. 1.19.

The revised estimates for 1961-62 show a possible loss to the Corporation of Rs. 10.91 lakhs only, as against the original estimate of Rs. 60 lakhs.

The following table gives the Corporation's budget estimates at a glance:

IAC'S BUDGET AT A GLANCE

	1960-61 Actuals	1961-62 Original Budget	1961-62 Revised Estimates	1962-63 Budget Estimates
		(Lakhs of Rupees)		
Revenue Hours	119,459	124,118	119,815	136,775
Operating Revenue	1306.27	1361.75	1470.20	1748.00
Operating Expenditure	1298.96	1411.63	1497.51	1679.93
Operating Profit/Loss	7.31 (Profit)	49.88 (Loss)	27.31 (Loss)	68.07 (Profit)
Non-operating Revenue/Expenditure (Net)	2.63 (Exp.)	10.12 (Exp.)	16.40 (Rev.)	13.00 (Rev.)
Profit/Loss	4.68 (Profit)	60.00 (Loss)	10.91 (Loss)	81.07 (Profit)

SUGARCANE PRICES FOR 1962-63

The Government of India has decided that from the commencement of the sugar season 1962-63, cane prices should be linked with sugar recovery. In coming to this decision, the Government, it is stated, had before it the advice of the Tariff Commission.

For the sugar year 1962-63, it has been decided to maintain the price at Rs. 1.62 nP. per maund of sugarcane for delivery at the gate of the factory, but link it to a recovery of 9.8 per cent. A discount or premium, as the case may be, shall be allowed on this price at the rate of 1.5 nP. for every 0.1 per cent fall or rise in the average certified recovery of the factory for a prescribed duration during 1961-62 season, provided that the minimum price payable shall be Rs. 1.50 nP. per maund for a recovery of 9 per cent or less. The price for delivery at purchasing centres connected by rail shall be Rs. 1.50 per maund of cane with corresponding discounts or premia at the prescribed rate provided that the minimum price payable at such centres shall be Rs. 1.38 per maund of cane for a recovery of 9 per cent or less.

In order that cultivators and factories have sufficient advance notice of Government's intention about the production of sugar during 1962-63, the Government has decided that the total production in the coming year should not fall below the production in 1961-62.

DIESEL LOCOMOTIVES: CZECH OFFER

The Sales Manager of CKD-Praha, Mr. M. Kortus, and the Manager of the Locomotives Department of Strojexport, Praha, Mr. Josef Taurek, are here to explore the possibilities of exporting to India diesel locomotives manufactured by their company in Czechoslovakia. They have already had exploratory talks with the Railway Board and the Ministries of Planning, Transport and Commerce in this regard and discussed with them the prospects of India's importing some of these locomotives, presumably on rupee payment.

The response from the Indian side is stated to have been encouraging. It has been suggested that a team of Indian experts should visit Czechoslovakia to study the technical details of this proposal. The prospects of India importing these locomotives in the near future, however, are not considered to be so bright in view of the foreign exchange difficulties which stand in the way of any large-scale dieselisation of Indian railways. The Czech firm is anxious to enter the Indian market when the opportunities arise and it is primarily for that purpose that the present exploratory talks have been initiated by it.

The Czech diesel manufacturers entering into collaboration arrangements for the manufacture of their locomotives in India is not ruled out, but detailed dis-

Rs. 50 CRORES

TO CONFER THE BENEFITS OF SCIENCE ON THE MAN IN THE STREET

Research...to make Indian products compete in world markets, to explore new avenues of creative thinking, to confer the benefits of science on the man in the street. The Third Plan has earmarked Rs. 50 crores for research. An extensive programme will strengthen and expand existing research units, widen their range of activities, train new personnel and provide an adequate number of research scholarships and fellowships. The ultimate aim is best summed up by the Planning Commission—"to carry the application of science into the everyday life of the community".

Research makes good products better

Bird-Heilgers recognises that national research is closely linked to national development. The group's own research and quality control centre is expanding to meet increasing demands. Bird-Heilgers applies the results of research to production techniques. The rich dividend : products of a uniformly high standard, economies in the use of by-products and raw materials, development of new products, quick, easier manufacturing processes...The group translates research into results which benefit India's new and growing industries and, ultimately, the man in the street.

Towards a self-generating economy

A phrase on everyone's lips. A phrase that finds concrete expression in the urgent activity of an economy on the move. Bird-Heilgers reflects the nation's striving. The group delivers millions of tons of basic materials to the new blast furnaces. It produces jute goods, paper and board, air compressors and springs, and engineering and water treatment equipment. A project for the manufacture of coal washeries was the first in India. Planned diversification finds the group engaged in shipping, insurance, exporting and importing. Its agency department handles everything from heavy capital equipment to light consumer goods.

...and an exciting, promising future

The Five Year Plans are a challenge : existing industries must expand, new industries open up, per capita income increase. India needs more goods and services than ever before. Bird-Heilgers is alive to the problems of a growing economy. The group deploys the full potential of a century's resources, technical knowledge and executive skill to increase and broaden its activities...intensify its use of research...join the national drive to economic independence.

cussions will have to take place before any concrete proposal emerges in this regard.

Czechoslovakia has supplied to India in the past some steam locomotives and railway coaches.

IMPORT OF NON-FERROUS METALS FROM USA

The Government of India has removed one of the conditions for the grant of import licences for non-ferrous metals under the aid granted by the U.S. Agency for International Development. This condition is that "the supplier is not more than 49 per cent owned by stockholders who are not citizens of the United States."

Importers who have received or who may receive licences as established importers and actual users under non-project loans granted by the Agency for International Development would now be required only to obtain a certificate from their U.S.A. suppliers that (a) the commodities listed on the invoice were processed in the United States into the commercial product sold to the importer and that (b) the supplier is a United States citizen or a corporation, partnership or other association created under the laws of the United States.

IOC'S WORKING

The Government-owned Indian Oil Company (IOC), which was incorporated in Bombay on June 30, 1959, and started its actual trading activities about two years ago, can be stated to have established itself as a new nation-wide entity. The company is operating at present five main port storage installations at Kandla, Bombay, Cochin, Visakhapatnam and Calcutta and 26 inland distribution depots spread all over the country through which it markets a wide range of quality oil products such as Jyoti kerosene, high-speed diesel oil, aviation turbine fuel and furnace oil. During the past 22 months it has imported nearly 3,43,600 tons of oil products from Russia in 32 shipments. Of late, it has also started marketing or arranging to market the entire output of light diesel oil, tea drier oil, furnace oil, aeromex and petrol being produced at the Noonmati Refinery.

INTERNATIONAL CONFERENCE ON LEAD

The first International Conference on lead is scheduled to be held in the Connaught Rooms, London, from October 8 to October 12, 1962. It is being organised by the Lead Development Association, London, which acts as the Secretariat of the European Lead Development Committee, a newly formed body whose membership consists of the European Lead Development Association and other European lead producers.

Some 18 papers on the various aspects of lead industry will be presented at this conference by the leading authorities from France, Germany, Italy, Sweden, the United Kingdom and the United States. A couple of papers will deal with lead for batteries, cables and nuclear shielding.

TELEX SERVICE TO HAMBURG

A direct international telex service has been started between Bombay and Hamburg since last week. The international telex is a subscriber-to-subscriber, direct, instantaneous communication system. It provides identical printed records simultaneously, at both sending and receiving ends. Fast and accurate, its operation is very similar to that of the overseas telephone service except that the messages are exchanged by printed words via a teleprinter.

In India, telex service is now available from Bombay and Ahmedabad to Argentine, Australia, Belgium, Brazil, Bulgaria, Canada, Czechoslovakia, Denmark, Faroe Islands, Federal Republic of Germany, Finland, France, German Democratic Republic, Greece, Hong Kong, Hungary, Iceland, Irish Republic, Israel, Italy, Japan, Kenya-Uganda, Luxemburg, Malaya, Netherlands, Norway, Philippines, Poland, Singapore, Spain, Sweden, Switzerland, U.K., U.S.A. and U.S.S.R.

Similar services are proposed to be introduced during the Third Five-Year Plan for Calcutta, New Delhi and Madras. It is expected that international telex service from New Delhi will be available by the end of this year.

INDIA TO PARTICIPATE IN NEW YORK WORLD FAIR

The Government of India has decided to participate in the 'New York World Fair' to be held in 1964-65. The Fair is being organised with the object of 'promoting peace through understanding'.

In view of the importance of the project, a nine-member committee has been set up to advise the Government on various aspects of organising India's participation in the Fair. The committee will consist of Mrs. Indira Gandhi, Chairman, and Mr. D. S. Joshi, Dr. H. J. Bhabha, Mr. P. K. Panikkar, Mrs. Pupul Jayakar, Mr. G. L. Bansal, Mr. Gautam Sarabhai, Mr. S. K. Joglekar, and Mr. Sankho Chaudhari as members.

IN BRIEF ..

Mr. Aery, a representative of the Californian Chemicals Company, was here last week in connection with the plans to set up the coromandal fertilizer project. The U.S. firm is collaborating in this project, which is expected to go into production by the end of 1964 or early in 1965.

*

A Bombay firm will be shortly producing foam glass developed by the Central Glass and Ceramic Research Institute of Calcutta. This will save the country valuable foreign exchange to the tune of about Rs. 50 lakhs a year which sum is at present spent on importing cork-slabs (mainly from Portugal) for aid-conditioning, cold storage and various other developing industries. Foam glass has been found to be an excellent substitute for cork in this respect and can be used extensively in building, air-conditioning and cold storage industries as well as for insulating hot and cold pipes and tanks.

*

The Government of India has decided to allow upto the end of August, 1962, import of dry fruits, asafoetida, cumin seeds and medicinal herbs from Afghanistan by steamers via Iranian ports on C. & F. basis, subject to the condition that the importers will pay for the total C. & F. value of the imported goods by export of Indian goods to Afghanistan.

*

The validity of the permits issued for the import of hides and skins from Afghanistan by established importers and new-comers has been extended to cover the despatch of these goods from Afghanistan upto the end of September, 1962. Import of these goods will be permitted by steamers via Iranian ports.

*

The International Development Association, an affiliate of the World Bank, has extended a development credit of the equivalent of $15 million for assisting financing a project for the improvement and expansion of the Sone Irrigation System in West Bihar. The credit carries no interest but requires a payment of ¾th of one per cent per annum to be made as service charge.

HOW

KIND HEARTED

IS YOUR DIET?

Doctors now agree that heart ailments due to hardening of the arteries can be avoided by excluding saturated fats from one's diet. In fact, the use of an unsaturated cooking medium is highly recommended. Nature has provided such a medium in the form of safflower oil (kardi, in Hindi). Known as saffola, it is the ideal cooking medium for everyone and particularly for those over forty Saffola is nutritious, palatable, easy to digest and so economical. For health's sake get a tin of Saffola from your nearest store.

ORIENT GENERAL INDUSTRIES LTD., CALCUTTA-11

COMPANY AFFAIRS

EQUITABLE COAL

During 1961 Equitable Coal Company Limited could not record favourable quantity of raisings because rail transport for coal movement was unfortunately not available during the first half of 1961. Moreover, there was a sever shortage of electric power in the Raniganj coalfields. The Directors indicated that Seam at Bhutgoria Colliery was exhausted, but that loss in production was made good by the output obtained from Selected Baraboni Colliery which was acquired in 1961 in exchange for the company's Haripur property. The company, however, is planning expansion round Mouza Khottadih. The sales of coal during the year brought in Rs. 3.99 crores as against Rs. 3.93 crores during the previous year. Profit for the year at Rs. 24.5 lakhs was, however, Rs. 6.42 lakhs after making adjustments for depreciation, taxation, etc. The Directors proposed the payment of a dividend on ordinary shares at the rate of 10 per cent which will absorb Rs. 2.96 lakhs.

NEW STANDARD

The working results of New Standard Engineering Company Limited for the year to March 31, 1962, show a gross profit of Rs. 22.20 lakhs against Rs. 18.04 lakhs during the previous year. The sales during the year also were higher by nearly 33 per cent at Rs. 1.59 crores against Rs. 1.19 crores during the previous year. After making provision for depreciation, development rebate reserve and taxation, the Directors recommended the payment of a dividend at the rate of 9 per cent on 50,000 equity shares which will absorb Rs. 4.50 lakhs. Out of the balance Rs. 50,000 were transferred to general reserve. During the year, it may be added, the fixed assets of the company increased by nearly Rs. 26 lakhs.

SELECTED SATGRAM

During 1961 Selected Satgram improved its raising by 28 per cent at 3.69 lakh tons. Despatches were also higher by 30 per cent at 3.49 lakh tons. It was indicated that the performance of New Satgram Colliery, the biggest unit of the company, was not upto the mark because of the declaration in February 1961 of expenditure on repairs and renewals. The company has expansion plans for their mines in collaboration with Messrs. CEKOP of Poland and Sofvemines of France. Dividend during the year was Rs. 14 per share as against Rs. 16 during the previous year.

NEW ISSUES

The Controller of Capital Issues has granted consent to the following companies to raise capital. The consent in all cases is valid for twelve months.

The Commercial Ahmedabad Mills Limited, Ahmedabad, has obtained the CCI's consent for issuing bonus capital of Rs. 5,77,500 (in 2,310 equity shares of Rs. 250 each) in the ratio of one bonus share for every six shares held, on capitalisation of company's reserves.

Madura Mills Company Limited, Madura, has been authorised by the CCI to issue debentures of the value of Rs. 125 lakhs at par. The debentures will carry a rate of interest not exceeding 6½ per cent. The proceeds will be utilised on a compressive scheme of modernisation and expansion.

Nanubhai Industries Private Limited will issue Rs. 1 crore capital in equity shares of Rs. 100 each to be offered to the public for cash at par. The proceeds will be utilised in the existing plant for the manufacture of nylon.

Elpro International Limited, Bombay, a new company, has been permitted to issue capital of Rs. 85 lakhs in equity shares of Rs. 100 each at par. This will be subscribed as to Rs. 42,50,000 by Messrs. General Electric Company, U.S.A., Rs. 8.5 lakhs by the Indian Employees of GEC of (India) Ltd., Rs. 12,75,000 by Investment Corporation of India Limited, its friends and associates and the balance of Rs. 21,25,000 by the Indian public through prospectus. The proceeds of the issue will be utilised for the manufacture of lightning arresters, magnets, heating elements, X-ray equipment, etc.

Prestolite of India Limited, Delhi, will issue share capital of Rs. 40 lakhs in equity shares of Rs. 10 each at par. Of this, shares of the value of Rs. 17.5 lakhs will be offered to M/s. Electric Autolite Company of U.S.A. against the supply of plant and machinery and the balance to Indian nationals for cash. The proceeds will be used for manufacture of automobile electric equipment.

Company Meetings

THE FERTILISERS AND CHEMICALS, TRAVANCORE LTD.
UDYOGAMANDAL

Speech delivered by the Chairman, Shri T. A. Joseph, at the Eighteenth Annual General Meeting held on 27th June, 1962.

Gentlemen,

On behalf of the Board of Directors I welcome you to this, the Eighteenth Annual General Meeting of the Company. Printed copies of the accounts and the report of the Directors are before you. These have also been circulated to all the shareholders. I shall, if you agree, take them as read.

As you would have seen from the statement of accounts, there has been a general increase in production all round consequent on the completion of the First Stage of Expansion of the factory towards the close of 1960. Ammonia production increased by 15 per cent, Ammonium Sulphate by 29 per cent and NPK Mixtures by 177 per cent. In addition, 12,897 tonnes of Ammonium Phosphate were produced during the year for the first time. As a result, the sales turnover rose to Rs. 411 lakhs as compared to Rs. 309 lakhs in 1960. The financial results have therefore been encouraging. After providing Rs. 38.75 lakhs for depreciation as against Rs. 25 lakhs in 1960 and Rs. 22.75 lakhs for Development Rebate as against Rs. 23.55 lakhs in 1960 and making a new provision of Rs. 1.5 lakhs for taxation, the company has a net surplus of Rs. 32.64 lakhs as compared with Rs. 27 lakhs in the previous year. You will be pleased to note that the reserves at the end of the year will be standing at Rs. 98,93,096 as against Rs. 64,30,156 at the end of the previous year.

After seeing all these figures it might be a trifle disappointing to note that your Directors are coming forward with the same old recommendation regarding dividend to be distributed to the shareholders from profits of the year 1961, viz. 6 per cent subject to deduction of tax. I would in this connection refer you to my remarks last year on this subject. We are on the threshold of a very large scale expansion, more than doubling our capital investment. No doubt finances necessary have been arranged, as explained later. We have to find from our own resources only two out of the ten crores necessary, and this should not be difficult. But we have to keep in mind the fact that half the balance is going to come from the Government of India in the shape of a loan, and there is really something incongruous in large-scale borrowing with one hand and liberal distribution of profits with the other at the same time. However, we try to justify it with facts and figures. We have also to remember that when the share capital is expanded (practically doubled) as agreed to by you at the last Extraordinary General Body meeting, our liability in respect of dividends would also double. Until we could see our way clear to maintaining without interruption to present rate of dividend on the increased equity capital, we did not consider it prudent to increase the rate, and hence we agreed to place before you the same recommendation which we made last year.

While on this subject, it might be interesting to draw your attention to what the eminent Economist, Prof. J. K. Galbraith (now U.S.A. Ambassador to India) had to say on this subject while commenting on Indian Planning in 1959.

> "In both capitalist and communistic countries investment is in very large measure from the earnings of industrial enterprises. Something must happen in India like this. Industrial plants must take on their full job which is to be efficient producers and to accumulate surplus which will provide for future expansion."

This sound principle has been kept in view by your Directors in recommending this dividend.

The Second Stage of Expansion involving the installation of an Oil Gasification plant is well under way. The new plant is expected to be commissioned towards the end of August. When the Oil Gasification process is introduced, the old wood gasification plant will cease to function. The Company will no longer be using firewood as a raw material. The Oil Gasification plant will be fed by raw naphtha supplied by the Refinery at Bombay. To ensure uninterrupted supply of raw material, Messrs. Burmah-Shell, our supplier, with whom the Company has entered into a fifteen year contract for the supply of raw naphtha, are laying a pipeline from Ernakulam to the factory.

As the firewood gasification process is being abandoned, the Company has terminated the contract arrangements for transport of firewood from April this year. These arrangements that were in vogue since the inception of the Company involved over two hundred country craft employing about four hundred workers. The termination of the arrangements was effected on the basis of a negotiated agreement with the Navika Thozhilali Union. I would take this opportunity to record our appreciation of the valuable services rendered to the Company by these workers and of the practical approach shown by their Union in negotiating and concluding a satisfactory agreement for the smooth termination of arrangements.

With the completion of the Second Stage of Expansion, the Company's capacity would have risen to 30,000 tonnes of Nitrogen per annum, the end products being one lakh tonnes of Ammonium Sulphate, 33,000 tonnes of Ammonium Phosphate (16 : 20 grade), 8,000 tonnes of Ammonium Chloride and 44,000 tonnes of Superphosphate. In addition the Company will be able to manufacture and supply NPK Mixtures on an "as required" basis for both food crops and cash crops.

During the first half of this year the production schedule of the Company was upset due to unusual draught as a result of which salinity in the water of the area increased considerably. For more than two months the Company was not able to maintain production even at a reasonable level. Added to that there was also a power cut from 1-3-62 to 10-5-62. I gather that the Government of Kerala are taking urgent steps to prevent a recurrence of salinity in the region. I hope the work will be expedited with the urgency it deserves so that there will be no more trouble on this account next year. With the introduction of the Oil Gasification scheme it will be necessary for the Company to shut down its wood gasification plant to enable the commissioning of the new plants. This will also affect the total production during the year. But it is expected that with the increased capacity that will be established as a result of the Second Stage of Expansion, production will be picked up during the last quarter of this year.

In the year under review the Company entered the export market for the first time in its history. This has opened a new field for further development. With the increase in production of Ammonium Chloride as a result of the Third Stage of Expansion, it is hoped that in the years to come the Company will be able to effectively meet the competition in the world markets in Ammonium Chloride.

I had mentioned to you at the last meeting that the Company was engaged in planning a Third Stage in their Expansion Programme. I am glad to say that the programme has now been finalised. Necessary licences for the expansion have been obtained from the Government of India. Most of the contracts for the supply of plant and equipment from both foreign and Indian sources have been concluded. The Government of India have been pleased to sanction the necessary foreign exchange amounting to approximately Rs. 427 lakhs, under the credit facilities available to them from the U.K., U.S.A., West Germany and Switzerland. The capital investment involved in the Third Stage expansion is approximately Rs. 10 crores. Of this the Company will be able to find from its own resources about Rs. 2 crores. The Government of India have agreed to contribute the remaining Rs. 8 crores partly as share capital and partly as loan. You would recollect that at an Extraordinary General Meeting held on 22-1-1962 the Company had agreed to raise its Authorised Capital to Rs. 10 crores and to issue shares of the value of Rs. 4,03,84,780 to the Government of India at par. Consent has since been obtained from the Controller of Capital issues for the issue of 35,00,000 equity shares of Rs. 10 each to the Government of India. When the shares offered to the Government of India become fully subscribed, the Government of India will be acquiring majority control over the shares of this Company. Against the total loan of Rs. 400 lakhs agreed to be made available by the Government of India for this expansion, the Company has already drawn Rs. 170 lakhs to meet the expenses.

It is expected that the Company will be able to complete its Third Stage of Expansion by the end of 1964. The production capacity that would be achieved as a result of the expansion would be 20,000 tonnes of Ammonium Sulphate, 135,000 tonnes of Ammonium Phosphate and 25,000 tonnes of Ammonium Chloride. There will be no further expansion in the capacity for production of Superphosphate. One of the interesting features of this expansion programme is that it is essentially based on the increased production of Ammonium Phosphate, one of the most popular compound fertilisers in the country today. The byproduct gypsum arising out of Ammonoum Phosphate production will be further utilised to enhance the production of Ammonium Sulphate, thereby achieving the additional quantity of 100,000 tonnes. By adopting this method of FACT has shown the way to the rest of the Country for the effective utilisation of byproduct gypsum, thereby ensuring that the Sulphuric Acid manufactured out of imported sulphur gets used twice, first in the production of Phosphoric Acid for making Ammonium Phosphate and later, in the production of Ammonium Sulphate using gypsum obtained from Phosphoric Acid production. In addition to ensuring maximum utilisation of imported sulphur this process would also lead to better economics in the cost of production of Ammonium Phosphate, as the byproduct gypsum raised during the process is further utilised for production of Ammonium Sulphate.

A significant achievement of the Company recently has been the signing of an agreement with Messrs. Power-Gas Corporation Ltd. of the U.K. Under this agreement FACT will be getting a royalty from the U.K. firm on all contracts entered into by the latter for the supply of plant and, equipment designed on the basis of the technical know-how provided by FACT for the manufacture of Ammonium Sulphate out of by-product gypsum. There has been a growing recognition in the country and abroad of the technical knowledge and competence acquired by the Company. A few weeks ago, the Company has signed another agreement with Messrs. Project Engineers Private Ltd., an Indian firm of consulting engineers, engaged in the planning and designing of chemical plants. Under this agreement the Company has agreed to impart technical know-how on payment of a royalty for the designing of plants for the manufacture of Ammonium Sulphate using the direct neutralisation process of Ammonia and Sulphuric Acid. These achievements have been possible only due to efforts of the executives, staff and workers of the Company working together with unreserved co-operation and sense of participation. I would like to take this opportunity to congratulate them on these achievements of theirs and record our appreciation of the esprit-de-corps displayed by them.

Industrial relations continued to be quite satisfactory during the year under review. The long term agreement that was in force expired at the end of the year. A fresh agreement for a further period of three years has since been negotiated and concluded with the FACT Employees' Association. A notable feature in the field of industrial relations is the conclusion of an agreement between the Management and the FACT Employees' Association for the introduction of Work Study and Job Evaluation. It has been possible for the Company to negotiate and conclude these agreements because of imagination and cordiality shown by the FACT Employees' Association, whose approach has been realistic and influenced by the best interests of the Company. I would like to record our deep appreciation of the manner in which these negotiations were smoothly carried out resulting in the conclusion of agareements that give mutual satisfaction. The average earnings of an employee in the Company stand today at Rs. 2,840 per annum as against Rs. 1,520 in 1955 and Rs. 2,283 in 1960.

Last year I had mentioned about the efforts the Company were making towards increasing fertiliser consciousness among the farmers of Kerala. The Company has been laying great stress on the use of balanced fertilisers and has been progressively increasing their production of NPK Mixtures to meet the demand. You will notice that during the year under review the Company has produced over 19,000 tonnes of NPK Mixtures as against 7,000 tonnes in 1960. The Company has plans to expand its mixture production capacity on a large scale so that it should be possible to meet the requirements of NPK Mixtures, if necessary, to the extent of 30,000 tonnes a year. The Company has been maintaining nearly 400 Demonstration Farms in Kerala State alone. During this year the Company has extended this work to some of the Districts of Madras, Mysore and Andhra Pradesh also.

The Company has been included in the list of approved Mixing Firms of the Coffee Board, UPASI and the Government of Madras. The activities in the field of production and marketing of NPK Mixtures will therefore be enlarged consistent with the demands that will be arising in Madras State as well as in the Plantations.

In Kerala State the Company has at present over 900 distribution points, of which over 60 per cent are

held by Service Co-operatives. The Company has been extending its full measure of co-operation to the Government of Kerala in the implementation of their policy in regard to progressive utilisation of Service Co-operatives for distribution of fertilisers. Over 40 Agronomists of the Company are now working in different parts of Kerala State rendering technical assistance to farmers and Service Co-Operatives and assisting them in obtaining their requirement of fertilisers in time during the season. Soil tests are conducted by the Company's Agronomists free of charge and where possible, they also supervise manuring operations. It is gratifying to note from the rising demand for fertilisers in Kerala that fertiliser consciousness has been on the increase in Kerala State as a result of the measures taken by the Company in this direction.

In all these activities the Company has been fortunate to enlist the active assistance and encouragement of the Department of Agriculture of the Kerala State. I would take this opportunity to express our sense of gratitude to the Governments concerned, the Coffee Board and the UPASI, and in particular, to the Department of Agriculture of the Kerala State.

In the current budget, excise duties have been imposed on almost all our intermediate products utilised for the manufacture of fertilisers. Besides Ammonia and Sulphuric Acid, excise duty will be payable on oxygen and carbondioxide obtained as byproduct and utilised in the process. All these form the basic raw materials for the production of fertilisers. Increases in their cost due to the imposition of excise duty are bound to lead to increased cost of production of fertilisers. I hope it is not the intention of the Government of India that the cost of fertilisers should increase any further. The prices at which they are available in India today are already higher than in any other country. In the interests of increased food production which has become a matter of vital necessity to the country, I do hope that the Government of India will re-examine the question of imposition of excise duty on raw materials that go to make fertilisers, so that fertiliser prices are not increased any further.

I would take this opportunity to express our thanks to the executives and workers of FACT for their good work and devotion to duty.

I now move that the Directors' Report and the Audited Statement of Accounts for the ended 31st December, 1961 be adopted.

N.B.: This does not purport to be a report of the proceedings of the General Meeting.

JAIPUR METALS & ELECTRICALS LTD., JAIPUR

Speech of the Chairman, Shri R. H. Kamani, at the 18th Annual General Meeting of the Shareholders on the 29th June, 1962.

Gentlemen,

It gives me great pleasure in extending to you all a cordial welcome on behalf of my colleagues and myself to this 18th Annual General Meeting of your Company.

The Directors' Report, Audited Profit and Loss Account and the Balance Sheet for the year ended 31st December, 1961, have been in your hands for some time and with your permission, I propose to take them as read.

ACCOUNTS:

An examination of accounts will show that the year just passed has been a record one for the Company. The profits before providing for Depreciation and Managing Agents' remuneration has recorded marked increase over the previous year of working. Likewise turnover has also increased to Rs. 1,60,11,964 as against Rs. 1,46,95,507 in the last year.

Allocations include Rs. 1,02,919 for the Managing Agents' remuneration, as against last year's remuneration figure of Rs. 71,611 and Rs. 4,33,709 for Depreciation as against Rs. 3,82,092 for the previous year. The provision for taxation has been increased from Rs. 3,58,067 to Rs. 3,90,685 and the Development Rebate Reserve has increased from Rs. 81,443 to Rs. 3,05,000. Provision for Gratuity absorbs Rs. 20,000 as against Rs. 10,000 in the previous year.

The Directors have recommended Dividends of 10 per cent on Ordinary Shares and 40 per cent on Deferred Shares (subject to deduction of tax at source) as against previous year's 9 per cent and 25 per cent subject to deduction of tax at source) respectively. The Board has also recommendd a Dividend on Preference Shares. After providing Rs. 3,72,640 for proposed Dividends, a sum of Rs. 7,561 has been carried forward against Rs. 5,645 brought in.

By the new Finance (No. 2) Bill 1962, introduced in the Lok Sabha on 23rd April, 1962, the Corporation Tax has been increased from 20 per cent to 25 per cent. This step on the part of the Government of India would lead to the reduction of the Company's surplus which would otherwise have been useful for creating reserve for the development programme of the Company.

PRODUCTION:

You may recall that in the year under review the production of Jaipur House Service Meters has reached a record figure of 1,76,020 as against the production of 1,34,500 in the previous year. The production of Siemens type of Meters in collaboration with Siemens of Germany was taken in hand and the production during the last quarter of the year under review was 6,400 Meters. As far as the working of Metals Division is concerned the Company could not increase the production due to the shortage of raw materials especially copper owing to paucity of foreign exchange and drastic cut in quota of raw materials.

EXPANSION AND DEVELOPMENT:

You will be happy to know that the Company has already planned to undertake manufacture of Jewel Bearings and important Components like Cyclometers and Magnets so as to cover the entire manufcture of Components.

After the successful completion of the Second Five-Year Plan which has helped to strengthen the found-

ation and stimulated industrial and economic growth, the country has entered into the Third Five-Year Plan period. In a way, this is the most crucial period in the industrial, economic and therefore social life of the country, as the foreign exchange reserves have been extremely low, and the prospects of getting adequate amount from the Aid-India Club at the moment not very bright. It will require tremendous efforts on the part of the Government, the Industry and the Trade to emerge successfully from this crucial period. But I am hopeful that with greater efforts, we shall pull through it. As, however, your Company has decided to make all the components, I may assure you that our progress will not be affected by this crisis.

During the Third Five-Year Plan, the power supply will play a significant role towards the achievement of Industrial Development as the addition to the country's power system will be to the tune of 12.69 million K.W. representing an increased in installed capacity of 123 per cent. As a part of the development programme, it is proposed to install a net of transmission lines to the extent of 1,50,000 circuit miles and to electrify 43,000 villages and towns in the country. This Development of Power Supply implies that your Company will have still better future.

It would not be out of place to mention here that the installed capacity as registered with the Government for Single Phase House Service Meters by the end of 1961 was 4,44,000 numbers on single shift basis. The total production in the country for 1961 was of the order of 6,24,113 numbers. This year's capacity has been further licensed to the extent of 1,02,000 numbers bringing the total registered capacity to 5,46,000 numbers on single shift basis. When this additional capacity goes into production the total demand of single phase meters will be adequately met, and I may assure you that your Company will remain in the forefront. It is a matter of gratification to note that the Government have recently decided not to increase this capacity any further.

With a view to enlarging the field of operations, we have obtained industrial licence for the manufacture of All Aluminium Conductors and A.C.S.R. Conductors, Cotton Silk and Paper-covered Wires and Strips and Enamelled Copper Wires. With a view to implementing the scheme of diversification, your Company has approached the Industrial Finance Corporation of India for a substantial loan. It has also increased its authorised capital from Rs. 50 lakhs to Rs. 1 crore by creating an additional Equity Capital of Rs. 50 lakhs. Out of this, 25,000 Equity Shares have been already issued to the existing shareholders with a premium of 15 per cent by way of right shares. You will be pleased to know that this issue has met with complete success and has already been fully subscribed.

PERSONNEL:

In view of the progress in technology, the Company's technical staff is equipped with necessary training and it will have further personnel fully trained in the factories of the collaborators in the lines of new schemes which your Company propose to undertake.

I am grateful to you for the encouragement and backing your Company has received from you all from time to time. I am also grateful for the wonderful co-operation of the workers and the members of the staff for the good efforts they have made in the past for the betterment of your Company.

THANK YOU.

Note: This does not purport to be a report of the proceedings of the Annual General Meeting.

12 JUL 1962

THE ENFIELD INDIA LIMITED

Higher Output of Motorcycles: Scooter Production Commences

Sri K. R. Sundaram Iyer's Review

Presiding over the Sixth Annual General Meeting of the Company held on the 29th June, 1962, Shri K. R. Sundaram Iyer, Chairman said:

Gentlemen,

I have great pleasure in extending to you a cordial welcome to the Sixth Annual General Meeting of the Company. The Directors' Report and the Statements of Account for the year ended 31st December, 1961, have been with you for some time and with your permission, I shall take them as read.

During the year under review motor cycle production increased by about 20 per cent. The sales turnover was higher at Rs. 119.68 lacs. During the previous year it was Rs. 90.58 lacs. The profit before depreciation increased from Rs. 8.49 lacs to Rs. 11.13 lacs. As mentioned in the Directors' Report, the profits would have been still higher if the Company had been in a position to increase its selling prices earlier than September 1961 to make good the continuous increase in the cost of various raw materials since the prices were fixed three years back.

At the last Annual General Meeting, I dealt in some detail on the implications of the phased programme which your Company had undrtaken for the substitution of imported motor cycle components by those made in the country. With the virtual completion of this programme in 1961, your company has reached a stage where production and productivity can be increased without being hampered by the inevitable teething troubles involved when large number of new components are taken up for indigenous manufacture. I am glad to inform you that during 1962 the output of motor cycles can be expected to register a further increase of 15 per cent, while the sale volume will be aided by the marketing of scooters shortly. The working results for the current year will, therefore, be better than those for 1961.

In the present context of acute scarcity of foreign exchange, the policy of your Company in having gone through the phased programme at a fast pace has been fully justified. Of course, we still require foreign exchange for some raw materials, gear box and proprietory components not yet available in the country. But, without the completion of the main phased programme, the dependence on foreign exchange would

have been considerably more. It is expected that, in due course, these proprietory parts also will be available in the country from ancillary industries. The manufacture of gear box for motor cycle will be taken up in 1963 along with the gear box for the scooter.

IMPACT OF NEW TAXES

The Automobile Industry purchases a large variety and number of materials for its production. For example, your Company keeps in stock about 6,000 items. It would appear that in a developing economy such as ours there will be a continuous increase in the cost of various materials. The new and increased excise duties levied in the recent budget have stepped up the cost of various kinds of materials. Because the area and extent of their application is so wide, it will take some time even to assess their full implication. Therefore, what portion of the benefits of high productivity and consequently, of higher profitability expected in the motor cycle production from 1962 onwards, will be available to the Company, is dependent upon how much the Company is obliged to absorb the increases in the cost of materials. Representations have been and are being made to the Government for suitable revisions of selling prices so that increases in costs due to reasons beyond the Company's control can be absorbed. It is hoped that early decisions in this regard will be taken by them.

In passing, I would like to make a reference to a factor in our country applying to industries such as ours. It is the necessity of having to hold larger inventories in order to ensure uninterrupted availability of raw materials and bought-out components.

SCOOTER PROJECT

You have already heard the gratifying information that the production of our scooter which has been very highly spoken of by all those who had an opportunity to see it, has commenced. They will be in the market in about a month or so. Your coimpany has been the pioneer in the country in the powered two-wheeler field. The implementation of the Scooter Scheme will enable your Company to continue to play a leading role in catering to the growing demand in the country for motor cycles and scooters. The Villiers engine is used in our scooter. The Company will, in due course, fit to the light-weight motor cycle also the Villiers engine in place of the present engine. The standardisation, in addition to resulting in economies in the production of engines for both motor cycle and scooter, has also the important advantage that it would enable your Company to alter at short notice the ratio of production of light-weight motor cycles and scooters.

SCHEME OF NEW INDUSTRIAL ESTATE

The arrangements for undertaking the manufacture of Villiers engines for industrial and agricultural purposes are going apace. The Company has been licensed for a production of 15,000 engines per annum on a single shift basis. There is already a large unsatisfied demand in the country for these engines; but the existing demand itself is considered to be only a fraction of what it would be in the coming years. Villiers engine is an international leader in this field. As stated by me at the last Annual General Meeting, the operations of your Company with regard to this line will be restricted to assembly and testing. The components of these engines will be obtained from Industrial Estate of ancillary units which your Company has sponsored. This arrangement is mutually beneficial. With the guidance and technical know-how of your Company the ancillary units will be able to establish and stabilise themselves within a short time. The advantage to your Company lies in the fact that it could undertake this important new line without the large increase in capital that would have been otherwise necessary. The fixed assets employed by the ancillary units in the Industrial Estate will be about Rs. 75 lacs. The Company has to provide only tooling and machines for the maintenance tool room. I should mention here about considerable guidance and financial assistance which both the Central and State Governments are rendering to facilitate the establishment and healthy growth of these ancillary units. Production and marketing of the engines are scheduled to commence in the first half of 1963.

During the year under review industrial relations continued to be cordial.

I would like to take this opportunity to offer our sincere thanks to the Government of India, the Government of Madras and our U.K. collaborators, for their continued guidance and assistance.

Appreciation is due to the selling agents, dealers, sub-dealers and service points, and the workmen, staff and officers of your Company for having made their contribution to the results of the year under review.

Note: This does not purport to be a record of the proceedings of the above Annual General Body Meeting.

Mr. Al Foil wraps tobacco to perfection

Leading cigarette and tobacco manufacturers recognise aluminium foil as the best protective packaging for their products. Experience has proved that foil packaging retards the 'drying out' of tobacco, forms a hygienic wrapper and keeps cigarettes and tobacco fresh and flavourful for a longer time.

Foil in the package implies quality and adds prestige to the product.

The Bank Award

ANY assessment at this early stage of the impact of the Bank Award on the emoluments of bank employees as a class or on the operating costs of banks as a system must be treated with great circumspection. The process of assessment has become too intricate to make prompt estimates of any greater value than unhelpful guesswork. The entire structure of the emoluments of bankmen at different levels has assumed complexity by reason of the fact that the emoluments are not governed by a uniform scheme due to the unhappy historical developments in the settlement of bank disputes about eight years ago. It is not a matter of applying Mr. Justice K. T. Desai's Award straightaway to the different grades of employees and their pay scales. Differentials have emerged in these scales according as the bank employees are or are not governed by the modified Sastri Award. They will need to be adjusted where necessary. Those who are governed by the Sastri Award as regards their time-scales of pay present no difficulty. Those who are not so governed will probably need to be placed in those scales and on its basis adjusted to the new time-scale fixed in the Desai Award. There will remain some borderline cases which will attract temporary adjustment allowances. The Tribunal has dealt with this preliminary issue in an appropriate manner.

A tribunal's decision ought to be accepted normally as an impartial decision of a disinterested third party; but, even so, in the last analysis, it cannot be divorced completely from the element of imposition. If agreement is not possible on the basis of negotiations and give and take between the parties, the arbitrator has to decide what is in the best interests of each. It is a substitute compromise on these lines and it is no wonder if it happens to fall short of the demands and expectations of either party in some respects.

The criticism which some of the leaders of the staff associations have made about a raw deal being meted out to bankmen can hardly be taken as based on the merits of the Award. The Award is denounced on the ground, among others, that a section of the employees may find themselves worse off than under the Sastri Award. It shows how the limits of responsible reaction are disregarded in the face of the basic principle that no employee's position can be changed to his prejudice. Mr. Justice Desai has proceeded on the assumption that in several respects the banking industry has now to accept some of the obligations of a public utility. Social justice, as he has emphasized, is a guiding principle of his Award and, finally, he has been forthright in his appraisal that the new scales suggested by him have been very favourable to the employees. There the truth of the issue rests.

The Indian Banks Association has wisely used its discretion in not raking up any irritating differences of view and it has rightly accepted with grace the Award with an assurance to implement it as required by the Government's decision accepting the Tribunal's recommendations in toto. Most of the recommendations have been given retroactive effect from January 1962 and a time-limit of five months has been granted to the bank managements within which to make the payment of arrears. The employees have raised the grievance that, in view of the rejection of their demand for the grant of interim relief, the retrospective effect should be pushed to a much anterior point of time. This will be to introduce a precedent that will involve uncalled for burdens on industry. Interim relief is not a matter of a rigid rule and tribunals have taken more than two and a half years that Mr. Justice Desai required in spite of his discipline of speedy dispatch of work.

Both the sides have learned to their cost the bitter lesson of the consequences of insistence on litigation right from the time of the Sen Award and of the vicissitudes which the bank wage dispute has taken thereafter. With Mr. Desai's liberal and comprehensive deal they would do well to draw the curtain on the past. It is in this spirit that the Indian Banks Association seems to have given a pledge to abide by the Award. Placed in a happier situation, the employees can give a similar response.

The Desai Award simplifies the classification of the banks, but, since in this process a few small banks are likely to be hit hard, exemption has been rightly extended to them. With a liberalisation of the classification to the greater advantage of the bankmen, more benefits have been provided to them. The major part of the dearness allowance has been merged in the basic pay, putting an end in this manner, to the artificial arrangement of clinging to an outmoded level of cost of living to which there is no question of returning any time. This means higher rewards to employees in terms of the provident fund, gratuity and pension (where the pension scheme also operates on the fringe). Equity requires that relief should be granted to the banks from an excessive burden of liability on these counts and the Tribunal has made a modest provision for readjustments to secure this purpose.

The new formula of linking the dearness allowance with the cost of living brings a greater correlation between the two by virtue of its quarterly basis. The increase in the cost of living will be neutralised to the extent of 75 per cent for the clerical staff and 100 per cent for the subordinate staff. The raising of the age of retirement by 3 years to 58 would go to mitigate, on the one hand, the immediate post-retirement hardships of employees, and, on the other, the shortage of experienced personnel in the context particularly of branch expansion. The new scales of pay after merger are calculated to raise the real earnings of the staff.

Bankmen have raised a plea of the insufficiency of the increases on the ground of the recent

higher trend in bank profits. This plea is untenable. For one thing, increases warranted by the higher cost of living have been awarded; for another, the claim of bonus is overlooked. A whole series of bank reforms, beginning with deposit insurance and the improvement of the capital-deposits ratio, taken in hand to strengthen the financial structure of the banks to meet the higher pressure of services for a developing economy, ordains that profitability and capacity to build strong reserves ought to be raised. Banks owe important obligations to the community, too.

Canada in Travail

THE emergency measures which Mr. Diefenbaker has announced to meet the challenge of the economic crisis could have been more drastic, looking to its gravity. But even in the form in which they have come, they may not find the political climate altogether propitious. It is as the head of a minority government that Mr. Diefenbaker issued his appeal to the nation to accept austerity in a genuine sense of emergency. A minority government is not unknown to Canadian history and the late Mr. Mackenzie King led one such after World War I. But in his minority position, Mr. Diefenbaker is handicapped by the defeat of five of his previous Cabinet colleagues at the polls and two, who are elected, are prevented by ill-health from giving their utmost to their chief in this hour of trial.

In his appeal over the radio the Premier counselled his people to show patience, pleading that Parliament should not be convened until after the post-election temper is calmed. It has taken an unusual form by reason of the imbalance which has emerged in the strength of the parties as a result of the electorate's verdict — and the verdict itself is vitiated by the confusion generated by the economic crisis. Mr. Diefenbaker's Progressive Conservatives have retained 116 seats after a heavy loss of over 42 per cent. The Liberals have emerged with an increased strength of 99, the New Democratic Party has won 19, while the Social Credit Party has made its debut with a high score of 30. It is the Social Credit Party which holds the balance of power and this party is in no mood to lend support to the emergency programme.

It is a creeping crisis that has overtaken Canada's economy and, in retrospect, judgment is being passed that better and more firm economic policies could have stopped its steady march. What was perhaps not fully appreciated was that the boom generated by the post-war expansion had spent its force. But meantime industrial capacity was allowed to be over-extended and could not long be sustained at its level. The continuous inflow of hot money may have been welcome for a time, but its repatriation now will certainly accentuate the strain on the Canadian dollar. The wisdom of imposing no regulation on the free movement of capital, which has been maintained, is open to question. Short-term capital is the first to take flight and there is already the evidence of official statistics that this reverse process is gathering momentum.

This is to be seen also in the context of the conditions of Canada's foreign reserves. Since the beginning of the current calendar year they have been run down by $850 million and it is particularly noticeable that, out of this depletion, $300 million have been accounted for in the past few weeks. They have now touched the low of $1,100 million. Canada's balance of payment on current account too has taken a severe turn. After a brief spell of a couple of years of improvement, started the deterioration early in 1961 and the deficit at the close of the twelve months amounted to $1,000 million. With the inflow of external capital having come to a halt, the payments deficit is making inroads on the foreign exchange reserves. Mr. Diefenbaker's Government has to fight a valiant battle to maintain the par value of the dollar at US cents 92½.

The programme of stabilisation in its immediate context calls for bolstering the external payments position. Credits of the total value of $1,050 million is the first plank in Mr. Diefenbaker's emergency measures. Besides the IMF credit of $300 million and the Exim Bank's loan of $400 million, recourse has been taken to the support from foreign Central Banks — a new instrument forged by the Basle Agreement in 1961 when the need arose to reinforce the defence of the pound sterling. The US Federal Reserve System is providing a line of credit of $250 million and the Bank of England $100 million.

Mr. Diefenbaker's strategy in regulating the volume of imports contravenes, on the face of it, GATT's provisions, but notwithstanding this fact, he has announced a surcharge on import duties at varying rates for different commodities. While his defence of this course will lie in the urgency to meet the payments disequilibrium for the time being, his other purpose is to draw into the fisc, while discouraging laxity in imports, a customs revenue of the order of $200 million. With a slash of $250 million in Government expenditure, he will be in a position to reduce the budget deficit by $450 million. The Canadian Bank Rate was linked with the rate for Treasury Bills for the last about six years and as such it contained some element of fluctuation from week to week. This unusual arrangement has now been discarded and the Bank Rate is raised to 6 per cent. At around 1 per cent above the Treasury Bill rate, it is intended to create a psychology of tight money. All in all, Mr. Diefenbaker's emergency programme is expected to defend the dollar, provided production and exports look up without painful delay.

Shipping: Raising the Target

THE National Shipping Board has suggested to the Government of India that the financial allocation for shipping in the Third Five-Year Plan should be increased by nearly Rs. 27 crores so as to provide about 2 lakh tons of additional tonnage. This will take the target to 13 lakh tons as against 11 lakh tons prescribed in the Third Five-Year Plan. The Board had taken this decision on the basis of the reports of the Coastal Shipping Committee and the Financial Allocation Committee, both set up by it.

Will this new proposal from the Board need fresh allocation to attain the new goal? Mr. Raj Bahadur indicated recently in Parliament that the target of 11 lakh tons fixed in the Plan had already been achieved in the sense that orders had been placed to reach that level. On the investment side not all the Rs. 55 crores allocated for this purpose have been absorbed. In fact, there was a saving of Rs. 27 crores in the outlay during the current Plan because of the various deferred payment arrangements which had been made while placing the orders for the new ships. The proposed higher target could be attained within the limits of the resources allotted for shipping in the present Plan. The question of incurring additional expenditure which in this case means foreign currency expenditure, does not arise.

In fitting the acquisition of an additional tonnage of two lakhs within the resources originally allocated in the Third Plan, however, some important considerations arise and they ought to receive due weight. Actually, an estimate attributed to the Transport Ministry shows that an extra 2.5 million tons can be acquired without over-straining the provision of foreign exchange already made. It is significant to compare with this estimate the recommendation made by the Shipping Board. As against the Transport Ministry's estimate of the possibility of purchasing another 2.5 lakh tons of shipping, the Shipping Board has urged that 2 lakh tons should be added. The Shipping Board thus errs on the lower side in pressing the claim for further expansion of the tonnage.

The estimates made in the Plan about the possible requirements of outlay are not claimed to be quite precise inasmuch as much depends upon the market prices of new ships and second-hand ships at the time of placing orders. But the Shipping Board has issued a note of caution to the Transport Ministry that, to the extent possible, the purchase of second-hand ships should be kept to the minimum and, then again, it should be restricted to the coastal tonnage required for specific types of trade. By and large, the tonnage required for plying the distant waters should be new. Thus here different calculations of costs of ships would be involved. Furthermore, the question of spreading the allotted outlay over the acquisition of ships as an addition to the tonnage and acquisition for the purpose of replacement will need a more detailed scrutiny. On balance, it may be that a little more expenditure than Rs. 55 crores allocated in the Plan may be required. But this expenditure should not be grudged.

The priority which shipping claims on its inherent merits is the major consideration for not hesitating to raise the outlay by a modest margin above Rs. 55 crores, if it becomes absolutely necessary. The Planning Commission is fully seized of this aspect and the text of the Plan acknowledges the fact that the provision for shipping cannot be considered as adequate, the programme or its expansion should be considered as flexible and higher allocations should be made if there is an elbow room. This approach further strengthens the recommendation of the Shipping Board for bringing additional tonnage on the national register.

The coastal tonnage is an integral part of the overall tonnage for the expansion of shipping. It is true that there have been vicissitudes in the fortunes of the coastal operators and particularly during the recent acute depression in the freight market the coastal tonnage capacity was lying idle and the operators were in hard straits. But there has been a turn in this situation and the shipping capacity has been pressed into service for the transport of coal to the distant consuming areas of the south and the west, in order to give the sorely-needed relief to the railways. The sooner the policy of rail shipping co-ordination and allocation of traffic is finalised and acted upon the better it will be in the interest of resolving the transport bottlenecks. The prospect during the Third Plan and even thereafter clearly is that all the three principal modes of transport will have enough traffic and more to carry.

The deferred payment arrangements — according to which most of the new ships have been agreed to be purchased — will no doubt postpone the actual liability to the Fourth Plan. This, however, is to be preferred because of the tight foreign exchange position in the Third Plan. During the Third Plan, the new tonnage is sure to earn additional foreign exchange and assist in mitigating the strains of the foreign exchange crisis. To that extent the deferred payment agreements are welcome as they facilitate expansion in a key sector.

The Board has lent support to the demand of the shipping companies for the utilisation of the development rebate over a long period of time. According to the current rules, 75 per cent of the development rebate needs to be provided in the very first year of the acquisition of the new ships. The present demand is that they should be allowed to take advantage of the concession over a period of 5 to 6 years. This seems to be a reasonable suggestion, though it is not clear why the Ministry of Finance has not hitherto provided this concession to the shipping industry, while it is available to various other industries.

The main argument for making a larger allocation for shipping in the immediate context rests upon the ground that it will compensate for the great delays that have already occurred in the achievement of the targets which were first envisaged by the Shipping Policy Sub-Committee in 1945. Perhaps the Committee took too ambitious a view and undoubtedly it could not have foreseen the difficulties in the acquisition of tonnage that actually arose afterwards. It may even be perfectly valid to contend that shipping should be given a higher priority at the cost of some projects for the very significant reason that the ships which will ply the distant trades will earn foreign exchange and pay their way in a period of something like seven to eight years. It is better to concentrate on the outlay on shipping in the Third Plan rather than extend part of it to the Fourth Plan for the obvious reason that the expenditure of freight in foreign exchange would be saved and an additional net earning would be made.

THE WEEK'S NOTES

Kerala Coalition

SEARCH FOR STABILITY

MR. LAL BAHADUR SHASTRI'S qualities of tact and sweet reasonableness as a mediator have been put to a severe test in Kerala. His prolonged stay at Trivandrum for full four days gives an indication of the strenuous course which his mission of mediation between the two partners in the Kerala coalition apparently took. It is yet too early to say whether this ace mediator of the Congress Party has succeeded on this occasion. But there cannot be the least doubt that he has done his best.

Mr. Shastri's five-point formula for accord between the two partners gives the first impression that it may perhaps be difficult to find its acceptance at the hands of Mr. Pattom Thanu Pillai. It needs to be borne in mind that there are no ideological differences responsible for the rift between the partners. The differences relate to sharing of power. Top priority in the formula seems to have been given to the reallocation of the portfolios to redress the present imbalance and the unfavourable deal meted out to the Congress Party. Education, planning and public works, it is urged, should now be entrusted to the Congress Party. Related to this suggestion is the recommendation that charges and complaints against Ministers should be investigated into. It is an open secret that charges of corruption are repeatedly made in the State against the PSP Ministers. The suggestion for the transfer of the public works portfolio to a Congress Minister cannot be unconnected with them. But on this issue it is apt to be overlooked that charges could breed counter-charges and make the situation worse confounded. The suggested reallocation of the education and planning portfolios discloses the present recurring source of friction. An informal Cabinet Committee of three is urged to be set up to deal in advance with controversial problems of administration and governmental policy to put an end to the anomaly of the Chief Minister in a coalition cabinet making important decisions. Mr. Shastri had long discussions with Mr. Pattom Thanu Pillai, but how the latter reacts to his advice to accept the formula cannot be forecast. No time limit has been set — and wisely so — as it may savour of an ultimatum.

In his Press conference on the eve of his departure from Trivandrum, Mr. Shastri appeared to be at pains to explain the reality about the Congress Party's demand for the dissolution of the coalition. What he emphasized was that no unanimous resolution for ending the coalition was adopted during his stay by the Congress Legislature Party. But it is a hard fact that informally the Party urged upon Mr. Shastri to terminate this state of uncertainty and distrust. Even at this stage, the Congress Party does not seem to realise that the real beneficiary from the dissolution of the coalition will be, not that party itself, but the Communist Party. The Congress Party, as Mr. Shastri was pained to stress, was a greater victim of the corroding influence of casteism and communalism than any other party in the State. It may be that differences between the coaltion will be composed for the time being. But it is difficult to be sure that the search for stability in Kerala has been successful.

The Congo

STALEMATE DRAGS ON

IN THE CONGO, it would appear, that nothing is so certain as uncertainty. The bitterest of hostilities are followed by a lull and negotiations for settlement may approach the point of success when hope proves illusory. This is what has actually happened to the protracted talks between Mr. Adoula and Mr. Tshombe. It is now over half a month that the parties have postponed the talks and in the meantime the wind has started blowing the other way. The crux of the problem is to end the secession of Katanga to unify the Congo and to bring back peace which its continuously worsening economic situation urgently needs. But Mr. Tshombe gave an inkling of his mind on the question of the termination of the secession by celebrating the second anniversary of Katanga's independence. From Mr. Adoula's side, there is repeated and emphatic declaration of a determination to resolve the issue of secession by peaceful means; but, at the same time, now and then are issued angry statements or veiled threats that all means might be used to achieve this end — presumably not excluding the use of force. The postures adopted by the two parties are thus not helpful for speedy rapprochement and meantime the stalemate drags on.

U Thant has refused to flinch from his responsibilities as the Secretary-General of the UN, but he has left no doubt that the best that the UN should strive to do is to offer advice and co-operation to the two warring regions in the Congo. It is characteristic of this man of peace that he looks with positive disapproval on anything that might savour of the UN playing the role of the potential governor of the Congo by subtracting from the sovereign authority of that State. U Thant has rightly put his finger on the effective approach to the solution to bring Mr. Tshombe to the path of reconciliation by directing his efforts to ensure that the Union Miniere, the gigantic copper combine in Katanga, pays the taxes and royalties to the Central Government at Leopoldville. The Union Miniere's action in making these payments to Mr. Tshombe's Government all along these two years has put considerable financial resources in his hands, while totally depriving the Central Government at Leopoldville of the revenues which are legally due to it alone. His efforts are bearing concrete fruit and the Belgian Government is advising the Union Miniere to make the payments to Leopoldville. Mr. Tshombe has reacted sharply to this development and he has issued threats to blow up the installations in the copper mines. It is possible to argue that these threats are not intended to be carried out physically, since such a course would be highly ruinous to the economy of Katanga itself. But driven to desperation, his restive colleagues might carry out the threat partly at least. Realizing these imponderables, U Thant is taking timely precaution in seeking the mandate of the UN to use armed security measures, if necessary, to safeguard the copper mines. How soon and how far Katanga will see the wisdom of rapprochement now depends upon the pressing problem of the direction of the flow of revenues from the copper mines.

West Bengal

CHOICE OF CHIEF MINISTER

IN THE hour of trial, thrust upon it all too suddenly by the death of Dr. B. C. Roy, the West Bengal Congress Legislature Party showed a remarkable sense of unity and responsibility. Looking to the wrangles and intrigues for ascendency to positions of power, which constitute the dark features of the Congress Legislature Parties in some States, one might be tempted to say that the display was marvellous. The choice of Mr. P. C. Sen as successor to Dr. B. C. Roy was made so smoothly that harmony and team spirit in the working of the State Cabinet seem assured. The arrangement in pursuance of which Mr. Sen's name was proposed by the President of the State Congress Party and seconded by the Deputy Leader of the Legislature Party augurs well for harmonious relations between the organizational and legislative wings of the Party as also for loyalty from the ministers to the new Chief.

Mr. Sen's succession was obviously determined by his past record and his capacity to bear the burden of the new office. Lately, during the periods of absence of Mr. B. C. Roy, he officiated in his place and was virtually regarded as the next in command. This makes the Ministry—with no changes in its personnel—look forward with confidence to continuity of policy. The new Chief Minister's ample administrative experience since 1947 when he joined the State Cabinet under Mr. P. C. Ghosh and devotion to the duties of office will be great assets in guiding the affairs of the State Government. With over four decades of service to the nation through the Congress Party, he has deservedly earned respect for his personality. He possesses a rational as well as emotional grasp of the problems of his State and he has rightly explained that his central emphasis in industrial development will be on its employment potential to be achieved, among other factors, by dispersal of medium-scale units. Regional self-sufficiency in food may be desirable, but it is not necessarily imperative in a State where the population pressure may be increased by a political factor beyond the Government's control. But employment and progressive purchasing power are correctly chosen as the central aims of economic policy. Mr. Sen can plunge into his onerous task as soon as he breaks the concentration of too many portfolios which have passed into his hands. And he is fully aware of it.

Language

A LESSON

THE U.P. GOVERNMENT has only itself to thank for the consequences of its superficially conceived decision to introduce forthwith and on a State-wide basis the three-language formula in the high schools, recommended by the National Integration Council. It is apparent that the spirit of the Council's resolution, embodying this recommendation, did not contemplate the kind of change which the UP Government set about to introduce. Almost with boundless enthusiasm, it hit upon the project of launching the overambitious scheme of including in the higher secondary school curriculum a third language as a compulsory subject, besides English and Hindi. This transformation was sought to be brought about throughout the length and breadth of the State with a hasty operation. Students were to be given the option to choose the third language from among the thirteen languages (excluding Hindi) which are listed in the Eighth Schedule to the Constitution. It is not clear whether any limits of a minimum number of students opting for a particular third language from a school were prescribed or not.

It is a matter of plain commonsense that when the number of schools is increasing from year to year and the growing pressure of the strength of students is keenly felt by the existing institutions, the resources that would be required would be vast. And the resources are not merely financial, although it should be clear that the financial burden is the first consideration for the Government. A difficulty of still greater complexity would be posed in procuring teachers for the different Indian languages of the requisite quality in the impressively large numbers required and a further hitch would arise from their readiness to settle (even if not permanently) in a different region on the scales of pay conventionally offered there. Such a scheme requires a phased programme, on a policy of gradualness and co-ordination. The decision in its present form had to be abandoned on the eve of the new academic session.

The failure of this hasty scheme in UP constitutes no reflection on the value of language as one of the diverse media for bringing about national integration, although it would be well to realise the limited scope of its value. But its lesson is worth learning. Almost the same considerations apply to the teaching of Hindi in the non-Hindi speaking regions. There is, however, one sanguinary feature—Hindi as an official and national language will take relatively shorter time for its propagation. But the protagonists of Hindi will need to exercise restraint and patience.

As we go to press comes the report that the U.P. Government is evolving an orderly programme for this problem to be executed in suitable stages. This attitude is to be welcomed.

Election System

MALAISE AND CURE

WHEN A person of high integrity and impartiality, holding the office of the Attorney-General of India, makes certain radical observations on our system of elections and the extent of their genuine free character, they ought to be treated with respect and consideration that is their due. At the recent seminar in Bangalore, under the auspices of the Mysore State Commission of Jurists, Mr. M. C. Setalvad was severely frank in making the assertion that the elections as they are conducted in our country need not necessarily be treated as quite free. They suffer from two drawbacks which fail to ensure their freedom. One of these relates to the lack of power on the part of the Election Commission to stamp out certain abuses for the surprising reason that they happen to be outside the purview of the Commission or the Tribunals set up by it. Mr. Setalvad did not dilate at length on this question apparently because he felt that the legal nature of the issue would receive full treatment in the course of the proceedings of the seminar.

But, by and large, Mr. Setalvad's frontal attack on the system of elections in operation was on the serious inroads, which threaten to be made on an increasing scale, by the pressure exerted by the capacity of the political parties to incur expenditure in the course of the elections. This danger assumes a grave nature in the light of the illiteracy and poverty of the masses of the people. Mr. Setalvad was forthright in his statement that the expenditure permissible under the law to the candidates bore no relation to what was actually incurred. Moneys spent during the election campaigns literally assume a huge dimension, as he was careful to underscore. What unhappily results from the influence of money is that a party once elected to office finds itself in a position to perpetuate its existence by procuring the wherewhithal for elections in various ways. This function is performed by the party caucus which manages the campaigns. Mr. Setalvad again agitated a question (which has been set at rest by the amendment to the Companies Act) whether it was not possible to prevent the political parties from accepting donations from Big Business. This would eliminate the existing distinction between ostensible and disguised expenses. As an effective suggestion, he proposed for the seminar's consideration whether it was advisable to place political parties under an obligation to publish donations received by them from companies and the election expenses incurred by them. To plug any possible loopholes, he urged a system of independent, authorised audit. Such a safeguard could place the real picture of party finances and instruments of power before the electorate. He urged that a reform on these lines was necessary to ensure free elections for the functioning of real democracy and the rule of law.

The World Abroad

INFLATION: FALLING PROFITS: RISING WAGES

By

ODYSSEUS

FROM TIME TO TIME we devote several weeks of this column to the detailed study of some outstanding contemporary economic problem. The moment has come to do so again. What I want to consider are two related problems — how to halt inflation without curbing production, and, once having halted inflation, how to prevent ever rising wages from squeezing profits until there is an insufficient margin of profits to plough back for the re-investment necessary for growth, or preferably to pay out in dividends in order that good dividends may induce the public to decrease its liquidity preference and turn its cash over to producers to invest in expansion.

That this is the big problem of the day seems clear since the stock exchanges of the free world, beginning with New York, have all plunged downwards. Values have declined in crores of dollars, pounds, marks and so on. This is a spectacle which puts Socialists into a state of high glee. "Ha, the speculators are getting their fingers burned," they exclaim, rubbing their hands. They also write to the newspapers to point out that falls in stock exchange prices do not alter the amount of wealth in the shape of factories, inventories, and productive capacity of all kinds in existence. Such falls, they say, are merely in paper, not in real, values. What the Socialists do not realise is that stock exchanges exist to mobilise savings for investment. It is (with many exceptions) roughly true to say that investors are induced to part with their savings more by hope of capital gains than of dividend income. They periodically cash part of their profits to buy a sewing machine, or a motor car, or a house, or what have you. A fall in the values of their shares, if steep (as at present) may dissuade them from selling and therefore prevent them from buying the sewing machine, car, or house. A big stock market fall is thus apt to be strongly deflationary; it reduces demand for goods and labour. Others who sell at a loss to get out of the market (a) cannot now afford to buy their sewing machines, etc. and (b) prefer to keep their cash in the bank (Keynes's "liquidity preference") rather than lend it to producers. Thus do they curb production even further.

KEYNES ON INFLATION

This is how the classic depressions of the past snowballed on. Thanks to Keynes, nobody foresees a really serious depression of 1929 type. We can agree that Keynes killed the orthodox view that a depression could be left to cure itself, but fewer people remember that among Keynes's writing occurs the following observation: "There is no subtler, no surer means of overturning the existing basis of society than to debauch the currency. The process engages all the hidden forces of economic law on the side of destruction, and does it in a manner which not one man in a million is able to diagnose."

In recent years one government after another has grasped the truth of this observation and has sought to halt inflation. For reasons that we will examine later, virtually every government has attacked inflation on the side of demand, by raising the bank rate, by increasing purchase taxes, and further reducing the bank's ability to lend by taking compulsory deposits from them. As far as I know, the Netherlands is the only country which has made the effort, not very successfully, but still has made it, to curb inflation caused by increased costs due to ever rising wages. In his mischievously entertaining "Affluent Society" (H. Hamilton. London. 1958.), Mr. J. K. Galbraith implies (page 165) that just as we needed a Keynes to jolt us out of thinking that depressions would cure themselves, we need a new Keynes to jolt us out of the idea that persistently rising prices will cure themselves. I suggest that he is mistaken. Every economist, in obscure corners like me, or from the house tops like Graham Hutton in "Inflation and Society" (Allen & Unwin. London. 1960.) and not omitting Mr. Galbraith himself, has warned you all that inflation is the enemy of the economic allocation of resources and labour, and therefore of growth. Pushed far enough, as in the great snowballing German inflations of 1914 to 1923 and of 1936 to 1948, production becomes well-nigh impossible. The index of production in Germany (1936=100) stood in January, 1946, at the incredible figure of 27, which meant that three quarters of capacity lay idle. Inflation had reached a degree in which the currency itself was repudiated. Barter had become the basic means of exchange.

No, we don't need another Keynes to devise a formula for preventing inflation. There is no theoretical economic problem involved. Inflation today is a practical political problem, caused by politicians who seek votes by competing with each other in offering largesse from public funds, or who fear to lose votes by insisting that trade unions should not be above the law (as in the UK) and should not be allowed to pursue wage demands which endanger the currency.

The trouble with most of us average human beings is that we are congenital optimists. The more the economists cry "Woe!", the more we shrug our shoulders, murmuring "You can't frighten us with the examples of the German inflations. Those were due to exceptional local situations. It can't happen here."

Today, however, there is not a country in the free world of the West which is not feeling its way towards some kind of national wage and incomes policy in an effort to halt rising prices from the cost side.

A WAGE POLICY KILLS THE UNIONS

However tentative the beginnings, a really successful wages policy must ultimately end in government machinery to determine wage rates for all jobs throughout the economy. Now, a free market is the only objective, neutral job evaluator. Determination by state machinery must be arbitrary because there is no discoverable objective standard of "fair" wages. In real life, a "fair" wage means a little more than you are getting now, or perhaps as much as, or more than, someone else in a better paid industry is getting. If the present trend towards wage policies continues, it can only end in the elimination of the trade union as the worker's defender. The worker will eventually be dependent on the legally binding decisions of a government committee for his wage. The trade unions in

This is the time to think about Cold Storage

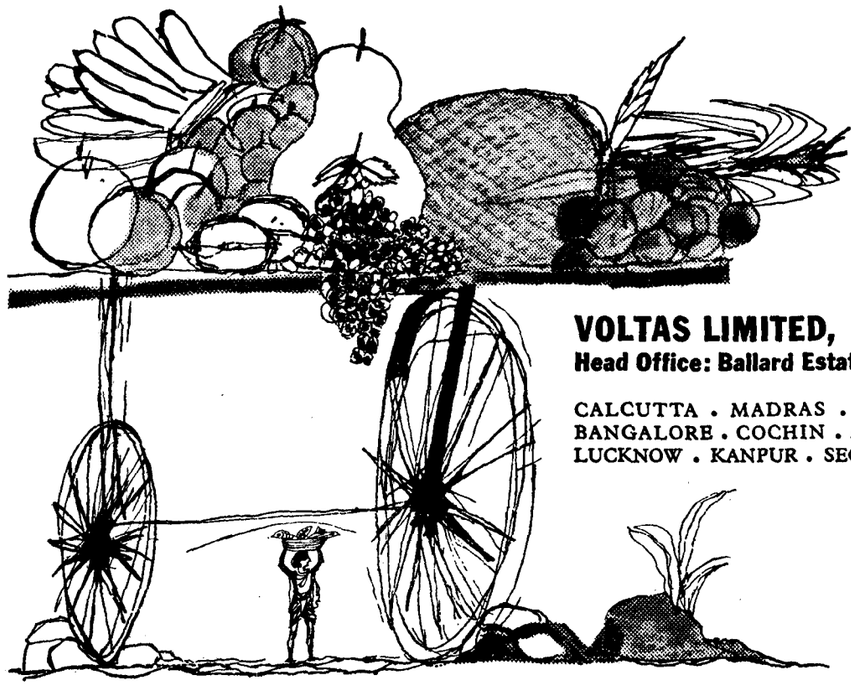
And this is the time to think about Carrier and Voltas

—now, when our need for food is so great nothing should be allowed to perish and go waste. Specially valuable foods like fish, meat, poultry, vegetables, fruit and dairy products which spoil rapidly—particularly in the heat.

Cold storage is a most effective way of reducing waste. It keeps perishables fresh—some for weeks, some for months, others for years! Seasonal fruits and vegetables are thus made available right through the year. Fish and dairy products can be carried and sold far from their sources of supply. A surplus of foods in one area can be transferred to supply the areas where they are needed. All this means more profits!

Why Carrier and Voltas?

Because they bring the maximum engineering experience to every refrigeration project. Carrier in the field of manufacture of equipment. Voltas in the field of engineering, installation and service.



Cold Storage Plants, Deep Freezers, Walk-in-Coolers are meticulously designed to suit a particular project. Work is carried out by skilled engineers and technicians, and serviced with the expert care that guarantees efficient, economical operation.

Look what you get with

HONEYWELL instrumentation

Far more than just instruments, you get a complete control system, custom designed for your specific needs, by men who know your processes.

You get expert, interested assistance every step of the way, with your initial planning and long after your instruments are installed. Blue Star assume full responsibility for the engineering, installation and start-up of your system.

You get training for your instrument technicians in the most up-to-date maintenance methods at the tuition-free Blue Star-Honeywell Instrumentation Education Centre at Bombay.

You get prompt, competent service from your nearest Blue Star office and immediate replacement of emergency repair parts.

These are but some of the plus-values that comprise Instrumentation by Honeywell...and they apply regardless of whether you buy a single instrument, a replacement part or a complete control system.

Germany are well aware of this, which is why they are hostile to proposals for a wage policy. The British unions theoretically approve of a wage policy if carried out by a Socialist government, committed to eliminate capital gains, and to ration profits and dividends. But this is tantamount to complete state control of the economy and the end of political and economic freedom, not only for the individual citizen but for the trade unions, and in practice they will certainly resist officially imposed wages. Remember the precedent of the first post-war UK Labour government. Sir Stafford Cripps sought to impose wage restraint and in 1949 persuaded the Trades Union Congress to support a total wage freeze so long as prices rose by no more than an agreed figure. By September, 1950, the wage pause had broken down and the scramble for higher wages was once more on in full. With 1938 as 100, the purchasing power of the £ in 1950 was 49. Today it is 33.5, that is, I suggest, 15.5 points nearer a wages policy with a Socialist government enforcing it on the unions by a maze of controls. And what have the unions gained? Between 1952 and 1959, according to the OECD Report on Rising Prices, whereas nominal hourly earnings rose 48 per cent in the UK, real hourly earnings rose by only 21 per cent. In Germany, nominal hourly wage rates in the same years rose by 55 per cent, but as Germany managed to hold inflation to a slower rate, real hourly earnings rose by as much as 42 per cent. The proportion of the gross national product secured by wage earners in Germany remained steady around 55 per cent between 1950 to 1959. On the other hand, the index of the gross national product rose from 100 in 1950 to 191 in 1959, so that the German worker's "unfair" share of 55 per cent was giving him 91 per cent more income in 1959. In the UK, the workers took 71.7 per cent of the GNP in 1950 and 73.3 per cent in 1959, but the GNP rose only from 100 in 1950 to a mere 123 in 1959, so that the UK worker's "fairer" share was only worth 23 per cent more (by this method of calculation, which gives a result close to that made above on a different basis).

FUTURE WITNESSES

Although I venture to disagree with Mr. J. K. Galbraith's solutions, I have not read a clearer or more realistic analysis of these problems than that which he offers in his "American Capitalism" and "Affluent Society", and I proposed to put him in the witness box to give his evidence next week. Other witnesses, whom I shall call in subsequent weeks, will be the OECD Report on Rising Prices (Paris. 1961. Price 21 sh.), Mr. A. E. Jasay of Nuffield College, Oxford, on wages, profits, and growth rates (Westminster Bank Review. May 1962), Mr. H. A. Clegg, also of Nuffield College, on a policy for incomes (Lloyds Bank Review, April 1962), the 1961 edition of the Handbook on the German Economy issued (in English) by the Deutches Industrieinstitut of Cologne, and several others.

The European Scene

POPULAR CAPITALISM

From Our Special West European Correspondent

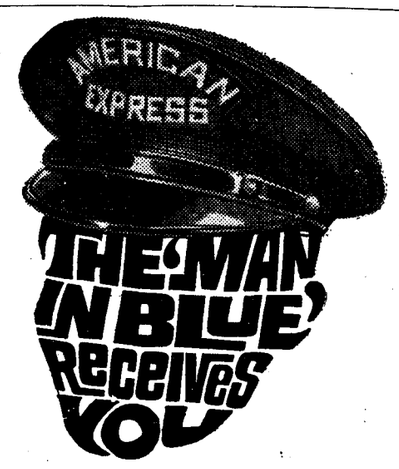
PARIS, July 7.

IN Wolfsburg, Lower Saxony (about 100 miles west of Berlin), last Saturday I attended the annual general meeting of a pioneer venture in popular capitalism: the world's second biggest joint stock company after American Tel & Tel as to its number of individual shareholders. Volkswagen-werk AG is the largest enterprise in West Germany, with an annual turnover of Rs. 6.25 crores, and it has 1,500,000 shareholders all of whom earn (or were earning less than two years ago) under Rs. 20,000 a year. That sounds a lot of money in rupees, but in Deutschemarks and at today's prices in West Germany it is a wage bracket that includes only workers, clerks, artisans and lower-level civil servants. These people own, on an average, two and a half shares each in Volkswagen, which means they are capitalist to the tune of about Rs 1,500, taking the current price of their shares in the stock market. Actually, they bought at much less than that; their average initial investment would have been about Rs. 1,000. These averages are meaningful, and not just the average of a few holders with hundreds of thousands of shares and of many holders with a few: in reality, it is unlikely that any single person owns more than 10 shares. The company thus answers any reasonable definition of popular capitalism, with the qualification that 40 per cent of the shares are held by Government, a minority holding too small to dominate the company but big enough to prevent anyone else doing so by "cornering" the shares of small holders.

How does the running of such a popularly owned company differ from that of a normal joint stock enterprise? There is first of all the fact that Wolfsburg is a *magnificent* town (it contains nothing of economic importance except the Volkswagen works) most of whose building has been financed by the company, for this region was a Junker's shooting box before the war. But that has nothing to do with Volkswagen's popular ownership, because the firm had built Wolfsburg and proven itself a good employer long before its stock was sold to modest savers. If the shares of the company had been sold to a few powerful financial groups in 1958, Wolfsburg probably would look no different today. Labour is acutely scarce in the Federal Republic and notably in Lower Saxony, and the firm would have had to practise a generous social policy to attract workers there, no matter who owned it. Maybe there is a different atmosphere from other "company towns" because the workers (who are the biggest shareholders, having bought an average of five shares each) feel that they own both the factory and the town, whereas most factory towns fall into two halves: "us" on this side of the railway line, and "them" on the other side.

On closer enquiry, however, it emerged that this lack of tension dated from before the sale of shares to the workers. What the workers seem to enjoy is not so much the pride of possessing stock in the company as the satisfaction of knowing that their bosses possess none; they were excluded from buying shares by the means test, for obviously most of the upper grade staff were earning more than Rs. 20,000 a year when the flotation was made. In any event, the directors of Volkswagen had from the beginning followed the policy of keeping factory matters in the factory and not extending their influence into the town's life: there are no company clubs or restaurants in the town, and once the workers cross the canal to the civic centre they have always been in their town. Professor Nordhoff, who has been the president of the firm since 1948, knew what oppressive prisons factory towns can become and he would have followed his instinct even if the workers had not become substantial shareholders. So far then, I had found nothing that could be put to the credit of popular capitalism. Wolfsburg, both the plant which is the largest single automobile factory in the world, and the town which is a showpiece of modern urbanism, is a beautiful place, but given the quality of Volkswagen management and the enterprise of its workers, it would have been so under any system of industrial ownership consistent with democracy.

It was at the company meeting that I expected to see the signs of popular capitalism. Indeed, superficially, it differed from any I have ever known. It was held in the town hall and there were 2,800 people present. The meeting went on all afternoon and well into the evening, the participants sustaining themselves with *copious (and free) orange* juice and coffee. Affairs sometimes became tumultuous, with much shouting and interrupting. There were plenty of questions, and the sensible ones were carefully answered; the few really silly ones were laughed down by the audience. There was the inevitable obstreperous shareholder who bores and irritates directors by trying to make a scandal out of petty matters, but I was assured that this particular individual was well known all over West Germany and puts on this performance in the many companies in which he owns one or two shares; Calcutta readers may recall a similar type, an Englishman, who was notorious for this some years ago in their city. So that had nothing to do with Volkswagen's popular ownership.



Although large, the attendance was much less than one might expect at a meeting of a company with 1,500,000 shareholders. Last year the firm cleared the floor of one of the factory's assembly halls, expecting a roll-up of 30,000. In fact only 5,000 came and this year the number was about half. Most had left their proxies with banks and so, counting the 40 per cent share of the two governments of the Land of Lower Saxony and the Federal Republic, most of the voting was decided by half a dozen people in the large hall. Before concluding that shareholders' interest in their affairs was derisory, one must recall that the 60,000 odd workers of the firm who own shares are in daily touch with the organisation and are not likely to learn anything at the annual general meeting that they do not already know. They have their representatives on the board of directors, not to mention in their normal union machinery, so their failure to appear is no sign of disinterest.

More serious, it seemed to me, was the fact that no one queried the form in which the company's accounts were presented. It was perfectly in accordance with German law, of course, and followd the accountancy tradition of all Continental joint stock companies. But that only means that it was quite uninformative and would not be accepted by any shareholders' meeting in the USA, for example. No figure was given for the company's real profits; there was just a declared net earnings figure which, as usual happened to coincide with the amount the directors proposed to distribute as dividends. That is, allocations had been made and tax payments provided for before the so-called profits were shown and it was impossible to see what profit the company had really made i.e. the profit figure the directors must have revealed to the tax-collector so that he would know how much company profits tax to charge. This figure features in all US company balance sheets and is the first thing an investor wants to know. Continentals have always allowed company directors to hide this essential information from shareholders and one hoped that a popularly owned concern that was pioneering in "industrial democracy" would break with that tradition. None of Volkswagen's modest shareholders raised the point.

The matters that interested them most were the price of their share, and the recent attempt of the Federal Government to stop the firm raising its selling prices. On these two points they received some lessons in elementary capitalism from Professor Nordhoff. He showed them that the performance of their company was unaffected by the dramatic fluctuation of its share in German markets over the past year. Having bought at 350 DM, Volkswagen's tyro capitalists jubilantly saw their stock soar to 1108 DM last summer. They felt that they were getting rich, but forgot to book their profits: only 7 per cent, it is estimated, had sold by the time the share reached its peak. Thereafter began a disastrous decline, to around 500 DM. Many of the shareholders at last Saturday's meeting evidently felt they had a legitimate grievance and that the company meeting was the place to air it. Professor Nordhoff re-assured them that their company was flourishing: it produced 1,000,000 vehicles last year and exported 55 per cent of them, thus establishing itself as the world's third motor car firm after General Motors and Ford, and as the world's biggest exporter of cars, selling abroad as much as the whole British auto industry. Moreover, in doing so it had made a profit that enabled it to maintain the dividend of 12 per cent. He and his fellow directors were responsible for so much; as for the price of the share, that was beyond their power. If you cannot stand the excitement of stock market fluctuations, he told them, then you must sell your stock and choose some other savings medium.

None of the popular capitalists found anything to oppose to this argument, but it was clear that their first experiences in the share market had left them disillusioned. Volkswagen was not the first West German concern to be "privatised" in favour of modest savers; Preussag AG was similarly sold to people of limited means and they have had the same experience: a big rise followed by a bigger decline. The alarm and dismay among small holders is so extensive that the Federal Government is understood to have delayed its plans for further privatisations. Not that these initial disappointments are conclusive arguments against popular capitalism. It is clear what is happening. People excluded from the original offer of shares (wealthier Germans and foreigners) seek to buy when the share comes on to the market, but the small capitalists do not sell. Vigorous demand in the complete absence of supply produces artificial inflation of the share price. The small holders think they are getting richer and are less inclined than ever to sell. At the first share market scare, demand dries up, the stock is left exposed at unjustifiable levels and then small sales in a narrow market produce heavy losses. The people's share is actually more unstable than any other equity and the popular capitalists get a disastrous impression of investment. At least, this is true at first; maybe later as they learn to book their profits (and thus iron out artificial price rises) or, alternatively, to weather market recessions philosophically, the market behaviour of their stock will be more normal.

The Volkswagen price controversy, which ranged the popular capitalists solidly on the side of their directors against the Federal Government, was more interesting than the US steel price battle because here the Government was the largest single shareholder in the defiant enterprise. Professor Nordhoff's logic was recognised as impeccable by all his budding capitalist stockholders. If Bonn does not like our price increases, he said, it must defend the value of the mark, and that is not our job. We make cars and we must write our price-tags in accordance with the money cost of production and expansion. It is absurd for Bonn to encourage national inflation and then seek to peg the price of one article that, in real terms, has risen less than food and other necessities. It was instructive to see a company that was largely owned "by the people" and for the rest by Government taking the classic capitalist line, and doing so with more courage than the US steelmakers, those ogres of capitalism according to President Kennedy. Maybe that is the main lesson of this first big venture in popular capitalism. The popularly owned firm behaves, in relation to its shareholders and to Government, not very differently to any capitalist company that is well managed and has the courage of its convictions.

This warm reception is just one item in American Express Friendly Travel Service.—**In addition, you get** ■ Advance arrangements ready-made...no bother with hotel reservations, itineraries, transportation, tips. ■ Experienced travel Managers... selected for their travel knowledge and personality. ■ Finally a delightful and memorable holiday!

TRAVEL'S FUN—
TRAVEL'S FRIENDLY
WITH **AMERICAN EXPRESS**

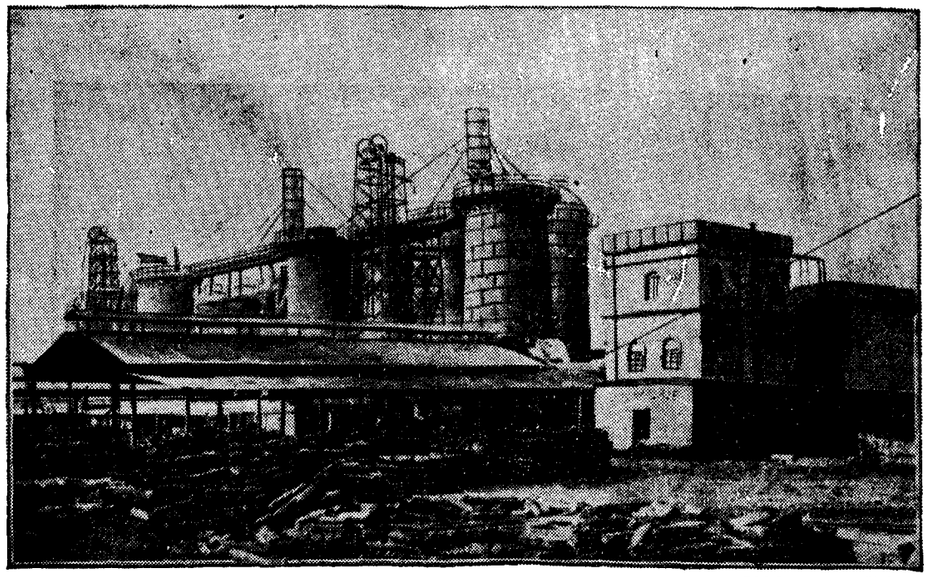
At the day's end, long tired queues await the journey home. Among them are *your own employees*, men and women who travel to and from your office in crowded buses, trams and trains. People whose loyalty you value and whose lot you want to make happier.

HOMEWARD EMPLOYEE The Life Insurance Corporation has two Schemes which every employer will do well to know:

GROUP INSURANCE SCHEME offers low-cost Life Insurance protection to your staff under one Master Policy.

SUPERANNUATION SCHEME is the cheapest method of providing retirement pension, with or without life insurance benefit.

MORE ABOUT THESE SCHEMES:



* For tax purposes premiums on both Schemes are treated as normal business expenses
* Under certain Schemes attractive tax-relief is allowed to the employees
* Employees get the benefits of these Schemes at lower cost
* They can often be instituted at no extra cost to the employer
* Administratively, they do not involve your office in anything but minor clerical work
* It is being increasingly realised that these Schemes go a long way to increasing staff productivity and length of service

When next an Insurance man calls on you about these Schemes, give him a few minutes of your time—with no commitments of course.

Life Insurance Corporation of India

THE FLUX AT KULTI

Old furnaces at Kulti

By general consensus of opinion, Josiah Marshall Heath, a superannuated civil servant of the East India Company, was the first to produce steel in India by modern methods at the Indian Iron, Steel and Chrome Company which he set up in 1830 at Porto Novo in south Arcot.

India's nascent steel industry blundered on through many heart-breaking errors and failures until 1876 when the Bengal Iron Works erected, in the jungles of Kulti, two small open-top furnaces powered by a single blowing engine and charcoal-fired boilers. Welcoming this "economic revolution in the country," *The Statesman*, in its issue dated March 8, 1876, said: "... if these new works are but successful with the flux, India will at no distant date supply herself with her own iron, in place of importing it from Europe" thus speeding "the redemption of the people from poverty".

In 1892, the managing agency of these early works at Kulti passed to Martin & Co. Progressing steadily since then and continually expanding its iron-making and foundry facilities, the Kulti Works were merged in December 1936 with The Indian Iron & Steel Co. Ltd., already in operation at Hirapur under Burn & Co.'s managing agency.

Today, The Indian Iron & Steel Co. Ltd., with fully modernised and integrated works at Burnpur and Kulti and with their own ore-mines and collieries, stand a fitting monument to the perseverance and toil of the early engineers and pioneers and as an abiding testimony of the vital role played by the Company in the development of India's foremost basic industry.

Economic Report from the U.S.

U.S. AND THE COMMON MARKET

By GUY SIMS FITCH

WASHINGTON, July 10.

THE Trade Expansion Act which the House of Representatives has just approved, and on which the Senate will soon start its deliberations, is essentially the same measure, incorporating the same need and bold approaches to trade liberalization, which President Kennedy proposed at the beginning of the year. While this measure is unprecedented in that it contians a number of features new to the American scene, it is rooted in a policy which has been basic to the United States for more than a quarter of a century At its heart of the conviction that the growth of international trade is in the interests of the United States and all other free countries, that with an expanded interchange of goods and services come rising living standards and increased understanding among peoples and nations.

In this, the United States plays a key role. With an economic position pre-eminent in world affairs, it is in position to offer the leadership needed in bringing down the artificial obstacles that inhibit constructive expansion of world commerce. The Presidential authority to negotiate with other nations that is in the new act thus amounts to an expression of U.S. readiness to continue its role of responsible leadership. This authority to negotiate reciprocal tariff reductions is not new. It has been held by every president since the first Trade Agreements Act was adopted in 1934, and every president has made ample use of it. In accord with the U.S. Constitution, each one has done so under powers delegated to him by the Congress, and under rules laid down in appropriate Congressional Legislation.

In this sense, the new law represents no departure from the past, but rather an extension of a time-honoured American principle. This applies with particular force to the Act's general tariff-cutting authority, whereby the President would be empowered over a five-year period to negotiate reductions of up to 50 per cent in U.S. tariffs in return for reductions in other nation's tariffs, on a basis of mutual benefit. Also in this legislation, however, are a number of elements that go far beyond past delegations of authority, and can best be described as revolutionary as far as U.S. economic policy is concerned. They represent specific kinds of negotiating power which take into account the new challenges and opportunities of today's economically interdependent and expanding free world.

Chief among these is the power to negotiate with the European Common Market not merely for the reduction but also for the elimination of tariffs on categories of goods in which the United States is interested. This provision would take on real meaning at the time the United Kingdom joined the original Six — France, West Germany, Italy, Belgium, the Netherlands and Luxembourg — in the Common Market. Another new provision worthy of note is the authority to reduce or eliminate duties on products of tropical agriculture and forestry, subject to the condition that the Common Market take similar action. Most U.S. tariffs in this area already are low or non-existent, but the provision stems largely from the U.S. desire to open markets in the advanced countries on a non-discriminatory basis to all producers of tropical products — in Latin America, Asia and Africa.

As in the past, the President would have recourse under exceptional circumstances to modify tariff concessions harmful to American business. But here again, the new legislation explores new ground, with a significant switch in emphasis toward domestic self-help and away from a special, if seldom-used, form of tariff assistance. This is a trade adjustment programme, new to the American scene, under which the government would offer no tariff, but financial and technical aid to companies and workers hurt by rising imports.

From this necessarily brief description, it is clear that the trade legislation, now evidently well on its way to final congressional approval, would help force new trade links with the European Economic Community (EEC), as the Common Market is more formally known. The fact that the United States is a global power with major economic and political responsibilities around the world seems to argue against its full association with a regional European entity. An effective U.S. partnership with a strong and stable Europe, however, could contirbute immeasurably to the welfare of all free nations. This would be particularly the case as EEC external tariff walls are kept low and non-discriminatory, and the benefits of widened trade opportunities are extended generally to all free world trading partners.

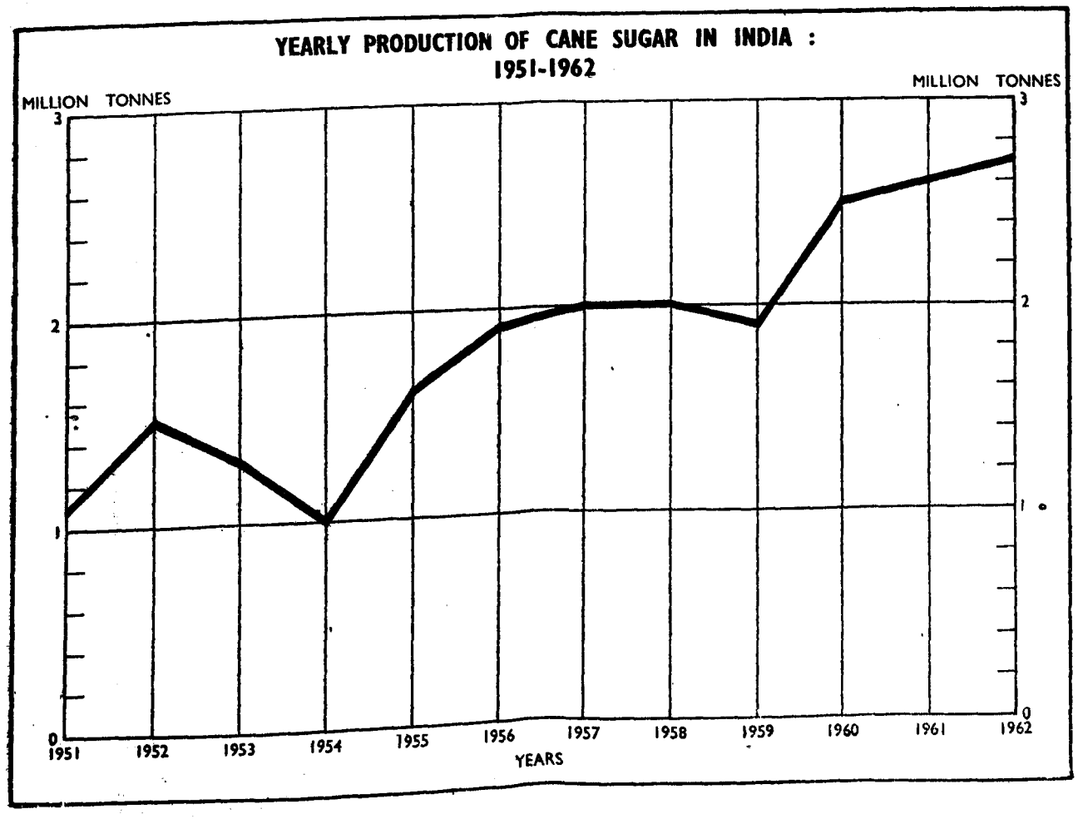
PRICE LINKING IN SUGAR

AT long last the Union Government has taken steps, though in a half-hearted manner, to link the price of sugarcane with the sucrose content of sugar. According to the latest notification of the Government of India, the cane price would remain unchanged at Rs. 1.62 per maund for delivery at the mill gate. It has, however, been linked to a recovery of 9.8 per cent i.e. 100 maunds of sugarcane must yield 9.8 maunds of sugar for claiming the price of Rs. 1.62 per maund of sugarcane. A penalty will be imposed at the rate of 1.5 nP. for every 0.1 per cent fall in the recovery at the factory. An equivalent premium would be paid for every rise of 0.1 per cent in recovery. The minimum price has been fixed at Rs. 1.50 per maund for a recovery of 9 per cent or less.



What will be the impact of this new price-linking formula? Will it reduce the cost of the raw material so as to bring down the ex-factory price of sugar? Will it assist exports? Will the consumer have any relief?

The present decision of the Government will achieve none of these objectives. It will only perpetuate the already rigid structure of cost wherein the raw material forms a disproportionately large share. According to the findings of the Tariff Commission the cost structure of each region for the 1957-58 season was as follows:

THE COST STRUCTURE OF SUGAR: 1957 - 58 SEASON

Region	Northern	Bombay	M.P. & Rajasthan	Southern
No. of Crushing days	123	165	105	130
Recovery Percentage	9.89	11.15	9.65	9,51
Cost of Manufacture	5.65	5.47	6.64	5.53
Cost of Cane including commission on cane and cess	16.85	16.68	14.96	17.08
Total cost excluding excise duty	22.50	22.15	21.60	22.61

It will be seen that the cost of cane including the commission on cane and cess varied between Rs. 15 and 17. In Northern India the cost of cane (including commission on cane and cess) at 9.89 per cent recovery was

Rs. 16.85. Excluding both commission and cess, the price worked out to be around Rs. 16.80. In other words, the new scheme would impose no additional burden and would tend to perpetuate the present rates. Again, the new formula does not take into account the period of crushing days. When the recovery tends to be significantly below 9 per cent at the end of the season, the mills would like to reduce the crushing period. It is not known why the Government has ignored, for the first time, the crushing period in the computation of price payable to the cane growers on the quality of the cane. Maybe, the Union Government feels that the State Governments would see to it that the mills crush all the cane allotted to them, whatever the level of recovery. This will naturally add to the burdens of the industry. Moreover, the international price of sugar is much below the price fixed for sugarcane in India. That explains the paradox of India's failure to sell sugar in the markets abroad.

Ostensibly the present measure has been taken to induce the agriculturists to improve the quality of cane because the new formula ensures a higher rate of return for better quality cane. To the extent that the agriculturists are encouraged in producing improved quality sugarcane, it will be a gain to the nation as well as to the peasant. The basic problems of the sugar industry will, however, remain unchanged.

The history of the sugar industry during the last decade is full of interest. Production has been steadily rising and has more than doubled since the beginning of the First Plan. As the graph on the earlier page shows, in 1950-51 the total production of sugar was a little above a million tonnes and after slight improvement in the succeeding years, it came down to a million tonnes in 1953-54. Since then it has not looked back and has been continuously increasing. In 1959-60, for the first time, the target of Second Five-Year Plan was exceeded by a wide margin. In 1960-61, the output was 2.6 million tonnes and in the current year it is expected to be 2.7 million tonnes. It may be mentioned here that during the current year the Government were forced to restrict the output of most of the units by 10 per cent as compared to the preceding year. This restriction was imposed because stocks of sugar were accumulating with the mills and consumption at home plus exports were not sufficient to cope with supply. The sugar industry thus stands in a class apart amongst all major industries of the country. As against the shortages which haunt other leading industries, sugar alone has produced unmanageable surpluses. There are already 1.2 million tons of stocks with the mills. In the next year they will get inflated to 1.5 million tons. Normally, the industry has surplus stocks of not more than 0.5 million tons. These additional stocks of a million tons will pose a serious problem. They will increase the cost of manufacture because the interest charges on stocks would rise if the stocks are not speedily reduced.

The Indian Sugar Mills Association had suggested that the minimum price should be fixed at Rs. 1.44 per maund of cane, while the price linking schedule should operate between 8.5 per cent recovery for the lower limit and 11.0 per cent recovery for the upper limit. Whatever the political pressures for keeping the price of sugarcane at a high level, the national interest should not be foresaken. The industry has today idle capacity because neither its output can be sold in the markets abroad because of the high cost of raw materials nor can it be cansumed within the country. The steadily increasing acreage under sugarcane also proves that the sugarcane is an extremely remunerative agricultural pursuit as compared to other agricultural crops.

The present measures will only maintain the status quo. They will certainly not help the consumer with a reduced retail price or earn more foreign exchange for the country—the two basic problems of the industry which have remained unsolved for a long time.

when the topic turns to BANKING FACILITIES...

...it is agreed all round that for ABSOLUTE SECURITY & FRIENDLY SERVICE it is THE BANK OF INDIA LTD.

...Why not send for our attractive free booklet **"AT YOUR SERVICE"P** —it will show you the various ways in which THE BANK OF INDIA LTD. can be of use to you.

Specialized ENGINEERING AND CONSTRUCTION FOR THE IRON AND STEEL INDUSTRY

For more than half a century McKee engineers have specialized in the design, engineering and construction of steel-producing facilities. Our comprehensive mine-to-metal services include every phase of the work necessary for any steel-plant project, from preliminary studies to completed plant ready for initial operation.

The McKee Organization has executed contracts in 49 countries including India. Among these are some of the world's largest and most modern completely integrated steel plants and hundreds of individual units, including blast furnaces, open hearth shops, rolling mills, agglomerating, sintering and pelletizing plants. Most recent examples of large-scale integrated plants are the new Somisa plant at San Nicolas, Argentina and the C.S.N. plant at Volta Redonda, Brazil.

To the steel industry of India the McKee Metals Division offers the services of its large, well-qualified staff with a fund of sound, practical experience and specialized knowledge that is unmatched anywhere in the industry.

Comprehensive engineering-contracting services, similar to those of the McKee Metals Division, are supplied by these specialized divisions of the McKee Organization:

PETROLEUM & CHEMICAL DIVISION
Complete Refineries and individual Processing Units for all modern petroleum and petrochemical processes and certain types of chemicals and chemical products.

WESTERN KNAPP ENGINEERING
Plants and facilities for production of Non-ferrous Metals, mining, preparation, handling, beneficiation and storage of Ores and Industrial Minerals.

THE BUSINESS WORLD

What Price Power?

By CROESUS

HAD not the monsoon started with a bang, as it did, and made up the shortage in the level of water supply at the Mulshi Dam, from which water is let down to the Bhira Power House of the Tata Power Grid network, industries in the Greater Bombay area and Thana would have experienced a drastic cut in power, the extent of such cut depending upon the category in which a given industrial establishment fell under a system of grouping evolved jointly by the Government of Maharashtra, the electricity companies and the business interests, at a recent meeting convened by the Government of Maharashtra. Needless to say, both employees and employers, not to speak of the public generally, heaved a deep sigh of relief at this last-minute happy turn of events. Similarly, the jute industry in West Bengal was relieved when the threatened 10 per cent blanket power cut failed to materialise, following the intervention of the Board of Trade and the personal efforts of the Union Minister for International Trade. A more or less similar experience fell to the lot of the industrial users of power in Madras. As a matter of fact, consumers of electrical energy practically all over the country have been faced with such threats of cut in power supply off and on, so much so that people have begun to talk of Indian industries also being "a gamble in the rains", even as Indian agriculture is proverbially known to be. It is not surprising, therefore, as the Secretary of the Federation of Electricity undertakings in India has observed in "A Survey of Indian Industries 1962" (Supplement to the 'Capital' of June 20, 1962) "not a day passes without the press highlighting the power shortage in one part of the country or another. No meeting of industrial or trade organisations concludes without emphasis on the need for raising the (Third Plan) power target. It has been urged that industries be allowed to instal their own generating plants to meet their power needs."

But what is the net result of it all? What has been done so far and what is proposed to be done during the rest of the Third Plan period do not both add up to much, at any rate not that much as to afford much comfort to the interests concerned, nay to the people at large. The public certainly has a right to demand of the powers-that-be why they have allowed power crisis situations, such as those in West Bengal, to develop involving a potential loss of foreign markets of as much as Rs. 25 crores. This, by the way, is the estimated loss, according to the jute industry, which a curtailment in the production of jute goods would have brought about, had the power cut in Calcutta eventuated. There would appear to be no reliable estimate of the probable loss to the country's national product and to our total export trade as a result of power cuts, both threatened and actual, from all over the country. But there is no gainsaying the fact that this would run into several hundreds of crores. This is, indeed, a very unsatisfactory state of affairs, especially in a planned economy.

What, then, is the remedy? Suggestions, such as asking industrial units to have their own generating sets are no effective solution to the problem; at best, they are palliatives or short-term remedies. A more lasting and effective solution would be to allow all public utilities, whether in the public sector or in the private sector (licensees), to augment their installed capacities. It is high time that there was a reappraisal of the idea that power development is the primary or the sole responsibility of the State Electricity Boards, if only because of the miserable performance of quite a few of these boards. Here is a brief description of how these boards have fared:

"The State Electricity Boards, constituted under the Electricity (Supply) Act, are supposed to adopt the best features of both the Government and commercial enterprises. But this ideal has remained unrealised. Instead, the boards have tended to remain under the control of the State Governments. They are under a statutory obligation not to conduct their operations at a loss. But almost all of them have incurred loss, as far as commercial accounting goes." In other words, these boards have failed to be either autonomous or to pay their way.

If this is the lot of the pampered public sector, one can very well imagine the position of the private or the "vanishing sector", as this sector of the Electricity Industry has been aptly described. When, presumably, it was the intention of the authorities (at the time they framed the provisions dealing with licensees' finances) that these licensees should not continue to remain in existence for long, the step-motherly treatment that they have been rceiving lately need not occasion any surprise. The financial control imposed by the Electricity (Supply) Act has proved to be more draconian than was either visualised or apprehended. The result has been a veritable squeeze on the licensees' undertakings. The crucial question, therefore, as every one connected with the electricity industry has pointed out on several occasions, is whether it is possible to provide a return to the investor which can be regarded as reasonable enough to attract further investment in the industry. The burden of song of every electricity company chairman's statement is only this, viz., that "until the provision of the Sixth Schedule of the Electricity (Supply) Act is so altered as to improve the financial return to electricity undertakings, it would be difficult to raise additional equity capital." The standard rate, i.e. the rate of return of the investor linked to the Bank Rate, which was expected to provide some relief has, in the event, proved disappointingly low, thanks to the new system (this has been made into a four-tiered one from the erstwhile three-tiered one) of penal rates of interest payable by the scheduled banks for borrowings over and above their quotas, which has the effect of more or less holding down the effective Bank Rate to the disadvantage of the industry. Not until the question of a fair return is determined will it be possible to ensure any sizable progress in power development. What requires to be underlined in these circumstances is that the private sector of the electric supply industry has large-scale potentialities for expansion and, therefore, for adding to the country's power resources, and that the authorities cannot afford to ignore the legitimate claims of the industry indefinitely, except at great peril to the success of their development plans.

Business Notes

Plantation Industry

COFFEE AND THE COMMON MARKET

IT IS not surprising that the plantation industry, like any other export-oriented industry, should view with concern the impending entry of the U.K. into the European Common Market. If the U.K. obtains entry without any safeguards, it is obvious, India's tea exports would be affected adversely. On the other hand, a suitably negotiated entry of the U.K., as Mr. D. C. Jarvis, Chairman of the Nilgiri Planters' Association, (N.P.A.), pointed out, would be a blessing in disguise, since such "can only result in an increased per capita consumption in other European countries, in most of which there is considerable scope for increase."

Speaking at the 71st annual general meeting of N.P.A., recently, at Coonoor, Mr. Jarvis doubted whether even otherwise, we could count on an expanded market in Europe, in the context of our existing excise and export duties, on the one hand, and the steadily increasing tea production elsewhere, on the other. The present levies on the tea industry, he pointed out, have been, in fact, acting as a subsidy to our competitor countries. Again, he said, whereas the rate of increase in tea production had been increasing at a greater pace, the rate of increase in the overall world consumption was still slow. It is, therefore, of paramount importance, as Mr. Jarvis observed, that we should have a bold and adventurous approach to this problem, if we have to increase exports and earn greater foreign exchange.

Indicating what this approach meant, the N.P.A. Chief suggested a uniform method of collection of all forms of duty on tea at one point, namely at the point of sales which, in his view, would meet every one's need, since these could be suitably scaled for the various producing districts in much the same way as the excise duty is being scaled now. He also expressed the view that this would be much easier than to offer anything like a worthwhile rebate on teas that are exported. In other words, it would serve a double purpose, namely, encourage the overseas buyers and also serve as an incentive to local producers to produce more exportable grades.

Referring to coffee production in Nilgiris, Mr. Jarvis observed that, in view of the low coffee prices, the small coffee growers, who form the bulk of the producers in the Nilgiri Districts, were not only not able to show any profit but were forced to wait for nearly 20 months to receive the final payment for coffee delivered by them to the Coffee Board. Their financial position was such, Mr. Jarvis noted, that, at this rate, they would never be able to maintain their assets in a reasonably good condition. The present system of marketing might have worked well so far, but it has since become outmoded and outdated, especially in the context of phenomenal crop increases. Hence the plea of the N.P.A. Chirman for an immediate change in the system. He also suggested the revival of estate marks, which had been formerly in vogue, as this would facilitate the picking up of superior quality Indian Coffee associated with a given estate mark.

FAO

WORLD FOOD PROGRAMME

ONE WOULD wish all success to the FAO Executive Director, Mr. A. H. Boerma, in his present mission to the capitals of the FAO member-countries with the object of securing their co-operation for the World Food Programme, scheduled to be launched in October next. It is, indeed, encouraging that the response of the countries which Mr. Boerma has already visited—several European and some African countries—has been, to quote Mr. Boerma himself who was here a few days ago on a short visit for talks with the Government of India, "surprisingly positive".

The programme envisages creation of a $100 million fund in the shape of commodities, services and cash, for rendering assistance to developing countries. Twenty-five per cent of this fund is proposed to be set apart in the initial satges for meeting emergencies like floods, earthquakes and other natural calamities. The remaining resources are to be utilised for financing in kind some pilot projects in the under-developed countries primarily with a view to helping them in their economic development, particularly in the agricultural sector. A few instances of such projects are: (i) paying workers employed on construction jobs partly in the form of food made available under this programme; (2) provision of food supplies in the initial stages for those employed on reclamation of land for cultivation; (3) assisting in the migration of people from thickly populated areas to new settlements within a country and meeting their food requirements for a short initial period from the reserves created by FAO under this scheme.

Although misgivings have been expressed in not a few under-developed countries—in the food deficit countries on the ground that this programme might affect bilateral assistance provided to them by the United States under PL 480 programme and in the surplus food producing but otherwise under-developed countries on the basis that this plan might affect their export earnings needed by them for their development purposes—the programme requires all assistance for its implementation as it is only envisaged to act as a catalytic agent in fostering the economic development of the backward regions within a country and of the economically weak areas of the world. Since for the next few years, this programme can be undertaken only on a modest scale, it is not likely to affect commercial exports of the surplus food producing countries. The misgivings entertained by the countries deficit in food production at present also appear to be exaggerated as overall assistance to them under this programme and their bilateral arrangements with the US or other surplus food producing countries may not be materially affected. Even if it does to some extent, the underdeveloped countries receiving bilateral assistance should be expected to make a small sacrifice in the interest of the other developing nations.

Banking

BANKERS' TRAINING COLLEGES

SINCE THE ushering in of the five-year plans of economic development in this country, the activities of banks have not only been increasing but their number (at least of their branches) also has been multiplying. This has brought in its wake the demand for efficient and adequately trained staff, and it is to meet this demand primarily that the Reserve Bank of India decided to open Bankers' Training College as early as in 1954. Since then, other bankers' training colleges, started independently by some scheduled banks themselves or jointly with other banks, have come up. One such college was established by the State Bank of India at Hyderabad, six months ago. The establishment of these colleges, according to Mr. P. C. Bhattacharyya, Governor of the Reserve Bank of India, is a big step forward in banking in India, inasmuch as they help to set the tone of the banking industry in the years to come. Apart from the comprehensiveness of the curricula of studies, the teaching methods adopted by these colleges are designed to develop an attitude of mind which will be receptive to new ideas. Moreover, trainees can learn all banking practices and techniques without going through the mill, as was the lot of the older generation of bankers.

Addressing the trainees at the State Bank of India Training College, recently, at Hyderabad, Mr. Bhattacharyya pinpointed the two tasks that banks have to perform of not only mobilising the resources through branch expansion, improving the quality, widening the range of banking, etc., but also of allocating the resources so mobilised to various productive and distributive sectors of the economy in a judicious manner. Alluding to the extent of deposit mobilisation since inception of the Plans in the country, the Reserve Bank Chief recalled how Indian Banks had recorded spectacular increases in deposits. While the deposits of scheduled banks rose by Rs. 130 crores or 3 per cent per annum in the First Plan period, he said, these figure rose to Rs. 600 crores or 12 per cent per annum during the Second Plan period. In the first year of the current Plan, he went on to say, the rise was as much as Rs. 200 crores or 13 per cent per annum. However impressive this performance may be, as Mr. Bhattacharyya cautioned, no effort should be spared to speed up further the rate of deposit growth, since the task ahead would be much greater than what has so far been accomplished. For, in the remaining four years of the Third Plan, it is estimated, our credit would range somewhere between Rs. 600 and Rs. 700 crores and a substantial part of this amount would be required by industry. In fact, industrial advances of banks today form 54 per cent of the total bank credit, as against only 33 per cent less than a decade ago. Any decline in deposit would certainly retard this rate of growth, which would affect both the private and the public sectors. Hence the great responsibility that devolves on the banking industry. As Mr. Bhattacharyya put it, "the banking industry has to acquire more and more the spirit and character of a public utility; in doing so, banks have to shoulder heavy and complex responsibilities resulting in an impressive growth in the scale of their operations." If this is the heavy responsibility of banks, the responsibility of the training colleges which train the bankers of the future on whom eventually this responsibility would rest, is undoubtedly heavier still.

Engineering

ENFIELD'S EXPANSION PROGRAMME

MR. K. R. SUNDARAM IYER, Chairman of the Enfield India Limited, indicated at the annual general meeting held recently that the company had reached a stage where output and productivity could be increased without much effort. A large number of new components that are being taken up for indigenous manufacture are not posing any problem to the company. Naturally, therefore, the company is progressing rapidly towards its independence of the imported items required for its end-products. He indicated that during 1962 the company is likely to register an increase in the output of motor cycles to the extent of 15 per cent. At present the company is dependent upon the availability of foreign exchange because it still has to import certain raw materials like the gear-box and various propriety components not yet available in the country. But he hoped that these propriety parts also will be available in the country from ancillary industry. The manufacture of gear-box for motor-cycles will be taken up in 1963 and after that the company naturally will be able to expand its production in the face of increasing demand and without its dependence on the availability of foreign exchange. He also revealed the fact that scooters manufactured in the company would be available in the market quite soon. He added that the Villiers engines are to be used for the scooter. As a measure of economy and higher productivity, he was of the opinion, that even in the light-weight motorcycles produced by the company Villiers engines would replace the present ones. This standardisation would also enable the company to achieve more manoeuvrability because the company would be able to alter at short notice the ratio of production of light-weight motor-cycles and scooters.

In view of this increasing demand as well as the larger responsibility on the company to meet it, the Chairman was of the opinion that the company may not be able to supply the end-products at present prices. This, he said, was due to the fact that the indigenous producers of components gradually will expect higher profits and the costs of various raw materials were increasing. The company might not, therefore, be earning the advantages of its productivity and output. They have, therefore, approached the Government for a suitable revision of selling prices so that they can meet the rising costs and continue their policy of utilising more and more indigenous items.

A NEW NON-FERROUS FABRICATING PLANT

MESSRS. METAL DISTRIBUTORS PRIVATE LIMITED, CALCUTTA, have entered into collaboration arrangements with Messrs. Revere Copper and Brass Incorporated, New York, for setting up a plant at Kota, in Rajasthan, to undertake the manufacture of copper and brass tubes and rods and copper printing rolls. A new public limited company is envisaged to be floated under the Industries (Development and Regulation) Act for this purpose. Copper print rolls—used in the textile industry — are all being imported at present from abroad; the proposed Kota plant will, thus, be a pioneer in the field.

The total capital outlay on the project is estimated at over Rs. 1.25 crores. Construction of the factory will begin shortly. Production is expected to start in the latter half of 1963.

The US firm will provide all the technical assistance, plant and equipment. It will also participate in the equity capital of the new venture to the extent of 33.3 per cent. Messrs. Metal Distributors Private Limited will subscribe to another one-third of the new company's capital. The balance one-third capital is envisaged to be offered to the Indian public.

The US firm is one of the largest producers of nonferrous products in the world. It owns and operates 16 fabricating plants in the United States and has annual sales exceeding Rs. 110 crores a year.

JAIPUR METALS PLANS EXPANSION

At the annual general meeting of the Jaipur Metals and Electrical Limited, Mr. R. H. Kamani, the Chairman, indicated that the output of house service meters of the company had reached a record figure of 1.76 lakhs and along with that the company had started producing Siemen type meters in collaboration with the Siemens, a well-known firm of Germany. They are planning to manufacture certain other components like cyclo-meters and magnets. The Chairman was of the opinion that these electrical items are going to play a significant role in the industrial expansion of the country. The power system in India is to achieve a capacity of 12.69 million KW by the end of the Plan which means an increase in the installed capacity of nearly 123 per cent. Naturally, therefore, the transmission lines will extend by several thousand miles. The development of power supply will naturally mean larger demand for the goods produced by the company. The

Chairman, however, indicated that the present installed capacity in the country including this year's additional licensing to the extent of 1.02 lakh single phase house service meters would be adequate enough to meet the present demand. The Government he added, had naturally decided not to license additional capacity any further. The company has obtained industrial licence for the manufacture of aluminium conductors and other electrical wires as a measure to enlarge their field of operations. This diversification is therefore likely to assist the company considerably. The Chairman indicated that they had approached the Industrial Finance Corporation for a loan and had also increased their authorised capital from Rs. 50 lakhs to Rs. 1 crores by creating an additional equity capital of Rs. 50 lakhs. The company, therefore, is on the way to substantial expansion.

Finance Corporations

LOANS FOR NEW INDUSTRIES

ONE SIGNIFICANT highlight of the working of Mysore State Financial Corporation during the year to March 31, 1962, is the assistance that has been sanctioned for the establishment of various new units. The year-end review released recently shows that loans were sanctioned for establishment of following new units:

Saccharine plant	..	1
Solvent extraction plant	..	1
Coffee Curing Works	..	1
Manufacture of ready-made garments	..	1
Manufacture of machinery	..	2
Manufacture of sewing machines		1
Manufacture of toys and educational aids	..	1

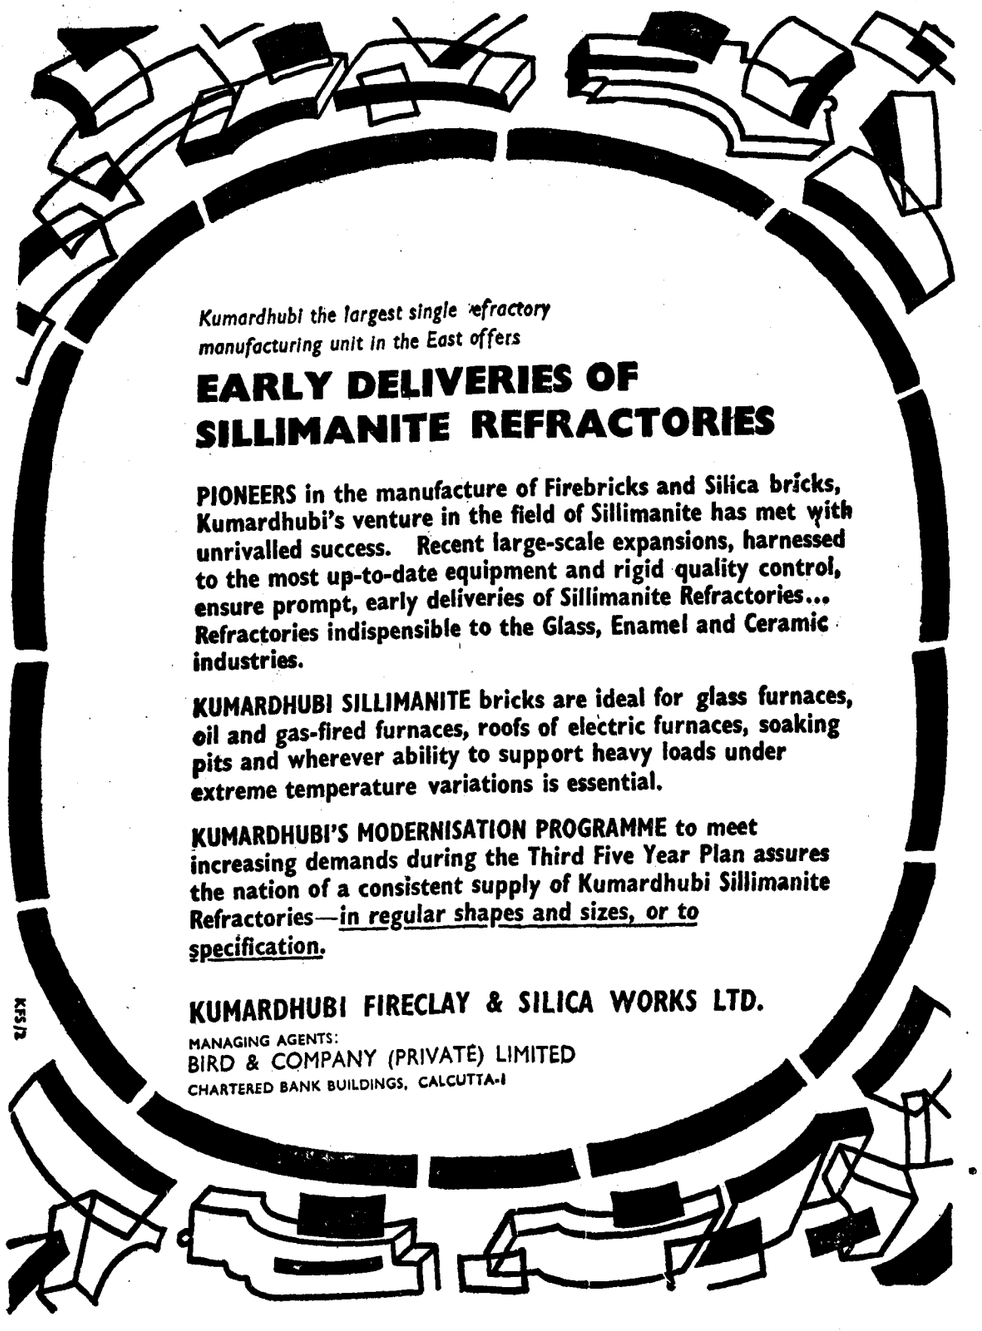
The demand for funds from industrialists — both big and small — had been continuously increasing. Mr. H. V. Koujalgi, Chairman of the Corporation, indicated that the Corporation during the year handled nearly 111 applications for a total loan of Rs. 1.29 crores. Financial assistance to the extent of Rs. 55.03 lakhs was sanctioned to 46 industrial concerns. The performance of one year compares quite favourably with the fact that since the inception of the Corporation on March 30, 1959, financial assistance has been granted to the extent of Rs. 1.27 crores. In line with the general policy of the Corporations, financial assistance to small-scale industries was provided on increased volume. Out of total applications handled during the year, about 95 per cent were received from small-scale industries and about 50 per cent of the total loans sanctioned went to such concerns. The Corporation, it is indicated by the Chairman, has been taking advantage of the Credit Guarantee Scheme formulated by the Government of India in respect of financial assistance to small-scale industries.

As a measure of possible larger loans for various applicants, the Corporation issued debenture bonds of the value of Rs. 55 lakhs which were subscribed quite easily. On account of various recent amendments the Corporation is likely to give more loans to the applicants. For instance, the hotel industry, transport industry and industrial estates having been brought within the purview of the definition of the word "industrial concerns" as a result of which these industries are also eligible for financial assistance from the State Financial Corporations.

Commenting on the wide margin between the loans sanctioned and actual disbursements the Chairman pointed out that the primary factor was that borrowers could draw the loans only after attending to the necessary formalities. They were required to undergo various types of inspections. The other fact that limited the speed of disbursements was that machinery and equipment acquired or constructed by the applicants was sometimes quite slow. The disbursements by the Corporation was based on the progress made by the clients in completing their schemes. Naturally, therefore, there were wide margins between the sanctions and actual disbursements.

LOANS FOR SMALL PRODUCERS

MR. BIKKANI VENKATARATNAM, Chairman of the Andhra Pradesh State Financial Corporation, revealed certain interesting facts about the working of the Corporation during the year to March 31, 1962. The Corporation earned a profit of Rs. 6.36 lakhs which was lower than the previous year's profit earned — Rs. 6.48 lakhs. It is essentially a rise in the expenses that caused this marginal decline in profits and an analysis of the income shows that interest on loans and advances increased from Rs. 4.78 lakhs last year to Rs. 6.14 lakhs during the year under review. The Corporation had to incur considerable expenses for floating bonds of the value of Rs. 55 lakhs. A large proportion of this amount had to be kept for short-term deposits with banks earning interest at a lower rate than what was paid on the bonds. This anomaly is not likely to be repeated because the State Financial Corporations Act has now been amended and the Corporations can borrow money for short-term periods from the Reserve Bank or from the State Governments and even can rediscount loans scanctioned with the Refinance Corporation of India as and when necessary.



The working of the Corporation in respect of advances of loans to various industries shows that the aggregate for the year is nearly double than that of the last year's figure. The Directors approved advances to the extent of Rs. 98.33 lakhs and this approval compares quite favourably with the last year's figure of Rs. 56.03 lakhs. More important than the amount sanctioned is the amount actually disbursed and there too the disbursement of Rs. 53.71 lakhs was the heaviest since the inception of the Corporation. These advances are likely to increase in the coming years both on account of the fact that the Corporation will have more funds at its disposal and also because now the Corporation will lend to the extent of Rs. 20 lakhs to public limited concerns and Co-operatives. The Corporation has, however, maintained the positive bias in favour of smaller units. It is revealed that out of 105 loans sanctioned as many as 50 were for the amounts between Rs. 10,000 and Rs. 50,000. Advances beyond Rs. 1.50 lakhs were very few. The Corporation charge a rate of interest of 7 per cent per annum with a rebate of ½ per cent per annum for present payment of half-yearly interest and instalments of principal on due dates.

New Issue

NANUBHAI INDUSTRIES

NANUBHAI INDUSTRIES PRIVATE LIMITED, which is proposed to be converted into a public limited company in the near future under the name Nirlon Synthetic Fibre Limited, is expected to approach the public for raising Rs. 1 crore capital, all in equity shares of Rs. 100 each, sometime in the last quarter of the current year. The present paid-up capital of the company is Rs. 1.6 crores.

The proceeds of this issue are proposed to be utilised for financing the expansion programme of the com-

pany's nylon yarn factory at Goregaon and also for setting up a caprolactam plant in Thana/Belapur area.

The Goregaon nylon plant, now nearing completion (initial production is expected to start in September and full production before the end of the year), has a capacity to produce two tons of nylon yarn a day. It is proposed to expand this capacity to 5.6 tons a day. The higher capacity will include daily production of two tons of high tenacity nylon tyre cord yarn.

The capacity of the proposed caprolactam monomer plant will be 12 tons a day. Caprolactam is the raw material for nylon yarn and is at present mostly imported from abroad.

The two projects, envisaged to be completed in about three years, are estimated to cost Rs. 13 crores. A sum of Rs. 8 crores is proposed to be collected through capital issues in stages. The above-mentioned Rs. 1 crore issue will be the first in the series.

Technical collaboration for the expansion programme of the nylon plant has been arranged with Messrs. Von Kohorn International Corporation. The caprolactam plant will be set up with US assistance. A bye-product from the caprolactam plant will be ammonium sulphate, the popular nitrogenous fertilizer of which there is today an acute shortage in the country.

Oil

TWO LUBRICATING PLANTS

IN ITS 60-page report, prepared at the instance of the Union Government and submitted recently, the Badger Manufacturing Co., of Boston, U.S.A., has recommended the establishment of two lubricating oil plants — one in the private sector to be located on the west coast near Trombay and the other in the public sector to be set up on the east coast near the Caltex Refinery at Visakhapatnam — with an ultimate annual capacity of 2,00,000 metric tons each. It may be mentioned that the company's services were specially commissioned by the Government of India and the State-owned Indian Refineries Ltd., to advise them on the location, capacity and the type of lubricating oil production in India. The company's recommendations are now under the consideration of the Union Government.

According to the experts, who came to this country to advise their principals, the existing annual demand for lubricating oils in India is estimated between 300,000 and 350,000 metric tons. It is expected to exceed 600,000 metric tons per annum by 1966. Immediate steps have, therefore, been recommended by the experts to achieve a production of 400,000 metric tons per annum of the full range of main grades of lubricants i.e. HVI, MVI and LVI.

As the recommendations on particular types and sources of raw materials will depend on the final choice of the products to be manufactured and the prices and economies available of feed stocks, they can be made only after an exhaustive study of the demand trends. Till then, the experts have recommended that production of lubricating oils on the east coast should be based on raw materials presently processed in the Caltex Refinery, i.e. Iranian export (Agha Jari) and Minas crude oil, possibly later on switching over in co-operation with Caltex to Armaco crude. The west coast plant is to be based on ESSO Standard supplies.

The design of the plants, according to the experts, should be based on the use of reduced crude from an atmospheric fractionation units as feed stock, at least for the initial phase of operation. The cost of imported equipment and material except structural steel, insulation and civil construction materials is estimated to be approximately Rs. 8 crores.

S. T. SADASIVAN
GENERAL MANAGER

FROM THE CAPITAL'S CORRIDORS

BOARD OF TRADE'S DELIBERATIONS

AT its second meeting held in Calcutta on July 6, the Board of Trade is stated to have given deep thought to the export performance of the three main foreign exchange-earning industries of this country (jute, tea and cotton textiles), the problem of cost reduction in principal Indian industries, the question of public recognition of outstanding export performance, setting up of an Institute of International Trade and carving out of free trade zones at various port towns.

To push up exports of jute manufactures, the Board decided that the jute industry should be assisted in setting up a permanent exhibition in Calcutta of all the different varieties of jute products made in India and in the various other jute goods manufacturing countries of the world. This, it was thought, would help the Indian Jute Industry to keep abreast of all types of fabrics and products made from jute. The Board disfavoured any cut in electric supply to the jute industry and was instrumental in getting this industry exempted from the proposed 10 per cent cut in power supply to the industrial units in Calcutta area.

While satisfied with the general trend of tea exports, the Board felt that all assistance should be extended to the tea industry for undertaking artificial irrigation and application of fertilizers. The Chairman of the Board, Mr. Manubhai Shah, held out an assurance to the tea industry that the necessary rupee finances as well as the foreign exchange required for this purpose (between Rs. 2 and 3 crores) would be made available to it through the Tea Board. Provision of adequate supplies of right quality coal to the Assam tea gardens and of funds for financing the development programme of the tea industry as a whole also came up for discussion. These matters would be further looked into by the Ministry of International Trade. The Board also accepted the proposal of the Tea Board for sending a delegation to Australia, the Far East and some other areas with a view to publicise Indian tea there.

With a view to step up cotton textile exports, the Board emphasized the need for building up a buffer stock of cotton to ensure the industry a steady supply of this raw material to meet the increase in demand, both for domestic consumption and export. The need to promote the export of dyed, printed, processed and finished cotton textiles was recognised by the Board.

CUTTING DOWN PRODUCTION COSTS

With a view to cutting down production costs in the industrial sphere, the Board thought that the economy of scale was very vital and any large-scale expansion of the export sectors could be fruitfully brought about by building in the economies of scale through correct location, application of most modern methods of production and productivity techniques and selection of up-to-date capital goods. These studies, it felt, would have to be on an intensive scale and of a practical nature. A committee is being set up to study the cost reduction programmes of various industries as well as some agricultural products, in collaboration with the contemporary organisations and institutions engaged in this field of work like the National Productivity Council, the Tariff Commission and different Institutes of Economics. To begin with, these studies are proposed to be instituted in respect of the following industries and agricultural products: sugar, cotton textiles, vegetable oils and cakes, raw cotton, coir manufactures, pig iron, manganese ore and ferro-manganese.

PUBLIC RECOGNITION OF EXPORT PERFORMANCE

The Board rejected the idea of instituting any award like Vanijya Nipuna etc., as a measure of recognition of outstanding export performance. It, however, felt that it would be very necessary to provide an incentive in some other form of recognition of outstanding work and performance of merchant-exporters and manufacturer-exporters in different export items. The criteria, it was stressed, will have to be evolved in a very careful manner and may have to vary from commodity to commodity, only extraordinary performances in terms of high value of exports, introduction of Indian products in difficult markets, valuable research and market studies and provision of sales services for promotion of exports being taken into account. A small committee is proposed to be constituted to draw up a scheme in this regard.

Recognising the dearth of trained personnel in international trade as a great handicap, the Board resolved that an Institute of International Trade be set up at an early date to impart training to those engaged in export promotion and for undertaking research in this field. It entrusted the job of preparing the necessary curricula and other details of the scheme to Dr. P. S. Lokanathan.

FREE TRADE ZONES

As regards the setting up of free trade zones around some ports, the Board felt that in the present context of India's developing economy, the establishment of such zones would be an impracticable proposition. But considering the benefits that have been derived by various countries in the world through the establishment of free trade zones, the Board considered it advisable to give more thought to this issue. It constituted a Committee, with Prof. D. R. Gadgil as Chairman and Dr. S. R. Sen, Mr. G. L. Bansal and Mr. Sachin Chowdhary as members, to examine all the implications of this issue, particularly the problem of smuggling.

The next meeting of the Board will be held in Delhi on August 18, 1962.

CASH INCENTIVE FOR HANDLOOM CLOTH EXPORTERS

Under an incentive scheme for promoting the export of handloom fabrics manufactured from cotton mill yarn, 12½ per cent of the cotton entitlement allowable to the exporters will be paid in cash.

The cotton entitlement scheme introduced in July 1961 provided that the manufacturers, exporters as well as co-operatives and other organisations exporting handloom fabrics worth not less than Rs. 2,000 in any quarter of the year would be eligible to receive entitlement for import of cotton calculated at 40 per cent, either of the actual value of the consignment calculated at Rs. 2 per sq. metre, whichever was less. No import licence will be granted against this entitlement, but the Textile Commissioner will arrange the payment of cash incentive to the exporters and exporting organisations at the rate of 12½ per cent of the cotton entitlement value.

CEMENT MANUFACTURE

The Planning Commission, it is learnt, has turned down the proposal of the Union Ministry of Steel and Heavy Industries for raising the installed capacity target for the cement industry from 15 million tons to 18 million tons. The main reason being given for this decision is that the consortium of cement machinery manufacturers has been slow in producing this equipment and the country cannot afford any further allocation of foreign exchange to buy plant and machinery needed for a higher target for the cement industry. Then there are also difficulties arising out of power and transport shortages. The higher target for cement production would obviously put great strains on these two important industrial pre-requisites.

Cement shortage during the current Plan period, thus, is likely to continue and even to accentuate unless

demand is kept within bounds. This will undoubtedly hamper construction activity and may affect some of the programmes of the Third Plan, particularly the housing plan; the 15 million tons capacity target for the cement industry, according to the Third Plan documents, is an under-estimate and the Planning Commission had envisaged the possibility of having to revise this target upwards if restraints on construction activity were not considered necessary or desirable.

IMPORT OF PETROLEUM PRODUCTS

With a view to conserve the precious foreign exchange resources, the Union Government has decided to cut down imports of petroleum products by Rs. 3 crores during the three months to September 30, 1962. To some extent the difficulties emanating from lesser imports of these products are anticipated to be mitigated by the temporary permission granted by the Ministry of Mines and Fuel to the Burmah-Shell and ESSO Standard refineries at Trombay to maximise their throughput to 3.5 and 2.4 million tons per annum, respectively. The increased output of these two refineries is estimated to result in a saving in foreign exchange to the extent of Rs. 1.5 crores during the three months.

The Union Government, however, would be keeping a close watch over the situation and if the demand justifies, some ad hoc relief might be given for import of petroleum products.

The Fuel Ministry's this step has raised a good deal of discussion around expansion of private sector oil refineries. It is pointed out that valuable foreign exchange was unnecessarily being wasted on import of petroleum products owing to the adament attitude adopted by the Ministry of Mines and Fuel on not allowing the private sector refineries to process crude to their maximum capacity which they had succeeded in building up during the past two or three years through improved efficiency and with only minor adjustments in the equipment. In view of the acute foreign exchange crisis that is developing in the country, it is not easily comprehensible why the Government should have asked the ESSO Standard and Burmah-Shell refineries to operate to their maximum capacity for only three months pending a satisfactory agreement being reached on the offer of the two concerns to abrogate the refinery agreements which govern their working at present and their replacement by industrial licences under the Industries (Regulation and Development) Act.

A FOREIGN EXCHANGE-EARNING PROJECT MESSED UP?

If ideology has been responsible for considerable wastage of foreign exchange on import of petroleum products, nothing but inefficiency can be stated to be the reason for unnecessary delays in commissioning of an important foreign exchange-earning project. The project involved is the synthetic rubber manufacturing plant of Messrs. Synthetics and Chemicals.

In 1959, Messrs. Synthetics and Chemicals were issued a licence to set up this plant at Barielly, in U.P., in association with Firestone. Originally, it was to have a capacity to produce 20,000 tons of synthetic rubber per annum. But recognising its importance, especially from the point of view of saving foreign exchange now unavoidably expended on imports of rubber, the Government allowed its capacity to be raised to 30,000 tons. The plant, construction of which started in 1959, is now nearly complete, but at this crucial stage both the Ministry of Fuel and the Railway Board are understood to have informed the company that they cannot provide 700 tons of coal per day, without which obviously the plant cannot operate at full capacity. It is, indeed, intriguing that when the decision to allow the capacity of this plant to be increased from 20,000 tons to 30,000 tons was taken, was it not envisaged that the coal requirements of the expanded plant would be higher? It is obviously another case of lack of co-ordination in the Government which has been responsible to a great extent for appreciable under-utilisation of the many an existing industrial unit.

ECONOMISING ON IMPORTS

The Committee of the Federation of Indian Chambers of Commerce and Industry has set up a Sub-Committee, under the chairmanship of Mr. Shanti Prashad Jain, to go into the foreign exchange allotment to various projects and industries, both in the public and the private sectors, with a view to determining the further scope of cutting down imports. As already reported in this column last week, some further cuts in imports should not be ruled out as a consequence to the acute foreign exchange difficulties that the country is facing today.

At a meeting of the FICCI Committee held in Calcutta last week-end, it was stressed that consultations between the Government and the industry should be on a more intimate basis so that the problems which were uppermost both in the minds of the Government and the Federation could be discussed across the table rather than at meetings, which useful in themselves, do not allow more than a general airing of views. The Committee felt that the foreign exchange problem, though serious, was not incapable of solution provided it was tackled pragmatically.

The Sub-Committee that has been set up under Mr. Jain's chairmanship is expected to draw up a detailed plan for import substitution and pruning of imports of various items without much affecting the economy of the country.

$100 MILLION FROM THE IMF

The International Monetary Fund has authorised India to draw up to the equivalent of $100 million in currencies held by the Fund, to resolve her balance of payments difficulties during the next 12 months. An IMF press release containing this announcement says that the decision has been taken to support India's foreign exchange reserves position which has been under considerable strain in the past few months. It notes that although India has obtained substantial foreign assistance, the bulk of it has been provided for specific projects included in the Third Plan, with the result that there has been pressure on India's foreign exchange resources for effecting maintenance imports and for meeting her foreign debts obligations.

Government of India's export promotion programme now being finalised and the steps intended to be taken to rectify the adverse balance of payments position to the extent possible has also been appreciated by the IMF, as also the additional taxation which has been imposed this year both on the Central and State accounts and the policy of tighter credit initiated by the Reserve Bank.

IDA LOAN FOR BOMBAY PORT TRUST

The International Development Association, an affiliate of the World Bank, has agreed to make available a loan of Rs. 8.57 crores to meet the foreign exchange costs of the Bombay Port Trust's Third Plan projects. The loan will be advanced by the IDA to the Government of India which will pass it on to Bombay Port Trust. It is for a term of 50 years, free of interest. Repayment of the principal will begin on January 15, 1973. Thereafter, 1 per cent of the principal will be repayable annually for 10 years and 3 per cent will be repayable annually for the final 30 years. A service charge of ¾ of 1 per cent per annum on the amount withdrawn and outstanding will be made to meet IDA's administrative costs.

The development programme drawn up by the

RESERVE BANK OF INDIA

Applications are invited for the following posts in the Bank :

(A) **POSTS AND SCALES OF PAY :**

(i) **Probationary Assistants on the General Side:** Rs. 250-25-450 EB 25-650.
(ii) **Economic Assistants in the Economic Department :** Rs. 175-12.50-300 EB 20-440.

Note : *Candidates for the Probationary Assistants' posts possessing exceptionally good qualifications and experience of value to the Bank may be given a higher starting pay in the prescribed scale.*

In addition to pay, the selected candidates will be eligible to draw local pay, house allowance and dearness allowance at the rates prescribed by the Bank from time to time.

(B) **QUALIFICATIONS :**

(i) **Probationary Assistants :** *Applicants should have a good academic record and a first or high second class Master's degree of a recognised Indian or foreign University with Economics, Banking, Commerce or Accountancy as a special subject and should also have some proficiency in drafting. The educational qualifications may be slightly relaxed in the case of candidates who possess a good degree in law. Preference may be given to those who have passed the Institute of Bankers' Examinations.*

(ii) **Economic Assistants :** *Applicants should possess a first or high second class M.A. or M. Com. degree in Economics or Commerce of a recognised University, as also a thorough knowledge of economic analysis and have specialised in Economics. Preference will be given to those who have practical experience of research in Economics.*

(C) **AGE LIMITS AS ON 1ST JULY, 1962 :**

(i) **Probationary Assistants :** Between 21 and 25 years.
(ii) **Economic Assistants :** Between 18 and 24 years.

The maximum age limit is relaxable but not beyond 30 years in the case of :

(i) candidates possessing special qualifications and experience of value to the Bank;
(ii) ex-employees of banking institutions whose services had to be terminated for reasons of economy or as a result of the banks going into liquidation;
(iii) personnel retrenched from Government offices after at least one year's service applying through Employment Exchanges; and
(iv) candidates belonging to the Scheduled Castes or Scheduled Tribes.

2. Candidates who wish to apply for more than one category of posts must submit separate applications accompanied by separate application fees and **should clearly indicate the post for which they have applied.**

3. Applicants for the post of Probationary Assistants must remit with their applications a fee of Rs. 7.50 by cheque or Bank Draft on a **Scheduled Bank** or by Postal Order, payable at Bombay. Applicants for the posts of Economic Assistants must remit a fee of Rs. 2.00. **The application fee is in no case refundable.** Bonafide refugee candidates **not in employment** applying through Employment Exchanges are exempted from payment of application fees while in the case of candidates belonging to Scheduled Castes / Tribes, the fee will be reduced to one-fourth.

4. Applications in the candidate's own handwriting in the prescribed from obtainable from the Reserve Bank's offices at Bombay, Calcutta, Kanpur, New Delhi, Nagpur, Madras, Bangalore, Lucknow, Hyderabad, Trivandrum and Patna accompanied by copies **(originals should not be sent) of certificates regarding age and educational qualifications, statements of marks secured in the Graduate and Post - Graduate degree examinations and copies of at least two testimonials** should be forwarded to the Secretary, Central Recruitment Board, Reserve Bank of India, Central Office, Post Box No. 406, Bombay No. 1 so as to reach him on or before the 31st July, 1962.

5. Candidates already in service will be required to produce a proper discharge certificate from their employer in the event of their being selected, at the time of their appointment in the Bank's service.

6. Candidates belonging to Scheduled Castes / Scheduled Tribes should mention this fact prominently in their applications and also enclose a copy of a certificate to that effect from a competent authority.

7. Candidates must be prepared to serve in any office of the Bank in India and to undertake tours when required.

8. Selected candidates for Probationary Assistants' posts will have to appear for interview/s before the Selection Board at any of the Bank's offices. Selected candidates for the Economic Assistants' posts will be required to appear for a written test which will be held at the abovementioned offices of the Bank. Candidates should clearly state on the top of their applications, the office of the Reserve Bank at which they desire to appear for the test, if called. Those successful in the test will have to appear for an interview at Bombay.

9. Appointments will be subject to candidates being found medically fit for service in the Bank by the Bank's Medical Officer.

10. If any candidate desires to have his application acknowledged, he should send it by "Registered Post—Acknowledgement Due". Apart from those who may be specially called, interviews will not be granted to candidates nor will the Bank enter into correspondence with them.

11. Canvassing will be regarded as a disqualification.

Bombay Port Trust for implementation during the current Plan period includes dock expansion, dredging of the harbour channel, acquisition of floating craft, electrification of the dock plant and machinery, construction of a new berth at Ballard Pier Extension and purchase of essential cargo-handling equipment.

STEPPING-UP COAL OUTPUT

Poland and West Germany are stated to have offered substantial fresh aid for stepping up coal production in India during the Third Five-Year Plan period. Poland is understood to be willing to provide both technical know-how and equipment to work a number of public sector coal mines. West Germany has offered to send four top technicians to be assigned to various coal projects.

NEYVELI POWER PROJECT

The first unit of the Neyveli thermal power station is expected to be inaugurated by the President of India in the first week of August, 1962.

The thermal power station, being set up under the Indo-Soviet Rouble Credit Agreement, will have five generating sets of 50,000 KW each.

The Integrated Neyveli Lignite Project envisages the mining of 3.5 million tons of lignite per annum, out of which 1.5 million tons are to be utilised in a thermal power station with an installed capacity of 250,000 KW, about half a million tons on the production of Urea-fertilizer and the remaining quantity of about 1.5 million tons of lignite to be briquetted and carbonised, to yield about 380,000 tons of carbonised briquettes for use as domestic and industrial fuel.

Work on the construction of other power units is preceeding steadily and the entire power station is expected to be commissiond early in 1964.

The power generating capacity of the Neyveli plant is likely to be increased from 250,000 KW to 400,000 KW during the Third Five-Year Plan.

THE SECOND ATOMIC POWER PLANT

The Planning Commission, it is understood, has decided that the second atomic power plant should be set up at Pratapgarh, in Rajasthan. Pratapgarh was one of the various sites recommended by the Hayat Committee for putting up this nuclear power station.

A tentative decision has also been taken by the Planning Commission for setting up a third atomic power plant somewhere in South India. The precise location of this unit will be decided in course of time.

The Pratapgarh atomic power station will cater to the needs of the Delhi-Punjab-Rajasthan-U.P. region.

STATES' SHARE IN OIL REFINERIES

The Planning Commission is also stated to have decided that the State Governments in whose jurisdiction oil may be found, can claim a maximum of 15 per cent partnership in the Central Government's projects for the production and refining of that oil. The matter had been referred to the Planning Commission following a much higher participation having been claimed in the Nunmati and the Koyali refineries by the Governments of Assam and Gujarat, reespectively; the State Governments had asked for 25 per cent share in these refineries.

The Planning Commission's this ruling, it is felt, will help to some extent in resolving the stalemate that has of late occurred on the Assam oil royalty dispute. Although the Assam Government is reported to have been disinclined to link the issue of participation in the share capital of the Nunmati refinery with the question of royalty payment, the increased revenue which it will derive from its higher participation in the Nunmati refinery's capital, should off-set to some degree the loss to it as a result of the cut in the well-head value of crude.

The 15 per cent ceiling on State Governments' share to the other industrial and mineral development projects to be undertaken by the Union Government in in the Centrally-sponsored oil projects does not apply partnership with the States. The Planning Commission, it is understood, will not have any objection if the share of the States in these projects is allowed at a higher percentage on an understanding being reached between the Central and the State Governments.

The ceiling has been fixed at a low level in the case of projects because oil is considered to be strategic and scarce material and the Planning Commission would like it to remain under the effective control of the Central Government.

ROURKELA FERTILIZER PLANT

Several sections of the Rourkela Fertilizer Plant of Hindustan Steel, for the construction of which Fertilizer Corporation of India is responsible through its Project Division, are being commissioned and the Plant is expected to be ready to receive ammonia for the production of nitric acid early in August, five to six months ahead of the revised schedule.

The Fertilizer Corporation of India is responsible for the construction of the nitric acid and nitro-limestone plants with storage and bagging and other ancillary facilities. The ammonia production facilities are outside the scope of contractual obligations of the Fertilizer Corporation.

This is the first time that the Indian engineers of the Fertilizer Corporation have designed, engineered and built one of the largest plants of its kind in the world with a production capacity of about 2,000 tons of fertilizer (calcium ammonium nitrate) per day.

Erection has been completed and preliminary mechanical tests have been satisfactorily conducted on the following sections of the plant: limestone handling plant, limestone reclaiming plant, limestone grinding plant, fertilizer reclaiming scraper machine, water circulation pumps of the cooling tower, ammonia vaporisation section and the electrical sub-station for the nitric acid and nitro-limestone plants.

The performance of the water treatment plant (having practically more than 98 per cent of the components from indigenous sources) has been tested and found to be within the desired specifications and with better than anticipated performance. Tests on the main air compressor motor in the nitric acid plant have just been started and a number of equipment in the nitro-limestone plant, namely driers, crushers, pug mills, screens, blowers, have been tested. All the auxiliary sections will be more or less completed by the end of July.

SELF-SUFFICIENCY IN FOOD BY 1965-66?

At an informal meeting with the pressmen last week, the Union Minister for Planning, Mr. G. L. Nanda, expressed the opinion that if India was unable to attain self-sufficiency in food by the end of the Third Five-Year Plan, he would consider it as a failure of planning in this country. The Planning Commission, he added, would go all out to meet the legitimate demands for funds required for agricultural development.

This view of the Planning Minister apparently is not shared by the Union Food and Agriculture Ministry. The Union Minister for Agriculture, Dr. Ram Subhag Singh, who also had an informal talk with the pressmen on Tuesday, declined to hazard a guess whether India would be able to dispense with food imports after 1965-66. He, however, was optimistic about attaining the 100 million tons foodgrains target set for the Third Plan period, provided, of course, all the agencies connected with the agricultural development of the country pulled their weight and no unnecessary impediments were placed in the way of the Union

Valuable Protection

for Valuables

Your home is perhaps a vulnerable place for keeping costly jewellery and important documents. Why run the risk of losing your valuables by theft, fire and other hazards?

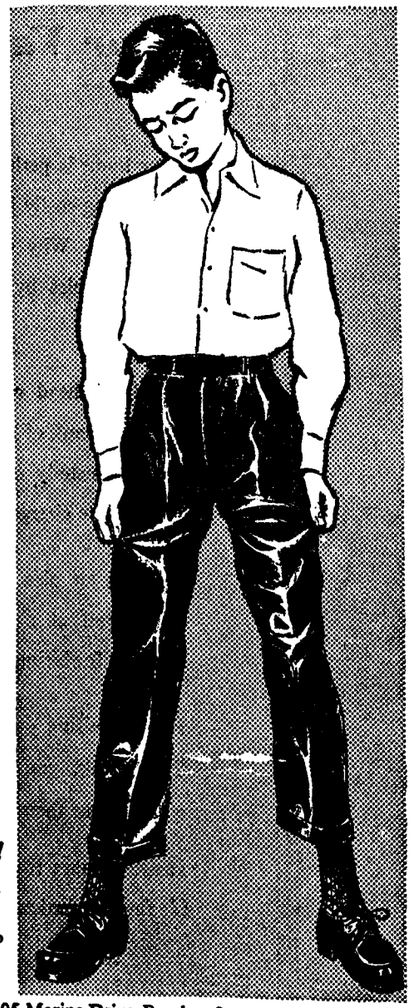
The local head offices and branches of the State Bank of India afford facilities for the safe custody of your personal effects at moderate charges.

Facilities are also available at local head offices and at a number of important branches for hiring lockers of various sizes.

By depositing your valuables in the State Bank, you will save yourself the worry about their safety.

Please contact the nearest Branch Agent for further particulars.

STATE BANK OF INDIA



INDIA'S LEADING BANK

SISTA'S-[illegible]

The Birthday Gift

Mother stitched a pair of trousers for his birthday and sent them to the laundry so that they would look fresh, crisp, new. But they shrunk—she had forgotten to look for the label 'Sanforized'!

If only she'd taken a little more care in the selection of the fabric, these trousers would have retained their immaculate fit even after many, many washings.

Make certain you get the full measure of value of the material you buy—

Look for ·SANFORIZED· REGD TO MK *on the label*

and your clothes will never shrink out of fit!

Issued by Cluett, Peabody & Co., Inc. (Incorporated in the U.S.A. with limited liability) proprietors of the registered trademark 'SANFORIZED'. The trademark proprietors use the trademark SANFORIZED, or permit the said trademark to be used by registered users authorized to use the trademark, only in respect of tested fabric which meets the trademark proprietors' strict requirements as to residual shrinkage.

For information: 'Sanforized' Service, 95 Marine Drive, Bombay 2

The trademark 'SANFORIZED'—registered and trusted in 129 countries of the world—is a vital force for the export of Indian textiles.

mss. SAN. 246

Agriculture Ministry in the form of smaller allocations of resources for augmenting the supplies of fertilizers and implementation of the small irrigation schemes. The task of the Union Food and Agriculture Ministry was indeed an onerous one, opined Dr. Ram Subagh Singh, and the success of the agricultural front depended on diverse factors, not excluding vagaries of weather and close co-ordination between those directly or indirectly involved in this task.

The supply position of chemical fertilizers, though it might show some improvement during the ensuing agricultural year, is expected to fall short of requirements by as much as 30 per cent. The demand for fertilizers is anticipated to go up to 5.90 lakh tons in terms of nitrogen, while the supply will be somewhere around 3.80 lakh tons — 1.50 lakhs tons from indigenous production and about 2.30 lakh tons from imports. A target of 84 million tons foodgrains output has been set up for 1962-63.

RECLAMATION OF AGRICULTURAL WASTES

Dr. Ram Subhag Singh disclosed that his Ministry had set the target of settling 50 lakh families of landless labourers on nearly 10 million acres of agricultural wastes which can be reclaimed during the Third Five-Year Plan period at a cost of approximately Rs. 500 per acre. Whether this target would be achieved or not, it is too hazardous to guess at present. Although the performance of the State Governments, which are the primary agencies connected with this task, is claimed to be improving, knowledgeable circles believe that the job is stupendous indeed and its fulfilment depends on not merely some improvement in the performance of the State Governments in this field, but on leaving no stone unturned by them to attain this objective. The imperativeness of fulfilling this target is obvious in view of the fact that raising of unit-area yields in India is not an easy task at present, taking into consideration the slow-changing habits of the peasantry and the shortfalls that might be experienced during the current Plan period in respect of fertilizer and irrigational water supplies.

RECORD WHEAT HARVEST

Wheat output during the last rabi season has been an all-time record at 11.62 million tons — nearly 7.4 per cent (8,02,000 tons) more than last year's production. This is disclosed by the final estimate of the 1961-62 wheat crop released by the Directorate of Economics and Statistics.

Area under wheat during the year is put at 33,240,000 acres — an increase of 1,193,000 acres or 3.7 per cent over the previous year's acreage.

As a consequence to increased wheat output and the comfortable supply position of the commodity, the Government is exploring the possibilities of cutting down commercial wheat imports. But imports of wheat on commercial account can only be curtailed with the consent of the countries making exports on this basis. At the time of negotiating the 17-million tons food deal under the U.S. P.L. 480 Programme, these countries had been given an understanding that their commercial exports would not be adversely affected. The Union Food Secretary, Mr. V. Shankar, during his current visit to the United States and London is envisaged to sound the U.S. Government, the Australian Wheat Board office in London and possibly Canada on this issue. If India is able to reduce her wheat imports on commercial account this year, that will save appreciable foreign exchange so sorely needed for effecting maintenance imports. It is hoped here that the wheat exporting countries will accede to India's request in view of the acute foreign exchange difficulties she faces today.

PARTICIPATION IN FREEDOM-FROM-HUNGER CAMPAIGN

The Ministry for Agriculture has announced that as part of the Freedom-from-Hunger Campaign, organised by the Food and Agriculture Organisation, a National Campaign Committee has been set up with the President, Dr. Radhakrishanan, as Patron-in-Chief. The Committee has drawn up some projects for popularising the Japanese agricultural implements and training of Indian farmers in their use, development of poultry and piggery to supply protein-rich food, improvement of fruit and vegetable production, upgrading of sheep, intensification of plant protection measures, promotion of nutritional diet and application of science and technology for the conservation and effective utilisation of food. All these projects are expected to cost about Rs. 2 crores, inclusive of the foreign assistance that may be available in the shape of equipment and materials.

SALINE-CUM-ALKALI SOILS: RECLAMATION POSSIBLE

Field trials have proved that saline-cum-alkali soils can be completely reclaimed by proper drainage and green manuring in combination with the use of distillery waste or press-mud.

After providing adequate and deep drains all round the fields, it should be sown in early April with **Janter (Sesbania aculeata)** for green manuring. As soon as the plants grow about a foot high, the leaching operations should be started and continued till June. If it is not possible to grow **Janter** during the first year due to too much of alkalinity in the soil, it may be grown in a nearby field and transported from there in mid-June.

To enable the organic matter to decompose, one or two irrigations may be given subsequently. The combination of green manuring with distillery waste or press-mud, a waste from sugar factories, has been found to help the soil regain its fertility.

TRADE WITH NORTH KOREA

Letters were exchanged here last week between Mr. K. L. Dalal, Deputy Secretary, Ministry of Commerce and Industry, and Mr. Rim Dal Sun, Trade Representative of the Democratic People's Republic of Korea, extending the validity of the existing Trade

M. J. Maclaren,
General Manager.

Agreement between the two countries till December 31, 1963.

The main items available for exports from India to North Korea are ferro-manganese, leather goods, cotton textiles, handicrafts, vegetable oils, mica, shellac etc. Available imports from North Korea are chemicals, fertilizers, electrolytic zinc, high speed and special steel, anthracite and various kinds of plants and equipment.

BANK AWARD ACCEPTED

The Government of India has accepted in toto the award of the National Industrial Tribunal on Bank Disputes, headed by Mr. Justice K. T. Desai. As a result of the award, which will have retrospective effect from January 1, 1962, bank employees all over the country will get bigger pay packets.

Banks and the areas in which they operate have been divided into three categories. Pay scales will vary according to the category to which the bank belongs and the area in which it operates.

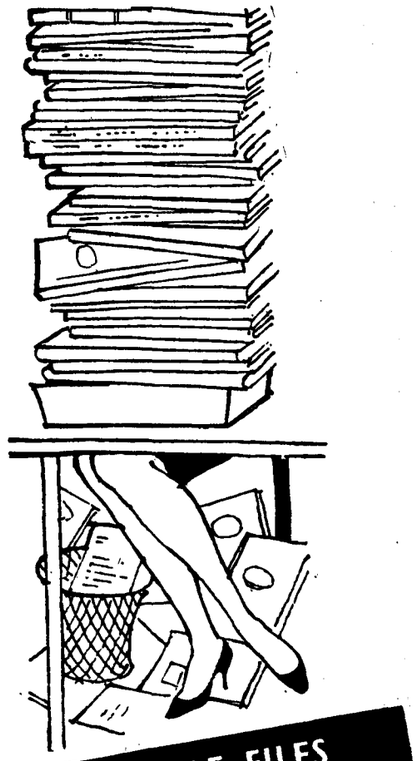
All exchange banks and all those banks with working funds totalling Rs 25 crores and above will be class "A" banks. Class "B" banks will be those which have working funds amounting to Rs. 7.5 crores or more, but below Rs 25 crores. Banks with working funds below Rs 7.5 crores will be class "C" bank. Six banks have been placed in a special separate category. The employees' demand for placing the State Bank in a separate category by itself has been rejected.

The Tribunal has fixed the pay-scale on the basis of those obtaining in 1949. Since the new scales are much higher than the present ones, and a great part of dearness allowance is to be merged with the pay, the Tribunal has made some changes in the provision for dearness allowance.

INTERIM WAGE INCREASE FOR TEA WORKERS

The recommendations of the Central Wage Board for Tea Plantation Industry for grant of interim wage increase in respect of Assam and West Bengal, have also been accepted by the Government of India. These recommendations of the Wage Board were unanimous.

The daily rated labour employed in tea plantations in the States of Assam and West Bengal, except in Darjeeling Hills and Cachar District, will get an interim increase of 0.08nP. The increase for women workers is 0.07 nP. and for employable child workers 0.04 nP.



The increase in regard to daily rated men labour employed in tea plantations in Darjeeling Hills will be 0.09 nP. and for women workers 0.07 nP. The increase in respect of employable child is 0.04 nP.

For monthly rated workers employed in tea plantations of both Assam (including Cachar District) and Bengal, an increase of Rs. 10 per month each in respect of clerical, educational, medical and supervisory staff and artisans and Rs. 6 per month in respect of others has been recommended.

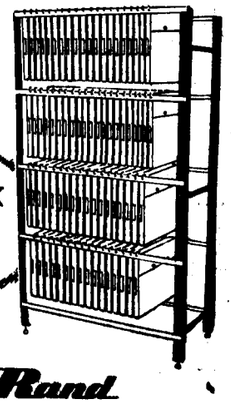
The interim increase is to take effect from June 27, 1962.

IMPROVING THE IMPLEMENTATION OF THIRD PLAN

With a view to improve its implementation, the Planning Commission would hereafter be submitting to the Union Cabinet quarterly reports on the progress of the Third Plan. It is envisaged to have every quarter rounds of meetings with all the Union Ministries and the States so as to locate the impediments in the way of an expeditious implementation of the various projects and programmes included in the Plan. Disclosing this, the Planning Minister told newsmen at his last week's informal meeting with them, that implementations of power programmes needed special attention. About coal shortages he stated that some balance between the output of coal and transport availability might be restored in another two year's time. Till then the present bottlenecks are bound to continue, though on

HOW TO FILE FILES in a SPACELESS AGE

RR



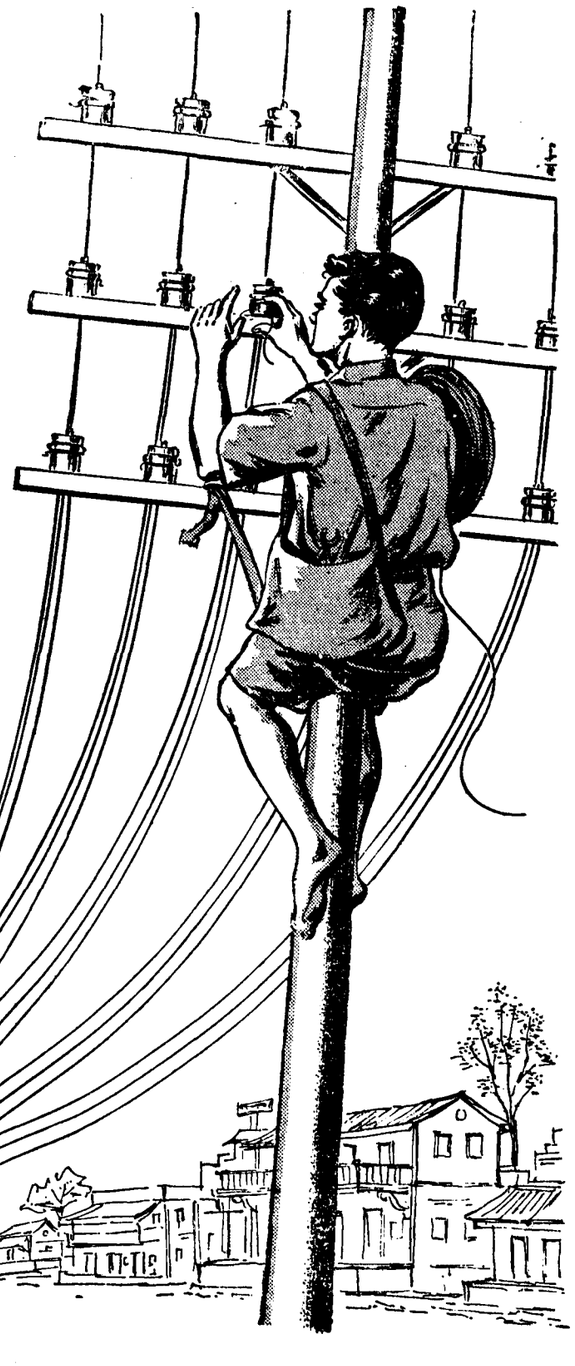
REMDEX

OPEN RACK SUSPENSION FILING SYSTEM

House your files in unique REMDEX file pockets suspended from a rack *and save valuable space* by placing the racks, side by side, back to back or even one on top of another.

Single- and four-tier rack units are available, both of which may be housed in steel cupboards, if added security is required.

The visible REMDEX indexing system makes finding and filing of papers easy.



WE GIVE THE RACK Free!

Remington Rand of India Limited

Right man on the Right lines...

That is the linesman in the public utility serving you. Be it a transient fault or a major line failure, the utility is always on the alert to restore service with least possible delay.

With the unfolding of the National Plans there will be more power but this to be of use must be delivered to Industries and homes. Towards this task, and in augmenting power resources, the Electric Supply Undertakings affiliated to the Federation of Electricity Undertakings in India are dedicated. The successful performance of this task calls for investor confidence which is best fostered by the return being made really reasonable.

With investor confidence comes more finance, which means enlarged power facilities for the Nation.

THE FEDERATION OF ELECTRICITY UNDERTAKINGS OF INDIA

COMPANY AFFAIRS

OIL INDIA

The annual accounts of Oil India Limited, a partnership concern of the Government of India and the Burmah Oil Company, for the year to December 31, 1961, show considerable progress. The gross surplus before charging depreciation, etc. since the incorporation of the company upto December 31, 1961, amounted to Rs. 465.70 lakhs. There was a net surplus of Rs. 115.44 lakhs after providing for depreciation, taxation and statutory development rebate reserve and this was transferred to general reserve. The company is still in the stage of expansion and development. During 1961, for instance, 30 additional wells were drilled. This brought the total number of wells drilled in the area to 118 by the end of 1961. Out of these wells, 79 produced oil, 3 produced gas, 5 produced both oil and gas and 14 are unproductive. The remaining 17 are still awaiting proper testing. The total reserves with the company of oil and gas are estimated at 47 million metric tons of oil and 724,452 million cubic feet of gas. Construction work of various types like industrial installations, and pipelines is still going on. It is reported that by the end of the year all major design work has been completed and all remaining materials required for the completion of the project had been procured. The company is likely to show positively better results in the years to come.

GEORGE SALTER INDIA LTD.

George Salter India Private Limited will start producing in their new factory in West Bengal coiled and flat springs and balances—the items that were imported till now—and are likely to effect a saving in foreign exchange to the tune of Rs. 50 lakhs. The company is likely to take up an expansion programme phased over three years which will be implemented to meet accelerated demand. Salters' springs are well-known all over the world and the George Salter & Company Ltd. of UK have pooled resources with Bird and Company Private Limited of India to form this company to produce springs and spring balances in India. This collaboration is likely to be a considerable success.

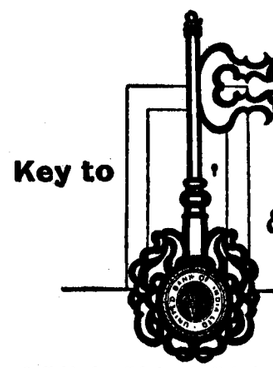
CIBA'S NEW INSECTICIDES

The two specialists in agro-chemicals from Switzerland—Dr. G. Heim and Mr. P. Oberer—revealed recently that CIBA has formulated a new insecticide based on Phosphamidon which has proved to be more effective than all the insecticides because of its penetration into the internal plant system. It was also pointed out that these insecticides were more useful for Indian conditions being water soluble and are comparatively easier to use. The CIBA company is likely to introduce some more fungicides.

SINGARENI COLLIERIES

The output of coal at the Singareni Collieries Co. Ltd. for the year to December 31, 1961, was 27.95 lakh tons which was more than 12 per cent higher than last year's output of 24.29 lakh tons. The company made considerable progress in respect of development programme of new mines and is committed to increase the production to 56.5 lakh tons by 1965-66, and this is likely to cost nearly Rs. 20 crores. The profit before providing for taxation and development rebate reserve amounted to Rs. 73.91 lakhs against Rs. 50.51 lakhs a year before. After various adjustments the Directors recommended payment of a dividend at the rate of 7½ per cent as against 7 per cent distributed a year before. The Board of Directors has approved the establishment of a mining chair in the Osmania University at an annual cost of Rs. 20,000 for five years. It has also approved a capital budget of Rs. 5.31 crores for the year 1962-63 for entering into commitments in connection with the expansion scheme of the collieries.

NEW ISSUES



The Controller of Capital Issues has granted consent to the following companies to issue capital. The consent of the Controller in all cases is valid for 12 months.

Braithwaite, Burn & Jessop Construction Company Limited, Calcutta, engaged in business as engineering contractors, is to issue 35,500 bonus shares of Rs. 100 each on capitalisation of its free reserves. The existing paid-up capital of the company is Rs. 21.30 lakhs.

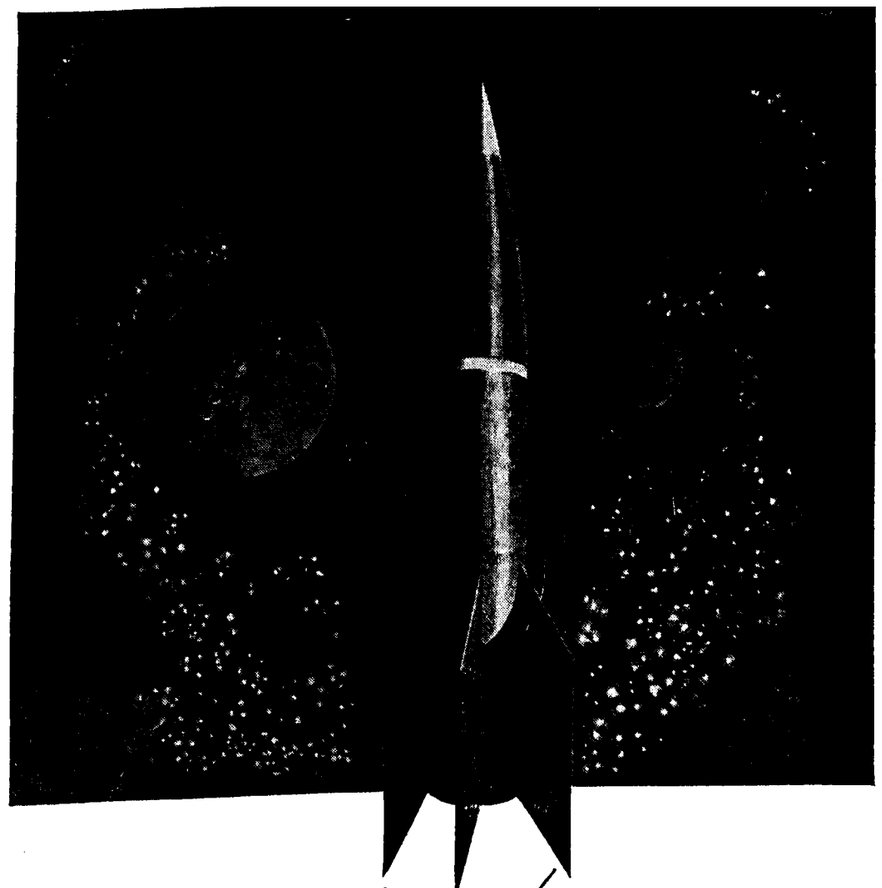
Consolidated Modi Theatres Limited, Bombay, a new company, is to issue capital of Rs. 160 lakhs in equity shares of Rs. 100 each at par, of which Rs. 70 lakhs shall be for consideration other than cash and the remaining Rs. 90 lakhs for cash. The new company would take over the various theatres and studios owned by the Western India Theatres Limited, Bombay, and would purchase additional theatres in important cities in India and renovate the same.

National Buildings Construction Corporation Limited, Delhi, a Central Government undertaking, having a paid-up capital of Rs. 34 lakhs, is issuing further capital of Rs. 22 lakhs divided into 2,200 equity shares of Rs. 1,000 each, for cash at par.

Jay Shree Tea & Industries Limited, Calcutta, is to issue (i) 2,91,558 equity shares and (ii) 29,156 cumulative redeemable preference shares of Rs. 100 each carrying dividend at 9.5 per cent per annum. The capital is required for modernisation of plant and machinery and for working capital. The existing capital of the company is Rs. 90.92 lakhs.

Key to Planning & Prosperity

Individual well-being is linked with national prosperity and only planned efforts can ensure both in the shortest possible time. And planning, for its success, largely depends on savings, individual as well as national.



Saving in the form of Bank Deposits provides resources for the National Plan.

THE EASTERN ECONOMIST

JULY 20, 1962

The State of the Nation

THIS week when we are only a month from India's fifteenth Independence Day, it is an appropriate time for an annual assessment of the state of the nation. Over the last two months, there has been growing anxiety in Delhi that the stresses and strains in the country's political and economic life are assuming large proportions. There is a tendency, as always, to exaggeration; but no one conversant with political and economic affairs in Delhi, or even more so with the temper of international opinion abroad, particularly in the capitals of countries where we are seeking aid, can doubt that this new crisis is of uncomfortable dimensions. Unfortunately, so much is hidden from the public view that even good diagnosis in public discussion has been absent. In addition, there has been a conspiracy of silence such as in regard to the growing burdens on the Prime Minister in his obviously indifferent health. It is wise for a nation, seeking the high goal set in the Third Plan and beyond, to face squarely the difficulties ahead. It is in this context that *The Eastern Economist* feels that a current outspoken review of our difficulties will not be out of place.

From a political point of view, there is no doubt that in the last two months India has experienced severe setbacks almost all over the world. China has become militarily more aggressive and the new anxiety in the Galwan Valley is by no means the only portion of the front where actual hostilities may ensue. A brave front is being maintained, but it is clear that in the Ladakh area India is heavily outnumbered. The suggestion that we can compel obedience from the Chinese in this particular area is obviously wishful. And the most recent exchanges, notwithstanding the restrained diplomatic language, are as severe as any that have come in the course of negotiations, by no means cordial, over the last three years. The situation is serious, and it is not likely to be retrieved by diplomatic protests such as the External Affairs Minister periodically makes. Over the next three months, it is obvious we must deploy far more troops in the area. This itself is a source of additional strain, particularly as the support of the troops requires considerable transport allocations which are painfully short elsewhere.

At the same time, as we have an immediate challenge on our own territory, the climate of international opinion abroad has swung strongly against India. It has not been noted in India—and this constitutes a hard and unpalatable fact—that in the Security Council both the United Arab Republic and Ghana abstained from voting, and our defeat by seven votes to two shows, not unrealistically, the character of opinion in favour of India abroad. It is now rumoured that the Kashmir dispute is to go to the General Assembly, and the mobilising of the majority there seems to indicate that this is not merely a matter of the Anglo-Amrican bloc, but also much of so-called neutral opinion which might vote with Pakistan or abstain. This will be a severe blow to our prestige although it may not alter our Kashmir policy. It is clear that undue dependence on the veto of the Soviet Union is not adequate against the shifting sands of the world opinion, for which lack of support over a wide international front is responsible.

This would have been a time for the Prime Minister himself to have conducted a campaign of explanation abroad before his attendance at the Commonwealth Prime Ministers' Conference. This might at least have retrieved the serious damage that Mr. Krishna Menon has done to India's good relations with a number of Western States. Unfortunately, the Prime Minister's health is a source of continuing concern and indeed, this constitutes one of the large political problems of the current situation. There has been a tendency in New Delhi to contrive not to present to the nation the true diagnosis of the Prime Minister's present physical condition. It is right and proper that the truth should be set out in a manner which is helpful to an understanding of what is required of this country at a time not very distant when the substance of power is transferred while the Prime Minister still has some years to live. It is a mistake to suppose, as the Prime Minister himself implied in a speech at Mysore, that the nation, because it has potential Prime Ministers, has one in readiness to replace him. His towering personality and his complete ascendency over the political machine can never again be secured. This is itself a factor making for instability as when a mighty pillar supporting an edifice gives way. It is right and proper that the Prime Minister should consider urgently the means by which the transfer of the central power which he undoubtedly wields can be effected in the least disturbing manner in a time not too distant from the present.

While our international political relations have had a major setback—clearly audible to Indian citizens who have recently visited these countries—unfortunately, our economic difficulties particularly because of foreign exchange have greatly increased. The Finance Minister, Mr. Morarji Desai, has just accomplished a notable task of great difficulty in explanation in the United Kingdom and in European capitals. He has maintained dignity and honour under extremely difficult circumstances, and the country owes him a debt for the remarkable skill with which his difficult mission has been accomplished. It is too early to be optimistic, but his mission has probably helped to underwrite about $450 million expected to be voted at the adjourned Aid-India meeting now fixed for July 30. This by no means underwrites the Plan; and we must be prepared for a considerable shortfall in the foreign exchange of the Plan, possibly of the order of 500 million dollars. At the same time, the behaviour of our exports for the first five months of 1962 which show a loss of Rs. 7 crores against last year, has indicated that foreign assistance may need to be larger, and not less, than what has been indicated in the Plan. The foreign exchange situation of the country has become critical in every respect, and the temporary relief provided by the International Monetary Fund loan and by untied credits from the United Kingdom and West Germany have not entirely removed the gloom. It is necessary that this country should immediately set its f about preparing a hard core for the Third Plan as it did for the Second.

The revision of the Plan would be one reminder to the Indian people that the relatively easy tenor of the last decade cannot be expected to

continue over the next five years. The country needs, quite apart from political changes, which are implicit in the deterioration in the Prime Minister's health, to extend a much more enthusiastic acceptance to the sacrifices necessary to sustain economic progress even at the moderate rate of 5 per cent per year. There has been far too little recognition of the need for managerial efficiency in every single producing unit in the country. Resources are still being wasted and managerial decisions being delayed by an indifference to responsibility which should receive no countenance at this time of stress. It is obvious that the leadership of the country has lagged seriously in galvanizing the people into action. It is essential that the Prime Minister, on his return to Delhi, should apprise the nation of this new emergency and summon every patriotic Indian citizen to the task of the Plan's implementation under the critical situation which has now arisen. This Independence Day could well be one of the greatest in our history if we were re-dedicated to the period of sacrifice and suffering which made the country glow from end to end in the Gandhian Age even while we were under foreign rule.

The United Nations Development Decade

ONE of the most inspiring landmarks in the United Nations was well and truly laid at the 34th Session of the Economic and Social Council held in Geneva last week. This was a session in which India had a powerful delegation, led by the Finance Minister, as was appropriate, since the subject was one in which India has a vast and, indeed, an overwhelming interest. The leadership of the United Nations on this matter has not merely been spacious in terms of the spelling out of the original General Assembly Resolution No. 1710 of November 1961. It bears the mark of genius in the presentation of the connected proposals of action to the world at large. While the Economic and Social Council was the appropriate forum of discussion of the Development Decade, the dissemination of information on this project has not by any means been confined to this forum. Indeed, at the same time as the Economic and Social Council was in session, the Under-Secretary for Public Information, Dr. Hernane Tavares de Sa', invited twenty Editors from all over the world to participate in what was a unique programme of explanation and discussion on various aspects of the programme. These twenty leaders of the Press were privileged, off the record, to have detailed discussions with the Heads of all the Specialised Agencies and, indeed, with the Secretary-General himself. As a programme in understanding and public relations, there can be no doubt that it has proved itself far beyond expectations, and that a remarkably new vehicle of communication between the United Nations and the leaders of mass communication media has been forged. It is sincerely to be hoped that this interesting experiment will be conducted from time to time to bring the message of the Development Decade rapidly into the pattern of thinking of all the newspapers of the world. One of the most clearly visible signs was the extent to which the Secretary-General, U Thant, has thrown his rising personal prestige and all the strength of his office behind this project. In his speech to ECOSOC, he said: "To these new tasks I am determined to devote fully all the resources available to me both in Headquarters and in the four regional economic commissions of the United Nations." Those who heard him speak will recognise that he spoke not only with a deep personal conviction, but a high sense of collective moral purpose. More particularly, one might quote a paragraph of his speech which reflects the predominant philosophy of the United Nations Secretariat at this time.

"It is gratifying to see that financial and technical assistance from high income to low income countries have become an accepted feature of the international economy, with former colonial powers often accounting for a decisive share in the foreign financial and human resources placed at the disposal of the newly independent countries. But the problem of increasing external assistance and of maximizing its effectiveness becomes every day more acute. In a world shrunken by the progress of communication media, the pressure of under-privileged citizens against national inequalities in levels of living becomes the impatience of entire populations with subnormal standards of nutrition, shelter, education and medical care while billions are spent on, say, space research. I say this because, if everybody is not assured a share in the benefits of the scientific progress which leads us into space, if the fast growing investment capital and technical know-how which are applied to push farther the present boundaries of the kingdom of man are not also fully used to bring better life to all within such boundaries, then the fate of mankind itself is in serious jeopardy. And while, on the plane of tactics, this explosive situation might still allow the interplay of political considerations, on the plane of global strategy it has come to assume the proportions of a compelling moral challenge, in terms of human dignity and human kinship."

In more mundane terms, the Development Decade attempts to set a minimum target of 5 per cent annual rate of growth in national income. It is recognised that these figures only indicate a minimum. But this minimum, well beyond the performance of the fifties, can constitute a major international effort. The Secretary-General spoke of the United Nations' Development Decade "as a pressing invitation to member governments to increase their social and economic investments in a most forward-looking, purposeful, co-operative and integrated effort." But he recognised also that this was as much a development plan for the United Nations' family of organisations. Every specialised agency of the United Nations has a large and spacious programme set before it in the proposal for action. These cannot be set out here in detail, but *The Eastern Economist* proposes to bring out a Blue Supplement setting out for each of the Specialized Agencies its Development Decade programme and its particular relation to India.

In the great sweep of the Development Decade proposals, it is possible for us in India to express the vast interest that India has in the tremendous operation which the United Nations now proposes. One might take just three simple illustrations to explain the extent to which, if the targets are accepted—as broadly they have been—India can benefit from the United Nations programme. To take information media, first it is proposed, for example, by UNESCO that the minimum standards for mass communication should be that for every 100 inhabitants in any country there should be at least ten copies of daily newspapers, five radio sets and two cinema seats. This would be multiplying the Indian Union newspaper circulation by about ten times and radio sets over ten times in the decade. At the same time, UNESCO is proposing greatly to extend the area for scientific training raising the number of research scientists, in countries which have machinery for a "national" scientific policy, to reach one thousand per million of the population and there should be 4,000 engineers per million of population. In the field of education, it is assumed that 70 per cent of the cost of the development programme will be borne by the national economy and 30 per cent from external sources. There would thus be an enormous entry of external finance to support a new content in education, presumably by books, television and new equipment which could well be a catalytic agent for the whole of the Indian educational system.

The UNESCO programme is, by no means, the most spacious of the programmes advanced by the specialised agencies. To take the United Nations Special Fund, for example, Mr. Paul Hoffman, its Managing Director, has suggested that its activities should multiply many times; he was of the view that provision should be made, counting in all the areas to which this Special Fund might make contributions, of an expenditure on an average of $2 billion a year, that is, $20 billion in the decade, covering, of course, both national and international contributions. This is a range which is almost breathtaking, and anyone but Mr. Hoffman might have raised the suspicion that this was an idealist's dream. The fact, however, that one of the world's most successful businessmen and a Marshall Plan Administrator advanced this programme with abundant optimism suggests that some radical change in the thinking of the Western world is about to take place.

Much the largest immediate element in the programme is provided by the Freedom from Hunger Campaign, otherwise described as Development Through Food by the Food and Agriculture Organisation of the United Nations. This spacious programme, for which Dr. B. R. Sen, the Director-General of FAO, is responsible, is to be the subject of a Blue Supplement in *The Eastern Economist* next week and, therefore, little need be said on the subject here. The current fund of $100 million for surplus foods is by no means a measure of the extent to which this programme can be both a source of relief from malnutrition as well as a powerful shot in the arm for new development. This is because, allied to the United Nations resources, are the much greater and currently more effective resources of P.L. 480 funds of the United States. We, in India, already anticipated much of the operation of the Freedom from Hunger Campaign through P.L. 480 funds, and we are beginning to find through the same means abundant resources for development.

All in all, the picture is one of a tremendous operation, many times the size of the Marshall Plan, and, indeed, many times the size of any programme which the world has ever seen. Indeed, the whole canvas is so broad, the operation so exacting and the elements in fulfilment so varied, that one can well wonder whether the high hopes entertained from the Development Decade will be justified. This, however, is not the moment for doubts and hesitation. A momentous programme has already been accepted by the United Nations; all the under-developed countries and, indirectly, the rest of the countries of the world will be its beneficiaries. The content of the plan, therefore, should have a powerful appeal both from the point of humanitarianism and from the point of active self-interest. In this age of great advances in technology there is also hope that the problem of organisation will yield to the tremendous capacity that men have to arrive at destinations unforeseen and unpredictable even a year or two ahead. The decade from now is full of wonder. We, in India, should take new courage as well as a new faith from the powerful programme of action which the United Nations has thus unfolded for all the world.

Telstar and India

THE dramatic success achieved by the United States Telecommunication satellite 'Telstar' has somehow or other failed to awaken in India anything like the interest which is its due, or anything comparable to the tremendous reception that has been accorded to Telstar on the European Continent. The reason for the contrast should be clear. Telstar here and now is the means of communicating television programmes across the Atlantic, and thus at one great sweep all the involved mechanisms of the booster stations and complicating telecommunication arrangements look as though they can be made obsolete by the simple principle of reflection of television programmes through Telstar. It is true that the full programmes will need a series of such satellites which might conceivably take two to three years to put into orbit. But the technical problem of long-range transmission of television programmes has now finally been solved. In India where we have no comparable interest in television, the significance of this great discovery has not been appreciated. At the same time, since we have no widespread receiving apparatus, we have not recognised the possibility of our using Telstar within the Indian Union for long-range communication across the length and breadth of the country from a single transmitting point.

It is this latter possibility which invests the coming of Telstar with enormous significance for India. From Delhi, or, indeed, from Bombay and Calcutta, if there were a sufficient number of satellites in orbit, one could relay programmes continuously over the whole of India so that one single transmitting station could serve the whole country. This changes completely the economics of transmitting television programmes in India. What looked like an uneconomic and a totally unworkable single television network might become a possibility. Indeed, one of the immediate requisites of the present time is that the Ministry of Information and Broadcasting should work out the economic consequences of a new network based on telecommunication, via space satellites. It is likely that it will bring television within immediate reach of the great cities of the Indian Union, with a single integrated programme, suitably arranged, to cover news, opinion, and education. The largest purpose for which television should be used in the Indian Union should be education. Over all the world educational television has made vast strides and is proving that it is an instrument of communication of information second to none. It is particularly valuable in cases where—as in the Indian Union—illiteracy and absence of teachers are severe handicaps. The way lies open for a dramatic development both in mass communication and educational advancement in India. Will the opportunity be grasped?

Guest Editorial

The Price of Gold

By PAUL BAREAU, Editor, "The Statist"

FOR some time past, there has been an undercurrent of unease and suspicion about the prospects for the US dollar. It has been increased by the slump in Wall Street and the effect this has had on movements of capital between the United States and Europe. That sense of suspicion has also been deepened by the serious difficulties in which the Canadian dollar now finds itself. The position of the two dollars cannot, for obvious reasons, be equated but one nonetheless reacts on the other. In the massive rescue operation in which over $1 billion has been mobilised to help the Canadian currency, the major contribution has been made by the United States. This is putting up one weak currency to help one which is weaker still and there can be no doubt that the US dollars thrown into the battle in order to help Canada have increased the strain on the US balance of payments.

Another factor in that strain has been the unsettlement of the American security markets and the fear that this may yet snowball into a deeper recession in the United States. There are already signs that retail trade has responded to the fall in security prices. If the repercussions of Wall Street are not quickly offset by official intervention, it will not be long before American industry as a whole lowers its sights, not only for current production but also in its plans to expand productive capacity. If, however, the US Administration pulls out all the stops to arrest the onset of economic recession, this cannot be prevented from adding to the difficulties of the US balance of payments and of the dollar. The United States, in other words, are in a cleft stick. Either they save their economy and wreck the dollar, or they save the dollar and wreck their economy.

A superficial glance at the US balance of payments might suggest that the position is susceptible of fairly easy correction. The current balance, including merchandise and invisible items, is in fact in surplus. It is, however, a surplus which is inadequate to cover the net export of capital by the United States, the economic assistance it is giving to the less developed and emergent countries, and the vast military expenditure which the US Government has to incur abroad. It can, therefore, be argued that nothing would be easier than to ensure equilibrium in the balance of payments and the stability of the dollar, since all that is needed is to cut aid and reduce defence expenditure.

This argument, however, must be shot through with reservations. A great deal of the aid is now tied to American exports and to cut aid would be automatically to cut some of the exports which now help to provide the surplus in the current balance of payments. This is not a case in which "other things remain equal." If economic assistance to other countries is suddenly curtailed, US exports will not remain "equal". Apart from this there are the massive political and social arguments that must weigh against any sudden, unilateral slashing either of the capital that is being exported or the economic assistance that is being given by the United States to the poorer countries of the world. This does not gainsay the fact that the United States are bearing an unduly large proportion of the cost of defence and economic assistance. This burden should be readjusted and there are solid reasons why today's great creditor countries, and particularly those of the Continent of Europe, should take on a larger share of the load. To induce them to do so, however, will be a lengthy process, and meanwhile the US balance of payments is likely to show a continuing deficit and the US dollar to sustain persistent pressure.

That pressure, though it has been mounting in recent weeks, has until this week had no visible effects on the US gold reserve. This is because the United States have been elaborating the technique of inter-central banking credits. Under these a number of central banks, mainly European, have been prepared to accumulate dollars in the course of their official operations in the foreign exchange market and they have furthermore agreed not to exercise their legal right to convert those dollars into gold. These arrangements are similar to those that were arranged little more than a year ago at a Bank for International Settlements meeting in Basle in order to give support to sterling which was then under grave pressure.

That technique is now being applied to the US dollar but probably on a larger scale and so far without a US application for assistance from the IMF. Moreover, some of the European central banks are beginning to show signs of concern about the size of the dollar reserves they are carrying without the protection of an exchange or gold clause. One Swiss banker was heard to mutter recently about the gentleman's agreement not to convert dollars into gold: "It is time we ceased to be gentlemen and became Swiss again". The central banks are undoubtedly becoming restive. They have acquired dollars not only as a result of the bilateral credit agreements with the Federal Reserve Bank of New York. They have also done so as a result of the international gold pool of $250 million created earlier this year to stabilise the free market price of gold. Each bank has contributed its quota to this pool. The latest indications are that the pool is virtually exhausted. Since the currency offered against the gold has been absorbed by hoarding and speculative demand in the free market, the central banks now find themselves holding dollars instead of the gold they contributed to the pool. The Swiss and the French have this week converted $137 million of their US dollars into gold.

These are the circumstances in which increasing interest is being taken in the possibility of a rise in the price of gold. The United States authorities are still adamently opposed to such a move, if only because it would primarily benefit two countries for which they have no particular love, the Soviet Union and South Africa. Such arguments, however, would not weigh heavily against the reality of a worldwide run on the dollar. We are not there yet. There is still reassuring evidence that monetary collaboration between governments and central banks can hold the position and can supply the world with the international liquidity which it needs and which is now so largely provided by the two key currencies, the US dollar and sterling. But confidence is an essential part of that mechanism of the gold exchange standard. If confidence were really undermined nothing could prevent a rush for gold, not only by private individuals but by monetary authorities and this in its turn would inevitably lead to a worldwide devaluation of currencies in terms of gold.

THE WEEK'S NOTES

Kenya

BRIGHTENING PROSPECT

THE LANCASTER HOUSE CONFERENCE left no doubt that the constitutional future of Kenya still required a certain determined effort to give it a concrete shape. The KANU and KADU are no doubt sharing the burden of responsibility, but the suspicions and fears entertained by KADU, representing the minority tribes, have not been removed. A minority always suffers from a fear psychology, but it must be overcome sooner rather than later, if progress is not to be hampered. KADU's insistence on the maximum possible autonomy for the regional assemblies is rooted in its apprehensions about the domineering influence of KANU. All the same, both the parties are sincere and determined in their aim to hasten the advent of full freedom and the desire for co-operation is now becoming more and more evident.

Nevertheless, an attitude of profound mental reservations is far from being conducive to a smooth launching of independence. Mr. Maudling, then the Colonial Secretary, had really a delicate task once again in bringing the parties closer together. But the compromise formula that he evolved during his recent stay at Nairobi could be forged because of his stiff attitude which was inevitable. One of the tough problems posed at the Nairobi talks was the ways and means to strengthen the authority of the Centre. KADU relaxed its rigid attitude on separate administrative services for the regions and agreed to a common cadre. It is not as if it is opposed to a powerful Centre at any cost. It has proposed that a provision should be incorporated in the constitution for a coalition cabinet at the Centre in which case permanent authority could be given to it. This pattern would be preferable to excess of autonomy for the regional assemblies. But a practical difficulty sure to arise is to secure voluntary agreement between the participants on policies to be adopted by the coalition. A significant contribution made by Mr. Maudling on behalf of his Government to the solution of the land problem was to raise the limit of the highland acreage for distribution to the landless Africans to one million or about threefold of what was originally proposed. The cost of compensation would be somewhere around £45 million. Mr. Kenyatta has publicly stated that this liability should be borne by the British Government since it was obviously beyond Kenya's financial resources to undertake. This important aspect should be treated with a liberal attitude. It now seems that the general elections would be held not earlier than February 1963.

Ceylon

THE SQUEEZE

IT IS a sound convention scrupulously observed in diplomatic relations not to do anything that would prejudice the status quo, when a problem is under negotiation or settlement between two governments. Apparently the Government of Ceylon has its own view in this matter. It is not only a different view but quite significant too. Not long ago the Governor-General of Ceylon had given the indication that the question of the stateless residents of Indian origin in Ceylon would be taken for discussion and settlement between the governments of the two countries. The arrangement contemplated for this settlement was to hold talks first at the official level to prepare the ground for the maximum possible agreed approach and in the final stage to take up the question at the summit in October when Mr. Nehru is to visit Ceylon. The arrangement has been conceived on sound lines since talks at the top level ought always to be preceded by talks at the official level to discover the greatest area of agreement and also to narrow down the differences to the minimum. But all this presupposes no change in policy or administrative actions and no disturbance of the existing state of affairs.

If the Ceylon Government is really intent on settling this long-standing problem fairly and equitably, it is incomprehensible why legislative measures should be taken by it that would produce an adverse effect on these unfortunate victims of statelessness. The Bill for the registration of citizens in Ceylon, now on the legislative anvil, contemplates the registration of all citizens into two categories: Ceylon citizens and citizens belonging to other nationalities It is quite obvious that when the registration comes into force, as it is apprehended to be in the near future, an overwhelming majority of, or practically all, the persons of Indian origin who are now stateless will be refused registration as Ceylon citizens. Residents of this class have settled in the island for generations, they have contributed substantially to its economic development in the strategic plantation industries and they have given an unequivocal indication of their choice to adopt Ceylon as their homeland. Unemployment will be the logical sequence of the lack of registration. The obvious intention of this policy is to exert pressure on them to return to India. The problem of residents of Indian origin in Ceylon has long ceased to be an economic problem. It has taken a definite linguistic and racial complexion. The official talks are unlikely to yield fruit and there is little room for optimism when the issue comes up before the two Prime Ministers. India is willing to accept those who opt for Indian citizenship, but she cannot accept any imposed obligation of wholesale repatriation. These people account for one-tenth of Ceylon's population and in her own interest Ceylon ought to settle their future equitably from a human angle.

British Cabinet

THE RESHUFFLE

ALTHOUGH A reshuffle of the British Cabinet was being talked about during the past few days, it was not expected to occur on such a drastic scale. Mr. Macmillan has thrown overboard seven senior colleagues in a single operation. Among them, the two stalwarts are Mr. Selwyn Lloyd, Chancellor of the Exchequer, and Mr. Harold Watkinson, Minister for Defence. Such a sacrifice of senior ministers would naturally suggest deep differences of opinion on matters of policy. But the surprising fact about this reshuffle is that such a rift did not exist. In the exchange of letters between the two, Mr. Macmillan has assured Mr. Selwyn Lloyd that they would follow the path laid by him. This could mean nothing else but the minimum departure from former Chancellor's dogged determination to fight inflation by a bold policy of wage restraint. It is difficult to see in what other directions policy changes are contemplated by Mr. Macmillan for there is no indication so far in this regard. It is the termination of the career of Mr. Selwyn Lloyd that is uppermost in the public mind more than the exit or entry of any other ministers. Mr. Selwyn Lloyd had the courage of his conviction and he never cared for the consequences even if it came to courting open unpopularity. His policy on wages and salaries has cost the Conservative Party many votes. The reshuffle is obviously the direct

result of the recent telling reverses of the Party at the by-elections. This tide could be stopped only with a change of policy, but Mr. Macmillan has at best a vague idea of what the change should be.

Mr. Butler's elevation to the status of Deputy Prime Minister ratifies the de facto state of the hierarchy. Even so, his new authority will strengthen his hands and dispell any doubts about the question of succession when the necessity for it arises. The most important change is the installation of Mr. Reginald Maulding as Chancellor of the Exchequer. He has earned a reputation for imaginative and hard thinking. Besides, his experience at the Board of Trade and his recent intimate knowledge of economic problems particularly in relation to the colonies will stand him in good stead. To what extent he succeeds in bringing about impressive changes at the Treasury will be judged harshly by a critical electorate. Mr. Thorneycroft, who sacrified office for the sake of principle, is now fully reinstated and, likewise, a few of the former departed ministers have been brought in. In the second round, Mr. Macmillan has dropped some of the junior members of his Ministry. The reshuffle has made room for quite a number of new entrants whose claims were being pressed by the back-benchers. By this reshuffle on an abnormal scale, Mr. Macmillan has made it plain that he will not oblige Labour by making an appeal to the electorate in the immediate future. Two years are still to go before the regular term of the present Parliament expires. His reshuffle will prove useful only if the cabinet with a new look will adopt really new measures to turn the tide of the electorate's mood against the Conservatives and strengthen their hands at the next general election. Whether this will happen is problematical.

Pondicherry

DE JURE TRANSFER

THE CURTAIN has now been dropped finally on the chapter of French colonial rule in India. The ratification of the treaty of cession of May 28, 1956, between France and India, by the French National Assembly is to be followed by a similar act by the Senate before the final seal of approval would be put on it by President de Gaulle. What now remains to be done is only a constitutional formality to complete the de jure transfer of the former four French colonies of Pondicherry, Kariakal, Mahe and Yanam. The existence of any colonial pockets in India after Independence was obviously an anachronism and the French Government showed full awareness of this fact. It was really to negotiate a formal transfer. But the first efforts in this respect, dating back to June 1948, were frustrated by the overbearing activities of a powerful section of the residents who had come to acquire shady vested interests. This obstacle, however, had to melt and the referendum was taken on October 13, 1954. The local Assembly and the Municipal Communes voted in an overwhelming majority for merger with India and in pursuance of this decision the de facto administration of the four French colonies was transferred to the Government of India on November 1, 1954. What remained to be done was the act of follow-up by de jure transfer.

There can be no doubt that a period of about eight years was altogether disproportionate for effecting this formality even after making a liberal allowance for certain important political factors which kept the French Government anxiously pre-occupied. The Algerian problem was the most important among them and in India there was ample appreciation of the difficulties for the French Government to take the final step expeditiously. Even so, it could hardly be denied that the delay strained the patience of the Government and the people of India. Besides, there were positive difficulties which embarrassed the Government in the administration of the four territories. The sanction behind the administration was of course that of French Jurisdiction Act, but the state in which the French system of law had to be maintained without any authority for the Indian judiciary to entertain appeals created an anomalous situation. The Supreme Court ruled -- and this was quite apparent — that no rights under the Indian Constitution could be claimed by the citizens of the four territories. By contrast, the transfer of the fifth former French colony of Chandernagore proved an expeditious act. Its de facto transfer on May 2, 1950, was followed by the de jure transfer on January 2, 1951. The four territories now legally transferred to India will constitute a separate entity. The French colonial rule in its wake has left a rich legacy of culture and tradition. These ties which the local population has inherited are to be preserved, of course, without prejudice to the genuine integration of the people with the rest of their countrymen.

Prohibition

SENSE AND SENTIMENT

IT IS amazing that Mr. G. L. Nanda, Minister for Planning, and Mr. Shriman Narayan, a Member of the Planning Commission, should allow their enthusiasm for total prohibition to outrun plain commonsense. It was not long ago that Mr. Shriman Narayan took up the question of total prohibition throughout the breadth and length of the country, but somehow he seems to have relaxed his crusade. Mr. Nanda stands in a better position of effective authority than Mr. Shriman Narayan, and, as Minister for Planning, he put a proposal to all the States except Maharashtra, Gujarat and Madras (which are already dry) whether they would be prepared to introduce total prohibition by the end of the Third Plan period on the condition that the Centre would compensate them for 50 per cent of their loss of revenue from excise on liquor. It would appear that Mysore, Kerala, Punjab, U.P., Madhya Pradesh, West Bengal and Bihar responded to his query, while as regards the remaining States no information is available about their attitude to this question.

Of all the States Punjab has been somewhat soft to the Planning Minister in its reply and it has stated that the difficulties of enforcing total prohibition in the adjoining areas of the capital city would prove intractable, unless Delhi goes dry first. All the other States have made it bluntly clear to the Planning Minister that the proposition will not be acceptable to them unless 100 per cent loss of the excise revenue is made good by the Centre and, in addition, the cost of the enforcement of prohibition is also borne by it. UP and Madhya Pradesh have gone one step ahead — and rightly so — in pointing out that half the relief against loss offered by Mr. Nanda is confined only to the Third Plan period and not further. Mysore and Kerala have urged that the cost of rehabilitating the displaced toddy-tappers in other small industries ought to be a responsibility of the Centre.

These demands are absolutely unexceptionable. They show in very simple terms the financial difficulties that lie in the pursuit of the Utopia of total prohibition. The loss of excise revenue on liquor will have to be made good by additional taxation at a time when anti-tax compaigns have emerged as a new hurdle to raising resources for the Plan in some States. The enthusiasts of total prohibition seem to be oblivious of the bitter reality of illicit distillation and bottlegging on an extensive scale that cannot be stamped out. It is to be hoped that now at least this fad of total prohibition will be abandoned.

THE INDIAN BANK LTD.,
(Established in 1907)
REGD. OFFICE: INDIAN CHAMBER BUILDINGS, ESPLANADE, MADRAS-1

Offers complete Banking service of every description, backed by more than 54 years of sound experience

	Rs.
Authorised Capital	...1,00,00,000
Subscribed Capital	... 88,60,000
Called & Paid-up Capital	... 82,99,975
Reserve Fund	... 68,44,584
Share Premium	... 14,57,300
Deposits as on 31-12-61	... 40.05 Crores

Has a net work of 145 offices (24 situated in the city of Madras, 5 Overseas and 116 spread over 8 States in the Indian Union) and is fully equipped to advise and help regarding deposits, advances, remittances, collections, foreign exchange business etc.

Directors

JENSON & NICHOLSON-1962

The Name : **JENSON & NICHOLSON**
The Year : **1922**
The Place : **NAIHATI, NEAR CALCUTTA**

AND THE RESULT : Forty years of dedicated service to India's homes and industries by Jenson & Nicholson—the country's leading manufacturer of decorative finishes and industrial coatings. The J & N factory is now the focal point of a farflung distribution service. J & N paints are used in places as distant as Patiala and Pondicherry and for purposes as widely separate as interior decoration and industrial coating.

'JAPAN BLACK' FOR MILADY'S GIG

The firm now known all over the world as Jenson & Nicholson was founded in London in 1821. Its sole product : a varnish imaginatively called 'Japan Black'. It was used to paint 'society' carriages—the status symbol of the day. Japan Black was a fine varnish—a rich, glossy black—blended with infinite care. It was, as the phrase goes, 'a quality product' *Today as in the past, quality is still the keynote...*

DECORATION OR DONKEY WORK—J & N HAS A PAINT FOR IT

Plastic emulsion for a penthouse flat, anticorrosive composition for a lockgate ; rivelling enamels for typewriters ; porcelain lacquer for bathroom fittings...orders like these are all in the day's work to J & N. Whether it's a paint to make a place look pretty, or a coating to prevent a termite attack, J & N can supply it. J & N decorative finishes are to be found in such landmarks as the Taj Mahal Hotel, Bombay, and Raj Bhavan, Calcutta, while J & N industrial coatings are used on everything from domestic appliances to railway rolling stock.

'GO OUT AND SELL PAINT !'

A traditional order at J & N, where production is matched in importance by selling. Comprehensive distribution covers the subcontinent. J & N has established paint depots at Calcutta, Delhi, Bombay, Madras, Coimbatore, Gauhati, Kanpur and Siliguri, and from these depots paints are supplied to a network of stockists strategically located so as to cover even the smallest villages. Distribution is backed by a vigorous selling force. *You can always get a J & N paint when you want it, where you want it.*

FROM SUNFLOWER SEEDS TO 'BATTLESHIP GREY'

Sunflower Seeds, Castor and Soya Beans, even fish, are used in the manufacture of paint. The metamorphosis takes place daily in the J & N factory. The most advanced paint factory in India, it is now expanding under a phased programme. In this busy complex of men and machines, raw materials are converted to paints like Robbialac Super Gloss Enamel and Jensolac Stoving—leaders in their fields. Precision control is the keynote in every department of the factory. From the 'varnish kitchen' where gums are 'cooked' with oils to the dry-distemper department, there is an emphasis on quality and an endless striving for improvement.

CAVE PAINTS AND CHEMISTRY

We've come a long way from the days of our cave forebears, when colouring matter came from natural pigment scooped out of the ground. Today the production of paint is a science and an art.

At the J & N factory, the chemistry of paint is vitally important. A fully-equipped laboratory, staffed with skilled chemists, pursues an unceasing programme of research, development and testing.

J & N PAINTS RUN THE GAUNTLET

Testing is exhaustive. The quality of pigments must meet rigid standards of purity, colour strength and correctness of shade. Raw materials are tested for stability and durability. On the laboratory terrace, surface coatings are exposed to the full force of sun, wind and rain. Each batch of paint is tested to precise standards before leaving the factory. So far is attention to detail carried that the laboratory even contains a miniature production plant—a duplicate of the actual factory machinery. Here new formulations are evolved and existing paints improved. The result of all this care : *you take quality for granted in a J & N paint.*

TEAM WELFARE AT J & N

J & N believes in teamwork and team welfare Much thought is given to the well-being and happiness of factory employees. Labour quarters, medical facilities and other employee benefits are provided. Team welfare leads to better teamwork. At the J & N factory, where India's leading paints are produced, this policy speaks for itself.

*

Do you see PINK ELEPHANTS ?
In which of J & N's shades of pink ?

*

BJN PAINT GROUP

In September 1960 two of the world's largest paint groups, Lewis Berger & Sons Ltd., and Jenson & Nicholson Group Ltd., pooled their resources by amalgamation to form Berger, Jenson & Nicholson Ltd. Paints manufactured by J & N in India are backed by the joint technical knowledge and experience of this international organisation.

QUALITY SELLS J & N COATINGS

The World Abroad

INFLATION: MR. J. K. GALBRAITH IN THE WITNESS BOX

By

ODYSSEUS

OUR attitude towards inflation is our attitude towards sin — we are all against it, but we accept it as an inevitable and permanent human weakness.

And just as (unofficially) a good many of us enjoy sin, so we enjoy inflation, provided, like sin, that it is not too blatant. Those who enjoy inflation most obviously are governments, industrialists, and trade unionists — people in a position to exact higher price at the expense of all those on fixed incomes who are powerless to hit back. Sin and inflation are, however, short term enjoyments. In the not so long run, they both end in hell. Ignoring the soul's eternal torments, and sticking to this world, persistent inflation leads to the hell of a static or declining economy.

How do you combat inflation? For a preliminary answer I turn to Mr. J. K. Galbraith's "Affluent Society". The ordinary average duffer usually fails to grasp that Mr. Galbraith's best seller is basically about the problem of inflation. Most people regard the "Affluent Society" as an exposition of the thesis that wants (at any rate in the USA) are artificially created by massive advertising in a frenzied race to keep industrial production at full capacity in order to maintain employment. Mr. Galbraith does, indeed, make this point, but this is only part of his theme that insistance on production at near-capacity together with full employment as basic social aims inevitably means over strained capacity and over full employment, and that this leads to creeping inflation. However I may disagree with Mr. Galbraith's solutions, I think that his book offers one of the clearest, non-technical analyses of the problem, and I particularly direct your attention to what he says about the orthodox anti-inflationary weapons of (a) monetary and (b) tax policy.

FAILURE OF MONETARY CONTROL

Mr. Galbraith points out that, theoretically, to raise the rate of interest reduces the aggregate demand for goods. By thus reducing the total volume of spending, monetary control aims to reduce the pressure (a) of demand on productive capacity and (b) of demand on the labour force, and so stabilise prices. To the extent that this policy is successful it reduces consumer demand, which reduces the prospects for profits, and so reduces investment. But investment is necessary for growth, and we all now agree that growth is one of the chief aims of a modern economy. So that here the aim of price stability seems incompatible with growth. This has been a constant criticism of the UK's post-war "Stop and Go" alternations of high bank rates that halt growth followed by low bank rates which allow production to catch up, so that production bottlenecks appear once more, employers bid against each other for scarce materials and scarcer labour, and prices and wages resume their way up.

Mr. Galbraith insists that monetary policy does not even, in fact, achieve what it seeks. For when production is at full capacity, profits will be encouraging. Further investment will therefore seem attractive. Investment plans will not be changed by moderate increase in the interest rate. If really high rates are enforced, small firms are hit while big firms are not. Where a comparatively small number of big firms (i.e. an oligopoly) predominate in an industry, they are likely to be able to pass higher costs on to the consumer. Such big firms, which are important customers of the banks, and which can also raise funds easily on the stock market, can, broadly, contract out of a high bank rate policy, unless the government persists in it for a prolonged period, until real unemployment and real deflation threaten to a degree that is socially undesirable and politically impossible. On the other hand, people in highly competitive markets — farmers, small builders, small retailers, dealers — cannot easily raise their prices to consumers. Here, again, a stiff disinflationary policy can hardly be kept up for long, because farmers and small business are also voters.

Spending by consumers (at any rate in an advanced industrialised state with strong unions and welfare machinery), as also by governments (heavily committed to defence and to electoral largesse) is fairly constant. Business investment spending, by contrast, is mercurial. It depends on industry's estimates of future returns. All that we know about the future is that it cannot be known. Estimates as to what the future holds change, and so accordingly will investment. And changes in investment, by changing prospective earnings, change the future itself. If high interest rates are persisted in long enough, they will, by curtailing the borrowing of weaker firms and industries, in the end affect demand and so the investment prospects of the larger firms. High interest rates therefore work on the most mercurial type of spending in an economy. Mr. Galbraith concludes that there must always be the danger that monetary policy, if pressed until it does, in fact, stabilise prices, will reduce investment to the point of causing depression. A depression can, of course, be corrected, but it can hardly be regarded in itself a desirable aim of policy.

FAILURE OF TAX CONTROL

Mr. Galbraith then turns to tax policy. The government can attack inflation by increasing taxes, and aiming at a budget surplus big enough to reduce total spending to a point which eases the pressure of demand on productive capacity and on the labour force. Whereas monetary policy hits the weaker industries and firms first, tax policy reduces the demand for the products of all firms, big and small.

Now in democracies, government expenditures are likely to be at the minimum that voters regard as tolerable, so that a tax policy against inflation must mean an increase in taxes. We need not elaborate the point that however much democratic governments may talk about economies in expenditure, substantial cuts are

virtually impossible, as Mr. Thorneycroft, Chancellor of the Exchequer, found in 1958 when his colleagues would not let him cut a paltry £50 millions out of a £6,600 millions budget.

Next, proposals to increase taxes arouse the electorally dangerous controversy between the Left and Right on inequality of incomes. The Left wants higher income taxes to reduce, or even to eliminate, inequality. The Right attacks high taxes as killing incentives, impeding saving, and so on. Mr. Galbraith dismisses this controversy as of minor importance in the USA now-a-days, where, he says, it is widely appreciated that (as I pointed out here last week has been the case in Germany) wage earners benefit more by a relativly constant percentage share in an expanding economy than by a rising share of redistribution in a stagnant economy. If the masses in the USA have grasped this, they certainly have not in the UK, where "fair shares" remains prominent in the Labour party's programme, and judging by the exceptional pressure for wage increases characteristic of most Western countries in the past two years, the European masses seem nearer to the British than the American in this.

Finally, higher taxes conflict with the aim of production and full employment. When the economy slackens, business reduces investment. Just as demand quickens investment as production reaches capacity and capacity is enlarged, so falling demand slows investment as production drops away from capacity, so that a substantial decrease in growth begins. In other words, growth will only be at a maximum when the economy is under that pressure to use capacity which produces inflation. A policy which holds production below capacity for the sake of price stability inescapably sacrifices economic growth.

This, broadly, with some interjections and asides from me, is Mr. Galbraith's exposition of the dilemma of full employment versus inflation. What is his solution? In effect, he says, the whole problem arises from an insensate insistance on industrial growth, whereas we (or at any rate the West) are now rich enough to relieve pressure of demand on capacity and the labour force by slacking off production and divorcing the resulting unemployment from loss of income by paying unemployment benefits close to the average working wage. We must stop worrying about efficiency, incentives, avoidance of waste, etc., and allow industry to be managed at a level slightly below capacity, which is the only hope of checking inflation. Hitherto (at any rate in the USA), industrial goods have been overproduced, while education, health, and other public services have been starved of funds. These should now be financed by a sales tax on private spending.

That wealth is now so great that a country can afford to slack off may, just conceivably, be true of the USA, but it is certainly not true of Europe and not remotely true of Asia. Mr. Andrew Shonfield has pointed out that as far as the USA (or any Western economy) is concerned, if more public services are to be provided, more workers will be needed to produce them. The number of doctors, teachers, and builders of new hospitals, schools, etc. must be increased. That means fewer workers available for industry, so that the USA will have to go on worrying about efficiency, waste, and incentives to obtain higher productivity per worker. Nor do US statistics suggest that many workers could be transferred from industry to the public services. Already manufacturing employs only a quarter of the total US labour force, and already US workers are increasingly entering the service industries, in which it is difficult to achieve the great benefits of rising productivity. This places an ever greater responsibility on manufacturing industry to raise productivity even higher, so that its increased productivity can be shared in the form of lower prices by the low productivity service industry workers, for whom there will be nothing left if the manufacturing workers absorb all productivity increases in higher wages, passed on to consumers in higher prices. Altogether, affluence, properly used, will mean more, not less, work all round. Mr. Galbraith has analysed the problem of full employment and inflation, but it seems that we must look elsewhere for a solution.

INDIA AND POLAND: CO-OPERATION IN ECONOMIC RESEARCH

By DR. IGNACY SACHS

(Dr. Ignacy Sachs is currently in charge of the Centre of Research on Underdeveloped Economies, sponsored by the Warsaw University and the Central School of Planning and Statistics).

AT a recent gathering of economists from all quarters of the world, convened by UNESCO in Warsaw to discuss the Marxist contribution to the theory of growth, it was felt that co-operation between students of economic affairs, and more particularly between planners, should take a more concrete shape, attacking specific issues rather than sticking to generalities. Good will was certainly necessary, stated one of the participants, but it could not make us happy by itself, just like a healthy body would not suffice without an inquiring mind.

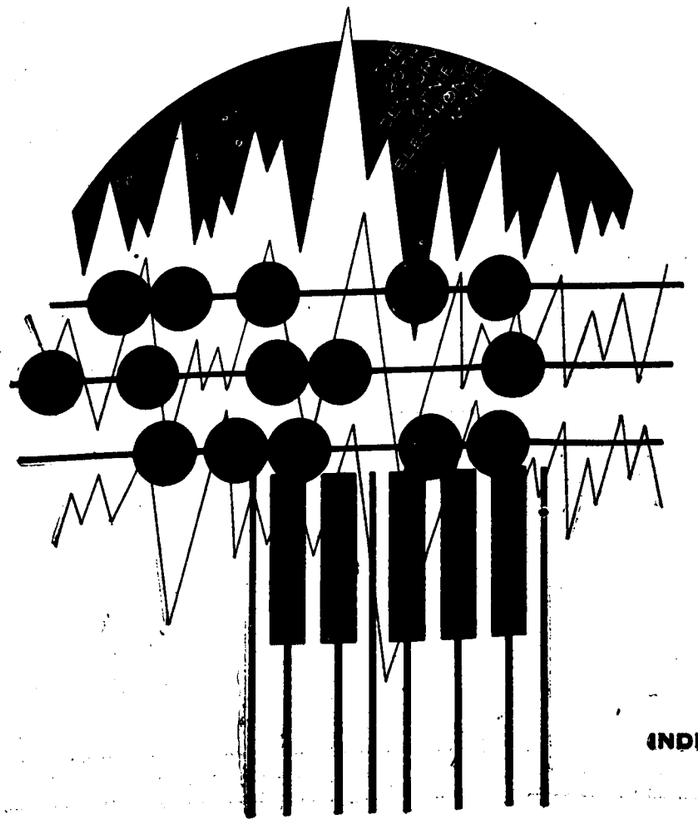
This calls for measures both on a multilateral and on a bilateral level.

In the United Nations and in different other international bodies and meetings economists from developing countries and from the socialist world could join in working parties devoted to practical problems and current experience of planning, as well as to the lively issues of international trade. But, even if we foresee an intensification of such activities, plenty of room is left to bilateral exchanges.

In this respect, India and Poland have an impressive record. Poland's leading economists, professors Oscar Lange and M. Kalecki stayed for some time in India on the invitation of the Indian Statistical Institute, while in Warsaw we had the privilege of listening to lectures of Professors Gyan Chand, P. C. Mahalanobis, V. K. R. V. Rao, K. N. Raj, A. K. Sen, V. B. Singh to mention only some of our distinguished guests from India. Indian magazines opened their columns to articles on 'Polish economic model' and Polish planning, written by Polish and Indian authors. One of the leading publishing houses in Poland brought out a bulky volume with seventeen essays on the Indian economic and social scene contributed by Indian scholars. Indian authors will again figure prominently in

series of 'symposia by correspondence' called 'Studies on Developing Countries' to be issued shortly in English and French in Warsaw under the responsibility of an Editorial Board headed by Professor Oscar Lange.

Of course much more may be done on the same lines. But new avenues should also be explored. Both the countries take a passionate interest in economic planning and are engaged in framing five-year and long-range plans. Academic and working economists in Delhi and Warsaw are busy drawing certain generalizations from the experience accumulated by the planning commissions. It would seem, that there is a vast scope for exchanges in this matter.



Then comes the field of teaching. The Central School of Planning and Statistics in Warsaw intends to organize an advanced course of planning for economists from developing countries. The lectures will be delivered in English by members of the School staff, as well as by professors and specialists from the Warsaw University, the Polish Academy of Sciences, the Planning Commission. Most probably a few scholarships will be extended to Indian fellows. Several Indian teaching and research institutions take interest in the syllabus of the course, as they are also engaged in training planners. At the same time, a Centre of Research on Underdeveloped Economies sponsored jointly by Warsaw University and the Central School of Planning and Statistics came recently into existence. Professor M. Kalecki was appointed chairman of its Scientific Board. The main area of interest of this rather modest research unit is again that of economic planning and programming, and therefore, the Indian developments will be followed with special attention.

Last but not least, mention should be made of a still more specific subject, namely that of prospects of Indo-Polish economic co-operation and trade. Although the situation of the two countries is very different in many respects, in both the cases the overall rate of economic growth will depend in the long run to a considerable extent on the likely performance of foreign trade.

The record of Indo-Polish trade, on the whole, is satisfactory and shows great vitality. But the rapidly changing economic structures of the two partners call for a careful study of new possibilities and long-run arrangements. In this author's view, Indo-Polish trade could grow at a considerable speed for years to come, if appropriate measures are taken on both sides. The complementarity of two growing and planned economies depends to a considerable degree on investment and trade decisions, taken by the planners, mostly when the share in each other's trade remains small.

The existence of long-range plans should make possible a far-seeing attitude and certain steps could be agreed upon, to lay foundations for durable collaboration between different industries in both the countries. Poland and India could use more extensively such instruments, like long-range agreements and contracts, achieving some degree of international planning and drawing thus all the advantage from the fact that Indo-Polish trade should be the bridge between two planned and to some extent co-ordinated economies. Although much remains to be done in this respect, a good climate of responsiveness to such ideas seems to exist in Delhi and Warsaw. And perhaps more thought on these lines, followed by action, constitutes the most appealing challenge to the skill of those among Indian and Polish economists, who strive to promote fruitful co-operation between the two countries and, at the same time, feel that theory and practice should always walk together as close as possible.

THE BIG HURRY IN THE WORLD OF ELECTRONICS

Diagnosing diseases, composing harmonious music, translating simultaneously in a dozen languages, solving complex engineering problems or playing an expert game of chess, electronic computers are the miracle child of the present century. ■ Reading, writing and calculating at the speed of light, with 'memories' that learn by experience, these giant minds are freeing expert technicians from time-consuming mental drudgery, for more creative planning, making possible whole new industries and products, which assure greater employment and prosperity. ■ In making the electronic tubes that keep these computers twinkling, a highly specialised knowledge of gases is required. ■ It is this specialised knowledge of industrial gases and their diverse applications that Indian Oxygen affords Indian industry.

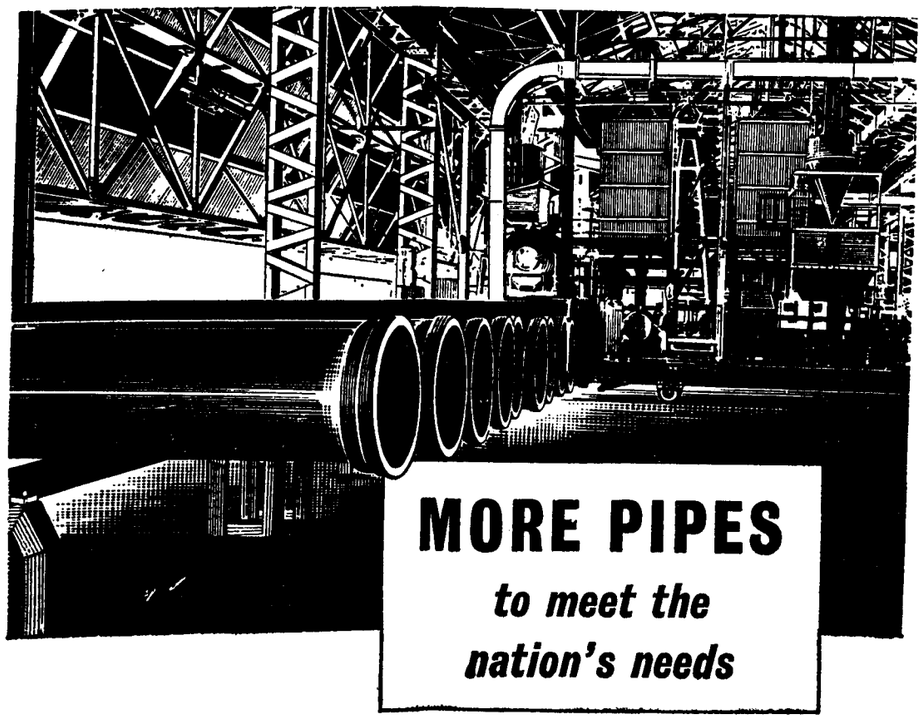
THE FRENCH ECONOMY NOW

From Our Special West European Correspondent

PARIS, July 13.

AFTER repayment of some long-term debt and after a loan of $80 million to Canada, France's gold and dollar reserves at the end of last month were $3,483 million. They thus exceeded Italy's and became the fourth largest central reserves after those of the USA, West Germany and Britain. About the same time, it was calculated that France had become the world's fourth trading nation, after the same three countries. Her industrial production, having reached a record of 199 in May, i.e. having doubled in ten years, also stands fourth in volume, among Western nations, although in absolute terms well behind that of the other three, whose populations are greater than hers. Without detracting from the credit that is due to the men and the methods that have achieved these results in the last few years, one is entitled to point out that France has done no more than re-claim the place that one would expect her to occupy in the scale of industrial economies, given her population and its abilities, her geographic situation and resources, and her accumulated advantages in domestic assets and overseas connections.



Far from the recovery of the last four years having taken her to a temporary and precarious summit, it has restored her to what one might call her normal position: distinctly behind the larger and better endowed Anglo-Saxon and German economies, but comfortably ahead of other nations that either are smaller or do not enjoy her natural and historical advantages. In other words, there is no reason why, properly managed, her economy should not stay there. It took decades of inflationary folly, two disastrous wars, a declining population and profitless colonial adventures to reduce her to the situation of economic dependence and insignificance she knew after the last war. There is not the remotest possibility of her re-finding the pre-eminence of the beginning of this century, when Paris was the world's biggest lender, the Credit Lyonnais the world's biggest bank and there were more motor cars in France than in the rest of the world put together. Yet her current role in international business by no means exceeds her capacities and resources, and it is a reasonable economic policy to seek to maintain it.

This is the object of present planning, and if it is frequently described by its authors and critics alike as "ambitious" and hazardous, that only reflects that fact that constant effort is required even to maintain an honourable fourth place in the expanding Western economy. There is, for example, an ever-present danger of price-inflation but one cannot imagine that things should be otherwise when literally every employable person is at work and when organised labour, naturally enough, seeks to exploit this circumstance to hasten the rise in living standards to those known in the USA and Britain (those of West Germany are already surpassed). To increase the gross national product by 24 per cent between 1961 and 1965 will be no more than is necessary to keep fully employed a rising population while allowing it, on average, a 23 per cent increase in purchasing power.

Although bordering all the time on the precipice of price-inflation (which is, however, railed off nowadays by convertibility and free trade within the Common Market), this effort is within the powers of the economy, as recent performance shows. Continued expansion has been maintained, at a time when slower progress or none at all was recorded in other industrial economies with the exception of Italy — and even there the long rising curve appears to be flattening out. Despite rising prices at home, despite freer imports and hence more competition from neighbouring industries whose home markets were weaker, and despite the sharp contraction of imperial trade, French exports throughout the first half of this year have been 103 per cent of imports. The massive increase in exports produced in 1959 by the devaluation has settled down to a steady expansion of export sales that approximates 8 per cent yearly and this has every chance of being maintained, for these reasons: liberation of trade inside the Common Market still has a long way to go, and that Market may soon be widened by the inclusion of Britain; expansion in the business activity of France's main trading partners, and notably the USA, Britain and West Germany, could soon be resumed; and the demand of former French colonies, Algeria first among them, will soon rise in absolute terms while remaining relatively less important than trade with industrial countries.

Against that, wage increases have been altogether too fast in the past year; so have they been in West Germany and, more recently, in Italy. There is no mistaking the long-term trend: for European wages to approach American, until the present disadvantage the USA suffers in production costs is wiped out. That prospect, however, need not intimidate European industry, for it means that the European consumer will have the same purchasing power as the American has had in the past decade—and that consumer will by then be, not a hypothetical average of national figures, but the member of a unified market of several hundred million souls. Meantime, the French problem is to prevent the rise going faster here than in neighbouring countries. There is no reason why it should. Recent rises in the price level have not been due to industrial prices, which are virtually stable, but to the impact of the vagaries of the weather on agricultural prices. The natural rise in the working population as the post-war generation comes of age, the demobilisation of soldiers as the army is converted from a clumsy colonial police into a streamlined modern force, and the repatriation of many settlers from North Africa all guarantee an expansion in the offer of manpower greater than will be known in other European countries.

In one respect the improvement in France's international position has been due, not to exploitation of domestic resources, but to substantial investments abroad, specifically in the oilfields of the Sahara and the other producing regions, from the Middle East to Venezuela, where French oil companies have a stake. The cost in foreign currencies of oil imports in 1959 was $350 million, in 1960 $240 million and last year $160 million; thus $100 million each year has been economised on the import bill. This process will continue: oil output of the franc zone will be 24 million tons this year, against 10 million tons in 1960, while natural gas production will grow somewhat less quickly. Given the present glut of world oil supplies (the same tonnages could be bought even more cheaply from Russia, and

With the addition of a second plant at the Kulti Works of The Indian Iron & Steel Co. Ltd., the production of spun iron pipes has increased from 60,000 to 150,000 tons per year. Besides helping to satisfy India's growing demands for large diameter pipe mains, the increased tonnage saves India many crores of rupees annually in foreign exchange. Employing latest techniques, the Kulti Works of IISCO is the first to produce 3" to 30" diameter spun iron pipes in the country.

from the Middle East too when the Iraq-France overland pipeline is built), the Saharan source seems reliable despite political uncertainties, so France may take as resolved—pending the appearance of commercial atomic power—her traditional problem of inadequate energy resources. This is true notwithstanding the fact that consumption of petroleum products is constantly increasing.

More notable, perhaps, than France's return to her normal situation of a prosperous country with a favourable trade balance is the return of sanity to her governmental accounts—more notable, because for centuries this comfortable nation has been recurrently ruined by improvidence in Paris, or Versailles. Public finances are today in a healthy situation, because the normal increase in governmental revenues due to economic expansion has been adequate to meet even extraordinary expenditures, such as the cost of rehabilitation of the 350,000 settler refugees returned from Algeria since January. The Treasury's deficit has been kept within easily manageable proportions for several years, and the Government has abstained from borrowing, leaving the capital market free to meet the needs of the fast-growing steel and chemicals industries. True, promised reductions in tax rates have had to be postponed, but expenditures now include more "social" outlays that are as welcome as tax-cuts: more money for the aged, more help for teaching and scientific research. This restoration of fiscal sanity cannot be taken as irreversible, but it would require a wide shift in political power to undermine it—more frankly, the return to office of the socialists—and meantime the Common Market and currency convertibility have instituted a discipline that will make difficult the re-appearance of the fiscal lunacies of the Fourth Republic.

There are those, both in France and abroad, who predict that the excessive ambitions of de Gaulle will jeopardise the country's chance of preserving her present equilibrium in fourth place among the Western nations. To date, these fears have no firm support. The Government's programme is indeed bristling with prestige projects that would seem retrenchable in a less chauvinist point of view: the nuclear striking force, atomic submarines, an all-French satellite to be launched by 1965, i.e. one year before the combined European Blue Streak satellite in which France has a stake, and so on. Yet, apart from noting that none of these is a peculiarly Gaullist design but all date from before him and will survive him, one is bound to point out that so far their pursuit has not been inconsistent with balanced public finances. The supplementary estimates presented this month, for example, include instalments on the cost of the Pierrelatte isotope separation plant that is needed for nuclear weapons, for the tanker-planes required to refuel the Mirage IV bombers of the striking force, as well as for the supersonic airliner to be built in co-operation with the British—and yet, as mentioned, the budget is as balanced as at the start of the year. All of these projects are open to criticism on political, or moral, grounds: they are being financed at the expense of housing, sanitation, roads, etc. and some of them imply disruption of the Western alliance on which French security will probably depend for many years yet. However, they are being financed, and in ways that are, from the purely financial point of view, unexceptionable, presenting no threat to the budget nor to the country's economic growth. It will seem silly in 1965 to have a satellite, a nuclear force, an atomic submarine and a supersonic airliner but no autoroutes, and pokey flats without baths; but comparable forms of silliness are known from India to America via Russia.

Although the balance has been held to date, it is undeniable that the position of fourth place among the industrialised nations is, for a country of 47 million, a dangerous one, as containing the constant temptation to over-reach oneself. With resources notably less than Britain's, not to mention America's, France is tempted to try things that Italy or Japan would regard as beyond their powers and which West Germany is prevented from attempting; was not that, precisely, the theme of her unlucky imperial age? It is here that European unity offers the possibility of a transfer of chauvinism from the insufficient national base to the more generous West European scale. It is very likely that such a transfer will be effected if and when Britain agrees to make it too. There would then be no serious obstacle to France maintaining her position as the West's fourth economic power, while awaiting the emergence of the Common Market as its second.

Economic Report from the U.S.

U.S., E.E.C. AND DEVELOPING NATIONS

By GUY SIMS FITCH

WASHINGTON, July 17.

IT is a significant fact of our time that a thousand million people have been moving with extraordinary rapidity from a state of colonial dependency to independence. Such new nations for the most part are born weak, and in some cases perhaps prematurely. But each has a yearning for, and a right to expect, a better standard of living and degree of self-respect than it may have known before. This is the backdrop for the widely heralded Decade of Development which is being promoted by the United Nations at the initial suggestion of President John F. Kennedy. It is quite fitting that Mr. Kennedy should have done this, as it long has been U.S. policy to encourage and strengthen these new nations, and others in the less-developed group, in their efforts to build and improve their societies.

The United States has been doing this through a vast foreign aid programme that has included grants, loans and technical assistance of various kinds to nations all over the world. Specifically in the Western hemisphere, the co-operative development venture known as the Alliance for Progress holds a special promise for the economic and social advancement of the Latin American nations. At the same time, it has been necessary for the United States, often in concert with other free countries and the United Nations, to take steps which would forestall situations of disorder and disarray in developing parts of the world. Such situations, if allowed to foster, obviously could sap the political integrity of the newly developing lands and negate their economic and social progress.

In the effort to strengthen the Free World's economic, social and political fabric, the United States and other industrial countries are working more closely together than ever before. A strong and stable Western Europe can be an invaluable partner in the pursuit of policies to ease the growing pains and speed the progress of the new and less-developed countries. This kind of a Europe already is taking shape, as symbolized by the economically expanding Common Market, or European Economic Community (EEC) — a community which other European countries may in time be joining. The United States welcomes such a Europe not as a rival, but as an ally in the struggle to safeguard the security and improve the conditions of life for all free peoples. This is basic to the Atlantic Partnership concept, of which President Kennedy has spoken often and convincingly. The details of such a partnership will have to be worked out, of course, point by point and case by case. Much progress already is being made in this direction.

Through the Organization for Economic Co-operation and Development (OECD), Western Europe and the United States are devising means of co-ordinating their internal and external economic policies to an unprecedented degree. Among their objectives are the acceleration of their economic growth and the stabilization of international capital and currency flows. An Integral and important part of OECD, in addition, is its Development Assistance Committee (DAC), of which Japan also is a member. Through this body, leading capital exporting nations are attempting to co-ordinate their foreign assistance programmes so as to step up their effectiveness and enlarge their total impact.

In the field of trade, as important as aid to economic health, the aim is to widen commercial opportunities for all nations through the reduction of tariffs and other barriers. The U.S. Congress is now considering a trade bill which would greatly enhance the President's authority to cut tariffs in negotiations with other countries, with special emphasis on the EEC. As this authority is put to use, it presumably would induce the EEC to keep its external tariff wall low and non-discriminatory, in accordance with the principles of the General Agreement on Tariffs and Trade (GATT). The benefits of expanded trade would thus accrue to all GATT parties, abetted by the most-favoured-nation principle under which concessions granted to one trading partner are by and large extended to all.

This by no means exhausts the ways in which an effective Atlantic partnership could contribute to the vitality of all free peoples. A multiplicity of international institutions — such as the U.S. Special Fund and the World Bank and its affiliates — already exist, to which the United States and other countries are contributing, and through which assistance can be, and is being, distributed. The main problem, it appears, is not to increase their number, but rather to improve the effectiveness of the aid machinery already at hand.

As envisaged here, then, a partnership between a strong United States and a strong Western Europe, whatever form it may eventually take, would do more than raise levels of living on both sides of the Atlantic. It would be an outward-looking and progressive force, with its vast and growing resources devoted in large measure to the advancement and well-being of peoples everywhere.

THE MANAGERIAL REVOLUTION IN INDIA

By G. L. MEHTA*

THE success of our national planning depends not merely on the availability of resources but also on the execution and administration of schemes and measures. For this, efficient and imaginative management is essential. It is a prerequisite of modern business but it is also a fundamental of modern Government, especially in a country like ours where the State is increasingly assuming the role of an entrepreneur and trader. More than ever before, the system of management has to fit in with technological, economic and social needs.

During recent years, the pattern of management in our country has been undergoing important changes. It may, therefore, be useful to consider these changes and see what they signify. In industrially developed countries, economic and technical progress has brought about a managerial revolution. Is such a managerial revolution taking place in India? If so, what are its significant features and implications?

THE MANAGING AGENCY SYSTEM

We might begin by reviewing the pattern of management with which we have been familiar in our country. When we speak of management, we have usually in mind the industrial management of joint stock companies since State enterprise in industry on a large-scale is of recent origin. Private enterprise has been functioning through the joint stock form of organisation and it is with corporate management that we are mainly concerned. No doubt, small scale industries have their own problems of management but in many respects, they are qualitatively different. So far as medium and large-scale industries are concerned, the traditional form of corporation management has been the managing agency system. This pattern is in some ways peculiar to India and has been the product of the political and economic conditions obtaining in this country during the latter part of the last and the early part of this century. British and Indian entrepreneurs who promoted and established new industries performed the dual function of providing and mobilising capital as well as of carrying out the day-to-day management of an enterprise. British merchant houses were the first to promote modern types of industry in India and were soon followed by Indian merchant houses. In the earlier period of industrialisation, the British were more prominent in Calcutta, Kanpur and Madras while in the Bombay area, Indian entrepreneurs were the principal contributors to industrial development. British entrepreneurs promoted jute, coal and tea industries, and Indians pioneered the development of industries such as textile, steel and power.

The special features of the managing agency system were, however, common to both British and Indian business houses, such as ownership of part of the capital alongwith direction and control of management in the hands of the managing agency for which remuneration is given not in terms of salaries but as a fixed percentage of profits. This system contributed to industrialisation in the early stages by providing organising and administrative capacity as well as finance and credit through the managing agency. Entrepreneurial attitudes in our country today resemble, in many respects, those prevalent in England and Europe during the last century. Industry is closely held in many cases where the managements have a proprietorial approach towards the enterprise though some industrial firms do have an institutional structure. The working of corporate management disclosed several shortcomings and abuses many of which have been mitigated or removed by reform in company law in 1936, in 1956 and in 1960 as well as by supervision and administration by a separate department. Consequently, the powers of managing agents have been curtailed, the duration of the agency shortened and its sphere of operation regulated. The maximum remuneration for managerial functions has been limited to 11 per cent of profits with a sliding scale as the quantum of commission goes up; there is also a limitation on the number of companies which can be managed by one managing agency. The new institution of secretaries and treasurers provided for in the Companies Act of 1956 is designed to serve the same purposes as the managing agency system shorn of some of its defects. Several companies have adopted this system of management.

In the post-war period, new trends and forces have been modifying the structure and functions of the managing agency system. For one thing, Government themselves have been promoting industrial enterprises which are controlled and managed by corporations and companies run by their officials. Entrepreneurs from abroad who are collaborating with Indian industrialists have in many cases been operating without a managing agency system. Besides, in several existing concerns, the managing agency has been terminated without adverse effect on management. Several new enterprises prefer to have managing directors or managers to organise and operate their concerns.

It is increasingly recognised that for efficient management, modern industrial enterprise demands the services of technicians and specialists. The role of a mere financier in management is no longer crucial. The managing agency has hitherto been regarded primarily as a hereditary or family concern but this is not likely to be acceptable in future. Some managing agencies have recognised this trend and a number of managing agency houses have converted their partnership firms into private or public limited companies so as to broaden the organisational set-up and enlist talent from outside. Most of the managing houses in Calcutta, for example, have been transformed into public limited companies during the last decade. By throwing open their share capital to the public, the managerial remuneration is also shared with the stockholders.

Until recently, most industrial enterprises in India were concerned with production of consumer goods such as textiles or paper or of durable consumer goods like cement where production techniques are simple and well-known. But as the country has increasingly turned towards producing capital goods, machine tools, chemical products and the like, manufacturing techniques have become more complex. In these, new technical processes and scientific methods need to be studied and applied. Establishment and operation of an industrial enterprise requires today talents and skills which have to be mobilised and co-ordinated. Industrial organisation requires long-term planning which cannot be achieved without the co-operation of professional men and technicians. With a variety of governmental controls and regulations and the intricacies of finance and taxation, an industrial enterprise today has to depend on the advice and assistance of accountants and lawyers. The growth of trade unionism and increase in the volume of labour legislation

* Speech delivered by Mr. G. L. Mehta at the symposium organised by the All-India Management Association at Srinagar on July 17, 1962.

requires close attention to problems of industrial relations, supervision and welfare. The top executives in an industrial enterprise have to possess trained intelligence and capacity to work with others — qualities which can enable them to analyse the varied and changing requirements of the industry and co-ordinate the work of the specialist. The work of a manager is primarily concerned with achieving results through the co-operative action of a number of persons to attain common objectives. Moreover, as industrial enterprises grow in size and their activities are diversified, work has to be delegated and procedures decentralised which need a staff with knowledge and experience that cannot be the preserve of a family or a privileged group. Managerial ability, in other words, is not an inherited trait. Vertical mobility is essential in our industries so that the man at the lowest rung of the ladder can, if he has merits and becomes qualified, rise to the topmost position. An industrial enterprise has to look at many factors apart from the purely financial ones — economic implications, public image, political repercussions — before arriving at a decision. The difficulty, as Keynes said in another context, "lies not in new ideas but in escaping from old ones." It is apparent that the managing agencies which look after a number of concerns cannot run them effectively unless they have a staff of specialised and trained persons devoting all their energies to numerous, complex problems which face industries today.

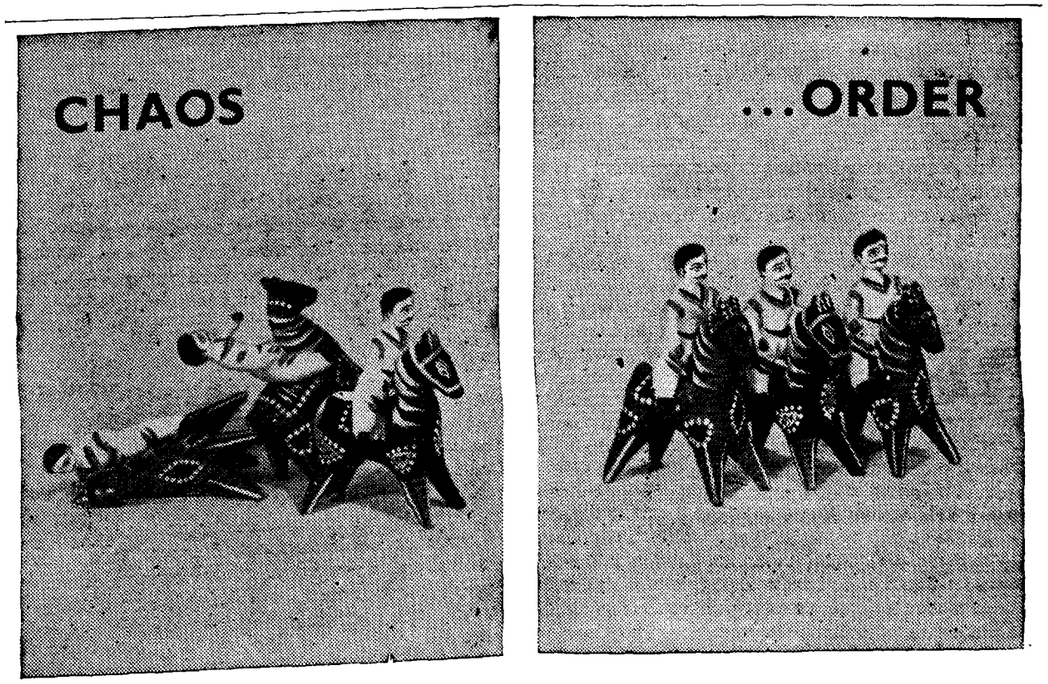
NEW TRENDS IN MANAGEMENT

New changes are also taking place in the field of direction and policy-making of industrial concerns. The board of directors of a company is the ultimate authority which is responsible for managing an enterprise. Following the British pattern, the majority of directors in Indian enterprises comprise of outsiders who are experienced men giving general advice on matters of policy but are not closely associated with detailed management. Such directors with varied background can give valuable guidance but there is an increasing trend whereby the executives of the company itself have now a place on the board. Many concerns now have full-time paid chairmen and executive directors. Several foreign enterprises prefer to have their own executives on their boards. This trend is bound to grow because with the gradual elimination of the managing agency system, management through full-time competent executives will have to take its place.

Another interesting line of development in the entrepreneurial and managerial field is the enlisting of new talent from other spheres. Until a few years ago, there was little exchange of higher staff between the business community and the Government. This situation has been changing and many senior Government officials have joined business while the services of business executives have been utilised by Government on boards of directors in state-run corporations. Such two-way movement is common in industrially advanced countries and would be useful here also. Closer understanding between Government and business is essential to promote fruitful co-operation between the public and private sectors.

Problems of management have assumed much greater importance because of the Government having entered the industrial sphere. It is not widely recognised that the Government are, in fact, the holding company for the largest group of industries in India. If planning is not to fall into disrepute through economic crisis, miscalculations and inefficiency of administration, much more thought should be given and much better organisation set up for management of industrial enterprises. We cannot afford to let planning be discredited by bureaucratic machinery being regarded, in Bagehot's words, as "a grand and achieved result, not a working and changeable instrument." Functioning of the giant Hindustan Steel Corporation serves as a warning rather than an example. It is a matter of satisfaction that the new Minister for Heavy Industry is addressing himself to this task and endeavouring to decentralise the administrative machinery of the steel plants. Indeed, some of our large industrial establishments are prone to be infected by one kind of official virus or another. As Ambassador Galbraith who has made many pertinent observations on this subject has said, "the intrusion of civil service procedures and routines which may be admirably designed to ensure equality of treatment of all employees, can have the effect of destroying the easy inter-personal adjustments and the automatic co-ordination on which effective operation depends."

With the growth of industrialisation in India, industrial enterprise has grown in dimension with the result that its capital requirements have been increasingly provided by a large number of individual and institutional investors and the hold of big financiers and capitalists has correspondingly weakened. Finance and management which have, in the past, been largely provided by the same set of persons have gradually been divorced. The private investor has been content to receive a return on his investment leaving the function of management in the hands of professional full-time executives. The company executives consequently, tend to be on their own and would be concerned with the interests of the company rather than being at the mercy of a group of financiers who happen to control an enterprise. Industrial organisation is no longer a mere matter of finance; its effective functioning demands ability, ingenuity and application. In the sphere of top-management, especially in an industry based on technology, economic and technical questions become merged, and even in preliminary projects of manufacture, research and development are, in a sense, only capital investment one stage further removed. Technical errors involve financial risks just as reduction in costs can be achieved through applied research. This development has hastened the pace of the managerial revolution and is raising the status of the full-time executive. In short, a class of civil servants in the world of business is growing charged with the responsibility of creating national wealth through the private sector working in public interest.



THE TRAINING PROGRAMMES

An encouraging sign is the growing awareness of the need for schemes of staff training at various levels. In private as well as public enterprises, programmes for training in industrial, financial and administrative spheres have been instituted for junior and senior staff. Management associations, productivity councils and other organisations are focussing attention on problems of productivity and industrial efficiency. The Administrative Staff College, the Reserve Bank Staff Training College and other similar institutions are providing training facilities. In several universities and institutes of technology, courses of industrial management have been introduced and are attracting young men and women. Institutes of management are also being organised at important centres. With all these training facilities, the new generation of managers and administrators will, it is hoped, start their career much better equipped than hitherto and the outlook of higher executives will be broadened through refresher courses and well-organised seminars. A word of caution is, however, necessary. Research can also be bogus and symposiums an exercise in self-advertisement. Besides, most industrial psychologists and sociologists study problems from the management's viewpoint and tend to regard questions of productivity as concerned only with workers rather than with organisation as a whole including management.

For, there is no mistaking the trend: industry is moving from personal to social ownership. Consequenly, the emphasis has to shift from status and wealth

to competence and skill. The managerial revolution will increasingly reflect a smaller and, over a period, a declining share in the ownership of a concern of those who merely finance it. Managements all too often deal with other people's money—those of shareholders, banks, credit institutions, even Government's, that is the tax-payer's. The concept of an entrepreneur dealing entirely with his own money is becoming out of date. This does not mean that enterprise and initiative are not needed or that bureaucracy and regimentation can secure industrial progress. But it does mean, in the first place, that qualified and trained men will have to run industry and that the hereditary principle is no more valid in industry than in democratic government. It also means that profit motive by itself and ability to speculate on the stock exchange are no substitute for imaginative leadership and organising capacity. "Hit and miss" methods are out-of-place in an environment of technological development, high costs of production, and economic impact of concepts of social welfare. As Prof. Arnold Toynbee has observed, "in place of original association with notions of enterprise and profit, the term business is coming to be associated with the very different notions of administration and organisation." The wholly new study of "organisation and management" has been hitherto decried in many quarters as mere charlatanry and waste of energy. And it is only now coming to be recognised that it has an important place in industrial development, even if not all that is spoken and written on the subject is really worthwhile.

But with the growing complexity of industrial society and magnitude of business operations affecting individual and collective life, we need not only trained men and women; we shall also have to evolve a managerial ethic. As management becomes increasingly professional in character, it will have to adopt norms of competence and standards of responsibility. As Professor Harold J. Laski observed many years ago in a stimulating essay, "Can Business be Civilised?" the great avenue of social change is the need to organise business as a profession. We should seek to subordinate industry and commerce to public interest by insistence on definite standards of performance such as we have established in law, in medicine, in engineering or in architecture. We must learn to demand responsibility for the technical competence of those engaged in it. We have to endeavour to abolish, on the one hand, anti-social monopolies and on the other, competition which is detrimental to the interests of the community. We should do away with speculative profits and secret commissions. Industrialists are entitled to returns for their risks and efforts and may grow rich in pursuit of their vocations but their wealth should be a by-product of their work and not the "be-all" and "end-all" of their activities. Wealth is a means of welfare, not its substitute.

Running a race? Running a business? The keynote is CONTROL.

But control is a complicated problem in a business organisation, for it means consultation and assessment of records. It also means arrangement of all kinds of records and information in such a manner that they can be consulted easily and quickly.

We have gone a step further in the Systems Division of Remington Rand.

We have devised Systems which not only arrange all your records for easy consultation, they even provide the *Control*. They convert your piles of files and notes and lists and ledgers into a *Working Force*.

Remington Systems can be arranged to tell you when to act, how to act. They can quickly and easily give you all the data you need to do the one thing they *cannot* do, use your judgement.

You do not have to be a big businessman to use a Remington System. You just have to be a good businessman.

MAKE YOUR RECORDS WORK FOR YOU

THE BUSINESS WORLD

Economic Growth—Pertinent Points by a Professor

By CROESUS

MANY eyebrows are bound to be raised in Congress and Socialist circles by the thesis recently put forward by Prof. G. Carl Wiegand that neither the Totalitarian State nor the Socialist Welfare State, nor, for that matter, the Statist-interventionists and Economic Planners will help materially to raise the average standard of living of our people. If the people in under-developed countries are content to import socio-economic systems from foreign countries, they will not achieve the economic and social advance that Europe and America achieved during the past one hundred and fifty years. For while foreign influences can be stimulating, they can also have a sterilising effect. "An imported machine civilisation can easily destroy traditional cultural values and, in the end, produce social chaos and economic stagnation, rather than material progress."

Prof. Wiegand is convinced that millions in the underdeveloped countries go hungry not because the world cannot produce enough but because the leaders of mankind are blinded by ideologies and a strange confusion of values. He is also not among those who believe that capital and natural resources alone assure economic growth, and, in order to establish this, he takes the examples of Switzerland, Brazil, Germany, Malaya, Indonesia, and Japan. Switzerland is poor in natural resources and yet enjoys one of the highest standards of living in the world, but Brazil, potentially one of the richest countries in the world in terms of natural wealth, is not only heavily dependent on foreign aid, but more than fifty per cent of her population suffer from malnutrition. Both Malaya and Indonesia are rich in tin, rubber and oil, but Malaya has a stable currency, whereas the Indonesian 'rupiah' sells only at about 25 per cent of its official value. Again, it is not foreign aid alone that explains the "German miracle", nor is it the political independence of Japan alone which accounts for the increase in her national income at a rate three times as fast as that of India. The truth is that Switzerland's high standard of living is due to a happy combination of hardwork, private initiative, a high regard for private property rights and a well-developed sense of social responsibility. The German miracle is the result of sound economic policies and a strong belief in private initiative and personal freedom. What makes Malaya prosperous, again, is her belief in economic freedom and respect for private property rights. Japan has not become what she is today by copying Europe, but by assimilating certain ideas and forms which she has shaped to suit her own needs. Conversely, Brazil has relied too much on the theory that foreign aid can provide a sound basis for economic development, while overlooking the risk of inter-governmental loans being used to expand the public sector at the expense of the private sector; Indonesia has not been able to make much headway, because she has been hampering private initiative, and nationalising or confiscating private property.

It is interesting to note that the Professor is wholly on the side of Mahatma Gandhi on the dangers of the all-powerful State. And, for this reason, he is naturally critical of Prime Minister Nehru's view that, "without social freedom and socialistic structure of society and the State, neither the country nor the individual could develop." Remarking that the latter's philosophy is also shared by many American economists and politicians, he makes the point that this philosophy rests on two false premises: (i) a Totalitarian or Socialist State is actually a People's Republic, in which the people have a choice and (ii) that the people, rather than the ruling bureaucracy — or the State as a moloch — enjoy the wealth of country. Both these premises, according to him, are mistaken, as evidenced by the three bitter struggles which overthrew collectivism in Europe and North America — the Glorious Revolution of 1688 in England, the American Revolution of 1776 and the French Revolution of 1789. "In each case", says Prof. Weigand, "the power passed from the ruling aristocracy and its proliferating bureaucracy to the 'entrepreneurial' middle class, and it was this step which precipitated the rapid economic growth of Europe and North America". Modern Totalitarianism and Socialism are likened by him to the European absolutism and Mercantalism 300 to 400 years ago, and, he says, they have all their earmarks: "the replacement of social conscience by jingoistic nationalism, the glorification of the State, the contempt for the individual, the disregard for agriculture, the emphasis upon fiscal and monetary manipulations and a naive economic pragmatism which neglects economic forces." It is these ideas which under-developed countries like India have to fight and defeat, he cautions us.

Prof. Wiegand is particularly critical of the tendency in under-developed countries to overlook the importance of agriculture as a basis for industrial and economic growth. In his opinion, this is at least, in part, the result of a prejudice dating from the colonial rule. After their newly won independence, the free nations do not wish to continue as producers of raw materials in the belief that, thereby, they would be regarded as handmaidens of industrial nations. Dr. Raul Prebisch, one of Latin America's best-known economists who has popularised this concept, is therefore, reminded by Prof. Wiegand that he has completely forgotten that, until the end of the last century, the major portion of the United States exports consisted of two farm products, namely, cotton and wheat, which even today account for about one-fourth of the U.S. exports. Even during the decades of declining prices, the U.S. farm production expanded and this, he maintains, did not prevent, but actually made possible, the industrialisation of the U.S.

The American Professor also deprecates the glamour that under-developed countries generally associate with heavy industries. In fact, he goes so far as to call it "a dangerous illusion" on the part of the under-developed nations to think that all their economic problems can be solved if they can only build enough modern factories. Holding that industrialisation requires a peculiar type of skilled worker (quite different from the skilled artisan) and a market for finished industrial products, he argues that neither can be developed overnight, Europe itself having taken centuries to achieve the transition. Referring specifically to the craze of the planners for heavy industries, this is what he has to say:

> "The case against heavy industries, created by the Government and financed through heavy taxation or inflation, is particularly obvious in India, with its very large supply of cheap labour, and its acute shortage of investment capital. Economic logic calls, for the time being at least, for labour rather than capital-intensive industries. It requires at least $10,000 in capital investments to provide one job in an automated steel plant, compared with $100 to $200 in cottage industries. Some 100,000 steel plows at $20 each will do far more for India's economic development than a $2 million machine tool."

Another bubble that Prof. Wiegand is out to prick is the rather widely held misconception that the four ways in which investments can be financed—(i) through private savings. (ii) private foreign investments; (iii) Government funds obtained through taxation or through printing press, and (iv) foreign aid or inter-government loans — are complementary. They can be complementary, according to him, only under ideal conditions, but, in reality, "they are often mutually distinctive. Private domestic capital formation and private foreign investments go hand in hand. Traditionally, one depends upon the other. Public investments, on the other hand, whether financed through taxation or through inflation, are likely to hamper — contrary to post-Keynesian doctrine — both private capital formation and private foreign investments, unless great care is taken not to undermine private capital formation through heavy taxation and to discourage private investment through direct Government competition. Unfortunately, modern economic planners are rarely satisfied to use public funds to prepare the basis on which a private economy can develop. Instead of building roads, schools, irrigation systems, and enforce social economic order, modern economic planners build steel mills and power plants, in direct competition with private enterprise, and yet they wonder why private enterprise seeks greener pastures in other countries."

What Prof. Wiegand has to say about investment policies in under-developed countries generally seems to fit India's cap perfectly as the following quotation bears out:

> "Investment policies in under-developed countries suffer from a basic defect in economic reasoning. Instead of starting with the available resources and planning their most effective allocation, much of what passes as economic planning in under-developed countries is concerned with production goals usually far beyond the available supply of capital and skilled workers. While there is an old saying that some men succeed better than others because they attempt more, and the fraudulent check-passer may succeed better for a while than his more honest neighbour, in the long run, he is likely to get into trouble; and inflating the currency in order to achieve utopion production goals, like passing bad checks, is a form of fraud, as the two great scholastic writers, Buridan and Oresme, already warned more than 500 years ago. Nor does inflation pay in the long run. It hampers private capital formation, drives existing private capital abroad or into sterile treasure hoards, and scares away foreign investors."

Perhaps the greater service which Prof. Wiegand has rendered to under-developed countries is to point to the dangerous doctrine that "a nation need not worry about the effect of rising prices on the balance of payments as long as the national income continues to grow at a rapid rate." How much more dangerous the effect of rising prices on the balance of payments when the national income refuses to grow except at a snail's pace, as in the case of India, cannot be better summed up than by quoting the following extract from the "Economist", as the Prof. himself has done:

> "The growth through inflation formula is undermining the strength of the United States, and it makes impossible the economic development of India except on a Totalitarian basis and at a cost in human dignity and well-being far greater than even Mahatma Gandhi could have anticipated when he called the State a soulless machine which can never be weaned from violence."

It is for us now to ponder over and decide whether we should persist with this formula or to give it a prompt burial.

Business Notes

Banking

THE LIQUIDITY RATIO

THE REPORTED decision by the Reserve Bank to raise the liquidity ratio (percentage of investments in government and approved securities plus cash to total deposits) from 20 per cent to 29 per cent has agitated the bankers for some time past. They have represented to the Reserve Bank that the ratio should not be raised, by statute, beyond 25 per cent. The underlying idea behind the resistance is the fear that this measure, though ostensibly being introduced to increase the stability of the banks, will result in lowering their earnings at a time when costs are rising steadily due to the penal interest rates charged by the Reserve Bank on advances and also due to the additional burdens imposed by the latest Bank Award. Before coming to a definite conclusion on this controversial problem, it will be necessary to look at the facts. The table below shows the investments made by both the scheduled banks and the non-scheduled banks in 1960-61 in government securities as percentage of aggregate deposits:

	(Last Friday) 1960	1961
I. **Scheduled Banks**		
Banks each with total deposits of		
(i) Rs. 100 crores and above	40	33
(ii) Rs. 25 crores but less than Rs. 100 crores	26	28
(iii) Rs. 5 crores but less than Rs. 25 crores	37	33
(iv) Less than Rs. 5 crores	26	29
II. Non-Scheduled Banks	26	26
III. All Banks	35	31

It will be seen that for 1961, the lowest ratio turned out to be 26 in the case of the non-scheduled banks and 28 for the scheduled banks. If the cash balances are also included, it is certain that

even these banks in 1961 would have complied with the proposed restrictions. It might be asked, then, why the banks are making such a "fuss" over the whole problem. The fact is that these averages for certain groups of banks conceal the low liquidity ratios of certain banks. It is true that all the big banks, specially those with deposits of more than Rs. 100 crores, have nothing to fear from this new legislation. It is the banks in the lower deposit-brackets where increased pressure would be felt. The siphoning off of funds by investment in Government securities at 25 per cent and cash at 4 per cent will certainly reduce their earnings especially when substantially higher rates would be available by making advances to industry and trade. Will it not be better for the Reserve Bank to raise the liquidity ratio by stages? As agreed by the banks, it should be raised from 20 to 25 per cent at the first stage with the warning that within the next four or five years, it will be taken to 29 per cent so that the banks may adjust their investments accordingly. Any sharp jump from 20 to 29 per cent in the liquidity ratio will certainly create trouble in the case of some banks whose current ratio is below the desired level. It is suggested that Reserve Bank should agree to raise it to 25 per cent in the first instance, especially when there is no major threat to the banking system in the short period which may warrant such drastic revision in one stroke.

Foreign Trade

DECLINING EXPORTS

INDIA'S EXPORTS during the first five months of the current year have presented a gloomy picture. Mr. Manubhai Shah, the Union Minister for International Trade, has been planning in recent weeks to set targets of exports so as to take the total volume of exports to Rs. 720 crores—an improvement of about Rs. 60 crores over the preceding year. The figures for January to May 1962 show a fall of about Rs. 7 crores as compared to the corresponding period last year. In other words, instead of showing any increase in India's export earnings as a result of all the steps that have been taken including the self-imposed obligation of the textile mills to export ten per cent of their output, the performance has been far from encouraging. It has naturally created doubts whether the target of Rs. 720 crores for exports is a feasible one at all.

The Third Five-Year Plan had envisaged total export earnings of Rs. 3,700 crores on the basis of Rs. 740 crores per annum. In the first year of the Plan, the exports were well below the annual average. Similarly, the exports are likely to be below the average in the second year of the Plan as well. In order to achieve the stipulated target, the exports will have to be in the region of about Rs. 800 crores per annum in the last three years of the Third Plan. How will the Indian Union face this formidable challenge? With the prospects of the United Kingdom joining the Common Market soon and depressing India's export earnings from Europe, the outlook seems to be far from reassuring.

According to the press reports, some new steps are likely to be taken in order to offer facilities to exporters so as to boost up India's exports. According to authoritative sources in New Delhi, two legislative measures are likely to be undertaken by the Government of India for extending credit to exporters. It is likely that the Reserve Bank Act will be amended so as to enhance the period of its advances for export credits from 90 days to 6 months. Another measure will be to modify the terms of loan facilities offered by the Refinance Corporation. Since the funds for this Corporation are obtained mostly from the P.L. 480 proceeds, negotiations are being undertaken with the US authorities to finalise the new measures. As a result of these moves, the Indian exporters will be in a position to grant longer credits to importers abroad. These credit facilities may range from 6 months to 2 years. Some of India's competitors in the international market are known to have sold their goods on a 5 years' credit basis. This handicap will be removed to a certain extent after these changes have taken place. Heavy equipment in particular can be exported on the basis of credit for two years. The Reserve Bank, however, cannot extend its credit period to two years and, therefore, exports financed by the Refinance Corporation only can come under this category. Extended credit may mean smaller earnings in the short period but in the longer run it will assist the Indian Union in retaining its markets.

Wool

A SMALL-SCALE INDUSTRY FACES EXTINCTION!

WHILE THE Union Government is never tired of giving vent to its protestations that it wants the cottage and small-scale industries to flourish in the expanding economy of India, and is providing assistance in various forms for the achievement of this objective, it is indeed intriguing that an important and already well-established one such industry, namely, the handknitting wool processing industry is being throttled. The travails of this industry, on which are dependent for their livelihood nearly 4,500 families in four cities—Delhi, Amritsar, Ludhiana and Calcutta—emanate from the shortage of grey handknitting yarn which the industry alleges is being diverted by the spinning mills to feed their own dyeing units installed during the course of the last two years. While there can be little objection to the spinning mills themselves going in for dyeing operations, to allow this to be done to an extent that the very existence of the small-scale sector, which during the past two decades has been meeting the demands of the consumers quite efficiently and at reasonable prices, is something that can hardly be justified.

Although the requirements of the small handknitting wool processors were assessed last year by the respective State Directors of Industries (on the basis of their actual purchases in the three years 1957-58, 1958-59 and 1959-60) around 20 lakh lbs. per annum, no proper arrangements have yet been made by the authorities to ensure them regular supplies of their raw material at reasonable prices. Even the ad hoc quota of 2½ lakh lbs. fixed for them to meet their requirements for the three months to September 30, 1961, has not been fully delivered by the spinners; this quota was to be made available by October 15 last year. The industry further alleges that whatever supplies have been effected are also of sub-standard quality. Numerous communications from the Federation of the Handknitting Wool Processers, which was formed last year on the advice of the industrial Adviser to the Textile Commissioner, both to the Government and the spinners are said to have failed in getting redress for the industry, with the result that it has been virtually starved of its raw material.

What is more shocking, however, is the allegation made by the Delhi processors, who form the biggest contingent in the Federation, that the discussions their representatives had at the meeting of the Distribution Committee for Worsted Woollen Yarn, formed out of the Development Council of Woollen Textiles, held in Bombay in May last, had been given a wild twist so much so that the protests and objections raised by them do not even find mention in the Minutes of this meeting, while some of the points mentioned in the Minutes were not even raised or discussed. This is something very unusual. The Ministry of Commerce and Industry should obviously look into the matter and set the things right so that this small-scale industry is allowed to continue to play its useful role in the economy of the country.

Public Loans

PATTERN OF RESPONSE

NOW THAT the details of the total subscriptions to the latest issue of the Government of India Loans are available, a correct assessment of the response may be attempted. According to the Press Communique issued by the Reserve Bank of India, the following are the figures of subscription for the three Loans:

3¾ per cent National Plan Bonds — Fifth Series (3¾ per cent 1968)	:	Rs. 92.25 crores
4 per cent Loan 1972	:	Rs. 80.59 crores
4½ per cent Loan 1985	:	Rs. 84.03 crores
TOTAL	:	Rs. 256.87 crores

Out of the total subscriptions aggregating Rs. 256.87 crores, conversions amounted to Rs. 153.67 crores. It may be noted that the total of the two outstanding maturing Loans offered for conversion amounts to Rs. 183.14 crores. In other words, holders of the maturing Loans who did not choose to convert accounted for Rs. 29.47 crores, which means that the net borrowing during the second year of the Third Five-Year Plan (assuming that the Government of India will not enter the market again this year, will amount to Rs. 73.73 crores. This is by no means the highest amount of net borrowing in recent years, since the net borrowings in 1956-57, 1958-59, and 1959-60 were higher at Rs. 77.21 crores, Rs. 180.86 crores and Rs. 106.71 crores, respectively. In view of this, there is a school of opinion which feels that the Reserve Bank should have kept the subscription lists open for the full three-day term as had been announced. Had this been done, it is argued by this school, the Government could have got at least Rs. 275.00 crores, i.e. 10 per cent over and above the Loan amount announced without any extra effort. It would have meant a total net borrowing of Rs. 91.86 crores. Apparently, the authorities were anxious to close the lists very soon after the target of Rs. 250 crores was reached to take credit for the Loan being fully subscribed even on the second day itself, long before the official closing hours of the day. This is perhaps understandable in the light of the response to the Central Loans (issued in two stages) last year. Even so, there seems to be force in the contention that the subscription lists should have been kept open until the close of the third day. Incidentally, this would have provided some more time for the up-country investors about whom the authorities are known to have expressed quite some concern in the past.

But the authorities today evidently feel that they have not to bother themselves to the same extent as they had to do in the past, thanks to the easy money conditions and the large deposits which have been accumulating with the commercial banks, not to speak of the L.I.C. and the Provident Funds which can always be relied upon to lend a big helping hand to any government Loan. If even with the response of the commercial banks, the L.I.C. and the Provident Funds, there should still be any gap left, the Reserve Bank is, of course, there to fill it. There is no information as yet on the extent of subscriptions from these sources individually. Nevertheless, the impression in market circles is that the L.I.C., the commercial banks, and the Provident Funds must have subscribed to the tune of Rs. 80 crores, Rs. 60 crores and Rs. 65 crores, respectively, the balance of Rs. 51.87 crores coming from the Reserve Bank and other sources, including individuals. We may expect that this would be the broad pattern of public subscriptions to Government Loans in the coming years.

HMT

COMMENDABLE RECORD

THE UNCHARITABLE amongst the critics of the public sector in India may be prone to pay a left-handed compliment to Mr. M. K. Mathulla, the Chairman and the Managing Director of Hindustan Machine Tools, and his colleagues on the success attained by them, but for an engineering enterprise to be able to show a net profit of 24 per cent on its share capital within a period of six years, and that too after progressively reducing and maintaining its sale prices at 10 to 20 per cent below the landed cost of foreign machines of equivalent quality, is by no means a small achievement. The Hindustan Machine Tools' management, which was honoured last year with the Presidential Award for the best-managed public sector undertaking and the Presidential Certificate of Merit for outstanding performance during 1960-61, can legitimately be proud of the working of this venture.

The company's balance sheet for the year 1961-62 reveals that it has made further commendable progress. Total sales this year were substantially higher at Rs. 4.76 crores, against Rs. 3.36 crores in the previous year. The gross profit amounted to Rs. 201 lakhs, as against Rs. 127.51 lakhs. After providing for increased depreciation at Rs. 65.01 lakhs, against Rs. 45.72 lakhs, and Rs. 8.49 lakhs, against Rs. 7.34 lakhs, for paying interest to the Government of India on the loans advanced by it, the net profit comes to Rs. 127.53 lakhs, compared to Rs. 74.07 lakhs in the previous year.

The dividend has been quite judiciously maintained at 10 per cent, for the company is still in the throes of its expansion programme. The Development Rebate Reserve has got an allocation of Rs. 22.56 lakhs, as against Rs. 1.95 lakhs in the previous year. The General Reserve has been provided for for the first time—a sum of Rs. 40 lakhs has been allocated for this purpose. The income-tax liability of the company during the 1961-62 was nil, because the losses incurred in the earlier years were yet to be fully set off against the current profits. A sum of Rs. 3.10 lakhs has been carried forward as against Rs. 1.39 lakhs brought in.

The number of machines produced by the company increased from 702 in 1959-60 and 1,002 in 1960-61 to 1,251 in 1961-62. Despatches correspondingly went up from 644 machines in 1959-60 and 1,007 machines in 1960-61 to 1,240 machines in 1961-62. Production in 1961-62, though substantially higher than in the preceding years, was, however, still running short of the orders booked which were for 1,380 machines during the course of the year. The indigenous content in the machines produced by HMT now ranges well over 90 per cent, except in the case of grinders where it is 43 per cent. Although no further progress was made in this regard during the course of the last year, it is hoped the company would be able to improve upon its working in this respect during the current year.

Another very encouraging fact about the working of the company during 1961-62 has been that it has entered the world market by export of machine tools to West Germany and Switzerland. In view of the current foreign exchange crisis in the country, it is appro-

priate that HMT has planned to undertake an extensive export promotion programme.

The expansion programme of the company is also making good progress. The company was able to commission into production its second factory, built at Bangalore, in July last year—nearly 10 months ahead of schedule. This factory was built entirely by Indian engineers and out of company's own funds. The full benefit of this second unit will probably be accruing during the current year. The HMT's two existing units have now a capacity to produce 2,000 machines per annum.

The work on the third unit to be set up at Pinjore, in Punjab, at an estimated cost of Rs. 10 crores, is stated to be progressing satisfactorily. Approximately 850 acres of land are being acquired for this project and the ground levelling operations have begun on the land already taken possession of. Orders for the purchase of machinery and equipment from abroad have also been placed. A master plan for the main factory as well as the township has been prepared and construction is expected to commence shortly.

The first phase of the construction of the company's watch factory, which was delayed by seven months as a result of an unforeseen defect in the title of the land originally selected for it, is expected to be completed by September. Manufacturing operations are expected to commence in October. Most of the equipment has already arrived at the site for installation.

New Issue

MOHATTA AND HECKEL LTD.

MOHATTA AND HECKEL LTD., a new company recently registered in Maharashtra with the object of undertaking the manufacture of wires and wire ropes, is expected to enter the capital market sometime in October to raise Rs. 25 lakhs by way of public subscriptions.

The authorised capital of the company is Rs. 1 crore. Capital worth Rs. 55 lakhs — Rs. 10 lakhs in preference shares of Rs. 100 each and Rs. 45 lakhs in equity shares of Rs. 10 each — is to be issued in the first instance. Of this, the promoters and their friends will be taking up capital worth Rs. 20 lakhs. Another Rs. 10 lakhs worth capital is proposed to be subscribed by the foreign collaborators, Messrs. George Heckel Limited, Saarebruckel, West Germany. The public issue will represent the remainder.

The factory of the company (capacity 3,600 tons of wires and wire ropes per annum) is proposed to be located somewhere between Thana and Kalyan, near Bombay. Plans are to commission it into production by the end of the next year.

The total capital outlay on the project is estimated at Rs. 1• crore. Negotiations are being carried on by the company with the Industrial Credit and Investment Corporation of India and some other financial institutions for securing some loans to meet the expenditure over and above the funds made available by the share capital.

The Board of Directors of the company comprises Mr. G. D. Kothari, Mr. R. L. Kirloskar, Mr. B. D. Somani, Mr. Kantilal Desai, Mr. Brij Rattan Mohatta, Dr. A. V. Baliga and Mr. Suraj Rattan Mohatta. Messrs. Mohatta Sales Limited will be the Managing Agents.

Plastics

ENGEL INDIA MACHINES AND TOOLS

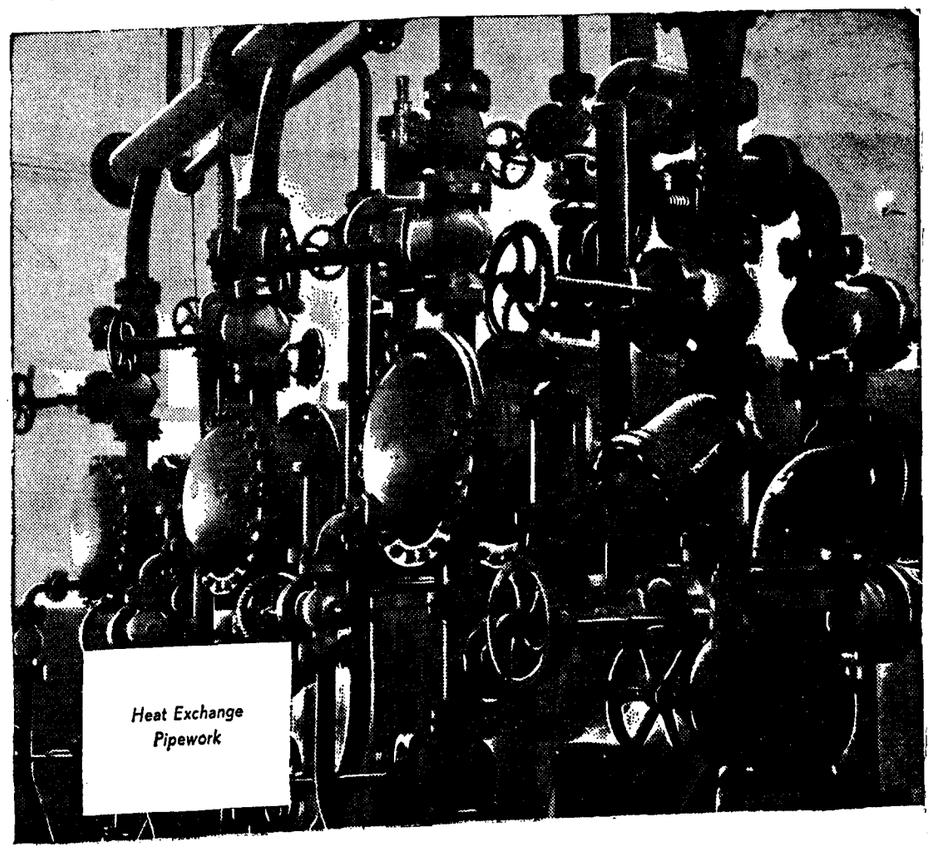
A NEW company called Engel India Machines and Tools Ltd., has been incorporated in Calcutta for the plastics industry, in collaboration with the world-renowned Maschinenfabrik Ludwig Engel Kg. of Austria. The foreign collaborators will not only supply the necessary plant and machinery for setting up the company's factory near Calcutta and train Indian technicians in their factory in Austria, but will also participate in this Indian venture's equity capital. They will also be providing Austrian technicians to set up this factory and run it in the initial stages.

The company will have an authorised capital of Rs. 1 crore, of which half is proposed to be issued in the first instance. 50 per cent of issued capital will be subscribed by the Directors of the company, their friends and the Austrian collaborators. The balance 50 per cent issued capital—Rs. 25 lakhs—all in ordinary shares, is envisaged to be offered to the public in the near future as soon as the formal sanction of the Controller of Capital Issues is obtained.

The entire standard capacity machines and equipment requirments of the Indian plastics industry are at present being met through imports. In spite of the serious foreign exchange shortage, India had to import in 1961 machines and tools for this industry to the tune of Rs. 30 lakhs, mainly from Europe. The setting up of the Engel India factory will help in saving all this foreign exchange expenditure. Besides, it will ensure a regular supply of machines and tools of the latest design for the Indian plastic industry so as to enable it to produce articles at a competitive price.

The Board of Directors of Engel India include Mr. Ranadeb Chaudhuri, Mr. Sasadhar Raha (the two promoters of the company), Mr. Ludwig Engel, Mr. S. C. Sen and Mr. S. C. Raha.

Textiles



COTTON YARN OUTPUT UP: TRADE IN PIECEGOODS DOWN

WHILE THE cotton yarn production in countries outside the Soviet Bloc was approximately 3 per cent higher in the first quarter of 1962 than in the corresponding period of 1961, the world trade in cotton piecegoods continued to suffer a setback started in 1961. Shipments of cotton piecegoods from the main non-Soviet Bloc exporting countries were roughly 4 per cent less than in the corresponding period of 1961, according to the quarterly statistical review of the UK Cotton Board.

The principal change in the pattern of output, the Board says, has occurred owing to a severe curtailment of production in Japan where output is running below last year's level. The Board observes that fluctuations in cotton yarn production in the non-Soviet Bloc countries as a whole are much smaller than the fluctuations in some individual countries. While production in India, the US and Canada continued to register substantial increases, the production in the UK and Western Europe as a whole was well down in comparison with a year earlier, the main exceptions being Italy and Spain.

Against this, exports from the UK, Japan, India, Germany, the Netherlands and Spain were all substantially lower then a year earlier. It is possible that exports from some of the other European countries and the US may have been marginally greater than in the first quarter of the last year, but the only major exception to the general rule is Hong Kong, where massive shipments in the US helped to boost exports of cotton piecegoods to record levels.

India's textile exports have dropped by over 120 million yards as a result of uncompetitive prices of Indian cotton piecegoods occasioned by the rise in the cost of production owing to the acute raw cotton shortage. According to an analysis of the pattern of exports in 1960, prepared by the Cotton Textile Export Promotion Council (India) there has been a notable shift in consumer preference in overseas markets towards finished goods in which India has yet to become competitive.

S&L

make it

This is an S & L pipework installation—a part and parcel of the rapidly growing Indian Industry.

S & L undertake fabrication and installation of the pipework, as well as the design work entailed in the engineering of piping systems. Our years of experience gained on projects so far completed in India, plus the extra attention that has made S & L so well-known for quality and dependability, assures you of complete satisfaction.

Whatever your project—a Steel plant, Power Station, Paper Mill, Chemical plant, a single item or a complete installation—call for S & L.

The Third Five Year Plan
Bird-Heilgers' part in it...

FOURTEEN MILLION NEW JOBS

Employment. A word that translates into a meaningful future for millions of people without jobs. India's Five Year Plans are aimed at the concept of full employment. The intensified drives of the Third Plan are estimated to create 14,000,000 new job opportunities—more jobs for more people than ever before in the economy's history! To achieve the employment target calls for a single-minded national effort. It must be co-ordinated, dedicated, complete...

75,000 jobs—and more in the offing

Bird-Heilgers is convinced that the quickening tempo of industrial activity must be accelerated if unemployment is to be checked and full employment brought about. Wedded to this concept, the group provides well-paid employment for approximately 75,000 people. They are concerned with iron ore and insurance policies, bridges and writing paper, gunny sacks and laboratory tests—a complex of goods and services which involves the group heavily in the industrial insurgence of India.

Towards a self-generating economy...

A phrase on everyone's lip. A phrase that finds concrete expression in the urgent activity of an economy on the move. Bird-Heilgers reflects the nation's striving. The group delivers millions of tons of basic materials to the new blast furnaces. It produces jute goods, paper and board, air compressors and springs, and engineering and water treatment equipment. A project for the manufacture of coal washeries was the first in India. Planned diversification finds the group engaged in shipping, insurance, exporting and importing. Its agency department handles everything from heavy capital equipment to light consumer goods.

...and an exciting, promising future

The Five Year Plans are a challenge: existing industries must expand, new industries open up, per capita income increase. India needs more goods and services than ever before. Bird-Heilgers is alive to the problems of a growing economy. The group deploys the full potential of a century's resources, technical knowledge and executive skill to increase and broaden its activities...provide employment for many more thousands...join the national drive to economic independence.

FROM THE CAPITAL'S CORRIDORS

CENTRE - STATES CONFLICTS

CONFLICTS between the Centre and some States have been impeding economic progress in several crucial sectors. But they continue to be handled lackadaisically. There seems to be no sense of urgency about removing these obstacles to the progress of the Plan in spite of the fact that other challenges to economic growth are also mounting.

Take, for example, the Assam oil royalty dispute which has already lasted more than a year. During this period, Oil India Limited (OIL)—in which the Central Government is an equal partner with Burmah Oil Company—has been prevented from finding more oil in the State because the Union Mines and Fuel Ministry and the Assam Government cannot agree on quantum of royalty payable to the State.

After a great deal of talk about referring the issue to the Supreme Court for its advisory opinion, it has now been decided to ask the Union Finance Minister, Mr. Morarji Desai, to arbitrate on it. Mr. Desai is reported to have accepted the ticklish assignment. But while it is presumed that both the sides will abide by the Desai Award, there is no guarantee that they would, in fact, do so.

In one respect, at least, the decision to refer the dispute to Mr. Desai for arbitration is a welcome development. The Supreme Court would have taken at least a year to complete its hearings and pronounce the judgment which would necessarily have been confined to the Constitutional issue: whether the Centre could alter the rate of royalty without the concurrence of the State Government. Mr. Desai will attack the heart of the question: what should be the fair quantum of royalty to be paid to the Assam Government? And he is expected to give his award within eight or ten weeks of his return from overseas later this month.

Meanwhile, what baffles disinterested observers is a simple question: Why cannot the State Government allow Oil India to start its exploration and prospecting programme in the new concession area and apply the rate of royalty finally accepted with retrospective effect?

WEST BENGAL COAL DISPUTE

With slight variations, the story is more or less the same in relation to West Bengal's dispute with the Centre over coal. The coalmines under dispute are among the best in the country. But nobody seems to be worried by the fact that they have not been worked for so long because of the long-distance argument between New Delhi and Calcutta which ultimately resulted in a suit being filed in the Supreme Court by the West Bengal Government.

After he became the Minister in charge of Coal, Mr. K. D. Malaviya discussed the matter with Dr. B. C. Roy and the two arrived at a working arrangement. That was more than two months ago.

During this period, the agreement could not be announced and enforced because the Planning Commission took serious objection to one of the provisions of the draft agreement. This clause gave the West Bengal Government the right not only to work the coalmines in the State, but also to earmark their output for the public sector projects in the State. The Planning Commission thought that it would be dangerous to concede the principle of a State Government having the exclusive right of using the coal produced within its jurisdiction. In practice, the Commission said, the coal produced in West Bengal would mostly be used locally. But in theory the distribution of coal would have to be planned by the Centre in the best interests of the national economy as a whole. The Commission, therefore, insisted that the Centre must retain the right to supervise the distribution of coal even if it was mined by a State Government.

The Cabinet, which considered the problem a day after Dr. B. C. Roy's death, reached a decision which accommodated the Commission's point of view without basically upsetting the agreement reached by Mr. Malaviya and the late Dr. Roy. Why has the agreement not been announced so far, so that early steps can be taken to work the disputed coalmines, nobody in New Delhi seems to know.

The Planning Commission has lately been trying, however, to set some norms about the States' participation in Central projects for industrial and mineral development. One decision the Commission has taken is that in oil refineries to be set up in any State to process the crude found there, the State's share should not exceed 15 per cent.

The background to this decision is that originally Mr. K. D. Malaviya wanted all the public sector refineries to be under the ownership of the Centre, the State Governments being given a share in them to the extent of the value of the land to be supplied by them for setting up the refineries and the townships. It was on that basis that the Gauhati and Barauni refineries were planned. But when the royalty dispute with Assam began to simmer, he offered the State Government 12½ per cent partnership in the Gauhati refinery. The State Government was not satisfied and the offer was raised to 15 per cent. Meanwhile, the third public sector refinery at Kyoli in Gujarat was planned. The Oil Ministry, therefore, offered the Gujarat State Government also 15 per cent partnership in the Kyoli refinery. The State Chief Minister, Dr. Jivraj Mehta, is however, reported to have spurned the offer as inadequate. In fact, he is believed to have threatened to take the matter to the Supreme Court.

ROYALTY ON MINERAL RESOURCES OTHER THAN OIL

While the Planning Commission has taken a fairly firm decision on the participation by the States in oil ventures of the Centre, its findings about other Centrally-sponsored mineral and industrial projects are far from precise. In brief, the Commission's attitude is that the extent of the States' participation in these projects will vary from case to case, and be fixed by the relevant States and Central Ministries by agreement.

Another way of saying the same thing is that a State can get away with a share in a Central project directly proportionate to the pressure it can bear on the Centre.

Mr. Bijoyananda Patnaik's success in pushing through the first phase of his ambitious plan to develop Orissa's mineral wealth under the auspices of the State Government is an instance in point. Not only has the State Government been allowed to start the mining of iron ore on its own, but it has also been allowed to go ahead, with the Centre's help, with the development of Paradip Port. Now, Mr. Patnaik is to accompany the Union Minister for International Trade, Mr. Manubhai Shah, to Japan to negotiate arrangements for a long-term supply of Orissa's iron ore to Japan in return for foreign exchange as well as Japanese help in developing the requisite transport facilities in the region.

COAL PROBLEM: MORARJI DESAI'S APPRAISAL

Before leaving for Europe, the Union Finance Minister, Mr. Morarji Desai, took an unusual step. He wrote a letter to Mr. K. D. Malaviya, the Union Minister for Mines and Fuel, giving his frank appraisal of the coal policy and production, and urging that the Government should not hesitate even to revise coal policies and procedures in order to ensure that the Third Plan target of 97 million tons is actually achieved.

In this letter, Mr. Desai is believed to have made no secret of his apprehension that a substantial short-

fall will take place in both the public sector and the private sector unless new methods are adopted speedily to execute the coal projects.

Apart from drawing attention to the chronic shortage of power, explosives and funds, the Union Finance Minister has put his finger on a particularly sore point in the coal policy. He is reported to have said that the decision to restrict the private sector operations to existing mines and those immediately contiguous to them is hampering production.

A dismal fact to which the Finance Minister has drawn pointed attention is that even today, more than a year after the Third Plan came into force, the country has not reached the level of coal production fixed for the end of the Second Plan.

On the basis of the expected transport capacity, coal production next year will exceed only slightly the Second Plan target of 60 million tons. This means that the entire increase of 37 million tons in the production of coal during the Third Plan will have to take place in less than three years.

This task is formidable enough. According to Mr. Desai's analysis, it has been made even more difficult by the fact that there is already a built-in shortfall in the programmes of both the NCDC and the private sector. Even the Singareni coalfields are unlikely to achieve their target.

Whether the Finance Minister's plain speaking will have any effect or not, it remains to be seen. But the obstacles to a change in the coal policy are as formidable as the coal problem itself.

An important straw in the wind is the fate which is being meted out to Mr. T. T. Krishnamachari's first note to the Prime Minister on the problem of coal transport and power. Details of this note are not yet available, but it is known that the Minister without Portfolio has been critical of the railways.

The Planning Commission has considered the note twice. The Special Committee of the Cabinet has discussed it at length. But we are back again where we were. No decision has been taken on Mr. Krishnamachari's proposals. Instead, they have been referred to the officials of the Railway Board and the Coal Ministry who are to go over the much-trodden ground all over again.

FICCI ESTIMATE OF COAL OUTPUT IN 1965 - 66

Meanwhile, the Federation of Indian Chambers of Commerce and Industry has come to the conclusion that coal output during the Third Plan period will considerably fall short of the 97 million tons target. According to an official spokesman of the Federation, the Planning Commission should thank itself if the output reached a figure of 75 million tons in 1965-66.

The spokesman said that it took India nearly thirty years to raise coal output from 25 million tons to 55 million tons. Even if note is taken of the fact that intensive efforts to raise coal production had been made only during the last decade, the annual rate of growth in the industry did not work out to more than 3 million tons. With extra efforts during the next three years, the spokesman added, an average annual increase of about 4 million tons was the upmost that could be expected.

NUCLEAR POWER

It is now reasonably certain that the expectations of commissioning India's first atomic power plant at Tarapur by April 1966 would not materialise. There has been so much delay in securing the necessary financial and technical collaboration—which the USA has now promised to provide—that to expect atomic power from this station for meeting the industrial requirements of Maharashtra and Gujarat States is just unwarranted. It is, however, hoped that this nuclear power plant would start feeding some industries in the western region towards the close of the Fourth Plan period.

In pursuance of the decision, taken last week by the Planning Commission, to set up the second atomic power station at Partapgarh, in Rajasthan, the Atomic Energy Commission has been authorised to start the preliminary work on this project straightaway so that it can start coming up early during the Fourth Plan period.

OIL REFINERY IN SOUTH INDIA

Preliminary studies, it is understood, have been initiated by the Union Ministry of Mines and Fuel for setting up an oil refinery in South India. Four port towns, namely Madras, Cochin, Tuticorin and Mangalore, are being considered as possible sites for this refinery. A study team is stated to have already visited these sites and submitted a report to the Indian Refineries Ltd. The factors that will weigh in the selection of the final site are availability of land, electricity, water and transport facilities. Another important factor that has to be taken account of before any final decision is taken for setting up this refinery is the pattern of demand for petroleum products in South India. This question is being examined by the Union Ministry for Fuel.

The Government is believed to have received several offers for setting up this refinery on a participatory basis. Among these are included the offers of the American oil companies, Philips Petroleum and Standard Oil of Indiana and that of the State-owned Italian firm ENI. Since the Government's policy is to have all future oil refining business in the public sector, the offers of the foreign companies can only be considered on the basis of minority share-holding on their part.

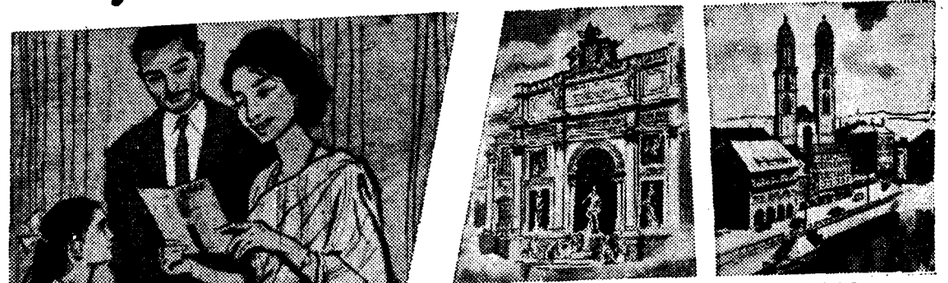
The decision whether this refinery should be based on indigenous crude or the imported one depends on how far the proposed oil prospecting operations in the Cauveri basin prove successful. Taking into consideration the fast expanding demand for petroleum products in India, basing of this refinery on imported crude cannot be ruled out.

According to the present thinking of the Ministry, this refinery is to be set up by the end of the Third Plan or the beginning of the Fourth Plan.

TAXATION IN STATES FOR RAISING RESOURCES FOR THIRD PLAN

Although the Planning Commission has not yet completed its discussions with the State Governments about raising of resources for the 1962-63 State Plans, it is clear that the Commission's efforts to persuade the States to step up their tax effort with a view to making available adequate resources for the implementation of the Third Five-Year Plan, have borne fruit. In 1961-62, the first year of the Third Plan, the State Governments cumulatively levied fresh taxes totalling Rs. 17.5 crores only. 1961-62 being an election year, the States' performance in mobilising community's resources in the form of additional taxation for the uphill task of building the economy of the country, was understandable. But the Planning Commission had apparently viewed this with dismay, because the minimum additional tax revenue which the State Governments are required to bring in during the whole of Third Plan period is to be of the order of Rs. 610 crores. On this reckoning, the additional taxation target in the States' sector during 1962-63 had been fixed at Rs. 73 crores. The additional taxes which the States have levied this year are expected to yield a total of Rs. 65 crores during a full year and about Rs. 50 crores during the remaining nine months of current financial year.

This year's performance, though still somewhat short of the target, is considered satisfactory and has prompted the belief that States would be in a position



This is why so many people

to fulfil the obligations enjoined on them by the size of the Plan.

The Planning Commission, it is learnt, has also off and on reminded the State Governments that non-Plan expenditure must be avoided. Some time ago, the U.P. Government launched a scheme for providing pension to old people. A noble thought, but it implied eating into the resources meant for the execution of the Plan. Similarly, the Punjab Government's intention to raise the salaries of police constables to a minimum of Rs. 100 per month and the effects this move would have not only on the other services in this State, but also on the police personnel in the other States of the Indian Union, cannot be viewed with equanimity. The massive taxation resorted to by the Punjab Government recently with a view to build houses for Harijans is another instance of how the requirements of the Third Plan are sometimes sacrificed for achieving "other" objectives. The Union Finance Ministry and the Planning Commission, if they have been urging the State Governments to desist from upsetting the apple cart of the Plan resources, have obviously been doing what is apparently called for in the situation. A programme of social uplift can only be accorded its legitimate place in the planned development of the country. Trying to foster it beyond a point where it will start affecting development in the other key sectors apparently amounts to throwing all propriety and pricrities laid down in the Plan to winds.

PANNA DIAMOND MINES

The diamond mines in the Ramkherya and Majhgawan areas in the Panna district of Madhya Pradesh are expected to go into production during 1963, it is learnt here.

The project reports for the exploitation of the diamond deposits in these two areas have been prepared by the National Mineral Development Corporation which has been entrusted by the Government of India the task of executing these mining projects.

The investment in the Ramkherya mines is envisaged to be of the order of Rs. 46.2 lakhs. The target of production for this area has been put at 12,500 carats of diamonds per year.

The investment envisaged to be effected for the development of the Majhgawan mines is Rs. 90 lakhs. The production target for these mines has been put at 30,000 carats per annum.

Although no commercial exploitation of the Ramkherya and Majhgawan mines has been undertaken so far, diamonds have already been recovered here in the course of prospecting. During 1960-62, 540 gems weighing 330.3 carats were recovered in this area in addition to 284 industrial diamonds having a total weight of 152.7 carats. The industrial diamonds are utilised in the manufacture of diamond tools.

IRON AND STEEL BOARD: PROPOSAL SHELVED

The Union Government has dropped the idea of setting up an Iron and Steel Board in India on the lines of the Steel Board in the United Kingdom. The proposal, it may be recalled, emanated some time ago at a meeting of the Central Advisory Committee on Steel. Sardar Swaran Singh, the then Minister for Steel, promised to examine it. Consequently, the Secretary to the Ministry of Steel, Mr. N. N. Wanchoo, was asked to study the working of British Steel Board during his recent visit to the Continent. The proposal, it appears, has been dropped as a sequel to Mr. Wanchoo's this study.

Mr. Wanchoo, it is learnt, had found that most of the functions of the UK Steel Board were being discharged in India by the Steel Ministry or the Iron and Steel Controller. He is, therefore, said to have expressed the opinion that there was no reason to change the present set-up and to add to the official agencies that already exist.

The UK itself, it is understood, is thinking of revising the structure of its Steel Board, especially in view of the likelihood of its joining the Common Market and the European Coal and Steel Community. This is stated to have provided another reason for shelving the proposal of setting up an Iron and Steel Board in this country.

STORAGE CAPACITY FOR BUFFER FOOD STOCKS CROSSES 3 MILLION TON MARK

The Union Food Department claims that it has now adequate storage facilities to keep more than three million tons of buffer stocks of foodgrains. "Storage is no longer a problem. The position at present is extremely satisfactory and it will go on improving further as each month passes", it was officially stated here this week. It was pointed out that proper storage facilities were an indispensable factor for the success of Government's plan to meet emergencies, to ensure the supply of good quality foodgrains to the people and to stabilize food prices.

Construction of Government godowns for storing foodgrains made striking progress in the first year of the Third Plan and, in all, godowns with a capacity of about 5 lakh tons were added to the network at a cost of about Rs. 5 crores This capacity is over 1 lakh tons more than that built during the entire period of the Second Plan. At present, the total capacity of Government-owned godowns is 1.25 million tons and new godowns are coming up (nearly 60,000 tons capacity) each month. The construction target for 1962-63 is 7 lakh tons and this will be the peak year. The target for 1963-64 is only 5.4 lakh tons.

At the end of the First Plan, Government-owned storage capacity was only 228,000 tons. This rose to 686,000 tons at the end of the Second Plan and to about 1,250,000 tons by the middle of this year.

In view of the decision to maintain a buffer stock of 5 million tons of foodgrains, it is proposed under the Third Plan to increase storage capacity in the country to the same level, including 30 to 35 lakh tons of Government-owned accommodation—10 lakh tons of bulk storage godowns (both silos and flat storage) and the rest as bagged storage godowns. The Third Plan has provided Rs. 25 crores for this construction programme and there is an assurance that more funds will be forthcoming later, if necessary.

Most of the existing godowns are for bagged storage, but the bulk storage programme will gather momentum this year. Global tenders have already been invited for four big flat storage godowns at Borivilli and Manmad in Maharashtra, Kanpur in Uttar Pradesh and Kalyani in West Bengal. These four new bulk godowns will together have a capacity of about four lakh tons.

Progress in the construction programme has been speedy of late because many improved godown designs have been worked out and standardised. Shortage of steel is no longer a major bottleneck as tubular trusses are being extensively used. At some places, timber also has been utilised. The organisation at the Centre in charge of the construction programme has also been streamlined with the creation of a special Food Wing of the Central Public Works Department. Certain difficulties like shortage of cement and bricks and sheets, however, still persist and in some places, land acquisition proceedings are time-consuming. Difficulties are also being experienced in the matter of railway sidings.

At all Government godowns, modern scientific methods of storage are being applied to preserve the grains in good condition over long periods. Rodents cannot enter these godowns. There are also arrangements for proper fumigation of food stocks in gas-tight chambers. New operational devices are also being introduced such as weighbridges for railway wagons and lorry-loads of foodgrains, which will go a long way in speeding up arrival and despatch of supplies. As more and more

Government godowns are built, private godowns, which are now being hired for storing food stocks, are being released for the storage needs of private traders.

LABOUR LEGISLATION

A number of labour laws are due for amendment, and it is possible that the Union Law Ministry will sponser legislation for this purpose in the monsoon session of Parliament beginning on August 6. Compensation payable to workers in the case of death or permanent disability is sought to be increased through amendment of the Workmen's Compensation Act. The Payment of Wages Act will be amended in order to extend it to new industrial establishments such as air services, tramways and motor transport etc. A new law may be enacted to ensure safety standards in the Construction Industry where recent years have witnessed an increase in accidents.

NO MORE FEAR OF FOG AT AIRPORTS

A West German scientist, Prof. Ulrich Schmieschek is stated to have developed an equipment by which even the densest fog can be dispelled in a few minutes within a radius of 150 meters. The equipment should obviously go a long way in reducing the hazards in air travel.

Giving the details of this new equipment, German News, of July 14, states: "In an open area in Cologne, this fog disposal device has already proved its merits. From afar, the equipment has the appearance of a large fan or radar screen of seven-metre diameter. The essential part of the device is a two-blade propeller sucking the air into a rotating wire mesh in which the fog is condensed into tiny water droplets. Behind the screen there develops a kind of funnel of entirely fog-free air expanding at a speed of ten meters per second.

"Equipping one of the major airports completely with fog-disposal units will cost roughly one million Marks. The cost per landing will to no more than 40 to 50 Marks. Therefore, the method developed by Professor Schmieschek is much more economical than the previously known system of 'FIDO' which was developed during the Second World War, and is based on the burning of oil whereby the fog is ousted by the heat that rises up.

"Numerous enquiries from Germany and abroad are being received in the Aviation Institute at Cologne. The equipment developed by Professor Schmieschek is now being put to test on an industrial scale."

IMPORTS FROM RUPEE COUNTRIES

An Import Trade Control Public Notice says that it has been decided that applications from Actual Users borne on the books of the Development Wing, Government Departments and Public Sector Corporations for licences for import of goods from rupee countries, in pursuance of the Trade Agreements made with them, may, at their option, be submitted direct to the Chief Controller of Imports and Exports, New Delhi. These applications will be examined for issue of licences from rupee area countries on merits and taking into account the availability of the particular goods applied for under the rupee payments agreements.

The applications, complete in all respects, should be accompanied by the necessary essentiality certificates from the sponsoring authorities. Applications from firms borne on the books of the Development Wing have to be submitted through the Development Wing, while applications from Public Sector Corporations and Government Departments should indicate that the approval of the Ministry of Finance for sanction for the release of foreign exchange has been obtained.

IN BRIEF...

The Indian Standards Institution has decided to hold the Seventh Indian Standards Convention at Calcutta on January 28, 1963. About 600 delegates drawn from different scientific and technical institutions, and State Government Departments and industrial and commercial organisations are expected to participate in the deliberations of this Convention. A few delegates from the neighbouring countries are also expected to attend it. The subjects to be discussed include Food Purity and Food Quality Standards, Aluminium in Electrical Technology, Standardisation in Automobile Industry, Informative Labelling, Standardisation in Multi-Purpose Projects, Export Promotion and Standardisation, Consumer Organisations and Standardisation and Promotion of Company Standardisation in India.

•

A Rs. 5 crores fisheries corporation is likely to be set up soon. Japan and Norway are expected to lend help in this venture.

•

The 29th annual general meeting of the Indian Sugar Mills' Association will be held in Delhi on August 8. Besides reviewing the various important developments during the past year, the meeting will discuss various resolutions having a vital bearing on the future of this industry. Mr. S. K. Patil, the Union Food and Agriculture Minister, will inaugurate the meeting.

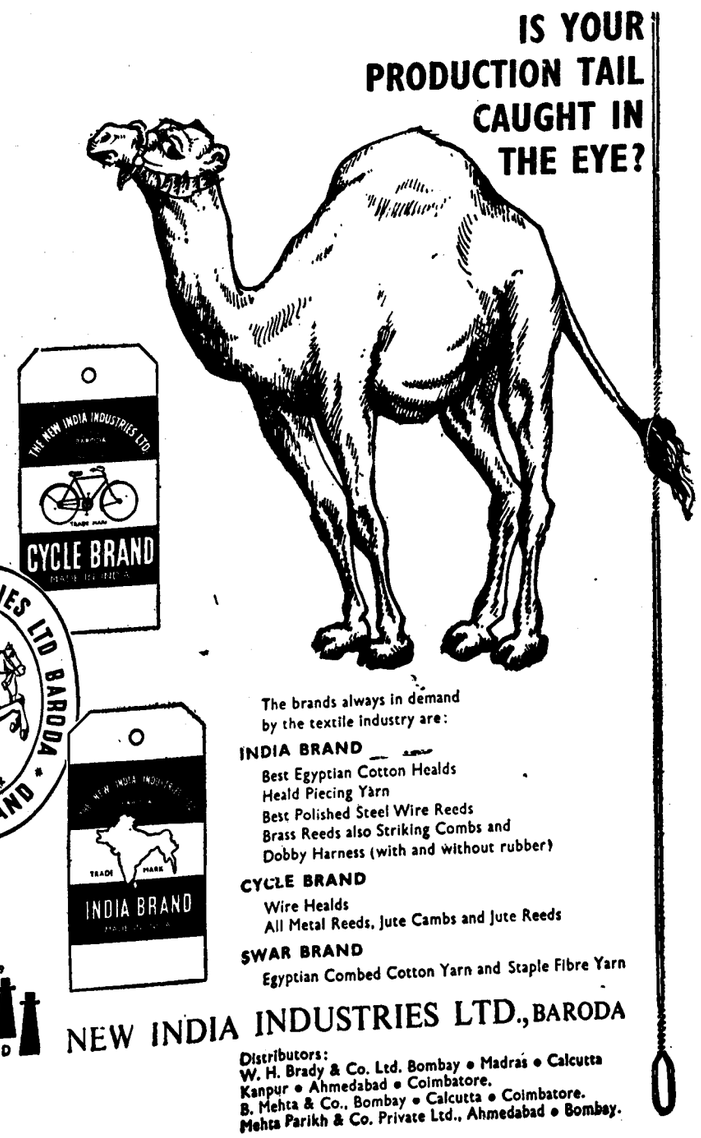
•

A trade delegation, under the leadership of Mr. M M. Vadi, Industrial Adviser (Engineering) to the Ministry of Commerce and Industry, will be leaving from Bombay on July 21, for Djkarta to explore the possibilities of exporting engineering goods to Indonesia. On its way back, the delegation will visit Singapore, Kaula Lumpur, and Bangkok.

•

The Bombay Oxygen Corporation Limited expects that the oxygen plants at its Muland (near Thana) factory will go into production before the end of this year. It has already imported four oxygen plants from Germany and 10,000 oxygen cylinders. The acetylene plant, which the company is also importing, is stated to have already been shipped. The supply of acetylene cylinders from abroad has also been arranged. The entire project is expected to be commissioned by the first quarter of 1963.

•



Tube Investments of India Limited has announced that the first part of its new factory near Madras to manufacture cold roll formed metal sections is now complete and the plant will be installed shortly. Its main products will be cold formed sections that can be used for building of bus bodies, rail cars, roller shutters, insulation systems, furniture and in motor and textile industries. The second phase of the project, which the company has plans to complete within two years, will widen the sphere of activity by fabrication of the cold formed sections by bending, welding, pressing, rustproofing and painting, for the building industry. Technical know-how for all these activities is being provided by the TI subsidiary of UK, Metal Sections Limited, Birmingham.

Talks for the extension of the existing trade agreement between India and Morocco (the agreement has been in operation since August 1, 1961) are scheduled to be held in Rabat on July 22. The Indian delegation to these talks will be led by Mr. S. Vohra, Joint Secretary, Ministry of Commerce and Industry. Since the agreement came into force, goods worth Rs. 90 lakhs have been exchanged by either country. The chief items of export from India are light engineering goods, tea, textiles and coir. Rock phosphate, lead, cork and asbestos are the items imported by India from Morocco.

Ultra-sound is now used to clean wrist watches in Czechoslovakia instead of chemical solutions. The new method has been introduced in the Prime Watch Factory there with great success.

COMPANY AFFAIRS

THE BANK OF INDIA

The Bank of India has made satisfactory progress during the six months ended June 30, 1962. The profits, after making the usual provisions for contingencies, for the first half-year of the current year are a shade lower at Rs. 47.50 lakhs as compared with Rs. 47.85 lakhs in the corresponding period of last year. The Directors have decided to pay an interim dividend at the rate of 16 per cent per annum (Rs. 4 per share) subject to deduction of tax for the first half of 1962 — same as in the first half of 1961.

PUNJAB NATIONAL BANK LTD.

The Punjab National Bank Ltd. has reported good progress for the half year ended 30th June, 1962. Subject to audit, the net profit of the Bank for the first half year of 1962 after providing for tax and making other necessary provisions amounts to Rs. 59.93 lakhs (including Rs. 10.38 lakhs carried forward) against Rs. 80.29 lakhs (including Rs. 4.23 lakhs brought forward) subject to tax for the corresponding half year in 1961. The Directors have declared an ad-interim dividend for the current year at the rate of Re. 1 gross per share amounting to Rs. 20 lakhs, leaving a balance of Rs. 39.93 lakhs to be carried forward to the next half year's account.

NEW STANDARD ENGINEERING

The working of New Standard Engineering Company Limited for the year ended March 31, 1962, shows a gross profit of Rs. 22.26 lakhs against Rs. 18.04 lakhs in the preceding year before providing Rs. 8 lakhs for depreciation (Rs. 5.92 lakhs), Rs. 1.73 lakhs for development rebate (Rs. 4.50 lakhs) and Rs. 5.50 lakhs for taxation (Rs. 3.10 lakhs). Sales have increased to Rs. 1.59 crores against Rs. 1.19 crores in the preceding year i.e., increase of 33 per cent over the sales of the last year. The directors have recommended an ordinary dividend of 9 per cent, 4.50 per cent from profits exempt from income-tax and 4.50 per cent subject to tax. A sum of Rs. 50,000 is transferred to general reserve leaving a balance of Rs. 11,838 which is carried forward.

UNIVERSAL ELECTRICS

The directors of Universal Electrics Limited, in their first annual report for the year ended March 31, 1962, have stated that work at the factory has started and at present the building is under construction. The plant is expected to commence trial production by the middle of next year. Construction period expenses amounting to Rs. 63,284 will be allocated to the fixed assets on completion of the factory buildings and erection of the machinery. The company has undertaken a project to manufacture house service meters in collaboration with Messrs. Mitsubishi Electric Manufacturing Company Limited of Japan. A public issue of its capital was made in January this year and was oversubscribed.

NEW ISSUES

The following five companies have been authorised to issue capital totalling Rs. 1.37 crores. Of these, Jaswant Sugar Mills Ltd., is issuing 'bonus' shares, Swastik Oil Mills Ltd., 'debentures' and the other three 'equities'. Details are as under:

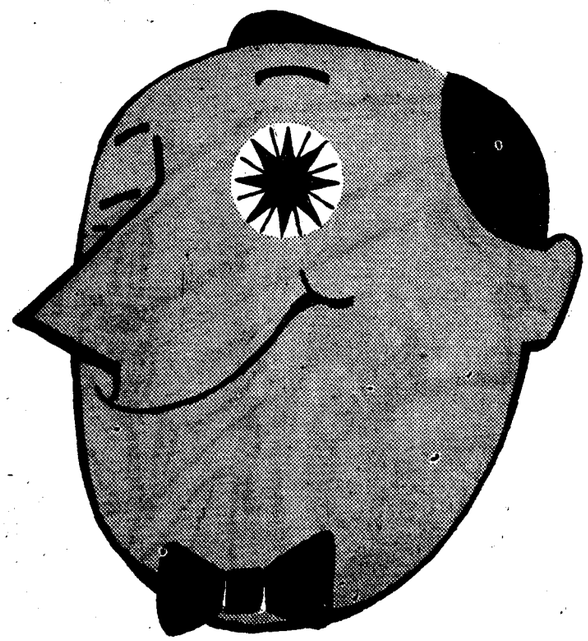
1. **Jaswant Sugar Mills Limited, Meerut, U.P.,** having a paid-up capital of Rs. 30 lakhs, is to issue bonus shares of the value of Rs. 12 lakhs on capitalisation of its reserves to a like extent.

2. **Swastik Oil Mills Limited, Bombay,** will raise 6.5 per cent debentures of the value of Rs. 20 lakhs for cash at par. The proceeds will be utilised for redeeming the existing debentures and for providing working capital.

The present paid-up capital of Rs. 30,37,500 is in equity shares of Rs. 100 each.

3. **Super Spinning Mills Limited, Andhra Pradesh,** is raising capital of Rs. 25 lakhs, in equity shares of Rs. 10 each, for cash at par. The proceeds will be utilised for establishing a cotton spinning mill.

4. **Deccan Sales Corporation (P) Ltd., Bombay,** having a subscribed capital of Rs. 30,600, is issuing equity capital of the value of Rs. 19,69,400 in shares of Rs. 100 each for cash at par. The money will be used for the manufacture of granulated compound fertilisers.



5. **Bombay Wire Ropes Limited, Bombay,** has been granted a revised consent to issue capital of Rs. 60 lakhs in equity shares of Rs. 10 each for cash at par. The proceeds of the issue will be utilised for the manufacture of wire ropes. The revised consent is valid upto December 31, 1962.

A CORRECTION

The profits of the Simplex Mills Co., Ltd. for the year ended March 31, 1962 were Rs. 55.82 lakhs (quoted incorrectly as Rs. 52.82 lakhs), while the amount earmarked for additions to the plant and machinery was Rs. 18.38 lakhs and not Rs. 13.38 lakhs as was inadvertently stated on page 1493 of our journal dated June 29, 1962. The errors are regretted. — Ed.)

THE EASTERN ECONOMIST

JULY 27, 1962

Shooting in Ladakh

THE news this week that the Chinese fired twice on an Indian outpost in the Galwan Valley has naturally produced in the country a sense of deep anxiety that our soldiers in these outposts are inadequately prepared both in numbers and in equipment to meet Chinese challenge. The Prime Minister described the situation as serious and stated that we need to be wide awake. Somewhat by contrast, Mr. Krishna Menon in Geneva after lunching and breakfasting with Marshal Chen Yi, the Chinese Foreign Minister, bypassed the issue in what appears to be somewhat light-hearted banter. Mr. Krishna Menon is reported to have said: "These are largely unoccupied areas. They have posts and we have posts. Sometimes they say we shot first and sometimes we say they shot first — actually they shot first."

There can be no doubt that, whether or not the situation can be described in these terms, Mr. Krishna Menon in this matter is plainly outside the ambit of Indian public opinion. When the report first appeared that he was lunching with the Chinese Foreign Minister after Indian troops had been fired upon, what are described as "political circles" in India prophesied adverse comments in the next session of Parliament. One need not assume that these political circles are wiser in their time than the Defence Minister. There is no reason since, in any case, the Defence Minister and the Chinese Foreign Minister were meeting at a neutral base in order to celebrate the signing of the 13-Nation Agreement on Laos, why the Defence Minister should lose an opportunity of presenting to the Chinese Foreign Minister the seriousness with which the Indian public opinion views Chinese aggression there. It is true that Mr. Krishna Menon's reported comment looks very much as though he did not present India's case with quite the vigour with which Indian opinion holds it should be presented. Indeed it does look very much as if criticism in Parliament will again be on the lines presented before, that, while the Defence Minister loses no opportunity to fasten on Pakistan's aggression he tends to be much more tolerant towards Chinese occupation of our territory in Ladakh. This is undoubtedly so, but it would be premature to assume that in his conversation with the Chinese Foreign Minister he has been equally unwise.

It is fair to allow Mr. Krishna Menon to make his statement in the House before he is arraigned at the bar of public opinion. Whichever way Indian public opinion feels about the Defence Minister — and he has his ardent admirers no less than his severe critics — it is time to recognise that the debate on personalities is subordinate to the immediate problem of helping our soldiers who, probably heavily outnumbered, have only their own courage and determination against death and dishonour. It is vital, at this time of crisis, that we should not give the impression that we are more concerned about the personality of the Defence Minister than about the country's predicament. Equally, it is hoped that the Defence Minister will not anger Indian public opinion by light-hearted references to Chinese aggression as though this were picnicking with the enemy in the same manner he has been entertaining and is being entertained by the Chinese Foreign Minister. It is often wise to remember that the devil sups with a long spoon. There is no indication whatever that Chinese intentions are, in any way, less aggressive because Mr. Chen Yi and Mr. Krishna Menon are supping together in the quiet peace of Geneva.

Agreement on Laos

PERHAPS 13 is after all a lucky number. At least, after almost insuperable difficulties, 13 nations have agreed at the Geneva conference on Laos and a new neutral Laos has been born out of their labours. In the process 13 itself has changed its magic character because, with Laos herself, the total is now 14. But its original merit has not been in doubt and the fact that 13 nations hammered out one of the most complicated agreements of all time is a historical lesson which cannot be lost upon those who still believe that international affairs can be hammered out in a civilized manner at points far removed from the area of hostilities. In this case, although so far removed, passions ran high. It has been many months before an agreement could be reached, notwithstanding the herculean efforts of many great diplomats, in particular Mr. Averall Harriman and Mr. Dean Rusk, the Secretary of State of the United States and Mr. Malcolm Macdonald. It is often not recognised in India that it was the West that was making a major sacrifice of its position and a considerable saving of face was involved in accepting the point that neutrality in Laos was necessary. The new Treaty finds a method of withdrawing the "protection" offered on paper by SEATO which has been over and over again reiterated by American statements of policy. The Kennedy Administration is to be congratulated on its great capacity for flexibility in this matter, and its willingness to recognise that, when the military position became untenable, its political forces needed to bow to the inevitable.

The agreement on paper at Geneva does not remove all military complications. The United Control Commission now proposed will have the difficult task of removing the North Vietnamese troops and advisers within a period of 75 days. Similarly, Americans will need to withdraw, but

this constitutes no extreme difficulty because it is extremely likely that they will remove themselves without any pressure from the Control Commission. Since the presence of the Chinese Foreign Minister, Mr. Chen Yi, seems to commit China fully to the pact, one might hazard the view that China's tremendous influence on Ho Chi Minh and those primarily interested in a Communist Laos situation, will also be affected. On the other hand, we are in no position, in view of our experience in Ladakh, to take China for granted. The Control Commission obviously has difficult problems in Laos. And the presence of three separate armies—Right Wing, Neutralist and Communist—by no means implies that civilian government will not operate under military pressures in large areas of this problem State.

With all its difficulties, nevertheless, the agreement signed this week is a notable triumph for diplomacy. Not a little credit should be given to Mr. Malcolm Macdonald, the leader of the British Delegation, who has negotiated skilfully over the period of nearly a year. Credit must also be given to the Russians who have not merely exercised their full influence—although Mr. Chen Yi angrily denied that he submitted to Russian pressure—but they have gone further and indicated that the present might be a stepping stone to further Cold War agreements. Tribute here should be paid to Mr. Nikita Khrushchev who has again exhibited some flexibility which in previous days marked him off from his Stalinist predecessor. It is difficult to say how far this new flexibility will reach.

While the present agreement is strictly confined to Laos, it suggests that the thawing of the Cold War in certain areas where military action has brought about a stalemate is a real possib lity. It has been reported from Geneva that this, by no means, covers Berlin where positions are as difficult as before. But there must be many who feel that international negotiation such as has been conducted recently has at least been rescued from disrespect by a major success. Even if one such success comes each year, there will be a power of survival in this machinery, the only that we have between ourselves and total destruction. For this reason men of goodwill all over the world will look to the agreement on Laos as of a new star raising again in an hour of darkness the hopes of mankind for peace on earth and goodwill amongst men.

Guest Editorial

Atlantic Partnership

By Our Special West European Correspondent

EUROPEAN reaction to the remarkable speech of President Kennedy in Philadelphia on American Independence Day has so far been rather cold. The President, it will be remembered, drew a parallel between the unification of the newly independent American colonies that was consecrated in the "city of brotherly love" just 175 years ago, and the process of unification now in course in West Europe, and went on to say that the problem for both of these collectivities was no longer independence but their mutual interdependence. "The United States are ready to adhere to a Declaration of Inter-dependence. We will be prepared to discuss with a united Europe the means of forming a concrete Atlantic Association". (These may not have been his exact words, for I am translating the versions published in Paris; I mention the point because it is evident that the President aimed at, and no doubt attained, a rare nobility of language.) Whereas Alexander Hamilton 170 odd years ago invited Americans to think on "a continental scale", Mr. Kennedy asked them to think on "an inter-continental scale". Alone, neither the USA nor united Europe could succeed in defending themselves from Communism, aiding the developing nations and promoting their own economies. Together, they could do all this and more.

Aware that this grand design for an Atlantic Association would be regarded by many as premature, Mr. Kennedy admitted that its construction would be neither rapid nor easy. Eleven years elapsed, he recalled, between the Declaration of Independence and the publication of the American Constitution, while another generation was required for the elaboration of federal institutions that would function along the lines indicated in that great document. A first European reaction has been to point out that this long delay applied, first of all, to the construction of a united Europe, that is, to the very appearance of one of the members of the President's "equal partnership". May be further delay (and by now we are reckoning in terms of decades, if not generations) would be necessary before that new collectivity could devise, with the USA, the framework of an Atlantic Association.

In saying this, European commentators are not objecting to framing plans that might take a long time to realise. They are hinting that it is not only too early but positively pernicious to plan inter-dependence between groups of whom only one is yet really independent—because the blueprint for inter-dependence can act as a brake on the liberation of the other from its inferior position. The point is very familiar in France, for in the 1950's conservative cabinets that were not genuinely converted to decolonisation granted both Tunisia and Morocco what was hypocritically called "independence in inter-dependence", which meant (or was intended to mean, for it never worked) a neo-colonial status, an incomplete relaxation of imperial bonds. Of course, no one suspects the American Government of similar perfidy; its 17 years of unfailing support for European integration and the immense sums it gave to restore the European economies that now rival its own are there to attest its sincerity. And yet, in some ways, the Europeans feel that they are still too much the wards or clients of their American protectors to be able to discuss equal partnership.

They feel this in regard both to their industrial power and their ability to defend themselves. That is, they believe that European industries are too small and that in a free-trade association that embraced all the Atlantic nations, they would be wiped out, swallowed up or at least outclassed by the giant American corporations; while their defence forces are notoriously insufficient to match Russia's without American protection. A difference between these two sorts of inferiority is

everyone agrees that West Europe should, and probably could, continue its industrial development until it approaches the USA's, whereas many (a substantial minority in Britain and France, and the absolute majority in all the other West European countries) believe that Europe should not, and could not, build nuclear forces independent of America's and intimidating enough to discourage Russia. In the former case, the matter of Atlantic economic unification, it is too early yet to project an Atlantic community, and that is why no authority in the Common Market takes seriously Washington's dream of a free-trade area in manufactures. In the second case, defence, there can be no question of equal partnership between the USA and, on the one hand, European nations that are content to remain protegees forever, nor, on the other hand, with Europeans who are striving to assert their atomic independence.

West Europeans, then, are not ripe for an offer of inter-dependence and equal partnership because they do not feel "equal enough". Some of them have suspected that previous American offers in this sense (prior to the Philadelphia speech, which had a different ring) were designed to prevent them becoming "more equal". For example, when the Democrat Administration tells Americans that freer trade with Europe would improve the US balance of payments, Europeans, who know that the USA already has a substantial surplus in its trade with Europe, see that this can only mean that US corporations could be expected to sell much more on this side of the Atlantic; so the equality in question would cover a unilateral invasion of American goods, at the expense of European industry. Or when Washington offers to equip a "NATO nuclear force" that would be additional to the USA's own force, Europeans soon see that this offer changes nothing in their dependence on America as long as the head of NATO is automatically an American general responsible solely to the White House. So the scheme is interpreted as a red herring, intended to dissuade certain Europeans from constructing a truly independent modern defence. Such ulterior motives appear to be absent from President Kennedy's latest description of inter-dependence. On the one hand, the brief but instructive tussle between Brussels and Washington about tariff increases on some European goods (the Common Market promptly retaliated) has made clear that the Europeans will not let the President's "grand design" in trade become an instrument for unilateral commercial gains. On the other hand, Washington is reluctantly reconciling itself to the prospect of a completely independent French nuclear force, with which one day it will co-operate rather than dominate.

Nevertheless, most Europeans consider that their unification, economic expansion and military modernisation will all have to make much more progress yet before the notion of equal partnership between inter-dependent groups will be meaningful. "The idea of inter-dependence", wrote Le Monde, "is not at this stage particularly exalting. It could only become so if Europeans and Americans really agree to transform into relations between equals a connection which at this moment is that between clients and protectors". It is obviously true that the reciprocal concessions of sovereignty implied in the notion of inter-dependence only become possible when West Europe has some sovereignty to abridge, and at present it has not — and not because the Americans are dominating it, but because the Europeans have not been able to agree on what political form their unity should take. The quest for political unity, for some sort of a European sovereign (which, no doubt, will never be more than a shadow of the real unity forged in Philadelphia 175 years ago) had already been complicated by the clash between the One-Europe movement and Gaullist ideas of an international confederation; it will henceforth be vastly more complicated by the approach of Britain to the European association. (For, although the British reserve the word "nationalist" for folk they do not like, they have super-chauvinist sensitivity about abatement of sovereignty alongside which Gaullism pales into a rather unpatriotic internationalism).

It would, however, be mistaken to conclude from this, and from the indifference with which European capitals greeted Mr. Kennedy's address, that absolutely nothing will be done toward realising his scheme for an Atlantic community until the West Europeans have completed their political unification in one form or another, concentrated their industries till they can stand up to General Motors and Dupont, built a ruggedly independent nuclear force fit to terrify the Russians and in general overcome all their inferiority complexes. Far from it. As long as they avoid precisely the sort of solemn Declaration of Inter-dependence that President Kennedy rhetorically suggested, the USA and uniting West Europe will evolve toward the sort of equal partnership he had in view. The process, for example, is already far advanced in the monetary sphere. Moneys, national currencies, can become "equal", be equally demanded in exchange markets, even though the economies that use them are widely unequal in industrial power; and when, as at present, the currencies of half a dozen European countries that are joined in an enterprise of economic integration attain this monetary equality with the dollar, inter-dependence becomes a reality. Just after the Common Market's spokesman, Professor Hallstein, went to Washington to pooh-pooh the idea of an Atlantic free-trade area, European central banks reached a secret agreement in New York with the Federal Reserve to defend the dollar against the speculation that might have been unleashed by Wall Street's "Black Monday". Progressing in these discreet ways, monetary interdependence across the Atlantic is further advanced than is commonly realised.

Similar partnership is developing inside the Organisation for Economic Co-operation and Development, where it is becoming clear that numerous problems can be dealt with only by "thinking on an inter-continental scale". Aid for developing nations, the marketing of agricultural surpluses and the promotion of trade in manufactures are all being treated in this way, and I do not mean simply by a multilateral approach: discussion begins multilaterally, but the habit of the Common Market powers of taking a joint line on most of these issues soon converts the problem into two-sided co-operation between the USA and the ECM. This will be even more evident when Britain joins the Six and learns by experience that (imperial nostalgia and Anglo-Saxon fraternity notwithstanding) membership of the European economic unity leads to thinking in terms of a European policy — which then requires to be co-ordinated with US action on a basis of equal partnership.

A DELHI DIARY

THE RETURN OF THE PRODIGAL

I HAVE been absent from these pages so long that I feel my return is like that of the prodigal who has wasted his substance in riotous living—seeing that most of my time has been spent abroad where hotel prices are incredible though this may be, sometimes twice those of the Ashoka! I shall have more to say about ways of living in subsequent diaries, but for the moment, having made my profound apologies for my absence, and having quickly obtained forgiveness from my all-too-generous readers, I can proceed at once to partake of the fatted calf and all that that implies. So far as Delhi is concerned, let me say that from a narrow journalist's point of view it remains one of the most interesting places in the world even without the Chinese in Ladakh to give us a special cause of excitement every day, whether or not Mr. Krishna Menon makes a statement. Security, trade, aid, planning (or its absence!) are all invested here with a direct personal appeal which one sadly misses in foreign countries.

THE PALAIS DES NATIONS

While I must defer observations on many great events and institutions for future diaries, I cannot resist immediate comment on my first view of the Palais des Nations in Geneva, too often believed to be the monument of an age that ended before World War II. I am quite sure in my own mind that this is a tremendous error. The Palais des Nations is alive today with the same spirit of its beginning, and even though the United Nations, because the great monument was believed to be inauspicious, now lives in New York, a vast amount of its thinking is still done in Geneva by the same international civil servants who patiently, and not skilfully, are building a new international world largely with the assistance of the Specialized Agencies. Of these, the Economic Commission for Europe, the International Labour Office and representatives of many others are still housed in a building which, for sheer beauty of design, must be one of the greatest in the world. On clear days across the Lake of Geneva one can see Mont Blanc in all her glory. I can claim the special privilege of having seen her thus in three days out of five. I believe this record is one which very few people have been able to beat!

U THANT

I cannot also resist the temptation of saying my first piece on a meeting with the Secretary-General of the United Nations, U Thant, who was attending the Economic and Social Council meeting at Geneva. Those who heard him speak there and elsewhere will agree with me when I say that one of the great historical events of our time is the manner in which the Acting Secretary-General of the United Nations has risen in stature to fill his great office with dignity and skill in judgment and discrimination. Undoubtedly, one of the great discoveries of our time is the manner in which greatness thrust accidentally upon particular men draws out the greatness latent in them. I make this prophecy here and now that U Thant, if permitted to continue, will be a great Secretary-General and a worthy successor to Dag Hammerskjoeld. That I know is high praise. I meant it to be the highest praise of all.

THE PRICE OF FREEDOM

Before I proceed further to exalt Delhi by comparison with other countries, I should promise my generous readers in expiation of my sins, a round up in five countries: the United States, Italy, France, Germany and the United Kingdom. This, I regret to say, will need five whole weeks in which I have to pay the price of my recent freedom. I wonder whether the world can be so compressed at this time of eternal crisis. I do not know. But I promise to make an attempt to pay the penalty of the freedom of the last two and a half months by an agonizing reappraisal of the sights that I have seen and the odious comparisons consequent there on.

JULIUSZ KATZ-SUCHY

Today, however, may I refer to one of the notable omissions in the landscape discovered on my return to New Delhi? The Diplomatic Colony misses two notable figures; Mr. Walter R. Crocker, the popular High Commissioner from Australia, and Mr. Juliusz Katz-Suchy, the dynamic Ambassador of Poland over the last four years. Both Mr. Crocker and Mr. Katz-Suchy are distinguished scholars; both are ardent listeners in political affairs in the sense that they welcome different points of view, although they hold vigorously their own. They both developed a wonderful circle of friends covering many shades of opinion; their houses were opportunities for stimulating intellectual exchange such as all journalists must surely envy. One acquired not merely new ideas but almost a new environment. Sometimes, for those of us who, like myself, have tended to build a somewhat rigid wall around the mind, the discovery of a new world such as that of Poland has been somewhat disconcerting. I do not know whether Mr. Katz-Suchy would consider this a compliment, but I feel that so far as Poland is concerned, he first opened windows to me to demonstrate its flexibility and non-Communist catholicity! Whilst an ardent expositor of the policies of his country's Government, he was a widely tolerant preceptor of what might be described the non-Communist culture of this country. He understood the language of the West even though he believed in the doctrines of the East. And thus he made an original contribution to East-West (and neutral!) understanding which was substantial. I think in this respect he will be very difficult to replace, though Poland has had other distinguished representatives, and India has been particularly fortunate in Ambassadors, beginning from Mr. Grudzunski, who pioneered developments in Indo-Polish trade which under Mr. Katz-Suchy has now reached such substantial proportions.

CHUP - CHAAP AND CHUP !

As I shall be dealing too much with international affairs in five succeeding weeks, let me comment on a large domestic issue. I submit my irrepressible cartoonist who, as usual, reflects not a little of the opinions I share without treading, as I do, heavily on anyone's toes !

"Let us remain chup chaap"

THE WEEK'S NOTES

Railway Accidents

A GRAVE TURN

THE ACCIDENT to the Amritsar Mail at Dumraon Station in Bihar, which took place on the night of July 21, has come as a bolt from the blue. The toll of casualties shows that 65 passengers have been killed and over 50 injured. This accident is bound to be treated as grave. Responsibility can be directly attributed to the human element. The failure of the human element seems to have been very serious in this case. The circumstances which led to the head-on collision of the mail train against a stationary goods train are most surprising. The goods train in question was in the process of doing shunting operations and, inexplicably enough, it moved on the down main line over which the Amritsar Mail had a line clear signal to pass. The fact that at the time of the accident (and presumably some time before that) the goods train was standing on this same line shows a tragic error in directing the shunting operations. The person responsible for this error was the cabin-man, who is reported to have fled the cabin immediately on the occurrence of the accident. This failure of the human element is as tragic as it is indicative of a deplorable lack of due care and diligence in the discharge of duties by the railway staff directly concerned with traffic movements.

It is a matter for deep concern that the safety factor on the railways should be weakened, and weakened in no trifling manner, in the course of a short period. During June this year four major railway accidents occurred on the Indian Railways. This one, which took place on the Eastern Railway, was the gravest of them all. Two more occurred earlier on the South-Eastern Railway and one on the Southern Railway. The toll of casualties in the three earlier accidents was 14 lives lost and 108 passengers injured. This is so far as the safety factor is concerned in relation to passenger traffic. But between mid-April and mid-June this year, not less than 22 accidents are estimated to have taken place involving passenger and goods trains.

In fairness to the Railway Administrations it could be conceded at once that in some cases nothing is so accidental as a railway accident. Sometimes a serious accident may take place in a situation absolutely beyond the control of the railway staff. The blowing off of a railway train from the rails by a forceful and extraordinary cyclone is a recent tragic illustration. But this is an exception. Not long ago Mr. Swaran Singh disclosed that a large number of level crossings have been left unmanned and this situation increases the danger of accidents. The cost of protecting them with watchmen and equipment would, no doubt, be heavy; but happily there is the assurance that this operation would be taken in hand and the programme would be phased over a reasonable period of time. The condition of the track and pressing into service high-powered heavy-weight locomotives may make accidents easier than otherwise would be the case. Supervision and maintenance of the track need considerable tightening up and close vigilence.

But when all these considerations are given due weight, the cruel fact remains that the responsibility of the railway staff arising from its negligence is increasing in railway accidents. Even the routine annual official report on accidents does not conceal this fact. The Railway Ministry and the Railway Board must now do real hard thinking about this new menace. The first thing to be stamped out is laxity in discipline.

M.P. Congress

DISCIPLINARY ACTION

IF FACTIONALISM and indiscipline have reached a culmination in some of the States of which Madhya Pradesh is a notable example, it is a matter of reassurance that the Congress High Command is not hesitating to take firm action against those who undermine the solidarity of the party. Ever since Mr. B. Ramakrishna Rao tendered his report on the internal affairs of the Madhya Pradesh Congress Committee and recommended strong corrective action, the High Command has taken a serious view of the wrangles among Madhya Pradesh Congress leaders. The members of the State Congress Executive Committee have been found guilty of breach of party discipline and as a punishment the entire Executive Committee has been put under suspension. To this, however, the State Congress President, Mr. Deshlehra is an exception inasmuch as Mr. B. Ramakrishna Rao has exonerated him from direct complicity in surreptitious activity in the last general elections. The reason for suspending the Executive Committee is to keep the atmosphere clear and free from any exercise of questionable influence during the forthcoming elections of the Congress organisation due to be held in October.

Mr. Deshlehra was not directed to tender the resignation, but he has yielded to the persuasion of Mr. G. L. Nanda and Mr. C. Subramaniam to vacate office to inspire confidence among Congressmen about free elections. Mr. Deshlehra has given further corroboration to what was already a widely known fact that groupism in Madhya Pradesh has been complicated by regionalism. He was perhaps right in telling in plain words Mr. Nanda and Mr. C. Subramaniam that any attempt to set up an interim Executive Committee by rapprochement among the contending factions would produce artificial results. The alternative therefore was for the High Command to appoint an ad hoc committee and also to nominate a President until the elections are held.

The question that really arises is: What after the disciplinary action? Mr. Deshlehra's statement that he himself may be held guilty of forming a group is significant. But his defence to the effect that he did it in the best interests of the organisation and without any factional purposes can be taken as no more than an expression of self-righteousness. Just at about this time comes the MPCC's decision to expel Mr. M. P. Mishra, a former Home Minister in the State Government and a leader of considerable influence in the Mahakosal region of Madhya Pradesh. Mr. Mishra was charged belatedly with having enrolled bogus members three years ago. The coincidence of his expulsion with impending disciplinary action against the Executive Committee cannot be ignored. It will vitiate the atmosphere more. All in all, matters have become too complicated and it is to be wondered how an ad hoc committee and a nominated President — perhaps from outside the State — would be able at all to bring about any improvement. Groupism in Madhya Pradesh is much more deep-rooted than appears on the surface.

Laos

NEUTRALITY TREATY

THE TRYING and difficult negotiations for achieving peace, independence and neutrality for Laos lasted well over fourteen months. But it was a momentous occasion when the neutrality treaty was solemnly signed at Geneva on July 23. Thus the labours of the fourteen-nation Geneva Conference, which declared in 1954 the acceptance of the principle of neutrality for free Laos, were brought to a happy culmination.

While there was anxiety on the part of the leading nations of the two power blocs about the achievement of a neutralist government for Laos, the real obstacles arose among the three Laotian parties on the formation of the coalition. It is this major problem of agreement on coalition that was responsible for the long delay in signing the treaty. The tone of the speeches delivered at the Conference session on Saturday, July 21, shows that there is a genuine desire on the part of all the nations that Laos should be really independent and neutral. To this end, the time-table laid down for the withdrawal of foreign armed forced from Laos will be observed. What is, however, really important is that there should be no subversion of neutrality from outside and on this score the present indications are reassuring.

Proof of the determination of Laos not to deflect from the path of neutrality is already to be found from the Coalition Government's decision not to allow any part of its territory to be used for aggression directed from whatever sources against her neighbours. This clearly relates to Thailand and South Vietnam, which, not long ago, entertained apprehensions about such a threat via Laos. Military pacts run precisely counter to the policy of neutrality and it is because of this that the coalition has declined the protective wing of SEATO. A somewhat intriguing development, which synchronised with the conclusion of the treaty, is the decision of the Coalition Government in Laos to extend de facto recognition to the Kuomingtong Government of Taiwan. The last two developments are significant pointers to the desire of Laos to steer the path clear of alignment with any of the two power blocs.

Banking

FOREIGN BANKS IN PAKISTAN

THE PAKISTAN GOVERNMENT'S action in promulgating the ordinance, which calls upon the branches of foreign banks in that country to deposit with the State Bank of Pakistan a minimum of Rs. 20 lakhs or 5 per cent of the time and demand deposits combined (whichever is higher) is not so simple and harmless as it may appear on the face of it. It is a universally recognized practice to safeguard the interests of the depositors by prescribing a certain minimum statutory limit for the maintenance of cash bearing a definite ratio to the deposits. The object is unexceptionable. But by another universally accepted convention, these cash balances, which are made compulsorily placeable with the Central Bank, form part of the deposits which the foreign banks attract from depositors inside the country of their operation. All that is required is to keep the cash balances in the local currency.

But the Pakistan ordinance makes a significant departure from this practice and stipulates that these cash balances must be obtained from outside the country. In simple terms this stipulation requires the branches of foreign banks to procure the foreign exchange equivalent of the required balances. It is here that the sting of the novel provision lies. Apparently, the object is to secure some additional flow of foreign exchange in the State Bank of Pakistan. This requirement, however, will adversely affect the foreign countries to which the branches in Pakistan belong. As many as 21 Indian banks have 48 branches in Pakistan and this new obligation would involve placing foreign exchange of a sizeable amount. In India's present strained foreign exchange position, it certainly involves an avoidable burden. It is to be trusted that the Pakistan Government will pay heed to the representation made by the Government of India to alter the condition about the procurement of the needed cash balances in foreign exchange.

Iran

DR. AMINI'S EXIT

AT A TIME when Iran's economic crisis requires a man of vision and firmness at the helm of affairs, Dr. Amini found no alternative but to resign. This is indeed very unfortunate. Ever since he accepted the high responsibility of the office of Prime Minister in difficult circumstances, he has shown a determination to bring within manageable dimensions the problems of inflation and foreign exchange shortage. He made a bold bid for implementing the policy of land reform and took unpopular measures to stamp out official corruption. But precisely all these policies invited for him hostility from a cross-section of the population, ranging from the landlords and traders to civil officials and army officers.

Dr. Amini's immediate problem was to raise external resources to meet the maturing obligations of repayments for foreign loans to the tune of about $100 million in the budget year and to find another $100 million to finance the foreign exchange component of the development projects. Besides that, he had to narrow down the gap in the budget estimated at $160 million. All this was really difficult to do, but Dr. Amini did not flinch from his responsibility. He proposed to reduce the budgetary gap by retrenching expenditure on defence and the civil administration where Parkinson's Law seems to operate with a vengeance. In the process he succeeded only in inviting a storm of opposition all around him. This, in brief, was the background to his resignation. His successor, Mr. Assadullah Alam, has announced that there will be no change in the home and foreign policies. It is difficult to see how he can succeed where Dr. Amini failed, if, as he says, there is to be no deviation from his predecessor's policies.

U.N. Finances

WORLD COURT'S RULING

THE COST of the Suez and Congo operations has involved the United Nations in a debt of $170 million and created a crisis of a significant magnitude in its finances. While the Congo operations are still going on and there are portents which threaten to prolong it for an indefinite time, U Thant finds himself faced with a dilemma to finance these operations. The General Assembly voted expenditure of the order of $80 million to cover the Congo expenditure for the eight months ended June 1962. It was at the time of this vote that Russia and Belgium raised a basic objection to the sanction of the outlay contending that these operations were not authorised by the United Nations Charter. The controversial point had to be referred to the World Court for its advisory opinion.

By a majority of 9 to 5, the judges of the World Court gave their ruling on July 20, upholding the General Assembly's view that both the Suez and Congo operations were covered by the Charter and an obligation rested on the members of the U.N. to contribute to their costs. Britain, which was directly involved in the Suez, did not oppose the expenditure. But France took the contrary attitude. Russia and Belgium raised objections to the sanction in respect of the Congo operations. The real problem is how the ruling of the World Court can be enforced. Presumably, the member nations are expected to respect its decisions. Russia's objection is apparently influenced by her disapproval of the late Mr. Hammerskjoeld's handling of the Congo issue. It is to be trusted that no embarrassing precedent would be set by disregarding the World Court's opinion. If unfortunately it is disregarded, South Africa's position will be strengthened in flouting the World Court's decision on the issue of South-West Africa in case it goes against her.

The Ring Road at Rourkela

LIGHTING BY PHILIPS

Girdling the busy, growing steel town of Rourkela, Ring Road is the main arterial link between the township and the plant site. 16 miles long and 100 feet wide, it is flanked by footpaths and is divided into two broad avenues by a green belt. It is further designed to have two cycle tracks separate from the main carriageways.

The lighting for this splendid, vital highway was entrusted to Philips. Philips Lighting Engineers worked in close co-operation with the town planning authorities and the final lighting scheme is a fine example of street-lighting which promotes safety and efficiency.

Philips' exclusive lighting—consisting of lamps, fittings and accessories—ensures ultimate economy by providing the maximum illumination level at lowest running cost and gives longer, trouble-free performance. Philips' scientifically designed equipment is the result of experience, research and development aimed to meet the ever-growing demands of better lighting. And hand-in-hand with Philips' unrivalled quality goes the invisible *plus* of Philips international experience and know-how.

FREE: *For planned lighting, designed economically to suit your specific need —whether it is industrial, commercial or any other specialised application— consult Philips Lighting Service Bureau.*

The World Abroad

INFLATION: THE ROLE OF EXCESS DEMAND

By

ODYSSEUS

OF THE FOUR CAUSES of rising prices, which the 1961 OECD Report on this problem identified—namely, (1) special or temporary factors (such as bad harvests, increased sales taxes, and relaxation of rent controls); (2) monopolistic pricing; (3) excess demand for goods and labour; and (4) excessive negotiated wage increases as an independent force—the Report held that items (3) and (4) predominated. These have been widely discussed as demand-pull inflation and cost-push inflation. Both have greatly influenced postwar Europe, though they have differed in strength from country to country.

Extreme cases of excess demand, caused by persistent large government spending, financed by bank credit, occurred in Turkey, where between 1953-59 the consumer price index rose from 100 to 215, Spain (100 to 150), Iceland (100 to 130) and in France in 1956-57 (100 to 129). But 13 other European countries all experienced periods of excess demand, particularly in 1955-57. That all experienced it (in varying degree) shows the international character of the movement. The condition of excess demand came about typically as a strong rise in private fixed investment was added to the existing strong upward trend in consumption demand, the sharpness of which was often not fully revealed by the annual statistics. For example, in the USA, expenditures on new plant in 1957 were 23 per cent higher than in 1955. But between the first quarter of 1955 and the first quarter of 1957, the increase, at 60 per cent, was nearly thrice as great. Fluctuations in investment demand of this size are incompatible with financial stability and a steady growth rate at high levels of employment.

POLITICAL CONSCIOUSNESS GROWING

The OECD Report excuses the financial authorities for their frequent "too little and too late" policies by reminding us that (a) the 1955-57 investment boom was the first post-war experience of its kind, and (b) in many countries there were major gaps and serious delays in the information available to the authorities. But the Report notes that statistical analysis has improved since then and, above all, that there is greater political consciousness of the problem and more determination to face it firmly. They wrote this before Mr. Selwyn Lloyd stepped up the UK bank rate to 7 per cent, inaugurated his wage pause, and created the National Economic Development Council last year. Whatever criticisms can be made of his policies, they certainly have not lacked determination and political courage. Europe is, one hopes, getting cured of the depression psychology of the 1930's and is coming to the view that the alternative to over-strained capacity and over-full employment is not necessarily depression.

The authorities have hitherto relied more on monetary than on fiscal policies, because amongst other reasons, monetary policies are more flexible, and do not have the same direct, unpopular impact on consumers as fiscal measures. But more and more, the governments of Europe are coming to see that fiscal policy can also be made flexible. The OECD's recommendation that the authorities be given power to change the effective rate of tax for specified sources of government revenue over a specified range of tax rates, without prior Parliamentary approval for each change, has been sympathetically received in several European centres, including London, bearing in mind that (1) the period of a year, usual in national budgets, is too long to give enough flexibility to tax receipts as an instrument of stabilisation policy, (2) the annual budget often involves forecasting economic developments from 18 months to two years ahead—an extremely speculative job; (3) interim budgets are, of course, possible but are not often used for tax increases, because (a) they imply that the regular budget was wrong and (b) the amount of tax change that would be desirable often appears small compared to the fuss and bother; (4) a big difficulty in securing flexible tax changes for anti-cyclical purposes is that they involve debate as to which taxes should be changed — a politically sensitive topic; if powers to vary taxes were taken in advance, before any crisis had appeared, they would probably arouse less political excitement; (5) the orthodox annual budget system works both ways—there have been instances when tax cuts to stimulate demand were not made for fear that if the whole formal parliamentary precedure were needed each time, the cuts would not be restored when required. Finally (6) these proposals would help to reduce the repercussions among consumers of expectations aroused by the fact that tax changes can only be made on regular annual occasions. It has often happened that the public has hastened to buy goods in anticipation of a budget tax increase or to postpone consumption in anticipation of a cut.

The OECD's proposals have aroused criticism from those jealous of the legislature's authority to tax, but it should not be difficult to find ways of meeting this objection. What is at stake is not some tremendous issue of principle, but the power to vary specified taxes up or down—within limits specially authorised by the legislature.

PRICE CONTROLS DISTORT

As for monetary policies, most authorities would accept Mr. J. K. Galbraith's argument that big firms, able to tap the banks and to raise funds on the stock markets, can, at any rate for a fairly long period, contract out of higher interest rates. The Report on the (British) Monetary System (the "Radcliffe Report." 1959. Price 15 sh.) not only agreed with this, but pointed out that nearly half of the total volume of UK investment is now financed by the public authorities and that this public finance does not respond to the rate of interest so much as to administrative decisions to go ahead or to cut down. Nevertheless, both the Radcliffe and the OECD Reports agree that monetary and fiscal measures, jointly, still have important roles to play. Among the several measures suggested by Mr. Galbraith in his "Affluent Society" to solve the twin problems of inflation and full employment were price controls, but, as the Radcliffe Report points out, experience has shown that purchasing power frustrated by particular controls will eventually, and inevitably, spill over into other markets where uncontrolled goods and services can be bought, and this distorts the allocation of resources.

The wide differences in the money markets and in the traditions of the central banks of the twenty countries which the OECD Report covers make generalisation difficult. Nevertheless, one important point which

emerges is that instruments of monetary policy must be chosen in such a way that the normal working of the various credit and security markets is not undermined. A good deal of the equilibriating forces normally operating in the economy work partly through the demand and supply of various types of credit and the consequent adjustment of interest rates. The task of fiscal and monetary policy can be complicated if these equilibriating forces are needlessly hampered by administrative control or arbitrary decisions about particular interest rates.

There is, however, a special case for the regulation of consumer credit, although even here experience shows that control breaks down if enforced over too long a period and that it tends to distort the behaviour of credit institutions. Consumer credit regulation is a useful standby in emergency situations but the need for continual restraint of this kind indicates that more fundamental measures are required.

All European countries have applied monetary and/or fiscal measures to influence the rate of housing construction, either over-all or to even out seasonal fluctuations. These measures need to be applied more energetically in future, because housing construction in the last boom was stimulated to rise to too high a level in many countries, and was not restrained quickly and strongly enough as excess demand developed. It should be possible to do better in future now that the greater part of the postwar housing shortage is over.

It cannot be too greatly stressed that a condition of excess demand—i.e., when capacity is overstrained and labour shortages are general—is a matter of degree because of the existence of structural rigidities in the economy. These determine how much unemployment will arise from the firm use of fiscal and monetary policies intended to control pressure of demand when prices rise. Some unemployment will be frictional, but, in addition, other unemployment will arise because total effective demand will not always distribute itself among the various branches of activity in such a way that high employment of resources is simultaneously obtained everywhere. Full employment in some fields will be reached while there is still slack in others. Hence, the management of demand unavoidably means that advantages must be weighed against disadvantages. The OECD Report believes that this dilemma can be best faced in two ways. The first is to assure the greatest possible flexibility of the economy by promoting competitive conditions. And when one considers the vast amount of tariff protection still persisting in Europe and North America one cannot help feeling that the scope for action here remains substantial.

The second way is to assure that the consequence of high demand in individual industries is not an inflationary rate of wage increase in the economy as a whole, because if an excessive rate of wage increases can be avoided, this will allow the total demand to be higher and the level of unemployment to be lower without creating a general pressure on the price levels. This, of course, is part of the general problem of wages, which we will examine next week.

Economic Report from the U.S.

THE INTERNATIONAL COFFEE AGREEMENT

By GUY SIMS FITCH

WASHINGTON, July 24.

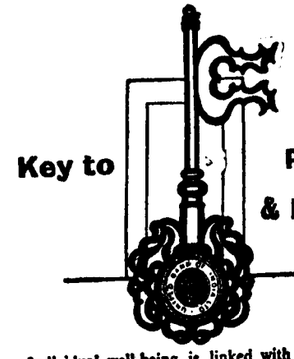
THE UNITED STATES traditionally has favoured open trade, generally free from governmental regulation and interference in the market place. At the same time, the U.S. Government has come to recognize that commodity situations can occur in which governmental intervention on an international scale becomes a matter of virtual necessity.

A case in point is the current Conference on Coffee, in which the United States is participating along with the other interested countries. The objective is to arrive at a long-term stabilization agreement that is workable, realistic and equitable to all concerned.

Such an agreement presumably would take into account the interests of both the exporting and the importing countries, and both would assume certain responsibilities. In regulating the flow of coffee entering world markets, exporters would share the burden of controlling production and shipments, while importers would assure that world consumption is not inordinately limited by unreasonable trade restrictions. For itself, the United States imposes virtually no obstacles that might limit its coffee consumption.

The Coffee Conference in New York, thus, has implications for other international commodity problems as well. Success in the coffee negotiations could point the way toward similar solutions for other products in similar difficulties—in which the world situation is clearly unsatisfactory and in need of this kind of a remedy.

While plans for the negotiation of an International Coffee Agreement are most advanced, it is likely that the United States would seriously consider the desirability of participating in other commodity stabilization arrangements when and if they appear warranted. As in the case of coffee, the effort would be to reach a global agreement that embraces both exporters and importers, with emphasis on progress toward multilateral and non-discriminatory trade.



Each such proposal, however, would have to be treated on its own merits. Commodity stabilization is a highly complicated and difficult problem at best, one in which solutions, to be effective, should be tailored to individual cases. Conditions, after all, vary from product to product, and what might be desirable and feasible for one, such as coffee, might not be for another.

In addition to reconciling the interests of producers and consumers, an effective agreement also calls for reasonably accurate predictions of what the future market for a particular commodity may be. This can place difficult demands on economists, who are, in their finest function, more than mere technicians dealing in impersonal sets of statistics, oblivious of political and social forces. They are concerned largely with vital questions affecting human needs and aspirations in a world of constant change and modernization.

In this kind of a world, economic estimates and measurements do not always supply definite answers to pressing problems. But commodity agreements can be highly useful, if carefully devised. They can, for instance, help achieve such worthy ends as establishing fair prices for producers and consumers, adding to the income of exporting countries, increasing consumption and assuring adequate supplies of primary products.

They are not necessarily panaceas, however, and there are limits to what can be expected from even the best of them unless other important steps also are taken. These include the search for new commodity uses and for more efficient production techniques so as to lower costs and widen potential markets. Above all, they include the diversification of industry and agriculture so as to transfer resources to other gainful pursuits and, thus, reduce a nation's dependence on one or just a few primary products. These combined moves could lead to an enlarged national income and a higher standard of living.

In short, there should be an intimate relationship between stabilization agreements and the entire process of economic development—a process to which the United States and other "free" industrial countries are contributing through their economic aid and technical assistance programmes.

Individual well-being is linked with national prosperity and only planned efforts can ensure both in the shortest possible time. And planning, for its success, largely depends on savings, individual as well as national.

Saving in the form of Bank Deposits provides resources for the National Plan.

THE BUSINESS WORLD

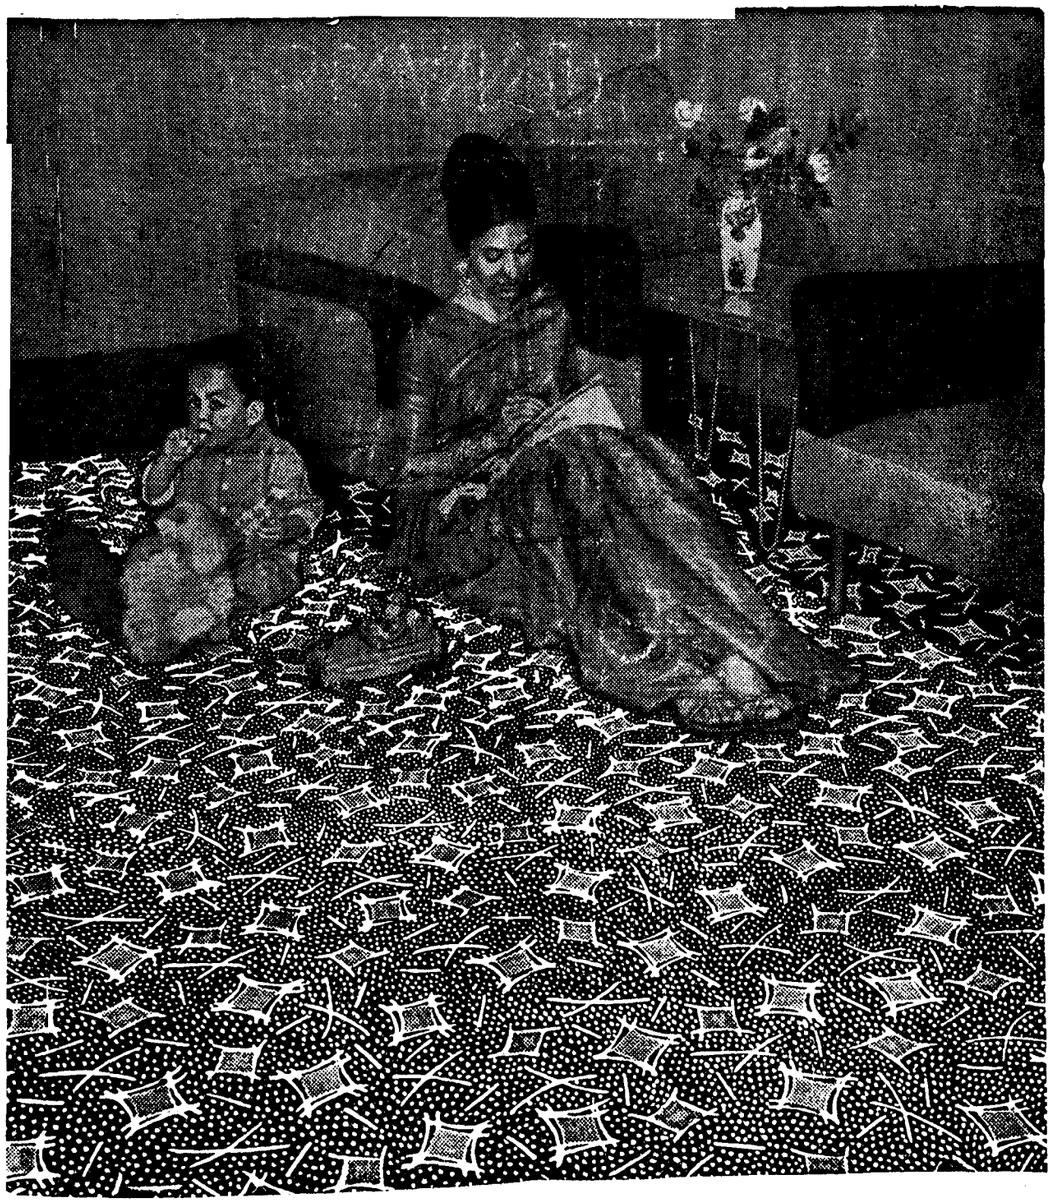
The Sugar Industry in Maharashtra

By CROESUS

THE unrealistic policies of the Maharashtra Government in respect of the sugar industry in the Deccan region are coming home to roost, but the worst is yet to come. Thanks to these unrealistic policies, Maharashtra has begun to lose, one after the other, the distinct advantages that it enjoyed at one time over other sugar-producing States. One of the main advantages that the State has been enjoying over the other sugar-producing States, for example, is its high per-acre yield of sugar. With the implementation of the Maharashtra Agricultural Lands (Ceilings on Holdings) Act, 1961, by the Maharashtra Government, however, sugar factories will be deprived of their extensive and very efficiently managed cane farms, the principal source of their raw material. Apart from the psychological effect of the uncertainty occasioned by the delay, on the part of the State Government, to make up its mind as to the machinery to be set up for the implementation of the provisions of the Act, there is genuine apprehension that the Ceilings Legislation would affect both the quality and the quantity of the cane produced. And, if and when this happens, it is bound to be reflected in the raw material prices of the sugar industry in the State. Now, it is common knowledge that raw material costs constitute nearly three-fourths of the total production cost in the case of the sugar industry. The only silver lining to the cloud of raw material (cane) costs, if any, is the recent announcement of the Government of India fixing cane prices based on sugar recovery. True, but, in so far as the Deccan sugar factories are concerned, this notification cannot make much difference, inasmuch as the Maharashtra Government has ere now been fixing cane prices in the State on recovery basis.

Another outcome of the State policy, namely, the indiscriminate licensing of sugar factories, mostly on co-operative lines, which has already begun to tell on the economics of the sugar industry in the State, is the loss of freight advantage which sugar factories in Maharashtra have enjoyed in the past. For Maharashtra has now become not only self-sufficient in sugar; it has become a surplus State. In view of these marked changes for the worse in the condition of the industry, it remains to be seen how long the present wage scales of sugar factory workers in Maharashtra — the highest in the country — can be sustained. It is not surprising, therefore, that Mr. F. Edwards, President of the Deccan Sugar Factories' Association (D.S.F.A.) should have told the twenty-third Annual General Meeting of that body, last Monday, that "the competitive capacity of the sugar factories in this State vis-a-vis sugar factories in the other States will be taxed severely."

A third aspect of the State's unrealistic sugar policy is reflected in the inordinate delay of the Maharashtra Government in refunding the cane cess on exported sugar. It may be remembered that, in order to reduce the loss incurred by sugar factories in exporting sugar to foreign countries, the Government of India had agreed to the refund of cane cess in respect of all exported sugar. Accordingly, all the other concerned States have refunded the cess but not so the Maharashtra Government. To quote Mr. Edwards, "it is a matter of deep regret, however, that the Maharashtra Government have not still refunded the cane cess amounts to the factories on sugar exported during the year 1958-59, 1959-60 and 1960-61. Prolonged correspondence with the State Government has only evoked a response that the State Government are seeking clarification on certain points from the Central Government and the refund would be made after the clarification is received. The matter has remained unsettled for more than three years and it is a sad commentary on Government administration."



This is not only a sad commentary on the administration of the State Government but also on the authorities at the Centre who seem to be content with only passing laws and making announcements but not caring to ensure that these are properly and effectively implemented. No country which is in such dire need of augmenting its exports could afford to let so much delay in refunding cane cess and thereby jeopardising future exports of sugar. In this case, the State Government, which has not exactly bothered to utilise the proceeds of the cane cess for the specific purpose for which the cess was avowedly introduced, has even less justification to withhold the refund as directed by the Government of India.

So much for the sugar industry in Maharashtra. But Mr. Edwards had some important observations to make on sugar problems affecting the country as a whole as well. By reason of the fact that the main problem which the sugar industry in the country is confronted with today is the disposal of surplus sugar, Mr. Edwards made two pertinent observations, both affecting sugar exports. Observing that the sugar cost structure is very rigid — and this cannot but be conceded when "the cane price, which accounts for nearly three-fourths of the total production cost, is controlled by Government" and "the wages of labour (representing 9.15 per cent) are regulated by the Wage Board" — he declared: "The only way to bring down the sugar cost is by reduction in the present high excise duty." As he rightly remarked, the excise duty on sugar was increased in 1957 by Rs. 4.20 per maund to Rs. 10.70 per maund with the specific object of restricting internal consumption so that larger supplies of sugar might become available for export, but the position has since radically changed, and "there is now no justification for continuing the excise duty at the enhanced rate."

An even more important and timely observation of Mr. Edwards relates to the feasibility of producing raw sugar for export. He was no doubt provoked to give public expression to his views because of the reported good prospects for export of raw sugar to many countries in the world, particularly Canada and Japan, and the rosy chances of long-term contracts with those countries. These reports have since taken an even more positive form, by way of a deal which is reported to have been finalised, last week, between the Indian Sugar Mills' Association and the State Trading Corporation for exporting 200,000 tons of raw sugar between December 1962 and March 1963 (i.e. during the coming sugar season). Before a final decision is taken in

WIPE YOUR FEET

To most people mud is something to be got rid of, a nuisance. Not so to the oilman. His mud—a specially prepared mixture of clay and chemicals—is an essential aid to drilling. Pumped down the well, inside the drill pipe, it flows through holes in the cutting bit and works its way around the outside of the pipe up to the top of the hole. It flushes out the rock cuttings (which give valuable geological information) and keeps the drilling bit cool. It lines the walls of the hole with a protective coating of mud helping to prevent them from caving in. And by its weight it reduces the risk of blowouts which might wreck the drilling outfit.

The safe and satisfactory completion of an oil well calls for a high degree of skill. Great care is taken to keep the well under control at all times, and a gusher—a well out of control—is a rarity.

this behalf, the interests concerned would do well to heed the warning of the D.S.F.A. President that "the question requires to be very carefully considered, since a wrong decision would only create new problems without solving old ones." He was fully justified in sounding such a note of caution, because, as he said, all the sugar factories in the country are equipped to produce only white sugar and a change-over to raw sugar would necessitate alterations and additions to the existing machinery equipment, not to speak of the foreign exchange expenditure that might be necessary. Again, as he said, in the absence of refineries in India, all the raw sugar produced would have to be exported. As raw sugar deteriorates very quickly, steps would have to be taken to ensure its speedy export, besides, of course, the construction of special storage godowns. Hence Mr. Edwards' considered conclusion: "It is, therefore, very doubtful whether, in these circumstances, sugar factories in India would be able to produce raw sugar as cheaply as other countries, where factories are equipped to produce raw sugar exclusively". It may be recalled, in this connection, that an effort was made in this country, a few years ago, to start a refinery to refine imported raw sugar, to begin with, and manufacture raw sugar indigenously later on, but discussions about the feasibility of producing raw sugar in the country proved abortive and the plan had to be given up.

Business Notes

E.R.I.C.

STEADY EXPANSION

SINCE ITS establishment, five years ago, the Export Risks Insurance Corporation (ERIC) has been making steady progress in covering export credit risks and thereby helping to foster the export trade of this country. May be, the absolute figures of our total annual exports do not clearly reflect the extent of the precise contribution made by the ERIC towards our export trade, but there is sufficient evidence, it would appear, to establish that, in the case of new industries which have begun to export, the ERIC has been playing a very useful role. Its role should be equally effectively felt in the coming years when small-scale manufacturers enter the export field in an organised way, as the ERIC will extend its activities to cover these interests as well.

During the short span of its existence, the ERIC has introduced a number of policies. Thus, the issuing of "shipments comprehensive" and "contracts comprehensive" risks policies was followed by the introduction of policies to cover the risks involved in increases in freight and insurance charges. Towards the end of 1960, the Corporation began issuing packing credit policies to cover risks involved on advances made by the banks and other financing institutions to exporters to enable them to manufacture or purchase goods for the purpose of exports. These policies were followed by manufacturers' credit policy to cover risks involved in manufacturers supplying goods to exporters on credit terms and also by the market development policies to enable exporters to develop the foreign markets.

In addition to these, the ERIC has made recommendations to the Government to permit the Corporation to introduce two new policies, one for providing export finance facilities to small-scale exporters and another for advances to small-scale manufacturers. When every possible effort is being made to boost up our exports, these additional facilities should encourage a large number of small exporters and small manufacturers to expand their export business. As this section of the trade finds it difficult to get bank facilities, it is hoped the new scheme now proposed would enable them to approach the banks backed by the insurance cover received from the ERIC and secure the required accommodation.

The steady increase in the actual business of the ERIC already and the proposed extension of its activities have prompted the Corporation to extend its customary risk-covering period of three years to five years. For the same reason, the ERIC has also sought the permission of the Government to allow it to double the present permissible ceiling of export credit risk of Rs. 25 crores to Rs. 50 crores.

At a Press Conference last week, Mr. Kapur reviewed the latest half-yearly progress of the ERIC, and also disclosed the new schemes contemplated to be taken up by it as above. Thus, in the first half of the current year, the Corporation has issued 231 policies with a maximum liability of Rs. 6.17 crores, as against 166 policies with a maximum liability of Rs. 4.39 crores for the same half-yearly period of last year.

Banking

RISE IN DEPOSITS AND LIQUIDITY RATIO

PERHAPS THE most important task that the banking system in the country is faced with today is that of mobilisation of savings. It is estimated that, as against the total private investment required under the Third Five-Year Plan of Rs. 4,300 crores (including Rs. 300 crores of external assistance), the additional demand for bank finance is of the order of Rs. 1,300 crores or roughly 33 per cent. The additional deposits that would have to be gathered by the banks if this demand is to be met has been estimated at Rs. 1,850 crores, that is on the assumption that bank advances would be maintained at around 70 per cent of the deposits. As was pointed out by Mr. Tulsidas Kilachand, Chairman of the Indian Banks' Association (I.B.A.), this would represent a rate of growth in deposits of around 20 per cent per annum, as against only 3.7 per cent, and 12.6 per cent per annum achieved during the First and the Second Plan periods, respectively. To step up the rate of deposit growth to 20 per cent would undoubtedly be a most arduous task, as evidenced by the fact that aggregate deposits of scheduled banks rose by only 7 per cent in 1960 and by 11 per cent in 1961. This is as things stand today, but if the higher liquidity ratio proposed by the Reserve Bank of India were able to be brought into operation, it is doubtful, as Mr. Kilachand opined, whether even the 20 per cent increase in deposits would do to reach the Rs. 1,300 crores figure.

Speaking at length on this aspect at the three-day Indian Banks' Seminar, the first of its kind to be convened in the country, last week, in Bombay, the I.B.A. Chief suggested certain measures to meet the demand: namely (i) expansion of branches into areas where banking facilities are non-existent or inadequate (there are still some 1,400 small townships without any banking offices); (ii) better service to customers, and (iii) tax concessions to stimulate growth of savings bank deposits. In order to implement these, Mr. Kilachand rightly underlined the need for certain other measures also, to be taken up simultaneously, such as facilities for training personnel to man the new branches.

The absence of a well-organised credit information agency to collect up-to-date information as regards the

financial and business status of individuals and firms in the country, was another important point touched upon by Mr. Kilachand in his address. As he observed, the existence of an agency for collecting and analysing such data would be of immense use to the banks in processing applications for credit, a work that needs to be done quite regularly and systematically. Although individual banks have been doing something in this connection, it is known that the collection of information on the business standing of individuals and firms by individual banks has not only remained exclusive, the data so collected also has been too general or too inadequate. This is a lacuna that does little credit to the Indian Banking industry. In this connection, Mr. Tulsidas referred to the existence of several private agencies in the U.S.A., such as Dun and Bradstreet Inc. and Robert Moris Associates, which collect information and supply credit reports to subscribing banks and wanted the possibility of organising an agency on similar lines for the benefit of banks in India to be explored.

Suggesting that a five-year plan be drawn for the development of banking in the country, Mr. S. G. Barve, Finance Minister of Maharashtra, said, in his inaugural address, that, in view of the imperative need to develop banking habit in the country, the bankers should take banks to remote and uncovered areas in the country. He said it was rather curious that, whereas there was cut-throat competition among banks in certain areas, the coverage still remained inadequate. Adverting to the crucial role of banks in the rapid industrialisation of the country, the Maharashtra Finance Minister suggested that at least five per cent of the funds with the banking system needed to be earmarked for term-lending. It is only thus, he opined, that the scope for industrial development could increase in the country. Mr. T. D. Kansara, General Manager of the Bank of India, who participated in the Seminar, observed that the banks could even give 10 per cent of their deposits for term-lending, provided the liquidity of the banking system was assured. But this would only be possible if there are assurances that larger borrowing limits would be permitted by the Reserve Bank.

Goa

A TECHNO-ECONOMIC STUDY

GOA, TILL lately a colonial possession of Portugal, is known for its rich mineral resources. But this has not helped remove the backwardness of this region, whether in the agricultural or in the industrial sphere. According to the Study Team, sponsored by the Central Small-Scale Industries Organisation, which has gone into this question, this is the outcome of two factors: (i) hitherto, the exploitation of the mineral resources of the territory was undertaken by the erstwhile Portuguese Administration solely for purposes of export; (ii) adequate power supply, sufficient technical skill and necessary administrative structure were not there to foster a bold programme of industrial development.

The Study Team has made comprehensive recommendations and outlined a detailed plan for rapid industrialisation, on the one hand, and suggested certain measures to bring about self-sufficiency in food production, on the other. Besides, the Team has suggested the establishment of a Department of Industries in Goa and an Institute at Margao for training technical men. The present prohibitive power rates charged in Goa are a reflection of the shortage of power, as also an indicator of the need to make power available at cheaper rates to facilitate rapid establishment of industries. In order to stave off the present power crisis, the Team has recommended that Koyna power should be made available, and Maharashtra is only too willing to oblige, with an eye on the future. Further, it has also suggested the harnessing of the power potential of Dudsagar and Eravalem Falls.

With regard to the question of the establishment of large-scale industries, the Team has favoured the setting up of pig iron furnaces and manufacture of industrial chains, welding electrodes, and chemicals. The Team has also a plan for establishing twenty-four small-scale industries to manufacture clocks, mechanical toys, machine tools, electrical accessories and boat building and repairing, among others. It is in this context, incidentially, that the Team has suggested the establishment in Goa of a unit of the Geological Survey of India and the Bureau of Mines for the proper exploitation of minerals in the region.

As regards food and fruit production, the Team has suggested immediate measures to step up rice output as also to encourage the production of more fruits and commercial crops. The proposed measures are intended not only to bring about self-sufficiency in these fields but also to provide adequate surpluses to be made available for exports. In this connection, the Team has called for every possible aid from the Government to the fruit preservation units, so as to enable them to maintain their exports. Aid has also been recommended to units engaged in the extraction of oil from cashew-nut shells, for which there is a potential buyer in the Indian paint industry. The Team has further recommended the establishment of a small emporium for exhibiting and publicising the various handicrafts of Goa, such as metalware, clay modelling, shoe, embroidery and bamboo handwork. All these are no doubt valuable suggestions, but they need ample funds before they could be effectively implemented. It is here probably that the Report of the Team has failed to make specific and concrete recommendations. To say that banking facilities should be provided and financial institutions should be created, as reported in the daily Press, is too broad a generalisation which will not carry one very far.

Fertilizers

ERRONEOUS CALCULATIONS

THERE SEEMS to be some mystery about Government's calculations on achieving the Third Plan target for nitrogenous fertilizers. In June last — to be precise, on June 12, 1962 — the Deputy Chairman of the Planning Commission, Mr. G. L. Nanda, told Parliament's Consultative Committee on Planning that no more than two-thirds of the Third Plan fertilizer target could be expected to be achieved by 1965-66. This presumably was stated after a review of the Plan's progress. Barely 10 days later, however, Mr. Nanda, staged a complete turn-about and emphatically announced that the fertilizer target would be fully achieved. What happened in the meanwhile to justify this volte-face? It is understood the Planning Commission's Deputy Chairman had received some assurances from the Ministry of Steel and Heavy Industries to the effect that foreign technical and financial collaboration had been secured for the Hanumangarh project, in Rajasthan, and West Bengal Government's project at Durgapur, the dispute over the site of the Visakhapatnam project was over and that the collaborators for these projects were confident of completing them in a period of 18 to 24 months.

On the face of it, all this should suggest that the fertilizer target would be achieved. But if one goes by the U.N. Fertilizer Mission's Report, submitted to the Government of India last year, the optimism shown by the Ministry of Heavy Industries appears to be grossly misplaced. This Mission, after a detailed study of project planning in India, had reached the conclusion that the various stages of execution of a fertilizer project in this country took as many as 52 to 71 months, as

Kumardhubi the largest single refractory manufacturing unit in the East supplies

REFRACTORIES FOR INDIA'S VITAL INDUSTRIES

Half a century of experience, intensive research, expert advisory services, modern equipment and quality control at every stage of production... these factors contribute to the unsurpassed excellence of KUMARDHUBI REFRACTORIES... Refractories indispensible to the Steel, Ceramic, Chemical, Sugar, Cement and other major industries.

KUMARDHUBI firebricks, Silica bricks, Sillimanite bricks, Insulating bricks and bonding materials are economical too...they last longer and stand up better to variations in temperature—saving replacements costs and time.

KUMARDHUBI'S modernisation and expansion programme ensures the nation a consistent supply of the finest refractories—in regular shapes and sizes or to specification—to meet India's industrial advancement during the Third Five Year Plan.

Vital supplies for growing industry!

Wherever in India new projects, new industries, new enterprises are being launched, you will find the quality goods and services supplied by Voltas. Industrialists have learnt from experience that quality machinery and equipment are indispensable for efficient operation in industry. They have learnt too that the merchandise distributed by Voltas—whether it be a mighty hydraulic press or a minute spindle—is absolutely dependable in quality and performance.

Briefly, Voltas' activities comprise:

- **Marketing and Distribution of goods:**
  Representing leading manufacturers, both foreign and Indian, Voltas supplies a wide range of goods—Electrical, Mechanical, Air Conditioning and Refrigeration, Textile and Paper Machinery, Agricultural and Construction Equipment, Machine Tools, Pharmaceuticals, Chemicals, Bulk Vitamins, Plastic Raw Materials, Processed Foods.
- **Manufacture and Development:**
  Air-Conditioners, Water Coolers, Switchgear, Farm Implements, Drilling Machinery...and the list is growing!
- **Service:**
  Voltas after-sales service is a by-word in India. Voltas sales are fully backed by its nation-wide service and spare parts organisation.

Where quality equipment is demanded VOLTAS IS THERE

against 35 to 47 months required according to global norms. The following table, based on the U.N. Mission's report, clearly shows that the minimum normal time needed for setting up a fertilizer plant, after calling the tenders, is 28 months. How the Planning Commission should be taken in by the Heavy Industries Ministry's claim that the Hanumangarh, Durgapur and Visakhapatnam projects would be completed within a period of two years is something which passes comprehension:

Phasing of the Project	Approx. time taken by Govt. of India (months)	Normal time period (months)
1. Preliminary analysis of project report and initial decision to proceeds with the project	5 — 7	4 — 5
2. Preparation of tenders, preliminary process and specifications, etc.	3 — 4	3 — 4
3 Contractors' project bids, review of bids and final decision to construct the factory	12 — 20	4 — 8
4. Ordering, construction and start-up	32 — 40	24 — 30
TOTAL	**52 — 71**	**35 — 47**

In the case of Hanumangarh project, a fundamental decision has also yet to be taken. It refers to the principal raw material and the source of power on which the project is to be based. The original idea of basing this project on Rajasthan gypsum is reported to have been given up. It is now proposed to base this project on petroleum naphtha. But where from is this naphtha to come? It may not be available from the proposed Koyali Refinery before the end of the Third Plan. Is the country in a position to spend foreign exchange on its imports? About power, the U.N. Mission had suggested that to base this project on coal would be a costly proposition, since coal had to be brought from long distances and there were transport bottlenecks in the way. The alternative fuel which the Mission had suggested, namely gas, can be available from Gujarat oil-fields. But the transportation of this gas to Hanumangarh is not included in the plan for utilisation of Gujarat areas gases. Until and unless firm decisions about these two issues are taken, it is obviously hazardous to say that this particular plant can be commissioned into production during the Third Plan period.

In the face of the above facts and the uncertainty about completing three other fertilizer projects, namely, Itarsi, Neyveli and Gorakhpur projects, according to schedule (the licensee for the Itarsi project is reported to have returned his licence and the other two projects are running behind schedule by about a year and half), it requires no second thoughts to say that nitrogenous fertilizer output by the end of the Third Plan is sure to fall considerably short of the planned target, despite the fact that the installed capacity allowed to be set up is in excess of the target fixed. If the country, therefore, is to be made self-sufficient in food during the current Plan period — Mr. Nanda observed recently that if the country was not made self-sufficient in its food requirements by the end of 1965-66, he would consider it a failure of planning in India — it is obvious that arrangements should be made for importing more fertilizers. The recent barter deals for importing fertilizers in exchange for sugar are a step in the right direction and ways and means should be explored to augment fertilizer supplies further. This is necessary in view of the key role fertilizers are to play in keeping the granaries filled with indigenous production when the massive imports under P.L. 480 cease in 1964.

New Issue

METAL DISTRIBUTORS LTD.

METAL DISTRIBUTORS LIMITED, CALCUTTA, will be entering the market shortly to raise equity capital to the tune of Rs. 45,90,160. Of this, capital worth Rs. 6,70,160 is envisaged to be taken up by the directors of the company and their friends. The balance Rs. 39.20 lakhs worth capital is proposed to be offered to the public for subscription in the form of equity shares of Rs. 10 each. The company being a going concern, the new shares will be entitled to dividend from the current financial year which began on November 6, 1961. They will rank pari passu with the existing shares in all respects except that the dividend to be paid thereon will be proportionate to the amount of the capital called up.

The proceeds of the issue are to be utilised for financing the expansion programme of the company, which includes not only furthering of its present activities of supplying non-ferrous metals to the fabricating industry in the country, but also setting up of two new ventures for the manufacture of non-ferrous metals and some finished products from them.

The two new companies which have been organised by Metal Distributors are: (1) Multimetals Limited which will be manufacturing copper alloy rods, tubes, section etc.; and (2) Cominco Banani Zinc Limited which is envisaged to undertake production of electrolytic zinc and its by-products.

The copper products plant is to be put up at Kotah, in Rajasthan. It will have a capacity to turn out various copper products to the extent of 1,800 tons per annum, single-shift basis. Multimetals has also been given a licence to produce 5,000 units of copper printing rolls for the textile industry. These rolls are also proposed to be manufactured at the Kotah plant. Technical collaboration for this project has been arranged with the U.S. firm, Revere Copper and Brass Incorporated, New York. The foreign collaborators will also participate in the equity capital of the Indian venture to the extent of Rs. 25 lakhs. Arrangements have as well been made to obtain a loan of Rs. 54.64 lakhs from the Development Loan Fund to meet the foreign exchange cost of the project. This plant is expected to be commissioned into production in the second half of 1963.

The zinc plant is to be set up near Cochin, in Kerala. It will have a capacity to produce 20,000 tons of electrolytic zinc per annum and 130 tons of by-products (sulphuric acid) per day. Technical collaboration for this project has been arranged with Consolidated Mining and Smelting Company Ltd. of Canada. The Canadian firm will also participate in the share capital of this venture to the extent of Rs. 84 lakhs, which will presumably be utilised for financing the im-

port of machinery. The Canadian Export Credit Insurance Corporation has agreed, in principle, to provide a loan to cover foreign exchange requirements of the project over and above the share capital to be subscribed by COMINCO.

The present paid-up capital of Metal Distributors Limited is Rs. 34.10 lakhs. The company's turnover during 1960-61, when its paid-up capital was Rs. 24.36 lakhs, amounted to Rs. 7.81 crores. In this year, its net profit was Rs. 9.57 lakhs, out of which a dividend of 27.5 per cent was paid. The company has also substantial interest in Metal Distributors (U.K.) Limited.

Corporate Finance

A REVIEW : 1956-60

THE RESERVE BANK OF INDIA Bulletin for the month of June 1962 has made available an analysis of the finances of Indian Joint Stock Companies for the Second Plan period, 1956 to 1960. It is now possible to see in one sweep the performance of the corporate sector during the Second Plan in so far as the rates of growth of the major components are concerned. The growth in the paid-up capital plus free reserves i.e. net worth started with a very high rate of 9.5 per cent in 1956. With the progress of the Plan, it started declining and touched the low figure of 5.1 per cent in 1958. It again started picking up and in 1960 it finished at 8.3. Broadly, this major indicator shows that 1958 was the worst year for the corporate sector. This was mainly a result of poor performance in profits in 1957. Profits before tax in 1957 indicated a fall and this had an adverse effect on capital formation for 1958. All the major indicators in 1958 bore the impress of the failure of the industrial sector in 1957. By and large, it was the failure in the cotton textile industry (211 units out of 1001 in the present Study) which was primarily responsible for the downturn. Sales also, in a similar pattern, started declining in 1957 and the lowest rate of growth was witnessed in 1958.

The results of 1960 as compared to 1959 show a slight deterioration in the sense that the provision for dividends as a percentage of profits before tax has shown a decline. The retained profits also have suffered a similar fate because the provision for taxation had to be enhanced. This new pattern of distribution of profits before tax has emerged because of the increase in raw material costs and other manufacturing expenses. Whereas in 1959 raw-materials and other manufacturing expenses claimed 53.9 per cent of the total expenditure, the percentage for these components rose to 55.2 in 1960. Salaries and wages claimed a slightly lower proportion. Even excise duty in percentage terms indicated a decline. These relative pressures of the various influences on the cost structure show that the industry is gradually facing an increasing burden from rising costs of raw materials and other manufacturing expenses. This is the central finding of the analysis. Unless something is done to arrest the rising cost of raw materials as well as manufacturing expenses, there seems to be no possibility of reducing the cost of manufactures so as to provide relief to the consumers and to make our products competitive in the international markets.

Offices at:

NEW DELHI • BOMBAY • CALCUTTA • AHMEDABAD • COIMBATORE

marketing tea. In addition, the company has under consideration several new projects as part of its expansion and diversification programme. The principal ones among these are: (i) the setting up of a new factory near Ghaziabad, in U.P., and equipping it with the latest type of machinery for the manufacture of soap and glycerine; (ii) a plant for the manufacture of fruit juice, fruit and spice flavours in powder form in technical collaboration with a Japanese firm; (iii) a solvent extraction plant at Tatapuram for extraction of oils from rice bran, cottonseed, coconut cake etc., (iv) a synthetic detergent plant at Bombay, and (v) modernisation of certain plants and equipment in order to keep abreast of the latest technological improvements.

The total estimated capital expenditure (including working capital) on these projects over the next few years is Rs. 3.50 crores. Of this, Rs. 2.50 crores are expected to be provided by the company from internal resources and borrowings. The deficit of Rs. 1 crore is intended to be partly met by the immediate issue of 140,150 equity shares of Rs. 25 each at a premium of Rs. 15 per share to the existing shareholders in the ratio of one share for every two ordinary shares held. (This will provide a sum of Rs. 56.06 lakhs). The balance is intended to be met by the issue of additional debentures of the value of Rs. 50 lakhs, carrying interest at 6½ per cent, subject to tax.

The authorised capital of Tata Finlay will be Rs. 1 crore, but the subscribed capital for the present will be restricted to Rs. 50 lakhs. Out of the Tata's holding of 51 per cent in the capital of this concern — the balance being held by James Finlay and its associates — TOMCO directors have decided that they should subscribe 21 per cent of the subscribed capital and should be appointed the sole selling agents of the company.

In his statement, circulated along with the directors' report, Mr. J. R. D. Tata, Chairman of Tata Oil says that this venture will eventually prove a valuable and profitable addition to the company's range of activities. The factory of Tata Finlay, to be located in Bangalore, will have a capacity to pack 10 million lbs. of tea in a single shift and will be the most modern in India when it goes into production by the end of 1963.

Managing Agencies

A REVIEW

AFTER THE first five years of the working of the Companies Act of 1956, the managing agency system appears to have attuned itself to the new climate of discipline and controls created by the Statute and through various other administrative measures. All managing agency agreements now in force are said to have been scrutinised in the light of the new norms formulated under the Companies Act, 1956.

The decline in the number of managing agencies and their managed companies is said to have been occasioned by the administration of this Act. Before the Act came into force, there were as many as 4,000 managing agencies which managed over 5,000 joint stock companies. At the end of 1960-61, there were less than 1,000 managing agents managing about 1,400 companies. The reduction in the number of managing agencies and their managed companies is in accordance with the provisions of the Act under which "fit and proper" persons are to be appointed as managing agents after detailed examination of facts by the Government in consultation with the Advisory Commission.

As regards the tenure of managing agents, practice has been established to allow a term of 10 years in the case of first appointment and of 5 years in the case of reappointment. Even the ten-year initial term is liable to be reduced in appropriate cases where the gestation period required by a company is not long. The introduction of a sliding scale of remuneration is designed to bring about a progressive reduction in the remuneration of managing agents in cases where the annual net profits of the managed company exceed Rs. 10 lakhs. In regard to payment of guaranteed commission, the policy adopted by the Government is intended to close an obvious source of needless expenditure to managed companies, but encouraging result has not been achieved because of the traditional practice of many lending and credit institutions asking for a guarantee from the managing agents. Commission on sales and purchases and payments for various miscellaneous services said to be rendered by managing agents have been controlled under the Act.

Under the Companies (Amendment) Act of 1960 the provisions relating to the remuneration of managing agents were further amended in order to regulate the payments to the managing agents and their associates by the managed companies. Under the amended Act any separate payment to the partners of a managing agency firm or to the directors and/or members of a managing agency company shall be deemed to be included in the remunerations of the managing agents. Certain anomalies in the calculation of the managing agency remuneration have also been removed by the amended Act. The managing agents' power to nominate the Chairman of the Board of Directors of the managed company has been withdrawn.

FROM THE CAPITAL'S CORRIDORS

GUJARAT PIPELINES PROJECTS

A SCHEME for laying a network of pipelines in the Gujarat area, involving an outlay of Rs. 6 crores, is now being considered by the Union Government. These pipelines are meant for (a) transporting crude oil from the Ankleshwar and Kalol oilfields to the Koyali refinery; (b) transporting the refined products from the refinery to Ahmedabad, a principal centre of consumption and distribution; and (c) for the utilization of associated and other gases produced in the oilfields.

The table below gives the details of the six pipelines that have been proposed.

The foreign exchange component of these projects is estimated at Rs. 1.5 crores. It is expected by the Union Mines and Fuel Ministry that this will be available from the ENI credit. In fact, it is being said that the Italian Government and the ENI authorities are agreeable to finance this pipeline network. They are even willing to transfer to these projects any foreign exchange that they may save on the projects which are already being financed by the ENI credit.

In the Third Five-Year Plan, a total provision of Rs. 41 crores has been made for the pipeline programme. Of this amount, only Rs. 4 crores are to be used for crude oil pipelines. The remaining Rs. 37 crores are for product pipelines.

A survey is already being conducted for laying a product pipeline from the Barauni refinery to Calcutta and Delhi. Another product pipeline is to be laid from the Noonmati refinery to the Siliguri distribution centre. Both these projects are already covered by the ENI credit. According to present estimates, the first project will cost Rs. 24 crores, and the second between Rs. 6 crores to Rs. 8 crores.

According to the Fuel Ministry, therefore, enough funds are available under the Plan to accommodate the Gujarat pipeline network.

AVAILABILITY OF NATURAL GAS IN GUJARAT

The Ministry has also argued that there is at present a "most urgent need for the maximum and immediate utilization of the associated and non-associated gases which are likely to be available in Gujarat." By the middle of 1964, or at the latest by the end of that year, the total availability of natural gases in the area will be 1,000,000 c.m.d., which is equivalent to 28.5 million cubic feet per day or to 1,000 tons per day in terms of coal.

According to the Ministry, the gas from Cambay has already been committed for the Dhuvaran power house, which is being built by the Gujarat Electricity Board, and the Ankleshwar gases for the Uttran power house. In order to keep wasteful flaring of natural gases in the area to the minimum, the Ministry says, it is necessary to have gas pipelines at the earliest possible date, and in any case before the middle of 1963.

As a result of the discussions between the Oil and Natural Gas Commission and the Gujarat Electricity Board, it has been decided that the price of gas would be equated to the price of residual fuel oil on a thermal value basis. On this basis the sales per year on the gas pipeline would amount to as much as Rs. 3 crores on a maximum throughput capacity. Even if the throughput is much less than the maximum envisaged, the price now agreed to would be quite profitable, according to the Fuel Ministry.

Much of what the Ministry says is undoubtedly correct. But a closer examination reveals that the gases available from the Gujarat oilfields will not be enough to meet the entire needs of the power stations to which they are being assigned. Consequently, the problem of coal movement to these power stations will remain.

PIPELINES PROPOSED FOR GUJARAT AREA

Pipeline	Distance	Product to be transported	Maximum capacity	Date of completion
1. Ankleshwar - Uttran	30-35 miles	Natural gas from Ankleshwar to Uttran powerhouse	400,000 c.m.d.	February, 1963
2. Cambay - Dhuvaran	12 miles	Natural gas from Cambay to Dhuvaran power house	250,000 c.m.d.	April, 1963
3. Kalol - Ahmedabad	12-15 miles	Natural gas from Kalol to Ahmedabad	350,000 c.m.d.	June, 1963
4. Ankleshwar Koyali	70 miles	Crude oil from Ankleshwar to Koyali refinery	2,000,000 tons/yr.	June, 1963
5. Kalol - Koyali	70 miles	Crude oil from Kalol to Koyali refinery	2,000,000 tons/yr	December, 1963
6. Koyali - Ahmedabad	60 miles	Refined products from Koyali to Ahmedabad	8" to 10" pipeline	September, 1964

What is more, these power stations will have to make necessary adjustments in their equipment so that they can use either gas or fuel oil or coal.

Another snag is that at some stage, the power stations will find it profitable to use residual fuel oil from the refineries rather than gas. In such an event, a realignment of the pipeline network may become necessary.

AID PROSPECTS

With the return of the Union Finance Minister, Mr. Morarji Desai, from his tour of the West European countries, optimism is growing in official circles here that the shortfall of 220 million dollars in the contribution of the Aid-India Club members other than United States vis-a-vis the U.S. contribution of 500 million dollars for the second year of the Third Plan, will be by and large made up at the next meeting of the Consortium scheduled to be held on July 30. Part of this gap is envisaged to be filled by the World Bank stepping up its assistance by about 50 million dollars.

West Germany, which had been hitherto reluctant to raise its contribution from the level originally intimated by it to the Aid-India Club, is understood to be resiling from this position; some extra assistance from this country is now expected. The United Kingdom also is understood to be willing to step up its contribution. The remaining gap is envisaged to be filled by the entry of Italy, Belgium, the Netherlands and Austria into the Consortium and some more aid being available from Japan and France.

RUPEE RESOURCES FOR THE PLAN

As a sequel to an examination made by the Planning Commission recently of the balance sheets of all the public sector undertakings, it is now feared that an important source of rupee finance for the Third Plan will partly dry up. The examination has shown that on the basis of the performance so far most of the public sector undertakings would be yielding a return of about six per cent on their share capital by 1965-66. But this excludes the State-owned steel plants in which more than half of the total investment of the public sector is locked up. Although all efforts are being made to speed up production at the public sector steel plants, the shortfall that has already resulted in the production of these plants is going to lead to a considerably smaller accrual of resources from the public sector undertakings for financing the Third Plan.

The Planning Commission had envisaged that as much as Rs. 450 crores would be available from surpluses of public sector enterprises, other than the railways, for financing the current Plan.

The Commission, however, feels heartened by the fact that the States are showing promise of raising more resources than was thought early this year. Optimism is growing in the Yojna Bhavan that the States would be able to fulfil their commitments in regard to raising of resources for financing the Third Plan. The only exception appears to be the Jammu and Kashmir State whose resources for the Plan were discussed last week. Kashmir's 1962-63 Plan envisages an outlay of Rs. 16 crores. The State Government's effort to raise about Rs. 1 crore in a full year from fresh taxes is obviously not commensurate with the needs of its Plan. Central assistance amounting to no less than Rs. 14 crores will, thus, have to be provided if the State's current annual Plan is to be seen through.

But even these figures are misleading because they hide one very important fact that during the recent years, Jammu and Kashmir State has defaulted in payment of interest on Central loans. If the arrears of this liability were added to the State's this year's budget, its entire 1962-63 Plan would have to be financed by the Centre. The Planning Commission has generally allowed the State to spread the payment of arrears of interest over a number of years.

RURAL INDUSTRIES PROJECTS

A two-day Conference on Rural Industries Projects held here last week-end endorsed the objectives and approach of the scheme for promoting intensive and integrated development of small industries in rural areas as part of an all-round and well co-ordinated plan of original development.

The scheme envisages progressive extension of small industries to rural areas as a solution to the problem of employment and as one of the means of raising the standard of living.

The Conference approved the launching of 42 rural industries projects in the States and 4 projects in the Union Territories. Additionally, a few projects will be set up in the vicinity of the large industrial projects so as to achieve integrated industrial-rural development. The original scheme envisaged setting up of 40 projects only, but the number was increased owing to pressing demand from States.

A beginning is expected to be made by starting rapid techno-economic surveys of the selected project areas in October next. These surveys are to last not more than 3 months and will be the basis of decisions regarding the content of the area development programme. While in the first year about 46 projects will be initiated, it is expected that as experience is gained more such projects would be set up during the remaining years of the Third Plan.

An organisational structure for planning the programme, providing policy guidance and implementing it at various levels has been designed. The Rural Industries Planning Committee of the Planning Commission will be the top planning body and will be assisted by a Standing Committee. At the State level, advisory committees with Chief Minister or Minister of Industries as chairman are being set up to guide and supervise the implementation of the programme. The main brunt of executing the scheme will fall on the Project Officers who will be assisted by Project Committes. It is intended that non-officials who have already been working in the field of small industries should be closely associated with the project committees and wherever possible should function as project officers also.

Each project would be able to draw funds from the State Plan and the all-India Boards, loans and credits from financial and co-operative institutions and under the State Aid to Industries Acts. Additional funds would also be given to the projects as its own nucleus. To start with an assured minimum provision for each project of Rs. 20 lakhs will be made available to cover the four-year period, 1962-63 to 1965-66, over and above the present allocations under the Third Plan. Besides Rs. 8 crores for 40 projects, there will also be provision for contingent fund of about Rs. 7 crores. For the year 1962-63, a provision of Rs. 1 crore is being made in the first instance.

YEN CREDIT FOR SMALL INDUSTRIES

The Government of India has allocated a sum of Rs. 30 lakhs out of the Second Yen Credit to the National Small Industries Corporation for the import of plant and machinery from Japan for distribution to the small industrialists on hire-purchase basis.

The Japan Small Plant Committee, Tokyo, will assist the National Small Industries Corporation in obtaining reasonable quotations for Japanese plants and machinery of standard quality. The small industrialists of India will be able to choose the machines. The Japan Small Plant Committee will help in consolidation of small contracts by recommending a representative supplier who will obtain the export permits and undertake to fulfil other formalities required in Japan.

An agreement embodying the procedure to be observed in obtaining the quotations and for placing the orders has been signed.

IDA LOAN FOR PURNA PROJECT

The Internatioanl Development Association (IDA), an affiliate of the World Bank, has approved a development credit equivalent to $13 million to India to help complete a project to irrigate about 152,000 acres in the Purna River Valley in Maharashtra, and to provide a 15,000-kilowatt hydro-electric power station in the area. The project will, for the first time, introduce irrigated agriculture in a drought-stricken area in the Deccan Plateau.

This credit is the sixth that IDA has extended to India for irrigation and drainage projects during the past year. IDA credits $56.5 million are now assisting in the development of agriculture in widely scattered areas of India in the States of Punjab, Uttar Pradesh, Bihar, Orissa, Gujarat and Maharashtra.

EXPORT TRADE: QUALITY CONTROL AND PRE-SHIPMENT INSPECTION

An Export Inspection Advisory Council has been constituted by the Government to advise it on all matters relating to quality control and pre-shipment inspection of export goods. The Council, which has been set up after consultation with the Board of Trade, will particularly prepare an operational programme for quality control on export goods with priority for pre-shipment inspection measures.

The Special Secretary (Commerce) in the Ministry of Commerce and Industry will be the Chairman of the Council and Joint Secretary in the same Ministry (Department of International Trade) will be the Deputy Chairman.

The appointment of the Council is in pursuance of a suggestion made by the Ad-Hoc Committee on Quality Control and Pre-Shipment Inspection, which had been set up in November 1960, that the task of improving the quality of export goods would be facilitated if the Union Government had available to it the advice of persons intimately concerned with the day-to-day problems of quality control and with export promotion generally.

A GUIDE FOR COMPANIES

The Department of Company Law Administration has compiled a guide called "Guide for filling forms and making applications" under the Companies Act, 1956. It will be a priced publication and is expected to be put on sale all over the country very soon.

The publication seeks to provide useful information and guidance to those who may be required in course of the day-to-day working of joint stock companies to file returns or making applications under the various provisions of the Companies Act, 1956, and the rules framed thereunder. The experience of the Company Law Department has been that in filling such returns or making such applications, mistakes are often made or necessary information omitted. This entails avoidable correspondence and, hence, delay in the acceptance of the returns by the Registrar or in the disposal of the applications. The 'Guide' takes into account the common defects which have been noticed in the returns filed with the Registrars of Companies and the applications made to the Central Government and give examples to illustrate how the returns and applications prescribed under the Act should be filled in or made. The forms in which the different returns and applications are required to be submitted have been reproduced in full and filled in so that they may serve as models.

STREAMLINING COMPANY LAW ADMINISTRATION

Meanwhile, the Company Law Administration Department is trying to improve the current methods and procedures, adopted in dealing with the individual applications. Some time ago, target dates for the disposal of cases under the different sections of the Act were laid down for the guidance of section and branch officers. In the light of the experience gained during the last two years, the Department has recently reviewed the current procedures and has prescribed revised time targets for the disposal of the applications received by the Central Government under the different sections of the Companies Act. Every effort will be made to adhere to these target dates, provided the applications submitted to Government are complete in all respects and contain full information regarding the various items indicated in the prescribed pro formas and are accompanied by the requisite returns and other relevant documents. According to the revised targets, applications under several sections of the Act are expected to be finally disposed of within four weeks of receipt. In some cases, a period of 12 weeks is fixed.

To impart greater efficiency in its administration and to achieve the above end, the Company Law Department has embarked upon an ambitious scheme of training of its staff.

ECONOMIC UTILIZATION OF IRON ORE FINES

The Government of India is considering measures of economic utilization of iron ore fines, it is learnt here.

Pieces of iron ore of less than ¼" in size are generally known as fines. The fines cannot generally be charged into the blast furnaces. Sintering is the most common process used abroad for the economic utilization of such fines. In India, sintering plants have already been installed in the steel plants at Jamshedpur, Bhadravati and Bhilai. Rourkela will soon have a sintering plant whereas Durgapur and the proposed Bokaro steel plants will also have one each.

With the increasing mechanisation of large iron ore mines, the percentage of fines has increased recently. A special study made last year revealed that mines using mechanical equipment in the Bihar-Orissa area had already accumulated about 6 million tons of fines. Detailed laboratory tests are in progress in the National Metallurgical Laboratory and the Indian Bureau of Mines for assessing the characteristics of the iron ores specially from large mines. The tests will also reveal the economic feasibility of exporting fines, after treatment. At present, except for marginal quantities from Goa, no iron fines are being exported.

FICCI'S CONFERENCE ON NORTHERN REGION PROBLEMS

The Conference of the Federation of Indian Chambers of Commerce and Industry pertaining to the Northern Region, held here last week, spotlighted the problems faced by the industry and trade in this area on account of shortages in respect of transport, coal, power and raw-materials. The region suffers from a serious handicap in that it is situated away from the coal-fields as well as the principal port towns, which results in higher transport charges being incurred on bringing of some of the essential raw materials and for sending of finished products to the consumption centres. This handicap has not only pushed up the cost structure of industries in this region, but also hampered export promotion efforts. The Conference called for a many-sided action to overcome the difficulties emanating from this handicap and suggested that:-

(1) Concerted efforts should be made to improve the rail transport position so that coal can be moved to these areas speedily. Efforts should also be made to encourage the use of alternative fuel that is furnace oil. (The use of furnace oil in greater quantities will be possible only when adequate supplies are made available and the heavy excise duty is appropriately reduced);

(2) Intra-State and inter-State restrictions on road transport should be removed so as to ensure free movement of goods from one State to another;

(3) Railway freight concessions should be extended for movement of raw materials and finished goods from centres of production to those of consumption and/or onward despatch;

(4) Dry ports at two or three conveniently located centres should be set up — alternatively, the programme for setting up inland bonded warehouses should promptly be implemented.

The Federation is holding a conferece here in September to discuss the transport and power problems of the northern region. It was suggested at the last week's meeting that this opportunity should be availed of inter alia for detailed study and discussion on matters relating to power rates and levies thereon, especially those of hydro-electric, the basis thereof, the possibility of reducing these rates to industry which currently are heavily biased against it.

In the interest of export promotion, as much as in the interest of domestic consumers, the Conference felt manufacturers should be assisted to do all that is possible to improve the quality of their manufactures.

To alleviate the distress of small-scale industries which have made considerable progress in this region in the past few years, it was felt that raw material quotas allotted to small industrialists should be firmally adhered to and promptly made available to them.

The Conference was of the unanimous opinion that the lack of uniformity in the working of sales-tax system in different States was causing considerable hardship to the business community. There was multiplicity of procedures and the basis and the rates also differed from State to State. It was noted that the Federation had from time to time suggested to the Government that sales-tax be replaced by Central Excise Duty. In case it was not found feasible to implement the suggestion wholesale, as many items as possible should be freed from sales-tax and brought under excise duty.

Dealing with the premier industry of this region, namely, sugar, the Conference called for a sympathetic cosideration of this industry's problems, especially arising out of the sucrose content of cane, both at the hands of the State Governments as well as the Centre.

In regard to the difficulties faced by the jute manufacturers in this region, the Conference pleaded for the grant of suitable rebate in excise duty to these mills as they have to draw their raw jute supplies from distant places in Bihar, Bengal and Assam, thus incurring extra freight. Freight concessions were also sought on raw jute procured and jute goods despatched for exports.

In respect of shifting of factories from Delhi on account of the Master Plan being implemented, the Conference took the view that factories should be given help by way of subsidies and loans on easy terms to enable them to rehabilitate themselves on the new sites. It was pleaded that power, water supply, sewage and drainage facilities should be arranged by the authorities in an adequate measure for the factories at the new sites.

The Conference also called for greater co-ordination between the Central and the State Governments so as to facilitate implementation of the projects without delay and smoothen the flow of trade without causing undue hardships.

1961 CENSUS: REVISED ESTIMATE

The population of India last year had been undercounted by a little more than three million, according to post-enumeration check of the 1961 census. The provisional total population estimated on March 1, 1961, was around 436 million.

The post-enumeration check has revealed that there were 1,007 persons per every 1,000 counted on that day. If the under-count is taken into account, the population of India on March 1, 1961, stood at 439 million.

The revised population figures, in fact, place India's population on March 1, 1961, at about 442 million. This total is arrived at by adding to the revised census figure of 439 million the population of Goa, Daman, Diu, Dadar, Nagar Haveli and the N.-E.F.A. The population of these areas is estimated at three million.

IN BRIEF ....

The Government of India has announced that the rate of interest on all Post Office Savings Bank Accounts will be increased by ½ per cent with effect from August 1, 1962. Interest on deposits up to Rs. 10,000 in individual accounts (up to Rs. 20,000 in joint accounts) will now be 3 per cent per annum and on balances in excess thereo" as also on public accounts, 2½ per cent per annum as against the existing rates of 2½ per cent and 2 per cent respectively. Other Savings Bank Accounts will also earn a similar increase of ½ per cent ever the rate of interest admissible to them.

*

The Union Government has decided to grant licences for the import of 12 items — dhanicha seeds, chuna khari pearls, eggs and poultry, green spices, fish dry and salted, betelnuts, drugs and medicines including Unani and Ayurvedic, black cumin seeds, mother of pearl shells, betel leaves, guar seeds and gramophone records — from Pakistan within fixed ceilings. These licences will be issued subject to the condition that payment for the goods imported will be made in non-convertible Indian rupees as provided for in Protocol No. I to the Trade Agreement between the Governments of India and Pakistan concluded on March 21, 1960. The agreement has since been extended upto March 21, 1963. This last date for applying for licences is August 31, 1962.

COMPANY AFFAIRS

KESORAM INDUSTRIES & COTTON MILLS LIMITED: ANOTHER GOOD YEAR

The working results of Kesoram Industries and Cotton Mills Ltd. for the year ended March 31, 1962, disclose a gross profit of Rs. 1.81 crores. The Directors have reported that the profits would have been much larger if the circumstances prevailing at the time of last year's report had continued. During the current year the ex-mill prices had not been increased, while the off-take of cloth had slackened. The lean cotton crop and the consequent rise in the price of cotton, and the rising prices of stores, dyes and spare parts etc. increased the expenditure and the bill of wages also rose. These additional burdens cut profits which would otherwise have been much larger; but the results reflect the mill's good management under adverse conditions.

The provisions for depreciation at Rs. 69.43 lakhs, for taxation at Rs. 36.00 lakhs, for Development Rebate Reserve at Rs. 13.38 lakhs and for other charges such as Managing Agents' Commission, Directors' Commission and Investment Reserve total upto Rs. 129.52 lakhs, leaving the net profits at Rs. 51.35 lakhs. Alongwith the carry forward from the last year, the amount available for disposal for the current year is Rs. 53.80 lakhs.

The Directors have recommended that a sum of Rs. 19.52 lakhs should be transferred to general reserve. Cumulative Preference Shares and the Redeemable Cumulative Second Preference Shares would together take away, by way of dividend, a sum of Rs. 9.84 lakhs. For equity capital a rate of 12 per cent gross has been recommended taking the total allocations for dividend distribution to Rs. 33.82 lakhs, including the provision of Rs. 23.97 lakhs for equity capital.

The Directors have reported difficulty regarding the power supply which became acute during April to June 1961 and had an adverse effect on the production of the Company. The coal situation is also causing anxiety because wagons are not available. Coal for the mills is being transported by trucks, enhancing costs still further.

Because of the expanding activity of the mills, the authorised capital was increased to Rs. 5 crores. Ten lakh ordinary shares at Rs. 10 each were issued, taking the issued and paid-up capital to Rs. 3.20 crores. The Directors are hopeful that despite the ups and downs in the economic condition prevailing in the market, the mills will do better in the next year. The new expansion plans and diversification of the Company's activities are expected to yield dividends in the coming year.

COCHIN MALABAR ESTATES

The Cochin Malabar Estates Ltd. has recorded a net profit of Rs. 6.39 lakhs, after providing for all charges including taxes for the year ended February 28, 1962 or Rs. 2.07 lakhs less than in the previous year. With the brought forward amount of Rs. 10,145 and a transfer of Rs. 50,000 from general reserve together with other sundry credits like unclaimed credit balances, Sales Tax Refunds etc. has resulted in a total credit of Rs. 7.03 lakhs. Out of this disposable balance, a sum of Rs. 1.30 lakhs has been appropriated to the Rehabilitation Reserves. The Directors have decided to pay a Final Gross Dividend on ordinary shares at the rate of 11 per cent which together with the Interim Gross Dividend of 9 per cent, makes a total of 20 per cent for the year 1961-62 which is the same as in 1960-61.

The rubber crop harvested during the year was 11,59,898 kgs. as against the estimate of 11,41,396 kgs., indicating in increase of 18,502 kgs. over the estimate. It may be added that this is the second highest crop harvested by the company since its inception—the previous best being in 1960-61 with a yield of 12,64,304 kgs. This is a satisfactory performance taking into account the none-too-favourable weather conditions experienced in 1960-61. It is estimated that a crop of 11,48,970 kgs. will be harvested during 1962-63 at an all-in-cost of 316.35 cents per kilogram. Details of the crop harvested, cost of production, and the average price realised during the past three years is as under:

	1959-60	1960-61	1961-62
Crop ('000 kgs.)	9,78.8	12,64.3	11,59.9
Cost of production (cents per kg.)	257.6	239.8	248.9
All-in-cost (cents per kg.)	292.8	270.2	296.8
Average price realised (cents per kg.)	399.9	392.2	358.3

The interim wage rise to workers following the recommendation of the Wage Board for Rubber Plantation Industry and the enhancement by Rs. 10 per month per staff member obviously account for the increase in the wage bill and the consequent rise in the cost of production. The company is doing everything possible to reduce expenditure so as to be able to give a better performance in the accounting period.

NEW ISSUES

The Controller of Capital Issues has authorised six companies to raise capital aggregating Rs. 1.33 crores. Of these, two companies are issuing 'right' shares, one 'bonus' shares and the other three 'equities'. A Central Government undertaking and a bank figure in the list. The consent of the Controller in all cases is valid for 12 months. The following are the details:

The Aluminium Industries Limited, Kerala State, is raising capital of Rs. 35 lakhs in ordinary shares of Rs. 10 each for cash at a premium of Rs. 3.50 per share to the existing shareholders on right basis. The proceeds will be utilised for the manufacture of PVC cables, covered conductors etc. The company's paid-up capital is Rs. 1 crore, all in equity.

Kumbakonam Bank Limited, Kumbakonam, is issuing further capital of Rs. 64,250 divided into 412 full shares of Rs. 50 each; and 873 ordinary shares of Rs. 50 each. All the shares will be issued for cash at par, to the existing shareholders on rights basis. The proceeds will be utilised for strengthening the bank's capital base.

Malleable Iron & Steel Castings Company Private Limited, Bombay, will issue bonus shares of the value of Rs. 1 lakh on capitalisation of its reserves.

Indian Drugs & Pharmaceuticals Ltd., Delhi, a Government undertaking, having a paid-up capital of Rs. 80 lakhs, is raising further capital of Rs. 50 lakhs divided into 5,000 equity shares of Rs. 1,000 each to be issued for cash at par.

Globe Auto Electricals Limited, Bombay, having a subscribed equity capital of Rs. 20 lakhs, is raising further equity capital of Rs. 25.75 lakhs for cash at par. Out of this, shares of the value of Rs. 15.75 lakhs will be offered for subscription to Messrs. Electric Autolite Company of USA and the remaining Rs. 10 lakhs to the existing shareholders. The proceeds of the issue will be utilised for the manufacture of dynamos (AC and DC) and motor starters.

Fort Gloster Industries Limited, Calcutta, will issue 21,000 equity shares of Rs. 100 each for cash at a premium of Rs. 90 per share. The capital is required for manufacture of V.L.R. cables, trailing cables for mines and railway sigalling cables. The existing capital of the company is Rs. 84 lakhs.

AUGUST 3, 1962.

After the Aid-India Consortium Meeting

THE news that the Aid-India Consortium meeting on July 30 voted a total of $1,070 million has created almost as much a confusion amongst the sophisticated as it has amongst laymen who are constantly baffled by the vast array of figures which "aid arithmetic" presents for their admiring gaze. At first sight, a figure of $1070 million looks considerably more than it was anticipated seeing that the figure bandied about in India was $450 million, being the "excess" or "shortfall" required to be under-written in this particular meeting. It now transpires that there is considerable but undefined overlapping. The actual figure required for the second year of the Plan is $1150 million and the current agreed figure is, therefore, $80 million short. Since the United States will match any figure put up by the other members of the Aid-India Club, what seems to be short is, in fact, a petty element of $40 million from the European members of the Club. It would only add to the confusion if one added details of each country's contribution and worked out, very improperly, a balance-sheet of generosity or otherwise on the basis of one year's figures. What is important is a general view not of the finances on the second year of the Third Plan, but what can be deduced from the current view of our friends abroad on the much greater ordeal which we jointly face when the remainder of the Plan is to be underwritten in about six months from now.

With good cause, the addition of certain members to the Club has been noted with optimism. At the infructuous May meeting, Austria and the Netherlands formally joined the Club; at the current meeting Italy and Belgium have joined. Italy's substantial contribution reckoned for this purpose, however, includes only $45 million of the $100 million ENI credit. This in itself is an unexpected blow because if the full credit had been assumed at $108 million ($100 million for the oil industry and $8 million for the Madras Aluminium project) there would have been no shortfall since the United States' matching credit would have more than provided the balance. On the other hand, the complaint at New Delhi that no matching grant has been provided for IDA's additional contribution of $50 million is not justified. The United States undertaking was designed to bring the European members into the consortium in fuller partnership; it was neither the spirit nor the substance of the latter that the United States should match all World Bank contributions.

So far as the current gap of $40 million on European account or $80 million on total account is concerned, one might assume that additional negotiations will bring in this sum without much difficulty. It may be irksome, but it is, nonetheless, necessary for us to pursue actively the lines which the Finance Minister and his officers conducted in discussions prior to the current Consortium meeting. The pattern of international aid is increasingly that of a consortium arrangement, and we must need to develop a new machinery of persuasion and operation suitable to this. It is doubtful if either Mr. K. B. Lall in Europe or Mr. B. K. Nehru in the United States has adequate staff for the detailed preparation of memoranda to fill gaps in information and in persuasion as they arise. It is vital that the Ministry of Finance should send some of its most able officers to Brussels and Washington to continue a process of consultation which has been so well begun during the Finance Minister's visit.

Even if this is done, however, one cannot assume that the foreign exchange required in the Third Plan would be forthcoming in full. Anyone who has been abroad over the last three months will know, for reasons which it is not difficult to see, that India has dropped considerably in the order of priority in both European and in North American Continent. In the North American Continent, both the United States and Canada have their own balance of payments problems which make it difficult for them to commit substantial aid to India for a long term. In Europe there is tremendous internal preoccupation, in view of Britain's proposed entry into the European Common Market, which has created a sense of uncertainty. A very large number of senior Treasury officers, who, in the last analysis, need even more convincing than their Ministers, are wholly absorbed in European affairs. At the same time, and much to our detriment, a very large number of candidates for aid are roaming over Europe in different guises and attires, picturesque for the most part and attractive as newcomers, but wholly unconvincing advocates of the foreign aid philosophy. If foreign aid is to be thrown into every State now seeking it,—and Africa herself counts as Legion—the whole philosophy behind aid will acquire a diversified hue which will do damage to the best interests while not arresting the worst. No one can have any doubts that the Secretaries

of Economic Ministries in the European Continent are tired of ceaseless attempts by countries not prepared to absorb aid, basing their claims on the theory that under-development is its own best argument. There is no doubt whatever that in this process India—a good candidate for aid with a solid record of performance in the last decade—has suffered almost as much as anybody. This will undoubtedly also affect attitudes in the next Aid-India meeting.

It is wholly unjust that this should be so, and that aid should be considered in "overall" terms because of the political factors involved, not least because of the point of maintaining some proportion between India and Pakistan on the one hand, and a proportion between Asia and Africa on the other. We are unduly confident if we assume that because our Plans are well prepared we will be able to surmount these political obstacles without a tremendous campaign of selling such as we have never been prepared to do, partly because of political inhibitions. *The Eastern Economist* holds the view that unless both political and economic forces joined to sell the Indian Plan as an element in world development and the self-interest of various contributing nations are underlined in the process, there will be a large gap left in the Plan which we cannot under any circumstances fill from sources outside the Aid-India Club.

It is these circumstances which require that India should take thought for herself apart from depending, as we have too often done, unduly on foreign aid from our friends whether from the West or from the East. We cannot benefit any longer from our independent dynamic neutrality, nor, indeed, should we wish to do so. It is far more important that we should develop by the intelligent use of the equipment that is already in the country and by wise management, a capacity to reduce our demands rather than a capacity to ask for more. The preparation of a hard core of the Plan should be worked out in self-defence. In the preparation of the hard core it is not the shortfall in our foreign aid, but the shortfall in our own managerial capacity that will be decisive. It is possible for many existing units to save foreign exchange on expansions of the order of 10 to 20 per cent. Even if half this sum were contributed to filling high priority blocks in the economy, we might be better off than if we received additional foreign aid with its great obligations of servicing in foreign exchange and repayment in the period of the Fourth and Fifth Plans.

If our difficulties over the Aid-India meeting have taught us that self-reliance is far more valuable than dependence on that portion of foreign aid which is uncertain, its hard lesson would not have been in vain. India should be grateful to her friends for the generosity which the current meeting has displayed. We should not foolishly present to them a bill over the next six months which, in any way, is in excess of essential requirements, after the most careful scrutiny of our capacity and ability to do for ourselves things which have often been cast upon a foreign friend. Our attitude of mind must now be far more disciplined and economical in the demands for additional foreign funds with the burdens which the economy in the years to come may be unable to bear.

The Delhi Power Crisis

FOR many years there has been a superstition in this Capital city of India that it was protected so far as power supply was concerned, by two great buffers; first, the unlimited capacity of the Central Government to pay any price for rush equipment, and secondly, because management was kept on its toes by the fear of the Prime Minister's visible displeasure. This week has shattered both illusions. The sudden failure of the electricity supply has exposed not so much the collapse of one transformer reducing power from Nangal, as many unsavoury details of the manner in which another transformer has been left unrepaired for months as well as other indications of absence of any planning in dealing with Delhi's rising power needs. The shock has been so complete that it has overflowed everywhere, but particularly into politics. The New Delhi Municipal Committee is up in arms against the Delhi Corporation; the Delhi Corporation is up in arms against the Chairman and management of the Delhi Electric Supply Undertaking. The Delhi Electric Supply Undertaking is shifting the blame, wherever it can, on to the Punjab Government State Electricity Board. The Punjab Government State Electricity Board, not to be undone, keeps pointing to applications for import licences, one of which, having been delayed for months, was sanctioned on the day when the transformer was burnt out. In the month of August in sweltering heat which is sometimes unbearable, cuts of power for four hours per day have been ordained and every organisation and every household has to bear the brunt of this corporate mismanagement. Truly can it be said that democracy has been fulfilled in this city in the sense that universal hardship has been bestowed almost equally on all.

So far as individuals are concerned, it is not proper at this stage to come to a judgment. The Government of India has ordered an inquiry to be presided over by Mr. Dharma Vira, Secretary of the Ministry of Works, Housing and Supply, who commands high respect. It is generally believed that a fair and impartial inquiry with no attempt to whitewash those responsible is now under way. The Committee is to report within a fortnight, and it would be wholly wrong to anticipate its findings in any way. It is a fact, however, that the inquiry is not concerned with the problem of planning technical efficiency so that we do not have recurrence of power failures which have become frequent as units, both new and old, keep failing for reasons of which the public is largely unaware. Undoubtedly, weaknesses in management are responsible. One of the greatest weaknesses is leadership in management leading to absence of discipline and a high sense of responsibility in those entrusted with a continuous utility service of the highest national importance.

The warning has come late; it is hoped not too late. The nation has lapsed over the last two years badly in terms of efficiency in the operation of public sector undertakings, notably power units and the Railways. The discipline of these organisations has sunk so low at this time that one may wonder whether or not the disease does not require drastic surgery in some places. Basically, the maintenance of existing units cannot be beyond the capacity of trained engineers and of workers who have to do no more than routine checking of details from time to time so that adequate intimation is given to those responsible for new planning. This duty is not being done in a very large number of public sector enterprises and conceivably in many private sector ones. There needs to be a comprehensive review of the use of power in the country as a whole. It would not be inappropriate if Mr. T. T. Krishnamachari, Minister without Portfolio, who is undertaking co-ordination of important elements in the Plan, should conduct at the highest level a thorough enquiry into the power supply situation and submit a report to the Cabinet which will compel all those responsible to perform their duties adequately or resign. A drastic overhaul of the administrative machinery is required in respect of every public utility service if the country is to be stopped from the rot which Delhi's crisis has shown lies very near the heart of the Central Government.

The Cairo Conference

THE original doubts expressed about the advisability of convening the conference of the thirty-five under-developed nations at Cairo and the hesitation with which some of them consented to participate eventually proved to be completely misplaced. Also, the scepticism with which the propriety and the utility of the Conference were looked upon by the industrialised countries turned to be miscalculated. There was a certain element of surprise in the course which the deliberations took when the proceedings got off to a start. Speaker after speaker gave increasing reassurance that this assambly of new nations really meant business. If any lapses in anti-colonial slogans and accusations were evidenced, they had no more significance than stray utterances.

The declaration issued after the conclusion of the Conference gives further corroboration of the realistic approach of the delegates to the problems of the economic development of the backward nations. The fact that these problems were distinctly divided in their internal and external aspects was convincing proof that the delegates were fully aware how responsibility for the development effort rested essentially, and in the first instance, on their own shoulders. External factors have their vital impact on the pace of the growth of the economies of the under-developed countries. But in the order of priority of mobilisation of resources, they come next after the internal factors. This is not to say that the interaction of the two was ignored, but the emphasis was on the principle of self-help before external help could be invoked.

If the goal of all economic development is the raising of the standards of living all around, the Conference laid stress not only on the rate of increase in the national income but more significantly in the per capita income. The significance of this emphasis was highlighted in unambiguous terms. At the root of the disparity in the growth rates of the national income and the per capita income lies the high incidence of population growth and the point was powerfully brought home that prior attention should be given to population control. Other more important problems stressed by the delegates were the urgency of agrarian reform which could brook no delay, diversification of the economy to redress the current imbalances and fiscal reform in order to tap resources at the right points. In the domain of internal problems was included the wider issue of co-operation between the developing countries for mutual assistance. The example of the Colombo Plan has inspired confidence in this type of co-operation and a more intensified effort in the spheres of research, technical aid, expansion of trade, transport and communications was prescribed as one of the effective ways in which the lack of domestic resources could partially be removed.

Contrary to the widely entertained apprehension, the Conference studiously refrained from indulging in any denunciation of regional economic grouping and in particular of the formation of the European Economic Community. It is not as if this attitude emerged all too suddenly. There existed sharp differences as shown by the speeches of delegates from certain countries. Ghana, for example, made an outright condemnation of the association of the former African colonies with the EEC as neo-colonialism with a vengeance. Such ventilation of emotion, however, was allowed to pass without any fuss. By and large, the consensus was that regionalism was turning to be a very effective technique to promote economic expansion and expansion of trade in particular. To this, however, one fundamental reservation was made. The economic integration of the advanced countries was welcomed subject to the proviso that it was not allowed to degenerate into an instrument of restrictive policies at the cost of the countries outside.

A proposal was moved at the Conference to organise a counter economic bloc of the under-developed countries. But wiser counsels prevailed and the isolationist consequences of such a course of action were realised promptly. This question cropped up again in another form, when at a session, held *in camera*, a motion was discussed for setting up a permanent secretariat for the Conference. This proposal was also opposed — India was one of the chief opponents—primarily on the ground that the secretariat would inevitably turn out to be an embryo of the projected bloc. The very compulsions of inter-dependence in trade between the developing and developed countries underlined the shortsightedness of the formation of a bloc as a counter move, apart from the inherent structural weaknesses of such a bloc.

Aid and trade were bound to figure as important problems for consideration. External aid was indispensable to fill the wide gaps in domestic resources and here the emphasis was on soft loans. In the absence of soft loans, sooner or later the developing countries, it was cogently argued, would find themselves confronted with a further aggravation of their balance of payments deficits. But a positive angle from which the problem of balance of payments needs to be attacked as a normal phenomenon is the restoration of the export trade of the developing countries to a stabilised basis. A conspicuous fact of great relevance was that their terms of trade were getting more adverse. This was the outcome of the widening disparity between the international prices of the primary commodities and the prices of capital goods and other manufactures. It was urged that resolute measures ought to be taken to stabilise the international markets for primary commodities both in the short-term and long-term context. In the process of stabilisation due attention was demanded for the role of price

parity between primary commodities and manufactures. Stabilisation is by no means a novel proposal and attention was drawn to the declaration made in November 1961, by the Ministerial Council of GATT to devise ways and means to promote the external trade of the underdeveloped countries. Faith in GATT as an instrument for securing development of trade on a basis of non-discrimination has been fortified as indicated by the tenor of the speeches.

The Cairo Conference made it abundantly clear that the under-developed countries are definitely evincing a state of maturity in their thinking on questions of international economic co-operation. Their insistence on self-help as a condition precedent to external aid as well as an enlightened outlook on the new emergence of regional economic integration, as embodied in the EEC, now invite a responsive gesture from the industrialised countries.

Raising Cotton and Oilseeds Output

WITH some success achieved in the last three years on the food front, it was natural that the Ministry of Agriculture in New Delhi should have bestowed more and more thought on raising the output of the major cash crops which are essential not only for feeding the expanding industrial sector of the Indian economy, but also from the point of view of earning valuable foreign exchange. The calling of the last week's two-day Conference of Agricultural Experts was, thus, a step in the right direction, though it came a bit late in the day taking into consideration the acute situation that has developed on the cotton front after partial failure of the last year's crop. The Conference dished out some very eminent measures, both short-range and long-range, for stepping up cotton and oilseeds production. Raising of cotton output is primarily intended to reduce the drain on foreign exchange earnings, while augmenting the production of oilseeds has a two-fold objective—ensuring of adequate supplies for the domestic industries, and also earning foreign exchange.

The production of cotton and oilseeds, which has been trailing behind the stipulated targets, can be raised in the short-term only through measures such as plant-protection and increased use of fertilizers and improved seeds. There is little scope for extension of area under these crops (unless through substituting them for other crops) and whatever further area can be made available for their cultivation in the vast tracts to which canal irrigation is being extended, especially Rajasthan, can come over a number of years. Similarly, provision of additional irrigational facilities in the cotton and oilseeds growing areas, even through minor irrigation works, is a time-consuming process. The Agricultural Experts' Conference, therefore, rightly laid great faith in the efficacy of the former measures for stepping up cotton and oilseeds production in the next one or two years. Extension of the package programme for groundnuts to 24 blocks, instead of 8 as envisaged hitherto, in a period of three years and institution of similar programmes for some cotton growing areas should be welcomed in view of the success achieved through this process on the food front. But this ambitious plan obviously requires great efforts on the part of the State Governments. While the introduction of the package programme in selected areas pinpoints the energies of the authorities over small tracts, it involves a large co-ordinative effort which is by no means an easy task.

From the long-range point of view, the experts have recommended earmarking of all the area brought under irrigation in Rajasthan for growing cotton, debarring of raising of competitive crops on lands particularly suitable for the production of cotton in some other regions, making available liberal and easy supply of credit, strengthening of co-operatives etc. For raising the output of groundnuts they have recommended that the Saurashtra and Andhra Pradesh practice of mixed cropping of groundnuts in cotton areas should be popularised wherever practicable. While much can be achieved through these measures, one important prerequisite for all this appears to have been overlooked and that is the assurance to the agriculturists that if they are able to produce more cotton and oilseeds, their returns in financial terms would not go down with the fall in prices of these commodities. In the immediate future, as long as the country is short of adequate supplies of cotton and oilseeds, fixation of support prices for them is of only academic interest. But the psychological effect of this measure on the farmer can be considerable and needs to be taken advantage of even in the initial stages. For cotton there are already fixed support and ceiling prices, but their recent upward revision has not been adequate. As experience is gained, it is hoped this important aspect of the issue will be looked into again.

Another crucial matter that should be given attention to, while fostering the use of chemical fertilizers in the cotton and oilseeds growing areas having assured rainfall, is the introduction of crop insurance. This is necessary in view of the fact that howsoever assured of rainfall an agricultural tract may be, it is subject to "extreme" vagaries of weather which have not been uncommon in the recent past. In the absence of assured irrigational facilities through canals, tanks, tubewells etc. there is always an inhibition on the part of the agriculturist to go in for chemical fertilizers which may do a considerable damage to his crop if rains fail. Inclusion of crop insurance in all package programmes, thus, is urgently required. The financial burden of this measure obviously cannot be great because the areas to be covered by package programmes are always carefully selected.

If the growth in our agricultural economy is to be fostered judiciously and without augmenting the output of one crop at the expense of another, there is apparently a case for greater specialisation in Indian agriculture as between different regions of this country. This is evident from the fact that yields of various crops vary widely from one State to another. But this specialisation should be effected through properly educating the agriculturists rather than through legislative sanctions. If the experience of the Communist countries is any guide, the adoption of the latter course would be suicidal. Broadly, the areas to produce particular crops, as is envisaged in the case of cotton, may be earmarked on the basis of scientific experiments, but the ultimate decision of producing a particular crop on an acre of land has to be left to the judgment of the agriculturist, tempered, of course, by educating him through a massive demonstration programme.

THE WEEK'S NOTES

Algeria

END OF INTERNAL STRIFE ?

THE STRUGGLE for power in Algeria seems to have been finished with the entry of the guerilla officers who took control of Algiers on July 29. The rapid decline in the support for Mr. Ben Khedda was quite apparent when, on Wednesday last week, his army guards refused to continue their security duties for the safety of his person and he hastened to recognise Mr. Ben Bella's Political Bureau which he describes as the internal government of the country. The units of the Central Algerian Military Zone (Wilayya IV) took possession of the capital city and virtually completed the struggle. The Vice-Premier, Belkacem Krim had already left for Kabyli the night before to join the other Vice-Premier Mr. Mohammed Boudiaf. It will be recalled that these two Ministers offered armed resistance to Mr. Ben Bella after his forces captured Constantine and Bone. Some more resistance to Mr. Ben Bella's power at the centre from them may not be ruled out. But its chances are slight.

Mr. Ben Bella has announced that for him the struggle is over. Latest reports of Mr. Mohommed Khider's mission in Paris and Algiers indicate that it has been a success. The stage is thus set for parleys for a compromise between Mr. Ben Bella and Mr. Ben Khedda. What now lies ahead is the task of establishment of complete peace, proceeding with the elections and getting down to the challenge of the civil administration. Actually law and order have practically been at the lowest ebb since the vacuum, created by the departure of the French officials, has not been filled. The differences between Mr. Ben Khedda and Mr. Ben Bella came to a head immediately as a consequence of Mr. Ben Khedda's precipitate action in dismissing Colonel Boumedienne and two other army officers. It was these officers who mustered support in an overwhelming measure for Mr. Ben Bella. Mr. Ben Bella has all along been protesting that the army will have no control over the Government of free Algeria. If his confidence, or rather his hope, turns to be true it will certainly be to the good of the future growth of democracy in Algeria. But it will be difficult to be blind to the potentiality of the army emerging as the real and continuing sanction behind the administration. It will be a supreme task before the united leadership to keep a jealous watch on the army and to allow no opportunity to it to get the upper hand in controlling the internal situation.

Rajasthan

REPHASING THE PLAN

POLITICAL PRESSURES easily constitute one of the important factors in the imbalance between the reasonable estimates of capacity to raise resources for the Plans and the targets fixed for raising them. The Third Plan is a glaring instance of how a distortion may be caused in its structure. It is in this Plan that the unique duality of the financial targets and the physical targets, the latter being higher than the former, has been created. The responsibility for this queer defect in planning must be placed squarely on the shoulders of the National Development Council. And in the NDC it is the pulls exerted by the Chief Ministers of the States which count for not a little. The ambition of the State Ministers to plan on a big scale is understandable to the extent that it demonstrates their desire to raise the levels of the economies of their States. But these ambitions would be meaningless if they are not matched by the capacity of the economies and the determination of the Ministers to raise the requisite resources.

Rajasthan has emerged as an unhappy illustration of planning in haste on a grand scale and repenting not at leisure but rather early in the Third Plan period. The Third Plan for the State has been drawn up at an estimated outlay of Rs. 236 crores. One of the basic commitments made by the State Ministry was that about Rs. 80 crores would be raised internally by the State. The contributions from the Centre were naturally made in relation to this promise. In the very second year of the Plan the State Ministry has made an agonising reappraisal of its capacity to find the resources to which it stands committed. It is not difficult to find why the need for making this reappraisal was felt at this juncture. The Party in office is shaken to its foundations by internal strife. While similar strifes have been set at rest somehow in some other States, every nerve is being strained to find a formula of compromise between the two warring groups in the Rajasthan Congress Party. This is for the very simple reason that the Congress Government in Rajasthan is precariously poised on the support of a slender majority and, if any defections occur, its fate will be seriously jeopardised.

Whatever the immediate cause of the reappraisal of the State's own resources for the Plan, it is good that the Plan is being pruned at this stage, so that high hopes may not be kept dangling before the public for a long time to bring disillusionment in the end. On the present estimate, the Rajasthan Government feels that it can raise not more than Rs. 50 crores by way of its contribution to the resources. This represents a shortfall of Rs. 30 crores below the original commitment. But strangely enough, the State Government has asked the Planning Commission to cut down the financial outlay for the State Plan by Rs. 51 crores, revising it downwards from Rs. 236 crores to Rs. 185 crores. This is intriguing. Does it imply deeper apprehensions of a further shortfall in the State's own resources and therefore in Central contributions? Care has been taken to give to the public the assurance that, while an all-round revision of the expansion programmes in the different sectors of State's economy will be essential, the target of power production will be maintained at the original figure. If the State Government is able to keep up to this assurance, it will have earned the gratitude of the public for adhering to the right priorities. But one cannot be too sure about it.

Road Transport

A WRONG APPROACH

THE BITTER reality of the transport situation has been producing at long last some realistic thinking on the readjustment in the transport policy adopted by the Government for three decades now. The physical

limitations on the capacity of the railways to carry even the priority categories of traffic at the right time and in the right directions have changed the outlook of the Government on the policy for road transport. Last week the Planning Commission and the Central Transport Ministry had a very important discussion on the question of augmenting the transport capacity of the economy. This discussion, of course, related to all the modes of transport, but as the prime reliever to the railways it was naturally concentrated on road transport.

The importance of the occasion can be gauged from the fact that four Ministers, Mr. Gulzari Lal Nanda, Mr. V. K. Krishna Menon, Mr. Jagjivan Ram and Mr. T. T. Krishnamachari attended this discussion and made their own contributions to the solution. The meeting seems to have come to the conclusion that the road programme prescribed in the Third Plan should be accelerated by a special effort. If this was its only view, it falls far too short of the present requirements. The road transport programme has been drawn up on a very grudging scale and financial stringency has been pleaded for the inability to include a larger plan consistent with the increase in demand that would be created for transport capacity. A definite step forward would have been taken if the Commission had given an indication to advance the completion of the programme and to make allocation for a larger programme in the remaining period of the Plan.

Mr. Krishna Menon's fad of the ordnance factories being capable of manufacturing anything under the sun for civilian requirements was in evidence again on this occasion. It is reported that the Planning Commission in its discussion gave the pride of place to the manufacture of heavy trucks and Mr. Krishna Menon was quick in coming forward with his categorical assurance that the ordnance factories would produce trucks with a pay-load varying between 60 tons and 90 tons. To that end he insisted upon a rapid survey to assess the mechanical, economic and financial problems involved in the manufacture of heavy trucks. At a time when the Himalayan border situation threatens to be prolonged and different types of equipment, not excluding trucks, can be fruitfully manufactured by the ordnance factories for defence requirements, it is utter misdirection of their capacity to divert them to the production of heavy trucks for civilian freight transport. Are the factories in the private sector not equal to the task of manufacturing heavy trucks, given the necessary resources? On what hypothesis is it assumed that they will be found wanting if they are entrusted with this extra programme?

Equally erroneous is the line on which the Commission is thinking in making a decisive change in road transport operations. The consensus of view at the meeting was that the State should enter the field of truck transport on a major scale to provide the necessary road service capacity. It is surprising that in spite of the shortcomings of the public sector practically on every single front on which it has been tried in the Plans, so much blind faith should be put in its ability to undertake new ventures. Truck transport stands in a category quite distinct from railway freight transport, since a considerable volume of personal service and attention is involved in the former. Moreover, the points of commencement of traffic are far-flung. It is not as if the State has not tried this experiment. In the former Bombay State it was tried on a limited scale, on a selective basis which was quite favourable to the government operated services; but it had to be abandoned as a dead-weight loss. It is astonishing that a facile assumption should now be made that the State will somehow acquire the technical skills required to run truck transport services on a nation-wide scale.

The proper thing to do would be to liberalise the present restrictions on transport licensing on proof of capacity to run longer hauls. Already there is ample evidence about this capacity set out in the Neogy Committee's preliminary report. Large-scale manufacture of heavy trucks will be a costly and time-consuming problem. If road capacity is to be used to the optimum, one sure way in which this object can be achieved is to allow truck-trailer services on appropriate roads and on roads which can be improved to facilitate their operation.

The Congo

THE FEDERAL SOLUTION

HITHERTO ALL the solutions to the recurring crises in the Congo were based on what was considered to be the fundamental and unalterable principle of a unitary type of Government for a well-knit State of Congo. But the wide tribal differences and the extreme disparities in the distribution of natural resources with their concentration in certain provinces like Katanga, have made a sense of unity, however eminently desirable, difficult to achieve in practice.

Mr. Cyrille Adoula has now requested the UN jurists to draft a federal constitution for the Congo. The basic principle on which the federal constitution is to be drawn up is to define and restrict the jurisdiction of the Federal Government to a limited number of subjects, leaving the residuary jurisdiction to the provinces or the federal units. In view of the coverage and potential importance of the residuary subjects, the federation is likely to acquire a loose rather than a strong and well-knit structure. Foreign affairs, defence, customs, currency, foreign trade, communications and immigration are being mentioned as the federal subjects. Two important considerations arise here. If the revenue from the mineral wealth is left to the federal units, the Centre would be left in a very weak position. This would totally upset the balance between the economic strength of the Centre and the units. Easily Katanga would emerge as the strongest force in the federation.

Such a position, however, may be untenable and it would even not be acceptable to the Congo at large. Belgium and the Big Three Western nations, having important stakes in the Union Miniere, are preparing a draft scheme for the allocation of the mining revenue between Katanga and the Federal Centre for the consideration of the UN. If agreement on this important issue is reached, the structure of the Federation will have acquired the vitality it would so badly require. Although defence is to be a federal subject, it cannot be presumed that complete integration or cohesion of the army, drawn from the different tribes and regions, will be easy of achievement. Besides, the problem of disbanding the irregulars in the provinces may also pose some difficulty. But obviously a firm beginning will have to be made to build up the armed forces with a sense of national unity and this is what the constitution would contemplate.

The World Abroad

INFLATION AND WAGE RISES

By

ODYSSEUS

WHEN COLLECTIVE BARGAINING leads to wage increases greater than the forces of supply and demand alone would have yielded, and at the same time greater than the increase in labour productivity in the economy, it is an independent factor contributing to inflation.

In surveying Europe during the period 1953-1960, the OECD Report on the Problem of Rising Prices found that wage increases had not been excessive in Austria, Belgium, Italy, and Switzerland, nor, except for 1956-57, in Germany. France was a border-line case, since excessive demand in 1956-58 created a situation in which wages chased up behind prices, but collective bargaining, as such, had no significant effects in the private sector. On the other hand, excessive wage increases did constitute important independent inflationary forces in the U.K., the U.S.A., the Netherlands, Denmark, Sweden, and Norway. Wage inflation was more important in the U.K., the U.S.A., and Denmark because the pressure of total demand was relatively smaller in these countries than elsewhere.

In Switzerland, unemployment was low but pressure of demand on the labour force was controlled by allowing foreign workers to enter freely — a decision which would have been impossible without the co-operation of the unions and which reflects how alive Swiss public opinion is to the evils of inflation.

Historically, one important cause of excessive wage increases in the West has been that during the booms (a) of post-war reconstruction and (b) of the Korean war, unions became accustomed to large increases in money wages, and with the return to more normal conditions they continued to expect such increases, even though the gain in real income was inevitably offset by higher prices, particularly in the U.K. and in the U.S.A. To the extent that these wage demands reflected a desire to increase the share of national income going to labour, they were unsuccessful. The share of labour has remained remarkably constant in all countries since 1950. This was because, with high employment, business was largely able to pass on price increases to consumers. But since the OECD Report was published, the active government policies in so many countries to curb excess demand, and to enforce competition, have led many observers to fear that the unions will continue to force wage increases at the expense of profits. This could well raise the percentage going to labour but it must slow down the rate of growth, so that labour faces the choice either (a) of accepting a smaller percentage of a more rapidly expanding national income with a corresponding greater absolute share or (b) of insisting on a large percentage of a national income that is stagnant, or rising negligibly, so that labour will obtain an absolutely lesser share.

We need not elaborate the statistical evidence which shows that excessive wage increases have been inflationary forces in the countries sited. Instead, let us ask what can be done about it. Four of the distinguished internationally known economists, who drafted the Report, advocate the adoption of a Wages Policy. Two argue against this. The majority argue that restraint of demand by monetary and fiscal measures alone, without a Wages policy, will, if persisted in long enough, stabilise prices at the expense of full employment and of growth.

What is a Wages policy? It is not (a) exhortations to labour to exercise restraint, (b) informal understandings with labour for a wage pause, (c) arbitration by itself, nor (d) centralised national wage negotiations by themselves.

FOR A WAGES POLICY

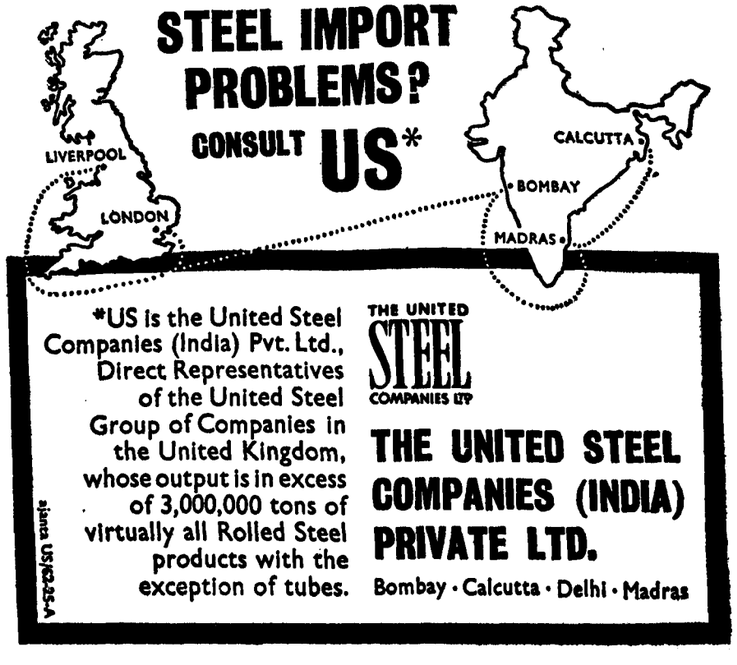
The government's first task should be to create a climate favourable to the working of a Wages policy by educating public opinion in the dangers of inflation, and thus creating a political will to prevent it. Recognition of the problem of wage-push inflation by the national leaders in politics, industry, and labour, and the enunciation of a Wages policy would be a big step forward and would add a new dimension to the thinking of workers and employers before negotiating, and the hope is that this would make it difficult for the public interest thereafter to be ignored. A clear lead from the government could have a marked effect on public opinion, if the nation's leaders have previously kept explaining how the wage system has contributed to the continuous erosion in the value of the money in the citizen's pocket. The establishment of a norm should, the majority argue, mean that the burden of proof would be upon any group of workers or employers who wanted to depart from it.

As the aim of a Wages policy is to set a norm for wage increases there must be a public authority (such as the Dutch Social and Economic Council, the French Planning Commission, or the newly fledged National Economic Development Council in the U.K.) charged with the job of assessing what it should be. The function of such a governmental body should not be that of a mediator. Mediation has often helped to pave the road to inflation. The government's job is to ascertain and assert the public interest.

GOVERNMENTS AS EMPLOYERS

Since in all countries today the government is by far the biggest single employer of labour, it is vital that the government should have a Wages policy for its own employees. Hitherto, governments have usually fixed the wages of their employees as if for all eternity. Time passes and a day of shocked surprise comes when it is found that school teachers, civil servants, doctors, nurses, or railway men, have fallen far behind the scales achieved by workers in private enterprise. The result is a wage adjustment of a size wholly incompatible with any stabilisation policy, which is bad in itself and as an example. Governments should recognise that wages do rise and that a planned slow rise is better than large abrupt jumps.

In the private sectors of the West, there is an astonishing diversity of legal provisions, institutions, and practices, governing collective bargaining. Many are still conditioned by pre-war experience, when lack of security and fears of depression justified the protection of sectional interests and the neglect of wider views of the national welfare. Changes are needed to adapt



these systems to the wholly different circumstances of the post-war West, in which the basic problem is to secure a steady and equitable rise in real incomes without inflation.

AGAINST A WAGES POLICY

Professor W. Fellner of Yale and Professor F. Lutz of Zurish, who constitute the minority on the OECD Committee, agree with the majority in holding that (1) inflation can only be avoided if the average rate of money wage increases stays within the limits of the average increase in output per man-hour; that (2) it should be possible to calculate rough estimates of the probable average rate of increase of output per man-hour for some years ahead; that (3) those in charge of arbitration services should be informed of the tolerable average rate of increase in many wages; and that (4) the government should adopt a consistent policy towards its own employees.

The minority, however, doubt that the publication of guiding "norms" would solve much. They believe governments would have to intervene in the economy in much greater detail to enforce a Wages policy. They point out that wage negotiations do not relate to average wage rates but to wages and prices is specific industries. They therefore believe that governments would have to become involved in extensive regulations covering individual wages and prices. In such circumstances, political considerations and group pressures would influence the wage and price structure and also the general wage and price level. What the minority have in mind, I presume, is the tremendous bargaining power and political influence of, for example, such trade unions in the U.K. as the railway men and the dock workers, a strike by either of whom could inflict losses on the national income running into hundreds of millions of pounds, endangering the balance of payments itself.

The minority say that the majority assumes that without a Wages policy it is impossible to prevent inflation at acceptable levels of employment and indeed that inflation could develop even at high levels of unemployment, but the minority think that this is too pessimistic. They believe that union leaders will learn from the experience of self-defeating wage rounds and from the subsequent adjustments which have in fact reduced the inflationay momentum. They concede that, given the present bargaining attitudes, the prevention of wage-push inflation would require unreasonably low levels of employment. But rather than fall back on government regulations, they would rely on the education of public opinion by making it clear that wage bargaining between powerful groups had become incompatible with a reasonable employment policy. If a sufficiently high level of employment were assured by monetary and fiscal policy, the trend in the general level of real wages, would in any event correspond to productivity trends. In other words, if full employment could be approximated without inflation, collective bargaining for wages by large unions would not be needed to protect labour's interests. At the same time, wage bargaining between powerful groups makes it difficult for monetary and fiscal policy to function without inflation. This leads Professors Fellner and Lutz to assert that on neither side of the labour market should the permissible size and functions of organisations be regarded as immutable. Bargaining arrangements and attitudes required to protect labour in eras of unemployment may prevent the attainment of full employment in the present era in which modern monetary and fiscal policies could ensure it without inflation. This is the nub of the matter. Wherever bargaining attitudes threaten to conflict with the aims of policy, the organisation on both sides of the bargaining table should be modified in the light of contemporary needs. The conflict cannot be solved by measures which imply that the stabilisation authorities have (a) the independence of pressure groups and (b) the knowledge needed to appraise market forces and to settle the wage structure. A recent article in the Manchester "Guardian", which argued that to secure an acceptable Wages policy, the National Economic Development Council will have to engage in thousands of job evaluations in order to arrive at a "fair" wage structure, suggests that Professor Fellner and Lutz have taken a more realistic view than their colleagues of the difficulties of enforcing a Wages policy.

The European Scene

SCANDINAVIA AND THE COMMON MARKET

From Our Special West European Correspondent

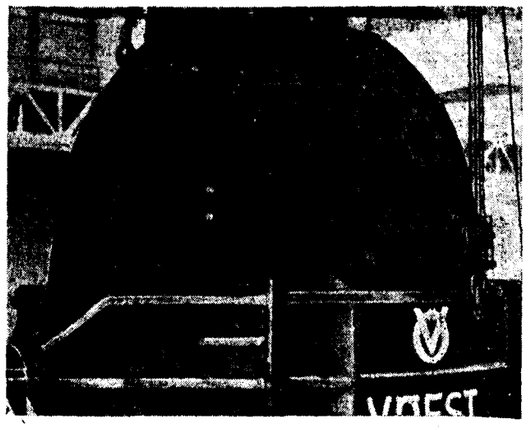
PARIS, July 30, 1962.

MR. GAITSKELL went back from the Brussels meeting of West European socialist parties last week saying that he had been seriously dismayed to find that his Continental friends in the Common Market parties were quite indifferent to the fate of the European neutrals whom Britain roped into her EFTA escapade but who risk being excluded from the enlarged Common Market. His dismay is well founded, for this indifference is common both to the governing parties and the opposition in the Six States. Britain's official concern for them (it is Switzerland, Austria, Sweden and Finland that are involved) is interpreted here as an expression of guilt for having misled them into thinking that EFTA could ever be an effective reply to the Common Market. The pre-condition set by London, that these countries be accommodated fairly, is, if not largely ignored, taken much less seriously than the other stipulations about safeguards for the Commonwealth and for British agriculture. Not that any European who stops to think is literally indifferent to what happens to these four democracies that are economically tied to West Europe but politically incapable of accepting the terms of the Rome Treaty. But there is a general belief that the enlarged Common Market can continue being as "neat around the edges" as the six-nation association has been since 1958. That is to say European nations will either be in or be out, and if they suffer inconvenience by being out, that's too bad.

Hard-heartedness is not the reason for this attitude (although many Continentals are apt to get a little steely when the prosperous and canny Swiss complain of possible trade losses). Common political objectives and, eventually, joint military responsibilities are part of their plan for unification, and its sense would be radically altered if they admitted nations that accepted neither. The economic boundaries of their union will have to be drawn somewhere, in the shape of a common external tariff which, preferably, should be equal for all outsiders saving unobjectionable dispensations in favour of developing countries from Greece to Africa. It is hard to see—juridically, politically or economically—how certain prosperous neutrals could, or should, be granted extraordinary favours. A limited exception might well be made in the case of Austria, whose situation is unique; this could take the form of a generous commercial treaty signed between Vienna and the enlarged Common Market. No special treatment is, to date, envisaged for Switzerland; the other Europeans are not inclined to it and the Americans are positively hostile.

There remains the case of the Scandinavian countries, and here, it seems, Britain is correct in insisting that the enlarged association can never hope to be as neat around the edges as the six-nation union was. For Scandinavia poses apparently insoluble problems and, whatever the theory of European integration may demand, one cannot conceive how Scandinavia can be either in or out; there will have to be a gradation of association from Denmark to Finland, ranging from complete membership to privileged connection. Scandinavia will be the ragged edge of the Common Market. At the present moment, the position is that Denmark and Norway have applied for simple admission to united Europe, posing no special conditions except that Britain join. Sweden and Finland, on the other hand, have applied for a complicated relation of association. There are those in Brussels who rapidly conclude that the solution is easy: Norway and Denmark are in, and Sweden and Finland are out. This happens to be almost impossible, for the four Nordic countries constitute an entity which, in many ways, is more closely knit than the other Europeans can hope to become in two generations of common markets, Euratoms and the rest. The Nordic Union exists and has in fact just this year been reinforced; it is based on long tradition and a community of interests, although not expressed in any military alliance (Norway and Denmark are in NATO, Sweden is a well-armed neutral). If it were excluded as a whole from European unification, its economic viability would be gravely jeopardised, to an extent that other Western nations would soon regret, if only because two of its members are also members of NATO and because all of them live in Russia's ominous shadow. Yet if two of its members were admitted to Europe and the rest shut out, the Nordic Union would be undone and this is unacceptable to Scandinavian opinion; it will seem unacceptable to other Europeans too when they have thought about it as seriously as Britain, connected to Scandinavia by older ties than EFTA, has done.

The four Nordic countries found membership of EFTA congenial, for it was principally an exercise in tariff disarmament and they are inclined to free trade, not only with Britain but with all the world. On the other hand, EFTA aimed at no common economic policy and did not institute a unified market for labour and capital; this suited the four Nordic States who, though they have harmonised these affairs as between themselves, are suspicious and restrictive when it come to intervention from outside the region. Above all, EFTA had no political flavour and this not only accorded with Swedish neutrality but allowed Finland, which remains under Russia's thumb, to enter the European trade arena and benefit from trade liberalisation. The Common Market is in every respect a more difficult commitment for them, and if they have applied for admission or association, as the case may be, it is with considerable apprehension and because they feel they are forced by circumstances.



Summarily, their problem is that they have to stay intimately connected with at least one or other of their two principal clients, West Germany and Britain. If both those clients are members of the one association, as they will be when Britain joins the Common Market, they cannot afford to be excluded from it. Denmark, the only one of the four that has an efficient and competitive agriculture and the one that is nearest in every sense to Continental Europe, could best afford to take the plunge into the Common Market—and could least afford to stay out of it, because Holland, whose production is very similar, would quickly exploit the least tariff advantage to take over Danish custom in Britain and Germany. Yet no Danish government could take the responsibility of disrupting the Nordic Union. Norway, like Sweden and Finland, has a precarious agriculture because of the inclement northern climate and the poor soil, and would be hard put to meet the conditions of the Common Market's joint farm programme; but, at a pinch, she could hold her own in the European Economic unit, from which moreover she is not excluded by military considerations. Yet Oslo could not envisage being isolated by the common external tariff from Sewden, with whom

Norway has 1,000 miles of common frontier. Sweden in turn is no more inclined to compromise her neutrality than Switzerland, and could never abandon Finland which already has enough trouble maintaining her autonomy in regard to Russia.

Far from envisaging the break-up of their Union, the Nordic countries are strengthening it, precisely at the time they are applying for different forms of connection with the Common Market. This is not illogicality but optimism; they believe that when their southern neighbours take the measure of Scandinavian realities, they will be able to devise a network of economic relations that preserves the Nordic Union while giving its members varying status in regard to the Common Market. To date, there is no sign of this comprehension in Brussels, but the Scandinavian parliaments this summer are, each in turn, ratifying the new convention signed in Helsinki in March of this year. This convention codifies and extends the co-operation that began with founding of the Nordic Council in 1952. (Just to be complete, I should recall that Iceland is the fifth member of this organisation; that remote and tiny community—its population is 150,000—will probably seek association with the Common Market on the same terms as Sweden.)

The Nordic Council, which meets to discuss all questions of common interest, can only frame recommendations but it has been the promoter of a number of measures reinforcing Scandinavian co-operation. For example, a common market in labour was introduced in 1954: nationals of each country can move freely about Scandinavia without passports, work where they wish and everywhere enjoy identical social welfare benefits. Later, joint Scandinavian institutions were set up for education and scientific research. The document drawn up in Helsinki in March codifies the forms of collaboration so far practised and opens the prospect of further progress in unification of legislation, social and economic policies, cultural activities, etc. It can be seen that Scandinavians have already achieved a degree of genuine unity and practical fraternity that remains an objective for the peoples of the Common Market, and an objective that may well recede when the insular British bring their particularism into an enterprise that was hitherto, in theory at least, aimed at building a European nation. Naturally, then, Scandinavians would be reluctant to disrupt this creditable achievement for the hypothetical benefits of the Common Market.

However, and here's the rub, commercial necessity forces them to consider the possibility of doing so. For their unity and fraternity are expressed in business by the fact that they all do mostly the same things and are thus competitive. That is why, for all their collaboration, they had never managed to form a customs union until Britain, a major industrial power that supplied the necessary element of complementarity, invented the Free Trade Association. With that Association on the rocks, they find themselves competitors again at the gates of the big European market for their wood, paper, shipping and electro-chemical and electro-metallurgical exports. They, or some of them, are thus tempted to seek commercial advantage over their neighbours. If the Common Market powers prove to be insufficiently understanding of the need to preserve the Nordic Union, the problem will be whether commercial competition will be stronger than the common traditions, history and religion on which that Union is founded.

Erection of a 100 tons LD-Vessel at Richard Thomas & Baldwins Ltd., "Spencer Works," Newport, Mon.

For this project VOEST have supplied three complete LD-Vessel plants.

Economic Report from the U.S.

DOLLAR NOT TO BE DEVALUED

By

GUY SIMS FITCH

WASHINGTON, July 24.

THE United States has made it clear, repeatedly and emphatically, that it will maintain the international value of the dollar. President Kennedy's latest statement to this effect, at his news conference here this week, ranks among the most forceful he has yet made on this subject. Even the most cynical and determined of speculators and gamblers in gold should be convinced by now of the U.S. Government's intentions. The dollar will not be devalued, and no change is contemplated in the U.S. Treasury's standing offer to sell gold at the fixed price of $35 an ounce.

The policy of the U.S. Government on this matter is based on an abiding confidence in the U.S. position, and on the conviction that dollar devaluation is not only needless, but could create a whole spate of new international problems. This also is the stated view of responsible world experts, including Mr. Per Jacobsson, respected head of the International Monetary Fund. The world, after all, is heavily dependent on the dollar as a reserve currency. An increase in the U.S. Treasury's selling price for gold, would not only reduce the dollar's value in relation to that precious metal, but would seriously affect the value of the dollars many countries keep as part of their financial reserves. These dollar reserves could be rendered all but valueless if the United States were to withdraw its pledge to exchange gold for dollars. With international trade and other transactions closely linked to the U.S. dollar, moreover, any U.S. devaluation might only set off a whole series of similar currency devaluations around the world. Any significant change in U.S. policy, therefore, in all likelihood would serve no useful purpose, and could constitute, in Mr. Kennedy's words, "the most backward step" since World War II. U.S. readiness to sell gold abroad at a fixed price has contributed in no small measure to the economic and financial health of many countries, notably those in Western Europe, throughout the post-war period, and hence has been a bulwark of international strength and stability.

Confidence in the U.S. position and in U.S. policies is further augmented by the noteworthy improvement in the nation's international accounts, or balance of payments. In keeping with its self-imposed international responsibilities, the United States throughout the post-war period has spent more abroad than it has received, as its large surplus of exports over imports has been more than offset by capital outflows for such purposes as foreign economic aid, overseas defence costs and private investment. As other countries, the beneficiaries of this outflow of U.S. capital, have built up their reserves of gold and dollars, it has been possible for the United States to look to its own balance of payments position. The deficit, which exceeded $3,500 million a year in the 1958-60 period, was reduced to $2,500 million in 1961. Today, President Kennedy pointed out at his news conference, the deficit is running only one-half of what it was last year, which would bring it down to about $1,200 million for 1962. And the President reaffirmed his off-stated intention to eliminate the deficit entirely by the end of 1963.

Of course, as the President also noted, the United States could bring its payment into balance any time it wants, merely by withdrawing support for foreign aid and defence programmes. But this is not the path being taken by the United States, particularly as Western European nations, with their resurgent economies and improved gold and dollar holdings, show a readiness to share increasingly in the effort to promote the free world's economic progress and security. Instead, the U.S. Government has been following other and more constructive approaches, such as further expanding its trade, curtailing non-essential foreign spending, improving its domestic economy, and co-operating with other countries on the stabilization of international currency flows. In all this, there is no evidence of hasty or ill-conceived moves. The policies the United States is pursuing have been carefully and deliberately formulated, they are born of the confidence that international problems can be met within the framework of responsible action, and that an investment in the U.S. dollar is "as good as gold," as Mr. Kennedy has so aptly phrased it.

AUSTRALIA'S LARGEST COMMERCIAL BANK CAN HELP YOU TO PROMOTE TWO-WAY

TRADE WITH AUSTRALIA, NEW ZEALAND, AND FIJI

Want to sell? Want to buy? Want market information? The international Division of the Bank of New South Wales can tell you about the opportunities for trade offering with these countries.

The Bank's complete banking service includes such specialized facilities as trade introductions to buyers and sellers, industrial enquiries, economic and market information, and a complete travel service. The Bank is closely and constantly in touch with industry, business, and agriculture in the areas it serves through more than 1,100 branches and agencies.

How
ISI Helps
the
Manufacturer

BY PROVIDING THE SEAL OF INTEGRITY

The ISI Certification Mark may be given to any manufacturer whose products are made to the relevant Indian Standards. It is a recognition of his business integrity and trustworthiness.

Modern methods of quality control, an essential part of any scheme of certification, bring about many economies in production through elimination of defectives, increase in productivity, and securing of uniform quality of output. These benefits far outweigh any additional cost involved in instituting continuous inspection and testing.

Periodical check-up by ISI of manufacturers' own quality control systems constitutes an invaluable service to ensure top management of the high efficiency of production and maintenance of quality.

Consumer satisfaction and competitive marketing position are the obvious advantages enjoyed by all ISI Mark users.

Enquire for details NOW how you too can join the distinguished company of manufacturers who already hold the ISI Certification Mark Licence.

Special Article

THE RISING TREND IN PRICES: 1955-62

GREAT anxiety has been expressed recently in regard to the rise in prices which has imposed considerable pressure, as always, upon those least able to bear it. The Congress Parliamentary Party Executive Committee set up, a month ago, a special sub-committee to study the whole problem of prices so as to suggest ways and means for curbing another steep rise. It is the object of this special article to analyse the available statistical evidence so as to highlight the commodities where the pressure has been the heaviest and also to measure the rate of rise in prices since the beginning of the Second Five-Year Plan. Earlier, in "The Eastern Economist", both the Economic Adviser's index of wholesale prices and the All India Working Class Cost of Living Index have been subjected to scrutiny. The Economic Adviser's index was the subject of a special article in "The Eastern Economist" dated March 25, 1960 and the All India Working Class Cost of Living Index in a special article in "The Eastern Economist" dated April 8, 1960. It is now proposed to extend the series analysed in these two articles so as to measure the new pressures during the last two years particularly.

The All India Working Class Cost of Living Index which represents the average of working-class indices of 27 industrial centres all over the country shows that upward pressures are usually generated in the second half of the year, i.e. from July to December. In 1960, the rise in prices in the second half over the first half was of the order of 2.5 per cent. Similarly, in 1961, the rise was of the order of 3.2 per cent. It is believed that this will be repeated in 1962 as well.

The behaviour of the index since 1956 shows a remarkably uniform pattern wherein the average index in the first half of a year turns out to be the same as the average in the second half of the preceding year. This fact is brought out by Table I below. On this analogy the index for the second half of 1962 will certainly cross the limit of 130 (Base: 1949=100) — an all time peak. The conclusion which emerges from a scrutiny of this index is that the secular trend in prices is up, and there seems to be no prospect of the consumer prices either stabilising or declining in the short run.

The same technique of measuring the rate of rise in the wholesale prices in the second half of the year

Percentage change of first half over second half	+1.2	+8.2	+1.9	+7.1	+4.0	+3.9	—0.7	

†Average of two weeks.

as compared to the first half reveals an interesting pattern (see Table II), though not conforming exactly to the behaviour of the All India Working Class Cost of Living Index. Except for 1961, the average of the index of wholesale prices for the second half has been always higher than the average of the first half since 1955. A steep fall in jute prices last year which affected both raw jute and jute manufactures kept the index subdued with the result that 1961 did not follow the pattern exhibited in the earlier years. But this is certain that the prices have been steadily rising from year to year whatever the manner of comparison. Whether the figures are looked at month to month or year to year, the trend has been upwards. The wholesale price index did show a slight downturn from August 1961 onwards but this was a temporary phase, as already explained, caused by the crashing jute prices. Prices have started looking up once over again and the index is now struggling to beat the all time peak recorded in July, 1961 at 128.8 (Base: 1952-53 = 100). The average of the index for the first two weeks of July, 1962 has already attained an all time high at 129.1.

Table III sets out the indices of wholesale prices of selected commodities for the months of June from 1955 to 1962. There is no commodity which has shown any tendency to drop. Pulses had kept a stable level for the last four years, but here also the index has shown a rise of 12 points in one year. At the top of the list in the spiral of rising prices stand "other food articles" which include tea, coffee, spices, salt and betelnuts. Metal products stand next followed by oil-cakes, oil-seeds, edible oils, fruits and vegetables, fish, eggs and meat and woollen textiles. It provides some relief to note that cereals have been pegged down by the import of PL 480 wheat. But the prices of other quality foods such as fish, eggs, meat, edible oils, fruits and vegetables and sugar have been allowed to continue their upward trend. With increasing incomes, the demand for quality food is rising and the thesis that restraining prices of cereals alone will keep inflationary pressures in check does not hold any longer.

However useful these indices may be in measuring inflationary pressure in the Indian economy, they do leave out certain essential elements such as expenditure on education, transport, housing etc. which are imposing increasing burdens on the urban population particularly. No index gives due weight to these pressures. The wholesale price index has no provision for measuring the changes in rents except for recording the prices of cement, steel, bricks etc. The rise in prices of these components fails to measure accurately the staggering increase in house rents. The consumer price indices assume a constant rent because of the application of Rent Control Acts in most of the urban centres. In fact urbanisation in this country has progressed very fast in recent years and families migrating to urban areas find it very hard to get accommodation at reasonable rates. That is why the slum areas are growing in all urban centres. No index evolved so far in this country takes care of these additional pressures.

TABLE III.

INDEX NUMBERS OF WHOLESALE PRICES OF SELECTED COMMODITIES: 1955 - 62

THE BUSINESS WORLD

Public Interest Concept in Company Law

By CROESUS

IN all the discussions that Mr. D. L. Mazumdar, Secretary of the Company Law Administration, had with commercial bodies and various other associations in Bombay, early this week, one noticed, he stressed what he described as the "public interest" concept, and this, he claimed, has come to be accepted in the administration of Company Law or Mercantile Law as a whole since the last two decades. One can appreciate this only when one is sure of what "public interest" precisely means. Unfortunately, the term is as vague as it is comprehensive and, for this reason, is liable to be interpreted variously. But, I must say, a measure of definiteness was sought to be provided by Mr. Mazumdar when he distinguished between the emphasis on property and proprietory rights under Mercantile Law all along and the public interest concept as enshrined in our new Company Law now. He maintained that, under the new law, a joint-stock company was no longer allowed to be treated as the exclusive concern of either the management or the shareholders alone; the company too enjoyed a status of its own; it was a seperate legal entity. In view of this, according to him, although the management and the shareholders may approve of something as being in their interest, the Government can still step in, if it feels the decision in question to be opposed to "public interest". Now, a really ticklish question is whether any representative of the Government who will decide this can be allowed such vast discretion, or whether it should be left to the discretion of an experienced judge. Since it is coming to be accepted that our courts are not merely courts of law, as they were hitherto, but courts of justice, as they ought to be under ideal conditions, it follows that the courts are, in fact, the most competent to determine whether a particular decision of a joint-stock company militates against "public interest".

Although no one can question the thesis that the safeguarding of "public interest" should be an important aspect of company management, one should not overlook the complexity of the problem and the impossibility, at all times, of securing an impartial decision, especially when there is a conflict among the concerned interests. For example, when a company is not making profits and an industrial Tribune awards an increase in wages and other emoluments, maybe in the interest of industrial peace, will it not conflict with the interests of the shareholders? Again, when the State compels a company to export at a loss, maybe in the interests of the country's balance of payments position, will it not affect the profits of the company? Similarly, when the management persists in experimenting on a given product to achieve the best results and give the consumer the finest product, the expenditure incurred may turn out to be out of all proportions to the concerned company's financial position at the time, although, in the long run, the effort may prove worthwhile; and, in such a case, if the shareholders and even some directors were to object to the expenditure, would the authorities consider the action of the management to be in "public interest" and overrule the opposition of shareholders and directors? In other words, by reason of the existence of different interests that constitute a joint-stock company, the determination of what is in "public interest" will not be easy; to hold the scales even as between the different conflicting interests of the parties concerned will by no means be a simple task. The problem may perhaps present itself as a choice between what is in "public interest" and what is in "the larger public interest".

While on this point, Mr. Mazumdar was asked about the time taken by the countries of the West to import the concept of "public interest" into their respective joint-stock company management. The C.L.A. Secretary replied that the concept had become known in the Western countries by about the twenties. In this context, he recalled the suggestion made by the late Mr. Hargreaves Parkinson of "The Financial Times", London, that the British Government should own one share each in every joint-stock company of the land and watch the progress of each company by virtue of its right as a shareholder. Incidentally, this is so characteristic of Mr. Parkinson, a friend of revered memory, who could not reconcile himself to too much of State intervention in anything. Be that as it may, the great social awakening that has come upon the world is bound to manifest itself in the sphere of joint-stock company management also, even as in other spheres. Perhaps it is this consideration, as much as the difficulty of judging the degree of offence involved in any contravention of Company Law in different circumstances that prompted Mr. Mazumdar to rule out the suggestions for minimum penalties in the case of all convictions for offences under Company Law.. He disclosed that this proposal had, in fact, been examined, but the difficulty about implementing it was, he said, that circumstances varied so much in two different cases of the same type of contravention that it would not be correct to lay down any minimum penalties.

Another idea that claimed Mr. Mazumdar's prominent attention in many of his discussions was the future of joint-stock company management. He was quite hopeful that the future working of joint-stock companies in India would be on sound and healthy lines not only because of the deterrents to mismanagement under the new Company Law but because of the emergence of a new enterprising and imaginative managerial class. In this connection, he welcomed the advent into the field of the younger generation of business men with good educational equipment and foreign training, and wished that more and more of them would come forward to take on the responsibility of company management. Like Mr. G. D. Birla on a number of occasions in recent months, he felt that the future of the country, as well as of good company management, lay with the younger generation.

Referring to the recommendations on Company Law reform made by the Jenkin's Committee in the United Kingdom, Mr. Mazumdar, who would not give his considered reactions, felt that some of the recommendations of the Jenkin's Committee came very near the Indian

Companies Act as amended in 1956. Although his department was still studying the Jenkin's Committee report to be able to commit himself yet, to the extent of suggesting any reforms on these lines in our Company Law, he said he was particularly struck by two recommendations: (1) that the final responsibility of directors in respect of company affairs should be prescribed in the Law itself and (2) that a person who "habitually" violated Company Law should be debarred from holding any directorship. When, in the light of these reactions a question was put to him as to whether there was any more in the offing to amend the Indian Companies Act again so as to bring it in conformity with the further reforms in the British Law as suggested by the Jenkin's Committee, Mr. Mazumdar said that it was too early to say anything on the subject. All the same, he said, these reforms, the experience of working the present Indian Company Law, and the Vivian Bose Tribunal Report would all be considered at the time of the next amendment. According to him, Company Law needed to be reviewed every five or ten years in order to adapt it to the changing requirements of a dynamic society.

Finally, a notable remark was made by Mr. Mazumdar in regard to the advisability of the Life Insurance Corporation claiming underwriting commission in respect of a bloc of shares whenever it agreed to take it on firm allotment. As the Law stands and as the current practice goes, he said, this might be all right, but, personally, he did not regard it as a sound practice. He would like a public sector undertaking like the LIC, he said, to conform to model practices. It now remains to be seen what the reaction of the LIC would be to this friendly suggestion.

Britain's Entry into Common Market: Impact on India and Australia

By DON WALKER

[Britain's application for membership of the European Economic Community seems destined to mark a further stage in the loosening of the Commonwealth political and economic ties. It is already apparent from the course of negotiations between Britain and the six members of the Common Market that her entry is unlikely to be on terms which would completely satisfy Commonwealth trading interests. Some aspects of the effects on the trading interests of Australia and India are discussed in this article.]

OFFICIAL AUSTRALIAN and Indian reactions, an amalgam of fear, suspicion and impotence, reflect the importance attached by the two countries to their respective exports markets in the United Kingdom. The perambulations of Mr. Menzies and the Australian Minister for Trade, Mr. McEwen, plus the coming and going of a small army of Australian officials across Britain, Europe and the United States, are now so well documented as not to require elaboration here. The vociferous approach of Australia, New Zealand and Canada contrasts strangely with the more restrained Indian attitude. Two reasons for Australia's reactions and their contrast with India's might be mentioned.

The first is political. Despite a slightly reduced majority in the Lok Sabha after the recent general elections, Mr. Nehru still retains the confidence of the large mass of Indian voters. Mr. Menzies, with a working majority of one in the House of Representatives, knows that anything less than an all-out effort to safeguard Australian export markets in the United Kingdom would be to commit virtual political suicide.

The second and more important reason springs from the fact that certain Australian products, for example, wheat, butter, cheese and meat, would suffer immediate and severe competition from European production if Britain entered the European Common Market unconditionally. In these circumstances, Australia would lose not only its preferences against non-Commonwealth countries afforded by the Ottawa Agreements—that is, the difference between a zero or low tariff and the United Kingdom's General Tariff—but be faced in addition with the full common external tariff.

Conversely, it is argued that India's exports to the United Kingdom will not be so severely affected, particularly in the short-term, because of the relative inelasticity of demand for tea and jute products. Against this, it is conceded that unbleached cotton cloth from Japan and China could make large inroads into Indian sales on the United Kingdom's market. Increased competition from within an enlarged Common Market could come, in the longer term, from substitutes; for example, paper packaging and synthetics. India's main competitor in the production of raw jute—Pakistan—would face similar problems, but is in a somewhat more favourable position because of cheaper raw material and the current emphasis on plant modernisation.

TABLE I
INDO-AUSTRALIAN TRADE WITH UNITED KINGDOM

(Percentage ad valorem)

Principal Indo-Australian exports to the United Kingdom	U.K. General Tariff	Proposed Common External Tariff
Butter	15s. per cwt.	24% and C.A.P. measures.
Beef and veal, boned or boneless	20%	
chilled	¾d. per lb.	20% and C.A.P. measures.
frozen	2/3d. per lb.	
Cheese	10% — 15%	23% and C.A.P. measures.
Cotton, raw and waste	Free	Free
manufactures	17½% — 25%	15% — 17%
Flour	10%	C.A.P. measures
Hides and skins, raw	Free	Free
tanned	10% — 20%	6% — 9%
Jute, manufactures	10% — 20%	10% — 23%
Mutton and lamb	Free	20%
Sugar	2s. 0.2/3d. to 6s. 10.8d. per cwt.	80% and C.A.P. measures.
Tea	2d per lb.	18% — 23%
Wheat	Free	C.A.P. measures
Wool	Free to 10%	Free

Note: All the Indian and Australian products listed above, except sugar, enter the United Kingdom duty-free under Commonwealth Preference. C.A.P. (Common Agricultural Policy)

To date, Britain and the Six have reached a measure of agreement on a "package deal" for Commonwealth manufactures whereby the common external tariff would be applied to these items in three stages: 30 per cent when the United Kingdom enters the Common Market; 30 per cent in 1967; and the balance in 1970. There are also provisions for consultations in 1965 and 1967 between the enlarged Community and Commonwealth countries on the effect of the measures.

Britain's demands for "comparable outlets" for temperate foodstuff exports from the Commonwealth met head-on opposition from the Six. Both sides now agree that there should be transitional arrangements for the Commonwealth countries until 1970 and negotiation of world-wide commodity agreements during this period. The lack of a firm assurance from the Six on the protection of Commonwealth interests after 1970 should these negotiations fail is an issue on which Britain must press for further clarification. Another point of difference is the Six's proposal that the quantity of foodstuffs from the Commonwealth for which access is to be guaranteed (the form of guarantee is not specified) should diminish during the transitional period.

The future of exports from India, Pakistan, Ceylon, and Hong Kong—the so-called Category I countries—is to be determined in another "package deal" between the United Kingdom and the Six. India has already expressed concern at the proposal to apply gradually the common external tariff to a large range of Indian manufactures on the grounds that a reduction in exports (mainly of cotton textiles) would aggravate further the country's tenuous balance of payments position before the guaranteed remedial action could be taken.

While a reduction in imports would afford some relief from loss of export earnings in the United Kingdom, a prolonged use of this method of making trading ends meet is precluded in economies bent on rapid economic expansion. Demands from both public and private sectors set a relatively high lower limit to the level of imports; in this situation, exports must not only be maintained but, wherever possible, expanded.

The most satisfactory arrangement from India's point of view, according to Mr. K. Lall, head of the Indian Mission to the European Communities, would be the abolition of the common external tariff on those products now enjoying free entry to the United Kingdom.

With the idea of associate status on the lines of Morocco and Tunisia being unacceptable to the Six, there remains the possibility of tariff-free quotas and/or special concessions for products of particular interest to India.

What then are the prospects for future Indian and Australian exports? Surely not as bad as depicted by Eyre in the "Sydney Morning Herald" of May 15 this year. His cartoon shows Mr. McEwen, a weatherbeaten salesman, turning back into the rain from two street doors labelled "US Market" and "Common Market". A final piquancy is added by his blown-out umbrella marked "Preferences" and the plaintive cry "You'd think SOMEONE would let me in!"

Two broad lines of approach may be taken in answer to this question: a further look at the possible effect of the common external tariff and world developments designed to promote freer international trade.

There are many misapprehensions as to the true object of the common external tariff. This is not, and was never meant to be, an absolute barrier against imports from the rest of the world. Dr. H. F. Bell, economist to the Australian Mutual Provident Society, said recently that poor harvests in Europe and rising living standards would necessitate some flexibility in the common external tariff.

The move to align the six member countries' tariffs—according to the Treaty of Rome, by 1970 the common external tariff will be the arithmetical average of rates ruling on January 1, 1957, in the national tariffs—enhances the possibility of offsetting some of the loss of sales to former low tariff countries by increases to former high tariff countries.

These would not compensate, however, for reduced Australian export earnings from the United Kingdom (see Table II). It is estimated that approximately £A165,000,000 or 70 per cent of exports to Britain will be affected. Here, Australian producers must treat whatever transitional arrangements may emanate from the Brussels negotiations as a breathing space in which to find new markets.

TABLE II

INDO-AUSTRALIAN EXPORTS

(Lakh of Rupee)

	1958-59	1959-60	1960-61
Exports from India to:			
U.K. ..	1,64,23	1,78,85	1,72,61
E.E.C. ..	39,20	49,97	51,77
Other ..	3,65,54	4,10,83	4,18,41
TOTAL ..	5,68,97	6,39,65	6,42,79
Exports from Australia to:**			
U.K. ..	2,72,84	2,50,54	2,12,32
E.E.C. ..	1,48,62	1,85,79	1,63,49
Other ..	4,36,33	5,48,86	6,10,44
TOTAL ..	8,57,79	9,85,19	9,86,25

* Excludes gold.
** Period from July-June.

Implementation of the common agricultural policy by the Six poses the main threat to Australian producers. For instance, if the Common Market Commission sets a "target price" for wheat above the present French level, an increase in output would be expected from French and other low-cost producers and, theoretically, production could be stimulated to such an extent that lower prices in the Common Market would exclude all Australian wheat.

The changing international climate of opinion on freer world trade may be traced directly to the Treaty of Rome. Critics, who in the Common Market's formative stages viewed the process as the erection of yet another barrier to the flow of international trade, did not make sufficient allowance for the possibility of similar action being taken by other countries.

As a direct consequence of the Six's decision to eliminate all tariff and trade restrictions between themselves and establish a common external tariff, the European Free Trade Association was formed, and

countries in Latin America and the Communist bloc opted for a lowering of internal barriers to the movement of trade, capital and labour.

Earlier this year, the Six negotiated tariff cuts with the United Kingdom and the United States and recently similar reciprocal concessions to Canada and Australia were announced. More significantly, perhaps, the Kennedy Administration has firmly grasped the nettle of free trade. Under the Trade Expansion Bill, President Kennedy may negotiate for (a) the elimination of tariffs on those products where trade between the United States and the European Economic Community, plus Britain, accounts for four-fifths or more of world trade and on tropical raw materials and, (b) tariff cuts of up to 50 per cent on imports other than from the EEC.

While India and Australia may derive some benefit from these measures — shipments to the United States from the two countries account for roughly 15 per cent and 8 per cent of total exports at present — it will, nevertheless, be necessary to intensify the search for other markets.

Business Notes

Textiles

TARIFF PROBE INTO FAIR PRICES

THE COMPREHENSIVE inquiry into the fixation of fair ex-mill prices of cotton yarn and cloth by the Tariff Commission has begun. Since the enquiry made by Mr. G. L. Mehta years ago, the working of the Indian Cotton Mill Industry has not been subjected to such close scrutiny. Explaining the circumstances leading to the present enquiry, Mr. K. R. P. Aiyangar, Chairman of the Tariff Commission, observed that the highest price spiral in cotton textiles witnessed in recent years, caused mainly by the short supply in cotton during the year 1959 and also by the implementation of the recommendations of the Central Wage Board, had necessitated the inquiry. In this connection, he complemented the Indian Cotton Mills' Federation, which voluntarily undertook (more out of deference to the Government's wishes) to bring down prices to the pre-October 1959 levels. Although this and the other steps taken by the Government had achieved a measure of success, Mr. Aiyangar noted, the price rise was not without its adverse effect on the consumers, as also on the persons employed in the handloom sector.

The industry, as at the beginning of 1961, comprised 287 composite and 192 spinning mills Among the composite mills, while 89 are located in Gujarat, 80 are situated in Maharashtra. Of the remaining 118 mills, 25 mills are located in Madras State, 19 mills in West Bengal, 17 mills each in Uttar Pradesh and Madhya Pradesh, and the rest in other States. The total number of spindles and looms as at the beginning of January, 1961 is placed at 13.66 millions and 1.99 lakhs, respectively.

On the spinning side, Madras has a majority of the mills, i.e. 109 out of 192, Gujarat and West Bengal having 14 mills and Maharashtra only 12 mills. The Madras State has thus a greater concentration of spinning units; in fact, it has more than 56 per cent of the total spinning units in the country, though it has accounted for only 23 per cent of the total spinning capacity.

The total production of yarn during 1948, 1956 and 1961 was 1,448, 1,671 and 1,900 million lbs., respectively, while that of cloth was 4,319, 5,307 and 5,139 millions yards, in that order. Out of the total cloth production, the percentage of medium cloth remained as much as 75 per cent, while that of fine and superfine cloth showed a definite decline, and Mr. Aiyangar suggested that the impact of high excise duties might have influenced this adverse trend.

As regards the utilisation of capacity, the Tariff Commission Chairman pointed out that two shifts were being run on the optimum level, but the non-utilisation of the third shift was due, he said, to (i) deterioration in quality of fine and superfine fabrics, (ii) higher unit labour cost (iii) contingency of more retrenchment compensation to workers discharged in case the third shift was stopped and (iv) unfavourable attitude of labour generally towards third shift working.

Referring to demand, Mr. Aiyangar pointed out that, according to the figures made available by the Textile Commissioner, the consumption of cotton yarn in 1961 was of the order of 1,900 million lbs., while that of cloth (on the basis of production of the mill sector and the decentralised sector and imports and exports) was of the order of 7,080 million yards. As against this, at the end of the Third Plan, the Planning Commission placed the figure of domestic consumption at 8,450 million yards and that of exports at 850 million yards, and had accordingly fixed the target of output at 9,300 million yards. The figure for domestic consumption, it was pointed out, provided for an increase of about 20 per cent over the estimated level of demand in 1961, or allowed for an annual increase of two per cent in population and per capita consumption alike.

In view of its important role as much in the country's internal economy as in its external economy thus, Mr. Aiyangar urged the industry to go ahead with its "ceaseless efforts to step up output and bring down costs."

Ferro-manganese

THE LOT OF AN EXPORT-ORIENTED INDUSTRY!

THERE IS so much talk all over the country about measures to promote exports. Could it be that, because we are still so pre-occupied with determining the measures to promote exports, we fail to take, or relegate to a secondary phase, steps that could effectively increase our exports almost straightaway? Take, for example, the case of ferro-manganese. Every one knows—and it is heartening to draw attention to it here —that, out of the total production during the year 1961 of 16,359 metric tonnes, as much as 10,409 tonnes were delivered to the State Trading Corporation, against the India-US ferro-manganese versus wheat barter deal. And, according to Sir Ramaswami Mudaliar, Chairman, Khandelwal Ferro-Alloys Ltd., there have been further moves afoot with other foreign countries for barter arrangements so as to maintain continuous export of ferro-manganese. He also declared: "The industry is, and, for sometime to come—not indefinitely, though—must continue to be, in a large measure, an export oriented industry". For this purpose, he not only favoured more barter deals but also seemed reconciled to the idea of letting the STC play an important role. He was also satisfied with the new Department of International Trade of the Government of India and the alacrity with which the Board had held discussions with the industry and become "fully seized with the serious export problems facing the industry". But, then, he was not satisfied with the Government's policy in regard to supply of power to this industry. Not only was the power supplied (in the case of this particular unit of the industry, by the Maharashtra Government) inadequate, but there were avoidable discriminations in the rates charged, depending upon the source of supply, he complained.

Dwelling at length on this and other problems, at the fourth annual general meeting of Khandelwal Ferro-Alloys Limited, Sir Ramaswami Mudaliar observed that, as against the total requirements of 16 M.W. the Company had been able to obtain only 7.5 M.W. on a firm basis and 3.5 M.W. on a "contingent basis". In the result, the Company was able to utilise production capacity to the extent of only 11/16ths of its total capacity. And this state of affairs, it was pointed out, would continue till the completion of the 30 M.W. Thermal Power Plant now under construction at Bhusaval. While the under-utilisation of the capacity thus had resulted in excessive costs per ton as it was, Sir Ramaswami pointed out, the very high rates of electricity charges that the industry was called upon to pay by the Maharashtra State Electricity Board, had further aggravated the already high cost of production. In fact, the Company had been charged 6 to 7 nP. per unit while the ferro-manganese units in other areas have been paying 3 to 4 nP. per unit. And even the latter, according to the Khandelwal Ferro-Alloys Chairman, is much higher than what foreign concerns engaged in the production of ferro-manganese have been paying, namely about 1½ to 2 nP. per unit. And, to make matters worse, as he added, the Maharashtra Government has abolished, with effect from April 1, 1962, the lowest slab applicable to about 70 per cent of power consumption, and this, again, had brought about a substantial addition to the cost of production. Sir Ramaswami, therefore, urged that, unless electricity rates were brought down, there could be no prospect of the Company being able to effect any substantial reduction in the cost of production.

Making out a case for the introduction of a uniform tariff irrespective of source of supply, the K.F.A. Chairman explained how anomalous the existence of different electricity tariffs depending on the source of power supply, i.e. thermal or hydro-electric, in Maharashtra State would seem, when practically all the power stations and power projects were under State control. In order to remove this anomaly, he suggested that the generation and distribution expenses of all power stations under the direct administrative control of the State Electricity Board should be pooled so that a uniform basis of charge could be formulated and consumers could be given equality of treatment. While on this question, he also referred to different rates charged for different industries, and wondered how, when the Aluminimum Industry in the country, also an electro-metullurgical industry like the ferro-alloys industry, was being charged a comparatively low rate, the ferro-alloy industry should be denied a similar concession. Entering a plea with the Ferro-Manganese Enquiry Committee that this industry also should be treated on a par with the aluminium industry, he made it clear that such would not conflict with the principle suggested by him, inasmuch as it would apply to the electro-metallurgical industry as a whole and not to any individual consumer, depending on the locale of the consumer.

Foreign Trade

TRADE WITH LATIN AMERICA

IT NEED hardly be emphasised that more trade will not come our way unless we seek it. The realisation of this fact is no doubt there, but it is a pity that much has not been done to explore the markets of the developing countries. The report of the Engineering Export Promotion Council's Trade Delegation to Latin America and to the U.S.A. is an eye-opener in this direction. The Report mentions various facts as to why much trade has not been possible with Latin America and also makes recommendations that could mend matters to a certain degree. Although the recommendations of the Delegation are of a very broad nature, they, however, have been made after assessing the situation in each of the Latin American countries very carefully.

Of the handicaps mentioned by the Delegation are the high freight rates, absence of trade agreements and lack of credit facilities. These in fact are the main reasons why countries in the region are reluctant to import goods from India. So it is in fitness with things that the Delegation has reiterated that an Indian Trade Commissioner be located somewhere in the region, preferably in Buenos Aires, and a network of market intelligence be established. The matters could be facilitated further if the exporters of engineering goods were enabled to offer credits to buyers in South America and for this purpose it was essential that ERIC should do something in this matter. The establishment of branches in Latin America of one or two Indian banks and insurance companies and utilisation of warehouses in either London or in New York for forward shipment of goods to Latin American destinations in view of the absence of large shipping facilities, perhaps, could also go a long way in bringing more trade from this region. The Delegation seems to be convinced that personal contact is very essential at every stage. After-sales service is, of course, very important if the hold over the markets is to be established. Publicity and propaganda with a full zest is a must for without it Indian products will not be able to compete with the goods of other advanced countries.

The demand for many of our goods in these countries is tremendous and it is for the Government and our traders to see that this developing market is tapped fully. So far we have been devoting our attention only to trade with industrialised nations of the West and have not cared much for the developing countries like Latin America and South-East Asia. An effective change in our policy is now the need of the hour and it is to be hoped that full attention will be devoted to it. Of the many goods that could have a ready market in Latin America may be mentioned the railway rolling stock, track and signalling materials, locomotives, rails and railway track materials. In the U.S. could be sold casting, steel mill products, electric and machinery apparatus, steel pipes, barbed wire and wire nails, small tools, bicycles and accessories and railway stores. The Delegation is of the view that in the crucial period ahead, U.S.A. will offer a more solid footing for Indian manufactures and semi-manufactured products. We have, therefore, to see that our activities are geared up to meet the challenge offered by the American market.

Transport

INCREASE IN MOTOR VEHICLES TAX

A COMMITTEE constituted to voice the grievances of bus and lorry operators in the Madras State has submitted a memorandum to the Madras Government against the steep increase in the Motor Vehicles Tax and T.P.G. proposed in the budget for 1962-63. The committee is of the opinion that this increase in taxation will drive the marginal operator out of business and will discourage truck and bus owners in operating on uneconomical routes and poineering new routes. It will also discour-

age the opening up of new village routes and will prevent the small income group from entering the business. The reasoning behind the memorandum is quite sound. What to talk of small operators, cost even in the case of bigger companies and well organised units have gone up a good deal. Administrative expenses have also increased as a consequence of the Motor Transport Workers' Act, the implementation of the Provident Fund Act and the introduction of ESI scheme to the transport workers throughout the State.

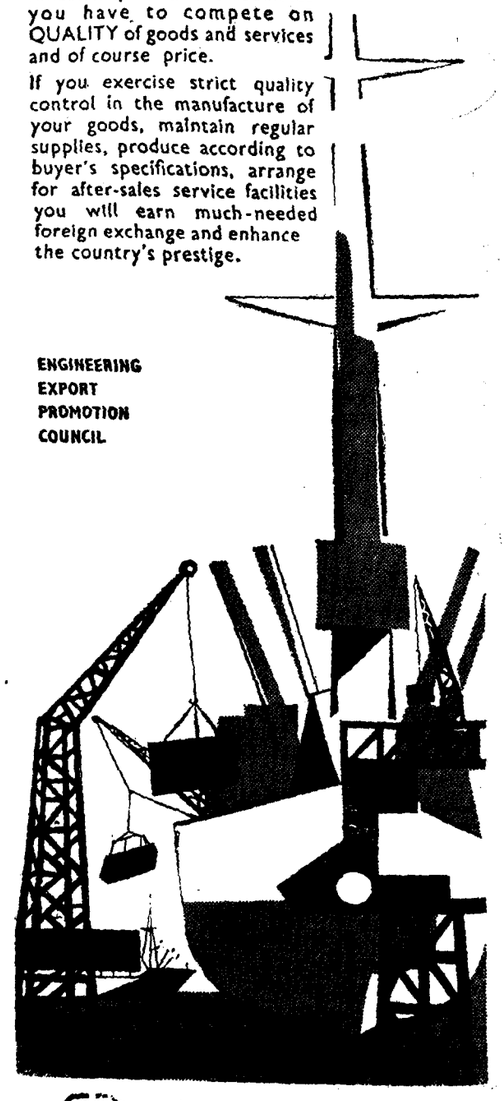
There are two propositions in the budget — an increase of approximately 50 per cent in the existing levels of taxation in category A, 110 cwts. — 150 cwts, 150 cwts — 180 cwts and a new slab of tax on vehicles coming under category over 180 cwts. Since the Ministry of Transport and Communications, Government of India permitting a 25 per cent extra load on the gross vehicle weight has been implemented by almost all the States of India, the Committee feels that this new slab virtually would mean doubling the tax on lorries which they cannot bear. It is with this idea in mind that they have submitted to the Government not to introduce the category of over 9 tons. Besides it is impossible to gauge in advance the mileage that will be done by the spare buses and therefore it is difficult to fit in the spare buses into the category of mileage slab. Keeping all these points in view it has been strongly urged that this change in the method of taxation be completely withdrawn and the practice followed in the past be continued. Since the truck and bus operators have rendered comfortable service to the public and have tried at short intervals to improve the efficiency, it seems fair and logical that their interests be protected.

Economy

POWER AND TRANSPORT CRISIS

HIGH TAXATION, fiscal policy, restrictions and controls which interfere with the day-to-day affairs of productive enterprises were the main subject of criticism in the speech of Mr. S. T. Sadasivan, delivered at the first quarterly general meeting of the Indian Chamber of Commerce. While it is true that taxation and controls have hindered the progress of many productive enterprises, it is the power and transport crisis that is in forefront now. Of late this crisis has taken a serious turn and it is being felt that until and unless it is successfully tackled soon, the progress of the economy may be affected adversely. To remedy the situation, Mr. Sadasivan has urged that the country be made self-sufficient in power generating capacity and in the manufacture of power generating equipment, as soon as possible. He is also of the belief that it is necessary to implement all the power projects in the first two years of the Third Plan rather than in the last year.

Adverting to transport difficulty presently being experienced, Mr. Sadasivan regretted that no effective solution for the transport of coal has yet been found. Since the railways were unable to cope with the problem of coal transportation, Mr. Sadasivan urged that transport of coal by road should be encouraged and all possible avenues of river transport should be explored. While the suggestions may not be new, the pity is that nothing much has been done to solve the transport crisis. It is high time that the planners should concentrate more on the problem of transport and power for in it lies the effective answer of gearing the wheels of progress.



INTEREST ON LIC MORTGAGE LOANS RAISED

The Life Insurance Corporation of India announced on July 30th, 1962 that, with effect from July 18, 1962, it had fixed the rate of interest under its scheme for grant of loans on mortgage of immovable properties at three per cent above the Bank Rate, subject to a minimum of eight per cent per annum, payable half-yearly, with a rebate of one per cent per annum, for punctual payment of principal and interest instalments. Anyone would have objected to this, as it means giving retrospective effect of nearly two weeks to a later decision, but, anticipating such reaction, apparently, the LIC has added specifically that interest under loans already disbursed, or sanction whereof has already been communicated to the applicants, will remain unaltered at seven per cent per annum with a rebate of half a per cent per annum for punctual payment.

Your market outside is discerning

As an exporter of engineering goods you must be aware that in the export markets, for the buyer to select your goods in preference to those of other industrially advanced countries you have to compete on QUALITY of goods and services and of course price.

If you exercise strict quality control in the manufacture of your goods, maintain regular supplies, produce according to buyer's specifications, arrange for after-sales service facilities you will earn much-needed foreign exchange and enhance the country's prestige.

ASP/EEPC-1/62

FROM THE CAPITAL'S CORRIDORS

ASSISTANCE FROM THE AID-INDIA CLUB

THE $220 million gap in the matching contribution of non-US members of the Aid-India Consortium, left unfilled at the Consortium's meeting in May last, has been filled up to the tune of only $155 million at its this week's Washington meeting. The United States has given a matching contribution of $435 million. Thus, the total aid that has been promised by the Aid-India Club for the second year of India's Third Plan amounts to $870 million, as against the expectation and requirements of $1,000 million from this source.

The following is the break-up of this assistance :

(Million dollars)

Country	Amount
United States	435
Britain	84
West Germany	139
France	45
Japan	55
Canada	33
Italy	53
Belgium	10
Austria	5
Netherlands	11
TOTAL	870

Simultaneously, the International Development Association, an affiliate of the World Bank has announced a fresh assistance to the tune of $50 million which brings the total assistance promised by the World Bank and its affiliate IDA for the current financial year to $200 million. If IDA's this contribution is taken into consideration, the total assistance available from the World Bank and the Aid-India Consortium comes to $1,070 million. This falls short of the total requirements from these two sources (of $1,150 million) by only $80 million.

The assistance promised by the Aid-India Club has not come as a surprise to this country since it is understood an indication of this had been given to the Union Finance Minister, Mr. Morarji Desai, during his recent tour of Western Europe. Contrary to expectations, however, West Germany has not stepped up its contribution from the level it had indicated at the May-end meeting of the Consortium. Britain has stepped up its contribution by $16 million, France by $30 million, Japan by $25 million and Canada by $5 million from the levels these countries had indicated earlier.

The Aid-India Club's offer has been received in official circles here with mixed feelings. It is considered good so far as it goes, but obviously it has to go further. Particular significance in this context is attached to the fact that the US offer to extend assistance to the extent of $500 million for the current year of our Third Plan still remains open, provided the existing members of the Consortium or any new members who may join it hereafter make up the balance of $65 million in their quota. The curtain over this affair has, thus, not yet been drawn finally and there is every prospect of another meeting of the Club being held sometime later to explore the possibilities of bridging the $65 million gap that remains in the matching contribution of the non-US members. If the non-US members of the Consortium are able to raise another $65 million, the US assistance would be raised to the full level indicated by it, that is $500 million. In that case India's requirements of foreign assistance from the Aid-India Club and the World Bank should be more than fulfilled since IDA's contribution will be additional.

How much of the assistance promised by the Aid-India Club can be utilised for maintenance imports is not yet clear. The World Bank and IDA loans, of course, would be tied credits meant for utilisation on specific projects. The aid from Italy consists of the $45 million ENI credit and the $8 million credit for the aluminium project. India will have to negotiate with the other members for part of their contribution to be made available to her in the form of untied loans. This question will be taken up when the bilateral agreements with the individual members of the Consortium are negotiated.

FOREIGN TRAVEL: RESTRICTIONS TO STAY

With the Aid-India Club's meeting now over, it is certain that there is to be no relaxation in the rigorous restrictions on foreign travel and those on imports. Indeed, it would not be surprising if some of these are made stricter. Mr. T. T. Krishnamachari's recent suggestion that maintenance imports should be pegged to exports minus the repayment liabilities during the year is reported to have received widespread support during recent official discussions. A beginning with the implementation of this idea is likely to be made soon.

It is recognized that an abrupt reduction in imports, which have already been cut to the bone, may cause hardships and social problems such as unemployment and rising prices. The idea, therefore, is to arrange the cuts in a way that their adverse effects are minimized.

An important proposal that is now being discussed in this connection is that the scheme for slashing imports in order to bring them down to the level of exports should be linked to a carefully formulated plan for "import substitution". The idea is that the Planning Commission and the relevant Ministries should appoint a number of technical panels to recommend, commodity by commodity, how imported materials can be replaced by indigenous goods.

THE MIG AFFAIR

With the report of Air Vice-Marshal Harjinder Singh, Air Vice-Marshal Ranjan Dutt and other experts of the Indian Air Force, who were in the United Kingdom recently to study the suitability of the UK-made Lightnings as an alternative to the Russian-built supersonic aircraft MIG, going against the former and the decision taken by the Union Cabinet's Defence Committee to send a high-level mission, including test pilots, to Moscow, there remains now little doubt that India would soon purchase MIG Aircraft from the Soviet Union and subsequently manufacture them in this country with Soviet help.

The timing of the decision to send the high-level mission to the Soviet Union to negotiate purchase initially and manufacture in India ultimately of Soviet MIG's barely a week or so before the meeting of the

Aid-India Club in Washington this week, was particularly significant in that it put the Western aid-giving countries to test. The outcome of the Aid-India Consortium's meeting in the face of the last week's developments in regard to the MIG deal was envisaged to reveal the real intention of the Western nations, whether they wanted to extend economic assistance to this country with or without political strings. Now that the Aid-India Club has assured massive assistance, the inference should be obvious.

The proposed MIG deal is also envisaged to play an important role in the diplomatic manoeuvres in connection with India's dispute with China, which is assuming serious proportions. Despite wide differences between the USSR and China on the ideological plane, it would be absurd to expect the Russians to be against China in any armed conflict. But they can very well be neuralised and that presumably is one of the reasons why the MIG deal may come through. By buying the Soviet aircraft, India, many argue, would also be buying Russia's neutrality which, at times, especially like the present one, could be as valuable as active support from it.

THE CAIRO CONFERENCE

The Cairo Conference of non-aligned developing nations of Asia, Africa and Latin America was in a manner of speaking related to Mr. Morarji Desai's mission to Europe, where it was his main pre-occupation to persuade the policy-makers of the Six that India's trade interest must not be jeopardized in the event of Britain's entry into the European Common Market.

The Conference was called to consider the impact of the ECM and other regional economic groupings on the economies of the developing countries of the world. Some of the sponsors, especially Yugoslavia, the UAR and Ghana, were known to have strong views on the subject. There was every possibility, therefore, of the Conference developing into a kind of an agitation against the European Community. Such a state of affairs would have been prejudicial to Mr. Morarji Desai's persuasive efforts in the European capital.

On the other hand, any attempt by India to soft-pedal the proceedings at Cairo could have led to serious misunderstandings with her friends in Asia and Africa, and might even have put ideas into the heads of the Europeans.

Happily, both extremes were avoided, and the Cairo Conference turned out to be eminently fruitful. Without becoming intemperate, the Conference succeeded in focussing attention on the paradox that the developed countries, while eliminating tariff barriers among themselves, are raising towering tariff walls against the economically weaker nations of the world. The fact that a World Economic Conference, under the auspices of the UN, is now a certainty is a source of satisfaction to those who organized the Cairo Conference.

An incidental advantage of the Conference was that the Indian delegation, headed by Mr. Manubhai Shah, was able to do a good deal of trade promotion on its side. An agreement was reached in principle with the UAR for doubling the Indo-UAR trade over the next three years from the current level of Rs. 22 crores annually.

Details of the agreement will be negotiated in Cairo in September by an Indian official delegation, and the agreement may be signed in New Delhi at Ministerial level. Other countries of the Middle East and Persian Gulf have also shown interest in expanding trade with India, and an early opportunity is likely to be taken to capitalize on this sentiment.

MR. MIKOYAN'S VISIT

Mr. Mikoyan stayed here for a short while last week on his way back to Moscow from Indonesia. Though a chance visit, his brief stay here has had results that must be described as important and beneficial. First of all, the problems posed by the delay in the supply of Soviet power equipment, which was causing great concern, has been nearly solved. The period of delivery of the generating units for the Korba, Neyveli, Singarauli and Pathratu power stations has been cut down. The USSR will make available the requisite equipment for these stations well in time to enable them to be commissioned during the Third Plan period. Indian technicians will go to Moscow for training in the proper operation of the power plants.

During Mr. Mikoyan's talks with the Prime Minister and Mr. T. T. Krishnamachari, the acceleration of the supply of power equipment was discussed in principle. Details were settled later between Indian officials and Mr. V. A. Sergeev, Deputy Vice-Chairman of the State Committee for Foreign Economic Relations. Before being appointed to this post, Mr. Sergeev was Economic Counsellor at the Soviet Embassy in New Delhi.

While no specific request for additional Soviet aid was made during the talks with Mr. Mikoyan, there was general understanding that if and when need arose for starting more projects with Russian aid, there will be little difficulty in securing it. In broad terms, however, some mention was made of the fields in which the Soviet Union may conveniently expand its contribution. Interesting enough, steel was included in this list. It is learnt that there is a tentative proposal further to expand the Bhilai steel plant to 3.5 million tons, while the present expansion programme—for which a firm commitment has been made by the Soviet Union—envisages an increase in the plant's capacity from 1 million tons to 2.5 million tons.

STEPPING UP STEEL OUTPUT

With a view to speed up the execution of the Third Plan projects, the Planning Commission has recently completed crucial discussions with the Union Ministries of Steel and Heavy Industries and Transport and Communications.

The basic problem facing the planners in respect of steel is that the demand for it during the current Plan period is going to outstrip the supply by a much larger margin than had been anticipated so far. On the one hand, the estimates of demand, even after disregarding some known shortages, have gone up. On the other, actual production is lagging behind even the revised estimates which were lower than the original ones.

The full picture of the requirements and production of steel as it has now emerged is as follows:

(Figures in million tons)

Year	Requirements	Production	Gap
1961-62 ..	4.3	2.90	1.4
1962-63 ..	5.0	4.0	1.0
1963-64 ..	5.8	4.4	1.4
1964-65 ..	6.6	5.0	1.6
1965-66 ..	7.2	5.8	1.4
TOTAL ..	28.9	22.1	6.8

The overall position, therefore, is that there will be a shortfall of 6.8 million tons over the five-year period

KOTHARI'S

ECONOMIC GUIDE AND INVESTORS' HAND BOOK OF INDIA – 1961

(24th Edition)

A most comprehensive all-India Directory that gives details of a precise nature of working of almost all companies in India.

Contents

Date of Registration
Nature of Business
Managing Agents Names & Address
Details about Capital Structure
Capital History
Telephone Number and P.B. No.
Telegraphic Address
Auditor's Name
Summary of latest financial position
Statement showing the progress for the last 7 years

Classification of Industries

Bank, Cement, Coal, Electrics, Engineering, Insurance, Investment Trust, Jute, Mining & Chemical, Miscellaneous Cos., Paper, Planting, Public Sector, Railways, Sugar, Shipping, Textiles, Vegetable Oils, and General Information.

Review of various industries in the respective sections

Details of various taxes of Central and State Governments, Stock Exchange Quotations, Central, States, Port Trust Improvement, Electricity Board, Land Mortgage Bank, State Finance Corporation Debentures, and Municipal Loans, Industrial Licenses sanctioned, foreign collaboration, special articles on important subjects.

A ready-at-hand information book for those connected with Trade, Commerce and Industry. A set of two volumes with provision for thumb index for easy reference.

Size : Crown Octov' — Printed in thin bible paper.
No. of Pages — 3786.

In 1961-62, nearly a million tons of steel were imported at a cost of approximately Rs. 78 crores. If the entire shortfall in subsequent years is to be met, imports over the Plan period would exceed Rs. 600 crores, whereas the planners had hopefully thought that steel imports during the Third Plan would cost no more than Rs. 110 crores.

The matter does not end there. Two other factors aggravate the drain on foreign exchange on account of steel. Firstly, the Third Plan anticipated that India would be able to export steel worth Rs. 90 crores over the Third Plan period. Actually, the exports will at best fetch Rs. 15 crores. Secondly, the supply of special and alloy steels is likely to be even more unsatisfactory than that of ordinary finished steel. Against a targeted capacity of 375,000 tons at the end of the Third Plan, the existing capacity is no more than 19,278 tons. Nobody has any illusion about the licenced capacity materializing before the last year of the Plan. Consequently, the entire demand for special steels during the Third Plan will have to be met from imports. This will mean a further addition of Rs. 100 crores to the foreign exchange burden.

Faced with this formidable problem, the planners and the Steel Ministry have decided that the steel imports must not exceed the present level of a million tons a year, and that the anticipated shortfall must be made up by increasing indigenous production and better distribution and utilisation of available steel. Three measures are being taken to step up production:

(a) TISCO, Durgapur and Rourkela plants will be brought into full production, ahead of the present schedule, in 1963-64. This will give an increased production of 200,000 tons.

(b) The expansion of the Bhilai steel plant will be so organized as to set up a blast furnace there by the end of 1963. This will be utilized along with the use of basic rules and at Durgapur to augment the steel supply from there by 500,000 tons.

(c) Orders for the erection of new plants will be phased in such a way as to get maximum results in the minimum time.

The steel imports will be divided into three categories and licensed accordingly; (i) essential; (ii) of secondary importance; and (iii) of low priority.

PUBLIC SECTOR TO ENTER LONG-DISTANCE ROAD HAULAGE BUSINESS

Of the series of decisions taken in the field of transport and communications, the most important perhaps is that the State should enter the business of long-distance haulage by road. The proposal is now being examined by the Union Transport Ministry which will submit to Planning Commission a scheme to set up an organization or a series of organisations to take up this business.

Simultaneously, the Government intends to launch on a programme to manufacture heavy trucks with a pay-load ranging from 10 tons to 90 tons. Mr. Krishna Menon has said that the Defence Production Organization can cope with the task of manufacturing heavy trucks, but the question of selecting a production agency is still an open one. A number of engineering and economic details have to be dealt with before the production can be started. These are now being studied. The Orissa Government intends to move iron ore to Paradip port by means of 25-ton trucks and the proposal is being commended.

In the programme for road building, which is being carried out with the help of IDA loans, priority will be given to the construction of feeder roads and improving national highways in the Bengal-Bihar coal belt. A provision of Rs. 16.8 crores is likely to be made for this purpose.

Some time ago the Shipping Board had suggested that the shipping target should be raised from 12.75 lakh GRT to more than 14 lakhs GRT. But the Planning Commission has ruled that whatever additional shipping has to be obtained, it must be acquired within the present Plan allocation, of which Rs. 14 crores are still left unspent. No free foreign exchange will be provided for the purchase of any ships. Even the first instalment for the ships must be paid from out of their net earnings.

STEPPING UP COTTON, OILSEEDS OUTPUT

With a view to step up output of cotton and oilseeds through improvements in their yields per acre, the two-day conference of the country's leading agricultural experts, held here last week, has recommended a major extension of plant protection measures "to the maximum extent and with the utmost speed" in respect of these two important cash crops. This step alone, it was felt, could make a significant and immediate impression on the output of these two vital crops.

The State Governments have been urged to mobilise plant protection measures on a mass scale through sprayers and dusters for intensifying work on the ground. Aerial spraying might also be arranged for compact areas whenever possible. The agricultural experts were unanimous in their opinion about tackling of the inter-connected aspects through concerted action by means of a "package programme" aiming at simultaneous provision of scientific know-how, adequate and timely supply of pesticides, implements etc., liberal and easy supply of credit, marketing, strengthening of co-operatives and other institutions and organisations, as also adequate incentives and legislative measures wherever necessary.

They approved the proposal for the introduction of "package programme" for cotton in several areas in the States of Punjab, Rajasthan, Uttar Pradesh, Gujerat, Madhya Pradesh, Maharashtra, Mysore, Andhra Pradesh and Madras. Some of these areas are Ferozepur and Hissar in Punjab, Ganganagar and Mewar in Rajasthan, Bundelkhand, Allahabad and Rohelkhand in Uttar Pradesh, Rajkot in Gujarat, Marathawada and Vidarbha in Maharashtra, Belgaum and Gadag in Mysere and Krishna-Guntur in Andhra Pradesh.

For groundnuts, the experts recommended that considering the acreage under this commodity and the potentialities for encouraging its production, the number of package programme units for groundnut production should be raised from the existing eight to 24 in the States of Gujarat, Maharashtra, Mysore, Andhra Pradesh, Madras, Madhya Pradesh, Uttar Pradesh, Rajasthan and Punjab.

It was also recommended that even the existing programme should be accelerated by covering the entire area under groundnut in three years instead of four. It was also felt that the scheme which was originally sanctioned for irrigated areas only should also include areas with adequate rainfall. It was recommended that areas should be separately demarcated for growing cotton and sugarcane. No sugar factory should be allowed in the cotton areas.

With regard to the extension of cotton to new areas, it was suggested that having regard to the increasing irrigation facilities as a result of the Rajasthan Canal Project and excellent climatic conditions, maximum area should be earmarked for growing long-staple cotton in Rajasthan. Possibility of setting up large-scale State farms for cotton, mechanised if possible, in the irrigated areas of Rajasthan should be examined.

It was suggested that additional technically qualified agricultural staff should be provided which should be fully integrated with the normal agricultural staff.

Another recommendation related to the arrangements for buffer stock storage of fertilizers before the commencement of the season. The Ministry of Food and Agriculture was understood to have agreed to bear interest and storage charges of such stocks. It was felt that fertiliser loans should be given only in kind as that would check its misuse for other purposes and would increase fertiliser consumption.

With regard to seeds, the experts recommended that suitable arrangements should be made for providing improved seeds on adequate scale and efforts made to saturate 95 per cent of the area under cotton with improved seeds. Steps should also be taken for setting up a seed testing laboratory in each State.

The practice of mixed cropping, i.e., groundnut in cotton crop as prevalent in Saurashtra and Andhra Pradesh, should be popularised wherever practicable. It would not only ensure maximum utilisation of land, manurial and irrigation resources and afford greater income to the farmer but also production of two crops so much needed by the country.

STC SIGNS TRADE PACT WITH JORDAN

The State Trading Corporation has renewed its agreement with the Jordan Phosphate Mines Company for importing 1,50,000 metric tons of rock phosphate. Against this import, India will export to Jordan tea, coffee, spices, footwear, leathergoods, shellac, textiles, engineering goods, cotton yarn, chemicals and pharmaceuticals etc. The agreement is valid upto December 30, 1962.

To facilitate Indian exporters to get their payments under this agreement, all contracts/orders entered into by Indian exporters with Jordanian importers will have to be registered with the STC. Payment to Indian exporters will be made from the rupee account of the Jordan Phosphate Mines Company maintained with the State Bank of India.

DUTY DRAWBACK ON EXPORTS

As a measure of export promotion, the Government of India has decided to allow drawback of customs and/or Central Excise duty on export of some more items. They are: tarboilers, duplicators, detonators, machine tools, pistons, Gudgeon pins, cylinder liners, piston rings, centrifugal castings, hydraulic brake fluid (not otherwise specified), fountain pen nibs, switchgears and control gears and components, capacitors, cocoa powder, chocolate, cocoa butter, stainless steel, copra cake, deoiled copra cakes, storage batteries and steel barbed wire.

Some changes have also been made in items relating to textile machinery, steel products, glassware, mill machinery, radio receivers, noil yarn, paints, chemicals and pharmaceuticals and plastic goods.

Further details and advice regarding the procedure for obtaining these concessions are available at the at the Custom Houses at the ports from which the goods are to be exported.

ENROLMENT OF EXPORTERS UNDER PROMOTION SCHEMES ABOLISHED

Several amendments have been made in the export promotion schemes with a view to simplifying the procedure.

The scheme for enrolment of exporters has been abolished. No enrolment certificate will hereafter be asked for from any exporter in connection with his application for registration or for incentive licences under any export promotion scheme.

An exporter will hereafter have only to register himself with an Export Promotion Council, a Commodity Board or the Export Promotion Officer at the port (as the case may be) in order to avail himself of the benefits of an export promotion scheme.

An exporter once registered will not have to apply for registration every year. The present procedure of exporters having to re-register themselves annually has been discontinued.

In order to expedite the issue of incentive licences against exports, the Export Promotion Councils have been authorised to recommend direct to the licensing authorities imports of such raw materials, components and spares as an exporter is permitted to import as per his latest actual user licence.

Government is also considering the strengthening of the organisation and staff of the Export Promotion Councils. These sanctions are expected to issue shortly.

ETHER EXPORTS TO EGYPT

Messrs. Hyderlabad Chemicals and Pharmaceuticals Works Limited have been able to export three tons of ether sulphuric to Egypt. This is the first time that this commodity has been exported from India.

The negotiations for this deal were started in 1958 and the final order from the Egyptian importers was secured in June, 1961. The shipment could not be effected earlier as the port authorities objected to the entry of ether sulphuric into the dock area because of its highly inflammable property. It was only recently that this difficulty could be overcome.

The company is hopeful of securing further orders for export of ether sulphuric to Egypt. Recently, it has also negotiated a deal with the Ceylon Government for exporting to that country ether worth Rs. 33,000.

IN BRIEF...

The man-days lost due to industrial disputes in 1961 are provisionally estimated at 42 lakh as against 78 lakh in 1958. The decline is attributed to the success achieved—though not in full measure in other respects—by the Code of Discipline introduced four years ago to smoothen labour-management relations.

*

The French Government has allowed special quotas for the import of the following Indian goods into France during the current calendar year: jute manufactures, woollen carpets, coir mats, woollen hosiery, miscellaneous textile articles, hand-made silk fabrics, handicrafts like ivory goods, eathern ware, jewellery etc., sewing machines, sports goods, dried mushrooms, frog legs and canned fruits. The quotas are valid upto December 31, 1962.

*

Messrs. Goodyear Tyres have a $2.5 million plan for expanding the company's research and development facilities at its headquarters in Akron. The plan is said to have been launched to keep the company in the forefront in the rubber industry.

*

According to a press release from IMF, the International Monetary Fund has been advised by the Government of Japan of its formal adherence to the Fund's general arrangements to borrow. Japan has a maximum commitment equivalent to $250 million and becomes the third of ten participating industrial countries formally to announce its adherence. The United Kingdom ($1,000 million) and Italy ($550 million) announced their formal adherence May 8 and March 28, 1962, respectively.

COMPANY AFFAIRS

THE INDIA CEMENTS

The working results of the India Cements Ltd., for the year ended March 31, 1962 disclosed a profit of Rs. 51.29 lakhs after meeting all expenses and providing for Bonus and Depreciation. With the brought forward amount of Rs. 1.19 lakhs and a transfer of Rs. 5 lakhs from General Reserve together with refunds add upto Rs. 58.15 lakhs. Allocations, out of this disposable balance, include Rs. 23.50 lakhs for taxation, Rs. 2.07 lakhs for Rehabilitation, and Development Reserve, Rs. 0.87 lakhs for Development Rebate and Rs. 14.58 lakhs for payment of interim dividend, leaving a balance of Rs. 15.96 lakhs. The Directors have decided to pay a final dividend of Rs. 0.30 per share on equity shares, absorbing Rs. 13.47 lakhs. A balance of Rs. 1.39 lakhs has been carried forward to the next year's account.

The Directors report that the Vizag Scheme has been deferred owing to the delay in the proposed railway line connecting the Borra Cave Region to Vizag port which would be completed only 1966. In the meantime the company has received the necessary sanction to utilise the licence originally obtained for the Vizag factory for setting up a large sized cement factory at Salem. The factory will be put in commission by the middle of 1963.

The Directors are exploring the possibilities of setting up a two-lakh ton cement factory in Andhra Pradesh at Ramagundam, if the geological survey now in progress confirms adequate deposits of lime stone in the area.

HOWRAH MILLS

Howrah Mills has reported results which are far from encouraging for the year ended March 31, 1962, reflecting the exceptionally difficult conditions experienced by the jute industry in general and the Howrah Mills in particular. The shortage of raw jute in the first half of the year, disparities between the manufacturing costs and the selling price and the resistance from overseas buyers account, by and large, for the unsatisfactory results. Sales have suffered a set-back, declining from Rs. 4.60 crores to Rs. 4.11 crores. A loss of Rs. 14.59 lakhs, after providing Rs. 8.75 lakhs for depreciation, has been reported for the year. No allocations have been made for the general reserve (against Rs. 1.50 lakhs), Development Rebate Reserve (against Rs. 17,494), Debenture Stock Sinking Fund (Rs. 1 lakh) and taxation (against Rs. 5.05 lakhs). The dividend for the year, for obvious reasons, has been skipped.

The Directors, however, take a fairly encouraging view about the prospects for the current year, considering the comfortable position in the supply of raw jute and the steady overseas demand for jute goods. The power shortage and effects of the lock out declared in May 1962 are, however, causing anxiety.

INDIAN OVERSEAS BANK

The Indian Overseas Bank has reported encouraging results during the half-year ended June 30, 1962. The net profit, including the sum of Rs. 2.23 lakhs brought forward from last year's account, amounts to Rs. 22,06 lakhs as against Rs. 19.97 lakhs in the corresponding period of the preceding year. Deposits and advances have recorded appreciable increases during the period under review. As on June 30, 1962, deposits and advances are over Rs. 35 crores and Rs. 23 crores respectively as against Rs. 31 crores and Rs. 20 crores as at December 31, 1961.

NEW ISSUES

Eight companies have been authorised to issue capital totalling Rs. 5.94 crores. Of these, three companies will issue 'bonus' shares, four 'equities' and one 'debentures'. One is a new company. The consent of the Controller of Capital Issues in all cases is valid for 12 months. Following are the details:

1. **Suhrid Geigy Limited, Ahmedabad,** will issue Rs. 25 lakhs bonus capital to the existing shareholders of the company on capitalisation of the General Reserve of the company to a like extent.

2. **Geoffrey Manners & Company Limited, Bombay,** will issue bonus shares of the value of Rs. 24 lakhs. Out of this, shares worth Rs. 10.80 lakhs will be issued to the existing non-resident shareholders, M|s. American Home Products Corporation, U.S.A.

3. **The Associated Rubber Industries Limited, Maharashtra,** will issue bonus shares of the value of Rs. 1.00 lakh.

4. **The Fertilizer Corporation of India Limited, Delhi,** a Central Government Undertaking, is issuing further capital of Rs. 4 crores divided into 40,000 equity shares of Rs. 1,000 each, for cash at par. It is engaged in the manufacture and production of fertilizers and has a paid-up capital of Rs. 39.63 crores.

5. **The U.P. State Industrial Corporation Limited,** a State Government Undertaking, having a paid-up capital of Rs. 45 lakhs, is issuing additional capital of Rs. 30 lakhs divided into equity shares of Rs. 100 each, for cash at par to be subscribed by the State Government entirely.

6. **Permali Wallace Limited, Bhopal,** a new company, is raising capital of Rs. 17,25,000 for cash at par. Out of this, shares of the value of Rs. 5,75,000 are to be offered to M|s. Permali Limited, Gloucester, England, and their associates. The proceeds of the issue will be utilised for the manufacture of densified wood, impregnated and laminated wood.

7. **Giovanola-Binny Limited, Madras,** is raising further equity capital of Rs. 5 lakhs for cash at par. The proceeds together with that of the earlier issue of Rs. 35 lakhs will be utilised for the manufacture of penstocks in collaboration with M|s. Giovanola Freres S.A. Mouthey, Switzerland.

8. **Ahmedabad Manufacturing & Calico Printing Co. Ltd., Ahmedabad,** is issuing debenture stock of the value of Rs. 92 lakhs in debentures of Rs. 1,000 each carrying interest not exceeding 6½ per cent and redeemable after 10 years from the date of issue. The debentures will be pledged with scheduled bank/banks as security for raising loans. The debentures shall be payable to registered holders only.

BOOK REVIEWS

NILOKHERI : BIRTHPLACE OF A MOVEMENT

Nilokheri: By S. K. Dey: Asia Publishing House, Bombay: Price Rs. 10.50.

NILOKHERI is a romantic place, the vision, and even passion, of one man, the seed of a revolutionarv idea, possibly of a great national movement. It is impossible without reading this little book of just over 100 pages to decide which of the elements in this picture is the dominant note of the story that it tells. It is likely that every reader will place the emphasis differently. But here at least is a story quietly, yet effectively, told of something which Indians have done for themselves under the throes of crisis, but nevertheless, out of their own qualities of self-reliance and human fellowship, if one does not use Mr. S. K. Dey's word of 'love'. It is possible to exaggerate the element of 'love' and underestimate the element of self-interest, but these are only the fringes of the philosophy behind the movement which Nilokheri represents. The time will come when scholars in universities will be analysing profoundly the motivation of this particular performance. This is the time for a description of its factual, or historical, context; the thing itself is of abiding interest.

One thing at least can be stated; but for another crisis in the life of Mr. S. K. Dey this book may never have been written. It was a heart attack in 1959 and the knowledge that similar attacks had laid low two great friends — Mr. Feroze Gandhi and Pandit Govind Ballabh Pant — that persuaded Mr. Dey that the record must be written. "I felt convinced", he says, "Nilokheri had a lesson for India. In any case, I had no exclusive title to its lessons. So the story is here for what it is worth."

In the main, the story is one of S. K. Dey's own vision. The period during which he was on trial, including carrying conviction in Delhi both to the Ministry of Rehabilitation and to the Prime Minister, provides interesting comment on how enthusiasm can surmount giant obstacles, even those set by Indian red tape at its height. This was no ordinary proposal. It was to start in the middle of swampland in the Kurukshetra Refugee Camp in the Punjab a great self-reliant community, with a training centre for industries, a township, and an agricultural and industrial complex, small but, by no means, the less complicated on that account. The men who were to work were as unknown and in many cases untrained as the 40 original workers with S. K. Dey in this new movement. Quite by chance a strange advertisement.

"Wanted men who can love."

"Invited men who can build men."

Brought in an engineer, B. D. Nanda, who became the architect of the new township, and thus a substantial partner. But those who assume that the enterprise consisted only of the factories and the houses that were built, will miss the spirit of Nilokheri and the lessons that it presents. The lesson is that, out of the human raw material of India, there can be built under Indian leadership powerful communities, well-knit, capable of sustaining themselves both spiritually and materially for a considerable period. One is not satisfied, that once the leadership is withdrawn the experiment can always be a success. That is the large question-mark to Mr. Dey's forceful answer.

If one looks upon the work of Nilokheri as an urban effort and links it, as Mr. Dey would have us do, with Albert Mayer's work at Etawah, one can say he has built here a prototype of Community Development, Panchayati Raj and that tremendous transfer of power to the Indian village which is the most dramatic element in the changing pattern of the Indian Revolution. Whether or not it is this changing pattern which has brought about an improvement in agricultural production will always be a matter of debate. The current estimates are somewhat to the contrary. But that a new India is being born, with the character of revolutionary change in the village, it will not be in doubt. Power is being dispersed and with it responsibility. Nilokheri might be described as an experiment in the decentralisation of power and in the decentralisation of responsibility.

It is appropriate because it presents the prototype of political decentralisation, that the book should carry an epilogue, "Community Development Through Panchayati Raj". This is a summary, in a sense, of the basic ideas which Mr. Dey himself, more than anyone in the country has, set in the Indian political, economic and social system. The story is not yet ended, and perhaps the best comments on it are those with which the book concludes on its 100th page: "The pilgrimage is young. There is a long road ahead. The direction is right. A giant is on the move. The speed of the journey will be determined by the push from behind and the pull from ahead. Short-cuts are but the pranks of the devil."

Whether or not this tremendous experiment will be worth all that is expected of it only the future can tell. But it is quite certain that history will record that Nilokheri was a tremendous failure, if its fruit should fail to endure. And undoubtedly this book will stimulate and provoke thought as well as great hope and faith that men under strain can raise themselves largely by their own boot-straps.

THE MOHINI LECTURES 1961

Lessons of Indian History: Professor Humayun Kabir: Department of Publications; University of Gauhati; Price Rs. 3.

Department of Publications, University of Gauhati, is to be congratulated on having published, even though somewhat belatedly, the Mohini Lectures delivered by Professor Humayun Kabir last year. The theme, "Lessons of Indian History" is one of perennial interest, but it is not often that lecturers on this theme can be found who can be frank and critical as well as scholarly and profound. In the two original lectures, one on "Toleration and co-existence" and the other on "Authoritarianism and Restriction of Knowledge", one obtains directly, as well as between the lines, some very uncomfortable reminders of defects in Indian character which today as well as over the past have tarnished our character no less than our history. Two illustrations well illustrated by Professor Kabir will suffice.

He narrates (on page 22) the old story of Ekalavya, the rival of Arjuna in archery, who, because of class and caste considerations, was prevented from exercising his skill and was commanded by his teacher Dronacharyya to cut off his thumb and thereby deny both himself and society the skills which he had developed on his own.

The destruction of the individual is less important than the weakness thus induced in society. Indian society is still full of instances where ineffective leadership, by denying opportunities to others, inflicts severe damage on society. Professor Kakir points to the sharp contrasts of Indian practice to restrict knowledge within groups with the advances made by Arabs and later by Europeans. Amongst others injured was the privileged class itself. Because fighting was the prerogative of a special class, and new technologies were restricted because of absence of knowledge, the defeat of a single group meant the defeat of the country as a whole. The privileged group never seemed to see its interest in protection by building a powerful society as a whole. Thus leadership of single individuals has been a disastrous pattern for Indian history. Can it be said that we have escaped this tyranny of monolithic leadership at the present time?

Second instance of national weakness, depending in part on the personality cult, is referred to by Professor Kabir as the "supine inactivity before evil". Courageously, — because he was speaking before an Assam audience — Professor Kabir referred to the disturbances there. He said: "In the unfortunate disturbances which have occurred in different parts of India in the last twenty years — and the incidents in Assam last year or at Jabalpur only recently are a cruel reminder of the continuance of the evil — the miscreants have hardly ever been more than a small fraction, perhaps at most 5 per cent of the population. The vast majority of the people have disliked their action and disapproved of it but rarely taken action to stop them."

The Third lecture of the series, "The Lesson of 1957" was not delivered as a Mohini Lecture, but it is good that it is now included, because here we can feel a little more satisfaction. India, according to Professor Kabir, has become the prime inheritor of the links of the cultures of East and West. "She may well serve as a meeting ground where clashes of political ideologies and institutions and social and economic organisations may be peacefully resolved for the benefit of the whole world". Every one will hope with him that our natural destiny will be grasped and fulfilled. But who will argue that the stars are all in our favour?

This little book is a remarkably effective reminder to the Indian people that both their theory and their practice are urgently in need of reform. Will they, as an adult suffrage democracy, bring about the reforms which authoritarian society based on a powerful class prejudice has down the years made difficult to the verge of impossibility?

THE EASTERN ECONOMIST

AUGUST 10, 1962

Appeasement

THE revelation on the opening day of the new session of Parliament last Monday that the Ministry of External Affairs had actually suggested discussions on the Ladakh border between India and China without the withdrawal of the Chinese forces beyond "the 1956 line" created a storm of anger which has far from subsided. The Prime Minister's explanation, as well as a previous discussion with certain Members of Parliament has done nothing to detract from the feeling that, while the Government's official declarations, particularly during the elections, were to the effect that there would be no appeasement, its whole policy is now directed to a settlement short of recovering India's territory as described in Indian maps or in the schedules of the Constitution. In effect, therefore, much brave talk about maintaining the territorial integrity of India has been undermined by a nagging belief that the Government is privately convinced that the recovery of this territory is impossible and a settlement somewhere in between is desirable. The Prime Minister has claimed that he has the right, in so doing, to negotiate with the foreign countries without the sanction of Parliament. He implied, though he did not say so, that the remedy was for Parliament by a vote of censure, if it were so minded, to deny ratification of his action. The suggestion that Parliament should be consulted before such a serious step were taken was to him unacceptable.

There is no doubt that, in ordinary routine negotiations, the Executive should be free to act as the Prime Minister suggested. It would be impossible for any Executive Government to act with speed and the necessary promptitude if every letter had to be couched in terms which were in accordance with directions from Parliament. But the present case is surely singular in that Parliament is known to be highly incensed in regard to the possibility of a compromise on Indian territory which subsequent negotiations may be powerless to reduce. In effect, therefore, if the point were accepted that the Chinese could stay in possession of territory which we have always claimed as our own without our declaring that this is aggression — and not a border dispute — we may be building up a semi-legal case on the basis of which much of the enthusiasm for the defence of our territory might melt away. There is a widespread belief that the Minister of External Affairs and the Minister of Defence, by implying that conversations should take place on the basis of a line well inside Indian territory, are sounding a defeatist note in that the vacation of aggression has given place to much milder phrases such as the settlement of a border dispute. The evil word 'adjustment' has also been given currency. It is doubtful, whatever the prestige of the Prime Minister and however difficult the military situation, whether the country is psychologically prepared for a settlement on the lines proposed. It is, therefore, right and proper, instead of taking risks of non-ratification by Parliament under circumstances which cannot be anticipated, if a mandate is sought from Parliament in regard to the precise area on which negotiations are to be undertaken. The report of the officials on which there has been substantial comment previously in *The Eastern Economist* is a good enough basis for further discussions. The 1956 line as a cease-fire line is not, however, a good basis, because it involves India's vacating outposts which we did not hold on that date. A great deal of hard military work will thus be lost and, in the event of there being no agreement in the discussions, China, already better situated for an advance, would then be even in a stronger position to entrench herself.

Apart from the military issue as to whether or not withdrawals on both sides will not be in favour of the Chinese, we are faced with the constitutional issue as to whether or not the Prime Minister of India can act with freedom on an issue on which he has no mandate from the Indian people. Indeed, if anything the mandate was very much to the contrary. The Congress Party affirmed solemnly before the General Elections that China must vacate her aggression on Indian soil. There was never talk of a compromise. This was used to win votes not only for the Congress Party, but, in particular, for the Defence Minister in Bombay. It would be a sad betrayal if, because the military situation has become adverse, the Prime Minister should conclude that the mandate given to his Chinese policy at the time of the elections applies also to a policy in substance substantially different from what was then described. It is right that the people of India should rise up against the suggestion that because we are weak we must surrender to the invader in wrongful possession of our territory. It is vital that the country, through Parliament, should leave the Prime Minister in no uncertain mind in regard to the extent of feeling against the dangerous trends in his current thinking and policy. He will never, notwithstanding his tremendous popularity, acquire the right on his own to barter Indian territory for a settlement unacceptable to the country. We desire peace ardently: but we will embrace it only if it can be had with honour. The country is far from sure that what the Prime Minister proposes will secure both peace and honour.

The EEC, Britain and India

THERE can be no denying the fact that negotiations between the Six and Britain at the Ministerial session of August 1-4, progressing so well for days, have made the subsequent deadlock look unexpected. The bargaining was hard and strenuous for both the sides or else the meetings would not have been long and the final session would not have assumed the marathon dimension it did — only to end inconclusively. The agenda was not only heavily loaded but it touched the crucial sector of trade — imports of foodstuffs into the enlarged community from the temperate zone Commonwealth countries of Canada, Australia and New Zealand. The tariff policy on these imports is of profound importance to Britain and the Six from their respective angles. Nil to low tariffs on these imports have a vital bearing on Britain's wage and export cost structure, but the Six can see no logic in adding a new complication to the complex and intractable problem of the Community's agricultural policy. This is a subject in which there is a wide diversity in the interests of the individual members of the EEC and it was no easy exercise for the Six to evolve a broad-based formula for a farm policy which would do justice to the diametrically opposite claims of West Germany and France, for instance. Britain has acquitted herself well of the role of

the honest broker on behalf of the Commonwealth countries, but she has to negotiate the safeguards within the framework of the Treaty of Rome which she is to sign.

Whatever progress was made in the negotiations over the temperate foodstuffs could not be expected to meet the Commonwealth case for the terms of the Treaty of Rome are supreme and they must be respected by every signatory. The Six on their part could not easily resile from the position that a satisfactory solution ought to be found after the transition in the commodity agreements in the larger context of world trade wherever they did not exist. New Zealand presented a special case in view of her extraordinarily lopsided dependence on the export of farm products, particularly butter, and the Six made a gesture which would suggest either contemporaneous arrangements for her or a protocol on the import of butter to be added to the Treaty of Rome.

The deadlock does not by any stretch of reasoning mean a breakdown of the negotiations. But it marks a crisis and Britain seeking accession to the Community will be called upon to take a radical stock of the situation. The issues have been transmitted to the deputies for further exhaustive examination and the Ministers will reassemble, according to the present reckoning, early in October. This development deprives the Commonwealth Prime Ministers, due to meet on September 10, of the anticipated availability of the outline of the agreement on Britain's accession to the Community as a concrete basis for discussion. But here also the limits of the potential contribution which the Premiers' discussion can make to the issue ought to be appreciated.

This crisis in the negotiations has apparently led to an agonising reappraisal of the problem of Britain's accession to the Community. The tools of attack of the Labour and other opponents of entry have been sharpened at the moment. For a time it may seem as though the chances of Britain's choice to join are now getting weaker. But this is a superficial impression. The debate in Britain to join or not to join will go on raging until her Government is formally committed to the Treaty. There can be no iota of doubt, however, that the British Government has taken calculated steps towards accession and there is no rational justification for her to retrace them. The sooner the Commonwealth countries appreciate the reality that their trading pattern will need to be adjusted to the Treaty of Rome after Britain joins it, the more convenient it will be to agree upon the urgent transitional concessions. Not in vain have the Six repeatedly stressed that Britain ought to assimilate the spirit of the Treaty of Rome. They urge that Britain must become European which is another way of stating that her zealous advocacy of the Commonwealth is hardly consistent with the role of a prospective (now sure) signatory to the Treaty of Rome.

It would be less than fair to charge the Six with inflexibility in their attitude. They themselves are committed to the Treaty whose sanctity must be upheld as inviolable. Within the permissible margin they have shown a spirit of accommodation to the Commonwealth countries. The future, too, holds an assurance of fair treatment. They sincerely mean what they say when they proclaim that the EEC will resist any trends towards inward-looking policies and will be positively forward-looking, operating as a powerful engine for the speedy liberalisation of world trade. Britain has placed full trust in this solemn profession. It is for the rest of the trading partners of the enlarged Community to evince a similar faith. The Common Market is bound to emerge as a powerful and dynamic force in world trade and with its outward-looking attitudes, it will throw open its outlets to the developing export trade of third countries. International trade cannot flourish unless it is a two-way flow conducted on the principle of non-discrimination.

Mr. Morarji Desai's statement on his mission to Europe made in the Lok Sabha on Monday this week effectively serves to put the Common Market picture vis-a-vis India in the right perspective. The original impression that safeguards for our export trade with Britain in particular and the Six in general were to be negotiated and obtained as part of the talks between Britain and the Six has now happily been dispelled. In essence, there is a clearer realisation of the position that the future pattern of our trade with the enlarged Community ought to be determined by a separate treaty which the Community has agreed to conclude with us, as it has agreed to do in the case of Pakistan and Ceylon. This treaty will have to be concluded after an elaborate item by item investigation by the end of 1966. The EEC has given the assurance in no equivocal terms that it is fully conscious of the difficulties and requirements of the developing countries in regard to their export trade and it has committed itself to a treaty calculated to meet them and also to provide reasonable room for future expansion of the trade. It is in this spirit that the separate treaty will be negotiated. How we fare in the trade competition in the Common Market is a matter of our internal strength. But there will be no barriers of discrimination against us.

The question of the transitional difficulties for our exports with the enlarged Community until the separate treaty comes into force early in 1967 is being tackled with a feeling of understanding on the part of the Six and Britain. The provisional arrangements which they have agreed upon for accommodation for our strategic items of export need to be appreciated. The levy of the full common outer tariff on our cotton textiles is now to be phased over four stages instead of the originally proposed three. In the matter of tea, which is one of our ace exports, a magnanimous gesture has been made by the Six. The entry of tea in the enlarged Community is to be duty-free which means that there will be the withdrawal of the EEC's outer tariff on tea at the rate of 18 per cent ad valorem. There are also a few more items on which India's difficulties have been softened. To expect a throughly unaltered pattern of low or zero tariffs, which are now available to us in our export trade with Britain, is to show a lack of understanding of the basic fact that whether it is the Six or Britain, they have to abide by the discipline of the terms of the Treaty of Rome. The gain to India for the transitional period is by no means negligible.

Power from Neyveli Lignite

THE thunderous applause from over 10,000 persons that greeted the formal inauguration by President Radhakrishnan of the first 50MW lignite-based power generation unit at Neyveli on Sunday was symbolic of much more than joy on a landmark truly laid. This happy occasion marked not only the fulfilment of a long-cherished dream of the Southerners, but also the beginning of a new epoch in the economic development of South India, particularly the Madras State. On the reddish brown soil where only a few years ago stood some seven tiny villages inhabited by half-famished, rather emaciated, peasantry, there has come up an extensive modern township and a huge industrial complex which ultimately is envisaged to produce not only the breath of an industrial economy — power — but also the life-blood of modern agriculture — chemical fertilizers —, besides domestic fuel and a number of other useful products ranging from china clay to carbolic acid, phenols, fuel oils, char dust, tar and Montan wax. These bye-products would provide the base for setting up such diverse industries as ceramics, electrical insulation equipment, plastics, calcium carbide, carbon electrodes, explosives, etc.

It is proposed to deal with the various aspects of this complex in a special article next week. Not all these are causes of congratulation. Here comment is confined to only the most important aspect of it, namely generation of electricity. The Neyveli complex, if it is a classic example of internal co-operation and external collaboration — the Rs. 113 crores integrated scheme came into existence with the help of the Colombo Plan members and is being financed by the Central Government in collaboration with the Soviet Union, West Germany and Italy — it is also a typical instance of how a project previously considered not-very-economic has become an economic proposition due to changed circumstances in the country, particularly owing to the developing transport bottlenecks and the shortfalls experienced in coal production. Although existence of lignite in the Neyveli area had been known as far back as 1920 or even earlier, its commercial exploitation was not considered feasible because of the easy availability of coal till about a decade ago and the difficult problem posed by the upward thrust exerted by sub-lignite water.

So far as generation of electricity goes, the Neyveli project today has obviously become an economic proposition. A ton of coal if brought to Madras by all-rail route costs as much as Rs. 60 and if brought by the rail-cum-sea route Rs. 96. But 2½ tons of lignite (which in terms of power generation are equivalent to one ton of coal) cost only Rs. 34. Admittedly, lignite-based power is costlier than hydro-electric power, but the potential of generating electricity from water has been nearly exhausted in the Madras State. Of the other two competing sources of power, namely, furnace oil and nuclear energy, the former is as costly as the thermal power and the latter is far more expensive.

Apart from this economic justification of generating electricity from lignite, there is another imperative factor that goes in favour of launching on this pattern of generation. Balanced regional development is an important objective of our planning. Neyveli is a striking instance of translation of this idea into practice. It is sometimes contended that the investment of about Rs. 75 crores (on mining, thermal power generation and lignite briquetting) which is being effected at Neyveli would have yielded better results if diverted to coal-mining in Madhya Pradesh. But it is forgotten that augmenting the rail transport facilities for moving any substantial quanties of coal from Central India to South would have involved appreciable outlay which can be better utilised elsewhere, especially when transport bottlenecks exist throughout the country. Central India coal can further be better made use of for feeding the industries in Western and Northern India. When a potential source of power was available in South India, it was only prudent to utilise it. A beginning in this respect was also necessary from the long-range point of view. Neyveli area contains as much as 2,000 million tons of lignite, of which 1,400 million tons are easily exploitable. This means that even at the rate of 25 million tons utilisation per annum, these reserves can provide a source for power generation for over half a century. In the immediate future, however, it is envisaged to exploit these deposits upto 3½ million tons a year to generate 250 MW of electricity, 152,000 tons of prilled urea and 380,000 tons of briquettes for domestic and other uses. Electricity generation would be stepped upto 400 MW under the first expansion scheme which will raise lignite utilisation to 6 million tons per annum.

Compared with the costs of excavating lignite in Australia and East Germany, the Neyveli cost is stated to be 2 to 2½ times—seemingly inordinately high—although the same open-cast method of mining is being practised here. What makes the cost at Neyveli so high? The primary factor is the artesian ground water which has necessitated installing of a network of deep-well pumps. In East Germany and Australia this problem is not faced. The other factors responsible are the heavy and hard over-burden, the high costs of imported machinery (including customs duty and freight) and the large expenditure incurred on constructing a township which according to the present requirements of the project is apparently lavish and is justified only by the prospect of many-fold increase in activity in another decade or so. The delays caused by the non-availability of some construction materials too have contributed in no small measure to stepping up of the cost of the project; they may even further raise the total cost by about Rs. 7 to Rs. 10 crores.

The high cost of mining lignite at Neyveli, however, should go down progressively as the operation gathers momentum and the scale of production is enlarged. But this assumes that the bureaucratic hydra is not allowed to have a free play and that inflationary tendencies are not allowed to grow beyond proportion. Power generation from Neyveli lignite will remain an economic proposition only as long as coal prices are high. The project authorities deserve commendation for having planned the complex well and taking adequate precautions against all eventualities by building up sufficient stocks of spares — worth about Rs. 3 crores — which undoubtedly is another factor for pushing up the production costs vis-a-vis the East German and Australian costs. Although the teething troubles of the first of the five 50-MW power generating units proposed to be set up here are not yet over, it is hoped they will not persist for long.

Whereas power from Neyveli would undoubtedly accelerate the economic development of the Southern region, marrying of this lignite with the Salem iron ore would fulfil another cherished desire of South Indians for having a large steel plant in their midst. When that comes — and it can be expected to come soon in view of the encouraging reports received from East Germany where pilot experiments are being conducted in this connection — it would spearhead renewed industrial development of the Madras State and the Southern region and provide an effective economic answer to the separatist movement that believes that only exploitation can come from the North.

An Import-Export Stabilisation Fund

MR. MANUBHAI SHAH's able reply to the spirited debate on Wednesday on the Ramaswami Mudaliar Committee's Report has, somewhat unexpectedly, opened out a new prospect in export promotion. It was not believed that the Government of India was prepared so early to accept one of the most fundamental recommendations of the Ramaswami Mudaliar Committee, namely, an Import-Export Stabilisation Fund to finance in foreign exchange additional raw materials for purposes of export only. The decision, it would seem, has now been reached to establish such a fund with an initial capital of Rs. 10 crores, partly based on payments to be received from foreign bankers and other agencies. If this should result in a turnover of additional exports of the value of Rs. 30 crores in a full year — or Rs. 40 crores as is conceivably possible, depending on the run of production — it would have meant a substantial addition to Indian exports. It is not necessary here to argue the case for such a fund, since it has been adequately and succinctly done in the Ramaswami Mudaliar Committee Report. It is necessary, however, that implementation should not fall short of the purposes there described.

In the first place, while a Stabilisation Fund of Rs. 10 crores might look as a good beginning, it must be recognised that, for the export targets set before the country, it is woefully inadequate. If the Government of India agrees that the Fund should be independently operated and that the foreign banks that contribute are assured that the fund acquired on exports will not be diverted to general financing of the Plan or 'normal' imports, it should be possible to sell a larger scheme than at present envisaged. It is conceivable that what the Government of India has in mind at the moment is that the original Rs. 10 crores fund should not include the foreign exchange provided by banks whose contribution will be in the form of loans so that, in fact, the actual finance outstanding at any time may be many times that of the original sum mentioned. If this is the intention, it should be made clear and a proposal placed before the Parliament for early approval, since the separation of foreign exchange in an independent fund to be operated by a corporation similar to the Industrial Investment Corporation of India would require a separate Act. No time should be lost in framing such on Act and bringing into being an independent corporation adequately sponsored and serviced.

If this corporation is brought into being, much of the debate on incentives would lose its immediate interest. It is obvious that many Members of Parliament are deeply dissatisfied with the performance of some of our big businesses, who, they think, are earning substantial profits on the home market with no inclination to launch a large-scale programme abroad on which the profit margins are small or insignificant. There is something to be said for the view that businessmen often keep their patriotism for charities rather than for their business, and incentives with a money connotation provide very much the motivation of their actions in the market place. It is a fact that businessmen give large funds to political parties and do not ask for incentives for this purpose. These sums are often paid from company funds. Therefore, if there is a reduction of profits for the country's stability and the promotion of long-term markets, it should not be impossible for businessmen to convince themselves that contributions for export are about as urgent, and may be as profitable, as contributions they made from company funds to political parties. For reasons not entirely clear, the motivation which operates there somehow or other fails in the export field. One of the great difficulties of the Ramaswami Mudaliar Committee was to analyse the weaknesses of motivation in terms of export promotion when the allocation of large funds to charities and to political parties seems of no substantial difficulty. Sociologists, no less than psychologists, have here an excellent field for research.

In the last analysis, however, facts should be accepted before theories. The fact is that India's business community is notoriously uninterested in exporting at a loss and, indeed, notoriously uninterested in losing profits on the home market, even if it can export at a profit. The answer to this situation may not necessarily be a money incentive. It can well be a deprivation of raw materials not used for exports. The Import-Export Stabilisation Fund begins happily at the other end, choosing not a deprivation of the raw materials but an additional allocation of raw materials. The purpose is not merely the fuller utilisation of fixed capital. It is also the reduction of costs by a larger turnover and a consequent deflationary effect both on the export front as well as at home. It is vital that the Import-Export Stabilisation Fund should be utilised particularly in those industries in which this deflationary effect by using unutilised capacity is promoted to the best extent subject to the condition that all the additional raw materials are committed to additional exports. It is likely that the high-powered committee to go into the costs of export industries in the country may institute an enquiry into the priorities most likely to benefit the country in the allocation of raw materials.

In the last analysis the confidence in the new Fund will depend upon its constitution and the eminence of the men who are conducting its affairs. There is everything to be said for asking Sir Ramaswami Mudaliar, the distinguished Chairman of the Import and Export Policy Committee, to be the first Chairman of the Import-Export Stabilisation Fund. His name commands large international support, apart from being very acceptable within the country. There should be associated with him a number of businessmen who are primarily interested in export and representatives of foreign bankers who are willing to commit their resources to this scheme. The Secretariat of the Fund should be manned by officials of proved capacity in the selling and the marketing fields. Here at least are the outlines of an institution which can do more than anything else to create a climate for a breakthrough on the export front. It is right that the country should refuse to accept the stagnation that has been revealed by the latest export figures. The Minister for International Trade, Mr. Manubhai Shah, who is making an attempt to galvanize the country on this front deserves support from all the people of India, but particularly from the industrialists who have often dragged their feet in this process, largely because they have not been compelled by circumstances to stake their fortunes abroad.

THE WEEK'S NOTES

India-China Border

A DANGEROUS ACQUIESCENCE

THE GOVERNMENT OF INDIA'S note of July 26 to the Government of China has quite justifiably raised a wave of indignation throughout the country. Its contents are as unexpected as they are astonishing. They disclose that in its obsession with trying every possible means of negotiating a peaceful settlement of the border dispute with China, the Government is being blind to the demarcation between negotiation on honourable terms and negotiation with humiliation. This note specifically makes the statement that without prejudice to the contention of the Government of India not to recognise the border line claimed by China in her map of 1956, it would be prepared to resume negotiations with the Government of China on the condition that the "local forces" of China should not go beyond the line they have claimed in their 1956 map. This precisely is the line which shows China's blatant act of occupying by force and attempting to swallow 12,000 sq. miles of Indian territory in Ladakh.

Now comes the Government of India's offer, in effect, to stabilise the march of aggression along this line and to ask for a ceasefire across that line. This is practical ratification (even if, for the time being, as the Government might protest) of aggression and the fact that Government will still contend that it does not recognise the validity of Chinese occupation of the Indian territory beyond that line will be of little avail. The modification in the stand taken by the Government now will be interpreted as nothing short of a revocation of its earlier insistence on creating a no-man's land in the occupied territory.

Negotiations cannot be carried on with any real hope of success, however strong our case may be, unless we mean to talk from a position of strength. The impression conveyed by the recent statements of the Prime Minister and the Defence Minister in Parliament and outside gave rise to a feeling of reassurance and confidence that our defensive potential, based on a strong strategic net-work of communications, establishment of check posts and a flow of equipment, was being strengthened to achieve that position. Time and again, Mr. Krishna Menon has announced that vacation of aggression was a condition precedent to the resumption of negotiations. Where has that legitimate and honourable stand evaporated now? The Opposition leaders, excluding those of the Communist Party, have raised timely protests against this strange offer of July 26. It does the Government no credit that the Communist Party alone, among the Opposition parties, should rush forward to endorse this faltering position. If the Opposition leaders have branded this offer as an ignominious surrender, the nation will not find their expression of protest strong. China will interpret this softness as a concession to aggression and press forward. This blunder needs to be reversed.

Malaysia

AGREEMENT ON CONSTITUTION

THE JOINT statement issued in London on behalf of the Prime Ministers of Britain and Malaya on July 31 on the formation of the Federation of Malaysia was made possible by the unanimous report of the Cobbold Commission on the constitutional future of North Borneo and Sarawak. Hitherto, although the solid groundwork for the general agreement in principle on the federation of the five territories of Malaya, Singapore, North Borneo, Sarawak and Brunei was carefully prepared on the basis of the widest measure of accommodation to the last three territories, no positive steps could be taken for implementation. The views and aspirations of the people from North Borneo and Sarawak were ascertained by the Cobbold Commission. Brunei is governed by the Sultan. The only official agreement as such for the Federation was entered into between Malaya and Singapore. But now the residual task of bringing the three territories has been completed in its preliminary stage which goes a long way enough. Before the way can be fully cleared for the launching of the Federation on August 31, 1963, as now agreed between Mr. Harold Macmillan and Tunku Abdul Rahman, many vital constitutional questions and administrative arrangements will have to be completed. The Cobbold Commission's finding is to the effect that one-third of the population of North Borneo and Sarawak is in favour of merger with the Federation, one-third would be willing to opt for merger on the specific understanding that satisfactory constitutional safeguards are guaranteed, while a minority of one-third chooses to stay aloof. It is here that the progress towards evolving the necessary instruments of Federation will have to be carried with great care and caution. The safeguards which North Borneo and Sarawak would insist upon as the minimum include freedom of religion, education, adequate representation in the Federal Legislature, maintenance of the status of the indigenous people, citizenship and, above all, control of immigration from the rest of the Federation to ward off the possibility of upsets in the composition of the population. These, it is agreed, will not present any insurmountable difficulties. Brunei's entry in the Federation does not raise any hurdles as the Sultan is convinced of the benefits of participation in the Federation and the likely consequences of isolation.

This particular agreement on the formation of the Federation notwithstanding, the difficulties of the transition period, before the last vestige of the legitimate apprehensions of the people from the smaller territories disappears, cannot be under-estimated. Nothing will spoil the cause of the Federation like haste and impatience in the name of unity and a strong Centre. A sufficient period of transition is to be allowed during which many of the constitutional rights and responsibilities of the Centre will be delegated for administration to the federal units. Unless this is done, the integration of administration cannot be smooth and, on the other hand, internal stresses and strains might develop. This task has been assigned to the intergovernmental committee, which will be presided over by the Minister of State for Colonies, Lord Lansdowne. The original proposal for the merger of Malaya and Singapore proved abortive primarily because of the high proportion of the Chinese population in Singapore. This comprehensive Federation of the five territories has solved the problem and facilities will be provided to the Chinese citizens in the Federation to be fully assimilated without looking for inspiration to the land of their origin. Tunku Abdul Rahman has candidly stated that the Federation would not recognise the principle of co-existence with the Communist bloc, ostensibly because of the likely room it may make for infiltration. Consistently with his blunt outspokenness, the Tunku has announced that the Federation will not be neutralist, but forthright pro-Western.

West Irian

END OF A CHAPTER

IT WAS really very unfortunate that, in spite of the pledge given at the time of the transfer of sovereignty to the people of Indonesia in 1949 that the remaining outstanding controversial issue of the future of West Irian would be settled within one year, twelve long years were allowed to pass only to worsen the relations between the two countries. Retention of West Irian during this period was no gain to the Netherlands and, on the other hand, it constituted a drain on her

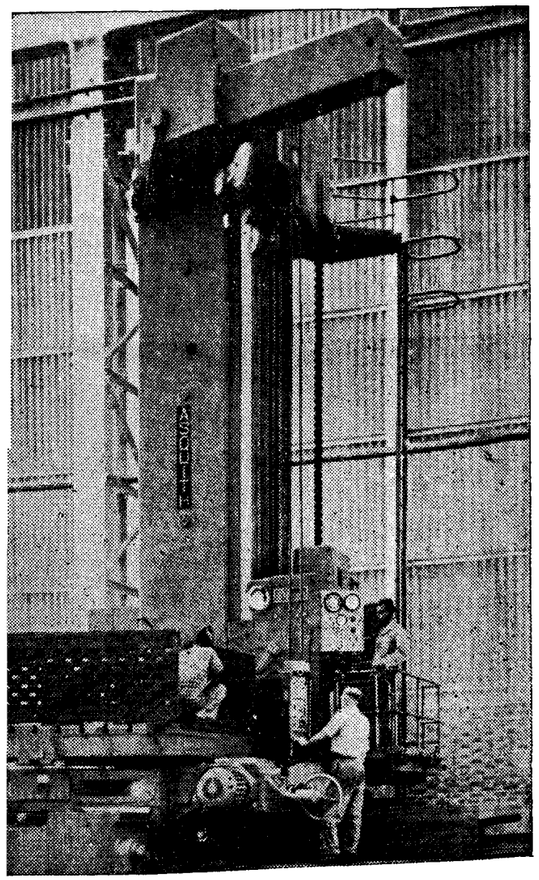
financial and administrative resources. The drain was equally damaging to Indonesia as it disrupted her relations with the Netherlands, adversely affected the trade between the two countries, kept up political tension queered to a high pitch and, in the recent past, there was a serious drain in the form of expenditure on armed preparation and infiltration in West Irian. To the Western allies of the Netherlands, this situation caused not a little uneasiness and Russia was only too willing to oblige Indonesia by offers of defence equipment. It redounds to the credit of America that her patient and persevering efforts of persuasion succeeded in the end. The Bunker formula aimed at satisfying the Indonesian claim of transfer of control over the administration of West Irian and the Dutch claim of ascertaining the wishes of the Papuans.

If the Dutch acceptance of the Bunker formula in May this year was not free from hesitation and reservations, it is a great satisfaction now that these impediments no longer exist. The agreement reached between the two countries and endorsed by their Governments indicates the reasonableness of the terms propounded by Mr. Bunker. At the end of the next session of the UN General Assembly, a joint Dutch-Indonesian resolution will be moved for transfer of the control of the Island to the Secretary-General, who, immediately upon the adoption of the resolution by the Assembly, will depute his representative to take over. Within one year all the Dutch officials are to be withdrawn from the island's administration and for the second year the administration is to be manned by officials of non-Dutch and non-Indonesian nationality. During this two-year period the UN Administrator is to prepare the ground for a free expression of vote by the Papuans on the question of integration with Indonesia. At the end of the second year the administrative control is to be passed over to Indonesia, subject to the stipulation of a specified period within which the Indonesian Government would undertake to hold the plebiscite. This is an agreement on honourable terms to both the sides which draws the curtain on an unhappy chapter.

Newsprint

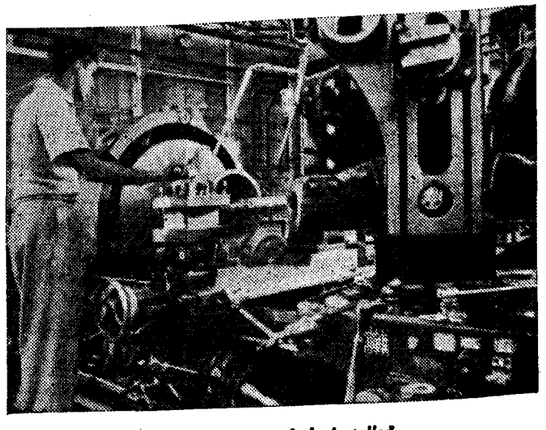
THE SHARP CUT

THE DECISION of the Indian and Eastern Newspapers Society to make a strong representation at the highest level to the Prime Minister with regard to the cut which has been ruthlessly applied to the newsprint quota should suffice to highlight the gravity of the problem raised before the Press. The quota of newsprint has been severely cut down by means of a reduction of the order of 5 to 7½ per cent of the newspaper's circulation in 1961. To accept the base of 1961, when, in fact, more than seven months of 1962 have already elapsed, is to ignore the larger circulation which practically all the papers have been able to develop. In effect, therefore, the cut will be much steeper than what it appears on the face of it. The cut in the newsprint quota confronts the newspaper industry with alternatives none of which is a happy choice to make. Either the number of pages must be reduced or the circulation of the papers must be curtailed if they are to keep up to the existing number of pages. To cut the number of pages is directly to cut advertisement space and there is hardly any paper which would accept this choice. Advertisement revenue is the mainstay of the finances of any newspaper and it is not feasible to sacrifice it. In the event, the lesser of the two evils, namely, reduction in circulation, will have to be accepted at the cost of refusing services to an ever-increasing number of readership. Reduction in the circulation of newspapers goes ill with the existence of progressive democracy and at the present crucial time, when all manner of crises are assailing the economy and administration of the country, restriction of circulation and information can produce harmful intangible effects.



But this is not the whole truth about the axe applied to newsprint. There is another and vital aspect to it. The obligation imposed up to now on newspapers to use indigenous newsprint manufactured at Nepa was fixed at 10 per cent of the requirements. But now newspapers have been asked to step up the consumption of Nepa newsprint up to 25 per cent. Apart from the high cost of this indigenous supply, which is higher than imported newsprint by something like 50 per cent, this restriction would mean that a further cut will be effected in the use of imported newsprint. Imported newsprint is already placed on a parsimonious ration and it is estimated that under the new dispensation the reduction in the imported newsprint would be substantially high. One important factor which the Government has conveniently ignored in imposing austerity in the matter of foreign exchange expenditure on imported newsprint is the sizable decline in its price. It is not the quantity of imported newsprint that is to be economised, but the expenditure of foreign currency.

Jamaica



FREEDOM AND FUTURE

JAMAICA JOINED the family of free nations on Sunday this week. It is one of the outstanding features of the political life of this small island inhabited by people of African stock that democratic institutions have taken root there and people's representatives, first mostly nominated and now elected, took vigorous part in running the institutions for the last seven decades Jamaica has always entertained a profound sense of its individual personality. Because of this dominant consciousness its inclusion in the Federation of the West Indies in 1958 did not give the people a full sense of participation in the new organisation. Its grievances were inadequate representation in the federal legislature consistently with the weightage it deserved and the lack of a feeling of identity of interests with the other federal units. The demand for secession was pressed soon after the formation of the Federation and in 1960 Sir Alexander Bustamante, leader of the Opposition Jamaica Labour Party, forced the issue to a referendum. The referendum resulted in a fair majority for secession. Sir Alexander, the architect of secession, becomes also the first Prime Minister of Jamaica, after the verdict of the people in the general elections of April this year.

Naturally there were spectacular scenes of jubilation at the birth of independence after 300 years of colonial rule. The Jamaicans have their own cheerful outlook on life and one of the ways in which independence was celebrated was perhaps unique in the world. Every child born between the mid-nights of August 5-6 and 6-7 is to be presented with a silver spoon. This outlook, in a sense, demonstrates the capacity of the Jamaicans not to be overweighed by national problems. For the rapid rate of birth and of the net growth of population is one of the major national problems of the island. The population today is 1,750,000 and at the rate it is developing there is a great risk that development achievements may be eroded, when development comes to be measured in terms of growth in per capita income. Sugar and banana plantations bring plentiful wealth and Jamaica is the world's major producer of bauxite. The production of wealth notwithstanding, a cognate problem is the existence of very wide disparities in income distribution. There is the assurance that as a member of the Caribbean region, Jamaica will be eligible for the associate status in the European Common Market. But secession from the Federation of the West Indies and now independence, together with the challenge of economic viability, have posed still another problem for the future of the island. How strong will the ties with Britain remain? Geographical proximity would exert its influence in the direction of greater economic co-operation with America in the years to come.

6" spindle ram-type horizontal mill and boring machine

No. 14/36 combination turret lathe installed in the AVB light machine shop

The
REAL POWER
of AVB...

Vast Technical Resources...
Modern Workshops...

Immensely rich in experience and technical knowledge, with modern workshops equipped with some of the world's most up-to-date machine tools... here is the *real power* of AVB. The essential combination to generate *real industrial power.*

This real power and potential of AVB will give added impetus to the continued and large-scale expansion of industry... by providing the finest facilities for the manufacture of high pressure steam-raising plant and pressure vessels and heavy machinery for the cement-making and mining industries.

Among the modern machine tools in the AVB workshops are

1. **6" ram-type horizontal mill and boring machine:** This machine has a vertical movement of 14' 6" and a horizontal movement of 20' and is the largest of its kind in India
2. **Numerous capstan and turret lathes:** Upto 36" diameter swing and central lathes upto 42" diameter.
3. **28/60 vertical model hydrotel milling machine:** With 360° profile milling equipment.

AVB

...a Powerful Partnership for Progress

ACC-VICKERS-BABCOCK LTD.

The World Abroad

PAYING OURSELVES MORE MONEY

By

ODYSSEUS

EVERYONE seems to agree that real wages cannot go up faster than real output, but in a remarkable article in the "Westminster Bank Review" (41 Lothbury, London, E.C.2.), Mr. A. E. Jasay of Oxford, disagrees. He shows that between 1950 - 1960 the UK's real gross national product (GNP at constant prices) grew by 2.1 per cent a year and the money gross national product (GNP at current prices) rose by 6.6 per cent a year. Average money incomes were rising at 6.6 per cent and their rise in excess of growth of real output was reflected in inflation. Sector incomes, however, did not conform to the average. Total incomes from employment (wages and salaries) rose at a yearly rate of 7.1 per cent, i.e. faster than money GNP. Gross trading profits of companies in the private sector grew at only 5.4 per cent, and incomes in the self-employed sector rose at only 3.6 per cent.

Thus, wages were gaining on profits of 1950 - 1960. The difference between their respective rates of growth —7.1 per cent against 5.4 per cent—was reflected in the share of wages and salaries in the national cake for 64.7 per cent in 1950 to 67.7 per cent in 1960. Thus, the belief that inflationary wage increases are futile needs to be reconsidered.

SOCIAL JUSTICE VERSUS GROWTH

Popular ideas of social justice prescribe that for growth with stable prices, not only must total money incomes rise at the same rate as total output, but also each major type of income must rise at the same rate as every other. If, e.g., profits rise faster than wages, this is not "fair shares", and any agreements on income restraint are held to have lapsed. On the other hand, economic theory demands that for growth with stable prices and a stable balance of payments, the several classes of income-receivers should choose to save an aggregate amount exactly equal to the savings requirements of the economy.

The gross savings requirement is made up of gross fixed investment, accumulation of stocks and work in progress, and the balance of payments surplus on current account (i.e. goods and/or services exported and so not consumed at home). In any one year, these items add up to a certain percentage of GNP and total gross savings will also add up to the same percentage. If, however, the population intends to save a different percentage from that required for investment as decided by entrepreneurs one of two things will happen. Either the relations between prices, wages, and profits will change, causing some redistribution of income among the various classes of intending savers, thus adjusting actual savings to the savings requirement or, alternatively, the balance of payments will change, adjusting the savings requirement to what people have chosen to save. More typically, as many countries have learned from bitter experience, some of both types of adjustment take place.

It is only by an extraordinary fluke that the "fair shares" prescription—a constant division of income between wages and profits so that no party to a "deal" feels cheated—can in any one year coincide with the economic prescription that the various classes of income-receivers should save as much as is required in the aggregate. That planning, which kept strictly to "fair [illegible]" would run into difficultis in prices, costs, and the balance of payments, should not surprise anyone who studies the UK's national accounts for 1950 - 1960. In 1950, gross fixed investment in the UK was 14.4 per cent of GNP; investment in stocks and work in progress and the balance of payments surplus brought total savings requirements to 20.4 per cent of GNP. Fixed investment thereafter rose and, by 1960, absorbed 18.3 per cent of GNP. The items for stock appreciation and the balance of payments declined, but the total savings requirement of 21.3 per cent was nearly one per cent higher than in 1950.

Actual savings, of course, equalled the requirement, but their component parts—governmental, personal, and company savings—diverged.

Gross savings by the government, i.e., the excess of current revenue over current expenditure by the central government, local authorities, and nationalised industries, fell at an average rate of 1.3 per cent a year in 1950 - 1960.

Personal savings rose spectacularly. From a mere £104 million in 1950, they rose to £1,494 million in 1960. The annual compound rate of growth was 45 per cent in the first, and 17.5 per cent in the second, half of the decade. At the beginning, persons contributed a little over one twentieth of total required savings, at the end their contribution was well over a third.

The third contribution to total savings, and the third potential partner with government and labour in a wages policy "income deal", is the company sector. Its gross savings (depreciation, net additions to provisions for future taxation and undistributed profits) grew at 5.7 per cent a year, i.e. at much the same rate as gross trading profits (5.4 per cent) and 1.2 per cent more slowly than GNP at current prices (6.6 per cent).

One way of defining the required rate of growth of profits is that they must rise to just the required volume of savings in the company sector. If the total savings requirements of the economy are growing at one rate and personal savings are growing twice or thrice as fast, company savings neither need nor can grow as fast. The actual balance between the UK's aggregate gross savings requirement (investment and the balance of payments) and actual gross savings in 1950 - 1960 was attained by (1) a decline in government savings, (2) an extraordinary rise in personal savings, and (3) company savings which grew more slowly than GNP itself. The growth of company profits could, of course, have been faster or slower if the savings habits of the company sector had been changing up or down. The following table shows, however, the remarkable consistency of company saving.

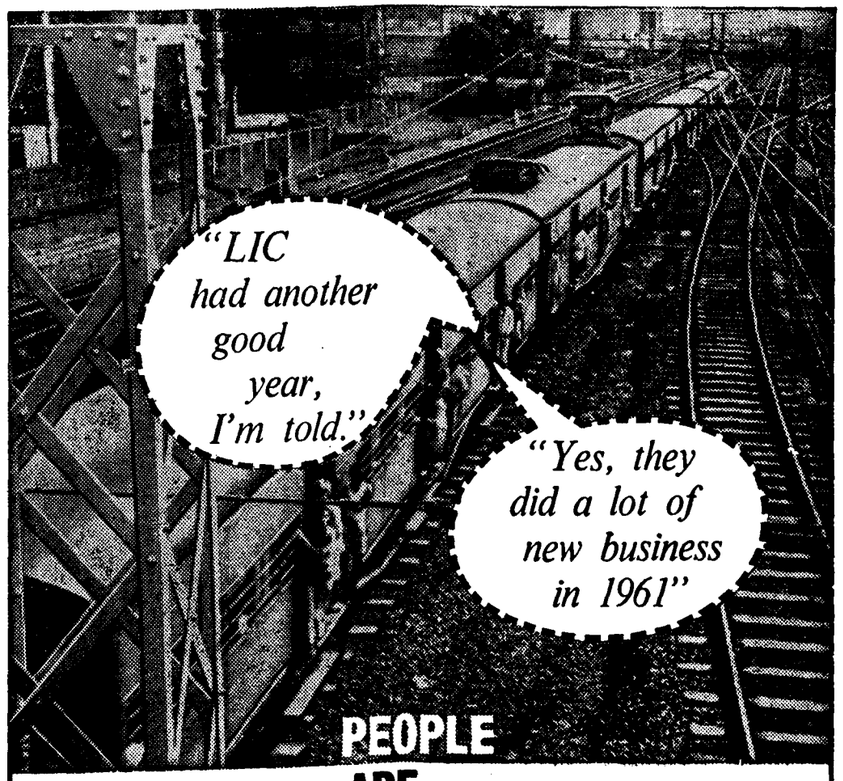
THE COMPANY SECTOR: ALLOCATION OF INCOME

	Total Income	Dividends	Interest	Taxes	Savings
1950	£3,042 m.	£394 m.	£223 m.	£1,019 m.	£1,406 m.
	100%	12.9%	7.3%	33.6%	46.2%
1960	£5,077 m.	£961 m.	£469 m.	£1,343 m.	£2,304 m.
	100%	18.9%	9.2%	26.5%	45.4%

What is striking is that the rise in dividend and interest payments was, as it were, financed by a fall in tax payments (mainly because of the growing weight of initial and investment allowance reliefs) and the two opposing changes left the proportion saved virtually constant. Since the relation between profits and savings out of profits was stable, it is not surprising that profits grew at about the same rate as company savings; and since the savings required from the company sector for the maintenance of the overall savings-investment equation grew more slowly than GNP, profits themselves also grew more slowly.

PROFITS AND GROWTH

Another way of putting this is to say that as wage costs rose, companies could not, on the whole, pass on all of the increase by means of higher prices, and had to accept narrowing profit margins, because consumers would not spend all of the increase in their incomes. Still another way of saying this is that the rise of the share of wages and salaries in GNP is attributable to wage and salary earners' abstinence from trying to consume all of their gains. It was this which allowed some of their paper gains (the excess of money wage increases over productivity increases) to become real gains (an excess of the rate of growth of real wages over real output). Had it not been for the growth of personal savings, profit margins would presumably have been maintained in the face of wage inflation by means of more price inflation than occurred.



Most trade unionists regard "fair shares" as a simple matter of dividing a fixed quantity. For example, a union leader recently complained that UK dividends and interest last year rose 25 per cent faster than wages. It is this short-sighted attitude which leads to Mr. Jasay's proposition that labour could have a bigger piece of cake if it were not concerned to keep profits down but to increase the size of the cake to be shared. To achieve a faster growth rate is possible only if profits are allowed to benefit. Growth does not spring from expectation of a "normal" profit, but from exploiting opportunities which offer hopes of exceptional profits. The vital distinction for growth is between (a) the profit which one is making on plant already built, operating at a figure already decided on, and (b) "marginal" or additional profit, which one hopes to make from building another plant, or from increasing the scale of output from an existing plant.

Mr. Jasay calculates that with a small growth rate of, say, 2½ per cent, real wages may well rise faster than profits, which might well fall (with disastrous long-term consequences). But with a faster growth rate of, say, 4 per cent, profits would probably have to rise thrice as fast as wages. Yet the rise in real wages would be considerably greater than if the national growth rate were only 2½ per cent. With money wages rising at the same rate as GNP, profit margins would widen and prices rise a little, so that the rate of growth of the real wages bill would still be rather less than GNP's rate of increase. But by holding profits down, the lower rate of growth of GNP would not be exceeded, although wages might rise slightly faster at this lower rate. Hence Mr. Jasay's choice for the workers: "Wages may go up faster than profits, but still too slowly for your liking: or else fast, but still more slowly than profits. A loss in labour's relative share could be traded for more rapid progress towards affluence — or conversely. Both relative and absolute gains may be worthwhile aims, but to have more of one you must accept less of the other."

This warm reception is just one item in American Express Friendly Travel Service.—**In addition, you get** ■ Advance arrangements ready-made...no bother with hotel reservations, itineraries, transportation, tips. ■ Experienced travel Managers... selected for their travel knowledge and personality. ■ Finally a delightful and memorable holiday!

ARE TALKING ABOUT LIC

LIC's new business in 1961 totalled Rs. 608 crores—an increase of 22% over the 1960 figure of Rs. 497.5 crores. A good record, by any standard. Especially so because 1961 was a bad year for field activity, with vast areas affected by floods. Greater reliance on Life Insurance as a means to safeguard the financial security of the individual and the family, and confidence in LIC as a stable organisation devoted to the welfare of the nation and its policy-holders, have been the main reasons for the phenomenal growth of LIC's business year after year.

Life Insurance Corporation of India

ASP/LIC-E-28

4½% STATE GOVERNMENT LOANS, 1974

State	Amount (In crores of Rs.)	Issue Price per cent
1. ANDHRA PRADESH	10	Rs. 99.50
2. ASSAM	3	Rs. 99.50
3. BIHAR	4	Rs. 99.50
4. GUJARAT	6	Rs. 100.00
5 KERALA	4	Rs. 99.50
6. MADHYA PRADESH	5	Rs. 99.50
7. MADRAS	12	Rs. 99.75
8. MAHARASHTRA	12½	Rs. 100.00
9. MYSORE	6	Rs. 99.75
10. ORISSA	7	Rs. 99.50
11. PUNJAB	3½	Rs. 99.50
12. RAJASTHAN	4½	Rs. 99.50
13. UTTAR PRADESH	9	Rs. 99.75
14. WEST BENGAL	7	Rs. 99.75

All the State Governments reserve the right to retain subscriptions upto ten per cent in excess of the notified amount.

All the above loans will be repaid at par on 27th August, 1974.

THE LOANS WILL OPEN FOR SUBSCRIPTION ON MONDAY, 27TH AUGUST, 1962 AND CLOSE ON SATURDAY, 1ST SEPTEMBER, 1962 OR EARLIER WITHOUT NOTICE AS SOON AS SUBSCRIPTIONS APPROXIMATE TO THE AMOUNT OF EACH ISSUE.

All the loans will bear interest from 27th August, 1962.

Subscriptions may be in the form of CASH / CHEQUE in respect of all the loans.

Securities of 3% Bombay Provincial Development Loan, 1962 and 3½% Bombay State Development Loan, 1962 will be accepted AT PAR for conversion into the new loan of the Government of Maharashtra. Securities of 3½% Madhya Pradesh Loan 1962, Madras Government 3½% Loan 1962, 3½% Uttar Pradesh Loan 1962 and 3½% West Bengal Loan 1962 will also be accepted for conversion AT PAR into the new loans of the respective State Governments.

Interest on the securities of 3% Bombay Provincial Development Loan 1962 tendered for conversion will be paid at the rate of 3% per annum upto 31st July, 1962 inclusive and at 4½% per annum for the period 1st to 26th August, 1962 inclusive. Interest on the other securities tendered for conversion will be paid at the rate of 3½% per annum upto and inclusive of 26th August, 1962.

APPLICATIONS FOR ALL THE LOANS WILL BE RECEIVED AT THE OFFICES OF THE RESERVE BANK OF INDIA AT BANGALORE, BOMBAY, CALCUTTA, MADRAS, NAGPUR AND NEW DELHI, THE BRANCH OF THE STATE BANK OF INDIA AT PATNA AND THE BRANCH OF THE STATE BANK OF HYDERABAD AT HYDERABAD.

Applications will also be received at OTHER PLACES WITHIN THE RESPECTIVE STATES as follows :

(i) Branches of the State Bank of Bikaner, State Bank of Hyderabad, State Bank of Indore, State Bank of Jaipur, State Bank of Mysore, State Bank of Patiala and State Bank of Saurashtra, conducting Government work.

(ii) Branches of the State Bank of India at places where there is no branch of its Subsidiary Banks conducting Government work.

(iii) Treasuries and sub-treasuries (except in the States of Assam and West Bengal) at places not served by the aforesaid banks.

Copies of Notifications and Application Forms may be obtained at any Receiving Office.

Applicants tendering applications at the offices of the Reserve Bank of India at Bangalore, Bombay, Calcutta, Madras, Nagpur and New Delhi will, in the event of oversubscription to the loan applied for, be given the option of transferring their cash refunds to any of the other State Government loans which may still be open for subscription. To avail of this facility, the applicants should complete the "Special Option Form" copies of which are available at any of the abovementioned offices of the Reserve Bank of India.

The European Scene

TAKE-OFF THEORY CRASH-LANDS

From Our Special West European Correspondent

PARIS, August 4.

A TRANSLATION of W. W. Rostow's "Stages of Economic Growth" has only just appeared here, two years after the original publication in English, but the term "take-off" has already passed into economic jargon in Europe and Africa as widely as in the English-speaking world. A summary of the American author's striking theory was popularised in 1960 by a journal patronised by Mendes-France, just as the London "Economist's" resume in August 1959 served to carry it to an audience much larger than secured by most works on the economics of development. The translation's fortune is as assured as that of the original, for the taste for simple schemes and sensational labels is universal. In academic spheres, on the contrary, it is being roughly handled because economists, working from the original, had produced refutations long before the full text became available. Quite bluntly, the notion of "take-off" is not taken serious by Continental economists and their arguments are of importance in a country like India where this concept has made its way from educated conversation into governmetal literature on planning. New Delhi has several times hopefully invited us to fasten our safety belts in preparation for a take-off which, in the present state of the discussion, seems unlikely to occur.

Months before Mr. Rostow's work was printed here, J. Marczewski had examined its application to French economic history in a paper called "Was There a Take-off in France?". (Cahiers de l'ISEA, supplement No. 111). The case is of some importance to Mr. Rostow's argument because the French take-off was, according to him, the second to occur in history and one of the best documented. It took place between 1830 and 1860, a generation after Britain's and at a time when the British economy was already at the stage described as "maturity", but ante-dating that of the U.S.A. which began in the 1840's. M. Marczewski has gone over the same ground and has failed to find any sign of the take-off. The period 1830-1860 has no extraordinary significance in his view. What he finds is continuous and rapid economic growth from 1799 (under the regime of the Consulate) right up to the World War I. This rising curve was not of course smooth; there were various periods of acceleration, but none of them so remarkable as to deserve isolation as a take-off. I wonder even whether the long period 1799-1914 deserves to be called a "stage". It is sure that expansion had suffered a set-back during the Revolution, but it is also well known that the last years of the Old Regime had seen vigorous expansion. Certainly, something broke in 1914 in Frence that was not repaired until 1946 or so, but Mr. Rostow's theory seems to have no room for economies that make belly-landings well after take-off and stay grounded for a generation or more.

M. Marczewski does not try to make a mystery of economic development but on the contrary looks for the causes of it in France. He arrives at the conclusion, "Growth must be considered an extremely complex phenomenon, subject to the influence of so large a number of factors that it is absolutely impossible to conceive a theory of it that would apply to all countries". Thus he does not expect to find in the economic history of various countries the pattern of "stage" outlined by Mr. Rostow. nor in particular to find in each case a crucial point where the economy suddenly takes off and becomes self-sustaining.

This scepticism is confirmed by a work just published by Elias Gannage, professor in the university of Beyrouth, called "The Economy of Development". Studying the process in which an "inarticulated" economy, a society divided into a traditional and a productive sector, becomes a progressive organism, he finds no more precise scheme than the truism that expansion begins when "the population obeys two basic motives, to work and to innovate". This will seem disappointingly tame to those intoxicated by the mathematical exactitude of Mr. Rostow's formula, but it might be the best we can hope for in this field.

Professor Francois Perroux's "Economy of the Twentieth Century" also contained, by implication, advance criticism of the thesis of Mr. Rostow. He pointed out that "the national product, either in absolute volume or per capita, has often increased in the past and can still do so without a population and its economy entering the situation of development". That is, he denies that the sort of statistics relied upon for a simple "philosophy of economic history" indicate whether or not a country has begun self-sustaining progressive expansion. There can be regular growth of output and even sudden accelerations in that growth without, for all that, the economy making that abrupt break with its past that we associate with the transition from under-developed to modern societies. Development, says Professor Perroux — resorting to that rather vague language with which, perhaps, we must be content on so large a question — means the conversion (in the religious missionary's sense) of a whole nation, a radical transformation of its mental structure and social habits. The facts do not indicate that this, when it occurs at all, coincides with any unique, steep rise in the statistical indicators.

Bertrand de Jouvenel, in a study called "Social and Political Aspects of Economic Development", attacked the very notion of one fixed path along which all economies must travel to pass from traditional forms to a structure more suited to modern conditions. Too many people, he says (and if this is not literally true of Mr. Rostow, it is surely true of many of those who have taken up his scheme with such enthusiasm), imagine that the United Nations' table of national economic statistics contains an illustration of universal economic history. That is, a list of national revenues per capita stated in dollars and in descending order of magnitude "irresistibly suggests the picture of a great highway of economic development along which the various nations are strung out, so that the leggards must sooner or later reach the milestone that marks the present position of the American people." This vision, which approximates to that of fixed stages that are so inevitable that one can predict that developing nations will pass through them as Britain and France once did, is misleading, says M. de Jouvenel. "One must think of economic development as a national expansion starting out from peculiar conditions, in the world context of that epoch, and we must not rely on references to other countries". That is to say, what happens to a developing economy depends on what it is like now and what

the international situation is at the moment. Since both of these vary immensely from country to country and from age to age, there is no reason why all development will show the same pattern. In particular, supposing there was in some instances a phenomenon fit to be called take-off, we have no grounds for expecting that the same sudden and irreversible spurt will occur elsewhere.

In failing to find in their history any such decisive "break-through" as would justify the aeronautical metaphor "take-off", French economists confirm the refutation of this popular theory already administered by British economic historians. In Britain's case, the take-off is supposed to have occurred in the period 1782-1802, two critical decades in which the first industrial economy built up a head of steam that enabled it to launch into self-sustaining flight (if you will excuse the mixing of transportation metaphors). Last year, however, Professor Cairncross wrote, "I know of no evidence that growth was more self-sustaining in 1802 than it had been in 1782. The issues that seem to me important do not relate to this span of time at all, and they do not all relate to the same span of time" (i.e. there is no other critical period that better deserves to be called take-off).

The loss of the British and French cases is extremely damaging for Mr. Rostow's argument, for these are the oldest and most familiar instances of extensive industrialisation. No real use can be made of the cases of the U.S.A., Canada and Australia because these new societies lacked all the traditional restraints on sudden economic growth that existed in Europe and exist, in different form, in Asia. The Russian example has been contested but of course that may be because Mr. Rostow was inconsiderate enough to place Russia's take-off in the Czariat regime, claiming that it was already complete by the time of the Revolution whereas the Communists wish to show that the country was totally undeveloped in 1917 and owes all to the new doctrine. In this they are travestying the truth because British and French capital and technology had already set up enclaves of industrial expansion in the Czarist economy, but at least one must note that the take-off theory has not been confirmed by native economists. We are left with three odd instances — Germany Sweden and Japan — where Mr. Rostow's theory might, or might not, hold. There is no proof that anything like take-off has yet occurred in the other countries he mentions (Turkey, Argentina, Mexico, China and India) because it is too early to say whether recent progress in industrialisation in those places constitutes an irreversible and self-sustaining process.

Despite this slender and dwindling historical foundation, the take-off notion continues to win converts. This week I find a reference to it in a journal here reproducing a U.N. Secretariat study on savings in developing economies. The UN experts are admonishing governments " to make more vigorous efforts to encourage saving if they want to attain economic development that is rapid and self-sustaining". It seems quite improper for international experts to hold out the hope of take-off to developing nations when the context in which this aeronautical metaphor appears is a study that sadly reports that there are no signs of take-off in any of the under-developed economies examined. In spite of all the talk about faster economic growth, they say, savings have increased more than national product in only one-third of developing countries in the past decade and then only in modest proportions. In half the countries studied, savings actually declined. If economic historians cannot find convincing cases of take-off in the past and if UN experts can see no evidence of it in the present, one wonders whether this term warrants further use.

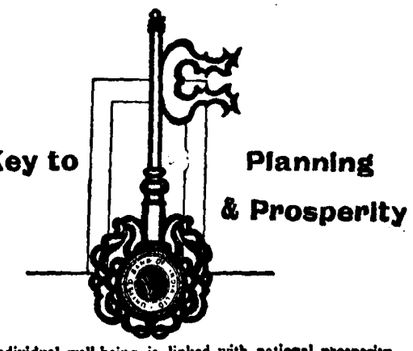
ECONOMIC PROGRESS

By GUY SIMS FITCH

WASHINGTON, August 1.



THE American economy is operating at the highest level in history at mid-summer 1962. Yet, the question of a tax cut to further stimulate economic activity has become the subject of a great national debate, one that involves Congress no less than the Adminstration, and economists in and out of the government. Behind this question is the fact that the pace of the economic advance has slowed this year, after the vigorous expansion of 1961. A slow-down, of course, is a far cry from recession or stagnation—two words which are being used about rather discriminately. For a valid perspective on the current situation it is important to take realistic note of the strength and balance of the nation's economic progress during the past 18 months of sustained expansion, as measured by a number of wide-ranging indicators.

The gross national product (GNP)—total output of goods and services—has grown more than 10 per cent, to an annual rate of $552,000 million, industrial production has expanded by more than 15 per cent to 118 per cent of the 1957 average. Personal income of all Americans is up more than nine per cent to an annual rate of $440,400 million. Employment, in toto, has climbed to a new high of 69.5 million, and the number of workers on non-farm payrolls has risen by nearly two million. The number of unemployed has declined by 18 per cent, when adjusted for normal seasonal variations, from 4.8 million to 3.9 million. The seasonally adjusted unemployment rate has dropped from 6.7 to 5.5 per cent of the civilian labour force. Personal consumption expenditures have risen $24,000 million to an annual rate of $355,000 million. Per capita consumption in real terms—in constant dollars after adjustment for price fluctuations—has increased nearly $75, or more than $250 per family, as Americans have advanced their living standards. Business investment, for durable equipment and non-residential construction, is up 12 per cent to an annual rate of $73,500 million. Prices have remained virtually stable. Consumer prices have risen less than 1.5 per cent, with most of the increase in the service sector, while wholesale prices have declined slightly.

It is not this commendable over-all record that has excited some concern, but rather the more recent trends. In several key sectors, the economy has begun to show signs of sluggishness. Seasonal lull in economic activity is normal during the summer, of course. But what has concerned many of the experts is the fact that business appeared to be losing some of its buoyancy even earlier. Retail sales, for instance, declined in May and June, the unemplyment rate levelled off, the steady rise in personal income and industrial production narrowed, inventory accumulation tapered off, some building and machinery orders dipped. The picture is hardly one of unrelieved pessimism, however. Auto sales and housing, for instance, have remained strong, sales of non-durable goods have continued to set records, total construction has risen to new peaks of activity. On balance, the economy has continued to move up, albeit at a more leisurely pace than anticipated. To further confuse the picture, department store sales, usually a reliable indicator of overall trends, seem to have recovered a good deal of momentum in the early weeks of July and have been running well ahead of last year's level.

There also are other favourable factors. Government purchases of goods and services are heading upward on federal, state and local levels. Business investment plans show a moderate increase and could be further accelerated by the treasury's recent action in liberalizing depreciation allowances for new facilities. Reasonable price stability is still in prospect. Inventories are at conservative levels relative to sales, and may prove conducive to further expansion. The extent to which conditions in the steel industry may have contributed to the current slow down is a pertinent if puzzling consideration. Following the early labour-management settlement in that industry, output for the past several months has been curtailed and previously built-up inventories have been reduced sharply. But now a pick-up in steel orders and output appears in the making. What effect this may have on general industrial activity remains to be seen, but at the very least any further heavy inventory liquidation appears unlikely.

Whether these diverse trends represent only a passing lull or a further slow down in the nation's economic advance is by no means clear. In sum, they add up to a highly mixed picture, one that can be described as inconclusive as far as public policy is concerned. This helps explain the wariness with which the Kennedy Administration is approaching a tax cut decision right now, and its inclination to wait for at least another monthly results before making a decision one way or the other. Eventually, taxes will be cut. The administration already has planned for a net reduction in both personal and corporate levies, to be effective early next year, as part of a comprehensive tax reform measure designed primarily to accelerate the economy's long-term growth and further increase its ability to compete in world markets. It is a difficult question the Administration faces: whether to recommend a tax cut soon, and perhaps run the risk of jeopardizing needlessly its carefully formulated long range plans, or whether to wait until January and perhaps risk a further short-term slow down in economic activity. Much may depend on the economic data which will be coming in for expert analysis during the next few weeks.

Individual well-being is linked with national prosperity and only planned efforts can ensure both in the shortest possible time. And planning, for its success, largely depends on savings, individual as well as national.

Saving in the form of Bank Deposits provides resources for the National Plan.

THE CENSUS AND OTHER SURVEYS: A REVIEW AND A COMMENT*

By COLIN CLARK

"WHEN the British ruled India", complained a high Indian official at an international conference, "they gave us a highly unbalanced education system, with too many university students, and too little primary and technical education. Since we have been running our own affairs, however, we have made matters worse!"

What has been said of education must also, it appears, be said of the Indian Census. Much information obtained by taking Census results as they stand is shown in this book to be inaccurate. This is particularly unfortunate in a country in which there are so few other sources of economic information. A statement made by the present reviewer in "Conditions of Economic Progress", regarding an apparent serious decline in Indian manufacture between 1881 and 1931, is shown to be unjustified (though it is possible that there was some such decline before 1881). Much of the great change in land ownership which is supposed to have taken place in India since 1947 is dismissed under the sardonic heading "Agrarian Revolution by Census Redefinition". In spite of Census and numerous other enquiries, we still have practically no idea of how many landowners there really are in India, or how the landholdings are distributed between them; there are, however, numerous indications that much of the recent legislation providing for land redistribution has been more paper than real, was often in fact unworkable from the start, and permits new landowners to re-appear to replace the old. Carefully examining the dusty chaos of past Census records, the authors find themselves compelled to conclude that the system of classifying the agricultural population was designed by some conscientious but unimaginative official who had been reading Adam Smith and Ricardo, and who imagined that their categories of landowners, farmers and labourers applied to India. It is a more serious accusation, however, that the Census officials of post-independence India apparently have so little knowledge of village life, and so little desire to innovate, that they are content to continue a system which yields such confused and indeed meaningless results.

The American authors have lived in India (and spoken an Indian language) from 1952 - 1960, with no ulterior objects beyond the truth, and the welfare of India. This indeed made them a thorn in the flesh not only of self-satisfied Indian officials, but of others also. Some of their most trenchant criticisms are reserved for the "Ford Team" (Agricultural Production Team sponsored by the Ford Foundation) of April 1959. According to this team, India then was already facing near-famine conditions, which were almost bound to become worse. As the reviewer elicited in a television debate in New York, they had made no serious study of the possibility of fertilizers increasing Indian crop yields. The "Community Development Programme" also comes in for some acid criticism, for having helped mainly those farmers who were successful already, but done little to ease the plight of the really poor.

On the other hand, participating in a Congress of Orientalists in Moscow in 1960, the authors refused to make the attempt to force Indian history into the classic Marxian categories of "feudalism" and "capitalism". "A feudalism without manors, serfs of the manor, feudal contract, vassals and fiefs based on feudal contract, is simply not feudalism." Marx, on the strength of railway building, Maine on the strength of the legal changes whereby, in his classic phrase, "contract replaced status", both, in the mid-nineteenth century, predicted rapid social change in India; both predictions were disappointed.

There are several other criticisms of Indian officialdom. The administrators of the Sarda Canal in the Punjab are never able to supply enough water at the times when it is needed, and the available water seems to go to "the strong, the powerful, the well-connected" —and also to the local strong-arm men. Indian irrigation officials should "promise less and deliver more". Choking of the distribution channels causes a great deal of the water which is available to be wasted. The extensive survey of rural credit undertaken by the Reserve Bank of India was badly designed, excessively complex, and hastily executed; and the results are of little value. The reviewer would be even more critical than are the authors of the Agricultural Labour Survey, carried out by the Indian Ministry of Labour, apparently using completely untrained interviewers. On what is perhaps the most important of all questions for Indian agriculture, namely the extent of under-occupation of rural labour, this survey produced results which are obvious gibberish. But the authors put their finger on the heart of the trouble—namely that Indian high officials (many of whom have been mathematically educated) have "an obsession with the theoretical virtues of random sampling", which blinds them to the innumerable other things which can go wrong in such surveys, including obscure and unnecessarily complex formulation of the questions, for which they are responsible, quite apart from the failings of the ill-educated lower officials. The Indian Ministry of Agriculture is criticised for publishing index numbers of agricultural production, the manner of whose construction has not been revealed, and which are in conflict with certain other published official figures of yields and acreages. This may however be due to the desire to conceal the fact that the published official figures from the mid 1940's to the mid 1950's (when food was rationed, and farmers had every incentive to understate their crops), were much too low. It is hard to get a government department, in any country, to admit that its own past published figures were erroneous.

The authors paint a vivid picture of the strictly traditional, almost non-monetary economy of 18th century India. Perhaps, however, it is too idealised a picture, saying nothing about the miseries of wars, raids, and periodic famines, which kept the population down. The British achievement in establishing peace, order and law throughout India, and in creating a system of transport and communications, should not be underrated. Nor should the authors complain that the growth of transport and trade was designed solely to benefit Britain. The Indian (unlike the inhabitant of French or German colonial territories) was left quite free to sell his produce anywhere in the world, and to buy anywhere he liked; and often did. It is true that Indian industry, in its early stages, was in comparatively few hands; but this was not due to any official monopoly, but to the lack of interest in industry on the part of the great majority of Indians. Those who did so interest themselves (often religious minorities, such as the Parsees) quickly made fortunes. Indian historians have complained that their country did not have the right to impose tariffs to protect their infant industries; but this right was granted (against strong protests from Lancashire) as early as 1921, long before independence. The authors however may be right in complaining that the British rulers did not take such active steps to encourage productivity in agriculture and industry as did the Emperor Meiji in Japan (though he too was prevented by treaties from imposing tariffs until 1899).

The book includes an excellent critical review of all the available information on Indian national product from 1868 to the present time. One of the most important features of Indian development during this period has been the growth in the production of commercial cash crops relative to subsistence food crops. The authors cite some figures by George Blyn, of the University of Pennsylvania (although Blyn's paper is unpublished, his conclusions have received wide attention) purporting to show that foodgrain supplies per head fell from some 587 lbs. per year in the period 1893-96 to 399 lbs. in the period 1936-46. No other country is ever recorded as eating cereals at anything like the rate indicated by the former figure. Nor can it be explained by experts: even if Burmese rice was included, exports were never more than 4-5 per cent of cereal production. It is just possible that in the 1890's very large quantities of cereals were being produced to feed livestock: but it seems very unlikely. A more careful study by Bhattacharjee* (using a somewhat shorter list of cereals) shows that consumption per year (excluding exports, including imports) was 432 lbs. in 1901 - 5, 340 lbs. in 1936 - 45, 356 lbs. in 1954 - 57. Increased consumption of groundnuts, sugar and other non-cereal foods may or may not have offset this decline.

Although we lack anything like precise data for the earlier periods, it appears that rents, or the share of the crop demanded by the landowner, were rising throughout the period of British rule in India. It is probably true that the need to pay rents and taxes, and also interest to money-lenders, played a large part in increasing the output of cash crops. The rise in rents (treating taxes on land as part of the economic rent, as the economist should) is attributed by the authors to three factors; firstly, the great rise in population—in 18th century India, partially depopulated by wars, landowners, as in early mediaeval Europe, had a real need to attract tenants, and therefore did not make their terms too exacting; secondly, to the introduction of the British legal system, with dispossession for unpaid rents, taxes and debts, in place of the older customary relationships; thirdly, the growth of large numbers of intermediaries between the cultivator and the ultimate owner, particularly in the densely populated areas. While all these three factors were at work, it is probable that the two latter were of much lesser importance. As we can see from some other Asian countries which do not have a Westernised legal system, great population density, with lack of any alternative industrial employment, is bound to lead to high rents. The social consequences of these high rents have been undesirable, particularly in the creation of a large idle class, holding the belief that it is socially degrading to do any manual work.

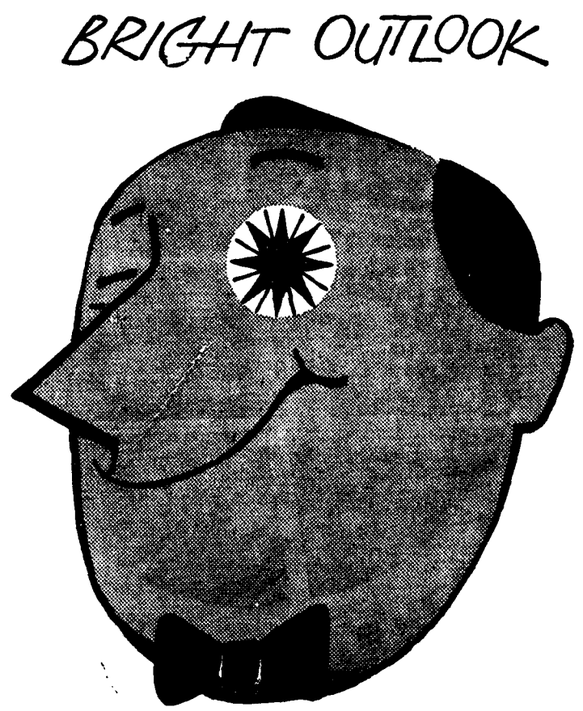
THE BUSINESS WORLD

"Competition Versus Tariffing"



By CROESUS

SHOULD insurance companies furnish "working" capital to industries? Is it advisable for them to participate in the capital structure of new industries and in the right issue of old ones? Has the stage been reached when the business of machinery-cum-erection insurance, and also of marine insurance, require to be "tariffed"? These questions were raised and answered by Mr. P. U. Patel in the course of his Chairman's address at the last annual general meeting of the Indian Insurance Companies Association (I.I.C.A.), held in Bombay on August 6, 1962.

A recent development in the Indian insurance world has been for certain insurers with substantial financial resources at their command to furnish guarantees in favour of banks or other financial institutions, "with the sole aim of acquiring a sort of monopoly control over the insurance business of several new and old clients". This, according to Mr. Patel, "is inimical to the interests of Indian insurance as a whole". It has had the only effect expected, he said, namely "that the medium-sized and small insurers have been completely debarred from having a fair and legitimate share in the fruits of our expanding economy. Not only that, they have lost and are fast losing the business of so many of their old and valued clients because of their unwillingness or inability to grant covers involving financial guarantees". Mr. Patel's objection to this recent development is that it is an innovation and that "this weapon has been, and is being, mercilessly used by certain insurers to the detriment of the trade as a whole." His submission is that "it is no part of our (insurers) business to furnish working capital to industries in general. The granting of a guarantee cover by an insurer, say in favour of a bank in relation to somebody's overdraft account is certainly tantamount to providing working capital in an indirect manner."

Now the I.I.C.A. Chief's objection seems to be based mainly on the score that smaller insurance companies are either unwilling or unable to grant similar covers. One can understand if one is not able to do this kind of business because of want of resources, but, if one is unwilling to do it, the question of resources does not arise and the bigger insurance companies cannot reasonably be blamed for their willingness to take on the risk. The whole question, however, assumes a different complexion if, as alleged, "a financial guarantee cover is granted only if the client concerned agrees to his entire business with the company in question," in other words, if it is being used as a weapon for attracting a much larger volume of desirable business. If providing such covers is desirable in itself, Mr. Patel argues, insurers would grant covers without any strings attached, but this does not sound very convincing. For, it is but natural to expect something in return for taking on even a contingent liability, and such 'quid pro quos' are not uncommon in any business. Again, if, as Mr. Patel says, "it is business basically hazardous in nature and is full of all sorts of pitfalls", it is for the underwriter concerned to be on his guard. If, as he himself concedes, those insurers who are offering financial guarantees know what they are doing, it is their lookout and they will suffer if their judgment is wrong. But to say that Indian insurers should not think in terms of offering new types of insurance covers because some insurers are not either willing or able to do so is to bar the natural growth of insurance business.

Unfortunately, Mr. Patel's objection to machinery-cum-erection insurance also stems from a similar reason. He concedes it is a welcome development and compliments the vision and pioneering efforts of his friends who are responsible for the spectacular growth of the demand for this type of cover, but he is perturbed at what he describes as "the low and uneconomic rates" quoted. "In an effort to get acquainted with a new client", he alleges, "insurers appear to be going a lot out of their way to quote rates, which, a few years back, would have been considered ridiculously low". Because of this, the I.I.C.A. Chairman feels that it is time to think in terms of "tariffing" this business. He has also bracketed marine business, or a bulk of it, for the introduction of "tariffing". To oppose low rates — even if uncommon — quoted by a fellow insurer is one thing, but to invite "tariffing" to get over competition, which must necessarily be inconvenient to some, is quite another. It is not merely the practical difficulties in the way of "tariffing", such as, for instance, the international character of marine business, that militate against "tariffing", but the difficulties of effectively enforcing the tariff rates agreed upon. It is common knowledge that, while, under the law, no rebate is allowed, rebating still continues to hold the field, albeit clandestinely. Personally, I believe, what has made the position of the medium and small insurance companies unenviable is not so much the lack of opportunities as the necessity to underwrite a given gross business to be within the corresponding permissible expense slab. More malpractices have taken hold of the Indian General Insurance field ever since the gross premium formula came to figure on our Statute Books than one cares to remember. Mr. Patel would, therefore, do well rather to concentrate on the removal of this anomaly than plead for the introduction of tariffing". The introduction of "tariffing" it should be noted, presupposes a degree of discipline in the ranks of our insurers, and no one is in a better position than Mr. Patel to explain the reluctance of the industry to accept the Code of Discipline proposed by the Union Ministry of Labour. It seems strange logic to argue, in one breath, that the Code is acceptable in principle (subject to certain clarifications being obtained from the Government) and in the next, to add that the application of the Code of Discipline to the insurance industry should be deprecated in the existing circumstances. What the industry should do is to lose no time in obtaining the clarifications required and the modification necessary in the Code of Discipline, having regard to the special character of the insurance business. It would perhaps be easier than to think in terms of having recourse to "tariffing".

BRITISH OVERSEAS AIRWAYS CORPORATION IN ASSOCIATION WITH AIR-INDIA AND QANTAS

The main handicap of Indian insurers has been their inability to build up adequate tax-free reserves. Year after year, insurance interests have appealed to the Government to permit them to build up tax free reserves (equal to 100 per cent in the Fire and Miscellaneous Departments and 200 per cent in the Marine Department), even as Mr. Patel did at the last annual meeting of the IICA. The response of the authorities to these pleas, however, has been anything but encouraging. On the contrary, by forcing the insurance companies to reduce their fire premium rates drastically for the second time in less than two years, they have only served further to weaken the capacity of the industry to build up reserves. It seems that something more than the persuasion from the insurance industry is called for to convince the power-that-be that the long-term gains resulting from financially stronger institutions in the field of general insurance will far outweigh any temporary loss that the Exchequer may suffer, as Mr. Patel observed.

Business Notes

Borrowing Programme

STATE LOANS

AS ANTICIPATED, 14 States of the Indian Union have entered the market to raise new loans totalling Rs. 93.5 crores. According to market indications, all these loans will be fully subscribed without any difficulty. The loans, according to the terms announced by the Reserve Bank of India, will carry interest at the rate of 4½ per cent per annum. All the loans are medium-term, maturing in August 1974. The subscription lists will open on August 27 and close on September 1, 1962. If the loans are fully subscribed before September 1, the lists may be closed earlier.

The table below sets out the amount being raised by each State Government along with the issue price. It will be seen that the biggest loan is being raised by Maharashtra at Rs. 12½ crores. The issue price shows a rebate of 50 naye Paise in the case of Andhra Pradesh, Assam, Bihar, Kerala, Madhya Pradesh, Orissa, Punjab and Rajasthan. The discount of 25 naye Paise has been allowed by the States of Madras, Mysore, U.P. and West Bengal. Maharashtra and Gujarat alone have floated loans at par. It may be stated that the interest on these loans is liable to tax under the Income Tax Act, 1961.

State	Amount of loan (in crores of Rs.)	Issue price per cent
Andhra Pradesh ..	10	99.50
Assam	3	99.50
Bihar	4	99.50
Gujarat	6	100.00
Kerala	4	99.50
Madhya Pradesh ..	5	99.50
Madras	12	99.75
Maharashtra	12½	100.00
Mysore	6	99.75
Orissa	7	99.50
Punjab	3½	99.50
Rajasthan	4½	99.50
Uttar Pradesh	9	99.75
West Bengal	7	99.75

The borrowing programme of the States will be made successful by the current plethora of funds in the market. The delay in the sanctioning of loans by the Aid India Club has hampered the formation of new companies and sizable rupee funds have been lying idle for the last few months. The terms of the State loans confirm the steady upward trend in interest rates. Even though the bank rate remains at 4 per cent, the yield on most of these securities will be more than 4½ per cent due to the rebate of half a rupee which has been allowed by a majority of the States.

Sugar Industry

EXPORTS

AT THE Twentyninth Annual General Meeting of the Indian Sugar Mills' Association, Mr. D. D. Puri, President of the Association, presented an analytical picture regarding the causes of the failure of the Indian Sugar Industry to export its surplus output. In 1960-61, the Indian Union produced about three million tons of sugar while domestic consumption was not more than 2.1 million tons. The area under sugarcane in the country, according to Mr. Puri, had increased beyond the needs of both the domestic market and the export potential and therefore there was need for taking some drastic steps so as to arrest the extension of area under sugarcane.

He welcomed the linking of the new price formula whereby the price of sugarcane was fixed at Rs. 1.50 nP. per maund as a minimum price of cane upto recovery of 9 per cent. The rate was to be increased as recovery improved. He said that the industry would give the new formula a fair trial; constructive suggestions could be made only after it had worked for one season. He rightly stated that the price of sugar could be reduced only by increasing the productivity of land so that the share of the raw material component in the overall cost could be reduced. Since the production of sugar in the world is in excess of world demand, keen competition exists and only those countries which have the capacity to produce sugar at a cheaper price can hope to sell their product in the markets abroad.

Mr. Puri expressed the view that India could export 5,00,000 tons of sugar in 1963. This figure could certainly be improved in subsequent years. Since the foreign exchange position is taking a serious turn, it is all the more important that concerted efforts must be made to accelerate the export of sugar so as to earn additional foreign exchange to finance the development projects.

Discussing the international sugar market, he said that brown sugar was being exported by all the sugar producing countries in the world. The buyers had their own refineries and the seller had no choice; he had to

produce what the buyer wanted. It is, therfore, imperative that if the Indian Union wants to capture a bigger slice of the international sugar market, it must export raw brown sugar. The advice tendered by the National Sugar Institute to the Association, however, says that the exacting specifications demanded by some of the importers make the task of exporting brown sugar very difficult. The problems of storage, handling and deterioration in transit are still greater. The Industry is likely to make an all out effort to produce 200,000 tons of raw sugar in the next season which is likely to provide valuable experience to the Industry.

In order to stimulate domestic consumption, the President of the Association stressed the need for lowering the excise duty on sugar. He said that a reduction in excise duty would not lower the revenue of the Exchequer. If the basic duty was reduced to the 1957 level, a part of the fall in revenue would be off-set by increased consumption. This will not endanger the export programme also and will take the industry out of its present difficulties. If the current level of the duty was maintained, he feared that the problem of surplus stocks today would definitely turn into a problem of shortage in a couple of years. He struck a note of warning that if the present state of affairs continued the sugar industry would never be able to get out of the regularly recurring cycles of surplus and shortage. There was no cheaper solution for the problem. The excise duty must be reduced.

Tea

NEED FOR A RATIONAL TAX POLICY

AT THE 9th annual general meeting of the Association of Planters of the State of Madras, Mr. E. J. C. Menzies, Chairman of the Association dwelt at length in his speech on some of the problems facing the tea industry and underlined the need for a rational tax policy to strengthen the industry. There is no doubt that the reduction of the export duty should go some way in improving the position, although many would feel that the Government should have abolished it altogether. In any event, Mr. Menzies highlighted, the measure would prove effective only if it is ensured that the benefit of the drawback on excise duty accrues to the producer. It was emphatically stated that the enhanced excise duty on several articles used by tea factories, such as plywood, aluminium linings, etc. will put up costs unless drawback is allowed on these intermediates as promised. The actual effects of these measures and the enhancement of the Central Income-Tax on rupee companies to 50 per cent will manifest themselves in due course. To resuscitate the industry the plea was, therefore, made that the tax policy at all levels, i.e. Centre, State or Local bodies, should be continually reviewed. This was the only way to ensure that the industry is left with adequate resources. Unless this was done, a day will come when, for lack of finance, the industry will be unable to replace or replant worn out tea areas, replace worn out or obsolete machinery and thus be unable to maintain its position in the world tea market without substantial assistance from the Government.

Dealing with taxation Mr. Menzies also referred to the Madras budget which enhances tax on consumption of electricity, on lorry transport and on land. He pin-pointed that if tea factories could not altogether be exempted from the additional levy they could at least be given the benefit of a concessional rate as is proposed to be fixed for certain other industries. Since tea industry is one of our important foreign exchange earners, it is the bounden duty of the Government to encourage it by means of a suitable taxation and marketing policy. While keeping in view the necessity to keep down costs, it was also essential to see that we do not fail on our propoganda front abroad as it was one of the effective ways of capturing foreign markets.

Paper

GRIEVANCES OF TRADERS

AT THE 44th annual general meeting of the Calcutta Paper Traders' Association, Mr. C. C. Mukerji in his presidential address voiced extensively the grievances of the Association and pleaded that the possibility of producing a hard-sized mechanical paper be considered. Excise duty which has gone up from about 25 per cent to 30 per cent of the total price of the paper and board was the main subject of attack in his speech. It may be noted that the excise duty hits the traders in several ways. In the first place the consumer is not concerned over the break-up of the rise in prices but about the total price. He looks askance at a dealer who tries to explain the increase in total price as a consequence of the increase in duty. In the second place, the excise duty being exclusive of mill rate, the dealer does not get any discount over the same. On the other hand, his total investment increases. Lastly, the inspectors often use individual discretion in classifying the category of paper and the duty chargeable thereon. A recent case in point is the sudden increase in the duty to 50 nP. on cream wove and map litho paper. The duty was later restored to the original rate of 22 nP. per kilogram but meanwhile the market was put off balance. Mr. Mukerji specifically stated that with a view to do away with such occasional confusion, it would be better to adopt a uniform policy for classification. It is now only to be hoped that the Chanda Committee on re-organisation of Central Excise would offer effective suggestions on such administrative issues.

Mr. Mukerji also requested to broaden the base of the distributive system, and the rationalisation of the import trade. He also urged that incentives be provided for export of paper by traders and a uniform sales-tax policy be adopted. Apart from the benefit that the bonafide trade will derive from a uniform sales-tax policy, it may be pointed out that such a uniform sales-tax policy can help West Bengal to recover the lost ground and develop further the inter-State business.

Bombay Municipal Corporation

A BOLD BID

SELDOM HAS any move of the Bombay Municipal Corporation (B.M.C.) raised so much controversy in Bombay as its proposal for the introduction of a development tax. Not unexpectedly, it has occasioned considerable concern among the commercial and industrial organisations of the city. It is pointed out by Municipal spokesmen that the proposed levy is intended to enable the B.M.C. to raise the resources of the Corporation for the successful implementation of the Greater Bombay Development Plan. But the fact is that such a plan is still under preparation, and, no wonder, that all sections of Bombay's population have condemned it. Commercial bodies in the city have characterised it as ironical to consider ways and means of financing a development plan the size and extent of which is yet to be determined. But the really reprehensible aspect of this Municipal Muddle is that the Corporation has already begun collecting the levy, as determined by it, in the guise of "voluntary" contri-

UNDER SECRETARY TO GOVERNMENT
16 AUG 1962
PUBLIC DEPARTMENT

The Third Five Year Plan
Bird-Heilgers' part in it...

Rs. 1900 CRORES FOREIGN EXCHANGE BILL FOR THE THIRD PLAN

The foreign exchange bill for the Third Plan is the highest ever—more than Rs.1900 crores. Clearly, the economy's pressing need is to find means of earning and saving more foreign currency. To bring this about, the Third Plan is implementing a clear-cut policy: stepping-up exports, cutting down imports. To stimulate exports, controls on most products have been relaxed, export duties abolished or reduced, promotion councils set up and trade agreements concluded with 25 countries.

Export—a priority with Bird-Heilgers

Among export commodities, jute is high on the list of the Plan's priorities—and tops the list of Bird-Heilgers exporting activities. Between 1957 and 1961 the group's exports of jute earned well over Rs. 94 crores—a significant addition to India's foreign exchange earnings. During the Third Plan, the group hopes to better this effort by intensifying and widening the scope of its export drive.

Towards a self-generating economy...

A phrase on everyone's lips. A phrase that finds concrete expression in the urgent activity of an economy on the move. Bird-Heilgers reflects the nation's striving. The group delivers millions of tons of basic materials to the new blast furnaces. It produces jute goods, paper and board, air compressors and springs, and engineering and water treatment equipment. A project for the manufacture of coal washeries was the first in India. Planned diversification finds the group engaged in shipping, insurance, exporting and importing. Its agency department handles everything from heavy capital equipment to light consumer goods.

...and an exciting, promising future

The Five Year Plans are a challenge: existing industries must expand, new industries open up, per capita income increase. India needs more goods and services than ever before. Bird-Heilgers is alive to the problems of a growing economy. The group deploys the full potential of a century's resources, technical knowledge and executive skill to increase and broaden its activities...earn and conserve foreign exchange...join the national drive to economic independence.

Chartered Bank Buildings, Calcutta-1

butions or deposits, to be adjusted later when the State has legally enacted and the Municipality is in a position properly to enforce it.

Meanwhile, this development tax in disguise has raised certain legal issues. First, the B.M.C. has no legal sanction to levy the proposed tax until such time that an amendment of the relevant provisions of the Bombay Municipal Corporation Act is brought up before, and the amendment is passed by, the State legislature. Hence the pertinent criticism of Mr. Pravinchandra V. Gandhi, President, Indian Merchants' Chamber, that, "when the basic authority is still not statutorily conferred on the Corporation, it goes without saying that the Corporation has yet to apply its mind to matters, such as the determining of the rate of tax and the manner in which it should be applied to different categories of properties in the city, and to formulate rules in accordance with which the levy could be made effective." In order to avoid all these difficulties, presumably, the B.M.C. was ingenious enough to call only for 'voluntary' deposits! The deposits demanded in the suburbs differ from those in Bombay proper: so far as industrial lands are concerned, they range from Rs. 4 to Rs. 6 per sq. yard in the suburban area, while, in Bombay proper, the rate is six per cent of the market value of the plot. In spite of the fact that such deposits are termed 'voluntary', in practice, as Mr. Gandhi noted, they are not so, since, parties refusing payment of the 'voluntary' deposit face the risk of either the sanction to their plans of construction being withheld or the permission for some essential facilities denied. However, following the recent public agitation against the move, there have been apologetic moves in the direction of mitigating the burden, but, even then, with certain reservations such as an usdertaking from the concerned party that it would pay the Development Tax as and when the State Legislature accords its approval to the proposed levy. This means, as Mr. Lalchand Hirachand, President, Maharashtra Chamber of Commerce, observed, in his presidential address, at that body's quarterly meeting the other day, that the contemplated move to give retrospective effect to the development tax from 18th of Seetpmber, 1958, is an indication that the B.M.C. has been taking for granted many things as a 'fait accompli'. Municipal Commissioners in Bombay are known to have taken the Corporation for granted on occasions, whether justifiably or not, but this is perhaps the first time that any Municipal Commissioner has chosen to take the Maharashtra Legislature for granted, which is certainly going too far. It is, to say the least, an encroachment on the sovereignty of a duly elected legislature which must be resisted at all costs. This apart, it is for the State Government to see how far the proposed move has struck at the confidence and killed the enthusiasm of those who have been planning to set up industries—small, medium or large—or to put up housing colonies for the workers. The effect on the already established industries and housing colonies also needs to be looked into, if the authorities do not wish to create an avoidable chaos, if not crisis.

Andhra

NCAER SUGGESTS 10-YEAR PLAN

IN ITS report based on a techno-economic survey of the State of Andhra, the National Council of Applied Economic Research, New Delhi, is understood to have suggested to the State Government a 10-year plan of Rs. 600 crores.

Emphasizing the role of agriculture in the State's economy, the report urges for the reorientation of agriculture with accent on industrial and commercial crops, thus giving a fillip to the establishment of agro-industries. Important among the agro-industries recommended for development in this context include "sugar factories, spinning mills, solvent extraction plants, pulp and paper mills, barium chemical industries, two cement factories and a low temperature carbonization plant."

Diagnosing the malady in the weakness of the agricultural sector and inadequacy of industrial base, the report suggests that power programmes, involving an installed capacity of 600 m.w. of hydro-power and 400 m.w. of thermal power, should be undertaken to meet the rising demand for power in the State. Contributing only 13 per cent of the State's income, the existing inadequate industrial sector is dominated by small enterprises mostly of the cottage and village industry type. The report, therefore, emphasizes upon the development of large-scale industrial sector for maintaining a well-balanced and sustained growth of its economy. A steel plant to manufacture special alloy sheets, a pig iron plant, a structural steel plant and four fertilizer plants have been suggested in the report.

As regards agriculture, the report suggests that existing monoculture (paddy) economy, specially in the districts should be changed and immediately diversified. Future cropping pattern should be oriented towards high value industrial and commercial crops. As there exists great scope for development of coffee and pineapple plantations in forest areas, the report suggests systematic mining of targets and increased use of soft clay disposits.

Cable

AIMING AT HIGHER PRODUCTIVITY

LOW PRODUCTIVITY is more or less a general problem in Indian industries, old or new, and the cable industry is no exception. Considering, therefore, the imperative need to increase productivity in this vital industry, the National Productivity Council has sponsored a team, perhaps the first of its kind for a specific industry of this kind with only a few items of manufacture, to visit the USA and Japan. Led by Mr. V. G. G. Nayar, General Manager of the Aluminium Industries Ltd. of Kerala, the team will make itself acquainted with problems relating to raw materials, production equipment and techniques, quality control, research and development, end-use and applications, personnl management and training, general administration and productivity techniques adopted by the industry in USA and Japan. The team will further study the extent to which those techniques can be profitably used in India to raise productivity.

The team recently made an in-country tour in order to make itself thoroughly conversant with the problems of this industry. The team observes that there exists full scope for the formation of a cable makers' organisation on a voluntary basis for co-ordination among the various units in the industry in matters likely to raise productivity in addition to solving the many common problems in the industry. The team makes a cogent plea for the establishment of a co-operative research institution which can help to undertake fundamental and applied research of raw materials for finished lines of cables, besides advising end users on proper installation practices. The team has sounded a bell of tocsin about the dangers inherent in allowing the small units

to manufacture an unrestricted range of sizes and types of products without specialising in any particular line. While most of the units have testing facilities and follow the ISI specifications, many of the smaller units do not possess any testing facilities. The older units of the industry should be given preference to the extent possible over the smaller ones for expansion and diversification programme so as to enable them to rationalise their available resources and man-power more effectively and achieve higher levels of productivity. On the face of it, the suggestions made by the team are all very constructive and practical and there is hardly anything to contend with. It is to be hoped that the team, after their tour in the USA and Japan, will have much to profit by their experiences.

Steel

PROBLEMS OF THE INDUSTRY

MR. K. RAMACHANDRAN at the fifth annual general meeting of the Steel Importers' Association of India, in his presidential speech touched upon many of the difficult problems faced by the Association during the year. Mr. Ramachandran specifically pointed out that the shortfalls to be made up between now and March 1963 would be to the tune of 1.2 million tons and it will be a most difficult task to achieve. Since the demand for steel is rising every year without a corresponding increase in the availability, the gap will have to be fulfilled to a greater extent by way of imports.

As exports and imports go hand in hand, Mr. Ramachandran reiterated that it is a fallacy to think that imports could totally eliminate once satisfactory indigenous production levels are attained. On the other hand, exigencies of payment and supply position will promote exports of certain items and will necessitate imports of certain critical categories. Under the DLF loan, India is importing steel at prices 40 to 50 per cent higher than the international price level. To maintain touch with foreign markets and to gradually develop an export market for steel, it is considered that a minimum quantity of indigenous steel should be set apart for exports at prices which can withstand international competition. Subsidy on exports should be given to exporters from Equalisation Fund. The exporters could be authorised to utilise the foreign exchange earned by them for importing categories of steel which are in short supply, in accordance with the specifications approved by the Iron and Steel Control Office. Since the cost of imported steel will be well below the present statutory selling price in India, the surcharge collected on such imports could be credited to Equalisation Fund in order to offset the export subsidy. It was urged that the Government should give due consideration to this suggestion.

At the same time it was also stated emphatically that as stocking and accounting of supplies received from different sources are proving to be more and more problemetical, it was high time that the Government should abolish the sales tax on steel and merge it with the excise duty.

Kumardhubi the largest single refractory manufacturing unit in the East offers

EARLY DELIVERIES OF SILLIMANITE REFRACTORIES

PIONEERS in the manufacture of Firebricks and Silica bricks, Kumardhubi's venture in the field of Sillimanite has met with unrivalled success. Recent large-scale expansions, harnessed to the most up-to-date equipment and rigid quality control, ensure prompt, early deliveries of Sillimanite Refractories... Refractories indispensible to the Glass, Enamel and Ceramic industries.

KUMARDHUBI SILLIMANITE bricks are ideal for glass furnaces, oil and gas-fired furnaces, roofs of electric furnaces, soaking pits and wherever ability to support heavy loads under extreme temperature variations is essential.

KUMARDHUBI'S MODERNISATION PROGRAMME to meet increasing demands during the Third Five Year Plan assures the nation of a consistent supply of Kumardhubi Sillimanite Refractories—in regular shapes and sizes, or to specification.

SCALING DOWN THE COAL TARGET

THE Central Mines and Fuel Ministry has notified that the aggregate demand for coal at the end of the Third Plan is not likely to exceed 87 million tons. In other words, the coal required by the country by the end of the Third Plan will be at least 10 million tons less than the targeted quantity of 97 million tons. The scaling down of the coal target by a little more than 10 per cent is on account of various reasons. Firstly, it is thought that a number of projects whose need of coal has been calculated while fixing the Third Plan target will not materialise by the end of the Plan. The Bokaro Steel Plant which is likely to be a major consumer of coal is considered to be one of these projects which will not materialise by the end of the Third Plan. Amongst the other factors considered is the shortfall in the power programme, which decidedly is likely to play a great part in reducing the demand for coal.

The production of 87 million tons of coal is, considered to be easy and presenting no problems. So far as the transport difficulty is concerned, Mr. K. D. Malaviya seems to be very optimistic and hopes to solve it by unconventional methods of carrying coal by road, river, canals, pipelines, and railways which would take care of about 78 million tons. It is reported that he has made some progress with his plans to transport coal by road and river and by the end of September he hopes some coal might start moving through the Ganges. According to Mr. Malaviya's estimates, by the end of the year it would be possible to carry 80,000 tons of coal by river annually. This quantity will increase to 1,50,000 tons early next year, to 5,00,000 tons by the end of the year 1963 and to 3½ million tons by the end of the Third Plan. Mr. Malaviya is hopeful that the road from Karanpura to Bakhtiarpur can easily sustain an additional traffic of 300 trucks full of coal every day, and a number of boats and barges have been acquired by the Fuel Ministry to carry this coal to Allahabad. As far as the position goes in Punjab, it is hoped that the opening up of coal mines in Kashmir would go a long way in supplying the needs of the neighbouring areas of Punjab. Similarly, the needs of the eastern region would be met from Assam coalfields thus partially relaxing the pressure on the transport system in the Bengal-Bihar coal belt. The estimates referred to above are based on a number of assumptions which may or may not materialise. For instance, it has been put forward that coal can be loaded into boats and barges without any jetties and bankers being built on the river side and through manual labour. Then it has also been stated that arrangements for dredging, desilting and taming the river will be made somehow or the other. For the manufacture of trucks and also for setting up installations for mechanical loading and unloading of coal, reliance has been placed on the Defence Ministry. In this context it needs to be mentioned that Mr. Malaviya's optimism of solving the transport difficulty is not shared by his colleagues Mr. T. T. Krishnamachari and Mr. G. L. Nanda. They seem to be positively sceptical about the success of Mr. Malaviya's courageous plans.

On the production side Mr. Malaviya seems to be having two-fold plan. While he has given the coal producers the bait of increasing the coal subsidy, he has also announced at the same time that he would withdraw the subsidy from those coal mines which will fail to achieve the target expected of them. He also seems to be having in mind the idea of bringing about organisational changes in the National Coal Development Corporation. Under the scheme contemplated greater authority is likely to be delegated to individual coal mines somewhat on the lines on which the set-up in the public sector steel industry was reorganised recently.

NCDC'S NEW PROJECT IN MADHYA PRADESH

The National Coal Development Corporation will shortly open a new colliery at Sonawani in Madhya Pradesh. Situated to the east of the Corporation's Kurasia colliery, Sonawani has a mineable reserve of 14 million tons of Grade I coal. The project will cost a little over Rs. 3 crores and will produce over half a million tons per annum — 0.56 million tons. At the present average selling price, there will be an annual profit of Rs. 21.7 lakhs that is to say, a return of 10.81 per cent on the capital. The life of the mine will be 25 years. Besides the provision for miners' quarters, pithead bath, canteen etc., there will be a 11-bed hospital and primary school also.

SWANG COLLIERY REORGANISATION

The Swang Colliery Reorganisation Corporation has approved a reorganisation scheme for the Swang Colliery in the Hazaribagh District of Bihar. At present, this colliery is manually operated and cannot be worked economically at deeper levels. The reorganisation is designed to mechanise the quarry to increase production and also to get at the extractable reserve of 3.2 million tons of good quality coking coal which lies deeper. Estimated to cost about Rs. 185 lakhs, the scheme will yield results by the end of 1964. The targetted annual output is 0.4 million tons. The cost net return on the capital invested will work out to 6.75 per cent per annum. The life of the mine will be eight years. The entire output of Swang will feed the Swang Washery which the Corporation proposes to set up in 1965-66. The Corporation has also plans for a deep mine in this area to be worked with British collaboration.

SOUTH INDIAN REFINERY

The report on oil refinery to be set up in South India has been submitted by ENI, the Italian State-owned oil combine. Its main points are as follows: (a) that the proposed refinery and a lubricants plant should form part of the same project and should not be set up as two separate units. ENI has therefore recommended that the refinery should have a capacity of 1.9 million tons and should also produce 1,50,000 tons of lubricants. (b) The refinery should be based on crude oil to be imported form either Kuwait or Iraq. This means that the idea of making the refinery dependent on Russian crude to be imported on rupee payment is not favoured. (c) The refinery should be located on either of the four South Indian ports — Madras, Cochin, Tuticorin and Mangalore. The determining factor apart from the demand pattern, will be the ease and the speed with which these ports can be developed in order to cope with the huge tankers in which crude oil is usually transported these days. The case of Madras seems to be ruled out because of this consideration and water supply and land acquisition difficulties. Under the circumstances the rival claims of the remaining three ports now will have to be assessed. The project report mentions the cost of the proposed refinery at Rs. 18 crores exclusive of the township and other facilities.

An offer from a number of Indian business men has been made for setting up the South Indian refinery

at a cost of Rs. 10 crores only. They seem to be having the assurance of technical and financial collaboration from Shell International. On the face of it the difference between the two costs seems to be substantial. It, however, seems certain that the offer from the private sector is not likely to be accepted. An alternative, therefore appears before the Government that the South Indian project be wholly owned by the Government. So far as the foreign exchange cost is concerned, it can be met from the ENI project and the Italians can build that refinery. But there is one snag in this alternative and that is that the Italian credit can be used for other important and indeed unavoidable ventures such as petro-chemicals and pipelines, if a suitable source of foreign finance for the refinery can be found elsewhere. For this project Phillips, an American firm seems to be also willing to participate in this project as a minority partner leaving the major ownership to the Indian Government. It is just possible that this arrangement might suit the Government very well, particularly for ideological reasons and also for the reason that foreign exchange may be obtained from the American firm. In that case the ENI credit could be diverted to other purposes. Final decision will at least take some time to materialise. It goes without saying that the port authorities will have to be closely consulted.

INDO - G.D.R. TRADE AND THE LEIPZIG AUTUMN FAIR

At the Leipzig Autumn Fair from September 2 to 9, 1962 — a sample fair — an assortment of technical commodities will be offered. Six thousand and five hundred exhibitors from more than 45 countries in 16 Fair buildings and several halls on an exhibition area of 110,000 sq. metres will participate. India's participation will be more than 30 exhibitors on more than 300 sq. metres exhibition ground and the exhibits would be of the type: equipment for jute and textile plants, cashew kernels, coffee seeds, pepper, bone-meal, animal products, rubber goods, linoleum, tea, spices, tobacco, cigarettes, coffee jute manufactures, shellac, coir and coir products, Indian handicrafts, handwoven textiles, carpets, sports goods, leather goods, foot wear, cotton waste, tinned goods, ivory goods, brass goods, wood-carvings, goat-skins and hair.

Total turnover of the G.D.R. at the last Spring Fair was nearly Rs. 5,000 million. The Leipzig Fair will provide business facilities with exhibitors and visitors from all over the world, especially with those from the European socialist countries, from Western Europe and many African countries. Advantages of the trade with the G.D.R. are well-balanced trade, no indebtedness, and export and import against Rupee-payment. At the Autumn Fair arrangements for 1963 shall be made. The G.D.R. is interested in a further increase of the trade to the interest and for the benefit of both the parties. There will be negotiations for the new trade agreement in autumn 1962. The first agreement covered the period from 1960-1962. Development of the Indo-G.D.R. trade is as follows:

DEVELOPMENT OF THE INDO - G.D.R. TRADE
(In tons Rs.)

	Indian Import	Indian Export
1959	60,177	52,030
1960	64,388	78,931
1961	91,388	62,287
1962 last six months ca. ..	46,000	44,000

Disposition of the Indian import from the G.D.R.

Machines and equipment (machines for textile industry, machine tools, printing machinery, machines and equipment for chemical industries)	50%
Mining and chemical products	30%
Electrical, optical and scientific instruments and appliances	13%

Disposition of the Indian exports to the G.D.R.

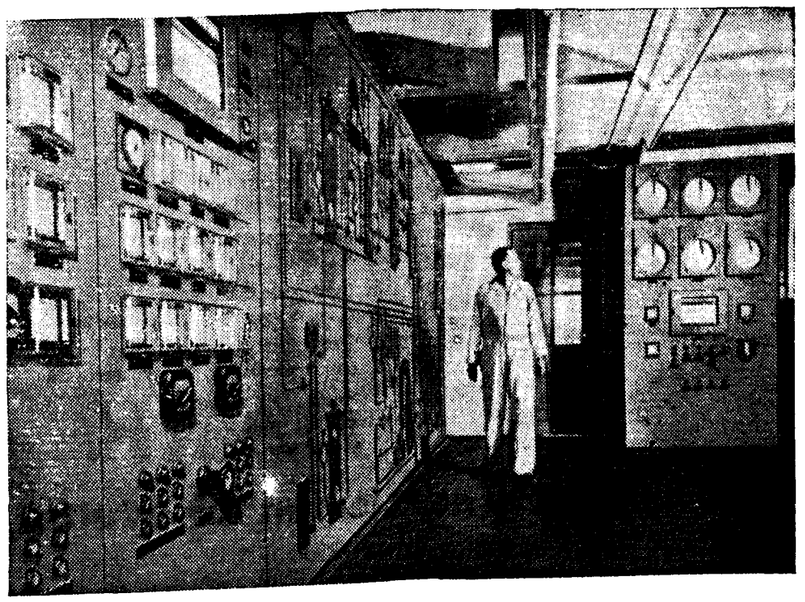
Oil cakes, cashew nuts, oils	35%
Tea, coffee, spices, tobacco	28%
Jute-manufactures, textiles, foot-wear etc.	21%
Iron ore, mica etc.	9%

The figures given in the Indian import and export statistics of the trade with the G.D.R. show only 50 per cent of the total turnover for it is founded on ports, but apart from the newly built Rostock sea-port the G.D.R. utilizes also West German and Polish ports.

FOREIGN AID

On his return from Europe, Mr. Morarji Desai; India's Finance Minister seemed to be very optimistic about the inflow of additional aid and also about the future of Indian trade in the event of Britain's joining the Common Market. This hope was based on the reception that his cause had received in the capitals of the Common Market. It is also reported that France was particularly responsive to the Indian needs. But now things seem to be taking a different turn as the arrangement between the Six and the U.K. have failed to take into account the assurances given to the Finance Minister. As things are uncertain, it is quite natural that strenuous efforts will have to be made on our part to sustain the interest of the aid-giving countries. The latest meeting of the Aid-India Club had shown that the flow of aid in future is not going to be automatic. It becomes, therefore, all the more important that a close watch be kept at the negotiations at Brussels.

STC'S AGGREMENT ON SUGAR



The State Trading Corporation of India is understood to have concluded an agreement under which approximately one lakh tons of Indian crystal sugar will be supplied to Canada in 1963. The Agreement has been concluded on the normal Commonwealth Contract Terms with the average London daily prices as the basis. Out of the total sale proceeds, half will be utilised by the Corporation to import from Canada items like newsprint, woodpulp, and fertilizers at international prices. The balance will be earned in cash in foreign exchange. The sugar will be supplied to the refineries in Canada.

IMPORT CURB ON X-RAY FILMS WITHDRAWN

The Central Government is reported to have restored in full the import quota of X-ray films which was proposed to be drastically cut by 50 per cent. Arrangements have also been made to import more X-ray films under rupee payment through the State Trading Corporation of India. As such, it is expected that there will not be any danger of further shortage of X-ray films which had earlier reached such an alarming proportion that in some hospitals the surgeons were compelled either to turn away patients or to treat them on the basis of guess work.

CUT IN NEWSPRINT IMPORT QUOTA

In view of the looming crisis in the foreign exchange, the Government of India have imposed fresh cuts on newsprint imports and have introduced slab-system under which consumers of 1,000 tons or more will undergo a cut of 7½ per cent, while those consuming below 1,000 tons but more than 100 tons will have to face a 5 per cent cut. There will be no cut on consump-

Look what you get with
HONEYWELL instrumentation

Far more than just instruments, you get a complete control system, custom designed for your specific needs, by men who know your processes.

You get expert, interested assistance every step of the way, with your initial planning and long after your instruments are installed. Blue Star assume full responsibility for the engineering, installation and start-up of your system.

You get training for your instrument technicians in the most up-to-date maintenance methods at the tuition-free Blue Star-Honeywell Instrumentation Education Centre at Bombay.

You get prompt, competent service from your nearest Blue Star office and immediate replacement of emergency repair parts.

These are but some of the plus-values that comprise Instrumentation by Honeywell...and they apply regardless of whether you buy a single instrument, a replacement part or a complete control system.

THE PENNY BANK

(no admission for adults)

Mrs. Priscilla Wakefield of Tottenham started the first Penny Bank in 1798. Children under 20 were invited to bring pennies every month to the Female Benefit Club which she sponsored. The money was paid back when needed for apprenticeship fees, clothes for service, or other good objects.

Banking has become more complex and better organised since the Penny Bank. But the concepts of friendliness, service and social benefit have survived in modern institutions such as the Union Bank of India. The Union Bank prides itself on its unique *personalised service* under which every depositor is treated as a Very Important Person.

The Union Bank Helps People

SERVICES OFFERED: Current, Savings Bank and Cumulative Deposit Accounts; Fixed Deposits and Three-year Cash Certificates; Inland Bills, Demand Drafts and Telegraphic Transfers; Letters of Credit and Guarantees; Foreign Bills and Remittances; Loans, Overdrafts and Cash Credits; Sale and Purchase of Government Securities and Shares and Safe Custody; Standing Instructions accepted; Credit Reports and Trade Information; Safe Deposit Vaults; TELEX contact with countries all over the world.

THE UNION BANK OF INDIA LIMITED

ASP/UBI-5A

tion below 100 tons. After the cut in entitlements is imposed, the balance would be made available to the the extent of 25 per cent by Nepa newsprint and the rest will be imported newsprint from free sources or from State trading countries. The condition about using 25 per cent Nepa newsprint would not apply to those consuming below 100 tons. The Government has made it clear that with effect from April 1962, demands for additional newsprint due to increase in circulation will not be entertained. But within the authorised quota of newsprint, for each publication, for the lincensing period, the actual users are permitted to adjust either pages or circulation to meet their individual requirements for each publication.

In the case of new publications, the allotment of newsprint will not be made for more than 10,000 copies per publishing day. No additional newsprint for any increase in circulation will be allowed for one year from the date of their commencement.

FICCI SEMINAR

In order to ventilate the grievances of the private sector, in respect of securing adequate power and transport, the Federation of Indian Chambers of Commerce and Industry will hold a three-day conference from September 20 next. The conference will be inaugurated by Mr. G. L. Nanda and will be attended by representatives of trade, industry and the Planning Commission. It is likely that the Federation will engage itself in focussing its attention on coal raising and movement of coal, transport and power shortages which have lately assumed grave proportion thereby greatly hampering the normal production and business. The Federation is reported to have drawn up a provisional agenda on three main points. They are: (i) transport and power as needed in countries in a comparative stage of development and as also in advanced countries; (ii) an evaluation of progress in the fields of transport and power and assessment of the targets set for Third Plan; and (iii) an assessment of indigenous production capacity, the extent of dependence on imports and the action to be taken for their progressive curtailment, on the one hand, and augmenting the indigenous capacity, on the other.

REVOLVING FUND FOR IMPORT REQUIREMENTS

The setting up of a revolving fund to meet the import requirements of those industries which may later earn foreign exchange has been suggested to the Union Government by the Federation of Indian Chambers of Commerce and Industry. It has been pointed out that, to begin with, the fund should be of Rs. 500 crores. As there is shortage of foreign exchange, the idea is that certain industries which were essentially foreign exchange earners, if started, should not suffer on account of paucity of foreign exchange for the initial import of machinery. The revolving fund, the President of the Federation, Mr. Shriyans Prasad Jain, disclosed recently would be self-financing. An industry, he underlined, when it started earning foreign exchange could pay back the amount. Since India normally would have to continue to import capital equipment for industrial development, Mr. Jain feels that any industry capable of earning foreign exchange should be granted sufficient foreign exchange to meet its requirements regarding import of machinery.

RAISING PRIVATE SECTOR'S STEEL OUTPUT

A major question of policy whether further steel production should be permitted in the private sector during the Third Plan period is likely to be referred shortly by the Planning Commission to the Union Government for decision. The reference has been occasioned by the application made by the Indian Iron and Steel Company for doubling its output by 8 lakh tons of finished steel to 1.6 million tons, in two stages at a cost of Rs. 40 crores. The application of IISCO was recently processed by the Ministry of Steel and Heavy Industries and this Ministry does not seem to be averse to the first stage particularly because it will make good the gap left by the postponement of the Bokaro Plant.

GROUNDNUT IN POULTRY RATION

Groundnut cake can now be used for replacing cereals to a greater extent in poultry feed. Recent research shows that it can be used upto 45 per cent by weight in the mash without lowering its food value. The secret of making poultry farming a paying business lies in reducing the cost of feed, which alone accounts for about 60 per cent of the total cost of keeping poultry. Experts have found that the inclusion of groundnut cake in the mash in higher proportion not only makes the feed cheaper but also increases the body weight and egg laying in birds.

RISE IN TRADE BETWEEN EFTA MEMBERS

The European Free Trade Association (EFTA) has reported an increase of about 10 per cent in trade over a year both within the group and with the European Economic Community (Common Market). The EFTA annual report covering the year up to June 30 showed that total EFTA exports to the rest of the world, as opposed to trade within the organization, rose by 4.2 per cent. EFTA's efforts to keep up the momentum of integration while its members negotiate to link with the Common Market had been most successful, notably regarding the acceleration of the timetable of tariff reduction, the report said. By the beginning of 1963 tariff rates within EFTA are expected to be only half what they were before the association was formed in 1960. EFTA is an association of Austria, Denmark, Norway, Portugal, Sweden, Switzerland and Britain.

MODERNISATION OF INDUSTRIES

In reply to a question in the Lok Sabha about the measures the Government intends to adopt to promote exports, Mr. Manubhai Shah, the Minister for International Trade, stated that the Union Government was considering the proposal to help modernisation of industries by allowing the import of capital goods and equipment as a compulsory machinery entitlement in every export promotion scheme.

The Government, he said, was planning to ensure that indigenous raw materials were easily available for the manufacture of exportable items and to that end the appointment of a Director of Production was being considered. Other measures which the Government has already decided to take include priority in foreign exchange allotment for export oriented industries, simplification and liberalisation of export promotion schemes involving grant of import licences for raw materials, components and machinery, liberalised and expanded financial and credit facilities to exporters, and the establishment of a large number of export houses and international trading firms. In this context the proposal to enlarge the activities of the State Trading Corporation was specially referred to by Mr. Shah. The Government, he said, were considering similar other steps namely, income-tax relief to exporters and introduction of various fiscal measures besides refund of customs and excise duties which were already granted. It is also proposed that work surveys and product display and quality control are to be intensified.

Indian exports, Mr. Shah said, declined by Rs. 2 crores during April-June 1962, compared to the corresponding period in the previous year. The small decline appears to have been occasioned by the pilot strike in Calcutta Port in May last and the relative fall in prices of jute goods and other products in the world market in 1962. Exports have, however, gone up in this quarter this year in the case of sugar, tea,

tobacco, jute cloth, oil cakes, vegetable oils, cotton yarn, raw hides and skins, artificial silk fabrics and other commodities.

ADDITIONAL LINE WORKS FOR COAL MOVEMENT

It was revealed by Mr. S. V. Ramaswami, Deputy Minister for Railways in the Lok Sabha, that the Planning Commission had authorised the Railways to undertake certain additional line works to provide adequate capacity for coal movement. Partial doubling of Bina-Bhopal (48 miles), Waltair-Samalkot (50 miles), Khurda Road-Vizianagram (70 miles), Bhopal-Ujjain (30 miles) and Phulera-Jaipur Sections (23 miles) and certain sections in the coalfield areas (24 miles) was being considered for the purpose. In addition, certain other line capacity works such as remodelling of yards, provision of crossing stations, additional loops, extension of loop and terminal facilities etc. would have to be undertaken.

IN BRIEF ....

The Mandya National Paper Mills Ltd. was formally inaugurated by Dr. S. Radhakrishnan, the President of India, on August 2, 1962. The factory is situated at Belgula, near Mandya, Mysore State. The foreign collaborator in this venture is Messrs. Parsons & Whittemore-Lyddon who are the pioneers in making use of bagasse — a raw material arising from the waste of sugarcane. This will be the first bagasse pulp and paper mill in the country with an installed capacity of 35 tons of super-white printing and writing paper per day, but will be capable of producing up to 50 tons. The production capacity may even be extended later up to 100 tons per day, as there is no dearth of space nor raw materials from the Mysore Sugar Company.

*

Messrs. India Leather Corporation, Madras, will be showing for the first time their exhibits in two world fairs — one at Paris and the other at Brno (Czechoslovakia) this year. The fair at Paris "Semaine du Cuir" is an important international fair solely for leather and leather goods and is held in September every year. A preview of the exhibits to be displayed at these fairs was held recently in Madras.

*

The Indian Airlines Corporation, it is learnt, has, for quite some time past, been negotiating for the purchase of Dutch Fokker Friendship and French Caravells aircraft to replace the Dakotas. The manufacturers of Caravells are reported to have been offered attractive terms for the proposed deal. But the Government's clear directive to IAC is that it must rely on Avro-748 — the Defence Ministry's product. So far only one Avro plane has been produced, but the Defence Ministry claims that it can meet IAC's entire needs. It is further learnt that Avro is also being hawked round Burma, Mayala, Thailand, Singapore and Indonesia in the hope that these countries may be interested in buying it.

*

Preliminary studies of the pattern of demand for petroleum products prepared by the Indian Refineries Ltd. have led to an interesting conclusion. The refinery to be planned, after the South Indian venture is through, will be located in Calcutta. Since such a refinery will be based on imported crude, its construction will depend on the satisfactory progress of the Haldia project. Any official thinking on these lines, however, will be done only in the early years of the Fourth Plan.

*

The Planning Commission has approved the network of gas and oil pipelines in Gujarat proposed by the Oil Ministry and the Rs. 7 crores project for laying a products pipeline between the Gauhati refinery and the distribution centre of Silliguri, 260 miles away.

4½%

MAHARASHTRA STATE DEVELOPMENT LOAN, 1974

ISSUE PRICE AT PAR

OPEN ON MONDAY, THE 27TH AUGUST 1962

The loan will be closed as soon as the total amount of Rs. 12½ crores has been subscribed and in any case not later than the close of business on the 1st September 1962.

The applications for the loan will be received at—

(a) the offices of the Reserve Bank of India, Bangalore, Bombay, Calcutta, Madras, Nagpur and New Delhi,

(b) the branch of the State Bank of India at Patna,

(c) the branch of the State Bank of Hyderabad at Hyderabad,

(d) the branches of the State Bank of Hyderabad conducting Government work within the State of Maharashtra,

(e) the branches of the State Bank of India within the State of Maharashtra except at Bombay and Nagpur and at places covered by item (d),

(f) the Government treasuries and sub-treasuries in the State of Maharashtra at places not covered by items (d) and (e).

Full particulars can be obtained at any of the offices mentioned above

COMPANY AFFAIRS

THE BRITANNIA BISCUIT COMPANY LTD.

The Forty-fourth Annual Report and Accounts of the Britannia Biscuit Co. Ltd., for the year ended March 1962 show a sizeable improvement over the working results of the preceding year. During the year under review the turnover of the Company attained an all-time peak at Rs. 4.28 crores as compared with Rs. 3.29 crores only in the last year; this represents an increase of more than 30 per cent. Naturally it has resulted in raising the net profits from Rs. 31.68 lakhs in 1960-61 to Rs. 34.49 lakhs in 1961-62. Directors have given the opinion that the profits would have been much higher but for the steep rise in costs.

The Directors have decided to pay a final dividend of 21 per cent (taxable) on equity shares taking the total to 25 per cent for the year on the enhanced ordinary capital. Dividends would absorb Rs. 14.49 lakhs as against Rs. 8.74 lakhs in the last year. The Directors have allocated Rs. 8.61 lakhs for depreciation, Rs. 38.26 lakhs for taxation, Rs. 13.76 lakhs for General Reserve, Rs. 1.98 lakhs for Development Rebate Reserve and Rs. 1.50 lakhs for debenture redemption reserve. The carry forward for the year at Rs. 2,84,100 is almost the same as in the last year.

CHITALE SUGAR

The Chitale Sugar Works Ltd., will be approaching the capital market towards the end of this month to offer for public subscription 2,01,919 Equity shares of Rs. 10 each amounting to Rs. 20,19,190 and 8,648 Cumulative Redeemable Preference shares of Rs. 100 each (or Rs. 8,64,800). The preference shares will carry a dividend of 9.285 per cent, subject to tax. The preference shares are redeemable at par at the option of the company any time after January 1, 1971 but not later than December 31, 1975 by giving six month prior notice. The entire issue of Rs. 28,83,990 has been underwritten by the Union Bank of India.

The factory, situated at Chitalenagar, 90 miles from Poona, will have a crushing capacity of 800 tons of sugarcane per day. It will thus produce about 1,38,000 bags of sugar during the average crushing season of 150 days. The average sugar recovery will be around 11.5 per cent and it may even go as high as 12 to 13 per cent. The factory will commence production by the end of the current year.

Chitalenagar is an ideal site for the manufacture of sugar, considering the abundant supply of sugarcane from surrounding areas, which ensures short-distance transport, cheap labour, and adequate water supply.

The factory buildings are nearing completion and most of the plant and machinery have been erected on the site. Considerable economy has been achieved in the cost of plant and machinery by making purchases from indigenous sources at comparatively cheap prices.

The estimated capital cost of the project is Rs. 89.81 lakhs. The Industrial Finance Corporation of India has sanctioned a loan of Rs. 32 lakhs, out of which an interim payment of Rs. 20 lakhs has already been received.

One of the highlights of this issue is that the company hopes to declare reasonable dividends much earlier than two years.

Mr. Murarji J. Vaidya is the chairman of the Board of Directors. Chitale and Company Private Ltd. are the Managing Agents of the Company. The public response for this Issue will undoubtedly be encouraging. The fact that the Issue has been fully underwritten by the Union Bank of India speaks for the appeal of the public to this Issue.

RELIANCE JUTE MILLS

The Reliance Jute Mills Ltd. has fared well during the year ended March 31, 1962. The profit and loss account of the company disclose a profit of Rs. 7.3 lakhs, after providing Rs. 0.59 lakhs as retrenchment compensation and Rs. 0.34 lakhs for depreciation, as against Rs. 5.4 lakhs in the previous year. A sum of Rs. 1.64 lakhs has been earmarked for taxation (against Rs. 1.27 lakhs), Rs. 1.94 lakhs towards contingencies (against Rs. 0.98 lakhs), Rs. 3,917 for Development Rebate Reserves and Rs. 78,415 as provision for doubtful debts. A debit balance of Rs. 25.41 lakhs has been carried forward against a debit balance of Rs. 28.32 lakhs brought in. No dividend has been declared for the year.

The main sources of income for the company are from the selling of loom hours under the working time agreement of the Indian Jute Mills Association and from the leasing of the jute and gunny godowns to the Government of India for storage of foodgrains. The earnings from the latter source, during the year under report, amount to Rs. 3.29 lakhs as compared with Rs. 2.85 lakhs in the preceding year. As the Government of India is likely to change its policy in respect of these godowns, the earnings from this source may decline during the current year.

NEW ISSUES

Five companies have been permitted by the Controller of Capital Issues to issue bonus shares.

The companies are: Parry's Confectionery Ltd., Asian Oil and Paints Co. Ltd., North-West Cachar Tea Company Ltd., Khare and Tarkunde Ltd. and Electro-Metallurgical Works Ltd. Details are as under:

Khare and Tarkunde Private Ltd., Nagpur, having a paid-up capital of Rs. 6,08,800, is issuing further capital of Rs. 80,900 divided into 809 equity share of Rs. 100 each, to be issued as bonus shares on capitalisation of the company's free reserves to a like extent.

Electro-Metallurgical Works (P) Ltd., Maharastra will issue bonus shares of the value of Rs. 7,49,400 on capitalisation of reserves to a like extent.

The North-Western Cachar Tea Company Ltd. is issuing bonus shares of the value of Rs. 5,60,000 on capitalisation of its free reserves. The existing capital of the company is Rs. 7 lakhs.

Parry's Confectionery Limited, Madras will issue bonus shares of the value of Rs. 5 lakhs on capitalisation of the company's share premium account to a like extent. The bonus shares will be issued in proportion of one bonus share for every three shares held.

Asian Oil and Paint Company (India) Private Ltd., Bombay will issue bonus shares of the value of Rs. 5 lakhs on capitalisation of reserves to a like extent.

Association Meeting

INDIAN INSURANCE COMPANIES' ASSOCIATION

Mr. P. U. Patel Surveys Current Problems

Indian Insurance is an integral part of the National Economy and it is in the interests of the Nation itself that our Insurers should be helped to strengthen themselves, said Mr. P. U. Patel, Chairman of the Indian Insurance Companies' Association in Bombay on August 6.

FIRE PREMIUM RATES

Mr. Patel, who was addressing the 34th Annual General Meeting of the Association, discussed at some length the recent cut in the Fire Premium Rates, coming on top of a similar reduction made 18 months ago. He disclosed that, as in the past, the present cut had been effected under official pressure and felt that the cut was bound to add to the Industry's difficulties. He stated that the continuous slashing of rates in the Fire Department would prevent Indian Insurers from building up their reserves as fast as they would like to. "It is my fervent hope that we shall not be called upon to effect any further cut in our Fire Premium Rates for years to come", he said.

FINANCIAL GUARANTEES

Proceeding, Mr. Patel referred to the practice adopted by some Insurers of granting Financial Guarantees in favour of Banks and other Financial Institutions with a view to acquiring a sort of 'monopoly' control over the Insurance business of new and old clients. This practice had prevented medium-sized and small Insurers from having a fair and legitimate share in the fruits of the country's expanding economy. "It is my submission that it is no part of our business to furnish 'Working' capital to the Industries in general. The granting of a Guarantee Cover by an Insurer, say in favour of a Bank in relation to somebody's Overdraft Account is certainly tantamount to providing 'working' capital in an indirect manner", he observed. Accordingly, Mr. Patel called for a healthy restraint on the part of Insurers and the adoption of the motto of 'live and let live'.

While on this subject, Mr. Patel also referred to the practice of Insurers participating in the capital-structure of new Industries. "While one does not question the right of any Insurer to invest his funds in any manner he likes or on merits, it is certainly debatable whether it is fair for only a few Insurers who are in possession of huge funds to try to create conditions of monopoly for themselves by this sort of financial tie-up", he said. His appeal to Insurers was: "Invest your funds in any manner you like. But please desist from being aggressive. Leave the client free to select his own Insurer."

MACHINERY - CUM - ERECTION

After welcoming the growing demand for Machinery-cum-Erection insurance, Mr. Patel deplored the low and uneconomic rates being quoted nowadays for this type of cover. He believed that a stage had been reached where they should seriously think in terms of tariffing this business in the interests of all concerned. Indeed, he would go further and suggest that to the extent it was practicable they ought to tariff a major portion of their Marine business.

TAXATION OF RESERVES

Mr. Patel reiterated the plea made by his predecessors year after year for fiscal concession designed to build up Reserves on a higher scale than allowed so far. He appealed to the Government to be realistic in this matter and permit Insurers to accumulate Tax-free Reserves equal to 100 per cent in the Fire and Miscellaneous Departments and 200 per cent in the Marine Department. He was convinced that the long-term gains from stronger Insurance Institutions would far outweigh any temporary loss to the Exchequer through tax relief.

LATEST DEVELOPMENT

A development of far-reaching significance to General Insurance, according to Mr. Patel, was the Scheme adopted by the Executive Committee at its meeting held in Simla in May last. Under this Scheme, the existing Administrative Machinery is to be considerably enlarged and it will be empowered to check all Receipts and Payments by Insurers in relation to transactions taking place on and after 1st July, 1962. Insurers controlling more than 80 to 85 per cent of the Direct Gross Premium Income in the country had already furnished or would shortly furnish an undertaking to implement the Scheme. "Speaking for myself, I welcome this move and I am confident that it will go a long way in placing the Industry on sound and healthy lines", he said. In this connection, he paid a well-deserved tribute to Mr. E. Kolet, Chairman of the Executive Committee of the General Insurance Council.

ANNOUNCEMENT

The following Annual Numbers of **THE EASTERN ECONOMIST** are available for sale. Special concession may be given to educational institutions, libraries and students, if a single order exceeds Rs. 50|-.

1.	India & the World and India in 1950	Rs. 5|-
2.	A Social History of the Indian People & India in 1951	Rs. 5|-
3.	India & the Free World and India in 1952	Rs. 5|-
4.	India in Asia & India in 1953	Rs. 5|-
5.	India in South East Asia and India in 1954	Rs. 5|-
6.	India & the Communist World and India in 1955	Rs. 5|-
7.	India in 1975, A Study of the next Twenty Years & India in 1956	Rs. 7.50
8.	India & the Middle East and India in 1958	Rs. 7.50
9.	India and Europe & India in 1959	Rs. 10|-
10.	India & North America and India in 1960	Rs. 10|-
11.	India and Europe Divided	Rs. 10|-

TATA ENGINEERING & LOCOMOTIVE COMPANY LTD.

Statement of the Chairman, Shri J. R. D. Tata

The following is the statement of Shri J. R. D. Tata, Chairman of Tata Engineering & Locomotive Co. Ltd., for the year 1961-62.

The Company's performance during the past year has been good and sales and earnings have maintained their upward trend. During the course of the year, the Company's manufacturing facilities have been further improved and its capacity for the efficient production of high-grade engineering products has been substantially enhanced. The details of output in each of the Divisions and the present status of the projects under expansion are indicated in the Directors' Report.

2. The Company's operations during the past year have made substantial contributions to the national revenue and to the transport industries of the nation. Last year, the operations of this Company alone contributed to the national revenue by way of customs duties, excise, sales, income and other taxes as much as Rs. 13 crores, which incidentally is almost 1 per cent of the total tax revenue of the Central and States Governments combined.

PROFITS AND APPROPRIATIONS

3. Although the gross profits for the year exceeded the previous year's figure by Rs. 66 lakhs, the disposable profits for the year are about the same as last year's because of the larger provision for taxation necessitated by the increase in the taxable profits and also by the higher rates of tax under the Finance Act, 1962. The amount set aside for depreciation is higher by Rs. 39 lakhs, the increase being attributable partly to the amount provided on new assets created during the year and partly to depreciation being provided for a full year on fixed assets which, in the previous year, had qualified for depreciation for a few months only. The increase of Rs. 21 lakhs in interest charges is due to the higher interest rates paid as well as to large bank borrowings necessitated by increased manufacturing activities.

4. As there is no appreciable increase in the net profit available for payment of dividends, your Directors have recommended the same dividend as in the previous year, namely, 14.5 per cent or 10.15 per cent tax-free per share, subject to tax relief under Section 84 of the Income-tax Act, 1961, which will be somewhat higher than in the previous year. In viewing the dividend recommended this year, it is necessary to bear in mind the present uncertainties, particularly in regard to the availability of foreign exchange, which may impede production in the current year, and the need to retain within the Company a reasonable share of current earings to finance the further growth of the Company. It may also be noted that a good deal of expenditure already incurred on various projects has not yet fructified and that it will be only during subsequent years that we shall be able to earn a return on our investment in production facilities now being set up.

FINANCE

5. Substantial additional funds will be needed for the expansion and diversification of our manufacturing facilities. A part of these funds will be available from retained earnings and it is proposed to secure the balance partly from a long-term foreign credit which is being negotiated with the Agency for International Aid (A.I.D.), Washington, in consultation with Government, and partly from an issue of Rs. 5 crores convertible debentures. The terms and conditions of the issue including the conversion terms are still under discussion with Government, but I may mention that our intention is to offer the debentures for public subscription by prospectus after reserving a proportion for direct subscription by holders of ordinary shares. The Directors have chosen this method of raising capital in the long-term interests of the Company and its shareholders.

EXPANSION AND DIVERSIFICATION OF ACTIVITIES

6. Last year, I gave an indication of the various schemes approved or under consideration for expanding and diversifying the Company's activities. I am glad to say that all of them are now taking concrete shape. The manufacture of Tata-P & H power shovels has been firmly established and high-grade capacity created for the production of machinery for paper and pulp. Apart from the major expansion of the Automobile Division about which I shall have more to say in subsequent paragraphs, the construction of factory buildings and services and the enlargement of capacities of our foundries and forge shops are under way. All efforts are being directed towards increasing the efficiency and productivity of our manufacturing facilities and reducing our dependence on imported materials and components.

EXPANSION OF THE AUTOMOBILE DIVISION

7. You will note from the Directors' Report that the Agency for International Development (A.I.D.) has under consideration a loan to this Company of $13.65 million required for implementing the first stage of the Automobile Division expansion programme which when completed will step up the capacity of this Division from 12,000 to 18,000 units per year.

8. As stated in the Directors' Report, the expansion programme of this Division is being carried out in two stages at the specific request of Government in the light of the current balance of payments crisis. As the production of commercial vehicles is a high priority element in the country's development plans, we hope that Government will find it possible to sanction the second stage of the plan in time to avoid a costly hiatus between the two stages of the complete programme.

FOREIGN EXCHANGE

9. The critical foreign exchange situation prevailing in the country today is a matter of deep interest to us. The vehicles we manufacture at Tatanagar contain an appreciable proportion of parts made from imported raw materials and also some imported components and ancillary products. Our capacity to maintain the present level of production, let alone to increase it, must therefore at least for the time being depend on adequate allocations of foreign exchange for such imports. Our foreign exchange allotments for the licensing periods April-September, 1962, and October 1962 - March 1963, have not yet been communicated to us, but from preliminary indications received, there is a possibility of some reduction in the foreign exchange allotment to us in respect of these two licensing periods.

10. We are fully conscious of the gravity of the balance of payments position in the country and the imperative need to save foreign exchange. We hope, however, and have represented to Government accordingly, that the revised allocations of foreign exchange during the two licensing periods mentioned earlier, will take into account the fact that although we were the last to enter the automobile field, our output of commercial vehicles is by far the largest in the country and also has the largest indigenous content. This is reflected in the fact that in 1961-62 we were allotted 35 per cent of the total foreign exchange made available to the industry for the manufacture of such vehicles, while we produced over 50 per cent of the entire country's output. It is clear from these figures that for every Rupee by which our allotment is cut, the loss of production will be the largest and will have the most adverse impact on the country's economy. I might also mention that since we began production of Tata Mercedes-Benz vehicles, we have saved the country over Rs. 35 crores in foreign exchange, of which nearly Rs. 12½ crores were saved last year alone.

11. Shareholders will no doubt be concerned about the likely effect on our rate of production of any cut in foreign exchange. While such effect cannot be predicted until the exact extent of the cut, if any, in our foreign exchange allocation and the period for which it will apply, are known, there is in my view no cause for anxiety or pessimism. Government are fully aware of the Company's performance and the consequences to it and to the economy as a whole of any substantial or prolonged cut in production at Tatanagar. They are to my knowledge as anxious as we are to see full production of our vehicles maintained. We have, therefore, every reason to hope that if any cut is imposed upon us it will be a relatively small one and of short duration.

12. Before I leave this subject, I wish to point out that the achievement of complete self-sufficiency in raw materials is not within our control and only partially so in the case of components and ancillary products. Whatever our own efforts, we can never make ourselves every part and component entering into our vehicles, and like every other automobile manufacturer in the world, we shall always have to depend largely on outside supplies for our raw materials and for certain components and ancillary products. It is therefore of crucial importance that capacity for the manufacture of essential raw materials, particularly steels of the specifications and qualities required for the manufacture of automobiles and trucks and of ancillary and proprietary products, keep pace with the growth of the automobile industry. While substantial progress has already been made in this direction, a considerable gap still remains to be filled and I would urge that Government give their full and urgent support to the rapid development of these industries.

EXPORTS

13. Apart from the steps we are taking to increase still further the indigenous content of our vehicles, we have also launched a vigorous export drive as a further contribution to the solution of the country's foreign exchange problem. For exporting the products of our Company, not only from the Automobile Division but also from other Divisions, we have to face stiff international competition and also to surmount national barriers from industrially advanced countries. Despite the formidable obstacles in our way, we have already made a modest beginning and have secured a few orders from South Viet Nam, Malaya, Ceylon, Pakistan and Sweden.

14. Although the Company's export field for commercial vehicles is restricted to certain territories in terms of our agreement with Messrs, Daimler-Benz, I have every hope that with their understanding and cooperation we shall before long be in a position to achieve a sizeable volume of export business.

ROAD TRANSPORT

15. In these days of acute transport shortage pointing to the urgent need for providing greater freight and passenger carrying capacity, road transport deserves, in my view, a higher priority and more sympathetic consideration than it has received so far. It seems, instead, to have been specially selected for a cascade of impositions and taxes as well as of innumerable restrictions and impediments in its intra-State and inter-State operations, in addition to the limitations imposed by the inadequacies, both in mileage and quality, of the country's road system. A vigorous development of the latter, coupled with an adequate and balanced production of commercial vehicles, would yield immeasurable benefits to our entire national economy. While India has one of the largest railway systems in the world, the mileage and quality of our roads and the number of commercial vehicles plying over them, are grossly inadequate to the needs of a developing economy such as ours. While there can be no question as to the urgent need to improve and add to the rail transport system of India, I wonder whether our Planners have sufficiently appreciated the special advantages and potentialities of road transport: for instance, the fact that road transport capacity can be built up more quickly and at much lower cost than any other method of transportation; also its extreme flexibility and large employment potential. In this connection the following conclusion by the National Council of Applied Economic Research in a detailed study made by them of the subject is worth quoting in full:

> "The conclusion that emerges is: that the financial contribution of the road transport industry is far from negligible. Indeed it is greater than that of the railways in absolute terms and in terms of return on capital invested. This is true for net as well as gross contribution (deducting the cost of offsetting payments made by Government for example in road construction). Some items in the calculations may possibly be challenged, but the margin is so great that any adjustment that is conceivable is hardly likely to alter the main conclusion."

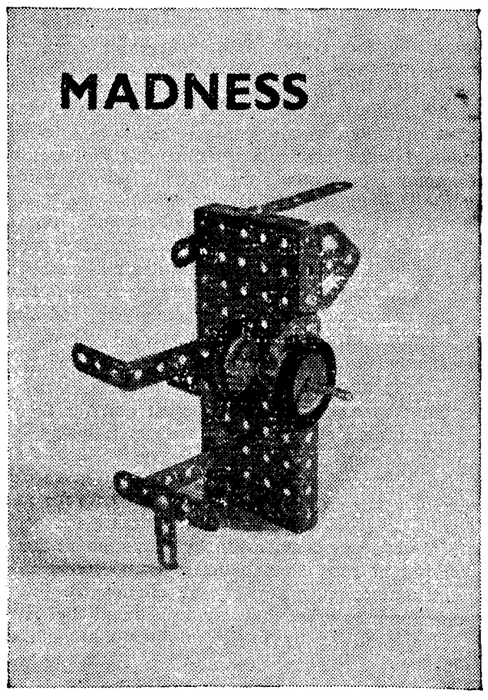
16. Quite apart from the immense value and importance of road transport to the physical needs of a developing economy, the financial contribution which road transport already makes and will make in future to public revenues is tremendous. For instance, out of the price of about Rs. 34,000 which the purchaser of a Tata Mercedes-Benz chassis pays in Bombay, as much as Rs. 10,000 or only slightly less than 30 per cent, goes to pay for duties and taxes to the State and Central Governments. In addition, every commercial vehicle during its many years of operation, continues to be a favourite source of national revenue through crushing fuel taxes and a variety of other taxes. These factors seem to be some times overlooked in determining relative priorities to be given to different types of transport.

EXCAVATORS

17. The manufacture of Tata-P&H excavators has been established on a sound basis, your Company being the first in the country to produce this heavy line of equipment. We have started with the production of 2½ cubic yard machine. Our present output of three such machines a month will be increased to four from about September this year onwards. Our machines have received an excellent reception from users and are in operation in various locations in the country. The demand is a large and growing one; our order books are full for the next 12 months and we do not anticipate any difficulty in disposing of our total output.

LABOUR

18. Whereas last year there was no interruption to production caused by action on the part of our workers, there was a brief stay-in strike in a few shops of our Automobile Division during the year under review.



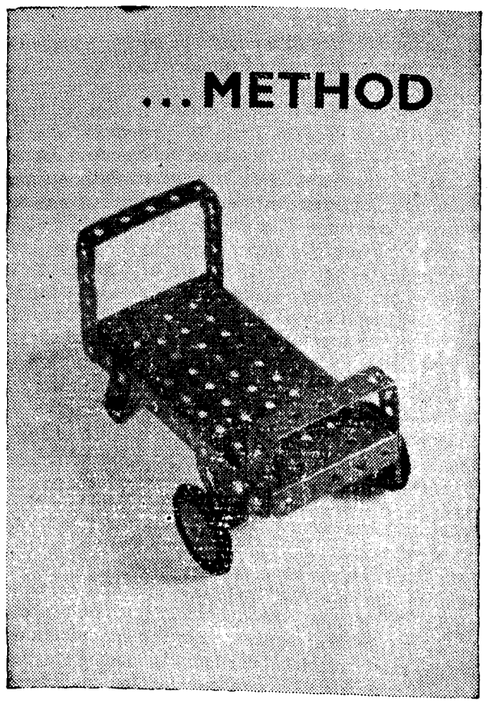
19. During the current year, the workmen as well as the management will have to face the challenge posed by the reduction in vehicle output which has been forced on us by external circumstances. There is need to consolidate still further our position to enable us to implement rapidly the expansion programmes and make the most intensive use of the expensive plant and machinery that will be installed. I earnestly hope that we shall have the co-operation of our Union and our workmen in facing these problems.

20. In conclusion, I wish on your behalf to thank all those responsible for the Company's operations and progress during the past year — workers, staff, supervisors and top management, particularly our General Manager, Mr. R. G. da Costa. Mr. Hans a Stoehr, who was in charge of our Automobile Division from its very inception, retired from the Company's service during the year under review on being recalled by Messrs. Daimler-Benz for an important assignment in Germany. Mr. Stoehr's exceptional abilities, drive and leadership were largely responsible for the growth and success of the Automobile Division since its early beginnings in 1954 upto its present pre-eminent position. I would also like to record our appreciation of the valuable part played in the Company's growth and development over a period of 11 years by Mr. A. B. Parakh, who recently relinquished charge of the Company's Head Office in Bombay on taking up a senior appointment in Voltas Limited.

J. R. D. TATA
Chairman.

BOMBAY, 26th July, 1962.

MADNESS



It's not enough to have the parts. They must be fitted together according to a plan.

We are talking about your records. All the lists and ledgers and notes, the files and folders and references. They are there. But they are not working for you as they should—unless of course you have a Remington System.

Remington Systems can be tailored to your business, so that your records and information are not only arranged for easy reference—they provide an automatic Control of your operation. They can tell you when to act—promptly and effectively.

...METHOD

Remington Systems are well planned—there are many years of research in many countries behind them. But they are simple to use. And you do not have to be a big businessman to use a Remington System. You just have to be a good businessman.

MAKE YOUR RECORDS WORK FOR YOU

AUGUST 17, 1962

Hafiz Mohammad Ibrahim

THE performance in Parliament this week of the Minister for Irrigation and Power, Hafiz Mohammad Ibrahim, and his determined refusal to withdraw from office urged brutally in the Press must constitute the most remarkable case of political stone-walling that the world has ever seen. The charges have been framed in ways which are as deeply humiliating to the Minister as they are to the Central Cabinet. He is accused of incompetence in overlooking the Delhi power crisis, incompetence in presentation in Parliament, and helplessness in information as well as in debate. He has been accused of old age and infirmity. There may conceivably be some sympathy with the Minister in that his technical responsibility for the Delhi Electric Supply Undertaking comes to him after refraction from various other authorities. In a further attempt at dispersion the Law Minister seemed to argue that responsibility could only be invoked after a breakdown had occurred, because the Ministries of the Central Government, via the Ministry of Home Affairs, had powers only of issuing 'directives'. In point of fact, therefore, notwithstanding the Prime Minister's firm declaration of the Central Government's responsibility (presumably both of the Home and the Irrigation Ministries) a nice legal loophole has been presented to Hafiz Mohammad Ibrahim. To do him justice, he had not waited for this loophole to make good his escape. He had absolved himself of his responsibility the previous day and, in fact, with hands folded to the Chair, had begged that all responsibility should be transferred speedily to the Punjab Government.

The nice issue of responsibility can be left to the constitutional pundits of which it might be remembered Mr. Asoke Sen is not necessarily one of the most accomplished. His current presentation seems to suggest that the makers of the Constitution were singularly blind to the fact that democratic government has, as one of its first principles, the doctrine that responsibility must rest specifically somewhere. In the last analysis, the Central Government, whenever a subject is in the collateral list, must take full responsibility — however the occasion of responsibility presents itself in terms of the sequence of events or, perhaps, through inferior authorities. The Prime Minister has caught the spirit of the Constitution which the Law Minister would wish to deny. The issue of responsibility is actually threefold. There is, firstly, the legal responsibility, on which a nice battle of words can be produced without giving any satisfaction to the country or conviction to the lawyers themselves. The second is the problem of planning future power requirements, and the Ministry of Irrigation and Power certainly cannot absolve itself from the point that its sanctioning in this particular case did not foresee the disastrous events which occurred. Finally, there is the personal competence of the Minister operating in what might be called his political or parliamentary capacity to explain, expound, convince and, in the event of failure to do any of these things, to be honest enough to recognise his incompetence for the job.

The country as a whole, and almost everyone in Parliament, is convinced that Hafiz Mohammad Ibrahim is now not fit to be in the Central Cabinet. There is, indeed, a delicate political problem for the Prime Minister to solve. For one thing, Hafiz Mohammad Ibrahim has a substantial following in Uttar Pradesh and he is, therefore, of political importance to the Congress Party. Secondly, he is an old friend of the Prime Minister, and the fact that he is a Muslim, as well as a stalwart from Uttar Pradesh, makes his friendship take on a particularly heavy obligation. It is arguable that, irrespective of the country's interest, the Prime Minister should look after his Party at any price. This is a principle which will not be acceptable except to those who believe the Congress Party is identical with this nation, as one might argue that what is good for General Motors is always good for the United States. The Prime Minister's habit of putting party preferences above the country's interest is what has brought us to our present pass. If the Prime Minister insists, while he is ageing himself, in surrounding himself with those more aged and even more incapable of taking additional responsibilities, both the Congress Party and the country will bear the marks of his errors with scars which may never heal. For the political vacuum will be filled by parties not necessarily with higher principles by reason of the fact that power, even while not absolute, has corrupted the administration absolutely.

It is time to recognise that the Prime Minister of India is at present conducting the affairs of this country on his own preferences and not on principles. His preference for Hafiz Mohammad Ibrahim is understandable, but in terms of the national interest, unforgivable. If Hafiz Mohammad Ibrahim will not resign from his office, he must be dismissed by the gentle art of kicking him upstairs. This has been used ruthlessly in the case of Dr. P. Subbarayon with the result that the Congress Party has lost a prestige seat in a by-election in Tiruchengode, to which reference is made in the following article. This does not make the Prime Minister's action wrong; this was the necessary price to be paid for administrative gain over political advantage. There can be no justification whatever for being more gentle with Hafiz Mohammad Ibrahim. It is true he is a leading Muslim, but the Muslim community is not so deprived of eminent people that a more able Muslim Minister cannot be found. *The Eastern Economist* supports the view that there should be adequate Muslim representation in the Cabinet, notwithstanding the fact that the Prime Minister, wedded to the secular State, sometimes neglects minorities like the Christians who need almost equal assurance at this time. This is not, however, the time to argue the case for the minorities. It is the time to argue the case of the nation as a whole. It is a blot on the Prime Minister's management of the country's affairs that someone of proved disability like Hafiz Mohammad Ibrahim should be retained in the Central Cabinet. The fact that the Press of this country has to come out with strong personal attacks of this kind is itself an indication that the limits of containment have been reached and passed beyond repair.

The D.M.K. Victory at Tiruchengode

THE announcement on August 13 that Mr. S. Kandappan, the D.M.K. candidate, had defeated the Congress Party in the Lok Sabha bye-election in Tiruchengode, in the seat rendered vacant by the resignation of Dr. P. Subbarayon, Governor of Bombay, must cause the Congress Party furiously to think. It was not believed that this seat, in which Congress influence was strong enough to win a decisive victory by 12,164 votes in February, would so soon succumb to the D.M.K. assault. Indeed, Mr. Bhaktavatsalam, the Home Minister of Madras, had even challenged the D.M.K. to prove that their campaign against rising prices in Madras had the support of the people. It is difficult to know exactly what to read into the current election figures, but certainly it cannot be argued that the D.M.K. stock is declining and that of the Congress Party rising in this particular constituency. This may be no guide to the structure of opinion for Madras State as a whole, but it will be treated, and rightly treated, as decisive in respect of Tiruchengode.

It is interesting to notice that the grand opening of the Neyveli complex by the President, and much reassurance on the development of the South including a probable steel mill, which Mr. C. Subramaniam, Minister of Heavy Industries and Steel, has rightly sponsored, has not been effective in influencing the climate for this election. There is some considerable doubt whether, in fact, the South, even as represented by the Congress Party, is at all satisfied with economic progress being made in all the four States, Madras, Andhra, Mysore and Kerala. Indeed, the Minister of Finance of Andhra Pradesh, Mr. Brahmananda Reddi, writing in the *Financial Express*, has quoted critically the Indian Institute of Public Opinion figures to show that the progress in the South has been lower in the Second Plan and is likely to be lower in the Third Plan than comparable areas in the North, West and East. This follows on Mr. Venkataraman's forceful statement nearly a year ago at a meeting of the National Development Council based on the same figures, not yet refuted. It cannot, therefore, be suggested that the D.M.K. accusation that there is discrimination against the South, is entirely the slogan of one party. It is not, indeed, clear that, even if it were a slogan of one party, it would greatly effect the structure of political opinion. The volume of economic discontent in the South is large, much larger than the Central administration in New Delhi is willing to recognise.

The remarkable political skill of Mr. Kamaraj Nadar, the Chief Minister of Madras, stands pitted now against the growing popular appeal in Tamil Nad of a somewhat extreme, and possibly fanatical, belief that a compromise between North and South cannot be found except on separatist grounds. The warning that the people of the South are likely to be influenced by this wayward trend is contained in the Tiruchengode figures. The Congress Party can only ignore this warning at its peril. Even the tremendous figure of Mr. Kamaraj Nadar will not be able to arrest decline, unless positive measures are taken both to control prices and to accelerate economic development in the State of Madras. It is likely if the economic discontent can be significantly allayed in the next three years, far less will be heard of secession. In any case a policy of economic development for the South beyond the Plan must be conceived without delay.

The Lesson of the Power Crisis in Delhi

THE three-week old power crisis in Delhi has brought forth a spate of protests from the harassed population which had to face the "worst ever" monsoon season in Delhi, but equally, it is good to remember, has it brought forth activation in centres where stagnation and complacency had previously reigned supreme. While the Prime Minister's speech at a public meeting assuaged the feelings of the people because he promised that the Government would try to bring to book those officers who had been negligent in their duties and had precipitated the power crisis, the power shortage persisted till someone made a serious effort to locate the idle capacity of generators available in Delhi. This and not the Prime Minister's soothing hand, is the discovery of the moment. Truly, necessity is the mother of invention!

The Military Engineering Service, for example, possessed capacity for generating power through its own units through which it could meet the requirements of the military establishments. It was only at a very late stage in this ordeal that the Government hit upon the idea of requesting the Military Engineering Service to commission its plants. This naturally reduced the pressure on the Delhi Electric Supply Undertaking by half in so far as the military establishments were concerned. Again, there were available with the Undertaking two stand-by generators capable of producing 4,500 KW which had, for no clear reason, not been pressed into service. Again only when the crisis had created an unmanageable uproar did the officer in-charge think of using the 1,500 KW generator at Chandrawal or of repairing the 3,000 KW generator at the Central Power House. At the same time it was discovered that the industrial units in Delhi possess generating plants with a total capacity of 3,000 KW. The administration decided to provide coal to these plants—again very late—so as to tap this additional source. The Delhi administration also discovered from nowhere that it had another diesel plant of 8,000 KW which needed to be overhauled. Someone hit upon the plan to speedily overhaul this generator so as to add to the available capacity. Thus unutilised capacity alone produced more than 15,000 KW of additional power. If 15,000 KW or about 15 per cent of Delhi's normal load can be dreamt up in this manner, can it be that other portions of the country have no untappable resources? It is ironic that only in a crisis like this, the unutilised idle capacity was frantically sought in order to fill the gap. This also confirms the belief that idle capacity exists not only in power but in many other industries as well and only a crisis of the magnitude of the present one could really awaken the Government and its agents. The power crisis in Delhi will have done a great service if it awakens the country to the necessity of utilising available capacity in industry and power to the maximum. Meanwhile, can one dare to hope that an immediate enquiry will be instituted to find generating capacity to operate elsewhere in the country?

Guest Editorial

Common Market Hitch: A British View

By PAUL BAREAU, Editor 'The Statist'

THE British Government has put a very brave face on the intensely awkward situation which caused the deadlock in the Common Market negotiations in the early hours of Sunday, 5th August. They have even gone to the length of preparing a White Paper setting out all that had been accomplished during the discussions but ignoring the all-important fact that on the most crucial of these issues, namely the treatment of temperate zone foodsuffs exported from Australia, Canada and New Zealand, the French have now reserved their position.

The reassurances which have come from British Ministers are less than completely honest. The hitch which occurred in Brussels is something more than a mere pause in the negotiations. In the first place it has killed the hope that had been expressed that the general outlines of an agreement for Britain's adherence to the Common Market might be drawn before the end of July. The disarray in this time table must obviously interfere with the agenda for the Commonwealth Prime Ministers meeting convened for next month. Indeed, it will be asked whether the journey of the Prime Ministers to London will, in the circumstances, be worthwhile. The Finance Ministers will be coming in any case prior to the annual Bank and Fund meetings which this year will be held in Washington. There will not be too much on their plate to prevent them giving quite enough attention to the latest developments from the Common Market front.

Whatever ministers may say in public, the latest developments in the Common Market talks have caused something like dismay at Conservative headquarters. The Government had staked far too many of its political chips on the Common Market card and any considerable delay in the negotiations would play havoc with the political time table and in particular with the platform for the next general election in which Britain's membership of the Common Market and the dynamic challenge which it involves is destined to play a dominant and perhaps winning role for the Government.

Finally, the perpetuation of uncertainty about the Common Market is unquestionably one of the factors undermining British industry today. It is causing the postponement of a number of projects which would be launched were the outlook clearer and in this way it is reinforcing other influences which are today making for economic recession. This is all the more damaging as every week that passes allows the Economic Community of the Six to crystallise and gain greater cohesion. In this way the metaphorical channel which divides Britain from the Continent of Europe is being deepened.

It is, therefore, of primary importance to discover what went wrong in Brussels after so much appeared to have been achieved. There can be no doubt as to the progrss which had in fact been made up to the moment when the negotiations were brought to an abrupt close. A provisional agreement had been made to deal with exports of manufactured goods from Australia, Canada and New Zealand to Great Britain. It had also been agreed that the enlarged European Economic Community would conclude comprehensive trade agreements with India, Pakistan and Ceylon at the latest by the end of 1966. Measures had been designed to remedy any fall in exports from these three countries to Britain as a result of the gradual application by Britain of the common external tariff on certain imports from these three countries. The E.E.C. have also undertaken to reduce to zero the common external tariff on tea which otherwise would have amounted to 18 per cent. This alone opens up to India possibilities of expanded exports which far outweigh any contraction that might occur in other items of trade with the U.K. as a result of E.E.C. membership. The broad outlines of agreement had also been reached on the association of other Commonwealth countries with the Community and on the all-important issue of exports of temperate zone foodstuffs from Australia, Canada and New Zealand.

The desired goal seemed almost within reach when the French threw their spanner in the works. To understand this manoeuvre it is necessary to understand that the protection of European agriculture will, under the Community rules, be secured by fixing prices for the primary foodstuffs. Imports of such foodstuffs from outside the Community, if they are made at less than these fixed prices, will attract a compensating levy equal to the difference between the fixed price and the price actually paid for the imports. This levy will be paid to a common fund to be used for a variety of purposes, including the purchase of surplus foodstuffs produced within the community, the subsidisation of agriculture and related items.

The exact formula for contributing to the fund and also for its utilisation had not been agreed even between the six existing members of the Community. But at 3 a.m. on Sunday morning, at a time when the powers of human resistance are reputedly at their lowest, the French delegation suddenly produced a precise and detailed formula for which they required immediate agreement. Some other members of the Six would have objected anyhow. Mr. Heath, the leader of the British delegation, did the work for them, saying that without further study he could not commit his Government to acceptance of the French formula. At this the French reserved their position on the crucial agreement concerning temperate foodstuffs and the negotiations came to a dismal and confused close.

The French manoeuvre can only be interpreted in one way: it was a deliberate and successful attempt to bring to a close discussions which seemed to be getting much too near success. The episode reveals all too clearly that the political will to agree is not to be found among the French delegates. France does not want Britain to be a member of the Common Market. That view is shared by at least one but very important German, Dr. Adenauer. He has given the reason honestly. It is that to admit into this Community a new member as important and as heavily commited to the outside world as Great Britain, would be to change its nature radically. Given that attitude, we must expect the French negotiators, whose skill in these matters exceeds that of any of their colleagues among the Six, to find many more spanners to throw into the works.

This does not shake my own personal belief that ultimately Britain will become a member of the European Economic Community; but it confirms the view I have long held that the way of entry will be far more difficult and protracted than the optimistic utterances of Ministers have led us to expect.

A DELHI DIARY

PROTECTION FROM OUTER SPACE ?

AN inconvenient thing (sometimes called a Leading Article) pushed me out of these columns last week. I forgot what it was the previous week that accomplished the same nefarious result. I, however, wish to assure my readers—although one of them has lost faith in me, referring to an unfortunate phrase that promises are like piecrusts meant to be broken—I am resolutely committed in five sessions to pursue a description of my travels abroad. As time recedes naturally the vision splendid tends to recede, and some of the vacuums (or vacua?) thus created at least in my mind tend to get filled by cosmonauts or, at a far less interesting level, by border disputes, or even the Plan. It is vital that I should not be distracted further from my high purpose of concentrating on the receding image and that the Editor should not under any circumstances intrude on my air or writing space.

THE SEATTLE WORLD FAIR

I start with the United States which was what may be described as the end-point of my trajectory. More particularly that point was the Seattle World Fair, which, happily, is so placed that one cannot help seeing both a large number of countries and a large number of cities before arriving at one's destination. In this particular case, the trajectory moved through Rome, London, Washington, Chicago and San Francisco. But I shall pass hastily over the points of transit to dwell particularly on the World Fair, or rather on what surrounds the World Fair. Few people realise that the great World Fair at Seattle has its roots not in an idea, but in a Community. The Community is a group—(or is it an Inner Cabinet?)—inside the people resident in the city of Seattle. Making an invidious comparison, I dare to say that this Community is the most vital in the world. Its problems are almost as vigorous as its restless mind, and it is out of its problems in a sense, no less than out of its intense devotion to its own soil, that the Seattle World Fair was born. In this remarkable Community, which is to be seen to be believed—only a hundred years old in terms of American history—there has been imparted a sense of adventure of which it can truly be said that age cannot wither nor custom stale its infinite variety. The Community—Capital 'C'—always in its honour—needed (a) An Opera House; (b) a magnificent park with fountains (c) an adult (and even teen-ager) advanced education programme; (d) profit from free enterprise; (e) international communication and an exercise in international affairs; (f) as is inevitable in a competitive society, competition with the greatest of all cities, New York !

Let me begin with the last first, thereby illustrating that vital precept in the Bible that the last shall be first and the first last. The Community of Seattle decided to compete with New York before the Paris International Bureau of Exhibitions (Expositions), which guides all international exhibitions, in order to fight for the fair in the year 1962. About four to five years hard work goes into all the arrangements in a fair such as this. The President of the Fair, Mr. Joseph Gandey (not Gandhi) had actually to conduct in the two years preceding the Fair fifty-seven international visits to persuade, expound and, I presume, to sell his idea to 57 different nations. In the process, most daringly, but apparently without any undue violence to himself or Seattle, Mr. Gandey outwitted New York which was undertaking a similar number of trips and a similar campaign of persuasions at the Central Bureau of International Exhibitions at Paris. Seattle won, I believe, by a process which can only be described as the application of the New Frontier. They demonstrated, in fact, that their conception of a Fair was quite different from that previously held and their victory over New York remains one of the classic examples of the success of mental, over material, resources !

To do Seattle justice, it has not under any circumstances spared material resources. I forget today what the actual amount invested on the Fair is, but I would imagine that it must be in the region of well over 200 million dollars. I believe, the Fair Committee raised on its own 20 million dollars by way of equity capital and loans from banks; it has already repaid it all as well as a dividend. It then proceeded to sub-contract space as well as ideas. Out of one of them has come a Space Needle, the model version of the Eiffel Tower, which in terms of construction and elegance, is as far ahead as the 21st century is of the 19th. In its beautiful slick almost vertical 500 ft. height one marvels at the daring of modern steel architects and pays only a passing tribute to Eiffel, the greatest of the steel workers of his time. The Space Needle, of course, has—as the Eiffel Tower—its restaurant, its space platform and, of course, its telescopes from which one can look upon the great city throbbing with its own vitality.

The most striking of the exhibits—all arranged in the context of what living would be like in the 21st century—is a group of modern versions of the Home—Kitchen first. Since I am not, by any means, a homely person, I found much more attraction in the great Science pavilion built by the United States Government, they tell me, at a cost of $10 million to demonstrate the beginnings of Science and then its tremendous role down the world ending up in Spacemanship and all the wonders of the heavens. Here one must pay profound tribute to the two leading architects—one of Japanese origin—who has done so much of architectural work in the Fair which is one of the most exciting architectual monuments that the world has presented to itself. Alas! I have forgotten his name but he performed in Delhi at the US Pavilion in the Industries Fair.

One should also pay tribute to the scientists who in the space world are making history with Soviet Cosmonauts of whom happily we have two in the space at the time that this is being composed. The tremendous range of Space Science—particularly the use of computers, the study of special steels and so on that go into spacemanship—is briefly touched upon here only to show that spacemanship is to be the great new frontier of the 21st century as much as internal and comfortable living is the old world target of the great providers of hearth and home.

THE MONORAIL

I, however, expended a not inconsiderable sum — as did thousands of grown ups and children alike—by travelling by the monorail from what is called Down town Seattle to the Fair. The monorail is an amazing invention consisting of two carriages moving on a cement rail about 14 feet high for a distance of about a mile and a half through the busiest streets. This distance is covered by the monorail moving noiselessly on rubber wheels beautifully hidden from sight at the speed of 60 miles per hour so that one travels through the busiest portion of Seattle at the top speed of trains in this country. This is also the most comfortable travel in the world; it is incredible how one glides on this rail without any feeling of insecurity because the vital rail on which one glides is innocently hidden from view except before and behind. I will not — in order to spare my readers' intense disappointment at its not coming to India disclose the figure of the construction costs per mile. Perhaps, in the course of time, as with the atomic energy, its price will come down to meet that of the conventional methods of travel! Let us watch and pray!

ARGUS.

THE WEEK'S NOTES

Wage Policy

ACCENT ON PRODUCTIVITY

THE PERSISTING crisis of our balance of payments has forced attention to greater production, lower costs and expansion of exports. These three goals have now become so supreme and over-riding that there is hardly any important sphere of economic activity in which due note of such of them as are relavent cannot be taken. It was certainly refreshing to find Mr. G. L. Nanda placing accent on productivity and on an expanding volume of production as the corner-stones of a stable policy for progressive improvement in wages. Mr. Nanda's inaugural address at last week's session of the Indian Labour Conference was welcome for this reason and calculated to make a positive contribution to a fresh orientation of the policy for wages. It is a stock plea with the representatives of labour at the sessions of the Indian Labour Conference to harp upon the demand for the need-based minimum wage. Mr. Nanda brought home to the delegates the bitter truth that if the need-based wage was to be provided, the minimum increase in production that would be necessary would be of the order of 60 per cent above what was contemplated in the physical targets accepted in the Third Plan for the agricultural and industrial sectors of the economy. At a time when the shortfall in foreign exchange as well as rupee resources for the Third Plan is hovering like a dark cloud and the pruning of the plan targets has become inevitable, the question of raising production by 60 per cent does not fall within the realm of reality.

It would be well to recognise that there is another important aspect of labour policy. The backlog of unemployment handed down to a subsequent plan period from the previous one keeps on mounting up. The position, as frankly admitted by the Planning Commission, is that as against a volume of unemployment of the order of 5.8 million at the end of the First Plan, the number unemployed at the end of the Third Plan will go up to 12.0 million at least. This is to say that in spite of a vigorous Second Five-Year Plan with a bias for industry and a Third Plan on an ambitious scale, the level of unemployment will increase by more than 100 per cent in the ten years of the Second and the Third Plans. This is, however, on the assumption that the physical targets of the Third Plan would be achieved. Now that a pruning of these targets will become essential the apprehensions are that the number of the jobless at the end of the Third Plan will rise much higher than the estimated twelve million. Mr. Nanda was therefore quite right in emphasizing that the future policy for wages cannot take care only of an increase in real wages and that the question of higher wages cannot be divorced from fuller employment.

This does not imply that any increase in real wages will have to await the achievement of full employment. Such a situation surely cannot be contemplated. There ought to be an increase in real wages of labour in the existing industries and agricultural occupations. But if higher real wages are to be sustained on a basis of stability, they must be realised by means of higher productivity. Thus it is that higher productivity becomes the absolute precondition of the increase in the real wages of labour. Mr. Nanda exhorted the representatives of workers and employers to undertake a joint investigation into the causes which raise impediments to higher productivity. One cannot endorse this exhortation as of much substantial help. The free and unreserved co-operation of workers and employers is the very basis of the acceptance of the schedule of higher productivity industry-wise and unit-wise, but the measurement of productivity is a complex, technical function, which can hardly be left to workers and employers alone. It is here that the National Productivity Council has to play an ardent and vigorous role. When will it pull itself out of the cob-web of infantile activity ?

Madhya Pradesh

MR. MANDLOI FIRM IN SADDLE

MR. MANDLOI'S victory in the secret ballot specially arranged by the High Command to settle the question of the leadership of the State Congress Legislature Party is of significance for more reasons than one. It did not redound to the credit of the High Command to try and extend oblique support to Dr. Katju. If per chance the leader of the Party loses the election, his re-entry by a by-election is quite justifiable and also essential for a vigorous leadership in the cabinet. But there is no evidence to indicate that this was the case in Dr. Katju's defeat at the general elections. The suspicion of the Congress High Command that Dr. Katju was a victim of group politics at the election was apparently without any sound basis. After his entry in the legislature, speculation began to be rife that he would be reinstated as Chief Minister and Mr. Mandloi would step aside. But Mr. Mandloi was quite confident of the genuine support he enjoyed at the hands of the majority of the Congress legislators and he was in no mood to oblige Dr. Katju. The Congress High Command apparently developed the thesis that Dr. Katju was wanted by the majority and his return would be conducive to the solidarity of the State Congress Legislature Party. It was reported in the Press on the eve of the secret ballot that this was the evaluation of the situation made by Mr. Swaran Singh, who was specially deputed to Bhopal for a probe into the Party's affairs and from other sources also the High Command was stated to have received corroboration of this assessment. But the secret ballot finally settled the issue and made it clear where the truth lay. It must, however, be said in fairness to the High Command that it made a wise decision in not interfering in the matter but leaving it to the Legislature Party itself to announce its choice with the safeguard of the secret ballot for free vote.

Mr. Mandloi's firm seating in the saddle has another significance. The internal state of affairs in the State Congress Party is among the worst to be witnessed at the present time in some of the States. Mr. Deshlehra, the State Party Chief, was persuaded to resign office, although no involvement in factionalism was ascribed to him. But there are other complicated developments like the disqualification of Mr. D. P. Mishra from the State Party executive on a charge relating to a remote past date. All these complications underlined the urgency of strong action to restore a sense of discipline in the Party. The final proof of such action came with the suspension of the Executive Committee of the State Party. How soon the tangled affairs inside the Party would be straightened out is anybody's guess, but the apprehensions are that the rot may continue for a long time, although in a milder form. Precisely at this time the P.S.P. has taken the most harmful course of carrying on a highly agitational movement against the new taxation levied this year. The Madhya Pradesh Legislative Assembly has been made the target of unseemly and violent scenes. It is in such a disturbed situation

that there arises the urgency to ensure that the authority of the Chief Minister must be kept above doubt to remove any possibility of demoralisation in the administration. The chances of any further challenge to Mr. Mandloi's position do not exist at the present time. This is a happy circumstance.

U.P.S.C.

A CONSTRUCTIVE DEBATE

TIME WAS when the Union Public Service Commission invited bitter criticism of its lax and leisurely functioning during the Parliamentary debates on its yearly reports. In contrast with this tradition, there was a marked change in the evaluation of the Commission's work by the Rajya Sabha last week. This shift in the attitude of a highly critical House leads to the strong inference that the Commission has achieved a good measure of transformation in its work. High appreciation was made of the Commission's recent record and the impartial manner in which it is discharging the somewhat delicate task of recruitment to the highest cadres of administrative services. In fact, the boot was now on the other leg. It was the Government which came in under heavy fire for trying to bypass the Commission by resorting to curious tactics including keeping vacancies open even after the Commission had selected suitable candidates. It may be that in some extremely rare cases the Commission's choice may not be appropriate because of the highly technical nature of the jobs to be filled. But barring such exceptions, Government's action in not abiding by the recommendations of the Commission is highly objectionable and is conducive to violating the spirit of the Constitution in confering upon the commission a supreme, independent status.

The linguistic controversy was introduced in the debate and later, as was inevitable, it developed into a major issue. The protagonists of Hindi charged the Government with sidetracking the Presidential order of 1960 which urges that Hindi should be made on optional medium at the UPSC examinations. The truth of the matter is, as Mr. Datar forcefully pointed out, that no time-limit has been prescribed in the Presidential order and the Government is entitled to take adequate time to make a considered decision on the recommendation. One most welcome outcome of the linguistic part of the debate was a categorical assurance from the Minister of State for Home Affairs that English would be continued for the purposes of the UPSC examinations even after 1965. A point urged was that proficiency in Hindi should be made a condition for employment in the all-India Government services. This insistence again highlights the impatience for the introduction of Hindi. The good cause of Hindi is unfortunately being spoiled by bad pleading and a crude display of indecent haste. At a time, when the gap in the standards between the ICS and the IAS is getting woefully wider, what is really required is not proficiency in Hindi but high calibre of the candidates selected. The IAS and the IPS as all-India services involve appointments of candidates with a particular mother-tongue being posted to regions where the language is different. Such inter-regional-cum-linguistic appointments would be one of the potent instruments for promoting national integration. A relevant question may be posed. Would it be appropriate if it was insisted that the candidates from the Hindi-speaking areas should pass proficiency tests, for instance, in one of the South Indian languages, to facilitate their posting in that region? Such a rigid condition would raise inequitable impediments for candidates who, otherwise, would stand high in the order of merit.

The personality test quite appropriately came in for sharp criticism. If anything, it has given rise to grave apprehensions that assignment of marks in personality tests is not guided by any scientific principle and room is made for a very large element of chanc and luck in the UPSC examinations. There is muc sense in the two suggestions made on this issue. Th first was that the marks allotted to the personality tes should be halved to 200 for the IAS and 150 for the IP and, next, a sub-committee of psychiatrists and educationists should be appointed to make a critical reviev of the personality tests as they are now held by the Com mission.

The Congo

KATANGA'S OPPORTUNITY

THE WEARISOME drama of strife in the Congo ha been dragging on to the benefit of neither of the tw parties and without doubt the United Nations woul be only too happy if it sees the end of its intervention The secession of Katanga and the partition of the Cong it would involve was certainly no solution and it wa probably for the purpose of preventing partition tha Mr. Adoula requested the United Nations Secretary General to appoint a committee of constitutional experts to draw up a federal constitution for the Congo. This was the farthest limit of concession to Katanga enabling it to enjoy a reasonable latitude of internal autonomy as the strongest unit in the Federation. It is from any angle a good opportunity for it to make the utmost of the settlement without disrupting the territorial integrity of the Congo.

A knotty problem in the settlement of the final pattern of the distribution of the revenues is presented by the rich copper mines in Katanga owned by the Union Miniere. Obviously the royalties and taxes payable by the Union Miniere cannot be allocated exclusively to Katanga and a modus vivendi had to be devised for their fair distribution between the federal centre and Katanga. These two types of revenues taken together add up to more than $40 million which is no negligible amount. America, Britain and Belgium have evolved a formula in terms of which Katanga is being asked to agree to the payment of the revenues from the Union Miniere between the federal centre and itself in the ratio of 50:50.

Unanimity among the three authors of the formula however is lacking when it comes to the question of the application of the formula. While the United States is clearly and strongly of the view that, in the event of the failure of acceptance by Katanga of the formula, economic sanctions should be applied to that province, Britain is doggedly opposed to the instrument of sanctions. Britain's attitude, it would appear, is not solely governed by the practical difficulties that lie in the task of enforcing such sanctions. Katanga's exports are mainly routed through Rhodesia which is the first factor to be reckoned with. Also, the Union Miniere has got inter-investment locking arrangements with the Tanganyika Concessions, a British venture, and the latter is also inter-connected with two more concerns in one of which America has some interest. Lack of unanimity in invoking sanctions may be due to any cause. But it would be the course of wisdom not to hold out a threat of sanctions at this stage, when attempts are being made to persuade Katanga to agree to the honourable compromise of a federal constitution. Mr. Tshombe may still find, perhaps under the pressure of some of his colleagues, intransigence a handy instrument to prolong this struggle of attrition. But in the end it will work to the great injury of the two sides. The olive branch now held out ought to be grasped by him without any reservations.

The World Abroad

FOREIGN TRADE AND GROWTH

By

ODYSSEUS

BETWEEN 1953 AND 1961 the index of industrial production of the countries of the European Economic Community rose by 86 per cent, whereas the combined index of the USA, the UK, and Canada rose by only 20 per cent.

Disturbed by this discrepancy, the USA and the UK have now put the acceleration of economic growth in the forefront of policy. To speed up growth, you must eliminate impediments to growth, the chief of which have been price rises followed by balance of payments difficulties, which have been tackled by raising the bank rate in hopes of halting the rise of prices by restricting demand.

In the effort to break out of this vicious circle of Stop and Go, the authorities have become sensitive to constant rises in wages as a leading cause of rising costs and prices. While no one suggests that rising wages have in all countries been the sole cause of rising costs, there is no need to argue that in the USA and the UK rising wages have been a major factor. Despairing of halting the wage spiral, the USA and the UK are now searching for policies that will accelerate growth and so enable higher wages to be met more easily.

One of the most important contributions to the debate on how to accelerate growth—whether in a developed country like the UK or a developing country like India—is an article in the July issue of Lloyds Bank Review (71 Lombard St. London, E.C.3.) by Professor C. P. Kindleberg of the Massachusetts Institute of Technology, entitled 'Foreign Trade and Growth: Lessons from British Experience Since 1913." This is a constructive and up to date criticism of Roy Harrod's "Towards A Dynamic Economy" (Macmillan. London. 1949). Those who find Harrod's classic—with its mass of algebra—altogether above their heads will find in the chapter entitled "Some Principles of Economic Development" of H. C. Wallich's admirable study "Mainsprings of the German Revival" (Oxf. Univ. Press. London. 1955) a non-technical and readable exposition of the important problems that Harrod raises. They should also look at Colin Clark's "Growthmanship" (Institute of Economic Affairs, 66A Eaton Sq. London. S.W.1. 2nd edition 1962. Price 6sh.)

Harrod argued that the engine of growth is capital formation. Investment needed to offset savings in order to maintain employment today creates new capacity tomorrow. He added that expenditure must be expanded if this capacity were to be used. The American economist, E. D. Domar, emphasised the addition to capacity as an opportunity for growth: savings lead to investment, which expands the potential for output, giving rise to new savings, new investment, more output, and so on.

Now comes Mr. Kindleberg (1) to point out that the influential Harrod-Domar thesis was largely discussed in terms of a closed economy, and (2) to insist that what needs to be asked is whether the expansion in demand, which acts as the stimulus to growth, comes within the economy or from the outside world. In most circumstances, as both the UK and the USA have found out, growth based on domestic investment and domestic demand, with limited technological development, leads to rising imports, ending in balance of payments crises. The best example today of growth stimulated by the expansion of demand is that of the developing countries, which invest at home, raise consumption as fast as, or faster than, output, and run into balance of payments deficits.

GROWTH SPRINGS FROM TECHNOLOGICAL CHANGE

Increasing difficulty has been found with the Herrod-Domar model, as the econometricians, including Domar himself, have tried to measure the contributions of capital, land, and labour to the growth process. Two other US economists — Abramovitz and Solow — have found that growth has typically been more rapid than can be accounted for by the additional factor inputs. Domar does not try to explain why this is so. Colin Clark says, in non-technical language, that it is more correct to say that capital is created during growth than that growth is a creation of capital, and that we are misapplying in a period of over-full employment the theory that Keynes designed to maintain employment by investment in a period of chronic unemployment. Abramovitz and Solow ascribe the additional output to technological change resulting in increased productivity from a given investment of resources.

Demand from abroad may stimulate exports, which in turn stimulate technological improvements, investment, and growth. This was illustrated in UK economic history in the years 1780 to 1880 in cotton spinning and weaving, and between 1840 to 1860 in iron, steel, and railway equipment. When growth is thus export-led, the balance of payments almost always benefits, providing that it is technological progress which is the stimulus to growth.

In principle, admittedly, the balance of payments may suffer if innovation in the export industry lowers prices of exports for which the overseas demand is inelastic, so that total export proceeds are reduced. Although Mr. Kindleberg does not say so, it seems reasonable to expect this today in the case of raw material exports in competition with cheaper synthetic products, or in the case of old established export industries, like textiles, which, as Our Special Correspondent in Western Europe explained here on June 22, are now competing with newly developed European technologies.

Typically, however, technical change in the domestic sector may be shared with foreigners as increased real income leads to additional imports. But the initial effect of such technical progress is likely to be a reduction of costs. This in turn will tend to enlarge the volume of exports and to reduce imports.

The distinction between Harrod-Domar and Abramovitz-Solow growth is sometimes said to be an empty one. If growth comes about as the result of capital formation, this necessarily involves technological improvements, since the new equipment will have a higher average efficiency, whether it is a net addition to, or a replacement of old, capacity. On the other hand, if the stimulus to growth comes from technological progress, then rapid capital investment will be needed to embody the new techniques. The distinction is clearly not a fine one but can be made in general terms. In a period like 1896-1913, the UK experienced Harrod-Domar

growth, and substantial capital formation but little technological change. On the other hand, the German, French, and Italian growth since the early 1950's has been based on rapid technological change, which has pushed out exports along with high rates of capital investment.

THE BALANCE OF PAYMENTS

H. C. Wallich, in his "Mainsprings of German Revival", distinguishes between the effects of growth which comes about when the expansion in capacity precedes the expansion in demand and that which comes about in response to an expansion in demand. The splurge in world demand following the Korean war in 1950 found Germany with surplus capacity, so that exports improved Germany's balance of payments, whereas growth in response to an expansion of demand worsens the balance of payments. Mr. Kindleberg points out that the race between supply and demand is usually close, and when exports lead, imports follow closely because of the rising income of the exporting country. It is, however, the lag which makes the balance of payments favourable.

The UK's growth in the 1930's and in the 1950's was of the Harrod-Domar variety. In the 1930's, the main investment was in housing, which yields no exports. In the 1950's investment was initially concentrated on social overhead capital and, later, on industrial undertakings responding to the domestic demand for durable consumer goods. In both periods, internally stimulated growth led to balance of payments difficulties. In the 1930's, the UK was saved by the accident of the fall in her favour of the terms of trade, generated by the world depression.

Mr. Kindleberg says that the weakness of the US balance of payments since 1957 has been due to inflation in some lines, such as steel, but more generally to th narrowing of the technological gap between Europe an the USA, and that whether the US balance of payment is improved or not depends on whether the US ca resume the former pace of her technological progres relative to Europe. The US Council of Economic Ad visers has urged that demand should be expanded i order to promote growth. The OECD has advised both the UK and the USA to stimulate consumer spending These policies, however, only lead to growth in a closed economy, or in one in which the demand for imports is inelastic and the terms of trade with the rest of the world suddenly improve.

It is production, not demand, which needs to be stimulated in the USA and the UK. The initiative needs to be restored to the entrepreneur. It was, as H. C. Wallich observes, his drive for profit which carried the economy forward in the 19th century. The entrepreneur saw the great possibilities offered by new techniques in new markets, and unimpeded by penal taxation, h made the investments required to exploit them. Th desire of the masses for greater welfare was not th initiating factor, although greater welfare was achieved in the process. Investment in the 19th century was based on technological improvement and the lure of profits. Private savings were high, stimulated by entre preneurial self-financing and unfair shares. Buyers markets predominated. Entrepreneurs therefore faced risks and were not guaranteed success. Today's easy money policies have given entrepreneurs sellers' markets with profits ensured, but efforts to avoid inflation, to pay for "welfare", and to endure fair shares, have meant high taxes. The entrepreneur has been allowed to keep only a small proportion of his guaranteed profits. Entrepreneurial initiative and the drive to technological improvement have been undermined. Hence the stagnation of growth in the USA and the UK.

4½ Per cent

ANDHRA PRADESH STATE DEVELOPMENT LOAN, 1974.

Issue Price Rs. 99.50 Per cent
Open on the 27th August, 1962.

The Loan will be closed without notice as soon as the subscriptions amount to Rs. 10 Crores approximately, and in any case not later than the close of the business on the 1st September, 1962.

Applications will be received at (a) the offices of the Reserve Bank of India, Bangalore, Bombay, Calcutta, Madras, Nagpur and New Delhi, (b) the branch of the State Bank of India at Patna, (c) the branches of the State Bank of Hyderabad conducting Government work in the State of Andhra Pradesh, (d) the branches of the State Bank of India in the State of Andhra Pradesh at places not covered by item (c), and (e) the Government treasuries and sub-treasuries in the State of Andhra Pradesh at places not covered by items (c) and (d).

FULL PARTICULARS CAN BE OBTAINED

at any of the offices or branches mentioned above or at any treasury or sub-treasury in the State of Andhra Pradesh.

The European Scene

HALF-TIME SCORE IN BRUSSELS

From Our Special West European Correspondent

PARIS, August 12.

NO one doubts here that the negotiations for Britain's entry into the Common Market will be successfully completed within a few weeks of their resumption in October. On the major issue that remains to be settled, the question of food imports from Canada and Australia, the position of the Six has been made abundantly clear and the determination with which they will defend it has also been put beyond doubt. The British Government, it is said here, cannot have the least hope of breaking down this resistance, and if the solution proposed by the Six were really unacceptable, the talks would have been broken off once and for all several weeks ago. So if London has asked for a suspension, it can only be in order to choose a more suitable moment for capitulation. That moment will arrive after the Commonwealth Premiers' conference. The Premiers of Canada, Australia and New Zealand will not be presented with a fait accompli but they will be told what fact must inevitably be accomplished: the progressive loss of all their preference in Britain without any absolute guarantee from the enlarged Common Market for their future sales. Their objections having been recorded, Britain will accept this solution in October.

This French view of the current position of the negotiations differs, it can be seen, from the rather dramatic account given by most of the British Press. The upshot is taken as a foregone conclusion and the supposed "crisis" is seen as a tactical incident. At least this is so as far as concerns the key issue of farm produce imports. It is admitted that there will yet be much bargaining, of which the outcome cannot be foreseen, as regards protection for British fruit and vegetables and duties to be charged by the enlarged Common Market on aluminium, zinc and newsprint. Though these are sensitive points, one cannot imagine the negotiations foundering on them once the major problem has been resolved; although the Six have interests in these matters that they will defend energetically, they also envisage the possibility of making notable concessions to the British point of view on some at least of them.

It will be noticed that no question of direct concern to India is left unsettled, saving the matter of protection for the European jute goods industry. The rest has been arranged in tentative agreements which will become final once the negotiation as a whole is completed. So what we have learned so far about the imposition of the common external tariff on British imports of Indian textiles (in three stages), the abolition of the duty on tea, and the conclusion of bilateral trade agreements between the enlarged Common Market and India, all this may be taken as the final shape of Indo-European relations as far as they depended on the Brussels conference. For India, the affair is at an end and, to the extent that the outcome is unsatisfactory, repair will lie not in seeking to influence the Anglo-Continental bargaining but in preparing the Indian cause for presentation to the enlarged Common Market.

This was already evident several weeks ago, as "The Eastern Economist" pointed out, but Delhi appears to have gone on placing faith in certain "assurances" about concessions to be won in the Brussels talks on her behalf; if ever such assurances were seriously given, they must now be regarded as "flouted". But the error was to believe that such a momentous affair could be made to depend on questions that are of marginal importance both to Britain and the Six, however, vital they may seem to India in the short run. Since the Six had no inclination to make the hoped for concessions to India, and since Britain could not choose that point to call off the talks, it was plain that no concessions would be won, nor assurances honoured. It is exasperating to have one's own principal business treated as of marginal importance by others, but in the longer view India has no reason for apprehension about her relations with Europe. While refusing to jeopardise (or rather to take the risk of incommoding) some of their industries for the sake of India's specific demands, the Europeans have recognised their moral responsibility to that country. The Common Market with which Delhi will be dealing from 1964 on will include Britain as its most influential single member, and thus offers more interesting possibilities than either the stagnating British economy alone or the Six alone.

These certitudes depend on the French being correct in the view I have referred to, namely that the affair is "in the bag" and that a formal conclusion awaits only Britain's choice of a suitable moment to accept the Continental position on temperate-zone food imports. To the outsider this seems a fair reading of the course of the negotiations. Whether the solution thus arrived at will be "just" is another matter. The problem at issue, after all, is whether damage be done to the material interests of European peasants (primarily, Italian and French) or to those of Canadian and Australian farmers. Between them they grow more food than West Europe can eat, there is no one else rich enough to buy it at the fancy prices they ask, and so one or other group must suffer when the West European market is united. Crudely, the Continentals say that it must be the British Dominions that suffer, and the British say it should be the French and Italian peasants. To those of us who are not directly concerned, there seems to be no rational grounds for choosing, and we can well understand each side supporting its case with enthusiasm. European peasants are poor and Commonwealth farmers opulent, but that is not conclusive because the foreign earnings of New Zealand would be gravely endangered by an unfavourable decision, whereas France's and Italy's would not.

Though we cannot choose between one group and the other (at least, once we take the angel's view in which the material interests of Europe's peasants are as respectable as those of Australasian farmers, and European unity as good a cause as perpetuation of the Commonwealth), we have the resource of referring to the stand of the ECM Commission. Though not impartial, this is less affected by nationalist considerations than either the French or British case. How does the matter look to, say, a former Dutch agriculture minister who is now a supranational bureaucrat in Brussels? Firstly, it is clear from his vantage point that Britain is asking an association to give preference to non-members at the expense of present members who, moreover, have consented to various sacrifices to make the association possible. Worse, Britain is proposing for these curious advantages not all non-members, but only a few who have been selected on grounds that must seem

arbitrary to, say, Argentina. He is well aware of sustained pressure from Washington against any such discriminations between non-members, and in any event already knows that it would complicate life for the Common Market unnecessarily.

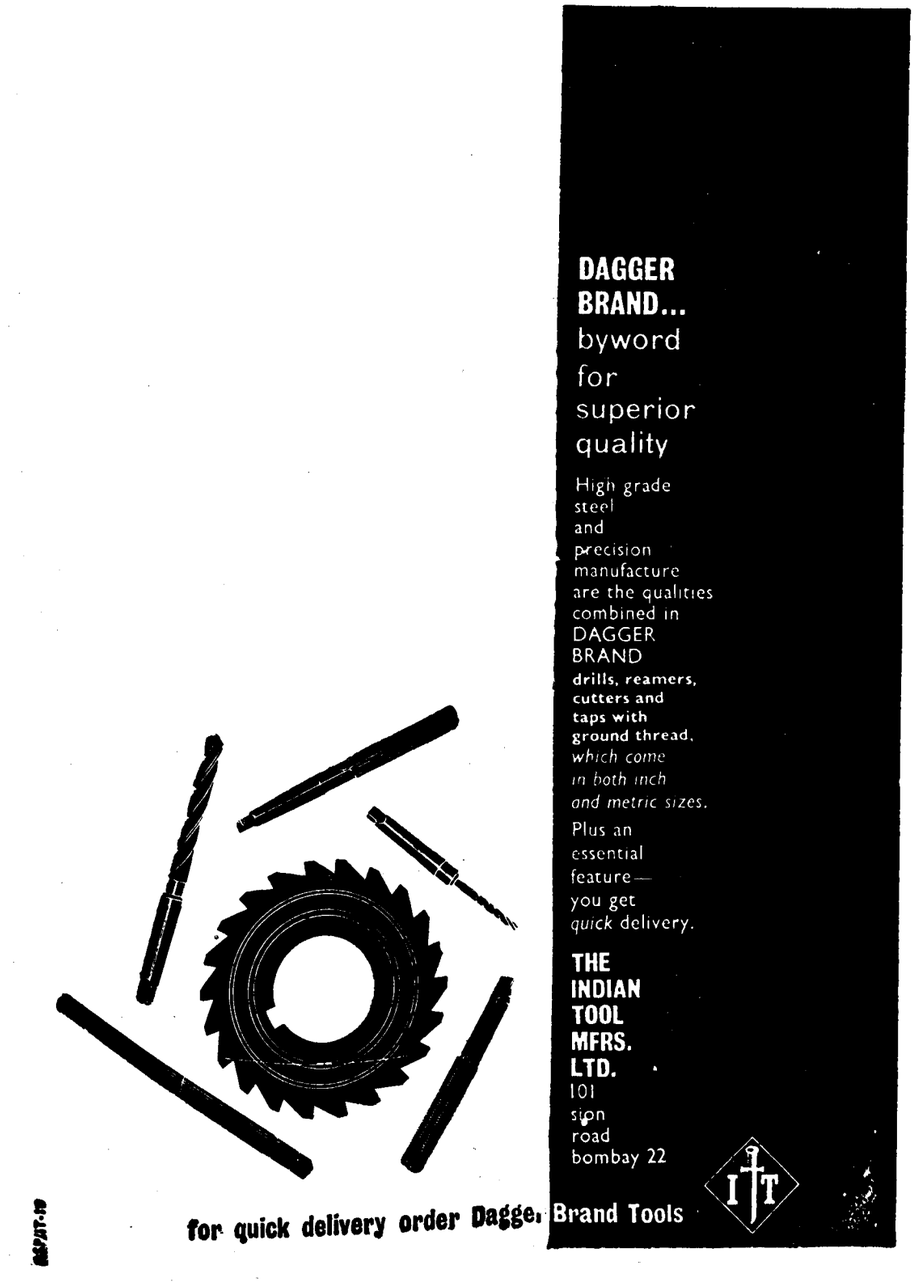
Secondly, it will appear from his position that whereas Britain is asking European peasants to suffer uncompensated loss, the Six are replying with a plan that claims to safeguard the earnings both of European peasants and overseas farmers. Indeed, in asking the Common Market to accept the Dominions' produce on the same terms as it markets its own, London is suggesting that British manufactures be admitted freely to the markets of agricultural countries on the Continent whereas those countries would be unable to sell any more farm produce to Britain; worse, they would see their home markets invaded by cheaper farm produce from abroad. The loss is net and unilateral. In contrast, the Six urge that Europeans prefer European farm produce, but that all the countries of the world that now have food surpluses make agreements about its disposal. Such agreements would raise the price of food to all the industrialised nations, thus assuring the incomes of all farmers, and would arrange for the inevitable surpluses to be channelled toward developing countries that cannot buy at present market rates.

Thus the point of view of the Six will appear, from a position as little nationalist as one can find among the participants in these negotiations, to be more reasonable than the British case. Sine the history of every crisis in the life of the Common Market has shown that the "community" viewpoint always wins out over a narrowly nationalist case, one would except Britain to be obliged to abandon her present stand and accept that of the Six. To be sure, the "community" viewpoint will be different after Britain joins, because food-importing countries will then be in a majority in the Common Market. At present, they are in a minority among the Six: France and Italy, with the addition of the small but effective agricultural interests of West Germany, give the Six a producers' view on all farm problems. It can be argued, and very plausibly, that France is making a last-ditch stand to ensure that this producers' view be written into the Common Market's law on the eve of Britain's admission, because she knows that once Britain is in and the consumers' view dominates, she will never again have the chance to ensure that Europeans prefer European food.

In this light, the French stand can be made appear something like dishonest. If Britain had joined the Common Market from the time of Messina, or if these food-import questions were to be settled well after her forthcoming admission, the majority opinion inside the bigger association would certainly have been against preference for European food. France is digging her toes in to obtain a policy that suits the present Six but not the enlarged community. The only weakness of this line of argument is that if there were to be no preference for European food, there would be no Common Market, whether with six members, seven, ten or any other number. The essence of the association is complementarity between European nations with big agriculture and others with more efficient industry; the scheme does not work unless the first give preference to the second's manufactures, and the second give preference to the first's farm produce—regardless of whether, on balance, the association is a net importer or exporter of foodstuffs. Since France contains just half the total arable land in Continental West Europe, she would not be in any association that did not entail agricultural preferences, any more than industrial West Germany would join any association that did not widen the market for her manufactures. If, as they confidently expect, the French secure adoption of their policy when the talks with Britain are resumed in October, it will not be because they have better negotiators but because their stand is in accord with the logic of the Common Market.

4½%

ORISSA GOVERNMENT LOAN, 1974



Issue price Rs 99.50 per cent.

Opens on the 27th August, 1962.

The loan will be closed as soon as a total of Rs 7 crores has been subscribed and in any case not later than the close of the business on the 1st September, 1962.

Applications for the loan will be received at (a) the Offices of the Reserve Bank of India, Bombay, Calcutta, New Delhi, Madras, Nagpur and Bangalore, (b) the branch of the State Bank of India at Patna, (c) the branch of the State Bank of Hyderabad at Hyderabad, (d) the branches of the State Bank of India located in the State of Orissa, and (e) the Government Treasuries and Sub-Treasuries.

Full particulars can be obtained at any of the Offices mentioned above.

Economic Report from the U.S.

COMMON MARKET AND COMECON

By GUY SIMS FITCH

WASHINGTON August 8.

THE dream of an effective Atlantic partnership is coming ever nearer to reality. And as the United States and Western Europe, with their prosperous and vibrant societies, draw closer in economic and political co-operation the dream apparently is becoming something of a nightmare for Mr. Khrushchev and his communist cohorts. The economic and social performance of the industrialised free nations has just about annihilated the most cherished tenets of Marxist dogma. The competitive enterprise economies of the United States, Western Europe, Japan and other free lands are thriving, not dying as the communists have so often and mistakenly predicted. The fruits of expanding production are widely shared, and living standards are mounting steadily. On top of this, the emergence of the Common Market as a dynamic and probably growing group clearly contradicts the Marxist premise that so-called capitalist nations are destined to destroy one another in a battle for shrinking world markets. This Western European integration, in friendly association with the United States, offers the best evidence that democratic societies with enterprise economies, far from forcing governments into conflict, can contribute to the closest and most constructive type of international co-operation among themselves and with all nations.

What must make all this particularly galling to the communist leadership is the fact that communist-dominated lands by and large have been unable to keep up with even their most essential needs. They have not come close to solving the basic problem of food production. And the vainglorious boast of overtaking the free nations industrially is even further removed from reality today than it was when made by the Kremlin four years ago. Unable to arrest the tide of free world economic and social progress, and with the communist performance falling far short of propaganda claims, Moscow apparently is attempting to set up a sort of common market of its own. It is using for this purpose a grouping of Moscow's East European satellites, and Outer Mongolia, with the Soviet Union under the council of mutual economic assistance, popularly known as Comecon. Actually, Comecon was set up back in 1949. It never really worked, however, as each East European nation, following the Soviet lead, strove for self-sufficiency, and was subject to considerable Soviet trade domination. But the underlying obstacle to effective communist economic integration and progress, one that has never been overcome and is not likely to be overcome within the limits of accepted practice, remains the inherent inability of communist systems to cope with changing demand, supply and cost situations. This is a lingering, and to some experts a fatal, weakness of central totalitarian planning.

In the EEC, for instance, the play of market forces is vital basis for knitting together the economies of member nations in a workable manner. With the help and guidance of public policy, each economic sector in each country is able to make any necessary adjustments to new situations. But in Eastern Europe, with the Soviet Union as the prime example, state planners try to organise everything for everybody in advance. Not only does this ignore the human factor and weaken personal initiative and incentive, but as experience has so amply demonstrated, it leads to costly rigidities and miscalculations in economic policy. These inefficiencies then pervade every aspect of communist economic life. It is small wonder that it is the Common Market, and the vast potential inherent in an Atlantic partnership with the United States, that is capturing the imagination of the world. The demonstrated achievements of the free nations, and their still greater promise for the future, are pointing the way to economic and social satisfaction for all peoples in a world of peace and freedom.

INDIAN ILMENITE—ITS SCOPE IN THE WORLD MARKET

By P. V.

TITANIUM-DI-OXIDE is one of the whitest substances known. The brilliance of this oxide and its covering power and inertness to atmospheric action have made it a first class material as pigment for paints and varnishes. It is also used as a filler and sizer for paper, rubber, plastics etc. The titanium pigment industry has become a vast one on account of the increasing and diverse uses to which it is put.

Its main source is a black mineral, ilmenite which occurs distributed widely over many parts of the world. It occurs in two forms, one as sand and the other as rock. From the small beginnings of a few hundred tons, in the early twenties of this century, the production of titanium pigments has now exceeded one million tons. It is interesting to recollect how the small stretch of of the beach at Manavalakurichi in the south-west tip of India contributed the raw material for the extraction of titanium-di-oxide and continued to do so for many years. Over 90 per cent of the requirements of the U.S.A. — the major producer in the world — was supplied from this source. The requirements of the European manufacturers were met by supplies from the rock ilmenite from Norway.

Table I below indicates the growth of world production of ilmenite. Except for the war years between 1941 and 1944, on an average India produced and exported 250,000 long tons of ilmenite every year. Peak production of over 300,000 long tons was attained in 1949. But by then World War II was on and shipments could not be maintained at the normal rate. The manufacturers in the U.S.A. who had till then relied on shipments of ilmenite from India faced a very difficult situation of shortage of supplies; although reasonable stockpiles were maintained, it appeared imminent that unless other sources of raw material were tapped, the manufacturing plants may have to close down. The manufacturers had therefore to explore the possibility of procuring ilmenite from indigenous sources nearer at hand. The National Lead Company of New York who are the largest consumers of titanium ores explored successfully the rock ores in the MacIntyre Mines in the area round Sanford Lake, Essex County, New York, which yielded both ilmenite and iron ore. The lean beach deposits and dunes at Florida were exploited by another major consumer of titanium ores, E. I. du Pont de Nemours and Company. When production from these sources stablised, India became a secondary source of ilmenite. But still, the high quality of Indian ilmenite and its easy beneficiation from very rich sources made it still able to stand competition with other sources and soon after the war when shipping conditions became normal, exports regained to almost the pre-war levels.

TABLE I

WORLD PRODUCTION OF ILMENITE

('000 Short Tons)

Source: U.S. Bureau of Mines Information circular 7791.

Along with the changes in the international field, other changes within India also affected the exports of ilmenite. Although ilmenite production in the State of Travancore had stabilised itself for nearly 20 years, the State derived only a very nominal royalty of one rupee per ton of the mineral exported. The mining companies were not paying any value for the sands mined. The then Dewan of the State, Mr. C. P. Ramaswami Iyer, took concrete steps to reorganise the industry by framing new rules for these mines. According to these regulations the operating companies had to sign what was known as a Mining Agency Agreement by which the companies were agents of the State Government. This arrangement was a very satisfactory one because if the State itself took over and tried to run the plants the international contacts of a long-standing nature as well as the goodwill built up by the companies would have suffered a great deal. An effective system of calculating the royalty on minerals exported was worked out in consultation with the producers of minerals. First of all a basic cost of production for each mineral was agreed upon. Royalty was fixed at 75 per cent of the difference between the selling price of the mineral and its basic cost. This system limited the profits of the companies and yielded good royalty from the export of minerals which are after all a wasting asset of the country. The State had no problems of investing capital, or finding markets for the minerals; besides, the system was an inducement to the companies to sell the minerals for the maximum prices so that they could maximise their profits.

It would have been very wise to leave the matter at that. But soon after the signing of the Mining Agency Agreement, steps were taken to acquire the companies so that they may be run by the State itself. It was not realised that the terms of the Mining Agency Agreement were very satisfactory from the point of the State. Ownership and day-to-day administration of the plants involved many responsibilities such as investment of capital, administrative and technical control, international contacts for sales etc. All the benefits of the previous goodwill and efficiency which the industry had built up suffered a great deal under the new set-up. As later developments have disclosed the step to acquire the companies has proved wrong and harmful to the industry. To add confusion to the whole picture, the acquiring of the mineral plants was not carried out fully, and was left half way.

As it has been mentioned already the terms of the Mining Agency were satisfactory enough for safeguarding the prices for the minerals. The way in which the

price for ilmenite was increased year after year had a fatal effect on the industry. The following table (Table II) gives the prices for ilmenite fixed by the State. It may be seen how within a period of 15 years the price of ilmenite had risen from 30 shillings per long ton, naked at works, to 90 shillings.

TABLE II

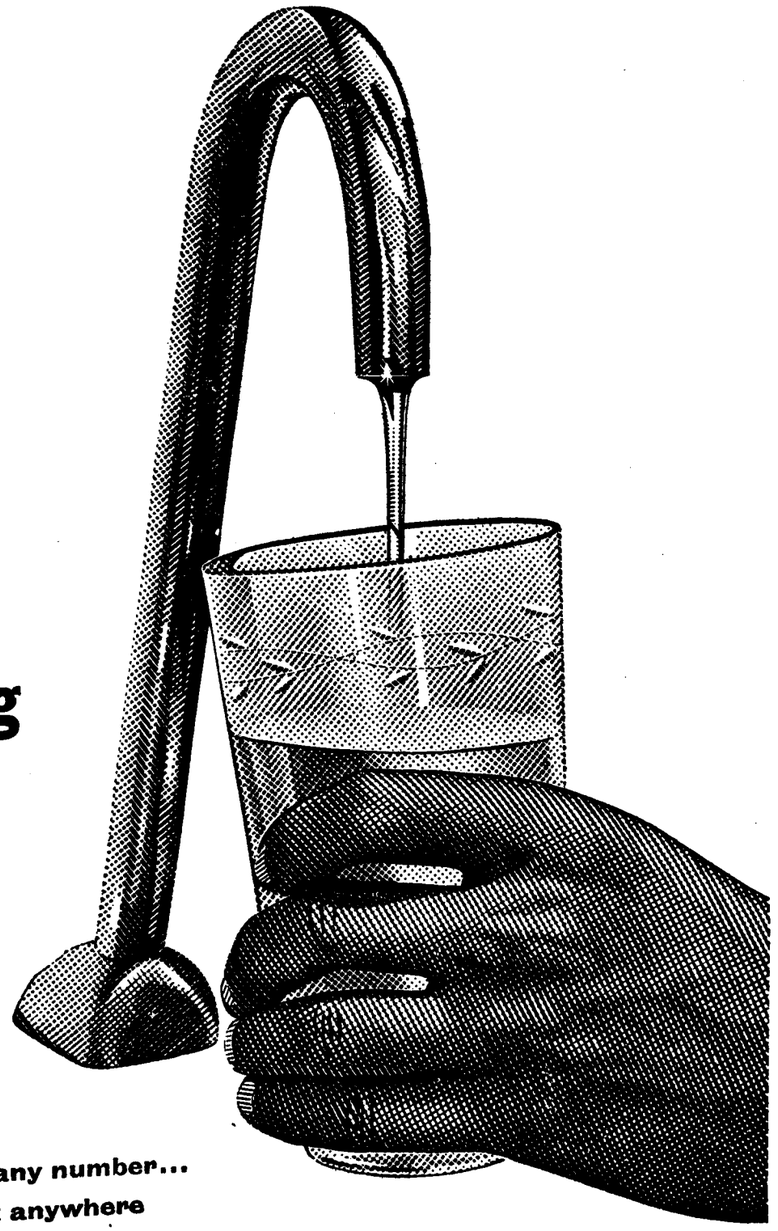
PRICE CHART OF INDIAN ILMENITE

Year	Price per long ton naked at Works
1946	30 shillings
1947	-do-
1948	-do-
1949	-do-
1950	50 shillings
1951	65 „
1952	68 „
1953	70 „
1954	75 „
1955	80 „
1956	89 „
1957	90 „
1958 onwards ..	90 „

The chemical process of extracting titanium-di-oxide from ilmenite is an extremely complicated process, which has been worked out by a few world manufacturers after extensive research and investment of millions of dollars on manufacturing plants. Production and sales are planned years ahead. The quality of ilmenite for the process, particularly the ratio of ferric and ferrous iron in the ilmenite — which varies in ilmenite from one source to another —, has to be maintained at steady levels in order to obtain maximum efficiency from the plants. In other words, the reliability of continuous supplies of a uniform grade of known composition is very important. With a control on State level having no definite policy of pricing, it became apparent that the manufacturers had to turn to other sources which they considered more reliable. Hence after a hectic buying at any price — which was sadly mistaken for correct pricing — the major buyers closed their doors to Indian ilmenite after stock-piling for an interim period. The position is now that, in the U.S.A. the consumers who purchased three-fourths of ilmenite produced in India, have completely stopped buying the Indian ilmenite although they are well aware of the fact that the ilmenite from Indian sources is the richest in titanium and is easiest to produce.

Meanwhile very huge deposits of iron-titanium ores were discovered by the Quebec Iron & Titanium Corporation in the Allard Lake region in Canada. Development of these deposits began in 1948. An entire-revolutionary process of working these ores in the electric furnace was standardised by which titanium slag containing 70 per cent titanium-di-oxide as well as pig iron were obtained. 700 tons of slag are produced per day. Thus with many other world sources going into production Indian ilmenite had to face severe competition. Hence if Indian ilmenite had to hold the market, it was a question of readjustment in its economic production and price control because one great disadvantage it had to face was, the distance from the consumers which meant heavy shipping freight. As long as the material could be had at a competitive cost, no consumer would have liked to stop using the material.

Analysing the economic aspects of costs, the price of Indian naked at works is now 90 shillings per long ton. Adding shipping charges, ocean freight, insurance, unloading etc. it would cost the purchaser not less than $30.00 per ton at the receiving works. The cost of raw material obtained from indigenous sources in the U.S.A. is believed to be higher, because the sources of ilmenite in the deposits in Florida are very low in ilmenite content. As for the titanium slag, the process is a chemical one and has involved very heavy capital investment of nearly 35 million dollars. The utilisation of the titanium ores from Florida and the slag has apparently proved economical as they are being consumed by the industry. The continuance of the import of ilmenite from Indian sources will be possible only if its cost compares favourably with the cost at which indigenous material can be had.



In the case of British consumers, particularly the British Titan Products, there is no possibility of obtaining titanium ores from the U.K. But the rock sources of Norway and Finland as well as titanium slag from Canada are suitable alternatives for Indian ilmenite. It seems as if even the British importers are likely to stop using Indian ilmenite because of the high cost.

The question then arises, is there no remedy? The answer is simple. The remedy lies in a thorough re-organisation of the set-up of the production pattern of Indian ilmenite.

There is little doubt that the beach deposits of Kerala are still the richest and the oldest in the world containing besides ilmenite no less than four other precious minerals, namely, rutile, zircon (which contains 3 per cent hafnium too), monazite and sillimanite. If only all these minerals are also extracted from the basic feed to the plants, ilmenite can be produced at perhaps half the cost or even less. It will then be possible to market the ilmenite at attractive prices and the other minerals also will fetch good prices. The only way to re-establish the old market is to offer the mineral at lower prices in order to mitigate the high shipping freight involved.

All the four dressing plants which have been producing ilmenite consumed about 2,000 tons of mined raw sand from the beach. Every one hundred tons of raw sand can yield at a very conservative estimate 65 tons of ilmenite, 2 tons of rutile, 3 tons of zircon and 2 tons of sillimanite. These figures will be higher if good raw material is used. Working out at rock bottom figures, the 2,000 tons of raw sand should yield 1,300 tons of ilmenite per day which is all that is being produced now. If all the other minerals too are recovered, there would result besides the ilmenite another 40 tons of rutile, 60 tons of zircon and 40 tons of sillimanite per day. This is in addition to any monazite that can also be produced. Since the export of monazite is banned the income from this is not included in the estimate of returns. Working 300 days in the year the additional source of income from the bye-product minerals alone in one year will be equivalent to £7,50,000. There is therefore no reason why ilmenite could not be marketed at any price to attract buyers.

It is therefore very obvious that if the industry is reoriented on proper lines there will be no difficulty in recapturing the lost markets and at the same time earn for the State an appreciable amount as foreign exchange.

Pilferproof packaging
protects your health—your life

PUBLIC ENEMY NO. 1 is the racketeer trafficking in spurious drugs and foodstuffs. He exists—and flourishes—because you cannot always test the purity of your purchases.

Packaging in small pilferproof units, like this tablet bottle protected with a Roll Seal closure, is your surest guarantee of product purity. Roll Seal closures for bottled drugs and foods, foil diaphragms as on vanaspati and baby-food containers, sealed cans for processed foods, tear-off seals on pharmaceutical vials, heat-sealed plastic and laminated packs: these are some of the Metal Box packages which protect your health... your life.

Metal Box pilferproof containers and closures, with trade-marks and brand names indelibly printed directly on to the package, have helped to stimulate the manufacture and marketing of a variety of packaged consumer goods—by guaranteeing their purity, by prolonging shelf-life and by promoting brand identification. Today Metal Box packages go to 1,400 packers who pack well over Rs 100 crores worth of goods and employ more than 80,000 people.

THE BUSINESS WORLD

Exports, A National Obligation

By CROESUS

NO one who has been in Bombay for the past week or ten days should possibly have failed to note that the question of exports dominated practically every meeting that took place during these days. Whether it was the annual general meeting of the Indian Council of Foreign Trade or the Symposium on Export Promotion organised by the Junior Chamber of Commerce, Bombay, the main theme was exports and more exports and how to bring that about. As expected, Mr. Manubhai Shah, Union Minister for International Trade, who inaugurated the meeting of the Cotton Textiles Fund Committee (C.T.F.C.) on August 11, and the Symposium on Export Promotion on the following day, availed himself of both the occassions to stress the need for not only more exports but also quality exports. Indeed, he called for the eradication of the ugly image that the Indian exporter, by and large, has left so far in the overseas markets and to recapture the thrill of being the most prized exporters of the good old days that India was. Then, if Dr. A. Ramaswami Mudaliar called for an export crusade at the Indian Council of Foreign Trade meeting, Mr. Ratilal M. Gandhi appealed to the business community, at the annual general meeting of the Indian Oil and Produce Exporters' Association (I.O.P.E.A.) to consider export promotion as a "national obligation". It is further significant that the meeting in Bombay, which stressed the importance of exports thus, followed closely on the heels of the Rajya Sabha debate on the Import and Export (Dr. Mudaliar) Committee Report. Of course, nothing new, or what has not already been said on the subject, was said at these meetings, but one could not help noticing a supreme sense of urgency and imperativeness about export promotion all round.

In appealing to the industry, trade, and the Government alike for a combined effort to launch a national crusade for exports, Dr. Mudaliar made a few striking observations which merit the most careful consideration, if only because, behind these observations, there lies not only the long experience of a veteran administrator but also a fresh and intimate knowledge of the subject as Chairman of the Import Export Policy Committee, whose recommendations form the basis of the present trade policy of the Government of India. He did not spare either the Government or the business sector. While he took the Government to task for some of its policies, he had no good word either for those who brought a bad name to the country by exporting sub-standard goods, thereby importing a bad name for the entire trade. He was also extremely critical of those business men who are content to sell only in the internal market and make profits, while not caring for establishing an export market for their goods abroad. "There is nothing I hate more," he said, than some people saying: "why should we at all export when we have good and hungry local markets for our goods" He described this attitude as "illogical, immoral and anti-national." He also called upon chambers of commerce not to countenance such people and even went to the extent of suggesting to them to bring to book all those exporters who erred and perpetuated the stigma of unreliability on this country. Without enforcing such a moral sanction on the erring trader and inculcating in him a degree of self-descipline, he said, they could not tone up the export trade. Significantly enough, Dr. Mudaliar also urged business men to accept the State Trading Corporation as an established entity of the Government of the day, although this did not prevent him from reiterating his Committee's outspoken criticism of the Corporation's woeful lack of experience.

A point that has received general acceptance is that it is not possible for this country to export except at a loss and that, therefore, incentives are absolutely necessary. At the Symposium on Export Promotion, although, Mr. Manubhai Shah declared that the packer of incentives could never be a permanent solution and the country had to break through the vicious circle of incentives and losses, he did not dispute the thesis that incentives should be there to neutralise the losses suffered. Incentives, he said, were offered everywhere in the world to make up the gap between internal and international prices. But, at the same time, as Dr. Mudaliar underlined, it is no less important to remove dis-incentives and avoidable obstacles in the way of exports. In this connection, he said he was amazed that the Union Government has not yet given any directive to State Governments to show a greater awareness of the need for exports by forging sales tax and other levies on exported goods. Similarly, Mr. Ratilal Gandhi, the I.O.P.E.A. President raised his voice against the present system of the compounded levy scheme of excise duty on vegetable oils. He said that the excise duty scheme on vegetable oils needed to be looked into and revised on a rational basis with a view to giving a greater fillip to the production of vegetable oils and oilcakes. How important action along these lines is necessary should be evident from the very creditable export performance of oilcakes and extraction meal (deoiled oilcake) over the past few years, as also the considerable scope that exists for the further expansion of these exports. According to Mr. Gandhi, exports of groundnut extraction meal, which amounted to only 27,000 tons in 1957, successively rose to 1,31,246 tons in 1958, 2,68,609 tons in 1959, 2,95,176 tons in 1960, and 3,88,402 tons in 1961. In his opinion, the capacity of the solvent extraction industry (which is about seven lakh tons at present) does not lack raw material, what with the production of about 11 to 12 lakh tons of groundnut expeller oilcake within our country. With the expanding world demand for oilcakes and meal, therefore, it is his belief that there are better prospects of earning additional foreign exchange through increased exports of extraction meal from our country by utilising the idle capacity of the solvent extraction industry. While on this subject, it is noteworthy, Mr. Gandhi referred to the growing quantum of our export trade with the communist countries of this commodity

and cautioned against a barter deal for, as he maintained, groundnut extraction meal could move on its own without any incentives.

The I.O.P.E.A., President's optimism with regard to exports of oils and oilcake, however, was somewhat tempered by his apprehensions about the probable effects of the surprise increase in freight rate on oilcakes and meal with effect from 1st October recently announced by the Karmohan conference. The way in which the Conference has done this has angered not only the I.O.P.E.A. but the entire business community. Several representations have already been made to the Government describing the increase, which by the way, has been effected without consulting the trade, as being "ill-conceived" and against the spirit of liaison which the business community is having with the Conference. In any case, the decision could not have been more ill-timed. Notwithstanding the explanation which it has given for the increase (which is hardly convincing), the action of the Conference has caused resentment as an attempt to undo the all-out efforts of the Government and private agencies actively engaged in the promotion of exports. When the Indian public as a whole would have appreciated a gesture from the Conference by way of a reduction in freight rates to bring down the export prices of Indian goods the proposed increase in freight rates is, to say the least, a psychological blunder. Apparently, as Mr. Gandhi remarked, the Conference has forgotten that "the shipping lines also have to play a helpful role in furtherance of the country's export trade by providing regular and adequate shipping facilities at competitive rates."

To turn now to the work of the Cotton Textiles Fund Committee. Evidently, Mr. Manubhai Shah is thoroughly satisfied with it. He complimented the Committee not only on having rendered a good account of itself during its 17 years of existence but also on having executed satisfactorily its functions — of supervision and promotion of exports of cotton cloth and yarn, of devising ways and means of developing technical education and research, and of exhibiting a commendable sense of awareness in the discharge of its duties. Handling, on an average 50 lakh yards of cotton textiles per month, or about Rs. 5 crores worth of textiles per month, the inspectorate of the Committee, he claimed, had established a climate of confidence in the overseas market regarding the quality of Indian textiles. It is a pity that the maximum advantage of the free inspection facilities provided by the Committee which are responsible for this is not taken by our manufacturers and exporters. Inasmuch as a large bulk of our cotton textile exports continues to leave the country without prior and adequate inspection, the authorities have been obliged to approve and put into operation a scheme drawn up by the C.T.F. Committee for ad hoc survey inspection and also for considering whether compulsory inspection is not necessary in certain cases. This cas come not a day too soon, because "we have not only to sustain and improve the overseas markets we already have for our various exportable items but have also to exert to the utmost to find out and establish new markets". These new markets are highly quality-conscious, and, in many of them, we have to face severe competition, especially in textiles, at the hands of Japan, Hongkong, China and other textile-exporting countries. As Mr. Shah rightly remarked: "Trade will flourish only if complaints are obviated. Dissatisfaction either regarding quality or price will lead ultimately to reduction in volume of business. Maintenance of quality standards is accordingly a 'must' for establishing and continuing a successful export trade."

Mr. Shah gave concrete evidence of his appreciation of the work of the C.T.F. Committee not only by entrusting it with the inspection of textiles manufactured from fibres other than cotton — such as art-silk, synthetic fabrics, pure silk, and woollen — meant for export, but also by deciding to confer on the Committee a more broad-based and independent status by replacing the present Cotton Textile Fund Ordinance, 1944 with a comprehensive bill which will shortly be placed before Parliament for enactment. The Union Minister for International Trade also blessed the Committee's agreement with the Cotton Council International (U.S.A.) for conducting market research studies for Indian cotton textiles based doubtless on its experience of the three distributive studies already completed in this connection. In fact, he wanted the Committee to take the utmost advantage of the technical guidance and other facilities afforded by the C.C.I .through its experts and consultants and make its programme of market research an eminently successful one.

The unqualified praise as above of the activities of the C.T.F. Committee by Mr. Shah, it is needless to say, is, in a large measure, due to the dynamic leadership of the Committee by a veteran business man in the person of Mr. R. G. Saraiya, which prompts me to ask: "Can this not reasonably be interpreted to mean that, where business men and Government work together purposefully, the results are bound to be most beneficial to the country?"

Business Notes

Trade

SEVEN-POINT PLAN TO STIMULATE EXPORTS

ALTHOUGH NOT at the same rate, in line with the expansion of world trade generally, India's foreign trade also has been expanding. Thus, between 1955 and 1961, while the value of total world trade expanded by over 40 per cent, our foreign trade increased by about 37 per cent. Paradoxically, nevertheless, although the total value of our foreign trade has recorded a gradual increase, the net result has been a growing deficit in our balance of trade. Thus, the deficit, which was Rs. 97 crores in 1955-56, rose to as much as Rs. 427 crores in 1960-61. In other words, as Mr. Murarji Vaidya, President, The Indian Council of Foreign Trade (I.C.F.T.), noted, whereas our exports increased only by 25 per cent since 1953-54 till 1961, our imports rose by as much as 65 per cent. This is the outcome, as he said, again, of heavy imports of plant and machinery, as also of defence equipment.

Dwelling at length on this problem, in his presidential address at the ninth annual general meeting of the I.C.F.T., held in Bombay recently, Mr. Vaidya said: "The only rational conclusion that can be drawn is that we have failed as a nation to plan our productive capacity for our requirements of capital goods or defence equipment in a manner which would enable us to meet our needs to a much greater extent." He also maintained, in this connection, that dependence of as much as a fourth of our total plan outlays on loans and assistance would have to be reduced. Dr. A. Ramaswami Mudaliar, who inaugurated the proceedings of the meeting, also sounded a similar note of warning when he drew attention to what he described as a unique feature in the world today for many a country, namely to come forward with crores of rupees of assistance to help

"It's exciting—it really does look like a giant snake slithering into a snakepit". This very apt description was given by a visitor who saw a continuous strip of skelp moving at 400 ft. per minute into the furnace of the Fretz Moon Mill of our Works at Jamshedpur.

The Fretz Moon Plant is a highly efficient and mechanised unit that manufactures continuous weld tubes from the best quality open hearth steel skelp.

How are these continuous weld tubes used? They have many applications, industrial and domestic. You will find them carrying gas, water and other liquids, and they are also used for structural and mechanical purposes.

INDIAN TUBE

THE INDIAN TUBE COMPANY (1953) LIMITED

41, CHOWRINGHEE ROAD, CALCUTTA-16

industrialise an under-developed country like India, and stressed the need for this nation not to fail in honouring its commitments of repayment of either the interest on the loans or the instalments in amortisation thereof on the due dates. This only serves to underline how imperative the need for export promotion, as also a progressive reduction in our increasing dependence on foreign assistance, is.

As though to disprove the charge lightly made so often by the critics of the Swatantra Party that the party is totally opposed to planning, Mr. Vaidya (who, by the way, is a leading member of the Swatantra Party) suggested a seven-point programme of "realistic" planning embodying the following features:

(a) Greater attention to the expansion of our agricultural production (most of which can be achieved without much foreign exchange expenditure) which, in turn, would enable us to earn more foreign exchange by larger exports of our traditional items;

(b) greater utilisation of the existing indigenous capacity for production of capital goods by importing more of engineering designing, wherever it is not available in the country, rather than importing actual capital goods;

(c) fuller utilisation of our productive capacity for consumer goods and durable goods so that the additional production could be made available for exports to earn more foreign exchange;

(d) judicious and balanced reduction of imports in value by replacing the imports of basic materials which can be processed to a greater extent to provide the raw materials and semi-finished products required by our industries rather than continuing to import the semi-finished products and components;

(e) a scheme of automatic export incentives which would replace the existing intricate and dilatory methods of providing these incentives against exports.

(f) Encouragement of export houses without attaching too many strings;

(g) extending the benefits of export incentives without any discrimination to manufacturers as well as to exporters.

Plastics

FURTHER PROTECTION?

WHEN PROTECTION was granted to the plastic industry in 1950, for the first time, the benefit covered phenol formaldehyde moulding powder (P.F. Powder), buttons, (made of dumnut, mother of pearls, metals, and plastics) and electrical accessories, but only P.F. powder has continued to enjoy tariff protection to this day. However, this also is due to expire at the end of this year, though the chances of its continuance for a further three-year period seem to be bright. For, as was disclosed by Mr. J. N. Dutta, Member of the Tariff Commission, who began the public inquiry into this question a few days ago, this industry has not only taken rapid strides to improve its position by expanding its capacity and increasing and diversifying its production, but has also contributed perceptibly towards our export trade, though not directly.

The aggregate capacity (on a single-shift basis) has increased from 1,500 tons per annum in 1959 to 2,640 tonnes per annum at present. The units engaged in the production also have risen from four in 1959 to six in 1962. Out of these, three units have technical collaboration with foreign manufactures, and, in the case of two more, negotiations for such agreements are reported to be in progress.

The indigenous production of P.F. moulding powder, which amounted to 1881 tonnes in 1959, increased to 2219 tonnes in 1960; in 1961, it was higher still at 2245 tonnes. Out of the five grades produced, production of the G.P. grade has remained predominently high, accounting for about 66-67 per cent, with the G.X. grade following as a distant second. The output of other grades (namely, telephone, radio cabinet and others) remained negligible.

The domestic demand for P.F. moulding powder of all grades was estimated at 1800 tons in 1959 by the Tariff Commission, which also anticipated a 20 per cent increase per annum during the following years. According to the T.C's latest investigation, however, the demand is believed to range between 2500 to 3100 tonnes for 1962, 3300 to 3750 tonnes for 1963, 3700 to 4700 tonnes for 1964 and 4000 to 6000 tonnes for 1965. In this connection, Mr. Datta stated that an examination into the substitution of P.F. moulding powder by other plastics, e.g. urea formaldehyde moulding powder, polythene, polystyrene, would be made before deciding to continue the protection to this industry.

Three firms have been licensed to manufacture phenol (19,600 tonnes capacity), two to manufacture formaldehyde (13,200 tonnes capacity), and two to produce hexamine manufacture (600 tons), all of which have been imported so far. Besides these three chemicals, cellulose, pulp, carbon black and some dyes are still being imported by the industry, while some other raw materials, such as sulphuric acid, stearic acid, lime and pigments, are available indigenously.

P.F. moulding powder articles, such as electrical accessories, have been exported to East Africa, Middle East and South-East Asia. Such exports amounted to Rs. 2.78 lakhs in 1959, Rs. 8.39 lakh in 1960, and Rs. 7.80 lakhs during 1961. This, according to Mr. Datta, is the main justification for continuation of protection as sought by the industry. With its low productivity, small capacity and high prices it has to pay for its raw materials vis-a-vis the industry in other countries, the Indian Plastics Industry is naturally at a handicap in the export markets where it has to compete with its stronger and more entrenched European rivals.

Finance Corporations

BHARAT CHAMBER'S CRITICISM

THE BHARAT CHAMBER OF COMMERCE, Calcutta, in the course of a communication to the Reserve Bank of India has made a pointed reference to the fact that the State Finance Corporations have been making available very little funds to the small-scale producers. All the Corporations put together upto June 1961 had advanced only 20 per cent of the funds to the small-scale industries. There is no doubt that the progress made by the corporations in respect of loans and advances has been very encouraging. For instance, the corporations increased their overall aggregate amount of loans and advances from Rs. 2.72 crores at the end of 1955-56 to Rs. 17.12 crores at the end of 1960-61. Thus during the period of the Second Five-Year Plan there was an eightfold increase. During 1961-62 again the increase was to the extent of Rs. 6.04 crores, which is a significantly encouraging development. But it appears that the objection raised by the Chamber is fairly

genuine. By way of illustration it may be observed that in the case of the West Bengal Finance Corporation the aggregate of loans and advances of Rs. 2.13 crores was distributed 44 per cent to large industries with assets over Rs. 20 crores, 47 per cent to medium industries with assets between Rs. 5 lakhs and Rs. 20 lakhs and the remaining only 9 per cent to small industries with assets less than Rs. 5 lakhs. It is quite true that the small producers always have difficulty in terms of sureties, as well as proper schemes about which all the corporations have to be particular. It is to be remembered that the resources of finance for larger units are varied and it is only the smaller units which need special attention.

The chamber also was of the opinion that the services of the State Finance Corporations should be expanded and diversified so that they help in the promotion and development of small-scale industries in other ways than providing finance. It was suggested that each of these Corporations should have a guidance service particularly for the smaller enterprises so that the probability of rejections and withdrawals of applications may be brought down. This is necessary because small industries involving an investment of not more than Rs. 5 lakhs are generally operated on the basis of the proprietorships, partnerships or private limited companies. Such industrial units need more sympathetic treatment. The corporations can also relax some of their rules in respect of lending so that these units could make themselves eligible. It is suggested, for instance, that instead of 50 per cent margin requirement the smaller industries should be allowed to take loans upto 75 per cent of the value of their assets and the rate of interest charged should also have some reference to the earning capacity of the borrowing units. In view of the special role assigned to the smaller units in the expansion of the industrial sector in the years to come, it would be worthwhile if the Finance Corporations took special care of the smaller units.

Investment

GAPS IN INDUSTRIAL STRUCTURE

MR. G. L. MEHTA, Chairman, Indian Investment Centre, while addressing the first meeting of the Advisory Committee of Industrial experts held in Bombay recently, drew its attention to the need for a programme of industrial surveys and feasibility studies of industries which have a high priority in the Third Plan. In spite of fairly rapid industrialisation, the country is still depending upon imports of vital raw materials and parts and components which exceed Rs. 100 crores every year. This naturally shows that there are certain gaps in the industrial structure which remain unfilled. There are certain items for which the production is lagging behind and there are other items the manufacture of which has not yet been undertaken. Mr. Mehta stressed that whatever the causes for the gaps in the industrial structure and lack of development in such specific fields, the situation definitely called for a detailed investigation. He requested the Committee to suggest methods of carrying out the preliminary studies and the subsequent implementation of the whole programme. This suggestion by Mr. Mehta is quite timely because the country seems to have achieved fair success in the field of industrial expansion and it is time that a proper assessment is available for further achievements. To attain a properly balanced growth such surveys are bound to prove valuable.

Mr. Mehta also referred to ancillary industries, the growth of which has also to be assessed properly. Parts and components of machinery valued at crores of rupees are being imported. It would be advisable to have surveys of different industries and on their basis finally select products which can be manufactured indigenously economically. Once such surveys and studies are available, the Chairman of the Indian Investment Centre was of the opinion that it would be possible to elaborate them in specific investment opportunities. Thus the Indian producers will be able to move forward in the spheres where they will be most effective.

Banking

ADVANCES AGAINST WAREHOUSE RECEIPTS

WAREHOUSES HAVE started playing a significant role in the field of bank advances during the last few years. A recent study undertaken by the Reserve Bank of India on warehouses in India indicates that advances against the receipts of the Central and State Warehousing Corporations amounted to Rs. 9.24 crores at the end of March 1962 and this figure compared favourably to the corresponding figures in last two years. Advances against such receipts at the end of March 1961 and 1960 were Rs. 5.69 crores and Rs. 2 crores respectively. It may be added that individually these figures are not very substantial when compared to the overall advances provided by the scheduled banks. But as a new source this is a very important development. The commodities against which the advances were given mostly are foodgrains, groundnut and other oil seeds.

Apparently, this source of banking advances will continue to grow but the study reveals that there are certain problems that hamper this development. Perhaps the most important is the problem of imparting to the warehouse receipts all the attributes of free negotiability, a fact which had been examined by th Law Commission. Warehouse receipts do not have all the attributes of free negotiability in the same way as promissory notes, bills of exchange or cheques and advances against them were generally made to borrowers who had full title to the goods as original depositors or first transfree of the relative receipt. This naturally reduces the chances of warehouse receipts being utilised for such benefits. Incidentally the study reveals that the storage capacity of Central and State Warehouses increased markedly from 44,000 tons and 1.30 lakh tons in 1959-60 to 73,000 tons and 2.78 lakh tons in 1960-61 respectively. Maximum capacity was available in Uttar Pradesh, followed by Maharashtra, Mysore, Madhya Pradesh, Andhra and Rajasthan. In the coming years when the storage capacity will be available to a large extent the chances of banking advances being taken against warehouse receipts are fairly bright. It is time that methods of advances against such receipts are simplified.

Tata Engineering

ONWARD MARCH

PROGRESS IN sales and earnings of the Tata Engineering and Locomotive Company Limited was encouraging in the year 1961. Not only that, in a way, manufacturing facilities have also been further increased and its capacity for the efficient production of high engineering products has been substantially enhanced. Various schemes approved for expanding and diversifying the company's activities are also under way. The manufacture of Tata-P. & H. power shovels has been firmly established and high grade capacity created for the production of machinery for paper and pulp. Apart from the major expansion of the automobile division,

the construction of factory buildings and services and the enlargement of capacities of company's foundries and forge shops are taking a concrete shape. With vigour efforts are being directed towards increasing the productivity and reducing company's dependence on imported materials and components. The Agency for International Development has under consideration a loan to this company of $13.65 million required for implementing the first stage of the automobile division expansion programme which, when completed, will step up the capacity of this division from 12,000 to 18,000 units per year. Funds will be available from retained earnings and it is proposed to bear the balance partly from a long-term foreign credit and partly from an issue of Rs. 5 crores convertible debentures.

So far as exports are concerned, the company has secured full orders from S. Vietnam, Malaya, Ceylon, Pakistan and Sweden. Although the company's export field for commercial vehicles is restricted to certain territories in terms of company's agreement with Messrs. Daimler-Benz, it is to be hoped that the company before long will be in a position to achieve a suitable volume of export business. The company has started with the production of 2½ cubic yard machine (excavators) and the present manufacture of three such machines a month will be increased to 4 from September this year. The heartening factor is that the demand is large and a growing one, so there would not be any difficulty in disposing of company's total output. In nutshell, company's progress has been quite substantial and it is making an onward March.

Heavy Water

COMMERCIAL PRODUCTION STARTS

TO THE Fertilizer Corporation of India goes the credit of commissioning the first plant in Asia to produce heavy water on commercial scale. Since this water is one of the essential materials used as a moderator in atomic reactors, its production at Nangal brings a step nearer the harnessing in India of atomic energy to provide electricity to industries situated far away from the main coal-belt of the country.

It is, indeed, encouraging that the entire Nangal Plant is now being operated by Indian personnel under the supervision of only a few German technicians, made available by the collaborators, Messrs. Linde of West Germany. Some parts of the plant such as the compressor house, the deriming station etc., are being operated independently by Indian personnel.

The process employed for the production of heavy water is that ordinary water is electrolytically decomposed in electrolysers to produce pure hydrogen and oxygen. These electrolysers are so arranged that hydrogen is produced in two streams, one containing higher amount of deutrium (heavy hydrogen) and another containing lower amount of deuterium. The former stream is purified, cooled and distilled to separate hydrogen and deuterium in a separate plant. The separated deuterium is burnt in pure oxygen to form heavy water.

The total cost of the project is now put at Rs. 2 crores. Its annual output would be 15 million grams of heavy water, valued at approximately Rs. 45 lakhs. In spite of the high cost of electricity, the cost of production of the Nangal Plant is stated to be one of the cheapest among the existing heavy water plants in the world. This presumably is due to heavy water being a co-product from the Nangal Fertilizer Factory.

Woollen Machinery

R.K. GROUP'S NEW VENTURE

THE R. K. GROUP OF INDUSTRIES, Ludhiana, has plans to set up a Rs. 1 crore project for the manufacture of machinery for the woollen and waste spinning industry and also some other preparatory equipment. The Union Government is understood to have already approved of the proposal.

The project will be executed by a public limited company being floated for this purpose. It will have an authorised capital of Rs. 1 crore. A substantial part of the issued capital is proposed to be offered for public subscription. The total cost of machinery and equipment required for the project is estimated at Rs. 50 lakhs. Foreign exchange component is put at half of this, since a part of the machinery is to be obtained from domestic sources. Technical collaboration is being arranged with a Japanese firm well-known in the field of woollen and worsted machinery manufacture.

The project is the first one in the country going in for the manufacture of waste spinning plants. It is envisaged to relieve the difficulty experienced by several units already licensed to set up cotton waste spinning plants in obtaining machinery from abroad as the two rupee-payment sources of such machinery, East Germany and Poland, are said to be fully booked up to 1965. The difficulties being encountered in meeting the replacement needs of woollen spindles in the country should also be mitigated to a very great extent when this project goes into production by mid-1963.

Indian Copper

PROGRESS AND FUTURE PROSPECTS

THE AFFAIRS of the Indian Copper Corporation Limited were discussed in a concrete form at the annual general meeting of the Indian Copper Corporation Limited held recently in Calcutta. Mr. J. W. Eason, chairman of the company pointed out that costs during the year 1961 increased a good deal and output declined. The fall in production may be attributed to a reduction in the number of days worked. The shut down was mainly caused by the shortage of coal. Certain essential stores, in particular explosives and drill steel, were in short supply and development had to be suspended or curtailed in a number of areas. Although power difficulty was not very extreme, yet the coal and transport shortages were sufficient enough to stand in the way of the company to achieve overall good results. The overall increase in production costs may be principally attributed to the lower output but the fact that the raw materials were more expensive and the labour costs were higher and the mining was generally being carried out at great depths can also be said to have added to the increase.

Modifications to the equipment of existing plant and equipment continued according to the schedule in conformity with the plans to increase the production and it is heartening to note that alterations necessary to increase the capacity of the air ropeway were successfully completed during the year. A particularly satisfactory achievement of the year was the settlement by way of compromise, of the long outstanding dispute with the State of Bihar over the company's lease to mine kyanite. Electrical project is also now making satisfactory progress. So far as the financial position of the company is concerned, it may be noticed that the profit for the year 1961 before providing for taxation, depreciation and reserves amounted to £1,222,163 compared to £1,307,982 for 1960.

FROM THE CAPITAL'S CORRIDORS

EXPORT PROMOTION

THE Rajya Sabha debate on the Mudaliar Committee report developed into a fairly agonizing reappraisal of the country's export policy and performance, although some issues continued to remain clouded. It brought into sharp focus the basic weakness of the entire structure of export promotion.

Both Mr. Avinashlingam Chettiar of the Congress and the Communist leader, Mr. P. Ramamurty, quoted chapter and verse to prove that official exhortations as well as material incentives had failed to add appreciably to India's exports, and in fact the exports had lately declined. The reason, they added, was simple: To export may be a patriotic obligation or duty, internal sales were easy and much more profitable. The traders therefore preferred profits to patriotism.

Mr. Chettiar suggested that every industry should be compelled to export a specified proportion of its products at competitive prices. Mr. Ramamurty thought that this would not do. He said the Government should look into the cost structure of every industry, and requisition a specific portion of each industry's production at cost, to be exported by the State Trading Corporation. Many other members pleaded that unless internal prices were controlled, exports will not improve, for the traders will sell in the profitable internal market rather than compete in overseas markets.

The Union Minister of International Trade, Mr. Manubhai Shah, apparently agreed with the diagnosis of the speakers, but did not show any enthusiasm for the suggestions made by them. Instead, once more with feeling, he appealed to industrialists to divert a part of their high-profit sales in the country to the "losing business of the export trade" in national interest. He relied on the traders' patriotism. They will, he hoped, forego the high profits ensured by India's protected market to help the Government in the "single most important task"—export promotion!

Mr. Shah took the opportunity provided by the debate to announce acceptance of almost all the recommendations of the Mudaliar Committee as well as other export promotion measures. An important announcement he made was that he would establish a Rs. 10-crore Export-Import Bank in India to provide help to exporters.

He did not explain, however, as to what precise purpose such a bank will serve. In most countries, export-import banks have been established, largely, if not exclusively, to finance the export of capital goods. India is unlikely to export any capital goods for a long time to come.

Mr. Shah also announced that a full-time committee of experts will be set up shortly to study the cost structure of all major industrial and agricultural products that figure in foreign trade. Another committee which Mr. Shah has lately appointed will advise the Government on the development in the country of a number of "free trade" zones at important ports. The committee is headed by the distinguished economist, Prof. G. R. Gadgil.

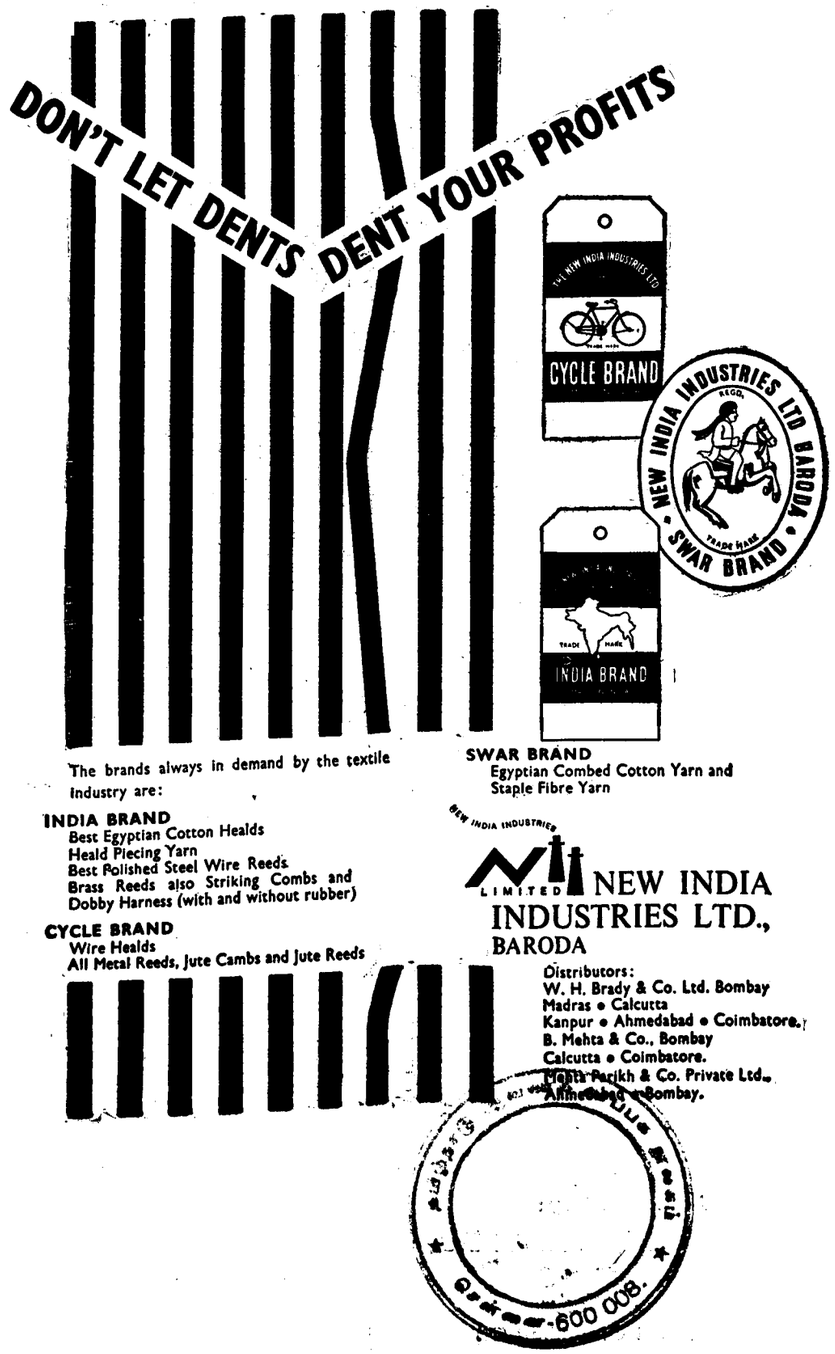
Meanwhile, observers in the capital have been disheartened by official attempts to play down and explain away the decline in the export trade during the first six months of 1962. The country is being told, for instance, that the fall in exports was primarily due to the Hooghly pilots' strike in Calcutta, and a decline in the world prices of jute. If that were so, what accounts for the steep fall in the cloth exports? There has been no official explanation.

INDIA'S TRADE WITH BRITAIN

From Mr. Morarji Desai's recent statement in Parliament it appears that the outlook of Indian trade in the event of Britain's entry into the European Common Market at present is even more bleak than appeared a week ago. All the assurances given to Mr. Desai during his European visit, or which he thought had been given to him, have not been borne out by the result of the inconclusive negotiations at Brussels.

Firstly, the list of items, which are proposed to be allowed duty-free entry into the European Community after it is enlarged by the accession of the UK, excludes many items of vital interest to India. In this connection, it is emphasized that Indian interest is not confined to primary products or raw materials. It extends to some processed and manufactured goods, especially vegetable oils, handloom cloth and cotton textiles, jute goods, East India kips, and handknitted carpets.

Secondly, and this seems to be the most important cause of concern, the Six now insist that the Common External Tariff of the Community should begin to apply, in stages, to Indian exports to the UK from the day of UK's accession to the European Community.



Such an abrupt disruption of India's right of duty-free entry into the British market is bound to have a serious effect on India's export trade and development plans. For the next many weeks, the Indian Ambassador to EEC, Mr. K. B. Lall, has his work cut out. He must convince the negotiators at Brussels that until India has negotiated a comprehensive trade agreement with the enlarged Community, her existing trading rights in the UK market must be left undisturbed and unimpaired.

PEOPLE'S CAR

A decision has been taken virtually to drop the "People's Car" project. Four major reasons have been given by the Union Minister for Steel and Heavy Industries, Mr. C. Subramaniam, for deferring the "consideration" of this project to a day "until we can see more propitious conditions." These reasons are as follows:

"(1) In the context of our current economic situation both in regard to internal and external resources, the question is not whether the project is a good or sound one on merits but what its priority should be. Although the small car project had been approved by Government in principle before the Third Five-Year Plan was finalised, it had not been found possible to include the project in the Plan because projects which were then judged to be of a higher priority added up to a larger figure than the resources in terms of rupees and foreign exchange which we could foresee. The position has not improved since. If anything, conditions have become more difficult. Consequently, the small car project cannot be moved up in any list of priorities.

"(2) The priority in the field of automobiles should, for some time to come, be definitely and overwhelmingly in favour of the manufacture of commercial vehicles

The brands always in demand by the textile industry are:

INDIA BRAND
Best Egyptian Cotton Healds
Heald Piecing Yarn
Best Polished Steel Wire Reeds
Brass Reeds also Striking Combs and Dobby Harness (with and without rubber)

CYCLE BRAND
Wire Healds
All Metal Reeds, Jute Cambs and Jute Reeds

SWAR BRAND
Egyptian Combed Cotton Yarn and Staple Fibre Yarn

HOW

KIND HEARTED

IS YOUR DIET?

Doctors now agree that heart ailments due to hardening of the arteries can be avoided by excluding saturated fats from one's diet. In fact, the use of an unsaturated cooking medium is highly recommended. Nature has provided such a medium in the form of safflower oil (kardi, in Hindi). Known as saffola, it is the ideal cooking medium for everyone and particularly for those over forty. Saffola is nutritious, palatable, easy to digest and so economical. For health's sake get a tin of Saffola from your nearest store.

Saffola

Refined and processed by:

THE BOMBAY OIL INDUSTRIES PRIVATE LTD.,

Kanmoor House, Bombay-9.

Also manufacturers of:

PARACHUTE Refined Groundnut Oil
Cocoanut Oil, Til Oil
COCOVITE Refined Cocoanut Oil

ANNOUNCEMENT

The following Annual Numbers of **THE EASTERN ECONOMIST** are available for sale. Special concession may be given to educational institutions, libraries and students, if a single order exceeds Rs. 50|-.

1. India & the World and India in 1950	Rs. 5|-
2. A Social History of the Indian People & India in 1951	Rs. 5|-
3. India & the Free World and India in 1952	Rs. 5|-
4. India in Asia & India in 1953	Rs. 5|-
5. India in South East Asia and India in 1954	Rs. 5|-
6. India & the Communist World and India in 1955	Rs. 5|-
7. India in 1975, A Study of the next Twenty Years & India in 1956	Rs. 7.50
8. India & the Middle East and India in 1958	Rs. 7.50
9. India and Europe & India in 1959	Rs. 10|-
10. India & North America and India in 1960	Rs. 10|-
11. India and Europe Divided	Rs. 10|-

Please take advantage of this offer and mail your enquiries to:

THE EASTERN ECONOMIST LTD.,
United Commercial Bank Bldg.,
Parliament St., Post Box No. 34,
NEW DELHI.
Phone: 44984 Gram: "Research"

which will provide the base for the transport of goods and for public passenger transport.

"(3) Although resources, particularly external resources, for this project appear to be in sight, the expectations in regard to exports of cars abroad and of non-traditional goods to France are not absolutely certain; and, in the latter case, would impose a strain on our export surpluses which, on considerations of the priority of the project, it would be difficult to justify.

"(4) Although the credit offered for the project might be outside the French Government credits available to India under the Aid-to-India Consortium arrangements, the size of present and future credits available to us from all sources would be based on the lenders' judgment of our overall capacity to make interest payments and payments on account of capital repayment. On this reckoning, any outgoings, whether in terms of foreign exchange, or in terms of goods on account of the small car project, would be a debit against our overall capacity to make payments."

"I should like to recall further," the Minister continued, "that the immediate implementation of the project would involve not only money resources — of which we are short enough, in all conscience, especially in terms of foreign exchange — but also physical resources like building materials, steel (for production), power and transport. These are all in short supply and I do not see that we can expend any of these on what is, after all, not a project meriting high priority in our present situation".

COAL-MINING IN WEST BENGAL

Details have been announced of the agreement arrived at between the Central Government and the Government of West Bengal in respect of coal-mining rights in this State. The following is the text of this agreement, negotiated by the late Dr. B. C. Roy and the Union Minister for Mines and Fuel, Mr. K. D. Malaviya:

"(1) The Government of India decides, on the advice of the Planning Commission, what the plan and programme regarding coal production for the Plan-period should be. It also fixes the target in this respect. In drawing up the plan and programme or in fixing targets, the Government of India takes into account the requirements of all the States including the requirements of industries in the public sector and the private sector, as well as requirements for domestic or other consumers. Coal is a basic commodity, supplies of which have to be ensured to consumers in all parts of the country, though its production may be concentrated in a few States. In order to ensure this, as a matter of national policy, the Central Government undertakes control over production distribution and price of coal and must continue to do so. It is also essential that any organisation in the public sector engaged in the development and production of coal should conduct its operation with due efficiency and economy.

"(2) Any scheme of development of coal production by the State Government of West Bengal should, therefore, be consistent with the all-India policy and should form an integral part of the all-India programme. Keeping this in view it is possible to evolve a formula for development of coal production by the State Government of West Bengal.

"(3) The following agreement has been accordingly arrived at between the Government of West Bengal and the Government of India in the matter of mining of coal in the public sector in West Bengal, without prejudice to the legal issues before the Supreme Court:

"(i) The State Government shall produce coal of the requisite type and quality only for the purpose of feeding their own projects in the public sector, and only for such projects in the all-India plan, as finalised by the Planning Commission.

"(ii) For the purpose of coal production as contemplated in (i) above, the State Government will assess its requirements for its own coal-based industries in the public sector. On the basis of such assessment, the State Government should specify precisely the areas in which they propose to take up operations. The potentiality of each such areas should be assessed by the State Government or its agency. The requirements so assessed, the data regarding the potentiality of each such area and the State Government's plan and programme should be submitted to the Government of India. The Central Government will examine for approval the plan and programme so submitted, with particular reference to the State Government's requirements in respect of their Plan projects, the potentiality of the areas of mining selected and the administrative arrangements proposed. The plan and programme so approved will not be changed except by mutual agreement between the Central Government and the State Government, but may be subject to periodical reviews jointly by the Central and the State Governments at such intervals as may be agreed upon.

"(iii) On approval by the Central Government of the plan and programme of the State Government the State Government will undertake mining operations in the approved areas. The State Government agrees that such operations would be conducted wholly in the public sector by a Corporation formed for the purpose, in consonance with the provisions of Central laws or rules governing mining operations.

"(iv) In undertaking mining operations, the objective would be not merely production for the immediate requirements but also optimum production on the basis of the assessment of the potentialities of the areas selected for operation by the State Government. The distribution of the coal raised by the organisation referred to in clause (iii) above, will be governed by the appropriate Central legislation, rules and orders issued by the Central Government from time to time. It is, however, understood that the requirements of the projects referred to in sub-para (i) above have priority in the matter of allocation of coal from this source. Any production from such areas, which may be surplus to the immediate requirements of the State Government, would be made available by the State Government to the Central Government or its agency for distribution.

"(v) The State Government will meet the requirements of its own public sector approved industrial projects from the coal mines operated by them in accordance with the programme of production. If however, in any particular year, the quantity of coal raised is not sufficient to meet the requirements of the approved industries, the Government of India will through the Coal Controller, endeavour to meet such deficit subject to the general scheme of distribution of coal by the Coal Controller and provided the requisite transport is available. In case, however, when the phased target of production of coal by the State Government is not reached in a particular year, the Central Government will not be held responsible for meeting such deficit.

"(vi) Prospecting of the proposed area of mining will be undertaken through the agency of the State

Government and not by any foreign agency, unless authorised to do so by the Central Government. It is expected that the State Government would speedily build up their own prospecting organisation. The Central Government would be happy to render such assistance as is possible to the State Government to build up such an organisation.

"(vii) The finances required for the mining of coal by the State Government would be met entirely from the resources of the State. As regards the foreign exchange facilities, it would be a matter for settlement between the Government of West Bengal and the Department of Economic Affairs of the Ministry of Finance, Government of India, although the Ministry of Mines and Fuel will, as usual, help the State Government in its efforts with the Department of Economic Affairs to obtain such facilities.

"(viii) The State Government may seek assistance of the Government of India in technical and other matters. The Government of India will be glad to render such help to the extent possible."

SOLVEEN REPORT ON ROURKELA STEEL PLANT

The report submitted by the six West German experts who visited the Rourkela Iron and Steel Works between March 14 and 21, to diagnose its malady, has now been made available. The more important conclusions outlined in this report are reproduced below:

"The defects observed by the Commission are serious and their elimination is one of the most urgent tasks. Action in the field of personnel which has been recognised as necessary cannot be successful unless the operational organisation in the metallurgical plant is fundamentally improved. Measures planned by the management are to be quickly implemented and the further measures suggested are to be pursued urgently.

"Shop Discipline: The shop discipline in the plants is unsatisfactory. The Commission satisfied itself that the operating staff often stands about in groups and keeps away from work. Obviously this situation should be remedied quickly. The abnormally high percentage of absentees which, according to data of the Energy and Economy Department, temporarily reached 20 to 25 per cent of the full strength in important departments is also disquieting. Such conditions are not apt to secure a continuous smelting mill operation and call for a review of the shop regulations and personnel policy. It was pointed out that absenteeism in India ran generally high, and a 10 to 15 per cent allowance is provided in staffing. Since experienced men are so short, it would pay to bring down absenteeism by all means.

"The unsatisfactory willingness to work and productivity of labour can only be counteracted, according to the opinion of the Commission, if (a) unqualified and insubordinate workers are released and replaced by suitable personnel and (b) the general factory atmosphere is not burdened, also in the future, with continuous wage disputes resulting in open strikes or in go slow tactics.

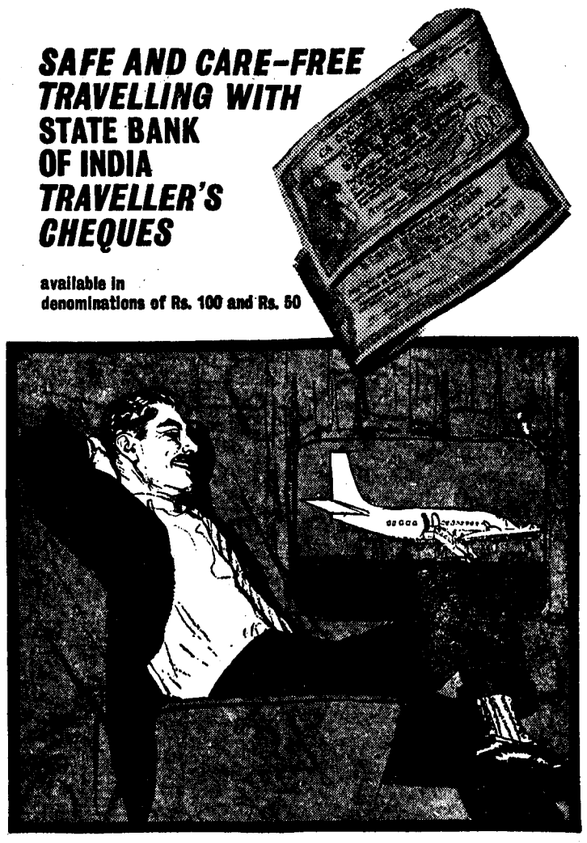
"In order to reach this goal the Hindustan Steel Limited should immediately decide on drastic measures. It does not suffice to take disciplinary action in the case of particularly serious infractions and as the cases present themselves .... On the other hand, the skilled and willing workers should be encouraged to good performance by corresponding wages. It must be doubted whether the recently adopted bonus system will suffice to reach also the necessary 'individual' increased performance. This must be secured by a suitable promotion policy.

"Delimitation of Responsibilities. The machinery also suffers from the fact that the machinery department reports to the production department. A clear separation of responsibilities between the production and maintenance departments must be secured. The maintenance department must be entitled to order 'immediately' repairs which it deems necessary.

"Equipment of the Central Workshop: The Central Workshop of the metallurgical plant is insufficiently equipped, though all that was planned has been given. The mechanical workshop is, above all, short of machine tools, tools and auxiliary tools. There is also a shortage of raw material (forgings, rounds, etc.) which must be available in sufficient quantities because of the isolated location of Rourkela in order to be able to manufacture spare parts in the plant itself. Also the electric workshop is insufficiently equipped and consequently it is not possible to repair and test motors of any size as well as transformers and switching appliances of any type. Small workshops attached to units are also necessary and should be provided as early as possible.

"Drawings for Repair Purposes: There is a shortage of drawings for repair purposes. The drawings delivered by the suppliers along with the equipment obviously do not always meet the needs of a plant situated far away from the supplier. The supplying firms should be induced to supply suitable drawings.

"Storage: The works have a great central store for spare parts and consumables. The organisation of the storage is, however, insufficient. There is no standardised list of available spare parts and consumables. There are only individual lists of the supplying firms with a differing nomenclature. An overall inventory of the stores and a standardisation of the nomenclature of spare parts and stores are therefore most important. The Commission recommends urgently to erect an additional storeshed with a crane so that heavy material which is subject to deterioration when exposed to weather can be sheltered.



"Telephone Network: The absence of an in-plant telephone system is a handicap. There are only a few direct lines which are absolutely insufficient for an urgently necessary communication between the factory departments. A large automatic exchange is under commissioning and this should give considerable relief.

"Ordering of Spares: The handling of the orders placed by the individual plants with the purchasing department in respect of urgently required spare parts and accessories threatens seriously the production operations. In some cases urgent requisitions of the plants were not forwarded by offices which are not in a position to judge the necessity or urgency of the purchases. Repeated requests of the plants were unsuccessful. These organisational nuisances should be immediately abated, as otherwise obstacles to production cannot be avoided. Emergency powers for urgent purchase which the General Superintendent has for short circuiting some of these procedures are alone not sufficient.

"Transport: In general the present track system is considered to be good. The rolling stock is in extremely bad condition and has to be replaced by new

Canada has from January to June 1962 purchased 396000 pairs of footwear from Bata India

He is ready to take off on a business cum pleasure trip. He is care-free as he is taking with him the State Bank of India's Traveller's Cheques which are encashable anywhere, anytime.

When you travel next, for business or pleasure, please remember to carry with you the State Bank of India's Traveller's Cheques which can be cashed at:-

SBI/A'S-SB-63A

wagons, above all special wagons are required. For the supply of nearly 400 wagons and 6 more engines, 20 million D-Marks are required. A wagon repair shop has to be built as soon as possible. The costs are estimated within one million D-Mark.

"Personnel for Production Plants: The German technical personnel available at present for Dr. Mintrop for the operation of the plant must immediately — and at least for one year to begin with — be supplemented by additional qualified workers from Germany. (a) It is necessary to make available for the blast furnace plant 9 skilled men for one year. (b) It is necessary to make available 16 qualified men for the LD-steel plant.

"Personnel for Maintenance and Repair: The upkeep and the maintenance routine of the plant are so faulty at present that a sufficient number of qualified skilled workers must be made available in order to prevent considerable future production obstacles. The Commission is of the opinion that a total of 168 skilled German men are necessary for repair and maintenance work, and they understood that the majority of these personnel are already in position in Rourkela.

"Transport Personnel: The operating troubles of the steel plant can, to a considerable extent, be explained by an insufficient flow of material which is due to an unsatisfactory availability of means of transport. In order to be able to do away with the recognised deficiencies at least 4 more German railway workers from German steel plants must be sent to Rourkela to give the necessary assistance.

"Selection of Personnel: It is expressly stated here that all men to be sent to Rourkela as well as assembling personnel must be very highly qualified as far as technical knowledge and character are concerned.

"Earmarking of Funds for Urgent Purchases: In order to facilitate the procurement of necessary repair and spare parts and to adjust the equipment of the workshops to the requirements of the plant the Commission estimates that roughly DM 25 million would be necessary, of which DM 22 million are for spare parts and DM 3 million for workshop equipment. An additional sum of DM 11 million is necessary for the urgently required special rolling stock and for the erection of a wagon repair shop. In addition ordinary rolling stock equivalent in value to DM 11 million should be purchased from Indian sources.

"Training of Indian Qualified Workers in Germany: In order to make it possible that the operation of the plant be transferred to Indian personnel as soon as possible, it should be considered whether additional qualified Indian workers should not be sent to German steel mills for training purposes. If this is done, care must be taken to safeguard that the training of those men is conducted at working places similar to those which they are to fill in Rourkela and the men actually work on the jobs as part of the German crews.

"Conclusion: It is the opinion of the Commission that difficulties arisen in the steel mill could have been avoided if during the initial period the Hindustan Steel Limited had employed a sufficient number of German personnel authorised to give instructions and carrying the full responsibility; the more so as technical procedures find application in Rourkela which are new for the Indian steel industry and difficult to be carried out (LD-process, hot and cold wide strip mill). The German men should have Indian counterparts so that management and operation can be transferred to the Indian personnel as soon as possible."

RICE AND FISH EXPORTS

The Government of India is considering the prospects of exporting some small quantities of superior quality rice for consumption by Indians abroad. This was disclosed last week by Mr. V. Shankar, the Union Food Secretary, in the course of an informal talk with newsmen here.

The reason why rice exports, which in the initial stages are expected to be of the order of 15,000 to 25,000 tons, will be restricted to the Indians living overseas is that as a recepient of large quantities of foodgrains from the United States under the P.L. 480 programme of that country, India normally cannot be expected simultaneously to effect exports of her own foodgrains.

The major markets which are being explored for this purposed are: Kuwait, Kenya, East Africa, Persian Gulf territories and Mauritius, which have a large number of Indians settled their as permanent residents. The foreign exchange to be earned through rice exports is estimated to be of the order of Rs. 2.5 crores.

The Government is also considering the feasibility of setting up a Fisheries Corporation in collaboration with some foreign firm of repute to enable the Indian fishing industry to gain a stable and permanent foothold in the world marine fish market. There is said to be a good scope for export of Indian marine fish, but there are three factors which have stood in the way of exploiting this source of earning foreign exchange to any appreciable extent. The first factor has been the lack of adequate mechanization of the Indian fishing industry. Then there has been the drawback of absence of refrigeration facilities in the initial stages of transporting the catch which leads to some deterioration in its quality. The third factor has been the absence of any big organisation to handle exports on competitive basis. The proposed Fisheries Corporation would aim at elimination of all these drawbacks. A couple of experts from the United States are expected here in the near future to gain a first-hand knowledge of the prospects of fish exports from here. They are coming on their own.

Mr. Shankar, during his recent tour of the United States, is stated to have discussed with the U.S. authorities the question of cutting down imports of wheat on commercial account in view of the acute foreign exchange situation faced by India. The U.S. authorities, it is understood, have expressed sympathy with India's plea and have promised to take up the matter with the principal wheat-exporting countries. Some reduction in wheat imports on commercial account may, therefore, be expected in the near future.

With the steady improvement in the foodgrains storage capacity effected during the last year, wheat imports under the U.S. P.L. 480 programme are envisaged to be stepped up from 1,80,000 tons to about 3,00,000 tons per month. This stepping up of wheat imports, it is stated, should not stand in the way of India's cutting down imports on commercial account.

SUGAR EXPORTS

According to present indications, India would be able to export during the current calendar year about 4,00,000 tons of sugar. Next year these exports may be stepped up to 5,00,000 tons. Malaya, Japan and Canada are likely to be the major markets for Indian sugar, although the prospects of exporting sugar to both sides of the Iron Curtain in Europe are also rated fairly high. As far as the European Common Market

is concerned, Britain, it is stated, may ask for some special treatment for her sugar imports from her colonies and from the Commonwealth countries in the event of her joining the European Economic Community, because a good deal of investment had been effected in this industry by the British nationals during the period of the British rule in the Commonwealth countries and some of the colonies which are now gaining independence.

In view of sugar exports going up this year and an ambitious programme having been chalked out for exports next year, the Government is not likely to continue the 10 per cent cut on the manufacture of sugar which had been imposed at the beginning of the last season owing to heavy carry-over from the previous year.

The problems of the sugar industry caught the spotlight last week when the annual general meeting of the Indian Sugar Mills Association was held here. In his presidential address, Mr. D. D. Puri pleaded for reduction in excise duty on sugar and also for utilisation of the cane cess in various States for the specific purpose of development of cane for which it is levied. He also called for the restoration of the cut in sugar mills' quota of hard coke.

With a view to maintain sugar prices in the domestic market at a stable and remunerative level for the industry, Mr. Puri pleaded that the industry should be consulted by the Government at the time when monthly releases for domestic consumption are determined.

Mr. Patil, Union Food and Agriculture Minister, who inaugurated the meeting, categorically ruled out any cut in excise duty on sugar, at least for another couple of years, since, according to him, it would not be desirable to create any artificial demand for this commodity in the country. Further, he said, large funds were needed to meet the loss on exports of sugar. The Government, which has undertaken to meet this loss, is doing so out of this high excise duty.

Mr. Patil dwelt at great length on the recent formula evolved by his Ministry for linking cane prices with sucrose content. The present formula, he stated, had been worked out with a view to encourage the agriculturists to produce better cane.

Dealing with the increase in acreage under sugarcane that has been brought about since the raising of the cane price from Rs. 1.44 per maund (delivery factory gate) to Rs. 1.62 per maund in 1959, Mr. Patil gave an indication of a scheme which his Ministry has under consideration at present. The scheme relates to regulation of area under various crops so that balanced development of Indian agriculture could be fostered. The regulation, it is stated, is not sought to be brought about through legislation. What other measures should be taken to achieve this end is the problem that is engaging the attention of the Government.

Dealing with manufacture of raw sugar (recently a barter deal has been negotiated to export 3,00,000 tons of raw sugar to Japan) which the ISMA President had opined to be not an easy task, Mr. Patil observed that if India had to embark on any large-scale sugar exports, she had to go in for this sort of manufacture since it was the foreign importers' preference which had to be catered to.

IDA CREDIT FOR KOYNA PROJECT

The International Development Association has made available a credit of $17.5 million to India for financing the second stage of the Koyna hydro-electric power project which will increase its capacity to 5,80,000 kilowatts. The credit will be passed on by the Government of India to the Maharashtra State Electricity Board which is handling the project.

This IDA credit, like all others, is for a term of 50 years. Repayment of the principal will begin on January 15, 1973. Thereafter, one per cent of the principal will be repayable annually for 10 years and 3 per cent will be repayable annually for the final 30 years. The credit is interest-free, but a service charge of ¾ per cent per annum on the amount withdrawn and outstanding will be made to meet IDA's administrative costs.

The Koyna project when its second stage will be completed by late 1967, will meet most of the future demand of electricity in the Bombay-Poona-Koyna area, which is estimated to go up from 5,14,000 kilowatts at present to about 10,60,000 kilowatts by the end of 1967. Another interesting development in this connection, however, has been that the Union Territory of Goa has approached the Central Government with a request that some of the Koyna power should be earmarked for Goa's development.

POWER FROM DVC

The largest thermal power station in India is now under construction at Chandrapura for the Damodar Valley Corporation, and will come into operation late in 1964. The Chandrapura station is in the 280 megawatt bracket and will feed power to the Railways, new projects and to collieries in Bihar and Bengal.

Though most of the equipment is being imported, the order for the clarification and filtration plants has been placed jointly with Messrs. Paterson Engineering Co. (India) Private Ltd. and Messrs. Bird & Co. (Private) Ltd., while the order for the demineralisation plant has been placed with Bird & Co., who are the leading designers and manufacturers of this type of equipment, having built similar plants for several other power stations in India. These plants will give, daily, a continuous supply of 8 million gallons of clarified, and 1.8 million gallons of filtered water and 1,50,000 gallons of water demineralized down to the equivalent of 'triple distilled' quality for make-up to the boilers operating at 2,150 lbs. per square inch pressure.

The total value of the equipment ordered is Rs. 30 lakhs. A considerable saving of foreign exchange has been effected as most of the equipment is designed and manufactured indigenously.

IN BRIEF ....

The net collections of small savings in India in 1961-62 amounted to Rs. 91 crores as compared to Rs. 105 crores in 1960-61. The fall in collections in 1961-62 is attributed to the reversal of the trend of diversion of deposits from the commercial banks to post office savings bank which had been induced in 1960-61 by the failure of the Palai Central Bank and some other small banking companies.

*

The West Germany Government has agreed in principal to grant a credit for meeting the foreign exchange cost of Rourkela Steel Plant's expansion. But this credit is conditioned on a certain action being taken to bring the existing plant to full working. The total cost of expansion programme is estimated at Rs. 90 crores, of which about Rs. 50 crores would be in foreign exchange. Tenders for the plant and equipment needed for the expansion programme have already been receiv-

COMPANY AFFAIRS

LARSEN AND TOUBRO

The Larsen and Toubro Limited has reported all-round improvement during the year ended March 31, 1962. The sales invoiced by the company have increased sharply from Rs. 3.51 crores to Rs. 5.71 crores, while the income from commissions, compensations, engineering fees, and other sources have risen from Rs. 19.48 lakhs to Rs. 25.88 lakhs. This has naturally resulted in raising the net profits from Rs. 18.03 lakhs to Rs. 19.26 lakhs. The Directors have decided to pay a gross dividend of Rs. 1.40 per equity share and Rs. 6.50 per Preference share.

Though sales are substantially higher, the profits comparatively show a maderate rise. The general increase in expenses, mainly on salaries and wages and costs of raw materials, the delay in shipment of goods owing to the last minute changes in procedures for importing equipment from Development Loan Fund allocations, and the large orders secured in the face of severe competition at narrow profit margins, account by and large for the relatively small increase in profits.

Allocations include Rs. 12.20 lakhs for Depreciation (against Rs. 11.52 lakhs), Rs. 2.96 lakhs for Development Rebate Reserve (against Rs. 4.82 lakhs), Rs. 21 lakhs for taxation (against Rs. 17.40 lakhs), the same amount of Rs. 2.50 lakhs for general reserve, an equal amount of Rs. 1 lakh for Dividend Equalisation Reserve and Rs. 16.38 lakhs for dividends (against Rs. 15.38 lakhs). A sum of Rs. 1.51 lakhs has been carried forward to the next year's account as against Rs. 0.99 lakhs brought in.

The company has completed satisfactorily the contracts for erection of the Gauhati Oil Refinery and the installation of machinery and equipment for the Worli Dairy Project. The Madras Harbour Extension Works, in which the company is associated with Engineering Construction Corporation Ltd., is progressing satisfactorily and is nearing completion.

The company is negotiating for new contracts for the erection of factory structures, machinery and equipment which are expected to be secured shortly.

During the year the company has been granted an industrial licence for the manufacture of flour milling, feed milling and grain silo plant in collaboration with Messrs. Buhler Brothers of Switzerland.

The workshop of the company and its subsidiaries are working to full capacity and the company has a satisfactory backlog of orders.

BAJAJ AUTO LIMITED

The working results of Bajaj Auto Limited for the year ended March 31, 1962, show a significant improvement over the preceding year. Gross profits (before providing for depreciation and other provisions) show a rise of more than 57 per cent, increasing from Rs. 13.17 lakhs to Rs. 20.74 lakhs. In sharp contrast to the small appropriations made last year, the allocations for the current year indicate substantial improvements. In the case of General Reserve, for example, the appropriations for the year at Rs. 6.25 lakhs show a rise of Rs. 5 lakhs. Similarly, the appropriations for Development Rebate Reserve at Rs. 2.49 lakhs is more than four times the allocation made last year. The salient results of the working of the company for the current year as compared with the preceding year are set out in the table below:

	Year Ended 31-3-1962	Year Ended 31-3-1961
	(Rs.)	(Rs.)
Gross Profit (before providing for depreciation and provisions)	20,73,933	13,17,022
Depreciation	3,37,547	27,823
Provision for taxation	6,00,000	5,20,000
General Reserve	6,25,000	1,25,000
Development Rebate Reserve	2,49,052	65,000
Dividends	3,19,600	4,45,500

After the appropriations and adjustments the position of Reserve and Surplus remains as under:

	As at 31-3-1962	As at 31-3-1961
General Reserve	7,50,000	1,25,000
Development Rebate Reserve	3,16,052	67,000

NEW ISSUES

Tata Hydro Electric Power Supply Co. Ltd., Bombay, and Tata Power Supply Co. Ltd., Bombay, have obtained permission from the Controller of Capital Issues to raise Rs. 100 lakhs and Rs. 85 lakhs, respectively, by issuing debenture stock.

The following are the details:

Tata Hydro Electric Power Supply Company will issue debenture stock of the value of Rs. 100 lakhs. The debentures will carry interest not exceeding 6¾ per cent and will be offered to the public through a prospectus.

The proceeds of the issue will be utilised for the company's programme of modernisation, improvements and rehabilitation, etc.

Tata Power Supply Company has been permitted to issue debenture stock of the value of Rs. 85 lakhs. The debenture will carry interest at a rate not exceeding 6¾ per cent and will be offered to the public through a prospectus.

Other companies granted permission to raise capital are as follows:

Ahmedabad Manufacturing and Calico Printing Company will issue bonus shares of the value of Rs. 6,25,000 on capitalisation of the company's general reserve.

Parle Products Manufacturing Company has obtained the CCI's sanction to issue bonus shares of the value of Rs. 11.76 lakhs on capitalisation of reserves.

Ahmedabad Kaiser-i-Hind Mills has been granted consent to the issue of Rs. 2.75 lakhs bonus capital on capitalisation of the company's reserves.

Bombay Steel Rolling Mills will raise new capital of Rs. 15,59,900 in 1,55,990 equity shares of Rs. 10 each at par. The capital is required for the establishment of a rolling mill at Kalyani, district Nadia.

The Assam Gas Company, a State Government undertaking, incorporated for carrying on the business of transporation and distribution of natural gas for domestic and commercial use, has been allowed by the CCI to issue Rs. 15 lakhs divided into 15,000 equity shares of Rs. 100 each to be subscribed by the State Government at par. The proceeds will be used for the payment of technical consultancy fee.

Company Meetings

INDIAN SUGAR MILLS ASSOCIATION

Need to Reduce Excise Duty on Sugar to ensure Stability in Sugar Industry.

In his Presidential Address at the 29th Annual General Meeting of the Indian Sugar Mills Association, held at New Delhi, on the 8th August, 1962, Shri D. D. Puri, President of the Association said:-

DETERMINATION OF SUGARCANE PRICE

For a realistic assessment of the problem of the Sugar Industry, it has to be borne in mind that the production of sugar in the world is much more than its consumption. The potential is even bigger than the production achieved hitherto. That is why most exporting countries and some importing ones, notably the U.S.A., have imposed statutory restrictions on cane and beet acreages. In India, however, control of this type would present insurmountable administrative problems because of the large number of growers involved. Here the only way to stabilise the production of cane is to fix its statutory price at a level that is not so low as to be unremunerative as that would inevitably discourage cane cultivation and affect sugar production, and not so high as would divert additional land to cane cultivation and thereby disturb the economy of other food crops. Experience has proved that whereas the price of Rs. 1.44 was too low resulting in shortages in sugar production, the price of Rs. 1.62 was definitely too high and caused the crisis of over-production. The price was raised from Rs. 1.44 to Rs. 1.62 in 1959-60. Within two years, area under cane registered an increase of about 20 per cent in the Northern zone alone. Thus in 1960-61 we produced 3 million tons of sugar when we consumed only 2.1 million tons. This rapidly expanding area under cane unless checked would lead to disaster. It would bring about a collapse of the Sugar Industry and with it wide-spread suffering to the millions of cane growers all over the country. That is why production of sugar had to be statutorily controlled in the last season. We have, therefore, to strike a balance between these two extremes to avoid measures like restrictions on production becoming a recurring feature.

BASIS FACTS OF SUGAR INDUSTRY

The basic concept of a statutory price of cane, irrespective of its sugar content, has been a major obstacle in the way of cane development. It has acted as an incentive in the wrong direction; it has encouraged the grower to grow cane without regard to the sugar content thereof. There is no getting away from some basic facts of life in sugar economy. Let me state these as clearly as I can.

One, sugar is produced in the field; the factory only processes it. If India is one of the highest cost sugar producers in the world, the causes and the cures will have to be sought in the field.

Two, when cane is sold, it is the sugar in cane that is or should be paid for. The rest is trash, literally and metaphorically;

And three, the grower has to be helped into a correct concept of the common objective and provided with the wherewithal to achieve it.

In the light of these observations, I venture to suggest that the recent policy of Government fixing Rs. 1.50 per maund as the minimum price of cane up to a recovery of 9 per cent and increasing it corresponding to increase in recovery is a welcome first step. One might be tempted into suggesting improvements even in this first step. For instance a mechanism could be built into the scheme whereby factories should be compelled to pay a higher than minimum price for cane at a time when competition from gur is particularly fierce and adjust this additional payment later on without in any way deviating from the average minimum price payable to the growers. The Industry, however, has an open mind on the scheme and is prepared to give it a fair trial so as to be able to make constructive suggestions after working it for one season. Later on the scheme of incentives will have to be carried further to groups of growers and ultimately perhaps the individual grower.

CANE DEVELOPMENT

Alongside the quality incentive price scheme, we have to provide the grower with the wherewithal to improve the production of sugar in cane. State Governments raise crores of rupees every year on account of cane cess. They have done so for decades now. By and large these monies have not been spent on cane development. Let it be understood clearly and without doubt that diversion of cane cess to general revenues is carried out almost entirely at the expense of the grower. There is no getting away from the fact that cane cess was first proposed and levied in the name of cane development. The most important single factor that can put sugar production on a sound footing is the utilisation of cane cess for cane development. The biggest beneficiary, if this ever happens, will be the cane-grower. And this step will bring about stability to all aspects of the Sugar Industry, including exports.

I am happy to acknowledge here the welcome step taken by the Punjab Government when they announced that the entire cane cess would be spent on cane development in the State and sincerely hope other States will emulate the example,. . I also welcome the announcement of the Chief Minister, U.P., for setting up a high power committee to suggest ways and means of improving the position of the Industry in the State. I hope this committee will be formed soon, will go deep into the problems and suggest a corrective that could be implemented expeditiously.

SUGAR EXPORTS

Moving now from sugarcane to sugar, I may express that an export target of 5 lakh tons for 1963 is a safe figure to start with. This could be improved upon progressively in the following years. Our national economy is entering a difficult phase. As time passes the foreign exchange position is getting more and more difficult and there is no hope of checking the strain at least in the next few years. We, therefore, must export. Our failure on this front would rob our hard-won freedom of its content and meaning and deal an irreparable blow to our economic growth. We have passed the stage of ifs, buts and whethers and must get on with the job. My appeal to every one concerned is to make an all-out effort to promote exports.

NEED TO PRODUCE RAW SUGAR

For the Sugar Industry, which is relatively a new comer in this field, exports on a large scale will present many difficulties. Take raw brown, to start with. Technologically, switching over from the production of direct consumption white to raw brown which has to undergo further refining may appear to be a retrograde step. It may appear very easy. It may or may not be retrograde but it is certainly not as easy as may appear at first sight. We have to recognise the fact that a large part of the sugar that sells abroad is in the raw state. As more and more countries establish refineries, the raw market is expanding at the cost of white. The seller has no choice. He has to produce what the buyer wants.

This Association has given a very close look to the production of raw brown sugar. We convened two seminars followed by two meetings where the technologists discussed the problems involved. We have received valuable advice and assistance from the National Sugar Institute. As a result all this, it is clear that with the exacting specifications demanded by some of the importers, the switch-over is not an easy matter. Apart from production, there are the problems of storage, handling and deterioration in transit. Nevertheless. I am confidence that with co-operations and understanding at the hands of Government, the industry will and it must make an all-out effort to produce 2 lakh tons of raw sugar in the next season. Personally I have no doubts whatsoever, that the target will be achieved and valuable experience gained for expanding this production in later years.

SUGAR EXPORTS DURING LAST YEAR

During the last year we exported about 2.47 lakhs tons of which more than half was for the U.S.A. and the balance for Malaya and other destinations in East and West Asia and East Africa. This was by far the largest quantity ever exported from India. Apart from affording some relief to the Industry in disposing of its stocks, exports of sugar have enabled the country to earn a substantial amount in foreign exchange. Its contribution to the foreign exchange resources last year was about Rs. 13 crores at a time when the most unsatisfactory aspect of the country's economic situation, according to the Finance Minister, was "the persistent attrition of our foreign exchange resources".

EXPORTS IN THE CURRENT YEAR

This year, we have already exported about 2.25 lakh tons and according to the sales already contracted should ship 1.10 lakh tons before the start of the next session. We have this year also made a first entry into the Canadian market by selling about one lakh tons there. This has given us confidence in being able to develop markets in far-off places also.

U. S. QUOTA

I would also like to make a brief mention of our efforts to obtain a quota for our sugar under the new U.S. Sugar Act. I am sorry that our expectations in this regard have remained unfulfilled and that we have been able to secure only a nominal quota of 20,000 tons per annum for the next two and half years. We have not won a better quota in spite of our having successfully overcome the difficulties involved in shipping, bulk handling and making supplies available at short notice. I make bold to say, the performance of Indian sugar — and we have exported 1.37 lakh tons to the American continent in a short span of three months — will bear comparison to that of any nation in the world, including those well established over decades in this business of exporting sugar to America.

REGULATION OF RELEASES

Coming now to releases for sale within the country, we are at one with Government that a fair and stable price for sugar is desirable in national interest. We recognise that in a large country like ours, transport and other problems tend to create bottlenecks leading to ups and downs in prices here and there. These limitations are inherent and have to be borne with patience, without panic. We believe that regulation of releases can help build a statutory corrective to the forces of instability. We thus state that the Industry should be consulted at the time these releases are determined.

REDUCTION IN EXCISE DUTY ESSENTIAL

Excise duty on sugar was first levied in 1934 at 97 Naye Paise per maund. Over the years it was increased to Rs. 4-12 per maund. In May 1957, this basic excise duty was doubled to Rs. 8.25 per maund. Further, an additional excise duty was levied in December, 1957, in replacement of sales-tax which together with the basic duty, amounted to Rs. 10.70 per maund.

About one-third of the cane grown in the country finds its way to the vacuum pan sugar factory. The rest goes into the manufacture of gur and khandsari. There is no duty on gur. The duty on khandsari is nominal. Vacuum pan sugar alone bears this heavy burden. Whenever there is shortage of cane, the factories are unable to pay the price that khandsari and gur manufacturers can. In times like these, cane which is normally supplied to factories is diverted to gur and khandsari manufacture. This is a national loss, for the factory is able to extract between 33 and 50 per cent more than the gur and khandsari manufacturer is able to. And it leads to idling of capacity on the one hand and an over-all loss of sugar on the other. This phenomona acts most acutely when there is a shortage and aggravates this shortage. This situation leads to control and control in its turn inhibits production.

Sugar has swung between regularly recurring cycles of shortage, control, decontrol, glut and control again. In the three seasons ending 1955-56 we have imported 13.17 lakhs tons sugar and later had over a million tons to export.

A major factor in this instability is the heavy excise duty on sugar and the economic disparity it generates between the different users of cane — vacuum pan factories on the one hand, gur and khandsari manufacturers on the other.

The only way to get out of this vicious cycle is to reduce excise duty on sugar. If the basic duty is reduced to the 1957 level, a part of the loss of revenue would be off-set by increased consumption. And yet the increase in production would easily take care of the increase in consumption, so that our export programme would not be endangered.

If the present disparity perpetuates itself, the Indian Sugar Industry will never be able to get out of regularly recurring cycles of surplus and shortage. Vagaries of weather are bad enough by themselves. The man-made disparity created by the excise duty,

aggravates the climatic variations, in both directions. This keeps every one connected with the Sugar Industry, the cane grower, the Industry, the trade and the consumer in a perpetual state of instability, almost of crisis. Pray do not imagine our sugar export programme can remain immune from these crisis. Excise duty has to be reduced drastically. This Gordian knot has to be cut. No cheaper solution is available.

INSTALLATION OF NEW UNITS — VS — EXPANSION OF UNECONOMIC UNITS

Another matter which I must touch is that before licences for new factories are issued, the small uneconomic units must be allowed to expand to economic capacities. The latter must rank prior to the former.

COAL SHORTAGE

The country has been passing through a period of acute coal shortage due to which the coal quota of the Sugar Industry was drastically reduced to 185,000 tons for the season 1961-62 against its demand for 250,000 tons. It was with considerable difficulty that the Industry was able to carry on the season. For the year 1962-63 a drastic cut was again effected in the steam coal and hard-coke quotas of the industry from 711 wagons to 365 wagons per month. However, I am glad to state that on repeated representations made, the cut in respect of steam coal has now been restored. But the cut on the hard-coke quota has yet to be restored. Hardcoke is essentially required by carbonation factories in the actual process of manufacture without which the factories cannot work. I would, therefore, like to urge upon the Mines and Fuel Ministry of Government of India to reconsider the matter and arrange for early restoration of the cut in the hard-coke quota to enable the carbonation units to have sufficient supplies ensuring smooth and uninterrupted working during the coming season.

S. T. SADASIVAN
GENERAL MANAGER

INDIAN COPPER CORPORATION LIMITED

Address delivered by the Chairman, Mr J. W. Easson, C.A., at the Annual General Meeting of the Company for the year ended 31st December, 1961, held on the 8th August, 1962.

Gentlemen,

The Annual Report of the Directors and the Accounts for the year ended the 31st December, 1961, were submitted to you several weeks ago and I am sure you will agree that the results are not unsatisfactory despite the economic hazards which your Company, in common with many others, experienced during the year. This is the first occasion on which I have had the pleasure of addressing you and I would like to continue the practice of my predecessors and tell you something about your Company's trading throughout the year, the progress achieved and future prospects.

GENERAL REVIEW

From June 1961, Copper prices on the London Metal Exchange have been remarkably stable and the difference between the highest and lowest quotations has been as little as £5 per ton. This compares with a fluctuation of £61 in 1960 and £33 in the first half of 1961. This unusual stability is the result of a balance between supply and demand which has been achieved by some of the largest producers who have reduced their output and given some support to the London Metal Exchange price. The cut back in production now stands at 15 per cent of capacity and there is no reason to suppose that this percentage will not be varied to keep the world Copper output in balance. As long as there is no violent fluctuation in the demand for Copper or labour unrest among the larger producers I expect the price of Copper to remain around the present level of £234 per ton.

The selling prices of your Company's products are linked to the world prices of Copper and vary in accordance therewith. Thus the price stability in the world markets which I have mentioned has been reflected in the steadiness of the price structure of our products in the Indian markets. At the present selling rates and if our production is maintained at approximately the current level the profit margin can be regarded as satisfactory and I think we can view the immediate future with confidence.

WORKING REVIEW

You will have noticed from your Directors' Report that production of Copper dropped by 574 tonnes in comparison with 1960, in which year you will recall production reached a record level. The fall in production during the year was due to a reduction in the number of days worked as the 1960 annual overhaul, when the plant has to be shut down, was postponed to January 1961 and had to be extended by several days in order to modify the Ropeway. A further shutdown of a few days later in the year was caused by a shortage of coal.

I am however pleased to be able to tell you that due to an improvement in the Copper recovery percentage the rate of production was actually higher than in the previous year.

Development and prospecting continued throughout the year but on a considerably reduced scale. Certain essential stores, in particular explosives and drill steel, were in short supply and development had to be suspended or curtailed in a number of areas. Nevertheless I am glad to be able to report that despite the reduction in footage developed, the ore reserves increased by over 110,000 tonnes during the year. These reserves at the 31st December, reached the record figure of more than 4 million metric tonnes.

Last year your Chairman drew your attention to the adverse effect on production of cuts in import licences. Your Company's output of Brass and Yellow Metal Sheets and Circles depends entirely on the availability of Zinc, which must be imported and as a result of the serious foreign exchange position our full requirement of Zinc was not sanctioned in 1961. The output of rolled products, therefore, fell substantially in comparison with the previous year and with India's foreign exchange position still critical, the prospects of any improvement this year are rather remote.

Like most industrial undertakings your Company has been greatly concerned with the serious shortage of power, coal and transport but overall the effect, I am pleased to say, was not as bad as had been expected. Nevertheless the threat remains and it is to be hoped that every effort will be made to bring about a definite and permanent improvement in the supply of these utilities on which all industry depends.

Your Company is fortunate in that it possesses its own generating plant to augment the Electric Power supply from the Damodar Valley Corporation and thereby has largely been able to counteract power cuts. As a result the Company suffered no serious power shortage during the year but I trust that there will be a considerable improvement before the end of 1963 when we shall require substantially more power.

Your Company has suffered an acute shortage of coal throughout the year and despite full co-operation received from suppliers and the Coal Controller it has been impossible to build up stocks which have remained at dangerously low levels. The facts of the national coal shortage are well-known to you all and need no repetition here. Suffice it is to say that energetic action is now being taken by the authorities concerned and while the scarcity will undoubtedly remain with us in the immediate future, I hope that it will get no worse.

The shortage of coal has been aggravated by the difficulties of rail transport and in an effort to avoid a recurrence of a stoppage of work it has become necessary to augment supplies by the far more expensive method of road transport.

The rail transport problem has also been reflected in a decrease in the despatches of finished goods from the Works and in consequence there has been a further increase in Stocks. This accumulation of Stocks is, I am afraid, locking up more of the Company's finances than is desirable but I am pleased to say that there have recently been signs of an improvement in the wagon allotments and if this is maintained despatches should improve and the stocks should come down to a more satisfactory level.

The overall cost of production has increased principally due to the lower output but the facts that raw materials are now more expensive and labour costs are higher and mining is generally being carried out at greater depths, have also added to the increase.

Modifications to and replacement of existing plant and equipment continued according to schedule in con-

formity with the plans to increase production and I am pleased to tell you that alterations necessary to increase the capacity of the Aerial Ropeway were successfully completed during the year.

I am happy to inform you that in place of Consolidated Goldfields of South Africa Ltd. who, for domestic reasons had to relinquish their appointment as the Company's Technical Consultants, we were most fortunate in being able to appoint John Miles & Partners (London) Ltd. as Consulting Engineers and Technical Advisers for a period of five years from the 1st July, 1961, and the appointment has received the approval of the Government of India. John Miles & Partners (London) Ltd. have already been of considerable assistance in the progressing of our expansion programme.

I am pleased to report that good relations between the management and labour were maintained throughout the year.

KYANITE

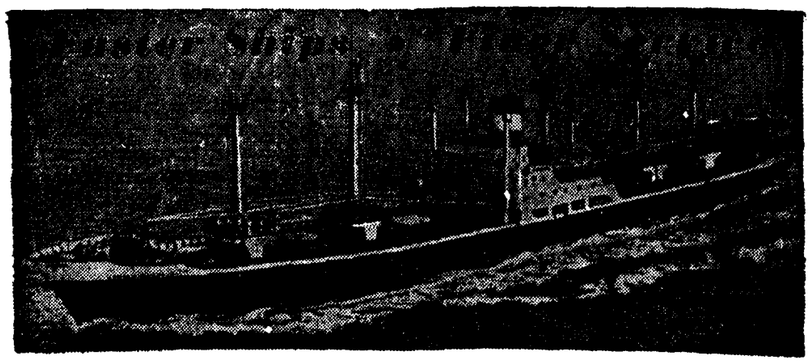
A particularly satisfactory achievement of the year was the settlement, by way of a Compromise, of the long outstanding dispute with our Superior Landlord, the State of Bihar, over our lease to mine Kyanite. Our thanks are due to all those persons who have brought these negotiations to a successful conclusion. I am pleased to report that the State Governmest has granted to your Company a fresh lease of the property to mine Kyanite ore for a period of 20 years from the 1st September, 1961 with an option of renewal. The claim of the Bihar Government on your Company including mesne profits for the period between the date that the old lease expired in 1955 to the date that the new lease was granted in 1961, was Rs. 1 crore which, in terms of the Compromise Settlement, stands satisfied by the Company undertaking to pay agreed annual instalments throughout the period of the lease.

Despatches of Kyanite increased from 21,659 tons in 1960 to 27,460 tons in 1961. The export of Kyanite continues to earn much-needed foreign exchange and with this in view we have increased our efforts to improve overseas trade and we now have contacts in most countries of the free world.

ELECTROLYTIC PROJECT

I am happy to report that work on the Electrolytic Copper Refinery is now progressing satisfactorily. Work has suffered from the shortage of cement and certain delays in the issue of licences for equipment being imported from overseas but these difficulties have now largely been overcome and there is no apparent reason why the Project should not be completed by the end of 1963.

ACCOUNTS



Turning now to the Accounts, the results disclosed reflect the conditions under which the Company has operated during the year and which I have outlined in my remarks to you today. The Profit for the year before providing for Taxation, Depreciation and Reserves amounts to £1,222,163 which compares with £1,307,982 for 1960. The provision for Taxation requires £504,512 while your Directors have decided to place £165,000 to Depreciation and £100,000 to General Reserve. This year £56,250 goes to Development Rebate Reserve.

I mentioned earlier the settlement of the Kyanite Suit and you will no doubt have noticed in the Balance Sheet that a sum of £280,964 has been transferred from General Reserve to make provision against the Decretal amount for previous years. In addition £68,465 has been appropriated out of the profits for the year under review.

The balance available for disposal, including the amount brought forward from the previous year, is £442,561 and your Directors are recommending the same Dividend distribution as last year, namely 27 per cent subject to tax. This will absorb £370,251 leaving a sum of £72,310 to be carried forward to next year.

STAFF

In conclusion, I am sure you will wish to join me in thanking Mr. N. A. B. Hill, the General Manager and the staff at the Mines and at the Works and all the workers for a year of loyal and industrious effort.

Why CIMMCO Sakamoto

BECAUSE

★ AUTOMATIC LOOM IS A MUST FOR QUALITY TEXTILES
★ 62% OF COUNTRY'S AUTOLOOMS ARE SAKAMOTO TYPE
★ 25% OF COUNTRY'S AUTOLOOMS ARE OTHER JAP. TYPE

ALSO

★ THESE ARE STURDY IN DESIGN
★ SIMPLE TO SET-UP AND OPERATE
★ TRIED IN COUNTRIES THE WORLD OVER

AND

TECHNICAL COLLABORATION COMBINES A LOOM BUILDING EXPERIENCE OF 18 YEARS AT CIMMCO WITH OVER 34 YEARS IN JAPAN.

Specially developed technique of boring frames on assembly ensures of perfect allignment. Improved temple cutter, end cutter and latest mechanised warp stop with efficient brake ensure faultless weaving continuously with minimum efforts.

Masters of Space

THE tremendous feat of Russia's "twin" cosmonauts who have filled the world again with wonder at the capacity of men to triumph over nature has led to universal exaltation in the wisdom and courage of *homosapiens*. It has also led, less happily, to invidious comparisons of political environments in which these tremendous feats of intellect and endurance are accomplished. Sir Bernard Lovell, Director of Britain's Jedrell Bank Radio Telescope Station, credited with being a great neutral observer of these operations, allowed himself to be drawn into the vortex of these Cold War reflections when he said that the Russians were now masters of space and could knock down American 'spy' satellites. It is obvious that the West considers the wonderful achievement of the Russians a new military danger, resulting largely from the capacity to accomplish in space with precision many tasks hitherto believed impossible. Observers in India have not yet been able to grasp either the technical scientific advance implicit in these flights or their military potential. It is probable that the scientific side has been exaggerated, and the military side underestimated in this country. There is ground for believing that the increased secrecy with which the Soviet Union guards its new techniques is a measure of the military possibilities that they contain. If so, the original exaltation of the world at the wonders of spacemanship must be tinged with a new sadness that our methods of destruction are still running ahead of our capacity for peaceful discovery and self-preservation.

This is not, however, the time to look morbidly on the terrible possibilities of new vistas of spacemanship which Soviet daring and skill have opened out to an astonished and admiring world. The demonstration that men could remain in orbit for four full days in a state of weightlessness seems to prove that the flights to the moon believed a decade away might take place within two to three years. The *rendezvous* which seems to be another purpose of this flight does not seem to have been an equally conspicuous success, since, while close contact was once achieved (and the reports say that the two cosmonauts could see one another's spaceships), the control of proximity is obviously not within immediate reach. Nevertheless, what the Russians have done is far and away the highest feat in spacemanship yet accomplished. If it had no immediate military significance and was capable only of assisting the paths of peace and discovery there would be no reason why the Western world should not applaud much more loudly than it has done.

In the Indian Union, whilst we pay our full tribute to the wonderful success of our Russian friends, we must not fail to remember that the vast military potential of satellites is being used by both sides to develop new sources of espionage as well as of attack and defence. Convinced as we are that nuclear tests serve no useful purpose, in that they engender an endless chain-reaction of destructive experiments, one might perhaps argue that we should view with equal fear the wonderful discoveries of space which conceivably might have the same long-run disastrous effect upon the relations between nations. It is possible at this moment to wonder whether or not the wonders of space are being bought at too heavy a price for the human race. There are many, at least in India, who would feel that the spirit of men exalted unduly by their own capacity to fly like gods in outer space might be humbled by their notorious incapacity to keep their rivalries, scientific and military, within the bounds of wisdom, which they have applied so effectively to other ends.

A Great Success in West Irian

THERE is no one in India who will not rejoice as, indeed, has most of the world, at the West Irian Pact signed last week by Dr. Subandrio, Indonesia's Foreign Minister, and Dr. J. H. van Rougen and Mr. C. W. A. Schurman, for the Netherlands. It was appropriate that the signatures to this historic document were affixed in the U.N. Security Council Chamber, for it is, undoubtly, a U.N. - created peace. By a happy accident, this remarkable success of the U.N. Secretary-General has come on the eve of his departure for a historic visit to Moscow. Those who know the trials of his predecessor may well, in congratulating him on his great success in West Irian, wish that his present laurels might be a forerunner of many difficult negotiations that he will be called upon to undertake.

A United Nations Secretary-General, like every great dignatory, needs success even more than imagination and hard work. It is still true in the international world, whatever is true elsewhere, that nothing succeeds like success. But U Thant will be the first to give the main credit to Mr. Ellsworth Bunker, who patiently over many months worked at the details of what are appropriately now called the Bunker proposals, which contain the elements of the solution which finally obtained. Mr. Ellsworth Bunker is widely remembered here as U.S. Ambassador to India and thus by reflection there is large Indian interest in the Bunker proposals. This is the time when his many friends in India would wish to convey to him their warmest congratulations on a great mission of peace, patiently and most skilfully accomplished.

A cease-fire has now been in operation, and with a small military unit of a thousand men to be drawn particularly from Malaya with only six Indian officers to help, it is believed that peace will be maintained over an area three times the size of England. The small United Nations force will be paid for, as is appropriate, by the Netherlands and Indonesia equally. The Bunker proposals call for approval in the U.N. General Assembly of a Joint Dutch-Indonesian resolution

for transfer of the control of the Island to the Secretary-General, who, immediately upon the adoption of the resolution by the Assembly, will depute his representative to take over. Within one year all the Dutch officials are to be withdrawn from the island's administration and for the second year the administration is to be manned by officials of non-Dutch and non-Indonesian nationality. At the end of the second year the administrative control is to be passed over to Indonesia, subject to the stipulation that before 1969 the Indonesian Government will hold a plebiscite of opinion of Papuans. Thus has the image of self-determination been given concrete form and shape.

No one on this day of accord wishes to consider the possibility that the Indonesians will be asked to withdraw, after the plebiscite, and thus it looks as though a stable situation has at last arrived in an area held in dispute for no less than thirteen years. It is in work such as this that the constant striving of the United Nations for peaceful solutions commends itself to the people of Asia, who have too often cynically denied its capacity and power to bring peace where there has been dissension and strife.

Safety on the Railways

IT is idle to pretend that the confidence of the railway user in the safety factor in railway operations has remained unshaken despite the heavy recurrence and high toll of accidents to railway trains, with an ominous accent on accidents to passenger trains, during the last seven months. But by an extraordinary twist of reasoning, Mr. Swaran Singh tried to impress upon the Lower House that the gravity of the recent accidents was being magnified out of all proportion to the truth of the situation. He initiated the debate with the tactless and erroneous observation that the incidence of the accidents that occurred in the recent past was light as compared to what happened in the earlier years not quite remote and, with a dryness that so ill-fitted the occasion and the mood of the House, the quoted extensively from the official statistics to lend corroboration to his thesis. This made an indignant House all the more indignant, driving it to demand the Minister's resignation and the imposition of capital punishment on the culprits.

Facts give a lie to Mr. Swaran Singh's thesis. During the first decade of planning, the year 1956-57 stands out as the worst in casualties with a toll of 276 killed and 335 injured. But the record of the first seven months of 1962 surpassed this hazardous peak with its incidence of casualties—180 killed and 710 injured, out of them 136 grievously injured. To come to still another exacting toll, in the seven weeks between June 23 and August 15 this year, 23 accidents took 74 lives, letting 162 escape with injuries. Surely the truth of the situation demanded precision in facts. The grave concern felt in the country over the serious erosion of safety in railway travel urged that the issue of human failure as a major cause of the accidents should be faced boldly and remedies discussed for its elimination fearlessly.

But the Railway Ministry's, rather the Railway Board's, supine attitude of evasiveness when it comes to confronting labour was exhibited again on this occasion. It is nobody's case that in railway traffic operations acute stresses and strains of duty, particularly night duty, do not produce quicker fatigue than in many other industrial operations. Work schedules and relieving staff are being provided on a progressively rationalised scale to counter fatigue. The Railway Minister is rightly undertaking an investigation into the prevalence of fatigue during duty and he was also right in declaring that the proposition of providing facilities for change-over in engine crew at non-scheduled points was being actively considered. Curbs must also be put on the confirmed tendency to create overtime for earning allowances in spite of fatigue. When all this is conceded, the blunt truth remains that, in the official analysis of railway accidents, fatigue has not emerged as a contributory factor worth the name.

There was a good deal of emphasis placed on the condition of the rolling stock and references were made to grievances against obligation to operate locomotives with defects. Several of such complaints may be true, but the ratio of defective engines being continued on the track cannot on any reckoning but be small — negligible. Efficiency and turn-over at the workshops have improved considerably and this trend is being sustained. During the decade beginning in 1950-51, the proportion of locomotives awaiting or undergoing repairs at the shops was reduced from 18.95 per cent to 14.90 per cent of the total on line daily. The corresponding figures for freight wagons are a reduction from 7.28 per cent to 3.79 per cent and for passenger coaches they are a drop from 14.17 per cent to 8.07 per cent. To lay the blame on the rolling stock is to harp on the old order of things which has ceased to exist on that scale. On the contrary, replacements and additions to stock represent modernised engines and vehicles with superior efficiency. The condition of the track, however, is not satisfactory and furthermore track usage, as measured in train miles per running track mile per day, increased during the decade from 16.5 to 20.2.

If accidents are to be prevented and minimised to the extent it is humanly possible to do so, there can be no escape for the Railway Ministry from the stark reality that human failures must be dealt with drastically. Human failure is a significant factor responsible for 40 per cent of the accidents over a period of sixteen years covered by their analysis. It was astonishing to find the plea raised that the increase in the staff is not proportionate to the increase in the volume of traffic. No such direct correlation can be presumed between the two. Additional staff is required at points where additional pressures are created by the increasing traffic and not all over the railway systems. This is not to suggest that isolated points remain understaffed. But the Railway Ministry is liberal in its estimates of additional requirements of staff and cases are on record where the traffic anticipated does not materialise and surplus labour of a spectacular size is maintained to be absorbed in the following years. It is a matter of common experience that in the recent past efficiency and discipline have figured as casualties in railway operations. To evade this challenge is to accept defeat. But can defeat be accepted where human lives and property are concerned?

Guest Editorial

Education—for Whom and for What?

By PEGGY HOLROYDE

[This article has been specially sought to indicate where a fetish for academic excellence by itself can lead—Ed.]

A PECULIAR malaise has afflicted the British spirit until recently. This began with the last election appeal of never having had it so good and was reinforced by the ethos of the "I'm all right, Jack" attitude. But suddenly we have sprung to life again with a political groundswell of dissatisfaction taking shape in a remarkable liberal revival. The momentum gathers, so much so that a Cabinet guillotine has thrown forward the youngest and most intellectual Minister of Education we have had in a long time. This is symptomatic. If there is one subject which exercises more passion and soul-searching unease in Britain today it is education.

A political reshuffle, however, does not in itself constitute a safe sea-wall against the force of the incoming tide — and the ordinary Britisher has just about had enough of what still amounts to a clear-cut class differentiation in educational opportunity. Dr. Michael Young, Cambridge sociologist and founder of the Advisory Centre for Education, recently commented on this phenomenon in the course of a review of Anthony Sampson's new and penetrating dissection of our body politic—The Anatomy of Britain. He pointed out that the traditional ruling classes, coming from the aristocracy, public schools and Oxbridge, continue to dominate and stultify government with their amateurishness, their cliques and their resistance to innovation. These old style rulers, Dr. Young goes on are out of touch with the new people and the new forces coming to the fore in science, education and industry.

Only a few days later this observation was further underlined by Mr. Macmillan knotting the old schooltie (as the *Daily Mail*, erstwhile Conservative paper now showing signs of defection, astringently put it) with considerable fervour. Among twenty four new appointments seven were Etonians, three were Wykamists, two were Harrovians and eight more were from other public schools. These reinforcements were gathered in to a Cabinet already manned by six resident Etonians.

It is precisely this stratification at the top and the consequent repercussions at all levels of English society especially, in comparison with American, Russian, European or even for that matter Scottish, that perturbs a growing number of people here who regard good education for a wider spectrum of children as an essential component of healthy democracy.

But attidues change more slowly than policies and overt methods of reform. It will take a long time to dislodge an inherent and distinctive attitude bred of the Oxbridge tradition—that is, a deep-seated suspicion of real education for the masses. Education in depth, yes. Education in the mass, no. What both America and Russia proudly proclaim—a free and high-geared educational programme leading on to widespread educational facilities for an eventual fifty per cent of the population—we in no way wish to emulate even if financially we had the resources to do so. On the part of both academic and Government leaders there is this unconscious, hardly-expressed belief that what Oxbridge still stands for—education for the meritocratic elite—is right and proper.

Oxbridge stands upon the pinnacle of our educational edifice. All the nerve-racking grind of an exam-ridden process which we now see from the eleven-plus in State schools through the Common Entrance in the public schools, the General Certificate of Education, Ordinary and Advanced levels, are hurdles to be taken unhesitatingly up this steep gradient. As education progresses to higher reaches the path narrows into the dangerous groove of over-specialisation in order to squeeze through the passage of university entrance. Of course this is happening in all the technologically advanced countries; nevertheless the average brain is catered for by them and acknowledged as of use to the community in a way that we still regard only the first or second class mind.

The eleven-plus examination in the State school system is the agonising result of this attitude and our greatest bugbear to date. It is a stumbling block of undemocratic magnitude and increasingly arbitrary (depending more on where you live than on your IQ) in its selection of pupils for grammar schools. Education still being a local authority affair, some counties allocate far more finance towards educational expansion than others. Therefore more finance and more places can be allocated to grammar school education. Even for those who can afford to break the system by opting out and using the public school (so anomalously named) neglect of the school building programme and of the teaching profession has led to a tremendous demand on even these schools. Here Common Entrance is the same nightmare as the eleven-plus, creating another invidious meritocracy. I have been reliably told that to gain entrance to one of London's best private schools for girls, applicants have to achieve an average of 85 per cent in every subject. This makes nonsense of true education and creates a snobbery of its own which is hard to eradicate in later life and which sees no merit in the third or fourth class mind at University — yet often these very people turn out to be the backbone of the community.

If ever there was a prime example of this it is Sir Winston Churchill. Looking back on his early academic career, his hatred of formal learning, and his inability to acquire Latin, it is salutary to speculate on how he would have fared with the hurdles we now place in the way of the present generation.

Fortunately a new generation of educationists are in revolt against the Oxbridge view of the

academic life. Directors of Education at London University, Reading, Manchester and Cambridge have all in the last few months deplored the existing rat-race. Croydon Borough Council have thrown a bomb into the State school edifice by passing a scheme for the setting up of Sixth-form colleges to break the invidious segregation at 11. This Education Committee was perturbed at the wastage of those children denied grammar school places who show academic promise in later maturity; their plan is to create high schools for all with autonomous Sixth-form colleges for those who have the aptitude and the desire to continue their higher education. As Mr. Lionel Elvin, Director of the Institute of Education at London University, pointed out in his advisory role to the Borough Council, there is nothing wrong with selection so long as it is self-selection — in fact the only answer is to provide many more better grade schools for all children up to the age of 15. If then they show no academic leanings, apprenticeships in industry and technical colleges can provide the equality of status which is at the moment so lacking, creating a desperate inferiority among those streamed away from grammar and public schools.

The Crowther report of 1959 (still unimplemented) stated that there was some danger "of English education lagging behind the times .... We do not think that the figures of about 12 per cent of the age group still in full-time education at the age of seventeen and of 6 per cent at twenty are nearly good enough. The education that is provided for the great mass of children is inadequate both in its quality and duration." The Robbins Committee is still hearing evidence on the whole subject of further education, but at the moment one has the disturbing sense of niggling restraint, of diminution and stunted growth with many teen-agers haunted by a vague sense of humiliation and apathy born out of inferiority created by the system. "We are the rejects" is the succinct way a class of secondary moderns put it to their new teacher.

Obviously the moral of this is that we have to spend far more on education than we have been willing to do in the past if we are to widen the opportunities for more children of every background to experience better education. And even from the point of view of expediency we have to do this if we are to train the scientists and technologists to expand the nation's industrial capacity. Otherwise we shall find ourselves in a vicious spiral without the wealth to plough back into the intangible cultural aspects of our national life.

Fortunately in Britain public opinion is mature enough to exercise itself with remarkable elasticity. A group of parents discovered that it was easier within present credit restrictions to build a cinema or a Bingo hall than a new school. They did the very British thing of forming themselves into an Association for the Advancement of State Education in order to deal more effectively with their local education authorities. Carping complaint without co-operative effort makes of democracy an acrimonious and negative freedom. To anyone who has known Asia and the lethargy of individual effort this is one of the more rewarding aspects of Western life — people can and do come together in order to force authority into action rather than directing verbal broadsides alone — a private and besetting sin of the individual in India.

So the ferment has grown to the present state of widespread discontent. And here is the crux of the matter, of concern as much to Indians whose present educational system rests upon foundations laid by British thinking over one hundred years ago, as to English people. Perhaps Oxbridge sufficed in the past for a race of administrators and highly cultivated guardians of Empire. But this is the age of technocrats and astronauts born of illiterate peasant stock, of American Cabinet officials such as Ribicoff and Rusk whose parents were poor immigrants, of unorthodox Afro-Asian politicians moved by different thought processes and other values of scholarship, of inquiring young Russians increasingly reaching to the fringes of dissent, and their American counterparts who regard education as a vast humanising process.

To what end then, we ask ourselves, should true education be aimed? This is our problem, but it is yours too in India. All schooling leads in the final analysis to the product of good citizen who understands the world in which he lives and recognises the forces that are at work in shaping the future. Ideally this should be so. At the moment it is not. But there are signs that the spirit of our new universities only just beginning to emerge upon our island scene is in tune with the needs of the time. Sussex, York, Norwich and Essex are all formulating exciting and dynamic new ideas. These new places of learning may well shape a whole new educational pattern for Britain — a pattern which is at the heart of the whole painful evolutionary process that is unfolding itself in India.

ANNOUNCEMENT

The following Annual Numbers of **THE EASTERN ECONOMIST** are available for sale. Special concession may be given to educational institutions, libraries and students, if a single order exceeds Rs. 50|-.

1.	India & the World and India in 1950	Rs. 5|-
2.	A Social History of the Indian People & India in 1951	Rs. 5|-
3.	India & the Free World and India in 1952	Rs. 5|-
4.	India in Asia & India in 1953	Rs. 5|-
5.	India in South East Asia and India in 1954	Rs. 5|-
6.	India & the Communist World and India in 1955	Rs. 5|-
7.	India in 1975, A Study of the next Twenty Years & India in 1956	Rs. 7.50
8.	India & the Middle East and India in 1958	Rs. 7.50

THE WEEK'S NOTES

Rajasthan

THE STOP-GAP

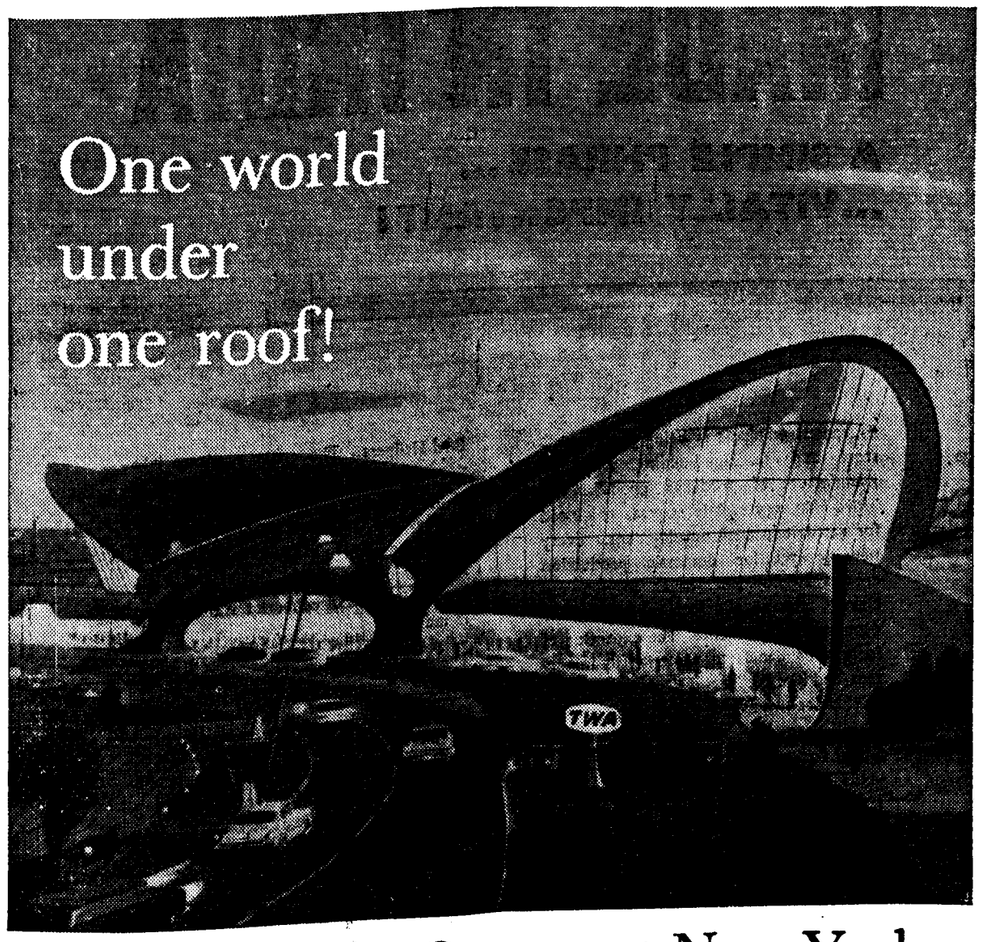
AFTER A protracted period of tiresome activity and indecision a "solution" has been found to resolve the crisis in the Rajasthan Congress Party as well as the Congress Legislature Party. The threat which was held out for some time past about the appointment of a tribunal to reopen the enquiry against Mr. Kumbharam Arya was removed when the High Command eventually came to the decision that any further enquiry would be pointless. This was a realistic recognition of the consequences likely to ensue in case matters were allowed to be worsened still further by an enquiry involving, perhaps, several defections. Mr. Arya has bowed before the Disciplinary Committee and resigned his membership of the State Congress Executive Committee as well as the more important Pradesh Elections Committee. This action on the part of the rebel dissident leader should not be misconstrued as a surrender in the scramble for power. He and his group are biding their time. When the elections to the State Congress Executive will be held in November next, Mr. Arya and his supporters will use their freedom to wage a bitter struggle for the capture of key positions in the Party organisations. What may follow thereafter, it is difficult to speculate. But the revival of internal party strife seems to be a high probability.

The Rajasthan Legislative Assembly is being convened for a short monsoon session sometime in the middle of September. Although the internicine warfare has been stopped for the time being, Mr. Sukhadia's cabinet must be prepared for repeated onslaughts from the opposition groups and parties in the legislature. Already the administration of the State has been demoralised by the uncertainty prevailing in the Legislature Party as well as inside the Ministry where members of Mr. Arya's group have been lodged. This intolerable situation needs to be ended. For that purpose Mr. Sukhadia has sought the permission of the Central Parliamentary Board of the Congress Party to obtain a vote of confidence of the Legislature Party in his leadership. As we go to Press, the decision of the Board, which was likely to be taken up on August 22, is not known; but Mr. Sukhadia would get the permission he seeks. There are thick reports of a "reshuffle" of the State ministry. The probabilities are that it will not be confined to a change in portfolios, but will significantly take the form of the expansion of the cabinet to ensure stronger support to the Chief Minister.

C.P.I.

A MIXED BAG

THE RESOLUTIONS adopted by the National Council of the Communist Party of India at its recent session held at Hyderabad, have produced a mixed bag of the Party's attitudes to the Government. At long last, the CPI has realised the futility of trying to swim against the current with a tenacity for an anti-national ideology and changed its China policy. The resolution on the subject is free from any equivocal positions and it extends unqualified support to the Prime Minister's policy on China. There is, of course, a compliment paid to China for her readiness to localise the dispute, not to allow it to assume wider dimensions and to reopen negotiations. But what is significant is that there is no more any tacit or disguised support to China's territorial claims. The Government's policy to go headlong with the defence build-up, while the olive branch is being held out, has been endorsed by the CPI.



In regard to prices and taxation, however, particularly the latter, the policy of an agitational approach, which appears to have been approved in the resolutions on the two subjects, discloses the ulterior purpose. The ground which the CPI has so damagingly lost in the last general elections is being attempted to be recovered by this unusual tactic against taxation. The burdensome rise in prices is blamed on the "monopolists, bankers, landlords and speculators" in the hackneyed communist style. While the State sector is exonerated from responsibility in this behalf, there is a thrust at the Government for making a bad price situation worse by imposing excise duties and sales taxes on a wide range of consumer goods. This is a concealed imputation of responsibility for higher prices directed against the Government. Taxation has been the centre of attack in sectors where it impinges on the incomes of the masses. But if taxation is to be opposed, the Party has to furnish an explanation how financial resources for planned development are to be raised internally. Verbal support is lent to the principle of no opposition to planned development, but opposition is aimed at the burden of taxation on the working people. The public has a right to demand an unequivocal exposition of the CPI's policy on indirect taxation which is bound to emerge as the source of increasing importance in future tax-revenue. It will be no surprise if the no-tax campaign recommended in the resolution will be concentrated, in the first instance, in Kerala, Andhra Pradesh and Orissa where mid-term elections are approaching.

Kenya

TRIBAL PRESSURES

IT IS not without significance that Mr. Jomo Kenyatta has somewhat despairingly uttered the warning that the "Congo signs" are beginning to be ominously visible in Kenya. This deplorable development, if it takes any shape at all, will be due to the domestic political factors alone. These factors are strongly rooted in the tribal rivalries and mutual suspicions. Nevertheless, the timing of the upsurge in the tribal pressures cannot be without an explanation. That explanation appears to be no other than that the Boundary Commission got off to a start in its delicate and difficult assignment on August 9. This Commission has been charged with delimiting the boundaries of the six regions which will constitute the administrative units. The constitution envisages a wide measure of autonomy to the regions as a safety-valve against the emergence of any dictatorial trends at the Centre in the name of a strong national government. The different tribes will no doubt strive to secure the delimitation of the regional units to ensure their individual rights and safety. Even while the Commission has now only touched the preliminaries of its work, it is being pressed with diverse kinds of demands.

The target of attack in this crucial phase of the demarcation of the regional boundaries is the dominant majority tribe, the Kikuyu led by Mr. Kenyatta. This is also the tribe which leads the majority partner in the coalition government — the Kanu. If within such a short time the minority groups and tribes are making themselves bold to raise protests against Mr. Kenyatta's authority, it is perhaps due to the apprehensions generated by some of his actions in the Government. The labour and youth wings have also joined the present resistance to what they call Mr. Kenyatta's dictatorial attitudes. The Luo tribe, which owes its allegiance to the Kanu, has declared its support to the party as on a basis of trial, depending on a modification in the policies of Mr. Kenyatta against which it nourishes its main grievances. It has threatened defection in case the modifications are not brought about. In view of the regional reorganisation, it may be easy to exaggerate these tensions and pressures. Ultimately, however, the well-being of the nationals of the country unity and cohesion.

TWA's Flight Center at New York

"To express the excitement of travel"—Eero Saarinen.

TWA presents the most advanced airline terminal of the jet age!... its soaring roof and sweep of glass enclose a hundred new ideas to speed your departure and arrival...like TWA's fast new jet check-in and boarding, and automatic baggage delivery. International shops are here Comfortable lounges. Glamorous restaurants.

TWA's Flight Center is the only airline terminal where routes from Europe, Africa and Asia are linked to 70 cities in the U.S.A. Truly one world under one roof!

U.S.A.-Europe Africa-Asia depend on TWA

The Third Five Year Plan
Bird-Heilgers' part in it...

MADE IN INDIA

A SIMPLE PHRASE...
...VITALLY IMPORTANT!

"...special emphasis is being placed on... steel and machine-building and the manufacture of producer goods". The Third Plan very rightly stresses the need for rapid industrial development. Every new project for domestic production creates employment, saves foreign exchange, adds to the national striving for economic independence. The expansion of indigenous manufacture is critically important, and Bird-Heilgers is deeply committed to this decisive aspect of the Plan.

Steel for a solid industrial base

Steel is the very life-blood of an economy. Industries, utilities, homes, all depend on steel. Steady steel production depends, in turn, on the uninterrupted supply of minerals to the nation's blast furnaces. Bird-Heilgers supplies these minerals. Between 1957 and 1961, the group's output of minerals—coal, dolomite, iron and manganese ore and limestone—shot up almost 100% to well over 6,000,000 tons. The group will continue to help meet demand...to feed the blast furnaces with the minerals they must have

"Made in India"—by Bird-Heilgers

A vast range of products, hitherto imported, are now manufactured in India by Bird-Heilgers. The group produces jute goods, paper and board, water treatment equipment, air compressors and springs, castings and fabricated steel. The refractory manufacturing plant is the largest single unit in the East. A factory for the production of coal washeries was the first in India.

The group's engineering units are extremely flexible. They contribute, with equal facility, to projects as far removed as blast furnaces and ceramic plants. Planned diversification finds the group engaged in shipping, insurance, exporting and importing. The agency department handles everything from heavy capital equipment to light consumer goods.

Towards a self-generating economy

A phrase on everyone's lips. A phrase that finds concrete expression in the urgent activity of an economy on the move. Bird-Heilgers reflects the nation's striving. The group is alive to the problems of a growing economy. It deploys the full potential of a century's resources, technical knowledge and executive skill to broaden its activities...increase domestic production...join in the national drive to economic independence.

The World Abroad

INSIDE ENGLAND

By

ODYSSEUS

DOES BRITAIN FACE a glorious past? Is she a played-out country of stately homes in advanced stages of picturesque dilapidation, peopled by colourful, anachronistic aristocrats and snobbish country gentlemen, educated in barbaric public schools, a backward looking nation, lacking the drive to be in the vanguard in this age of electronic industry and atomic power?

These are some of the questions in Anthony Sampson's new book "The Anatomy of Britain" (Hodder & Stoughton. London. 1962. 35sh.), which is today's best seller in the UK. My guess is that it will be widely read throughout the English-speaking world, because it is topical, packed solid with inside information about personalities in parliament, the political parties, the press, the cabinet, churches, schools, universities, civil service, the City, business, industry, science, trade unions, nationalised industries, and so on: It is well written in the lively personal style popularised by John Gunther's "Inside Europe" and "Inside the USA". With all British public life as his landscape, some parts are inevitably better than others, but as a guide book to contemporary Britain, the book, as a whole, is well worth reading.

Mr. Sampson offers no solution of his own for the UK's lack of dynamism, but his sympathies are obviously with the Labour party rather than with the Conservatives, and his general tone implies that Britain's future would be brightest with Labour in office.

ETON AND OXFORD V. "THE PEOPLE"

Mr. Sampson rightly argues that a nation can only forge ahead by the constant adaptation that leads to change and growth. In his view, however, the domination of class distinctions and caste taboos, which uphold snobbish Victorian ideals of the "gentleman" and nostalgic reverence for a vanished imperial past, impede innovation. The traditional ruling classes, coming from the aristocracy, the upper middle classes, the public schools typified by Eton and Harrow, the ancient universities of Oxford and Cambridge, and the world of exclusive London clubs, all combine, Mr. Sampson thinks, to stultify progress by their ideals of the amateur, their old boy networks and their instinctive resistance to the new forces coming from the "people" and from the "red brick" universities, with their educational emphasis on science and their social emphasis on egalitarianism.

Now, although Mr. Sampson greatly exaggerates the snobbery, reactionary attitudes, and lack of adaptability of the British upper middle classes, I readily concede that these weaknesses exist. They are not, however, as you would suppose from Mr. Sampson's pages, peculiar to the UK. All societies resist change. All have their classes and vested interests, not least the USA, usually upheld as "classless" and ever restlessly changing. If you don't believe me, read John Gunther's "Inside the USA", which shows the extent to which all Americans seek to conform to the pattern of "regular Americanism." See, for example, what John Gunther says about "social pressures" on page 266 of "Inside the USA" (H. Hamilton. London). See John Gunther and also Philip Wylie ("Generation of Vipers") on anti-semitism in the USA—another symptom of reaction and conformity. See, again, Mr. J. K. Galbraith's witty appraisal in his "Affluent Society" of the conservatively minded majority in the USA, where "originality is taken to be a mark of instability" and where "the bland lead the bland."

However, to suggest that you find resistance to change in all countries does not dispose to Mr. Sampson's belief that dynamism in the UK is frustrated by British reactionaries.

How, then, would the Labour Party make the UK dynamic? For them, the panacea is to abolish what they regard as privilege, particularly in education, and to spread the ideals of egalitarianism, "fair shares" and Socialism. Mr. Sampson speaks of "the new and potentially exciting institutions which control large areas of the future" and (apparently in all seriousness) offers among examples of these "new and potentially exciting" institutions — the nationalised industries! He blames the Conservatives for tarnishing the ideals of public service (which he asserts, inspired these industries under the Labour government) by beginning at long last to insist that they shall try to lose fewer millions and aim at a profit. He observes that the state has been landed with many of the most unprofitable industries in the country, "because they have apparently become unworkable by anyone else." This contradicts his argument that it is the Eton and Oxford ruling classes who are impeding innovation. If the coal mines and the railways, for example, cannot be made to pay by anyone else why should they be kept alive, as museum pieces, by the state? As I said here on June 22, if you regard the social "establishment" in the UK as a moth-eaten survival, you must recognise that the economic "establishment" is a vigorous political force, alive and kicking hard. The economic "establishment" is largely made up of obsolescent industries surviving from the Victorian era, which employ so many thousands that governments shrink from letting them be pushed aside by new and expanding industries. This is because the unions fear unemployment, although since the war unemployment has averaged 1.7 per cent a year and employers have never ceased to bid against each other for workers.

The Labour party would like to substitute the new state-sponsored, comprehensive modern schools for the traditional public schools. Mr. Sampson asserts that the public schools "remain as they were designed by the Victorians, a device by which the new rich can become absorbed with the old rich, and the sons of tradesmen can be removed from the taint of trade. But in contemporary Britain...what is needed is to turn the sons of gentlemen into businessmen: the sons of amateurs into professionals." The Labour party believes that the future lies with the state schools, which provide what has come to be known as the "meritocracy"—the new cast of men "owing nothing to family influence or money, sifted out by intelligence tests, separated from the rest, and groomed for positions of influence." The "most spectacular" of the UK's postwar educational experiments has been the state-maintained comprehensive schools which group all kinds of children under one roof for secondary education. They have "become firmly associated with Socialism and egalitarianism."

Now, I am not arguing that the traditional public schools are fully adjusted to modern requirements. No institution in being is ever perfect. It is possible that the UK's future does lie with the classless, state con-

trolled, comprehensive schools. Nobody knows. There is only one way to find out and that is by trial and error. Let the public schools and the comprehensives continue to compete for pupils. In this contest, the dice is loaded in favour of the state schools, which are free, and against the public schools, which ask substantial fees. Whichever of the two systems prevails will thus have been proved to correspond to modern requirements —as defined not by planners and bureaucrats but by parents.

THE HISTORICAL BACKGROUND

If Mr. Sampson will read Vivian Ogilvie's scholarly history, "The English Public School" (Batsford. London. 1957. 30sh.), he will find that an outworn educational system has, in the course of English history, several times been transformed by private enterprise responding to demand. Grammar schools were originated in the Middle Ages by the Church as training centres to meet the pressing need for clerks in minor orders, the professional class of the day from which civil servants, lawyers, teachers, doctors, and others, were recruited. The essential professional qualification was a knowledge of Latin, which was the language of administration and of international communication. Then, after Henry VIII's dissolution of the monasteries, many of these schools disappeared. The Tudor period was one of great commercial and industrial expansion, and the rising class of merchants, yeomen, lawyers, and country gentry, were active in launching new schools in place of those destroyed. The grammar schools were mostly re-started by the initiative of local people, who formed committees and enlisted the aid of wealthy businessmen.

Then, in the course of time, the grammar schools gradually lost touch with current needs, as Engli h pushed out Latin. The 18th century saw English education at its nadir, just as the industrial revolution began to create new problems and requirements. A new emerging middle class found the grammar schools fossilised by ancient statutes which prescribed an obsolete curriculum. They took the obvious step: they started new schools in accordance with their new ideas. Dr. Arnold of Rugby was but the best known of a host of reformers and innovators. It is hindsight to criticise the new public schools as "class" foundations. There could, as E.L. Woodward says in his "Age of Reform" (Oxf. Univ. Press. 1962), be no question in the early 19th century of secondary education for the poor because no elementary schools existed as yet. The technique itself of elementary education was unknown. Secondary education was therefore confined to the middle and upper classes. The reforming headmasters provided different kinds of education in different schools.

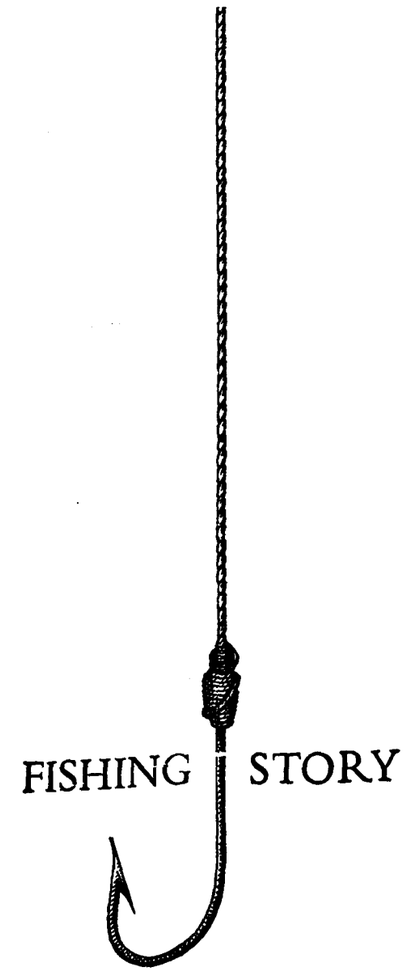
Those parents who disliked a particular kind of education were neither asked to pay for it, nor to assist through taxation in enforcing it on others.

Thus, the public school system was evolved, by trial and error, to meet the contemporary demand. The difference today is that, if they could, the Labour party would transform all existing schools into their "comprehensive" schools, and by allowing no other kind of schools, force all pupils into one standard machine.

That the British social "establishment", the products of the older public schools typified by Eton and Oxford, are resistant to change is true. But every country in the world has its established social system, which dislikes innovations. If, therefore, Britain is lacking in dynamism today, we must look elsewhere for the major causes. This we will do next week.

4½%

ORISSA GOVERNMENT LOAN, 1974



Issue price Rs 99.50 per cent.

Opens on the 27th August, 1962.

The loan will be closed as soon as a total of Rs 7 crores has been subscribed and in any case not later than the close of the business on the 1st September, 1962.

Applications for the loan will be received at (a) the Offices of the Reserve Bank of India, Bombay, Calcutta, New Delhi, Madras, Nagpur and Bangalore, (b) the branch of the State Bank of India at Patna, (c) the branch of the State Bank of Hyderabad at Hyderabad, (d) the branches of the State Bank of India located in the State of Orissa, and (e) the Government Treasuries and Sub-Treasuries.

Full particulars can be obtained at any of the Offices mentioned above.

Despite every care, a driller's "string" of steel drillpipe may occasionally break and his heavy tools fall to the bottom of the well. The expensive process of recovering the lost equipment is called "fishing". Many types of recovery tools are on hand at every well site to deal with such an accident — some gripping the fish with steel fingers, some screwing into it with a fine tapering thread, some using a powerful magnet. Other tools, such as the junk basket, will collect small pieces of broken equipment from the bottom of the well and bring them to the surface.

Fishing experience is part of the know-how of trained drillers everywhere, for although the art of drilling has progressed greatly since the early days of the oil industry, it still presents many physical difficulties.

The European Scene

ITALY'S PLANNING BOARD LAUNCHED

From Our Special West European Correspondent

PARIS, August 19.

ITALY this month set up a "national commission for economic programming", or in plainer language a planning commission. The name "plan" was avoided, as in Belgium's "economic programming bureau", not only because there is opposition to any method whatsoever of global forecasting in certain quarters, but because opponents exploit the totalitarian reputation of "national planning" to give a false idea of what is in view. An example is to hand this week in an article on Belgium's economy by Professor Baudhuin, a well known economic liberal who teaches at the University of Louvain. Claiming (in contradiction of the latest OECD study, incidentally) that Belgium's economy was expanding satisfactorily, the professor concluded with this shaft: "All this shows the vanity of planning of the sort some people want to foist on us. In fact we have noticed that the enthusiasm with which some young gentlemen in certain seats of learning embrace the idea of planning probably comes from the fact that they have the ambition to play a great role in it. No doubt it is much easier to settle down in an office and give orders after studying columns of figures, than it is to co-operate with the producers, whose task is much more arduous". Planning, that is, for this eminent liberal means careerism for idlers who like to boss others. The Italian and Belgian Governments, then, are wise to call their planning boards by another name, for they have very different objectives.

The Italian organism has 31 members: nine from the workers' unions, nine from employers' associations and 13 experts named by Government but not all from its own services. It is presided by Mr. La Malfa, the Budget Minister and one of the leaders of the Republican Party. This fact is significant, as suggesting that the allocation of public resources will continue to be made annually in the normal budget, instead of being made on a pluri-annual basis in a plan that is independent of traditional finance-ministry procedures; at most then, the plan will aim to provide a long-term prospective within which annual budgetting could hope to be more rational, less empirical. Thus planning does not presage a revolution, but simply — it is already a great deal — the desire to get budgetting off a hand-to-mouth basis and to take a longer view of the nation's possibilities. Such a long view requires consultation with others who are making long-range plans, i.e. industrialists whose capital investments take years to arrange and to mature, and with all those who have considered ideas about more remote national objectives, e.g. trade union leaders and university economists.

Any ideas that this conclave produces on long-term development will have to be submitted, as democracy requires, to the approval of the usual political organisations representing shorter-term and sectional interests. Thus the Italian commission has been charged to prepare "the outlines of a plan of national economic and social development". That plan will then pass to the Cabinet, be submitted to the National Council for Labour and the Economy (a sort of embryo third house of parliament like the French Economic and Social Council), and finally be debated by Parliament itself. We are a long way from Professor Baudhuin's picture of idle and ambitious bureaucrats bossing other people around on mere statistical considerations.

Nor does the Italian experiment indicate any shift to the Left in economic policy. True, it follows the widening of the parliamentary support of the governing coalition to include the Socialist Party of Signor Nenni but an Italian imitation of French planning had been on the way long before the Christian Democrats were obliged to accept this alliance in order to maintain a stable Cabinet. It coincides, too, with the nationalisation of electric supply companies, which was certainly the price paid by the Christian Democrats for Socialist support. The majority party, however, has just given an assurance that this is not the thin edge of a wedge; it has no intention of proposing further nationalisations. In any event, one has to set these developments in the Italian context. The State in that country already controls about 40 per cent of total industrial production. It inherited this large public sector from fascism and the war, and has since 1946 followed a generally free-enterprise doctrine, only extending its operations in fields where private capital (private Italian capital at least) was hesitant, such as the search for oil and natural gas. As for electric supply, the State already controlled much of this industry, through its big holding company IRI. It is completing its control, to satisfy the demands of the Socialists, but is thus doing nothing not already done in Britain and France many years ago.

The setting up of a planning body, then, does not foreshadow any extension of governmental hold over the economy. In fact, since the State already has so large a hold, what will be planned in the first place is its own manifold activities. In countries with a big public sector, it is usually found that the most disorderly and contradictory sector of the economy is precisely the zone that is theoretically responsible to the State but which in reality is subject to no general control. (In France last year, when there was talk of putting teeth into the plan and "forcing" enterprises to meet their targets, it came out that the worst offenders in falling short of targets were exactly certain nationalised companies. The fact is not unknown in India). If the Italian planners succeed in harnessing that 40 per cent of industrial power that is public property to some general philosophy of national development, private concerns will know better where they stand and will find their profit in adjusting their programmes accordingly without being ordered to do so by anybody.

Instead of seeing the cautious Italian venture in economic planning as a sinister political portent, one might notice that there are good economic reasons for wanting to take a broader view of the country's capacities as just this moment. The fact is that the extraordinary Italian boom has to date been easy going for several very special reasons — mainly, the existence of many unemployed people and a persistent payments surplus — but from here on it could be more difficult or even dangerous to rely wholly on unplanned initiative. The first warning has taken the shape of a marked rise in prices and in wage costs.

Up to this year, Italian prices were remarkably stable. The wholesale price index is still around the 1948 level, having reached a peak because of Korea in 1957 and falling by 1 per cent each year since. Retail prices in that time rose, but very moderately as compared with other Western countries. In recent months

the charm has been broken. The cost of living has risen by 3.4 per cent in six months. Behind this is a new and unfamiliar pressure on wages. These have been rising in the past decade more slowly than productivity, because of the existence of a substantial pool of jobless hands: between 1950 and 1960 they rose by 5.3 per cent a year, which is not only modest in comparison with West Germany and France but less than the parallel increase in production per man-hour. Just lately, however, and exactly because of the striking success of Italian economic development, skilled labour has become harder to find — and the unions have lost no time in exploiting this situation to increase wages. In six months wage costs rose by 5.2 per cent, or as much as in any previous 12 months.

These developments are signs that Italy is beginning to encounter the problems of more developed economies — for what the country has known in the past decade was not so much expansion as transformation, a veritable mutation from a backward agricultural economy to an industrialised nation. Throughout that period of change, Italy won what seemed like a dangerous gamble on inflation. Whereas expansion in West Germany and France was founded on tight credit control, Rome was able to open the gates of money-creation with apparent abandon: the supply of money (circulation plus deposits) increased by no less than 12 per cent yearly for 12 years! Interest rates were kept low for a developing country (they were lowered at the peak of the expansion in 1958) and banks' statutory reserves were lowered this year. The reason this lavish infusion of credit was consistent with stable prices is evident: ample manpower was available to be drafted into industry, keeping its costs low while it gained the advantages of large-scale production, so that Italian exports (notably mechanical goods and chemicals) could score spectacular success. Meantime substantial invisible earnings from tourism (19 million foreign visitors a year, no less) and from remittances sent by expatriates, enabled the country to import freely the raw materials it needed for its growing industry and the flow of consumer goods necessary to maintain pressure on domestic living costs. The country appeared to have found the secret of economic development without tears, for at the end of a period of fantastic growth its central reserves were exceeded only by the USA's and West Germany's, and the lira was one of the world's strongest currencies.

The game is up, or at least it becomes much harder to play, when the flow of labour diminishes and when wages and prices begin to rise as fast as they do elsewhere. Italy has by no means run into a dead-end, and I believe that it will remain the West's fastest growing economy for several years yet. But it has surely reached a point where the disposal of resources requires more forethought. It is just that measure of forethought that the economic programming commission is asked to provide, and to provide not in the shape of a ukase handed down from on high, but in the form of a joint decision taken by the people concerned: the State sector, private industrialists and labour when they have discussed alternative possibilities in the light of the information provided by the best official and independent experts. If "some young gentlemen in certain seats of learning" imagine that this opens the prospect of cosy command posts — that is, if they think there is no difference between advance discussion among economic agents, and the rule of technocrats — the further development of Italian planning will no doubt disillusion them.

WEST BENGAL LOAN, 1974

INTEREST AT 4½ PER CENT

ISSUE PRICE Rs. 99.75

OPENS ON AUGUST 27, 1962.

The loan will be closed without notice as soon as the total subscriptions amount approximately to Rs 7 crores and in any case not later than the close of business on September 1, 1962.

The loan will be issued in the form of:—

(1) Stock, the applicants for which will be given Stock Certificates, or

(2) Promissory notes, which will be in denominations of Rs 100, Rs 500, Rs 1,000, Rs 5,000, Rs 10,000, Rs 25,000, Rs 50,000 and Rs 1,00,000.

Applications for the loan must be for Rs 100, or for a multiple of that sum.

Securities of the 3½ per cent West Bengal Loan, 1962, will be accepted at par in payment of subscription to the 4½ per cent West Bengal Loan, 1974.

Applications will be received at —

(a) The offices of the Reserve Bank of India, Bangalore, Bombay, Calcutta, Madras, Nagpur and New Delhi;

(b) The branch of the State Bank of India at Patna;

(c) The branch of the State Bank of Hyderabad at Hyderabad; and

(d) The branches of the State Bank of India within the State of West Bengal except in Calcutta.

Full particulars and application forms are available from any of the offices mentioned above.

THE BUSINESS WORLD

The Neyveli Complex

A FORTNIGHT ago, while offering comment on the power aspect of the Neyveli Lignite Project, it was proposed to deal with its other aspects subsequently. An attempt is made here to assess the economics of this multi-purpose scheme, both in respect of the investment involved and the benefits that South India would derive from it.

The project is an integrated one in the sense that the products of the various units constituting it would provide the raw materials or an essential utility for one or more of the other enterprises included in this complex. For instance, the mining scheme, which envisages an annual output of 3.5 million tons of lignite by the open-cast method under the first stage of its execution, would be making available 1.5 million tons of this tan brown inferior type coal for the generation of 250 MW of electric power, 0.6 million tons for producing 152,000 tons of urea (70,000 tons fertilizers in terms of nitrogen) and the remainder for producing 380,000 tons of carbonised briquettes for domestic and other purposes. Another by-product of the mining operations will be clayey earth which will provide raw material for the Clay Washing Plant of the project for producing high-class China clay. Electricity produced in the power-house would provide the energy for running the various enterprises included in this integrated complex as also for running a multitude of other industries in the southern region. The Briquetting and Carbonisation Plant, besides turning out smokeless and odourless fuel for household and other non-industrial consumption, will yield a number of bye-products such as chemical grade carbolic acid, ortho cresol, meta-para cresol, xylenols and ploy valent phenols which would provide the base for a number of chemical and plastic industries. This plant would also produce kerosene and middle oils, two other essential fuels.

The total capital outlay on the first stage of the project, which consists of five schemes, is estimated to be Rs. 112.67 crores, made up of (1) the Mining Scheme (3.5 million tons of lignite) — Rs. 24.37 crores, (2) Thermal Power Generation (250 MW) — Rs. 28.07 crores; (3) Urea Plant (70,000 tons N) — Rs. 34.26 crores; (4) Lignite Briquetting and Carbonisation Plant (380,000 tons briquettes) — Rs. 25.83 crores; and (5) Clay Washing Plant (6,000 tons China clay) — Rs. 14 lakhs. The cost of the township and the common services provided at the project site — Rs. 13 crores in all — is included in the costs of setting up the various plants according to the number of people employed on each of them and the size of their capital investment. The cost of the entire project's first stage, however, is likely to go up by another Rs. 8 to 10 crores due to various factors, included in which are the rising costs of construction materials, labour, machinery, higher taxation and increased freight that is being paid on moving the machinery to the project site.

In the second stage, lignite output is to be raised to 6 million tons per annum. This will make available 400 MW of electricity per year. Ultimately, it is planned to produce 1,000 MW of electricity from this project. The Clay Washing Plant also is envisaged to be expanded to at least double its present capacity in the near future. Production of briquettes would as well go up as all the surplus lignite that is produced but not utilized for power generation and fertilizer manufacture is to be used for preparing carbonised briquettes with a volatile matter content of 15 to 18 per cent. According to the present estimates, this second stage would involve a capital outlay of Rs. 22 crores.

While the whole scheme can be said to have been imaginatively prepared, the same cannot be said about the cost structure of the various units constituting it, especially that of the Urea Plant, envisaged to be commissioned into production by early 1965. The high cost of moving coal from the principal coal-belt of the country, either by all-rail route or by the rail-cum-sea route, vis-a-vis the cost of producing an equivalent amount of lignite in terms of thermal power may have provided an economic justification for going in for power generation from this source, but the Rs. 34.26 crores cost of setting up the 70,000 tons (Nitrogen) Urea Plant is by all standards too high. According to the Planning Commission's standardisation, this cost should not have been more than Rs. 25 crores or if the cost of the township is also included, not more than Rs. 27-28 crores. The Gorakhpur Plant with a higher capacity will be costing much less. The high capitalisation of the Neyveli Fertilizer Plant will undoubtedly be reflected in the cost of its product.

The present operations of the Clay Washing Plant can also not be termed as an unqualified success. The current sale price of China clay produced at this plant, fixed by the State Government after taking into consideration the prevailing rates of the commodity in the neighbourhood, is Rs. 135 per ton f.o.r. Neyveli. But this is stated to yield only a small return on the investment. If the investment is to yield an adequate return of about 15 per cent — as such plants should do — the present price of Neyveli China clay would obviously become out of tune with the prevailing rates in the region. With the expansion of this plant to about 12,000 tons per annum — double its present capacity — some economies from the enlangement of the scale of production may be envisaged. But ways and means apparently need to be explored to bring down the current production cost.

The Briquetting and the Carbonisation Plant, where commercial operations will start in 1964, too is probably somewhat over-capitalised. But taking into consideration the domestic fuel requirements of the region — which have not only necessitated use of cattle dung in domestic ovens instead of its being used in the field as manure and denudation of forests so essential for attracting rainfall and for preventing soil erosion — and the high cost of moving even inferior quality coal from the Madhya Pradesh and Singareni coalfields, this can be justified on the grounds that there would follow from this plant appreciable tangible and intangible benefits to the region. A part of the area

now being planted with casuarina trees to yield firewood should in the near future become available for cultivation as a sequel to lignite briquettes being used for domestic and other purposes.

All this should suggest that political and regional considerations have played a greater role in the Neyveli Project being included in the Third Plan. It was perhaps necessary to do so in view of the present political climate in South India, particularly in Tamilnad. But high capitalisation of some of the schemes included in the complex enjoins on the project authorities avoidance of all wasteful expenditure. This also adds urgency to the expansion of the operations here for the economies of large-scale production need to be taken advantage of at the earliest.

An appreciation of the Neyveli Project would, however, be incomplete without a reference to the interesting experiment that is being conducted here on co-operative living. The whole of the project township has been developed as a private colony and all the trade activities and other services in it have been entrusted to the Corporation Employees' Co-operative Stores. There is one danger in it. The monopoly given to the Co-operative Stores can well lead to some unhealthy practices on the part of the management, born out of "human failings". The project authorities would do well to guard against these failings which can well be imagined, if this new experiment in Indian conditions, of running a whole town on co-operative lines, is to be made a success as an answer to the successively rising cost of living which in some parts of the country is apparently assuming menacing proportions.

The township planners deserve commendation for having planned it with the socio-economic and socio-psyschological integration in view. While the houses for the lower income groups in this township are larger in size, presumably for accommodating their large families, and have greater amenities than are available in similar townships at the other project centres in the country, those for the higher grade employees have been built on austerity standards. Further, houses have been built in the various blocks of the township for use by person belonging to all income groups. The high and the low will mingle in all the sectors of this township, thus giving rise to a true community life in a modern town, based on the socialistic pattern of society.

Raw Deal to Rayon

By CROESUS

IN the prevailing circumstances no one can afford to belittle any effort to promote exports and thereby earn foreign exchange. Every industry, in particular an industry with an export potential, has to put in its weight in this behalf. Even industries which do not directly contribute to the export drive cannot escape their respective share of responsibility, and it is only fair, therefore, that the Textile Commissioner should have called upon the Indian rayon yarn manufacturing industry to make its contribution. But this is not to admit that the two alternative proposals that he is reported to have made to the concerned interests for their consideration in this behalf are equally fair. And the industry has rightly lost no time, therefore, in making its view known.

The two proposals referred to above are (1) a cess of 25 nP. per lb. of rayon yarn produced and (2) payment of a premium of 50 per cent on a part of the pulp requirements of the industry. For obvious reasons, the reactions of the industry to these proposals have been anything but favourable. While they are opposed to the levy in the form of a cess on principle, they are averse to the payment of a premium on the score that it amounts to doling out cash to other people. Instead of a workable scheme for export to enable the industry to play its rightful role in the export trade of the country, it may be noted here that there is a prohibition on export of Indian rayon yarn. Besides, the burden that the industry is asked to bear is several times more than the monetary loss that the cotton mill industry is called upon to bear under its export promotion scheme. But then the industry has not turned down the proposal, it has offered to accept the proposal only if there is an upward revision of selling prices and a reasonable increase is allowed in the price differentials between denier and denier.

Neither of these demands would appear to be unwarranted. It is common knowledge that rayon yarn prices have remained unchanged since 1957-58. Between then and now, the industry has had to pay more for its caustic soda (15.75 np per Kg of yarn), sulphur (6.82 np per Kg of yarn), charcoal (1.25 np per Kg of yarn), power (6.52 np per Kg of yarn), steel coal (9.76 np per Kg of yarn), salary, wages and bonus (37.50 np per Kg of yarn), excise duty (41.10 np per Kg of yarn) and a loss on account of lower sales price fixed for yarn distributed under the Export Promotion Scheme (46. np per Kg of yarn), among others. The total of all these burdens aggregates nearly Rs. 2 per Kg. The Textile Commissioner, who should know this better than any one else, is known to be already examining the sale price of viscose yarn in view of all these increases in the financial burdens on the industry, but nothing is known as yet of what the outcome of such an examination has been. Again, while insisting on the industry changing its production pattern to be in conformity with changing consumers' preferences, the Textile Commissioner does not appear to have realised the implications of his own proposal. Whatever may be the justification for the Government wanting to equate the production of rayon yarn with denier-wise demand from the weaving sector, the adjustment of the pattern of production must needs be governed on the basis of the denier licensing capacity sanctioned at the time the particular unit of the industry was licensed. If a given unit installed plant and machinery on the basis of say, 150 deniers, it cannot be made to manufacture yarn of finer deniers except at the cost of some idle capacity resulting in reduced output and, therefore, increased costs. It is because of this that the industry requested the Government to rationalise the existing price differentials as between the various deniers. Had this been complied with, not only would the industry have made up the losses consequent on the readjustment of its pattern of production, but it would also have willingly adjusted its spinning programme to the needs of the weaving industry. While it is difficult to understand why the Government has not taken a decision on this question, it is even more difficult to appreciate how or why the State Trading Corporation has been reportedly asked to import 150 denier yarn from Italy. Is it not paradoxical that, while on the one hand, the government should insist on the indigenous rayon yarn manufacturing industry reducing the production of 150 denier yarn, it should, on the other, be resorting to the import of the same denier yarn from abroad? One wonders whether it has not at all occurred to the Government that it could very well save precious foreign exchange on the import of this by just asking the indigenous industry itself to manufacture the entire requirements of 150 denier of the country. One would have thought that, in these

circumstances, the Government could actually have imposed a complete ban on imports of 150 denier yarn.

It is true that the Indian rayon yarn manufacturing industry has fared quite well. But this should not be made a pretext repeatedly to insinuate the industry, as would unfortunately appear to be the case. Because the industry has been prospering there seems to be no appreciation of the fact that it is one of the very few industries which can claim not to have raised its prices, despite the several factors known to have contributed to an addition to its cost of production. Similarly, the fact that although not allowed to export any of its product, it has been making an indirect contribution to our foreign exchange fisc by conserving a sizable amount of foreign exchange is hardly taken note of. Since the establishment of the industry, it has been able to effect a saving of nearly Rs. 35 crores, which would otherwise have had to be expended on importing rayon yarn. It may be added here that, every year, (on the basis of the 1961 record) the Indian rayon yarn manufacturing industry would be saving for the country a foreign exchange drain to the extent of around Rs. 7 crores. It is time, therefore, that the authorities took note of all these factors and there was a refreshing reappraisal of their step-motherly attitude towards this important industry.

Business Notes

Protection

BALL BEARING INDUSTRY

THANKS TO the twin advantages of protection and pressure of domestic demand, the ball bearing industry in this country has registered rapid progress during the last ten years. Mr. K. R. P. Aiyangar, Chairman of the Tariff Commission, observed, at the inquiry, recently held by the Commission, for the extension of protection to this industry beyond 1962, in Bombay, that, with the coming up of new units, the industry would not only be able to meet the increasing internal demand but, at the same time, under the stimulus of healthy competition, it might also achieve a marked improvement in quality and succeed in bringing down the prices to more attractive levels. If these results should materialise, there would even be good prospects for exporting the industry's products.

Referring to production, Mr. Aiyangar said that the actual production of the National Engineering Industries was 2.7 million bearings upto 2" bore diameter in 1960, 3.2 million in 1961 and 1.9 million during January-June 1962. In addition to this unit, there are 36 small-scale units manufacturing ball bearings in the country the total annual installed capacity of which was 1.05 million pieces on single-shift, but their actual production in 1961 amounted to only 0.47 million pieces. According to the Tariff Commission Chief, nine more units have been licensed for the manufacture of ball bearings, of which three were in Gujarat, two each in Maharashtra and Madras, and one each in Bihar and the U.P.

Touching upon the domestic demand for ball bearings, Mr. Aiyangar said that the Commission had estimated that, for 1960-61, it would be 4.5 million ball bearings, but he envisaged that the demand would increase to 8.5 to 9 million pieces in 1963.

The industry has continued to depend upon imports for its principal raw materials, such as H.C.I. steel bars, tubes and wires. It is noteworthy that the industry has not made any complaints about the availability of these raw materials as such, but the industry has pointed out that the refusal by the authorities to permit adequate change-over of licences from bars to tubes has caused certain difficulties.

The overall performance of the industry would appear to be satisfactory, although there have been complaints as regards the selling system of the National Engineering Industries — its frequent change of distributors, its refusal to sell directly to large consumers and short supply of certain sizes and lack of credit facilities. One more general complaint about the industry appears to be the high cost of its products and the unsatisfactory noise level of the ball bearings. It is of vital importance that the industry should seriously think in terms of eliminating these complaints.

Foreign Assistance

TRADE GAP AND AID

THE UNION FINANCE MINISTER, Mr. Morarji Desai, had a frank and informal discussion, recently, with the Indian Merchants' Chamber (I.M.C.). Far from "flaying" the business community, he was only at pains to make the committee members of the I.M.C. appreciate the imperative need for raising the country's exports with a view to lessening the dependence of this country on foreign assistance. It is significant that he availed himself of this opportunity publicly to express his sense of sincere appreciation of the assistance and understanding of foreign countries and agencies and categorically to declare that India is sincerely interested in repaying all its debts. The latter declaration was particularly called for in the context of the irresponsible talk in certain quarters of this country not having any serious intention to repay all its debts.

Mr. Desai stressed the importance of doubling the country's exports in as short a period as possible. Although the realised that it might not be possible to double exports in less than 12 to 15 years, he wanted the target date to achieve the goal to be no later than 1972. At least by 1972, he was keen, India should cease to take loans from other countries.

Another point on which Mr. Desai was quite emphatic was with regard to the issue of "untied" loans. Urging the business interests not to think of "untied" loans, he said "I don't want untied loans in such a manner that we get into stresses and strains. In any case, untied loans should not be your concern, even if they are my concern". You must concentrate on more exports and manufacture of more spare parts and components. Unless we do this, we shall not be creating a self-generating economy."

Earlier, Mr. Pravinchandra V. Gandhi, the I.M.C. President, welcomed Mr. Desai and Mrs. Tarakeswari Sinha and spoke of the necessity to review and re-assess the development programme in the event of any short fall in foreign aid. He also wanted to know, in particular, how much of the aid promised was going to be in the form of "untied" loans and whether it would be open to the business community to negotiate with individual members of the Aid-India Club for providing a certain portion of the maintenance imports. He made a particular reference to the far-from-satisfactory capacity utilisation in the large, medium and even small-scale industries, as also the inelastic nature of our exports. Whilst speaking of exports, he also made reference to the probable effects on India's exports in the event of the U.K. joining the E.C.M.

Automobile Industry

FREEDOM FROM IMPORTS

THE POINT highlighted by Mr. C. Subramaniam, Minister for Steel and Heavy Industry, concerning the

automobile industry that indigenous components must constitute 90 per cent of the total output is perhaps a timely warning to the producers. At the moment, when automobile producers in the country have had sufficient experience, it is quite unreasonable that they should keep on depending upon the imported components. No one has to be convinced of the fact that the country is capable of producing all types of industrial machinery. Moreover, there is no lack of raw materials or technical know-how. The producers of automobiles — commercial vehicles, motor cars, motorcycles and scooters — should, therefore, realise their responsibility and enhance the indigenous components in their total output. This warning has to be judged in the light of the present foreign exchange crisis which is facing the country and which is not likely to be relieved in the near future. These items, though forming a very important section of the industrial economy, cannot continue to claim a share in the foreign exchange.

Mr. Subramaniam was of the opinion that commercial vehicles should be produced beyond the present target. It has, however, to be remembered that to bring about an increase in the indigenous contents there are specific needs of foreign exchange for the import of heavy machinery. Once such investment is through the producers are permanently free of the need to import such components. One cannot, however, agree with the Minister in respect of his proposal regarding the motor cars. This section of the industry also has to have considerable amount of foreign exchange if it has to raise its indigenous manufacture of the components till now imported. Any curtailment of foreign exchange allocation for maintenance imports for cars will only create a problem of production. To maintain the present volume of motor car output and also the increase in view of the increasing demand, it is necessary that their foreign exchange requirements are met so that capacity to manufacture all items indegenously is accomplished.

As far as motorcycles, scooters and such like light transport media are concerned, it is easy to raise the indigenous contents without much basic foreign exchange requirements. In their case the warning given by Mr. T. T. Krishnamachari in respect of the prevailing prices is not unreasonable. The producers of light means of transport should also try to reduce their costs. If a proper plan of ancillary producers is evolved, it would definitely be more fruitful. The industry in general should take a cue from the Minister to establish "common services" for body-building, chassis, castings and fringes. The tendency towards over-capitalisation can be reduced if smaller units can co-cperate and join together to have common services. Otherwise the smaller units specially in the field of scooters and motorcycles would find it impossible to survive the competition. An indication that such uneconomic units may be deprived of their licences if they cannot produce economically was also given by the Minister.

While all this advise to the producers is justified, it is time the Government looked into their demands properly. It is even being pointed out by the automobile manufacturers that they do not get proper quantity of raw materials of the required quality. Under such circumstances, they cannot be blamed for not being able to produce the required quality at competitive rates. It has to be remembered that industry is increasing its investment more rapidly as compared to the total ouput. For instance, in 1956, against an investment of Rs. 6.5 crores, the output was 32,138 vehicles. In 1961 the investment was Rs. 26.7 crores against an output of 53,560 vehicles. Thus it is quite clear that investment is increasing rapidly which is an indicator to the fact that more and more indigenous items are manufactured within the country. It is time that the Government develops a more favourable attitude towards the industry and looks after their needs. The industry, in turn, should take up the challenge of manufacturing their products indigenously, thereby becoming free of imports.

Pharmaceuticals

PHENOMENAL PROGRESS

THE PHARMACEUTICAL and drugs industry has made a phenomenal progress during the last few years. While its production was to the tune of Rs. 12 crores in 1948, it increased to Rs. 80 crores in 1961. Now not only there are several essential drugs being manufactured in adequate quantities but their imports have either been completely stopped or restricted. They are also being exported to countries like Ceylon, Burma, Pakistan, Malaya, Thailand and Kenya. The industry has switched over to more basic raw materials locally available.

Progress is also being made in the field of research. A basic research centre is being established in Bombay by a wellknown foreign firm and many international concerns are coming forward to participate in the Indian projects. Proposals are also being received by the Government from other firms for the setting up of similar independent research laboratories and it is to be hoped that these laboratories in co-operation with those in other parts of the world will discover new drugs. The research centre set up by the Hindustan Antibiotics has also contributed largely towards increasing the yield of penicillin, a medicine commonly being used for many of the diseases.

While all this is a satisfactory development, the production of spurious drugs has aroused considerable concern. So no wonder that a furore was created in the Lok Sabha about these spurious drugs. To put a stop to the drug racketeers, it was emphasized by the parliamentarians that they be dealt with a heavy hand. What measures now the Government will adopt to set the state of affairs right would be watched with great interest. The progress made by the drugs and pharmaceutical industry and the possibility of setting up the export of Indian drugs to Asia and Africa is to be reviewed shortly by a standing committee of the Central Advisory Council of Industries. This is welcome so far as it goes. It is now to be hoped that its findings and suggestions would help the industry to grow on healthy lines. The growth of the pharmaceutical industry is desirable from many angles mainly because it helps the growth of many other industries. Besides, in a country already underfed and under-nourished it has a definite role to play.

New Issues

BRAITHWAITE AND COMPANY INDIA LIMITED

THREE COMPANIES will be shortly entering the market for raising subscriptions from the public to their share capital.

Braithwaite and Company India Limited is offering 40,000, 9 per cent redeemable cumulative preference shares of Rs. 100 each. Firm offers have been received for 20,000 shares from the underwriters and their friends and these have been accepted in full. The remaining 20,000 shares are to be thrown open for public subscription. The list opens on August 28 and shall close on August 30, or later at the discretion of the directors.

The proceeds of the issue are to be utilised for meeting part of the expenditure on the company's expansion and diversification programme which includes undertaking the manufacture of various types of cranes such as dockside level luffing cranes, railway breakdown cranes and electric over-head cranes. There is a great shortage of these cranes in the country today. Technical collaboration has been arranged with Messrs. Thomas Smith and Sons (Rodley) Limited for the manufacture of the former two types of cranes and with Messrs. John Smith (Keighley) Limited for the production of the latter type.

The project is estimated to cost Rs. 4.4 crores. A sum of Rs. 88 lakhs is to be raised by way of loans in various foreign currencies from the ICICI and the CDFC; agreements with these two institutions have already been reached. Another Rs. 3.12 crores are proposed to be secured from the company's existing resources, future depreciation provisions, retained earnings and from bank borrowings.

The company is one of the leading bridge and structural engineering concerns and railway rolling stock manufacturers in the country and has heretofore specialised in the production of high class structural steel work for bridges and heavy workshop buildings. It has also developed the manufacture of rolling stock for the Indian railways and is well-known as a producer and supplier of pressed steel tanks and troughs. The capacity of the company's wagon shop has been expanded in the recent years to enable it to undertake the production of larger type wagons now required by the Indian railways. This particular line of manufacture is being further expanded.

USHA REFRIGERATION

USHA REFRIGERATION INDUSTRIES LTD., a new addition to the Shri Ram group of enterprises, is expected to approach the public for subscriptions to its share capital some time later this year. The authorised capital of the company is Rs. 2 crores, of which shares worth Rs. 50 lakhs — 3,60,000 equity shares of Rs. 10 each and 14,000, 9.3 per cent cumulative redeemable preference shares of Rs. 100 each — are proposed to be issued in the first instance. Of the issued equity capital, 51 per cent is envisaged to be taken up by the directors and promoters of the company and their friends. The balance equity capital and the entire preference issue will be offered for public subscription.

The company's plant is to be located at Hyderabad and is expected to go into production early next year. It is proposed to manufacture 1,00,000 sealed compressor units for refrigerators and air-conditioners per annum. Forty per cent of the production will be exported to countries other than the United States and Canada.

Technical collaboration for the project has been secured from Messrs. Westinghouse Electrical International Company, U.S.A.

INTERNATIONAL COMPUTERS AND TABULATORS INDIA MANUFACTURING COMPANY LIMITED

THE THIRD company that is expected to enter the capital market by the end of the current year is the International Computers and Tabulators India Manufacturing Company Limited, sponsored by the well-known British firm, International Computers and Tabulators Limited, to undertake the manufacture of data processing and calculating machines on a phased programme. The Union Government has already approved the project and has issued an industrial licence to the company for the production of hand punches, varifiers, sorters and tabulators. The authorised capital of the company will be Rs. 1 crore, of which capital worth Rs. 50 lakhs will be issued in the first instance. Of the latter, capital worth Rs. 30 lakhs would be held by the British firm and the balance would be offered for public subscription.

The factory of the company is to be located near Poona. In the first year of its going into production, it is scheduled to turn out 180 hand punches, 180 hand varifiers, 36 sorters and 36 tabulators. In a period of five years the production is envisaged to be stepped up to 700 hand punches, a similar number of varifiers, 150 sorters and 65 tabulators. The total cost of the machinery required for the project is placed at Rs. 33.5 lakhs. The foreign exchange component will be Rs. 25 lakhs.

A special feature of the project is its ambitious export programme. The company plans to start earning foreign exchange from the very first year of production during which complete machines, cards and parts worth about Rs. 6 lakhs are expected to be exported. When the factory is in full production its total turnover would be around Rs. 1 crore. Of this, 30 per cent is envisaged to be earmarked for exports.

Raw Cotton

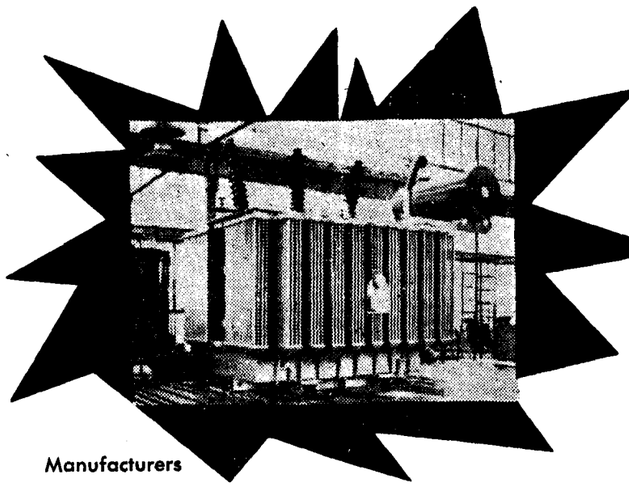
RAISING OUTPUT

THE UNION GOVERNMENT has decided to set up a new mechanised farm at Jetsar in Rajasthan. The decision, which had been delayed for a considerable time, has apparently been hastened by the Government's desire to take concrete measures to step up cotton and oilseeds output during the remaining period of the Third Five-Year Plan. An indication of this is available from the fact that in working out the cropping pattern for this farm an effort is to be made to grow more cash crops like oilseeds and cotton.

The farm will cover an area of over 30,000 acres in the Anupgarh and Raisinghgarh tehsils of Sri Ganganagar district. The land is proposed to be taken on lease from the Rajasthan Government. With a view to provide adequate irrigation facilities to this farm, it is proposed to divert to it from the Suratgarh Farm the existing perennial supply of 15 cusecs of water from Ganga Canal. Otherwise, this farm is expected to receive non-perennial irrigation facilities for about three months in a year from the Rajasthan Canal Project. The Suratgarh Farm will be compensated for the water supplies to be diverted to the Jetsar Farm through additional supplies from the Bhakra system.

Farming operations on the Jetsar Farm are expected to begin by the middle of next year. It is proposed to cultivate about 10,000 acres in the first year. Another 2,500 acres would be added in the second year. The farm will be using the same type of machinery as is being made use of at the Suratgarh Farm. This would help in keeping its operational costs at a low level, since the base workshop at Suratgarh will be able to undertake major overhaul and repairs of the equipment of the new farm. The services of the staff of the Suragarh Farm would also be made available to the Jetsar Farm so that there is better utilisation of the Suratgarh Farm's resources.

The Union Ministry of Agriculture also proposes to increase the area under cotton in several other States—Uttar Pradesh, Punjab, Bihar, Mysore, Andhra Pradesh and Maharashtra—and to adopt more intensive agricultural methods under the "Package Programme" over an area of 2.25 lakh acres in the cotton-producing States during the ensuing cotton season. Suitable cropping patterns, including inter-cropping (cotton and groundnuts and cotton and chillies) are also proposed to be adopted in the present cotton-growing areas. Renewed efforts are to be made for extending minor irrigation facilities for the cotton crop, particularly in areas where there are frequent crop failures. Special schemes for cotton cultivation are envisaged to be drawn up in the new tracts that come under the irrigation command of the Bhakra Nangal, Rajasthan Canal, Chambal, Hirakud, Nagarjunasagar, Tungabhadra and Lower Bhavani projects.



The various principal programmes that are being launched to raise cotton output are expected to yield the following results by the end of the Third Plan period: (1) Irrigation facilities—10 lakh bales; (2) Fertilizers—5 lakh bales; (3) Improved seeds—2.5 lakh bales; (4) Improved agricultural practices, inter-cropping,

plant protection and contour bunding—2 lakh bales. The unit-area yield, which during the fifties has gone up from 78 lbs. of ginned cotton per acre to 101 lbs. per acre, is expected to go up further substantially.

IBRD

SIR WILLIAM RETIRES

THE NEWS that Sir William Illiff, a Vice-President of the International Bank for Reconstruction and Development since 1956, is to retire on October 31, will be received with considerable regret. His services to the Bank and its member countries over a period of 14 years have been of a very high order. Whenever the Bank was faced with a real difficult job, demanding firmness of principle and breadth of vision, Sir William was considered to be a likely choice. We, in India, remember his very able performance from 1952 to 1960 while he was the Bank's representative in the negotiations between India and Pakistan which led to the signing of the Indus Water Treaty in September 1960. It may be recalled that the associations of Sir William with India are not limited to that period alone. He served in the Indian Army during the World War I and was stationed along with the Indian forces in Mesopotamia and Iran. Naturally, therefore, he proved to be a seasoned mediator: he understood the people of the sub-continent so well. From 1948 to 1951 Sir William was Director of the Loan Department of the IBRD and thereafter Assistant to the President until 1956. Apart from the Indus Basin negotiations, which made him very popular, he took prominent part in many other negotiations in which the Bank acted as the mediator. As a recognition of his services, he received a Knighthood from Her Majesty the Queen in January, 1961.

A family album of firsts!

PIONEERS IN PACKAGING, Metal Box introduced almost every new type of metal package to India.

Some notable firsts:

CROWN CORKS: To keep your aerated drink fresh and sparkling, Metal Box introduced decorated crowns. Today these precision-made closures serve bottlers all over India and in many export markets.

ROLL SEAL PILFERPROOF CLOSURES: The finest tamperproof seal for bottled drugs and foods. Metal Box developed the first Indian made Roll Seal closure as well as the first locally made machine to apply it. Today 150 million packages are hygienically sealed with these closures, frustrating the racketeer, protecting your health.

OPEN TOP CANS: A trusted sentinel in the cause of good health, the food can is common in appearance only. A supreme achievement of engineering and research skill, the Open Top can brings you the bounty of the harvest, fresh and uncontaminated, at any time of the year—wherever you are. Metal Box Open Top cans today carry Indian produce to all parts of the world.

COLLAPSIBLE TUBES: The convenient, versatile aluminium pack which brings you such diverse products as toilet articles, pharmaceuticals, adhesives and even food.

METAL BOX

pilferproof and protective packaging

JENSON & NICHOLSON-1962

The Name : JENSON & NICHOLSON
The Year : 1922
The Place : NAIHATI, NEAR CALCUTTA

AND THE RESULT : Forty years of dedicated service to India's homes and industries by Jenson & Nicholson—the country's leading manufacturer of decorative finishes and industrial coatings. The J & N factory is now the focal point of a farflung distribution service. J & N paints are used in places as distant as Patiala and Pondicherry and for purposes as widely separate as interior decoration and industrial coating.

'JAPAN BLACK' FOR MILADY'S GIG

The firm now known all over the world as Jenson & Nicholson was founded in London in 1821. Its sole product : a varnish imaginatively called 'Japan Black'. It was used to paint 'society' carriages—the status symbol of the day. Japan Black was a fine varnish—a rich, glossy black—blended with infinite care. It was, as the phrase goes, 'a quality product'. *Today, as in the past, quality is still the keynote...*

DECORATION OR DONKEY WORK—J & N HAS A PAINT FOR IT

Plastic emulsion for a penthouse flat ; anticorrosive composition for a lockgate ; rivelling enamels for typewriters ; porcelain lacquer for bathroom fittings...orders like these are all in the day's work to J & N. Whether it's a paint to make a place look pretty, or a coating to prevent a termite attack, J & N can supply it. *J & N decorative finishes are to be found in such landmarks as the Taj Mahal Hotel, Bombay, and Raj Bhavan, Calcutta, while J & N industrial coatings are used on everything from domestic appliances to railway rolling stock.*

'GO OUT AND SELL PAINT !'

A traditional order at J & N, where production is matched in importance by selling. Comprehensive distribution covers the subcontinent. J & N has established paint depots at Calcutta, Delhi, Bombay, Madras, Coimbatore, Gauhati, Kanpur and Siliguri, and from these depots paints are supplied to a network of stockists strategically located so as to cover even the smallest villages. Distribution is backed by a vigorous selling force. *You can always get a J & N paint when you want it, where you want it.*

FROM SUNFLOWER SEEDS TO 'BATTLESHIP GREY'

Sunflower Seeds, Castor and Soya Beans, even fish, are used in the *manufacture* of paint. The metamorphosis takes place daily in the J & N factory. The most advanced *paint factory in* India, it is now expanding under a phased programme. In this busy complex of men and machines, raw materials are converted to paints like Robbialac Super Gloss Enamel and Jensolac Stoving— leaders in their fields.

Precision control is the keynote in every department of the factory. *From the 'varnish kitchen'* where gums are 'cooked' with oils to the dry-distemper department, there is an emphasis on quality and an endless striving for improvement.

CAVE PAINTS AND CHEMISTRY

We've come a long way from the days of our cave forebears, when *colouring matter came from natural pigment* scooped out of the ground. Today the production of paint is a science and an art.

At the J & N factory, the chemistry of paint is vitally important. A fully-equipped laboratory, staffed with *skilled chemists*, pursues an unceasing programme of research, development and testing.

J & N PAINTS RUN THE GAUNTLET

Testing is exhaustive. The quality of pigments must meet rigid standards of purity, colour strength and correctness of shade. Raw materials are tested for stability and durability. On the laboratory terrace, surface coatings are exposed to the full force of sun, wind and rain. Each batch of paint is tested to precise standards before leaving the factory. So far is attention to detail carried that the laboratory even contains a miniature production plant—a duplicate of the actual factory machinery. Here new formulations are evolved and existing paints improved. The result of all this care : *you take quality for granted in a J & N paint.*

TEAM WELFARE AT J & N

J & N believes in teamwork and team welfare Much thought is given to the well-being and happiness of factory employees. Labour quarters, medical facilities and other employee benefits are provided. Team welfare leads to better teamwork. At the J & N factory, where India's leading paints are produced, this policy speaks for itself.

*

Do you see PINK ELEPHANTS ?

FROM THE CAPITAL'S CORRIDORS

BOARD OF TRADE'S THIRD MEETING

THE Board of Trade at its third meeting held here last week-end discussed three important issues, namely, expansion of exports of mineral ores, the question of better organisation of exporters and strengthening of the commercial sections of the Indian Missions abroad, as also of the administrative and expert staff dealing with foreign trade in the Department of International Trade, the Ministry of External Affairs and other Ministries.

While welcoming the steps being taken by the Government to expand exports of mineral ores, particularly iron ores, the Board advised that long-term planning of development of mineral ores should be pursued in an integrated manner and with vigour. It was of the opinion that the target of development of about 25 million tons of exports of iron ores per year was possible of realisation provided all the developments were undertaken in an integrated manner. The principal factors which would promote exports of mineral ores, the Board stressed, were encouraging and assisting modernisation of mines, development of transport, construction of roads in mine areas, development of railways and port facilities, and mechanisation of loading and unloading facilities. This, it was stated, would also go a long way towards improving the handling of these ores. Special attention, it was felt, should be paid to road development in areas adjacent to the ports for better and larger movement. The Board approved that selected ports both on the western and the eastern coast of India, namely, Mangalore, Madras, Marmagoa, Visakhapatnam, Paradip and Haldia, should be provided with expanded facilities so as to canalise the exports of ores from these ports.

In regard to iron ore exports, the Board emphasized the imperativeness of producing more pig iron, steel and steel products, castings, forgings, ferro-alloys and fabrications because this would not only lead to larger exports but would also earn more foreign exchange for the country per unit of investment and per unit of raw materials. The Board urged that further study should be undertaken to plan the export sector of pig iron, steel, steel products, steel fabrications, iron and steel castings, forgings etc., over and above engineering goods.

As regards manganese ore, it was recognised at the meeting that mining of this ore would have to be more efficient. Those mine-owners who could export manganese ore on their own, it was suggested, should be free to do so and they should get all transport facilities. Others requiring assistance in selling for export would make suitable offers for sale of managenese ore under barter arrangements.

EXPORTERS' ORGANISATION

While discussing the question of better organisation of exporters, the Board recognised that various aspects and problems facing the export trade should be dealt with thoroughly and continuously. It was felt that the work of the existing organisations such as the Federation of Indian Chambers of Commerce and Industry, the Associated Chambers of Commerce and similar other all-India bodies had hitherto been concentrating more on industry than on trade and particularly export trade. The variety and complexity of issues relating to export trade, including those of transport, shipping and freight, it was noted, required a specialised organisation at the all-India level and at State levels, particularly in the maritime States. The question of setting up such an all-India body concerned mainly with export business would be dwelt upon at the convention of exporters to be held shortly. The Board expressed the opinion that exporters should also organise themselves into local export chambers in important industrial and trading centres. It felt that such organisations of exporters should be built up so as to study and solve the problems facing export trade.

The Board approved the suggestion for having a non-official organisation for guiding, encouraging and promoting trade fairs and exhibitions in the country and abroad. The main aim, it said, should be to lay down standards for exhibition and developing proper themes and exhibiting products in suitable exhibitions abroad so as to create a correct impression of Indian goods and merchandise on foreign importers and to create a right image of India in the world as a healthy trading and technologically mature society. The Board appointed a sub-committee to examine the details for setting up the Indian Council for Trade Fairs and Exhibitions whose constitution it broadly approved.

COMMERCIAL SECTIONS

In respect of streamlining and strengthening the commercial sections of Indian Missions abroad and the administrative and expert staff dealing with foreign trade in the various Ministries of the Central Government, the Board generally approved the proposal that four or five Directors of Foreign Trade should be appointed with headquarters in New Delhi to look after the trade promotion work in different regions of the world. These Directors will co-ordinate and assist the work of the commercial representatives abroad. The selection of staff for the commercial sections, it was stressed, should be based on real competence, experience and expertise. The need was felt for strengthening the staff at appropriate levels.

The Board also welcomed the suggestion to give proper status to the commercial and economic staff alo g with their political counterparts. The work of trade promotion, it was emphasised, should be one of the major criteria for assessing and recognising the work of different embassies and their personnel.

EXPORTS LOOK UP IN JULY

The downward trend witnessed in exports during the first half of the current calendar year was reversed in July when they registered an increase of Rs. 5.59 crores over the July, 1961, figure. Total exports in July, 1962, amounted at Rs. 56.02 crores.

Total exports from India in the first seven months of the current calendar year have been of the order of Rs. 371.05 crores—an increase of Rs. 2.12 crores over the figure for the first seven months of 1961.

Total imports into India in the first six months of 1962 were Rs. 499.53 crores, as compared to Rs. 548.93 crores during the corresponding period last year.

The deficit in the balance of trade during the first six months of 1962 thus narrowed down to Rs. 184.77

crores from Rs. 230.74 crores during the first six months of 1961.

FREE TRADE ZONES

Speaking at the question time in Rajya Sabha last week, the Central Minister for International Trade, Mr. Manubhai Shah, declared that a decision on setting up a free trade zone at the Kandla port — "one way or the other" — would be taken within the next two months. And thereby hangs a tale. Mr. Shah and his Department are keen not only on setting up a free trade zone at Kandla, which has been talked about for more than two years, but also on creating a network of such zones along the country's coastline at Pondicherry, Karaikal, Marmagoa, Cochin and Nagapattinam. But after what appeared to be a fairly smooth passage so far, the proposal has now run into strong and serious opposition from powerful policy-making sections of the Union Government and the Planning Commission.

A Free Trade Zone has been defined as an "isolated, enclosed and policed area in or adjacent to a port of entry where foreign or domestic merchandise of every description, except such as prohibited by law, may without being subject to custom laws, be brought in, manufactured, assembled, repacked and exported".

The object of the scheme is, therefore, twofold: To encourage the establishment of industries in an area where industries are not normally being attracted; and to stimulate exports by making production on preferential terms conditional on the export of the goods manufactured or assembled. When the Kandla project was first thought, the former objective was predominant in the minds of its sponsors. But as the country's foreign exchange situation worsened, and "Export or Perish" became a stark reality rather than a smart slogan, the sponsors of idea began stressing the export potential of the project. In fact, export promotion has now become the raison d'etre of the whole scheme. There is no other way in which the import of raw materials and components on a large scale can be justified, except to say that all the production resulting from these imports will be exported to relieve the severe foreign exchange crisis.

It is this very claim of the sponsors, however, that is being challenged vigorously by the critics of the project. The critics say that there is absolutely no guarantee that the goods produced in Free Trade Zones will in fact be exported. After all, the only thing that the manufacturers in a Free Trade Zone need to do to divert their products to the ravenous internal market is to pay the various customs and import duties. If the industrialists in general have found it expedient to sell in the more profitable domestic market, then why must the industrialists in the Free Trade Zones be expected to be more patriotic, especially when the latter have a short-cut open to them. All they have to do is to smuggle their goods across the customs barrier, and then even customs and excise duties need not be paid.

That the danger of smuggling is very real is conceded even by the most enthusiastic supporters of the project. The Special Officer of the Commerce and Industry Ministry who made a report on the Kandla project also said that smuggling could be a possible danger. But, after "weighing the likely benefits against the possible pitfalls and dangers" he came to the conclusion that "with determination and a practical approach, we can successfully utilize the mechanism of free trade zone as one important step in the effort to tilt the balance of foreign trade in our favour."

The critics' point, however, is that the assumption that the Free Trade Zones will lead to greater exports in based only on hope, while past experince shows that instead of becoming centres of exports, the zones may become citadels of smuggling, thus undermining not only foreign exchange reserves but also national morale.

The case of the critics is strengthened by two facts. Firstly, it is generally recognized that under the existing law of the land, a foolproof system of checking smuggling cannot be devised. Secondly, some of the industries proposed to be set up in the Kandla Free Trade Zone are such as have a low priority in the Third Plan, and by no means have any assured export markets. To allow such industries — e.g., woollen hosiery and woollen fabrics, soaps and toilets etc. — will be to promote industries which are not strictly required.

What is more, all industries in the Free Trade Zones will, by definition, be dependent on imported raw materials. This again runs counter to the national policy. The Government has, in fact, decided to appoint a Technical Panel, headed by Mr. G. L. Mehta, former Ambassador to the USA, to explore the possibility of eliminating "maintenance imports" by larger indigenous production as well as use of substitutes.

It is, therefore, clear that the matter will have to go to the Cabinet for an authoritative decision. The pros and cons of the proposal will no doubt be weighed carefully. One important factor the Cabinet will have to bear in mind is that there cannot be one policy for Kandla and another for other ports. If a Free Trade Zone is allowed at Kandla, other States with any coastline worth the name are bound to clamour for similar ventures.

MANGANESE ORE — TERYLENE BARTER DEAL

For quite some time, the Department of International Trade has been under fire for a barter deal under which a Bombay firm was allowed to export manganese ore in exchange of terylene. Critics felt that the Government had no business to barter away a foreign exchange-earning commodity for a luxury item. Mr. Manubhai Shah made the following statement in the Rajya Sabha to justify the deal: "The barter involves the export of about 100,000 tons of manganese ore of various grades including very low grades to the value of £750,000 against import of approximately 700 tons of polyester fibre and tops. Polyester fibre will substitute and replace the imports of raw wool to that extent which would have otherwise taken place, and would thus save us free foreign exchange on import of wool to the extent of about Rs. 97 lakhs. This is used for mixed wool yarn, hosiery manufacture, woollen and mixed textiles fabrics manufactures, knitted wear and sports wear manufacture where raw wool is the raw material.

"The barter commodity was a difficult item to sell and fetched considerably higher price than the international price for these ores. The ICI will buy the manganese ore from several places including about 30,000 tons from Messrs. Shivrajpur Syndicate. The transaction will be carried out by the State Trading Corporation."

Mr. A. D. Mani, who had tabled a question on the subject, inquired if it was true that the Minister without Portfolio, Mr. T. T. Krishnamachari, had taken objection to the barter arrangement. Mr. Shah replied

4½%

MAHARASHTRA STATE DEVELOPMENT LOAN, 1974

ISSUE PRICE AT PAR

OPEN ON MONDAY, THE 27TH AUGUST 1962

The loan will be closed as soon as the total amount of Rs. 12½ crores has been subscribed and in any case not later than the close of business on the 1st September 1962.

The applications for the loan will be received at—

(a) the offices of the Reserve Bank of India, Bangalore, Bombay, Calcutta, Madras, Nagpur and New Delhi,

(b) the branch of the State Bank of India at Patna,

(c) the branch of the State Bank of Hyderabad at Hyderabad,

(d) the branches of the State Bank of Hyderabad conducting Government work within the State of Maharashtra,

(e) the branches of the State Bank of India within the State of Maharashtra except at Bombay and Nagpur and at places covered by item (d),

(f) the Government treasuries and sub-treasuries in the State of Maharashtra at places not covered by items (d) and (e).

Full particulars can be obtained at any of the offices mentioned above

A successful businessman knows that a bright office is the first step to winning the confidence of clients and customers

So, get down to brass tacks and keep the brass articles and fittings in your office bright as new with a regular Brasso polish. Brasso, available in large tins, is easy to use and economical too.

that no objection was taken by Mr. Krishnamachari, although people were free to form whatever opinion they liked.

In reply to another question, Mr. Shah explained that barter transactions were approved only in the case of difficult-to-sell items (for example manganese ore, ferro-manganese, sugar, vegetable oils, etc.) against the items of import of priority items on which foreign exchange would have to be spent anyhow (such as fertilizers, cotton and stable fibre, steel, machinery etc.). Such transactions were permitted to be entered into either through the agency of the State Trading Corporation or otherwise after approval by the Barter Committee. Mr. Shah added that no detailed rules had been published by the Barter Committee.

When pressed as to why specific rules were not made for barter deals, he replied: "The rules of the game are known. The price must be competitive, and the commodity must be essential."

CLOTH EXPORTS TO U.S.S.R.

An item of news which has gone more or less unnoticed is the purchase by the Soviet Union of Indian cloth worth Rs. 25 lakhs. Two years ago, Russia had brought small quantities of Indian textiles. The present deal may be a harbinger of new dimensions in Indo-Soviet trade. During Mr. Mikoyan's recent stopover in Delhi, it was mentioned to the Soviet dignitory that Russia should start taking Indian consumer goods if the trade between the two countries is to be increased to the level desired by both. India's trade agreements with Soviet Union and other Eastern European countries are due to lapse later this year or early next year. Their renewal is likely to be utilized to lay a foundation for a massive increase in India's trade with the Communist bloc. This is expected partly to mitigate the loss of trade in the European Common Market and the U.K.

GATT NEGOTIATIONS

The new agreement reached between India and the countries of the European Economic Community under the auspices of the GATT Conference has replaced the earlier concessions and does not call for any fresh concessions by this country in return, according to the details of the tariff negotiations released recently.

The agreement contains an assurance of continuance at fixed levels of the Community's common tariff in respect of the main Indian export products like cashewnuts, tea, vegetable oils, tanned hides and skins, jute manufactures and coir manufactures. It also provides for the reduction of the common tariff on woollen knitted carpets from 40 per cent to 32 per cent.

The tariff conference convened by the GATT in September, 1960, was brought to a close with the signature of this agreement on July 16, 1962. With this were established instruments embodying the results of the negotiations held among various countries for import duty concession on their mutual trade.

India held negotiations in the conference with the U.S.A., Australia, Sweden, Norway, Finland, Denmark, Turkey and Haiti, besides the European Economic Community.

The concessions now obtained from the Community replace the commitments given to India in the past in the national tariffs of West Germany, France, Italy, Belgium, Luxembourg and the Netherlands.

The assurances continued in this agreement do not, however, go very long towards the solution of the problems faced by Indian exporters in the European Economic Community since the common tariff on cotton textiles, jute manufactures and a number of other products continues to be high.

Efforts are still being made to have these duties reduced to a reasonable level as well as to assess the results of the proposed entry of the United Kingdom into the Common Market.

The agreement concluded by India with Finland, Australia, Haiti and Turkey also relates to the replacement of existing concessions by those on other products, and does not call for any new concessions by this country.

The second half of the conference—known as the 'Dillon Round'—was devoted to negotiations between the participating countries for reducing tariff rates on their mutual trade. In this round, India negotiated fresh concessions for her trade with Sweden, Norway, Denmark and the United States.

The agreement with Sweden provides for reductions in the present Swedish import duty on cashewnuts cardamom, ginger, brass bells, and some other items and, in return, guarantees that India would not raise the present rate of duty on specified varieties of paper, circular bandsaw blades, industrial centrifuges and plates for heat exchangers.

In the agreement with Norway, India has undertaken not to raise the current import duty of 50 per cent ad valorem on specified varieties of paper in return for a reduction in the Norwegian import duty on cardamom, jute fabrics, mica splittings, black copper and ginger.

India's agreement with Denmark is a limited one providing for a reduction of the Indian customs tariff on dried pectin powder, and a guarantee by Denmark to maintain without change the duty-free import of cardamom.

Negotiations held between the United States, the United Kingdom and the European Economic Community in the Dillon Round resulted in the reduction of their customs tariff rates on a large number of industrial products by 20 per cent or more.

By virtue of the multilateral rule of the GATT, these duty reductions will be available to India's exports. For example, jute yarns, ivory manufactures, cotton carpets and certain woollen floor coverings are some of the Indian products which will hereafter pay a lower rate of duty in the US as a result of these negotiations.

Details of the agreement reached between the US and India, involving concessions for 29 items of export from India, were announced in June.

RAILWAY'S THIRD PLAN: MORE FUNDS

The railways have been allowed yet another increase in their Third Plan allocation. Originally in the Third Plan, the railways were allotted a sum of Rs. 1,325 crores. Recently, this amount was increased by Rs. 120 crores largely to enable the railways to increase their coal-carrying capacity. Now, fresh programmes (to augment the railways' capacity to carry general goods

traffic) have been sanctioned, and some others are likely to be approved shortly, which will necessitate a further increase of Rs. 140 crores in the railways' share of Plan resources. Of this, Rs. 65 crores will have to be spent on rolling stock. The need to acquire more locomotives, both diesel and electric, as well as to expand the wagon manufacturing programme is now considered unavoidable. The rest of the money will be spent on increasing the line capacity. It is the Planning Commission's view that some readjustments can be made in the programme for new lines and track renewal in order to keep down fresh expenditure. However, the scope for such saving is admittedly limited.

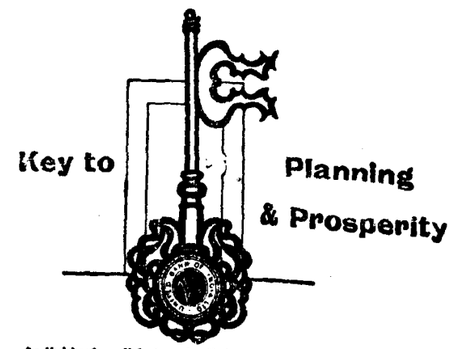
The Planning Commission's broad decision that the railways must not be denied funds which they manifestly need has created an important problem: where are the additional resources to come from? Nobody is agreeable to the transference of resources from one set of projects to another, not even when a project's completion during the Third Plan period is in doubt. At a recent meeting of the Planning Commission, the Finance Minister, Mr. Morarji Desai, is reported to have spoken at length on the need to inculcate in the country a sense of realism about resources. A complete and comprehensive review of the Third Plan resources and their deployment in various sectors of economy is now being contemplated.

PAPER INDUSTRY'S PROGRESS

The first meeting of the reconstituted Development Council for paper, pulp and allied industries, provided an occasion for a review of the progress of an industry which is vital to the cause of promoting literacy. The main conclusion to emerge from the discussion was that despite a four-fold increase in the production of paper during the last fifteen years, shortage of this commodity is bound to persist. The continuing shortage is due not merely to a rapid increase in demand. An alarming fact brought to light during the discussion is that the basic raw material for the production of paper, bamboo, is fast diminishing. It is reckoned that the present resources of bamboo will suffice to meet the needs of the paper industry only up to 1965-66. Beyond that period, the expansion of the paper industry will have to be linked with a vigorous campaign for planting suitable species of timbers and bamboo.

Interestingly enough, rural housing is playing its own part in accentuating paper shortage. Every increase in population means that new houses have to be built. In most Indian villages, bamboo continues to be a major prop for housing. The need for living space thus competes with that for reading matter. Enough attention has not so far been paid to the problem of reconciling these conflicting needs.

The position about newsprint is even more bleak than in the case of paper. Mr. Nityanand Kanungo, Union Minister for Industry, who presided over the meeting of the Development Council, announced the measures Government is taking to increase the newsprint production. He said that the first dissolving pulp unit with a capacity of 54,000 tons per year was likely to go into production this year. Eventually there will be seven such schemes. Three more newsprint factories have also been licensed. Their cumulative capacity will be 150,000 tons per year. Two of the three factories will be based on bagasse.



Meanwhile, some distressting statistics have been revealed about the shortfall at the NEPA newsprint factory. The following table sets out the position :

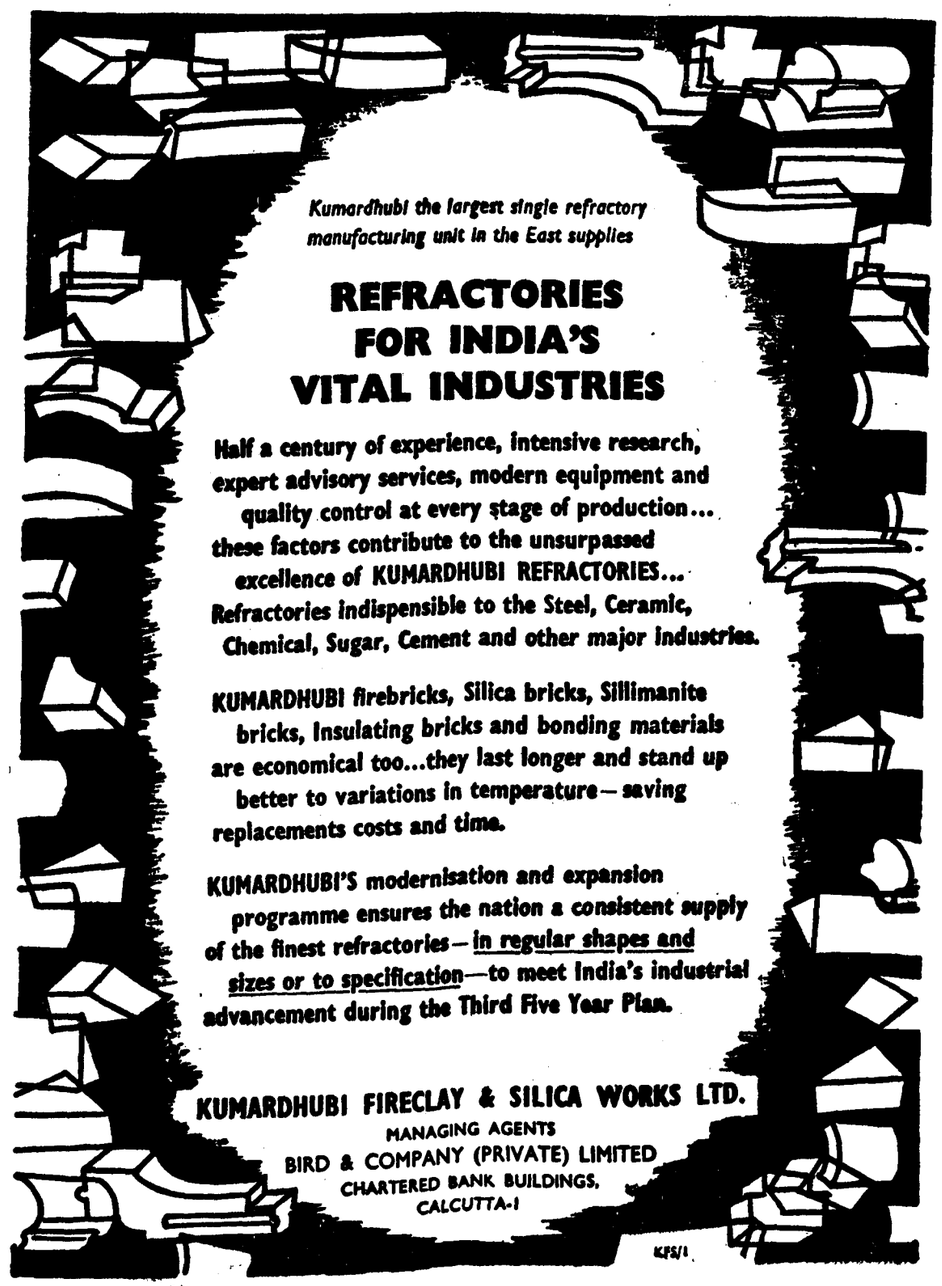
Year	Stipulated production target (Tons)	Actual production (Tons)	Shortage between the stipulated target and actual production (Tons)
1956-57	30,000	13,354	16,646
1957-58	30,000	14,145	15,855
1958-59	30,000	21,838	8,162
1959-60	30,000	22,411	7,589
1960-61	30,000	23,318	6,682
1961-62	30,000	25,279	4,721
1962-63	30,000	27,000 (Estimated)	3,000 (Estimated)

What is more, the cost of production at NEPA has gone up enormously. Originally it was estimated that the cost of production will be Rs. 478 per ton. Actually, it has turned out to be more than Rs. 870 per ton.

WAGE BOARD FOR COAL-MINING INDUSTRY

A Wage Board for the coal-mining industry has been constituted under the chairmanship of Mr. Salim Merchant to work out a wage structure based on the principles of fair wages as recommended by the Committee on Fair Wages. The Board will also consider the demands for an interim wage increase pending submission of the final report and for the introduction of a gratuity scheme on unit-wise basis. The Board has been asked to take into account the special features

Individual well-being is linked with national prosperity and only planned efforts can ensure both in the shortest possible time. And planning, for its success, largely depends on savings, individual as well as national.



Saving in the form of Bank Deposits provides resources for the National Plan.

United Bank of India Limited

HEAD OFFICE: 4, CLIVE GHAT STREET, CALCUTTA-1

with branches all over India and East Pakistan, and correspondents in all important trade centres the world over.

offers complete banking service

of the coal industry, its needs in a developing economy, the impact of the wage structure on the cost of production and the effect of these on other industries consuming coal.

Besides the Chairman, the Board will include Mr. P. R. Chakravarthy, M.P., Mr. S. S. Marathe (independent member), Mr. Rasiklal Worah, Mr. R. Lall (representative of employers), Mr. Kanti Mehta and Mr. Devan Sen (representatives of workers). The Board will have its headquarters in Bombay. The terms of reference of the Board also include the study of the need for adjusting wage differentials in such a manner as to provide incentives to workmen for advancing their skill, and the desirability of extending the system of payment by results. In applying the system of payment by results, the Board will keep in view the need for fixing a minimum (fall-back) wage and also to safeguard against overwork and undue speed.

Meanwhile, Mr. K. D. Malaviya, after a meeting with all important colliery owners has announced that FICCI and other "Big Business" spokesmen should leave him and the industry alone to achieve the Third Plan target. He said that the coal industry was quite capable of taking care of itself, and that others with no connection with coal should refrain from interfering. He claimed that FICCI was being disowned by the representatives of the colliery-owners themselves.

GIDI COAL WASHERY

The National Coal Development Corporation has signed an agreement with the Polish firm CEKOP for setting up a coal washery at Gidi in the Karanpura coalfields of Bihar. This will be the Corporation's second washery in this State; the first was set up at Kargali.

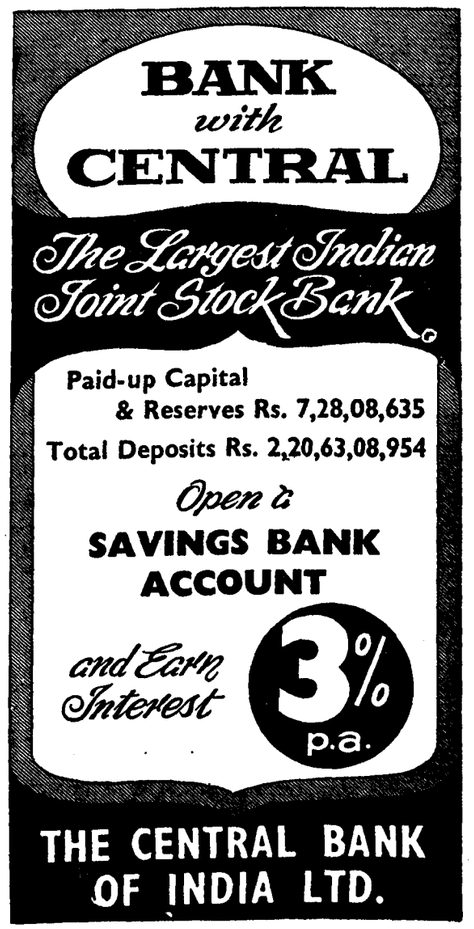
The project is estimated to cost a little over Rs. 8.31 crores. The annual raw coal input capacity of the washery will be 2.84 million metric tons. It will produce 1.1 million metric tons of washed blendable coal, 1.1 million metric tons of washed steam-size coal (suitable for railways) and over half a million metric tons middlings. Middlings will be used by the Patratu thermal power tation; now under construction. Commissioning of the refinery is expected to take place by April, 1965.

To the extent possible, equipment for the washery will be procured from Indian sources. The remaining items will be supplied by CEKOP which will also assist in erecting and commissioning the plant. The foreign exchange component of the project is to be financed out of the Rs. 14.3 crores credit made available to India by Poland in 1960.

REPLACEMENT OF DAKOTAS

Referring to a news item published in this column last week, the Chief Publicity Officer of the Indian Airlines Corporation, Mr. R. G. Jamalabad, has advised us that the French aircraft Caravelles are not meant to replace Dakotas, whereas the Fokker Friendships are. The Indian Airlines Corporation, he says, had placed an order for a second batch of five Friendships on October 17, 1961, and these aircraft are due to be delivered to it between November, 1962, and March, 1963. Mr. Jamalabad further adds that the Avro-748 is a short-haul turbine aircraft and is not claimed to suit IAC's trunk route requirements.

FOODGRAINS MOVEMENT AND OUTPUT



The Union Minister for Food and Agriculture, Mr. S. K Patil, disclosed in the Lok Sabha this week that zonal restrictions on the movement of rice could not be removed at present. In fact, there was no proposal to abolish the system in respect of any of the food zones, he said.

The Government's decision on not abolishing the rice zones follows the shortfall of 48,000 tons in the rice crop in 1961-62 from 33.6 million tons in 1960-61.

Earlier, Mr. Patil told at the meeting of the Informal Consultative Committee of his Ministry that the Government was in the process of building up a 5 million tons foodgrains buffer stock. With a view to make available foodgrains to the "vulnerable sections of the society" at reasonable prices, the Food Minister observed that there were more than 46,000 fair price shops now functioning in the country.

Mr. Patil also stated at this meeting that the Government had under consideration fixation of minimum prices for rice. Minimum support prices for the fair average quality of common variety white wheat, it may be recalled, were, for the first time, fixed at Rs. 13 per maund for the 1961-62 crop. Introduction of support prices for rice should obviously help in stepping up its output.

The Minister emphasized that it was Government's endeavour to see that the farmer was not compelled to

resort to "distress selling" at any time. In this connection, he stressed the role of co-operative societies in going to the aid of the producer by providing ready credit against his crops. This should enable the peasantry to secure better prices for its products in the lean periods.

Dwelling upon the question of distribution of fertilizers, Mr. Patil said that he was considering steps to improve arrangements to ensure that fertilizers always reached the farmer in time. Better machinery, he added, would also have to be devised for the training of farmers in the use of fertilizers as is done in countries like Japan. It might be made conditional on the selling agencies to set apart a percentage of their profits for conducting experiments and imparting training, he further stated. The Minister for Agriculture, Dr. Ram Subhag Singh, detailed at the meeting the steps which the Government had planned to increase cotton and oilseeds output.

IN BRIEF...

The Government of India has accepted the Tariff Commission's recommendation to continue protection to the crude antimony and antimony metal industry at the existing rate—25 per cent ad valorem in the case of crude antimony and 45 per cent ad valorem or Rs. 88.60 per quintal, whichever is higher, in the case antimony metal—up to December 31, 1963.

*

Sugar output during the current crushing season amounted to 27.14 lakh metric tons up to July 31, 1962, as against 30.06 lakh metric tons during the corresponding period last season.

The Central Warehousing Corporation opened 14 new warehouses in the first seven months of this year compared to 11 warehouses during the same period last year. The latest centres where Central warehouses have been opened are Bardwan (West Bengal), Baroda (Gujarat), Nasik (Maharashtra) and Kharagpur (West Bengal).

*

The "Research and Industry Meet" on cotton linters which was scheduled to be held on 6th and 7th September, 1962, at the Regional Research Laboratory, Hyderabad, has been postponed to 28th and 29th September, 1962.

*

The Machine Tools Factory being set up as a public sector project at Pinjore, in Punjab, is expected to go into production in early 1963. Its total capital cost, including the cost of the township, is estimated to be Rs. 7.5 crores. The capacity presently planned is about 1,000 machine tools per annum. The factory has been designed to produce 2,000 machine tools per annum after a few years.

*

Two additional blast furnaces are to be set up under the expansion programme of the Bhilai Steel Plant. The first of these furnaces will be commissioned by December, 1963, and the second by December, 1964.

*

A National Institute of Industrial Engineering is to be set up in Bombay with assistance from the United Nations Special Fund. The Institute will train about 250 industrial engineers every year. The National Productivity Council has taken the initiative in planning this Institute.

COMPANY AFFAIRS

TELCO

The working results of the Tata Engineering and Locomotive Company Limited for the year ended March 31, 1962, show a substantial improvement over the previous year. During the year under report the Company enhanced its capacity for production of high-grade engineering products and improved further its manufacturing facilities. Sales, excluding excise duty, maintained its steady uptrend, increasing from Rs. 34,27 lakhs to Rs. 37,93 lakhs. The profits, after providing for depreciation, Managing Agents' remuneration, taxes, and Development Rebate Reserve, show a small improvment, rising from Rs. 1.46 crores to Rs. 1.50 crores. As there is no appreciable rise in net profits, the Directors have recommended the same dividend of 14.5 per cent (gross) or 10.15 per cent (tax-free) per equity share, subject to the tax relief under Section 84 of the Income-Tax Act, 1961.

Allocations include Rs. 219.92 lakhs for Depreciation (against Rs. 180.63 lakhs), Rs. 187.75 lakhs for Taxation (against Rs. 122.23 lakhs), Rs. 40.18 lakhs for Development Rebate Reserve (against Rs. 44.88 lakhs) and Rs. 25 lakhs for General Reserve No. 1 (against Rs. 20.29 lakhs). No amount has been transferred to General Reserve No. 2 and Deferred Taxation Reserve against Rs. 75,000 and Rs. 8.40 lakhs respectively in the previous year. A sum of Rs. 3.62 lakhs has been carried forward against Rs. 2.47 lakhs brought in.

Substantial working capital will be needed for expansion and diversification. A part of the funds will be raised from retained earnings and it is proposed to fill the balance partly from a long-term credit from the Agency for International Aid and partly from an issue of Rs. 5 crores convertible debentures. The terms and conditions of the issue including the conversion terms are still under discussion with the Government.

Owing to the critical foreign exchange situation, the Company will implement the expansion programme of the Automobile Division in two stages. In the first phase the capacity will be raised from 12,000 to 18,000 units per year and in the second stage, it will be stepped up from 18,000 to 24,000 units. The Company is negotiating for a loan of Rs. 6.5 crores ($13.65 million) with the Agency for International Development. In the meantime the Government has also agreed to release a sum of Rs. 1 crore from "free" sources for import of special items to be purchased from West Germany. These amounts will, by and large, cover the foreign exchange requirements for the first stage of the Company's expansion programme.

The diversifying activities of the Company are taking a concrete shape. The manufacture of Tata P & H excavators has been put on a sound basis, the Company being the first to produce this heavy line of equipment. The demand for excavators continues to be satisfactory and the Company proposes to enter into an agreement with the Voltas Limited for the distribution of the product.

Though TELCO is the last to enter the automobile field, it is heartening to note, that at the current level of output of commercial vehicles, it is the biggest producer — with the largest indigenous content — in the country. The Company has already earned for the country Rs. 35 crores by way of foreign exchange.

A modest beginning has been made in the field of exports. During the year the Company exported 60 diesel engines, five vehicles and spare parts to Ceylon and South Viet Nam. An order for steel castings has also been secured from Malaya.

NEW ISSUES

The Controller of Capital Issues has allowed the following companies to issue equity capital.Details are as given below :

Heavy Electricals Ltd., Bhopal, a Central Government undertaking, having a paid-up capital of Rs. 23.20 crores is issuing further capital of Rs. 1.73 crores, divided into 17,300 equity shares of Rs. 1,000 each for cash at par.

The Apollo Mills Ltd., Bombay, having a subscribed capital of Rs. 50 lakhs — all in equity — is issuing further capital of Rs. 50 lakhs, divided into 25 lakhs equity shares of Rs. 2 each for cash at par, to be given to the existing shareholders in the ratio of one for every share held. The proceeds of the issue would be utilised for renewals, replacement, renovations and modernisation of the company's plant and machinery.

Navyug Dye-chem Industries Ltd., Bombay, a new company, is raising capital of Rs. 40 lakhs divided into 40,000 equity shares of Rs. 100 each for cash at par. Of this, shares of the value of Rs. 6.66 lakhs will be issued to the foreign collaborator, Mitsui Chemical Company, of Japan. The proceeds of the issue would be utilised for the manufacture of dye-stuffs.

Lederle Laboratories (India) Limited, Bombay, will raise capital of Rs. 25,40,360. Of this, shares of the value of Rs. 11.92 lakhs will be issued to American Cyanamid, of the U.S.A. at par to cover the cost of plant and machinery and for payment of designing and engineering fees. The shares for the balance of Rs. 13.48 lakhs will be issued to Atul Products Ltd. for a cash consideration of Rs. 21.01 lakhs. The proceeds of the issue will be utilised on Malathion Project of the company.

Carborundum Universal Limited, Madras is raising further capital of Rs. 20 lakhs, consisting of equity shares of Rs. 100 each. All the shares will be issued for cash at par to the existing shareholders, resident as well as non-resident. The proceeds will be utilised for starting the manufacture of synthetic abrasive aluminium oxide grains.

Gajrai Pannalal Limited, Calcutta, will issue capital of Rs. 12.50 lakhs in equity shares of Rs. 100 each for the modernisation of Mahalakshmi Cotton Mills owned by the company. The existing capital of the company is Rs. 10 lakhs.

The Lakshmi Commercial Bank Limited, New Delhi will issue further capital of Rs. 3,50,850 (nominal), divided into 7,017 equity shares of Rs. 50 each for cash at a premium of Rs. 3 per share. The proceeds will be utilised for strengthening the bank's capital base.

The East India Hotels Limited, Calcutta is raising capital of Rs. 17,75,100 divided into 3,950 cumulative redeemable preference shares of Rs. 100 each and 1,38,010 equity shares of Rs. 10 each for cash at par. The capital is required for the completion of the first phase of the company's development plan for the establishment of modern hotels at several places in collaboration with International Hotels Corporation of the U.S.A.

Indian Hume Pipe Company Limited, Bombay, having a subscribed capital of Rs. 110 lakhs consisting of Rs. 60 lakhs in equity and Rs. 50 lakhs in preference shares, will issue debenture shares of the value of Rs. 20,82,200, divided into 2,082, 7 per cent, taxable debentures of Rs. 1,000 each for cash at par. The proceeds of the issue will be utilised for financing the increased business activities of the company. The consent is valid up to December 4, 1962.

And Now Chittoor

THE victory of Mr. N. G. Ranga, Chairman of the Swatantra Party, over the Congress candidate, Mr. T. N. Viswanatha Reddi, at Chittoor has shaken the inner circle of the Andhra Congress Party with good cause. In this election, unlike that at Tiruchengode, all the Congress power and influence was exercised to the full. Mr. N. Sanjiva Reddi, the Chief Minister of Andhra Pradesh and very much the Party boss of the area, threw his personal influence fully into the fray. At the same time, Mr. Kamaraj Nadar and Mr. T. T. Krishnamachari threw in a mighty last-minute effort to sway the Tamil vote. Undoubtedly, Congress power and money were deployed on a bigger scale than was possible with the Opposition candidate. The Communist Party identified itself with the Congress. It was also a seat which in the last election had a significant margin of 24,000 votes over a Swatantra rival. The elimination of this advantage, in the circumstances under which it has occurred, presents a serious setback to Congress complacency. The Swatantra-DMK combination in Andhra, which has scored its first victory in this election, is likely to be an increasingly powerful combination in Madras.

The significance of this particular election must be sought in the future more than in the present. If the movement of votes in Tiruchengode and Chittoor is any guide to likely events in a general election, the Congress might be badly shaken both in Madras and in Andhra. It is probable that both elections exaggerate the current elements of discontent. Immediately after a general election, an electorate is much readier to shake the complacency of those in power than it would be in a general election, where it has necessarily to reckon with the inadequacies of an Opposition claiming to be a government for the first time. On the other hand, the trend of discontent in the South may well gather force if certain current policies there are not substantially reversed. These policies cover an inadequacy of investment in the South against a demonstrably larger investment in the North, West and East; secondly, the failure to meet the price problem in respect of the lowest income groups there more than in any other portion of the country. Finally, there is a somewhat confused and disorderly emotional upheaval, based in part on DMK propaganda, but basically a feeling of resentment that political power and resources are deployed so much at the will of non-Southerners in the Indian political system. The ascendancy of the Hindi area and some undefined resentment against the Hindi language are deep and growing. Undoubtedly, the DMK, in the Chittoor election, produced, as a result of this resentment, the small margin with which Mr. Ranga has won.

A single election cannot serve the purpose of convincing the Government that its policies are in error and, indeed, there was nothing said by Mr. Ranga in the election which can convince an impartial observer that the Swatantra Party at this moment has any better policy for the country. It has a substantial contribution to make in terms of criticism, and Rajaji's remarkably able speeches have added some zest and excitement to the political debate. He awakens response when he refers to the Congress as a tiger because of its arrogant demeanour and unruly dogma. On the other hand, it is much more likely that the major danger of the Congress is complacency and not arrogance. The Congress Party in Delhi, no less than elsewhere, is suffering not merely from tiredness due to the ageing character of its top leadership, but from a mental stagnation which is the result of the mechanical use of slogans in place of new policies. Some of the best friends of the Congress in the country will, therefore, welcome the result of the Chittoor election not because they like a disordered opposition, but because they feel that the Congress will need to be rebuked many times before it recognises that it has lost the deep respect of the people and needs now to justify itself by new thoughts, and above all, by new deeds. If Chittoor, added to Tiruchengode, can awaken the Congress from its slumber, the results of these elections can well be taken by the body politic as the best medicine it has had for a long time.

Indian Superphosphate Production

THE opening by Mr. Morarji Desai, the Union Finance Minister, of the Kothari Superphosphate Factory at Ennore, Madras, on August 23, provides a suitable occasion on which to review the progress of Indian superphosphate production. One of the great defects of Indian fertilizer use, in addition to the pitifully small quantity employed, is the maldistribution between nitrogen, phosphorus and potash. Whereas in advanced agricultural use the proportion is roughly equal, there are very few instances in India where phosphate amounts to more than a fifth of nitrogen use. This is largely the result of a basic error in planning in India's fertilizer production with the concentration on nitrogenous fertilizers as against NPK mixtures. Late in the day an attempt has been made, for the most part in the private sector, to increase superphosphate production and the splendid new factory opened last week by the Blue Mountain Estates & Industries Limited is one of the first of many new plants. It also happened to be one of the best, deriving its process from a special patent of the great Italian firm of Montecatini. The factory is also designed to produce granulated superphosphate for the first time in India, eliminating the need for a separate granulation plant. The Blue Mountain Estates have also devised further economies by producing their own sulphuric acid with a capacity of 16,500 tons, this time with the assistance of Simon-Carves.

In the light of the importance of superphosphate production and the need for giving it special incentives, those who were present failed utterly to understand the almost brutal rejection by the Finance Minister of the very moderate submission made by Mr. D. C. Kothari for exempting such factories from import duties on sulphur and rock phosphate and excise duty on sulphuric acid. Without any argument to support his contention, the Finance Minister said there was not much to support the request. And, adding insult to injury,

he observed that the efficiency of the factory would be demonstrated if taxes were paid and yet costs were kept down. The argument that, whatever the scale of operation, additional excise duties can be offset by efficiency in management is too patently in error for the point to be argued. Here, in fact, is a case of a factory designed with extreme efficiency and economy and with a foreign exchange element so low that it could hardly have been bettered in almost any country of the world. All the machinery has been fabricated in the country on drawings; even these drawings have been paid for in part by loans to be repaid by products. There is no evidence whatsoever that capital costs could have been reduced further, and the manufacturing process is one which, for those who know it, does not admit of any further cost reduction. It is clear that the only way that costs can be reduced for agriculturists is by a reduction of the taxes which go into intermediate products for which, in this particular case, there is no justification.

The point that Mr. Kothari was making — which is one which needs consideration in a large number of industries—is whether or not the Government of India is wise in first putting on taxes and then providing subsidies to particular consumers. In this case, the Government, in some degree subsidizes the use of fertilizers by an equalisation fund having, in fact, received a duty on some of the products which, as Mr. Kothari argued, could easily be reduced or eliminated. All that is required is some adjustment in two items of an equation, leaving small agriculturists as a whole as end consumers better off. Since all the factory's product is sold, the entrance of these taxes into costs in no way hurts the factory and what Mr. Kothari was arguing was a reduced price to the agriculturist, and not a larger profit for the factory. If every such argument is to be brushed aside on the ground that this is an argument for higher profits from the richer sector of Indian society, no reasonable correlation between taxable capacity and revenue will be obtained. In this case the agriculturist who bears the higher price for the fertilizer is being improperly taxed on an item whose use should be encouraged, and whose utilisation plays a direct part in increasing the welfare of India's lowest income groups.

It seems a pity that so much of Indian fiscal procedure is based on rules of thumb, which do not look into special cases which would further the purposes of the socialist pattern of society. *The Eastern Economist* cannot think that Mr. Morarji Desai has seriously addressed himself to the problem presented by the superphosphate industry. It is not too late for him to look into the matter with greater care.

Planning and Pruning

A PLANNING Minister it seems must be as constant as the Northern Star. This is probably why Mr. Gulzari Lal Nanda made the proud pronouncement in his reply to the Lok Sabha debate on the Plan that under no situation would it be pruned. He backed his pronouncement with an assertion of confidence that the "entire machinery of planning" and administrative execution would be streamlined to ensure that the retarded progress in the implementation of the planned projects would be rectified and its tempo would be powerfully stimulated. Whether he was speaking in this tone from conviction or he was goaded to do so by the trenchant criticism of the Government and the Planning Commission at the hands of all the sections of the House is not very relevant. In fact his answer has not been taken seriously.

Mr. Nanda found it convenient to ignore blissfully his own admission in his opening speech at the debate to the effect that the "vital and basic" objectives of the Plan would surely be achieved. This was nothing short of a respectable way of putting it by implication that the core of the Plan would be fulfilled, while pruning would be necessary in relation to the programmes of lesser importance. Is this to be a hard core or not? If so, cannot it be described or must it be perpetually hidden?

The thesis of no pruning of the Plan has been flatly contradicted by most of the statistical evidence adduced by Mr. Nanda. Acute shortages in the key sectors of power and transport have become so chronic and of such a prolonged duration that here at least the Planning Minister owed it to the country to give a forthright clarification to what extent these two primary resources would be provided, to what extent industrial production can be sustained and in what order the targets can be achieved. Out of the additional 7.5 million kw. capacity which is the target fixed for power in the Third Plan, as high a proportion as 4.6 million kw. is to be left over for the last two years as originally envisaged. At least an approximate idea ought to have been given to the House how the resources would be provided for the installation of more capacity which will be required much earlier. But Mr. Nanda merely dilated on the time-lag inherent in installation of generating capacity. In the production of coal the first year of the Third Plan lagged behind the last year of the previous Plan. The major defaulter in this serious shortfall was the National Coal Development Corporation.

Granting that the additional allocation of Rs. 130 crores (exclusive of Rs. 15 crores which are meant for the requirements of the Railway Plan period) for the enlargement of the Railway Plan is a most appropriate measure which has been rightly adopted, the question remains to be answered how much capacity in terms of ton miles, which alone is the precise and scientific measurement of rail capacity, would be available during the Plan period. All that Mr. Nanda had to enlighten the House upon was that out of the target assigned to the railways of providing additional capacity of 91 million originating tons, 69 million tons would be passed on to the last three years. The prospect is clear, making due allowance for the fact that the tempo of railway expansion will be raised, that rail transport will take care of top priority traffic led by coal and steel. But he would be an incorrigible optimist who would hope that the normal industrial and commercial traffic which the railways conventionally carry will be fully cared for by the railways. How the shortfalls in the capacity would be eliminated by road transport in the first instance, and by coastal shipping in the hinterland, is a very vital issue for preventing the productive potential of the economy from being paralysed. In neither of his two speeches had Mr. Nanda even a word to say about the measures to be positively taken to step up motor transport and coastal shipping.

Whether wittingly or unwittingly, the Planning Minister gave a misleading picture of the performance of the State Governments in the matter of raising their own resources from new taxation. He resorted to the technique of assuming that the shares of the States in raising tax revenue could be clubbed together and in this manner he held up before the House the picture of the States having raised in the first two years tax resources of the order of Rs. 360 crores, leaving a balance of Rs. 240 crores to be provided for by fresh taxation in the remaining period. This is completely erroneous. There is no such thing as the revenues of the States as an integrated whole. Each individual State is responsible for finding its allocated tax resources and what was really needed to explain the position in this respect was the performance and the shortfalls in the case of every single State. If several States fail to measure up to their allocations, as they threaten to do, how is the gap to be filled without pruning their plans?

On foreign exchange, Mr. Nanda did well to keep his discourse to the minimum. Perhaps the explanation lies in the fact that only a couple of days or so before the debate started the Planning Commission made a decision not to alter the targets either of external aid or exports. This is a tacit admission that the substantial margin of under-estimation in the requirements of foreign exchange and the allowance necessary for a possible increase in world prices pose the prospect of a gap in the foreign currency requirements about which *ad hoc* decisions would be made as the emergencies arise. But on the score of the slow utilisation of the committed amounts of aid from foreign governments, Mr. Nanda's bare statement that ways and means were being devised to improve the administrative and financial procedures comes as a poor defence.

Guest Editorial

Controversies in Mysore

By P. KODANDA RAO

THE name of the enlarged State, of which Bangalore is the Capital, has become highly controversial. It is now called Mysore. There is a proposal to call it Karnataka. By and large, leaders of the Vokkaliga majority in the former Mysore State insist on calling the integrated State as Mysore, while the Lingayet majority of the integrated State insist equally firmly on calling it Karnataka. The question has been brewing since the formation of the enlarged State, but recently it boiled over, as it were. In the last session of the Mysore Legislature the protagonists of either name discussed it with much animation and heat. Threats were uttered on the floor of the Legislature of blood-shed and even of division of the State into two parts! The Government offered that the question be decided by the free vote of the members, unfettered by party mandates. Neither of the two contestants would, however, risk a defeat and face the consequent agitation. Several alternative solutions were suggested, such as "Kannadanadu", hyphenated "Mysore-Karnataka" and "Mysore" for all-India use and "Karnataka" for local use, following the example of Madras where the State is called "Madras" for all-India use and "Tamilnadu" for local purposes. The protagonists of Karnataka point to the example of the truncated Bombay State being called "Maharashtra" instead of Bombay, in spite of the latter's historical associations. But none of the alternatives received unanimous or near-unanimous support. After hours and days of interminable and inconclusive debates, the decision was postponed till the next session of the legislature. There is, however, little hope of unanimity being reached even then, though miracles are not ruled out altogether.

Though the dispute is formally on the name for the State, the real issue is communal. In the former State of Mysore the Vokkaligas were more numerous than the Lingayets and hoped to achieve and perpetuate Vokkaliga Raj. In the enlarged State, the Lingayets are more numerous than the Vokkaligas. Even at the time of the agitation for a linguistic State based on the Kannada language, the Vokkaligas of old Mysore were not as keen as the Lingayets of Bombay-Karnatak for they feared the inevitability of Lingayet Raj. Since reorganisation, the fear has materialised, and the hope of Vokkaliga Raj has disappeared for ever.

Even the Lingayets do not seem to be quite happy and contented under Lingayet Raj because of group rivalries among them. Though both Mr. B. D. Jatti and Mr. Nijalingappa are Lingayets and Congressmen, they competed for the Chief Ministership. The last General Election returned a majority of the followers of Mr. Nijalingappa, but not him, while Mr. Jatti was returned but with a minority of his followers. The curious result was that neither of them could assume the Chief Ministership and form a stable Cabinet. The crisis was resolved by the provisional offer of Chief Ministership to Mr. S. R. Kanthi, a Lingayet and a devoted follower of Mr. Nijalingappa. Subsequently, a safe seat was found for Mr. Nijalingappa, who then took over the Chief Ministership from the magnanimous Mr. Kanthi. This is in striking contrast to the situation in Madhya Pradesh where Mr. K. N. Katju was defeated at the General Election but was subsequently elected from a safe constituency with a view to resuming the Chief Ministership, but was foiled by the reluctance of Mr. Mandloi to follow the example of Mr. Kanthi.

Mr. Nijalingappa had, however, to "broad-base" his Cabinet enormously by the inclusion of Mr. Jatti and some of his group. At present the Ministry consists of twenty-five members, with the prospect of some more being added to stabilise it! But stability is still doubtful, for the internal rivalries between Vokkaligas and Lingayets and between Lingayets themselves do not seem to have been composed as yet.

The education field is not free from acute controversies. A dispute which suddenly shot into prominence was due to the decision of the Mysore Government to raise the fees in its colleges affiliated to the Mysore University, with a view to achieving uniformity and raising revenue. In the former Mysore State, the fees were Rs. 96 per annum, while in South Kanara and Coorg they were Rs. 144. The Government decided to achieve uniformity by raising the lower fees to the level of the higher. The increase was steep and sudden and provoked opposition in the Legislature, leading to a "walk-out" by some members. Outside the legislature, the initiative for it was taken by

A DELHI DIARY

IGNORING the controversial election at Chittoor and various domestic sources of attraction, such as the inevitable debate on planning, I am adhering to my planned course of keeping my vision fixed on the receding image of affluent societies in the Western world. As I remember, I was in Seattle on the last occasion and got firmly rooted in the Fair. This was, in fact, doing the United States great injustice. Since in principle the whole is greater than the part, the United States cannot be dealt with adequately by treatment of one of its most interesting cities. I thus return to some general reflections on the United States which I have now seen after a decade. People tell me that the Fifties have been the most important decade of the century. So far as the United States is concerned, I doubt if this is so and statistics tell a not very glorious tale; but I doubt even more the current conclusion on stagnation full with its own statistics.

MEASURING VITALITY

According to the statistical pundits, the United States is just limping along with a rate of progress of possibly 2½ per cent per year of gross national product against 5, 6 or 7 per cent as well as some out-sizes in other economies. When one looks at the absolute value of production, one gets shaken a little on statistical dogmas, but the point first came home to me on this visit that one cannot look either in percentage terms or in absolute statistics for measurement of that thing called vitality. One should look at men and women or, if one is unable to catch the magic of vitality inside the human form, at their individual, not their aggregate, products. So far as the United States is concerned, I saw vitality at all levels. I met it in babies in super-markets being pushed about by their parents in curious contraptions, which provide restrictions on their abundant movements as well as space for vast purchases which everyone seems to make in super-markets. I saw it in schools with boys and girls of different ages. I saw it in the East; I saw it in the West as well as, in that strange world of isolation called the Middle West. I saw it in middle age, I saw it in the aged; I might almost say, I saw it in the octogenarian class, with the great passion which the American octogenarians have to do almost everything that 'normal' men wish to do—flying, motoring, cycling and discussing! If this is stagnation in an economy, let us in India have more of it.

CREATIVE ARCHITECTS

One of the most interesting marks of American genius today is to be found in an area which has not often been noticed in this country. I refer to American architects who are building all over the country remarkable new forms as well as new interiors to old forms. The TWA centre in Idlewild Airport has attracted particular attention in this country, but it is only one of a great group of imaginative buildings. This particular one is Saarinen like a giant bird taking off like an aircraft and yet holding very much to the ground—"to express" as its great architect Eero Saarinen has put it "the excitement of travel". One should look at the great arms of airport buildings themselves apart from the receiving centres. They reach out far out into the airfields with great star-like arms which have no parallel in Europe, both in respect of length and the imagination with which they have been used. I speak particularly of the O'Hare Airport in Chicago. One can report half an hour before the plane leaves; one's baggage goes mysteriously half a mile away from one on a conveyor and one is surprised to find that, before one arrives at the taking-off centre one's luggage has somehow or other raced ahead and is on the plane. Then there are no ups and downs. There come out from the limb two great telescopic arms, one for the first class and one for the economy class. One boards the aircraft from the building itself going through telescoping passages which fit into the aircraft doors. Similarly, when one arrives at the airport one does not go down a staircase and up into the aircraft. The gentle telescopic arms rush out to meet you and one collects one's baggage at a centre almost as soon as one arrives. The processes of transport in American airports have been organised by a new generation of architects and efficiency experts the like of which, I fear, we will never see. Movement of luggage in Delhi at Palam is for me a very sore subject!

THAT WALL STREET FEELING

During the period I was in the United States, Wall Street was behaving with that erratic mystery which causes tremors and trials all the world over. What was new on this occasion was not the behaviour of this strange barometer of American economic activity but the extraordinary extent to which almost everyone in the country seemed concerned. There are many jokes about juvenile interest in investment in the United States, but it happens to be a new and startling fact. A large number of boys and girls get presents of shares from their grandfathers—less often from their parents—on condition that they keep themselves up-to-date and regulate their own investments. Quite often, children do their profit-taking or loss-making in defiance of parental orders. A very large number of young men and women—aged 10 to 18—read the Wall Street Journal as though the mysteries of the economy were to be penetrated by behaviour of stocks rather than by text-book economic sophistication. Perhaps they are right because many of them had done better than their parents. In any case, I have been told, and I believe this is nearly true, half the American population is now affected by Wall Street. If one looks on the other half as being dependent on those who are Wall Street-minded, one might say that one begins to understand why the whole of the United States is now so share-ridden. Here, I am inclined to believe that the affluent society is certainly not a goal to be sought by those who seek peace and tranquility in this life before they receive it, inevitably, in the next. Wall Street is certainly a disturber of the public peace.

The face of the United States keeps on changing as I expect does the face of every country. But in addition to this character of vitality and new interest at all ages, there are great impersonal lines being drawn on the boards in the form of new highways and turn-pikes reaching from east to west and north to south. I believe, within a year one will be able to motor the three-thousand miles across the American Continent in four days. This is not—I repeat, 'not'—a consummation devoutly to be wished.

TELEVISION — PLUS

I must confess in conclusion, to a major reverse in regard to my opinion on Television. Many of us consider television a detrimental occupation for sophisticated persons. We are very apt to think that television programmes in the United States are designed for the crowd and are to be avoided at all costs by intellectuals and highbrows. I discovered, in fact, that the wealth of education available in television programmes was so great that in particular hours of day and night I was rooted to the spot drawing in American culture much more readily than if I walked the streets or indulged in elevating conversation in the campus of Universities. I am more than ever now a believer in television and I look, therefore, with great favour on the grand antennae of a transmitting apparatus going up on Broadcasting House opposite my window. When will it come to life?

ment) rather than as entrepreneurs seeking to maximise profits. The salaries paid to managers do not depend so much on their ability as on what electoral opinion at any moment thinks is appropriate to their status. But a society which will only stand for "appropriate" salaries, and which refuses to allow entrepreneurs to acquire private fortunes in a relatively short time as a legitimate form of remuneration will not in the long run preserve individual freedom because this basically depends on the survival of private enterprise. As Professor Hayek says in his "Constitution of Liberty" (Routledge. London. 1960) though there may be no difficulty in widely dispersing ownership of well established enterprises among many small owners and in having them run by managers, to build up new enterprises you need individuals controlling considerable resources. One of the advantages of the competitive system is that successful new ventures are likely for a short time to bring very large profits and that the capital needed for development will be formed by men with the best opportunity of using it. The large gains of the successful innovator meant in the Victorian era, whose memory haunts Mr. Sampson, that, having shown the capacity for employing capital profitably in new enterprises, he would soon be able to back his judgment with larger means. Much of the individual formation of new capital, since it is offset by the capital losses of others, should realistically be seen as part of a continuous process of redistribution of capital among entrepreneurs. The scale of taxation of profits in the UK amounts to heavy tax on that turnover of capital which is part of the driving force of a progressive society.

Mr. Sampson sees the differences between private corporations and nationalised industries as diminishing. He is disturbed by the conformism, narrow limits of competition, and the "endemic elephantiasis" of such huge firms as ICI or Unilever. He fails to realise that, as Hayek points out, the worst consequence of confiscatory taxation, where there are temporary opportunities for large profits, is to restrict competition, to favour corporate rather than individual saving, and above all, to strengthen established corporations against newcomers. Because taxes absorb most of a newcomer's "excessive profits", he cannot become big business and a match for vested interests. The old firms don't need to fear his competition: the tax collector shelters them. It is not Eton and Oxford which enable a big corporation to sink into a routine or to become conservative, it is the egalitarian ideal of the redistribution of wealth carried out by the Welfare tax collector. It is true that income tax hits their profits too, but what is more important for them is that it prevents the dangerous newcomer from competing with them. In his "Welfare and Taxation", Colin Clark says that many who favour high taxes hate monopoly, but if taxes were lower, and especially if undistributed profits were exempt, many businesses would spring up to compete actively with the old established business. "As a matter of fact, the present excessive rates of taxation are one of the principal reasons why monopolies are now so strong."

In short, if Mr. Sampson rightly diagnoses inertia as a British weakness, the cause is not so much the frustrations arising from class and snobbery as in the ever widening transfer of initiative to the State, and the grudging rewards for that successful individual enterprise which creates a sense of purpose.

PRICE INFLATION IN WEST EUROPE

From Our Special West European Correspondent

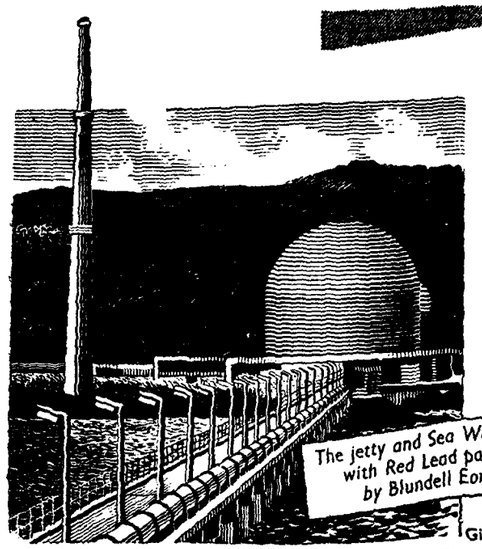
PARIS, August 26.

THE successive "economic miracles" on the Continent in the last decade—first in West Germany, then in France, Italy and, less spectacularly, in Spain—consisted in the achievement of rapid development without inflation. If that is indeed the meaning of "miracle", then West Europe's miracles are by now things of the past. Nowhere in this region today can we see rapid development without inflation. There is inflation everywhere and development has mostly slowed down. In fact, the Continent may be heading for the contrary and much less miraculous situation of rapid inflation without development. No doubt, that is too gloomy a view to take yet; the situation in this region is still healthier than elsewhere in the West, and if the danger of inflation is more obvious, this is in large part because governments have preferred, and continue to prefer, the risk of rising prices to the slough of stagnation. Economic policy nowadays involves steering a perilous passage between the reef of stagnation, on which the British economy has been stuck for several years, and the reef of inflation, from which several Continental economies were only lately dislodged. These straits are riddled with dangerous currents and there is no one perfect course to follow; at any given moment, each economy seems to be veering too far to port or starboard. The Continentals have to date managed to rectify their course before the danger has become too great.

At the present moment, it is clear, the drift is toward price inflation. The reason is the combination of a lower demand for many goods, and an increase in production costs. The former, reduced demand, has various causes, depending on the country considered. The most general cause is lower export demand, due to the poor performance of the British and American economies, and to the restricted importing capacity of the developing countries—some of the latter, moreover, being entangled in political unrest which is suspending their economic progress, as in North Africa, the Congo and Latin America. With the outside world ordering less of their goods, the Continental economies were bound to cut back their production in numerous lines, for their recovery has been heavily biassed toward exports. To this general cause, are added factors specific to each country. In West Germany, enquiry for capital goods from domestic industry has contracted, whereas on the contrary it is still being supported in France and Italy by public investment. In Benelux and, to some extent in France, demand for consumer goods is stagnating, while it is strong in Italy and West Germany.

In these circumstances, a slowing down of the rate of expansion was inevitable. It had been unusually high in recent years, and plainly could not maintain that pace indefinitely, least of all if the British and American economies were ticking over while too little was done to increase the purchasing power of developing countries. The slowdown, however, need not be serious, for the region has its own dynamism and could probably keep up a modest but still respectable pace of expansion, approaching 4 per cent annually. This is what is happening this year; after a pick-up in the early summer, the six economies of the Common Market will show an average growth rate of 4.5 per cent for the full year. Nor need this rather slower pace of expansion have been accompanied by price inflation, were it not that it coincided with competition for scarcer labour resources. True, the shortage of manpower is usually placed among the reasons for the slowdown in production-increase, as though employers were finding it impossible to produce more because of the absence of hands and therefore decided to cut back output. On the contrary, very impressive increases in output are possible with a labour force that is growing only slowly, as the French case shows over the past decade and, still, at this very moment. For that, it is necessary that industry make the right sort of investments, and that industrialists feel sufficiently assured of long-term demand for their products to make those investments well in advance.

Instead of that, employers have chosen to compete frantically for the limited supply of immediately available skilled labour while adjusting the pace of expansion of output to the somewhat poorer tone of the market. Thus hourly wage rates in West Germany have soared by 14 per cent in the past year (2.4 per cent in July this year alone) and are now 3.51 DM. for men per hour and 2.38 DM. for women. In Italy, minimum wages stated in collective contracts have jumped by 11.1 per cent in the past nine months, while actual wages paid to skilled workers have risen much more, for there is cut-throat competition among employers for qualified men. The real rise for a full year is no doubt higher than in West Germany and may approach the 19.6 per cent secured by Italian civil servants; the current wave of strikes (time lost in wage disputes has never been higher in Italy than this year) shows that organised unions in industrial regions are determined to exploit their advantage to the full, even if this is to the disadvantage of the 1.2 million still unemployed. In France, the increase in money wages is about 8 per cent over the year.



These massive increases in wages, occurring in economies whose rate of growth had slowed down, inevitably led to a rapid rise in prices, even in countries like Italy and West Germany where prices had been stable for years before. The cost of living has risen in Italy in nine months by 5 per cent, so that over a full year it will exceed even the 6.5 per cent rise seen in France. In West Germany the increase has been 4 per cent, and 3 per cent in Benelux. In view of the sound-money doctrines professed by all the conservative coalitions now in office in West Europe, one might have expected vigorous action by now to stem this price-inflation. On the contrary, no government is willing to restrict investment in order to offset the pressure created by wage increases, because they are reluctant to "sacrifice tomorrow" in a Europe that they all believe destined for continued and highly competitive expansion. No more are they ready to act directly and at short term on the move to higher wages; employers who resist get no backing from governments, some of whom, like Signor Fanfani's coalition and even General Franco's regime, make no secret of their support for wage increases whatever the immediate risks. At a moment when export demand is low, they are reluctant to add the depressing effect of restricted domestic demand.

It is as though economic-policy makers, convinced that fairly fast long-term expansion is both possible and necessary in West Europe, and determined to avoid the quasi-stagnation they see in Britain, were prepared to take a calculated risk on inflation. This implies that while continuing to pay lip service to the stability-first doctrine on which they based their recovery, Europe's orthodox financiers have been converted to the faith of their opponents of yesterday, the growth-before-stability school. The optimism created by the Common Market is no doubt responsible for this discreet change of attitude.

The risk involved would not be so great were it not that the same governments have chosen just this moment to increase the purchasing power of the agricultural community, by guaranteeing it higher prices for farm produce and protecting it from the exports of North America and Australasia. Much of the increase in living costs, and hence in turn in wages and industrial production costs, that has occurred this year is due to none of the factors so far mentioned, but to the big advance in food prices. Some of this was accidental, due to the long cold winter—but to say that it was accidental does not mean that its effects are reversible; in the field of prices, what goes up may never come down. Part of it, however, is no accident and is related to the increase in the incomes of farmers which is the objective of the common agricultural policy.

To show what is involved, one could say that the calculated risk on inflation that West European economies are taking would make more sense if governments accepted the original British suggestions about opening West Europe up to Commonwealth foodstuffs and certain manufactures like textiles. If Continental food prices were to come down to nearer the British level while copious supplies of cheap textiles were admitted, the price line could be defended more easily. However, this is politically impossible; and many European economists believe that it is economically impossible too: that steady expansion will be feasible only if the agricultural community (which forms up to 20 per cent of some Continental populations) is included in the general advance in revenues and living standards. European economies, then, are seeking to improve the revenues both of farmers and industrial labour while maintaining considerable investments, at a moment when the mainspring of expansion has lost some of its force.

The inflationary dangers of this proceeding could have been revealed long before this if the US dollar were not under suspicion. Whenever a European country, during the 1950's, let its prices rise too fast, it was promptly punished by depletion of its exchange reserves and, to the extent that controls sought to protect these, by deterioration in the standing of its currency. Today, on the other hand, all the Continental countries are practising a more or less equal inflation, so that they are not punishing each other for their unwise policies; France, for example, is relatively unconcerned about the rise in her prices as long as those of her main trading partner, West Germany, are rising just as fast. The USA and Britain are outside this inflationary club (their prices are indeed rising too, but less than Continental this year), but their currencies are chronically weak and funds continue to move toward the Continent. Thus countries in this region whose prices have risen too fast still see their central reserves mounting, even when their foreign trade is deficit. There is probably something in the thesis of M. Jacques Rueff, that the present method of international payments favours a world-wide inflation because some part of central reserves is being counted twice over. This cannot continue indefinitely, but on present indications the breaking point will come in the USA, when decisive measures have to be taken to protect the dollar, rather than in West Europe where insidious inflation has so far not caused serious apprehension.

PAINTED TO FIGHT CORROSION

For over a century Red Lead has been used as a priming paint on bridges, ships, wagons and structures and still continues to be the best protection against rust and corrosion.

The jetty and sea-water pipeline as well as other steel structures of the Atomic Power Plant at Trombay were primed with RED LEAD.

"Griffin" brand Red Lead pigment is manufactured in India by

RUSSIAN PANORAMA: A REVIEW AND A COMMENT*

By C. S. Venkatachar

FOR most of us, Russia is a 'terra incognita.' The genius of those master writers — Tolstoy, Pushkin, Chekov, Turgenev, Dostoevsky — has given us some vivid ideas about the Russian people and what they are like. How relevant are they to the Stalinist Russia of yesterday and Khrushchev's Russia of today?

An answer is difficult, for everything about Soviet Russia is strange, unfamiliar and alarming. But the problem of understanding her is there.

As a step towards understanding, Ambassador K. P. S. Menon takes you through the Soviet Union on a conducted tour in one magnificent sweep of the Russian Panorama, from Murmansk to Astrakhan, from Kiev to Alma Ata. His is not the travel diary of a philosopher; it is of a humanist, a historian, a cultured man of letters. History and legend, churches and ikons, art and culture, ballet and music, claim his interest more than statistics and production targets.

As your guide he is a charming companion, friendly and humorous. He narrates in limpid, sensitive English prose, making the unfamiliar familiar and the distant vision your friendly next door neighbour. He is never dull even for a moment. You instinctively share with him his joys, feelings and impressions. That is the real greatness of this travel diary.

"Russia", writes Louis Fischer "has a strange strength, the frustrated power of a giant. The nation possesses some uncertain dark brooding quality like a volcano, threatening to vomit forth black lava."

Ambassador Menon tells you to have a look at Mother Russia standing in the background of the immeasurably vast figure of Soviet Russia — with her steppes of Siberian 'taigas', the deep snow and the rutted, muddy roads of the countryside, rural Russia still answering to Gogol's description of a century back, her rivers and canals, her literature, poetry and songs. For all these the Russian people have a nostalgia, however heroic the new Soviet man may be under Soviet Communism.

Mr. Menon does not commit the indiscretion of straying into politics. It is quite apparent that Russian nationalism bolsters Soviet Communism, for the love of the Russians for their country has always been great. It is often forgotten that the Great Russians who are politically and culturally the dominant segment of the population of Soviet Union are a European people. They share the inheritance of European civilization; like the rest of Europe, Christianity has been the main axis of their civilisation.

From the days of Peter the Great, these great Russians have been faced with the problem of modernising their country. The process of Russia's modernisation has been painful. The Russians are still tortured by the dilemma: how to be true Russians and at the same time become part of Europe which includes the hated West. Dostoevsky poured out his heart in his diary "....under the circumstances can we renounce Europe. Europe is our second fatherland. Indeed the more strongly and closely shall we reflect ourselves in the European soul."

The travel diary is in three pieces. The central piece is Russia in Europe. Here Mr. Menon is at his best. He has neatly reduced the gigantic proportions by an orderly series of miniatures, etchings and snapshots. There are too many gems to be removed from their settings. Picked at random are: Tbilisi in Georgia looking at night 'like a bride decked in all her jewels, ready to receive the bridegroom'; the storms and sunsets on the sea-shore of the Black Sea; the glories of Kiev, past and present; the ikons and churches of Nizhny Novgorod, now renamed Gorky; Mathushka Volga—little mother Volga, travelling a long way from lake Seigar to the Caspian, 'poets have sung her praise, artists have painted her pictures'; the lotus covered lagoons of Astrakhan and the lovely legend of the Tartar Khan who sought the Indian lotus.

Ever since Yermack, the Cossack rode across the Urals to Vladivostock, the Great Russians have been colonising Western and Eastern Siberia and annexing lands in Central Asia. The author's diary covering these parts, which is the second piece of the travelogue, does not tread any fresh ground. The golden road to Samarkand has become somewhat dusty with too many travellers' description and Uluq Beg's Central Asian Jantar Mantar is all now too common-place. Attractive however, is the description of Kirghistan, the lovely dacha on the outskirts of its capital town — Frunze (alas, it is too far away from India as a holiday resort and as a place for meditation), the beautiful Alma Ata and the Heavenly Mountains.

More interesting is the author's visit to Urumchi and the comparison he makes of Sinkiang under the Chinese Communists with the conditions the author observed during his previous visit in 1944. The improvements he noted are a credit to the Communist regime of Mao.

The last part of the diary relates to his visits to Poland and Hungary in connection with his ambassadorial duties in those two countries. Poland and Hungary are dark and tragic spots to be included in a Russian Panorama. Here, Mr. Menon practises his trade of a professional diplomat and smothers you with pleasantries and irrelevancies. Neutralist countries adopt an ambivalent attitude towards imperialism practised by the Soviets over the people of Eastern Europe. They flog Western imperialism with a knout and flatter the Soviets, in the name of friendship, by giving them the benefit of doubt.

In the 19th century, with Poland in his mind, Alexander Herzen, the great liberal who was banished from Russia, wrote: "You cannot begin an era of freedom in your homeland, if you put a rope around the neck of your neighbour". This could be extended to include Hungary and other Soviet Satellites.

The Soviet rulers also conveniently forget what Lenin wrote in 1895: "Only a free Russia that is under no necessity to oppress Poles, Finns, Germans and other small nationalities or constantly to incite France against Germany will relieve contemporary Europe of its military burdens."

At the journey's end, we can truly say that this book is a landmark in the annals of Indian travel literature. No travel diary of such literary and permanent value has appeared since Aldous Huxley wrote in the thirties his 'Jesting Pilate'. Mr. Menon has also made history. Athanasius Nikitin was a Russian trader who spent some years in the Deccan round about 1470 A.D.; he observed and wrote of the court, the army and the conditions of the people under Bahamani rule. Now, five centuries later, independent India sent an ambassador to Soviet Russia who has returned the compliment by writing about one of the most vital and dynamic people of our world.

WELCOME TO THE
FIRST ALUMINIUM FOIL FACTORY IN INDIA

"Welcome to our Foil Factory," beamed Mr. Al Foil. "I promise you an interesting visit. You'll see how we make wraps, packs and caps so essential for our Nation's health. More, you'll see how our precision built machines, handled by experts, manufacture aluminium foil to the exacting specifications of industrial uses. Matter of fact, the industries which rely on aluminium foil make an impressive list.

"Your radio, fan and strip lighting, for instance, wouldn't work without foil condensers. And those marvellous electronic machines you hear so much about, they too need foil. As for Thermal Insulation and Refrigeration, Aluminium Foil is recognised as an absolute 'must' by modern engineers. These industries apart, structural engineers and photographic film manufacturers use industrial foil in many ways.

"Come now, I'll take you round the factory to give you an idea of the great technical skill and experience required for the manufacture of foil."

THE BUSINESS WORLD

L.I.C.'s Record in 1961

By CROESUS

FOR the first time in the history of Life Insurance in India, the premium income crossed the Rs. 100-crore level in 1961, which, incidentally, is also the year of the third biennial valuation of the Life Insurance Corporation of India (LIC). From the statement reviewing the working of the LIC in 1961 made by Mr. B. K. Kaul, Chairman of the Corporation at its 75th meeting, it is seen that the results are gratifying. The remarkable increase in the total business in force, in particular business relating to persons insuring for the first time, the reduction in expense ratio, the gathering financial strength as reflected in that visible index—the Life Fund of the Corporation—the satisfactory gross rate of interest on the mean Life Insurance Fund—the highest in the last five years—the welcome reduction in the overall expense ratio and the improved mortality experience, all point to the bright future ahead of the Corporation. The policyholder would certainly be justified, in these circumstances, to expect a fair deal, either in the form of a higher bonus or a reduction in the rates of permium, although the LIC Chairman would not commit himself on this point and endeavoured to evade the question by observing that it was all left to the actuarial wizards.

Apart from the results, there are certain features relating to the 1961 results, in particular, and to the LIC, generally, which deserve notice. Thus, while an increase of 22.4 per cent over the previous year in total completed business is undoubtedly a record worth noting, especially in the context of the conditions prevailing in the country during the year 1961, mention must also be made of the fact that, out of every three policyholders who insured their lives for the first time, one was insured without medical examination. To put it differently, out of every two of those seeking life insurance protection for the first time, one got the insurance benefit without medical examination. This means that as much as fifty per cent of the first insurance cases fell under the "non-medical" category. The LIC will do well to keep a seperate record of the mortality experience of these cases during the coming years, especially as it is a new experiment for us.

Another feature of the LIC's working that needs similar vigilance is the extension of the Corporation's business into the rural areas. Mr. Kaul disclosed that, out of the new business of Rs. 608.82 crores under 14.70 lakh policies, as much as Rs. 182.59 crores under 5.3 lakh policies were issued to people in the rural areas. This means that roughly a third of the new business represents business written in the rural areas. Here, again, the successfully keeping alive of these policies without lapsation is a matter of the utmost importance. True, the LIC Chairman is aware of the effects of a high lapse ratio, for he has himself stated that "apart from the monetary loss to the policyholders, as well as to the Corporation, which the lapses bring in their trail, the

Category	1960	1961
1) New business		
(a) Total amount insured	Rs. 497.54 crores	Rs. 608.82 crores
(b) Number of policies	12.58 lakhs	14.70 lakhs
2) Non-medical scheme		
(a) New business	—	38.30 crores
(b) Number of policies	—	2.5 lakhs
3) Foreign business		
(a) New business	Rs. 9.70 crores	Rs. 10.03 crores
(b) Number of policies	7,736 policies	8,056 policies
4) Total business in force		
(a) New business	Rs. 2,285 crores	Rs. 2,737 crores
(b) Number of policies	77 lakhs	86 lakhs
5) Lapse ratio	6.6 percent	7 per cent
6) Premium income	Rs. 96.89 crores	Rs. 112.30 crores
7) Total income	Rs. 116.00 crores	Rs. 141.00 crores
8) Life fund	Rs. 559.13 crores	Rs. 631.59 crores
9) Total investment in India	—	Rs. 503.56 crores
10) New issues underwritten	—	No. 52 valued at Rs. 7.59 crores
11) Total assets	Rs. 622.15 crores	Rs. 696.31 crores
12) Gross rate of interest	Rs. 4.58 per cent	Rs. 4.80 per cent
13) Overall expense ratio	Rs. 28.4 per cent	Rs. 28.0 per cent
14) Renewal expense ratio	Rs. 12.9 per cent	Rs. 12.4 per cent
15) Claims		
(a) By maturity	—	Rs. 25.4 crores
(b) By death	—	Rs. 8.7 crores
(c) Total	Rs. 30.7 crores	Rs. 34.1 crores

termination of life insurance protection for several lakhs of families every year is a matter of vital concern to us", and he has also indicated that he has been impressing on his staff the imperative necessity to reduce the lapsation of policies to the minimum. Mr. Kaul has further indicated that a separate machinery has been set up to review the lapse position periodically. This is to be particularly welcomed, inasmuch as it will help detect, at a fairly early stage, any adverse trend and check it by means of prompt remedial action. The growing extension of life business to rural areas has made this very necessary.

Being an institution commanding considerable financial resources, the Corporation's investment policy not only in stocks and shares but also in other fields like housing attracts public attention. If the investing public and the stock markets are interested in ensuring that the proportion of investments in the public and the private sectors is duly maintained at the same level as on the eve of nationalisation, many policyholders, especially in the middle income groups, would be interested in the LIC's investment policy as regards housing. It is known that the LIC has already been making loans to State Governments or to State Housing Finance Societies to assist the public in the problem of housing, but, as every one knows, this has hardly touched the fringe of the problem. The policyholder, who is steadily becoming more and more conscious, naturally wants to know what the Corporation has done to help him to build his own house. It is heartening to note what Mr. Kaul said on this point—that the Corporation has recognised this need and that it is revising its policy in the matter of granting loans on mortgage of property with a view to helping the middle and lower middle classes to avail themselves of the Corporation's loan facilities and build houses for themselves.

Now for a few figures to get a comparative idea of the progress achieved by the Corporation during the last two years. The synoptic table on the previous page provides the picture at a glance.

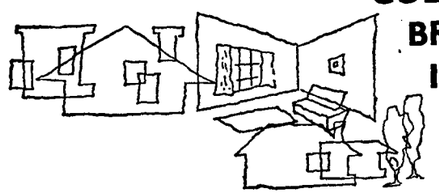
The following points of interest were also made by the LIC Chairman :

1) Total benefits by way of claims from 1st September, 1956 to 31st December, 1961 = Rs. 147 crores.
2) Net increase in the assets of the Corporation since inception = Rs. 281.00 crores.
3) Total premium income in 1955 (year preceding nationalisation) = Rs. 58.55 crores.
4) New investments in 1961 :

	(Rs. in crores)
In Government Securities	30.5
,, Approved Securities	5.0
,, Debentures, Preference and Ordinary Shares	10.5
,, Loans to State Governments for Housing Schemes	5.5
,, Loans to Apex co-operative Housing Finance Societies	2.0
TOTAL	**53.5**

Alleviating Power Shortages

ALTHOUGH some energetic steps have been taken in the recent past to alleviate the distress caused by power shortages in the country, these shortages continue to provide the burden for the annual speeches of the company chairmen. The growing imbalance in the availability of power in the country is not only due to the demand for it, which is said to be increasing at a much faster rate than was anticipated, but also due to the fact that power generation has been lagging behind than the targets fixed under the annual plans prepared by the Planning Commission on the basis of overall target stipulated in the Third Plan. In 1960-61, for instance, against the target of raising the total installed generating capacity in the country to 5.7 million KW, the actual installed capacity at the end of that year amounted to only 5.59 million KW. In 1961-62 also the achievement fell short of the stipulated target by about 13 lakh KW.



Now a decision has been taken to commission, out of the additional installed generating capacity envisaged during the Third Plan period, 2.4 million KW by the end of 1963-64 and the remaining during the last two years of the Plan. The Plan target too has been revised upwards to provide for installation of capacity to the tune of 13.2 million KW, instead of 12.7 million KW stipulated in the final draft of the Plan. In 1962-63 it is envisaged to increase the installed capacity by 7.07 lakh KW, as against 5.78 lakh KW in 1961-62. This higher rate of development proposed in power generation during the current year may bring about a slightly better balance between demand and supply, but stresses and strains caused to the economy on this account apparently will continue till the time the anticipated sharp increases in power generation come about in the last two years of the Plan.

In this context an eminent suggestion has been put forth by Sir Jehangir Ghandy which needs to be studied and given effect to expeditiously. It is to the effect that the Government should explore the possibilities of importing "package" units of 5 to 10 MW which can be put into operation within a period of six months. According to Mr. Ghandy, such units are now available at short notice both in Europe and in the United States. To finance imports of these units from the US, the possibility of utilising DLF resources needs to be immediately explored. These units can serve a very useful purpose, especially in the colliery areas where coal output is stated to be being hampered for lack of power supplies. No doubt, this would increase the foreign exchange cost of the Plan to some extent, but this would be more than offset by the gains that should accrue to the Indian economy from maintenance of production and fuller utilisation of capacity; this would have not only wholesome effect on the price level in the country, but also would make available industrial goods for export at somewhat more competitive prices.

The reliance placed by the Government on meeting the additional requirements of power by and large through the creation of the generation capacity in the public sector also is unrealistic. A pragmatic approach in this regard is apparently called for. While the Union Minister of Irrigation and Power has given indications of his readiness to amend the Electricity Supply Act to permit a slight increase in the rate of return on the capital invested in electricity undertakings, it passes one's comprehension what stands in the way of allowing a greater share in power generation to the industrial units in the private sector which are not only willing to undertake this task, but also are in a position to do so.

Side by side with all this, energetic efforts are required for exploring and tapping the idle generating capacity that appears to be existing in the country today. This became evident during the unprecedented power crisis that visited Delhi early this month.

JENSON & NICHOLSON-1962

COLOUR TO BRIGHTEN INDIA'S HOMES

LOOK UP NOW !

Chances are you'll be looking at a painted surface. *Since time immemorial*, the history of man has been coloured by paint. No one can safely say when it was first made. It may have been used to scar the skin of a primitive warrior, or

brighten the walls of his home. One fact is certain. Paint was a discovery as useful as fire, as important as the wheel.

J & N has produced paints for India's homes since 1922. The company has always believed that colour is vital to happy living. J & N use paint as a medium to reflect individual personality, to create mood and atmosphere, to enhance the warmth of a home...Towards this end, J & N has produced a range of decorative finishes second to none. It extends from the widely used *Umbrella* paints to Robbialac—a brand that spans the world.

LUCA DELLA ROBBIA—AN ITALIAN GENTLEMAN

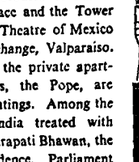
Little is known about Robbia the man—but Robbia the artist has achieved lasting fame. He began his professional career circa 1500, as apprentice to a Florentine goldsmith. His talent carried him swiftly to sculpture. From there he passed on to terra-cotta and spent years of painstaking *experiment* before producing what the world was to know as 'Della Robbia Glaze'. A contemporary used the words 'endless durability' in describing Robbia's work. The first John Nicholson had admired Della Robbia's art ever since he received an order for a 'blue white...as in the Della Robbia Glaze'.

The day came when J & N produced a new product—an enamel of exceptional hardness, lustre and durability. It was fittingly named Robbialac, *after the* Italian with whom perfection was a norm.

Today, in the remotest corners of five continents, J & N equates with '*Makers of Robbialac*'.

DID YOU KNOW ABOUT BERENICE ?

She was an impulsive, golden-haired Cyrenean princess. *One day she discovered* Religion, cut off her tresses and dedicated them to the goddess Venus. To an angry husband she explained that the stars had stolen her locks. We now have a group of stars called Coma Berenices. The lady has yet another claim to fame. Her name was bestowed on a certain amber—widely used today in paint manufacture. Berenice is now pronounced 'Varnish'.



When next you buy a J & N paint, think of Berenice...

Q. WHAT HAS BUCKINGHAM PALACE IN COMMON WITH NO. 1 M. GANDHI ROAD ?

A. J & N DECORATIVE FINISHES

Churches, hospitals, offices, cinema houses, universities, public buildings—all have been treated with J & N finishes. The list is international. It includes such historical landmarks as the Houses of Parliament, Buckingham Palace and the Tower of London, the Grand Theatre of Mexico City and the Stock Exchange, Valparaiso. At the Vatican, Rome, the private apartments of his Holiness, the Pope, are finished with J & N coatings. Among the many buildings in India treated with J & N finishes are Rastrapati Bhawan, the Prime Minister's residence, Parliament House, the World Health Organisation, National Museum, Vigyan Bhawan and the American Embassy, in New Delhi ; Raj Bhawan, Tea Board Building, Telephone Bhawan, Woodlands Nursing Home, Calcutta Club, Statesman House and Firpo's, in Calcutta ; 'Adelphi', Metro Cinema, Bank of Baroda, Chartered Bank Building, Nataraj Hotel and Glaxo Laboratories in Bombay. The list is always increasing. There is no finer tribute to the consistent excellence of J & N decorative finishes.

WHEN IT'S A QUESTION OF COLOUR...

...for your flat or office, get in touch with J & N. Our Colour Advisory Service is specially organised and staffed to help you. The Service is managed by a Colour Consultant—an expert in interior decoration—and provides colour schemes *free of cost and without obligation to use J & N paints*. Though colour is largely a question of individual taste, the scientific use of colour is a precise and delicate skill. Correctly employed, colour can add warmth or coolness to a room, impart an illusion of space, transform a drab flat into a warm, inviting home.

FROM TOY TRAINS TO THE TAJ MAHAL HOTEL

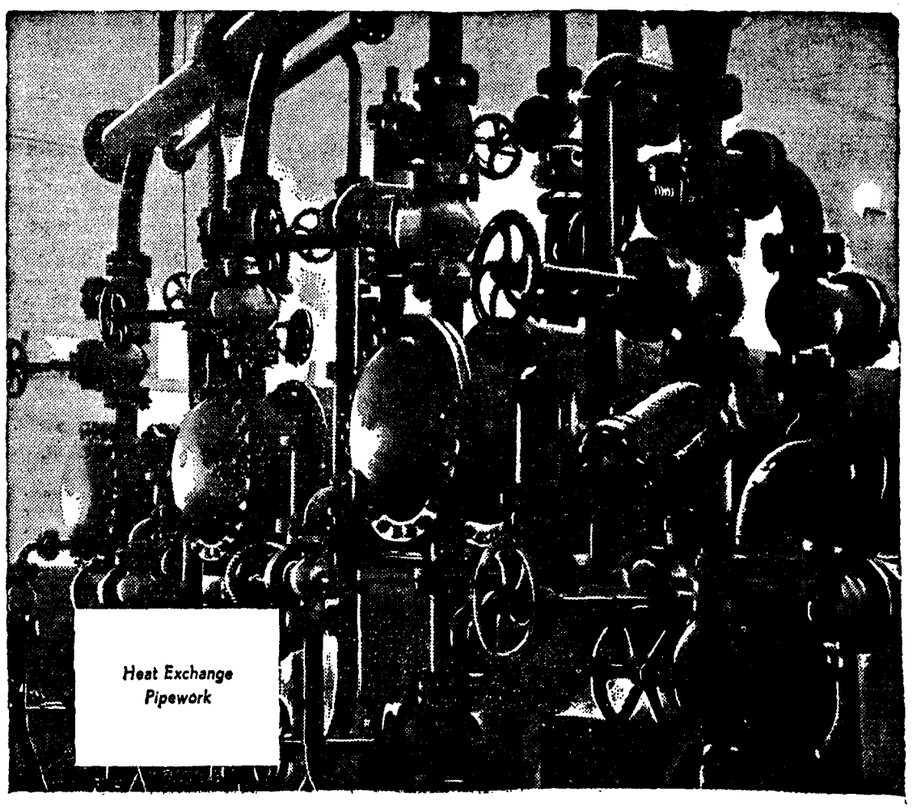
Or, for that matter, from tables to ten-storey buildings—J & N has a paint for *every* decorative need. Enamels, emulsions, dry-distempers, porcelain lacquers, cement coatings...the range is exhaustive. It covers such national brands as Robbialac, 3 Umbrella, Jhilmil, Jensolin—leaders in their fields.

Behind the success of these brands lies J & N research. At the J & N factory near Calcutta, a fully-equipped laboratory, staffed with skilled chemists, pursues an unceasing programme of research, development and testing. Each batch of paint is tested to precise standards before leaving the factory. The result of all this care : *you take quality for granted in a J & N paint.*

*

PEELING BLUE ?
In which of J & N's shades ?

*



ROBBIALAC PLASTIC EMULSION *is excitingly different.* It applies easily—brush marks vanish as you paint—and dries in an hour. It leaves a smooth, lustrous, extremely durable finish that will stand repeated washing and scrubbing. Robbialac Plastic Emulsion is especially suitable for decorating walls, ceilings and woodwork.

When planning your new colour scheme, consider Robbialac Plastic Emulsion—choose from 120 *delightful shades.*

Finance Corporations

PREFERENCE FOR SMALL PRODUCERS

THERE WILL be unqualified agreement with the view expressed by several commercial bodies on the working of the State Financial Corporations, namely, that the progress achieved by these corporations has not at all come up to expectations and that they could certainly afford to be more helpful to small-scale and medium industries. A number of suggestions has been made by the commercial bodies all over the country. In a detailed reply to the questionnaire issued by the Working Group of State Finance Corporations set up by the Reserve Bank, the Indian Merchants' Chamber (IMC) Bombay, has frankly stated that the procedures and practices adopted by the corporations are dilatory and also costly and has, therefore, urged the paramount importance of making these formalities simple and intelligible enough to the persons engaged in the medium and small-scale industries. As the IMC has pointed out, the small entrepreneurs do not have the requisite organisational set up for this purpose.

It is not only procedural formalities that militate against timely and adequate financial assistance to these industries, but the undue emphasis placed by the corporations on securities as well. It is accordingly urged that other criteria also should weigh in the matter, as for instance profit earning capacity of the project. The Bengal National Chamber of Commerce and Industry has pointed out that a system of financial help in the form of loans against security of assets is not suitable for those who have prepared sound schemes in regard to both technical and commercial aspects but are not in a position to start industries for want of capital. In such cases, especially when the parties are rank new comers who cannot enter the capital market on their own, it has favoured a system of share participation by financial corporations.

In addition to equity participation, the IMC wanted the corporations to engage themselves in underwriting debentures and shares to a larger extent than now, as also in giving guarantees to deferred payment in respect of purchases of equipment from indigenous sources. The latter especially is very significant in that it will facilitate "Suppliers' Credit", which is so essential to small-scale and medium industries.

While welcoming the raising of the maximum limit of accommodation to industries organised in public limited companies from Rs. 10 lakhs to Rs. 20 lakhs by a recent amendment of the State Financial Corporations Act, the IMC has recommended that the higher limit should be made applicable even to private limited companies.

The IMC has also offered detailed comments on hypothecation of machinery, ex-site value of machinery, instead of ex-works price or CIF value, the margin of 50 per cent of net value of the assets and equitable mortgage in place of legal mortgage. On the question of offering working capital loans also in addition to equipment loans, especially where particular units are disabled from raising such loans from commercial banks by reason of their having mortgaged their assets to financial corporations, the IMC has pleaded for a relaxation of the present practice. While not wholly in favour of the Finance Corporations collaborating with other credit institutions in financing fairly large projects, the IMC has given qualified support to such participation in deserving cases.

In reply to one of the very important questions in the questionnaire, namely whether any special facilities should be given to the corporations by the Government in order to improve their usefulness, the IMC has recalled the proceedings of the committee of the small-scale industries in the western region convened by it in June last and reiterated its suggestion that fiscal incentives should be given to these corporations. Specifically, the committee invites that the Government should consider the advisability of providing relief from taxation and quotas. The examples of Pakistan and some other foreign countries where tax concessions, such as tax holiday for a given number of years as in the case of new industries, have been given. As a further incentive, the IMC suggests that both the Reserve Bank of India and the State Government concerned should forgo the dividend on respective holdings in the corporations thereby helping the latter to strengthen their resources.

AIMO

A LESSON FROM U.S. POWER PROJECTS

THAT THE national loss sustained by the country so far on account of power shortage has been, to a large extent, the outcome of the rigid approach of planners was the view expressed by Mr. Prabhu V. Mehta, Chairman, All-India Manufacturers' Organisation (A.I.M.O.). He estimated that the value of production so lost would have paid for several power-generating units.

Speaking at length on this problem, Mr. Mehta told the A.I.M.O's first quarterly meeting, held in Poona recently, that it would not have existed as a problem, had it been entrusted to the private sector. In this connection, he recalled the successful power generation schemes evolved and implemented by the private-owned or invester-owned electric companies in advanced countries like the U.S.A. There are, he noted more than 300 invester-owned electric lighting and power companies catering to the need of 14 crores of people, providing employment to as many as 3 lakh men and women, and accounting for a rate of increase in the production of electricity about 2½ times the rate of growth of the economy as a whole as measured by the gross national product. (The average annual rate of economic growth in that country has been 3.05 per cent, while the average rate of growth of power per year has ranged about 7.15 per cent). Another important feature of power generation in that country was that, while the consumer price index had climbed from a base of 100 in 1913 to 299 in 1960, over the same period, the average revenue per kilowatt hour of residential electricity had dropped from an index figure of 100 in 1913 to 28 in 1960! In fact, according to Mr. Mehta, an examination into this question from any angle would prove that there is nothing to be lost, but every thing to be gained, by generation of power through invester-owned companies.

Making a brief reference to the role of the Reserve Bank, the A.I.M.O. Chief commended its very valuable role in establishing a number of financial institutions, such as the Industrial Finance Corporation of India, the State Finance Corporations, and the Re-finance Corporation for Industry, and observed that, while all these measures had resulted in increased credit facilities to industry and trade, to some extent, there was still considerable scope for improvement, whether in the quantum of the assistance provided or in that of expeditious disposal of applications. Accordingly, he welcomed the recent appointment of the Working Group, by the Reserve Bank, to review and suggest ways and means of improving the usefulness of State Finance Corporations. This group, by the way, has already issued a comprehensive questionnaire in this connection.

Mr. P. C. Bhattacharyya, Governor of the Reserve Bank, who inaugurated the meeting, remarked that the strains and stresses that the country's economy had been experiencing were the result of our attempt to develop

the economy rapidly. "What was achieved in the countries of the European Continent and the United States of America during the period of industrialisation covering several decades", he said, "is sought to be achieved here in a much shorter period. Because of this, he cautioned, the post-war economic growth in Japan and other countries should not create a sense of diffidence among the Indians. The main factors facilitating the enormous growth of those countries were the availability of technical skill, capacity for organisation, large savings and several other pre-conditions of rapid production. In spite of the fact that the under-developed countries stand on a different footing in all these respects, he pointed out, the pace of economic development shown in this country had already started to pay dividends and instanced the rate of growth of industrial production, which had risen from between 7 and 8 per cent during the period 1954—1956 to nearly 12 per cent in 1960.

Sugar

COSTS, PRICES AND EXPORTS

THE STATE of sugar industry in the country is quite enigmatic in the sense that while the output has been fairly satisfactory, there has been sufficient controversy over the costs as well as export prices. Last week the Government of India took certain important decisions on the recommendations of the Tariff Commission which were included in the report submitted in the middle of 1961. By and large, the Government of India has accepted the recommendations and perhaps the most significant decision has been the acceptance of a formula that will lead to the linking of sugar cane prices with the recovery of the preceding year with effect from the year 1962-63. This measure should be welcomed in the sense that it will lead to a general tendency among the growers to look after the quality of sugarcane. With the acceptance of this formula, the question of the payment of deferred prices will also be eliminated in the future. The Government of India has also decided to work out suitable legislation to amend the existing formula so as to evolve a "more precise determination of the share of the cultivator in the net price, the inclusion of a suitable rehabilitation allowance and the amount of export loss in the deductions from the gross realisation and a modification in the portion of incentives to be included in the realisations to be shared."

While this decision is likely to settle any controversy in respect of sugarcane costs, it may be added here that Mr. Gulzarilal Nanda, Minister for Planning, recently made a reference to the sugar prices which he thought prevailed at higher levels. It is necessary to indicate that the output has been quite satisfactory during the last three years and there is no reason for sugar prices to go up. In fact, it is essentially the fault of the administrative machinery involved in the distribution which fails to release sufficient quantities of sugar at proper intervals.

As is well-known, the price prevailing in the export market is much lower than the cost of sugar at home. In view of the fact that India expects to sell raw sugar to countries in the American Continent, Western Europe, Japan, Korea, Vietnam and certain African countries, it seems a supplementary grant of Rs. 8 crores is required for the payment of subsidy to the Indian sugar industry for meeting the loss incurred on increased exports of sugar. It may be added that a provision of Rs. 5.5 crores was included in the original budget for the current year in order to subsidise the loss on export of sugar. This was on the assumption that export would be of the order of 2.5 lakh metric tons, the bulk of which would be exported to the US where price realised was a preferential one. Now the expectations are that exports may be of the order of 3.5 lakh mertic tons and a large portion may be diverted to countries other than the US. Though the exact value of the loss is not yet known, it is estimated that it may be anything around Rs. 13.5 crores. The supplementary grant of Rs. 8 crores is, therefore, quite justified.

New Issues

CHITALE SUGAR

TWO SUGAR companies and one engineering concern are approaching the public in the near future for subscriptions to their share capital.

Chitale Sugar Works Limited is entering the capital market on September 12, with an offer of 2,01,919 equity shares of Rs. 10 each and 8,648 cumulative redeemable preference shares of Rs. 100 each. The preference shares carry a dividend of 9.285 per cent per annum, free of company's income-tax but subject to deduction of tax at source at the prescribed rates. The subscription lists are to close on September 19.

The company is stated to be, for the time being, the last one that has been licensed for setting up a sugar factory in the Maharashtra region which today is ahead of all the other States of the Indian Union in sugar recovery from cane. It will be producing about 1,38,000 bags of sugar per annum by crushing about 1,20,000 tons of sugarcane. The average recovery is estimated at 11.5 per cent, but it is expected to go up to as high as 12 or even 13 per cent. The company's factory is to be located at Chitalenagar. The project has been scrutinised by well-known sugar experts who have given their verdict in very favourable terms.

The Industrial Finance Corporation of India has sanctioned a loan of Rs. 32 lakhs for the company's capital outlay which is stated to be only modest. An interim loan of Rs. 20 lakhs has already been received by the company from the IFC. The erection of the machinery is in full swing and the plant is expected to go into production during the next crushing season.

The directors claim that despite the heavy carry-over of sugar to the current season from the previous one, the outlook for the industry is very bright in view of the firmness that has been witnessed in sugar prices during the past four months in spite of fairly large monthly releases allowed by the Government for domestic consumption. The shares of the company are already reported to be quoted at an unofficial premium.

THE AMALGAMATED ELECTRICITY COMPANY LIMITED

The Register of Members and Transfer Books of the Company will be closed from 15th September to 4th October, 1962, both days inclusive in connection with dividend payable on or after 15th October, 1962.

BY ORDER OF THE BOARD
FOR THE AMALGAMATED ELECTRICITY CO. LTD.,
FOR N. C. JAVERI & CO.,
N. C. JAVERI
Partner
Managing Agents

Registered Office:-
17-B, Horniman Circle,
Fort, Bombay-1.
27th August, 1962.

Mr. Murarji J. Vaidya is the Chairman of the company and Chitale and Co. Private Ltd. are its managing agents.

UPPER DOAB SUGAR

THE UPPER DOAB SUGAR MILLS LIMITED proposes to raise its present issued capital of Rs. 65 lakhs to Rs. 80 lakhs, out of an authorised capital of Rs. 150 lakhs. The new issue consists solely of equity shares of Rs. 100 each. Forty per cent of it has already been reserved for the existing shareholders of the company and the remaining 60 per cent—worth Rs. 15 lakhs—is to be offered to the public for subscription at par on September 6. The list closes on September 13, or earlier at the discretion of the directors but not before September 10.

The proceeds of the new issue are to be utilised for expanding the manufacturing activities of the company in terms of the licences it has secured from the Government to raise its Shamli factory's crushing capacity from 3,000 tons of cane per day to 3,750 tons per day and to augment its production of power alcohol from 0.8 million gallons to 1.2 million gallons per annum. The company has two units for producing power alcohol from molasses—one at Shamli and the other at Pilkhani. The total cost of the expansion project is estimated at Rs. 75 lakhs. Since the new issue will be making available Rs. 25 lakhs only, the directors propose to borrow the remaining Rs. 50 lakhs from its bankers. The expansion programme has already been taken on hand. The increased cane crushing capacity of the Shamli factory is expected to be available for utilisation during the crushing season starting in November, 1963.

The company has a creditable record of performance during the past and had been paying consistently 15 per cent gross dividend on its equity shares for 10 years upto the last year when despite the difficulties through which the sugar industry passed in that year, it declared a dividend of 12 per cent.

AIR CONTROL AND CHEMICAL ENGINEERING CO.

THE ENGINEERING concern that is expected to enter the capital market in the near future is the Air Control and Chemical Engineering Company Ltd., a new venture of the Maganlal Prabhudas group of industries. This company will be offering for public subscription capital worth Rs. 49 lakhs, all in equity shares of Rs. 10 each. It has an authorised capital of Rs. one crore and has been promoted with the object of manufacturing air handling ventilation, humidification, refrigeration and air-conditioning plants and equipment for commercial and industrial applications.

Of the capital worth Rs. 49 lakhs proposed to be issued in the first instance, 51 per cent has been agreed to be taken up by the company's promoters, directors and their friends. Shares of the value of Rs. 10 lakhs have already been issued to meet the preliminary expenses.

The company is to set up its factory at Devdi, near the Barejwadi railway station on the Ahmedabad-Bombay main broad-gauge line, where land has already been acquired.

Technical collaboration arrangements are said to have been finalised with five leading concerns of the United States and Canada. Two of these concerns are stated to have agreed to participate in the company's equity capital as well. The Government of India is understood to have approved the terms of collaboration with all the five concerns.

Cement

INDIA CEMENTS RECORD EXPANSION

MR. P. SURAYANARAYYANA, Chairman of the India Cements Ltd., at the annual general meeting, held recently, pointed out that the Company has been recording steady increases in their output capacity during the last one decade. Starting with 1,00,000 tons annual capacity in 1950, the Company will soon have an installed capacity of more than 10 lakh tons of cement which is an improvement quite creditable judged from any standards. He indicated during his speech that the Company had taken up a scheme to establish a cement factory in Sankaridrug with an annual output capacity of 200,000 tons of cement and this factory would be completed in a year or so. This steady improvement of the Company is quite in line with the country's increasing industrial activity in all the fields. Against the present installed capacity of cement in the country of about 10 million tons, the target in the Third Five-Year Plan is put at 15 million tons. It is quite clear that the whole capacity will have to be executed by the people who have sufficient experience in the line.

It was revealed in the export performance of 1961-62 that cement did play an important role. The total exports were of the order of Rs. 90 lakhs against Rs. 64 lakhs a year before. The Chairman has indicated that this Company made great efforts to export cement and during 1961-62 the export earnings were to the extent of Rs. 16 lakhs. Most of this company's exports were directed to Ceylon. The Chairman indicated that the Company is determined to step up the exports further. This seems to be a very encouraging picture and such companies that make efforts to export cement should be looked after as far as their demands are concerned. In fact the Government of India has already appointed the Director of Transport and has established machinery for quality control so as to look after the interests of the exporters of cement. It is time that such producers are made available raw materials like coal, expeditiously, so that their output does not suffer.

General Insurance

NEED TO BUILD UP RESERVES

AT THE annual general meeting of the Indian Insurance Companies' Association, Mr. K. P. Modi, while reviewing the progress of the general insurance industry in the country, dwelt at length on many of the problems facing the Indian insurers and expressed vehemently the view that the Controller of Insurance and the Tariff Committee, should consider the repercussions that reduction in fire premium rates would have on general insurance business before any cut was effected on fire premium rates. While Mr. Modi was happy in general with the progress of the general insurance industry, he was, however, concerned that index number of general insurance had not kept pace with the index number of industrial production.

His main emphasis in the speech was that reserves be built up as this only would enable the industry to meet unforeseen and catastrophic losses. He observed that the Indian Insurers could retain on their own account a larger portion of the premium if they had sufficient reserve strength. That would ultimately help in conserving foreign exchange which now went out by way of reinsurance to foreign countries. The reserves permitted by the Government, Mr. Modi underlined, fell short of requirements of the industry. He brought to notice the fact that the Taxation Enquiry Commission had recommended in 1954 that insurers should be allowed to build up reserves free of tax until they reached 75 per cent of the annual premium in respect of fire and miscellaneous business and 150 per cent in respect of marine and aviation-hull business. On that very basis, Mr. Modi appealed to the Government to reconsider this matter favourably. Among many other things, Mr. Modi appealed to the industrialists to increasingly draw on the services of the Indian insurers by placing their imports on c.f. instead of on c.i.f. basis.

Export

SUGGESTIONS TO INCREASE EXPORTS

IT NEED hardly be emphasised that our performance on the export front will ultimately depend on the advantages that we are able to offer to the foreign buyer in respect of both price and quality on a competitive basis. With this point in mind it becomes, therefore, imperative that our production costs be brought down so that we may be able to compete successfully in the foreign markets. The Central Committee of the All-India Manufacturers' Organisation has given a good thought to this problem and has come out with various suggestions which though have been repeated from time to time have their importance as they appear to offer a satisfactory solution. The incentives provided by Government have no doubt been helpful but they are just temporary expedient.

The slow rate of expansion of the export trade can be mainly assigned to the unco-ordinated approach of the Government in its fiscal, taxation, labour and population policies. To bring about a reduction in the costs of production the AIMO's suggestions are that there should be ensuring of adequate supplies of raw materials by the Government at international prices and keeping down the tax incidence; provision of subsidies for export products whose costs cannot be reduced to the level of competitive world prices; adoption of a realistic labour policy to keep the incidence of wage levels in tune with productivity; simplification of schemes of drawback of import and excise duties by fixing a tariff on a percentage basis of foreign exchange earned, enabling exporters to be sure of the amounts of drawback beforehand; arresting the growth of population by intensifying family planning programmes to restrict domestic consumption and leaving adequate surplus for export, rational use of energy resources, particularly coal and reorientation of outlook on the part of the Government and simplification of administrative procedures with faith in the integrity of the industrial and business community. This according to the Central Committee of the All-India Manufacturers' Organisation would help solve the problem to a certain degree. The suggestions as mentioned above appear to be quite realistic and need to be considered in right earnest.

(Continued from page 377)

college students, including girls, particularly in Bangalore, and the agitation took the form of abstention from classes, processions and protest meetings, etc. It was however, conducted so orderly and peacefully that it evoked the admiration of the authorities, who asked the students to terminate the agitation unconditionally and offered to give sympathetic consideration to their grievances. The students cordially responded and expected a sympathetic response from the Government. At this stage, the Education Minister called a meeting of a few parents and public workers in Bangalore to consider the situation and sprung a surprise by ruling that the Government's decision to raise fees was not open to question, but suggestions were welcome regarding its implementation! Instead of approving the decision, the members made various suggestions to modify it. It was, for instance, suggested that uniformity in college fees should not be limited to Government colleges affiliated to the Mysore University alone but should extend also to the Karnatak University where the fees were even higher, as both the Universities were in the same State and under the same Government, that uniformity should be achieved, not by raising lower fees, but by reducing the higher fees.

The Government's financial argument was the least convincing. The income from the increase in fees was a tiny fraction of the Government's revenue. The Govrnment found it possible to allocate money for the expansion of the Ministry in spite of the recommendation of the Ramachandra Rao Committee appointed by the Government to suggest economies in expenditure. Further, there was much justifiable scope for economy in college education itself.

Another educational controversy concerned some teachers who were engaged earlier as lecturers on higher salaries but on a temporary basis, and later demoted as demonstrators on lower salaries of lecturers. The affected teachers made representations and even threatened to go on hunger-strike. Whatever be the justification of the Government to terminate the terms of the lecturers and offer them the lower status of demonstrators on lower salaries, the important consideration is that the efficiency of teaching by the disaffected and humiliated teachers is likely to be very poor, and the students are likely to suffer most. The least that the Government should now do is to see that the demoted teachers do not suffer financially by giving them personal allowances to make up the loss.

FROM THE CAPITAL'S CORRIDORS

PROGRESS OF THE PLAN

THE two speeches made by the Union Minister for Planning, Mr. Gulzari Lal Nanda, in the Lok Sabha on August 25 and August 27, and a background note placed by him on the table of the House on August 22 contained much useful information on the progress of the Third Plan uptil now as also on the measures and decisions that the Planning Commission has taken since the publication of the final draft of the Plan, to strengthen the vulnerable sectors of the Indian economy. The following are the more important points which have been made in the two speeches of Mr. Nanda and the background note:

1. **Prices:** The rise in the index number of wholesale prices to 131.8 at the beginning of the current month from 128.7 about this time last year has been taken serious note of by the Planning Commission. The rise has occurred in varying degrees in the prices of various agricultural commodities such as rice, millets, subsidiary foods, sugar and gur, and also in the case of a number of manufactured products of general consumption. The Government is at present engaged in a thorough study of the implications of these recent trends (in prices) and will not hesitate to take whatever action may be required for regulating the prices of basic essentials within definite limits, safeguarding the interests of the lower income groups as well as those with fixed incomes, and achieving increases in agricultural and industrial production according to the requirements of the Plan. This study includes the main agricultural commodities—wheat, rice, millets, oilseeds and cotton —and a number of industrial products, especially cloth consumed by the lower income groups, kerosene, salt, edible oils, sugar and gur, soap, paper, drugs and medicines and infant foods. Not only the relevant problems of production of these commodities are being examined, but thought is also being given to the character and adequacy of the existing organisation of distribution, trading margins and other factors in respect of each of these commodities. Price controls on some of these commodities are not ruled out. Efforts are also being made to increase the production of protective foods such as fruits and vegetables, milk, meat, eggs and fish.

2. **Foreign Exchange:** To implement the Third Plan in full, additional foreign assistance required is of the order of Rs. 1,100 crores. The total external aid made available for the current Plan by the friendly countries and the international lending institutions till now amounts to Rs. 1,890 crores. Of this, a sum of Rs. 1,450 crores has been or is proposed to be allocated for project requirements and about Rs. 440 crores for non-project purposes. The foreign exchange requirements of the projects included in the Third Plan, which were previously estimated at a minimum of Rs. 2,030 crores, are now put at Rs. 2,150 crores. The estimate of Rs. 1,100 crores additional aid required for the Third Plan includes a carry-forward of about Rs 400 crores to the next Plan; a similar amount was available for the Third Plan as a carry-forward from the Second Plan. The bulk of the programme for power and substantial proportions of the programmes for transport, industry and minerals already have or will shortly obtain the necessary foreign exchange. There are a number of programmes, however, which are not at present fully covered by aid. There are also several individual projects of great importance for the growth of the economy, such as the Bokaro Steel Plant and the Durgapur Tool and Alloy Steel Plant, which do not at present have the necessary foreign exchange. In the course of such further aid as becomes available it is proposed to give priority to these two groups of projects, other projects being considered for the allotment of foreign exchange after these needs have been met. In Government's view, both in the public sector and in the private sector, the available foreign exchange must be utilised to secure the maximum results possible, keeping in view all the time that the vital needs of rapid economic development and of building up of a self-reliant economy should not suffer on any account.

3. **Rupee Resources:** With an encouraging tax effort made by the State Governments this year with a view to find resources for their Plans, about Rs. 370 crores have been ensured for State Plans out of the Rs. 610 crores which the State were envisaged to find by way of additional taxation upto 1965-66. Taking the Centre and the States together, the tax effort in the first two years has assured a sum of Rs. 1,200 crores, as against Rs. 1,710 crores stipulated to be raised over the Plan period through this source. The progress of the first two years, however, shows that it will be necessary to strive even harder to achieve the targets under loans, small savings and surpluses from public enterprises.

4. **Plan Outlays:** The Plan outlay during 1962-63 is being raised by about Rs. 300 crores over an outlay of Rs. 1,148 crores in 1961-62. The following are the details:

(Rs. crores)

Sector	1960-61	1961-62	1962-63
Agriculture, Community Development & Co-operation ..	140	151	192
Irrigation & Flood Control ..	93	98	125
Power	108	131	165
Industry	219	249	333
Transport & Communications ..	278	302	349
Social Services	206	203	257
Miscellaneous	27	14	25
TOTAL	1,071	1,148	1,446

5. **Industrial Output:** Industrial production in the key sectiors is envisaged to be raised in 1962-63 in the following manner:

Industry	1960-61	1961-62 (Estimated)	1962-63 (Projected)
Finished steel (million tons) ..	2.4	2.9	3.9
Aluminium ('000 tons) ..	18.2	19.4	38.0
Nitrogenous Fertilizers ('000 tons N.)	97.1	140.0	200.0
Phosphatic Fertilizers ('000 tons P205)	53.0	61.9	90.0
Sulphuric Acid ('000 tons) ..	353.9*	423.0*	523.0*
Machine Tools (value in Rs. crores	7.24*	8.50*	10.50
Cement (million tons) ..	7.8	8.2	9.5
Paper & Paper Board ('000 tons)	343.0	362.8	400.0
Iron Ore (million tons) ..	10.7	12.1	13.5
Coal (million metric tonnes)	55.5	55.2	62.0

* Calendar year.

6. **Power:** The target for power development has been revised upwards to 13.2 million KW. from 12.7 million KW. fixed in the final draft of the Third Plan. To augment power supply in the DVC area the available surplus power from the Rihand Project is proposed to be fed into the DVC system to be used for meeting the requirements of collieries. Supplies have also been arranged from the Hirakud system with the same end in view. Of the additional power capacity to be set up during the Third Plan period, 2.4 million KW. capacity is expected to be established in

the first three years of the Plan and the balance in the last two years. The progress made in respect of installed generating capacity, generation of power and electrification of towns and villages during the past two years and the targets fixed for 1962-63 are reflected from the following table:

Sector	1960-61	1961-62	1962-63 (Target)
Installed Generating Capacity (in MW)	5,595	6,174	6,881
Generation of Power (million KW Hrs.)	20,040	22,900	25,500
Additional Towns and Villages Electrified	1,600	3,100	3,500

7. **Coal:** Coal output in 1962-63 is envisaged to be stepped up to 62 million metric tonnes. A series of measures have already been taken in the past few months and a few more are envisaged to be taken in the near future to ease the situation on this front. Transport facilities for movement of coal are being expanded and the programme of coal washeries is being pushed forward.

8. **Rail Transport:** Additional outlay of Rs. 145 crores over the figure mentioned in the Third Plan's final draft has been sanctioned—Rs. 120 crores for works and rolling stock related largely to the movement of coal, Rs. 10 crores for line capacity works required to meet the increase in the target of movement of general goods and Rs. 15 crores for works for facilitating coal movement in the early period of the Fourth Plan. Measures are being devised to reduce the overall turnround time of wagon stock from the present level of 11.2 days to 9.5 days and in the case of box wagons to 9 days. Steps have also been initiated for increasing the utilisation of the available capacity on the railways for movement of coal in bulk in full rakes of box wagons and four-wheelers and through increased loadings on Sundays and holidays. An inter-developmental working group on coal transport has been set up and it is working on detailed programmes of production and movement of coal. The programme for the production of wagons within the country has been stepped up from 11,964 in 1960-61 to 19,115 in 1961-62 and to 23,469 in 1962-63. The five-year targets for rolling stock have been raised by about 42 per cent for wagons and by about 19 per cent for locomotives. Doublings and conversions in 1961-62 were completed on about 422 miles of track and electrification was completed on 327 miles. Problems of transport planning are, however, likely to become even more complex in future. The Planning Commission hopes to set up shortly a technical group which will work on full-time and continuing basis on transport problems related to future requirements of regions and areas of key importance in the country's economy.

9. **Roads:** During 1961-62, 70 miles of missing links and five major bridges were constructed, besides improving 300 miles of the existing highways. The Plan for 1962-63 provides for the construction of 70 miles of missing links and 10 major bridges and improvement of 400 miles of existing highways. The total addition to road mileage in the country, which in 1961-62 was about 4,000 miles, is expected to be about 4,500 miles during 1962-63.

10. **Fertilizers:** Every effort is being made to ensure that the target for capacity of one million tons and for production of 8 lakh tons in terms of nitrogen are realised. On the whole, the public sector projects are well under way and it is hoped to reach a capacity of 6,70,000 tons before the end of the Third Plan. There is some uncertainty in respect of a part of the capacity licensed in the private sector. The parties concerned are being pressed to complete their arrangements and the question of setting up a plant in the public sector in lieu of one originally approved for a private party is under consideration.

11. **Cement:** Effort at present is to ensure that the target for capacity of 15 million tons and production of 13 million tons is realised as speedily as possible. Efforts are being made to secure a higher rate of production on the basis of the existing capacity and to complete the approved programme with utmost speed. The Government is of the view that further expansion of the cement industry should be based, as far as possible, only on indigenous machinery and the proportion of imported components should be further reduced.

12. **Industrial Licensing:** The present rate of progress in respect of granting of industrial licences to the private sector for some vital industries is inadequate and must be stepped up. It has been decided that, in future, licences for industries in the private sector should be issued strictly in accordance with a scheme of priorities which has been drawn up. It has also been decided that new licences for setting up industrial units should be granted only on the basis of utilising capacity at least to the extent of two shifts.

13. **Imports of Spares:** Import requirements of various industries for spares and components are envisaged to be scrutinised strictly to reduce them to the absolute minimum. A technical committee is being set up under the chairmanship of Mr. G. L. Mehta to make early recommendations for import substitution over a wide range of industries, especially in relation to maintenance requirements.

14. **Agriculture:** Agricultural output during the past two years has progressed as follows:

Commodity	1960-61	1961-62
Wheat (million tons)	10.8	11.6
Barley (million tons)	2.8	3.1
Rice (million tons)	33.7	33.6
Jowar (million tons)	9.2	7.7
Bajra (million tons)	3.2	3.5
Maize (million tons)	3.9	4.0
Ragi (million tons)	1.7	1.8
Small millets (million tons)	1.9	1.9
Oilseeds (million tons)	6.5	6.8
Sugarcane (million tons)	10.4	9.7
Cotton (million bales)	5.4	4.5
Jute (million bales)	4.0	6.3
Mesta (million bales)	1.1	1.7

Efforts are being made to improve production of cotton and oilseeds. It has been decided that the planned target of the total area envisaged to benefit from minor irrigation and soil conservation should be increased by 20 per cent. An additional allocation of Rs. 50 crores is being made for this purpose over and above the State Plan ceilings. Detailed programmes in this regard are now being worked out in co-operation with the State Governments. The total irrigation potential at outlet created by major and medium irrigation schemes increased from 12.24 million acres in 1960-61 to 13.75 million acres in 1961-62. The target for 1962-63 is about 16 million acres. In minor irrigation an additional 1.67 million acres benefitted in 1961-62. The target for 1962-63 has been fixed at over 2 million acres. The consumption of nitrogenous fertilizers increased from about a little over 2 lakh tons in terms of nitrogen in 1960-61 to nearly 3 lakh tons in 1961-62. During the current year the consumption is expected to increase to about 4 lakh tons (N).

15. **Improving Administration and Planning:** Mr. V. T. Krishnamachari's report on the organisation of administrative services in the States in relation to Third Plan needs and on administration problems at the district and block level arising from the introduction of Panchayati Raj has been received and is under consideration of the Government.

16. **Public Sector Undertakings:** There are many problems in respect of these projects to which sufficient attention could not be given in the past, such as the question of delegation of power and responsibility, development of cost and budgetary controls, control of inventories, personnel policies, preparation of projects and development of design and research organisations. These and other questions are now being followed up in a systematic manner. To bring down construction costs, the Planning Commission is shortly establishing a Cost Reduction Cell whose special responsibility will be to ascertain the construction component of projects and to follow up with Ministries and States the recommendations of a high level expert Committee for Reduction in Construction Costs. It is proposed that in each major project or group of projects, the management should be assisted by a well-equipped cost reduction unit.

OIL MATTERS

While the Union Ministries of Steel and Power have already started drawing up their tentative programmes for the Fourth Plan, the Union Ministry of Oil is still engaged in an ideological warfare and has not even arrived at the final estimates of demand for petroleum products by the end of 1966. Mr. K. D. Malaviya is still sticking on to the estimate of petroleum products' consumption arrived at about two years ago, namely, about 14 million tons. The oil industry, however, presumably on the basis of the consumption trends during the past two years, feels that the demand for petroleum products in India would be anything between 16 million tons and 18 million tons.

A firm estimate of petroleum products' consumption during the latter part of the current Plan, on the part of the Government, is urgently called for since it is linked with the crucial question of allowing the private sector refineries to expand their capacity. The three months' concession given to Burmah-Shell and Esso Standard to increase their throughputs to their maximum capacity, which is envisaged to result in a foreign exchange saving of Rs. 3 crores, is due to expire on September 30. Whether this concession will be extended for a further period is anybody's guess at present; Mr. Malaviya is unpredictable. In the interest of conserving the precious foreign exchange resources of the country, this concession needs, however, to be extended even if the ideological warfare over the permanent expansion of the refining capacity in the private sector does not come to an end.

ENI OPERATIONS

Although the Union Minister for Oil has been reticent in disclosing the area in which ENI has agreed to undertake drilling on behalf of the Oil and Natural Gas Commission—no decision according to Mr. Malaviya has been taken on this question—a newspaper report from Rome says: "The Italian State Oil Corporation, ENI, has confirmed that it will prospect for oil in the Ganges Valley on behalf of the Indian Government. It was stated in Rome that ENI's prospecting would be carried out under contract from the Indian Government on the lines of the drilling operations on behalf of the Argentine Government".

ENI has also submitted a project report on setting up of a lubricating oil plant. This report inter alia includes: (1) a marketing study detailing the situation and prospects of petroleum market, including in particular the lube oils markets; (2) a technical and economical study on two main alternative basis—one concerning itself with production of lubricating oils only and the other with the production of lubricating oils along with other petroleum products. The project report is understood to have suggested the setting up of an integrated refinery of two million tons capacity to be located in South India along with a lubricating plant of 1½ lakh tons capacity. About the location of the integrated refinery, four sites have been suggested. These places, however, are not yet disclosed.

ENI has also submitted to the Government the project reports on Delhi-Barauni-Calcutta pipeline and the LPG Bottling and Distribution Projects. To the Assam Government it has submitted a project report on Gas Fractioning Plant.

ENI has also offered to drill production wells in Assam. Government, according to lobby circles, has asked ENI to prepare a project report of the pipeline system to be laid in Gujarat.

Bechtel Corporation of California (USA) has been entrusted with the task of preparing the project report for the Siliguri-Gauhati pipeline scheme (about 270 miles in length).

OIL INDIA PIPELINE

The work on the 14" sector of the Oil India pipeline, connecting Nunmati with Barauni, is stated to be progressing satisfactorily. The entire pipelaying operations have been completed. All the 40 rail crossings have been done and of the 66 river crossings, 56 have been completed, work in respect of others being in progress. Of the five pumping stations on this sector, three are already in operational readiness and the remaining two would be completed in the near future. The pipeline is being pressurised for initial testing and unless leakages take place due to faulty pipes, the entire operation is expected to be completed very soon.

The Governor of Assam, Gen. S. M. Srinagesh, paid a visit last week to the headquarters of Oil India Pipeline at Nunmati.. He was received by Mr. G. N. S. Robertson, T.D., Acting Managing Director of Oil India. The Governor evinced keen interest in the project.

RE-ORGANISATION OF CENTRAL MINISTRIES

At the instance of the Prime Minister, a four-member Committee, consisting of Mr. T. T. Krishnamachari, Union Minister without Portfolio, Mr. Morarji Desai, Union Finance Minister, Mr. G. L. Nanda, Union Minister for Planning and Labour and Mr. Lal Bahadur Shastri, Union Home Minister, has been set up to suggest a scheme to rationalise the distribution of work amongst the various Central Ministries dealing with economic matters.

According to one proposal, all the carriers of goods, namely, railways, inland water transport, shipping and road transport, are suggested to be grouped under one Ministry. Another proposal deals with delinking of the Department of Scientific Research from the Ministry of Cultural Affairs and tagging of it on to the Development Wing of the Ministry of Industries. Under a third proposal, it is suggested to place oil matters either under the charge of an independent Minister of State or under the charge of a Department with a full-fledged Secretary to head it and this Department to be made a part of a bigger Ministry which should have another similar Department to deal with coal and mines.

At present, there is a general dissatisfaction with the bifurcation of the internal and external trade subjects between the Department of Commerce and the Department of International Trade in the Ministry of Commerce and Industry. There is a feeling that cotton and jute industries should be given back to the charge of the Department of Commerce.

The Committee will also have to look into the dispute over the inclusion of the petro-chemical industry in the Ministry of Oil. Mr. K. D. Malaviya claims that this industry should be under his charge because petroleum is within his domain. The Commerce and Industry Ministry, however, does not appear to be amenable to this. If petro-chemical industry is placed under the

charge of the Minister for Oil, by the same token it is contended cotton, jute and plantation industries should be dealt with by the Ministry of Agriculture. The Committee may also inquire into the logic or otherwise of the Ministry of Agriculture having its jurisdiction over the sugar industry which needs to be placed under the charge of the Minister for Industries.

Lastly, the Committee would also probably give some thought to the re-organisation of the Education, Health, Agriculture and Irrigation portfolios at the Centre. The primary responsibility for these lies with the State Governments, the Central Ministries' working being mainly of policy decisions regarding the whole country and of co-ordinating nature.

DEVELOPMENT WING'S WORKING

The Government of India has also set up a Committee, with Mr. S. Boothalingam as its Chairman, to look into the work of the Development Wing of the Ministry of Industries. There have been complaints about the work of this Department; hence this enquiry, the credit for whose institution should go to Mr. T. T. Krishnamachari. Mr. Boothalingam is an ideal choice for the Chairmanship of this Committee since he was one of the architects of the Development Wing.

PARLIAMENTARY COMMITTEE ON PUBLIC UNDERTAKINGS

Pressure tactics and lobbying is in progress in connection with the selection of the personnel for the 15-member Standing Committee of Parliament on Public Undertakings, recommended to be set up by the Krishna Menon Committee. Lobby reports suggest that efforts are being made to include in the personnel of this Committee persons who were either "contact men" or who have had direct or indirect interest in the similar private sector undertakings. The committee has to be set up by a resolution to be adopted by Lok Sabha.

EXPORT TARGETS

The export target for 1962-63 has been fixed at Rs. 720 crores. The following targets in terms of value have been adopted for some of the commodities :

(1) Cotton textiles	Rs. 32.5 crores for July-December, 1962.
(2) Tea	Rs. 140 crores for 1962-63.
(3) Jute manufactures	Rs. 150 crores for 1962-63.
(4) Iron ore (excluding Goa)	Rs. 21 crores for 1962-63.
(5) Manganese Ore	Rs. 12 crores for 1962-63.

BARTER DEALS

Mr. Manubhai Shah, Minister for International Trade in the Union Government, clarifying the policy behind India's entering into barter deals with some foreign countries has stated: "The general policy adopted in sanctioning barters is to ensure that imports are limited to such essential commodities as would in any case have to be imported against free foreign exchange and that the exports under barters are of commodities which do not otherwise move to the markets concerned, except against barter deals". The following are the imports so far arranged under barter deals:

(Rs. in crores)

Items	Value
Tractors	0.13
Newsprint	0.08
Steel material	15.11
Giant tyres	0.21
Steel tubes	0.20
Art silk yarn	0.20
Aircraft	2.38
Printing and writing paper	0.43
Fertilizers	3.91
Printing machinery	0.12
Wheat etc.	16.60

About import of some luxury goods like terylene cloth and cosmetics, Mr. Shah stated: "Import of luxury goods like terylene cloth and cosmetics has been totally banned and no foreign exchange is spent on them. Only very small quantities of such cosmetic items used for studio make-up like collondion, lipgloss, tooth enamel black, eye-lash make-ups and other specialised cosmetic items as are not available from indigenous sources, have been permitted to be imported in small values."

WORLD BANK LOAN FOR PRIVATE COLLIERIES

The World Bank has offered a loan of 35 million dollars (Rs. 17 crores) to the Government of India to meet the foreign exchange requirements of the private collieries during the Third Plan. Of this amount, 30 million dollars can be drawn upto July 31, 1963, and the remaining 5 million dollars upto September 30, 1965.

So far, 4,288 import licence applications, valued at about Rs. 12.7 crores, have been received by the Government. Out of these, licences have been issued to 1773 applicants, valued at about Rs. 2.9 crores. The remaining applications are under scrutiny. Actual drawals from the loan account will, however, start only after the machinery and equipment have been imported.

MANUFACTURE OF HEAVY ELECTRICAL EQUIPMENT BY PRIVATE SECTOR

The Government of India has granted licences under the Industries (Development and Regulation Act), 1951, to certain parties in the private sector for the manufacture of heavy electrical equipment. The details are as follows :

LARGE TRANSFORMERS

1. M/s. Kirloskar Electric Company Ltd., Bangalore.
2. M/s. Hackbridge-Hewittic and Easun Private Ltd., Madras.
3. M/s. Hindustan Electric Company Ltd., Bombay.
4. M/s. Transformers and Switchgear Ltd., Madras.
5. M/s. Electric Construction & Equipment Co. Ltd., Calcutta.
6. M/s. Gandhi Electric Company, Bombay.
7. M/s. Hitachi Transformers & Electricals (Kerala) Ltd. Trivandrum.

H.T. SWITCHGEAR

1. The English Electric Company, Madras.
2. M/s. Jyoti Ltd., Baroda.
3. M/s. Mysore Electrical Industries Ltd., Bangalore.
4. M/s. Electric Construction & Equipment Co., Calcutta.
5. M/s. Hindustan Electric Co., Ltd., Bombay.

HMT WATCHES

Upto August 4, 1962, Hindustan Machine Tools Limited assembled 18,482 watches. The assembling of these watches from imported components is being carried on by HMT primarily to train technicians. The cost involved is being treated as the cost of training. A regular costing system would be introduced after the commencement of the manufacture of these watches in India.

The amount of foreign exchange expenditure per piece of the three types of watches produced by HMT at present is as follows :

"Citizen" (Gents)	Rs. 20.00
"Janata" (Gents)	Rs. 18.14
"Sujata" (Ladies)	Rs. 18.18

According to the terms of the collaboration agreement signed by HMT with the Citizen Watch Company of Tokyo, the latter would make available its technica know-how to the former to enable it to attain a leve of indigenous content equal to 84 per cent. This leve

From Cochin to California

PRAWN CANNING is an industry wholly dependent on foreign markets. Prawn exports from the Malabar coast-line to the United States and other parts of the globe are today earning foreign exchange worth several crore rupees. Metal Box has helped the enterprise of India's exporters of prawns—and many other products—by supplying packages made to exacting international standards.

The Canning Advisory Service of Metal Box—the only one in the packaging industry—provides free advice to packers on every aspect of the complex problems of canning technology. As part of this service Metal Box helps develop special containers and closures to suit the requirements of individual products.

In providing all this assistance to packers Metal Box draws on 29 years of experience in the packaging industry and the accumulated technical resources of its overseas associates.

Today precision-made Metal Box packages carry annually to over 50 foreign countries more than Rs 4 crores worth of Indian goods—fish, cashewnuts, vanaspati, vegetable oils, fruit, toiletries, confectionery and biscuits.

But this is not all. Metal Box helps to earn foreign exchange by selling direct to packers abroad. The value of exports of Metal Box packages to foreign customers has increased over 20 times in four years—a truly spectacular record!

THE BOOK TRADE

The well-known Canadian newspaper magnate, Mr. Ray Thompson, was here recently on a mission to finalise collaboration arrangements with Indian interests for setting up a most modern printing press and a book binding establishment, to be located in Delhi State. It is intended to publish at this press British and American books—literary, scientific and technical—for sale in India as well for export to the countries of South-East Asia. Mr. Thompson has agreed to take minority share of 49 per cent in the equity capital of this enterprise. The balance 51 per cent share is to be held by the Indian collaborators and the general public. He has plans to invest £500,000 in this venture, the excess of the 49 per cent of his share being in the form of a loan to be repaid through exports.

DE LA RAU'S NEW VENTURE

The well-known British firm, De La Rau is planning to set up a plant in Delhi for the manufacture of playing cards both for Indian consumption and exports. The firm believes that there is a very big market for playing cards in India as well as in countries of South-East Asia. De La Rau is not unknown in India even at present. This firm used to produce postage stamps for this country before they started to be produced by the Government of India. De La Rau is also collaborating with the Government of India in setting up a security paper plant in this country.

COMMONWEALTH CONFERENCES

Prime Minister Nehru is leaving for London on September 8 to attend the Commonwealth Prime Ministers' Conference starting there on September 10. The Union Finance Minister, Mr. Morarji Desai, will precede him by a day. He along with Mr. L. K. Jha, Secretary, Economic Affairs, who is leaving for London on September 6, and Mr. K. B. Lall, India's Ambassador in Belgium, will be a member of the Indian delegation to the Commonwealth Prime Ministers' Conference. Mr. Jha and Mr. Lall's inclusion in this delegation has presumably been necessitated by the fact that the Commonwealth Prime Ministers' Conference will discuss the issue of Britain's entry into the European Common Market.

Mr. Desai and Mr. Jha will leave London for Washington on September 17 to attend the meetings of the World Bank and the affiliated institutions which commence on September 18. The Commonwealth Finance Ministers' Conference, it is expected, will be held in Washington this year.

APO PRODUCTIVITY STUDY TEAM

A 7-member Asian Productivity Organisation's Study Team on Productivity Drive Programme and Programme Planning and Co-ordination is arriving in New Delhi on August 26. The Team's visit is a part of its 6-week tour of APO member-countries with a view to studying the progress made in the Productivity Movement, Development of Productivity Techniques, Management Development and the ways and means employed for disseminating productivity information. Besides India, the Team will visit East Pakistan, Philippines, Nepal, Formosa, Republic of Korea and Japan. It has already visited West Pakistan.

While in Delhi, the Team will be visiting the National Productivity Council Headquarters, Small Industries Service Institute and Workers' Education Centre, besides holding discussions with the officers of the Ministries and Institutions concerned with the productivity movement. The Team will also visit NPC's Regional Directorates at Bombay and Calcutta. The Team members will particularly examine and suggest the best possible ways in which training programmes could be successfully developed in the APO member-countries as also steps to be taken to bring about better co-ordination with the APO so as to enable it to play its full role in the overall productivity drive in Asian countries.

IN BRIEF...

Heavy Electricals (India) Limited has signed a contract with Messrs. Prommeshexport, Moscow, for getting two Soviet specialists for giving training to the Indian engineer-trainees for the Heavy Electrical Equipment Plant to be set up at Ranipur, near Hardwar, in designing of hydraulic turbines and for teaching the Russian language. The trainees will be given orientation training at Bhopal after which they will be sent to USSR for advanced and specialised training.

*

The Garden Reach Workshop and the Mazagon Dock are both stated to be in a position to undertake the construction of ships upto 5,000 DWT with their existing facilities. A scheme to develop the Garden Reach Workshop to undertake the construction of larger merchant ships is being examined by the Ministry of Defence.

*

The Central Government has sanctioned a scheme, costing Rs. 80 lakhs, for the construction of a grab dredger for Calcutta Port. This dredger will have a hopper capacity of 1,500 tons and will be built in Britain and brought to Calcutta as a complete unit.

*

The Government of India has approved an Indian concern's collaboration arrangements with a foreign firm for the manufacture of chaff cutter blades in this country. The quality of the blades now produced in India is not regarded as satisfactory.

*

The Government has under consideration some proposals for the manufacture of steel tapes (measuring tapes) with foreign collaboration. No scheme has yet been approved.

*

The National Industrial Development Corporation has so far sanctioned Rs. 6.15 crores as loans for the modernisation of jute industry. The jute industry's modernisation has almost been complete up to the spinning stage. Mills are experimenting with automatic looms imported from abroad. On the results of these experiments, plans for modernisation of the weaving sections are expected to be finalised in the near future. Jute mills have been allowed to expand their spinning capacity to the extent of about 15 per cent. Diversification of production by installation of broad looms is being encouraged.

*

Detailed investigation, boring and survey is now being conducted at Mangalore for finalising the layout of the new port there. It has been decided that the new port will be sited to the north of the Netravati river mouth. It is intended to connect Mangalore with Hassan by railway. The new rail link is included in the Third Five-Year Plan of the Railways. The actual construction of this line will be co-ordinated with the construction of the port. The work over the port is expected to be completed by 1967.

NEWS IN BRIEF

INDIA

The Andhra Government has decided to introduce the permit system for coal for domestic consumption.

*

The Punjab Government has made a gift of 4,063 bighas of land to the Hindustan Machine Tool Ltd. to set up its third plant at Pinjore.

*

Plant Protection Ltd., a subsidiary of Imperial Chemical Industries, has developed a new weed-killer, claimed to be affective against coarse grass and water weeds. The new product will be marked under the name of Gramoxone.

COMPANY AFFAIRS

BIRLA COTTON

The Directors of the Birla Cotton Spinning and Weaving Mills Limited, in their annual report for the year to March 31, 1962, have indicated that during the year under review there was a considerable increase in the cost of production in the textile industry by reasons of steep rise in the prices of cotton and substantial increase in wages and dearness allowance and prices of stores, dyes and spare parts. This adversely affected the working results of the textile mills. In spite of all these disadvantages, the overall working results of the Birla Mills could be considered fairly satisfactory. The profit for the year, for instance, was recorded at Rs. 47.1 lakhs. The ginning and processing factories at Malout and Kesirisingpur and a tent factory recorded good results. Out of the total profit, depreciation and taxation were separated to the extent of Rs. 7.33 lakhs and Rs. 23 lakhs respectively. Other amounts separated were for development rebate reserve (Rs. 2.45 lakhs) and general reserve (Rs. 6 lakhs). The Directors recommended the payment of a dividend on ordinary shares at the rate of Rs. 2 per share of Rs. 10 each. This will absorb Rs. 7.99 lakhs. A sum of Rs. 1.68 is proposed to be carried forward to next year's account.

During the year under review some more machines in the processing and finishing departments of the textile mill were added during the year. A few more machines are likely to be added during the current year. In view, however of the great difficulty in getting requisite import licences, the plan for modernisation of more machines in the textile mill is being deplayed. An application was made by the company to the Government of India for permission to instal additional spindles for balancing the existing ratio of looms to spindles, but unfortunately the application has not been approved.

Since the close of the accounting year the rate of excise duty on cloth and yarn has been increase by the Central Government. Excise and Custom duties have also been levied and increased on various items which are required by the textile industry. Due to failure of the cotton crop in the last season there is now an acute shortage of cotton leading to further increase in its price. All these factors are likely to affect the working results of the current year adversely.

It may, however, be added that the company has received licences to set up two textile units—one at Kathua in the State of Jammu and Kashmir with a capacity of 12,500 spindles and the other at Khurja in Uttar Pradesh with a capacity of 25,000 spindles. The Directors are taking necessary steps for setting up the units. Orders for Plant and Machinery for the Kathua Mills have already been placed.

UNIVERSAL CABLES

Universal Cables Limited had approached the Industrial Credit and Investment Corporation of India Limited and the Commonwealth Development Finance Corporation Ltd., London, for foreign exchange loans amounting to Rs. 80 lakhs to meet the cost of imported machinery. The Directors in their annual report for the year to March 31, 1962, have now recorded that these loan agreements have since been satisfactorily concluded. Therefore, naturally the necessary plant and equipment required for the cable plant are likely to be received without any delay. The order for plant and equipment have already been placed and the necessary import licences too have been obtained. The building construction is progressing at Satna and the cable plant is expected to start production in the latter half in 1963. To meet the increased requirements, the company has already increased its issued capital which now stands at Rs. 1.05 crores. This increase follows the issue of 7 lakh equity shares of Rs. 10 each. The Directors expect that the final call of Rs. 5 per share on the new capital will be made before the end of the current year.

The year's working of the company shows a surplus of Rs. 87,836. After providing for depreciation and taxation, there was an amount of Rs. 5,604 which has been carried forward. The Directors have thought it advisable not to recommend payment of any ordinary dividend for this year as they consider it desirable to conserve the company's resources in view of the development expenditure which will have to be incurred in the near future for putting up of the cable plant.

NEW ISSUES

Five companies have been authorised to issue capital totalling Rs. 1.14 crores. Of these, one company is issuing right shares, one bonus shares, two equities and two equity and cumulative redeemable preference shares. The consent of the Controller in all cases is valid for 12 months.

Duncan Brothers & Company Limited (Calcutta), a public company carrying on the business of non-industrial nature and having a paid-up capital of Rs. 1.35 crores, is to issue further capital of Rs. 18 lakhs divided into 18,000 equity shares of Rs. 100 each to be issued as rights for cash at a premium of Rs. 10 per share.

H. M. Kashiparekh & Company Limited (Ahmedabad), will issue 81,972 bonus shares of Re. 1 each on capitalisation of the company's reserves to a like extent.

Indofil Chemical Private Limited (Maharashtra) is issuing capital of Rs. 40 lakhs in equity shares of Rs. 100 each, for cash at par. Out of this, shares worth Rs. 23 lakhs will be offered to Rohm & Hass Company, Philadelphia, U.S.A. The money will be used for establishing the manufacture of Dithane fungicides etc.

Bellary Spinning & Weaving Company Limited (Mysore), is to issue capital of Rs. 25 lakhs in equity shares of Rs. 100 each for cash at par for establishing a spinning mill.

Indore Wire Company Limited (Bombay) a public company established to undertake manufacture of high tensile wire will issue capital of Rs. 20 lakhs divided into 15,000 equity and 5,000 cumulative redeemable preference shares of Rs. 100 each carrying divided of 7½ per cent (gross) per annum for cash at par.

AUSTRALIA'S LARGEST COMMERCIAL BANK CAN HELP YOU TO PROMOTE TWO-WAY

TRADE WITH AUSTRALIA, NEW ZEALAND, AND FIJI

Want to sell? Want to buy? Want market information? The International Division of the Bank of New South Wales can tell you about the opportunities for trade offering with these countries.

The Bank's complete banking service includes such specialized facilities as trade introductions to buyers and sellers, industrial enquiries, economic and market information, and a complete travel service. The Bank is closely and constantly in touch with industry, business, and agriculture in the areas it serves through more than 1,100 branches and agencies.

Company Meeting

THE INDIA CEMENTS LIMITED
MADRAS-2.

Speech delivered by Sri P. Suryanarayana at the 16th Annual General Meeting of the Company held on Saturday, the 18th August, 1962.

Ladies and Gentlemen,

On behalf of the management and on my own behalf, I extend to you all a cordial welcome to the 16th Annual General Meeting of your Company and place before you the Annual account of the Company for the year ended 31st March, 1962 and the Board's report and the Auditors' report thereon. Printed copies of these have been circulated to all the members and with your kind permission I will take them as read.

The year under review marks the completion of the first year of the Third Five-Year Plan. The Third Plan, as I mentioned on the last occasion, was presented to the nation on the 7th July, 1961. Economic growth in the first year of the Third Plan is satisfactory, though it has not been up to the full expectations of the planners. I feel that the progress in the first year is largely due to the increase in industrial production in the country. An idea of the growth is had, if one looks at the national income data provisionally estimated by the Planning Commission. The estimate for the first year of the Third Plan at current prices is Rs. 14,690 crores as compared with the preliminary estimate of Rs. 14,200 crores for the first year of the Second Plan. The percentage increase in the 1961-62 National Income is said to be about 3.5 as compared to the previous year. I need hardly point out that the cement industry has contributed its mite to the increase in the industrial production of the country.

Your Company was formed in the year 1946 and went into production by September 1949 and got on to full rated capacity production of 100,000 tons per annum in 1950. The plant was doubled after six years in 1956 and the production was again doubled in 1959 and the production today stands at nearly half a million tons.

The scheme for putting up a cement factory in Sankaridrug (Salem District) with an annual production of 200,000 tons of cement has just been taken on hand and speedy steps are being taken to bring this unit into production by June-September next year. Necessary lands for the construction of the factory as well as mining have already been purchased and the first sod of earth has been turned yesterday. Deliveries of machinery are also expected to start almost immediately. It is my earnest hope that I will be in the very happy position of announcing to you at the next Annual General Meeting that Sankari Unit of your Company has gone into production or is about to go into production. Your Directors and the Managing Agents are anxious that this project should go into production at a very early date, so that we can to the extent possible relieve the acute shortage of cement now prevailing in the country.

The scheme for starting a cement factory in Andhra Pradesh is also progressing, and would be in production in the next two years.

When these schemes are completed, the total production of your Company which had an installed capacity of one lakh of tons in 1950 will be more than one million tons of cement, which is an achievement which should be considered creditable judging from any standards. We may therefore feel proud of our share of contribution to the rapid industrialisation of the country and the attendant economic progress.

Your Company has, during the year under review, produced 4,57,116 tonnes of cement as against 4,64,295 tonnes in the previous year. The slight fall in production is largely due to the shortage of coal supplies and restriction on power consumption.

The present installed capacity of the cement industry in this country is about 9.5 million tonnes against which production is in the region of 8.5 to 9 million tonnes. The target for production of cement for the Second Five-Year Plan was at first fixed at 14 million tons, but subsequently in 1958 when a review of the Plan was made, the target was reduced to 9 million tons. This target has practically been achieved in the Second Plan. The target for the Third Plan has been fixed at 15 million tonnes and it would now appear that this would require a revision upwards, if we are to meet the growing demand of this essential commodity, so vital to the development of every phase of our planning. I once again emphasise as I did on the previous occasion that the industry has a bright future. I for one see no reason why the industry should not be able to live up to its expectations and at the end of the present Plan, "deliver the goods", if I may say so, or even do better by exceeding the estimated target.

In this connection, I may be permitted to refer to a matter, which of late is seriously engaging the minds of the planners, the Government and the entire business community, namely, the gravity of the position of our balance of foreign payments and the imperative need of not only conserving our present slender foreign exchange resources but also increasing the same by stepping up our exports. I have no doubt that every industrialist and businessmen is alive to the situation and there is a growing realisation on the part of everybody that the huge foreign exchange resources required for the import of capital goods for new industries for maintenance equipment and essential raw materials for the existing industries and the fulfilment of our ambitious Third Five-Year Plan can be achieved only by increasing our exports. Unless there is a marked increase, I should say, almost doubling or trebling of the present level of exports one cannot think of any appreciable improvement in the foreign exchange position. The Government's policy of effecting drastic cuts in imports will not solve the problem to any great measure. Perhaps such a policy, far from solving the problem will only aggravate the difficulties. The solution to this problem can, therefore, lie only in a great volume of exports and a highly imaginative export promotion programme. We cannot afford to halt the pace of industrialisation nor reduce the pace of our exports, if we are to achieve any success in fulfilling the plan targets. Besides increasing the exports of important traditional items such as cotton and jute products, tea, vegetable oils, etc., we should explore and gain new markets for the products of other industries such as engineering industry and other miscellaneous industries. The target for exports in the Third Plan has been set at Rs. 850 crores and therefore calls for a vigorous export drive on the part of the business and industrial communities. No doubt our path is strewn with difficulties and calls for considerable sacrifices. We have the paradoxical problem of shortages and high prices at home and resistance of increasing competition abroad.

In this context, it is a matter of gratification that the Government have been very much alive to this problem and in order to encourage exports, are formulating various schemes to make the business of export advantageous for the industry. I may, in fact, say with some degree of confidence that the Government are doing and will do their utmost towards this end.

You may perhaps be aware that as a first step in the export promotion compaign, the Government has appointed a Director of Transport, established machinery for quality control with a view to avoid any bottlenecks in the export trade.

It is a matter of sacred duty that we in the private sector of industry and trade should stand solidly behind the Government in the matter of export promotion.

The cement industry has not lagged behind in the export trade. I am happy to say that your Company has exported cement for a total value of Rs. 16 lakhs during the year under review. Most of the Company's exports go to Ceylon, where there is a great demand for Sankar Brand cement. It is hoped that with our expansion schemes in view we will not only be able to meet the growing demand in this established market but also explore markets in other foreign countries and thus contribute to the country's exports in augmenting foreign exchange.

The statement of accounts has been in your hands for some time now and members may have noted that the gross profit before deducting depreciation and Managing Agents' commission has increased by Rs. 20,18,070 as compared to the previous year. Production of clinker, cement and sales were slightly lower at 4,45,768, 4,57,116 and 4,58,382 metric tonnes respectively. The fall is due to continued coal shortage and restriction on power supply.

I mentioned to you on the last occasion that the Tariff Commission were then considering the revision of cement prices. The Commission submitted its report in August 1961 to the Government, recommending ex-works retention price in respect of each cement unit. The Government of India, however, did not approve of differential prices based on individual costs and felt that there should be a uniform price for the industry as a whole, so that the more efficient units will have the benefit of their economies. The Government therefore fixed an uniform ex-works price of cement at Rs. 69.50 per tonne with provision for adjustment in the case of high cost units subject to adjustments, whenever called for, for variations consequent on Governmental action, including escalation for fuel and power.

Since the fixation of the price from 1st November, 1961, there has already been increase in the cost of pit's mouth price of coal, railway freight on movement of all goods traffic including coal, sur-charge on power levied by the State Government and also increase in the Corporation tax, brought about by Governmental action. Suitable representations have been made by the Cement Manufacturers Association on behalf of the industry for suitable revision in the retention prices consequent on the above increases.

The Commission recommended to the Government that the revised prices should be made effective from 1st July, 1961. The Government, however, has thought fit to make the revised prices effective only from 1st November, 1961. Your Company has, therefore, had the benefit of the revised price for a period of five months only during the accounting year.

I am glad to inform you that the Government have recently sanctioned an increase of Rs. 2.37 per tonne in the retention price of your Company's cement to offset the increase in cost arising out of the use of furnace oil for one of its kilns.

Members would have noted that we have, along with the statement of accounts, given graphically illustrated charts showing details of distribution of Sankar Brand cement, Fixed assets of the Company and sales and dividends. We hope the information furnished therein will be of interest and give a full background to the Company's working.

In order to meet additional capital that will be required for the expansion schemes of your company, you are aware that a decision was taken by your Board to increase its subscribed capital by Rs. 1,25,55,250. In pursuance thereof, right shares were offered to the members of the company in February 1962. I am glad to inform you that the entire issue was over-subscribed. The Directors had reluctantly to refuse full allotment of additional shares applied for by members.

I am glad to inform you that the Sankar Institute of Polytechnic has recently moved into its own building near your factory at Talaiyuthu. The new building was declared open by Sri R. Venkataraman, Minister for Industries, on 17th June, 1962. The new building has been well planned and designed to meet the growing needs of the Institute.

A Junior Technical School has also been started from this academic year as an adjunct to the Polytechnic. The School is at present housed in temporary quarters, but plans have been approved to construct necessary buildings and workshops for the School in the Company's land near the Polytechnic.

Your Directors decided that there should be a pucca hospital with 50 beds at the factory area in Talaiyuthu to cater to the medical needs of the staff of the Company. The first phase of construction is over and the hospital will be complete in all respects in the next one year's time.

Government have large programmes under community development schemes. I would only like to mention in this connection that the starting of industries away from urban areas does in fact create opportunities for large scale employment, in the wake of which schools, technical training centre, hospitals, etc., spring up, thereby creating a well-contented community. With each such industry, the community is developed. Your Company has contributed in a large measure towards this achievement of ideal community development.

I am indeed happy to report that our relations with the labour at our factory and the staff at the Head Office continue to be very cordial as usual. I take this opportunity both on your behalf and on my own behalf, to tender our thanks to all the employees of the company for their unstinted co-operation and hard work during the year. The Company looks forward to their continued loyal and devoted service and co-operation in the years to come.

I thank you all, Ladies and Gentlemen, for the indulgence you have shown and the patient hearing you have given. I am afraid I have taken a little longer time, but I thought it my duty to present to you all these facts.

N.B.: This does not purport to be a report of the proceedings.

BENGAL CHEMICAL & PHARMACEUTICAL WORKS LIMITED

Address delivered by Dr. B. N. Ghose, Chairman, at the 62nd Annual General Meeting of the Company held on August 14, 1962.

Gentlemen,

I have great pleasure in welcoming you on behalf of the Board of Directors as well as on my own behalf to the 62nd Annual General Meeting of your Company. The Directors' Report and the Audited Accounts of the Company for the year ended the 31st March, 1962 have been with you for sometime past, and with your permission I take them as read.

From the working results of the year under review as explained in the Directors' report you have noticed that the sale of the Company registered an increase of about Rs. 4 lacs over the last year's figure, but the margin of profit was lower. The reasons for the decrease in profits were several the most determining factors amongst which were rising costs, high transportation charges and operating expenses, high price and shortage of coal, interruption in the supply of electricity etc. Notwithstanding the fall in profits as compared to last year, your Directors recommend a dividend @ 10 per cent on all classes of Ordinary Shares besides the usual dividends on 7½ per cent Cumulative Preference Shares and 4½ per cent Cumulative Second Preference Shares in accordance with Preference Shares (Regulation of Dividends) Act, 1960. Your Directors are attempting to increase the rates of Dividend on the Preference Shares of this Company in order to make up the losses now being suffered by the Preference Sharesholders who have already received notice to this effect.

Last year I struck a note of warning with regard to productive operations specially at Panihati Factory. The principal handicaps faced by the industry, amongst others, are non-availability of Crude Tar for our Tar Distillation Plant and drastic cut in the allotment of wagons for coal supply and other raw materials. Crude Tar is being burnt by the producers in their furnace as fuel, consequently supplies of this essential raw material are not available to feed our distillation plant. The drastic cut in the wagon allotment has considerably increased the cost of coal as we have to meet our demand by Road Transport. Furthermore the quality of coal is not up to the mark having ash contents up to the extent of 35 per cent.

Our export trade with regard to Napthalene has been substantially handicapped. In their overzealousness to earn foreign exchange M|s. Hindustan Steel Ltd., made all-out efforts to sell hot pressed Naphthalene in the foreign market and succeeded in exporting at a price of Rs. 625 per ton, f.o.b. Calcutta; whereas being the only producer worth the name in the country, they maintained their internal price for the indigenous refineries of Naphthalene at Rs. 1,100 per ton. Your Company had a small market in the neighbouring east Asian countries for refined Naphthalene balls but we could not compete with Japan who bought this very hot pressed Naphthalene from Hindustan Steel Ltd. @ Rs. 625 per ton quoting from £75 to £80 per ton. I may point out that by distillation of Crude Coal Tar at our factory the cost of Crude Naphthalene worked out at almost half the purchase price of the same from M|s. Hindustan Steel Ltd. But owing to non-availability of Crude Coal Tar we had to purchase the said raw material at such a high price.

The import restrictions and licensing policy of the Government have adversely affected our production of certain items, particularly surgical dressings and some of the toilet products for which sales in these lines could not reach the expected target. Last year I reported the difficulty in getting import licence for parts of machinery for replacement as well as machinery for increasing the production of surgical dressings. We could not effect supply of large quantity of surgical cotton wool to our Overseas Customers due to non-availability of Import Licence for machinery and their replacements although your Company has been doing this export business for the last two decades at some sacrifice as a national obligation. Furthermore, due to sudden reduction in the import licence of Tallow we could not meet our contractual obligations in the country, not to speak of increasing our export of Soaps. We exported our products during the year under review to overseas markets, e.g., Burma, Ceylon, Singapore, Penang, Kuala Lumpur, Thailand, California, etc. We are glad to report that of late we have put in the market our newly manufactured medicine "Diabinol," an oral anti-diabetic drug, which has been proved, on long and continuous clinical trials in two of the leading hospitals of the city, very efficacious in smaller doses. This product can very favourably compete with any foreign product of this category current in Indian market.

Imposition of Central Excise Duty on Proprietary medicines and toilet preparations necessitated enhancement of prices, and obviously there was considerable consumer resistance resulting in unexpected setbacks in our normal business during the year under review. You will appreciate that recent legislations with regard to Excise Duty on acids, patent medicines and other items embracing almost all our major products have adverse influence on this industry and price adjustments due to these levies are not in each and every case feasible owing to very competitive nature of the market.

You are already aware that unscrupulous traders and bogus manufacturers have been dealing in substandard and spurious drugs all over India for a pretty long time by presenting to the unwary public cheap products which very often cost human lives. In a recent Press report, a sweeping generalization has been made with regard to manufacture of sub-standard drugs by all the 700 drug licensees in West Bengal, I may assure you this is not correct and the network of the manufacture of sub-standard or spurious drugs by unscrupulous traders is spread all over India and not confined to West Bengal only.

Our new expansion schemes at Panihati in respect of Alum Plant and Sulphuric Acid Plant are progressing slowly and the delay in implementing the scheme in accordance with our original programme is due to some official paraphernalia standing in the way.

With regard to the scheme of forming a Chemical Project at Durgapur, I may inform you that the proposed Company, we have been told, will be a Government of West Bengal undertaking in which your Company will be represented as one of the promoters. The share of interest and the terms thereof of your Company in the proposed Company at Durgapur are still awaited. Of course, the sudden death of Dr. B. C. Roy, Chief Minister, may to some extent affect the smooth sailing of the affairs of the Company in its formative stage.

I have endeavoured to give you a review of the Company's affairs during 1961-62 and you will appreciate that the handicaps we had to encounter were only temporary phases. We are, however, trying to tide over the situation. I may assure you that the prospects for the current year are encouraging till now and in all probability we expect to achieve better results this year.

N.B.: This does not purport to be the proceedings of the Annual General Meeting.

LIFE INSURANCE CORPORATION OF INDIA

Statement by Shri B. K. Kaul, I.C.S., Chairman, at the Seventy-Fifth Meeting of the Life Insurance Corporation of India held in Bombay on 27th August 1962.

I have great pleasure in welcoming you to this sixth anniversary meeting of the Corporation. The draft of the Annual Report and the Statement of Accounts for the year 1961 have been circulated and are now before us for our consideration.

NEW BUSINESS:

During the year our new business amounted to Rs. 608.82 crores and 14.70 lakhs policies as against Rs. 497.54 crores under 12.58 lakhs policies in the previous year, thus showing an increase of 22.4 per cent. In the context of the rise in the price level during the year and of the natural calamities like floods in some parts of the country, the increase of more than Rs. 100 crores in the level of new business may be considered very satisfactory.

It is also gratifying to note that as many as 10.24 lakh policies were taken by persons who were insuring for the first time. Thus out of every three persons insuring with us, two were seeking life insurance protection for the first time.

RURAL DEVELOPMENT:

Out of the new business, as many as 5.3 lakhs policies assuring Rs. 182.59 crores were issued to people in the rural areas. I may mention that for the purpose of the definition of rural area we have now adopted the same criterion as was used in the 1961 census. As the earlier statistics were compiled on a different basis, we do not have the comparative figures for the previous year. There is, however, little doubt that we have made a considerable headway in our efforts of systematically expanding the business in the rural areas.

The main difficulty that constantly crops up in regard to the rural business is the lack of facilities for collection of premiums. **We have launched early this year a pilot scheme in Rajasthan for collection of premiums through selected post offices.** We are proposing to extend this scheme in due course to other areas, where banking facilities are not available, in consultation with the postal authorities.

NON-MEDICAL BUSINESS:

Another difficulty in propagating the message of life insurance in rural areas has been the paucity of medical examiners for conducting the medical examination of the lives to be assured. This has, to some extent, been solved by a wider application of non-medical schemes.

Under the general scheme, which now extends throughout the country, the medical examination is waived in respect of proponents within certain age groups, provided the total insurance on their lives does not exceed Rs. 2,000. Under this scheme, new business of Rs. 38.30 crores under 2.5 lakhs policies was completed during the year.

Besides this general scheme, we are also insuring, without medical examination, special categories of persons in civil employment upto a total sum assured of Rs. 5,000, which limit was increased, during the course of the year, to Rs. 10,000 in the case of eligible persons, whose ages at entry do not exceed 30 years nearer birthday and also in the case of Category "A-1" of the commissioned officers in the Armed Forces. Under this scheme, new business of Rs. 58.46 crores under 2.4 lakhs policies were completed bringing the total non-medical business to Rs. 96.76 crores under 4.9 lakhs policies. Thus, one out of every three proposers was insured by the Corporation without medical examination.

The Corporation has no doubt provided adequate safeguards to ensure that the class of lives coming under the purview of these schemes are of the usual standard who would experience a favourable mortality.

It is my desire that the scope of the scheme is gradually enlarged as we gain further experience of this class of business.

FOREIGN BUSINESS:

In some of the foreign countries, where we operate, the political and economic conditions were not quite favourable for the development of our business. However, due to sustained efforts of our officers and agents, our total foreign business in 1961 came to Rs. 10.03 crores under 8,056 policies, as against Rs. 9.70 crores under 7,736 policies in the previous year. Special mention must be made here of our London Branch which wrote in 1961 a new business amounting to Rs. 92 lakhs.

BUSINESS IN GOA:

Since the beginning of this year we have started transacting new business in Goa, Diu and Daman. Details of the scheme for taking over the life insurance business of the former Portuguese Companies are being worked out. In the meantime, we have extended to the Indian policyholders of these Companies facilities for the collection of premiums.

BUSINESS IN FORCE:

The total business in force at the end of 1961 was Rs. 2,737 crores under 86 lakh policies as against Rs. 2,285 crores under 77 lakh policies at the end of 1960, thus showing an increase of 19.8 per cent during the year.

LAPSE RATIO:

The ratio of net lapses to the mean business in force was 7.0 per cent in 1961 as compared with 6.6 per cent in 1960. The rise in the net lapse ratio of the Corporation seems to reflect the deleterious effect of the increase in the general price level on the saving capacity of the insured population. Apart from the monetary loss to the policyholders as well as to the Corporation, which the lapses bring in their trail, the termination of life insurance protection for several lakhs of families every year is a matter of vital concern to us. Accordingly, I have been impressing, in the course of my discussions with the Development and other Officers, the imperative necessity to reduce the lapsation of policies to the minimum and to improve the quality of business to the maximum extent. The necessary machinery has been set up to review the lapse position periodically so that any adverse trend may be detected at an early stage and checked by taking suitable remedial action without loss of time.

PREMIUM AND OTHER INCOME:

For the first time in the history of life insurance in this country, the premium income has crossed the Rs. 100-crore mark, the actual premium in 1961 being Rs. 112.30 crores as against Rs. 96.89 crores in 1960. It may be mentioned that the total premium income

in the year preceding nationalisation i.e. in 1955 was Rs. 58.55 crores only.

The total income for the year 1961 was of the order of Rs. 141 crores as against Rs. 116 crores in the previous year.

LIFE FUND, INVESTMENTS AND TOTAL ASSETS:

The Corporation's life fund as at 31st December, 1961 was Rs. 631.59 crores registering a handsome rise of Rs. 72.46 crores after taking into account the adjustments made to the life fund at the beginning of the year.

Of the total investments in India of Rs. 503.56 crores, the public sector accounted for 77.9 per cent and the private sector 22.1 per cent. During the year, 52 new issues were underwritten to the extent of an aggregate sum of Rs. 759 lakhs.

The total assets of the Corporation as at the end of 1961 amounted to Rs. 696.31 crores as against Rs. 622.85 crores in 1960. The net increase in the assets of the Corporation, since its inception, amounted to Rs. 281 crores.

RATE OF INTEREST:

The income from interest, dividends and rents before deduction of income-tax rose to Rs. 27.95 crores in 1961 from Rs. 23.97 crores in 1960. The gross rate of interest at 4.80 per cent on the mean life insurance fund (4.58 per cent in 1960) is the highest during the last five years. I expect that the Corporation will be able to maintain this rate in future, if not improve upon it.

The steep rise in the net yield from 3.55 per cent in 1960 to 4.68 per cent in 1961 is, however, largely due to the fact that the net rate in 1960 was depressed, whereas the net rate in 1961 has been pushed up as tax refunds, accounted for in 1961, comprise refunds in respect of two years.

EXPENSES OF MANAGEMENT:

The overall expense ratio of the Corporation fell from 28.4 per cent in 1960 to 28.0 per cent in 1961, although the full effect of the ad hoc increase in dearness allowance sanctioned in 1960 was felt for the first time in 1961. The renewal expense ratio, which provides a better indicator of the economy of management, also fell from 12.9 per cent in 1960 to 12.4 per cent in 1961.

In the larger interests of the policyholders, the majority of whom consist of middle class people, there is an imperative need to keep a constant vigil on the expenses and to eliminate unproductive expenditure by strict budgetary control.

CLAIMS:

Claims for the year amounted to Rs. 25.4 crores under matured policies and Rs. 8.7 crores under policies becoming claims by death. The total claims for the year amounted to Rs. 34.1 crores as compared with Rs. 30.7 crores in 1960. The total benefits by way of claims during the period, September 1, 1956 to December 31, 1961, amounted to Rs. 147 crores.

MORTALITY INVESTIGATION:

The Actuarial Department at the Central Office set up, during the year, the necessary machinery for the collection of statistics for the purpose of continuous investigations into the mortality of lives assured with the Corporation. The object of this step is to keep the mortality experience under constant review so as to facilitate the construction of up-to-date mortality tables.

VALUATIONS:

In exercise of the powers conferred by Section 49(2)(k) of the Life Insurance Corporation Act 1956, the Corporation framed regulations, with the prior approval of the Central Government, for the purpose of classification of policies for declaration of differential bonuses, and published the same during the year. These regulations came into force on 15th October, 1961. The bonuses on policies which became claims by death or maturity before this date, were settled on the basis of the provisional classification of policies which was also approved by the Government.

The second biennial valuation of the Corporation's business as at 31st December, 1959, was completed during the year and, as a result thereof, Rs. 24.29 crores were allocated amongst participating policyholders, the rates of reversionary bonus allotted both for policies issued by the Corporation as well as for policies issued by the erstwhile insurers being the same as those declared in respect of the first Valuation as at 31st December, 1957. The amount allocated to the Central Government was Rs. 1.28 crores.

The third biennial Valuation of the Corporation as at 31st December, 1961 is in progress and the results of the same are expected to be available before the end of the year.

BUILDING ACTIVITIES:

We have on hand construction of a large number of buildings to house our offices and also for investment purposes. Although the shortage of building materials has hindered our building activities to some extent, special efforts are being made to complete the various buildings, at different stages of construction, as early as possible. The housing of our offices in our buildings would relieve the present congestion and would lead to more efficient working. It is my idea that the Corporation should have its own buildings for its offices. Suitable plots of land are, therefore, being purchased for our Divisional and Branch office buildings at various centres.

MORTGAGES:

The scheme for grant of loans on mortgage of immovable properties has now been extended to 21 cities. It is expected that an increasing number of property owners would avail of this facility. The scheme for grant of loans to policy holders for construction of houses is being revised with a view to enabling the middle class people to own their homes with the help of loan facilities to be provided by the Corporation. The scheme is to operate in the first instance in 56 cities.

ADMINISTRATIVE AND DEVELOPMENT TRAINING:

I am glad to report that the work of training the administrative staff is progressing satisfactorily, the total number of assistants trained till 31st December, 1961, being 5,597. The Officers' Training College at Nagpur is also doing good and systematic work and has by now trained 741 officers. The effect of this training will, in course of time, be reflected in the increased efficiency of our offices. On the development side too, the training centres are doing useful work. So far 6,617 Development Officers and 10,665 agents have been trained.

I have always received sincere co-operation and valuable advice from my colleagues on the Board and on the Investment Committee. I offer my grateful thanks to them. I take this opportunity to record my appreciation of the services rendered by the officers and staff at all levels. It is their services which have solely contributed to the fine results achieved by the Corporation. Finally, I thank all the agents who have done such excellent work in enabling the Corporation to break its previous records in the matter of our new business.

THE WEEK'S NOTES

Land Acquisition

DRASTIC AND INEQUITABLE

IT IS not in the least surprising that Mr. S. K. Patil's motion for the consideration of the Land Acquisition (Amendment) Bill met with stiff opposition in the Lok Sabha from all the sections of the House, including the Congress benches. Mr. Patil made a bad situation worse and strengthened the apprehensions of the members by his persistent refusal to agree to the suggestion to refer the Bill to a Select Committee. The plea that the Ordinance promulgated before Parliament's monsoon session, which was the occasion for the introduction of the Bill, made it necessary to push the Bill through in this very session, was filmsy and untenable. No legislation fraught with far-reaching or fundamental consequences can be passed in post-haste, whatever the immediate effects of delay on certain parties or interests.

The amendments to Section 40 and 41 of the Land Acquisition Act are intended to circumvent a difficulty created by a recent ruling of the Supreme Court. The Supreme Court has held that compulsory acquisition of private-owned land for the location of a private factory may not necessarily fall within the definition of the term "public purpose" and, therefore, may not be a ground for compulsory acquisition under the Act, attracting all its special benefits including the award of compensation below the market value.

The Amending Bill seeks to bring within the ambit of the term, "public purpose," a private industry essential to the life of the community or likely to promote the economic development of the country. To outward appearances, this amendment may look innocuous and perfectly equitable. In reality, it is not so. It can lend itself to such a flexible interpretation that there are real and grave risks of the abuse of this new power for depriving private land-owners of a reasonable price based on appreciation of land values to which they are entitled. Why should the law favour a private firm likely to make lucrative profits by assisting it to acquire land at low prices, which is what compensation under the Land Acquisition Act usually gives? It is only right that a reasonable quantum much in excess of the normal margin of compensation under compulsory acquisition should be provided for in the Amending Bill. Mr. Patil has found a short-cut whereby the time-consuming procedure of the Select Committee could be eliminated. He has agreed to consult the members of the House to decide upon appropriate modifications to the controversial provisions. This is an issue on which Parliament should not compromise the position which it has so commendably taken.

Algeria

THE DANGEROUS VACUUM

FAILURE TO keep the generals in their proper place is now recoiling on the politicians at a cost which has already paralysed the civilian government and jeopardised the establishment of democracy in Algeria. It was Mr. Ben Khedda's helplessness to meet the challenge implicit in the expulsion of the top army officers and Mr. Ben Bella's complacent reliance on the army in his march to power that laid the foundation of the army's authority on a solid base. True, Mr. Ben Bella made a brave declaration of faith that the civilian government must reign supreme and the army must accept its normal position. But these brave words could not be backed by potential power and Mr. Ben Bella could not be unaware of his weakness. The generals who matter in the strategic zonal regions of Wilaya IV and Wilaya III have accused both the political sides with opportunism and treason. Mr. Ben Bella is now going the way of Mr. Ben Khedda, with a tragic confession that the Political Bureau's writ does not run anywhere in this unhappy land torn by dissension. The immediate and most important consequence of this paralysis of the Political Bureau has been the postponement of Free Algeria's first general election scheduled to be held on September 2, sine die.

The generals' demand for the convening of the Revolutionary Parliament is unlikely to be taken as an earnest solution. Even if it meets, what guaranteee is there that it will not be reduced to a captive status? The truth of the situation is that the generals fell out with the Political Bureau over the key issue of the selection of candidates at the elections and their attitude made it clear that their nominees must be assigned the weight they choose. But going a step anterior to this election affair, what antagonized Wilaya IV and Wilaya III was the perfectly legitimate attempt of Mr. Ben Bella and his Bureau to merge the irregular guerillas in the army in pursuance of the avowed policy of army integration. The guerillas who fought the battle of freedom in Algeria (while the Algerian Liberation Army was stationed in Tunisia and Morocco with very little experience of field action) could not be kept out. A vacuum has been created with the capitulation of Mr. Ben Bella. It is a dangerous vacuum which comes at a critical time when the country is seriously undermined by the exit of the Europeans and the common man is crying aloud for work and bread. How and when will the vacuum be filled?

Upper House

PRINCIPLE, NOT PRESTIGE

AN INTERESTING issue arose in the Rajya Sabha early this week which involves a point of constitutional nicety. Mr. K. C. Reddi, Minister for Commerce and Industry, is due to table a motion in the Lok Sabha that the House recommend the constitution of a committee of ten members to be elected by it to investigate into the working of the public undertakings to judge whether and how far their management conforms to sound business principles and practices. Mr. Reddi is scheduled to move a cognate motion approaching the Rajya Sabha for its concurrence with the proposal to nominate five of its members as associate members on the committee. The inclusion of this item on the agenda of the Lower House, probably for August 29, caused great resentment in the Rajya Sabha and drew all the members, irrespective of party affiliations, together in a united and stiff opposition to this move to relegate the House to a subordinate status. An unequivocal pronouncement was made during the heated discussion on the matter that the House would reject outright the proposal derogatory to its position.

It cannot be said by any stretch of reasoning that tempers rose high in the Rajya Sabha over a ticklish issue of prestige. Clearly a point of constitutional principle is involved here. It is only in money bills that the elders have no final say or authority to stay or modify the bill. The proposed motion clearly does not come within the ambit of this curb on the powers of the House. The very purpose of the constitution of the Upper House is to bring moderation and sober consideration to bear on the actions of the Lower House which are sometimes apt to be the result of haste and excessive zeal. The appointment of Joint Committees of the two Houses is a healthy constitutional practice that is followed in India. The Rajya Sabha stands on a solid constitutional ground when it affirms that it will participate only in a Joint Committee offering it an equal position and under no situation will it entertain the idea of the subordinate associate status.

The World Abroad

WHAT'S WRONG WITH BRITAIN?

By

ODYSSEUS

IT IS THE UNDERLYING THEME of Mr. Anthony Sampson's stimulating new book, "The Anatomy of Britain" (Hodder & Stoughton. London. 1962. 35sh.) that Britain's lack of dynamism, and of a sense of purpose, is basically due to leadership with anachronistic values — the old privileged values of aristocracy, the public schools, Oxford, and the exclusive clubs of London — which upholds a complacent conservatism, resistant to innovation of zeal.

I pointed out here last week that the U.K. is not alone in having an "establishment". Every country has one. What is more, "establishments" have their uses. Mr. J. K. Galbraith's "Affluent Society" attacks the U.S. establishment, but as he justly says: "Few men are unuseful and the man of conventional wisdom is not. Every society must be protected from a too facile flow of thought. In the field of social comment a great stream of intellectual novelties, if all were taken seriously, would be disastrous. Men would be swayed to this action or that; economic and political life would be erratic and rudderless. In the Communist countries, stability of ideas and social purpose is achieved by formal adherence to an officially proclaimed doctrine. In our society, a similar stability is enforced far more informally by the conventional wisdom. Ideas need to be tested by their ability, in combination with events, to overcome inertia and resistance. This inertia and resistance the conventional wisdom provides."

"MASTERS OF MUDDLE"

History suggests, however, that innovation overcomes inertia and resistance more easily in some social structures than in others. Nothing emerges more clearly from Mr. Sampson's brilliantly descriptive pages than that bureaucracy permits "enormous incompetence" which need never come to light. Individuals become blurred in committees, and, says Mr. Sampson, "committees are masters of muddle.... Muddle is the extra unknown personality in any committee."

"It comes from people not doing what they were expected to do or doing what they are not expected to do, or simply not bothering to say they have not done what they were expected to do. It springs from the exchanges of memoranda in which everybody puts his position too strongly, from the conference at which complete agreement is reached and which everyone leaves with a different idea of what has been decided, from the order half understood but instantly executed, from the stand on dignity....

"The most engaging feature of muddle at its best is that it proliferates like yeast in a warm room, and every attempt to explain it gives rise to a new and more complete muddle."

In a modern Welfare or Socialist pattern State, personal responsibility and initiative are bogged down in a swamp of licenses, permits, muddle, and high taxation. Including spending by local authorities, nationalised industries, and the national insurance funds, UK State expenditure is not less than 42 per cent of the gross national product, i.e., no less than 42 of the GNP is spent by committees — the "masters of muddle"!

It is not the philosophies of the public schools and Oxford (after all, not only the Conservative Harold Macmillan and Reginald Maudling, but also the Socialist Hugh Gaitskell and Richard Crossman are public school and Oxford men), which damp innovation in the UK: it is the creeping paralysis of Welfarism, which steadily spreads muddling committees and lower standards. In their important study, "Professional People" (Phoenix House. London.), Roy Lewis and Angus Maude explain how Socialism increases the demand for experts and lowers their financial rewards. Under free enterprise, an increased demand for a service raises the rewards offered and so attracts a greater supply. Not only is this contrary to Socialist doctrine, but since national expenditure cannot be increased indefinitely, the amount that can be spent on government employed servants, doctors, nurses, teachers, scientists, etc., is limited. Socialists do not, however, limit their recruitment of experts to the numbers available for a given cost, because this would limit the range of the benefits promised to the electors. The Socialist solution is to provide the promised quantity of benefits but to lower the quality, and they economise by lowering the real salaries, and therefore the qualifications, of their professional employees by inflating the currency and allowing salaries to lag behind the rising cost of living. In order to enable the proportion of experts in the country to go on rising, they must be recruited from lower and lower levels of ability and intelligence.

Mr. Sampson says that he feels, haunted by the Victorians who invented so many of the U.K.'s existing institutions — regiments, public schools, civic universities, the professional civil service, the political parties, the Prudential Insurance Co.: "their vast and confident buildings and churches .... were monuments to their sense of purpose." Precisely. To have a sense of purpose the individual must see the possibility of achieving something for himself, his family, or his group. This is exactly what the bureaucrats and Socialists prevent him from seeing. Indeed, it has come about that the very custodians themselves of "conventional wisdom" in the UK are those who assume that any new social or economic problem requires a new government department.

MANAGERS OR ENTREPRENEURS?

Mr. Sampson hankers after a managerial elite of professional men in place of the public school and Oxford elite whom he regards as amateurs. Now, in a Welfare or Socialist State, industrial and business managers are salaried men, who inevitably tend to think as civil servants in terms of the "national interest" (i.e., what is politically expedient at the mo-

Prices: India's Unfinished Business

THE debate on prices in the Lok Sabha last week and the indication by Mr. Gulzarilal Nanda, Planning Minister, that the Cabinet would decide on a new policy this week, has naturally left the door wide open to speculation on what urgent, and even hasty, measures may now be produced to arm the country against price rises. It is a fact that the General Index of Wholesale Prices, as well as the cost of living, has risen significantly in the last month. The rise between July 14 and August 11, 1962, was from 128 to 131.8 in the General Index, with the price of the food group alone going up from 128.13 to 132.8. As against a year ago, when the General Index was 128, there has been a rise of about three percentage points in all commodities, and over five in food articles. There is cause enough for concern, although there is a seasonal bulge at this time which has not fully been adjusted in the General Index. The concern on the cost of living is more serious depending on the areas involved. Whereas the all-India figure for June was 130 with 1949=100 as base, the Bombay figure was 148, the Madras City figure 150; Calcutta, for some unknown reason, has been lower at 119. In other words, there are particular centres of pressure in urban areas which reflect more than the usual hardship which is nearly universal. It is right that the country should be deeply concerned about the indication this gives of the deterioration of the standards of living of fixed income groups or lower income groups unprotected by dearness allowances from rising prices. To say that the hardships are great and should be avoided is, however, to express an opinion but not to provide the remedy.

Much of the debate in the Lok Sabha, and practically in all sophisticated circles is a reflection of an emotional revolt with a desire to find a scapegoat without, in fact, providing a working remedy. If one looks at the last copy of the 'Index Number of Wholesale Prices in India' issued by the office of the Economic Adviser to the Government of India, one discovers some curious anomalies. The rise in the General Index of Wholesale Prices as against last year is steep, so far as food articles are concerned, only in three items: 'pulses' where the index has moved up from 91.7 to 112.2; 'milk and ghee' where it has moved from 115.9 to 138.0; and 'sugar and gur' where it has moved from 123.1 to 165.4. The case of pulses is one of a true shortage, because of an unfavourable crop last year; it is conceivable that it might set itself right without a policy. The case of milk and ghee is one which cries out for a special investigation. This is obviously a case where much new management, as in the case of the Delhi Milk Supply Scheme, and co-operative supply as from Aarey and Anand for Bombay, could be introduced over wider areas. The case of sugar and gur is a true scandal, with prices maintained high in spite of a large supply surplus. Here Government controls have operated to maintain prices whilst sufficient controls over middlemen who are profiteering are absent. There must obviously be a drop in retail sugar prices at both ex-factory and intermediate levels. This implies a more realistic policy on cane prices as well as adequate releases, regardless of the pressures of vested interests.

While there is ground enough for complaint on milk and ghee and sugar and gur, there is none on 'industrial raw materials' as a whole which today in the general index sub-group stand at 139.5 against 150.5 a year ago, or in manufactures which stand today at 129.0 as against 127.9 last year. The same is true of 'intermediate products' and 'finished products'. The only items among finished products which have witnessed substantial rise are woollen goods (141.3 now as against 123.1 last year), and silk and rayon (130.8 now as against 118.0 last year). Special investigations need to be undertaken in respect of woollen and silk and rayon articles.

If one excludes these few items where special investigations are required, it appears that a general restrictive policy to control rising prices is far more likely to do injury to production than to assist the main purpose which is to depress prices further. The country has often been misled, not least by discussions in Parliament, on the true elements in a policy of development. Indeed, largely because of the constant protestations of the Government of India that the price line will be held, the people of India have gathered the erroneous impression that the spacious Third Five-Year Plan can be executed without any price rises. This, of course, is a foolish illusion. It is time that a Government responsible for the Plan shook off its habitual slogans and deceptions practised for political purposes, generally referred to as the protection of the people against "vested interests". By and large, there are few vested interests operating in the areas where price rises have taken place. It is quite true some big business houses have an undue share of participation and, therefore, of profit, in India's economic development. But this is not substantially the cause of the price rises to which reference has already been made. It has been pointed that recent price rises are not in the industrial raw material or in the manufactures group as a whole, though there are still a few items where action is required. It is time the country faced the truth, which is that a definite price rise was written into India's Third Plan.

The built-in inflationary pressures in the Third Plan have not been given wide publicity. A concrete study of the results of the large outlays of the Plan, including the elements of taxation, particularly excise duties, proposed for raising additional resources, was prepared eighteen months ago in a brief study presented in the 28th issue of the Quarterly Economic Report of the Indian Institute of Public Opinion. It was there shown that there was likelihood, because of the changes in money supply and the fact that the Plan provided an inadequate cushion of consumer goods, of a price rise of about 26 per cent over the five years. It was shown that this price rise itself would imply a corresponding change in the price of the Plan. If India adhered to the original plan in physical terms, notwithstanding the price rises, and financed three-fourths of the additional outlay by taxation, the total price rise would be of the order of 37 per cent instead of 25 per cent. At the present time, expenditure has been running roughly according to the Plan and according to this calculation we should, indeed, have had a rise of about 10 per cent already. The real

reason why this has not occurred was a remarkably good agricultural year in 1960-61 which cushioned the entire rise for a period of a year. These exceptional circumstances cannot always be repeated. Both 1961-62, particularly in respect of pulses, and 1962-63, possibly in respect of rice, might be unfavourable. One might expect a further rise of 5 per cent to be written into this situation if the Plan is to be pursued without a major cut-back in its physical and financial components.

These are some hard facts which the Indian people will need to face. The Government of India — largely because of the ostrich-like attitude of the Planning Commission—insists on arguing that the Plan can be fulfilled without a rise in prices. This is a falsehood which should no longer be allowed to deceive the Indian people. The truth is that it is intrinsic in the Plan and the pattern of taxation proposed that there will be a rise in prices of between 3 to 5 per cent per year on an average, depending on the agricultural conditions which prevail from year to year. The Central Cabinet of the Indian Union may seem to be invested with supreme political power, but it cannot command the course of prices any more than King Canute could command the waves. The belief that the Central Cabinet has a price policy which can master the price situation is, of course, one of the great superstitions which the Central Cabinet has done more than any single element in the country assiduously to perpetuate.

Prices, therefore, remain India's unfinished business. It is vital that everything should be done to control prices by assisting production and productivity which are, in the long run, the major elements in price control as they are of welfare and of financial resources. The idea that by administrative action one can prevent prices from rising in spite of short production and abundant money is too patently absurd to be argued in any society with understanding of the issues involved. It is not the path of honour because it is based on a fundamental deception, which should be the prime purpose of public policy to destroy. What is vital at this time is that the Indian people should be told the truth in regard to the Plans for development and the price that is necessarily entailed therefor. If they are unwilling to pay the price for any reason, the Plan will need to be curtailed according to the hardship which the people can bear. This is a psychological, and not an economic, test. It is time that the Indian people faced squarely their own destiny which is that of free men choosing the financial burdens for themselves for the benefit of generations still unborn.

Land Acquisition for Companies

FEW legislative bills have provoked a controversy of the first magnitude and drawn all the sections of the House together in united opposition as the Land Acquisition (Amendment) Bill introduced in the Lok Sabha. Mr. S. K. Patil, who piloted the Bill, far from being allowed to retain the initiative in the discussion, was put on the defensive throughout the entire proceedings. At each stage the mover of the Bill had to yield ground in what he termed respectful submission to the profound feeling of the House on the subject.

It would appear that the deeper implications of the amendments proposed in the Bill were not either realised or properly weighed by the Government, which seems to have taken the view that it was a harmless enabling measure, necessary to meet the changed situation in the contingencies that would call for compulsory acquisition of agricultural land. Acquisition of land for companies is provided for in Sections 40 and 41 of the Land Acquisition Act, but a ruling of the Supreme Court given in December last year put a very strict restriction on the circumstances under which such acquisition could be made by the Government. There the Supreme Court ruled that an indispensable test of the validity of the acquisition would lie in the right of the public to use the constructional work for which the acquisition is made for its benefits, according to the circumstances of the individual case. Quite clearly, this ruling made it virtually impossible for land to be acquired for private companies for ordinary industrial use.

The effect of this ruling would have been altogether upsetting in the case of a large number of acquisitions which have been made in the different States and a spate of litigation would have caused considerable disturbance to the existence of established industrial units. To tide over the difficulty, an ordinance was promulgated on July 20, 1962, to validate the acquisitions which did not satisfy the test laid down in the ruling of the Supreme Court. It was incumbent on the Government to replace the ordinance by an Act of Parliament in the current monsoon session in the absence of which it would have lapsed and the situation would have been restored to the point of emergency created by the Supreme Court's ruling.

With this background the Government seems to have come to the conclusion that the passage of the Act in the current session of Parliament was inescapable, and, therefore, the amendments should aim at removing the disability, so to say, imposed by the decision of the Supreme Court. Thus it was that a very restricted and narrow view of the Amendment Bill was taken in the context of the expediency. But in reality the seemingly innocuous amendment was fraught with very significant and far-reaching consequences. It was these consequences which weighed with the Members of the Lower House and led to a concerted demand that the clauses of the Bill should be thrashed out fully and recast to prevent any likely hardship and injustice to the displaced agriculturists.

Much of the debate on the Bill was surcharged with undue emotion from both sides. On the one hand, the view-point was vigorously pressed that, if compulsory acquisition was not facilitated by the Amendment Bill as envisaged, industry would have to face a very difficult situation and in quite a large number of cases the very progress of the projected units would be seriously retarded. Its cumulative effect would be to slow down the pace of industrialisation to the detriment of the economy. On the other side, serious apprehensions were raised that wholesale acquisition of agricultural land at low prices and on an indiscriminate scale would drive agrarian discontent deep underground and an explosive situation might be created. Both these view-points were out and out exaggerated out of all proportion to the likely reality of the emerging situation. The basic fact is that the location of industry in future is bound to be diverted to the areas in the vicinity of cities and towns and also in the countryside where transport and other resources are conducive to their growth. But the spread of industry in the semi-urban and rural areas is certainly not going to change radically their cost structure.

Furthermore, it is an accepted fact that rapid industrialisation is absolutely essential to relieve the lopsided pressure on land and restore a proper occupational equilibrium in the economy. This transition, of course, is not without its hardships and sometimes even painful effects. But in the process of economic growth it is an essential phase. It is in this rational spirit that the necessity of the liberalisation of the legal provisions for compulsory acquisition of agricultural land needed to be considered. If such a view had been adopted, the area of divergence of view-points would have been considerably narrowed down.

The compulsion of having to pass the Bill in all its stages in the present session of Parliament itself ruled out the possibility of a reference of the Bill to the Select Committee. But a *modus vivendi* was devised by Mr. S. K. Patil to provide a substitute for the instrumentality of the Select Committee. The consideration of the Bill was postponed for about ten days, during which time there were consultations between the Minister and a small ad hoc committee representing the united opposition. When the debate was resumed after the interval, it transpired that the opposition had become stiffer by reason of the fact that the House took the view that the amendments proposed by Mr. Patil were calculated to confer blanket powers on the State Governments.

His amendments, in short, purported to enable acquisition to be made for a company if its activity was essential for the life of the community or it was likely to promote the economic development of the country or otherwise it was in the public interest. Any industry can certainly be regarded as promoting the economic development of the country and the term "public interest," in the absence of any precise definition in the Bill, would be stretched to include a wide range of objects. Unfortunately, the State Governments have shown hitherto a callous disregard for the interest of the land-owners in administering their powers of compulsory acquisition of land and some typical illustrations of this attitude were cogently pointed out. The objection to these amendments was that, the State Governments being what they are, the situation would be made much more worse than before for the land-owners.

It was quite obvious that the acceptance of fresh amendments proposed by the Members of the House was the only way to secure the passage of the Bill. Practically all the amendments were accepted by Mr. Patil with the solitary exception of the one disqualifying all privately owned companies from the benefit of compulsory acquisition. Acquisitions of agricultural land are to be justified on the ground of "public purpose"—a term with a clearly defined legal meaning. How the test of "public purpose" will be fitted into the requirement of acquisition of land for a variety of industrial firms will remain to be watched over time. The law on this elusive subject cannot, of course, be made foolproof, but the loopholes can certainly be plugged by rules made from time to time as they come to notice.

The most significant provision incorporated in the Bill is about the withdrawal of the rule-making power from the State Governments and placing it in the hands of the Central Government. The rules made or revised are to be placed before both the Houses of Parliament which will exercise the right to get them suitably modified. These rules are intended to safeguard the interests of the land-owner and also to provide for his rehabilitation either by means of offer of alternative plots of land or by offer of shares in the company or employment in the company. Mr. Patil gave the House the assurance that high grade agricultural land will not be acquired for siting industrial units as far as possible. But members were prompt in reminding him that this was a promise which the Government would find extremely difficult to fulfil. The best that could be done in the situation has been incorporated in the Bill. Any shortcomings that will be disclosed by its implementation can be rectified when the comprehensive Bill to bring about the overhaul of the Land Acquisition Act of 1894 is placed before the House as announced on behalf of the Government.

The State Loans

ALTHOUGH the fourteen State loans, aggregating a total amount of Rs. 93.50 crores, floated last week, were fully subscribed within three days — eight of them were even over-subscribed — and cash subscriptions at Rs. 104.27 crores were substantially higher than Rs. 87.05 crores last year when the total amount called for was Rs. 80 crores, evoking optimism about the fulfilment of the target set in the Third Plan for the borrowing programme of the State Governments, the response to the State loans this year can hardly be described as anything spectacular. This inference is based on the fact that not only the money market conditions this year were more propitious than last year, there were two additional factors which should have been reflected in this response to the State loans in a far more impressive manner. Firstly, the interest rates on the new State loans were made more attractive in the sense that they all provided higher yields. Secondly, asking the commercial banks to increase their liquidity ratios should have prompted them to go in for State securities, gilt-edged as they are known, in a greater measure than hitherto. The support from the Life Insurance Corporation and the Provident Fund Accounts could have been expected to be more encouraging in view of the record business done by L.I.C. last year and the steadily growing application of the Provident Fund Act to more industries and trades.

Another fact that illustrates the not-so-very-encouraging response to the State loans is the amount of maturing securities offered by the holders for conversion into new loans. Although the total amount of maturing loans was larger this year at Rs. 15.60 crores, as against Rs. 12.88 crores in 1961-62, actual conversions were lower at Rs. 4.73 crores, as against Rs. 4.95 crores last year. This is an intriguing phenomenon in view of the stepping up of the interest rates this year. The only explanation that has been offered for this curious development is that although the rates of interest offered were higher, the increase was by no means substantial in the prevailing context of the falling value of the rupee, on the one hand, and the growing demand for funds for trade and industrial purposes, on the other. Does it imply that there is a case for further upgrading of the interest rates on Government loans?

Mention must also be made here of another interesting development in the States' borrowing programmes in the recent years and this has been

(Continued on page 441)

A DELHI DIARY

GUIDED DEMOCRACY

I AM abandoning this week a description of my international tour to concentrate on events much nearer home. Throughout the week interest in Delhi has concentrated on a wholly unexpected windfall in the form of both views and news coming in bursts from Jakarta. The extraordinary events which seem to have occurred need not and, indeed, cannot be described in full here. Everyone knows the climax was the wrecking of the Indian Embassy at Jakarta pretty substantially although the Indonesian claim is that only the reception room was damaged. But the pursuit of the person of Mr. G. D. Sondhi is not denied, though he received, it seems, a parcel of mangoes from some well-wishing Minister speeding his departure. He seems to have leapt into fame on a wicket on which he had never bowled previously. All this seems to show that history has a particularly fickle way of behaving, both in respect of men and in respect of countries. As far as I can see from the Prime Minister's statement the Indian Government has been deeply pained by the campaign of extremism which seems to have run pretty heavily through responsible quarters in Indonesia. The Prime Minister described the attack on the Indian Embassy as "highly deplorable and distressing," and mentioned, innocently enough, while 'normally in Indonesia processions could not be organised without the prior knowledge of the Government', this one seems to have got by pretty easily. The Prime Minister also said in reply to a question that he did not think what Mr. Sondhi had said constituted an affront to President Soekarno. Very few people in India disagree with the Prime Minister, and everyone wants to be friendly with Indonesia. I expect, however, that something deep below the surface exists on both sides. Can it be that while we are for personal expression of opinion even when in error, Indonesia is not. This is probably, for those who do not know it, the essence of guided democracy.

THE ASIAN GAMES

I am sorry to say that I am in no position to describe Mr. G. D. Sondhi who has suddenly appeared in my horizon of awareness on the basis of the slings and arrows with which Outrageous Fortune has visited him. I am told he is a remarkably calm and patient gentleman who smokes the pipe of peace and resides in Simla, happily outside turmoil of Indian politics. How he managed to get into this particular battle is explained by the fact that history without giving him any warning projected him into the role of the Vice-President of the Organizing Committee of the Asian Games. I now recognize how dangerous it is to allow oneself to slip into high responsibility even if one is only visiting a neutral country. Apparently, the great thing about neutrality is that it must not only be dynamically neutral, but relatively silent. This, of course, has never been India's policy, but only the Prime Minister can play the troubled game of international politics in a truly dynamically neutral way. For Mr. Sondhi and for myself true neutrality, meaning silence, seems much the happier way. For the moment, I reproduce one of the two cartoons by which my naughty cartoonist desired to explain the situation. I take no responsibility for the wildness of my cartoonist's exuberations.

POSTSCRIPT ON THE ASIAN GAMES?

Should one not institute a great name like the 'Ashes' to describe our international performance in hockey over the last two years? The Ashes, it seems, have now passed to Pakistan. When will they return?

DUSAN KVEDER

I leave the Asian Games (not very reluctantly!) to pay a tribute to a great Plenipotentiary of a very friendly country. I refer to Dusan Kveder, Ambassador of Yugoslavia in New Delhi who left, they say, for good this week. The Ambassador and Mrs. Kveder have over the last four years carved a place for themselves in Delhi society which is almost unique. They had the widest circle of friends, going far beyond their immediate diplomatic interests. Their personal attraction and charm added to super diplomatic gifts has enabled almost every aspect of Indo-Yugoslav relations to benefit exceedingly. Very few, even amongst their friends know of their distinction in their own country.

Dusan Kveder was the youngest Field Marshal, I believe, in the world at any time in its long exacting military history. He became a Field Marshal at 25, holding charge of the Western front in Yugoslavia during World War II. I happened to have seen a good deal of the area over which the young Field Marshal reigned almost supreme, leading the Yugoslav guerillas against the enemy throughout the War. His problems were immense since he was without supplies for the most part and his personal staff had to be carefully chosen because of the live possibility of a Fifth Column at every moment. The attack had to be on both fronts against the Germans in Serbia as well as the Italians in Trieste. It was not an accident that, fighting shoulder to shoulder with Marshal Tito, he became one of his lasting friends.

This is the time also to pay tribute not only to Dusan Kveder, but to his great predecessors, Joze Vilfan and Crnobrnja. It seems a law of nature that Ambassadors from India become Secretary-General of the President of Yugoslavia. Will this be the destiny of Dusan Kveder? I might add that Mrs. Kveder is ranked in Yugoslavia as the foremost and most skilful translator in the world. She interpreted for Jawaharlal Nehru when he visited Yugoslavia and I heard reports from everywhere that almost every sentence drew applause. I dare to say that much of it was due to the interpretor! She could put magic into words.

ARGUS

What a Life!

"We found him standing there and not throwing stones at the Indian Embassy, Sir!"

THE WEEK'S NOTES

The Economy

WORLD BANK'S VIEW

OF THE WORLD BANK'S periodical surveys of the progress of the economies of the beneficiary countries, it cannot in fairness be said that they are of a formal, routine character made in compliance with its procedure. There is much more in them than this superficial view may purport to convey. The Bank's teams of experts, chosen with an eye on the special problems of the individual countries, have never deflected from their duty to be as critical in expressing their views as they are sympathetic in understanding the forces operating behind the working of the individual economy. The team which was sent to India early this year had to be more penetrating in its assessment of the progress of the economy in view of the emergence of a phase of stagnation, implying a flattening out of its pace. It could not be expected to accept at face value the commonplace explanation, so repeatedly publicised, that at the root of the stagnation lay the persistence of the shortage of foreign exchange attributable to causes beyond the strict control of the nation's Government.

Some precious little which has percolated to the Press from the team's draft report remitted to the Government confirms the criticism of the Government for lack of vigilance and energetic drive in the pace of the utilisation of foreign aid, granting that the legislative procedure in the aid-giving countries and the procedure involved in concluding the project agreements consume considerable time. Even so, the Bank's team has put its finger firmly on the lapses on the part of the Government of India in its failure to speed up the use of the approved amounts of aid. This is stressed as one vital factor contributing to the effective shortage of foreign exchange. There is yet another contributory factor of effective shortage on which it has again put its finger. The reference in this second context is to the persistence of idle capacity in several industries, particularly in the category of the engineering industries, arising allegedly from the inadequacy of maintenance imports. The team is reported to have questioned the propriety of expending foreign exchange on new projects in the same industry when the existing one was not being fully exploited. The current earnings of foreign exchange are critically reviewed to be below what an energetic drive for export promotion can secure. A more determined promotion technique is urged which throws up a challenge to the Department of International Trade set up after the expiry of the period covered by the review.

Mr. Gulzari Lal Nanda, replying to the Lok Sabha debate on the shortages in the Third Plan, made an assertion about throw-forward of a quantum of foreign aid from one Plan period to the next, which reveals a disturbing trend in the thinking of the Planning Commission and the Government. He referred to the carry-over of some Rs. 400 crores from the Second Plan to the present one and on the assumption of the inevitability of a carry-over of this order, he made the assertion that if Rs. 2,600 crores worth of external assistance by way of actual receipts is essential for the Third Plan, the commitments ought to be higher by at least Rs. 400 crores representing the margin for the carry-over. The fact of carry-over need not be disputed. But must it be on the scale which the Planning Minister takes for granted? The World Bank's critical observation on non-utilisation should force serious revised thoughts on this issue.

Singapore

SIGNIFICANCE OF VERDICT

SINGAPORE HAS given its verdict for merger in the Federation of Malaysia by a significant vote which has taken even Prime Minister Lee Kuan Yew and his People's Action Party by surprise. The verdict came after the referendum held in graceful deference to the wishes of the Opposition parties. The agreement on merger entered into between the Prime Ministers of Malaya and Singapore was endorsed by the legislature of the latter and in strict constitutional propriety this would have been a good sanction for merger. But the majority of the ruling party in the legislature rests on a narrow margin and it was the contention of the Opposition parties that an open appeal by way of a referendum was the really equitable mode to settle this momentous issue. It has now been settled.

A point of criticism or grievance that has been made out is that there was no choice allowed at the referendum for outright rejection of merger. On a closer look at the division in voting it would be apparent that this contention is without force. The three options allowed at the vote were (a) merger with autonomy in respect of education and labour, (b) unconditional merger and (c) merger on the pattern that will be decided by the Constitutional Committee for the remaining three units in the course of next few months. The Barisan Socialist Party, which was so confident of the anti-merger majority, devised a fourth option, so to say, by campaigning forcefully for casting blank votes which could be interpreted as disapproval of the merger, if not rejection in the constitutional sense. The difference is technical, though vital. The real test is: how many cast blank votes to give vent to their anti-merger verdict? They were a little over 144,000 in a total electorate of 624,000. Of the 85 per cent votes polled, the blank votes amounted to 25 per cent. Over 397,600 voted for the first option of merger with autonomy, while the second and their options got a poor 9,000 and 8,000. The 25 per cent blank votes need more analysis. The Barisan Socialists are composed almost entirely of citizens of Chinese origin and the blank votes go to their group. But the Chinese constitute something like 75 per cent of Singapore's population. It is obvious that an overwhelming majority of the Chinese resisted the anti-merger appeal and have made up their minds to cast their lot with the people of the greater Federation of Malaysia. This is an encouraging trend that has emerged from the referendum.

Parliamentary Democracy

FLOUTING THE CHAIR

FRIDAY, AUGUST 31, turned to be a sad day in the monsoon session of the Third Lok Sabha. On that day, Mr. Ram Sewak Yadav, leader of the Socialist group in the House, freely (and unashamedly) indulged in acts of rowdyism and in the process disrupted the proceedings of the House for full fifteen minutes. He persisted in this unseemly behaviour challenging the ruling of the Chair in disallowing his adjournment motion over the floods in UP, Bihar and Assam. His grievance was that the Chair had acted improperly in not allowing his adjournment motion on a subject of great concern, while an adjournment motion on a railway accident that occurred the previous day was allowed. Possibly, the Chair's ruling was influenced by the consideration that railways being the responsibility of the Central Government and the occurrence of railway accidents in the recent past having taken place repeatedly on an unusual scale, this adjournment motion

needed to be discussed. Similar considerations — particularly absence of direct and exclusive responsibility of the Centre — did not arise in the case of Mr. Yadav's motion and, therefore, it was disallowed. Once the Chair's ruling is given, there must be respectful submission to it; it cannot be challenged, whatever the views of the individual members about its propriety. Mr. Yadav disregarded this elementary but fundamental rule of parliamentary procedure and flouted the authority of the Chair by persistently challenging it. On being named and suspended for one day, he refused to leave the House. On the motion of the Minister for Parliamentary Affairs the House suspended him for a week. His behaviour was disgraceful.

The Socialist Party members have earned the disrepute of creating scenes of rowdyism and inviting expulsion from the legislatures in Madhya Pradesh and Uttar Pradesh since the last general elections. They are doing a great disservice not only to the Party but to the cause of parliamentary democracy. In UP after the sheer inability of the Marshal to remove the suspended member of the Legislative Assembly, the services of the police were requisitioned for the purpose. The use of the police inside the precincts of the legislature was resented by the members and the propriety of this course was seriously questioned. True, it was an unfortunate step to take. But had the members any alternative to suggest to meet such an exigency? Frustration and intolerance lie at the root of the misbehaviour of this type. But no party which defies the rudimentary rules of discipline can qualify itself for the electorates' approbation. On Monday this week, the unblemished record of the Rajya Sabha was marred by a Socialist member, Mr. G. Mara Hari, by defying the Chair. By unanimous consent he was suspended from the Upper House for the rest of the session. It is to be trusted that the responsible leadership of the Socialist Party will make a deep heart-searching and mend the ways in which their members are indulging — by design as the public has good reason to suspect.

Asian Games

A SHAMELESS TWIST

NO WORDS can be too strong for the condemnation of the organisers of the demonstration, more than 2,000 strong, which marched on the Indian Embassy at Jakarata on Monday this week, smashed window panes and furniture and inflicted still more damage on the property at the chancery. These organizers were none others than members of the Jakarta branch of the Indonesian National Front, the all-party movement sponsored by President Soekarno. What was all the more reprehensible was the dastardly attempt made by some among the rabble to pull down the Indian national flag, which, however, was energetically foiled. All this was intended for the so-called mission of presenting a memorandum of protest to the Indian Embassy against the proposal of Mr. G. D. Sondhi, Senior Vice-President of the Asian Games Federation, to change the name of the Fourth Asian Games, with which the Indian Government had nothing to do. The army men who accompanied the demonstrators at the head could have prevented the ugly development, but they did not. A mile long procession could not be organized without careful planning. This was a disgraceful exhibition of the intrusion of politics in sports and also an exhibition of hyper-sensitivity.

The facts of the episode, which have been twisted and distorted by Indonesia, are plain enough. It is an issue of sports, pure and simple, and ought to be decided in the real sportsmanlike spirit. Politics does not enter into it on merit and ought not to have been imported by the Indonesians. Israel and Taiwan are members of the Asian Games Federation and as such an invitation ought to have been extended to them to participate in the celebration at Jakarta. The Council of the Asian Games Federation rightly censured the Indonesian Olympic Committee for breach of the Olympic Code in not extending the invitation to the two countries. The Indonesian Olympic Committee pleaded that it did its duty in this behalf, but could not succeed. By implication, the attitude of the Indonesian Government in bypassing this issue by evasive tactics was responsible for the exclusion of the two countries. The naked truth is that the Indonesian Government was afraid of hurting the susceptibilities of China and the Arab countries. If Mr. Sondhi moved the proposal that, in case the unjustified exclusion is to stand, the name of the Fourth Asian Games at Jakarta ought to be changed, he was not only right but discharging his duty as a responsible office-bearer in an upright manner. No insult whatsoever could be conceived by any stretch of reasoning either to the Head of the Indonesian State or to the Government of Indonesia. But it was presumed. Was this not a blatant case of a guilty conscience? Dr. Soeharto, Indonesia's Minister for Trade, poured his wrath with the threat that the trade agreement between the two countries would not be renewed. Subsequently, however, Dr. Subandrio, the Foreign Minister, gave an assurance of maintaining friendly relations with India intact. Mr. Sondhi acted impartially, and fearlessly. Dr. Shrimali, the Indian Education Minister, did the right thing in emphasising in the Lok Sabha that "we cannot disown him" and thus made amends for the Government's earlier vacillating attitude.

Mr Krishna Menon

TWO FREEDOMS

MR. V. K. KRISHNA MENON has given a unique proof of his conception of intellectual freedom and freedom of speech. The occasion was his address at the Planning Forum of the Dayal Singh College in the capital city on September 3. Mr. Krishna Menon apparently thinks that his peculiar freedom of speech extends to casting serious doubts on the agreed decisions or atitudes adopted by the Cabinet of which he is a senior and important member. The Finance Minister, apart from other Ministers, has given unequivocal and assertive expression to the view that the European Common Market is to be welcomed as a force for the acceleration of the trade of the underdeveloped countries in course of time. India expects at its hands a fair treatment in her trade relations. But Mr. Krishna Menon proclaimed before his young audience that the ECM was an instrument of the cold war, representing the economic counterpart of NATO. Can such contradictory attitudes be entertained consistently with the functioning of the Cabinet system of Government? Now that Russia has taken the lead in consolidating and energising the Comecon, would Mr. Krishna Menon, with his sense of balanced assessment, tarnish the Comecon with the same brush as he has used for the ECM?

Mr. Krishna Menon welcomed the opportunities to speak at academic gatherings since they gave him scope to exercise his intellectual freedom — a scope which is practically denied to him by his pre-occupations with ministerial responsibilities. Significantly, he expounded his remark by asserting that most of his time as a Minister was taken up by "thinking, talking and discussing" subjects like Kashmir, colonialism and disarmament. The conspicuous omission in this list of pre-occupations is China. It is incredible how the Defence Minister tries to underrate the danger from China. Only a few hours earlier Mr. Krishna Menon was rudely heckled in the Lok Sabha for his calculated and cultivated technique of giving the unavoidable minimum of information about China's recurring fresh aggressive moves on the northern frontier.

The World Abroad

STAGE COACHES V. RAILWAYS

By

ODYSSEUS

HOW to speed the economy's growth rate is the question of the day.

Real explosive growth, like that of mid-nineteen century Britain, or of France, Germany, and Italy in the 1950's, does not spring primarily from increasing investment in response to internal consumer demand in the established industries. Additional income so generated (a) is likely to increase the demand for imports, (b) will not stimulate foreign demand for exports, and (c) may divert exportable goods into the home markets. As the American economists M. Abramovitz and R. M. Solow have estimated by statistical analysis, real growth springs from investment in new technologies, particularly those which raise productivity in exportable goods and services. The balance of payments benefits and wealth is multiplied both at home and abroad. Many who accept these ideas as abstract propositions recoil from their concrete application to the contemporary textile, coal, or railway "Establishments." "Ah! That's different!" they exclaim.

Very well. Let us recall—all passion spent—the case history of the biggest single stride in growth that the UK ever took—the inauguration of the railways in the 1830's when the stage coach was at its zenith.

In 1839, 9,388 persons were licensed to hire out post horses, there were 3,632 stage coaches, 2,619 coachmen and guards, and 1,116 turnpikes, which raised £1,532,956 in tolls from 22,000 miles of roads. With frequent changes of relay-horses, carried out to the split second by precision drill, speeds had been raised from 4 miles per hour in the 18th century to swaying, spanking averages of 7 to 10½ miles per hour.

Yet within five years or so, technological advance, in the shape of the railways, had driven virtually every coach from the roads, and the turnpike trusts were £9 millions in debt. Several thousand coach proprietors, coachmen, guards, booking clerks, and others, had to look for new jobs.

TECHNOLOGICAL ADVANCE

The first serious warning of trouble had come in 1830 when the Liverpool and Manchester railway had been opened. Before this, twenty coaches a day had plied between the two cities, carrying 108,000 passengers a year. But within the railway's first year, it carried 460,000 passengers at twice the speed and half the price, and all the stage coaches had gone. A journey by stage coach from London to Edinburgh cost £10-10 (excluding meals on the road) and took up to forty-five hours. By train it would cost £2, would at first take less than half, and, within a few years, less than a third, of the time.

The coach proprietors petitioned Parliament to reject all applications to build railways. They bemoaned the destruction of "our turnpike roads—the admiration and wonder of Europe—the abandonment of old inns, and the extermination of our noble race of horses." They agitated for the repeal of the taxes on coaches. These taxes, complicated and unsystematic accretions from a long past, were admittedly heavy, and compared with the straight-forward, and light, railway mileage duty (one eighth of a penny per passenger per mile) they constituted an unanswerable case of discrimination. In 1840, when the penny post was introduced, eighty-six mail contractors and stage coach proprietors protested that the GPO should not be allowed to inaugurate a cheap parcel post and so compete with a most lucrative side of their business. They appealed to the House of Commons for tax relief "to protect the large capital embarked in the old mode of conveyance." By 1843, however, only eleven mail coaches a day were setting out for the provinces from the GPO, compared with 80 of a few years earlier.

Parliament, dominated by the ideas of Adam Smith's "Wealth of Nations," was deaf to the opposition to the railways of canal companies, turnpike trusts, landlords, and coach proprietors. Between 1845 and 1847 Parliament sanctioned the investment of £227 million in 7,000 miles of railway. This amounted to an annual investment rate of 25 per cent of the national income (according to a contemporary estimate).

INCREDIBLE GROWTH

These millions invested in the new technology triggered a quarter of a century of incredible growth, which consolidated Britain as the workshop of the world. By multiplying the demand for labour, by opening wide new markets to agricultural products, by creating the export trade in coal, as well as in locomotives and railways themselves, and by lifting the iron and steel industries onto an altogether higher plane, the railways transformed Britain's economy.

Was this transformation built on the misery of the thousands engaged in the coaching industry? It is true that the railways killed the long distance coach, but they proliferated horse-drawn traffic. The number of coaches, cabs, and parcels collection and delivery vans, feeding the new railway stations employed more vehicles, coachmen, and horses, than the old system. Adaptable carriers like Pickfords (a 1962 survival of the pre-railway era) signed contracts with the railways. William Chaplin, who owned 70 coaches and 4,500 horses, was a man of vision. At the age of 51, he sold his coaches on routes where railways were being built and invested the proceeds — in railways. He ended his days as chairman of the London and South Western Railway. The terms "railway booking clerk" and "guard" are reminders that the coach booking clerks and guards, were, as skilled workers, mostly absorbed by the railways. The owners and employees of country inns suffered eclipse until motor cars restored their prosperity, but the old inns were killed not by the railways but by the speeds attained by the early 19th century coaches on Macadam's new road surfaces. Against this, the railways boosted the catering industry by opening up new buffets and station hotels all over the country.

STAGE COACH ITSELF A PIONEER

In their own day, the stage coaches had themselves constituted technological advance. They put the 17th century pack horse owners out of business. As far back as 1673, innkeepers were protesting that they would be ruined unless the new stage coaches, which rushed past their doors at 4 miles per hour, were suppressed in favour of the established system of pack horses, which

ambled along at a sensible rate that compelled travellers to stop to eat and sleep on the way. Instead of one horse per traveller, the coaches used four horses per ten travellers; horse breeders said the race of horses would be destroyed. Whereas pack horse riders arrived wet and mudstained, coach passengers arrived dry and clean; clothiers asserted that 100,000 of their number would be "deprived totally of bread."

The period after the Napoleonic wars up to about 1830 was one of stagnation and adjustment. The turn of the tide came gradually with the railways. Between 1846 and 1850, when the population was 19,000,000 and existing factory workers numbered 600,000, the railways created 600,000 'new' jobs.

What would have happened if the 19th century opposition to the railways had been as vocal, well organised and sympathetically heard, as are the opponents of change in the British coal and railway industries today? It is difficult to believe that the coach proprietors' demand that no further railways be sanctioned would have been granted, but sanctions might have been fewer and farther between; the coaches might have been relieved of all taxes, as they asked; and a tax (similar to the £2 a ton imposed on oil in 1961 for the benefit of coal) might have slowed the progress of the railways for the benefit of the coaches. The period of adaptation, instead of being short and largely painless, would have been long drawn out. The growth rate of the whole economy would have been slowed to the detriment of all. Indeed, the delay might conceivably have enabled France or Germany to become the workshop of the world by getting ahead of Britain in exploiting the new technology.

The moral is not that workers should be thrown out of jobs without adequate compensation or rehabilitation, but that real growth, with its corollary, a favourable balance of payments, is unlikely unless technological advance is welcomed, cordially and positively.

IMPORTANT STATISTICAL SOURCES

Two publications, which have recently come across my desk, which should be of particular value to economists, leader writers, reference libraries, banks, and business economic intelligence units, are the "United Nations Statistical Year Book for 1961", obtainable in India from Orient Longmans, and "The West German Economy", published by the Deutsches Industrieinstitut, Cologne. The "United Nations Year Book" provides 186 tables covering the population, manpower, production indices, agriculture, forestry, fishing, mining, quarrying, manufacturing, construction, power, consumption, transport, communications, finance, housing, education, and social statistics of all UN member countries, and is one of the most impressive statistical compilations yet attempted.

Besides general chapters covering all aspects of the economy, the West German handbook has 107 statistical tables covering population, employment, agriculture, industry, foreign trade, commerce, communications, prices, consumption, finance, East Germany, and a useful series of international comparisons of economic data in various countries.

In my own work, I find both these publications invaluable.

Let not your Tax problems tax you any more.

GUIDE TO INCOME TAX ACT

by

A. Ramaiya

(author of Guide to Companies Act)

The object of this book is to make available to the Income-tax assessees and their advisers, Chartered Accountants and Lawyers, a reliable Guide to the Income-tax Act and hand-book of easy reference on the Act.

The book contains explanatory notes, which will facilitate easy understanding of the provisions, and comments which will be found to be helpful in solving tax problems.

The provisions of the new Act have to be interpreted in their own language and on the back-ground of the basic material on which they are based. As the Act is a new Act, there is not much scope for citation of judicial decisions as authority for the interpretation of the new Act. Wherever there is room for interpretation the author has expressed his views clearly and these are bound to provoke further thought.

Here is a valuable book for your table which will solve many of your tax problems.

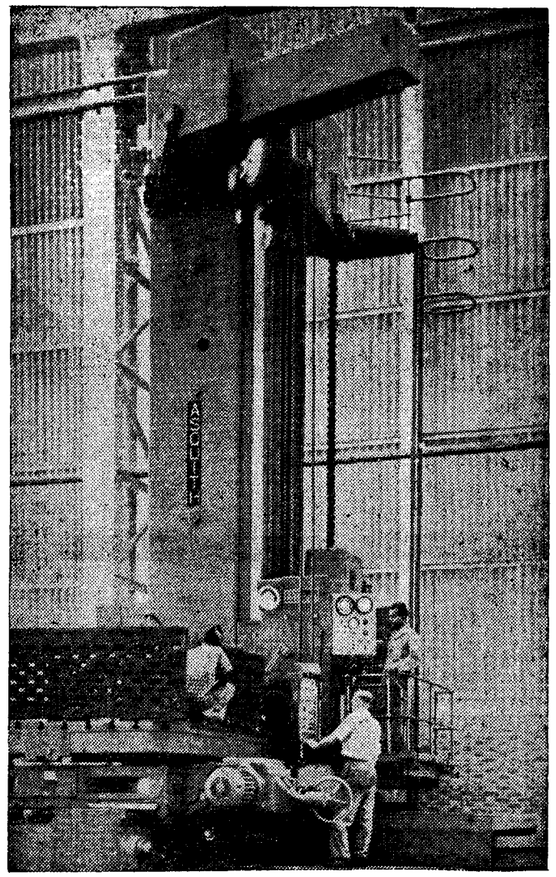
The Third Five Year Plan
Bird-Heilgers' part in it...

FOURTEEN MILLION NEW JOBS

Employment. A word that translates into a meaningful future for millions of people without jobs. India's Five Year Plans are aimed at the concept of full employment. The intensified drives of the Third Plan are estimated to create 14,000,000 new job opportunities—more jobs for more people than ever before in the economy's history! To achieve the employment target calls for a single-minded national effort. It must be co-ordinated, dedicated, complete...

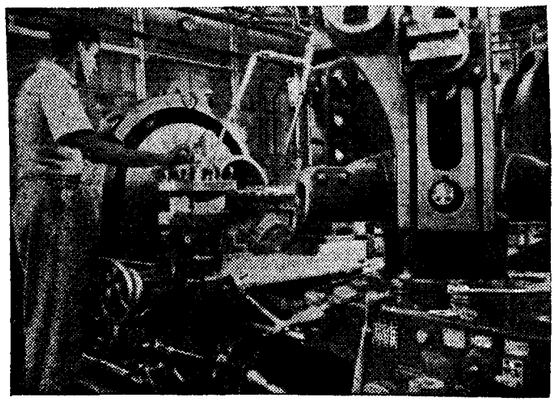
75,000 jobs—and more in the offing

Bird-Heilgers is convinced that the quickening tempo of industrial activity must be accelerated if unemployment is to be checked and full employment brought about. Wedded to this concept, the group provides well-paid employment for approximately 75,000 people. They are concerned with iron ore and insurance policies, bridges and writing paper, gunny sacks and laboratory tests—a complex of goods and services which involves the group heavily in the industrial resurgence of India.



Towards a *self-generating* economy...

A phrase on everyone's lips. A phrase that finds concrete expression in the urgent activity of an economy on the move. Bird-Heilgers reflects the nation's striving. The group delivers millions of tons of basic materials to the new blast furnaces. It produces jute goods, paper and board, air compressors and springs, and engineering and water treatment equipment. A project for the manufacture of coal washeries was the first in India. Planned diversification finds the group engaged in shipping, insurance, exporting and importing. Its agency department handles everything from heavy capital equipment to light consumer goods.



...and an exciting, promising future

The Five Year Plans are a challenge: existing industries must expand, new industries open up, per capita income increase. India needs more goods and services than ever before. Bird-Heilgers is alive to the problems of a growing economy. The group deploys the full potential of a century's resources, technical knowledge and executive skill to increase and broaden its activities...provide employment for many more thousands...join the national drive to economic independence.

6" spindle ram-type horizontal mill and boring machine

No. 14/36 combination turret lathe installed in the AVB light machine shop

The
REAL POWER
of AVB...

Vast Technical Resources...
Modern Workshops...

Immensely rich in experience and technical knowledge, with modern workshops equipped with some of the world's most up-to-date machine tools... here is the *real power* of AVB. The essential combination to generate *real industrial power.*

This real power and potential of AVB will give added impetus to the continued and large-scale expansion of industry... by providing the finest facilities for the manufacture of high pressure steam-raising plant and pressure vessels and heavy machinery for the cement-making and mining industries.

Among the modern machine tools in the AVB workshops are

1. **6" ram-type horizontal mill and boring machine:** This machine has a vertical movement of 14 6" and a horizontal movement of 20' and is the largest of its kind in India
2. **Numerous capstan and turret lathes:** Upto 36" diameter swing and central lathes upto 42" diameter.
3. **28/60 vertical model hydrotel milling machine:** With 360° profile milling equipment.

The European Scene

THE SAHARA AFTER INDEPENDENCE

From Our Special West European Correspondent

PARIS, August 31.

AMONG the ten conventions signed here this week by the French Government and the Provisional Algerian Executive were three relating to exploitation of the Saharan oilfields. The immense resources of this region have been rather forgotten during the months of political confusion that have followed Algeria's independence, although they constitute the main hope of economic viability of the new republic and the main reason why France will continue to aid that country even when most of her nationals have quit. The new agreements, implementing the Evian accord, set up the technical organism that will manage the empty desert; it will have six Algerian and six French members and will sit in Algiers. Its first meeting must be held in a month. Also, the conventions fix the terms on which French companies will enjoy preferential treatment in the allocation of research permits and the like.

The signing of the agreements is less important than the question of who will represent Algeria in their implementation, in other words, the nature of the Algerian authority. As is known, in other fields besides the Sahara, this is still an open question. After several months of obscure and sterile controversy, Algeria has no government, no central authority and no accepted leaders; it has not been able to hold elections nor apply for admission to the United Nations. The effects of this anarchy have been disastrous in the settled, northern regions of the country: over six lakhs of the minority community have fled and the economy is paralysed. Curiously, the effects have been much less noticeable in the Sahara, and the exploitation of the oil deposits is proceeding more or less normally. True, there is too much uncertainty to permit continued search for new deposits, but in any event the Saharan summer is too torrid for this work and it is always suspended at this time of year.

All that most companies have reported to their Paris offices is that soon after independence reconnaissance groups of the nationalist army came jeeping down the desert track alongside the pipeline, and sought to persuade local company officials to hoist the white and green flag instead of the tricolour. Being private concerns, they naturally refused. The nationalists could not think of anything else that would symbolise their independence and their sovereignty over the desert, both already recognised in the Evian accords, and are contenting themselves with guarding the pipelines—it is not clear from whom, for the installations have never suffered attack during the colonial war nor during the settlers' counter-terrorism. One company, S.N. Repal, used to have its offices in Algiers, for the Algerian Governor-General held 41 per cent of the shares; it has had to withdraw its administration to Paris and reports many resignations from its minority-community employees; but that has not affected work on the oilfields.

Thus in spite of the political chaos, the Sahara will this year produce the expected 21 million tons of oil, against 16 million last year, 8.5 million the year before and 1.3 million in 1959, the first year of large-scale exploitation. There seems to be no obstacle to the target for 1965 being reached; 35 million tons. In short, the discovery, development and transport of Saharan oil, which makes up one of the most striking chapters in the history of the world oil industry, will have gone on undisturbed by the longest and most tragic of modern colonial struggles. The only serious hitch was the temporary interruption of the flow of oil across Tunisia, when M. Bourguiba chose to seek extra prestige in the Arab world by his ill-fated and perfectly useless attack on Bizerta. Once the Algerian people extricate themselves from present confusion and find a responsible central authority, this latter will depute its agents to the desert and the companies will have someone more serious to deal with than the odd local chieftains and ex-terrorist squad leaders who have appointed themselves "police" and "political commissars" around the oil wells. Even then, the companies will be answerable rather to the joint Franco-Algerian commission. The only major innovation the new government, when it emerges, might want to make is the nationalisation of S.N. Repal, by increasing the 41 per cent share it has inherited from the Governor-General to 51 per cent, but this will not alter the terms on which the oilfields are exploited.

There are evident reasons for forecasting that the Sahara will continue to escape political disturbance in the north, and provide an example of Franco-Algerian co-operation even if the French and Algerian communities on the seaboard cannot live in harmony. For a start, the world has plenty of oil from other sources, and however well disposed Arab "brethren" and Soviet sympathisers may be toward Algeria, they will have no hesitation in offering their own oil to replace Saharan oil if this is withheld in view of obtaining better terms. Secondly, the guiding force in the development of the Sahara has all along been the French Government, and not private companies; its concern has been to have oil payable in francs, rather than in foreign currency, and it is willing to pass over its control to an Algerian government if this condition is met, as it will be as long as Algeria is in the franc zone. Thus it is a matter of co-operation between two governments who both have similar views about how to handle private oil companies and are equally suspicious of the international cartels; one of them is interested in the royalties and other revenues, and the other is not, as long as it can buy oil in its own currency.

Finally, Algeria's neighbours—both the Arab states to east and west, and Negro states to the south—cast covetous eyes on Saharan oil. They had indeed as much right to it as the Algerians, for the desert does not belong to anyone of the riverine states more than to the others; the French just happened to administer it from Algiers, for reasons of imperial convenience. The Algerians succeeded, nevertheless, in making good their claim, thus acquiring the largest part of the earth's surface that has ever changed hands in a dubious diplomatic deal. The French had envisaged exploiting the oilfields to the advantage of all the riverine states (i.e. all those on the shores of this sea of sand) and if they allowed the Algerians alone to usurp their neighbours' rights, it was no doubt because they saw the advantages this offered for peaceful exploitation. Jealous of its

prize, Algiers will be more concerned to co-operate with France than to start trouble that could awaken rivals' ambitions. Exploration is continuing, and it is likely that oil will be found in regions liable to be disputed by some of these neighbours; as long as the French and the Algerians are hand in glove, they will find it hard to press their claims.

What is the extent and value of the prize that France has bequeathed to the Algerians after 10 brief years of work? (The first permits for exploration were awarded in 1952.) As far as is so far known: reserves that are proven and exploitable of 700 million tons of oil, and 2 billion (real billion: million million) cubic meters of natural gas. Neglecting the natural gas, which is worth a fortune but whose value cannot readily be calculated, one can work out what it cost to find and market the 700 million tons of oil. Between 1951 and 1961, about 227,500 million old francs (at their 1961 value) were invested in exploration in the Sahara. Between 1956 and 1961, development of the fields discovered cost 200,400 million old francs. Between 1957 and 1961, the construction of pipelines and other transport facilities cost 157,800 million old francs. A total, in a decade, of 585,700 million francs. Thus every million tons of oil found cost 836 million francs. But a million tons of oil at the posted price without discount f.o.b. Bougie, on the Mediterranean coast, is worth 9,800 million old francs. In other words every 386 francs invested has brought a return of 9,800 francs, in the shape of located oil for which evacuation facilities already exist. Of course, these are merely global figures that aim to show no more than that the Saharan adventure was worth while. Individual companies, not all of whose areas yielded results, will not make any such gross profits; the return in question will go, probably as to half, to the Algerian republic, whose contribution to the work has been virtually nil apart from the diplomatic task of excluding all other African states from the share-out.

The 700 million tons in question is by no means a final estimate. Apart from technological improvements that will increase the yield of known deposits, exploration is continuing and new finds have been reported quite recently. Just before the summer interruption of exploration, a field described as important was located 100 kilometers east of Hassi Messaoud, and the companies at work are confident that similar discoveries will be made in the future. Exploration outlays reached their peak of 41,400 million old francs in 1959 and have been maintained there ever since; these considerable expenses are now being auto-financed by the Sahara, for income from current oil sales is already enough to pay expenses, taxes and amortisation of earlier investments while leaving funds for new work—only French shareholders who put their savings into oil stock during the 1956-57 boom after the first big strikes are still awaiting their reward.

Increased pace of exploitation in proven fields and the discovery of new deposits will not call for significant fresh investment in transport facilities. Existing pipelines have a good margin for increased throughflow, though extra pumping stations might be required. There are 24-inch pipes from Hassi Messaoud to Bougie (660 kilometers), from Edjeleh to the Tunisian coast, as well as pipelines that centralise the output of the various fields at the head of these major connections. There are also two natural gas pipelines from the fields to Algerian coastal centres. As is known, various projects are on foot for the transport of this gas to Europe by methane tanker and undersea pipes.

Investors who bought French petrol shares at Rs. 600 or more in 1957 today see their stock standing at Rs. 280, and they have meantime received no dividend from the Sahara. The commotion, both in Algeria and in France, associated with Algeria's liberation has caused heavy depreciation of these shares. Yet the one field where the struggles of the past decade have had no echo is the Sahara, and however dubious the prospects for cohabitation of the Muslim and minority communities on the coast, continued development of the desert's wealth seems assured.

Special Article

DEVELOPMENT FINANCE IN NEPAL

By Dr. Y. P. PANT*

MOBILISATION of resources for securing an adequate rate of growth is the crux of the problem of economic development. The scale of investment to be decided on is, in the last analysis, a matter of judgment depending on the availability of various sources of finance. Broadly, there are three sources from which capital for financing economic development can be found in a developing country. They are domestic savings or current revenues, foreign aid and deficit financing. Like any underdeveloped country Nepal also suffers from the problems of development finance even if foreign aid has been flowing into the country quite smoothly during the past one decade. The purpose of the present article is to analyse various sources of finance for Nepal's economic development, in the context of the overall emphasis on mobilising internal sources.

The taxation policy is the chief criterion in the revenue position of the Government. In Nepal's financial system revenue from customs, land revenue and forests account for even more than three quarters of the annual revenue. In the First Five-Year Plan, out of 330 million rupees, 145 million rupees or 44 per cent was estimated to be raised from internal sources, including taxation, internal borrowings and proceeds from governmental services and sales. The Plan, of course, anticipated, even on rough basis, that the Government would seek to realise progressively a policy of taxation. However, as the following lines show, experience of the First Five-Year Plan highlights the fact that despite all the care that may be taken in estimating the contribution likely to be secured from each of the above sources, the out-turn on individual items is in practice liable to diverge greatly from the estimates.

In the budget beginning with the fiscal year 1959-60 some new taxes including urban property tax, business profits tax, land revenue surcharge and so on were introduced; but revenue from them could not have been quite substantial so far. With the exception of a few ad-hoc taxes, whose yield was almost negligible, the budget for the fiscal year 1959-60 proposed to raise as much as 8.5 million rupees from new taxes including taxes on land and income. However, due to lack of administrative machinery and other conditions as evidenced from tradition and custom, taxes, as expected, could not be realised. Thus even the additional taxes were levied only in the fourth year of the Plan. The budget for 1961-62 introduced an increase of some new taxes like hotel guest tax, embarkation tax, water rates and the urban property and land registration tax. All these have, however, given satisfactory returns. The budget for the current year (1962-63) has introduced some changes in land revenue and revenue stamps to add to about 30 million rupees. The point to stress is that taxation should be sufficient to keep consumption down to limits consistent with the requirements of investment as envisaged in any process of economic development. A good beginning has been made in this direction in 1961-62.

The needs of an underdeveloped country like Nepal cannot be met by taxes alone particularly when there is the lack of tax paying habits of the people. Taxation has sometimes a discouraging effect on private savings.† Taxes have, therefore, to be supplemented by other sources, particularly loans and small savings. In spite of the fact that at initial stages prospects of internal borrowings are quite doubtful, the mobilisation of internal resources, with a view to encouraging private savings, is necessary for development. The First Five-Year Plan sought to increase net income to the tune of 26 million rupees by floating development bonds, pay roll savings and so on. Thus there was an indication to use this source gradually keeping with the psychological reaction of the people. Of course, no co-ordinated efforts were made regarding this aspect in the early years of the Plan. In the budget speech for the fiscal year 1961-62 there was a reference to the possibility of raising an internal loan and in fact during the year, for the first time in the country's history short-term treasury bills to the amount of 7 million rupees was raised. In the current year's budget it has been proposed to cover certain portion of the budgetary deficit both by long-term and short-term loans. Even if the psychology of the people is gradually geared to the desirability of such loans, in the subsistence economy like Nepal's substantial savings are not possible unless the economy develops considerably. The dynamic effect of public investment rising at a significant rate will definitely be one of the important pre-conditions for its success.

It is accepted that foreign aid in the form of equipment and technical personnel facilitates home investment and provides a necessary initial push towards the economic development of an underdeveloped country. Foreign assistance started significantly in Nepal after 1951 in specific projects. Indian aid to Nepal began in 1951, but it was on an ad hoc basis during the first four years. On April 1, 1956 India agreed to give Nepal aid up to 100 million rupees during the time of India's Second Five-Year Plan. On January 23, 1952 the US Government signed an agreement to help Nepal's development. Later on, other countries and the UN specialised agencies also extended help to the country in various ways. In March 1960 agreement on economic aid with China was signed by which China agreed to give aid amounting to 100 million Indian rupees. This amount together with 40 million Indian rupees unutilised from the earlier loan, (of October 1956) thus made a total of 140 million Indian rupees for the establishment of a few industries. On April 24, 1959 an economic aid agreement was signed with the USSR, under which Russia agreed to give Nepal 'free of charge economic and technical assistance' amounting to 30 million roubles for the erection of two industries and a hydro-electric station. The United Kingdom, Switzerland, New Zealand, Canada, Australia and West Germany have also been assisting Nepal.

The table on the next page gives some idea of the foreign aid available to Nepal, including that estimated for the current fiscal year (1962-63). Aid has been so far available in four main forms; cash contribution, commodity contribution, training facilities and technical services. At the same time, each individual country has more or less specialised in particular fields of development projects. Financial and technical aid from India and the United States have been utilized in agriculture, irrigation and village development. People's Republic of China and the Soviet Union have chosen to play an important role in the process of industrialising

*The views expressed here are purely personal.

†While in countries like Ceylon, Burma and India the amount of the national income which goes in taxation and other sources is more than 10 per cent, in Nepal it may not exceed 3 to 4 per cent.

the country. Other countries also have taken to one or the other types of projects.

TOTAL AID RECEIVED TILL 1960 - 61 AND EXPECTED FOR 1961 - 62*

(In thousands of Nepalese Rupees)

Country or Organization	Received till 1960-61	Committed for 1961-62	Total	Estimated for 1962-63
U.S.A.	24,50,70	6,55,61	31,06,31	7,92,72

* The fiscal year is from July to June.

† The amount shown for India for 1962-63 does not include finances for all such projects which are directly handled by Indian Aid Mission and do not pass through HMG's budget. Including all such projects which are not undertaken by His Majesty's Government, the total amount of aid would come to about 50 million rupees.

However, in the past both internal and external resources for even financing the First Five-Year Plan and their allocations appeared to be, on the whole, tentative, since the estimates were based upon certain assumptions, which could not materialise properly in subsequent years. The country's economic development in the past one decade shows that even the process of a foreign aid collaboration came to be changed with the progress of the Plan.

The use of deficit financing as a method of accelerating economic development and the dangers inherent in such a policy have been discussed by various economists and policy framers in recent years. Though in Nepal in a strict sense the expansion of money for development finance does not seem to have been liberally used, still as a result partly of widening the Nepalese currency‡ and expansion of the monetized sector in the recent years monetary expansion has been made in the past few years. For example, during the First Five-Year Plan period there was an increase in the circulation of currency from a little over 30 million rupees to 93 million rupees, and during January 1961 to July 1962 further 26 million rupees came into circulation. However, during the First Five-Year Plan period there was an increase of only 4 per cent in the price level of commodities.

Since in the existing monetary conditions in Nepal where the accepted weapons of monetary control cannot be applied and where in the absence of statistical facts it is impossible to assess even the trend correctly, monetary expansion as a source of development financing can be possibly ruled out. Even a moderate amount of deficit financing cannot possibly be indulged in, as appropriate safeguards, under the existing conditions of under development, cannot be effectively used. The recent experiences of inflationary pressure in most Asian countries have resulted in a growing appreciation of the pressing need for accelerating the mobilisation of domestic financial resources of non-inflationary character. Once inflation develops in the economy, it may be difficult to control it, especially in under-developed countries.

In a mixed economy, the role of private sector is quite substantial. Private investment draws on the same pool as public investment. More than 95 per cent of Nepal's total economic activity is believed to be conducted under private auspices, though large economic enterprises are till now few and far between in the country.

Though the First Five-Year Plan emphasised on the aspect of inclusion of the private sector, the financial parts of this sector, which come through corporate and individual savings were not considered in any length. It is quite difficult in a country like Nepal to indicate even roughly how the savings will emerge in private sector as in the existing conditions of vast regions of the non-monetized sector only a small proportion of the total savings utilised in the sector pass through institutional agencies. Again, private investment in the agricultural sector is very difficult to estimate as it is financed by direct savings. The Three-Year Plan also has recognised all such difficulties.

What is important is that in the process of development the progress of investment in this sector has to be constantly watched as much as that in the private sector and adjustments in policy have to be made from time to time.

Thus in any developing economy from a longer range internal sources have to play a predominant role in the economic development. The Government budgets in recent years appear to have emphasized on this approach. More attention is being given to framing a bold tax programme to raise funds necessary for development. In the development part of the budget for the fiscal year 1959-60, 71 per cent of development expenditure was expected from foreign aid and in 1960-61 about 88 per cent and almost 90 per cent in 1961-62, while about 83 per cent is expected in the current fiscal year. Thus measures to exploit internal financial resources for development works are being increasingly taken.

In the outline of the Three-Year Plan (1962-65) there is a proper emphasis on mobilising domestic savings for 'the effective utilization of foreign assistance'. The amount of foreign aid to be available during the Plan period is estimated at 360 million rupees, leaving a gap of 100 million rupees. The outline of the Plan has proposed to mobilise domestic savings to the extent of half of the deficit, or roughly about 10 per cent of the total financial outlay.

Since there is a limit to the exploitation of internal sources, His Majesty's Government seems to have been serious to increase the country's productive capacity and means. As the Finance Minister remarked in the budget speech for the fiscal year 1962-63, "the Government's intention is to distribute land among the people in a just manner by means of institutional reforms and to induce the private sector to undertake technological reforms". This is definitely a promising trend. In the field of development finance it is always necessary to review all decisions from time to time and there has to be a measure of flexibility in the Plan to permit the necessary adjustments in outlays. Since, however, the main objective is to carry through the physical programmes approved, and since any shortfall or slowing down on these affects the pace of further advance, effort has always to be concentrated on mobilisation of the resources required. The techniques of resources mobilisation and the scope for using each one of these more effectively have thus to be kept under continuous review.

‡Both Nepalese and Indian currencies have been in circulation in various parts, the latter particularly in the Tarai region.

THE BUSINESS WORLD

Cotton and Cloth Production

By

CROESUS

GOING through the annual reports of the Millowners' Association, Bombay, I was rather struck by the utter dependence of the Indian cotton mill industry on a variety of factors over which it can hardly be expected to have any control. Take, for example, the main raw material of the industry — cotton — and you will realise how unpredictable the planning of cloth production could be and has, in fact, been. For, if, in one season, there is a glut of cotton, you cannot be sure that the glut will continue in the next season as well; on the other hand, the chances are that, almost every alternate year, the industry has to be prepared for a shortfall in supplies of cotton. Hitherto, the industry did not have to bother very much about the availability of adequate supplies of cotton even during years of a lean crop or crop failure, thanks to the prospect of imports from abroad, but the position has changed radically with the worsening of the foreign exchange situation. During the season that has just ended, that is the 1961-62 season, although the total quantity allocated for import was over nine lakh bales — in the 1960-61 season, it was higher at over 11 lakh bales — the phasing of the imports to synchronise with the needs of the industry presented a no mean problem. Cotton had to be imported not from sources best suited to this country from the point of view of the industry's actual requirements, but from countries from where India could import either on a no-payment or a deferred payment basis, or under a barter rupee payment arrangement. In such circumstances, it would be clearly impossible for anyone to match the imports to the precise needs of the industry. Incidentally, the acute scarcity of cotton in 1961-62 thus proved how difficult, if not unworkable, price control could be in a year of unusual shortage.

It is significant that, although the 1961-62 season was a short crop season, it was not so allround; actually, the production of Bengal Deshi during the season turned out to be a record one and was a welcome source of additional foreign exchange earning too. There is a section of opinion in cotton circles which holds that the overall quota of Bengal Deshi in 1961-62 might well have been considerably higher, but for the Government's unwillingness to allow more exports. True, the export quotas for Bengal Deshi granted during the last season was fairly large at 2,76,000 bales, but this has to be compared alongside the record Bengal Deshi crop of the season of 5,65,000 bales.

A very important factor in ensuring adequate supplies of cotton is the price factor, and caught between the conflicting demands of the mill industry, which naturally wants a reasonably low price for its raw material, and those of the cotton cultivator, who, in his turn, wants a high return for his commodity in keeping with the market prices of other agricultural commodities, the authorities are certainly in an unenviable position to hold the scales even. It is only to be expected that the industry would urge the Government to introduce control measures to ensure an uninturrupted supply of cotton at reasonable prices, but then the authorities are also confronted with the problem of having to determine a level of prices below which they cannot let them fall, if only not to discourage the grower from continuing to grow cotton. It is not always that this level corresponds to the level of prices that would be considered economic by the grower. To the grower, only that price is economic which will enable him to go in for his requirements from out of the sale proceeds of his produce and will also compare favourably with the sale proceeds of other agricultural crops produced by his neighbour. But this is cutting too fine into the relative costs of raising competitive crops and, more often than not, it is the supply and the demand factors at a given time that determine the prices of any commodity, including cotton. Be that as it may, during the 1961-62 season, the Government was forced to raise the ceiling price of cotton by Rs. 105 per three quintals for the basic variety — Moglai Jarilla 25|32".

Another effect of the shortfall in cotton supplies in 1961-62 was that, instead of the usual three futures contracts — March, May, and August — futures trading was confined only to the March, 1962 delivery. Starting on July 30, 1961, at Rs. 604.25, the Jarilla March Contract finished the season at Rs. 693.00. The still unsatisfactory cotton position during the last season was also responsible for the commencement of the new crop contract of Jarilla March, 1963, after a long spell of uncertainty that lasted for nearly one and a half months.

The question has often been raised in cotton circles as to why the position in 1961-62, when the final crop estimate amounted to 46.5 lakh bales, was worse off than in 1959-60, when the crop was very much smaller at only 38 lakh bales. The explanation is simple enough. In the first place, the total consumption requirements in 1961-62 were very much higher than in 1959-60. Secondly, while the actual outturn of the crop in 1961-62 fell short by nearly eight lakh bales of the estimated crop, the position could not be met as easily as in, say, the preceding season, by resort to imports. The total import allocations in 1961-62, it may be noted, were only around nine lakh bales, as against over 11 lakh bales issued in the previous season.

It is against this background that one would have to forecast the outlook for the current season. For reasons which should be evident by now, the season 1962-63 has opened with an estimated carry-over of only 14.50 lakh bales of Indian cotton (plus three lakh bales of foreign cotton). However, as against crop of only 46.5 lakh bales in 1961-62, informed cotton circles anticipated the current season's crop, on the basis of the prevailing indications, at about 52 lakh bales. Imports

are estimated at another ten lakh bales, giving in all a total supply of 79.50 lakh bales. Total consumption needs during the season, on the other hand, have been put at 60 lakh bales (56.5 lakh bales, including ten lakh bales of foreign cotton, for mill consumption plus three lakh bales for exports of Bengal Deshi plus 50,000 bales for miscellaneous uses). On this reckoning, the 1962-63 season should end with more or less similar carry-over as the 1960-61 season, but it should be added at this point that all these figures are still in the nature of "guestimates", in that the size of the crop as well as the total quantity of imports depends upon a number of unforeseeable factors.

The statistical position of cotton during the current season and the season that has just ended is indicated in the table opposite for purposes of comparison.

(In lakh bales)

	1961-62	1962-63
1. Carry-over from the previous season	20.00	17.50
2. Crop outturn during the season	46.50	52.00
3. Imports	9.00	10.00
4. Total Supplies	**75.50**	**79.50**
5. Mill consumption	54.74	56.50
6. Extra-factory consumption	0.50	0.50
7. Exports	2.76	3.00
8. Total Disappearence	**58.00**	**60.00**
9. Carry-over for the next season	17.50	19.50

Business Notes

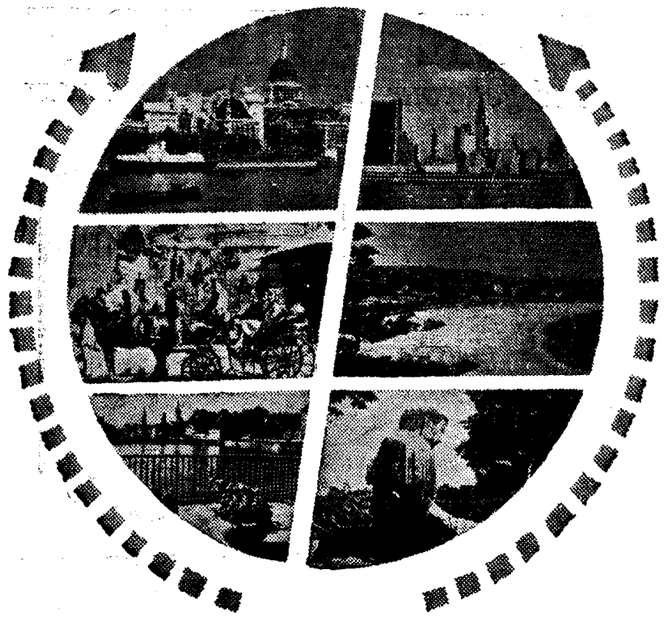
Textiles

EXPORT OUTLOOK CONSIDERED ENCOURAGING

AGAINST THE recent undertaking by the Cotton Mill Industry to export 12½ per cent of its production (on the basis of the 1961 production, this would amount to 643 million yards, as against the export target of 850 million yards, per annum during the present Plan period), it would be interesting to refer to what the Foreword to the latest annual report — Report for the year 1961 — of the Millowners' Association, Bombay, has to say on the subject. On the whole, it is gratifying to note, the Association is optimistic about the prospects. "There is reason for cautious optimism about the prospects of our textiles", says the Foreword, "since the countries with maturer economies appear to be convinced that a judicious encouragement to exports from the developing countries is one of the surer methods of helping them to take forward steps towards material progress than mere spoon-feeding through gratuitous assistance". But the industry is not content to rely wholly on this "judicious encouragement to exports". Says the Foreword thus: "It is realised by the industry that, if India's export goal in textiles is to be attained, **there is no substitute for modernising its productive equipment, for attaining higher levels of productivity and for achieving a general reduction in costs.** It is only by this means that it can expect to offer its goods abroad at competitive prices and gain a firmer foothold in the world market."

Apparently, the Association is satisfied with the progress made in the negotiations between this country and the British industry in regard to the export of textiles to the U.K. (It may be noted here that, as a result of changes already agreed upon, the Indian ceiling figure for 1962 has been raised from 175 million square yards to 195 million square yards; also the control over the administration of licensing has been made over to India. The position in regard to exports of yarn to the U.K., however, does not yet appear to have been settled to the satisfaction of the industry). The industry also seems to be satisfied with the progress of negotiations in Geneva for a long-term textile scheme, as suggested by the G.A.T.T. But as regards the E.C.M., it is the opinion of the Association that the task of export promotion "is likely to be rendered even more competitive, if the subsisting favourable terms for the export of Indian cloth and yarn to Britain are withdrawn, when that country joins the E.C.M." Accordingly, it has been urged that Britain's membership to ECM should not result in disruption of the long-established trade relations between her (Britain) and the Commonwealth countries. The industry has also pointed out the desirability, on the part of the ECM countries, as most of these have already been helping the economic development of this country, to encourage Indian exports by purchasing more and more of this country's products, especially textiles.

Two interesting points about exports are made in the Foreword. One is that, in spite of the incentives offered by the Government, the export trade in textiles has not increased, but, in fact, it has declined somewhat. And, this, the Association attributes to the severe competition from countries like Japan and China. Secondly, the Association is of the view that realisation of the physical target alone will not serve the purpose, since the basic aim of increased exports is to enable the country to earn sizeable quantities of foreign exchange. The Association has also suggested a way out of the difficulty. According to it, "if India is to earn even Rs. 75 crores worth of foreign exchange a year as envisaged in the Plan (for exports of textiles), efforts should be made to export finer and finished piece-goods on a much bigger scale than at present". But, as against this, the position today is that, apart from the fact that 95 per cent of our textile exports are of coarse and medium categories, about 60 per cent of the cloth exported is in grey state, while another 20 per cent is merely bleached.



Foreign Aid

BRITISH AUTHORISATIONS COMPLETE

WITH THE signing of the two agreements between the Government of India and the British Government this week on extension of £18 million aid during the current year, the British commitment of making available £95 million assistance under the Aid-India Club for the first two years of the Third Plan has been fulfilled.

Of the two new loans, one for 13 million (Rs. 17.3 crores) is to provide finance for a number of important Third Plan projects, including equipment for the Heavy Electricals Plant at Bhopal, a ropeway system and other equipment for the coal-mines and supplies for the River Steamer Companies operating in Eastern India. The second loan of £5 million (Rs. 6.7 crores) is an untied one and is available for spending on a wide range essential imports from Britain. While the former loan is welcome on the score that it will assist in the development of power resources in the country by helping in stepping up the production of electrical equipment at the Bhopal plant and coal output, the latter loan is of particular significance at the present juncture when India is facing an acute foreign exchange crisis and is finding it extremely difficult even to finance the essential maintenance imports. Similar loans expected in the near future from some of the other Aid-India Club members, particularly the United States and West Germany, should go some way in alleviating the distress caused by the inadequacy of freely convertible foreign exchange at the disposal of this country at present. If adequate untied assistance is available from consortium members in the near future, as is expected, the recent

AIRCON
Evaporative Climate Conditioners
FOR YOUR INDUSTRY

The initial cost of an AIRCON Evaporative Climate Conditioner is 1/3rd to 1/10th that of an equivalent refrigerant air-conditioner! And comparative running costs? Even less—1/6th the costs of a refrigerant air-conditioner!

And that's not the end of it: hundreds of industries have found that *productivity of workers increases substantially* with AIRCON climate conditioning. So much so that AIRCON installations have paid for themselves within a year!

It's AIRCON for *your* industry! No renovated construction needed, no impractical sealing of rooms needed. Please write to us for more information.

Mark XII 'Air Marshal' is specially designed for industrial sheds, big establishments, canteens and mines. All parts are triply protected against rust. 4-way, 180° directional control. Guaranteed for one year.

Lakshmi Woollen Mills Estate
Off Haines Road, Bombay-11

50 per cent blanket cut in imports would be restored to a substantial extent.

Like all the previous loans signed by the Government of India with Britain during the Third Plan period, the new loans are repayable over 25 years with a grace period of seven years, implying that the first principal repayment in respect of the two loans will fall due in 1969 and the last one in 1987. The rate of interest on these two loans is governed by the usual formula governing Commonwealth Assistance Loans — the rate is to be the same as applied by the British Treasury at the date of issue to a loan for a comparable period from its domestic Consolidated Fund plus one-quarter per cent administrative charges.

The total assistance made available by the UK so far for the implementation of India's Second and Third Plans amounts to £175.5 million. The following are the details :

A.	Grand total of disbursed and committed assistance during the Second and Third Plans to date:	£ 175.5 million
B.	**Second Plan**	
	Project aid for Durgapur 1958	£ 15 million
	General balance of payments aid 1958	£ 28.5 million
	General balance of payments aid 1959	£ 19 million
	Project aid for Assam pipeline 1959	£ 3 million
	General balance of payments aid 1960	£ 10 million
	General balance of payments aid 1960	£ 5 million
	TOTAL:	**£ 80.5 million**
C.	**Third Plan**	
	Commitment to date:	£ 95 million
	Loans signed	
	Mixed project and development goods loan — May 1961	£ 30 million
	General balance of payments loan — May 1961	£ 10 million
	General balance of payments loan — Novembed 1961	£ 5 million
	General balance of payments loan — May 1962	£ 10 million
	Durgapur Extension Loan — May 1962	£ 22 million
	Mixed project and development goods loan — September 1962	£ 13 million
	General balance of payments loan — September 1962	£ 5 million
	TOTAL Signed:	**£ 95 million**

Costs

SICC CHIEF EXPRESSES CONCERN

THE TWO major problems that are facing the Indian industry today are the rising costs of raw materials and the non-availability of foreign exchange. Naturally, therefore, Mr. Kumararajah M. A. M. Muthiah Chettiar of Chettinad, President of the Southern India Chamber of Commerce, chose to highlight these two elements which pose a serious problem to the producers of the region. The phenomena of high prices of industrial raw materials and components, he believed, was aggravated by excise duty and in turn it has tended to increase the cost of end-products very considerably. The alround increase in the prices of consumer articles in turn leads to widespread discontent among the middle classes which are significantly vocal as well as the working classes who in turn demand higher wages. While primary raw materials continued to cost more because the producers of cotton, jute, sugarcane etc. do demand higher returns, the pressure on prices as a consequence of higher costs of electricity charges, transportation and wages cannot be ignored. While, therefore, these pressures exist, the continuous rise in the excise duties has made higher prices nearly compulsory. The President of the Chamber was of the opinion that under these conditions sales tax levied by various State Governments made the things much worse. He stressed that the sales tax can be so eliminated as to be added to the excise duties considering that it will facilitate administrative processes and also in view of the fact that excise duty has begun to be levied on almost all commodities. The merchants are put to avoidable difficulties because the manufacturers and producers have to present books of accounts to furnish twice over, once to the excise duty authorities and again to the sales tax authorities. Sales tax has now been merged with excise duties in regard to commodities like cotton textiles, sugar and tobacco. As this system has been working quite satisfactorily, it is time that the Central Government tried to extend his practice to cover as many commodities as possible.

The President of the Chamber also very plainly raised the question of acute shortage of foreign exchange in the private sector. There are several industries in the private sector which have been licensed output capacities, and depend partly or wholly on external resources of supply of raw materials. In fact several of them have been licensed for implementation of expansion schemes. Now with the increasing difficulty of foreign exchange they are being advised to work below capacity which creates several problems for them and the one being that of higher costs because working below capacity would ultimately mean relatively higher capital costs. It may not be out of place to indicate that a part of the foreign exchange resources that are available from the countries that constitute the Aid-India Club and several other ones should definitely be made available to the private sector so that the existing plant and machinery may be kept going and made to work economically. It is not possible to dispute the fact that the shortages of foreign exchange are acute, but it will be a colossal economic waste if plant and equipment already installed are kept idle while foreign exchange is spent on the installation of new units. The heavy industry units in the public sector do demand priority but that should not mean a lopsided programme of output. The Central Government, the President of the chamber advised, should give due weight and consideration to vital needs of the industries in the private sector.

Plantations

PROBLEMS AND PROSPECTS

THE PROBLEMS of the plantation industry in prospect and retrospect were discussed at length at the 69th annual general conference of the United Planters' Association of Southern India. Mr. W. C. F. Simmonds, President, UPSAI, pleaded that the plantation companies should be left with adequate finances to keep the gardens in order and to enable them to comply with the onerous requirements of the Plantations Labour Act. He pointed out that if the volume of our exports of particular commodities had been going down, it was because of our failure to bring down our prices to international levels. In the case of tea, he said, taxation had been responsible for undermining the development of exports. Without mentioning the array of taxes and imposts that have been levied by the State Governments and the Centre, the President of UPASI asked the authorities to modify the rigours of these taxes so that a better atmosphere could be created and exports increas-

ed thereby. It may be recalled that the Tea Board delegation which visited recently the United States and Canada submitted in its report that the abolition of export duty could go a long way in boosting our tea exports. Since this export duty is inconsistent with our export drive, there is no reason why it should not be set aside or at least scaled down further. The picture in the outside markets is not altogether gloomy, what is needed is the production of right stuff so that we might be able to compete successfully in other markets. The President of UPASI at the same time expressed the opinion that it would be in the interests of the economy if we paid greater attention to the domestic market because it was the sheet-anchor which could well save the plantation industry from foundering on the rocks.

Dealing with coffee, Mr. Simmonds observed that it was absolutely necessary to concentrate on quality for our exportable grades. So far as the International Coffee Agreement is concerned, a new one replaces the old one in force since October 1, 1959. Although full details are not yet available, it seems India will not have to worry much as all producers are to retain a proportion of their exportable surplus. In regard to rubber, the position is not so happy because of the increasing use of synthetic rubber in various parts of the world. The depressing feature is that the cost of production of natural rubber is rising. The remedy on the face of it would appear to be to evolve a co-ordinated price policy in regard to natural and synthetic rubber and at the same time plant the low-yield areas with high-yielding planting material. All said and done the suggestions made by the UPASI President are quite realistic and need to be considered sympathetically. The plantation industry is our most important foreign exchange earner and it is time we devote full attention to its problems.

New Issues

METERS AND ELECTRICAL APPARATUS LTD.

TWO MORE companies have finalised their plans for raising subscriptions from the public for their share capital.

India Metal Agencies, Bombay, is floating a public limited company, called Meters and Electrical Apparatus Limited, to undertake a Rs. 65 lakh-project to manufacture electric house service meters. Its authorised capital will be Rs. 1 crore — Rs. 70 lakhs in equity shares of Rs. 10 each, Rs. 10 lakhs in preference shares of Rs. 100 each and Rs. 20 lakhs in the form of unclassified shares. Of this, capital worth Rs. 40 lakhs — Rs. 35 lakhs in equity shares and Rs. 5 lakhs in preference shares — is proposed to be issued in the first instance. The promoters, directors and their friends are envisaged to subscribe to half of the equity issue. The remaining 50 per cent equity issue is proposed to be offered for public subscriptions. The entire preference issue will also be offered to the public, but it is mostly expected to be subscribed by institutional investors.

The company proposes to meet the remaining requirements of the project (to the tune of Rs. 25 lakhs) through a loan from the Industrial Finance Corporation (Rs. 20 lakhs) and from bank borrowings.

The project envisages manufacture of 60,000 single-phase and 24,000 three-phase electric house service meters per annum. Technical collaboration has been secured from the Bulgarian firm Technoexport. The foreign collaborators would supply the complete plant for the project, valued at Rs. 25 lakhs, on rupee payment basis and will also train Indian personnel. The plant is to be located at Thana, an industrial suburb of Bombay. Production is expected to start by mid-1963.

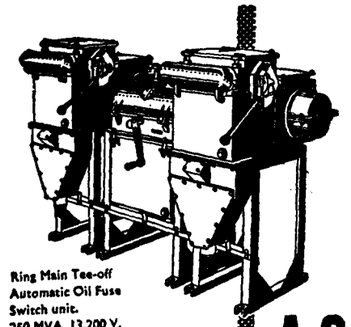
ARUNODAYA MILLS LIMITED

THE OTHER COMPANY which will be shortly entering the capital market is Arunodaya Mills Ltd., a textile concern floated by a Rajkot businessman, Mr. Gulabchand Talakchand Seth, to set up a spinning mill at Morvi, in Maharashtra. The authorised capital of the company is Rs. 75 lakhs, of which capital worth Rs. 37 lakhs is proposed to be issued in the first instance. The initial issued capital will consist of equity shares worth Rs. 32 lakhs and preference shares worth Rs. 5 lakhs. The promoters and their friends will take up equity capital to the tune of Rs. 16 lakhs. The balance equity capital and the entire preference issue would be offered for public subscriptions. An application has been made to the Industrial Finance Corporation for a loan of Rs. 25 lakhs to meet the cost of the project over and above the finances made available by the share capital. The promoters intend to make this new spinning unit a model one.

Electricity

OPTIMISTIC OUTLOOK

AT THE 22nd annual general meeting of the South Madras Electric Supply Corporation Limited, Mr. K. A. P. Visvanatham struck a note of optimism in regard to the affairs of the Corporation and pointed out that capital extensions to the value of nearly Rs. 20 lakhs have been executed. A dividend of 10 per cent as against 9 per cent in the previous year has also been declared because of the slightly increased earnings. The company has made a special appropriation of Rs. 1,21,600, making up the total of such appropriation to Rs. 2,47,600 for augmenting the company's capital resources.



So far as the rural electrification scheme is concerned the company, Mr. Visvanatham declared, is in a position to contribute its mite and has submitted to the Government of Madras that the loan assisance should be substantially increased to meet the demands of such an enlarged programme of work. It is expected that this request might receive a sympathetic consideration from the Government. Mr. Visvanatham hinted that the gap between the supply and demand for power would continue to remain in spite of the development programmes envisaged in the Plan. Although there have been great power shortages in most of the capital towns, Madras had not to face difficulty to the same extent. The storage position in most of the hydro-electric reservoirs is considered to be satisfactory and with the expected commissioning of the power plant at Neyveli in the course of this year, the situation is expected to improve further. Referring to the levy of graded tax on the electricity supplies made to different classes of consumers to augment the resources of the State, Mr. Visvanatham pointed out that this levy has been received by the consumers with mixed feelings. The industrial consumers are particularly more apprehensive. He, therefore, pleaded that the Government should take cognizance of these indications and afford whatever relief is possible in the interest of the industrial growth.

Insurance

SATISFACTORY PROGRESS

AT THE 26th annual general meeting of the Ruby General Insurance Company Ltd., Mr. B. M. Birla, Chairman of the Company in his speech revealed the satisfactory progress made by the company and underlined that it has risen to the position of one of the leading insurers in the country. The most encouraging factor is that the net premium has increased from Rs. 74,24,000 in 1951 to Rs. 1,81,80,000 in 1961, i.e. an increase of 246 per cent. The fire premium income for the year amounted to Rs. 71,99,000 as against Rs. 70,50,000 during the year 1960. The working has resulted in a profit of Rs. 16,13,000 as against Rs. 4,99,000 in the previous year. Reserves have also increased to Rs. 35,99,000 from Rs. 34,19,000.

The reduction in fire premium rates came in for a

good deal of criticism. A plea was made that since the Indian insurers are passing through a period of transition they should be allowed to build up their reserves and thereby serve the country better. If the progress in the fire department of the company has been quite up to the mark it is equally heartening to find that losses in motor and miscellaneous departments have been reduced and the reserves in the marine department have increased from 58½ to 100 per cent. Loss in the marine department can be assigned to the unsatisfactory conditions in the ports and it is considered that a careful watch and ward at these ports would certainly reduce the losses further. Mr. Birla also referred to the move of having a comprehensive marine tariff. This, he felt, could help in improving the results in the marine department. He pointed out that the Government should encourage importers and exporters to obtain policies in the country itself, as far as possible, as this would help in conserving foreign exchange to some extent.

Dealing with general insurance, Mr. Birla pointed out that the total premium incomes of all insurers in India in 1960 was only Rs. 38 crores. The scope of it can certainly be enhanced further if suitable steps are taken to educate the public bringing home to them the benefits of general insuarance. A lot, of course, would depend on the field staff as to how they are able to approach the problem. It is high time they activised themselves.

MANDYA NATIONAL PAPER MILLS LIMITED

WITHIN A period of less than a month since its inauguration by President Radhakrishanan on August 2, 1962, the Mandya National Paper Mills has achieved its rated capacity of 35 tons of paper per day. This outstanding success achieved by the company should strengthen the hopes that its plan to expand the capacity to 70 tons per day would materialise at none-too-distant a date.

The Mandya National Paper Mills Limited is the first factory in Asia manufacturing paper by making use of non-conventional raw materials like bagasse which is available in huge quantities in the neighbourhood of Belagula, Mysore State, where it is situated. The digestion system made use of at this factory is the Pandia continuous system which, unlike the conventional digestion system, is capable of utilising a variety of raw materials for pulping such as bagasse, straw bamboo, wood, etc., with equal facility. The quality of the paper now being manufactured by MNP Mills is claimed to be of a very superior order.

The MNP Mills came into existence through a collaboration between Messrs. Bedi and Co., Management Private Ltd., the Indian partner, and Messrs. Parsons Whittemore Lyddon Organisation of the United States, which is a reputed pioneer in utilising a variety of other than conventional raw materials for manufacturing paper.

ARBITRATION AGREEMENT BETWEEN INDIA AND HUNGARY

FACILITIES FOR the amicable settlement of commercial disputes arising between parties in India and the Hungarian People's Republic are now available as a result of an agreement entered into between the Arbitration Tribunal of the Federation of Indian Chambers of Commerce and Industry and the Hungarian Chamber of Commerce, Budapest, Hungary, on August 22, 1962.

The arbitration clause to be included in contracts between the Hungarian Foreign Trade Organisations on the one side and the Indian parties on the other side runs as follows:

> "Any dispute or claim arising out of or relating to this contract shall be heard and decided upon by arbitration in accordance with the agreement concluded between the Federation and the Hungarian Chamber of Commerce. The arbitration is to be conducted in the country of domicile of the defendant. If the arbitration is held in India, the dispute shall be submitted to the Arbitration Tribunal of the Federation of Indian Chambers of Commerce and Industry, Federation House, New Delhi, and settled in accordance with the rules of that Tribunal. If the arbitration is to be held in Hungary, it shall be submitted to the Hungarian Chamber of Commerce, Budapest, and decided in accordance with the Rules of Arbitration of the Hungarian Chamber of Commerce."

This is the sixth agreement in the field of international commercial arbitration to be entered into by the Federation with commercial organisations of foreign countries. The other five agreements were signed with the U.S.A., Japan, the German Democratic Republic, the U.S.S.R. and Poland.

(Continued from page 421)

reiterated by the last week's performance. The development is to the effect that response is growing for the loans of even the economically backward States. A striking instance of this is provided by the overwhelmingly large subscriptions (Rs. 11.81 crores) offered for the Uttar Pradesh loan of Rs. 9 crores. The response to the Andhra Pradesh loan has also been very encouraging, even better than the response to the loans of such highly industrialised States as Gujarat, Maharashtra and Mysore. The West Bengal loan just scraped through; the total subscriptions amounting to only Rs. 3 lakhs in excess of the Rs. 7 crores called for. Is all this an indication of the fact that the investors in the State loans consider the prospects of development in the hitherto economically backward States more promising due to the regional bias in the country's planning?

It will be only prudent for the States and the Centre to depend on market borrowings to a great extent than has been envisaged under the Third Plan. There are reasons to believe that the borrowing programme of the Government can be exceeded if appropriate measures are taken towards this end. This should obviate the necessity of going in for higher taxation than the target stipulated, which, to see the Plan through, would apparently be required in view of the shortfalls that are expected on the resources front in the contributions to be made by small savings and surpluses from public sector enterprises. Larger market borrowings should also have a salutary effect on the price level in the country which is causing no small concern to the authorities and the consumers alike.

FROM THE CAPITAL'S CORRIDORS

SCRAP COMMITTEE'S REPORT

THE Union Government has released the report of the Scrap Committee constituted last year, along with the action taken by it on this report. The main recommendations of the Committee are:

(i) There should be an over-all quota for exports of scrap. Export of heavy melting scrap and No. 1 sheet cuttings, including main producers' skull scrap, should be completely banned. Export of other types of scrap, like 2, 2A and 3 class of sheet cuttings and high silicon sheet cuttings, should be freely permitted upto the overall ceiling. Export of turnings and borings should be permitted only at the discretion of the Iron and Steel Controller. So far as electric furnace skull scrap is concerned, there should be no ban on exports until the producers and furnace owners in this country are in a positions to utilise this scrap.

(In considering what the export policy for scrap during the current year should be, the Committee had taken into account the two opposing sets of considerations, namely, the importance of not losing foreign exchange earnings and provision of an incentive for raising the domestic collection of scrap. These considerations, it says, would indicate a liberal export policy. But if exports are allowed without restrictions and price and distribution controls are lifted, it is of the opinion that there may be a steep rise in domestic prices. This will not only affect the domestic production, particularly of billets, but may also affect the exports of steel castings and other steel products. On balance, the Committee has felt that it would be best to impose an overall quota on exports of scrap and to fix the quota at the same level as in 1961, namely, at a little over 4 lakh tons. If the Government finds that the domestic prices of scrap settle at relatively low levels, the Committee has suggested that further liberalisation of this quota may be considered. On the other hand, if the foreign demand for scrap, which at present is low, rises so that an upward pressure is exerted on domestic prices, the Government may either restrict the quota or levy an export duty.)

(ii) The present policy of no control on cast iron scrap, except for the stipulation that cast iron cuttings should first be offered to foundry Associations and then allowed for export if refused by them, should continue.

(iii) The restriction on the export of stainless steel scrap may be lifted since such scrap cannot, at present, be utilised in the country.

(iv) Imports of only certain categories of industrial and re-rollable scrap may be permitted at the discretion of the Iron and Steel Controller, Calcutta.

(v) Price and distribution controls on melting scrap should be removed altogether, while the control on industrial and re-rollable scrap should continue. The price control over all varieties of cast iron scrap should also be abolished.

(The Committee has reached the conclusion that since exports are to be quantitatively restricted, the primary reason for the existing price and distribution controls, namely scarcity, will largely disappear. It says that even today a large number of purchases are from other than the control source and the actual price paid for heavy melting scrap has been as high as Rs. 235 per ton. The consumers of melting scrap told the Committee that considerable amounts of scrap had been purchased outside the control. The Committee, thus, says: "If the supply position permits, it would obviously be preferable to let the normal trade channels handle the distribution of scrap and this, in fact, is necessary to develop a healthy scrap trading industry". The Committee further observes: "It is, of course, undeniable that the free market price of scrap will probably settle at a level somewhat higher than the controlled prices though, in the Committee's opinion, the free market prices are likely to be below the top prices paid for extra purchases of scrap in the past. Even if a moderate increase in price per ton does take place, it is not necessarily undersirable ..... Actual collection of scrap in India would appear to be far below the levels feasible and a higher domestic price would act as an incentive to better collections. Since scrap is such a valuable resource, this means of increasing collections should be tried ..... It should also be noted that an increase in the price of scrap should lead to a much smaller rise in the price of finished products since the cost of scrap forms a minor part of the costs of production, particularly in the case of castings. The price of castings is not controlled and either the producer or the consumer should easily be able to absorb the increase in the price of scrap. It is true that the price of billets is controlled, but the electric furnace owners can adjust the production between billets and castings in the manner that they find economical. The long-term objective of policy should be to encourage the production of castings and other quality products by the electric furnaces).

(vi) The present price and distribution controls for ingot moulds should continue.

(vii) The freight rate of scrap should be re-examined so as to encourage collection.

(viii) Since there will be a surplus rolling capacity in 1965-66, no new re-rolling mills should be set up.

(ix) Immediate expansion of electric furnace capacity upto the limit set by scrap availability should be considered. The furnaces should be distributed regionally taking into account the economic size of ten ton capacity following the method of continuous castings of billets.

(The Committee has expressed the opinion that sizeable surpluses will accrue in the first three years of the Plan, while in the last year, unless availability increases significantly, there will be a shortage of scrap. It is, therefore, very important that the planned expansion of furnace capacity should be set underway immediately. After calculating the foreign exchange cost per ton of installing equipment for continuous casting of billets, with an average life of 15 years, around Rs. 14 per ton, and correlating it to the net foreign exchange cost of exporting scrap and importing billets around Rs. 200 per ton, the Committee has opined that there is a very strong case for the immediate expansion of electric furnace capacity up to the limits set by scrap availability. New furnaces, which the Committee says should be distributed regionally, taking into account the economic size of 10 ton capacity, would help in improving and encouraging widespread collection of scrap. Some concentration of furnace capacity, the Committee thinks, is, however, inevitable since the choice of location will depend at least as much on the demand for end-products as on the sources of supply of scrap).

The Government has accepted the Committee's recommendations (i), (ii), (iv), (vi), (vii), (viii) and (ix).

As regards recommendation (iii), the Government proposes to further examine the quantum of utilisation of stainless steel scrap in the country, in consultation with the technical consultants of the Ministry of Steel and Heavy Industry. As regards recommendation (v), the Government has decided that prices and distribution control on all categories of scrap, other than fresh unused defectives detailed in part IA of the Scrap Schedule, re-rollable scrap (Part II of the Scrap Schedule) and ingot moulds in all forms should be removed.

The Committee has made the following estimates of the demand and availability of scrap during the current Plan period:

('000 metric tons)

	1961-62	1962-63	1963-64	1964-65	1965-66
Availability	762	854	889	962	1,072
Demand	371	471	577	878	1,258
Surplus (+) Deficit (—)	+391	+383	+312	+ 84	— 186

POWER SHORTAGE

During the first year of the Third Plan, the actual additional installed capacity for power generation created amounted to only 579.6 MW., as against a target of 604 MW. There was a shortfall of 98.4 MW. in the target fixed for this year for the total installed generating capacity. The delays occuring in the commissioning of the 50 MW. thermal set at Neyveli (Madras), the 23 MW. hydel set at Chambal (Rajasthan and Madhya Pradesh), the 15 MW. hydel set at Neriamangalam (Kerala), the 9 MW. hydel set at Tungabhadra Left Bank (2nd unit) (Mysore) and in the setting up of diesel sets with a total capacity of 1.4 MW. in the Union Territories accounted for this shortfall.

The Planning Commission's Working Group on Power, which recently investigated this slower-than-anticipated growth on the power front during the last year, has held the following factors to be responsible for the delays in the commissioning of the new power projects:

(1) **Delays in Release of Foreign Exchange:** There occurred delays in the release of foreign exchange and issue of import licences mainly because of the need to get clearance of the Development Wing from indigenous angle.

(2) **Shortages of Steel:** Although the general position regarding supply of steel improved slightly last year, certain categories of steel, such as plates, continued to be in short supply. Shortage of steel for power project was further accentuated by the distinction that continued to be made by the Iron and Steel Controller between the requirements of "core" and "non-core" projects.

(3) **Shortage of Cement:** The third important factor that hampered the construction work on the new power projects was the shortage of cement, arising out of the actual deliveries falling considerably short of the allocations made by the Regional Cement Controller. For various projects, allocations of transport were not properly co-ordinated with the allocations of cement.

(4) **Shortage of Explosives:** The work on the new power projects was also grievously hampered by the supplies of explosives being not adequate in some States. The overall shortage of explosives was created by stringent import policy in regard to this item while the expansion programme of ICI took time to materialise.

(5) **Inadequate Supplies of Equipment from Heavy Electricals:** The Heavy Electricals (India) Limited, Bhopal, also contributed its share in creating bottlenecks in the way of implementation of the plan for power. It probably accepted orders for equipment in excess of its present production capacity.

(6) **Organisational Defects:** In some States prevalance of two or three departments or organisations entrusted with the various phases of the power programme also created difficulties and delays in deciding on tenders (extending in some cases to over a year) and in proceeding with various components of projects. In some State Electricity Boards there was also a shortage of personnel (the personnel needed to be properly reinforced in regard to design of power stations, procurement of material and processing of power projects).

In the recent past, steps have been taken to remove most of these bottlenecks. As a result of this, it is envisaged that unnecessary delays in the execution of the power programme during the remaining years of the current Plan would be obviated to a considerable extent. The Ministry of Irrigation and Power is creating a special unit to devote undivided attention to watch the progress of power projects and for assisting the States in removing the bottlenecks, particularly in respect of procurement of steel, cement, coal, explosives and expeditiously arranging for them foreign exchange import licences and timely procurement of equipment from indigenous sources.

To mitigate the distress caused by power shortage to the new industrial units coming up in the country, the State Governments have been advised that when delays in the commissioning of the new power projects become known, their concerned prospective consumers should be kept informed of ths delays so that they might readjust their own programmes and plans. It has also been arranged that a representative of the Ministry of Irrigation and Power should be invited to attend the meetings of the Licensing Committee to watch this particular aspect. The State Governments have been requested to express a definite opinion regarding availability of power whenever they sponsor a new undertaking or a substantial expansion of an existing one involving demands of over 2,000 KW. to be licensed.

ADDITIONS TO THE THIRD PLAN POWER PROGRAMME

The following are the power schemes that have been included in the Third Plan after its finalisation. Their aggregate capacity is 500 MW.

(i) 125 MW.—Trombay in Maharashtra.
(ii) 50 MW.—Calcutta Electric Supply Company.
(iii) 5 MW.—Dishlrgarh Electric Supply Company.
(iv) 75 MW.—Durgapur Coke Oven Plant, West Bengal.
(v) 6 x 1.5 MW. package sets in West Bengal.
(vi) 2 x 50 MW. instead of 2 x 30 MW. at Barauni in Bihar.
(vii) 2 x 30 MW. for Kanpur.
(viii) 2 x 50/60 MW. at Satpura instead of 1 x 30 and 1 x 50/60 MW. in Rajasthan.
(ix) 30 MW.—Durgapur Steel Plant.
(x) 40 MW.—Koyna Dam Power House.
(xi) 20 MW. instead of 10 MW. at Kalakot in Jammu and Kashmir.

PARLIAMENTARY COMMITTEE ON PUBLIC UNDERTAKINGS

The following is the text of the Resolution which the Union Minister for Commerce and Industry had tabled in the Lok Sabha for sponsoring a debate on setting up a Parliamentary Committee on Public Undertakings and which was subsequently withdrawn due to

lack of unanimity between the two Houses of Parliament and persistent differences within the Congress Party :

"(1) That a Committee of this House to be called the Committee on Public Undertakings be constituted with ten members who shall be elected from among the members of this House according to the principle of propertional representation by means of the single transferable vote.

(2) That the functions of the Committee shall be—

(a) to examine the reports and accounts of the Public Undertakings specified in the Schedule ;

(b) to examine the reports, if any of the Comptroller and Auditor-General on the Public Undertakings ;

(c) to examine, in the context of the autonomy and efficiency of the Public Undertakings, whether the affairs of the Public Undertakings are being managed in accordance with sound business principles and prudent commercial practices; and

(d) such other functions as are at present vested in the Public Accounts Committee and the Estimates Committee in relation to the Public Undertakings specified in the schedule by or under the Rules of Procedure and Conduct of Business of this House as are not covered by clauses (a), (b) and (c) above :

Provided that the Committee shall not examine and investigate any of the following matters, namely :

i. matters of major Government policy as distinct from business or commercial functions of the Public Undertakings ;

ii. matters of day-to-day administration;

iii. matters for the consideration of which machinery is established by any special statute under which a particular Public Undertaking is established :

Provided further that with regard to the Public Undertakings specified in Part III of the Schedule, the Committee shall not adopt and pursue any procedures which are not consistent with the interests of security.

(3) That the Committee shall have the power to examine witnesses so however that such examination shall take place in the presence of the representatives of the Ministries concerned.

(4) That as from the constitution of the Committee, the Estimates Committee and the Public Accounts Committee shall cease to exercise their functions in relation to the Public Undertakings specified in the Schedule and steps shall be taken separately to make necessary amendments in the Rules of Procedure and Conduct of Business of this House.

(5) That the members of the Committee shall hold office for a period of five years :

Provided that one-fifth of the members shall retire every year by rotation and the members to retire by rotation every year shall be those who have been longest in office since their last election but as between members who were elected on the same day, those who are to retire shall be determined by lot.

(6) That in other respects the rules of this House relating to Parliamentary Committees shall apply with such variations and modifications as the Speaker may make.

Schedule

(List of Public Undertakings)

Part I

(Public Undertakings established by Central Acts.)

1. The Damodar Valley Corporation.
2. The Industrial Finance Corporation.
3. The Indian Airlines Corporation.
4. The Air India International.
5. The Life Insurance Corporation.
6. The Central Warehousing Corporation.
7. Oil and Natural Gas Commission.

Part II

(Public Undertakings which are Government Companies formed under the Companies Act)

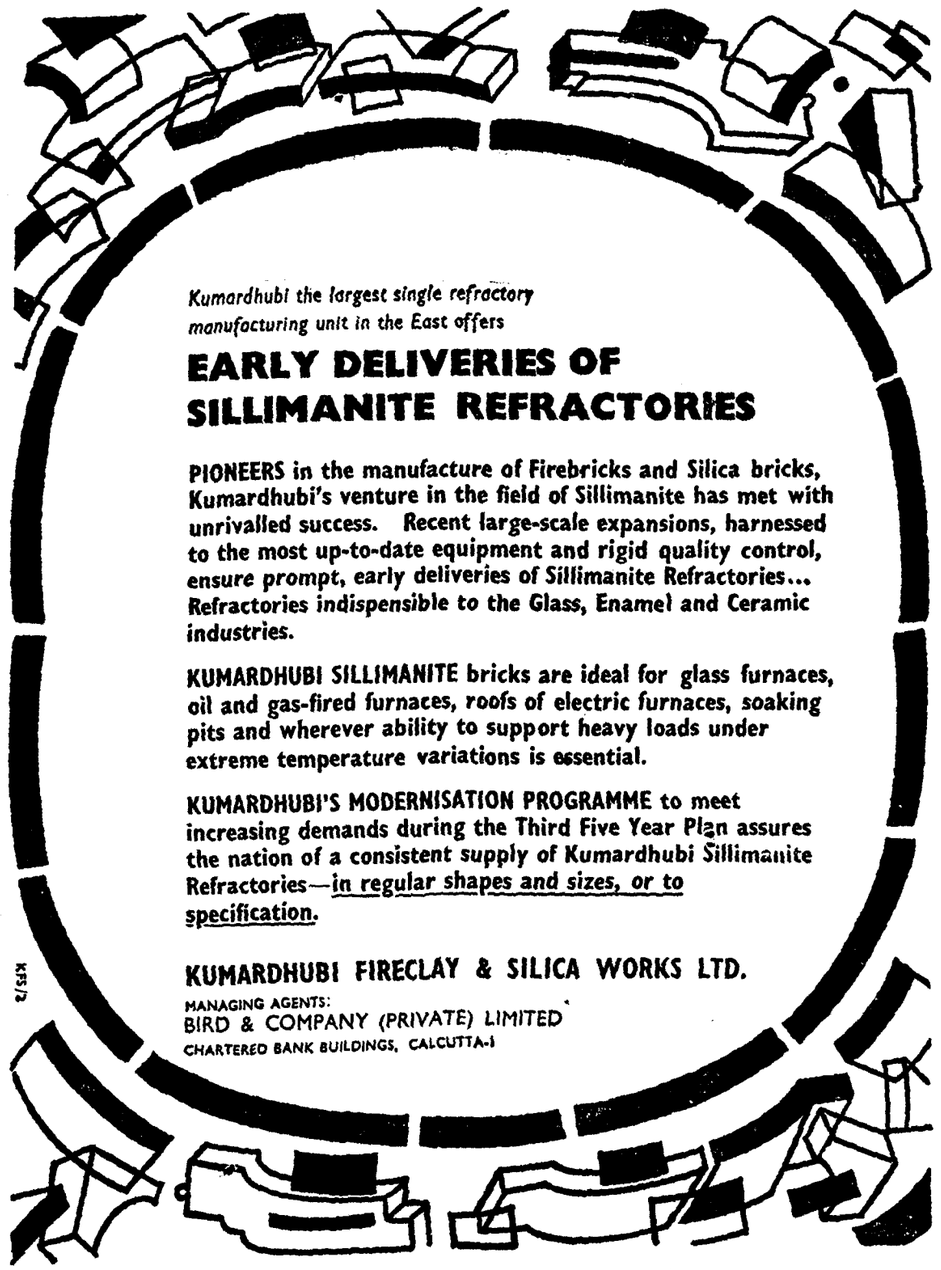
Every Government company whose annual report is placed before the Houses of Parliament under subsection (1) of section 619A of the Companies Act, 1956, other than the Public Undertakings included in Part III hereof.

Part III

1. Hindustan Aircraft Ltd., Bangalore.
2. Bharat Electronics Ltd., Bangalore.
3. Mazagon Docks Ltd., Bombay.
4. Garden Reach Workshop Ltd., Calcutta.

IMPORT SUBSTITUTION

The high level expert Technical Panel on Import Substitution, decided to be set up by the Planning Commission under the chairmanship of Mr. G. L. Mehta, would have as its members Mr. S. Mulgaonkar, Dr. M. D. Parekh, Mr. S. L. Kirloskar, Mr. K. Sreenivasan, Dr. Lal C. Verman, Dr. G. P. Kane, Dr. B. D. Kalelkar, Mr. S. T. Thadani and a representative of the Planning Commission. Mr. K. Rajagopalan will be its secretary.

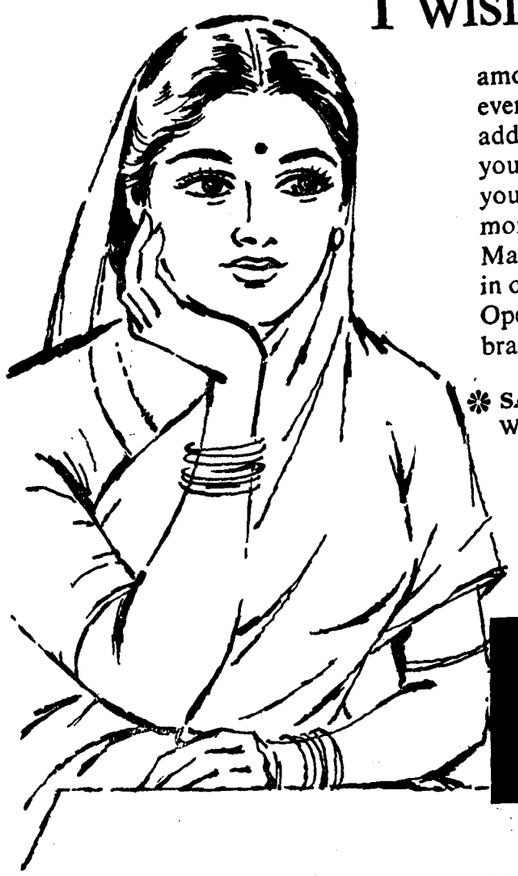


The panel will examine technical and other possibilities of replacing maintenance imports, formulating specific programmes and recommending appropriate measures in respect of specified industries. These industries are industrial machinery and parts (including boilers); cement machinery; paper-making machinery; dairy machinery and cranes; automobiles and ancillaries, including diesel and petrol engines; construction equipment, including pile driving equipment, earth moving machinery and agricultural tractors; railway rolling stock, equipment and materials; electrical industries; metal-working machines, such as rolling mills, foundry equipment, wire drawing machinery, machine tools, etc.; scientific and industrial instruments; substitutes for non-ferrous metals, fibres, rubber, tinplate, etc., and chemicals and dyes.

According to a Resolution of the Planning Commission, the Panel might make recommendations concerning individual industries as its studies are completed and might also submit interim reports. It might constitute special expert groups for evolving detailed proposals in co-operation with the industries concerned and might, for this purpose, co-opt such members to the Panel or to its experts groups as considered necessary.

RECOGNISING EXPORT HOUSES

The Union Government has adopted a revised scheme for recognition of export houses. Recognised export houses have been assigned an important role in the export promotion plans.



The Government will be prepared to consider according of recognition as an "Export House" to any

institution which satisfies the following conditions:

(a) It should be a company registered under the Companies Act, 1956.

(b) It should be dealing or proposing to deal in a wide range of articles, more specially for exports.

(c) Members of the "Export House" should have substantial standing and experience in export business; failing this, recognition may be on a provisional basis.

(d) It should have a broad programme of exports, which may include financing of production for export (including purchase of raw materials), market surveys, participation in fairs and exhibitions, advertising, opening foreign offices as may be approved by Government, after-sales service, warehousing and repacking in foreign countries etc.

(e) It should prepare and work out a plan of export; keep the Government informed periodically of the progress made in this direction; and set high standards in the performance of contracts for exports and, in particular, regarding maintenance of quality, adherence to specifications, delivery schedules etc.

Export houses recognised by the Government will be given adequate facilities to carry out export plans. Such facilities may, where appropriate and necessary, cover incentives to facilitate implementation of particular export plans including release of foreign exchange, assistance for establishing branches or agencies abroad and developing contacts with foreign buyers. The existing procedure of clearing such proposals from the Government of India or Reserve Bank of India will continue to be followed.

The continued recognition of an "Export House" by the Government will be subject to continued good performance on the part of the "Export House" and it will be open to the Government to withdraw such recognition, if in its opinion, an "Export House" has failed to perform quantitatively or qualitatively its functions in the field of exports.

Companies wishing to be recognised by the Government as export houses have to apply to the Directorate of Export Promotion with a copy of the Memorandum and Articles of Association and giving a broad export programme indicating the commodities and countries to which these exports are likely to be in large quantities and also the organisational and other steps proposed to be taken for this purpose. On being recognised as an "Export House" by the Government, the "Export House" will get itself registered as exporters with different Export Promotion Councils for the items covered by these Councils.

DEVELOPMENT WING'S REAPPRAISAL

The Boothalingam Committee set up by the Government to review the working of the Development Wing of the Ministry of Commerce and Industry, according to a statement issued by the Government, will examine the working of the Development Wing in the context of planned industrial development and make recommendations for improvement in—

(i) its structure and organisation;
(ii) the definition of its functions; and
(iii) its methods of working.

The Committee will consider inter alia the Development Wing's status and functions vis-a-vis the Ministry of Commerce and Industry, other Ministries of the Government of India and the Planning Commission, its relationship with industrial units, both in the private sector and the public sector, and its responsibility for the collection and collation of industrial statistics.

The Committee consists of four members, namely, Mr. S. Boothalingam (Chairman); Mr. N. C. Shrivastava, Adviser, Planning Commission (Member); Mr. S. S. Kumar, former Chairman of the Central Water and Power Commission (Member); and Mr. G. Ramanathan, Deputy Secretary, Department of Iron and Steel, Ministry of Steel and Heavy Industries (Secretary). It is expected to submit its report within a period of three months.

The setting up of this Committee follows the recommendation of the Estimates Committee in its 133rd Report on the Development Wing to the effect that since the Development Wing had functioned for a long enough time to necessitate a comprehensive review, its was prudent to institute this review with the purpose of not only to improve the working and efficiency of the Development Wing, but also to ascertain its exact impact on the industrial development of the country.

ALUMINIUM MANUFACTURE

The Government of India has issued a "letter of interest"—a new term coined for the issue of provisional licences to an industrial unit to allow it to process its manufacturing programme to a stage when a licence under the Industries (Development and Regulation) Act can be issued to it — to Hindustan Aluminium Corporation to step up its capacity by 30,000 tons to 50,000 tons per annum. Whether this expansion would be allowed to take place in the Third or in the Fourth Plan period will largely depend on the implementation of the other two aluminium manufacturing projects in the private sector.

It is regretted in knowledgeable circles here that the Mysore Aluminium Project is still facing heavy weather. Although the project depends on Maharashtra for its basic raw material, attempts, it is believed, are being made to bypass this State which under the scheme has been allocated 6 per cent share in its equity capital. The handling of the project is stated to be having unfortunate reactions on the foreign collaborator, Reynolds of the United States.

SHELL INTERNATIONAL'S NEW VENTURE IN INDIA

The Union Government has also agreed to issue "a letter of interest" to Shell International Chemical Company, of Great Britain, to manufacture 1,200 tons yearly of Isopropyl alcohol, 6,000 tons of acetone, 2,400 tons each of Diacetone alcohol and methyl isobutyle ketone, 840 tons byproduct polymers residual propane. The proposal envisages the use of Propylene gas from Burmah Shell Refineries in Trombay for establishing a plant for the manufacture of Isopropyl alcohol, acetone and other solvents. Technical know-how will be available from Shell International. Foreign exchange requirements will be met by 60 per cent equity participation by the overseas applicant. The balance capital will be offered to Indian companies.

India's demand for acetone is placed at 9,500 tons by 1965-66 and 18,000 tons by 1970-71. This includes conversion of acetone to other derived solvents like diacetone alcohol etc. Against the 1965 requirements of 9,500 tons of acetone, India has already licensed capacity of approximately 11,000 tons. Out of this, 1,500 tons capacity is in operation, but no effective steps have been taken so far for implementing the remaining capacity.

Shell International has indicated that it might be prepared to consider the payment of royalties involved as a lump sum and as a part of equity shares. Terms of collaboration with the overseas subsidiaries will be

subject to further consideration separately. Shell International will float a rupee company to undertake this venture. The "letter of interest" is a prelude to the issuance of a regular industrial licence which would be granted after the terms of collaboration have been approved by Government.

EXPANSION OF THE NEYVELI POWER STATION

Negotiations are stated to be in progress with the Soviet authorities for the supply of plant and machinery for the Neyveli thermal power expansion scheme which is expected to be implemented by the end of the current Plan period.

The scheme envisages stepping up of power generation at Neyveli to 4 lakh KW. When this potential is reached, 1.29 lakh KW. of power will be consumed by the industrial units included in this complex. After allowing for a stand-by unit for periodical overhaul, the net firm power which will be fed from this source into the Madras State Electricity Grid will be between 1.7 lakh KW. and 2.21 lakh KW.

COAL WASHERIES

The existing washeries of Hindustan Steel Limited are envisaged to be expanded during the current Plan period. Besides this, the National Coal Development Corporation is planning to set up six new washeries for coking coal and two new washeries for non-coking coal. Three of the NCDC's new washeries, however, are expected to come up only in the Fourth Plan period.

Two coking coal washeries are also planned to be set up in the private sector. Some of the public sector washeries are being linked with foreign credits; foreign technical assistance would be available for them.

THE BRNO TRADE FAIR

Holding a unique place among the trade fairs held all over the world so far as specialisation is concerned, the Fourth International Trade Fair to be held at Brno from September 9 to September 23 would be surpassing all the previous three such fairs held in this second largest city of Czechoslovakia not only in the wide range of engineering products that would be on display, but also in respect of the interest being shown by the participating countries from both sides of the Iron Curtain. As many as 41 countries, belonging to the European, the African, the American and the Asian continents, would be participating in this Fair, the prominent among them being the U.S.A., the U.K., West Germany, France, the Soviet Union, Poland, and the German Democratic Republic, besides the host country. India would be represented at this Fair by five leading concerns, two of them dealing with handicrafts, one with agricultural machinery, one with hides and skins and the remaining one with mica industry. Government of India is not officially taking part in the Fair, but this is due to the fact that an invitation from the Czechoslovak Government for its participation came rather too late. The Indian Government, however, is understood to have assured the Czech authorities that India would officially participate in the next Brno Fair.

About 50 Indians are expected to visit the Fair to study the latest techniques developed in the engineering industries. Two of these would be officials from Madras connected with the Heavy Boilers Plant to be set up at Trichy with Czech collaboration. Some of the Czech exhibits are envisaged to be sent to India after the Fair for utilisation in the setting up of the Heavy Machine Tools and Foundary/Forge plants at Ranchi and the Steam Turbines unit at Hyderabad. All these three plants are being set up in the public sector with Czech assistance. The Trichy Heavy Boilers Plant is still in the preparation stage. The equipment to be supplied to it, part of which would be on display at the Brno Fair, will, of course, be shipped later when required.

In the course of the Trade Fair, the Czechoslovak Scientific and Technical Society will be organising an international scientific and technical symposium.

Talks between India and Czechoslovakia for the extension of the current trade agreement between the two countries, which expires on December 31, 1962, are expected to take place next month. An Indian delegation is shortly leaving for Prague for this purpose. This year trade between India and Czechoslovakia is anticipated to go up to Rs. 40 crores, both ways. There is a proposal to step up this trade to about Rs. 100 crores in course of time. During the ensuing trade talks this aspect will obviously be borne in mind by the two parties. There is, thus, every possibility of providing for more trade between India and Czechoslovakia next year by the inclusion in the new pact of some more commodities that the two countries are in a position to export.

IN BRIEF....

Messrs. Engineering Developments Ltd., Calcutta, and the East Asiatic Company (India) Private Ltd., Bombay, hold licences under the Industries (Development and Regulation) Act for the manufacture of power-tillers, sometimes known as small tractors, of below 10 H.P. Neither of these companies, however, has yet gone into production.

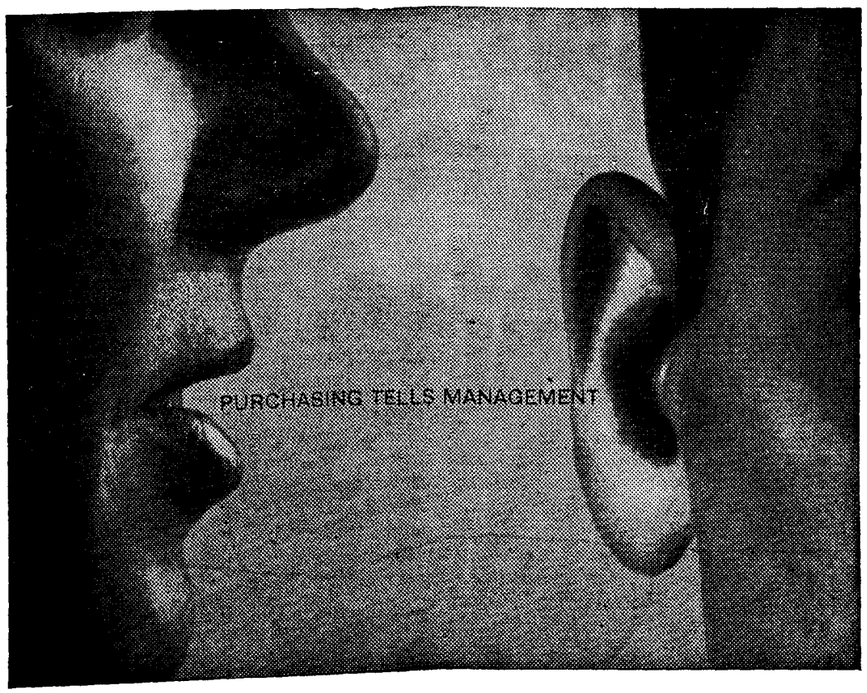
*

A Bill has been introduced in the Rajya Sabha to enhance the rate of contributions under the Employees Provident Fund Act, 1952, from 6¼ per cent to 8 per cent of basic wages, dearness allowance and retaining allowance, if any, in cigarettes, electrical, mechanical and general engineering products, iron and steel and paper industries. Necessary notifications enhancing the rate of contributions from 6¼ per cent to 8 per cent of the total emoluments under the Coal Mines Provident Fund Scheme with effect from October 1, 1962, have also been issued.

*

A joint meeting of the Import Advisory Council and the Export Promotion Advisory Council will be held here on September 8, 1962.

*

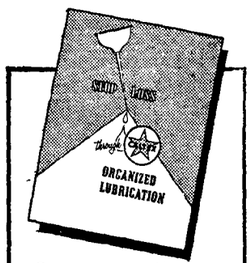


The Ministry of Commerce and Industry has set up a planning cell, under the chairmanship of Dr. Rao, to prepare its schemes for the Fourth Five-Year Plan.

*

Eighty cases of foreign collaboration were approved by the Government during the quarter ending June 30, 1962, as against 123 cases approved in the previous quarter. They included 23 arrangements with the United Kingdom firms, 11 with those of the United States, 13 with West German concerns, 6 each with French and Swiss concerns, 5 with Italian firms, 3 with those of Sweden and one each with Canadian and Norwegian interests.

*



Till the end of August, 1962, as many as 461 "show cause notices" had been issued by the Government to industrial licensees. Till then, 129 industrial licences had been revoked and time-limit in respect of 62 had been extended. The largest number of "show cause notices" that have been served so far are to cotton textile licensees, followed by those holding licences for manufacturing machine tools, automobiles and automobile ancilliaries.

The CALTEX "Stop-loss" Programme helps cut plant-wide maintenance costs as much as 15%

"Stop-loss" organises lubrication throughout the plant—from purchasing on through actual application. By specifying multi-purpose lubricants and by eliminating duplication, a "Stop-loss" Programme can reduce the number of lubricants needed by as much as 50%. By streamlining purchasing procedures the programme can cut the number of purchase orders.

Best of all—by assuring proper lubrication to every piece of equipment in the plant, a "Stop-loss" Programme helps extend equipment life. Result—plant-wide maintenance savings upto 15%. *Ask your Caltex Sales Engineer for information.*

Company executives can obtain a free copy of this booklet by writing on their official letter-head to their nearest Caltex office.

NEWS IN BRIEF

INDIA

Provision has been made for setting up 80 new post offices in the Ladakh District during the current Plan period.

*

India has been allotted an export quota of 3,60,000 coffee bags for the year 1962-63 by the executive committee of the International Coffee Conference.

*

The NEFA administration has announced a programme of rehabilitating some 5,000 Tibetan refugees along the NEFA frontier. Model villages with suitable amenities will be built for this purpose.

*

India has been allocated an additional export quota of 497 short tons of sugar by the United States Agricultural Department.

*

The Union Government has established three land customs stations in the Western region of the Indo-Tibetan border.

*

The Union Home Minister will lay the foundation stone of a six-storey super-market in Connaught Circus, New Delhi, on September 10. The market will be equipped with escalators and lifts and will accommodate nearly 300 shops and commercial establishments. The construction work would begin this month.

*

Changes in the Iron and Steel Controller's organisation are being contemplated with a view to ensure better distribution of steel among the consumers.

*

Preliminary work in connection with the development of Tuticorin as a major all-weather port has been started.

*

The Government of Punjab plans to start 20 industrial training institutes in the State next year at an estimated cost of over Rs. 8 crores. Each of the 17 districts in the State will thus have at least two or three institutes, which will provide a two-year technical training to about 9,000 students.

*

A Press Institute for India affiliated to the International Press Institute, Zurich, will come into existence next year.

*

The Governing Body of the Indian Council of Agricultural Research has sanctioned 99 new projects and extended 112 projects at a total cost of Rs. 158 lakhs.

*

The Government of India is studying the offers of technical and financial collaboration from many foreign firms for the construction of the second ship yard in Cochin.

*

The Government of India proposes to establish five export promotion councils to cover the entire international trade area.

*

Three tea centres will shortly be opened in the UK and seven more in the European capitals and other cities as a measure to inculcate tea drinking habit among the people there.

*

The State-run NEPA newsprint and paper mills has plans to produce 60,000 tons of paper per annum during the rest of the current plan period as against the present annual production of 25,000 tons.

*

The Geological Survey of India plans to undertake an intensive study of the Diamond belt in Andhra Pradesh.

FOREIGN

The United States Government has granted a $42 million interest-free loan to Pakistan, to help her in importing basic commodities for the Projects included in Pakistan's Second Plan.

*

The Inter-American Development Bank has approved a $3,850,000 Social Progress Trust Fund loan to help finance the construction of 8,500 houses for low-income families in Brazil.

*

The West German Minister of Transport has announced a major plan for the expansion of the famous autobahn motorway network from 2,700 miles to 3,700 miles by the end of 1970. This project costing DM 13,000 million, will be undertaken simultaneously with further improvements in the federal highways network, involving the construction of 2,400 miles of new routes and 4,800 new bridges.

*

The United Steel Companies Ltd., Sheffield, has announced the installation of a plant for the continuous casting of steel in the Appleby-Frodingham Steel Company of Scunthorpe, Lincs., England. Built at a cost of £1 million, this plant, with an annual capacity of 250,000 tons of semi-finished products, is designed to cast continuously 9 in. square blooms in four strands simultaneously.

*

Brazil has joined a UNESCO-sponsored agreement on the free entry of education films, sound recordings, glass slides, wall charts, maps and posters.

*

British scientists of the Vegetarian Nutritional Research Centre, Hertfordshire, England, have developed a method for producing milk from outer cabbage leaves, pea pods and other greenstuffs. The centre is in close contact with the Central Food Technological Research Institute in Mysore who work along the same lines, but with groundnut instead of green leaves.

Commercial production in this line after the necessary period of further experiments could open a new chapter in the nutritional needs of under-developed countries.

*

The Soviet Union has provided a credit of $100 million for the construction next year of a big oil refinery in the Red Sea port of Assab, Ethiopia. The refinery will have an annual capacity of 500,000 tons of Petroleum.

The Nissan Automobile Company, Japan, will export 2,900 Blue Bird Small cars to Finland at a price of US $778 f.o.b. per car.

*

The first state-owned Tea factory of Ceylon was opened recently by the Minister of Agriculture and Lands. Built at a cost of Rs. 1,300,000 with local material, the factory has an annual production capacity of one million tons of tea.

*

Agreement was reached between two Yugoslav companies and the Ethiopian Ministry of Mines for the delivery of equipment worth $580,000 for the Adola gold mines.

COMPANY AFFAIRS

BIRLA JUTE

The Directors of the Birla Jute Manufacturing Company Limited indicate in their annual report for the year to March 31, 1962, that all the four units of the company worked efficiently throughout the year. The company had borrowed Rs. 33.3 lakhs from National Industrial Development Corporation for modernisation of its jute mill machinery. Although this loan was repayable in instalments upto July 1, 1974, it is indeed a measure of the company's economic strength that the whole of the loan was repaid in full in June, 1962. It can be concluded therefore that the company has done admirably well.

The conditions regarding raw jute continued to be difficult till the middle of September, 1961 and these mills had to reduce working hours and to block looms. The situation, however, changed as the crop for 1961-62 came in. Demand for jute goods has been extremely good since January 1962, may be due to increased world consumption. The jute industry, the Directors add, was able to work with larger capacity during this year. The prospects during the coming year also look quite bright. The Government of India has already permitted the mills to import the additional spinning machinery.

The company's cement plant at Satna worked smoothly throughout the year. The total clinker produced during the year was 2.14 lakh tons and the total cement produced was 2.51 lakh tons. The capacity of plant during the next year will rise from 750 tons to 1750 tons per day. Plant and machinery have already arrived and the plant will be put into commission about the middle of 1963.

The spinning mill for staple fibre also worked satisfactorily with an installed capacity of 30,000 spindles. The calcium carbide factory of the company, the Directors point out, started receiving power supply from the State Electricity Board which has enabled the furnaces to attain a combined output of 35 tons of carbide a day.

This year's surplus of the company was Rs. 160.28 lakhs. After the provision of depreciation (Rs. 63.62 lakhs), taxation (Rs. 42 lakhs), development rebate reserve (Rs. 4.33 lakhs) and general reserve (Rs. 17.82 lakhs), the Directors have recommended the payment of a dividend on ordinary shares of Rs. 10 each at the rate of Rs. 1.50 per share (15 per cent per annum). This will absorb Rs. 23.93 lakhs. After the payment of a dividend on preference shares, there will be a balance of Rs. 1.08 lakhs which is proposed to be carried forward.

UNIVERSAL ELECTRICS

The Directors of Universal Electrics Limited have submitted their first annual report for the period to March 31, 1962. The company was incorporated on February 3, 1961. The company has undertaken a project of manufacture House Service Meters in collaboration with Messrs. Mitsubishi Electric Manufacturing Co. Ltd., of Japan. A public issue of its capital was made in January this year and was over-subscribed in spite of the list being closed on the fourth day. Work at the factory site has since begun and at present the building is under construction. The plant is expected to commence trial production by the middle of next year. Other necessary arrangements are also being made. The expenditure as shown in the Balance Sheet under the heading "Construction Period Expenses" amounting to Rs. 62,28,449 will be allocated to the Fixed Assets on completion of the factory buildings and erection of the machinery.

ACC - VICKERS BABCOCK

The Third annual report of ACC - Vickers Babcock Ltd., for the year ended March 31, 1962, gives a very interesting reading. It is reported that the great part of construction work at Durgapur has been completed ahead of schedule. Although certain heavier machine tools have yet to arrive from abroad, it is expected that the initial construction programme will be completed and works fully equipped by the end of September, 1962. The company has received firm orders for the manufacture and delivery of boiler plant to the extent of an estimated value of Rs. 8.23 crores. Further projects are in hand and Directors are hopeful that orders for further 5 boiler units of the value of Rs. 7.5 crores will be received. Orders for cement-making machinery and ancilliary plants have also been received to an estimated value of Rs. 68.76 lakhs.

The Directors add that the company has issued 4,00,000 equity shares of Rs. 100 each against which payment has been made in full. During the year, First Mortgage Debentures of the face value of Rs. 3.3 crores were issued in favour of the State Bank of India as security against cash-credit arrangements of upto Rs. 3.3 crores. Seven per cent Third Mortgage Debentures of a total value of Rs. 2,02 lakhs (on which interest is not payable upto 31st March, 1964) were issued in favour of The Associated Cement Companies Ltd., Vickers Ltd., London, and Babcock & Wilcox Ltd., London, in the proportions of 50 per cent, 25 per cent and 25 per cent. Negotiations for the loan of £1 million Sterling from Babcock & Wilcox Ltd., London, or their Nominees are progressing and it is expected that this loan against the pledge of Second Mortgage Debentures will be made available before the end of the current year.

NEW ISSUES

Six companies are given consent by the Controller of Capital Issues to issue capital totalling Rs. 2.15 crores. Of these, two are banks and one is an insurance company. Two companies are issuing bonus shares. The consent of the Controller in all cases is valid for 12 months.

Jayanti Shipping Co. (Pvt.) Ltd., Delhi, is issuing Rs. 2 crores divided into 2,00,000 equity shares of Rs. 100 each, to be issued for cash at par. The proceeds of the issue will be utilised in paying off the balance of amount to the sellers of the oil tanker 'Adi Jayanti' and getting it released from mortgage.

The Panipat Woollen & General Mills Co. Ltd., Kharar (Punjab), having a paid-up capital of Rs. 10,51,984 will raise further capital of Rs. 3,12,630 divided into 31,263 equity shares of Rs. 10 each to be issued as bonus shares on capitalisation of the company's general reserve to a like extent.

Asian Distributors Ltd., Rajasthan, is issuing bonus shares of the value of Rs. 5 lakhs on capitalisation of reserves to a like extent.

Sri Mayuram Bank Ltd., Mayuram, is to issue capital of Rs. 2,54,000 in 2,540 class shares of Rs. 100 each, for cash at par. The proposed issue will strengthen its capital base.

Indian Mercantile Insurance Co., Ltd., will capitalise Rs. 4,23,060 from its reserves for the purpose of raising the paid-up value of 42,306 shares already issued from Rs. 40 per share to Rs. 50 per share.

The Chettinad Mercantile Bank Ltd., is to issue capital of Rs. 1,800 in 18 shares of Rs. 100 each, for cash at par, Rs. 60 per share paid-up. The proposed issue will strengthen its capital base.

THIS IS ONLY AN ANNOUNCEMENT AND NOT A PROSPECTUS AND PERSONS INTERESTED IN THE MATTER ARE REQUESTED TO APPLY FOR A COPY OF THE PROSPECTUS FOR FULL DETAILS.

"An industrial Licence has been obtained from the Central Government for the establishment of this new Industrial Undertaking of which a copy is open to public inspection at the Head Office of the Company. It must be distinctly understood that in granting this Licence, the Government of India do not take any responsibility for the financial soundness of this undertaking or for the correctness of any of the statements made or opinions expressed in regard to it."

"Consent of the Central Government has been obtained to this issue by an order of which a complete copy is open to public inspection at the Head Office of the Company."

A copy of the Prospectus with the documents required to be attached thereto has been filed with the Registrar of Companies, Maharashtra, Bombay, for registration. Applications are invited only on the basis of the Prospectus, copies whereof may be obtained at the Registered Office of the Company, its Bankers, Underwriters and Brokers mentioned herein.

Application will be made to the Stock Exchange, Bombay, for admission of the Company's shares dealings on the exchange and for an official quotation.

Registered Office : 31, Western India House, Pherozshah Mehta Road, Fort, Bombay-1.

OBJECTS OF THE COMPANY

The Company was incorporated for establishing a Sugar Factory at Chitalanagar in District Sholapur (Maharashtra State), at a distance of 90 miles from Poona. The factory having a crushing capacity of 800 tons of sugarcane per day will produce approx. 1,38,000 bags of sugar by crushing about 1,20,000 tons of sugarcane during an average crushing season of 150 days.

PROGRESS MADE BY THE COMPANY

Construction of the main Factory Buildings has been already completed. After proper investigation the bulk of the plant and machinery has been purchased from indigenous sources at comparatively cheap prices thereby bringing down the capital cost to a considerable extent. The experts have opined that the selection of the machinery has been well planned, and efficiently made with modest capital cost. The Company has already spent Rs. 63,90,000 towards the project.

START OF PRODUCTION

As the construction of the Buildings and the erection of the machinery have reached an advanced stage, the Company expects to go into production during the manufacturing season of 1962-63.

LOCATION AND ITS ADVANTAGES

The Factory is ideally situated at Chitalenagar, in frost free canal zone. The supply of water is abundant and labour comparatively cheap. The supply of sugarcane in the neighbouring areas is quite adequate with an average yield of about 50 to 60 tons of sugarcane per acre and an average sugar recovery of about 11½ per cent to 12 per cent, the yield and recovery both being reckoned as amongst the highest in India.

There is a ready market for sugar in the area surrounding Chitalenagar which obviates necessity of long distance transport.

LOAN FROM INDUSTRIAL FINANCE CORPORATION

After a very careful study of the Company's project the Industrial Finance Corporation of India has sanctioned a loan of Rs. 32 lakhs on the first mortgage of the fixed assets of the Company, and has already paid an interim loan of Rs. 20 lakhs.

MAHARASHTRA AGRICULTURAL LANDS (Ceiling on Holdings) Act 1961

The Company is not covered by the provisions of the above mentioned Act as it does not have sugarcane plantations of its own.

ESTIMATED CAPITAL OUTLAY, AND FINANCIAL REQUIREMENTS

Particulars	Expansion incurred	Expansion to be incurred	Total	Other financial requirement
	Rs.	Rs.	Rs.	Rs.
(1)	(2)	(3)	(4)	(5)
1. Expenditure on Land & Buildings, Plant and Machinery etc.	63,90,000	20,91,000	84,81,000	
2. Margin for working capital	Nil	5,00,000	5,00,000	
3. Expenses of this issue	—	—	—	1,27,000
4. Repayment of dues to Holding Company	—	—	—	23,78,000
5. Repayment of dues to sundry creditors	—	—	—	1,38,000
TOTAL	63,90,000	25,91,000	89,81,000	26,43,000

FINANCIAL RESOURCES

It is proposed to raise the above amount of Rs. 25,91,000 and Rs. 26,43,000 totalling Rs. 52,34,000 from the following resources :

	Rs.
1) Proceeds of this issue	28,83,990
2) Balance amount of the loan from Industrial Finance Corporation of India	12,00,000
3) Borrowings from Banks and others ..	11,50,010
TOTAL	52,34,000

The Holding Company has assured this Company that it will make available to this Company adequate sums towards any unexpected increase in the estimated capital cost of the project if any, or towards working funds that may be required over and above borrowings from Banks, out of its loan of Rs. 23,78,000 proposed to be repaid by this Company, as shown above.

SCOPE AND PROSPECTS

The Industrial Licence granted to this Company is so far the last in the private sector in the State of Maharashtra, as further licensing of new units has been suspended.

With growing population of the country, demand for sugar is continuously increasing. The demand for sugar will further increase with exports rising.

During the last year India produced about 27.10 lakh tons of sugar against a target of sugar production of 35 lakh tons at the end of the Third Five-Year Plan. There is, thus a wide gap to be filled. With exports growing and internal consumption of sugar increasing, experts believe the present surplus position of the sugar stocks is likely to be a temporary phase.

ESTIMATED PROFITS

On the basis of existing prices and manufacturing cost arrived at after careful investigation, and also after considering the substantial savings effected in capital outlay, it is estimated that in the absence of any unforeseen circumstances, the Company will be in a position to provide an attractive return to the shareholders. As the plant is expected to go into production during the manufacturing season of 1962-63, it is expected that the Company will earn profits earlier than similar new units which usually take about 2 to 3 years to start operation.

UNDERWRITING COMMISSION AND BROKERAGE

The underwriters will be paid an underwriting commission of 2 per cent on the face value of the shares in terms of the underwriting agreement with them.

Brokerage at the rate of 1 per cent will be paid on all allotments made in respect of applications bearing the stamp of a Bank or a recognised broker including the Managing Broker. Brokerage on the same basis is payable to the underwriters, in addition to the underwriting commission, on all allotments in respect of applications made or procured by them and bearing their rubber stamp.

No commission and/or brokerage will be payable to the Underwriter, Managing Broker, Brokers or Bankers to this issue in respect of shares which may be allotted to Chitale Agricultural Products Limited, the Holding Company of this Company.

APPLICATION FOR SHARES

Application for shares should be made on forms accompanying the Prospectus and should be sent before the closing date of the subscription list to the Bankers of the Company at their Head Office or any of their Branches in India or the Managing Broker or Brokers to this issue or to the Registered Office of the Company, duly accompanied by the amount payable on application. Up-country drafts or cheques should not include Bank Charges, as the Collection Charges will be borns by the Company.

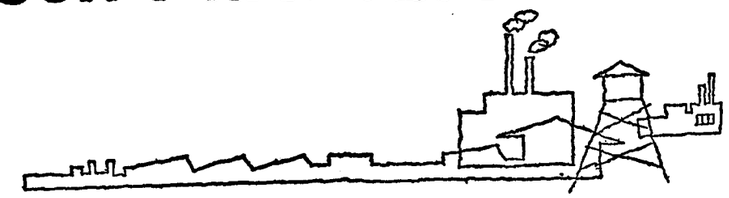
THE SUBSCRIPTION LIST WILL OPEN AT THE COMMENCEMENT OF BANKING HOURS ON 12TH SEPTEMBER, 1962 AND WILL CLOSE AT THE CLOSE OF BANKING HOURS ON 19TH SEPTEMBER, 1962 OR LATER AT THE DISCRETION OF THE DIRECTORS.

Company Meetings

THE SOUTH MADRAS ELECTRIC SUPPLY CORPORATION LTD.
TIRUCHIRAPALLI

Address delivered by Sri K. A. P. Visvanatham, Chairman, at the 22nd Annual General Meeting of the Company held on 30th August, 1962.

It is my privilege to once again preside over and welcome you to an annual general meeting being the Twenty-second meeting.



Since we met last year about this time, I am glad to say that we have generally done well as would have been revealed to you by the Directors' Report, the Auditors' Report on the accounts, the Balance Sheet and the other statements which have been in your hands for sometime now and which I have no doubt have had your careful scrutiny and attention. I therefore will take these documents as read and will invite your comments on them after the close of this address.

As has been mentioned in th Directors' Report, we executed capital extensions to the value of nearly Rs. 20 lakhs, which I consider a fair and satisfactory achievement. At the same time, I hasten to add that the demand for electric power is so great that there is yet a large measure of dissatisfaction from the unsatisfied applicants for agricultural and other categories of power, a state of affairs which, while causing us a lot of mental exercise, is from the national point of view a healthy sign being an index of the rate of growth of our prosperity.

The Government of Madras were pleased to give us loans to the extent of Rs. 15,24,634 for executing rural schemes in the year under review. We proposed to execute all these schemes in the current year besides urban extensions and system improvements to the extent of Rs. 10 lakhs from our internal finances.

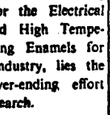
It is the declared policy of the Madras Government to electrify all the villages in the State in this plan period and we have agreed to wholeheartedly participate in this venture, by accelerating and executing construction programmes on the one hand and also by handing over to the State Electricity Board such parts of the area which are more contiguous to their expansion plans. We have also submitted to the Government of Madras that the loan assistance should be substantially increased to meet the demands of such an enlarged programme of work and we expect that this request will

JENSON & NICHOLSON-1962

PAINT AT WORK FOR INDUSTRY

J & N's FIRST PAINT WAS AN INDUSTRIAL COATING

—a glossy, lustrous varnish called 'Japan Black' It was used to paint 'society' carriages—the status symbol of 19th century London. Little did John Jenson suspect in 1821 that his Japan Black was destined for fame. It was to become the forerunner of a varied range of J & N coatings. Today, J & N can meet any industrial need.



APPLYING THE THREE 'R's' AT J & N

Range.....Reliability.....Resourcefulness—words which thoroughly sum up J & N's service to industry. The *range* is exhaustive—it extends from finishes for folding chairs to marine paints for ships; from polychromatic enamels for typewriters to non-yellowing whites for fans. *Reliability* is as much part of a J & N coating as the shade of colour—the happy result of J & N's achievements as Solventless Insulating Varnishes for the Electrical Industry and High Temperature Stoving Enamels for the Cycle Industry, lies the tireless, never-ending effort of J & N research.

WHEN MR. A WANTS TO PRODUCE A MORE ATTRACTIVE FAN...

...he approaches the J & N Technical Advisory Service. Mr. A's problem is simply stated: he wants to improve the finish of his product in appearance and durability. One of J & N's Industrial Representatives—an experienced chemist—visits the factory and discusses the entire problem. He may make recommendations on the spot, or return to the laboratory and work out a detailed plan. The scheme accepted, the representative supervises application at Mr. A's factory till he is satisfied that a more attractive fan has been produced. If *you* have a paint problem, call, write or 'phone J & N.

NOT JUST ANYONE'S CUP OF TEA !

A number of conventional treatments were tried and found wanting. Much time was wasted. A lot of money was spent. The Tea Industry had a paint problem and it wasn't just anyone's cup of tea ! Then they were introduced to EPILAC...The trade name for a range of outstanding Epoxy based industrial coatings, Epilac is noted for toughness, adhesion, good gloss retention and resistance to staining, heat and chemicals. When the Tea Industry required coatings which could be successfully used for cement floors, machinery etc., J & N recommended Epilac. It suited the industry to a 'T'. Write to Jenson & Nicholson at 2 Fairlie Place, Calcutta 1, for your free copy of the booklet 'Paint For The Tea Industry'

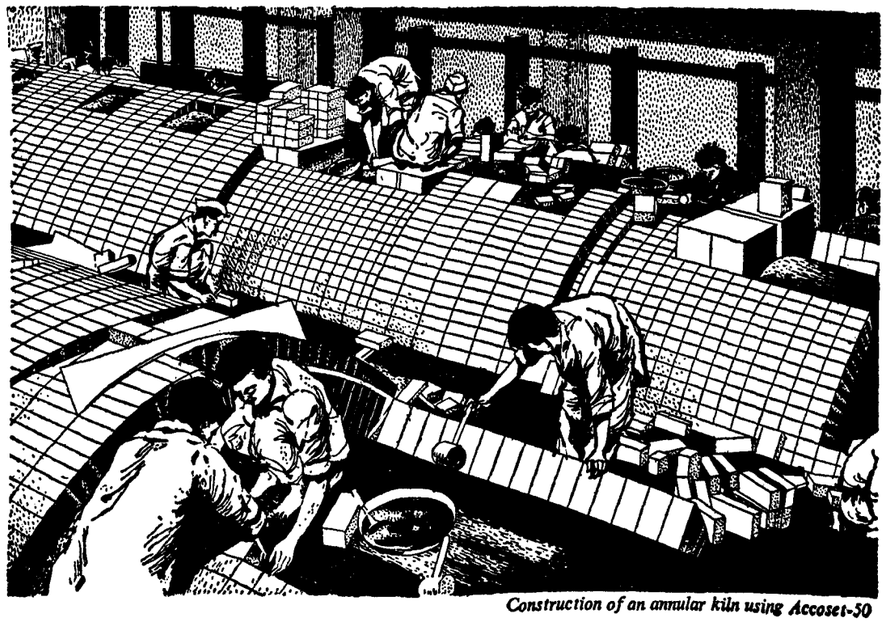
J & N PAINTS = $...£...₹

Keenly aware of the country's need for foreign exchange, J & N contributes to the national effort by providing specialised coatings to exporting industries. Almost all cycles exported are finished with J & N products. Sewing Machines...Electric Fans...Insulating Cloths...all kinds of manufactured goods carry J & N coatings to foreign markets.

In this challenging period of economic expansion, J & N continues to play an increasing role in providing India's new and growing exporting industries with the indispensable components they must have.

Do you often SEE RED ?
In which of J & N's shades ?

century-old policy: quality first ! J & N's *resourcefulness* has led to coatings like the popular rivelling enamel, with its wrinkled finish, so often found on cameras, office equipment etc. Equally ingenious is the polychromatic finish which reflects light in all directions. At J & N, the phrase 'paint is one of the lubricants of industry' finds practical outlet.



RESEARCH PRODUCES RESULTS

The research laboratory at the J & N factory near Calcutta is geared to a fine degree of up-to-the-minute efficiency. When necessary, it draws upon the pooled knowledge of J & N laboratories abroad. Behind such

EPILAC Primers and Finishes are outstanding for their toughness, adhesion, high gloss and resistance to staining, heat and chemicals. Backed by J & N's world-wide experience, EPILAC is one of a number of coatings specially formulated by J & N to meet the needs of Indian Industry.
Specify EPILAC Primers and Finishes for
- Excellent adhesion to the most difficult surfaces
- Toughness comparable to vitreous enamels
- Flexibility and impact resistance not found in other types of industrial coatings
- Exceptional chemical and electrical resistance, particularly in alkaline conditions.

QUALITY SELLS J & N COATINGS

Construction of an annular kiln using Accoset-50

ACC'S REFRACTORY CEMENT

ACCOSET-50

makes linings and joints as strong as the firebricks themselves

Composed of finely ground plastic clays, high alumina burnt refractory materials and special chemicals, **ACCOSET-50** gives good bonding strength and high heat resistance. Once it is dried and burnt **ACCOSET-50** becomes *one with the bricks.*

YOU CAN USE ACCOSET-50

for jointing, repairing and patching
for bonding and laying firebricks of any shape
for protective wash for furnace walls and floors
for monolithic and rammed linings

ACCOSET-50 — your refractory monolithic cement that makes strong joints to improve furnace thermal efficiency

ACCOSET-50 — saves your time, saves your money.

receive the Government's sympathetic consideration.

Position as regards construction materials like poles, conductors and cement has not been too good and these contributed in some measure to delays in construction. But our Managing Agents & Chief Engineers have been alert and have risen to the occasion by scouting round and securing substitute materials wherever possible. I have every confidence that with their ingenuity and enthusiasm our Engineers can fulfil any reasonable programmes we place before them.

We had a short spell of grave power shortage towards the end of June, 1962. This was on account of the delayed onset of the monsoon. Fortunately the crisis was over in a few days, thanks to rains. It is a matter for gratification that one 50MW. set of the Neyveli Lignite Corporation has been put into commission recently. We are informed that the storage position in most of the hydro-electric reservoirs is satisfactory and with the expected commissioning of further power plant at Neyveli in the course of this year, we may not be put to any inconvenience this year. It is however pertinent to point out that the demand for power far exceeds the pace of development throughout the country and this critical race between demand and supply is bound to be there, in spite of the vast and ambitious power development programmes envisaged in the Plan. You would have read in the papers of power shortages in Delhi, Bombay as well as Calcutta areas. I think we got out of the trouble much earlier than the others.

In this context, I would like to pay a special tribute to Sri V. P. Appadurai, who has been the architect of the Madras State Electricity development over the last decade and has been a worthy successor to such stalwarts as Sri Henry Howard and Sri G. Sundaram. He is doing a wonderful piece of work and has successfully placed the Madras State in the forefront of all the Indian States (why all the Asian countries!) in rural electrification and in the planned development of the State's power resources. He has been recently elevated to the position of the Chairman of the Madras State Electricity Board and I would like to tender to him on your behalf and mine our sincerest good wishes and many years of association with the Madras State Electricity Board as its chief administrator.

Besides leading in rural electrification, this State had also the reputation of having had the lowest tariffs in the Republic for electricity supply to industries in particular and comparably advantageous tariffs for agricultural and domestic lighting. This position is likely to suffer a setback now—I mean the enviable status as a producer and seller of cheap power—in view of the costlier thermal power that has to be injected into the power system from Neyveli, Madras and Madurai thermal stations. We should be prepared to accept soon, increases in all tariffs and I may say that this is inevitable, if we take into account the enormous increases in cost of construction and management.

The Government have also decided to levy a graded tax on the electricity supplies made to different classes of consumers, to augment the resources of the State mainly to meet the capital requirements in the plan period. This proposed levy has been received by the consumer-public with mixed feelings—the industrial consumers feeling particularly apprehensive, as even with cheap power they have been at a disadvantage when compared to manufacturers of the Bengal area. I sincerely hope the Government will take cognisance of these indications and afford whatever relief is possible in the interests of industrial growth.

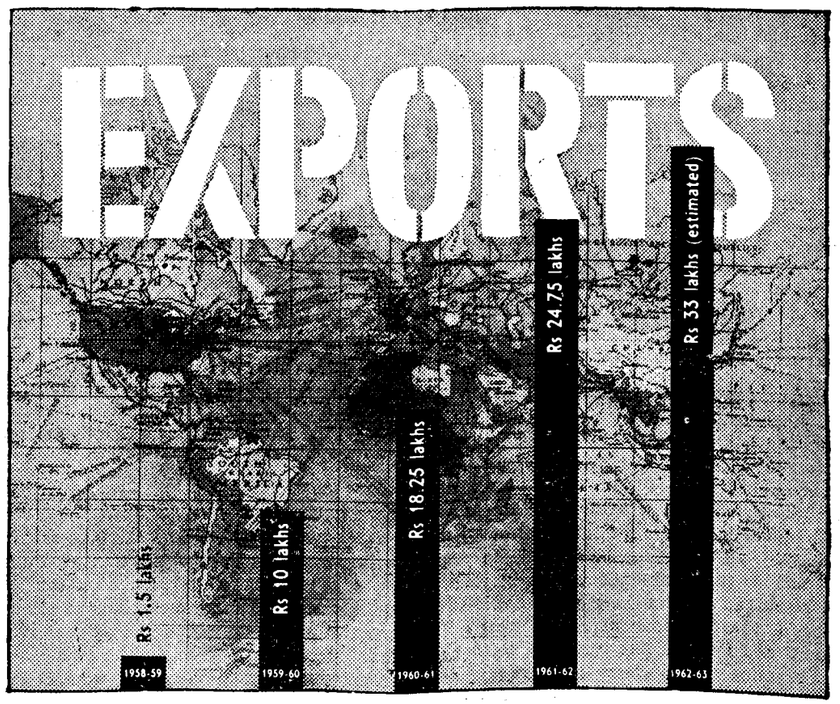
The long standing disputes with the Income-tax authority, which related mainly to rates of depreciation on fixed assets were settled in our favour by the Income-tax Appellate Tribunal; but the Income-tax authorities have appealed against these decisions to the High Court. I should imagine that this will take some further considerable time for a decision to be reached.

Relationship with consumers and power supply applicants has been satisfactory in spite of the inevitable delays in extending supplies to villages. The Directors and the executive of the Company have been constantly exercising their minds as to how best to improve consumer services and accelerate supplies. (If in spite of their efforts there are delays, I appeal to the consumers for patience with the assurance that every effort will be made by us to serve them better and these delays are mainly because of the enormous demand which necessarily involves a planned execution of schemes.)

The Company has made a special appropriation of Rs. 1,21,600 this year also (making up the total of such appropriation to Rs. 2,47,600) for augmenting the Company's capital resources. The appropriation is with reference to the suggestion given by the Federation of Electricity Undertakings of India as a result of their talks with the Government of India and is subject to approval by the Madras Government.

The Federation of Electricity Undertakings has also been ceaselessly working to get some of the stringent provisions of the Electricity Supply Act relaxed or modified so that profitability in Electricity investments is made more attractive to enable private capital to flow in, in a larger measure. I hope this effort will succeed. The indications are, the Government of India are sympathetic and are appreciative of the need of some such measure if capital is to be attracted to the supply industry.

At the level of the Government of Madras, the fact that Sri R. Venkataraman has been assigned charge of Electricity besides industry augurs well for both. He has been an outstanding success as Minister of Industries in placing Madras truly on the industrial field. He is fully aware and conscious of the role played by electricity as a tool to industry and I have no doubt that as Electricity Minister he will bring to bear his unbounded enthusiasm to increase our power resources and power distribution and have always a soft corner "for the private sector" which promises to implement his programmes.



Your Directors have recommended to you for consideration a slight increase in dividend making up 10 per cent for this year as against 9 per cent in the previous years. This has been possible due to slightly increased earnings and I hope we will be able to keep this up in future years.

The Company's staff have been as usual hardworking and devoted to their duties and relations with the Workers' Union have been cordial. I take this opportunity to thank all ranks of staff for their rewarding work.

I would also like to record my sincere thanks to the Managing Agents for their continued and efficient services and take this opportunity to congratulate Mr. H. K. Ramaswami, the Director of the Managing Agents in charge of the South Madras Electric Supply Corporation Ltd., on his nomination by the Government to the Electricity Board's Consultative Council, to represent electricity supply undertakings. I also thank the Government for having selected the right person for the post.

I now move that the Directors' Report, the Auditors' Report and the Balance Sheet as on 31-3-1962 and the Profit and Loss Account for the year ended 31-3-1962 be approved and adopted.

NOTE: This does not purport to be a record of the proceedings of the Annual General Meeting.

The graph Metal Box is proudest of

AN INCREASE OF 20 times in four years! That is the remarkable record of growth in the export value of Metal Box products. Crown corks, decorated tins, Open Top cans, Roll Seal closures, hardware, advertising materials and machinery manufactured by Metal Box go out to twelve countries in West Asia, South Asia, Africa and Europe.

Efficient protective lacquers, high class finish and attractive decoration have helped Metal Box packages sell against fierce competition in these foreign markets. Packers overseas have come to expect not only quality from Metal Box but prompt service and quick delivery at competitive prices. And so today Metal Box closures, containers and other products account for some 3% of the nation's engineering export earnings.

In addition Metal Box quality helped the export last year of *more than Rs 4 crores* worth of Indian goods by providing packages to exacting international standards.

Apart from earning valuable foreign exchange, Metal Box is helping to save it by reducing imports—

- Metal Box manufactures every year nearly Rs 60 lakhs worth of can-closing and bottle-sealing machinery and industrial components — all previously imported.
- Metal Box is constantly striving to conserve imported tinplate by developing alternative packaging materials such as plastics and aluminium.
- Metal Box is developing indigenous sources of supply of previously imported raw materials, putting to maximum use substitute raw materials available locally.

RUBY GENERAL INSURANCE CO., LTD.

Speech delivered by Shri B. M. Birla, Chairman, at the Twenty-sixth Annual General Meeting on Thursday, the 30th August, 1962.

Gentlemen,

It gives me great pleasure to welcome you to the Twentysixth Annual General Meeting of the Company. Your Company was established in the later part of the year 1936 and has thus completed 25 years of its working at the close of the year under review. A study of the progress of the Company during these years will reveal that there has been very satisfactory progress in its all-round activities and the Company occupies today the position of one of the leading Insurers in the country.

The figures given below depict the growth of the Company during the past decade. The net premium has increased from Rs. 74,24,000 in 1951 to Rs. 1,81,80,000 in 1961 which is an increase of 246 per cent.

Net Premiums	1951 Rupees	1961 Rupees
Fire	22,51,756	71,99,127
Miscellaneous Accident ..	39,07,657	94,02,600
Marine	12,64,536	15,78,516
TOTAL ..	74,23,949	1,81,80,243
CAPITAL AND FUNDS ..	79,48,263	1,56,98,056

FIRE DEPARTMENT :

The Fire Premium Income for the year amounts to Rs. 71,99,000 as against Rs. 75,50,000 during the year 1960. The working has resulted in a profit of Rs. 16,13,000 as against Rs. 4,99,000 in the previous year. The Reserves have increased from Rs. 34,19,000 to Rs. 35,99,000.

The Fire Premium rates have again been reduced considerably from July this year by the Tariff Committee. The last rate reduction was from January, 1960 and there seems to be hardly any justification for any further cut so soon. The Indian Insurers are passing through a period of transition and they should be allowed to build up their Reserves, so that they can serve the country in a better way as strong units. They can meet catastrophic losses only if they have satisfactory reserves.

MOTOR AND MISCELLANEOUS DEPARTMENT:

The net premium in this department has increased from Rs. 87,38,000 in 1960 to Rs. 94,02,000 in the year under review with a corresponding increase in the Reserves from Rs. 43,69,000 to Rs. 47,01,000. It is a matter of some satisfaction that this Department which has always been showing heavy losses has this year shown only a small loss of Rs. 39,000. The policy of cautious underwriting being followed by the Company may show better results in future.

The Insurance Association should give more encouragement to the careful and accident free motorists by way of increased 'No Claim Bonus'.

There is large scope for development of the Miscellaneous Accident Business other than Automobiles, particularly in respect of the Engineering Insurances and Personal Accident Policies. Your Company has already taken steps in this direction.

MARINE DEPARTMENT:

The net premium income is Rs. 15,78,000 this year as against Rs. 14,76,000 during the previous year. The department shows a loss of Rs. 7,41,000 but this has been mainly due to the increase in the Reserves which have increased from Rs. 10,33,000 in 1960 to 15,78,000 in 1961. The Reserves on the Cargo business has now been increased from 58½ per cent to 100 per cent.

The Marine underwriting is a problem all over the World. The business being non-Tariff, there is an unhealthy competition leading to the uneconomical rate-cuts by the Insurers. The unsatisfactory conditions prevailing in the Ports in many countries are responsible in aggravating the losses. More careful handling of the cargo and stricter measures for watch and ward to avoid pilferage at Ports and during the transit can minimise the national loss on this account. I understand there is a move to have a Comprehensive Marine Tariff. This will help in improving the results in the Marine Department. The Government should encourage Exporters and Importers to obtain Policies in the Country itself as far as possible. This will help in conserving Foreign Exchange to some extent.

GENERAL

Your Company has further strengthened its financial position during the year under review. The Capital and Funds stand at Rs. 1,56,98,000 as against Rs. 1,46,74,000 at the end of 1960.

The increased profit has enabled your Directors to recommend an additional Silver Jubilee Bonus of 25 nP. per Share in addition to the dividend of 80 nP. per Share.

Your Company has purchased a valuable plot of land in India Exchange Place for its office premises. It is proposed to put up a multi-storeyed building on the site, the plans for which are under preparation.

N.B.: This does not purport to be a record of the proceedings of the above Annual General Meeting.

ANNOUNCEMENT

The following Annual Numbers of **THE EASTERN ECONOMIST** are available for sale. Special concession may be given to educational institutions, libraries and students, if a single order exceeds Rs. 50|-.

1.	India & the World and India in 1950	Rs. 5|-
2.	A Social History of the Indian People & India in 1951	Rs. 5|-
3.	India & the Free World and India in 1952	Rs. 5|-
4.	India in Asia & India in 1953	Rs. 5|-
5.	India in South East Asia and India in 1954	Rs. 5|-
6.	India & the Communist World and India in 1955	Rs. 5|-
7.	India in 1975, A Study of the next Twenty Years & India in 1956	Rs. 7.50
8.	India & the Middle East and India in 1958	Rs. 7.50
9.	India and Europe & India in 1959	Rs. 10|-
10.	India & North America and India in 1960	Rs. 10|-
11.	India and Europe Divided	Rs. 10|-

Ninth Edition of

V. S. SUNDARAM'S

LAW OF INCOME-TAX ACT

(ACT XLIII OF 1961)

This book needs no special introduction being known to all its users over these years. Opportunity has been taken to revise the book not merely by way of re-arrangement as necessitated by the new Act including the new Finance Act XX of 1962, and of bringing all relevent material up-to-date but by re-writing a good part of the book. All obsolete matter has been cut out but in view of the applicability of the old Act to all pending proceedings, all essential and important matters relating to the old law are retained. Several minor changes have also been made in response to the suggestions from the many users of the book. The Publishers are confident that this edition will be distinctly better than its predecessors.

THE EASTERN ECONOMIST

SEPTEMBER 14, 1962

The Commonwealth Prime Ministers' Conference

THE Commonwealth is alive and kicking. This somewhat dubious virtue is certainly apparent from the totally unexpected vehemence with which the European Common Market has been attacked at Marlborough House. It is difficult from this distance to see very much that is constructive in the massive criticism which the assembled Prime Ministers of Commonwealth have chosen to discharge at Mr. Macmillan and his advisers, but it is not necessarily the task of the Prime Ministers to be constructive.. Each has a responsibility in regard to the problems of his own country and conservation of gains won over a past period is itself a major objective of diplomatic exchange. One might conceivably have expected a little more understanding of the British position, but at the present time what has to be noticed is not the new division in the Commonwealth, but the extraordinary vigour of an institution in which democratic exchange can sustain the high level of vehemence which has been aroused. It is likely, in spite of the dire predictions that this institution will soon die, that it will adjust itself and live vigorously. Undoubtedly, Britain's entry in the European Common Market will introduce greater strains than ever before. But it will be total error to look upon tariff changes as making the entire history of the Commonwealth any more than they have made the basic history of the world.

So far as the future history of the world is concerned, one guess seems almost as good as another. But it is probably a very bad rendering of current history to suggest that the European Common Market is an instrument for a new type of colonialism. If the argument is that the admission of raw materials free and the taxing of manufactured goods is a basic mark of colonialism, then we are all colonialists. The United States has used this instrument and so have we, not because its purpose is to make other countries provide raw materials for us; its purpose is to produce at the lowest cost, and to protect a market so as to obtain the level of increasing returns under which manufacturing operations reach their optimum level. It is a total distortion of history to argue that a country which buys cheap raw materials and protects its internal market in order to benefit by the operation of increasing returns has some nefarious political purpose behind its simple commonsense economics. It is a great pity, therefore, that the Prime Minister of India allowed himself without adequate evidence to imply that the Treaty of Rome was a means of reintroducing colonialism in changed circumstances. It is undoubtedly, so far as we are concerned, a restrictive operation but not all restrictive operations should be confused under a broad heading of colonial abuse which should not apply to the Treaty of Rome.

Undoubtedly, the Treaty of Rome, so far as India is concerned, is disturbing and, since it comes in the middle of the Plan, an incursion of history into our nicely planned affairs. But India has to make up her mind to live with the facts just as any other country. The Six have established a community which, whether we approve of it or not, has some tremendous sources of economic strength. It is this source of economic strength which has dictated Britain's application for entry into the Common Market. There is something paradoxical in the Commonwealth, which has stagnated and continues to stagnate in terms of international and inter-Commonwealth trade, proclaiming to Britain that she should not enter the European Common Market which is rapidly expanding and rely upon a market which is declining in proportionate terms. Undoubtedly, there are traditional claims of the Commonwealth, but history has left it in a position of a declining minority as a trading area.

Exports of the United Kingdom to the Commonwealth accounted for only 9.56 per cent of world trade against 12.49 in 1948. In Pakistan, India and New Zealand falls in percentage terms have been considerable. In all these markets West Germany, Japan and the Soviet Union have made spectacular gains. There is no likelihood whatever that we can give to the United Kingdom a *quid pro quo for* the abandonment of the European Common Market idea. What in fact, therefore, is happening is that the Commonwealth countries to safeguard their own economic position are dictating to the British economy a bargain in which Britain is certain to lose, whilst the other countries will merely continue to stagnate.

This is not, in the opinion of *The Eastern Economist,* a solution which will endure. It is based too much on the proposal of give and take in which the 'give' is on the side of Britain and 'take' on the side of interested members of the Commonwealth. Even if, because of these powerful political pressures, the British Prime Minister is unable to proceed with his application to the European Common Market, there will be left a train of discord which will not survive indefinitely. The Commonwealth is destined for change in any case. The question is whether or not it should continue the economic entity which, as the figures of the last decade show, is out-of-date or whether it should try a new experiment in international co-operation on the line which has proved itself in the European Common Market. Some countries, notably Canada and Australia, have serious adjustments to make. India would have a major adjustment on cotton textiles and unless she can negotiate a good agreement with the enlarged Common Market on other matters may have further difficulties there. But the reorientation of Indian trade by running away from Western Europe would be more difficult than hard acceptance. In the end, therefore, whilst the Prime Minister is right to protest loudly with the other Prime Ministers of the Commonwealth, he is powerless to affect the structure of change which has already undermined British resistance over the last three years. *The Eastern Economist's* guess is that the British people will now go on their own course simply because they feel they have no alternative. Emotional ties in the Commonwealth will yield to the far more pressing needs of material gain. The attempt to awaken a large personal response from the British Prime Minister and to argue cases of particular commodities assumes that the Treaty of Rome is a negotiable matter. This is probably the source of the error. The Treaty of Rome fashioned by certain international civil servants of great capacity is more unyielding than Mr. Macmillan. In the end it is the rules and not

the leading persons playing in this game that are to decide whether or not a view will prevail. *The Eastern Economist's* guess, based upon the history of the past three years, is that the Treaty of Rome will reign supreme.

After the excursions and alarums which have caught the headlines in the world are over, we are left with the dilemma that we are wrestling with an irreversible historical change. The Prime Minister, more than anyone else in India, should look forward and not back once the inevitability of this change is recognised. It seems a pity that for the first time he has persisted on a backward looking view, which has nothing substantial to contribute to constructive solution of a problem. We should be looking forward not to worse relations with the Six, but a much more positive approach of friendliness with new trading partners which might be very much the largest trading area in the world. Much the greatest portion of our work at the present time is negotiation of the expanded trade agreements between ourselves and the European Common Market after Britain has made her entry. This is the time to take a plunge into unfamiliar waters. Can we have the wisdom and adaptability to build anew with other partners or forge better links with the old? Time only can show.

Oil Refineries' Expansion

WITH the Steering Committee of the Oil Advisory Council having revised the 1966 demand estimates of petroleum products upwards from 14 million tons to 16.6 million tons, or 17.1 million tons if the 0.5 million tons refinery-burnt fuel requirements are included, the grand debate over the recent temporary expansion of the throughput of the three private sector refineries in India—Burmah-Shell, ESSO Standard and Caltex—to their maximum combined capacity of 7 million tons should come to an end. The 2.5 million tons increase in the 1966 petroleum products demand estimate is stated to have come about by the upward revision in the demand for kerosene by 7 lakh tons and for furnace oil by 1.8 million tons. In view of the saving in foreign exchange that results from the increased throughput of the private sector refineries (According to Mr. K. D. Malaviya, the Union Oil Minister, it amounts to Rs. 1 crore a month. But this appears to take into account only the saving in the import bill for petroleum products and possibly the additional earnings from export of gasoline and, thus, does not include the expenditure in foreign exchange to be incurred on the increased imports of 1.5 million tons of crude, the slight additional foreign exchange cost of refining this crude, remittances of profits, etc. The net saving after taking into consideration all these factors would, perhaps, come to about Rs. 4 crores per annum, which also is not an insignificant amount at the present juncture), the three months' concession given to the refineries to expand their throughput to their present maximum capacity, in all probability, is going to be extended for a further period beyond September 30, until firm estimates of petroleum products demand by the end of the Third Plan period are decided upon by the Oil Advisory Committee whose delayed meeting would take place in another few weeks.

While the immediate issue of maintaining crude refining by the private sector refineries at their present increased level beyond September 30, thus, appears to be resolving itself automatically, the question of allowing it to be maintained at that level on a permanent basis, in the first instance, and permitting the refineries some further expansion in their capacity in view of the explosively expanding demand for petroleum products, as a sequel to the rising tempo of economic growth, remains to be settled. Mr. Malaviya has been aiming—one may say, quite legitimately—at placing the public sector oil in a dominant position in this country. His strenuous efforts in this regard during the past few years evoke optimism that one day he would be able to do so. But does it imply that the future growth of the private sector in oil, especially when the foreign oil interests are prepared to work in participation with the Indian public, is to be stultified? Mr. Malaviya's observation in reply to a question during the last session of Parliament that the Industrial Policy Resolution of 1956 enjoined only the creation of a dominant edifice of the public sector in the oil industry — and this can be placed at 51 per cent of the total requirements of the country—appears to be a great advance in his thinking which hitherto has all along been interpreted as suggesting that all future refining of oil in this country is to be earmarked only for the public sector. This resilience on the part of the Union Oil Minister presumably has been occasioned by the rapidly growing requirements of petroleum products in the country and one would be prone to infer that Mr. Malaviya's not indicating any date by which 51 per cent dominance of the public sector is to be achieved keeps the door open for the foreign oil interests to invest in this industry in India. This is, indeed, a happy development and should augur well for the future growth of the Indian economy.

Since Mr. Malaviya has not specified any date for the public sector attaining a 51 per cent share in the Indian oil industry, it should be prudent that the question of further expansion of the private sector refineries' capacity should be taken up with a view, at least, to having some sort of understanding on principles. The private sector refineries have already suggested to the Government that they are prepared to abrogate their Refinery Agreements, which govern their working at present, and their substitution by industrial licences to be drawn under the Industries (Development and Regulation) Act, 1952. But these offers to surrender their special privileges are understandably conditioned on the fact that they should be allowed to continue to play their useful role in the development of this vital industry in this country through further expansion as and when warranted by circumstances. Even if one takes into consideration that the expansion proposed in the refining capacity of the two eastern public sector refineries, namely, Nunmati and Barauni, from their present envisaged capacity of 2.75 million tons—which through efficient working may be increased to even slightly more than three million tons—to about 4 million tons, and the setting up of the 2 million tons refinery at Koyali and another one in South India with a similar capacity would be completed according to the schedule, the total refining capacity in the public sector early during the Fourth Plan period would come to about 8 million tons. This along with the present capacity of the private sector, including the capacity of the Assam Oil Company's Digboi Refinery, would raise the total refining capacity in the country to only 15.5 million tons, with a near-parity between the private and the public sectors. The increase in demand for petroleum products during the Fourth Plan period from about 17 million tons to anything between 28 and 30 million tons would warrant augmenting of the oil refining capacity by anything to the tune of about 11 million tons. Of this, even if the dominant proportion is to be created in the public sector to make its overall share more than 51 per cent, there should still remain considerable scope for the private sector. Whether this gap should be allowed to be filled by some new foreign oil companies—one or two have already indicated their willingness to do so—or whether the existing refineries should be allowed to expand their capacity is the crucial question which the Union Ministry of Oil has to decide at none-too-distant a date in view of the fact that oil development planning for the period 1960-61 to 1970-71 has to be taken up quite early if the tempo of economic growth is not to be allowed to slacken.

The Eastern Economist is of the view that while the present private sector oil refineries should be allowed to maintain their increased throughput at the present level on a permanent basis in view of the net saving in foreign exchange of the order of Rs. 4 crores per annum, an understanding on the future growth of the private sector in the oil industry should be reached at an early date. While in the interest of fostering greater competition in this industry, there is justification for inviting some new oil interests to set up their refineries in the country, there should be little objection to the present three companies expanding their capacity—of course, in partnership with the Indian public. This is desirable if for no other reason than from the point of view of achieving further economies of the scale of production and completing the task expeditiously. Our foreign exchange difficulties are apparently not going to end during the Fourth and even the Fifth Plan period. A judicious use of our foreign exchange resources and the assistance that might be forthcoming from the friendly countries in future only warrants that dogmatic considerations are not allowed a free play, so as to make our economic growth lop-sided.

Guest Editorial

The Boom in Silver

By PAUL BAREAU

THE price of silver has recently taken another leap forward. The long period of stability in the price of the metal was broken in November of last year when the United States abruptly stopped selling silver from the stocks of freely available metal at the disposal of the U.S. Treasury. There was no question of choice about this decision: the stocks had in fact been exhausted. Since the amount of "free" silver in the U.S. Treasury was published week by week the prospects of this exhaustion must have been clearly apparent to one and all and in fact a substantial speculative position had been built up in anticipation of what duly occurred.

It was this speculative position which moderated the subsequent rise in the price of the metal and caused the market in the spring and early summer of this year to be as quiet as it was until the calm was suddenly broken during the month of August.

The recent leap in the price of the metal which carried the London quotation from 88½d to 97⅞d was due to the combination of a number of factors acting both on the supply and demand of the silver equation. On the demand side the market witnessed a sudden and sharp increase in industrial purchases. Silver is to an ever greater extent becoming an industrial metal. It enters widely in the new electronic equipment and it is rumoured that large quantities of the metal are now in space circling the earth in the increasing number of satellites sent up by the United States, Soviet Russia and Britain. That metal will never come back.

The same can be said of the vast quantities of silver which are now being used by the photographic industry. Every inch of photographic film carries a minute quantity of silver. Various technical devices exist for recovering the silver from old film but it is only a minute proportion of the film used in the world which is returned for this purpose. The silver used by the photographic industry is also for the most part lost for ever.

More recently there has also been an increased demand for silver for coinage purposes. There have been substantial purchases on French account and these bore part of the responsibility for setting the silver price on the move again in August.

On the supply side the two main developments within recent weeks have been firstly the virtual exhaustion of the substantial speculative stocks that had been built up in the final months of 1961 and a virtual cessation of Chinese selling. The Chinese Communist authorities sold no less than 60m ounces of silver last year in order to mobilize foreign exchange resources with which to pay for large imports of wheat and other foodstuffs with which to stave off famine. These sales have been rapidly running down partly because the Chinese authorities are now getting short of silver in saleable form and perhaps also because the need for exceptional imports of foodstuffs is diminishing.

The market therefore was once again brought face to face with the basic fact that the production of newly mined silver is running consistently and considerably below the consumption of the metal by industry and coinage. This fact has persisted for many years. It has been veiled firstly by the substantial sales of silver from United States Treasury stocks which have now come to an end and also by supplies of silver built up out of demonetized coins in India, Great Britain and other countries. This demonetized silver has for the most part been shipped to the United States in repayment of the silver that was made available by that country under war time lend lease agreements. For a time a margin surplus of this silver was available to meet industrial needs but that surplus has now disappeared.

In these circumstances it is difficult to avoid the conclusion that a further rise in the price of silver will occur. The price has now broken through the previous high record that had been set up in February 1920. The recent rise in the price has inevitably attracted some speculative activity and the liquidation of speculative positions may cause some technical reactions in the near future. But the basic facts of the silver posi-

THE WEEK'S NOTES

Land Tax

THE CRISIS IN U.P.

THE UTTAR Pradesh Land Holdings Tax Bill has created a crisis of an unprecedented magnitude and complexity from which the State Government finds it extremely difficult to extricate itself. It can neither push the Bill through the legislature in its unaltered form nor drop it altogether. It is amazing that this predicament should have arisen at all. Since the Congress Party rules all the fourteen States (except Kerala where it governs in coalition with the Praja Socialist Party), the least that was expected of it was to evolve a broad pattern of policy, based on scientifically conceived principles, for raising the land tax by whatever name it may be called. A broad pattern is not the same thing as a rigid and stupid uniformity which pays no heed to regional variations and the historical background of the tax. Determination of such a pattern was essential as land revenue or tax cannot claim immunity from periodical enhancements. The school of thought which argues for no change in land taxation is adopting an obscurantist attitude. The rise in the prices of agricultural produce in itself has brought about a reduction in real terms in the prevailing rates of land revenue. This is not to make out a case for indiscriminate increases in this particular tax. But agriculture, like other sources, needs to bear a rational share in the State's requirements of progressive tax revenue. The emphasis, of course, is on the rational nature of the burden.

The UP Bill suffers from two fundamental flaws. First, it does not exempt uneconomic holdings from the fresh levy. In the next place, it is gratuitously based on what some might describe as a foolishly evolved formula. The tax takes the form of an imposition of a charge of 2½ per cent on the capital value of the holding, but since the assessment of the capital value of agricultural land is a highly complicated process, a procedure based on the rule of thumb has been prescribed for this purpose. The actual effect of the proposed tax is estimated to be an overall additional levy of 50 per cent above the present level of land revenue. But in different grades of land it will vary at somewhat lower or very much higher levels — more than one and a quarter times as much as the average of 50 per cent. The administrative cost of collection is officially put at the high rate of 7.5 per cent.

Why is it that the Central Government has made a reference of the general problem of the land tax and of the UP Bill specifically to the Planning Commission and this confidence-inspiring course was not adopted in the case of the Land Tax Bills in Madhya Pradesh and Andhra Pradesh? There, too, opposition to the Bills was strong, but they were passed without radical changes. The reason is significant. In these two States resistance to the Bills emanated from the Opposition parties. In UP not only the Opposition parties but sections inside the Congress Party are vehemently opposed to the new measure. Many of the Congress opponents have a conscientious objection to the Bill. But, by and large, the internal and factional grouping in the party has determined the alignments for and against the Bill. The rift threatens to undermine the strength of the party seriously, and above all, there is the overriding regard which the peasant vote commands. The State Cabinet's discussions with the Planning Commission confirm sharp differences between the Ministers, mainly by group alignments, over the extent and nature of the modifications. But there cannot be the least doubt that the Bill will have to be recast with substantial changes.

Nepal

BETTER UNDERSTANDING

THE CLIMATE is now getting more propitious for a better understanding between Nepal and India to restore the relations between the two to the former spirit of complete cordiality. In Mr. Rishikesh Shah as Foreign Minister of Nepal, there is an able statesman capable of taking a realistic and long-range view of Indo-Nepalese relations as they should be. He has already given indications of a change in the approach of his Government to the problem. Unquestionably, this could not be without the concurrence of King Mahendra, rather the King is the source of inspiration for the changed approach. It speaks for King Mahendra's grip over the situation and the popular support he commands that he could transfer with absolute ease the key portfolio of Foreign Affairs from the anti-Indian and intensely pro-Chinese Mr. Tulsi Giri to Mr. Rishikesh Shah. This transfer is significant for the shift in policy which it signifies. During his recent stay in New Delhi, Mr. Shah lost no opportunity to promote goodwill for rapprochement.

The basic cause of irritation which has marred the traditional friendship between the two neighbours pertains to Nepal's grievance about insufficient measures taken by the Government of India to prevent the organisation or direction of the border raids in Nepal by the leaders in exile who have settled in India. The Indian case is plain. If even 'prima facie' proof is available that they indulge in subversive activities of the kind alleged against them by the Nepalese Government, they will surely be dealt with according to law. It was for the purpose of getting at the truth about the border raids that Mr. Nehru and King Mahendra agreed during the latter's visit to New Delhi to hold joint investigations into these raids by teams nominated by the two Governments. Something like three such joint investigations have been held, but their outcome hardly leads anywhere. The procedure adopted by the Nepalese team is to tender an exclusive report to its Government alone and in the result what the Government of India could come to know was the factual report and findings of its team. Mr. Nehru has proposed that there should be joint reports to be submitted to the two Governments setting out the points of agreement as well as issues on which the two groups of investigators differ, with an elaboration of their points of view. Such a procedure alone would be fruitful. What Mr. Nehru's personal letter to King Mahendra, sent with Mr. Rishikesh Shah, contains can be anybody's guess, but the least that can be correctly surmised is that there are positive suggestions to solve the existing small differences. If the joint investigations are put on a real basis of collaboration, much of the suspicion based on impressions will be removed. Now is the time to proceed in earnest for clearing up all the clouds that may possibly cast a darker shadow on Indo-Nepalese relations.

The Census

THE FINAL COUNT

THE FINAL count in the census of 1961 confirms the admirable near-accuracy of the provisional totals which were released within 20 days of the completion of the census operation over the entire country. The final figure at 436.533 millions is only slightly above the provisionally estimated figure of 436.424 millions. This is on the basis of the inclusion of comparable areas. The final count takes into consideration more areas which it has since become necessary to include in the Indian Union, by reason of accession of additional territories or otherwise. Thus the population of Dadra, Nagar Haveli, Goa, Daman, Diu, Manipur, NEFA, Nagaland, Pondicherry and Sikkim enters in the figure of the final count. The aggregate population of India, therefore, comes to 439.235 millions.

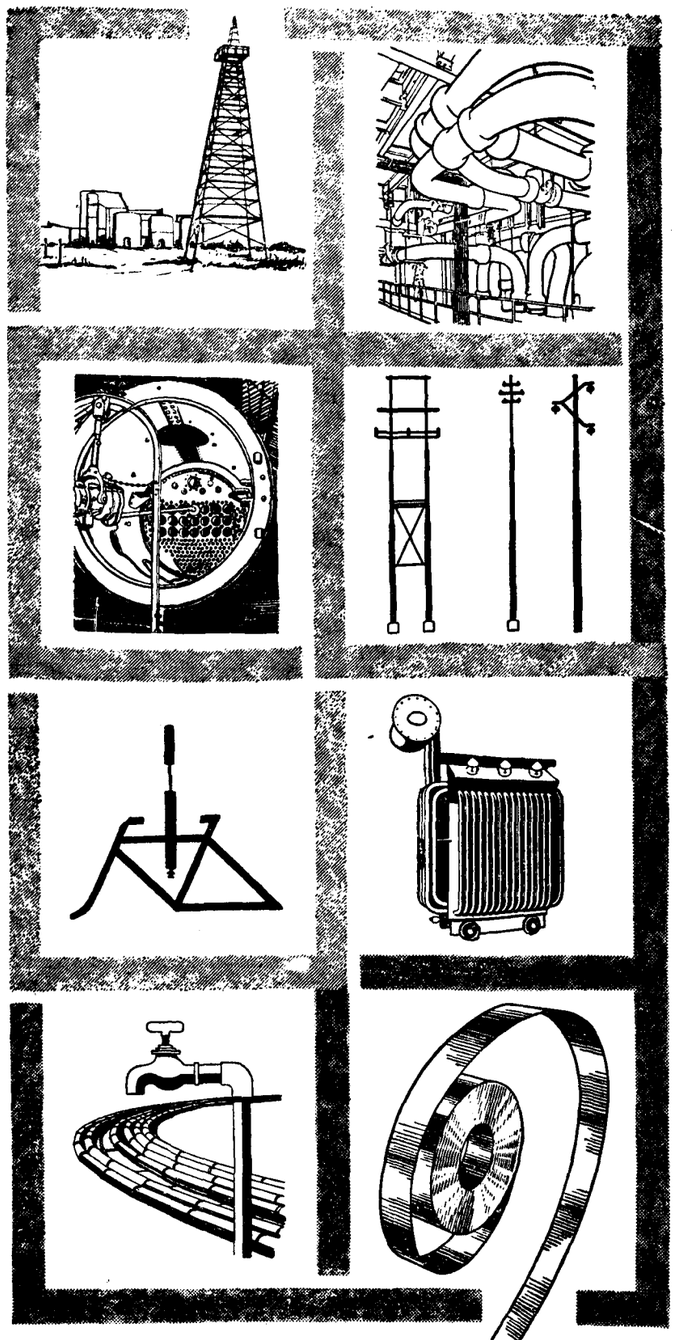
At this figure, showing an increase beyond all previous expectations, a disturbing state of affairs is revealed. Assuming the world population in 1961 at 300,000 millions and the inhabited land area at 135.16 million square kilometres, India accounts for 14.6 of the world's population with only 2.4 per cent of the world's area. In respect of population India takes the second position next after China. Far from being flattering, this record utters a warning against the threat of the population explosion. During the decade 1951-61, India's population showed an unprecedented decennial increase of 21.50 per cent. This period coincides with the period of the first two five-year plans. In plain terms the unprecedented rate of net growth demonstrates that family planning, which is so much trumpeted among the different schemes of the five-year plans, received lip sympathy and practically no tangible action worth the name. Even now, in the Third Five-Year Plan, family planning is more a leisurely subject of academic discussion than a task for practical and effective measures. If this cavalier attitude is indulged in, at the current decennial rate, India's total population will have been doubled in the first seven decades of the present century, far outstripping the means of maintaining it even at the subsistence level.

The light shed by the final count on the changes in the distribution of male workers in the primary, secondary and tertiary sectors of the economy reveals instructive as well as disquieting trends. It is here that the effects of planned development during the first two plans ought to be read as a broad indicator of the correction of the excessive occupational imbalance. Taking only the male population, it is found that, in the primary sector, cultivation and agricultural labour claim 64.88 per cent of the population in 1961 as against 66.85 per cent in 1951, while mining, quarrying, forestry, hunting and fishing claim, in 1961, 3.10 per cent against 2.23 per cent in 1951. This improvement reflects a relief in the intensive pressure on the primary sector. In the secondary sector, there is an improvement from 11.59 per cent of male population depending on it in 1951 to 12.68 per cent in 1961. But the most intriguing trend is the almost static ratio dependent on the tertiary sector, in spite of an impressive expansion of trade, commerce, transport and communications, and services. As against 19.33 per cent of the male population relying on the tertiary sector in 1951, the census of 1961 showed a nominal increase of 0.01 per cent to 19.34 per cent. The corresponding estimates sector-wise of the total population confirm the redressal in the primary and inprovement in the secondary sectors; but in the tertiary sector the percentage of the total population has declined from 17.26 per cent in 1951 to 16.02 per cent in 1961. The last reverse gift of planning in the first decade merits close analysis and a threadbare explanation.

Ghana

UNEASY LIES THE HEAD

THE ELECTION of Dr. Khwame Nkrumah as President of the Republic of Ghana for life should normally convey the assurance that his personal position in the highest office of responsibility in the State has become undisputed and unchallengeable. But, in reality, has it? One cannot be dogmatic on this issue either way. In the immediate present a matter of great significance is his absence from the Commonwealth Prime Ministers' Conference at which he was scheduled to lead his country's delegation. Like Mrs. Sirimavo Bandarnaike, Ceylon's Prime Minister, Dr. Nkrumah has found it incumbent and expedient not to leave his country due to the political uncertainty inside the country.



There has been unmaking and remaking of political careers on an unusual scale by the President in the course of only a few days. And in this sweep leftists as well as moderates have been wiped out from positions of power which makes the pattern of the purge none too straightforward to interpret. The Foreign Minister, Mr. Adjei, and the pronounced left-winger Mr. Tettegah, holding the key post of General Secretary of African Trade Unions, have fallen from grace. Mr. Adjei is not the lone Minister to be dismissed. A leftist and a moderate bear him company. All the dignitaries pulled down from positions of office or power have been lodged in prison. Complicity in the attempt on the President's life is hinted at as a reason for their deprivation of freedom. But their removal behind the prison walls under the Preventive Detention Act makes it difficult to reach any conclusion—whether it was threat to the President's life or to his personal position that is really responsible for their disgrace. But under the President's rule redemption is neither too difficult nor necessarily long delayed. Mr. Edusei, who was dismissed from the Cabinet in April last, as a sequel to the scandal over his wife's purchase of a golden bed in London, is reinstated and assigned the Agriculture portfolio. Uncertainty, however, continues to prevail. Quite recently, while a gathering 2,000 strong was celebrating, in the Presidential Residence, Dr. Nkrumah's escape from assassination, there occurred an explosion in close vicinity.

Delhi's Set-up

'SANS' LEGISLATURE

ONLY THOSE who want to grab power for a variety of purposes were keenly disappointed at the exclusion of the capital city from the Constitution (Fourteenth Amendment) Bill, passed by Parliament in the last session, to confer legislatures on most of Union Territories. Delhi's exclusion was a wise decision and it will be upheld by all upright persons. The clamour for Delhi's inclusion was raised mainly by the Delhi Pradesh Congress Committee, the real brain or brains behind it cleverly remained at a distance of safety. All pressure tactics were employed including the "threat" of the resignations of Delhi's representatives from Parliament. But the bluff was called and called promptly and to the pitiable discomfiture of the self-seeking fighters for the resurrection of the Delhi Legislative Assembly with the costly paraphernalia of the Cabinet of Ministers and a bulging secretariat. With little to do and to do that little all the time, there is no wonder if the ministerial groups and the followers owing allegiance to them engaged in endless and unseemly wrangles, culminating in tiresome reshuffles of the Ministry. Meantime, the administration of the capital city was crumbling fast.

It was a blunder to have conferred a legislature on Delhi, but once the blunder has been set right, why should it be repeated? And what face has the Delhi Pradesh Congress Committee to ask for the privilege (it is a unique privilege without parallel in the capital cities of most of the advanced countries) of a legislature? The ignominious power failure in the capital city merited the taking over of the administration of the Delhi Electric Supply Undertaking by the Central Government from the Delhi Municipal Corporation. But just because this impartial course would have tarnished the Congress Party, which has a majority in the Corporation, with censure, it was eschewed, although the Central Government seemed very nearly to have decided upon it. All that Delhi deserves is a constitutional set-up conferring on it an organisation vested with larger powers of local self-government. Selfless and honest servants of the public can prove their bona fides by asking for nothing more than a dignified and genuine Panchayati Raj for Delhi.

GENERAL SERVICES Screwed and Socketed Tubes, Light, Medium and Heavy (Galvanised and Black) to. I. S. 1239 (1958) upto and including 6" n.b., and Pipe Fittings. POWER Hot finished and Cold drawn Seamless and Electric Resistance Weld Boiler Tubes. POLES Tramway. Transmission and Lighting. PUBLIC SERVICES Air, Gas, Water and Sewage Mains. INDUSTRIAL Seamless and Electric Resistance Weld Tubes for Roller Conveyors and other industrial purposes. STEEL STRIP Cold Rolled Steel Strip for manufacturing purposes and High Tensile Steel Box Strapping.

Enquiries and Orders for Screwed and Socketed Tubes and Fittings ex-stock should be addressed direct to our Warehouse Offices.

The World Abroad

THE ECONOMICS OF DEVELOPING COUNTRIES

By

ODYSSEUS

MR. W. B. REDDAWAY, of the Department of Applied Economics in Cambridge University, well-known in India as Visiting Economist in 1959-60 at the Centre for International Studies in New Delhi, has just given a presidential address on the economics of developing countries to the economic section of British Association.

A good deal, although by no means all, of what Mr. Reddaway said may be familiar in developing countries, but I devote space to it because it will be new to many in those countries anxious to help India and other developing areas, and I trust that it will catch the eye of the foreign economic observers in the embassies of New Delhi, as well as of the many overseas readers of "The Eastern Economist."

Mr. Reddaway points out that in most developing countries there is an effectively unlimited supply of labour, and he asks whether this means that one can apply Keynes's remedies for depression, i.e., secure a large increase in production simply by increasing monetary demand. He answers "No," because although there is abundance of (at least unskilled) labour, a general increase in demand will not lead to a general increase in output, because other co-operating factors are needed to work with labour. The traditional factor is capital, i.e., real capital equipment: nothing can be done with bare hands alone. Hence the widespread view that the sovereign way to raise the income of the developing countries is to provide more capital to enable the unemployed to work.

The trouble is that, to secure increased output, it is not enough merely to bring labour and capital equipment together. You also need skilled labour, management, raw materials, components, power, transport, etc., and whereas these factors can be assumed in an industrialised country, their absence must, on the contrary, be assumed in a developing one. Of course, imports enable some difficulties to be overcome, but only if the foreign exchange is available — and this brings out a point that I have repeated here again and again: it is useless to lend or give developing countries capital to industrialise unless you are ready to buy freely from them the products eventually manufactured. European and American consumers have demonstrated their willingness to buy Asian textiles. They are prevented from doubling, tripling, or quadrupling their intake by the quotas and tariffs set up by their governments in response to pressure groups. If these man-made barriers to cheap Asian exports were removed, both Asia and the West would be substantially wealthier.

If Western textile mills were gradually closed down, many thousand expensive workers would be released to expanding industries suffering from the general labour shortage, and the capital tied up in expensive textile factories would be released for more profitable enterprises, suffering from the shortage of savings. American and European shoppers would have surplus funds in their pockets, made up of their savings from buying cheap Asian textiles, which they could spend on the products of expanding domestic industries. What happens too often today is that these European and American shoppers have less money to spend not only because they are not allowed to buy cheap Asian exports, but because they have also been taxed to provide the aid with which a factory in Asia is — either for lack of markets for its products, or for lack of imported materials or components — kept working below capacity!

But I digress from Mr. Reddaway, who goes on to emphasise that those who assert that capital is all that is wanted to raise the income of developing countries ignore the important possibility of raising output from existing capital. This reflects (a) under-utilisation of, e.g., textile mills or roads, which results from inadequate demand, and would largely disappear if demand could be increased, and inefficient utilisation, which can be cured by better methods. The overwhelmingly important example is agriculture, but it is also true that more efficient working of, for example, the railways would enable the growth in traffic to be carried without the need for vast capital expenditures.

WHY NOT EXPORT GOLD?

Mr. Reddaway does not argue that developing countries never need capital. On the contrary, he considers some of the factors which determine the speed with which capital equipment can be increased. First, either the people or the government of a developing country must be willing to save the necessary part of their income, or must be able to get the finance from abroad, by (a) an inflow of equity capital, (b) aid, or (c) by selling some idle asset abroad.

Thus, tucked away in an unobtrusive paragraph does Mr. Reddaway make an important practical suggestion to India. For obviously, the most painless way of obtaining foreign machinery, components, raw materials, and skilled personnel would be to pay for them out of the hoards of gold in India's 700,000 villages. Such exports would be welcomed with open arms by the West at a time when lack of international liquidity is widespread.

I am told that the idea of tapping village gold hoards had occurred to the authorities in India long before Mr. Reddaway thought it up, but that they rejected the idea as administratively impractical. Doubtless I am dense, but I can't see why. All you need to do is to allow gold and silver to be freely traded within India and freely sold abroad at the going world price. Such a proposition only raises horror in the breasts of bureaucrats because they think of gold in semi-mystical terms as a carefully guarded currency reserve in the Reserve Bank's vaults. But there is no difference between gold and any other commodity. If it benefits India for a man to earn foreign exchange by selling jute goods, why does it not benefit India for him to sell gold?

THE BRITISH DID IT

Impractical? But the thing was successfully done in the time of the old British Government of India on a grand scale, and do you tell me that what the British can do Indians cannot do? On September 21, 1931, the U.K. and India abandoned the gold standard. The de-

pression of agricultural prices in India, as throughout the world, had reversed India's previously favourable balance of payments, but there was no crisis because the ensuing deficit was more than made good by the export of gold. Between September 1931, and July 1936, India exported £211,000,000 in gold — a huge sum in the values of the 1930's. Scarcely any of this gold came out of the bank reserves. It came overwhelmingly from villagers anxious to make a cash profit out of the high price of gold, or to make up for the failure of their crops to realise their previously high prices. The government was criticised for allowing this "drain" of gold, which was alleged to be an exploitation of the poor peasant, and a gold export embargo was called for. How sensible the government was to refuse to enforce an embargo, so that the villager was allowed to exchange his gold stocks (a) to meet his current needs and (b) for profit. He and India benefitted. But, of course, if you won't let the villager make his profit, and prefer an annual foreign exchange crisis, it's too easy: carry on as now!

To return to Mr. Reddaway: he goes on to point out that a developing country differs radically from the normal developed country in that so much of the capital goods that it needs have to be imported. This creates a foreign exchange shortage, because of the difficulties of finding markets for exports on a scale large enough to cover both essential imports for the current working of the economy (raw materials, spare parts, etc.,) and also large amounts of imported machinery. In Keynesian terms, it is useless to argue that investment expenditure will generate its own savings, if the expenditure is to be wholly spent on imported machines, so that it creates no additional incomes in the developing country from which savings can accrue. In such a case, financing the investment by credit expansion leads to an equal loss of exchange reserves when the import bill has to be paid.

Every development programme includes, however, substantial expenditure on building and civil engineering, which can only be done inside India. Should India therefore plan an artificial amount of such work on the grounds that although the assets produced will not be as valuable as imported machinery costing the same amount, nevertheless they will be better than nothing?

The first point to note is that there may be imported elements in what look basically "made in India" schemes. The dam for a hydro-electric project is, for example, built locally but the (expensive) electrical machinery must be imported. If development projects are to be useful, the avoidance of a substantial import content is a more restrictive condition than it might at first seem. Secondly, since nothing much can be done with bare hands alone, it is important to ensure that there are no shortages of materials, transport or other facilities, or of skilled organisers.

These two points having been considered, there remain, in Mr. Reddaway's view, useful public works which can be tackled with Indian personnel and materials alone. He instances the making of rural roads to speed and to cheapen the movement of crops, goods, and services. Why should India's vast labour potential not be used to build networks of rural roads, to dig wells, and to improve irrigation channels? My comment is that the opportunity to spread rural works is not taken as often as it could be because it lacks the dramatic appeal of some great new hydro-electric scheme. Such a scheme is a status symbol — proof to the foreigner that independent India is abreast of the West in the latest industrialisation. Thousands of miles of new roads might add more to India's real wealth, but they are not show pieces that you can put in the tour programmes of visiting foreign VIP's.

More about the economics of developing countries next week.

LIVING WITH THE COMMON MARKET

From Our Special West European Correspondent

PARIS, September 9.

IF the Frenchmen and Germans who are this week celebrating their reconciliation, symbolised by the first visit of a French head of state to Germany, needed fresh confirmation that they are on the right track, they will have found it in the intense interest—furious or benevolent—that outsiders are taking in their union, and in what it has made possible: the Common Market. Their enterprise was the main subject of discussion at last week's Congress of "Marxist" economists in Moscow, and will be so again at next week's Commonwealth conference, while continuing to nourish keen debate in the USA and among the developing countries. They have respectable motives for taking satisfaction in these signs of interest mixed with apprehension, because the Common Market has to date done no harm to any of the outsiders concerned.

For example, while Communist leaders denounced the West European union as an instrument of economic aggression their own trade figures revealed the truth. Trade between the Six and the Soviet bloc has been increasing by 22 per cent yearly, or nearly as fast as the internal commerce of the Common Market; that bloc is the only outsider-group to have benefitted commercially as much as member-states themselves. True, the total value of that trade—$2,175 million in both directions last year—represents only 3.5 per cent of the Common Market's external trade; but the limitation is not caused by the policies of the Six but by Soviet reluctance to use normal Western methods of payment, and Russian insistance on bilateral balance.

Similarly in regard to Britain, the Common Market has stimulated trade across the Channel and North Sea, to the point where non-Communist Europe is henceforth more important in Britain's trade accounts than the entire Commonwealth. Europe and the Commonwealth last year represented 35 per cent each of Britain's foreign trade, but in the first half of 1962 Europe has claimed first place; the Six account for about half of Britain's European commerce, or roughly 18 per cent of the total against 14 per cent three years ago. The permanent council of the British trade unions, whose annual Congress this month will also be dominated by the Common Market, has, for its part, issued a statement where it is admitted that membership of that association would not be incompatible with full employment nor with policies to which their movement is attached: price control, nationalisation of credit, etc. The document is deliberately ambiguous because the unions wish not to embarrass the Labour Party which has reserved its decision until the upshot of the Brussels negotiations are known, but it is clear on the fact that the Franco-German reconciliation and the Common Market are not based on principles obnoxious to the workers' movement.

Nor could it be shown that the progress of the Common Market has to date damaged any American interests. The consolidation of Continental currencies has underlined, but not caused, the decline of the dollar, and Continental governments and central banks have acted to protect the dollar from further erosion; the methods chosen may not be as ambitious nor as effective as might have been wished, but they represent a degree of monetary cooperation between healthy economies never before seen. For the future, there is the prospect — to which American business is more sensitive today than only a few years ago — of keen competition for third markets between US industry and Continental firms (many of the latter operating with US capital and patents). This is the "fundamental contradiction inside capitalism" of which much was made last week in Moscow, i.e. increased commercial rivalry across the Atlantic. However, outside the Marxist logomachy, "contradictions" of that order are simply instances of competition, liable to compromise or to rational adjustment beneficial to all parties.

As for the "threat" that the Common Market is sometimes alleged to offer the developing countries, we are here even more plainly in the realm of speculation about the future. The hopeful signs of increased European aid for development are numerous, at least as numerous as the elements in the Common Market's trade policies that might hamper countries like India. Moreover, interpretation of those elements seems to vary widely. The abolition of the import duty on tea is, naturally, admitted to be an unmixed blessing, but the tentative arrangements made last month in Brussels for trade in Indian textiles have been criticised as harmful to India. Yet this week a leader of the French cotton textiles industry declared that, "the Brussels arrangement in fact amounts to adopting Britain's cotton policy. The Common Market as a whole undertakes to accept Britain's textile imports, notably those from India and Pakistan. The negotiators of the Six have fallen feet first into the clever traps set by the British. The commercial policy of the Seven (the Six plus Britain) will be exactly that now followed by Britain. The English have got practically all they wanted. The arrangement makes no reference to protection against an invasion of cheap textiles into the overseas associates of the Common Market. The Continental cotton industry is in process of 'Manchesterisation', i.e. in process of destruction". One assumes he was exaggerating no more than Indian textile interests when they asserted the exact contrary a few weeks ago. If judgments conflict so widely, the threat presented by the Common Market cannot be very marked at this stage.

Secure, then, in the knowledge that their enterprise has hurt nobody—although offending the amour-propre of some and awakening elsewhere the vague anxieties always caused in history by the emergence of a new power—Messieurs Adenauer and de Gaulle could repeat several times this week that "the Franco-German reconciliation is not directed against anyone". It would, of course, have to be understood that in interational affairs a union that "is not directed against anyone" is always directed against those who would have exploited the absence of that union; that is, nations can never establish good relations (let alone political unity) without seriously indisposing third parties used to speculating on their discord. The list of those who, over the centuries, have taken advantage—occasional or regular, substantial or petty—of the perpetual enmity of France and Germany is, of course, long, ranging from peaceful Switzerland to voracious Russia, via power-balancing Britain. That game is up.

For the moment, the party most gravely disturbed by this reconciliation is Russia who must see in the rise of "a new America" at the frontiers of her empire the end of her hopes of exploiting West European division for the enlargement of her influence. She would

no doubt see an unmitigated danger in this development were it not that the construction of a united Europe inevitably tends to increase the independence of Europe from the tutelage of her more powerful enemy, the United States. That is what lends interest to the ambivalent, not to say embarrassed, conclusions of Communist economic luminaries in Moscow last week after their symposium on the Common Market. The academician Azoumanian repeated the standard Communist doctrine that "the Common Market does not eliminate the contradictions of capitalism but aggravates them". It is this absurd notion—the Common Market cannot work because inconsistent with Soviet dogma about the destiny of capitalism—that explained the quiescent attitude of Moscow to European unity until this very year, when the success of the Common Market became evident to the blindest ideologue. Passing unperturbed from this exploded theory to a juster view of the facts, the academician recognised that there was occurring in the Common Market "a veritable technical and scientific revolution which is bringing about a gigantic renovation of capitalist industrial structure".

He went further and generously conceded that "we can no longer let ourselves believe that while we are advancing toward communism, other countries are standing still". Apparently, then, "aggravated contradictions" include economic progress, industrial renovation and a technical revolution, which is not too bad for aggravated contradictions. He noted, too, the "bolder language used by the Common Market powers in talking to the USA", no doubt wishfully misinterpreting (as Americans like Walter Lippman anxiously misinterpret) the perfectly natural interest rehabilitated economies take in their own protection when they no longer require support and patronage at every step. These are considerable developments, yet the Moscow Congress could draw only the lamest conclusions as regards practical action. "In the face of international agreement between the monopolies, which finds expression in European integration, the working class must increase its pressure on the monopolies by closing its ranks", ruled the Congress with a grandiloquent vacuity, adding no more instructively, "These new phenomena inside the capitalist camp must be exploited by Communists in their struggle".

However, the most interesting proceedings in Moscow were not public and one must rely on "well-informed" (i.e. Italian) sources for what was said. The main contribution appears to have come from Communist delegations from the Common Market countries and they are important as showing that the evolution of Communist opinion exactly reproduces that of Britain. That is, having been skeptical of the Franco-German reconciliation and of the chances of the Common Market, one passes first to violent verbal opposition and finally to compromise and co-operation. "The policy of opposition to the process of integration", the European Communists said in Moscow, "has turned out to be wrong because it was founded mainly on the expectation of a sharp fall in production in wide sectors of the economy. The Common Market has brought to a head and deepened some economic crises, especially in agriculture. But on the whole it has stimulated powerful development and reduced the effects of depression on certain sectors. We wonder whether it henceforth suffices to demand the abolition of the Common Market, which is showing a remarkable vitality". Instead, Communists should seek representation on the Brussels organisms... The Communists, then, have come full circle, from disbelief, to hostility, to an application for membership, and it is no secret that Soviet trading and even industrial corporations are following the American lead of seeking footholds inside the Common Market. Like Britain, the Soviet bloc is coming to accept the French-German reconciliation and the Common Market as a reality with which one must live, and the closer the better.

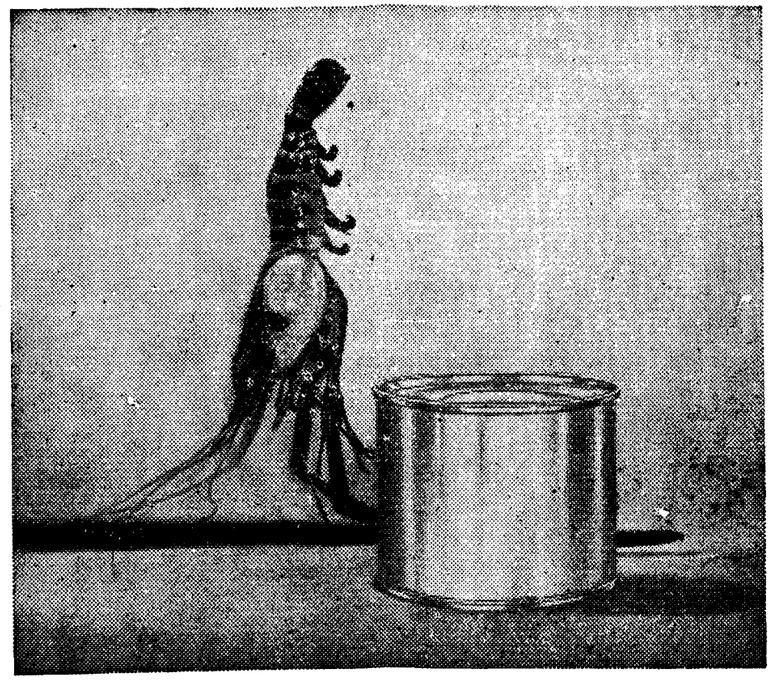
Ninth Edition of

V. S. SUNDARAM'S

LAW OF INCOME-TAX ACT



(ACT XLIII OF 1961)

This book needs no special introduction being known to all its users over these years. Opportunity has been taken to revise the book not merely by way of re-arrangement as necessitated by the new Act including the new Finance Act XX of 1962, and of bringing all relevent material up-to-date but by re-writing a good part of the book. All obsolete matter has been cut out but in view of the applicability of the old Act to all pending proceedings, all essential and important matters relating to the old law are retained. Several minor changes have also been made in response to the suggestions from the many users of the book. The Publishers are confident that this edition will be distinctly better than its predecessors.

Pre-Pub. Price Rs 40. Price Rs 45.

Compatible?

HOW LONG WILL A PRAWN LAST? And how will it taste in hot April or humid August, or in a home in far off California? That depends largely on the container—whether it is strictly compatible with the prawn. Container and product compatibility is a matter of packaging research and engineering development, which is a continuous, ever-changing process. And this is why at the Metal Box Research Division and Technical Development Section highly qualified scientists and technicians work to

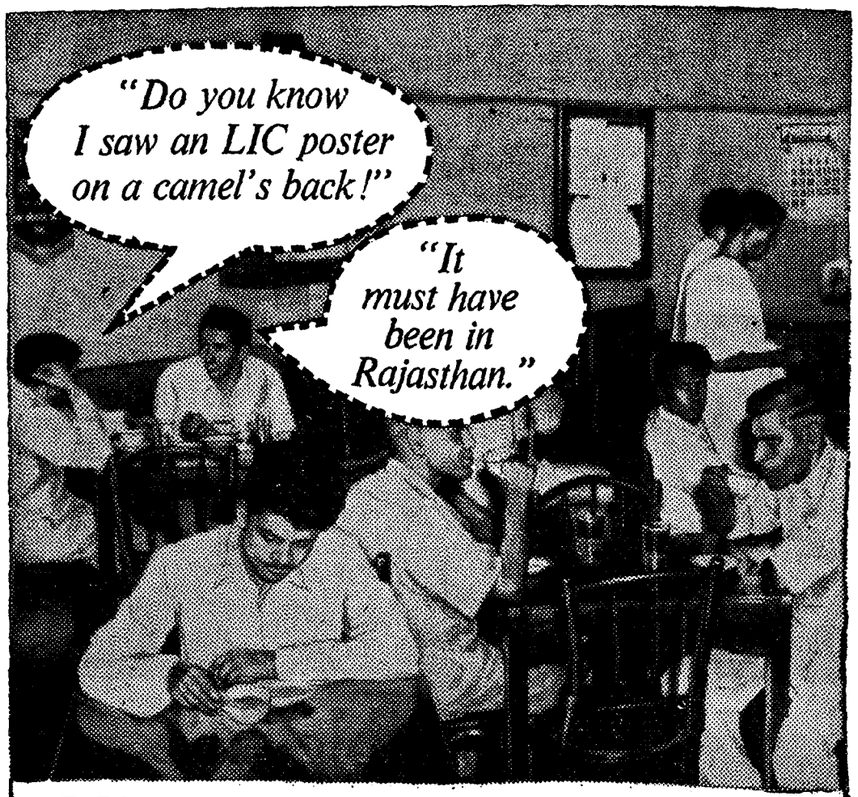
—conduct tests on package-product compatibility and keeping qualities

—advise on individual packaging problems

—create new products, develop new processes and modernise established ones

—develop local sources of supply for previously imported raw materials ... help improve the quality of raw materials

—design can-closing and bottle-sealing machinery.



All this and some 30 years' experience of the nation's packaging requirements help Metal Box offer a complete packaging service tailor-made to customer needs, supported by up-to-date technical resources and inspired by a fund of ideas for the future.

PEOPLE ARE TALKING ABOUT LIC

One of LIC's objectives is to extend the protection of Life Insurance to every insurable person who can afford it. Since most of our people live in villages, LIC have intensified rural publicity. Travelling by jeep and bullock-cart and even by boat and camel, LIC workers spread the message of Life Insurance to every nook and corner. They take films and cine-projectors with them to explain the benefits of Life Insurance more effectively. Such intensive publicity pays handsome dividends; often villagers come forward to take Insurance policies immediately after such a propaganda session.

THE BUSINESS WORLD

Tariff Commission Tarnished

By CROESUS

GIVING a dog a bad name and hanging it is an age-old political game and those that indulge in it must thank themselves for the repercussions that ensue. At a time when everyone in the country has been complaining of indiscipline all round, people in authority at least are expected to weigh their words carefully and make a pronouncement, but alas, this is, unfortunately, not the case. It may be all right for the Hon'ble the Union Minister for Steel and Heavy Industries to describe, — as he cavalierly did in Bombay a few days ago — the Tariff Commission's approach in the matter of steel retention prices as "out of date" and to suggest that some other alternative machinery be set up to take over the job of the Tariff Commission. But, after holding such a view and, what is worse, declaring it publicly, he owed it to himself and to the Tariff Commission, in all fairness, also to announce the scrapping of the Tariff Commission forthwith. He would probably have liked to do so, but was perhaps precluded from any such precipitate action by the fact that the Tariff Commission does not happen to be the creation of either himself or his Ministry, but of the sovereign Indian legislature. It is a pity that the Minister did not realise the disrepute into which he was throwing the Tariff Commission. I wonder whether, after this, any of the members of the Tariff Commission will ever be able to exercise the power conferred on the Tariff Commission, as a former member of the Tariff Commission once mentioned to me that he threatened to do to get an intransigent industrialist to show the degree of respect due to a statutary body. It is a point worthy of the most serious consideration whether, in indirectly inciting possible indiscipline vis-a-vis a statutary body like the Tariff Commission, the Minister concerned has not rendered himself liable to the charge of flouting the legislature.

The decision of the Government on the report of the Tariff Commission on the fair ex-works retention prices of steel and pig iron for the period April, 1960 to March 1962 may be in consonance with the political ideology of those that decided the question, but it is certainly not in the best interests of either the industry concerned or the economy of the country as a whole. This is not to question the right of the Government of India to modify the studied recommendations of the Tariff Commission, although it is debatable whether it is at all advisable to reject the carefully considered conclusions of an expert body specifically appointed for the purpose, especially when there is no reason to suspect the objectivity or impartiality of that body. True, there have been several instances in the past when the Government has rejected some of the recommendations of the Tariff Commission both unceremoniously and unwisely for at least understandable, if not acceptable reasons, but, in the present instance the decision of the Government is not even convincing; besides, it reflects an utter and unprecendented disregard of factual data.

Having considered the main recommendations of the Commission, the Government says, in its resolution of September 7, 1962, that "there is insufficient justification for accepting a block of Rs. 1,300 per tonne" and it has, therefore, "decided to base the retention prices on a block of Rs. 1,176 per tonne". Now, after examining the whole question carefully, the Tariff Commission has come to the considered conclusion that, for the price inquiry period, a block of Rs. 1,300 per tonne of saleable steel should be considered as "reasonably representative". The Commission has clearly stated that, because of conditions prevailing in our steel industry, it is not possible at present to assess the works cost and the overheads as the "standard cost" on the basis of an ideal plant and that, in any case, such an exercise for a "close period" (1960-'62) would have little significance. But the Government has chosen arbitrarily to bring this figure down to Rs. 1,176 per tonne and goes on to argue that it has arrived at this figure on the basis that the plants should have worked at 100 per cent of capacity, instead of at 90 per cent optimum as assumed by the Tariff Commission. It is easy to assume a 100 per cent capacity and it may also be possible to achieve it, but only under ideal conditions. As the TISCO Chairman, Mr. J. R. D. Tata, made it clear some time ago, "the continuous operation of a steel plant at its maximum capacity depends on such perfect balance and co-ordination between diverse elements of production, transport, labour and management covering the operations of so many separate departments and units of plants that it is rarely achieved on a year round basis". It may be noted here that even advanced countries assume an average rate of production of no more than 80 per cent. There is enough evidence in the Report of the Tariff Commission to establish that the perfect balance and co-ordination that Mr. Tata spoke of was no where in evidence. And yet our Government has not only not hesitated to assume that 100 per cent capacity should have been achieved, but has also hastened to base its retention price on that basis. If I may digress a little here, there would appear to be an obsession in official circles about achieving, nay exceeding, the rated capacity willy-nilly, and nowhere was this obsession in greater evidence than in Sindri and, with what results, we all know. The breakdown that followed the senseless driving of the Sindri plant to overcapacity must be still green in the memories of most people, even after making allowance for the old saying that public memory is proverbially short. In this connection, I make bold to advance the thesis that, while allowing idle installed capacity is a crime, it is no less a crime to overwork any plant or machinery except during a national emergency such as a war. If we ignore this, we will have to be prepared not only for a breakdown of the plant but also for avoidably inflating our import bill for replacements, which we can ill-afford, especially today.

Be that as it may, in arriving at the lower block figure of Rs. 1,176 per tonne, the Government has also excluded the special advances paid to the steel companies. In doing this, as well as in not providing an element in the retention price for the payment of interest on, and the repayment of, the special advances, the Government has unilaterally revised its earlier decision. In fairness to the steel companies, the Government ought to have made known its decision to revise its earlier procedure in advance—that is at the time of instituting the inquiry itself — so that they could have been prepared for it. To the same category also belongs the Government's decision to allow only

four months of the works cost, as against the recommended provision of six months, for working capital. But the worst of all — and this is like adding insult to injury — is the Government's decision to suggest to the companies to repay a part of the special advances with accrued interest by issuing fresh share capital at such time or times as the Government may decide. Does the Government expect that, with its latest decision on steel retention prices, and in the prevailing atmosphere of the capital market, the steel companies will really be able to raise further equity capital? Rather than subscribe to any more equity issues of steel companies, it is feared, the existing holders may seriously consider switching over from steel shares to relatively more attractive industrials. Could it be that it is precisely such an eventuality the authorities contemplate should happen? Does this mean, then, they have some ulterior motive? These questions are not too far-fetched; even if they are, the blame rests nowhere else except at the doors of the Government.

Business Notes

Banking

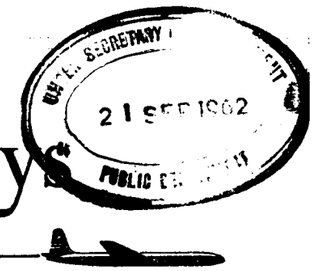
HARNESSING BANKS TO HELP EXPORT

THAT THE remarkable progress achieved by industrially advanced countries in the sphere of industry and foreign trade is the outcome of various forms of credit facilities, aid, and incentives enjoyed by them is too well known to need repetition. Japan, for example, has been able to maintain the high level of her exports because of the various promotional measures adopted by that country and the able manner in which they have been co-ordinated whilst implementing them. The Japanese exporters are not only provided with short-term loans, but the Export-Import Bank of Japan extends long-term loans for financing exports. Facilities are made available for providing finance to exporters, either prior to shipment or after shipment at a rate lower than the normal rate of borrowing. The Bank of Japan has also been assisting exporters to secure loans under the Export Trade Bill System, that is, by accepting bills suitable for collateral securities and for discounting. All these facilities have undoubtedly added to the competitive capacity of Japanese exporters in the world markets. After all, there is nothing unusual about them. Accordingly, commending these useful methods for promoting the exports of this country also, Mr. Pravinchandra V. Gandhi, President of the Indian Merchants' Chamber (I.M.C.), told its second quarterly meeting, held recently in Bombay, that, besides the promotional methods already undertaken by the Government, the implementation of these too would help augment our exports to a considerable extent. In this connection, he welcomed the bills recently adopted by the Lok Sabha amending the Banking Companies Act, the Reserve Bank of India Act and the State Bank of India Act, all facilitating the financing of export trade. These steps are in the right direction, he said and added that it would be much better if arrangements were also made for making credit available to exporters at concessional rates, that is, at rates below the bank rate, as in Japan.

Referring to the proposed banking reform calculated to reinforce the structure of capital and liquid assets of the banks and to strengthen their financial position generally, the I.M.C. Chief stated that, while the new proposals (namely to fix the liquidity ratio at 28 per cent of their aggregate deposits, inclusive of the new form cash ratio of 3 per cent, of their total liabilities, instead of 20 per cent of time and demand liabilities as at present, and the powers taken by the Reserve Bank to vary and raise the liquidity ratio to 40 per cent and the component ratio of cash reserves to 5 per cent) were to be welcomed, it was also necessary to judge them from the point of view of their practical implications to trade and industry, not to speak of the banking institutions themselves. According to Mr. Gandhi, "the implementation of Bank Award, Bonus Award, premia to be paid to the Deposit Insurance Corporation, servicing of additional capital which is being raised by a number of Banks, transfer of 20 per cent of their profits to reserve and the 5 per cent increase in the Corporation Tax—all these have cumulatively imposed additional burdens eating into the profit margins of banking institutions". He also made a mention of the increased cost of borrowing from the Reserve Bank of India under the new four-tier system.

In view of the special role that the banking system has been called upon to play in the context of promoting industrialisation and export trade, Mr. Gandhi suggested, that the Government should (a) allow a rebate from income-tax on 10 per cent of profits transferred to reserves, on the same lines as development rebate allowed to new industries and special rebate allowed to Finance Corporations, and (b) allow extensive branch expansion by the banking system in areas which have hitherto remained outside the orbit of organised banking system, with a view to harnessing deposit resources.

Exports



WANTED: A SENSE OF URGENCY

THE RESPONSIBILITY of expanding our exports rests not only on the Government of the country but on all sectors of the economy and particularly so on the business community — manufacturers as well as traders — declared Mr. G. D. Somani, whilst addressing a joint meeting of the Commerce Graduates' Association, the Progressive Group, and the Western India Chamber of Commerce, on "Exports—the Need of the Hour", the other day, in Bombay. Closer understanding and more hormonious relations among Government, business men, labour, and consumers were quite essential if this national responsibility had to be discharged successfully, he said. However, Mr. Somani added, the primary responsibility of export promotion fell on the business community which should try its best. So far so good, but, when he went on to say, this should be done, irrespective of profit considerations, even at a loss, if need be, and as a labour of love, and so on, to help the country in tiding over the present foreign exchange crisis, he sounded a little too unrealistic for a business man.

Referring to the recent measures taken by the Government, he expressed the view that these were all an indication of the earnestness of the authorities in tackling this problem, but, at the same time, he stressed the point that the strategy of export trade should rest on a detailed study of export prospects commodity-wise.

In this connection, he suggested that every industry —old as well as new—should prepare its own budget of foreign exchange, outlining a detailed picture of its total requirements and total earnings of foreign exchange over the entire period of the Third Plan. Any industry that revealed a progressive increase in the foreign exchange earnings and a steady decline in its foreign exchange requirements, he said, should be marked out for special treatment by the Government. Already, the Government of India has announced such special treatment (by way of higher priorities) to sixteen industries, but Mr. Somani hoped that many more industries would soon be brought under this category.

Emphasising that self-reliance should be the ultimate aim of a country, Mr. Somani pointed out that the pre-conditions for self-generating growth in the case of our country were a rise in investment and savings of 12 to 15 per cent of our national income. But, as against this, what had been happening actually was that, whereas the increase in the rate of investment during the last

"Here are five ways"

BOAC Air Cargo can help your business!"

★ *Fast* BOAC jetliners slash transit time by *hours*.

★ *Direct* BOAC city-to-city freighting cuts out time wasting journeys to and from docks.

★ *Simple* (cheap) packaging is all that's needed with careful BOAC handling.

★ *Safe*, efficient BOAC freighting means lower insurance costs, wider coverage.

★ *Experienced* BOAC staff give all goods *individual* attention all the way.

We deliver your goods in hours, instead of days or weeks! And that's only one of the things you gain. Speed alone may not be enough for you—but BOAC Air Cargo gives more and more successful businessmen these extra advantages...advantages that can help and benefit *your* business!

decade had been more or less satisfactory, that in savings had been most disappointing. According to Mr. Somani, "our stagnant export is just a reflection of our overall slackness in augmenting our national savings" Mr. Somani further felt that the easy availability of foreign capital had made this country complacent and that no great afforts had yet been made to divert an increasing propotion of the national income to investment. Recalling the speech made by Mr. David Rockefeller President of the Chase Manhatten Bank, at Paris, recently, Mr. Somani said that nearly nine-tenths of one per cent of the industrial nations' gross national product was given as aid, which was creditable by all means, but he felt that the ultimate goal of self-reliance needed to be reached as early as possible, even if this entailed "some sacrifice in our level and pattern of consumption".

Glassware

INCENTIVES TO BOOST EXPORTS

THE UNION GOVERNMENT'S decision, though belated, to grant special additional incentives to the glassware industry on the condition of stepping up exports by at least 10 per cent is welcome. The incentives are reported to have been offered, among other things, in the form of granting supply of heavy soda ash at a reduced price—possibly at the price at which the State Trading Corporation imports it. It is important to note that heavy soda ash, constituting 30 per cent of the cost of manufacturing glassware, keeps a sway over the cost component of the industry and the fact that the S.T.C's annual import of 70,000 tons is almost entirely consumed by the glass industry makes the case for special concessions all the more strong.

It may be recalled that the idea of supplying heavy soda ash at subsidised rate to the industry was conceived in January this year and the ministerial assurance followed later in May. The delay in implementing the assurance is reported to have been caused by the industry's failure to submit a statement of costs showing thereby that the industry is in no position to wipe out on its own the difference between the world price and internal price of Indian glassware with a reasonable margin of profit. Besides this, the S.T.C's hesitancy to part with profits on this commodity is said to be another reason for delay. The S.T.C. imports heavy soda ash at about Rs. 190 per ton, while the prevailing price in Bombay and Calcutta varies between Rs. 435 and Rs. 445 per ton, which have been statutorily fixed and cannot be reduced without adversely affecting the indigenous heavy soda ash industry which is in its infancy and needs protection. The concession will, therefore, have to be in the form of a rebate. This apart, several railway freight concessions have been granted for this industry and more may be announced later. It has been shown by a study of foreign markets that the industry has a bright future in the export market if the price of Indian glassware is made competitive. This is by no means an impossible task, if heavy soda ash is available at world market price and the internal market is gradually developed. In view of the possibility of a far greater demand of milk bottles, glass tubes, tubal vials, ampoules, flasks and bangles in the Far East and Middle East markets, the additional incentives will certainly be useful.

Coal

NCDC'S TWO NEW PROJECTS

THE NATIONAL Coal Development Corporation has approved two new projects to be undertaken in Madhya Pradesh during the current Plan period. One of these relates to coal-mining, by the open-cast method, in the Singrauli field which covers almost 220 sq. kilometres in the northern-most part of the Sone Valley coalfields. The proved reserves of the Singrauli field are more than 400 million tonnes. The scope of the present project, however, is limited to the extraction of 130.76 million tonnes of grade II and grade III coal. Production is to start in the last year of the current Plan at the rate of 2.54 million tonnes per annum. The ultimate target is to win an output of 3.05 million tonnes a year early during the Fourth Plan period.

The project, to be completed in two stages, will cost nearly Rs. 15 crores. The net profit, after paying interest on capital, on the completion of the first stage, is expected to be Rs. 77.37 lakhs per annum. On the execution of the second stage, when skips are envisaged to replace conventional coal-haulers, it is anticipated to raise the net profit to around Rs. 95.27 lakhs a year. The life of the mine is expected to be 40 years.

Singrauli, it is stated, will have the highest output per man-shift for any colliery in India—6.8 tonnes—as heavy earth-moving machinery, including two or three draglines, are to be employed here. The Obra power station in U.P., which is now under construction, will be one of the principal consumers of the lower grade coal to be produced at this project. The major beneficiaries from the better quality coal of this mine will be the consumers in western and northern India who, when the project goes into production, will not have to be handicapped by the Mughalsarai railway bottleneck.

The second new project approved by the NCDC for execution during the Third Plan is the opening of a new coal mine at Bijuri, in Sahdol district of Madhya Pradesh. This project is estimated to cost Rs. 2.06 crores and is scheduled to be commissioned into production in 1963-64 with an initial output of 50,000 tonnes. By March, 1966, production is envisaged to be stepped up to 3 lakhs tonnes. The full-rated capacity of 3.6 lakh tonnes per annum is proposed to be achieved in the Fourth Plan period. The return on investment is expected to be of the order of 9.4 per cent per annum. The coal reserves in this area are estimated at 12.82 million tonnes, of which 9 million tonnes are mineable. The quality of coal varies from Grade I to Grade II.

With these two projects, the National Coal Development Corporation's total projects in Madhya Pradesh come to twelve, out of which four are already working. The other six new projects approved for execution are (1) Jamuna, (2) Duman Hill (3) Banki, (4) Surakachhar (5) Manipur and (6) Sonwani. Their combined output target is 4.5 million tonnes of coal per annum. The four collieries which are at present being worked by the NCDC in this State have a production capacity of 5.8 million tonnes.

New Issues

ASIAN REFRACTORIES

TWO MORE companies have finalised their plans of raising capital from the public.

Asian Refractories, a new company sponsored by the well-known Calcutta house of Rampurias, is entering the capital market some time later this month with an offer of 3,30,000 equity shares of Rs. 10 each and 7,000 cumulative redeemable preference shares of Rs. 100 each. The company is to set up a plant in the Hazaribagh district of Bihar to undertake the manufacture of 24,000 tons of firebricks and 6,000 tons of silica bricks per annum. It has already got the licence to manufacture these two commodities to this extent. At a later stage, the company proposes to go in for the manufacture of magnesite bricks and chemically bonded bricks as well.

Technical collaboration for the project has been arranged with Messrs. CEKOP, the Polish Government undertaking, which will, besides making available the

production know-how, will supply the plant and machinery.

KOYNA FERRO ALLOYS LIMITED

KOYNA FERRO ALLOYS LTD., a new company sponsored by Mr. Pranlal Patel to undertake the manufacture of various kinds of ferro-alloys, is likely to approach the public for subscriptions to its capital some time towards the end of the current year. The project would be costing Rs. 2 crores. The share capital to be issued to the public in the first instance is to be of the order of Rs. 60 lakhs, all in equity shares.

The factory of the company will be located at Panvel, Maharashtra. It will have a capacity to produce 100 tons of ferro-molybdenium alloy (68 per cent grade), 50 tons of ferro-venadium alloy (50 per cent grade) and 1,250 tons of silicon metal per annum.

Oilseeds

PRODUCTION SCHEMES IN THE DOLDRUMS

THE WAY things are moving pertaining to the schemes of oilseeds production, it seems that the Third Plan target perhaps may not be achieved. On the very face of it the schemes of the States appear to be in the doldrums. Against the Second Plan target of 75.5 lakh tons and the actual production of 65.30 lakh tons in 1960-61, the final year of the Plan, the Planning Commission has fixed the production target of 98.20 lakh tonnes of five major oilseeds by 1965-66.

Although greater oilseeds production is very essential, it is a pity that these States should be lethargic and undecisive. Actual work on these programmes does not appear to have been seriously taken up in any of the seven States where such programmes have been sanctioned. Surely, it is a poor reflection on their administrative capacity. Sooner they wake up, the better it would be in the interests of the country. In this attitude of the States, the planners are also to be blamed who have distributed in a haphazard manner the overall target of oilseeds production. It is officially conceded that while the Third Plan target of additional production of oilseeds in Madhya Pradesh and Madras have been fixed as low as 28 per cent and 28.8 per cent they have been fixed at 191.8 per cent in the case of Andhra Pradesh and 239 per cent in the case of Orissa. It would be a magic if Andhra can bring about such results. And similarly the doubts can be entertained in respect of other States. To bring about good results, a proper emphasis will, of course, have to be laid on extensive and intensive cultivation. Proper fertilizers will also have to be supplied to the States so that they may be able to utilise it in a right manner for enhanced production.

A handicap which is said to be responsible for not implementing the oilseeds schemes is said to be the inadequate staff. By way of example, it may be mentioned that in many States a large number of posts sanctioned are still lying vacant. This attitude is not at all healthy and sooner an end is put to it the better it would be. Adequate staff is essential for running these schemes and steps must soon be taken to overcome this deficiency. The country is facing severe foreign exchange at the present moment, and to earn foreign exchange, it becomes all the more important that the schemes be given a proper shape. Co-ordination between the States and the Centre in a more effective manner perhaps could help to mend matters to a certain degree.

Public Sector

WORKING OF INDUSTRIAL AND COMMERCIAL UNDERTAKINGS

IT IS a sad commentary on the working of Hindustan Steel Ltd. that it should show great losses. Plantwise Rourkela showed a loss of Rs. 155.8 lakhs, and Durgopur Rs. 71.2 lakhs. The arrears of depreciation carried over amounted to Rs. 17.7 crores. The other Central Government undertakings which show losses are Hindustan Salt Company (Rs. 5.6 lakhs), Indian Oil Company (Rs. 2.6) lakhs and National Projects Construction Corporation (Rs. 0.7 lakhs). While it is understandable that teething troubles in case of Hindustan Steel and some of the other concerns were responsible for these losses, it goes without saying that if proper care would have been taken and the concerns managed efficiently, these losses perhaps could have been curtailed. Then again it is to be noted that the dividend declared is only by nine units. If dividends could have been declared by many of these units, things would have been more appreciable.

The total net profit earned by 23 concerns after taking into account the losses sustained by three was Rs. 7.7 crores. The amounts representing the difference between the net profits earned and the dividend declared were retained by them for being appropriated as reserves or ploughed back into business.

While this is the story of some of the important concerns, the picture on the whole is not very gloomy because there are some Central Government undertakings where they have been able to finance the acquisition/creation of capital assets higher in value than the amounts invested in them. These central undertakings are Air-India International, Ashoka Hotel, Sindri, Hindustan Antibiotics and Eastern Shipping Corporation. The results pertain to about 42 industrial and commercial undertakings of the Central Government and they do not include departmentally run enterprises like Chittaranjan Locomotive Works, Post and Telegraphs Workshops, Ordnance factories etc. The undertakings covered by the report have been grouped into four categories, i.e., 26 running concerns, one completed but not fully commissioned, six promotional or whose activities are of a purely developmental character and nine under construction. The total investment in these undertakings on March 31, 1961 stood at Rs. 952.5 crores of which Rs. 555.6 crores was investment in the shape of equity and Rs. 396.9 crores as long-term loans.

Although the results of the major concerns are not satisfactory as would be evident from the project report, things cannot be said to be in great dislocation as steps are being taken by the Government to impart more efficiency and bring about more productivity. Experience is a great teacher, and it is to be hoped that perhaps that would help to bring about better results.
