DE GAULLE LETS BRITAIN DOWN

PRESIDENT de Gaulle has proved that he is a general every inch. Over a fortnight ago, he announced to the world that Britain was welcome to join the Common Market only as mere British Isles, shorn of its ties with the Commonwealth and the coat that protected its agriculturists. If this was unacceptable to Britain, he was magnanimous enough to show an alternative, namely, associate membership, a status no different from that offered to its ex-colonies. He also threatened to veto negotiations, if these conditions were not acceptable to Britain. The fortnight interval has not changed him a bit. The appeals made by the other five members of the European Economic Community—another name for the Common Market—failed to impart any flexibility to his rigid stand. That is very much like the attitude of a military general. It must have been obvious to the President of France, when he laid down conditions for Britain's entry at such a late stage after 16 months of hard negotiations, that they would be unacceptable to his neighbour across the channel, that he was proposing something which would come as a painful shock to all the leaders of the free world and that the only countries to be happy over what he was doing would be Russia and China. Yet he went ahead with his plan for keeping Britain out of the Community, fearing or favouring none. And he has succeeded, for the present at any rate. Such inflexibility and determination of purpose are not commendable traits in this context and anyone who is interested in seeing that a strong, well-united, and forward-looking Western Europe comes into being as a bulwark against Communism cannot but deplore President de Gaulle's obstruction.

One fails to understand what the august President of France hopes to gain by denying an honourable place to Britain in the Community. Does he seriously think that the rest of the Continent will meekly toe his authoritarian line? Has he forgotten the history of Europe to entertain the belief that even in this latter half of the twentieth century he can be a Napoleon? Some commentators in Britain have called him that, while one has gone so far as to snub him as a Hitler. These are no doubt undignified, intemperate criticisms of the French leader who has shown more wisdom and tolerance than any democratic politician in France. Let us not forget that he sincerely worked for liquidating the Imperial French Empire and even risked his life in doing so. Nevertheless, if President de Gaulle is being misunderstood in the rest of the free world or if doubts are being cast about his real intentions, it is his own fault. None of his arguments is convincing when viewed against the need for an economic order that would safeguard the interests of the free world as a whole, including the underdeveloped countries. His main contention, spelt out after 16 months of negotiations which were nearly drawing to a successful conclusion, that Britain was not yet ready for accepting the discipline of the Rome Treaty does not stand scrutiny. Were all the detailed negotiations, most of which have resulted in agreement, stretched over as long a period as 16 months, necessary for the French President to come to this conclusion? He could have been honest enough to say so even when Britain first sought membership of the Community, for he was surely aware that Britain had obligations to the Commonwealth countries and to dependent territories and that it had been repeatedly giving assurances that it would strive its best to safeguard their interests. He says that Britain should give up its Commonwealth ties. But did he not try to protect the interests of its ex-colonies by securing for them associate membership?

That apart, the spokesmen of the Common Market have repeatedly stated that theirs was an outward-looking economic association, keen on an expanding world trade with special facilities for encouraging the exports of underdeveloped countries, and that those who spread the idea that theirs was an inward-looking regional trade association intent on protecting their own agriculture and industry through fiscal walls and import quotas were doing an injustice to them. Britain's efforts to secure fair terms of trade for its dependencies and Commonwealth partners were fully in keeping with this oft-reiterated profession. Besides, they were also in consonance with the Articles of the Rome Treaty. Part 4 of the Treaty, for instance, provides for associate membership. Article 238 of the Treaty provides an answer to those territories that do not qualify for association. The provision for "reasonable opportunities," under Articles 38 and 110 of the Treaty, is meant for taking care of outside interests, as, for instance, such Commonwealth countries as Canada, Australia, India and Pakistan. Thus, the Treaty of Rome provides for negotiations to ensure that the Common Market does not degenerate into an exclusive trading arrangement which will be contrary to the spirit and letter of G.A.T.T. Even the argument that negotiations with Britain have been protracted and taking more time than they should, is not fair, for the simple reason that the Six themselves took more than two years to give a practical shape to the Rome Treaty. Surely, the task of dovetailing Britain into the Common Market is a very complicated one, calling for more radical transformation than any the Six had ever faced. Unlike France, Britain, when it applied for membership, had fewer colonies but quite a large number of independent members of the Commonwealth covering a large part of the globe. Having regard to these complications, it must be said that the progress of negotiations at Brussels was brisk, especially in the latter half of the year. Most of the Commonwealth countries, recognising the merits of the British case to be a member of the Community, were sporting enough to wish their leader the best of luck and to accept compromises in agreeing to surrender Commonwealth preference, though they involved a considerable sacrifice for them. In fact, the talks had proceeded smoothly and successfully enough to warrant the optimistic belief that even the few remaining unsettled issues would be resolved, facilitating Britain's entry into the Common Market some time this year. If there were any doubts, they were due more to the uncertainty of British voters' verdict and the strong opposition from a section of the British Labour Party. None had thought that the whole plan would be sabotaged in the last minute by President de Gaulle.

Since the Common Market is not the monopoly of France, President de Gaulle was not justified in arrogating to himself the right to decide whether Britain was still mature or immature to shoulder the obligations of the Rome Treaty. There are five other members and all of them, without doubt, have disagreed with the stand taken by him. He should have, therefore, accepted the verdict of the majority and allowed the negotiations to continue. That would have been the democratic way of resolving differences of opinion as opposed to the authoritarian method. That would have also been the right way of finding out whether or not the still pending issues, such as protection for British agriculture and horticulture, temperate zone foodstuffs, including the special protocol on New Zealand, and the question of Hong Kong could be resolved through talks. If only the French President had patiently waited for a few more weeks, there would have probably been no need for him to take all the odium for the failure of Brussels historical meet as he has had to do now. Perhaps, there would have been no failure at all. By suddenly throwing a bombshell, President de Gaulle has justified

the British criticism that he was all along hoping that something or other would wreck Britain's plan and that, when he found that this hope would not materialise, he could not stomach it.

What next? In a television broadcast on Wednesday, Mr. Harold Macmillan, British Prime Minister, said that he would consult the Commonwealth Governments, the E.F.T.A. countries and the U.S. Government before deciding the future course of action. He also said that there was "no easy, ready-made alternative to the European Common Market." Mr. Duncan Sandys, the Commonwealth Relations Minister, observed: "Do not let us imagine that there is any magic Commonwealth alternative. If there had been, we would have gone in for that long ago." Mr. Edward Heath, Britain's chief negotiator at the E.C.M. talks, stated that "Britain would not turn its back upon Europe" and that five of the Six "showed a desire to build up the same sort of Europe as Britain wanted." All these are significant statements, in that they clearly suggest that the British Government does not attach much importance to developing the Commonwealth and E.F.T.A. as an alternative and that it does not propose to take any retaliatory measures against France. There is also no doubt that each one of the remaining five partners of the Common Market regrets the break in the talks and would like to bring Britain into the Community sooner or later. Most of the E.F.T.A. countries, too, desire to end the rift between the Six and Seven, as witness the fact that none of them hardly raised any objection when Britain decided to apply for membership of the Community. The U.S. Government, which tried to avert a breakdown of the talks, will not leave things to drift. It is, therefore, difficult to believe that France will be left in peace for long or that it will be in a position to resist the pressure of public opinion in the rest of Western Europe. Even in France, a large section of the Press is critical of the unbending attitude taken by President de Gaulle. No useful purpose will be served by discussing the possible alternatives so soon after the collapse of Brussels talks. Let us wait and see what happens in the next few weeks. One thing, however, is obvious. Western Europe cannot afford to remain divided as at present for long. President de Gaulle must, therefore, think afresh and gracefully retrace his steps without any delay.

FREE MARKET IN STEEL?

IRON and steel have been in short supply for a number of years now, and a system of distribution control has, therefore, been evolved to ensure their reasonable availability, on some basis or other, to industrial and non-industrial consumers. From time to time in recent years, the system of control has also been liberalised in particular directions, depending on the supply situation in respect of pig iron and of different categories of steel. For instance, the control over distribution of pig iron and ingot moulds was relaxed from the middle of 1959 when the supply position of these two items became easy with the commissioning of the blast furnaces of the public-sector steel plants. As for steel, in the first half of 1960-61, demand for all categories other than sheets, wire, tinplates and baling hoops was accepted in full. As a corollary, the system of procurement of steel against quota certificates was dispensed with in so far as Government Departments and statutory bodies were concerned, though, in the case of scarce categories like sheets and wire, they were still required to place their indents only upto a limited extent. All consumers and stockists were subsequently permitted in September 1960 to indent for plates and sheets of 14 gauge and thicker without any quota certificates. In the second half of 1960-61, the distribution system was further liberalised so as to permit all consumers and stockists to place indents for steel directly with the Iron and Steel Controller in respect of all categories other than sheets (thinner than 14 gauge), wire, tinplates and baling hoops. This relaxation meant not only that it was not necessary for the stockists and consumers to get quota certificates from the sponsoring authorities before placing indents for steel but also that they could place indents for any quantity they desired.

The liberalised system of distribution, which involved allotment of quotas only for thinner gauge sheets, wire, tinplates and baling hoops, was continued in 1961-62. The quota-wise allocations of these *restricted* categories aggregated 797,000 tonnes during the year, as compared with about 4,300,000 tonnes in 1960-61 in respect of *all* categories. Further liberalisation during 1961-62 was confined to distribution at the stockists' level. This took the form of permission to the 'controlled stockists' to sell materials not only to consumers but also to other stockists. 'Registered stockists' were also authorised to sell 100 per cent of some of the sections, and the list of sections, of which they could sell 50 per cent without any permit, was further amplified. Incidentally, the number of 'controlled stockists' was 214, and that of 'registered stockists' 1,903, at the end of 1961-62.

On the side of selling prices, too, control has been enforced for a number of years now. The controlled selling prices, incidentally are the ones at which steel is sold to the consumer. The producers, however, do not get the whole of this controlled price. After selling the steel, the producers, that is, the steel-works, only retain a part of the sale price (hence called the 'retention price') and pay the difference between the selling price and the retention price into the iron and steel equalisation fund. The retention prices, too, are controlled, for they are fixed by the Government in the light of the Tariff Commission's recommendations from time to time. It will be recalled here that both selling prices and retention prices have been increased in recent years. The increases effected in the selling prices of pig iron (all grades) and of different steel products, it is claimed by the authorities, have been in pursuance of the objective of rationalising the price structure at the consumer's end in accordance with various differential factors. But, at the same time, the authorities have continued the practice of fixing the average retention price of finished steel at the producer's end and then fitting all product prices into it within a given range. It is said that the cost differentials of rolled products do not get fully reflected in the product retention prices so determined.

How well or ill this system of control over distribution and prices has worked has been the subject of debate for some time now. There have been frequent public complaints about, as well as demands for a review of, the system of control. It is precisely such a review that has just been completed by the recently-appointed Committee on Steel Control (Chairman: Dr. K. N. Raj). The Committee has submitted, for the present, only a preliminary report to the Union Ministry of Steel and Heavy Industries. In the light of public opinion, which is being elicited on this preliminary report, the Committee is expected to revise and finalise its interim recommendations by the end of next month. Incidentally, if the objective of eliciting public opinion is to be served, copies of the preliminary report must be freely circulated to the interests concerned. But they are not readily available even to the Press. As the Government is not committed to accepting any of the interim recommendations, it may be thought that the preliminary report is not important except as a basis for public discussion. To think so would be to ignore the ten-to-one probability of many of the interim recommendations being finalised as they are, and ultimately accepted by the Government. According to circles close to the steel industry, a severely practical report such as this is commendable and some of its recommendations may be quite acceptable to all sections—Government, industry, trade and consumer.

It is, for instance, suggested that the Government may accept the Raj Committee's findings and recommendations pertaining to product retention prices. The Minister for Steel and Heavy Industry, Mr. C. Subramaniam, himself has publicly favoured a modification of the present method of fixing such prices. The Committee's findings, in this connection, are that the pricing policies followed hitherto in regard to steel have not taken adequate account of the need for prices to reflect relative costs and that, as a result, prices have exerted pressures of distorting character on the pattern of steel production. The Raj Committee has been frank to concede that the present retention prices allowed to producers do not allow adequately for the replacement of plant at current (or prospective) costs. It is also pointed out that the current relative prices allowed to different products have the effect of creating a bias among producers against rolling of certain sections. This is due, in part, to the fact that the 'product-mix' does not conform to the pattern of demand to the full extent feasible. The Committee has, therefore, recommended a revision of the 'product price relatives,' so that they may reflect the true relative costs of production of different products. As Mr. C. Subramaniam himself has stated, his preference for a modification of the method of price fixation "so as to allow a common retention price upto the ingot stage and then allow variable prices to different products rolled out at the subsequent stages, taking into consideration the overheads and other operational costs that may be special to the rolling mills," the industry may well look forward to the early execution of a fairer structure of product retention prices. But what is more important from the steel producers' point of view is the fixation of fair retention prices for steel ingots. Now that the Raj Committee's findings support the view taken by the Tariff Commission, there is no reason why the Government should still prevaricate on this vital issue. The Government's recent decision to intensify the move for a reduction in the number of standardised steel sections—a decision supported by the Raj Committee too—may be welcomed by the industry for one major reason. The reason is that, when the main producers are not called upon to roll too many sections (some of which may be required only in small quantities), they would be in a position to attain full capacity production in the rolling mills. Relevant in this context are the Committee's practical suggestions:

"Immediate action should be taken by the Ministry of Steel in consultation with fabricators, design engineers, traders and consumers to standardise the sections to be rolled by the big plants. The wide range covered by the new I.S.I. specifications, and the numerous customary specifications, while they may be desirable from the consumers' point of view and from the point of view of physically economising steel in some sense, seem to us to be based on very scant consideration of the economics of large-scale rolling. The sections for which total demand may be rather small should, as far as possible, be left for supply by re-rollers and from imports."

On the subject of distribution, the Raj Committee's recommendation that there should be only two priorities for allocation of steel—'over-riding priority' in respect of defence needs and 'ordinary priority' for basic industries and vital social overheads—is calculated to simplify and restrict the structure of priority grading. But it is doubtful whether non-priority needs, some of which may be quite essential, can be met adequately at a time of mounting defence demands for steel. If, however, conditions become reasonably normal again, non-priority supplies of steel are bound to increase. Only in such a situation of ample supplies can the free market, recommended by the Committee for non-priority steel after its first sale by the main producers, be expected to function in a manner most beneficial to consumers. Where, however, non-priority demands happen to be in excess of non-priority supplies, the free market prices of different categories of steel will be no other than the present high black market prices rendered 'fair and legal.' In the ultimate analysis, it is all a question of expansion in steel production, for this alone can lead to plentiful supplies in the free market.

Perhaps, it may be good to make a beginning in the direction of a limited free market in steel, for the present requirement that all consumers and stockists should place indents for steel directly with the Iron and Steel Controller in respect of all categories other than the scarce ones involves a delay of anything from two to five months. If, as recommended by the Committee, indents go directly to the sales offices of the two private-sector steel plants and of the Hindustan Steel Ltd. and the plants adhere to firm delivery dates in respect of such orders, supplies in the free market may be more quickly and readily available. The Committee's further recommendation that the Government should operate special stockyards in selected centres to regulate conditions in the free market is well conceived in theory, but how exactly it will operate is a question for which an answer can be given only from experience. The crux of the matter here is whether the Government stockyards will be operated efficiently and impartially. If there is corruption there too, the genuine consumer is unlikely to gain much. If, however, the operation of special stockyards have the effect of restraining prices and if, as suggested by the Committee, they ensure a certain minimum amount of steel for small-scale industries, the free market in steel is not likely to fare too badly from the point of view of the consumer. Moreover, the Committee's proposal that anyone should be free to be a trader in steel will make for greater competition in the steel trade. This factor, too, may prevent prices from rising unduly in the free market, assuming that supplies will be readily available to all. Given the related safeguards and measures suggested by the Committee, a free market in steel may be expected to adjust non-priority demands to the available non-priority supplies at a reasonable, even if somewhat high, level of prices. This is the rationale for giving the Committee's suggestion a fair trial. But it must be clearly noted that the success of this experiment is dependent upon quite a few ifs.

MARKET GOSSIP

Sir Norman on Investments in India

SIR Norman Kipping, Director-General of the Federation of British Industries, who made an extensive tour of India last month, in order to get a firsthand picture of conditions in this country, was firmly of the view that the Chinese aggression on India was not a deterrent to the flow of British private capital to this country. In answer to a straight question that *Commerce* put to him just before he left Bombay last week, he said:

"I am not aware that the Emergency has caused the deferment of any new British-based investment projects in India. In the past 15 years, there have been troubles in many developing countries, but we don't run away at every such difficulty. We are not that sort of people. We prefer to give you all the co-operation and help we can to surmount the difficulties and develop your country."

Are there any deterrents to the flow of foreign private capital to India? This general question was one of those posed to Sir Norman by Mr. Pravinchandra V. Gandhi, President of the Indian Merchants Chamber, when the leading members of the Chamber met him over a cup of tea. Two interesting points emerged from his replies to this question: one, the difficult balance of payments position and, two, the rising cost of production in India. Both, in his opinion, are serious deterrents to foreign investors. The severe import restrictions imposed by India on account of shortage of foreign exchange often led to inadequate supply of essential raw materials, stores and spare parts and thereby to underutilisation of capacity. Most goods made in India are unable to compete in world markets, mainly because the cost of production is high. Both the factors adversely affect the profitability of investments and are the cause of misgivings among foreign investors wanting to participate in India's plans for industrialisation.

This is, indeed, quite a rational explanation. The solution to the balance of payments problem itself lies, to a very great extent, in bringing down production costs. India has, of course, been seized of this problem for quite some time. And yet there are no signs that it is under effective control.

Foreign Capital for Shipping

The National Shipping Board, at its meeting this week in Bombay, has accorded partial approval to the Congress Parliamentary Party Executive's recent resolution which recommended an upward revision of the present maximum limit of 25 per cent for foreign capital participation in Indian shipping companies. The approval is described here as 'partial' because the Board is agreeable to greater foreign participation only in the spheres of tramp and tanker tonnage. Even here the Board has stipulated that the maximum permissible limit for such participation should not exceed 40 per cent. One can understand the Board's advice that coastal shipping should be reserved for purely national concerns. But the Board's 'firm' view that the present limit of 25 per cent should not be exceeded in the sector of liner trade is difficult to understand. At least it defies the understanding of this journal which presented, in a leading article last week, an elaborate case for leaving open the entire field of overseas shipping (liner, tanker and tramp trades) to non-Indian participation to the tune of 40 per cent or even 49 per cent. The National Shipping Board owes it to the public to explain why greater foreign participation is not desirable in the liner trade and how any such increased participation might affect the fortunes of Indian shipping in that particular sector. The Board's plea that the interests of Indian liner companies would have to be further safeguarded seems to be rooted in the fear that increased foreign participation might somehow adversely affect their working. There are not many even in the ruling Congress Party today who share this fear.

India and World Coffee Pact

Whatever be the justification for India signing the new five-year International Coffee Agreement, there is no denying that the export quota of 21,600 metric tons (360,000 bags) allotted to this country under the Agreement is very low. Taking the current (1962-63) season's coffee output at a little over 53,000 tons and internal consumption at about 21,000-22,000 tons, the exportable surplus comes to 31,000-32,000 tons. And the surplus will doubtless be larger in the coming years, what with the renewed efforts to boost output. Incidentally, the production target for coffee in the third Plan is 80,000 tons. India also is badly in need of foreign exchange and coffee is one of the surplus commodities which it can conveniently spare for this purpose. Looked at from whatever angle, India's case for a higher export quota is strong. One fails to understand as to why India's representatives who attended the Conference did not press for it.

Be that as it may, the International Coffee Agreement itself is not expected to come into force earlier than December next. It is true that 54 nations have either ratified or announced their intention to ratify the Agreement. But the Agreement cannot be brought into operation unless the U.S., which accounts for more than half of world coffee imports, ratifies it. Although the U.S. Administration has been consistently supporting the Agreement, the Senate has still not given its consent without which no ratification by the Administration is possible. Some regard this delay as deliberate, being part of a plan to persuade the Latin American countries to carry out the general economic reforms which are considered essential to the success of the Alliance for Progress. The U.S. Administration, however, is credited with the view that the World Coffee Agreement is vital to the well-being of Latin America and that it should not, therefore, be jeopardised for the sake of economic reforms which have, after all, nothing to do with coffee. The latest reports, however, indicate that the Senate's approval would be obtained by the time President Kennedy meets the Central American heads of State at the end of March.

The U.S. ratification of the Coffee Agreement apart, there is the outstanding problem concerning the recent decision of the Brazilian Coffee Institute (I.B.C.) to offer cash discounts to foreign importers and roasters who undertake to sell 100 per cent Brazilian blends. Such discounts are regarded by practically all the other members of the new Agreement as an infringement of the pricing clauses. If Brazil were to persist in giving effect to its decision, the work of the International Coffee Council would, it is widely felt, be sabotaged from the outset itself. Such a possibility, it is, however, hoped, may not arise. To quote the Commodities Editor of the London *Financial Times*:

"Already the principal Brazilian coffee exporters' organisation has started to bring pressure to bear on the I.B.C. and a compromise now seems to be on the cards. One possibility would be for the I.B.C. to sell its coffee at full price, but to give help with advertising and public relations campaigns, though even this would be unwelcome to some of the other producers."

Proceeding, the Editor says:

"Despite the alarms caused by the U.S. Senate and the I.B.C., the international coffee market is already working on the assumption that the Agreement will come into force within the next few months. Should it not do so, then prices could be expected to fall drastically and this is something which neither the producers nor the U.S. would like to see."

The need for stabilising world coffee prices is imperative in the interests of both exporting and importing countries, especially because of the huge surplus hanging on the world market. The current season is expected to end on 30th June next with a carry-over stock of as much as 31 million bags (4.9 million tons) which is sufficient to meet the current rate of world total consumption for as long a period as eighteen months. Viewed thus, a heavy responsibility is, indeed, cast on the International Coffee Council. The Council will be holding its first meeting at London in the first half of April next, if everything goes well. At this meeting, the Council is expected to estimate the total world imports in 1964 and then to allocate quotas to the exporting

Stand Firm

beside the Jawans

countries. The discussions will naturally centre round the Council's forecast of future demand for coffee, because the basic annual export tonnages have been built into the Agreement, the subsequent quotas being determined on the same percentage basis. It is thus obvious that, once the total demand is assessed, each country's share will follow automatically.

1962 *Exports: Record for a Decade*

With the publication this week of provisional official figures of foreign trade for the month of December, it is now possible to get a complete, albeit rough, picture of this country's performance during the calendar year 1962. It is probably a source of relief to those in charge of export promotion to note that the past year witnessed a further increase in exports. Total shipments aggregated Rs. 679 crores, a new record for the last decade. This figure, in fact, represents one of the all-time peak levels, except for the year 1951, when exports, stimulated by the Korean boom, bounced to touch Rs. 762 crores. There is, however, no reason to be unduly complacent over the export performance last year. For the export figure for 1962 showed only a relatively modest increase of just about 2 per cent, or Rs. 16 crores, over the previous year. What is more, exports have been running far behind the planned annual target for the year by as much as about Rs. 40 crores. It may be noted here that the figures for 1962 are only provisional; besides, these exclude trade figures of certain territories, particularly Goa, exports of which were of the order of Rs. 15 crores per annum.

The contribution of exports towards the improvement in the balance of trade position in 1962 was evidently too small to merit congratulations. Indeed, but for a decline in imports, there would have been hardly any significant change in the adverse trade balance. Imports actually were brought down by 3.5 per cent (or Rs. 35 crores) to Rs. 1,010 crores in 1962, as compared with 1961. The combined effect of the fall in imports and the improvement in exports was the narrowing down of the trade gap. The adverse balance of trade in 1962 was lower at Rs. 331 crores, as against Rs. 382 crores in 1961. Thus the unfavourable trade gap continues to be still substantial, being as much as 50 per cent of total exports. No wonder then that, over the year 1962, India's sterling balances fell by about 35 per cent, that is, from Rs. 150 crores to Rs. 97 crores. But for continued economic assistance from friendly countries, India's balance of payments position would have been unmanageable.

A Common Bank for COMECON

The suspension of negotiations between the U.K. and the Common Market Six this week must have come as a pleasant surprise to Soviet Russia and other Communist countries, which have been watching, with understandable discomfiture, the move towards unity in Western Europe. The creation of the Common Market itself has in a way been a blessing in disguise to Communist countries, in that it has spurred them to close up their own ranks and strengthen their trade bloc. For the last few months, Soviet Russia and other East European countries have been devoting much attention to the expansion and streamlining of COMECON (Council for Mutual Economic Aid). The COMECON, it may be recalled here, was originally set up in 1948 as a pioneer movement towards regional integration and international specialisation. This bloc now consists of all the European members of the Soviet bloc (Russia, East Germany, Poland, Czechoslovakia, Hungary, Rumania, Bulgaria) and Outer Mangolia. It, however, has not made any perceptible progress towards expansion of infra-regional trade and economic integration. But, with the Common Market getting into stride, several organisational changes have been brought about in the COMECON. It was only a few months back that a permanent secretariat was established for COMECON. Besides, a permanent Council of Deputy Premiers has also been set up. Still, no executive powers have been given to these bodies.

These organisational reforms are only the first step towards increasing the scope of the COMECON's work. At a meeting of the COMECON in Bucharest in December last, it was decided to set up an "international socialist bank." The proposed bank is expected to lead to radical changes in the system of intra-regional trade and payments among the COMECON countries. This appears to be by no means a bluff, as COMECON countries have pursued the matter in right earnest. The officials of the Communist countries, according to Mr. P. T. Nosko, Chief of the Currency Division of the Soviet State Bank, are now examining the details of the proposed bank. The primary object of the bank will be to organise a payments system for multilateral trade among the COMECON countries. This move is based on the belief that the present system of bilateral trade is a drag on the kind of mutual co-operation sought to be ensured under the ægis of the COMECON.

Another feature of the proposed bank, according to Mr. Nosko, will be that it will make it possible to ensure payments in a single 'transfer' monetary unit in the whole of COMECON. All the transactions will be in that one monetary unit only. It is said that the bank will also do business with non-Communist countries. By enabling easy convertibility, the proposed bank will facilitate easier movement of goods and services within the COMECON. This development is of considerable importance to India, in view of its steadily expanding trade with the member-countries of the COMECON. India's trade with each of these countries is now on a bilateral basis. But if the proposed bank comes into being and multilateral trade develops in the Soviet bloc in Europe, India will be in a position to utilise its trade surplus with any one of the COMECON countries for adjusting the deficit in its trade with any other member of the bloc.

Millionaires in Britain

Those who swear by socialism in India will do well to peruse the interesting annual report (1961-62) of the British Inland Revenue Commissioners. The report contains a wealth of statistical data which impressively highlight the extent of economic prosperity that has been achieved in a Welfare State under free enterprise system. The aggregate wealth of individuals in Britain as of 1961 is estimated at as high as £56,024 million, a rise of £4,543 million as compared with that a year before. Of this total, men own £33,081 million and the women £22,943 million. The latter hold almost half of the total quoted ordinary shares worth £9,744 of companies, their actual holding being put at £4,843 million. In the possession of landed property, however, women are less prominent, accounting for just £3,958 million out of the total of £11,305 million. Between 1960-61 and 1961-62, the number of millionaires, that is, persons with annual incomes exceeding £100,000, has actually gone up from 63 to 81, but the total is still negligible having regard to the size of aggregate population. There has also been a rise in the number of persons with incomes of £75,000-100,000, from 58 to 82. Nearly two-fifths of the U.K.'s population of about 53 million are taxpayers; 19.9 million persons paid in 1961-62 a total of £2,045 million as income-tax and surtax, an average of £102 each. There were in addition incomes amounting to £2.1 million on which no tax was paid. About 413,000 persons paid £225 million by way of surtax, an average of £540 each.

The biggest income group in those receiving over £2,000 per annum was in the £3,000-4,000 bracket where there were 109,400 individuals with a total income (in 1960-61) of £375.5 million. In all, there were 412,700 persons with an individual income over £2,000, having in the aggregate an income of £1,845 million. Incidentally, the *per capita* income in Britain during 1961 was over £400, with population put at 52.8 million and gross national income at £21,600 million.

The third quinquennial survey of incomes produced since the end of the war, the results of which are included in the latest annual report if Inland Revenue, covers the year 1959-60. The interesting features brought out in the survey are as follows:

In all income ranges during that year, 20.9 million people earned a total net taxable income

(*Continued on page 211*)

TREND OF SHARES

SOME LIMIT TO TAX FEARS

(From Our Own Correspondent)

BOMBAY, 31*st January*

TAXATION fears have gripped stock markets and, as the time for the presentation of the ensuing budget grows nearer, they have been assuming serious proportions. It is precisely because of this that the small rally witnessed towards the close of last week petered out this week and values closed further lower. Although nobody, including Prime Minister Nehru, is sure of the next move of the Chinese, responsible opinion in this country as also abroad has commended the Government of India's acceptance of the Colombo proposals as, to quote the London *Times*, "one step taken towards a *de facto* settlement" of the border issue. Temporarily, the anxiety over the border issue has eased slightly. But for stock markets, because of the emergency and the need for preparedness created by the Chinese aggression, that anxiety has been replaced by a very serious concern over the size and shape of new taxes.

The Planning Commission is of the belief that an all-out tax effort is called for to raise maximum resources. It is said to have sounded State Governments to avoid deficit budgets. Stock market circles believe that central taxes of the order Rs. 100 crores are in the offing, besides Rs. 60-Rs. 75 crores by State taxation. They talk of a further five-point rise in corporate tax. Dr. A. Ramaswami Mudaliar said in Bombay this week that excess profit tax would fetch the Government considerable resources.

Messrs. Maconochie and Co., the well-known Madras firm of stock brokers, writes in its fortnightly bulletin dated the 26th inst. that "in the forthcoming budget, the Finance Minister has doubly arduous task of bridging the current gap and providing the basis for increased defence investment in the coming years.... The Finance Minister seems to be left with only two alternatives, namely, to step up the rate of existing taxes both direct and indirect or to resort to larger deficit financing. ... If the recent increase in the Bank Rate and the current policy of dear money are any clue, it is obvious that deficit financing will be the last resort. . . So it seems fairly certain that a stiff dose of taxation is inevitable. ... Well meant suggestions for pruning the Plan have met with stern rebuff. Nor have savings shown any significant rise. As such we have to be prepared for larger taxation. ... For stock markets, what matters is the measure of direct taxation and the course of share prices after the budget will depend on this."

Another important share brokers' firm of Madras, namely, Kothari and Sons, states, in its fortnightly bulletin of the 25th inst., that "there are various ways to raise resources for the Plan and defence. ... While the capital market is not wrong in expecting a higher taxation in general, there seems to be no justification for taking any alarmistic view of the adverse impact of any higher taxation touching on industry, capital formation and the equity market. Because, the mighty economic endeavour which is now being gone through in the shape of the third Plan has a priority as much as has defence. Therefore, there is no need for hasty conclusions, and one can be hopeful of a promising economic outlook."

The above is a short account of the trend of thoughts and beliefs in market circles. Twenty-eight days hence, when the Finance Minister is scheduled to present the budget, all will be set clear. In the meantime, it is hazardous to draw any precise conclusions about the size and shape of new taxes, especially because the next budget is to be one for emergency. There are, however, silver lining to every cloud.

The net revenue from excise duty between April and October last is placed at Rs. 322 crores, as against the estimate of Rs. 522 crores in the budget for the whole of the 1962-63 fiscal year. On an average of Rs. 46 crores per month, it is likely that collections in the remaining five months will bring the total for the year to Rs. 552 crores, which will be Rs. 30 crores in excess of the income estimated in the budget. Income from customs duty between April and October last works out to Rs. 133 crores. On the basis of a monthly average of Rs. 19 crores, the revenue for the full year will amount to Rs. 228 crores, as against the budget estimate of Rs. 208 crores. Thus, the income from excise and customs duties is expected to exceed the budget estimate by Rs. 50 crores. A similar increase in the revenue by way of direct taxes can also be forecast. In addition to this excess revenue, the Government has obtained, up to the 25th inst., by way of contributions to the National Defence Fund Rs. 35.73 crores in cash and 1,269.136 grammes of gold in bullion or ornaments. Subscriptions to the gold bonds up to the 18th inst. have aggregated 2,003,700 grammes of gold valued at Rs. 1.09 crores.

In the light of these data, it is reasonable to conclude that the Finance Minister will use the axe sparingly. As in the past, his main concern now also will be not to overburden the industrial sector of the economy with a heavy tax-load and kill the goose that lays golden eggs.

The budget holds the whip either to revise the almost dead confidence of investors or to kill it with a heavy blow. Meanwhile, investors are still down with the grief of having lost 30 to 40 per cent of the value of their holdings from the last year's best levels. It would, however, appear that the stock markets at the current levels have discounted the effects of a reasonable amount of additional taxation. If the fresh tax burden were to turn out to be less than market expectations, it is very likely that values would bounce, provided, of course, nothing untoward happens in the meantime on the political scene.

* * * *

The Governing Board of the Bombay Stock Exchange lowered from Wednesday the 30th inst. the minimum price for Century from Rs. 525 to Rs. 515 and that for National Rayon from Rs. 395 to Rs. 380. It also decided to lift the minimum price for Scindia which had been fixed at Rs. 10.24. The Board announced that compulsory carry-over of business at the settlement tomorrow (Friday, 1st February) would be in respect of only three shares, namely, Tata Steel Ordinary, Century and National Rayon, as against 12 shares before. The making-up prices for Century and National Rayon will be the reduced minimum prices and for Tata Steel Ordinary the unchanged minimum price of Rs. 117. The minimum price for Indian Iron is also unchanged at Rs. 21.

Even after the reduction in their minimum prices, Century and National Rayon were hard to sell, and at least the latter were unofficially quoted at a discount of Rs. 10. Both the shares closed at their minimum levels, with Century showing a loss of Rs. 13 and National Rayon of Rs. 15 over the week. Scindia were sold down as low as Rs. 9.96 and were 28 nP lower over the week at Rs. 10.04. Incidentally, these shares have broken the level of Rs. 10.31, which was touched on 16th June 1950 and had been the lowest level since then. Tata Ordinary were Rs. 1.50 lower at Rs. 117 and Indian Iron 8 nP at Rs. 21.

Among other leading counters, Standard showed a loss of Rs. 25 at Rs. 735, Bombay Burmah of Rs. 15 at Rs. 613, Indian Dyestuff of Rs. 10 at Rs. 257.50, Voltas of Rs. 9 at Rs. 239, Telco of Rs. 6.50 at Rs. 281.50, Hindustan Motors of 28 nP at Rs. 16.92 and A.C.C. of Rs. 3 at Rs. 147. Phaltan sugar declined by Rs. 4.50 to Rs. 80 following the Directors' decision to prune the taxable dividend by two points to Rs. 7 per share for the year ended 30th September 1962 owing to the setback in profit before taxation from Rs. 9.30 lakhs to Rs. 7.41 lakhs. Cash scrips closed with widespread losses which were quite pronounced at Rs. 10 in New India Industries at Rs. 320, at Rs. 8.75 in Alembic at Rs. 166.25 and at Rs. 7.50 in Shah Construction at Rs. 147.50.

* * * *

Values on the Calcutta Stock Exchange closed generally lower. Among forward shares, Dunlop were down by 37 nP at Rs. 35.75, G.K.W. by 45 nP at Rs. 34 and Jaipur by 31 nP at Rs. 10.69, while Howrah Jute and Indian Aluminium were a shade higher at Rs. 38.50 and Rs. 30.31, respectively. Among cash shares, in Textiles, Bharat Commerce slipped back from Rs. 24.40 to Rs. 22.50 and Jayshree declined by Rs. 1.09 to Rs. 13.60. Bengal Coal dropped sharply from Rs. 335 to Rs. 294 and so did East India from Rs. 50 to Rs. 46.25. Jutes were easier, with Delta showing a big loss of Rs. 7 at Rs. 172. Burn, in the Engineering section, fell by 50 points to Rs. 500 and some other shares finished slightly lower. Miscellaneous shares were week, with American Refrigerator declining by Rs. 1.37 to Rs. 8, East Anglia Plastic by Rs. 1.25 to Rs. 11.31, Goodyear by Rs. 2.37 to Rs. 37.50, Hindustan Twyford by Rs. 2.13 to Rs. 13.62, Indian Oxygen by Rs. 1.88 to Rs. 28.87, Metal Box by Rs. 2.50 to Rs. 51, Universal Cable by Rs. 1.37 to Rs. 10.25 and Usha Martin by Rs. 2.02 to Rs. 13.10. Papers and Sugars were easy, but Teas were maintained at their minimum levels.

* * * *

In Madras, Plantings made, after last week's rally, a mixed show, while Textiles and Miscellaneous shares generally drifted lower. Thus, Cochin Malabar looked up from Rs. 6.35 to Rs. 6.45, Vaikundam from Rs. 30.50 to Rs. 30.85 and Kil Kotagiri from Rs. 4.90 to Rs. 4.95, but Consolidated Coffee declined from Rs. 16.75 to Rs. 15.97, T.R. and T. from Rs. 9.20 to Rs. 9.05 and Cowcoody from Rs. 4.06 to Rs. 3.92. With the exception of Lakshmi which gained Rs. 1.75 at Rs. 139.75 and S.I. Viscose which were two points higher at Rs. 127, Textiles displayed a weak trend, with Bangalore Woollen moving down by Rs. 4.80 to Rs. 238, Travancore Rayon by 75 nP to Rs. 27 and Coimbatore Cotton and Radhakrishna by two points each at Rs. 176 and Rs. 32.75, respectively. In the Miscellaneous section, Tube Investments dropped by 24 points to Rs. 238, Madras Rubber declined by 35 nP to Rs. 19.25 and Dalmia Cement showed a loss of 25 nP at Rs. 13.

FIRST NATIONAL CITY BANK'S AWARDS TO STAFF

The First National City Bank has a commendable way of rewarding efficient and promising talent among its staff, which deserves consideration of all banks operating in this country. The head office of the Bank in New York has recently approved three important awards for 1963 to its personnel in its offices in India. The awards are in the form of sponsored study-tours of important areas where the Bank operates. Mr. M. M. Mistri, who joined the Bank three years ago and is an assistant accountant, has received an international travel award from the National City Foundation of the Bank to visit the U.S. for nearly two months and make a trip to the Bank's branches in Asia and Europe. Mr. A. K. Varma, another recipient of the award, is also an assistant accountant and has been granted an opportunity to go round the Bank's branches in the Far East. He joined the Bank in 1930. The third award, which provides for a visit to the Bank's branches in India, has gone to Mr. V. S. Lajmi, who has worked in the Bank for 12 years and is a senior clerk.

DELHI LETTER

DRIVE FOR MORE POWER

SCHEMES FOR SEVERAL THERMAL 'QUICKIES'

(From Our Special Correspondent)

NEW DELHI, 29*th January*

APART from the additional provision of Rs. 37.50 crores in the annual plan for the current Plan's third year, 1st April 1963 to 31st March 1964, the Planning Commission's experts on electricity and the officials of the Irrigation and Power Ministry of the Union Government have been thinking up steps for a quick increase in the supply of power. The past year's experience showed that it was not enough to rely on long-term hydro-electric projects, and the defence needs also will make new calls on power supply. The Centre has suggested to the States that contractors may be given an incentive bonus for completing power house erection quicker than scheduled. Another novel plan is to have a central pool of power generators to be moved speedily to places where sudden demands for power emerge. Andhra, Mysore and West Bengal are expected to have in the next few months turbo-gas generators each with a capacity of 10,000 kW. Ten 1,000 diesel generators are being supplied to the Punjab almost immediately.

Steps are being taken to complete before schedule eight power projects which are under way. Additional working shifts and staff are to be provided on these projects. Under the new scheme, the time-table for commissioning is as follows:

Barauni thermal station in Bihar, 15 mW by March, 15 mW by June; Shahpur thermal station in Gujarat, 5 mW by March, 5 mW by April; Panniar hydro project in Kerala, 15 mW by March, 15 mW by June: Koyna hydro-project in Maharashtra, third unit 60 mW by February, fourth unit 60 mW by March; Gandhisagar's fourth unit in Madhya Pradesh, 28 mW by May; Hirakud's eighth unit in Orissa, 37.4 mW by May: and Delhi C station 30 mW by June.

American assistance has been offered for a new thermal power station in Madhya Pradesh in the Pathakada coalfields in Betul district. There will be five units of 50 to 62.5 mW each and the first two may be commissioned before the end of the current Plan.

Bhakra Project

Soviet experts will be arriving in February for the final approval of the contract for the Bhakra right bank power house. Russian design engineers, who had come in November, have approved the project report with minor changes. To cost more than Rs. 35 crores, including transmission lines, the right bank station will have five units of 120 mW each. Excavation for the foundation has been completed and the work on concreting the sub-structure has begun. The first phase of the Bhakra project is over with the commissioning of the fifth 90 mW unit on 10th December last and the completion of the dam on 30th October last. The installed capacity of the Bhakra system, including Gangwal and Kotla stations, is now more than 600 mW. So far the Bhakra project has cost more than Rs. 170 crores, including about Rs. 50 crores on the canal system.

Sister to the Bhakra project will be the Beas joint venture by the Punjab and Rajasthan Governments. The standing committee of the Beas Control Board recently approved the construction of a 24-mile long railway link (from Mukerian to the Pong dam site) for transport of construction material. Some construction materials like cement will now be transported in barges across the Bhakra reservoir, instead of by road as was originally envisaged. The Beas project consists of two main components, the Beas-Sutlej link and the Beas dam at Pong. The project will provide another 860 mW of power, including an additional 466 mW at Bhakra. The irrigation benefits will cover 800,000 acres in Punjab and three million acres in Rajasthan. The command area of the Bhakra dam is six million acres.

The first unit in the American-aided Chandrapura thermal project in the Damodar Valley is expected to be commissioned before the end of next year. Chandrapura will have three units of 125 to 140 mW each. Apart from the Hirakud hydro-electric project, Orissa, is to have a Rs. 25-crore thermal station at Talcher with American assistance. It will have four units of 50 to 60 mW each.

At Durgapur, the first of the new 66 mW units attached to the coke oven station will be ready by next September and the second will be commissioned by 1965. The cost of the extension is Rs. 12 crores. Additions are taking place to the Rs. 46-crore Rihand project whose dam was dedicated on 7th January. The power house, the biggest in Uttar Pradesh, had been functioning since April last. With a waterspread of 180 square miles and a storage capacity of 8.6 million acre feet, Rihand has the biggest reservoir in the country.

About Rs. 55 crores have been spent until the end of last year on the Rs. 140-crore Nagarjunasagar project in Andhra which will initially have two power units of 50 mW each. There is provision to add six more similar units later. The Korba plant which supplies Bhilai now has three units of 30 mW each. The Russians are aiding the installation of four more power generators of 50 mW each. The first of these new units will be commissioned next year.

Bandel Power Station

The 300-mW thermal power station at Bandel to feed Calcutta will cost about Rs. 30 crores and will comprise four turbo-alternator sets of 75 mW each. All the four generators are expected to be commissioned before the end of next year. The Sabarigiri or the Pampa-Kakki project, to cost Rs. 25 crores, is the main power project now under way in Kerala and will have six units of 50 mW each. The Aliyar Dam in Coimbatore district has been completed and its five powerhouses will provide 180 mW.

While the Russians have undertaken the task of helping the power stations in Neyveli, Patratu, Bhakra and Korba, power development plans in a large measure have been assisted by the United States. American help has covered dollar as well as rupee expenditure. Seven of *the sixteen loans given to India* by the U.S. Agency for International Development since it was established in November 1961 have been for power projects, which received $159.2 million, out of the $468.7 million sanctioned by A.I.D. to India. Under the Development Loan Fund earlier, $165.7 million were given for power projects. In addition, from funds obtained through sales of U.S. grants, Rs. 5.9 crores have gone to power projects. American rupee loans for power projects from the sales proceeds of U.S. commodities amounts to Rs. 247 crores. Adding all these, the total U.S. help for Indian power projects comes to more than Rs. 400 crores.

More Soviet Aid, Trade

The Russians who have kept their word on aid to and trade with India (see *Commerce* dated 1st December 1962, page 1022), despite the India-China conflict, have expressed their willingness to increase their stake in India. This is the impression of Mr. R. K. Nehru, Secretary-General for Foreign Affairs, who has just returned from a trip to Moscow where he initiated moves for closer Indo-Soviet collaboration. The Soviet team to discuss a new long-term trade agreement to cover 1964 to 1968 is likely to arrive in Delhi in a few weeks. Apart from about 30 projects in which Russia has been collaborating, the Soviet Union is said to be willing to examine another 15 projects costing about Rs. 54 crores. These projects will include some of importance to defence production. A team of experts will arrive soon for advising on the establishment of the two MIG aircraft factories.

Some difficulties have emerged with the project planning for the heavy electricals project planned to be set up in two sections, in Ramachandrapuram, in Andhra and in Tiruchi, in Madras State. The Central Government denies any plan to shift the whole factory to Tiruchi where the heavy pressure boiler plant section was to be sited. The Heavy Industries Ministry wants some radical changes in the products from this heavy electricals plant. One point under discussion is the Indian desire to raise the capacity of generators to be made in the factory to 100 mW from the originally planned 50 mW. Another aspect which will be discussed with the Czechs by an officials delegation going to Prague will be whether more Czech assistance will be available. Rs. 23 crores offered by the Czechs, it appears, may not be enough for the various projects with Czech help under consideration. The Czechs have yet to decide whether they can go ahead with Indian suggestions to produce heavier generators than first envisaged.

The first long-term economic agreement between India and Poland, signed on 7th May 1960, provided for assistance of Rs. 14.3 crores. This covered a variety of projects: silos for food-grains storage; expansion of Praga Tools; boilers for two power projects; the Jharia deep coal mining project; a coal washery; and a motor cycle factory. The new offer of a credit of Rs. 15 crores is almost entirely for one industry, coal mining. Each year Poland expects to launch the construction of a new Indian coal mine. Poland also expects trade with India in 1963 to increase by 10 to 12 per cent over the levels of 1962.

PERSPECTIVES & PROJECTIONS

By Mercator

While Peking Prevaricates

THREE months ago, the emergency seemed to unite all groups within Parliament behind their common determination to throw out the Chinese invader. The brief session now concluded this month indicated a certain lack of cohesion in regard to the attitude to be taken to the Colombo proposals; criticisms of the Government lacked substance and there was hardly any reason for the distrustful attitude taken up by some Opposition members, especially when it was becoming clear that it was China which was having reservations about its acceptance of the six-nation plan for disengagement. The whole episode illustrates the failure of the Government's public relations and the inadequacy of its machinery for informal consultations. The Opposition was not well advised in taking a somewhat hostile attitude to the six powers which had worked hard to produce a formula which, on the whole, avoided rewarding the aggressor, though they could not obviously settle all the vexed issues of China's claims, after they had disclaimed any desire to pronounce on the merits of the disputes. It should have been apparent to any discerning person that, in view of the mediatory role they had to perform, the six countries could not start by condemning Chinese aggression, when even a world authority like the United Nations sometimes finds it expedient to try conciliatory approaches in the first instance. Secondly, on the merits of the Colombo proposals, which came as close as they possibly could to India's declared minimum of restoration of the 8th September line, no valid objection was urged by critics while many could not distinguish between the ultimate objective of throwing out the Chinese invader and the short-term pre-condition for preliminary talks of a return to the 8th September position.

It is now clear that Peking will do all the prevarication and it suits India to let it do so. India's acceptance will at least take the sting out of Peking's propaganda among the non-aligned nations in Asia; but, more important, it will also be honouring Cairo and the other powers for the honest broker's role they have played during the difficult days of tension and for which they were much misunderstood in this country. Mr. Nehru recounted with regret the cross-examination to which Mr. Ali Sabry was subjected by the Press in India; but was this not also a failure of the public relations machinery of the Government and an illustration of its tendency to ignore the importance of the Press and the need to take it into its confidence? Cairo opinion has blamed India for its failure to make its case well known abroad among friends. Belated efforts have been made to mend this gap by "importing" a consultant as if any consultant, however ingenious, can find methods of overcoming weaknesses due to innate reluctance on the part of persons at high levels to accept that the public has a right to be well informed on many of these matters.

The failure of the Indian critics of the Colombo proposals to give point to their objections to acceptance is, however, a different matter. Rajaji was at least logical when he said that an alliance with the West and not non-alignment was the principal and immediate problem; but even this assumes that the West is now willing or eager to have India aligned with it and to fight Communist countries across the Himalayas, just when it is anxiously exploring all channels of achieving a *detente* with the Soviet Union and some hopeful signs have emerged recently. It is quite one thing to say that some day India may be aligned against China in the sense in which even the U.S.S.R. also may be so aligned; but that cannot apply to our present problem of remaining non-aligned while taking limited Western military aid to resist invasion.

That India needs a respite for defence preparations will not be denied, especially by those who have taken a serious view of our reverses in NEFA. The recent experience has given an indication of the scale of effort needed to defend a frontier as long and as difficult as the Himalayan; moreover, Pakistan's attitude has been uncertain and it cannot be that Mr. Nehru's critics are so lacking in understanding that they can urge the Government to fight on till victory with two powerful adversaries, without paying heed to proposals for negotiations, even of a preliminary character.

* * * *

Postscript on Gold

There has been equal misunderstanding of the Government's gold policy which has been subjected to much criticism from several angles. Those in the jewellery trade continue to speak of the unsuitability of 14-carat gold for ornaments of some kinds and of the possible unemployment of goldsmiths—as if these defects would be conclusive against the need to stop the current drain on foreign exchange due to smuggling and to mobilise gold if possible for productive uses. Having decided to take firm measures against smuggling, the natural corollary for the Government was to insist on lower purity for ornaments to enable existing stocks go a much longer way in satisfying the people's demand for gold jewellery. Far from interfering with the adornment habits or causing unemployment, this reduction of gold content should help to maintain both, and hence help a smoother transition than would have been possible if new gold was merely prevented from flowing in. The Gold Board has also been asked to provide technical information and training in the use of alloys for various purposes for which pure gold has been used hitherto, though these measures are likely to annoy those who want a speedy social revolution and effective ceilings on individual holdings of gold ornaments. The authorities are not at present inclined to attempt anything so drastic and thereby give room for their opponents to exploit the situation by saying that the Government is intent on depriving the womenfolk of their precious trinkets and disturbing their social and religious sentiments. Mr. Rajagopalachari was harsh but nearer the truth when he stressed that these trinkets may be safer where they are, since they may be mobilised only to facilitate the first attractive official adventure. This expresses forcefully the feeling of many people that the Government has not imposed on itself and its officials that degree of restraint and austerity which should match the heavy sacrifices made by those who parted with gold, whether as gifts or in exchange for bonds at half the market price.

It is clear from Mr. Morarji Desai's statements that the question of mobilising gold has become secondary to the more important task of first stopping the inflow. There may still be a last-minute rush before 11th February for gold bonds by waverers who have fears about the security of their hoards but it is very doubtful whether even this will bring a large amount of gold. There are enough channels left for black markets to flourish with the aid of stocks already in the country and those who keep back may feel that they are not taking any great risk. Like the Prize Bonds, the Gold Bonds scheme may also rank as an experiment of limited value. But it was certainly right that the Government should have tried it than not at all. It has begun a reform and aroused sufficient public consciousness of the importance of restraint to the future well-being; any beginning must be cautious, particularly when the scope for evasion is enormous. Wisely the Government avoided the pitfall of bringing ornaments within the scope of its control; that would have needed an inquisitorial system of vigilance and even then the honest would have been penalised while the dishonest would have found ways of getting round all restrictions.

QUALITY CONTROL

THE seventh annual Indian Standards Convention held this week at Calcutta is part of the campaign by the Indian Standards Institution to popularise standardisation and quality control in the country. The annual conventions of the I.S.I. provide an opportunity for industry and trade, as also Government representatives, to exchange views on problems relating to the adoption of national standards. Similar conventions had been held during the last few years in such industrial centres as Bombay, Kanpur and New Delhi. This year's convention seems to have assumed much more significance than the previous ones, in view of the additional responsibilities that are likely to devolve upon the I.S.I., when the Bill for compulsory quality control and pre-shipment inspection of export goods now being drafted by the Government is passed by Parliament. In this context, it was only natural that the Convention should have focussed its attention on the importance of standards as a means of export promotion. Mr. P. C. Sen, Chief Minister of West Bengal, who inaugurated the meeting, stressed the fact that India would not be able to expand exports and win the confidence of overseas importers without adhering to strict quality control and standardisation. He appealed to industrialists to abide by certain minimum national and international standards in the various stages of production, procurement of raw materials and in instrumentation. Mr. Sen's views were ably supported by Mr. K. K. Birla, Chairman of the Reception Committee, who observed that, unless export products were of standard quality, Indian goods would not make headway in the highly competitive world markets.

While there can be no two opinions on the need for quality control on exports, the Government's attempt to introduce compulsion in the matter has not been received with enthusiasm by a section of trade and industry. One of the objections raised against the enforcement of quality control is that the Indian national standard specifications are not binding on the overseas buyers. This argument is admittedly not irrelevant, as India apparently cannot impose its own standards on overseas buyers. But it should not be forgotten that, in the absence of comprehensive international standards readily applicable to world trade, a fair measure of guarantee of quality can be ensured only by relevant national standards. National standards are not strictly exclusive. For all the countries, including India, which have evolved national standards, do so only after elaborate mutual consultations with the standards institutions of other countries. What is more, in the absence of international standards for most of the goods, national standards are based generally on "international recommendations" for standardisation that are brought out by the International Organisation for Standardisation (I.O.S.) and the International Electro-technical Commission from time to time. These recommendations constitute a co-ordinating factor behind the various national standards. It is of particular importance to note that the I.S.I. has been working in close collaboration with the I.O.S. and also standards institutions in other countries. In fact, the I.S.I. has undertaken the Secretariat responsibility of some of the international committees, including those for shellac, mica, spices, electric fans, etc. The international significance of the Indian national standards is reflected in the participation in Calcutta Convention of several expert delegates from countries, such as the U.S., the U.K., West Germany, Ceylon and Indonesia. So the argument that Indian standards may not be acceptable to other countries is not perfectly correct. To say this is not to minimise the limitations of national standards and the difficulties in the way of their enforcement. One of the major difficulties relates to the dearth of trained personnel for executing the job. This problem deserves the urgent attention of the Export Inspection Advisory Council recently set up by the Department of International Trade and the I.S.I.

The I.S.I. has, to date, been able to inculcate an element of standard-consciousness in the country, ever since its inception in 1947. It has published about 1,000 national standards so far and has given certification marks to several producers. But no attention has been given in India so far to evolving "industry standards" and "company standards," which are popular in countries like the U.S. and the U.K. Industry standards, it may be noted here, are those which are established within the organisations of an industry or a trade, and company standards are operative standards within a given plant or a company for guiding operations within its own framework. It is gratifying to note that Mr. K. C. Reddy, Union Minister for Commerce and Industry, who is the President of the I.S.I., made a particular reference to the need for promoting the evolution of company standards in India. He disclosed that the I.S.I. had already secured the services of a U.N. specialist for this purpose. The I.S.I.'s work in this connection will be fruitful if it seeks to secure the co-operation of representative organisations such as the Federation of Indian Chambers of Commerce and Industry and the Associated Chambers of Commerce, besides the National Productivity Council and similar agencies.

U.S. TAX REDUCTION PROGRAMME

The Kennedy Administration has set its heart on a comprehensive programme of federal tax reduction and reform to lift the American economy out of its "chronic sluggishness" which has been responsible for a large amount of unemployment and of under-utilisation of industrial capacity. This programme, which has just been spelt out in detail in a special presidential message to U.S. Congress, is not designed as a remedy for the emergency of a recession, for there is currently no recession as such in the American economy. It is, on the other hand, a proposal for a permanent fiscal policy which could bring about a higher rate of economic growth through fuller utilisation of man-power and machine-power. From the long-term point of view, there can be no gainsaying that it is a constructive and sound policy.

There are six broad proposals in the suggested programme:

(1) The individual income-tax rate is to range from 18.5 per cent to 84.5 per cent in 1963, from 15.5 to 71.5 per cent in 1964, and from 14.0 to 65.0 per cent in 1965. The lowest, 14 per cent, would apply to the first $2,000 of taxable income for married couples and to the first $1,000 for single taxpayers.

(2) The present normal corporate income-tax rate of 30 per cent applicable to the first $25,000 of taxable corporate income is to drop to 22 per cent in 1963, while the rate applicable to income in excess of $25,000 would remain at 52 per cent (including a surtax of 30 per cent). In 1964, the corporate surtax rate would be reduced to 28 per cent, lowering the combined maximum corporate tax rate to 50 per cent. From 1965, the corporate surtax would be reduced to 25 per cent, thereby lowering the combined maximum corporate tax rate to 47 per cent. Thus, the maximum corporate income-tax rate is to be reduced, over the three years 1963 to 1965, from 52 per cent to 47 per cent.

(3) Tax payments by corporations with anticipated annual tax liabilities of more than $100,000 are to be accelerated.

(4) The percentage of long-term capital gains included in individual incomes subject to tax is to be reduced from the present 50 per cent of the gain to 30 per cent. Combined with proposed individual tax rate schedule ranging from 14 per cent to 65 per cent, this would mean capital gains tax rates starting at 4.2 per cent and going to a maximum of 19.5 per cent.

(5) The income-tax base would be broadened to remove unwarranted special privileges and provide more equal treatment to taxpayers by putting a floor on certain tax deductions, such as mortgage interest payments and State and local taxes.

(6) Certain inequities and hardships in the present tax structure are to be removed.

The proposed programme has several merits from the point of view of low-income groups. Thus, upto a million low-income taxpayers would be dropped from the tax rolls completely. The largest percentage cuts in personal income-tax bills would go to the benefit of lower-income taxpayers, for the tax rate on the first $1,000 of a taxpayer's taxable income would drop from 20 per cent to 14 per cent. As for the highest-income taxpayers, they have now to turn over to the Government 91 per cent of all taxable earnings over $400,000. But, under the proposed programme, they would have to give up only 65 per cent of such earnings over $400,000. While the maximum tax rate on the income of large corporations would drop from 52 per cent to 47 per cent, small corporations with less than $25,000 income would have to pay tax at the rate of only 22 per cent, as against the present 30 per cent.

The programme has also three other merits. One is that business investment in scientific equipment would be given more favourable tax treatment, and this would be a spur to greater technological progress. Another is that the tax treatment of capital gains would be changed to encourage greater risk-taking by investors, thereby ensuring freer and fuller flow of capital funds. And the third is that working mothers, aged persons, and persons with large medical bills would get even more generous tax treatment than under the present rules.

With so many merits to commend it, the Kennedy programme of tax reduction and reform cannot, in fairness, be criticised on the ground of an *immediate* revenue loss. The programme would, of course, involve a *gross* loss of $13,600 million in federal tax revenue over the three-year period 1963-65—$11,000 million under individual income-tax and $2,600 million under corporate income-tax. But adjustments in the tax structure are expected to produce, on balance, a revenue gain of $3,400 million. So, the *net* loss of revenue would only be $10,200 million—$6,000 million in 1963 and $4,200 million in 1964. Even this *net* loss of $10,200 million would be reduced permanently to $8,700 million *per annum* from 1965 by a change in the timing of tax payments of large corporations. In the ultimate analysis, even this will not really be a loss, for the speed-up in economic growth produced by the tax cuts may be expected to neutralise it by producing more revenue within a few years than the Government would receive under the present tax rates. Whether the U.S. Congress, too, would share the Administration's optimism in this connection and approve of the tax reduction programme in its entirety is the big question now.

NATIONAL DEFENCE FUND

Thanks to the spontaneous upsurge of patriotism in the wake of Chinese aggression on India's northern border areas, the classes and the masses alike have so far donated nearly Rs. 35 crores to the National Defence Fund. If socialism means: "from each according to his capacity," in a way this has been reflected in the equitable and voluntary sharing of sacrifices by the richer classes and the poorer masses of the country. Both the rich and the poor deserve equal praise for what they have contributed according to their respective capacities. Surely this is not the time for anybody to play up the contributions made by the poorer classes, and to have, simultaneously, a dig at the more well-to-do classes by belittling the latter's massive participation in the defence effort. Since, however, some politicians have chosen to run down the mercantile community in that manner, the Federation of Indian Chambers of Commerce and Industry has done well to make a class-wise survey of the contributions to the National Defence Fund.

This survey has been confined to the eleven lists of contributions published by the Centre. The contributions covered by these lists aggregate Rs. 8.6 crores and do not include the amounts paid into the branch accounts of the Fund at State headquarters. It is on the basis of its analysis of the published Central lists that the Federation has come to the conclusion that the major part of the contributions has been made by the well-to-do and business classes. As the State lists have not been published so far, the Federation has had to assume that the contributions of these classes to the State accounts of the Fund should have been in the same proportion as in the case of the Central lists. The Federation's assumption here seems to be a valid one, for "in the vast majority of cases businessmen and industrialists have had to contribute to the State headquarters in the first instance."

The broad finding of the Federation's survey is that the lion's share (75 to 80 per cent) of contributions to the National Defence Fund has come from the well-to-do and business sections of the community. As business concerns are claimed to have been contributing, in pursuance of the F.I.C.C.I's decision, a minimum of five per cent of their net profits to the Fund, they must have provided by now some 15 to 16 crores of rupees. If to this amount are added the contributions of other well-to-do classes, not less than 75 to 80 per cent of the entire defence fund collections must have come from the richer sections. This conclusion reached by the Federation is as it should be, for these classes have the capacity to contribute, both relatively and absolutely, much more than the poorer classes. It is a safe guess that, if and when all the lists are fully published, a detailed study thereof will confirm the Federation's broad finding. If the politicians, some of whom are high-ranking, wish to challenge this conclusion, they should do so by giving facts and figures. It would be most unfair to the business community which has wholeheartedly risen to the occasion, if they merely indulge in unsubstantiated verbosity.

INDIA AND WORLD CARPET FAIR

Carpets, floor rugs and mattings constitute one of the important earners of foreign exchange for India. The total exports of these items are currently maintained at an annual rate of Rs. 8 crores, of which over 50 per cent is accounted for by coverings made of wool and fine hair, the balance being shared by coverings produced from other textile fibres and vegetable materials. The scope for augmenting exports of carpets is pretty vast, thanks to rising overseas demand and existence within the country of conditions congenial to the production of high quality floor coverings at an economic cost. Indeed, Indian goods can, if proper steps are taken, compete effectively in world markets, notwithstanding the availability of overwhelmingly large alternative supplies. There is ample supply of raw wool, cotton, jute and other fibres. The services of experienced designers, spinners, dyers and finishers are also freely available. The carpet industry, as is well known, has the backing of rich tradition and experience. If all these advantages are exploited fully and properly, the floor covering will certainly earn much more foreign exchange than has been the case in the past few years. This aspect has to be specially stressed in the context of growing competition and the resultant downward trend in exports of late, as is indicated below:

(Value in lakhs of rupees)

	April-November 1962	1961-62	1960-61
Carpets, floor rugs and mattings made of:			
Wool and fine hair	277.29	428.33	478.53
Other textile fibres	45.12	75.20	131.56
Vegetable materials	217.16	324.91	299.54
Linoleum and lenoleum	2.95	15.64	10.15
Total	542.52	844.08	919.78

Not only can the downward trend of carpet exports be checked but the quantum of exports also can certainly be stepped up, provided the indigenous industry and trade endeavour their best to supply such floor coverings as would suit the tastes of buyers abroad and at reasonable prices. It is from this point of view that the forthcoming five-day International Carpet, Linoleum and Floor Coverings Fair (Carpex 1963), due to commence at Earls Court in London on the 25th inst., is of much importance. The U.K. is India's biggest customer for carpets, taking as it does about two-thirds of the carpets exported from India.

Carpex has grown steadily in range and extent since its first presentation seven years ago. Occupying an area of approximately a quarter of a million square feet, the Fair will present, in a blaze of exotic colour, the whole range, of floor coverings, the design and production of which have been influenced greatly by post-war discoveries in the field of synthetic fibres, rising standards of living, and development of new ideas in building, decoration and furnishing. A display illustrating the range and quality of sheepskin rugs, a highly popular form of floor covering, will be a feature of one of the exhibitor's stand. Another exhibitor at Carpex will be displaying a Cormar Casket patterned style, which, we are told, is a completely new conception based on random spinning effects, but coming as close as anything yet produced to a woven pattern Axminster. The other highlights of the Fair will be the new colourings and designs in Exeter, Torbay and Devonion ranges of Axminster Gripper carpets; the new "Royalty" range of carpets of special interest in the contract field (these are available in no less than ten designs with a choice of three qualities in each design, and wool pile yarns are reinforced with Bri-Nylon for durability); 'Rosella' P.V.C. coated felt floor coverings in inlaid and printed designs, including the new 'Tudor' design, an attractive marbled effect; new Wiltons with exciting colourings by Lucienne Day and other new contract Wiltons; a wide range of floor rugs with pile surfaces in mohair, wool, nylon and mohair-nylon and wool viscose mixtures, including a completely new development in washable rugs; an intriguing selection of the most recent trends in Continental floor-coverings, including rugs, squares, flatwoven reversible skin rugs and a completely new material from Holland; and a display of Lanoond carpet underlay, made of a wool/viscose mixture bonded with latex and specially treated to suit under-floor heating.

Carpet manufacturers in India who visit the Carpex Fair will certainly benefit considerably. They can study the results of extensive research in manufacturing techniques and the many applications of post-war discoveries in the vast field of artificial fibres. In the light of the knowledge acquired thus, they can adjust their production and marketing techniques. The Fair will also provide an opportunity to know how the traditional standards of skill and craftsmanship are combining with a new spirit of enterprise.

BONUS: CONSUMERS' CLAIM

Elsewhere in this issue (*vide* page 196) is published an article by Dr. M. C. Munshi on basic issues in bonus payments in India. The author makes out therein a closely reasoned case for looking at the bonus question not only from the point of view of the two parties directly involved in bonus disputes, namely, workers and employers, but also from that of the consumer, who ultimately bears the burden of any increase in reward to workers, in the form of higher wages or bonus, or to shareholders, in the form of higher dividends. Dr. Munshi is not the first person to plead for a consumer-oriented approach to bonus, but he has laid much-needed emphasis, which has hitherto been lacking, on the point that such an approach is necessary on economic and not merely political grounds. His reasoning is based on the apparently elementary, but invariably overlooked, principle that, when a product is sold in the market, the consumer too is a participant in the whole process governing price mechanism and that he, who ultimately bears the burden, has a right to share in the extraordinary and even ordinary surplus (or gains) of industry. In other words, consumers have as much right to share in the surplus as workers and employers (shareholders), because the surplus is a social product. It is not pure profit directly attributable to the endeavours of either workers or employers, or both combined, but largely the result of the inflationary boom in the economy and of sheltered and closed markets, a by-product of the forced

INDUSTRY AND TECHNOLOGY

SOME SUGGESTIONS FOR OVERCOMING INDIA'S BACKWARDNESS

By G. L. Mehta

[An interesting speech was delivered by Mr. G. L. Mehta, Chairman of the Industrial Credit and Investment Corporation of India Ltd., on "Industry and Technology," at the annual meeting of the Institution of Marine Technologists on Thursday, 31st January, 1963. In the course of his speech, he brought out the deficiencies of our country in industrial and scientific research and suggested how they could be made good, by illustrating the ways in which Japan, a relatively newcomer to the ranks of modern industrial powers, solved the problem. The article on this page is an adaptation of Mr. Mehta's address to the marine technologists. It contains some thought-provoking observations.—ED.]

IN the field of technology, the world was in a relatively static state for many centuries, and the technological innovations comprising what has come to be called the Industrial Revolution, took place only about 150 to 200 years ago. Inventions set in train a process of events which have gradually enveloped all countries and transformed sciences themselves.

The evolution of this development has been a fascinating phenomenon and he would have been a bold prophet who could have foreseen all the developments that followed the successful application of simple devices. One discovery or invention led to another and the chain of events, however tenuous some links may appear, has been a fairly continuous process from the beginning of the Industrial Revolution until now.

Not very long ago, our country had advanced considerably in technological development as it then obtained. Two industries in particular, cotton textiles and shipbuilding, were well developed in India at the level of technology then in existence. During the eighteenth and nineteenth century, however, India lost this supremacy. Economic historians have attributed this failure of India to develop to several factors, social and political. But, whatever the reasons, the fact remains that the technical developments which took place in the second half of the 18th century, increasing immensely the productivity per man in the cotton textile industry, did not occur here. Nor were we able to adopt them at a sufficiently early stage. The result was that we lagged behind other countries in the cotton textile industry. It is hardly worthwhile now to dwell on "might-have-beens" and try to determine whether we would have progressed more in a different political set-up. The path of history is not straight or easy and the growth of a people rests on many imponderables. Revolutions, as Barbara Ward has observed, begin or fail to begin in the minds of men.

Historical Perspective

So, too, we lost our position of advantage and superiority in the shipbuilding industry during the middle of the 19th century. As you well know, India had a fine merchant marine until then backed by a well-developed shipbuilding industry; indeed, we then built ships for other countries also. Here, again, technical developments occurred involving the substitution of iron for wood as the basic material for ship construction and the reliance on self-propelling power instead of on the wind for moving a ship. These developments took place in other countries pioneered by Britain, with the result that the Indian shipbuilding industry gradually declined. In this case, the decline was due even more to technical than political factors; we did not have the iron and steel industry nor the industrial basis necessary for development of modern shipbuilding. In other words, our failure to keep abreast in the technical sphere meant that we continually slipped more and more behind other countries which were continuously advancing. In any event, the fact remains that, as in the case of the cotton textile industry, the shipbuilding industry in our country gradually languished and virtually died out.

In the historical perspective, then for the time being at any rate, we lost out in the industrial field. We were neither free nor united at the time. Our social system was too rigid and was not capable of fostering and absorbing change. Technical knowledge was almost completely absent and the lack of scientific advance was equalled by want of saving and investment. While changes were taking place in other parts of the world, we were under a deadweight of stagnancy so that the gap between ourselves and advanced countries became steadily wider.

Gradually, however, we are beginning a process whereby we hope to catch up with developed countries. But let us not delude ourselves. This is going to be a difficult and time-consuming process. At present, our effort in economic development is mainly based on imported techniques and foreign "know-how". To some extent, this has been unavoidable; it has also simplified in some respects the task of development and reduced the time needed to carry through various programmes. The cost of a fully developed technology, it need hardly be said, would be formidable. It would not have been practicable or expedient at this stage to try to evolve, on our own, techniques developed over a long period in other countries by methods of trial and error. It is an advantage of coming late in the field that we can benefit by the body of knowledge and the fund of experience already attained by others and also profit by the errors of those who have preceded us. Provided, of course, we have the desire and the capacity to select and reject, to adapt and not merely to adopt blindly. Assimilation requires discrimination, not imitation.

However, I suppose, this is only a passing phase in our economic history. While we borrow techniques and technology, it is also imperative that we develop within our own country facilities for research and design and planning. At present, too much attention is being paid to setting up what might be called the "hardware" of development—factories, dams, power-stations and so on; and not enough care is taken to see that we also make a beginning simultaneously with evolving our techniques conditioned to our environment and suitable for our needs.

Lesson from Japan

One will appreciate that this is desirable for several reasons. Research takes time to bear fruit and, to obtain results in future, we have to make a start now. Here, I would like to instance the case of Japan. Japan's initial development was based almost entirely on "borrowed" research and design. And, until the 1930's, Japan's industrial products were regarded as mainly imitative in character. But Japan's economic programme and educational system have sought to combine national energy with indigenous talent for skilful adaptation. I shall confine myself here only to shipbuilding. In this industry, Japan has led the world consistently since 1956, relegating the U.K. to the second place. Last year, Japanese shipyards launched over 2 million gross tons exceeding the tonnages launched by Britain or West Germany. She has now the largest and most modern shipyard in the world at Nagasaki. Last July, the world's biggest tanker of 1,31,000 tons was launched from a Japanese shipyard. I found during my visit to Japan last May that the time taken for construction of a 10,000 to 12,000 ton deadweight steamer in Japanese shipyards was 5 to 6 months, while a 88,000 ton tanker was built in 11 months. Japanese shipyards are able to increase not merely the deadweight tonnage of ships but also their drafts. It is necessary to emphasise that Japan's remarkable industrial progress is not merely quantitative but also qualitative. The Japanese are no longer inspired imitators as they were once regarded but are innovators. They are prepared to adapt any machinery and techniques from abroad which they believe can be useful to them in their conditions and, wherever necessary, improve them. The Japanese may be better "knowers" than "thinkers," but they have shown the way for rapid industrial progress of an Asian country based on technological adaptation, which is worth our careful study.

We should not also forget that, unless we undertake our own research and develop a technology based on it, we are bound to remain a few steps behind other countries. In a competitive world, this has various drawbacks; it would place us at a disadvantage in regard to exports; it would involve constant borrowing of technology and occasionally failing in the endeavour; it would mean continuous dependence on other countries for maintaining our industrial progress; moreover, it means considerable waste of latent talent for research.

I would also like to mention another aspect of this problem. Research, design and technology are in a variety of ways related to social conditions in a country. The technology that is evolved in the West is in response to various pressures in its systems and may, therefore, not necessarily be appropriate for other countries. Even many advanced European countries have not found it possible in the same degree to adopt all the advances—such as in automation made in the United States. While we may, therefore, have to borrow from abroad, it will still be necessary for us to evolve a technology most suited to our own conditions and requirements.

We cannot also borrow techniques without generating social forces and creating social problems of which we have to take account. Despite our efforts to adapt techniques, it is not possible to avoid some of the social consequences of modern technology. So, also, our material resources have a different pattern from that of the West. For example, our coal has a high content of ash, and, of non-ferrous metals, we have abundant supplies of ores for aluminium only. Technological development has, therefore, to be conditioned by our material resources and our social environment.

We have, no doubt, advanced in many directions over the years in scientific studies and the application of modern techniques to industry. But science and technology are advancing so rapidly and in so many directions that the form of research and its application have radically changed.

Source of Inventions

The first point to note in this context is the source of invention. The earlier inventions were made by artisans or by what, in modern parlance, would be called, mechanics. Paul Mantoux refers to John Kay, the inventor of the fly-shuttle, as "half-weaver and half-mechanic" and Hargreaves the inventor of spinning jenny, was both a carpenter and a weaver. The inventions were simple mechanical devices which increased manifold the productivity of the instruments. As Prof. Joseph S. Fruton says in an article on *The Aims and Values of the Sciences*: "Because the sciences require not only uncommon ideas, but also meticulous precision in testing them, it is not surprising that some of the important scientific pioneers of the 17th and 18th centuries were highly skilled artisans, for example, clockmakers." Today, invention which includes improvement of existing equipment and development of new products is usually the result of organised research. For, scientific and industrial research is now carried on in universities, defence establishments, special departments of industrial enterprises and independent institutions. Countries like the United States and the United Kingdom devote about two to three per cent of the national income to research and Soviet Russia presumably even more.

It is all the more necessary that an industry like shipping and shipbuilding which is engaged in a highly competitive international field should keep abreast of developments in respect of ship construction as well as operation. A couple of years ago, the British shipbuilding industry set up a committee under the auspices of the Shipbuilding Conference, the Shipbuilding Employers' Federation, the National Association of Marine Engine-builders and the British Shipbuilding Research Association (now the British Ship Research Association, incorporating shipowners as well as shipbuilders and marine engineers) to "consider ways and means of improving productivity and developing research in the shipbuilding industry." I understand that the report of this committee was remarkable in its scope and implications and might well worth be a study by our own shipowners, shipbuilders and technologists.

Another factor of importance is the relative expensiveness of putting an invention into operation in modern times. In the earlier years, most inventions were, as already mentioned, of the kind that increased productivity per man; the advantages of such inventions were obvious and the cost of bringing them into operation not high. Many inventors were consequently able to exploit their inventions and, in the process, become manufacturers. This simple kind of world, unfortunately, no longer exists. Few inventors today can have or command resources to exploit their inventions; and when the invention is of a new product, its exploitation involves judgments of cost and market which means the taking of a business decision. The species, inventor-manufacturer, is getting rare now; in fact, in modern times, the only outstanding example one can think of is Henry Ford and he also lived several years ago.

At the same time, the link between the conception of an idea, its realisation in concrete

PROBLEMS AND CHALLENGES

POINTS FROM BRITISH BANK CHAIRMEN'S STATEMENTS

FEW public questions have been more thoroughly debated in Britain than the issue of that country's possible entry into the European Common Market; nor has a national issue involved longer negotiations or caused greater anxiety about the outcome. Chairmen of leading British banks are, therefore, understandably cautious in their assessment of the prospects for banking, in particular, and the British economy, in general. In view of the importance of the subject, a reference to Common Market and its implications to Britain has been made by almost all British bank chairmen in their latest annual statements to shareholders. But judging from their treatment of the subject, British bankers would appear to be more concerned with the problems and challenges of banking in the changed and changing economic climate, financial structure and monetary habits of the people at home than with developments (such as Common Market) abroad.

By far the most searching analysis of the challenges and problems of British banking in a changing world is made by Lord Monckton, Chairman of the Midland Bank. This veteran banker has probed beneath the passing pressures and detected deeper movements in the tide of affairs affecting banking. In Britain, as in any other country, according to Lord Monckton, the position of banking changes with alterations in the financial structure and monetary habits of the people. In recent times, the process has turned, in his view, in directions that do not altogether favour banking. There have been special influences in Britain, such as integration of business, extension of institutional and corporate savings and expansion of the public sector, all tending to reduce the demand for advances. But more important has been the way in which Government emphasis upon the adjustment of business conditions through banking channels has held back development of banks and presented opportunities to other financial institutions. These, in turn, have encouraged increased sophistication among investors and borrowers and still further specialisation in financial arrangements. Consequently, the scope for expansion of lending is less now than it was four years back, despite relaxation of credit restrictions. Hence, observes Lord Monckton, in embarking upon measures designed to enlarge their deposits, banks have to be convinced not only that proper employment is available for additional funds, but also that such steps would, in the event, prove worthwhile. Developments of this kind, in Lord Monckton's view, involve sharp departures from established methods and practices.

In the past few years, according to Lord Monckton, funds have been increasingly moving into employment through channels outside the banking system, notwithstanding the fact that banks constitute, in the words of the Radcliffe Committee, "widespread and efficient lenders" at moderate cost to borrowers. Consequently, the part played by banks in the financial arrangements of the country has diminished. Non-bank institutions have attracted funds by the offer of better terms. This they were able to do, perhaps, because, some of them enjoy tax advantages and some are possibly less inhibited than banks.

Competition for Deposits

Competition for funds through the offer of higher rates of interest has, according to Lord Monckton, raised some questions for the banks. He sums up these questions as follows:

"Banks have continued to maintain the long-established, regular pattern in the rates they allow and charge, relating these closely to Bank rate. Since, at this particular stage, the resources of the banks are adequate for lending of the kind they have so far considered appropriate to their function, it seems early to contemplate a change in long-established arrangements governing rates of interest allowed on funds deposited with them. Moreover, a rise in deposit rates would increase banking costs substantially, and it is by no means clear that the addition to resources would justify the outlay required to attract them. We could not be sure of success in restricting higher rates to particular categories of depositors, nor do we know to what extent the available resources would be redistributed in favour of the banks. What seems undoubted is that the process would lead to higher rates for at least some groups of borrowers, blunting an edge where the banks are keen competitors with other lenders, though this in itself raises the question of whether charges for bank lending, in changing circumstances, may not be unduly low.

"In practice, funds employed elsewhere can scarcely be seen as a full substitute for bank balances, if only because it is evident that bank accounts continue to be used more and more intensively. Then, again, banking facilities of all kinds are being called upon more heavily than ever before. Thirdly, the banks operate through branch systems spread throughout the country, and provide a comprehensive service conveniently available for individuals and for business in a way that other financial intermediaries do not."

Mainstays of Banking Progress

The attitude to which this gives rise has, according to Lord Monckton, found expression in recent changes in banking. On the one side, banks have improved their services for depositors, notably by better facilities for the transmission of funds through the introduction and extension of the credit transfer system. On the other side, bank lending expanded rapidly over the first period when restrictions were lifted and it is now on the move again.

Lord Monckton seems to take the view that service and safety are more important for depositors than rate of interest. Thus, he says:

"Looking back over the changes of recent years, it is clear that the mainstays of banking progress, and the areas where initiative has been most evident, are in the fields of activity that the banks regard as peculiarly their own, that is, in the unquestioned safety of funds entrusted to them; in the efficient transfer of money as required by the public and in lending at short-term at highly competitive rates. It is through these efforts that they make their most effective contribution to the country's business activities, a contribution that is neither inconsiderable nor diminishing."

The Chairman of the Westminster Bank, Mr. Duncan Stirling, has also referred to competition for deposits. According to him, banks can most effectively compete with other financial institutions for deposits by offering the facilities that go with a current account, which is the most important service provided by banks to the public. In his view, it is appropriate that those other institutions, which seek deposits from the public, should be required to practise the same prudence and endure the same restraint as banks do, whether for the protection of depositors or the good of the national economy.

Plight of Developing Countries

In their preoccupation with the problems facing Britain, most bank chairmen seem to have overlooked the problems of the primary producing countries and the role banks could play in stimulating and promoting trade with these countries. Only Mr. John Thomson, Chairman of Barclays Bank, has made a pointed reference to the need for supplementing aid with trade. His observations in this regard are worth quoting. Says Mr. Thomson:

"The primary producer in the poorer country is at the other end of the chain from the consumer in the more advanced economy. No progress is made if aid from the wealthy is offset by falling prices for raw materials, unless lower prices stimulate increased demand which can be sustained by low-cost output. This can be achieved only by capital investment in the producing territories. No such investment will be forthcoming without a prospect of political stability and the assurance that plant supplied will be efficiently employed. These two requirements are interlocking, as all who visit such territories can testify. The local influence of those who are prepared to go overseas to exercise their skills and to teach them can be decisive. Higher sales turnover produced economically and profitably must be the eventual salvation. In a sentence, this means the introduction of the right plant and the right people to the raw material areas. It is vital that the efficient and enterprising industrial companies which provide the machinery, should co-operate with those who organise our education to ensure a willing supply of good technicians who must be leaders as well as technicians. One tactful engineer, who knows his job and his mind, can do much to transform the economy of a 'backward' community. The responsibility may well begin with those who decide on the admissions to universities."

Welcome Stimulus

The bank chairmen are almost unanimous in their approval of the measures taken by the Chancellor of the Exchequer to stimulate the British economy. These are (1) the successive reductions in the Bank rate bringing it down from the post-crisis rate of 6 per cent on 1st November 1961 to 4½ per cent by the end of April 1962 and to 4 per cent on 3rd January 1963, (2) the release, in December last, of the whole of the banks' special deposits with the Bank of England and (3) the removal of restraints on credit. The latter two have been greeted as a welcome movement in the Government's policy of flexibility which had hitherto veered in the opposite direction. Other measures taken by the Chancellor in recent weeks are: relaxation in hire-purchase terms, reduction in purchase tax on a number of durable goods, including motor cars, increased investment allowance and repayment of post-war credits to men at the age of 60 and women at the age of 55.

The following comment of Lt.-Col. T. Marshall Brooks, Chairman of the District Bank Ltd., on these measures is perhaps typical of the reaction of the British banking fraternity:

"The increase in investment allowances and rates of depreciation and the permission to write off, against tax, capital expenditure on research and development in industry represent a positive encouragement to private investment which has long been needed; one wonders why the Exchequer could not afford it before. The changes add another factor favourable to a substantial upturn in the total product. Adequate stimulus to consumer demand by fiscal concessions now seems to have been given and further encouragement of consumer spending should await proof that the rise in exports is dependable. The Government cannot view with equanimity a further growth of imports to meet the demands of a spending boom at home until exports have made the strength of sterling reasonably sure. . . ."

Cautious Optimism

As regards prospects for the future, the bank chairmen have been extremely cautious in making forecasts. It will be evident from the foregoing quotation from Lt.-Col. Brooks' statement that, though steps have been taken by the Chancellor to revive the buoyancy of British economy, much depends on its ability to export more which in turn depends on the state of world economy. This is not all. There are other uncertainties as well. Mr. Harald Peake, Chairman of Lloyds Bank, has perhaps expressed himself more precisely and pithily on this subject than anybody else, as will be seen from the following extract:

"Inflation has been checked and the cost of living has steadied. We are preparing for an appreciable increase in the number of customers' accounts, following the legislation permitting the payment of wages by cheque from 1st March 1963. These new customers will be welcomed at our branches. It seems fairly certain that the average money rates in 1963 will be lower than in 1962. Consequently, profit-margins are likely to be rather lower. The freedom from restrictions on lending should, however, assist the expansion of our business generally. Uncertainty about the European Common Market is having a restraining effect on many industries. When a decision is reached, it will be reasonable to expect some general improvement in trade. In spite of the difficulties, the prospects are good."

Thus, Mr. Peake's forecast ends on a cautiously optimistic note. Apparently, he believes in the saying that one must always hope for the best.

DEPOSITS

The Bank accepts all types of deposits, Current, Savings, Fixed and Call and Short-Term Deposits.

Savings Bank Accounts opened and interest allowed at 3% upto a maximum of Rs. 50,000. Maximum withdrawal Rs. 5,000 per week.

ADVANCES

The Bank grants all types of advances against Government Securities, Post Office Cash Certificates, Gold Ornaments, Shares, Life Insurance Policies, Foodgrains, Warehouse Receipts—in short, any standard commodity which is readily marketable.

Medium Term Finance and financial assistance to Small Scale Industries, and Co-operative Marketing and Processing Societies at specially reduced rates.

REMITTANCES

The Bank through its wide network of Branches of the STATE BANK OF INDIA and its Subsidiaries, enables constituents to remit money to any part of the country.

FOREIGN EXCHANGE BUSINESS

The Bank undertakes all kinds of business connected with Foreign Exchange, including opening of Letters of Credit, Discounting of Foreign Bills, Issue of Letters of Guarantee, Issue of Travellers' Cheques.

T. R. KRISHNASWAMI,
General Manager.

SELECTIVE CREDIT CONTROLS

IMPLICATIONS OF THE DIRECTIVE ON FOODGRAINS

By A Special Correspondent

DURING the last two years, the Reserve Bank of India has dismantled, one by one, most of its selective credit controls. Now selective credit curbs remain against paddy and rice and groundnuts. Last Friday, the Reserve Bank issued orders curbing bank advances against paddy and rice and bringing within the scope of credit control advances in respect of stocks of paddy and rice against warehouse receipts. Co-operative and marketing societies have, however, been exempted from the purview of restrictions. The necessity arose, because "it was observed," to quote the Reserve Bank's explanation, "that a large part of the rise in paddy and rice advances during 1962 was accounted for by the rise in advances against warehouse receipts which have been completely exempted so far from the purview of credit control."

Under the directive, ceiling limits for each two-month period, commencing from January-February this year (1963), in respect of advances against paddy and rice including advances against warehouse receipts but excluding exempted categories, have been fixed at levels equivalent to the average aggregate levels of such credit limits maintained in the corresponding period of last year. With immediate effect, the commercial banks have been asked to impose a minimum margin of 25 per cent in respect of advances against warehouse receipts covering stocks of paddy and rice to parties other than co-operative processing and marketing societies. The additional credit facilities to dealers and millers in the Punjab and Orissa continue as before, but no additional limits have been provided for similar parties in Kerala on the ground that the level of advances in 1962 was sufficient to cover the existing requirements. Fresh credit limits have been given for rice millers and traders in Assam.

It is, therefore, obvious that the ceiling limit for the two-month period, January-February 1963, will be considerably less than the corresponding limits allowed in the first two months of 1962. Another directive was issued after the credit curb against advances of paddy and rice liberalising credit limits given against export of groundnuts. This relaxation, however, does not call for comment.

Time Lag

The directive against rice advances is not well timed from the point of view of the effectiveness of its implementation. This is because bank credit against paddy and rice generally spurts in February and touches its peak in March each year. For instance, in 1962, scheduled bank advances against paddy and rice rose from Rs. 15.62 crores in January to Rs. 18.71 crores in February and touched Rs. 21.39 crores in March. The Reserve Bank has issued the directive on the assumption that the spurt in advances against paddy and rice will be effectively controlled. It is worthwhile noting, in this connection, that the Reserve Bank issues its directive to the head offices of commercial banks; they, in turn, transmit the same to their regional or zonal headquarters in different parts of the country. The latter inform the agents of branches in their respective jurisdiction. These formalities take anywhere between a fortnight and one month. It is after about a month of the issue of the directive that the agent of a branch office sends for the party and draws his attention to the directive. The party takes his own time to deposit the necessary margin or adjust the advance. If the regional headquarters gives too much pressure, all that happens is that the margin is given as a clean loan facility to the party concerned.

It is thus clear that a minimum period of two months elapses before the Reserve Bank directive could be given effect. Accordingly, the latest restrictions may bei mplemented by April, long after the need is over, and thus may be self-defeating in purpose. The Reserve Bank has been in possession of 1962 data relating to advances against paddy and rice for some time and if the Bank really wanted an effective implementation of its directive, it should have issued the same around the beginning of November, that is, at the time of the commencement of the busy season. Why did it not do so? Why did it wait so long? Be that as it may, henceforth at least the Reserve Bank should seriously consider the possibility of instructing the commercial banks that as soon as its directive appears in the Press, their regional offices should take steps to inform the branch agents in their respective jurisdiction without waiting for the formality of receiving the directive from the head offices. This will save time, say, at least a fortnight, in the implementation of the credit control directives, especially when they are issued at the eleventh hour, as in the aforesaid instance.

Apart from the belated nature of the directive, the possibility of its implementation should be virtually deemed negligible. The Reserve Bank has not imposed any restrictions on clean credit and so long as this is left free, the higher margin required will always be adjusted through a clean loan. Simultaneously, the Reserve Bank should have therefore prescribed restrictions on clean credit to the respective parties affected by the directive.

Even if the leakage through clean loans is plugged, there is scope for evading the directive by overvaluation of paddy and rice stocks kept in the godowns to oblige the customer. The limitations of selective credit control directives of the Reserve Bank are obvious. Their effect on the price level or on the actual operations of commercial banks is invariably exaggerated.

What is the Rationale?

Let us now examine the logic for the provocation of the directive. The principal justification for the present directive imposing restrictions on advances given against paddy and rice kept in the warehouses is that the rise in bank advances is due to a spurt in such type of advances. It is well known to the Reserve Bank for quite some time that the warehouses are patronised mostly by traders to circumvent the restrictions of the Reserve Bank directives against various commodities. For instance, nearly 85 per cent of advances against warehouse receipts usually represent advances to traders. The Reserve Bank had purposely excluded the advances of paddy and rice against warehouse receipts from the purview of its selective credit controls all along because the warehouses could not have survived without patronage from some quarters and such patronage was forthcoming only from traders interested in escaping the selective credit controls.

The cultivators have generally found the warehousing accommodation beyond their reach. The reasons are several. First, the cartage, bearer and rent charges constitute a heavy burden for a poor agriculturist. He is accustomed to store paddy and other grains in *kutcha* type granaries or underground which does not cost him much. Secondly, in most of the places in the countryside, there is the system of middlemen known as *adathiyas*. These *adathiyas* purchase paddy even while it is in the fields or give advances to farmers on the understanding that the produce, as and when ready, will be marketed through them. They combine in themselves the functions of a big landlord, moneylender, miller, trader and exporter. A decade of co-operative movement under State patronage has not succeeded in loosening the grip of these middlemen on the cultivators. The integrated credit scheme envisaged by the Rural Credit Survey Committee has, therefore, by and large remained only a dream. In these circumstances, if the Reserve Bank imposes restrictions, as it has done now, what will happen is that the warehouses may lose their patronage and the programme of warehousing may receive a setback.

There is another angle from which the Reserve Bank directive should be seen. The latest estimates of production of rice (not paddy, be it noted) reveal that it will be around 33 million tons or about the same as in the last season. The impact of the Bank Rate rise to 4½ per cent has been to make money dearer in the organised and unorganised sectors alike, though it was not the Reserve Bank's intention to give a further push to interest rates. By curtailing credit limits, especially at a time when the Reserve Bank's monetary policy has thrown the economy out of gear, only a fresh imbalance in supply and demand for credit will be created. By driving the trade in paddy and rice to patronise the unorganised sector, the Reserve Bank has unwittingly made the movement of crops costlier than what it would have been otherwise.

This is not all. The agents of various branches in certain localities like the delta regions of South India where advances against paddy and rice constitute the staple diet of banks will be put to difficulty in showing satisfactory results. It should be remembered that, in the countryside, there is not yet sufficient diversification of the economy to permit a switchover of bank finance to lines not affected by selective credit control directives. The smaller the bank, the greater will be its difficulties. An important result of the directive, if it is seriously implemented, will be to force the small banks out of business.

These are but a few of the consequences which flow from the Reserve Bank's policy in actual implementation. When the limitations of selective credit controls in an economy like ours are familiar, it is not known why the Reserve Bank wants to cling to them. At best, selective credit controls in an economy like that of India, which has a large unorganised sector and where banks have perfected several indirect ways of overcoming them, will have a nuisance value.

LONDON LETTER

A CHAPTER OF CALAMITIES

(From Our Own Correspondent)

LONDON, 26th *January*

THE start of the new year is overshadowed for this country by a series of calamities. First one must recognise the death of the leader of the Opposition. Mr. Hugh Gaitskell. As one Labour commentator put it, bitterly, from the flow of commendation in the funeral orations of speakers of all political parties, "there is no Labour leader so good as a dead one." But the tributes paid have been sincere, for —party strife put aside—Mr. Gaitskell was not only generally well liked but greatly respected and honoured. And the irony is that the same tributes could not have been paid if he had died a year ago. His political career was largely one of struggle within his own divided party, he himself contributing not the least to the divisions. But he was a man to learn by mistakes and, in the last year of his life, he grew to his full stature—his finest memorial being the strength and unity of the Labour Party he leaves behind him, and which it is the overwhelming need of the Party now to preserve.

But, perhaps, most ironical is the fact that Mr. Gaitskell unified his party and led it to the position of being the likely next Government of the country, by his opposition to entering the Common Market on the terms apparently contemplated by the Government: the same Government whose leaders have given him such sincere eulogies this week.

Yet apart from the internal implications for the Labour Party and the personal aspects of Mr. Gaitskell's death, why is this unhappy event a calamity for the country? Because, as the Government has steadily lost favour with the electorate, the country was clearly looking to Mr. Gaitskell as its future Prime Minister. The loss, therefore, is that of the leader of a Government which would have to face formidable economic tasks. The Labour Party fully realises this and their concern is to present themselves to the country as rapidly as possible as unified and as strong as they were a month ago—behind the new leader of their choice. The controversy about leadership is in the Press, for, within Labour circles, the solemnity of the occasion has imposed an election without bitterness. The choice in the end will lie between Mr. Harold Wilson and Mr. George Brown. In making the choice, the Labour Party will decide which leader will maintain the unity of the party and present the country with a potential Prime Minister capable of attracting the floating voters who determine the result of elections.

Cold Spell

Next among the calamities comes the record-beating cold spell: never before since records were kept has the country had it so cold and for so long! For nearly forty days, the thermometer has never risen five degrees above freezing point throughout these islands. Fuel stocks are frozen, the railways run erratically, roads are a constant menace, gas and electricity supplies fail spasmodically, farmers are suffering serious stock losses and morale sink. Of course, the country will recover its morale when warmer weather eventually comes (and when the inevitable floods have subsided!), but there will be a heavy bill to meet in losses.

The first bill is with us already—the staggering total of 814,000 unemployed, about 200,000 more than a few weeks ago was considered likely. The jump since the last figures is about 250,000 and 165,000 of this increase is in the construction industries. Indeed, the *excess* unemployment over the anticipated figures is almost certainly ascribable to the weather: that it should be the construction industries that have suffered most (inevitably as outdoors work has become so difficult) is particularly bitter

BOMBAY MILLOWNERS ON BONUS ISSUE

PLEA FOR ADEQUATE REHABILITATION ALLOWANCE

THE Millowners' Association, Bombay, has submitted to the Bonus Commission another detailed memorandum amplifying its views on the question of bonus and the replies to several points raised by the Chairman and other members of the Commission at the public enquiry held in the City on 27th December 1962. In the course of the memorandum, the Association has highlighted, with an array of facts and figures, the economic conditions actually obtaining in the cotton mill industry, with particular reference to the mills located in Bombay, and indicated against this background its approach to the problems of wages, costs and profits. Incidentally, it has sought to dispel some of the wrong notions about the working of the industry. The six specific questions to which the Association has given clear-cut answers are: 1. What should be the approach to the issue of bonus? 2. Is the industry a riskless enterprise? 3. Who contributes to the reserves? 4. Is labour in Bombay mills underpaid? 5. What should be the return on capital employed? 6. What must be the quantum of rehabilitation allowance? The series of arguments marshalled by the Association in support of its views may be taken to represent the general stand of millowners in the whole country. In view of the vital role the cotton mill industry plays in the economy of India from the point of view of employment, production and export, it is proposed to deal with the memorandum extensively in these columns.

Pooling of Bonus Opposed

Briefly stated, the Millowners' Association is opposed to the pooling of bonus on the ground that such a scheme militates against the sense of participation by workers in the prosperity of the individual industrial undertaking to which they belong. In its opinion, in no case should bonus exceed 25 per cent or be less than 5 per cent of the annual basic earnings of employees, with set-offs allowed to be carried forward as losses and set-ons to be credited to bonus equalisation fund. For the purpose of calculating bonus, the Association wants the depreciation allowed under the Income-tax Act to be allowed as a deduction from gross profits as a prior charge, though it points out that it will not press for development rebate as a prior charge, if a separate rehabilitation allowance is granted on the lines suggested by it. Further, it wants a consolidated return of 10 per cent free of tax on capital employed—capital here is defined to mean paid-up capital plus reserves minus non-trading investment as reduced by borrowings—instead of on the basis of two rates, one on paid-up capital and the other on reserves employed as working capital. It prefers a scheme of bonus based on production or productivity to one on profit. Opposing the view that bonus is a deferred wage, the Association claims that the wages paid in the Bombay cotton mill industry are more than fair, being much higher than in other industries. The average annual earnings (basic monthly wage of Rs. 40 plus a dearness allowance of Rs. 96, besides leave with wages, paid festival holidays, sickness insurance and provident fund) of a mill worker are put at Rs. 2,232 (Rs. 186 per month), as against the average of Rs. 1,481 for all industries and Rs. 1,498 for basic metal industries, Rs. 1,436 for electrical machinery apparatus, etc., Rs. 1,225 for other machinery, Rs. 1,458 for electricity, gas and steam, and Rs. 1,434 for transport equipment, to mention a few. This comparison (of wages earned by a cotton mill worker in Bombay City with averages for the country as a whole) is, however, misleading, in that a rupee buys much less in Bombay than in many other parts of India.

To continue the analysis of the Association's memorandum. In order to substantiate its contention that a worker in Bombay mill is better paid than his confrere elsewhere, the Association makes the following interesting general observations:

"Wages—whether minimum, fair or living—should be judged against the background of general economic conditions in the country and the level of national income. . . . When the textile workers of Bombay are getting more than the need-based minimum wage (put at Rs. 125 by the Pay Commission and Rs. 80 recommended for Central Government employees), . . . there is no question of bridging the gap between the actual wage and the so-called living wage by means of bonus, as living wage is capable of gradual realisation only with the gradual economic advancement. We, therefore, urged that labour should rank equally with capital and management in sharing the available surplus and it can claim no priority whatsoever over others and that the available surplus should be shared among the three factors; the share that goes for labour is bonus, the share that goes for management is for expansion and diversification of the industry, and the share that goes for capital is the additional return to shareholders, the bulk of whom, being members of the middle class, are as much affected by inflation as labour. Further, the shareholding middle class does not get any compensation for the inflation as the labour gets by way of dearness allowance."

Not A Riskless Industry

The Association has refuted the contention that the cotton mill industry is a riskless industry. It recalls the throes of depression and the cut-throat competition from imported textiles in the past, as well as the physical and fiscal controls to which the industry is subjected at present, and asks: Could anyone dare say that an industry, such as the cotton mill industry which is cribbed, cabined and confined within the icy barriers of control and whose fortunes fluctuate with eccentric economics of our policy-makers, is one without a risk? It also quotes competent authorities who have held that the profitability of the mill industry is too low. The Reserve Bank's study, for instance, discloses that the average return on net worth (paid-up capital plus all reserves, other than taxation and depreciation reserves, and balance of profit) in the period 1951-60 was only 4.7 per cent, as against 5.6 per cent in the case of electricity industries and 5.4 per cent in respect of iron and steel. The Working Group of the National Industrial Development Corporation also stated clearly that, unless the expectations of profitability of the textile industry improve materially, private capital would not be forthcoming in large amounts for investment in this industry. The findings of the Indian Cotton Mills Federation, too, revealed that, out of the total resources used by 294 mill companies during the period 1955 to 1959, the amount raised from the capital market was no more than Rs. 7.16 crores, while bank borrowings aggregated as much as Rs. 43 crores.

There is no basis whatever, according to the Millowners' Association, for the claim that reserves represent unpaid wages or that they are a joint product of labour and capital. The reserves are, in its opinion, "the creation of the management policy through enforced abstention on the part of capital." Reserves are created out of profits which should have been distributed to shareholders after due payment of agreed or awarded wages and in some cases even bonus. Citing the data furnished by the representatives of textile labour union in Bombay themselves on total paid-up capital and dividend distributed in the years 1946 to 1959, the Association observes:

"The average capital and the average dividend (for the period 1946 to 1959) have thus been shown by the representative union as Rs. 22.98 crores and Rs. 2.44 crores per annum, respectively, while the reserves are shown as Rs. 32.51 crores in 1946 and Rs. 29.17 crores in 1959. Taking the average at Rs. 31 crores, the average net worth (paid-up capital plus reserves) of the Bombay cotton mill industry works out to Rs. 54 crores. The return on net worth (which is the investor's economic barometer) in the case of Bombay cotton mill industry with an annual average dividend of Rs. 2.44 crores in the period 1946-59 amounts only to 4.5 per cent. If the dividends which the shareholders did forgo in the period 1923-42 were taken into account, the return on net worth would be further depressed. If this return is compared with the returns of other industries such as iron and steel, mineral oils, cement, sugar, matches, coffee and rubber plantations, it will be observed that investors in the cotton mill industry have been denied a fair return and it is, therefore, out of their sacrifice that reserves have been built up and not because of the alleged underpayment to labour."

Bonus to Workers

Incidentally, the Association has drawn attention to the payment of bonus to workers, amounting to more than Rs. 48 crores between 1941 and 1961 or an average of Rs. 2.30 crores per annum, and says:

"In certain years, certain units of the industry have drawn on their reserves and, in certain other cases, they have even incurred borrowings in order to pay bonus to workers. Such being the position, it remains far from the truth that workers have contributed to the reserves, but, in fact, it can be said, they have corroded the reserves by causing the units to fork out bonus even when they have incurred a trading loss."

In the considered opinion of the Association, the minimum return on capital employed (paid-up capital plus working capital) should be a little more than the banks' advances rate of 7.5 per cent and a return of at least 15 per cent is absolutely necessary to attract capital towards new industrial undertakings.

Rehabilitation Allowance

The Association has made out an impressive case for granting the mill industry an allowance for rehabilitation at a stipulated percentage of the original value of the block, varying inversely with the statutory depreciation allowance earned thereon. The N.I.D.C. Working Group, it will be recalled, had estimated the cost of the "minimum" renovation and rehabilitation during the third Plan period at Rs. 180 crores (and complete rehabilitation at Rs. 800 crores). The estimate was based on 1958-59 prices. Adjusting the estimate to the rise in prices that has taken place since then, the Association puts the cost of "minimum renovation" at Rs. 234 crores for the whole industry and at Rs. 63 crores for the city mills. If the breakdown value of fixed asets is taken into account at 5 per cent of gross block, which was a little over Rs. 100 crores in 1961-62, the net rehabilitation requirements of Bombay mills work out to Rs. 58 crores for five years or an annual requirement of Rs. 11.6 crores. The two principles underlying the calculation of allowance, according to the Association, are:

Plant and machinery: (a) A fully depreciated block, that is, where the depreciation is technically zero, will, if replaced, earn depreciation of 15 per cent under the Income-tax Act, in the year of installation on a two-shift basis and hence 15 per cent has been claimed as rehabilitation allowance; (b) where an undertaking earns 10 per cent of the block as depreciation, the block is assumed to be the latest and hence does not call for any allowance for rehabilitation.

Buildings: (a) A fully depreciated building, that is, where the depreciation is technically zero, will, if reconstructed, will earn depreciation of 5 per cent under the Income-tax Act in the year of its reconstruction and hence 5 per cent has been claimed as rehabilitation allowance; (b) where in undertaking earns a depreciation equivalent to 4 per cent of the value of the building, the building is assumed to be a new one and hence does not call for any rehabilitation.

Apropos the Bombay Industrial Court's statement that the cotton mills in Bombay City had together a cash surplus of Rs. 24 crores at the end of 1946, the Association points out that this surplus represented nothing but the total of all reserves shown in the balance-sheets of all mills and adds: "Not only all the taxes were employed as working capital but the industry had also to borrow heavily from the banks to meet the working capital requirements." In support of this view, it has cited certain figures compiled from the balance-sheets of mills which are reproduced in the table given at the foot of columns 1 and 2. It will be seen from this table that the gross block of the industry has increased from Rs. 37.15 crores in 1946 to Rs. 103.73 crores in 1961, representing an increase of Rs. 66.58 crores. The depreciation on these new assets, together with such depreciation as is available on pre-1947 assets, which was almost fully written off by 1947, being higher than the so-called rehabilitation quota (which relates only to machinery of pre-1947 period and that too based on prices prevailing in or about 1947 and which did not take into account the life of machinery at 25 years as laid down by the Supreme Court), what was palmed off to the industry as rehabilitation allowance was only its depreciation mostly

* Current assets minus current liabilities.
† Figures of and including the year 1958 are taken from the statement submitted to the Industrial Court, Bombay, by the representative labour union in connection with their demands for bonus for the year 1959.
‡ Amounts shown against the years 1946 to 1952 represent depreciation actually charged to the profit and loss account of the respective years, while those for the remaining years represent statutory depreciation.
§ The quota is calculated on the basis of Rs. 45 crores for plant and machinery and Rs. 27 crores for buildings.

COTTON BOARD ON TEXTILE TRENDS

MOVEMENT TOWARDS SHIFT WORK STRONG

From Our Special Correspondent

MANCHESTER, 22nd January

LANCASHIRE'S multi-million pound re-equipment scheme to modernise mills is being held up by cheap import fears, says the annual report of the Manchester Chamber of Commerce issued in Manchester. "The levels at present accepted for imports," the report points out, "are not such as to permit development of our textile industry with any degree of confidence. It is without doubt causing many manufacturers to defer definite decision as to the fulfilment of a re-equipment programme amounting to some £115 million."

MANCHESTER LETTER

On the Common Market, the report urges that a decision one way or the other on Britain's entry must be made by the early part of this year, and satisfactory terms for agriculture, the Commonwealth and Britain's partners of the European Free Trade Association must be secured. The report adds: "If solutions to these problems cannot soon be found, your Board considers that the negotiations should be abandoned."

Urging closer links between all sections of the Lancashire cotton trade, Mr. Joseph King, the newly-appointed General Secretary of the Cardroom Workers' Association, one of the three large cotton unions—forecast a "major change" in the industry's production methods. A substantial amount of money in orders for modernisation programmes and new machinery had been placed, said Mr. King in his quarterly report to 34,400 union members. He suggested that, during the period of time before actual plant was installed, discussions should be held to meet new problems.

"The staffing of machinery together with the system of wage payments required will need to be more closely related to the operative productive capacity and work assignments," said Mr. King. "Machine and operative utilisation will be of paramount importance. This aggressiveness could and should lead to greater security for our members and the industry in general and we may see the days of slump and boom become a thing of the past."

More Shift Working

A quick surface appraisal of the quarterly report issued by the Cotton Board, backed up by statistical evidence, shows the broad picture but sometimes omits particular details which can be used as a guide towards future trends. Within the returns published in the latest document in this series are aspects which are not entirely unfavourable to Lancashire. In the spinning section, for example, although the rate of machine activity in the third quarter of last year had fallen to its lowest level since the reorganisation scheme was launched, the movement towards shift work was clearly gathering some momentum.

Out of 5,430,000 ring spindles running, 1,340,000 were on double shifts, a rise of 30,000 on the previous quarter. Those engaged on three shifts numbered 230,000, the highest figure yet recorded. A return to evening shifts was also evident, as 1,120,000 spindles were involved in such work, an increase of 30,000 on the previous quarter.

In doubling, machine activity of 79½ per cent was slightly higher than in the same quarter in 1961 and was above the average during the previous 12 months. Double shifts were operated by 238 000 spindles, maintaining the recent average, while a slight rise occurred in the plant working evening shifts.

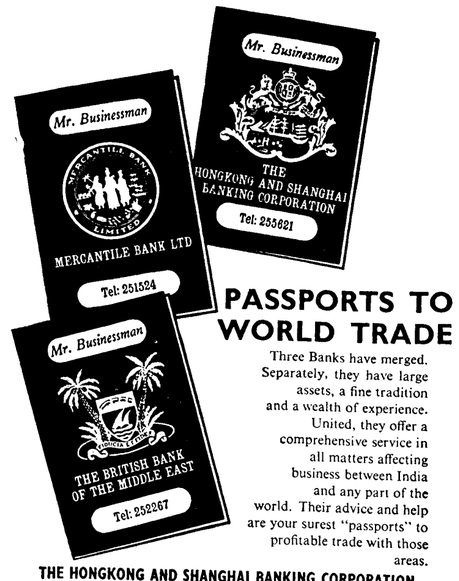
In the manufacturing branch, machine activity was lower than in recent quarters, being 84.7 per cent, as against the peak of 92.3 per cent in spring 1961. Fully automatic looms running, however, numbered 43,000 out of 139,000, as compared with 43,200 in the same quarter of the previous year when 10,000 more looms were in place.

Confirmation that the trade cycle is running its course can be gained from the table showing the availability of supplies of cotton and man-made fibre cloth. These statistics, obtained by adding imports to local production and deducting exports, show that the balance available for home use at the end of the third quarter last year was 463 million yards, as against 533 million yards in the second quarter, 562 million yards in the first quarter and the recent peak of 633 million yards at the end of the second quarter of 1961.

Shadow of Imports

Textile traders the world over have their problems and, in spite of the plaudits which greeted the long-term international pact to regulate the flow of cotton goods between nations with considerably divergent views on their future policy, imports remained a thorn in the flesh of nearly all the domestic industries, except those newly emerged on the industrial scene. Trade papers are full of complaints from individuals and organisations about the effect of such inroads into traditional sectors of each economy. Not only the loss of business itself, but the narrower margins available on the turnover recorded, are factors which businessmen find hard to stomach.

Lancashire's agitation has gone on for some years, leading eventually—and many would say too late—to recognition by the Government that the position has been pushed hard enough. The Americans are equally loud in their outcry, and tend to blame the adoption of the two-price cotton system by their Government in the mid-1950's for the upsurge of imports of processed goods, although this is still far below the proportion suffered in Britain.



On the Continent, the members of the Common Market group still fear that, if the United Kingdom is allowed to enter their Community, arrivals of cotton goods will in some way permeate into their domestic markets on a much larger scale, affecting their mills in the same way as in Lancashire.

Closer co-operation between respective Governments and industries, particularly in the case of cotton textiles, has been urged by the recently retired President of the French Cotton Industry Association. "Industries can no longer operate without the confidence of their Government," he declared. "Industry needs the Government's faith as much as the Government needs the technical help of industry." Compared with cotton, the man-made fibres trade has in recent years at least held its own in the export field, particularly in the disposal of yarns abroad. But there are now signs that the same growing nationalism in many regions will eventually affect this sphere just as drastically. From South Africa comes news of further development and diversification of the textile and chemical industries. Financial assistance is to be given to a company being established to form the nucleus of a chemical fibre industry in the Republic.

WORLD WOOL TEXTILE TRADE

The aggregate world exports of woollen and worsted cloth during the first nine months of 1962 were higher by 9 per cent as compared with the corresponding period of 1961, according to the Commonwealth Economic Committee's supplement on fibres released at London last week. Japanese and Italian shipments showed the greatest increase, while U.K.'s exports fell by 4 per cent. World trade in woollen and worsted yarns in the first three quarters of 1962 was 12 per cent up on the previous year, with woollen yarns showing the better rate of growth. Here again, British aggregate exports receded by one per cent. Shipments of worsted yarn fell, while those of woollen yarn rose. Although the Italian total was down by 11 per cent, Japanese exports more than doubled in the period. Belgian shipments also grew substantially, the Dutch and French more modestly. Among the importing countries, West Germany remained the largest buyer, taking 11 per cent more than in the same period of 1961 and the U.S. and Scandinavia also increased their rate of imports.

World trade in raw wool suffered some setback in the first five months of the current season 1962-63. However, shipments from Australia, which produces about 30 per cent of total supplies, aggregated 566 million lbs. up at the end of November, an increase of 13 million lbs. The improvement was more than offset by a decline in exports from South Africa, New Zealand and South America. British imports were markedly higher in the latter part of 1962.

PASSPORTS TO WORLD TRADE

Three Banks have merged. Separately, they have large assets, a fine tradition and a wealth of experience. United, they offer a comprehensive service in all matters affecting business between India and any part of the world. Their advice and help are your surest "passports" to profitable trade with those areas.

REACTION TO RELAXATION OF CONTROLS ON COTTON

NEW CROP ARRIVALS SLOW

WITH the recent relaxation of curbs on cotton (for details *vide* page 135 of *Commerce* dated 26th January), the stage is now set for freer trading in cotton. Both mills and the trade have welcomed the removal of restrictions on the size of stocks mills could hold. The condition that 5 per cent of the annual quota should be utilised by all mills in the purchase of long-staple Cambodia A and B cotton is designed to help the growers of this type of cotton. Similarly, the decision that 7½ per cent of the value of cotton, which had hitherto been paid to supervisors to be handed over to the sellers, could be paid by mills direct to the sellers, provided the invoices have been checked by the supervisors, is aimed at speedy transactions and quicker movement of cotton. Both these stipulations have been welcomed. The trade, however, feels that, in view of the decline in cotton prices to levels well below the official ceilings, the provision that invoices be checked before payment is made should have been dispensed with. This condition, it is said, will not only cause delay but also make it obligatory on traders to disclose their sales. The Textile Commissioner, however, would appear to have retained this provision as he does not perhaps rule out the possibility of business in certain varieties, for which there may be scarcity, being put through at prices above their respective ceilings. This is a wise precaution, because it is still not certain whether the crop would actually turn out to be the expected 5.4 million bales or whether some of the varieties will not be in short supply.

The enhancement of the quota for Indian cotton from 65 per cent to 75 per cent in the Northern zone and from 45 per cent to 75 per cent in other areas has also been welcomed by mills and the trade, though it is felt that the quota could as well have been raised to 100 per cent in the former area, as harvesting of the crop there is over.

Now that controls have been relaxed, the trend of cotton prices can be expected to reflect more faithfully the size and movement of the crop. The general expectation is that the crop during the current season would aggregate 5.4 million bales. Crop progress so far strengthens this hope. Messrs. Patels and Volkarts, a leading cotton firm of Bombay, have made the following assessment of the crop position as at the end of December:

"Unseasonal rains at the beginning of December all over the Oomra tracts and in the Punjab caused some anxiety about possible damage, quantity- and quality-wise, in these areas. Apart from lowering the grade of the cotton still in the fields in the rain-affected areas, there does not, however, seem to have been any damage worth mentioning and crop estimates for these regions could be maintained. At the end of December, most of the crop in the Oomras and the Punjab had been harvested and weather conditions there could not materially affect the supply position any more.

"The crops in Gujarat seem to have fared fairly satisfactorily in December, although weather conditions at times were not quite ideal. Unfavourable weather conditions in January could still do a lot of damage.

"In the South, crop developments in the Westerns/Northerns and Comptahs were not very satisfactory. It is expected that the Farm and Jaydhar crops in these areas will show subnormal yields and, possibly, also subnormal quality standards. The Laxmi crop seems to be normal, but a delay in the crop movement may have to be reckoned with. Further south, that is in Madras State, the crops are reported to be developing satisfactorily.

"On basis of present indications, a commercial crop of 5,400,000 bales still seems possible, but much will depend on the further progress of the crops in Gujarat and South India.

"The pace of arrivals during December quickened considerably. The following table (figures in bales of 400 lbs.) illustrates that total arrivals upto end of December were ahead of those at the same time last year, but were lagging behind when compared with those at the same time two years ago:

	Arrivals per 31st December		
	1962	1961	1960
Punjab/U.P./Rajasthan	540,000	578,000	466,000
Oomras	745,000	580,000	1,456,000
Elsewhere	45,000	...	...
Total	1,330,000	1,158,000	1,922,000"

It will be seen from the above quotation that, though new crop arrivals till the end of December were quantitatively higher, as compared with those in the corresponding period of the previous season (which is only as it should be, because of the relatively bigger crop this season), only less than 25 per cent of the total estimated crop had come to the markets till the end of December 1962, as against 34 per cent in the previous season and 35 per cent (or 1.90 million bales) in the 1960-61 season, when the crop, at 5.4 million bales, was almost the same as that expected this season. This trend suggests that either the holding power of farmers is not as poor as is often made out by their self-appointed spokesmen, or that the crop is late.

WORLD COTTON CONSUMPTION

World consumption of cotton this season is likely to remain at a high level, though probably somewhat lower than the 1961-62 record, according to the International Cotton Advisory Committee, Washington. Considering the marked increase in production, any decline in total consumption would seem to confirm the prediction that there could be a sizable addition to the world carry-over by the end of the present season. Despite the inevitable ups and downs in the textile cycle in individual countries, in the aggregate, the post-Korean period has been one of almost continuous expansion in cotton consumption. To a large extent, this can be attributed to differences in the timing of the textile cycle in the main consuming countries and the only break in the upward movement in aggregate cotton consumption, which occurred in 1957-58, had its origin in the fact that a downturn occurred simultaneously in the three main consuming areas of the United States, Western Europe and Japan. This observation, adds the I.C.A.C. is important in the sense that this situation could repeat itself during the present season. Certainly, at the moment consumption is lower in all these main areas.

In part also, the steady rise in consumption can be explained in terms of the rapid growth in cotton textile production in primary producing countries. In general, this continues but these are obvious signs in some countries that there has been some slowing down in momentum and during the present season it is doubtful if any increase in consumption here will be sufficient to offset further possible losses in the more traditional manufacturing countries. Consumption in the United States, based on returns covering the three first months adjusted for seasonal variations, was running at an annual rate of about 8½ million bales, as against the actual figure last season of 9.0 million bales. In Japan, a marked decline in cotton consumption has occurred since the beginning of 1962 and, in rough terms, consumption is now running at about a quarter of a million bales per month compared to the 1961 peak of over 300,000 bales. In contrast to other countries, the whole textile industry has been affected in various degrees by the current textile recession with, for example, a major switch away from rayon to the synthetic fibres.

The present high rate of curtailment of cotton yarn production will apparently continue well into the new year and plans are afoot to institute a more permanent reduction in spinning capacity. In prevailing circumstances, a further decline in cotton consumption is to be expected this season, although the impression is that the relaxation of credit and some improvement in textile exports should tend to improve the industry's position when once excess stocks of cotton textiles have been reduced and when supply and demand have been brought into better equilibrium. In India, while consumption is currently at a record level, any projection of the future trend of cotton consumption is clouded to some extent by continuing difficulties in the supply of raw cotton and by recent political developments. The textile situation in the country continues fundamentally strong and the presumption is, therefore, that under normal circumstances, cotton textile production could be expected to continue at a record level. The smaller textile industries in Asia, particularly Hongkong, have been obliged to regulate the flow of textile exports, either by bilateral agreements with the countries concerned or under the provisions of the cotton textile arrangement. While this may affect consumption prospects in the immediate future, in the longer run the arrangement looks towards an expansion in international trade in cotton textiles.

U.S. COTTON CREDIT FOR HONG KONG

The U.S. Export-Import Bank has extended two lines of credit amounting to 30 million dollars to Hong Kong for the purchase of U.S. raw cotton. The credits are in favour of the Hong Kong and Shanghai Banking Corporation and the Chartered Bank. Both credit agreements have been signed by officials of the participating banks and the Export-Import Bank in Washington.

The credits will be available for a period of one year for purchases of cotton from the U.S. 1962-63 and 1963-64 crop years by Hong Kong spinners. Advances under the credits will be against the U.S. seller's drafts drawn on and accepted by the two participating banks respectively. The drafts are payable in U.S dollars. Several U.S. banks are expected to assist in the transaction by issuing letters of credit in favour of U.S. cotton suppliers at the request of the banks in Hong Kong. The combined credits the first made by Ex-Im Bank to Hong Kong for cotton, could enable procurement of about 215,000 bales. As is common knowledge, Hong Kong has no domestic source of raw cotton. It is estimated that potential purchases under the Ex-Im Bank credits could equal about 45 per cent of the territory's annual raw cotton imports.

REPORT OF THE AUDITORS

To THE STATE BANK OF INDIA,

We, the undersigned Auditors of the State Bank of Travancore appointed under Section 41 (1) of the State Bank of India (Subsidiary Banks) Act, 1959 do hereby report to the State Bank of India upon the Balance Sheet and Accounts of the Bank as at the 31st December, 1962.

We have examined the above Balance Sheet and the Profit and Loss Account and the Accounts relating thereto of the Head Office and the certified returns from Branches, which Returns have been incorporated in the above Balance Sheet and Accounts and report :

(i) that the chitty liabilities and a part of the chitty assets equal to the amount of such liabilities are shown as contra and the balance of "chitty assets over liabilities" is shown under "Other Assets including silver" in the Balance Sheet ;

(ii) that, in our opinion, the Balance Sheet is a full and fair one, containing all the necessary particulars and is properly drawn up so as to exhibit a true and correct view of the affairs of the Bank, according to the best of our information and the explanations given to us and as shown by the Books of the Bank ;

(iii) that where we have called for any explanation or information such explanation and information have been given to us and have been satisfactory ;

(iv) that the transactions of the Bank which have come to our notice have been within the competence of the Bank ;

(v) that the Returns received from the Branches of the Bank have been found adequate for the purpose of our audit;

(vi) that the Profit and Loss Account shows a true balance of profit for the period covered by such account ;

(vii) that, in our opinion, the Balance Sheet and Profit and Loss Account are drawn up in conformity with the law and

(viii) that, in our opinion, Books of Account have been kept by the Bank as required by law.

TRIVANDRUM, 12th January, 1963.

CONCEPT OF MANAGEMENT AUDIT

FUNCTIONS AND METHODS EXAMINED

By R. C. Ganguli

THE subject of management audit is predominantly considered as an integral part of internal auditing, because this topic is primarily associated with certain well-recognised techniques of internal control of various activities, particularly managerial operations at any level, within an organisation. Therefore, to start with, it is desired to write a few lines about the evolution of internal auditing.

Internal auditing in the past was considered as a procedure of glorified checking of the various financial transactions appearing in the accounting books and records, with the ultimate view of allocating the transactions in the appropriate accounts, and finding out the arithmetical accuracies in such books. The functions and responsibilities of an internal auditor were that of an accounting clerk. The only purpose of internal auditing was seen in verification and assurance of the fact that the figures presented in the financial and similar types of operating statements were substantially correct, and there were no accounting irregularities. It was, more or less, a pet subject of the managers (who were, in major instances, the proprietors of the organisations) who desired to have, apart from the statutory audit by the external auditors, some additional accounting information. In short, internal audit was rarely given importance as a means of controlling the affairs of an organisation.

The present set-up of modern industrial organisation, with its varied complexities and diversified activities at various levels of operations, has called for a rational change in the age-old concept of internal audit. The developing economy of the country, followed by the growing size of the organisation and the intense need for its efficient management for obtaining "maximum out of minimum," has necessitated well-planned decentralisation and divisionalisation of the activities at various centres. As a consequence, authority is delegated downwards, as far as possible, while the overall controls are centralised in the hands of top management. In other words, authority is delegated without losing the control. Management has now become a profession in the truest sense and the function of "controlling" is one of its principal activities. With the increase in the size, scope, technicalities, specialisation, and volume of work, it is not possible for the management to scrutinise and find out as to whether the techniques installed by them for achieving the above purpose are complied with properly or not. That is why there has developed a tendency to broaden the assignments of the internal auditor, fixing upon him the additional responsibilities of examining, appraising and ascertaining the extent of compliance with the established plans, policies and procedures concerning all aspects of management, including finance, administration, operation, inventory, marketing etc. in all the departments of the company. Internal audit has now become a special phase of administrative accounting. The responsibility of internal auditor is not limited to day-to-day routine scrutiny of functional transactions of a department, but it further goes deeper in the department's general functions and makes objective appraisals of the systems and practices with a view to suggest improvements that will increase earnings and efficiency, and reduce wastages. To summarise, internal auditing is an independent appraisal activity within an organisation for the review of financial and other operations as a basis for service to management. It is a managerial control which functions by measuring and evaluating the effectiveness of other controls. Through the reports of internal auditor, the management gets in touch with the factual information at various centres, and if necessary, controls the situation at the most appropriate time. Internal audit is, therefore, considered as a tool of management in the controlling aspect.

It is evident from what has been discussed above that internal audit in a broader sense does not mean critical scrutiny of financial data and statements alone, but that it also includes the other developed techniques of audit, such as inventory audit, cost audit, operational audit, proprietory audit and management audit.

Definition

Now what is management audit? Well, management audit means the audit of managerial performance. This is the shortest as well as simplest possible definition which anyone can put forward. Once the functions of the management are clearly defined, and the procedures of carrying out those functions are properly planned and determined, then there should not be any difficulty in scrutinising from time to time the performance of the management and ascertaining the deviations from those predetermined procedures. This particular point needs further elucidation. Every type of work requires certain methods to do it. Here, of course, we are concerned with various activities within an industrial organisation. Certain particular methods are utilised in recruiting employees in the organisation, similarly certain other methods are used for purchasing materials for the purpose of production. The methods are further sub-divided and elaborated to cover up all the important phases of the main activities of the organisation. For instance, let us consider the sales aspect of the company. The sales function does not represent the activities of the sales representatives in the appropriate market alone, but it also invites one's attention to the various other aspects well connected with this particular function, such as examination of inward orders and terms of sales, requisitioning of the finished products from the stock, ratings and invoicing, sales accounting and compilation of sales statistics, recoveries of outstandings, credit facilities to the parties, discounting, travelling and outstation allowances payable to sales representatives, sales incentives, etc. If no planned and systematic rules are framed and aptly introduced at the initial stage for carrying out these functions properly, it would not only create chaos within the organisation (as it would be practically impossible for the management to control the activities and co-ordinate them) but it would even bring the organisation to the risk of extinction from the field. Methods are, therefore, developed for carrying out each work, at each stage.

These methods or rules or systems, when rationally planned with the ultimate view of achieving the maximum possible efficiency in activities with minimum possible labour, cost and supervision (because this is most essential in the present age of competition) and clearly expressed to those who are concerned with the aim of instructing them to follow these methods strictly, are known as procedures. Top management declares certain sound, clear-cut, stable, acceptable and understandable policies (may be basic or general policies) with a view to derive a set of objectives, and evolves the procedures to implement these declared policies. Through these procedures, management functions, and therefore regular follow-ups of these procedures are essential. This necessitates the top management to have an independent internal review of the performance of management at any level and at any operational centre. A constant examination and vigilance of the effectiveness of the predetermined procedures and managerial activities is the essence of management audit. Such appraisal discovers the lacunæ in the systems; reveals the difficulties faced by the executives in implementing programmes; reviews the shortcomings of the management; brings the deviations from the standardised procedures to the knowledge of the top management and suggests the possible courses for carrying out necessary investigations and corrections. An introduction of management audit further reveals as to whether the existing procedures and systems are quite adequate for a complete internal control, concerning organisational, profitability and productivity. (The latter two types of control through management audit are discussed, in brief, elsewhere in this article.)

Functions

The real need for control in management practices arises because of the fact that authori-

REPORT OF THE AUDITORS

TO THE STATE BANK OF INDIA:

We, the undersigned auditors of the State Bank of Bikaner, appointed under Section 41 (1) of the State Bank of India (Subsidiary Banks) Act, 1959, report on the Balance Sheet and Accounts of the Bank as at 31st December, 1962.

We have examined the foregoing Balance Sheet of the State Bank of Bikaner as at 31st December, 1962, and the Profit and Loss Account of the Bank for the year ended upon that date with the Accounts relating thereto of Head Office and with the Returns submitted and certified by the Branch Managers, which Returns have been incorporated in the foregoing Balance Sheet and Accounts.

We report that:—

(i) in our opinion the Balance Sheet is a full and fair one, containing all the necessary particulars and is properly drawn up so as to exhibit a true and correct view of the affairs of the Bank, according to the best of our information and the explanations given to us and as shown by the Books of the Bank;

(ii) where we have called for any explanation or information such explanation and information have been given to us and have been found satisfactory;

(iii) the transactions of the Bank which have come to our notice have been within the competence of the Bank;

(iv) the Returns received from the Branches of the Bank have been found adequate for the purpose of our audit; and

(v) the Profit and Loss Account shows a true balance of Profit for the year covered by such Account.

BOMBAY, 21*st January*, 1963.

N. M. RAIJI & CO.,
Chartered Accountants.

ties are delegated from level to level and each level remains ultimately responsible for everything happening below the level. A person who has been delegated certain rights is not the appropriate person to control the enforcement of his own rights. Control on delegation of authority would signify as the best possible internal control of the organisational activities of the company. Management audit keeps a watchful eye to verify that the authority has been delegated properly, and used within the purview of what has been delegated, and that the accountability of responsibilities has been kept quite distinct without creating any interferences.

Mention may be made at this juncture that an overall review made of one particular function (such as sales function as mentioned above) or a part thereof on a company-wide basis with a view to make improvements in the function is known as functional audit. Similarly, review of all functions performed under one responsibility or location is known as responsibility audit.

Review of Procedures

Periodical study and critical review of existing procedures and systems with a view to improve them is yet another essential function of management audit. In this dynamic world nothing can be said of having reached the final stage of development. Any concept developed today may need certain material changes in it after sometime. Similarly systematic procedures which are framed after due consideration of all relevant aspects concerned, and which are supposed to bring out most efficient results with considerable economy in money, labour, material, space and supervision, cannot be expected to produce the best results for all time. Circumstances and changes in techniques may demand suitable improvements in those preplanned procedures. One has, therefore, to study these procedures constantly and report to the top management about the desired changes so as to attain more economy and efficiency in achieving the declared objectives. Appraisal is, therefore, necessary to ensure continued efficient operation and improvement of managerial skill. Innovation in the procedures and exploration of all the possible methods to reduce the wastages in the managerial activities are attained through management audit. It may also be pointed out at this juncture that the inherent weaknesses of procedures and even of the basic policies can be detected through continuous review of managerial performance. Management audit can reveal as to whether sound business policies have been adhered to and are being properly administered. General types of procedures which are not beneficial for a particular function (though they may be suitable for other functions) can be prevented from being implemented at the most appropriate time, avoiding confusion and wastages.

To summarise, management audit (better known as "surgery of suppositions" in each and every arena of management) may be defined as an independent appraisal activity within an organisation for reviewing and controlling the managerial functions so as to ensure that the declared objectives, policies, and routines are strictly and effectively followed; that the company's assets are kept intact; that the deviations from the established standards are ascertained and brought to the notice of the top management through suggestive reports. It is a type of overall control whose functions are measuring, determining and evaluating the effectiveness of all other types of control (including profitability and productivity aspects) and initiating necessary measures for correcting the present position and making improvements in it.

Methods

It is now proposed to deal with some methods which are employed for internal appraisal of executive performance. First, we take up the procedural audits. Well-defined procedures, rules and systems comprising all the aspects of the company's internal activities (in the arena of Accounts, Sales, Stores, Purchases, Marketing, Development, Production Branch Administration etc.) should be properly drafted giving full consideration to all the relevant aspects aiming at the best possible efficiency with tolerable economy. These procedures are systematically arranged in a loose leaf form of book. The appropriate amendments and additional directives are suitably inserted in the proper places. This book is known as Organisational Manual. While drafting such a manual, particular care should be taken to ensure that all the relevant provisions of the various statutes concerning the company (such as Companies Act, Income-tax Act, Factory Act, Shops and Commercial Establishment Act, or any other Act concerning the particular type of industry) are embodied in the manual so that, while conducting such appraisal, the internal auditor would also get assured that such statutory regulations are not avoided. An internal auditor, while appraising the procedures of a particular function, is not only supposed to be extra careful to see that the relevant procedures laid down in the manual have been strictly followed, but also expected to recommend any improvements in the procedures themselves, if desired. The method of "depth checking" is recognised as a best form of procedural appraisal. Under this system, procedures of a particular function undergo critical scrutiny from the inception to the end. Audit personnel are generally provided with Audit Memoire which they use as guide for procedural audit. Standardised internal control sheet may also be beneficially utilised with a view to render breakdown of internal controls into the major functions, and can further be used as a check-list on the audit coverage.

Assessment of working habits, characteristics and features of the individual performer at all levels of management are completely and systematically carried out through the means of check-lists. Comprehensive check-lists are prepared for each area of management to suit its own specific requirement and, by compiling the factual answers against the queries mentioned in such check-list, one can secure a satisfactory view of the managerial performance. An internal auditor would start his job by noting down the necessary information through personal interviews and discussions with the principal and the junior executives, in the form of replies against the queries of the check-lists, and finally summarising his readings into a suitable report indicating the priorities to be assigned in effecting improvements. The number of persons interviewed should be such as to give a cross-section of the entire function under that particular area of management. It may be mentioned here that the internal auditor should be taken into confidence by the top management and he, on his part, should behave cordially with the managers at each level because, without full executive participation, neither the compilation of a comprehensive report nor the proper implementation of his recommendations for necessary improvements would be possible.

The control of profitability of an organisation is achieved through mathematical measurement of the actual results with certain preplanned established objectives. This is possible through critical study of varous figures, ratios and percentages revealed by the periodical financial statements, break-up of strategic sections of the financial accounts, budget reports, cost sheets, etc. An exhaustive scrutiny of these relevant percentages and ratios would disclose departures from the normal pattern. This particular technique is known as "audit by exception" and is profoundly used as a scientific tool of controlling the alarming situations at the appropriate time.

The latest development in the concept of management audit is the extension of its activities in the existing area of productivity and commercial operation of the organisation with the ultimate view of controlling the productivity (or technical) aspects. Control of innovations in products and new methods, output per schedules allowing non-controllable wastages alone, quality per specifications and designs, cost per predetermined standards, utilisation of materials, men, machines and floor per expected levels, etc. represent control of productivity. This control of productivity aspect in any type of industry is possible through operational audit. Operational audit is the review of physical operations; it may be either in the factory floor or in the market place. Outside the field of pure financial and procedural audit, an internal auditor can also contribute a great deal by reviewing and checking the percentages and ratios concerning utilisation and wastages in operations, personally and by reporting the deviations from the normal ratios allowed. He may assure himself that the technical procedures laid down for the various productivity operations are strictly adhered to. For this work, he need not be a technical personnel or an industrial engineer, as his simple commonsense, business acumen, and clear consciousness of the operating knowledge are quite sufficient to bring out material information for the use of top management.

The findings of the audit, along with the recommendations for the courses to be adopted, are interpreted to the top management through the means of comprehensive reports. Various academic qualities of the techniques of good reporting should be kept in mind while determining the form, size and type of the report which itself depends on specific requirements of the management. Regular periodical appraisals should be conveyed in the standardised forms, whereas, in case of specific audit, it would be appreciated if factual information is reported through exhaustive reports emphasising "attention-holding" factors so as to assist the top management in "protection" of the business in the right time and in obtaining constructive appraisal of the managerial performance. Small matters should be decided at the lower level and only significant issues should be brought to the notice of top management. A copy of the report submitted should also be forwarded to the executives concerned to enable them to forward their necessary explanations, if asked for.

It may not be incorrect to mention in this concluding paragraph that management audit is still a theoretical subject in our country and very few enlightened managements have actually endeavoured to gain from this scientific technique. Generally, top executives consider management audit as a luxurious portfolio and often prefer to control the managerial activities through their line and functional executives at various levels. A person who performs a job can never realise his shortcomings. The importance of an impartial and independent appraiser has, therefore, been repeatedly emphasised. Management audit is not a method of internal appraisal alone, but it is something where the external auditor of the organisation should also be concerned. It would be amazing to learn that, today, a part of the auditor's legal duty in Finland and Sweden is explicitly to audit the managerial performance as much as the financial accounts.

A ½" SPANNER PUT THIS UP

A half inch spanner is the only tool required to erect Mills Scaffolding. A few turns and the fittings secure the steel tubes firmly—the greater the load the stronger the grip due to the "shackle grip" principle on which they are designed.

Strong and safe, Mills tubular scaffolding is versatile; the same tubes and fittings can again be used to erect anything from Grandstands and temporary buildings to storage racks and road blocks.

All fittings are made from special quality spring steel, by Guest, Keen, Williams, Ltd., and the tubes are manufactured by The Indian Tube Company (1953) Limited.

TAPERED*

TO TAKE ALL THE LOADS

* Timken tapered (tapered-taperd) roller bearings.

TITANIUM, ZIRCONIUM AND BERYLLIUM ROLLED AT LOWEST COST ON TIMKEN BEARINGS

The Pechiney pilot plant at Chambery (France) does unusual things with rare metals. They have a four-high reversing cold strip mill and a two-high reversing hot mill to roll titanium, zirconium, beryllium and alloys of these strategic metals. To keep costs down and operations at maximum efficiency, Nouvelle Spidem, the mill builder, put Timken tapered roller bearings on all the rolls of these two mills. Timken bearings are tapered to take all the loads of rolling mill operations and they are case-hardened from nickel-rich steel to take heavy shocks, give longer life. Their low starting friction enables mills to start under load. Ask us about Timken bearings when you're planning your next mill. The Timken Roller Bearing Company, Canton, Ohio, U.S.A. Cable: "TIMROSCO". Timken bearings manufactured in Australia, Brazil, Canada, England, France and U. S. A.

BASIC ISSUES IN BONUS PAYMENTS

IMPLICATIONS OF SHARING AVAILABLE SURPLUS

By Dr. M. C. Munshi

IT was Lord Keynes who, in his *General Theory's* concluding notes, wrote of the great power of ideas both when they are right and when they are wrong. This dictum, perhaps, explains how, curiously enough, in our justifiable anxiety to restore 'labour' to its rightful social function in society (which it had lost after the advent of industrial capitalism) and to recognise its right to a fair (or a living) wage, we have sought not only to lift the concept of bonus payments from "a boon or gift over and above what is due as remuneration to employees"—(and lift it rightly as we shall see) but also sought to make it an instrument for somehow rectifying the ills or shortcomings of a whole economy—more specifically, somehow to enlarge the pay packets of workers—that is, employees from a watchman to a general manager. And let it also be added that, so far as 'labour' is concerned, in this controversy about bonus payments, the 'workers' here form hardly 1.5 per cent of our total labour force today.

Implications of Bonus

While it is well known that, following the experience of the First World War, bonus was claimed and granted (justifiably) during the last war and thereafter as labour's share of the extraordinary gains earned by industrial/commercial units, it has now not only become a matter of industrial disputes, but a complex of so many concept that the Supreme Court itself felt compelled to recommend an inquiry by a really competent body. To make a long story of the various awards of tribunals and verdicts or decisions of the Supreme Court short, we may summarise what in practice the bonus payments have come to mean today. It has to be added that it is not intended to convey that all of them at all times have uniformly meant the same thing.

A Medley of Claims

1. Beginning with (the Lahore Electric Supply Company case) as "a certain moral and economic right," it is now accepted as "a claim for bonus is a right against an employer to enable the workers to make good, at least to some extent, the gap which is always found to exist between the wages being actually paid by the employer and a living wage." Thus it has ceased to be an *ex-gratia* payment and is regarded as compulsory profit-sharing—or better still, "available surplus" sharing—though at least in some cases of *puja* bonus it has been deemed to be more of a traditional than a compulsory claim. There are three important landmarks in this development:

(a) The judgment of the Bombay Industrial Court in the dispute between 80 textile mills in Bombay (Millowners' Association) *vs.* Mill *Mazdoor Sabha* and the *Girni Kamgar* Union in 1948.

(b) The awards of the Labour Appellate Tribunal between 1948 and 1956. (The formula of the Full Bench of the Labour Appellate Tribunal 1950.)

(c) And the upholding of this interpretation in the judgments of the Supreme Court.

2. A compulsory profit-sharing which can be a "trade dispute" or an industrial dispute that can be decided in the industrial tribunals.

3. It has, as is well known, been adopted as a method of bridging "the gap" between the existing low levels of wages and a living wage.

This filling in the gap has sometimes been justified on moral and/or economic grounds though, in 1955, the Supreme Court said that "social justice" was a very vague and indeterminate expression—and that "considerations of social justice .... were not only irrelevant but untenable."

4. In one important case, however, it was averred that the two conditions—the gap and the profits—need not co-exist "when the allegation of workmen that there existed a gap between their existing wage and a living wage is not denied or *transversed by the employer* no further proof is necessary to prove the first condition stated above."

5. An additional payment with a view to promote or bring about "industrial peace." The Labour Appellate Tribunal evolved the approach: "Our approach to this problem is motivated by requirements that we should ensure an industrial peace which is essential for the development and expansion of industry."

6. An indeterminate 'incentive' payment, that is, payment not linked to performance.

7. An additional payment even when the "available surplus" emanates from the results of the working of a concern in other countries, besides India.

8. An additional payment to enable labour to "lessen its economic and social burdens."

9. An instrument of inter-firm income adjustments.

10. A compulsory payment even in the event of loss by a concern in a particular year. This was granted by the Labour Appellate Tribunal on the ground that shareholders were given a fat dividend out of the past reserves and on considerations of social justice; but the Supreme Court reversed this decision in 1955.

Historically speaking, the first question is that, whereas in the days of the war booms, bonus meant the sharing by labour of the extraordinary or adventitious gains that accrued to the firms or employers, today the issue is how such *extraordinary or even ordinary gains are* to be shared by these two partners in production. The present writer may be forgiven for having raised a rather elemental issue, namely that, when a product is sold on the market, the consumer, too, is a participant in the whole economic process of the governing price mechanism and that, therefore, in our economy, the consumer, who ultimately bears this burden, is also a rightful sharer in these gains. We must clearly understand this because it has also been claimed in some memoranda submitted to the Bonus Commission that the whole product emanating from the production process belongs to labour and therefore the issue is not so much one of employees sharing the gains with the employers as the latter's claim to wage-sharing with the employees. So long as the labour theory of value still remains an outmoded or exploded doctrine, it is not necessary to dilate on this issue here. But it is pertinent to emphasise the distinction between the bonus-payments claimed and paid in the war booms and the claims raised in the planned economy of our post-independence era. As we have already stated in the beginning, the position of labour in our economy has to be recognised and continuously stressed; but two other questions also need to be equally faced or emphasised: (1) that neither employers nor labour nor both of them combined, should be allowed to forget the fact that, in a planned economy the "so-called profits" (the phrase is that of the I.N.T.U.C. in its memorandum to the Bonus Commission) are not real profits resulting from their endeavours but they mainly accrue from the inflationary boom in our economy and from the sheltered and closed markets that have arisen and continue to flourish in our planned economy, and (2) that while the *ex-gratia* element in the bonus has been rightly given up, the available surplus-sharing is therefore not a corpse (or shall we say a 'kill'?) on which (only) these partners in production should lay their claws. It is for this reason that it will be shown, presently, that the Commission must not only correctly analyse the nature and scope of bonus payments but also examine how the *available surplus actually emanates.** Once this position is cleared, many of the questions relating to the payments formulæ and the mode of bonus payments will be more easy to solve.

Four Principal Claims

Briefly, then, the complex of claims to bonus that are described above can be reduced to four simple ones: (i) That bonus is a kind of profit-sharing or what we have called available surplus-sharing. (ii) That it has to be paid in order to fill the gap between the existing low-wages and a living wage to which the workers can lay a claim. (iii) It has been said that such bonus payments will *ipso facto* act as an incentive to further production like other incentive payments such as attendance bonus, good conduct bonus or no-strike bonus or efficiency bonus or production bonus. We shall soon show that to mix up bonus payment with other incentive-wages (or payments by results) is, to say the least, unscientific. We shall also leave it to the social psychologist to tell us how far this claim arises from the fact that the human donkey, no longer fearing the stick, now wants every time a carrot to be offered to it in order that it may do (even) its ordinary walking. (iv) Some of the awards of tribunals and even the Supreme Court decisions have supported the claim for bonus payment for the maintenance of industrial peace as we have seen in the catalogue of claims in the preceding section. In fact, it is said that the workers have now become more or less accustomed to this payment and that it would therefore be inadvisable to deny this claim. It is difficult to understand the logic of this claim. It has come even from institutions that claim allegiance to Gandhian ideology. Is bonus then to be "hush money" that must be paid to organised labour (whatever its justification or otherwise)? There should be little doubt in the minds of all those who have known Gandhiji or his writings that, had he been alive today, he would have put his foot down strongly on this type of a claim that seeks to justify a practice—that has perhaps grown in ignorance—of putting hands into other people's pockets even if both the employers and employees agree upon this joint endeavour.

Gains and Surpluses

Let us examine these claims seriatim. As regards profits, we have already asserted that it would be doing violence to scientific terminology if the earnings of firms in a planned economy where, besides closed or sheltered markets in which the consumer is compelled to pay a certain price, the resulting surplus over the firm's costs is to be termed profit in the sense of a reward for entrepreneurship. When the price of an article is fixed by authority, naturally, the margin between the costs and the sale price cannot be allowed to be wide and, if it is wide, it is obviously the fault of the authority fixing the price. Where the price is attained by the play of market forces, obviously, the 'gain' is largely due to the sheltered position of the producer and the margin is a monopoly gain and not the profit of entrepreneurship. It is not necessary to go very deep into the economist's theory of pure profit to be able to see this point, for, when industrial units are licensed/encouraged, when production targets are sought to be laid down according to the economic plan, when their products are 'protected' against imports, very little of risk-bearing remains once the unit has been properly established. If then, it earns "large profits," it is indicative of a higher charge on the consumer than is warranted or that the taxation machinery has not been effective enough to tax away the extra earnings as is envisaged in our planning. If these arguments apply to our private-sector industries they apply with greater force to the public-sector units, quite a number of which are professed monopolies. And no country would surely today tolerate a monopolist to run away with his monopoly gains, even when he says that he would share them with his labour force. The point, in brief, that has to be borne in mind, therefore, is that, when large margins are found between the cost of an industrial unit and its earnings, we must first inquire how and why the available surplus has resulted and secondly examine how far this surplus results from forces beyond the control or concern of the enterprise.

It need then hardly be emphasised that, if this available surplus really means either monopoly gains or adventitious profits resulting from economic plans, a great part thereof must go back to the community that bears the burden of the plans. If still there is some surplus over this, and this is really found to be "profits" of entrepreneurship, the claim to the sharing of this profit between the two partners to production will not be difficult to settle.

The Gap Theory

When we turn to the next claim, that the bonus must be paid to fill in the gap between the existing low level of wages and the living wage that the workers have a right to claim, here some three or four issues seem to be confused. Firstly, while it is true that wages in India are woefully low, is the gap to be filled up by anything that one can lay his hands on? Secondly, it is very pertinent to bear in mind that when low wages in India are referred to, the reference is generally made to basic wages only. But, on the other hand, there are a number of allowances and fringe benefits, besides the dearness allowance that have been added, in order, presumably, to make up this gap at least

(Continued on page 198)

Note: For a more detailed treatment of the basic issues discussed in this article the reader may refer to the author's memorandum submitted to the Bonus Commission on this problem.

* "The surpluses that are generated are a social product, to which neither employers nor the working class can lay exclusive claim; their distribution has been according to the worth of the contribution of each, subject to the requirements of further development and interests of all sections of the society, in particular, the satisfaction of the basic needs of all its members."—Third Five-year Plan, Ch. XV, p. 253.

PUMP MANUFACTURING INDUSTRY

THIRD PLAN TARGET MAY BE ACHIEVED AHEAD OF SCHEDULE

THE manufacture of power-driven centrifugal pumps is a well-established industry in India. It has made great strides since the 'thirties, manufacturing pumps of different types in a wide range of sizes. There are now as many as 50 registered concerns (half of them being small-scale) in the industry, with a rated capacity of more than 130,000 units per annum.

The second Plan's target of production for the industry was 86,000 units. This target was exceeded in the calendar year 1960 itself when actual production was as many as 102,200 units. Output in the next year, that is, 1961, was still higher at 126,200 units. In the first seven months of 1962, production was of the order of 75,600 units—representing a monthly average of 10,800 which was higher than the monthly average of 10,500 in 1961.

The industry's capacity and production targets under the third Plan are 194,000 and 150,000 units, respectively. Considering the pace at which additional capacity has been created so far, as also the pace of production, the industry may be expected to fulfil the production target (150,000 units) even before the end of the third Plan period. In fact, the Chairman of the Indian Pump Manufacturers' Association, Mr. K. K. Jajodia, made such a confident forecast in his speech at the eighth annual general meeting of the Association held at New Delhi on 25th January.

Diversified Production

A noteworthy feature of the industry is the diversification it has so far achieved in production. Several firms have increased the range of their production by undertaking the manufacture of bigger sizes of pumps. The largest size that is now being manufactured is one having 24" delivery diameter. Some of the firms have also begun to manufacture specialised pumps such as submersible types, petrol dispensing pumps, pumps requiring fractional horsepower motors for their operation and pumps required for sugar, paper and cement industries, that is, multi-stage and axial flow pumps. But as far as these specialised pumps are concerned, the industry, according to Mr. Jajodia, is unable to plan their production on any substantial scale because of lack of proper statistics concerning actual requirements. Sudden large orders for such pumps from the industries concerned, it is said, cannot be executed promptly by the pump manufacturing industry. In due course, however, this difficulty may be overcome, for the industry has the know-how and the capacity for the manufacture of specialised pumps other than the ones required for handling corrosive liquids.

The industry, it is claimed by Mr. Jajodia, is also in a position to meet the requirements of the Indian mining industry for deep mine pumps with flameproof motors. The coal industry alone, according to enquiries made by the Indian Pump Manufacturers' Association, will require about 100 mine pumps per annum during the next five years. In this connection, the Association has represented to the authorities that the responsibility for meeting the requirements of the coal industry for special pumps should be left to existing manufacturers in the private sector instead of to the public sector. The Government's decision that deep mine pumps with flameproof motors shall be manufactured, along with all types of mining machinery, at the Durgapur plant under construction would, therefore, have to be modified to give satisfaction to the pump industry which is in a position to manufacture such pumps. The industry's expectation seems to be reasonable, for it has the capacity to undertake this job. Not to avail of this capacity would amount to a waste of resources.

Idle Capacity

The industry's major problem today pertains to underutilisation of capacity on account of shortages in the supply of essential raw materials like coke, foundry pig iron and alloy steels. If, in particular, special steels are made available to the industry on a larger scale than at present, it will be in a position to execute possible orders for specialised pumps without and difficulty. Shortages in the supplies of coke and pig iron are common to all engineering industries, and these may well be mitigated, if not eliminated altogether, as part of the current effort to gear these industries to defence production.

On the import and export sides, developments in recent years have been gratifying. As far as imports are concerned, the figures show that they had come down from 6,173 units in 1957 to 2,732 units in 1960. The current annual value of pump imports is around one crore of rupees. Even this figure is bound to come down further, if the authorities take care, as suggested by Mr. Jajodia, to find out, while licensing imports of complete sugar plants, chemical plants, etc., whether the indigenous industry is in a position to supply the specialised pumps forming part of such plants. On the export side, the performance of the industry has been slowly improving of late. In the whole of 1961, for instance, exports of centrifugal and deep-well turbine pumps were valued at Rs. 5.5 lakhs, whereas in the ten-month (January-October) period of 1962 they accounted for about Rs. 6.0 lakhs. Still the industry has a long way to go before it can cultivate and stabilise its markets in South-East Asia and the Middle East. It is exporting at present just one per cent of its annual production in terms of units of pumps. If it can export at least a tenth of its output, it will mean that, as a long-established industry, it has reached a stage at which its products are competitive with those of European manufacturers in terms of price and quality alike.

THE STATE OF WORLD SHIPPING

The world merchant fleet now comprises 136 million gross tons, representing an increase of 60 per cent since 1950. The proportion of tanker tonnage has risen from one-fifth to one-third, whereas that of dry-cargo tonnage has dropped correspondingly. The recent setback on the dry-cargo freight market has been chiefly due to the recession in the steel industry in Western Europe and Japan, for it has meant decreased transport requirements for coal, ore and scrap.

Future prospects for the shipping trade are stated to be uncertain. While the continued expansion of world trade may lead to a rise in the transport volume, it must be expected that the expansion and modernisation of the world fleet will also continue. The rapid scrapping of the less effective tonnage is thought likely to continue during the next few years. The relatively favourable conditions of delivery for new ships are the result of the prevailing over-capacity in the world's shipbuilding industry. This factor is, therefore, expected to encourage the modernisation of the world merchant fleet.

IRON ORE EXPORT TO JAPAN

The Japanese iron and steel industry's long-range plan upto 1970 calls for an aggregate production of about 45 million tons of pig iron in that year. For attaining this level of production the industry will need to import 60 million tons of iron ore. It has, therefore, concluded in recent years several long-term, large-volume contracts with Peru, Chile and Brazil in South America and Swaziland in Africa to help assure it a steady supply of ore. These contracts are:

Country supplying ore	Quantity per year (in '000 metric tons)	Year shipment begins	Length of contract (years)
Peru	840	1963	7
Chile	1,100	1961	10
Chile	700	1962	11
Brazil	5,000	1966	15
Swaziland	1,200	1964	10

According to the January 1963 issue of *Yawata News*, a monthly economic report published by the Yawata Iron and Steel Co., Ltd., Tokyo, the above contracts represent a greater diversification of sources of ore supply, besides the usual sources in Malaya, the Philippines, North America and India. Such diversification has been rendered possible by the trend towards mammoth ore carriers and the consequent reduction in freight rates. Another major source of ore supply is likely to emerge with the recent discovery of huge iron ore deposits in West Australia. This is how the *Yawata News* rates the prospect, in this connection:

"For the Japanese steel industry, the discovery of the West Australian deposits is significant, in that it comes at a time when the industry has, in fact, been giving serious thought to alternate sources of ore apart from India on which it has relied heavily in the past. For the annexation of Goa by India not only has made Japan's dependence on Indian ore even greater but has resulted in an upping of the price of Goan ore to the comparatively high level of Indian ore. It means that, instead of being plagued by the problem of securing a stable and adequate ore supply as its first consideration, Japan will be able to indulge in the luxury of choosing its ore sources on the basis of quality and economy.

"Japan has in fact, received feelers for developing the West Australian deposits. Although a final decision must naturally await the outcome of negotiations on prices, quantity and quality, Australia's political and economic stability and its relative proximity to Japan are advantages that encourage prospects of Japanese ore purchases from this region in the not too distant future."

The question is how India may fare in its ore exports to Japan in the years to come. The export prospects for this country may not seem to be very bright if the question is viewed from the point of view of price alone. But, from the point of view of quality, the Indian iron ore may be expected to be favoured by Japan on a continuing basis. The latest discovery, by a Japanese mineral survey team, of extensive iron ore deposits, with 60 to 64 per cent iron content, in the Sukinda and Nayagarh areas of Orissa is heartening in this connection. As Japanese assistance may be available for building the Paradip port which is to handle ore exports, as also for constructing the express highway between Sukinda and Paradip, the chances are that Indian iron ore exports to Japan will be maintained at a fairly high level in the future, though not at as high a level as would be warranted by the import requirements of an expanding iron and steel industry in that country.

BASIC ISSUES IN BONUS PAYMENTS

(*Concluded from page 196*)

partially. Let us only catalogue the principal forms of these additional payments:

Acting allowance, additional allowance, additional work allowance, attendance allowance, *bhata* allowance, boarding allowance, Bombay allowance, carriage allowance, cash allowance, chemical allowance, climate allowance, clothing allowances, coke allowance, compensatory allowance, compassionate allowance, conveyance allowance, cycling allowance, daily allowance, detention allowance, diet allowance, duty allowance, education allowance, entertainment allowance, extra allowance, extra shift allowance, extra show allowance, factory allowance, food allowance, grain allowance, night allowance, halting allowance, hazard allowance, head office allowance, heat allowance, heavy work allowance, house rent allowance, laundry allowance, leave travelling allowance, line allowance, lodging allowance, lunch allowance, machine allowance, messing allowance, milk allowance, night shift allowance, officiating allowance, outdoor allowance, outstation allowance, overtime allowance, personal allowance, precision work allowance, processing allowance, regularity allowance, retention allowance, Saturday allowance, service termination allowance, shifting allowance, official allowance, subsistence allowance, tea allowance, tiffin allowance, tram allowance, travelling allowance, typing allowance, washing allowance, watchman's allowance, workshop allowance, unemployment allowance, uniform allowance, war allowance, allowances for working during holidays and machine allowances.*

Thirdly, as in other countries like Australia, New Zealand or Sweden, we have started remedying this defect in our economy (low wages) by starting with minimum wage legislation and passing on to regulated wages, most recently with the help of wage boards. Fourthly, even if we leave it to the economist to cry out ineffectually that this concept of a living wage is an elusive one, is not the question of wages a question of cost as much as it is one of income? Even the I.N.T.U.C. memorandum recognises that wages are an item of cost, so that, it is a strange claim to have been conceded that, even when a firm does not earn profits, this so-called bonus must be paid in order that it may fill up the gap between the wages actually paid and a living wage, whatever that might mean. Fifthly, is there to be no relation between a living wage and a fair wage? Finally, as an item of cost, when have wages to be related to productivity, if we look at them only from the point of view of income?

The third kind of claim is based on the plea that the bonus payments must be regarded as incentive payments. Here, too, there is a slight confusion of concepts. Incentive payments are payments by results and in the wage structures of any industrial unit the economist and the industrial engineer can devise a whole system of wage incentives or payment by results both on an individual and on a collective scale. But this is a part of the wage structure of an industrial establishment and a general omnibus payment, not related to performance, cannot be mixed up with incentive plans. Of course, all correct and properly devised profit-sharing plans are expected to improve employer-employee relations and to result in better production; but they are not to be treated as forming a part of incentives as such.

The Public Sector

The Bonus Commission has specifically been asked to state whether these bonus payments must now be extended to the public-sector units also and several memoranda to the Commission have advocated this extension. If the arguments in the foregoing paras have any validity, there is hardly any need to add that a major object of these State enterprises will be defeated if their gains or available surpluses are to be treated on the same basis as the available surpluses in the private sector.

NEW PRODUCTS AND PROCESSES

Clearing Blocked Pipe

AN easily-handled device for clearing blocked pipes or drains very quickly is to be marketed by Rigby Chemical Products, 41-43, Wardour Street, London. It is in the form of a gun, the body consisting of a brass cylinder housing a compressor unit which is charged by a hand pump. Pressures ranging from 1 to 160 lbs. per square inch can be selected according to the severity or distance of the blockage. The gun is also connected by a hose to the nearest water tap which is turned on until a column of water is formed between the blockage and the gun's ram. When a trigger is pressed the ram imparts a shock wave to the water and waves of kinetic energy travel at high speed along the pipe and strike the blockage. Speed of the waves of energy is said to be such that they pass stacks and vents before any of the force can be dissipated. The shock wave will shatter objects such as bottles or tooth brushes which may be jammed in a pipe. It is not intended for clearing frozen pipes.

Reproduction of Documents by Telephone Line

An equipment called "Mufax," which can transmit or receive the contents of documents in facsimile, over public telephone system or private line, has been announced by a British firm, Muirhead and Co. Ltd., Kent, England. It is a modification of earlier equipment that was suitable for private line only, and this development of a universal model follows on the British General Post Office's approval of the equipment for use on the public system. To transmit, a telephone call is put through to the operator at the receiving end, and transmitter and receiver are then brought into the circuit by a switch. The receiver records the transmitted document on an electro-sensitive paper. More than 500 typewritten words can be transmitted in three minutes.

Contract Arrangement for Automatic Machine

Automatic machine control, without a punched card or tape feed system, is now possible with a simple matrix switch assembly which utilises a new type of contract arrangement. Simply by inserting pegs into a series of holes set in vertical and horizontal rows, any combinations, governing machine operations, are possible. The assembly is designed for use in a wide field of automatic control, where flexibility is required when setting up operations, and where a large number of combinations are necessary. A new type of contract is embodied in the unit which makes it cheaper than conventional types, decreases maintenance costs and yet does not detract from its performance. Of robust design and construction, its mechanical strength avoids any possibility of contract displacement by distortion during life.

Machining Super-alloys

A major break through in the rapid and efficient machining of hard metals and super-alloys has been achieved in Scotland. This has been achieved through the development of a revolutionary automatic electro-chemical metal forming machine known as the "Barmax" which is now being manufactured at a Glasgow factory, Barmax Works, Haggs Road, Glasgow, England. The Barmax machine was designed at the Scottish laboratories of a famous aero-engine firm to machine high-duty metal alloys used in aircraft engines and rockets. The process is akin to the electro-polishing principle: metal being removed from the workpiece by an electrolytic action. The vital development is in the automatic control system which measures the exact dimensions of the gap between the forming tool (cathode) and the workpiece (anode). As metal is eroded from the workpiece the tool is advanced at a corresponding rate to maintain the crucial inter-electrode gap. The makers claim exceptional results with tungsten carbine and hard metals of the nimonic groups.

New Diesel Engine

A new diesel engine, light in weight and specially designed to fit into a very small space, has been introduced by a British firm, Davey, Paxman and Co. Ltd. Six-cylinder, V-form, it has an output of up to 800 b.h.p., combined with a bulk of only 144 cu. ft. (4 cu. metres). Apart from its obvious advantages for marine use, it is specifically suitable for railway undertakings and industrialists who have size and weight high on their list of priorities. The firm have also placed a special emphasis on accessibility. Individual cylinder heads can be removed without the use of cumbersome lifting tackle—this reduces the headroom required in an installation—and both fuel pumps and ejectors are placed so that access to them is immediate—no other parts have to be removed beforehand.

Miniature Regulating Transformer

For the regulation of alternating voltages a Dutch concern has produced a new 0.5 amp. regulating transformer which is the smallest 220 V transformer in the world. It is of sturdy construction and being completely cast-in in reinforced polyester it can easily be installed. The transformer has been kept so small because the enamelled copper wire inside is wound around a highly permeable ring-shaped laminated core in two layers. The transformer has a continuous voltage which can be precisely regulated and a high output. The brush path is formed by the top layer of the winding in such a way that the secondary voltage is regulated in two steps, namely, from 0 to 50 per cent and from 50 to 100 per cent of the primary voltage. The transformer is suitable for frequencies of from 50 to 400 periods per second. It is about 84 mm across and 45 mm high, and has already been applied in meat-slicing machines, photo-printing machines, airconditioning plants and measuring and control installations.

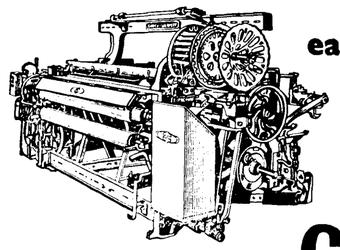
Semi-automatic Titration Apparatus

A simple and accurate semi-automatic titration apparatus has been developed by a Dutch firm. This apparatus can be attached to any standard burette and consists of a magnetic valve connected to a control unit. This control unit, which is connected to the lighting mains, can be placed 50 cm (19.7 in.) away from the burette. The flow of liquid to be titrated is controlled by three push-buttons on the control unit. By pushing the left-hand button a continuous flow of liquid is dispensed into the beaker. Before the liquid in the beaker has quite reached the desired level the flow can be altered to a slow dripping by pressing the centre button. The rate at which the liquid drips into the beaker can be regulated by means of a knob which is also located on the control unit. The flow can be stopped immediately the desired level has been reached by pressing the right-hand button. If two or more liquids have to be mixed during titration the beaker is replaced by a magnetic stirrer, also manufactured by the same works.

Unforgeable Identity Card

A special type of unforgeable identity card developed by AB Rollfilm, Stockholm, is reported to have attracted considerable international interest, according to reports in the Swedish press. Inventor is Mr. Eric Rothfjell, head of the firm, who has patented the card in 21 countries. The identity cards are coated with transparent plastic. The snap-shot of the bearer as well as his identity particulars are photographed simultaneously on a film strip which is then enclosed in the plastic coating. Mr. Rothfjell has designed a special camera which makes the entire procedure rapid and easy. The camera, manufactured in Sweden, won the Grand Prix at the International Inventors' Fair in Paris in 1956. A copy of the film strip is always kept in the firm's archives. Britain and Finland are said to have already bought the patent and in Sweden some 1,000,000 of these identity cards have been issued in the past 10 years, mainly for employees of big firms.

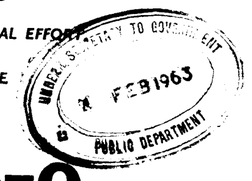
New Synthetic Material for Shoes



A new synthetic material for shoe-making—combining the properties of leather with a number of advantages of its own—is now being marketed by a London firm, Bonded Fibre Fabric Ltd. The material has a fibrous structure formed by bonding nylon fibres with a mixture of synthetic resins, using a special process. It can be used on standard shoe-making machinery and treated in exactly the same way as conventional materials. Unlike leather—where each hide has to be treated individually—the new material is a uniform product. This will, claim the firm, facilitate the increased use of automation in shoe-making processes and result in production economies.

Computer to Improve Quality

Computing equipment to be installed in a South Wales tin plate plant is expected to lead to an improvement of product-quality and reduce material wastage throughout the tinning operation. Used in a production-quality control system for a tinning line, it will monitor the manufacture of tin plate—produced in a continuous strip at speeds of up to 1,250 ft. (381 m.) per minute—and record flaws detected during the tinning process. The complete system at the works will provide a coil-by-coil analysis of the tin plate production of each shift. It will also produce two separate statements for every coil—one will show the total amount of defective tin plate contained in the coil and the other the location of the various flaws within it.



A Cigarette Case named Conscience

A Swiss manufacturer has just launched on the market an amusing cigarette case specially designed for hardened chain smokers who wish to cut down their consumption of cigarettes. This luxurious case is provided with a clockwork movement stopping it from being opened if a certain length of time—set in advance by the smoker himself—has not elapsed since his previous cigarette. Naturally, the setting can only be altered when the case is open, making it completely impossible to get at the cigarettes before the end of the time selected. "Memo-Smoke," as this smoker's second conscience is called, can be set to open at intervals varying between a few minutes and two hours.

PROGRESS OF WAREHOUSING CORPORATION

TURNOVER BETTER, BUT FARMERS ARE NOT BENEFICIARIES

THE Central Warehousing Corporation seems to have overcome its teething troubles and is now well set on the way to steady progress and financial viability. This is the overall impression one gets from a perusal of the speech of Mr. V. Shanker, Secretary, Union Ministry of Food and Agriculture, who is also the Chairman of the Corporation, at the fifth annual general meeting of the Corporation held at New Delhi last week. An indication of the improvement in the working of the Corporation has been the increase in the net profit of as much as 675 per cent over a year to about Rs. 1.80 lakh in 1961-62, as compared with 1960-61. As a result of this improvement in the profit position, the Corporation has been able to wipe out a part of its losses suffered earlier. Thus, the overall losses have declined from about Rs. 2.20 lakhs in 1960-61 to Rs. 2.03 lakhs. It is also important to note that earnings from storage charges almost doubled during the year under review to Rs. 14 lakhs. The number of warehouses increased by 50 per cent in 1961-62, as compared with the previous three years, storage capacity by 66 per cent, deposits by 96 per cent, outstanding advances from banks by 80 per cent and own construction by 560 per cent.

As many as 20 new central warehouses were set up in 1961-62. This is the largest number for any of the previous years, and brings the total so far to 60 (as at the end of March last). With the addition of new warehouses, the aggregate warehousing capacity of the Corporation has reached 125,533 tons, of which warehouses, with a capacity of 35,700 tons, are under the ownership of the Corporation. In view of the satisfactory performance in 1961-62, Mr. Shanker was quite optimistic about fulfilment of the third Plan target (that is, establishment of 100 additional warehouses during the five-year period). He, however, hinted that there might be some shift in emphasis in the development programmes in view of the national emergency. The Corporation, for instance, is considering the establishment of a few warehouses in Assam, at the instance of the State Government, with the purpose of meeting certain specific needs of storage arising out of emergency. Besides, the problem of shortage of building materials and other limitations on construction work might also slow down the pace of work on the planned warehouses. Considering the large leeway India has to make up in the field of organised warehousing, it will be incumbent on the Corporation to expedite the construction of warehouses not only in the north-eastern border areas but also elsewhere. For this purpose, the Corporation will have to press for priority of consideration in the matter of allocation of construction materials.

State Corporations

The Corporation's responsibilities are not confined to its own direct field of work, for it has also to look after the growth of warehousing undertaken by the various State Warehousing Corporations. Its share in the capital of State Corporations is of the order of Rs. 150 lakhs, roughly half of its own capital. During the year 1961-62, the State Corporations have altogether set up 83 new warehouses and 32 sub-warehouses, raising their total number to 335 and 37, respectively, with a total capacity of 396,000 tons. While the progress of State Corporations, in general, has been satisfactory, Mr. Shanker sounded a note of caution as follows:

". . . I cannot conceal from you the feeling that these State Corporations have yet to develop a keen sense of business-like efficiency in their functioning. Vaulting ambition is apt to overleap itself. There is a tendency to overspread one's activities which might entail financial embarrassments. A certain measure of healthy restraint, motivated by commercial prudence, might be indicated in accumulating capital assets of a productive nature. Your Corporation will endeavour, through its representatives, to seek those developments."

The Central Warehousing Corporation has a legitimate voice in the development of State warehouses, as it has a substantial financial stake in the latter's growth. In 1961-62 alone, the Central Corporation contributed Rs. 18 lakhs to the capital of State Corporations, besides agreeing to provide an additional amount of Rs. 65.7 lakhs towards their share capital.

There has been a steady increase in the volume of credit being made available against warehouse receipts. The State Bank and other scheduled banks have been granting credit facilities against the pledge of warehouse receipts, with the support of the Reserve Bank. Outstanding advances against warehouse receipts of Central and State warehouses aggregated Rs. 9 crores at the end of March 1962, as against only Rs. 5 crores a year before. This figure has since increased further to as much as Rs. 12 crores, as of May 1962, the latest month for which figures are available.

The increase in the volume of credits granted against warehouse receipts, as also the steady expansion of warehousing capacity, are certainly encouraging features of the development of Central and State Corporations. It is, however, a matter of some disappointment that farmers continue to be apathetic towards the warehousing schemes. It would appear that most of the facilities provided now by the Corporations are being utilised by traders. This is not a healthy development, considering the fact that the whole scheme, as originally drawn up by the Committee of Directors of the Rural Credit Survey, was designed mainly to help actual cultivators by enabling them to keep their produce till they get a favourable time to sell it. Warehousing is only one of the facilities needed by the farmer, the other two pertaining to finance and marketing. So if the Committee's integrated scheme for improving the lot of farmers were to succeed, the progress on co-operative credit and marketing too should go hand in hand with warehousing. The idea behind the scheme was that farmers would sell their produce through co-operative marketing societies which in turn will use the warehouses established by the Centre and the States. But co-operative marketing has not made any significant progress, though the advance in the direction of providing credit has been relatively better. This explains the poor utilisation of warehousing facility by farmers. Mr. Shanker conceded this fact in the following words:

"The whole scheme of Central and State Warehousing was conceived as an aid to agriculturists in the storage and marketing of their agricultural produce. It is, therefore, no cause of jubilation to us, if we still have more than 80 per cent of our capacity being utilised by traders. What is worse is that the share of the co-operatives and producers in the utilisation of this capacity is declining. This only shows that old habits die hard and that the message of warehousing has a long way to go, before it can command the attention of millions of agriculturists for whom this must eventually be a safeguard and a protection.

"As I am on this subject, I must also refer to the undoubted fact that organised marketing in agricultural commodities has still to make a marked impression on the life of the rural community. In the marketing of every commodity, we still have a number of intermediaries and a multiplicity of charges which reduce the producer's share in the ultimate consumer's price. The reduction or elimination of these can be secured only by the development in action of co-operative marketing and warehousing, the expansion of regulated markets, organised cheap transport, and the inculcation among the producers of their own vital interest in amenities and facilities, such as are provided by Central and State Warehouses."

Co-operative Marketing Societies

It will thus be seen that the remedy for ensuring that the warehousing facility is availed of more and more by farmers than by middlemen lies in expediting the development of co-operative marketing societies. This, however, is more easily said than done, for experience so far shows that there is no real urge among the people of this country as a whole, barring a few exceptions (namely, some parts of Gujarat, Maharashtra, Andhra Pradesh and Madras), to take to co-operation. There are also no signs to warrant the belief that one could look forward to a perceptible improvement in their attitude during the coming years. Some may advocate propaganda among the farmers, bringing out the advantages of storing one's surplus produce meant for sale in the warehouses belonging to the Centre and the States. We, however, doubt the efficacy of this remedy, because farmers are more interested in disposing of their produce in their own villages rather than cart them to marketing centres where the warehouses are situated. Of course, big farmers can be expected to come forward to take advantage of this facility, but their number is dwindling, thanks to the various land reform measures. Further, the big farmers themselves invariably play the role of middlemen for a large number of small producers in their neighbourhood. This state of affairs leads one to the conclusion that, so long as co-operative marketing does not make any significant progress, the warehousing corporations will have to starve of customers if they decide to deny their facilities to middlemen. This will not be such a serious drawback as it may seem on the surface, if suitable measures are taken to make sure that the middlemen are not of the extortionate type and that they pay a reasonable price to growers. There is thus need for some fresh thinking on this subject.

Loss in Storage

While the Central and State Warehousing Corporations made steady progress, quantitatively and financially, there is one aspect of their functions that needs to be looked into. Pointed attention to this aspect was drawn by Mr. H. M. Patel, a distinguished civilian administrator, in his article to *Commerce Annual Number* of 1962. Examining the role of warehousing, in the context of the question as to why agricultural productivity in India was lagging behind, Mr. Patel observed thus:

". . . There has been, in fact, a surprising lack of purposive action in this field. How else, for instance, can we explain the very large percentage of foodgrains which are lost each year while in storage? The loss has been placed at as high a level as 40 per cent or even if we prefer to accept the lowest estimate, the loss would be of the order of 20 per cent and more. Would it not be reasonable to expect effective and substantial action to prevent such recurring loss, or at any rate to reduce it to a minimum? And yet, so little is done, even though the solution for this particular problem is well known, namely, establishment of scientifically constructed silos, warehouses, and godowns, and the machinery with which to give effect to that solution exists in the Central and State Warehousing Boards!

"A critic and a persistent advocate of well-constructed silos was exasperated into saying almost bitterly the other day that 'in the long run, it is cheaper and more profitable to save and use the harvested crops than to grow more food to feed the already thriving storepests.' For some inexplicable reason, after over six years of its existence, the Central Warehousing Board has constructed warehouses with a capacity for no more than 165,000 tons, and not all of them are designed to keep out pests; only two silos have been erected, and so far as is known, no more are planned. And yet, if an adequate number of warehouses and godowns could be made available, even the problem of marketing and of provision of credit to small cultivators would have been materially assisted. This one simple and economic solution to our food shortage problem is virtually ignored; no one even hears of this as an effective method of adding to the availability of foodgrains."

It is to be hoped that Mr. Shanker, who is also noted for his dynamism as an administrator, will take note of the foregoing observations, from a former colleague of his and take appropriate steps to remedy the lacuna. As the Chairman of the Central Warehousing Corporation, he is in a position to tackle this problem effectively. The sooner this is done the better, because the Corporation has several plans to expand and diversify its activities. Already, as many as 80 commodities are being stored in the Corporation's warehouses. The commodities covered range from pepper and cardamom to fertilisers and jaggery. Central warehouses have also been started at Calcutta and Kanpur for the storage of jute purchased by the State Trading Corporation, as part of price support operations. The total deposit of jute in Calcutta is likely to be about two million maunds and at Kanpur about 25,000 maunds. To support this scheme, the Central Corporation has, according to Mr. Shanker, already taken godowns, with a capacity of 37,350 bales at Calcutta and 4,000 bales at Kanpur. The Corporation has also negotiated with the Tea Board for taking over all public tea warehouses in Calcutta under a guarantee of continuous occupation of 60 years in respect of the new tea warehouses, and upto the end of March 1990 in respect of the existing warehouses. In this matter, in a direct line of succession to the Port Commissioners who did warehousing about 17 years back and private business who handled it thereafter. The dimensions of this enterprise can be gauged from the fact that the total space required will be the equivalent of about 200,000 tons of foodgrains.

The new Act passed by Parliament a few weeks back replacing the one in force hitherto, envisages marked expansion in the scope of the Corporation's work. Explaining the amendments made by Parliament, Mr. Shanker observed:

"The major change in the new enactment is that the National Co-operative Development and Warehousing Board, which is a 40 per cent shareholder in the Corporation, is replaced by the Central Government. Opportunity was also taken to

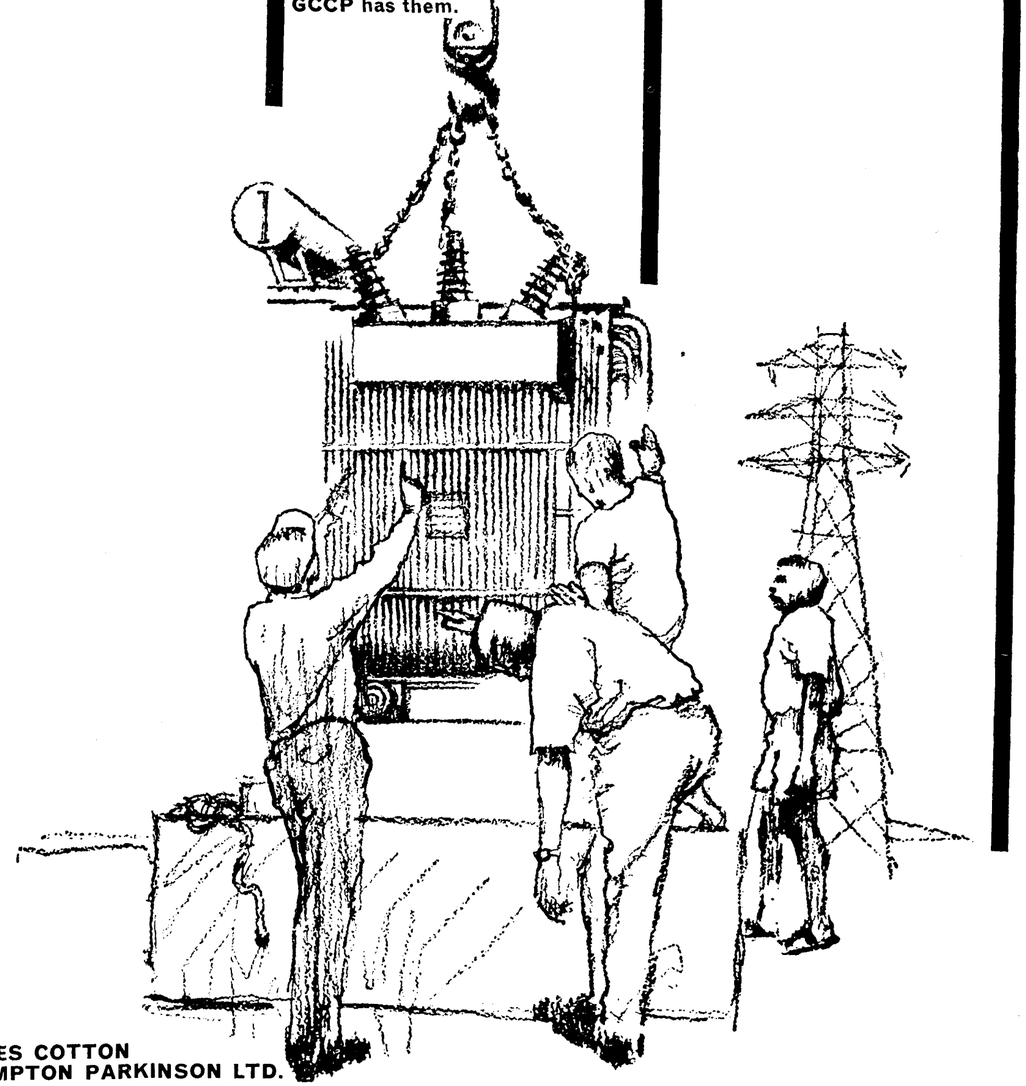
BUILDING A FACTORY?



GCCP INSTALLS EVERY ITEM OF ELECTRICAL EQUIPMENT

Factory owners know that a machine is only as good as the man who runs it. They try to ensure that both machine and man are the best available. But there's another factor—and it's rarely kept in mind.

SOUND INSTALLATION—A VITAL ASPECT

Much money and time is spent on electrical planning and equipment. Often, all this effort is jeopardized by contracting for cheap installation. The result: shoddy work, breakdowns which stop machines and hamper production, constant repairs and a generally unhappy situation. The correct installation of electrical equipment calls for a concentration of specialized skills and experience. GCCP has them.

CONTACT GCCP THE RIGHT PEOPLE FOR ELECTRICALS!

GREAVES COTTON & CROMPTON PARKINSON LTD.

GCCP also plans your electrification, supplies the equipment and provides a comprehensive after-sales service.

SECTION 43A OF COMPANIES ACT

SIGNIFICANCE TO PRIVATE COMPANIES

By S. C. Renganathan

SECTION 43A of the Companies Act is a new section and has been inserted by the Companies (Amendment) Act of 1960 following the recommendation of the Sastry Committee. The object of introducing this new section is to subject private companies which employ public money to a considerable extent to the same restrictions as would apply to public companies.

According to Section 43A, if, in a private company, not less than 25 per cent of its paid-up capital is held by one or more bodies corporate, it shall on or from the date on which the aforesaid percentage was first held by such body corporate or bodies corporate, become a public company. However, certain classes of private companies have been exempted from the operation of Section 43A.

Before the Companies (Amendment) Act 1960, the restrictive provisions contained in the Act relating to public companies were made applicable only to those private companies which were subsidiaries of public companies. As between pivate and public companies, private companies are exempted from the obligation of complying with certain provisions of the Act and are also shown some concessions mainly on the ground that the public are not interested in them. But it has been found in practice that there are many private companies doing extensive business with a large amount of capital subscribed by public companies. This was observed by the Sastry Committee in the course of their examination and they made recommendations to the effect that private companies whose financial and industrial operations were found to be wide and where large sums of public money were found to be utilised, ought to be treated as public companies for all purposes. However, at the time of considering the Bill by the Select Committee, it was felt that the deeming of all such private companies as public companies might cause certain amount of hardship and therefore the following classes of private companies have been declared to be outside the scope of Section 43A:

(i) A private company of which the entire share of paid-up capital is held by any single private company incorporated in India,

(ii) A private company of which the entire paid-up capital is held by one or more bodies corporate incorporated outside India.

(iii) In the case of other private companies if only each of the conditions mentioned below is satisfied:

(1) A private company in which body corporate or bodies corporate holding shares are themselves private companies (referred to as shareholding companies hereafter) and

(2) Nobody corporate is a shareholder in any such shareholding company, and

(3) The total number of shareholders in the private company and also in the shareholding companies put together, does not exceed 50.

The above exemptions and conditions have been provided under Section 43A(6) of the Companies Act.

Despite the fact that wholly-owned Indian subsidiary companies have been excluded, cumulative conditions have been imposed in regard to other private companies where the percentage of body corporate holdings is 25 and more but less than 100. It is not known why private companies which do not at all employ public money have been subjected to certain conditions in order to retain their status as private companies. To be within the orbit of a private company, a company must, of necessity, have to comply with all conditions mentioned *supra*. Of course, it may not be possible for companies in the majority of cases to satisfy all the requirements.

Added to this, when the Department of Company Law Administration was sought for clarification in regard to computation of total number of shareholders in terms of Section 43A(6), it informed that common shareholders of one or more shareholding companies of the private company should be counted separately. This would mean that, if the same shareholders held shares both in the shareholding company as well as in the private company, thereby exceeding the total number of 50, the private company would become a public company.

It is seen from the definition given in the Companies Act under Section 3 for a private company, that one of the conditions is that the total number of shareholders should not exceed 50. Keeping this in view, the legislature would have included necessary provision under Section 43A(6) restricting the total number of shareholders in all the shareholding companies and also in the private companies to 50, so that the exemption provided for under Section 43A(6) does not overstep the definition of a private company. However, one has to observe that the calculation of total number of shareholders under Section 43A(6) does not rest with the private company alone but also involves inclusion of the number of shareholders in shareholding companies. In the circumstances, it should appear that the interpretation to count separately the same shareholders in the shareholding companies and limiting the number to 50 is not in conformity with the definition given for a private company under Section 3.

The idea of providing the exempting clause was that, where the ownership of the company was not public in character, the private company should not be deemed to be a public company for the purpose of the Companies Act. Moreover, it is not in the fitness of things to count one individual two or three times simply because his name appeared on the Register of Members of one or more shareholding companies concerned. To fulfil the conditions outlined under Section 43A(6) it is apparent that the common shareholders shall be counted only as one instead of two as is being interpreted by the Company Law Administration.

In our country, where the industrial advancement does not keep pace with other industrially advanced countries or with its own requirements, such restrictive provisions will only act as a restraining factor on Inter-corporate investments which have always been looked upon as a useful machinery for transfer of funds to those units which are lacking in resources.

(*Concluded from next column*)

year under review with those in the previous year. The net increase in advances over the year is not significant, consequently, the rise in deposits is reflected largely in investments and to some extent in cash. Taking the unencumbered portion of investments, the investments-deposits ratio has expanded by seven points to 37.2 per cent. Although the aggregate cash balances are higher at Rs. 607.39 lakhs, as against Rs. 597.38 lakhs a year before, their ratio to deposits works out to a lower figure of 31.8 per cent, as against 34.8 per cent. It is nevertheless more than three times higher than the average for scheduled banks as a whole. For a State associated bank, a 32 per cent cash ratio is unnecessarily high. The Bank could have easily invested more in Government securities, if the scope for expanding its advances portfolio was limited. That would have enabled the Bank to report a larger profit.

During the year, currency chests were established at five other centres in addition to the nine places in the previous year. The requisite sanction of the Kerala State Government to hand over to the Bank the actual conduct of Government work was received during the year and six of the 14 centres had already taken up the work from the end of September. The number of branches at the end of the year had remained unchanged at 94. As a result of the implementation of a scheme of rationalisation, business at the Bangalore branch was handed over to the State Bank of Mysore and the unit was closed in July 1962. However, this did not affect the overal position in respect of branches, as a new centre had already been opened in the Medical College campus, Trivandrum, in February.

Sixteen centres in Kerala have been selected, we are told, for opening new branches. Of these, eight are sub-treasury centres and two are in industrial areas—one in Kalamassery in the factory belt near Alwaye and the other in Pappanamcode Industrial Estate, Trivandrum. Of the remaining six, two are in rural areas and four in suburbs of large towns.

The Bank's assistance to small-scale industries during the year grew in number of units covered from 13 to 38 and in value from Rs. 5·77 lakhs to Rs. 33.16 lakhs. Six co-operative institutions, as against four in the previous year, were assisted with a total limit of Rs. 61·67 lakhs, as against Rs. 5.15 lakhs. The aggregate limit of credit facilities against warehouse receipts to 386 accounts, as against 113 accounts in the previous year, amounted to Rs. 21.97 lakhs, as against Rs. 4.58 lakhs.

STATE BANK OF TRAVANCORE

BUSINESS EXPANDS FURTHER

DURING the year ended 31st December 1962, the business of the State Bank of Travancore (General Manager: Mr. T. R. Krishnaswami, Trivandrum) expanded further. The balance-sheet total went up from Rs. 21.62 crores to Rs. 25.25 crores which is double the level of Rs. 12.19 crores as at the close of 1960—the first year of the Bank as a State Bank unit. Net profit, after meeting all expenses and providing for depreciation and taxation, has, however, increased only slightly from Rs. 8.35 lakhs to Rs. 8.93 lakhs at which level it is Rs. 1.65 lakh more than that for 1960. The Directors concede that profit for the year under review is not commensurate with the expansion in business, but attribute the lag to the increase in establishment charges and higher cost of deposits. The Desai award has meant for the Bank an increase in staff expenses of Rs. 9.25 lakhs to Rs. 32.92 lakhs which, however, is the aggregate wage bill on a larger number of employees, 1,613 as against 1,570 a year before. Other expenses, reflecting a full year's expenditure on the three amalgamated units against only a portion of the year in 1961, have risen from Rs. 7.82 lakhs to Rs. 10.47 lakhs. The cost of deposits, represented in outward interest, has gone up by Rs. 20.63 lakhs to Rs. 54.54 lakhs. On the revenue side, earnings by way of interest and discount have improved by Rs. 25.37 lakhs to Rs. 87.92 lakhs. The Directors, however, say that income did not keep pace with the grant of fresh limits for advances owing to realisation of certain sticky advances taken over from the amalgamated banks. Interest on such of the advances of the amalgamated banks as are considered doubtful has not been taken into account while computing the earnings for the year.

To sum up, while total expenditure has shot up by Rs. 32.53 lakhs to Rs. 97.93 lakhs, gross income from banking business has improved only by Rs. 28.55 lakhs to Rs. 100.42 lakhs. Luckily, income from other sources, including the State Bank subsidy of Rs. 3.09 lakhs (Rs. 2.19 lakhs a year before), has been much higher at Rs. 7.85 lakhs as compared with Rs. 2.70 lakhs in 1961. It is gratifying to learn from the Directors that vigorous steps continue to be taken to raise the Bank's earnings.

The dividend for the year on the Rs. 100 fully paid ordinary shares has been maintained at 5 per cent per annum, subject to tax. The reserve fund has got Rs. 2 lakhs, as against Rs. 2.32 lakhs in the previous year. The provision for bonus to staff has been raised from Rs. 1.02 lakh to Rs. 1.80 lakh.

The Bank's progress in the past four years is tabulated below:

(In lakhs of rupees)

	For the year ended 31st December

* Figure relate to the Travancore Bank Ltd. † From 1960-61, after taxation. ‡ Subject to deduction of tax. § Only unencumbered portion.

It will be noted from the table that, deposits which had more than doubled in 1961 (from Rs. 8.33 crores to Rs. 17.15 crores) have risen by only about Rs. 2 crores to Rs. 19.10 crores. It must, however, be borne in mind that, in 1961, three banking companies were amalgamated with the Bank, and these together brought into its books Rs. 6.75 crores of deposits. This point must be remembered when comparing the changes in the assets portfolio in the

(*Continued in previous column*)

STATE BANK OF BIKANER

PROFIT LOWER DUE TO HIGHER COSTS

THE declared profit of the State Bank of Bikaner (General Manager: Mr. Balwant Singh, Bikaner) for the year ended 31st December 1962 shows a setback of Rs. 1.11 lakh at Rs. 5.99 lakhs. According to the Directors, the profit has declined mainly because of higher staff expenses following implementation of the Desai Award. The aggregate wage bill has amounted to Rs. 47.55 lakhs, as against Rs. 35.93 lakhs a year before. Other expenses have also gone up from Rs. 11.90 lakhs to Rs. 13.99 lakhs. Thus, higher costs have been primarily responsible for the reduced profit.

There is also another equally important reason for the setback in profit, namely, inadequate use of the available resources in the most remunerative manner possible. Deposits of the Bank have expanded as in the previous year, from Rs. 15.79 crores to Rs. 18.59 crores to be precise. But advances, unlike in the previous year when they had spurted from Rs. 769.52 lakhs to Rs. 980.37 lakhs, have dropped by Rs. 86.37 lakhs to Rs. 893.80 lakhs. Investments have increased by Rs. 64.96 lakhs to Rs. 612.79 lakhs, but the rise is clearly insufficient to counter the effects of lower advances. Further, not only has the credit ratio fallen from 60 per cent to 48.1 per cent but the investments-deposits ratio has also moved down further from 34.7 per cent to 32.9 per cent. In no small way, therefore, has the profit declined also because of too much funds finding relatively too little profitable use. As a result, the Bank has closed the year with cash balances aggregating as much as Rs. 490.01 lakhs, as against Rs. 206.79 lakhs in the previous year, and the cash-deposits ratio has doubled from 13.1 per cent to 26.3 per cent.

It may, however, be pointed out that whatever use the funds had been put to did fetch a higher income by way of interest, discount, commission and exchange earned, which aggregated Rs. 121.50 lakhs as compared with Rs. 97.48 lakhs in 1961. Nonetheless, a more intensive use of funds in advances and investments would have enhanced the Bank's profit. At Rs. 58.12 lakhs, interest paid is higher by Rs. 12.25 lakhs. Whereas the aggregate income has increased by Rs. 25.20 lakhs to Rs. 128.12 lakhs, total expenditure has risen faster by Rs. 26.32 lakhs to Rs. 122.14 lakhs.

Because of the lower profit, the allocation to reserve fund has been pruned by Rs. 1 lakh to Rs. 1.25 lakh and the provision for bonus to staff reduced from Rs. 1.75 lakh to Rs. 1.63 lakh. The dividend on the Rs. 100 fully paid shares has been kept unchanged at 6 per cent per annum, subject to tax. The carry forward at some Rs. 12,000 is nearly the same as the amount brought in.

The following comparative table presents in a nutshell the Bank's progress from 1959:

(In lakhs of rupees)

	For the year ended 31st December

* Subject to deduction of tax.
† Only unencumbered portion.

The Bank obtained during the year the Central Government's approval to its scheme for taking over the State Bank of Jaipur. The actual take-over has, however, taken effect from 1st January 1963 only. Following the take-over, the Bank has been styled as the State Bank of Bikaner and Jaipur and its head office has been shifted from Bikaner to Jaipur. There is now, therefore, only one bank conducting the Treasury work in Rajasthan. It is expected that the change will result in organisational and operational economies as also more comprehensive services to the public and industry through the accumulated resources. The amount of compensation to the shareholders of the State Bank of Jaipur, which is to be determined by the State Bank of India with the approval of the Reserve Bank on the basis of the formula of deducting outside liabilities of the Jaipur Bank from its assets, is to be paid in shares of the State Bank of Bikaner and Jaipur. The shareholders have, however, the option to be paid in cash. In order to put through the scheme for compensation, the Bank has already increased its issued capital from Rs. 50 lakhs to Rs. 80 lakhs.

The Bank is said to have made satisfactory progress in foreign exchange business which it had started only in 1961. It has continued to handle Government cash business under the State Bank agreement. Currency chests of the Issue Department of the Reserve Bank were established at seven centres during the year, thus bringing the total number of currency chests to 41. Eight new branches were opened during the year—seven in Rajasthan and one in New Delhi. In accordance with the policy of rationalisation, three branches outside the main area of operation of the Bank, namely, at Bhatinda, Indore and Secunderabad were transferred to the State Bank of Patiala, the State Bank of Indore and the State Bank of Hyderabad, respectively. Being an associate of the State Bank of India the Bank has a statutory obligation to help small-scale industries and co-operative banks. Total credit limit sanctioned by the Bank during the year to small-scale industries was slightly larger at Rs. 1.31 crore, as against Rs. 72.50 lakhs in the previous year, the units covered being 153, as against 102. The amount outstanding in these accounts totalled Rs. 37.46 lakhs, as against Rs. 26.59 lakhs a year before. Sanctioned limits in respect of advances to co-operative institutions stood at Rs. 5.85 lakhs at the end of the year, as against some Rs. 83,000 a year before. Advances against warehouse receipts aggregated Rs. 12.75 lakhs, as against Rs. 6.28 lakhs in 1961. The Bank's staff training school at Bikaner, it is noteworthy, extended its facilities from junior officers to clerks. And, as many as 33 junior officers and 30 clerks availed themselves of the facilities.

DEVIDAYAL TUBES TO ENTER CAPITAL MARKET

The Devidayal Tube Industries Private Ltd., Bombay, is being converted into a public limited company and will shortly enter the capital market inviting investors to participate in its capital. This was announced by Mr. Amirchand T. Gupta, Managing Director of the Company, at a Press Conference held at the premises of the factory located at Bhandup, a suburb of Bombay, on Monday this week. The new company, which will have Mr. H. M. Patel, I.C.S. (Retd.), as Chairman, will offer to the public Rs. 41.09 lakhs in equity shares of Rs. 100 each, at par, in March-April next. The entire issue will be underwritten. The proposed offer to the public is nearly half of the issue of Rs. 85 lakhs, all in equities, for which permission has been granted by the Controller of Capital Issues. Shares worth Rs. 2 lakhs will be made available to the British collaborators, the Delta Metal Company Ltd., London. The balance of Rs. 41.91 lakhs are being taken up by the promoters and their friends. Later, shares worth Rs. 20 lakhs are proposed to be given to the British firm to cover the cost of plant and machinery supplied by them. But Government's permission for doing so is yet to be obtained.

The capital now proposed to be raised and for which Government's sanction has been received will be used for financing the expansion of the existing plant. The Company has secured a licence for the production of 3,600 tons of copper and brass tubes annually. But the present rate of annual output is only 1,000 tons, which will be stepped up according to a phased programme. It may be recalled that the plant, which was set up at a cost of Rs. 54 lakhs, commenced production in May 1960. The expansion now proposed will cost a further capital outlay of Rs. 51 lakhs. The plant is specialising in the production of seamless tubes by special extrusion process. The Company is said to be saving foreign exchange of about Rs. 20 lakhs annually at present. This saving is expected to be about Rs. 65 lakhs, when the expansion is completed and the production at the works attain full rated capacity.

The non-ferrous metal tubes have a ready market in the country, being used by a wide range of industries, such as automobiles, refrigeration, and air-conditioning, railways and shipbuilding, stoves and petromaxes as also by sugar and chemical plants. The total requirements of copper and copper alloy tubes in this country, according to Mr. Gupta, aggregated about 5,400 tons in 1962; this is expected to go upto 9,700 tons by 1965-66. Mr. Gupta was of the view that the Company would be able to export a part of its products not only to some of the A'ro-Asian countries, but also to the U.S. and other industrialised countries. Devidayals claim that even their present plant is the biggest of its kind in India. Licences, it may be noted, have been given to three more units in the country, but their capacity will only be of 1,000 tons each.

RALLIS INDIA LTD.

DIVIDEND MAINTAINED, DESPITE MILD SETBACK

THE small crop and consequent rise in prices of indigenous cotton in the 1961-62 season have caused a mild setback for Rallis India Ltd. (Chairman: Mr. Badridas Goenka, Calcutta) during the year ended 31st August 1962. At Rs. 17.91 crores, sale proceeds are lower by a crore and eighteen lakhs. Gross profit has moved down from Rs. 58.45 lakhs to Rs. 49.75 lakhs. While the cost of materials consumed has also moved down, in line with the reduced turnover, from Rs. 16.48 crores to Rs. 15.14 crores, other expenses have soared by Rs. 25 lakhs to Rs. 263.64 lakhs largely because of the take-over of a subsidiary unit as also due to a settlement (partly retrospective) reached with the staff unions on outstanding bonus, grading and other questions. Out of the Rs. 25-lakh increase in other expenses, as much as Rs. 20.48 lakhs has been on account of aggregate staff expenses which stand at Rs. 97.47 lakhs. We are told that had the revised wages and other benefits been granted in 1960-61, the aggregate wage bill for that year would have risen by Rs. 4 lakhs from Rs. 76.99 lakhs. The provision for depreciation has been stepped up from Rs. 4 lakhs to Rs. 5.27 lakhs and that for taxation amounts to Rs. 21.97 lakhs, as against Rs. 24.33 lakhs in 1960-61. The tax provision includes Rs. 1.90 lakh additional liability for the previous year following the upward revision in the tax on corporate profits in the last budget.

After making these provisions, the net profit amounts to Rs. 22.51 lakhs, as against Rs. 30.12 lakhs a year before. The cost of bonus to staff in respect of past years is shown at Rs. 5.93 lakhs and to meet the bulk of it a sum of Rs. 2.89 lakhs has been obtained by adjustment of tax liability for past years and Rs. 2.25 lakhs have been withdrawn from contingencies reserve to which Rs. 2 lakhs had been credited in 1960-61 to meet any unforeseen liability. This tax adjustment and transfer from reserves, plus some Rs. 11,000 obtained by writing back other provisions, etc., have fetched Rs. 5.25 lakhs, as against *nil* in the previous year. After paying preference shareholders, the dividend on the 100-rupee ordinary shares has been maintained at 8.5 per cent per annum, subject to tax. On the other hand, the profit ploughed back to reserves amounts to only Rs. 7,500—this has been set apart for development rebate reserve (Rs. 13.500 a year before)—as against an aggregate of Rs. 7.14 lakhs a year before. The maintenance of dividend is, however, justified on the consideration that, for nearly a decade until 1959-60, shareholders had been denied any return on their investment and even in 1959-60 they had to console themselves with only a token distribution of 4 per cent per annum, taxable. The carry forward is Rs. 3.24 lakhs, as against Rs. 4.36 lakhs brought in.

The following comparative table brings out the progress made by the Company from 1958-59:

(In lakhs of rupees)

	For the year ended 31st August

* This represents excess provisions no longer required written back and other credit items.

Extracts from the Directors' report: The Mills continued to work in accordance with the working time agreement of the Indian Jute Mills Association and as the raw jute supply position improved, the working hours were increased and the percentage of looms which were required to be kept sealed was reduced on several occasions during the past eighteen months. From 24th December 1961, Members were permitted to work 48 hours per week with no looms sealed. By purchasing loom hours, the mills worked an average of 225 looms on double shift 96 hours per week during the year under review and at the time of writing 234 looms are so working.

Modernisation of machinery continues in the preparing and spinning sections of the Mill with a resultant improvement in productive efficiency.

In their last report for the year ended 31st July 1961, the Directors pointed out the difficulties caused by the shortage of raw jute which continued into the first few months of the year under review. However, with large crops during the 1961-62 and 1962-63 seasons, raw material is now freely available and the Indian Jute Mills Association is co-operating with Government to maintain prices and ensure an equitable return to the growers, by the continuance of their Quota System for Jute Purchases and the formation of a Jute Buffer Stock Association in January 1962, which commenced purchasing jute in April 1962.

Although the competition from the Pakistan Jute Industry is being increasingly felt, particularly in the traditional markets for heavy goods, the prospects for the immediate future appear reasonably good.

Accounts in brief as at 31st July 1962 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	25,00,000	Gross block	1,07,73,202

Low	15.69	14.37

Extracts from the Directors' report: The Mills continued to work in accordance with the working time agreement of the Indian Jute Mills Association.

By purchasing loom hours an average of 273 looms worked on double shift 96 hours per week during the year and at the time of writing 345 looms are so working.

Power cuts upset working arrangements in the Mills on several occasions and from 31st January 1962, Wednesday was declared the weekly "Closed" day under Government Orders to stagger the consumption of electrical power. Labour relations were satisfactory during the period.

Modernisation of the Mill Machinery continues with resultant improvement in productive capacity.

Large jute crops last year and during the current season have made the fibre freely available at economical prices but the pressure by Government on the Mills to purchase raw jute and maintain prices to the growers has resulted in severe strain on their financial resources and their jute storage capacity. However, the Jute Buffer Stock Association formed in January 1962, by the members of the Indian Jute Mills Association working in co-operation with Government has been largely successful ensuring an equitable return to the growers.

In the Directors' opinion the prospects for the foreseeable future are quite favourable although good quality fibre is in short supply.

Accounts in brief as at 31st July 1962 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	25,00,000	Gross block	1,17,82,516
Reserves and surplus	39,61,027	—Depreciation	82,59,067
Debentures	8,86,000		
Other liabilities	49,33,616	Net block	35,23,449
		Current assets	78,17,581
		Investments	7,26,624
		Cash	2,10,329
	Rs. 1,22,80,643		Rs. 1,22,80,643

* Paid-up capital consists of 10,000 seven per cent. cumulative preference shares of Rs. 100 each fully called up and 1,50,000 ordinary shares of Rs. 10 each fully called up.

Bhopal Sugar Industries Ltd.

[*Managing Agents*: Messrs. A. H. Bhiwandiwalla and Co. (Bombay) Private Ltd.]

Registered Office: Sehore (Madhya Pradesh).

Nineteenth Annual General Meeting—23rd February 1963.

Working Results:

	For the year ended 30th September (In thousand rupees)	
	1962	1961
Sale of sugar	82,22	84,92
Sale of molasses	32	38
Sale of bagasse	17	Nil
Closing stock of sugar and molasses	42,55	38,51
Sugar excise duty and purchase tax on cane	23,21	23,76
Gross profit	3,92	7,41
Transfer to Managing Agents' remuneration	59	59
,, ,, depreciation	2,71	2,48
,, ,, development rebate reserve	63	88
,, ,, provision for taxation	Nil	1,25
Net profit	8	2,90
Balance brought forward	2	93
Adjustments	1,25*	53†
Appropriations:		
Total available balance	1,35	3,76
To sugar cane purchase tax (1959-60)	Nil	15
To additional preference dividend for 1960	Nil	16
Transfer to unclaimed dividend reserve	‡	2
Proposed dividends (taxable) preference	79	79
,, ,, equity (ordinary)	53	2,62
	(2½%)	(15%)
Dividend per equity share	[Re. 0.30]	[Re. 1.50]
Carry forward	3	2
Market value of equity share (in rupees):	1962	1961
High	21.24	26.10
Low	20.00	24.36

* This includes Rs. 60,000 transferred from general reserve; Rs. 50,000 transferred from dividend equalisation reserve and other credit items.

† This includes Rs. 50 transferred from dividend equalisation reserve and other credit items.

‡ Only a small sum of Rs. 23.55.

Extracts from the Directors' report: *Recovery and Profits*: The factory started crushing on 3rd January 1962. At the start of the season, the Company had every hope of crushing a substantial quantity of cane as the cane supply was very satisfactory and the quality of cane was promising. Unfortunately, however, after a month or so a severe cold spell did considerable damage to both the Company's own and the cultivators crops. A number of fields were affected by frost and the cane was decayed; with the result that the out-turn dropped considerably e.g., the Company's farm cane dropped to 28,739.385 M. tonnes from 42,422.533 M. tonnes of the last season. In order to minimise the losses, the Company was forced to increase the intake of its own cane in the early period sacrificing cane from cultivators which could only be taken subsequently. By the time the Company was in a position to take cane from the cultivators, it was a little too late as the cultivators had already taken remedial measures to dispose off the crop. The total crushing, therefore, dropped from 95,659 M. tonnes to 84,516 M. tonnes producing 80,595 bags of sugar as against 87,347 the last season.

The cold spell not only affected the quantity of cane supplied to the Company but also led to a visible drop in the recovery. Although the factory started with a much higher recovery than the previous season, it was unable to get the highest recoveries because the crop was destroyed at the moment when it was ripe for crushing. The recovery only rose slightly and ultimately stood at 9.54 per cent as against 9.16 per cent of last year.

Although the production went down the expenses showed no corresponding decrease; on the contrary, they actually went up; and the erection of new machinery also increased the depreciation and interest charges compared to the previous year. These constitute main reasons for the fall in profits.

The Company has suffered a loss to an extent of Rs. 1,68,743 (Rs. 2.23.340) in respect of export quota of 10,171 bags allotted to it. This amount of loss is subject to final adjustment.

Expansion and Prospects: In accordance with the expansion programme, the Company has erected various machineries and almost major items have been completed now. Two *filter presses, 3 bodies of Evaporators, one boiler* etc. have been in the meantime installed. The investment in capital assets upto date was to an extent of Rs. 15,00,000 including the incidental costs.

Accounts in brief as at 30th September 1962 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital	30,00,000	Gross block	58,54,113
Reserves and surplus	10,54,375	—Depreciation	34,89,854
Other liabilities	59,68,204	Net block	23,64,259
		Block-in-progress	5,71,265
		Current assets	69,06,558
		Investments	54,930
		Cash	25,567
	Rs. 99,22,579		Rs. 99,22,579

NEW PUBLICATIONS

Investing in India—Taxation. Published by Indian Investment Centre, National Insurance Building, Parliament Street, New Delhi 1. Pages 182. Price Rs. 3.

This publication is the fourth in the series under the heading "Investing in India," prepared by the Indian Investment Centre, the object of which is to promote foreign private capital investment in this country. The first of the series, it will be recalled, dealt with the objects and functions of the Investment Centre, the second elucidated the Exchange Control Regulations and the third gave an outline of the facts of Indian economy. The present brochure—it is big enough to be called a book—on taxation in India is a fitting companion to the three earlier publications. Its release has been well-timed, in that it will prove to be a handy backgrounder particularly for the direct taxation proposals which Mr. Morarji Desai may announce at the end of this month.

Taxation, it may be noted, deals comprehensively with direct taxes on individuals and with corporate profits in India. It includes the main features of the Income-tax Act 1961 and of the Finance Act 1962. It is, therefore, of value to Indian and foreign businessmen interested in setting up joint ventures in India.

Other chapters of the publication deal with incentives to industries, double taxation relief, the wealth and gift taxes and estate duty. The incidence of these taxes is illustrated by examples. In addition to the direct taxes, the brochure provides with indirect taxation in India. The chapter, providing answers to questions relating to taxation in India, which are usually asked by prospective investors, is an interesting feature of the publication. Information of special interest to Indian and foreign investors is given in a number of indices.

"Swarajya" Annual Number 1963. Edited by Mr. Pothan Joseph. Published by Messrs. Bharathan Publications (Private) Ltd., Kilpauk, Madras 10. Pages 240. Price Rs. 5.

The latest annual number of *Swarajya*, an influential English weekly which supports Rajaji and the Swatantra Party, carries more than 40 contributed articles on a wide and impressive range of subjects—political, economic and philosophical. At least 15 of these articles are directly or indirectly related to Chinese aggression and its political and economic consequences. Another highlight of the *Annual* is the publication of the full text of three lectures, delivered by Rajaji at the University of Poona in November last, on Gandhiji's teachings and philosophy. A condensed version of Dr. C. P. Ramaswamy Iyer's report on his impressions of China which he visited in 1955 is to be found on page 49 under the title "Speaking to Dictation and Behaving to a Set Pattern." Also worthy of note is Mr. Sri Prakasa's article entitled "Our To-day and To-morrow," in which the author has turned the spotlight on some disquieting trends in India's body-politic and body-economic. Other distinguished contributors to the *Annual* are Dr. K. M. Munshi, Mr. M. R. Masani, Acharya J. B. Kripalani, Mr. K. Santhanam, Mr. G. L. Mehta, Mr. B. Shiva Rao, Dr. P. S. Lokanathan, Prof. B. R. Shenoy and Mr. H. V. R. Iengar. Their articles, along with those of several other writers, constitute a rich and varied fare.

Capital: Annual Review of Trade, Commerce and Industry. Edited by Mr. Dinesh Bahl, 5, Mission Row, Calcutta. Price Rs. 5. Pages 164.

The 1962 Annual Review of Trade, Commerce and Industry of *Capital*, our Calcutta contemporary, contains, as usual, a bunch of informative articles on a variety of economic subjects by well-known authorities in the respective fields. Prominent among the contributors are Mr. Wilfred Malenbaum who examines the dilemma of development, Mr. Neil McInnes, who writes on the Chinese economic disaster, and Mr. George Barrel, the erstwhile editor of the journal who emphasises the need for a new approach to development, combining aid with trade. Among other interesting contributions, mention may be made of those by Mr. H. M. Patel on power shortage, Dr. B. R. Shenoy on inflation, Dr. N. Das on workers' participation in management and Dr. S. Chandrasekhar on the dangers of the population explosion in China. The publication also contains critical reviews of developments in some of the main branches of Indian trade and industry as well as of banking, insurance and capital market. Attention has also been paid to India's closest neighbour, Pakistan, by including a short article on the trend of industrial and farm output in that country.

"The Eastern Economist" Annual Number 1963. Edited by J. G. Gadkari, United Commercial Ban Building, Parliament Street, New Delhi. Pages 250. Price Rs. 10.

The latest annual number of *The Eastern Economist* is devoted mainly to an examination of the economic and political implications of the national emergency. In a thought-provoking article, Mr. N. Raghavan Pillai, I.C.S. (Retd.), a former Secretary-General, Union Ministry of External Affairs, analyses the genesis and aims of Chinese invasion. In order to drive back the Chinese from Indian territory, Mr. Pillai advocates ungrudging acceptance of military aid from friendly countries. He is emphatic that it should be possible to devise suitable terms of military aid without infringing the principle of non-alignment. The Annual also includes Mr. H. V. R. Iengar's second lecture on "The financial implications of the present crisis," delivered recently under the auspices of the Commerce Graduates' Association of Bombay. In the section on "Emergency and economic growth," a comparative account of agricultural and industrial development in India and China is to be found. A blue-print supplement to the Number gives a review of the trends in production, prices and exports, as also banking and transport, in 1962.

NEWS IN BRIEF

THE Bank of Tokyo will open a branch at New Delhi in March next. The Bank has at present only two branches in India, at Bombay and Calcutta.

The Fertiliser Corporation is expected to set up at Katni in Madhya Pradesh a factory to produce, by gasification of slack coal, 100,000 tons per annum of nitrogen in the form of Urea.

The Soviet Union has agreed to import about 4,000 tons of fresh bananas worth Rs. 28 lakhs from India on a trial basis. Exports will be made through co-operatives of growers.

The techno-economic Survey report on the Bokaro Steel project by the U.S. team of experts is expected to be submitted to the Union Government in March next. A final decision regarding U.S. aid for the project is likely to be taken on the basis of the report.

A techno-economic survey covering non-ferrous metals and alloys used in utensil industry is expected to be undertaken soon by the Union Government in co-operation with the United Nations Bureau of Technical Assistance Operations.

The National Coal Development Corporation has completed all preparatory steps for setting up new coal washeries at Kathara, Gidi and Sawang and for expanding the existing washery at Kargali, according to the annual report of the Corporation presented to Parliament last week.

The Hindustan Shipyard has pleaded for the downward revision of its target from 50,000-60,000 d.wt. to 35,000-40,000 d.wt. and extension of time to attain even this reduced target to the end of the third Plan period. The estimates committee of Lok Sabha has expressed its regret over the shipyard's plea.

The 100,000-tonnes capacity pig iron plant, being set up at Udaipur in Rajasthan, is expected to go into production by the end of 1965. The plant is being installed by Messrs. Kamani Industrial Corporation Ltd. of Bombay in collaboration with a foreign firm which will provide the technical assistance as well as plant and equipment for the factory.

Owing to labour unrest and delay in the introduction of labour incentives based on norms of production the Heavy Electricals factory at Bhopal was able to achieve only half the production target fixed for the year 1961-62. The factory has a capacity to produce Rs. 25 crores worth of equipment, including hydraulic turbines, traction equipment and industrial motors. It has also plans to manufacture steam turbines.

The Life Insurance Corporation has ratified its five-year settlement with the All-India Insurance Employees Association signed in Bombay on 23rd January 1963. The main features of the settlement, which take effect from 1st January 1962 are uniformity of pay scales, house rent allowance, etc., for all its employees throughout the country, an automatic link-up of dearness allowance, with cost of living index, and a guaranteed annual cash bonus of 1½ months' basis salary.

The Government of India has decided to grant import entitlements under the Cotton Textiles Export Incentive Scheme to all registered exporters against exports of hard-dyes cloth effected on and from 1st January. Licences for import will be granted by the Joint Chief Controller of Imports and Exports, Bombay, only once in a quarter, on the basis of the export effected in the preceeding quarter on certification by the Textile Commissioner.

Although there has been some diversion of the automobile manufacturing capacity in the country to defence production there has been no revision in the third Plan target of 100,000 vehicles. The third Plan target consists of 30,000 commercial vehicles, 10,000 jeeps and 30,000 passenger cars. To the extent capacity had been diverted to the production of trucks, car production has been curtailed. Therefore, there is bound to be some shortage of cars. The entire production of Mercedes vehicles has been diverted for defence needs.

The second 50-MW unit of the Neyveli thermal power station was commissioned on 23rd January. This unit has actually been put into operation ahead of schedule. The first unit of the station, it will be recalled, was formally commissioned by the President. Dr Radhakrishnan, on 5th August last. The Neyveli power station has generated 167 million units up to 20th January. The performance of the first unit has proved beyond doubt, that lignite can be used as a boiler fuel successfully. The second unit is also using lignite as fuel.

The Central Government has decided to appoint an Export Promotion Panel for woollen goods with headquarters at Bombay. The panel will, *inter alia*, act as a media between the Government, Development Council for woollen industry and exporters, make recommendations regarding the best means and methods of expanding exports of woollen goods to both traditional and non-traditional areas, and advise the Government on the nature and type of export promotion in centres and the working of the Export Promotion Scheme. It will also seek to redress complaints from overseas buyers.

The State-owned Hindusthan Machine Tools at Bangalore has taken yet another step towards diversifying and modernising its production lines by signing a 7-year technical collaboration agreement with a U.K. firm, Messrs. Drummond Bros., of Surrey. The seventh such pact to be signed in three years, the agreement will enable H.M.T. to take up for the first time in India the manufacture of gear-shaping machines. The machines will be produced at the Company's factory in Pinjore, near Chandigarh, and India's full needs are expected to be met. The new agreement will also enable H.M.T. to utilise to the full the rapidly expanding capacities of its existing two machine tool factories in Bangalore. The Company also has under construction two other factories, one each in Punjab and Kerala.

The Union Government has decided to have the working of the Information Department at the Centre and in the States "examined" by a team of foreign experts. Government publicity in this country has been the subject of much criticism and the attacks on it have increased since the Chinese aggression. The five-member team led by Dr. Wilbur Schramm of the U.S.A., the experts will tract official publicity down to the village level before submitting a report to the Union Ministry of Information and Broadcasting on how best to make "the flow of information get into the economic development process" of the country. The desirability of starting one or more mass communication training and research centres will also be examined by them. Their visit has been sponsored by the Ford Foundation in consultation with the Indian Government.

The last date for the payment of premium in respect of the first quarter's insurances to commence from 1st January 1963 is 30th January 1963 according to a press release from the Government Agents for Emergency Risks Insurance Schemes. The Emergency Insurance Acts lay down that the premium is payable within 30 days in respect of compulsory insurances. Any delay in payment of the premium will attract heavy penalties as provided under the Acts. While inviting the attention of those who are required to take out compulsory insurance, the press note states that goods in excess of Rs. 30,000 in any one presidency town or district as also all Factories, Mines, Oil Mines, Gas and Electric Supply Undertakings, Standing Tea Crops and Inland Vessels are liable for compulsory insurances under the Acts.

The entire existing capacity of the Bhadravati Steel Mill will be utilised for producing alloy and special steel, according to Mr. C. Subramaniam, Union Minister for Steel and Heavy Industries. The total capacity so far licensed, including the existing units, for various types of alloy and special steel was 488,600 tonnes. Twenty licences were given since 1959, including 15 licences issued after March 1961. None of the units had gone into production. Of the 20 licences, three were under erection, five had been approved for the import of plant, three were under consideration for the import of plant, two had been revoked, while the revocation of one was being considered. The alloy and special steel plant being set up at Durgapur in a few months is behind schedule, but in view of the emergency it is now being handled on a "crash" basis, and production is expected to start at about the scheduled time, namely, the last year of the third Plan. The immediate programme is to put through the Bhadravati steel project. In addition, the Durgapur project is also being hastened. It will be recalled that, the Tatas were issued a licence in 1959 for a special steel project, but they had not been successful in implementing it. The question of their being given an extension of time is being considered, but in view of the Government's decision about Bhadravati, it may not be necessary to allow the Tata project to go through.

* * * *

From Abroad

An agreement to set up common customs stations along the Nigeria-Niger border in East Africa has been entered into between the Governments of two countries.

Japan and Burma have signed a memorandum providing for increased Japanese reparations payments and loans, together with interest, amounting to $200 million.

The average number of persons unemployed in West Germany during 1962 was lower at 142,000, as compared with 161,000 in 1961, while the number of vacant positions remained unchanged at 549,000.

The output of man-made fibres in the U.K. in the year 1962 reached 627.14 million lbs. as against 567.63 million lbs. in 1961 and 591.99 million lbs. in 1960. Of the total, staple fibre and filament yarn accounted for 53.6 per cent and 46.4 per cent, respectively.

The West German merchant fleet consisted of 1,146 sea-going ships aggregating 4.82 million gross register tons early this year. This means a decline in the number of ships by 10 but a rise in the tonnage by about 156,000 g.r.t. as compared with the position a year before. The average age of the ships remained unchanged at nine years.

The foreign trade surplus of West Germany during 1962 was substantially lower at DM 3,500 million, as against DM 6,600 million in 1961, a decline of as much as 50 per cent. This was because imports rose appreciably by 11.6 per cent to DM 49,500 million, while exports increased by only 3.9 per cent to DM 53,000 million.

Car production in the U.K. during the year 1962 fell short of the 1.25 million mark by just 574 units. Exports of cars were of the order of 545,000. Stimulated by hopes of further improvement in both exports and domestic demand, the manufacturers predict a record output of over 1.35 million in the current year.

PERSONAL

MR. S. K. Jain has been appointed Director of the International Labour Organisation's regional field office which covers countries from Pakistan to Japan.

Mr. Eugene R. Black, who recently retired as the President of the World Bank, has been elected a Director of the American Express Inc. and Special Adviser on the Company's international banking and financial operations.

Mr. Babubhai Chinai, M.P., has been unanimously re-elected the representative of the Federation of Indian Chambers of Commerce and Industry on the National Shipping Board for a third successive term of two years with effect from 1st May 1963.

Mr. George Cyriax, economic correspondent of the *Financial Times*, London has arrived in New Delhi on a three-week lecture tour of India. He will visit Calcutta, Madras and Bombay and will meet leading economic and financial journalists and student groups.

Mr. John E. Slater of Coverdale and Mr. Colpits of New York, arrived in New Delhi last week to undertake a study of the coal transportation problem in this country. The World Bank and the Union Government are jointly financing the study, which is expected to last about a year.

Production of motor cars in West Germany in 1962 touched the all-time peak of 2.36 million, as against 2.15 million in 1961. Of the total output, passenger cars alone accounted for 2.11 million, the share of lorries and buses being 247,446. Exports also recorded a rise; the number of vehicles actually shipped was 1.10 million, as against 1.01 million.

The U.K. Government's contribution during the current year to step up the production of the Anglo-French Concord Supersonic airliner will be between £4 and 5 million, according to Mr. Neil Marten, Parliamentary Secretary to the Ministry of Aviation. Since Britain and France are sharing the production costs of concord, the total actual spending on the aircraft is likely to be around £8 to 10 million.

The Studebaker Corporation of the U.S. has acquired the majority interest in Domowatt, S.p.a., the Italian firm manufacturing refrigerators and washing machines. The price paid is not disclosed. The Domowatt will henceforth work under the direction of Studebaker's Franklin Division, one of America's largest producers of "private brand" refrigerators, washers and home freezers. The corporation, it will be recalled, acquired the Franklin Division in November last.

Britain and the Common Market other than France have reached broad agreement on the functions of the Iron and Steel Board and on British steel tariffs. The agreement lays down the principles under which British steel tariffs will have to be harmonised with those of Europe, in consultation with the High Authority of the European Coal and Steel Community. It also outlines the functions of the Iron and Steel Board. One of the anticipated modifications in the steel tariff pertains to the replacement of specific duties by *ad volorem* assessments. Certain alterations have also been made in nomenclature.

The aggregate exports of electrical and allied products from the U.K. during the calendar year 1962 touched a record of £333 million, representing a rise of 4.4 per cent over 1961, according to the British Electrical and Allied Manufacturers' Association. The largest increases in exports were in electronics, radio and telecommunications. The shares of both the Commonwealth and Continental Europe were larger. The proportionate distribution of exports, however, was unchanged at 50 per cent to Commonwealth countries and South Africa and at 31 per cent to Europe.

Under the West German coal industry's rationalisation programme since 1957, 24 coal mines with an annual production of 10.2 million tons and 101 small pits with a production of 600,000 tons a year have been closed. The closing of mines with an annual output of 4.6 million tons is being prepared. The share of fully-mechanised production in the industry's total output rose from 15.3 per cent in 1957 to 59.1 per cent in the autumn of last year. As a result of the rationalisation the coal industry has been able to keep its prices virtually stable since 1958.

The members of the National Economic Development Council in the U.K. have agreed that their "tentative target" of a 4 per cent growth rate for the national economy between 1961 and 1966 is a realistic one and should be regarded as a firm objective. This statement, it is stated, implies the Government's acceptance of the need "to forge ahead must faster in future years." Incidentally, the target of 4 per cent is higher than the growth actually achieved over the last year or so. Agreement is, however, yet to be reached on the policies that will be needed to translate theory into practice. There are also said to be certain difficulties, especially those lying in the way of stepping up exports substantially. All these problems are expected to be discussed by the Council at its forthcoming meetings on the 6th and 18th inst. The council is expected to come out later with a full report on the growth of the economy over the five-year period.

COMMERCE AND INDUSTRY

(*Concluded from page 200*)

remove certain lacunæ in the existing Act on the basis of the experience gained in its administration. While the functions of the Corporation remain the same under the new Act, it will be able to store other commodities which it was not competent to do under the previous statute. The commodities over which the Corporation will have jurisdiction will now be those declared by the Central Government in a notification in the official *Gazette* as 'notified commodities.' Those will, however, include only such commodities over which Parliament has power to make law by virtue of Entry 33 in the Concurrent List of Schedule VII of the Constitution. Thus the Corporations will be able to serve the cause of national economy in a larger field than at present. The Corporation will also have to maintain a Warehousing Fund out of the moneys and securities belonging to the National Warehousing Development Fund and grants and loans made by the Central Government. The income earned from the investments of these accounts will be credited to the Fund itself which will be utilised for subscribing to the share capital of the State Warehousing Corporations and for promoting warehousing and storage of agricultural commodities."

In view of the plans for expanding the services of the Corporations thus, there is need for devoting some thought to the question of providing adequate number of trained personnel for executing the work. The Central Corporation has, therefore, done well in arranging some training courses for warehousemen and technical assistants. Two such courses were arranged by it in 1961-62. These were the sixth and seventh courses to be organised by the Corporation.

TEXTILES

(*Concluded from page 188*)

on new assets acquired after 1947. Thus the industry has been consistently denied a share in the profits for the purpose of rehabilitation and modernisation of plant and machinery.

The Industrial Court conceded only Rs. 45 crores for rehabilitation. Even this amount, the Court laid down, should be made available to the industry as a share in profits over a prescribed period. Neither in the case of plant and machinery nor in that of buildings, any account was taken of additions to assets subsequent to the year 1946-47 or of increases in prices. The inequity suffered by the industry in regard to rehabilitation allowance continued under the bonus pact of 1953-57 and 1958. For the pact provided for payment of bonus out of the surplus left after the deduction of only five prior charges, namely, statutory depreciation and development rebate, taxes, reserves for rehabilitation, replacement and modernisation of block as calculated by the Industrial Court (basic year 1947), a return on paid-up capital, and a return on reserves employed as working capital. For the three years 1959, 1960 and 1961, the mediator awarded a staggering bonus of Rs. 10.75 crores, while the available surplus itself was only Rs. 10.30 crores as is evidenced by the following calculations according to the Labour Appellate Tribunal award:

(In crores of rupees)

	1961	1960	1959
Gross profit	23.34	19.07	10.25
Depreciation	5.23	4.47	3.72
Balance	18.11	14.60	6.53
Tax at 45% for 1959 and 1960 and at 50% for 1961	9.06	6.57	2.94
Balance	9.05	8.03	3.59
Return at 8.57% on paid-up capital ..	2.41	2.26	2.23
Balance	6.65	5.77	1.36
Return at 4% on reserves employed as working capital	1.40	1.20	0.88
Balance	5.25	4.57	0.48

The Bombay cotton mill industry Rehabilitation Commission, in its report submitted in 1959, estimated the rehabilitation, replacement and modernisation cost at Rs. 105.91 crores (Rs. 66.57 crores for plant and machinery and Rs. 39.34 crores for buildings). This estimate, however, covered only the machinery and plant installed prior to 1st January 1947 and which continued to be in existence on 1st January 1956. The Millowners' Association has adjusted this estimate so as to bring it in conformity with current prices. The adjusted estimate is Rs. 164.16 crores. The additions to the block since 1947 have been of the order of Rs. 66.58 crores. Between 1948 and today, the price increases range from 108 per cent to 17 per cent, giving an average increase of about 60 per cent. On the basis of this increase, the rehabilitation requirement of the industry in respect of the additions to the block in 1947 and subsequent years would work out to about Rs. 106.53 crores (i.e. Rs. 66.58 crores which is the value of the additions to the block plus 60 per cent thereof as representing increase in prices). The total rehabilitation requirement of the industry in Bombay would thus be Rs. 270.69 crores. This estimate more or less agrees with the findings of the N.I.D.C. Working Group. The estimates of the Working Group were based on 1958-59 prices which have since gone up by more than 30 per cent. The estimate of Rs. 800 crores of the Working Group for complete rehabilitation and modernisation of the industry, therefore, requires to be stepped up to Rs. 1,050 crores. The Bombay cotton mill industry is about 27 per cent of the cotton mill industry of India and hence the rehabilitation requirement of the Bombay cotton mill industry is about Rs. 280 crores on the basis of the report of the Working Group.

The plea for a share in the profits of cotton mills for the purpose of rehabilitating their plants and machinery, which has been consistently denied by Industrial Courts and Tribunals, is quite justified. It is justified especially in respect of the Bombay mills which contribute as much as 47 per cent of the country's exports of cloth. The details are given below:

(In million yards)

	Jan.-July 1962	1961	1960	1959
All-India delivery of cloth for export ..	308.34	636.42	749.28	800.02
Share of Bombay mills ..	143.76	292.71	333.56	387.10
Percentage share ..	46.6	46.0	45.0	48.5
Loom—State production of Bombay mills ..	843.80	1,499.42	1,472.70	1,470.25
Delivery for export as % of loom—State production ..	17.0	19.5	22.6	26.3

The above figures not only underline the pivotal role of the Bombay cotton mill industry in earning valuable foreign exchange but also serve to caution against falling exports due to the non-competitive nature of the Indian industry in world markets, notwithstanding the Export Incentive Scheme which has been in operation since July 1958. The key to export promotion, it is needless to say, is price-*cum*-quality and this is possible of attainment only if there is a systematic scheme of rehabilitation and modernisation through adequate retention of profit. It is to be hoped that the Bonus Commission will bear this important point in mind when examining the question of bonus with particular reference to the Bombay cotton mills.

COMPANY AFFAIRS

(*Concluded from page 203*)

has closed the year ended 31st August 1962 with a loss of Rs. 1.13 lakh which is much less than Rs. 5.07 lakhs a year before. Higher costs for almost the same level of production as in the previous year and a recession in the market price of umbrella frames have caused for Ralli-Hoyland Ltd. only a small profit of Rs. 39,118 for the year ended 31st August 1962, which, however, contrasts favourably with a loss of Rs. 1.41 lakh in the previous year. The Company has carried forward a debit balance of Rs. 5.84 lakhs. From 1st May 1962, Teddington Chemical Factory Ltd. was merged with the parent Company which has since taken over manufacture of pharmaceutical products and has shown costs for the same in its books. The merger is expected to raise the Company's profitability. Hemlatha Textiles Ltd. has earned for the year ended 30th June 1962 a higher profit of Rs. 5.87 lakhs as compared with Rs. 4.42 lakhs a year before and maintained the dividend at 8 per cent per annum, taxable. The current year's prospects are, however, rated as less favourable in view of the disparity in the price of raw cotton and the ceiling price for yarn. The Company has been licensed additional 6,000 spindles and work on these is in progress. The profit of the wholly-owned W.T. Suren and Company Ltd. for the year ended 30th April 1962 has recovered from Rs. 16,683 to Rs. 55,522. This Company has raised the dividend to 11 per cent per annum, taxable, from 5 per cent to which level it had been reduced last year from 13 per cent for 1959-60. Internal transport difficulties delayed the construction of the factory of Ralli Chemicals Ltd. till the close of the year on 31st August 1962. Commercial production has commenced from September 1962. Boehringer-Knoll, an associated company, has completed factory construction and entered initial stage of production of chloramphenicol.

If one may ignore the poor backing for paid-up capital of Rs. 300 lakhs, including Rs. 75 lakhs in preference shares of Rs. 100 each, in reserves and surplus aggregating only Rs. 17.48 lakhs, which is understandable in view of the serious reverses in the past, the financial position of Rallis India is quite sound. Bank borrowings, which have risen pretty sharply from Rs. 123.95 lakhs to Rs. 238.30 lakhs, and current liabilities make for a total indebtedness to outsiders of Rs. 478.44 lakhs, as against Rs. 274.64 lakhs a year before. This heavy indebtedness is, however, fully taken care of by current assets and loans and advances aggregating Rs. 565.02 lakhs and investments amounting to Rs. 22.13 lakhs, excluding aggregate holdings in subsidiaries of the book value of Rs. 73.73 lakhs, as against Rs. 97.57 lakhs a year before. Net amount owing by subsidiaries has gone up from Rs. 12.31 lakhs to Rs. 43.26 lakhs. The gross block, which expanded during the year from Rs. 71.08 lakhs to Rs. 155.03 lakhs (the sharp increase has been owing to the take-over of a subsidiary as mentioned earlier), has been written down to Rs. 85.47 lakhs and, together with buildings under construction of Rs. 1.31 lakh, is shown at Rs. 86.78 lakhs.

The Rs. 100 fully paid ordinary shares of the Company are currently quoted at Rs. 150 *cum-div.* and offer, on the *ex-div.* basis, a net yield of 4.1 per cent per annum.

The value of import entitlement to be granted to registered exporters of hand-dyed cloth under the Cotton Textiles Export Incentive Scheme will be 15 per cent of the f.o.b. value of exports of hand-dyed cloth. The entitlement will be calculated on exports effected on or from 1st January 1963 and the Scheme will be in operation as an experimental measure for a period of one year upto the end of 1963. The entitlement will be granted for the import of specified types of coal tar dyes, textile chemicals and gum. The licensing authority will be the Joint Chief Controller of Imports and Exports, Bombay.

Notice

BURN AND COMPANY LIMITED

NOTICE

NOTICE IS HEREBY GIVEN THAT AN Extraordinary General Meeting of the Company will be held on Thursday the 28th February, 1963, at 11-20 a.m. at the registered office of the Company at 12, Mission Row, Calcutta, to consider and if thought fit to pass the following resolution as a special resolution:

RESOLVED that this General Meeting having taken under consideration the contracts now exhibited to the meeting and whose material terms are set forth below for the sale, purchase or supply of any property, movable or immovable, or for the supply or rendering of any service, other than that of a managing agent, between the Company and its managing agents, Martin Burn Limited, and their associates, such as (1) The Indian Standard Wagon Co. Ltd., (2) The Hooghly Docking and Engineering Co. Ltd., (3) Saugor Electricity Supply Co. Ltd., (4) Upper Jumna Valley Electricity Supply Co. Ltd., (5) Robert Hudson (India) Ltd., do approve of all these contracts.

PROVIDED that so far as the said contracts relate to the supply or rendering of any service other than that of a managing agent, this resolution shall be subject for its effectiveness to the approval of such contracts by the Central Government.

MATERIAL TERMS

GOODS AND SERVICES:—All such as may be dealt in or rendered or required by the seller or buyer for the time being and from time to time.

PRICE:—Such as shall be ruling with the seller or supplier at the date of requirement or such as shall be currently in force and be otherwise reasonable.

DELIVERY:—According to Buyers' requirements specified in relevant Advice Notes.

PAYMENT:—As specified in acceptance. Provided that for any property supplied or sold, or any services supplied or rendered, payment shall be made by the Buyer within one month from the date of such supply, sale or rendering as the case may be.

A member entitled to attend and vote at the Meeting is entitled to appoint a proxy to attend and vote instead of himself and a proxy need not be a member.

By Order of the Board,

MARTIN BURN LIMITED,
F. G. LIVERSEDGE,
Managing Director.
Managing Agents.

Registered Office:
12, MISSION ROW,
CALCUTTA-1.
Dated. 29th January, 1963.

Note: An Explanatory Statement is annexed to the convening notice issued to members of the Company.

TREND OF MARKETS

MONEY TIGHT

(*From Our Own Correspondent*)

BOMBAY, *29th January*

The short-term money market continued to be short of floating funds, with borrowers over. Consequently, the inter-bank rate, after being well maintained at the high level of 5 per cent till Monday, spurted to 5¼ per cent on Tuesday and stayed at that level today also. Calcutta also reported good demand for money, the call rate advancing by a further ¼ per cent to 5 per cent.

At last, the Committee administering the Inter-Bank Agreement has decided to maintain the minimum lending rate at 2 per cent above the Bank rate. The suggestion to modify the Agreement so as to fix the minimum at 1½ per cent above the Bank rate was opposed by the majority of member-banks. The decision implies the enhancement of the effective minimum lending rate by ½ per cent to 6½ per cent.

This week was notable for the issue, by the Reserve Bank of India, of two directives to banks. One of them pertains to the liberalisation of credit facilities to exporters of H.P.S. groundnuts and the other governs advances against paddy and rice. The salient features of the directives are as follows:

Groundnuts (H.P.S.): The revised additional limits allowed to banks on account of credit extended to exporters for the two-month period January-March 1963 are fixed at 200 per cent of the additional limits permitted to banks in the corresponding period of 1962. Under the provision hitherto in force, it will be recalled, every scheduled bank was permitted to maintain, in respect of any person or party who had a registered contract (for export) with the Export Trade Control authorities, an additional level of credit against the security of groundnuts to the extent of two-thirds of the value of the unutilised portion of the quota so registered. This provision has now been modified, in view of the discontinuance of the aforesaid export sale registration. The banks have also been asked to meet any further credit requirements of exporters on a priority basis within their general permissible limits of lending against groundnuts.

Paddy and Rice: The directive to scheduled banks governing advances against paddy and rice has been revised with a view mainly to bringing advances made against the pledge of warehouse receipts issued by the warehouses established by the Central and State Warehousing Corporations to parties other than co-operative marketing and processing societies covering stocks of paddy and rice under the scope of credit control. It was observed that a large part of the rise in advances against paddy and rice during 1962 was accounted for by the rise in advances against warehouse receipts, which have been completely exempted so far from the purview of credit control. The ceiling limits for each two-month period commencing from January-February 1963 in respect of advances against paddy and rice, including advances against warehouse receipts but excluding exempted categories, have been fixed at levels equivalent to the average aggregate levels of such credit maintained in the corresponding period of 1962.

There was no change again in the amount invited offered and accepted against tenders for the 91-day Government of India Treasury Bills sold on Tuesday the 29th inst., namely, Rs. 2 crores. The average rate of accepted tenders was also unaltered at Rs. 2.355 per cent per annum. The response to Intermediate Treasury Bills, which were on tap from the 23rd to 25th inst., was less encouraging than in the previous week, the bills actually sold amounting to Rs. 19.25 lakhs, as against Rs. 35 lakhs.

The foreign assets of India declined by another Rs. 16 lakhs to Rs. 95.46 lakhs during the week ended 25th January 1963, due entirely to the reduction in the balances held abroad from Rs. 7.54 crores to Rs. 7.38 crores. Foreign securities held in the Issue Department were unchanged at Rs. 88.08 crores. Loans and advances to scheduled banks receded by Rs. 3.63 crores to Rs. 23.57 crores, of which those against usance bills alone accounted for Rs. 15.44 crores. There was a drop of Rs. 19.32 crores to Rs. 2,164.85 crores in notes in circulation.

The aggregate credit made available by scheduled banks expanded further by Rs. 9.21 crores to Rs. 1,462.88 crores during the week ended 18th January 1963. The expansion was accompanied by a marked rise of Rs. 23.49 crores to Rs. 2,178.07 crores in deposits. Investments, too, increased by Rs. 6.69 crores to Rs. 642.20 crores. Inter-bank borrowings, however, declined by Rs. 5.58 crores to Rs. 40.19 crores.

An important development of the week in so far as the Gilt-edged market is concerned was the modification in the open market operations of the Reserve Bank announced on Monday, 28th January. The Reserve Bank has started to buy for cash the two loans which are due to mature next year, namely, 3½ per cent 1964 and 3 per cent 1964; hitherto, the Bank was buying these loans only in switches against sales of loans maturing in 1969 and later. Simultaneously, the Bank has reduced the purchase price of 3½ per cent loan by 30 nP to Rs. 99.05 but has left unchanged that of 3 per cent loan at Rs. 98.90. The purchase price of three other loans has also been cut: 3 per cent 1966-68 by 15 nP to Rs. 96, 3½ per cent 1965 by 25 nP to Rs. 99 and 3½ per cent 1966 by 30 nP to Rs. 98.95. Further, the Bank has resumed the outright sale of 3½ per cent 1974 and 4½ per cent 1985, which was suspended early in January for payment of half-yearly interest. These modifications have not had any significant effect on the Gilt-edged market which continues to rule dull with restricted turnover. This is only as it should be, for these changes do not imply any departure by the Bank in its policy of interest rates. The outright buying continues to be confined only to the very near maturities, while the purchase of other maturities will only be against switch. The object in buying near maturities is to facilitate their repayment when they fall due.

The rupee in the foreign exchange market eased further *vis-a-vis* the dollar, the banks' selling rate for ready T.T. dollars being Rs. 477.50 per 100 dollars as against Rs. 477.25 a week before and Rs. 477 two weeks before. Their buying rate (T.T.) was Rs. 474, as against Rs. 473.75. On the New York Exchange, the £ sterling softened again in terms of the dollar, the spot rate declining from 280.450-280.490 cents to 280.250-280.380 cents and the rate for three months' forward from 280.080-280.120 cents to 279.890-279.920 cents.

* * * *

The total contributions brought into the Central account of the National Defence Fund at New Delhi upto the close of business on 25th January 1963 amounted to Rs. 35.73 crores. In addition, gold and gold ornaments weighing 1,269.136 grammes, approximately equal to 108,845 tolas, have been advised.

SILVER FIRM AGAIN

(*From Our Own Correspondent*)

BOMBAY, *30th January*

Last week's softness in silver proved to be a short-lived affair, as, despite heavy arrivals of about 70 bars a day, prices improved again this week on upcountry support. Gold, on the other hand, eased further at first, but rallied to close a shade lower than last week's level.

Arrivals in silver continued to be far in excess of offtake which averaged daily at 10 bars. Notwithstanding this, spot silver, after opening 50 nP higher at Rs. 221.50 on Thursday the 24th inst., improved by three points the very next day and further by a similar amount to Rs. 227.50 on Monday the 28th inst. at which level it was held yesterday. Today, the price dropped by a point to Rs. 226.50. Even so, it was Rs. 5.50 higher over the week. This renewed strength in the metal was attributed to upcountry support which seemed to be more in the nature of speculation. Such support seemed to have been induced by firm overseas advices, restrictions on purchase of gold and prospects of silver finding use in the manufacture of 14 carat gold jewellery.

As against last week's price of Rs. 100-102, gold was mentioned at the start around Rs. 95. By Monday, the price had moved down to Rs. 90-92. But on the next day, it rallied to Rs. 98 and was steady around that level today. While the early easiness was caused by the waning demand for gold ornaments, the subsequent recovery was the result of buying reportedly for depositing gold against gold bonds. The jewellers' quotation for 10 grammes of gold in ornaments remained unchanged at Rs. 105, notwithstanding the fact that the urge for buying gold ornaments had subsided. No quotation was available for sovereign.

Demand for gold bonds showed considerable improvement this week, and to cope with the rush for subscription forms, the Reserve Bank opened another issuing counter, bringing the number of counters to two. The rush for the bonds was possibly the result of reports on Friday the 25th inst. that the exemption of not declaring the origin of gold holdings was to be made applicable only to subscribers of the bonds. These reports, it was construed, concealed a threat to the security of gold holdings at a later date. Subscriptions to the bonds were also influenced by the absence of any official move to extend the closing date of the bonds beyond 11th February 1963.

According to Mr. B. R. Bhagat, Deputy Minister of Finance, gold weighing 2,037,000 grammes valued at about Rs. 109 lakhs has been subscribed in gold bonds up to 18th January 1963. This information was given by the Minister to the Rajya Sabha on 23rd January 1963. The Minister also said that no official estimates of private stocks of gold holdings in India were available.

Silver prices in New York and London were maintained at the last week's highest levels, namely, 125.6 cents and 107½*d.* respectively. Activity was good, but buyers were reported to have met their requirements. Forward silver, in London, however, closed a shade lower at 107½*d.*, as compared with 108*d.* a week ago. Ready gold was a penny higher at 250*s.* 1*d.* and the dollar price of gold edged forward from 35.06¼ to 35.06⅞.

The following table shows the trend of prices during the week under review:

	30-1-63 (closing)	High	Low	23-1-63 (closing)
	Rs.	Rs.	Rs.	Rs.
SILVER				
Ready (.996 fine) ..	226.50	227.50	221.50	221.00
London—				
Gold	250*s.*1*d.*	250*s.*4*d.*	249*s.*11½*d.*	250*s.*
Silver Ready	107½*d.*	—	—	107½*d.*
Silver Forward ..	107½*d.*	108*d.*	107½*d.*	108*d.*
New York—				
Silver	125.6 cents	—	—	125.6 cents

N.B.—The quotation for gold is per 10 grams (about 0.85 tola) and that for silver is per kilogram (85.7 tolas). London and New York quotations are per ounce.

Any major changes in the gold control scheme were ruled out by Mr. Morarji Desai, Union Finance Minister, in a statement to the Lok Sabha on Thursday 24th January on the ground that the Government had reasons to think that the scheme had succeeded in halting smuggling of gold into the country. Besides, he added, the price of gold within India as also in areas from where the metal was usually smuggled had fallen and the rupee had appreciated in the free market. He disclosed, however, that minor technical problems in enforcing the Gold Control Rules would be examined by a panel of technical advisers which was likely to be appointed soon to help the Gold Board. He also informed the House that the Gold Board was considering a scheme for the manufacture of liquid gold for relatively less essential purposes such as *jari* making. He had issued instructions for the supply of gold to essential users such as ayurvedic and unani physicians and makers of surgical instruments.

Mr. Desai defended the Government's decision to restrict the purity of gold ornaments to 14 carats as 'sound' and averred that no change would be made in it, despite widespread demand from the trade as well as the people. According to him, there was neither religious nor sacramental rite for which pure gold was necessary, and ornaments of a higher purity than 14 carats were "wasteful, ostentatious and out of date." He conceded that goldsmiths and artisans would have to readjust themselves to the new situation, but called it as unavoidable, when established traditions were sought to be changed through "a major social revolution."

Speaking at a meeting of the representatives of the Indian Merchants' Chamber in Bombay on Monday, the 28th inst., Mr. G. B. Kotak, Chairman of the Gold Control Board, stated that over 80 per cent of gold dealers had declared their stocks of non-ornament gold. Replying to the I.M.C. President, Mr. P. V. Gandhi's plea for relaxing the time limit for declaring the stocks, Mr. Kotak said that the 30-day limit was fair and any relaxation in it would defeat the objectives of the Gold Control Rules. Two new points were made by the Gold Board Chairman, namely, (1) the Rules did not seek to impose any new restrictions on the export of gold ornaments and on the use of superior quality gold for the manufacture of the same and (ii) the Board was considering steps to facilitate supply of gold for industrial uses. Dr. N. A. Sarma, member-secretary of the Board, who also spoke on the occasion, said that individual declarations about the purity and weight of gold in images of deities and idols made in good faith would be accepted by the Board.

* * * *

Presiding over the first meeting of the Board of the Kolar Gold Fields Mining Undertaking at Bangalore on Sunday the 27th inst., Mr. Morarji Desai touched on the problem of high costs of producing gold in India at Rs. 367 per ounce, as against the international price of Rs. 167 per ounce. More production and all-round economy could bring down the costs, he said. According to him, the Mysore mine was not expected to last for more than five to seven years. However, there was a possibility of finding new veins in the mine, and, he said, that it should be investigated within six months so that the prospects for the mine could be known. The Undertaking consists of the Mysore mine, the Nandydroog mine and the Champion reef mine. While the Mysore mine has been languishing, the Nandydroog mine has shown great promise. During 1961-62, the mines produced 136,498 ounces of gold which fetched Rs. 5.15 crores.

Mr. B. R. Bhagat, Deputy Minister of Finance, told the Lok Sabha on Thursday the 24th inst. that it had been decided in principle that the Hutti gold mines in Mysore State should be taken over by the Central Government.

RECOVERY IN COTTON HALTED

(*From Our Own Correspondent*)

BOMBAY, *30th January*

The recovery witnessed in the cotton futures market towards the close of last week and the early part of the week under review would appear to have been short-lived. For, after a brief spell of firmness on the opening day of the week, which was in fact an extension of last week's recovery, cotton futures reacted on Friday, the 25th inst. The Jarilla March contract declined from the closing price of Rs. 683.50 (it had touched a high of Rs. 685.50 per three quintals) on Thursday to Rs. 676.25 the next day, thanks to profit-taking and renewed selling prompted by reports of heavy arrival of new crop and the consequent decline in prices in upcountry markets. The contract declined steadily thereafter and closed at Rs. 668 today. Lower advices from the spot market accelerated the downward trend. Over the week, however, the contract shows a net gain of 25 nP.

The Maharashtra Government is reported to have requested Mr. S. K. Patil, Union Minister for Food and Agriculture, to examine the feasibility of reducing the gap between the floor and ceiling prices of cotton. In a memorandum submitted to the Union Minister, the State's Minister for Agriculture is said to have pointed out that farmers in the State, who had switched over to cotton-growing from sugarcane, were losing heavily due to the wide difference in the floor and ceiling prices. The State Government has urged (i) a reduction in the gap between the floor and ceiling prices (which can be achieved either by raising the existing floor prices or lowering the ceiling prices) (2) valuation of the quality of cotton by scientific method instead of the current practice of deciding it by hand, and (3) representation of cotton growers in survey committees.

In the spot market at Sewri, after an initial firmness, prices tended to recede, thanks to the increasing pressure of new crop. Selected varieties of cotton such as Vijay and Digvijay, however, continued to rule firm. Mills were, therefore, reluctant to buy these cottons at the high prices. The Vijay/Digvijay crop is currently estimated at 600,000 bales, of which about one-third have been already marketed. Spinner interest was also evident for Co2, L. 147, Kalyan and 197/3 cotton. Stray business was reported in limited quantities of Bengal *Deshi* on a subject-to-license basis. Despite the receipt for individual quota allotment, mill demand for American did not broaden appreciably. Moderate

interest was noted in Egyptian Giza and selected Sudan and East African growths.

The following are the latest available quotations—in rupees per candy of 784 lbs.—from the spot market at Sewri: Ganganagar 700; Kalyan 905; Co2 1,300; L. 147 1,190; American (on sample) 1,235.

A divergent trend was witnessed in the Karachi cotton futures market during the week. The March contract declined, thanks to the switch-over of purchases from March to May position which, rallied as a consequence. Thus the March contract was quoted lower at Rs. 71.80, as against, last week's closing price of Rs. 72.25 and the May contract at Rs. 73.30, as against Rs. 72.55 on 24th January. The N.T.R.G. January contract went off the Board on 24th January at Rs. 70, as against last week's closing rate of Rs. 70.25.

Cotton futures in the Liverpool market recorded handsome gains during the week. Demand was good while offering were limited, except at higher levels. Both the American and American contracts consequently hardened. Sudan cotton contracts at Liverpool, however, ruled quietly steady. The following are the latest available quotations—in pence per lb.—from Liverpool, the figures in brackets being last week's closing prices.

March 24.05 (23.95); May 24.00 (23.90); January (Sudan) 29.25 (29.25).

Continued firmness of spot prices and scattered Commission House support imparted strength to the New York cotton futures market during the week. Turnover was, however, limited as traders were inclined to await the outcome of the Bill seeking to amend the Agricultural Act introduced in House of Representatives on 17th January.

The following are the latest available quotations—in cents per lb.—from New York as compared with those a week and a fortnight ago.

(In cents per pound)

	28-1-63	22-1-63	15-1-63
March	34.60	34.67	34.68
May	34.71	34.70	34.70
July	33.98	33.78	33.77
New York Spot ...	35.20	35.10	34.95

STAPLE FIBRE YARN STEADY

(From Our Own Correspondent)

BOMBAY, 30*th January*

Divergent trends were discernible in the yarn markets this week. While staple fibre yarns turned steady and closed the week with small gains, art silk yarns drifted down further and cotton yarns ruled listless. The steadiness of staple fibre yarns was due more to the decision of the Bombay Yarn Merchants' Association and Exchange to provide hedge facilities to stockists than rise in demand. The Association, as was mentioned in these columns last week, has sought the Forward Markets Commission's permission to conduct trading in monthly non-transferable specific delivery contracts in 2×40 staple fibre yarns produced by seven mills. Trading in these contracts is expected to commence from the first week of February, after the F.M.C.'s permission, which is considered to be a mere formality, is received.

Among 2×40 spot staple fibre yarns, Kohinoors moved up from Rs. 8.01 to Rs. 8.10 a kilo and Citys looked up by 4 nP to Rs. 7.74, but Centurys closed unchanged at Rs. 7.08. In the art silk yarn section, while 150D National Rayon at Rs. 10.71, showed a minor gain of 2 nP, 120D dropped further from Rs. 12.03 to Rs. 11.68. 150D S.I. Viscose lost 7 nP to Rs. 10.80 and 120D 13 nP to Rs. 12.65. Bright Centurys 100D declined from Rs. 15.05 to Rs. 14.85 and so did 75D from Rs. 18.15 to Rs. 17.40. Cotton yarns were more or less maintained at last week's levels.

The following table gives the prices of rayon staple fibre and cotton yarns, today, as compared with those prevailing a week ago:

	30-1-1963	23-1-1963
	Rs.	Rs.
Art silk yarn (per kg.)—		
National Rayon 120D	11.68	12.03
Century 75D	17.40	18.15
S. I. Viscose 150D	10.80	10.87
Staple fibre yarn (40×2)—		
Kohinoor (per kg.)	8.10	8.01
Century	7.08	7.08
Cotton yarn (per bundle of 10 lbs.)		
10s Podar	17.50	17.50
20s Modern	24.50	24.50
22s Century	—	25.50
26s Nandi	26.00	26.00
40s Hind	35.00	—
60s Finlay	67.25	67.25

Note.—Quotations for 120 and 150 Japan and Italy are not available, since there has been no trading in view of paucity of stocks.

GROUNDNUTS FORGE AHEAD

(From Our Own Correspondent)

BOMBAY, 30*th January*

The upward trend of oilseeds prices noted last-week gathered further momentum during the week under review. Groundnuts made further headway, thanks mainly to reduced arrivals of new crop from the South and Gujarat, and pierced the weekly ceiling level. The sentiment was also influenced by better overseas enquiries for groundnut oil, besides good offtake by *vanaspati* manufacturers and crushers. The operators welcomed the decision of the Reserve Bank to liberalise credit facilities to exporters of H.P.S. groundnuts in the conduct of the introduction of free licensing of exports of the commodity.

In sympathy with groundnuts, castorseeds ruled firm, although modest sagging tendency was in evidence towards the close induced by fears of large arrivals of new crops in the near future. Cotton seeds were also cheerful on better support. Linseeds, too, moved up initially, but a part of the gain was eroded later on better crop reports and apprehensions regarding continued difficulties in the way of linseed oil export, in view of larger crop in Argentina.

Groundnut April 1963 contract advanced by Rs. 5.50 to Rs. 12.37, which is the week's ceiling level. Nizam bold rose by Rs. 2.50 to Rs. 42. Khandesh quality put on Rs. 2.13 to Rs. 42.50. Oil ex-mill strengthen by 80 nP to Rs. 17.20 and railway receipts by 55 nP to Rs. 16.90.

Castorseed June 1963 contract moved up from Rs. 161.50 to Rs. 163.50, before finishing at Rs. 162.25. March 1963 contract improved by 50 nP to Rs. 159.75. Kanpur bold gathered Re. 1.13 to Rs. 31.50. Madras Small spurted initially from Rs. 32.12 to Rs. 33, but slipped back to Rs. 32.75. Oil commercial and B.S.S. put on 10 nP each to Rs. 12.85 and Rs. 13.80, respectively.

In the cotton seed section, April 1963 contract closed higher by 50 nP to Rs. 90.50 it was still higher at Rs. 91.50 earlier during the week. White hardened by 25 nP to Rs. 19.75.

Linseed oil picked up 10 nP to Rs. 13.70. Linseed March 1963 contract, which had gone up from Rs. 33.69 to Rs. 34.06, declined to close at Rs. 33.25. Bold ready too fell by 25 nP to Rs. 33.25.

The following table shows the closing prices of oilseeds and oils on Wednesday 30th January, as compared with those of two previous weeks:

	30-1-1963	23-1-1963	16-1-1963
	Rs.	Rs.	Rs.
Groundnuts			
January 1963 contract	—	—	195.50
April 1963 contract	212.37	206.87	204.00
Nizam bold	42.00	39.50	39.00
Khandesh quality	42.50	40.37	40.00
Oil ex-mill*	17.20	16.40	16.40
Oil commercial*	16.90	16.35	16.30
Castorseed			
March 1963 contract	159.75	159.25	158.50
June 1963 contract	162.25	161.50	160.50
Ready Madras	32.75	32.12	32.62
Ready Kanpur	31.50	30.37	31.37
Oil B.S.S.†	13.80	13.70	13.70
Oil commercial†	12.85	12.75	12.95
Linseed			
March 1963 contract	33.25	33.69	33.44
June 1963 contract	34.50	—	34.62
Bold ready	33.25	33.50	35.00
Linseed oil†	13.70	13.60	14.00
Cottonseed			
January 1963 contract	—	—	93.50
April 1963 contract	90.50	90.00	88.50

* Rates include excise duty but exclude sales tax.
† Rates exclude both excise duty and sales tax.
N.B.—All quotations for futures contracts are per 250 kilograms, except linseeds for which rates are per 50 kilograms. Spot quotations of seeds are per 50 kilograms and oil per 10 kilograms.

PEPPER MOVES NARROWLY

(Messrs. Parekh and Co.)

BOMBAY, 30*th January*

Barring a temporary flutter following the Water Front strike along the East and Gold Coasts of the U.S.A. which lifted the price for spot in New York from $0.34 to $0.37, Malabar black pepper moved within a narrow range for want of new incentive. The settlement of strike made New York holders soft sellers. They revised their price lower to attract business, but, the detained quantity of about 1,200 tons having been released and grinders getting delivery of their earlier purchases on ex-dock basis, buyers started horse-trading and asked for reduction at every next sale.

New York spot came down to $0.32, while offers for Lampong at $0.29 and those for Malabar at $0.30 remained untaken. Singapore remained fairly steady, in view of the uncertain political situation in North Borneo.

Ungarbled at the assembling centres moved up from Rs. 248 to Rs. 265 before finishing the week at Rs. 248. Garbled, after improving from Rs. 252 to Rs. 274, finished lower at Rs. 252. February delivery touched the highest of Rs. 274, the lowest being Rs. 256. The market is likely to move narrowly with tendency downward until it touches the bottom to attract buyers in competition with Lampong. Inland demand is poor, in view of the stringency in the money market. Speculations are sidelining for want of new development.

Ready ungarbled in the local market is nominally quoted at Rs. 138 per 50 kilos.

BLACK LEAF TEA ADVANCES

[Messrs. Forbes, Ewart and Figgis (Private) Ltd.]

COCHIN, 24*th January*

A total of 385,000 kgs. was offered in sale No. 4 held on Tuesday the 22nd Inst. A further slight seasonal improvement in quality was noticeable, particularly in teas from the Nilgiris. The market opened to a fair general demand which prevailed throughout the sale. Selected best quality Nilgiri teas realised some attractive prices, whilst the lesser brokens also appreciated in price, buyers closely following quality, but there was not so much competition for fannings in this category. The best good medium brokens ruled firm to dearer, but others, including fannings, were lower. Medium and low medium brokens attracted fair support at generally lower rates, but there was better competition for fannings in these categories which advanced 10-20 nP. Plainest brokens shed in price, whereas their fannings were dearer. Black leaf descriptions registered advance in price, as did whole leaf grades and tippy sorts. Teas of unorthodox manufacture were well supported at dearer rates.

The quotations (per kg.) were:

	1963	1962
	Rs.	Rs.
Low medium	4.30-4.80	3.85-4.15
Medium	4.80-5.10	4.15-4.85
Good mediums	5.20-5.90	5.00-5.70
Nilgiri B.O.P.	5.75-10.90	5.60-9.90

The average price realised in sale No. 4 was Rs. 5.28 as compared with Rs. 4.89 in the previous week and Rs. 5.24 in the corresponding sale last year.

In dust sale No. 4 held today, there was good general demand at around last rates. Highgrowns on offer elicited irregular demand. Mediums and low mediums sold at around last rates, but Wynaad types tended to be dearer. Milled and residual types were well supported and were steady on last levels. Unorthodox descriptions were firm.

The average price realised in dust sale No. 4 was Rs. 4.15 as against Rs. 4.18 a week ago and Rs. 3.96 in the corresponding sale last year.

Colombo: 7 million lbs. were offered owing to the heavy weight of Dimbula and Dickoya teas on offer; these met with more limited demand with the best sorts easing 20-30 cents, the lesser kinds 15-20 cents and others 5-10 cents. Good mediums were unchanged, but the poorer mediums and low-grown brokens were barely steady, whilst similar fannings were correspondingly easier.

London: North Indian and other growths: In Monday's auction, there was a fair demand. Whereas C.T.C. Assams eased by up to 3*d*. per lb., Africans and orthodox Assams were firm and plain sorts steady.

Ceylon and South Indians: In Tuesday's sale there was fair demand for the Ceylon and South Indian teas on offer and, although the better sorts were irregular and sometimes easier, the lower priced descriptions were steady.

As we go to press, Messrs. Forbes, Ewart and Figgis (Private) Ltd. wire as follows:

"Sale No. 5 held on 29th January, 618,000 kgs. offered. Low medium and good mediums irregularly easier by 20 to 25 nP. Highgrowns slightly lower. Unorthodox fully firm tending dearer."

PLAIN TEAS EASIER

(From Our Own Correspondent)

CALCUTTA, 29*th January*

Tea export sale No. 32, which was held here yesterday, attracted generally good demand for the 51,275 packages of leaf offerings. An irregular and easier trend in plain orthodox descriptions was a feature of the sale. However, cleaner and better sorts appreciated slightly. Brighter Dooars and Assam teas met with good inquiry, but, excepting brighter liquoring B.O.Ps, the trend was easy. C.T.C. descriptions were in keen demand, with B.Ps ruling dearer than similar fannings. The best liquoring sorts ruled easy. Fibrous types were only too irregular. Offerings of legg-cut teas were limited and sold well. The keenly supported whole leaf grades hardened and tippy teas attracted good attention. Darjeelings met with ready demand, though at freely varying prices. Quotations in rupees, including excise duty, per kg. were: Clean plain pekoe 4.90 to 5.10, plain B.P. 4 to 4.30, plain fannings 3.90 to 4.40, medium Assam C.T.C. B.P. 5.8 to 6.10, medium Assam C.T.C. fannings 5.40 to 5.80, best Assam C.T.C. B.P. 6.20 to 6.40 and best Assam C.T.C. fannings 6.10 to 6.40.

Good support for medium C.T.C. at unchanged prices and ready demand for good C.T.C. at lower levels were the features of the internal dust tea sale No. 31 held on the 24th inst. Offerings aggregated 29,263 packages. While plain orthodox teas ruled firm on good support, medium orthodox ones were irregular. Legg-cut teas maintained their firm trend, and the improved liquorings were fancied even at higher prices. Prices in rupees (including excise duty) per kg. were: Plain orthodox dust 3.85 to 4.10, medium Assam dust 4.15 to 4.90, legg-cut dust 5 to 5.35, medium Assam C.T.C. dust 5.60 to 6.10, good Assam C.T.C. dust 6.60 to 6.90.

With buyers in Mincing Lane following quality at last week's sale, when 76,000 packages were offered, prices turned lower. The lowest sorts were, however, well maintained. Prices for the North Indian and other miscellaneous offerings declined by 1*d*. to 3*d*. a pound. Teas below 4*d*. per lb. attracted competition and, therefore, ruled steady. The lower description African teas were, however, dearer on good general demand. The South Indian teas and offerings from Ceylon followed the general trend.

Stocks in London and provincial warehouses as of 11th January were higher at 145.55 million lbs., as compared with 141.81 million lbs. a week before. The total quantity, estimated to have landed on the 11th inst., was 19.83 million lbs. Deliveries during the week totalled 10.08 million lbs. and landings amounted to 8.89 million lbs. Total afloat, including 27.68 million lbs. from Calcutta, was 36.08 million lbs.

Offerings at the Colombo sale on the 21st inst. totalled 8,088,260 lbs. Best Dimbula-Dickoya brokens were easy in the absence of sufficient support; below best types were also easier, but plainer stuff was firm and Uva descriptions also were firm. Useful coloury medium brokens from Western districts met with good demand, though the trend was irregularly firm. Brighter liquoring B.O.P fannings ruled easy.

JUTE GOODS FIRM

(From Our Own Correspondent)

CALCUTTA, 29*th January*

Jute goods ruled slightly firm during the week under review, though prices did not show a marked tendency to rise. For the firmness was engendered not by any special bullish factors but by some covering by shippers against their earlier commitments. Actually, fresh overseas inquiries and support from local operators were poor. Over the week, B. twills February delivery moved up from Rs. 112.30 to Rs. 112.65 per 100 bags and hessian (40×10 oz.) from Rs. 49.88 to Rs. 50.22 per 100 yards. Ready hessian evoked good demand and spurted by Re. 1.5 to Rs. 51.25. In sympathy, B. twills gathered 40 nP to Rs. 112.40.

The fibre market was comparatively quiet. The floating stocks at Cossipore increased slightly, as a result of larger arrivals. The total of the stocks as of today was 430,000 bales, as against 400,000 bales a week before. There was no change in prices, Assam bottoms being quoted at Rs. 26.50 per maund and Jungli mesta bottoms at Rs. 22. Some business was reported today in Northern jute basis bottoms at Rs. 27.50 for January-February shipment.

Buying of raw jute by mills against their compulsory minimum purchase quota continued during the week. The Managing Director of the State Trading Corporation recently toured West Bengal, Bihar and Orissa and discussed with the State Government officials concerned arrangements for the purchase of raw jute from growers as a price support measure. Meanwhile, the S.T.C. has bought at Rs. 30 per maund the entire 281,760 maunds of raw jute offered by the National Agricultural Co-operative Marketing Federation.

Both the raw jute growers and the jute mill-owners are eagerly awaiting the Government of India's announcement of new floor prices for raw jute. The announcement, according to Mr. G. O. L. Joneja, Jute Commissioner, may be made sometime in February or March. Speaking at a Press Conference in Calcutta on Monday this week, Mr. Joneja disclosed that the Central Government was now reviewing the working of the present operational minimum price which is Rs. 30 per maund, Assam bottom basis. While fixing new prices, the Government's approach would be, he said, to discourage the cultivation of low quality jute which did not have much use for the mills. He recalled the various measures taken by the Government to arrest the fall in raw jute prices and claimed that quality jute in the mofussil was selling at prices far higher than the parity prices at Cossipore. Mr. Joneja revealed that, as a price stimulation measure, the Government had issued a fresh quota of 640,000 bales: 600,000 bales for the I.J.M.A. mills and 40,000 bales for non-member mills. He was confident that purchases by mills individually and the operation of the S.T.C. would improve the price situation further.

Meanwhile, the West Bengal Government is considering a proposal to set up machinery for direct purchase of raw jute from the market. It is also proposing new legislation to regulate the jute market in the State. The object of the legislation, it is said, is to prevent jute growers from being compelled to give the buyer a certain quantity of his produce free of cost whenever he sells jute.

The current (1962-63) season's jute and mesta crop is estimated at 7.10 million bales (of 400 lbs. each), as against the 7.97 million bales actually harvested in 1961-62 and 5.11 million bales in 1960-61. In view of bumper crop and the sizable carryover of the previous season, the jute mills will, there is no doubt, be able to maintain output at optimum levels, provided, of course, they are assured of the requisite power supply and sufficient offtake of goods for both domestic consumption and export markets.

Replying to a question in the Lok Sabha on Friday, 25th January, Mr. Manubhai Shah, Union Minister for International Trade, estimated the current season's jute crop at 7.0 million bales and said that, due to the higher prices ruling as compared with the adjacent areas, the total availability in the season would be about 7.5 to 8.0 million bales. Purchases made so far amount to 5.5 million bales, leaving a balance of 2.0 to 2.5 million bales for the next five months of the season. Mr. Shah added: "All the jute mills are working to full capacity subject to availability of power and, at the rate of current purchases both by mills as well as by the various other agencies, which work out to seven to eight lakh bales per month, the balance of the crop lying with the growers and the trade is likely to be acquired within a period of three months."

EXPORT DEMAND FOR COW HIDES

(From Our Own Correspondent)

MADRAS, 28*th January*

Export business in E.I. tanned cow hides increased here this week. Demand centred on top marks light weights of all selections and medium weight fifths. Importers did not respond to the shippers' offers in other tannages, and made counter-offers at lower prices. Demand for inland trade was less marked and the market was, therefore, quiet. The market for cow calf was steady and for buff calf dull.

Tanned goat skins, especially top marks light weights of all selections and 11/12 lbs. run parcels, were firm. Other lines were quiet. There were some inquiries for semi-prime sheep skins, especially lower ends, and steady call for middle class sheep of all grades was maintained.

In the German tanned skins public sales held on 21st January 1963, demand centred round good parcels of light-weights and heavies and prices realised were 3*d*. to 6*d*. lower than the current c.i.f. quotations. Half the quantity offered in the sales was sold. Regarding sheep skins, those suitable for clothing trade met with clearance but formed only a small proportion of the goods on offer. Other types were neglected.

METALS FIRM

(From Our Own Correspondent)

BOMBAY, 30*th January*

Metals ruled distinctly firm during the week under review, in view of sustained demand in the face of tight supply position. The reported move of the Union Government to impose drastic restrictions on the use of copper, tin and zinc was interpreted bullishly by the market. It was stated that the Government had already started collecting data on the possibility of substituting these metals by aluminium and its alloys which are available indigenously. The Metals Committee of the Council of Scientific and Industrial Research is inquiring into the whole question.

In the Bombay market, copper electrolytic coils advanced by Rs. 13 to Rs. 372 per 50 kgs. during the week. Copper wire bars put on Rs. 15 to Rs. 365. Zinc ready forged ahead by Rs. 14 to Rs. 250 per 100 kgs. and lead by a rupee to Rs. 164. Tin was quoted higher by Rs. 3 at Rs. 303 per 10 kgs.

On the London Metal Exchange, non-ferrous metals tended to move down during the week mainly on technical considerations. Operators in the tin section were hesitant to enter into fresh commitments pending the emergence of a clear picture of the U.S. policy regarding disposal of stockpiles. Three months metal fell by £½ to £854½ per ton. Cash tin eased by £½ to £851¾.

Copper was dull. Operators were hopeful of early resumption of uninterrupted copper supply from the Union Miniere refineries in Congo, following the U.N. army take-over of the secessionist Katanga province. The apprehended sabotage of the Company's mines and refineries did not also materialise. But for large buying by producers at the support price of £234½ per ton, the cash price would have actually gone down below this level. Three months copper is quoted unchanged at about £233¾. In the London market, spot lead fell by £¾ to £54-1/16 per ton and spot zinc by £⅛ to £67-9/16.

FOODGRAINS STEADIER

(From Our Own Correspondent)

HAPUR, 28*th January*

A steadier trend was witnessed in foodgrain prices here during the week under review following absence of adequate winter rains, which marred prospects of good *rabi* crops.

Good consumer demand in the face of limited local stock with the trade lifted the average wheat prices by 67 nP per quintal to Rs. 39.52 per quintal, with the farm quality superior produce quoted higher at Rs. 42.87 to Rs. 43.54. Arrivals of wheat here were negligible and the local stock dwindled to 60,000 maunds. Rice improved on good demand and poor arrivals. Local rice stock was limited at 16,000 maunds. Week-end prices were: Rice *basmati sela* Rs. 75.02 to Rs. 77.70, superior Rs. 80.38 to Rs. 91.09, *mainpuri* Rs. 50.24, *ramajwayan* Rs. 58.94, *raimunia* Rs. 61.62, and *gadda* Rs. 49.57, per quintal.

Gram ruled quiet in poor turnover. While the crop prospects have very much improved in areas where there had been good rains in the second week of this month, prospects in other areas have not been bright. The Punjab quality was now quoted at Rs. 41.19 and the local produce at Rs. 40.87 per quintal. Stock with the trade was nominal. Maize declined sharply by 67 nP to 99 nP per quintal, as stockists were anxious sellers before the start of new *rabi* arrivals in early March. *Bajra* was steady on good seasonal demand in the face of poor arrivals. While barley and *bejhar* prices turned lower in the absence of buying enquiry, *juwar* and *guwar* ruled quiet. Week-end prices were: Maize Rs. 26.79 to Rs. 29.47, *bajra* Rs. 34.83, *juwar* Rs. 32.15, *guwar* Rs. 32.15 to Rs. 33.39, barley Rs. 24.11, *bejhar* Rs. 24.11 and *methi* Rs. 50.94 per quintal.

In restricted trading, pulses were unchanged. Peas ruled quiet at Rs. 28.13 to Rs. 30.81 per quintal according to quality, with peas *dal* quoted at Rs. 33.49 per quintal. Local stock of peas was around 30,000 maunds. *Arhar* prices moved down to Rs. 48.23 to Rs. 49.57 per quintal.

SPURT IN SUGAR

(From Our Own Correspondent)

HAPUR, 28*th January*

Sugar prices here continued to be firm this week on brisk buying support from Delhi, Gujarat and other consuming areas. It was learnt that the Union Government was not considering a reduction in the excise duty on sugar at present and that the industry had been advised to offer higher rates to cane growers to attract more cane. Factories in this area have increased cane purchasing prices by 12 nP per maund, but the supply position has not improved much. Long-term steps to ensure enough cane supplies to mills are reported to be under consideration of the Government. Spot and mill delivery prices registered further sharp gains of over Rs. 2 per quintal during the week.

Buoyant conditions were witnessed in sugar prices in the Muzaffarnagar market, thanks to brisk outside demand. Rapid advance in *khandsari* and *gur* prices coupled with reports of lower production due to cane diversion also aided the bullish sentiment. Some factories were reported to have sold on their sugar quotas, but some had been withholding on expectations of higher prices. Advance selling against the ensuing quota was reported at Rs. 109.85 for D 29 quality as against former controlled price at Rs. 101.40 per quintal. Spot demand was also brisk and prices spurted by Rs. 2.50 to Rs. 3 per quintal. Week-end prices were:—Mill delivery AA 29 Iqbalpur Rs. 110.75, A 29 Lhaksar Rs. 109.25, Mansurpur Rs. 109.50, B 29 Saharanpur Rs. 107.50, C 29 Deoband Rs. 107.50, D 29 Amroha Rs. 106.15, Meerut Rs. 108, E 29 Simbhauli Rs. 107.50, Bijnore Rs. 105.50, Sechara Rs. 105.48 and Dhampur Rs. 105.83.

Khandsari also ruled firm on brisk buying support from Punjab, Rajasthan, Gujarat and other consuming areas. Stockists from U.P. and other areas also evinced interest in purchasing *khandsari*. As a result, prices shot up by Rs. 4.02 to Rs. 9.38 per quintal. While the inferior moist produce was quoted at Rs. 85.74 to Rs. 93.77, the superior quality was lifted at Rs. 96.45 to Rs. 104.49 per quintal. Crystal *boora* prices advanced by nearly Rs. 5 to Rs. 7 per quintal to be quoted at Rs. 112.53 to Rs. 115.21.

Ready *gur* recorded further gains during the week on good buying enquiry from the consuming areas of Gujarat, Saurashtra and M.P. Stockists, too, were keen buyers. Loading facilities were freely available and, with arrivals averaging 2,000 to 2,500 maunds daily, local *gur* stock improved to about 11,000 maunds here and over 2.5 lakh maunds in the nearby areas. Trade circles anticipated further rise in ready *gur* prices in view of the poor cane crop. The Government's directive to ban futures trading in *gur* in order to check the rising trend in ready prices has not met with any success. Week-end prices were:—*Pansera* Rs. 48.22 to Rs. 53.36 according to quality and *balti* Rs. 52.88 per quintal.

A steady to firm tendency prevailed in ready *gur* prices in the Muzaffarnagar market. *Gur chaku*, demand for which was brisk, advanced during the week by Rs. 2.75 to Rs. 3 per 40 kilograms to be quoted at Rs. 22 to Rs. 23, as against Rs. 15.80 to Rs. 16.90 on the same date last year. Stockists made bulk purchases. Daily arrivals averaged 12,000 maunds and total arrivals from the start of the current season were around 7.52 lakh maunds.

SURVEY

(Concluded from page 183)

pace of development of a scarce-resource economy.

If this surplus is to be distributed equitably, points out Dr. Munshi, it is necessary to examine not only the exact nature and scope of bonus payments, but also the source of available surplus from which bonus is paid. If the available surplus were found to be the result of monopoly gains or adventitious profits resulting from the pursuit of planned economic development, a great part thereof must go back, as rightly urged by this economist, to the community that bears the burden of the plans and monopolies. If there is still some surplus left, and if this is really found to be profits of entrepreneurship, it should be shared between the partners in production. This principle, according to Dr. Munshi, should apply equally to goods the prices of which are fixed by the Government, and to goods the prices of which are determined by market forces, for, in both cases, the wide margin between cost and sale price, which is responsible for the large surplus, is the result of extraneous factors and not entrepreneurship. It is due in the former case to defective price-fixing and in the latter to monopoly conditions, that is, existence of a sheltered and protected market.

The distinction drawn by Dr. Munshi between "pure profit" and "extraordinary or adventitious profit" is a pertinent one, and must be borne in mind by the Bonus Commission in assessing the contribution made by the partners in production to the total profit. But can it be a serviceable tool for equitably apportioning profit between the three claimants, namely, the workers, the employers and the consumers? This doubt arises, because, in practice, it will be pretty difficult to identify pure profit and adventitious profit and to distribute the surplus among the claimants, in proportion to their contribution towards it. All that one can expect the Bonus Commission to do is to bear in mind the need for protecting the interests of consumers, as also the need for creating more employment opportunities for the unemployed through a high rate of industrialisation. If it does, it will find that the surplus available for distribution to workers by way of bonus cannot be as large as is claimed by their spokesmen.

Notice

BURMAH-SHELL REFINERIES LIMITED

NOTICE IS HEREBY GIVEN THAT THE Register of the Company's 5¼ per cent Debentures 1965-69 will be closed for transfers from 14th February 1963 to 28th February 1963, both days inclusive.

Notices

THE INDIAN IRON AND STEEL COMPANY LIMITED

NOTICE

NOTICE IS HEREBY GIVEN THAT AN Extraordinary General Meeting of the Company will be held on Thursday the 28th February, 1963, at 11-00 a.m. at the registered office of the Company at 12, Mission Row, Calcutta, to consider and if thought fit to pass the following resolution as a special resolution:

RESOLVED that this General Meeting having taken under consideration the contracts now exhibited to the meeting and whose material terms are set forth below for the sale, purchase or supply of any property, movable or immovable, or for the supply or rendering of any service, other than that of a managing agent, between the Company and its managing agents, Martin Burn Limited, and their associates, such as (1) Burn & Co. Ltd., (2) The Indian Standard Wagon Co. Ltd., (3) The Hooghly Docking and Engineering Co. Ltd., (4) Saugor Electricity Supply Co. Ltd., (5) Upper Jumna Valley Electricity Supply Co. Ltd., (6) Robert Hudson (India) Ltd., do approve of all these contracts.

PROVIDED that so far as the said contracts relate to the supply or rendering of any service other than that of a managing agent, this resolution shall be subject for its effectiveness to the approval of such contracts by the Central Government.

MATERIAL TERMS

GOODS AND SERVICES:—All such as may be dealt in or rendered or required by the seller or buyer for the time being and from time to time.

PRICE:—Such as shall be ruling with the seller or supplier at the date of requirement or such as shall be currently in force and be otherwise reasonable.

DELIVERY:—According to Buyers' requirements specified in relevant Advice Notes.

PAYMENT:—As specified in acceptance. Provided that for any property supplied or sold, or any services supplied or rendered, payment shall be made by the Buyer within one month from the date of such supply, sale or rendering as the case may be.

A member entitled to attend and vote at the Meeting is entitled to appoint a proxy to attend and vote instead of himself and a proxy need not be a member.

By Order of the Board,
MARTIN BURN LIMITED,
F. G. LIVERSEDGE,
Managing Director,
Managing Agents.

Registered Office:
12, MISSION ROW,
CALCUTTA-1.
Dated, 29th January, 1963.

Note:—An Explanatory Statement is annexed to the convening notice issued to members of the company.

THE RAMNUGGER CANE AND SUGAR COMPANY LIMITED

NOTICE

NOTICE IS HEREBY GIVEN THAT THE Twenty-sixth Ordinary General Meeting of the Shareholders of THE RAMNUGGER CANE & SUGAR COMPANY LTD., will be held at the Registered Office of the Company, 7, Wellesley Place, Calcutta-1, on Thursday, the 28th February, 1963, at 12 noon to transact the following business:—

1. To receive the Directors' Report and pass the audited Accounts for the year ended 31st August, 1962.
2. To declare a dividend on Preference Shares.
3. To declare a dividend on Ordinary Shares.
4. To elect Directors.
5. To appoint Auditors and fix their remuneration.
6. To transact any other business which may properly be brought before the Meeting.

NOTICE is also given that the Share Transfer Registers will be closed from the 14th February to 28th February, 1963, both days inclusive.

A member who is entitled to attend and vote is entitled to appoint a proxy to attend and vote instead of himself, and the proxy need not be a member of the Company.

By Order of the Board,
ANDERSON WRIGHT, LTD.,
Managing Agents.

CALCUTTA, *28th January,* 1963.

MARKET GOSSIP

(*Concluded from page 179*)

of £15,332 million. There were 2,960 persons with incomes of £20,000 or more and, between them, they got £99 million. At the other end of the scale, 394,600 earned only £180, aggregating £74.8 million. The densest populated group was the £600-a-year bracket, in which there were 2.6 million earners. Next came the £700 group, totalling 2.2 million. Single or widowed women earners accounted for £1,860.9 million. Again, in all income ranges (including that from investments), 310 women earned £20,000 or more in that year, amounting to £10.4 million. But the densest populated single women earnings group was between £250 and £300 a year. There were 620,200 of them.

The report of the Inland Revenue Commissioners also contains a detailed analysis of the tax structure in Britain. The gross receipts of the Inland Revenue during the year 1961-62 amounted to £4,060 million. Excluding repayments of £424 million, the net receipts were of the order of £3,636 million, representing an increase of £427 million as compared with 1960-61. Collection charges accounted for 1.37 per cent of the net receipts £55.5 million to be precise or 3.28*d.* in the £. The major portion of revenue receipts is accounted for by income-tax which yielded a total of £1,808 million. Surtax and death duty collections amounted to £237 million and £261 million, respectively; the corresponding figures for 1960-61 were £199 million and £235 million. Profits tax (charged at 15 per cent of distributed and non-distributed profits) brought in £334 million during 1961-62. The excess profits levy and the excess profit tax, though long since defunct, continue to yield revenue. The former, which applied in the two calendar years 1952 and 1953, is shown to have yielded £84,212 during 1961-62 and the latter, that is the war-time tax which continued until the end of 1946, yielded £1,277,423.

Unemployment in Britain

Figures of unemployment in Britain, as at the middle of January 1963, published by the U.K. Ministry of Labour last week, disclose an appreciable setback in the employment situation. At 814,632, or 3.5 per cent of the working population, the number of jobless was higher last month than at any time since the last war, except in February 1947 when, thanks to fuel shortage and a cold spell similar to the one currently being experienced in that country, the number of unemployed had increased to 1.8 million. It may, however, be noted that, of the 1.8 million people unemployed in February 1947, as much as 1.4 million was only temporarily out of work because of the closure of factories due to fuel shortage. The number of persons wholly unemployed was only 461,000. As compared with this, the number of wholly unemployed persons, as distinguished from those temporarily out of work, is 604, 967. Hence, the current employment position is worse than that in February 1947 or January 1959, when unemployment was the next highest in the post-war period, namely, 620,000. Between mid-December 1962 and mid-January 1963, the number of unemployed rose by 248,474, of which 104,000 were wholly unemployed. Construction accounted for 66 per cent of the rise in unemployment—164,000 out of a total 248,474, to be precise. Indeed, construction industries laid off many thousands of workers because of the intense cold.

While the position in January was bad, it looks as though it will be worse in February, the current month. Even in a normal year, unemployment increases in February. Even assuming that this month, thanks to a possible improvement in weather, more jobs will be available, unemployment is not expected to fall much below 700,000. Although this can be partly attributed to weather conditions, especially the severe cold, and other seasonal factors, they cannot wholly explain the sharp rise in unemployment. Apparently, there is a hard core of unemployment of over 500,000, or 2.5 per cent of the working population, which can be absorbed only if the economy expands at a fast rate. It is significant that the national Economic Development Council, NEDDY for short, has set a tentative growth rate of 4 per cent per annum for the British economy for the five-year period 1961-66, a rate which is considerably higher than the growth rate achieved last year and one per cent above what was earlier considered desirable by Treasury officials. The Chancellor of the Exchequer, Mr. Reginald Maudling, has agreed to accept this target.

The Chancellor of the Exchequer recently adopted a series of measures to increase demand and to stimulate the economy. The steep increase in unemployment indicates that these measures have not yet succeeded in bringing about economic expansion sufficient to absorb all the unemployed. The British Government has, therefore, enhanced the unemployment, sickness and pension benefits. Besides bringing social insurance benefits paid to the unemployed, the injured and the elderly into line with the recent rise in wages, this step too is expected to stimulate the economy by adding to the spending power of consumers. It is significant that, for the first time, the Government will pay the higher benefits in advance, and will collect the higher contributions afterwards. Thus, while the higher unemployment benefits will be payable from 7th March 1963 and other benefits from 27th May 1963, the higher contributions will be collected only by the beginning of June.

The total extra cost to the Exchequer of the increased benefits will be £45 million in a full year. The total extra cost in a full year of the higher rates of pension and benefits will be no less than £212 million. Nearly 9 million people will benefit from the enhanced rates.

The increase in unemployment benefits will improve the lot of the unemployed in Britain *vis-a-vis* that of his opposite number on the Continent. With £3 7*s.* 6*d.* a week, the unemployed Briton will be better off than his counterpart in Italy and, perhaps, France, though he would compare unfavourably with his opposite numbers in any other Common Market country or Scandinavia. As compared with the U.S., even at the enhanced rate, an unemployed Briton would be getting only a quarter of what an unemployed American gets.

AMERICAN LETTER

TAX REDUCTION PROPOSALS SWEEPING

EXPERTS ON ECONOMIC IMPACT OF DISARMAMENT

From Our Special Correspondent

NEW YORK, 26*th January*

AT this time of the year, the United States business and financial scene is usually dominated by the annual Presidential messages to Congress and proposed legislation which may or may not be passed by the new Congress. This year is no exception. The emphasis in 1963 is on President Kennedy's proposed tax reductions and tax reform. Other dominating issues include the Common Market, French President de Gaulle's adamant stand against British entry into the European Community, the Sino-Russian rift and the internal labour situation which is deplorable.

The tax reduction proposals, which would become effective over a period of three years, are sweeping and would be the first ones in a long, long time. In brief, they envisage a cut in the top corporate tax rate from 52 per cent to 47 per cent and a reduction of the top individual tax rate from 90 per cent to 65 per cent.

The whole idea is to give the U.S. economy a lift and create incentives for savings and investments. In Congress, there are two schools of thought. The old guard merely figures by slide rules that a tax reduction would mean X dollars less of Federal revenue; that Federal expenditures should be cut to compensate for that and that the almost inevitable deficit financing is sinful. They cannot see that the U.S. has had deficit financing without inflation for years and that the economy is still going strong, but not as strong as it could be. The other school agrees with the President's premises.

The futility of all pro and con arguments is demonstrated by the fact that, out of a total Federal budget of about $90,000 million, $51,000 million go for defence, that is uneconomic expenditures in the sense that they do nothing but create jobs and only in a very indirect way contribute to sound economic growth.

Disarmament

There is very little agreement in this area either. The U.S. Arms Control and Disarmament Agency has issued a study entitled *Economic Impacts of Disarmament*. The broad conclusions of the panel of experts which put together this paper are:

(*a*) Disarmament of the type and at the pace implied by the U.S. programme "for general and complete disarmament in a peaceful world," submitted to the United Nations on 25th September 1961, after allowance for the proposed expansion of the National Aeronautics and Space Administration and the civilian Atomic Energy Commission programmes and the requirements of disarmament inspection and international peace enforcement "should create small danger of provoking immediate depression in the U.S. economy, assuming sensible adjustment policies and vigorous Government leadership to dspel adverse effects on business and consumer anticipations and to provide reassurance that aggregate demand will not be allowed to decline precipitantly."

(*b*) Steady decline in defence spending would extend over several years. It may prove a significant drag on the economy and pose serious problems for policymakers in some areas.

(*c*) A variety of adjustment programmes may be necessary, including retraining and relocation of individuals.

(*d*) If these problems are overcome, achievement of major national goals will be greatly facilitated by the use of human and material resources released from the defence programme.

International Trade

Another national foreign trade convention has come and gone. It was attended by some 2,000 international business executives and Government officials. They were concerned chiefly with two main issues: the U.S. Treasury's new rules on foreign income of American corporations and the balance of payments' deficit.

As stated in previous despatches, the new tax rules are highly complicated. U.S. taxes decrease, however, with the percentage interest an American company has in a foreign operation. Reduced to its simplest terms, income from an overseas company in which an American company has less than controlling interest pays less U.S. taxes than if there is controlling interest, regardless whether or not the income is repatriated or not. The net result is that American companies are selling their controlling interests overseas to native capitalists.

The National Foreign Trade Council, sponsoring the convention, also predicted that the U.S. would fall short $2,000 million in 1963 in the international payments' accounts. This would be about the same as in 1962 and would be the sixth straight year of U.S. balance of payment deficits.

LONDON LETTER

(*Concluded from page* 187)

when one considers that the building of houses and roads remains this country's first domestic priority.

But, when the unemployment due to the weather has been eliminated, there remains a frighteningly hard core. Total unemployment is now 3.6 per cent of the working population—a year ago it was 2 per cent. Of the total, 600,000 are "wholly unemployed" and the hard core, due to basic economic circumstances, must be very near this figure, or say 2½ per cent of the working population. This is the measure of the task of Government, to help shift this mass of work potential into real work. The N.E.D.C. ("Neddy"—the Economic Development Council), under the chairmanship of the Chancellor of the Exchequer, have accepted their staff report that a 4 per cent increase in productivity is practical and desirable this year. Even the achievement of this figure will not greatly reduce the hard core of unemployment, because there is so much underemployment of men and machinery, but, without it, the employment outlook will be bleak. This country has the potential to make a great economic surge forward and is looking for a Government that will achieve this objective.

PERSPECTIVES & PROJECTIONS

(*Concluded from page* 181)

it known just now that its calculations have proved that the poor will always be with us. Its "breath-taking" discoveries into Indian poverty were recently splashed as big news, showing that others also are sufficiently stirred by the theme, but what exactly was the purpose of such investigations at this time? What is 'enough' and what constitutes the starvation-line to enable the Planning Commission to decide these matters precisely? Nothing is yet known of the inquiries into the recent trends in inequality of incomes in the country since planning began and the Committee appointed for the purpose has apparently found it difficult to proceed; yet the Commission's research is reported to have disclosed that the top 10 per cent of the population accounts for one quarter of the aggregate consumption and that another 10 per cent at the other extreme, for only 3 per cent. This is *prima facie* very painful reading but did anyone expect it to be very different with present rates of population increase and levels of *per capita* income?

Let those, who can, get excited about these revelations. If this is merely a prelude for imposing larger burdens on the rich, the meaning will not be missed. But what are now relevant are not the broad facts of inequality but the latest trends in them and it is unlikely that Mr. Desai will be helped in locating the persons who can bear additional burdens without unease. The sectors to which new incomes have gone cannot be clearly separated from the rest of the community for tax purposes and any general measures may not only affect everyone indiscriminately but actually spare those who have to be taxed. It is not the average householder who is scared by rumours (since denied by the Reserve Bank) of demonetisation of 100-rupee notes; nor does he queue for grasping gold ornaments before their purity goes down under the new dispensation. But these are the groups which get the best of all possible worlds. The trading sector has been the biggest beneficiary of the era of planning and development but I do not think Mr. Morarji Desai has effective steps in mind to make them share the burden of defence and development.

But apart from this iniquitous system of imposing burdens, an important issue is to what extent recent trends in inequality affect demand and growth? One of the puzzling features of the present situation is the relatively lower price level and, unless one is so naive as to believe that it is due to large output or the innate goodness of the commercial classes and their refusal to profit by the present situation, one is left without a convincing explanation. Until prosperity percolates to the bottom, some of the distortions in demand are inevitable; on the other hand, there is some advantage in the short run if resources can be devoted less to current consumption of large masses of the population and more to diversifying the structure of the economy to enable it to face future demands. It is an exciting subject, particularly in view of our lack of knowledge which enables divergent points of view being put forward with extreme ease. But the present temper of the nation calls for some seriousness in our approach to major issues: the Planning Commission will lose nothing if it defers its excursions into these realms of inquiry to better times.

INDUSTRY AND TECHNOLOGY

(*Concluded from page* 184)

terms as a discovery or an invention and its application to practical use has increasingly become indirect. Frequently, there is a time-lag between a new discovery and its application, and the science of this process or technology is now a separate discipline. This is an illustration of what I have already alluded to, namely, increasing specialisation and the higher cost of exploiting an invention. As Prof. Fruton says in the article from which I quoted earlier: "Because of the greater impact of scientific theory on the development of technology, the skilled artisan has been gradually replaced by the scientific engineer." Research when undertaken in an industrial corporation's department and required to be translated into practical techniques and methods is a co-operative enterprise, and not an individual performance and achievement as in the past. There is little chance today of an inventor coming out of his bath tub shouting "eureka" as in ancient times.

Our national plan demands continuous technological development and a mounting supply of technicians. We have to see that our educational institutions meet the requirements of the modern technological age and adapt education to the development of abilities and skills essential for workers by brain and by hand. Research is being carried on in our country in many government-sponsored laboratories and institutions and, recently, an attempt has also been made to set up co-operative research institutions by some industries. But I should frankly say that little is known to the public of what is actually being done in these institutions. Although we know that hundreds of highly qualified persons are employed in these institutions, on research work, we see few signs of application of such research to our numerous and urgent problems of agriculture, industry and transport. We are continually asked to be thrilled by the scientific and technological revolution that is taking place in the world but what is pertinent is our own contribution, however modest, to this revolution. Massive buildings and expensive apparatus, conferences, committees and delegations do not ensure research. It is the imagination, inventiveness, determination and co-operative spirit of those who guide policies and those who work in such institutions that really counts. To take another example, the cotton textile industry which is the oldest organised industry in the country, set up co-operative research institutions about a century after its establishment. Besides, at the factory level in various industries where the infinite number of small changes in manufacture could reduce the unit cost or improve the product—research is still rarer. Research consciousness is not yet widespread in industry and unless this becomes ingrained, genuine and widespread, it will tend to retard our progress. Industrial development should have its roots in our own soil and not be a transplanted sapling.

Industrialists and technologists have, therefore, a heavier burden to carry than we normally realise; it is their task not only to build and work factories, not only to make profits and secure cushy jobs but also to lay the foundations for future growth. There is need for a fuller recognition of this function and a consciousness of the responsibility resting on all of us. The role as technologists is, therefore, by no means circumscribed or limited and by devoting themselves to the task, they will help in placing India again in the forefront on the industrial map of the world.

COMMERCE

"For Commerce, though the child of Agriculture, fosters his parent
Who else must sweat and toil and gain but scanty fare."
William Blake.

VOL. CVI. No. 2703 BOMBAY, 9th FEBRUARY 1963 PRICE Rs. 2

A TIMELY WARNING

THE Committee of the Federation of Indian Chambers of Commerce and Industry has rendered a signal service to the country by issuing a Press *communique* on the highly unsatisfactory manner in which the Government is handling the problem of gearing the economy to meet the challenges posed by China. It is, indeed, a pleasant surprise for us to find that the Committee could be as forthright and candid as it has been in its assessment of the "progress" made by the Government in this direction ever since the declaration of the state of emergency nearly four months ago, because it has invariably been soft in its criticisms of the Government. Apparently, the members of the Committee must have strongly felt that the Government deserves to be pulled up, if the country is to be saved from the dangerous drift in an ocean of words before it is too late. They were perfectly right in doing so, for even Parliament which met last week did not care to devote attention to this vital aspect, having been busy all the time with the proposals of the Colombo Conference.

There is no exaggeration in the Federation's claim that the Indian business community has wholeheartedly assured the Prime Minister by word and deed that "businessmen, small and big, throughout the country will do all in their power to build up the economy which is the core of our democracy and defence effort." The rapid fall in price levels since the emergency began reflects, in large measure, the co-operation extended by the business community. The large contributions to the National Defence Fund provide further evidence of its support to the defence effort. But voluntary restraints and voluntary contributions out of past savings alone will not suffice. There is a limit upto which they can yield sustained results. Already the price line is tending to look up. The index number of wholesale prices of all commodities, which had gone down from 130.8 in the week ended 17th November 1962 to 125.0 in the week ended 29th December, has been gradually edging forward since then; it was 125.8 in the week ended 12th January 1963, the latest week for which data are available at the time of writing. It is only through more production that the price level can be kept down and larger savings found for financing the defence effort. The Prime Minister has been repeatedly saying that it is not enough to put more men under green khaki uniforms and that the army has to be backed by greatly strengthening the industrial potential. But it is vigorous action aimed at achieving defence in depth that is lacking. And it is to this deficiency that the Federation's Committee has drawn the attention of the public in its statement to the Press. "The Committee cannot help feeling," to quote from the Press *communique*, "that, for some reason or other, neither the enthusiasm of the people nor the opportunities which the challenge has presented have been as urgently and fully utilised as ought to have been done by the authorities." Viewing the general position with serious concern, the Committee says:

> "On the economic front, the rate of growth is showing a declining tendency. Agricultural production has remained almost stationary; the pace of industrial development has slackened. There is stringency of finance, the credit policy of the Reserve Bank continuing to be restrictive. The stock exchanges are in a poor state. There are many signs of uncertainty and depression in the economy, precisely when it should have been invigorated to assist the defence effort."

Although, here and there, one may find signs of improvement in production, broadly speaking, the Federation's statement correctly sets out the situation. The most important point that needs to be noted, in this context, is that the country's performance on the production front could have been far better had there been less doctrinairism in the fiscal and industrial policies of the Government. The position is positively disturbing when one comes to think of the lack of progress on the agricultural front. It is no use consoling oneself by pointing to the net improvement that has taken place in production and productivity during the past ten years. What is really relevant, in this context, is the stagnation in agriculture as a whole in the three years 1960-61 to 1962-63. The slackness here reflects, in the main, the absence of dynamism (a word which the Prime Minister himself seems to have forgotten these days) at the level of administration in the States, in particular, and the Centre, in general. Something effective needs to be done which would compel the State Governments to shake off their lethargy and to show the results contemplated in the third Plan. The Federation's Committee has not brought out this vital point in its Press *communique*.

The Federation's observations on the monetary policy of the Reserve Bank seems to imply that it is in favour of cheap money policy. Here it is not realistic. With a large amount of expenditure ahead, with supply lagging behind demand and with a chronic balance of payments deficit, a general cheap money policy of the type pursued in the last war and post-war years will be highly conducive to inflation, the evils of which are already well known. In a closed market of the type that India has been having for almost all varieties of manufactured goods, the only instrument that can exact efficiency at all levels of the public and private sectors is dear money. It is also a good instrument for stimulating savings in the country. Buoyancy in share markets engendered by cheap money and liberal credit facilities will only whet the appetite for speculation among investors rather than for effecting genuine savings. In saying all this, we do not minimise the importance of adequate bank credit for productive purposes. Nor is this envisaged in the Reserve Bank's policies. Sufficient credit must, of course, be available for all genuine productive purposes, but that must be at a cost which will enable the banks to mobilise resources of their own and not rely excessively on central bank credit. Post-war economic development in many parts of the world has thrown up enough evidence to show that dear money policy does not deter economic growth of countries lacking in basic resources. There may be need for extending concession to some special sectors as, for instance, exports and agriculture. But this need is amply provided for in the Reserve Bank's credit policy. The Committee of the Federation of Chambers of Commerce and Industry would do well to think afresh on this important aspect of economic policies.

This qualification of ours on the Federation's observations on the defence effort should not distract one's attention from the main point of its criticism, namely, that "there seems to be an inexplicable indecisiveness and slackness in the rank and file of the administration." Proceeding, it observes:

> "There has been little evidence of the authorities taking advantage of the co-operation so readily offered by industrial establishments in private hands to galvanise defence effort. There is a virtual freeze on plans of expansion and development of industries. Market conditions have now become such that flotation of new companies is extremely difficult. The Commerce and Industry Ministry recently announced that applications for licences for over 210 industries will not be any longer entertained. The number of industries on the priority list for development is hardly ten. Even at this critical juncture, Governmental policy seems to be hampered by old ideology rather than meet speedily and effectively the exigencies of the situation. There does not seem to be any measurable heightened activity in the public sector enterprises either. Granting that such activity is brought about, it will be impossible to meet all our increased requirements by the public sector alone. In this connection, it is relevant to keep in mind the fact that the contribution of industry in private hands is more than 90 per cent of the value of goods and services generated in the economy. Facts as well as needs demand that all the resources in both the sectors should be fully utilised. There must be a common endeavour as much as common thinking on the common problems. Only then . . . would we be in a position to utilise the services of the expert teams which have and are due to come from friendly countries to study our problems of defence production and expansion."

Perhaps, for reasons of brevity and a desire to avoid acrimonious controversy, the Federation has refrained from giving instances to substantiate its criticisms. But several can be easily quoted. There is the refusal of the Government to allow the general insurance companies in the private sector to administer the emergency insurance scheme on no-profit basis. The oil policy of the Government, under which the existing petroleum companies with an excellent record of service and plenty of resources are not allowed to expand their operations in the country, is another typical instance. A third is provided by the manner in which th public sector steel company pinched away th foreign collaborator with which the Tata Iro and Steel Company Ltd. was negotiating fo putting up an alloy and special steels plant a Jamshedpur, thereby compelling it to give u the scheme in despair. The refusal of the Gov ernment to give sanction to the scheme submit ted by the industrialists in Madras for puttin up a large-sized power plant that would tak care of the periodical power shortage is anothe example of ideological considerations standing i the way of the country's industrial progress. Th doggedness with which the Maharashtra Gov ernment is applying its legislation on land ceil ings to the most efficiently and soundly manage sugarcane farms belonging to the sugar fac tories in the State is one more instance of th premium placed by the powers-that-be o doctrinairism. There is not a shred of evidenc in this case to show that either the defenc effort or the welfare of the have-nots in the country will be bettered by disturbing the existing arrangement which has stood the tes of time and proved its superiority over the systems prevailing elsewhere in this country And yet the Maharashtra Government, with the connivance of the Centre, has decided to stick to its policy. Obviously, prestige is a more important consideration for the Congress Party than the national emergency. Similar instances, large and small, can be multiplied. But the

that the Federation's criticism is not without substance.

If the Governments at the Centre and the States do not pay heed to the timely and well-intentioned warning given by the Committee of the Federation, the consequences will be pretty serious to the economy. What will they be? "As defence expenditure mounts, as it should, the nation will be faced with a dual problem: there may not be enough defence equipment to match the enlargement of our armed forces; neither will there be adequate consumer goods, resulting in excessive pressure on demand and higher prices, for which the business community will again be blamed, although the situation will be beyond its control." In short, there will be inflation of the worst type and discontentment among the people which in turn will weaken the defence efforts from within. The ground will become quite fertile for the communists to spread their creed. This is precisely the sort of situation that Communist China (and Russia, too) is hoping would develop in this country. Is it not time now that our policy-makers realised the danger and took appropriate steps to avert it?

STEEL AT THE CROSS-ROADS

THAT steel is basic to both defence and development needs no elaborate reasoning. But to some at least, who are allergic even to the mild heavy-industry bias of Indian planning, the proposition is not quite that self-evident. These critics can just find the proof, if any proof were needed, in the ever-increasing development needs and mounting defence requirements for steel. The competing demands for this most basic of all basic materials are too many and too large to be satisfied by an industry which, as of today, has an annual capacity of no more than six million tons in terms of ingot steel. The compulsions of industrialisation and national emergency alike have thus brought the iron and steel industry to the very cross-roads. Whether the industry is to take to the road of further large-scale expansion and faster growth or to continue in its present course of halting and modest advance is an issue of far-reaching public importance. What the decision on this issue should be is obvious. It can be nothing less than a decision in favour of "a bold and imaginative steel expansion programme."

The words within inverted commas in that last sentence are those of Mr. C. Subramaniam, Union Minister for Steel and Heavy Industries, who inaugurated the international symposium on "recent developments in iron and steel-making" on the 4th instant at Jamshedpur. The Minister's preference for a bold steel plan is perfectly justified, for, as he himself put it so pithily, "there are no rebates for caution in economic development, and the economic history of nations has nowhere recorded a penalty for boldness." The continuing drain on foreign exchange to the tune of Rs. 100 crores a year on steel imports provides further justification for a faster development of the industry. That the Steel Ministry under Mr. Subramaniam's stewardship means business is clear not only from the energetic steps taken in recent months for fuller utilisation of capacity in the public-sector steel plants but also from the Minister's announcement, on the 5th instant at Jamshedpur, that the first phase of Indian Iron and Steel Company's expansion programme, envisaging a capacity increase of 304,000 tons in terms of ingot steel, has been accepted by the Government in principle. Formal approval of the I.I.S.Co.'s expansion scheme is, incidentally, a foregone conclusion.

All this is heartening. But one cannot jump to the conclusion that a "bold and imaginative" steel plan, besides the scheduled expansion of the three public-sector steel plants under the third Plan, is already in the making. What is underway or in immediate contemplation is "expansion" in a limited sense—that is, expansion of production to the full limits of capacity already installed in the industry or, as in the case of the I.I.S.Co. scheme, expansion based on the expected higher productivity of the existing blast furnaces and open hearth furnaces. Expansion of the kind involved in, say, doubling the capacity of any existing steel plant in the private sector seems to be out of question as far as the third Plan is concerned, for, according to the Minister himself, no decision has yet been taken on the second phase of expansion proposed by the I.I.S.Co. for raising its ingot capacity to two million tons. The Government is presumably in no mood yet to permit large-scale expansion of either private-sector steel plant. But it is not inconceivable that it may yet realise that an "imaginative" steel plan should also involve an "imaginative" approach to expansion in the private sector of the steel industry. Significant, in this connection, is the Minister's statement that the question of I.I.S.Co.'s further expansion (that is, up to two million tons) "would be settled when a general policy decision is taken on the expansion of private-sector plants during the fourth Plan period."

No less significant is his refusal to be drawn into a discussion of the view expressed by Mr. Fiennes, President of the U.K. Iron and Steel Institute, at Jamshedpur—the view that, for some time to come, India would be well advised to expand existing steel plants and not to establish any new units in view of the shortage of technical and managerial manpower. Since the Government has not ceased to consider the I.I.S.Co.'s second-phase expansion scheme for possible approval, there is ground for hope that its interest in the establishment of new plants like the one proposed at Bokaro does not necessarily involve lack of interest in the expansion of existing plants. After all, the economic advantages, in terms of a much smaller outlay, of doubling an existing one-million-ton plant, in preference to establishing an entirely new one-million-ton plant, are too manifest to be ignored by the Government. Noteworthy, in this connection, is a paper discussed at the Jamshedpur symposium, in which it is shown that expansion of existing plants plays a substantial part in the growth of steel capacity in all major steel-producing countries. As the authorities presumably recognise the advantages of expansion, they should expedite a policy decision in the matter and not delay things as in the case of the I.I.S.Co.'s first-phase expansion scheme which has taken more than a year for getting approved even "in principle." An early favourable decision will make for early preparations by the private steel plants concerned.

Leaving aside the question of expansion of existing plants, one would like to know the official ideas in regard to entirely new plants. Mr. C. Subramaniam's present ideas, in this connection, may or may not find their way into the final policy. Still, they are worth considering, if only because they are indicative of a particular line of thinking in high quarters. There is, for instance, the Minister's proclaimed preference for the establishment of coast-based steel plants using indigenous iron ore and imported coal, supplemented by coal found in India. It is true that reserves of good quality coking coal are not abundant in India. But the economic feasibility of coal imports is not beyond doubt, what with the continuing ban on trade with South Africa. Nor are the technical and economic practicalities of blending imported low ash coals with domestic supplies quite established yet, for the Central Fuel Research Institute has not concluded its investigations. The expert group entrusted with the task of studying the feasibility and economics of a possible integrated steel plant in Goa, based on imported coal, is still at the job. Above all, there is the question whether a steel industry, based on imported coal, will be able to operate as profitably as a steel industry, such as that of Japan, which is based on imported iron ore. The economics of the proposal would call for some very careful examination before any policy decision can be safely taken.

Likewise the economics of small or medium-sized pig iron plants, based on the technology of low-shaft furnaces using non-coking coals, merits further investigation, especially because the Government, which has decided to license a million tons of pig-iron production in such plants, does not seem to have given careful thought to the cost aspect. Some scientific experts of the National Metallurgical Laboratory have, of course, sought to justify this move on two grounds. First, there is no price control or retention price on foundry grades of pig iron made in small plants; this will allow them in effect greater profit per ton of pig iron under Indian market conditions than is permitted in the case of a large integrated steelworks. Secondly, the small-scale plants will have a much less capital investment per annual-ton of pig iron output in relation to the corresponding capital investment in an integrated steelworks; this will have some specific economic advantages. The validity of these arguments is open to doubt, for the first one ignores the aspect of unit cost and takes into account the favourable price aspect in the existing conditions of market scarcity, while the second ignores the aspect of productivity per man-hour which, again, is related to the cost aspect. The question of pig-iron production in small plants can be usefully examined afresh, for the licensed plants are not likely to spring up overnight. A timely reversal of policy, if it is called for by fresh investigations, would be preferable to its abandonment after a time when a number of small, uneconomic plants will have come up.

In the iron and steel industry, the economies of large-scale operations are of crucial importance. As a paper contributed to the Jamshedpur symposium has emphasised, the size of new steel works should be determined in terms of an optimum capacity of four to five million tons of ingot, to begin with, because a modern primary rolling mill has equivalent capacity. Such large-sized iron and steel plants, according to the authors of the paper, will save both capital and foreign exchange in view of the lower outlay need per ton of capacity. Considered from this angle, there is a case not only for further expansion of the existing steel plants to realise the economies of scale but also for having the layout and initial choice of equipment of new steel plants to be such as to permit sizable future expansion. Here, again, is a matter involving high policy which, it is to be hoped, will be shaped with boldness and vision, so that the steel industry can take a big leap forward from the cross-roads at which it is now standing.

HOUSING PROJECTS

HOUSING is one of the immediate casualties of the national emergency which has necessitated some readjustments in financial allocations for the third year (1963-64) of the Plan—readjustments involving somewhat smaller allocations for the broad sector of social services and bigger allocations for development services. Central assistance for housing projects in the coming financial year, according to an announcement made by the Union Minister for Works, Housing and Rehabilitation at the State Housing Ministers' Conference held at Bombay on the 4th inst., will be no more than Rs. 14 crores, as against Rs. 20 crores allotted in 1962-63. The proposed cut of Rs. 6 crores can, however, be largely made good if the Life Insurance Corporation, which made available Rs. 16 crores during the first two years of the Plan, as against the expected Rs. 20 crores, advances the balance of Rs. 4 crores, along with its annual instalment of Rs. 10 crores, in 1963-64. The State Housing Ministers' Conference has, therefore, done well to appeal to the L.I.C. for making good the expected shortage of funds. The Chairman of the L.I.C., it is gratifying to find, has not only given the assurance that the sum of Rs. 50 crores to be provided by the Corporation during the five years of the third Plan period would be fully disbursed but also promised to examine the possibility of providing more funds in view of the importance of housing and the proposed cut in Central assistance.

In the light of this assurance given on behalf of the L.I.C., there would seem to be no case for diverting to State housing projects the additional Rs. 10 crores to be given by the Corporation for setting up a Central Housing Board. The State Housing Ministers' demand for such diversion of funds, in this connection, amounts to a plea for postponing indefinitely, if not scrapping altogether, the Central Housing Board Scheme. It would be useful, in this connection, to highlight the manifest advantages of the proposed scheme in the planners' own words:

"Such an organisation (that is, a Central Housing Board) could help to channel additional funds into housing, encourage the flow of credit on easy terms, amongst other things, by means of insured mortgages, improve lending practices and provide the machinery needed for the creation of a sound mortgage market in housing. It could, for instance, raise finance directly to some extent and provide loan assistance to State Governments or State Housing Boards for purchase and development of land, construction of houses and acquisition and redevelopment of slum areas. Funds obtained from the Life Insurance Corporation and from the Central Government could be channelled through it. In States where Housing Boards already exist, they generally serve as construction agencies for implementing the State housing programmes. The existence of a Central Housing Board and of Housing Boards in the States could, in due course, secure for the development of housing resources which might not be otherwise readily available. Together these institutions could assist in evolving housing policies which would facilitate construction of houses by persons of limited means for their own use and also enable banks and other financial institutions to undertake various services."

The Conference, which has pleaded for top priority to industrial housing on the ground of its importance to industrial production in the context of the national emergency, has urged that every major project, in both public and private sectors, should provide for workers' housing and that licences for new industrial undertakings should be given only after the Union Ministry of Commerce and Industry has satisfied itself that sufficient land has also been acquired for constructing houses for workers. The practicability of these proposals is by no means clear. With the fate of legislation for acquiring land for industrial uses still hanging fire, several industrial projects have been held up. It is a moot point whether acquisition of land for housing industrial workers will be regarded by the Courts as an essential public purpose. That apart, the proposed condition is nothing new. It was tried in the past by the then multilingual Bombay State and found that it only served to retard industrial growth in the State. Housing is essentially a social project, the return on which is so low that it will prove a deadweight on any new industrial project sponsored by the private sector. *Entrepreneurs* will find it difficult to attract sufficient capital, if they are to build houses for workers on their own account. The net result will be a decline in the rate of industrial growth and with that a fall in employment opportunities. It is painful to see that our leaders do not learn even from experience. It was a sheer waste of time for the Conference to have brought forward a proposal envisaging compulsion on industrial employers for providing housing for workers even after this remedy had been tried by the Bombay State and found wanting. Housing is essentially a civic function and falls more appropriately under the purview of Local Authorities and State Governments. It is their business to build industrial towns and maintain them on hygienic lines. But, unfortunately in this country, most politicians in power have been lazy, content to pass on all their difficult duties to private *entrepreneurs*. Anyway, it is to be hoped that, at least, the Union Ministries of Finance, and Commerce and Industry, as well as the Planning Commission, will display more realism than the Conference has done on this question. The right approach to it seems to lie in the direction of encouraging employers to build houses, to the maximum extent possible, under the subsidised industrial housing scheme which provides for 75 per cent assistance from the Government. But, if this alternative were to yield satisfactory results, the genuine difficulties which have been experienced by employers would have to be remedied at the earliest.

MARKET GOSSIP

Forward Market for Pepper in Bombay

AT long last, hedging facility of a limited character for pepper has been established in Bombay under the ægis of the Pepper and Ginger Merchants' Association. The forward market, as distinct from a futures market, was inaugurated by Mr. R. Doraiswamy, the outgoing Chairman of the F.M.C., on Thursday the 7th inst. The first token deal in the *Chaitra* (April) transferable specific delivery contract for the minimum permissible unit of 25 quintals was struck at Rs. 297 a quintal, as against the ruling spot price of Rs. 278 and the April quotation of Rs. 274 in Cochin, between Mr. Zaverchand Shah, Vice-President of the Association, and Mr. Vallabhdas Mariwala, President of the Association, with Mr. Doraiswamy accepting the bid on behalf of Mr. Mariwala as the seller. The President proved to be wiser than his deputy. For thirty minutes after the deal was made, the price was six points lower. The deal, however, had been squared up long before.

There has been a long-drawn-out controversy between the trade here and in Cochin over the need for a forward market for pepper in this metropolitan city. A reference to that controversy was made by Mr. Mariwala in his presidential speech at the inauguration function, as also by Mr. Doraiswamy in his opening remarks. Cochin had contended that a market in Bombay would rob the market in the producing State of all its significance and even make it subservient with the dominating influences of money and speculation. Bombay's case had rested primarily on the ground that the country's 60 per cent exporters in this city had found it almost impossible to pull on with a far-away market down south.

Mr. Doraiswamy said that a stage was reached, during the period of the controversy, when the Union Government had concluded that the market in Cochin was adequate to take care of the pepper producers as also of exporters. It was only through the good offices of the late Mr. W. R. Natu and Mr. Doraiswamy that the Association in Bombay could succeed, as Mr. Mariwala said, in convincing the India Pepper and Spice Trade Association of Cochin that a forward market in Bombay would be not competitive but complementary to the one in Cochin and would help broaden the trade in both the centres and enable the interests of the trade to be served more efficiently.

Mere words do not seem much. The Association in Bombay has, therefore, rightly placed the trading in this city (possibly under instructions from the F.M.C.) on par with that in Cochin in all respects, with the minor exception of dealings in ungarbled pepper and not garbled pepper as is the case in Cochin. In order to minimise the scope for unhealthy speculation, the Association has laid down in the by-laws governing trading that every member must pay a margin of Rs. 30 per quintal on daily outstanding business exceeding 50 quintals which represent the free-limit. The margin will be refunded on the settlement of the excess business. It may be noted here that the basis and the rate of margin are the same as in Cochin. There will be eight contracts in a year, two running at a time, as in Cochin, to be opened with the permission of the F.M.C. A board of 16 members comprising four each from exporters, the Association members, dealers and the Government is to supervise the trading.

The Association has ample experience and tradition in running a forward market. Long before the Cochin market was established some six years ago, it had the privilege of having a forward market from 1938 to 1942-43 and thereafter an officially regulated forward market for trading in non-transferable specific delivery contracts till January 1959 when it was closed at the Association's own initiative following the possible entry of big speculators from other commodity futures markets. The sense of responsibility thus displayed by the Association has in no small measure been responsible for securing permission for reviving the forward market. As the Association has both resources and tradition to its credit—it has as many as 80 members, as against some 50 in Cochin—the forward market in Bombay may soon supersede the one in Cochin in importance. As in all other fields, so also in forward trading in pepper, Bombay's role will be that of the big brother. It will also mean, as Mr. Doraiswamy said, that it is Bombay and not Cochin that will be blamed if, as a result of speculative activity, either producers of pepper or exporters of pepper suffer.

Cotton Yarn Prices

The Indian Cotton Mills Federation has just announced an upward revision in the net ex-mill prices of single hank yarn spun from Indian cotton. The increase actually effected (from the 6th of this month) varies from yarn to yarn depending on the counts. The prices have been raised only modestly in the case of lower counts but markedly in respect of higher counts. The revised price of six counts yarn (produced from cotton waste), for instance, represents a rise of just 6.90 nP per lb. as compared with the price fixed in January 1961, whereas, at the other end, the price of 40 counts has been enhanced by 47.50 nP per lb.

This is the first time since the inauguration of the voluntary price scheme over two years ago that an upward revision has been effected. These two years, it will be recalled, have witnessed a steep rise in the production costs of mills. The wage bill of the industry has gone up quite substantially following the implementation of the Central Wage Board's recommendations. The basic monthly wage of a worker has been enhanced by Rs. 8 in several centres and by Rs. 6 in some others. The industry is also paying more by way of dearness allowance, thanks to the continuously rising cost of living. The average dearness allowance paid by the Bombay City mills in the month of August 1962 was as high as Rs. 98.75, as against the monthly average of Rs. 91.79 for the year 1961 and Rs. 89.25 for 1960. Further, the employers' contribution to the State Insurance scheme for workers has been doubled since the ceiling prices of yarn were fixed in January 1961. There has also been an overall increase in the prices of raw cotton, spares, accessories, mill stores, chemicals, coal and power.

While the cost of producing cotton yarn continued to rise, sales realisations were comparatively lower, as the selling prices could not be raised under the voluntary price regulation scheme. Consequently, spinning units were incurring losses on yarn sales. It was the middlemen who made profits by selling yarn at prices much higher than those at which they obtained supplies from the mills. No wonder that there was a wide gap between the ex-mill prices and the prices actually ruling in the markets. By enhancing the ex-mill prices, the Cotton Mills Federation has plugged this loophole to some extent, besides covering a part of the higher output cost. Simultaneously, the Federation has sought to rationalise the structure of ceiling prices for cotton yarn. Thus, in fixing prices for the different counts, due account seems to have been taken of the differences in the cost of spinning these counts. Proper price differentials have also been fixed for the yarn produced from foreign cotton, yarn on cones, doubled yarns, intermediate counts and mixed yarns.

Sugarcane Price Formula

More than three months have elapsed since the new sugarcane price formula came into force and it is now pretty clear that, as a result of the application of the formula, the incidence of cane cost in sugar manufacture, which is already heavy in all conscience, will be heavier still. It is rather difficult to calculate the actual additional burden that will fall on the sugar industry as a whole, inasmuch as the payment to cane growers differs from factory to factory. One estimate places the extra burden at not less than Rs. 12 crores annually. It is true that the new formula, which links cane price to recovery per cent of sugar, marks a welcome departure from the defective system that had completely ignored quality considerations. And it is also true that the sugar mills are no longer liable to pay to cane growers a share in the price of sugar realised by them in excess of the fair ex-mill prices. The latter is, however, no advantage now, because the mills have been realising less than fair ex-mill prices, thanks to the loss they have to bear on exports and the large monthly releases by the Government which keep the market prices well under control. As for the former advantage, it has been more than neutralised partly by the disquieting feature built into the formula itself and partly by the Government notification indicating the price for cane payable by each factory. The disquieting feature is the fixation of the high minimum price of Re. 1.62 per maund for cane with a poor recovery of 9.80 per cent (as against the usual basis of 10 per cent) and the Government notification which took into account only the good months of the season as the basis for fixing cane price. Indeed, there is no exaggeration whatever in the statement of Mr. H. V. Reingar, Chairman of E.I.D.-Parry Limited, that the bias in favour of the grower goes by the name of payment by quality. In his statement circulated to the shareholders of the Company the full text of which appears on pages 234-235 of this issue, Mr. Reingar has explained this bias by citing the instance of the Nellikuppam factory. Here are the details given by him:

The actual duration of the season in the Nellikuppam factory during 1961-62 was 201 days from the start of the season on 19th November 1961 to its close on 7th June 1962. Instead of taking the recovery of 9.23 per cent over a duration of 201 days in which case the price would be Rs. 41.12 per tonne, the Government of India has taken the best part of the season—121 days from December 1961 to March 1962—as the prescribed duration. The recovery for this period is 9.8 per cent and the cane price works out to Rs. 43.40 per tonne. The extra cost involved on the anticipated crop in the 1962-63 season is Rs. 7.5 lakhs.

The bias in favour of the grower at the expense of the industry apart, the new price formula still suffers from the self-same defect as the old one, namely, placing a premium on inefficient farming. For the growers who supply low quality cane before December or after March get the same price as those who supply the highest quality cane in the peak of the season. How can such a mode of payment provide the requisite incentive for the cultivation of cane with richer sucrose-content? This view is shared by another sugar company chairman, too. Thus, Mr. Venugopal Naidu, Chairman of the Mysore Sugar Company Ltd., remarked, when he addressed the annual meeting of the Company last week, that only by encouraging the growers to produce quality cane with high sucrose content could the ultimate aim of reducing the cost of sugarcane be achieved. Even at the risk of repetition, one has to point out that the most sensible thing would be to fix the minimum price as the maximum to be paid for cane with the highest sucrose-content, say, 11 per cent if not 12 per cent, or, alternatively, the Government should at least extend the premium payment for the increase in sucrose-content upto 12 per cent, instead of stopping it at 10.14 per cent, as has been done now. Surely, the areas and farmers with better records ought to receive a better reward than those whose performance is below the mark.

There seems to be no end to treating the white sugar industry as a milch cow. One Government or another keeps on tapping it for more revenue. A perusal of Mr. Iengar's statement will show that the Madras Government has raised the rate of cess on cane from Rs. 2 to Rs. 5 per tonne, the ostensible purpose being development of cane. Considering that only a fraction of even the present revenue from cess is spent on cane development, Mr. Iengar cannot help feeling that the industry is being taxed once again without justification for the purpose of increasing the general revenues of the State. With a sales tax of 3 per cent *ad valorem* and a cess of Rs. 5 per tonne, Madras has, he says, the distinction of charging the highest tax on sugarcane in the country in terms of its incidence on the cost per tonne of sugar.

The cost of sugar production is steadily moving up. Take the case of the Nellikuppam factory, for instance. The factory, according to Mr. Iengar, may have to pay, besides the incidence of additional cost of cane under the new formula amounting to Rs. 7.5 lakhs, an extra Rs. 10 lakhs as a result of increase in cane cess and another Rs. 3.5 to 4 lakhs by way of emergency risks insurance premium, or a total additional burden of Rs. 21-22 lakhs annually. The sugar industry will, of course, be prepared to bear the additional burden, provided there is enough scope for manipulation in prices. But the question is whether such scope actually exists. Both Mr. Iengar and Mr. Venugopal Naidu have expressed concern over the low level of sugar prices. There is no denying that the industry must get a fair price for sugar that will yield a reasonable margin of profit which is so very necessary for the purpose of maintaining the existing capacity in good order and undertaking future expansion and development programmes.

Higher P. F. for Four Industries

The minimum rate of provident fund contribution by employers under the Employees' Provident Fund Act 1952, and the scheme framed thereunder, has been raised from 6.25 per cent of total wages (basic pay plus dearness allowance, including cash value of food concessions, if any, and retaining allowance) to 8 per cent, with effect from 1st January 1963, in respect of four industries. The industries concerned are (1) cigarettes, (2) electrical, mechanical or general engineering products, (3) iron and steel, and (4) paper, excluding hand-made paper. The employees, too, will have to make matching contribution at the higher rate of 8 per cent. The enhanced contributions are applicable only to factories and establishments employing 50 or more employees, while the old rate of 6.25 per cent will hold good in the case of smaller establishments employing 20 to 49 persons. At present, the Act applies to

TREND OF SHARES

WEAKNESS PERSISTS

(From Our Own Correspondent)

BOMBAY, *7th February*

STOCK exchanges continued to be virtually devoid of support this week owing to the prevailing pre-budget uncertainty. Investors remained where they had been, that is, on the fence, as nothing but anticipations of heavy taxation in the next budget seemed to influence the trend of their thoughts. Cool, calculated and (one may call) intelligent readings of revenue already gone and accruing to the Exchequer by some bold analysts were discounted by the general tendency to emphasise only the mounting Government expenditure on civil and defence needs and reports suggesting a sizable increase in tax load, an upward revision of the tax on higher income-groups and a reduction in the permissible development rebate to companies. Although a few selected counters attracted some investment buying and closed slightly higher over the week, rallies in some other shares on bear-covering proved to be a short-lived affair due to stale liquidation. The overall tendency remained weak.

The lack of investment enquiry can partly be attributed to the continuance of minimum prices for four market leaders in Bombay and Calcutta. The market authorities have not only kept the leading shares at controlled rates but have also been reducing the minimum prices. This policy is no doubt designed to allow for adjustment of outstanding business by inducing sellers to square up their commitments at lower levels. However, in the case of shares for which minimum prices are still in force, this policy seems to have had limited application either because the shorts have been purposely defying the objective of the authorities or because sales in such shares are only against actual investments by those who finance *badli* business.

In the case of sales against investments, the positions can be squared only if investors are available. The market authorities can do very little here. But they can certainly make it obligatory for shorts to close their commitments at least now. Apparently, they have been trying the method of persuasion. But this alone, it seems, will not work. In the meantime, on expectations of a lower adjustment in the minimum prices of the few leading counters and its effect on prices of other shares, potential buyers have been keeping aloof from the market. It would, therefore, be in the interest of a healthy market if the authorities were to lift the minimum prices for the remaining few shares also and leave values free to seek their own levels. This may possibly deepen the depression, but it will also allow the counters to stabilise at some level. As short selling is prohibited, it is likely that the markets may remain steady at slightly lower levels.

* * * *

Thanks to the maintenance of the minimum prices, Steel shares had a restricted market on Dalal Street, with Tata Ordinary and Indian Iron closing unchanged at Rs. 117 and Rs. 21, respectively. The market ignored the statement of Mr. C. Subramaniam, Union Minister for Steel and Heavy Industries, that the first phase of the I.I.S.Co.'s expansion programme, envisaging an increase of 310,000 ingot tonnes in the capacity, had been accepted in principle by the Government. The Company's output in January last showed an increase in saleable steel from 66,444 tonnes to 68,972 tonnes and in pig iron from 116,804 tonnes to 120,068 tonnes and a setback in steel ingots from 91,175 tonnes to 86,248 tonnes. T.I.S.Co.'s production figures for the same month showed a drop of 1,500 tonnes in saleable steel at 126,500 tonnes and of 10,100 tonnes in pig iron at 151,700 tonnes against an increase of 900 tonnes in steel ingots at 159,100 tonnes.

Textiles ruled weak, with Standard shedding 10 points at Rs. 725. Some Miscellaneous issues evoked support, and notably better were T.E.I.Co. at Rs. 268 *ex-right*, as against Rs. 281.50 *cum-right* a week ago, Voltas at Rs. 244, as against Rs. 239 and Bombay Burmah at Rs. 626, as against Rs. 613. Hindustan Motors found buyers at lower levels and closed 8 nP higher over the week at Rs. 17. With the exception of a few shares, the cash section disclosed minor changes. Quoted *ex-div.*, State Bank were up by Rs. 14.10 at Rs. 385, S.L.M. spurted 33 points at Rs. 143 and New Standard Engineering gained 10 points at Rs. 156 presumably following the news of oversubscription of the recent one-for-two rights issue at a premium of Rs. 20 per share, while Dhrangadhra Chemical slumped by 19 points to Rs. 90 and Jayant Paper lost six points at Rs. 82.

* * * *

The Committee of the Calcutta Stock Exchange decided on Tuesday the 5th inst. to remove the minimum prices for Shree Gopal Paper and Orissa Cement and to reduce the prices for Indian Iron and Kesoram from Rs. 21.50 to Rs. 21, for G.K.W. from Rs. 34 to Rs. 33 and for Rohtas Industries from Rs. 11.75 to Rs. 11.50. As a result, Shree Gopal Paper showed a gain of 12 nP at Rs. 22.37, while Orissa Cement declined by 13 nP at Rs. 15.12 and the other four shares closed at the new minimum levels. Among others, Orient Papers declined by 35 nP at Rs. 34.40, Texmaco by 65 nP at Rs. 19.35, Birla Jute by 81 nP at Rs. 28.25 and Indian Cable by Rs. 1.10 at Rs. 33.09. In the cash section, Bengal Coal dropped by four points to Rs. 290 and North Beerbhoom showed a loss of 84 nP at Rs. 20.12, Budge Budge Jute lost eight points at Rs. 160, and Champadany and Delta declined by three points at Rs. 135 and Rs. 169, respectively. Except for a big fall of Rs. 19 in Rallis India at Rs. 131, Engineering and Miscellaneous sections had hardly any feature. Calcutta Chemicals improved smartly from Rs. 14.50 to Rs. 18. Paper and Sugar shares were easier.

* * * *

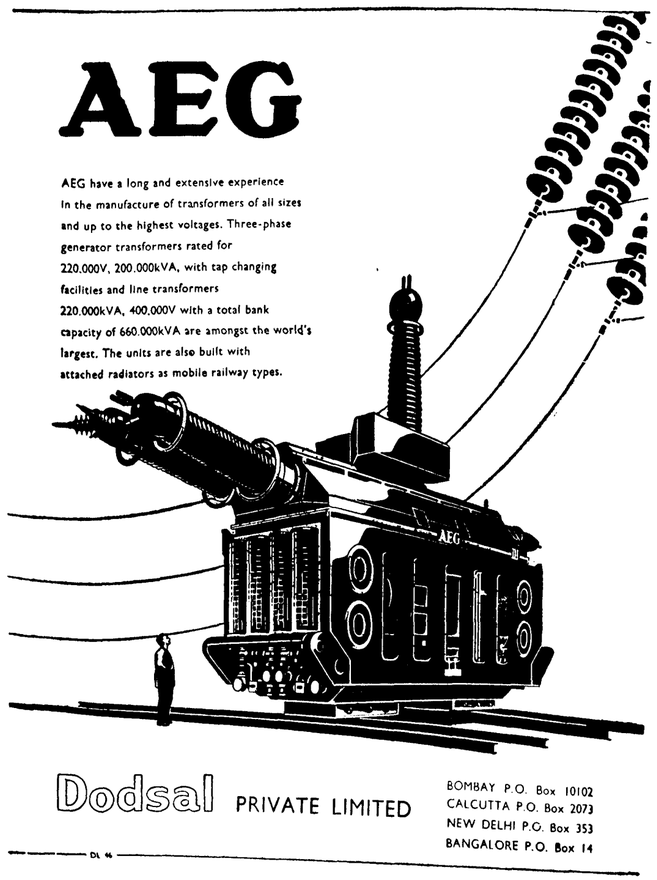
Activity on the Madras Stock Exchange was confined to some selected counters which closed, with a few exceptions, lower. Textiles were conspicuously weak with leaders like Buckingham declining by 20 points to Rs. 261, Bangalore Woollen by Rs. 10 to Rs. 228, Premier by Rs. 12.50 to Rs. 300 and S.I. Viscose by Rs. 3 to Rs. 124. In the Miscellaneous section, Tube Investments declined further by three points to Rs. 241, Textools showed a loss of Rs. 1.50 at Rs. 153 and Ashok Leyland were 28 nP lower at Rs. 7.72. Among Sugars, both Cauvery and United Brewery showed a loss of two points at Rs. 98 and Rs. 95, respectively. In Plantings, Coffee Lands suffered a big loss of Rs. 2.07 at Rs. 12, Consolidated Coffee declined by 37 nP at Rs. 15.60, Midland Rubber closed 25 nP lower at Rs. 10.25 and Blue Mountain shed 10 nP at Rs. 3.20, but Parkside improved further from Rs. 23.75 to Rs. 24.50.

UNICHEM LABORATORIES LTD.

The Unichem Laboratories Ltd., a new company incorporated in August last to take over as a going concern the business of the Unichem Laboratories of Bombay as manufacturing chemists and dealers in pharmaceutical products since 1944, has announced its capital issue of Rs. 22.05 lakhs for the public, all in equity shares of Rs. 100 each. The list opens on the 11th inst. and subscriptions will be accepted until the 16th inst. The total of issued capital is Rs. 45 lakhs, of which shares of the value of Rs. 22.05 lakhs have been offered to the vendor as fully paid shares for consideration other than cash. The Directors and their friends have been taken up shares of the value of Rs. 45,000.

The existing firm is said to be suitably equipped to make pharmaceutical formulations and chemicals. It has been granted sufficient actual users' import licences to meet its requirements for the manufacture of drugs. Some of the products are to be made in collaboration with reputed foreign firms, such as the Roshkilde Medical Company of Denmark and Shofu Dental Manufacturing Company Ltd. of Japan. The firm has lately received an industrial licence for the manufacture of the new anti-tubercular drug, namely, thiacetazone, which the tuberculosis committee of the British Medical Research Council has tried in Africa as a much more effective and economical substitute for the traditional paramino salicylic acid. The trials have shown that 158 mg. of thiacetazone give results equivalent to those obtained with 10 gm. of the other drug.

The Company will acquire from the firm the existing manufacturing facilities, trading activities and import licences. The existing firm enjoys a good reputation not only in this country but also in East Africa and Malaya, Ceylon and Thailand where its products are exported. Exports in the first seven months of 1962 exceeded the aggregate in the whole of 1961. Between 1958 and 1962, its sales almost doubled from Rs. 68 lakhs to Rs. 120 lakhs and its gross profit multiplied three times from Rs. 5.95 lakhs to Rs. 15.95 lakhs. Considering all this, the goodwill of Rs. 7.50 lakhs which it has charged the Company appears to be very reasonable.



BOROSIL GLASS WORKS LTD.

Some more light on the project of the Borosil Glass Works Ltd., a new company (the details of which were published on page 136 of *Commerce* dated 26th January 1963) jointly sponsored by Messrs. Industrial and Engineering Apparatus Co. (Private) Ltd. of Bombay and the Corning Glass Works of Corning, New York, U.S., were given by Dr. S. R. Lele, Managing Director of the former, at a reception on Tuesday the 5th inst. in honour of Mr. Cyril T. Paquette, Manager, Operation and Planning, and Mr. P. B. Dellisante, Financial Controller, Corning Glass International. Dr. Lele said that the Company would go into production by the end of 1963 and attain the rated capacity within three years. As the Company has been formed to take over as a going concern the business of I.E.A., it has succeeded in finalising formalities quickly. Its technicians sent abroad for training have arrived, and the Government's sanction has been obtained to engage foreign personnel. By the time the public issue is made, that is, in April or May next, the Company will be well set to take up its project.

The Company's sales are expected to rise from the current level of Rs. 35 lakhs to Rs. 180-185 lakhs in the next two years and to Rs. 200-225 lakhs when production reaches full capacity. Dr. Lele evaded the question on profitability, but disclosed that the present ratio of profit to sales, namely, 1 : 5, would be maintained. No new project, in addition to the other two existing units, is expected to take shape in the near future. And the Company's capacity output will be only one-third of the estimated demand at the end of the third Plan. Hence, the Company is not likely to encounter any serious competition. The collaborating firm has placed no embargo on exports. On the contrary, it will promote sales abroad.

BANK OF RAJASTHAN EARNS LESS

The profit (before taxation) of the Bank of Rajasthan Ltd. for the year ended 31st December 1962 is lower at Rs. 2.34 lakhs, as compared with Rs. 3.50 lakhs in the previous year. Taxation has claimed Rs. 90,000, as against Rs. 87,000 a year before. The transfer to reserve fund has been reduced from Rs. 71,000 to Rs. 47,475. General reserve fund, which had received Rs. 52,336 last year, has got nothing this year. The return to shareholders has been maintained at 10 per cent per annum, subject to tax, on the 100-rupee shares which are paid up to Rs. 50.

PERSPECTIVES & PROJECTIONS

By Mercator

A Hornets' Nest?

MR. T. T. Krishnamachari has broken his long self-imposed silence to say something most unusual even by his own standards. It was no mild rebuke but a damaging indictment of planners and executors that he expressed in his speech to the Central Board of Irrigation and Power this week. Many like this columnist have all along been too cynical to accept official claims for achievement of various sorts but rarely do they get the satisfaction of having it confirmed from a high source like a Union Minister who must be presumed to know what he is talking about. It is a safe assumption that T.T.K. was speaking from his practical experience—and the inevitable frustration—of the last eight months when he described the present state of affairs as "extremely illusory." The Panel on agriculture which met in New Delhi earlier in the week has been faced with statistical proof of this statement in that field of planning. The somnolent state of our industry (but for the belated maturing of the new steel plants) has been too obvious to be overlooked. Mr. T.T.K's own efforts to co-ordinate power and transport, though partially rewarding, was no pleasing experience and now defence co-ordination has further proved how obstinate some persons could be especially when they are not familiar enough with their jobs.

It may be that even plain-speaking will carry matters no further. The critics will cry I-told-you-so and some may even question why T.T.K. should continue to get involved in this sorry business of unco-ordinated Government if attitudes all round are not what they should be. Claiming credit for things undone or merely intended to be done is perhaps a common failing but it irritates if performance does not measure up to at least half the claim; T.T.K almost suggested that Ministerial statements lacked substance even to this extent. The Prime Minister usually taunts his critics by remarking that they speak without facts or details (which may often be due to his Government's withholding them from those who ought to know); but a member of his Cabinet intimately connected with the most vital aspects of its functioning ought to know.

* * * *

Politics Over Techniques

I have often heard exhortations to States' spokesmen for their taking broader national interests into consideration in settling questions like river waters and power-sharing, but nothing so forceful as Mr. Krishnamachari's point that a Chief Minister who claims all the waters in his State should be charge-sheeted when he lets loose floods into adjacent areas. The infructuous talks in Bhopal recently between the Chief Ministers of U.P. and Madhya Pradesh illustrated a very peculiar one-sidedness in both. Both Rihand and Matatila projects should have been tackled from the outset as joint projects for the benefit of both States; instead, Rewa in old Vindhya Pradesh extracted a stiff price for the areas submerged by the Rihand and the persons displaced by it; U.P. seemed only too willing to buy exclusive rights for itself on these terms but now finds that geography cannot be totally ignored. For over two and a half years the two Chief Ministers, the predecessors of the present holders of this office) refused even to talk on the subject, knowing how uncomfortable each would be in the context of the facts. But no Chief Minister, however generous by nature, can overlook the kind of politics in each State which makes any sensible compromise look like a surrender of its interests.

Cannot the Congress Party, for example, insist that its members must always view these problems from the national angle? May be some day Mr. Lal Bahadur Shastri will find it expedient to incorporate some such provision in the Constitution by way of Amendment, that new talisman for achieving radical reform. It is an easy substitute for the difficult tasks of infusing discipline and a sense of responsibility in the party ranks. But until that is done, need we deplore that politics has taken precedence over techniques in the D.V.C., as Mr. T.T.K. did? Could it have been otherwise? Would the repeal of the D.V.C. Act make the men responsible for its control different in their outlook or make it politically possible for other men to take charge of this enterprise of which great things were once expected?

Melancholy Record

The latest Public Accounts Committee's report on the D.V.C. exposes a deplorable state of affairs. The West Bengal Government has been impeding agreed settlements of questions of sharing expenditure on the project and has asked for arbitration which, though legally open to it under the Act, reveals a cantankerous approach. After constructing an irrigation-*cum*-Navigation canal at a cost of Rs. 4 crores, a bridge regulator collapsed in 1959 for which responsibility has not yet been fixed; and it has since been disclosed that the navigation portion of the canal of 35 miles could not be used until there was sufficient water from a fifth dam—for the construction of which no decision had been taken. And now when the canal is ready for boat traffic, the Government cannot muster sufficient courage to dismantle some bamboo bridges constructed by villagers which obstruct movement. Another criticism is that the D.V.C. has been singularly lax in taking disciplinary action against persons responsible for various irregularities.

Purely engineering problems, it might appear, should be capable of being resolved through technical men adopting a practical approach; even the fierce dispute concerning the Indus waters eventually ended in an agreement between India and Pakistan after outsiders had helped to focus attention on the practical aspects. But India's problems of sharing waters among States through which rivers flow are becoming more and more intractable. The Congress which seeks to promote emotional and other integration on a national scale is apparently without means of doing so among the few hundred top leaders who decide the destinies of particular areas.

* * * *

Conflict of Diagnosis?

Less conspicuous, but not less important, than Mr. Krishnamachari's disagreement over Plan performance was Mr. S. K. Patil's opinion on the agricultural situation which radically differs from the Planning Commission's; that the Union Minister was in Hyderabad when the Planning Commission was engaged in a detailed inquiry into shortcomings perhaps indicates a more serious breach than is normal in such situations. Mr. Patil may have a point in his favour when he argues that the present position is satisfactory but this is due to a fortuitous combination of good seasons and high prices. He cannot deny that the effect of planning on agricultural development has been negligible; this was exactly what the Panel of the Commission was trying to prove during the two days of its deliberations. In every field, State-assisted schemes have not made headway; fertilisers, seeds, credit and improved implements are not supplied in sufficient quantities to encourage hopes of fulfilment of Plan targets; official agencies have succeeded neither in popularising new types of fertilisers like ammonium nitrate and urea nor a wider return to the older ways of using organic and green manures; the most scandalous of all is the gap in the use of newly-created irrigation facilities for which about five States are mostly responsible.

Yet, what can the Commission or the Union Ministry do from New Delhi in a matter which by its nature requires sustained efforts at the State level and further below? It is nearly two decades since the "Grow More Food" campaign was started in the last war so that the kind of problems and solutions appropriate to conditions in India should be familiar to all State Governments. Greater local initiative by *panchayats* and district bodies can contribute to improvement but this again is likely to happen only in areas which have already advanced ahead of the others, like the Southern States; elsewhere local pressures which impede execution of many desirable schemes will continue to set the limits to effective stimulation of efforts from the top. The present emergency and the importance of growing food for defence may provide the appropriate background for intensified efforts, but there is little doubt that from the planning angle agriculture is still the weakest spot in the economy.

* * * *

Cassandras and Confessions

Expressing vague fears about every new development may be a national trait among us; the Cassandra tradition dies hard. I have seen this in the unsubstantiated misgivings voiced earlier over Britain's entry into the Common Market and the continued discontent over the inadequacy of the terms on which the Six decided to safeguard trade of India, Pakistan and Ceylon. Now that the whole game has been called off for the present, I should have expected cries of jubilation from business circles. But no! they are now distressed that we will not have some of the favourable points in the agreement during British negotiations—like free entry for tea. So the Government is being asked to pursue this matter directly with the Six. There is, of course, no reason why we should not get opportunities for better trade in any case to narrow the current trade deficit with Western Europe. But, if the rejection of British entry was a sign of the assertion of an illiberal trend in European attitudes, the climate cannot be conducive to grant of concessions not strictly necessary for the common purposes of the E.C.M.

Brussels will continue to be an important diplomatic post for India as for other countries. But over the year during which an Indian representative has been functioning there, the results in terms of improvements in current export opportunities or concessions have been extremely small. While our officials are undoubtedly competent and painstaking on matters of haggling over tariffs and concessions and can stand the interminable rounds of import duty negotiations at Geneva under G.A.T.T., their public relations are still poor and are confined to extracting favours by constant pleading, rather than by hard bargaining of the kind which made Mr. Heath justly famous. India has always lacked the right kind of publicity for her wares and I have recently found confirmation of this view in a strange quarter. An official note prepared for the Board of Trade puts the matter in these striking terms:

"Our commercial publicity and public relations do not obviously measure up to the requirements of an intensive export drive. In the context of the required effort for expanding exports, it is necessary to be aware of the defects and deficiencies. The present effort is feeble and lacks co-ordination. With few exceptions, the range and improving quality standards are not known to consumers abroad. Public relations programmes are stereotyped; publicity techniques are out of date; media planning hardly exists; no studies of marketing techniques are carried out, nor is their any organised effort for collection and dissemination of market information; and practically no material is produced in foreign languages. The entire approach to commercial publicity is *ad hoc* and half-hearted. This is reflected in inadequately produced documentary films, sporadic radio features and broadcasts, meagre and unattractive commercial literature and the very little advertisement done."

No Communist confession could match this unsparing self-criticism and I would be willing to offer this to rebut Mr. T. T. Krishnamachari's jibe about Ministers claiming credit for fancied and intended achievement—but for the suspicion that it was all made up to sound very depressing by some shrewd official who was under the irresistible influence of Parkinson's law to expand his own department!

COAL IN PUBLIC SECTOR

THE public sector of coal industry is predominantly represented by the National Coal Development Corporation. From the annual report, just available, of this Government-owned company for the year 1961-62, it is seen that all has not been well with its operations. In the year under review, the aggregate output of the N.C.D.C.'s collieries was a little above six million tonnes, which was less than 50 per cent of their aggregate capacity. This situation of under-utilisation of capacity has continued into the current year, that is, 1962-63. The transport bottleneck, it is said, has frustrated the Corporation's efforts to achieve the scheduled rate of expansion in production in the third Plan period, with the result that at present its 20 operating collieries are producing coal at an annual rate of around 10 million tonnes only, as compared with its second Plan target of 13.5 million tonnes per annum.

The Corporation has undoubtedly created the potential for a higher level of production than 10 million tonnes, although the Directors' claim that the Corporation has by now created the capacity for producing about 30 million tonnes per annum, corresponding, more or less, to the third Plan's target for the public sector of coal industry, seems to be rather premature. But its anxiety to avoid large accumulations of pithead stocks—the kind of accumulations which caused complications in the last quarter of the last year of the second Plan—seems to be currently responsible for the slower pace of production in its collieries. This is the most deplorable feature of the Corporation's activities. But the extenuating circumstance here is that the transport shortage, which has compelled the Corporation to restrict production voluntarily, has been a factor beyond its control.

Mere increase in capacity, involving a lot of capital investment, is thus of no avail in the context of transport bottlenecks. The inability of the railways to ensure a much larger offtake of coal, whether from the public-sector collieries or from those of the private sector, is there for all to see. One may, however, look forward with some hope to the report of the World Bank's expert team which has been recently charged with the responsibility of investigating the coal transport problem and recommending suitable measures to solve it during the third Plan period.

EMERGENCY RISKS INSURANCE

Industrialists and traders, no less than investors, are considerably exercised over the probable impact of the premium, payable under the emergency risks insurance scheme, on the profit margin of business and industry. This is understandable because, although the premium rates, which have been fixed at 15 nP for every hundred rupees of the insurable value in respect of goods and 25 nP for every hundred rupees of the insurable value in respect of factories, for the first quarter ending 31st March 1963, are not high in absolute terms, considering the mode of valuation of the insurable property and the wide scope of the scheme, the burden of premium will be considerable.

It may be noted that the Government clarified some days ago that the value for which insurance is to be taken should be the actual value at prevailing prices, after due allowance has been made for depreciation. This implies replacement cost at prevailing prices of buildings, plant and machinery as nearly as possible of the same description, standard, specification or design as the property insurable, minus, where replacement cost is for a new acquisition, depreciation at a reasonable rate. The value in conformity with this method can be arrived at in practice by taking the insurable value to be the market value of the property concerned in its depreciated form.

A precise estimate of the total yearly premium payable is yet to be made. Some unofficial estimates place the premium payable in respect of both the goods and the factories by the private corporate sector alone at Rs. 35 crores per annum, assuming that there will be no change in premium rates in the subsequent quarters. This additional burden is sure to reduce further the profit margins of industries which are already low unless it is passed on to the consumer by raising prices. The cotton textile industry has pleaded that it should be allowed to do so. Since cloth and yarn prices are subject to voluntary control, an additional burden, the millowners point out, will cut the profit margin on them further.

It may be noted, in this connection, that, at the time of enactment of the emergency risks insurance legislation, Mr. Morarji Desai, Union Finance Minister, had pointed out that the industry and business community had a reciprocal obligation in regard to the emergency risks insurance scheme which was designed to protect commercial goods and factories from the risks of war. The obligation, according to him, was that they should not increase prices on account of having to pay the prescribed premium. The sacrifices involved, the Finance Minister had emphasised, should be undertaken by the parties themselves, namely owners of factories and goods. This was necessary, he had further pointed out, not only on grounds of equity but also as part of the national policy to keep prices down in the emergency.

In the light of the above statement of the Minister, the plea for raising prices might appear incongruous. But it is not so. There is a justifiable case, in respect of industries whose goods are subject to price control, for passing on the burden of the premium to the consumer. The profit margins of these industries are severely restricted. A further reduction in these margins would, therefore, adversely affect the growth of the industries concerned. In the case of goods, the prices of which are not controlled, the burden of the premium will in practice be passed on to the consumer to the extent possible under the prevailing market conditions. In other words, industries which are subject to price control, would be doubly penalised if they are not allowed to shift the incidence of the premium.

The burden of the emergency risks insurance, whether it is borne by the industry or the consumer, would be much less than it is at present if the premium rates can be reduced. In fact, there is a growing feeling in trade and industrial circles that, in view of the cease fire and the receding possibility of a resumption of hostilities, premium rates should be reduced substantially. A representation to this effect has been made by the All-India Manufacturers' Organisation. The A.I.M.O., in a memorandum submitted to the Finance Minister, has pointed that, under the present conditions, the premiums are high and that they will place a heavy burden on manufacturers and traders. It has, therefore, suggested that, under the existing conditions, the premium rates charged should be on a par with those charged for ordinary fire insurance. In the event of a resumption of hostilities, the A.I.M.O. points out, the premium rates could be revised.

As the premium rates are fixed on the basis of the Government's estimate of the probable risks, there is no objective test by which to judge whether the premiums are high or low. But considering the apparent thaw in the border situation and the general feeling that an all-out conflict is now not very likely, the feasibility of a reduction in premium rates for the next quarter may well be examined.

FAILURE IN AGRICULTURE

The Planning Commission's panel on agriculture was only laying bare the truth when it conceded without a shadow of doubt, at its meeting at New Delhi the other day, that agricultural planning had failed in India. There is nothing startling in this admission. In fact, one would have been astonished, only if the Panel had sought to indulge in a verbal twist to cover up the unsatisfactory performance on the agricultural front. The facts of the case are simple. Agricultural production, in general, has been stagnant during the first two years of the third Plan, notwithstanding several ambitious measures envisaged for fulfilling the Plan targets. During the 1961-62 crop year (corresponding roughly to the first year of the third Plan), production suffered a setback, having gone down by 1.13 million tons to 78.57 million tons, as compared with 1960-61. During the 1962-63 crop year, which is now well under way, the output is expected to recover slightly. In any case, it will not exceed 80 million tons, which compares unfavourably with the provisonal target for the year laid at 84 million tons.

Thus during the first two years of the third Plan, food output has remained stationary, as against an annual increase of as much as 6 per cent envisaged in the third Plan. If the third Plan target for food production (100 million tons) is to be achieved, an additional quantity of 20 million tons (an increase of 25 per cent or 8 per cent annually) will have to be produced during the next three years. This is by no means an easy job, considering the fact that the average rate of increase during the period 1949-50 to 1960-61 was only 3.84 per cent per annum. Most of the cash crops have also fared no better. It is against this background that the Panel has come to the conclusion that the implementation of agricultural plans has gone awry. This is a crucial setback, and, therefore, Mr. Shriman Narayan, Chairman of the Panel, was not exaggerating in the least when he observed that "the third Five-year Plan stands or falls with the agricultural Plan."

There was a fair measure of agreement among the members of the Panel that the failure of planning in agriculture was due to lack of initiative and enthusiasm among the State Governments. But one does not know whether, simply by providing for higher allocations in 1963-64 for agricultural plans, as disclosed by Mr. Shriman Narayan, the State Governments will be induced to put things right. While the major part of the responsibility for failure lies with the State Governments, various Central Ministries like those for food and agriculture, fertilisers, irrigation, community development and co-operation cannot shift their own responsibility. It is, of course, difficult to apportion the blame among the various authorities. If that can be done, a solution would not be difficult. Mr. Nanda was, therefore, correct in insisting that the position would not improve until the responsibility for failure was fixed on some body or other. Mr. Ashok Mehta made a significant point when he stressed the need for proper coordination between the Centre and the States, which was lacking at present.

Despite the frank admission of failures and a thrust at the State Governments, the Panel did not make any new or significant suggestion to remedy the present difficulties. This is understandable since, as Mr. Nanda observed, "the ground has been ploughed enough and so deeply that nothing remains" to be said afresh. One decision of some consequence taken by the Panel is to establish pilot projects in States. These projects, which would be Centrally-sponsored, are expected to expand agricultural production by the fullest utilisation of local manpower and irrigation potential. Such schemes are always welcome, but it will be wishful thinking, if one expects these schemes, which are to be introduced probably in a dozen districts in the country, will make any perceptible difference to aggregate output in the agricultural sector. There has, however, been no dearth of ideas on the problems facing Indian agriculture. These have been discussed time and again in the last few years. What is required is to tone up and energise the administrative machinery entrusted with the implementation of plans. But it is unfortunate that the reform of agricultural services has been kept pending with the Government for several years now. So long as the administration of production aids to agriculture is not in efficient and reliable hands, financial allocations as such, howsoever liberal, cannot be expected to produce the desired results. It thus continues to be a problem of organisation of services and administration of aids.

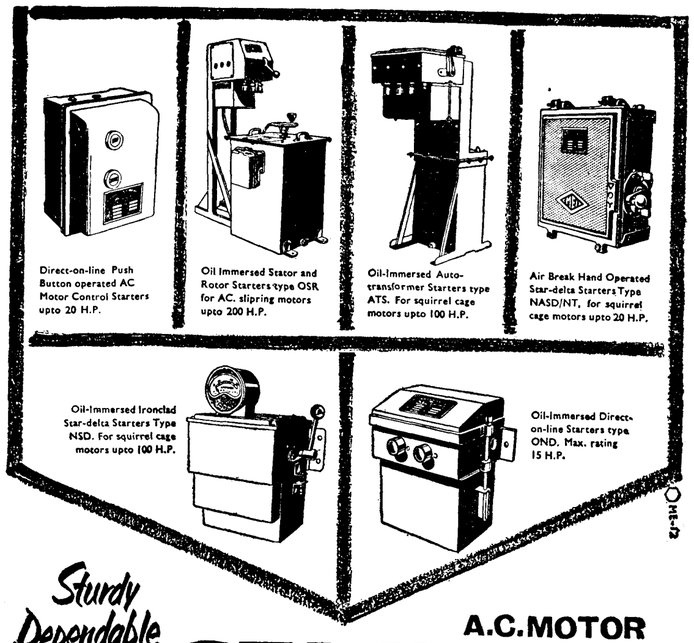
Mori Gate - - - DELHI

ROLE OF S. Q. C.

In the context of defence needs and civil consumption requirements, as well as the urgency of export promotion in the highly competitive world market, the need for taking steps to bring about an all-round improvement in the quality of products and reduction in costs through widespread use of statistical quality control (S.Q.C.) cannot be stressed too strongly. Although the importance of S.Q.C. has been repeatedly emphasised ere now, the progress actually achieved is negligible. Indeed, quality control and other tested methods are still adopted on a very limited scale. Regretting the slow progress thus, Mr. Gulzarilal Nanda, Union Minister for Planning, Labour and Employment, urged, in his speech at the meeting of the high level S.Q.C. Policy Advisory Committee held at New Delhi last week-end, the rapid extension of the use of these methods. Mr. Nanda certainly struck a note of realism when he declared that the time had come when the country could not afford any longer the manufacture of sub-standard products, produced at high cost through inefficient methods.

If any industry, be it in the private or public sector, is to maximise production of high quality goods at an economic cost, it is imperative that it must conform to reasonable standards of economy and efficiency. The industries should, as Mr. Nanda rightly pointed out, accept all obligations and exert their utmost in this regard. There is no other alternative. "A common code of efficiency," to quote Mr. Nanda, "should be evolved, on the pattern of the Code of Discipline, which the industry must voluntarily accept and implement. Standards of efficiency, norms of input of materials, fuel, labour, etc. and of utilisation time of machinery, etc., will have to be worked out and some machinery set up to watch implementation." It is necessary to mention, in this connection, one important lacuna in the statistical quality control programmes, namely, lack of proper co-ordination. This lacuna will soon be filled with the coming into existence of a National Society for Quality Control. It was announced at the New Delhi meeting that the proposed society would be established by the merger of the existing organisations.

Any scheme of quality control will depend for its success not merely on the managements of the industries concerned but also on the persons directly connected with the implementation of the scheme. What is wanted is an intensive programme of education designed to arouse interest among both these sections. Viewed thus, the move of the S.Q.C. Policy Advisory Committee to hold periodically at different places high level one or two-day management conferences for creating interest and awareness among industrialists in S.Q.C. and other scientific methods of improving productivity, ensuring quality and reducing costs must be widely welcomed. The Committee's decision to expand training facilities at different levels to prepare technical personnel for putting these methods in practice in industry is also a step in the right direction.



The need for standardisation, specification, adherence to quality control and proper inspection is urgent especially in the field of exports. If Japan ranks today as a successful competitor in international trade, it has been due largely to the quality-consciousness that has permeated the whole society. The experience of Japan was recalled the other day by Mr. Manubhai Shah, Minister for International Trade, while addressing the technical session on export promotion and standardisation held at Calcutta in connection with the Indian Standard Convention. Quite explicitly, Mr. Shah sought to rub home the point that, unless the country developed a sense of positive quality-consciousness, there was no hope of it regaining the position of pride enjoyed by it in world trade in the past. Several products have already been brought under the programme of a regular and integrated quality control; these include tobacco, raw wool, raw cotton, textiles, cardamom, chillies, black pepper and vegetable oils. It is gratifying to hear from Mr. Shah that the Government wants to bring within the next two or three years many of the commodities under quality control programme especially those for export; four study groups have been constituted for drawing up quality control programmes for engineering goods, chemicals and pharmaceuticals, jute goods and selected handicrafts. Before the end of this year, we are told, 30 per cent of the goods in the country will be brought under quality control and pre-shipment inspection.

COCONUTS AND ARECANUTS

Although one of the world's largest producers of coconuts and arecanuts, India is still not self-sufficient in these two commodities. Appropriately enough, the annual meetings of the Central Coconut Committee and the Central Arecanut Committee held last week at Madras devoted considerable thought to the measures required for increasing the output of these commodities with a view to reducing, or eliminating, dependence on imports. Imports of copra, in particular, are quite substantial, being of the order of Rs. 10 crores per year at present. The demand for coconut oil, for both edible and industrial purposes, has been steadily going up. The pressure of demand on coconut oil would not have been as strong as it is now but for the general tight supply position of oils and fats in the country, particularly because of the growth in population as well as the shortfall in production of other major oilseeds like groundnuts and mustard. The production of coconuts and coconut oil also has not been increasing at a satisfactory pace. In the second Plan, it was originally envisaged that the total output of coconut oil would go up from 130,000 tons in 1956 to 210,000 tons by 1960-61. But the actual output of coconut oil was only about 148,000 tons at the end of the second Plan. Because of this lag in production, India had to spend foreign exchange worth Rs. 55 crores for the import of copra, Rs. 7 crores for coconut oil and Rs. 14 crores for palm oil, during the second Plan period. Imports of coconut oil have been banned since 1960-61. But imports of copra and palm oil, which accounted for as much as Rs. 14 crores in 1961-62 alone, still continue.

There is hardly any prospect of a perceptible decline in imports of copra in the coming years. Of course, the output of coconut, which is estimated at 4,500 million nuts now, is expected to be raised to 5,275 million nuts by the end of the third Plan. By 1965-66, the availability of coconut oil is estimated to touch about 175,000 tons. Even if the coconut production target is realised, the demand for oil, according to the Planning Commission, will still exceed domestic output even at the end of the Plan and imports of copra or substitutes like palm oil on a substantial scale may have to be continued. In this context, it was only proper that Mr. A. D. Pandit, Special Secretary, Union Ministry of Food and Agriculture, who is the President of the Coconut Committee, should have urged producers and others concerned to redouble their efforts to ensure self-sufficiency in coconut oil. Self-sufficiency in coconuts, however, can be ensured only if per-acre yield from coconut trees is stepped up by intensive cultivation practices and by providing plant protection measures against the attack of a wide range of diseases to which these trees are prone. It is also essential to stress an aspect on the demand side, which is related to the need for conserving the available resources—an aspect which has been neglected so far by the Government. Is it not possible, for instance, to restrain the use of coconut oil for the production of hair oil and as fuel for lighting? Cheaper oils available within the country could be used for these purposes or could be refined to suit specific purposes. The import bill is so large that ways and means should be considered without delay for conserving coconut oil for essential industrial and edible purposes.

Equally necessary it would be to ensure self-sufficiency in arecanuts, imports of which cost the country Rs. 45 lakhs annually despite severe restrictions on imports. The current annual output is 93,000 tons, which is proposed to be stepped upto 100,000 tons by the end of the third Plan. Although emphasis in arecanut development is laid on intensive cultivation, two schemes for extension of cultivation of arecanut trees, one in Gujarat and the other at Telengana in Andhra, have also been envisaged. In view of the severe import restrictions, the prices of arecanut and coconut have gone up considerably in recent years. There is no prospect of relaxation in import restrictions in the foreseeable future. So consumers of both arecanuts and coconuts will continue to be penalised by the exorbitant prices unless measures for expansion of production of these commodities are implemented in right earnest.

AGRICULTURE: AN AGONISING REAPPRAISAL

F.I.C.C.I. DELIVERS A BROADSIDE

From Our Special Correspondent

NEW DELHI, *5th February*

DELHI LETTER

THE agonising reappraisal of the country's agricultural planning has, at last, commenced. The two-day meeting of the Planning Commission's panel on agriculture has squarely put the blame on the State Governments for the complete absence of increase in the rate of growth on the agricultural front in the first two years of the third Plan.

Meeting here during last week-end, the Union Ministers of Planning, Community Development and Agriculture found strong support among the Opposition parties represented in the panel, in accusing the State Governments of lack of enthusiasm about and faulty implementation of the various programmes chalked out for speedy growth in agricultural production. The charges ranged from failure to supply fertilisers in time, lax and disinterested administrative set-up at the block level and absence of local funds for matching grants, to the shift in the emphasis in the *Panchayati Raj* from development to pure administration.

As pointed out in this meeting, foodgrains production has remained static at lower than 80 million tons during the first two years of the third Plan as against a target of 100 million tons in 1965-66. No doubt, the area under cultivation has gone up by 2.08 per cent. But the per-acre yield has advanced by a mere 1.54 per cent between 1949-50 and 1960-61. The panel Chairman, Mr. Shriman Narayan, emphasised the need to replace the reliance on the "limited and vanishing scope for extension of cultivation" with "more and more dependence on intensive methods of cultivation" to achieve increasing productivity per acre.

Even after the spectacular rise in agricultural production by 8.1 per cent in 1960-61, after a decline by 2.5 per cent in 1959-60, the rate of growth dipped to 1.6 per cent in 1961-62. Food production fell to 78.6 million tons in 1961-62 from the record output of 80.5 million tons in 1960-61. The position is no better during the current year.

States' Reluctance

Barring a few, the States have been generally reluctant to move towards any radical change in their respective agricultural set-up. Quite some years ago, the Nalagarh Committee had recommended several changes in the States' agricultural administration to streamline production, but not much seems to have been done in this direction.

Even in the case of the intensive agricultural district programme, or Package Programme as it is commonly referred to, a standing complaint is that the State Governments are reluctant to delegate financial and other powers to people at the district level concerned with the programme, besides the general complaint of the lack of co-ordination between official and non-official agencies and between the official agencies themselves. In the Community Development Blocks, the States were urged to orientate the activities of the village level workers entirely to agriculture. But nothing has been done so far.

As remedial steps, the panel has recommended the establishment of centrally-sponsored pilot projects in each State to increase agricultural production. It has proposed the setting up of problem-oriented pilot projects for the "fullest possible utilisation of irrigation potential," intensive agriculture and increased use of local manpower and genuis. The panel has also proposed that expert agriculturists should be taken to neighbouring areas and other States to demonstrate their skill for others to emulate. It has stressed the need for ensuring timely supplies of fertilisers, provision of irrigation facilities, improved seeds and modern agricultural implements to the farmers in adequate quantities and at reasonable prices.

The Centre has already decided to upgrade the financial allocation for agricultural programmes by over 20 per cent in 1963-64, as compared with the previous year, besides devoting a much larger portion of the Community Development budget to agricultural programmes.

The Union Ministry of Irrigation and Power is currently reviewing the State ceilings and project-wise outlays for irrigation projects for 1963-64 to secure early benefits from them. It would like to accelerate the pace of progress of those projects which can give benefits within the coming two years. Six expert teams are now touring different States to help in the removal of difficulties and bottlenecks in the way of speedy execution of those projects.

A case in point is the D.V.C. project. The Public Accounts Committee has recently chastised it severely for the continued underutilisation of the irrigation potential, besides several other shortfalls in different fields. As against the irrigation capacity of 919,000 acres for *kharif* crops created at the outlets, the area actually irrigated was 639,235 acres. The target of *rabi* irrigation was fixed at 40,000 acres while less than 16,000 acres received water supplies.

The actual utilisation of the potential already created by major and medium irrigation projects fell short by 3.32 million acres at the end of 1961-62. The total potential of these irrigation projects rose to 13.79 million acres in 1961-62 from 12.15 million acres at the end of the second Plan. But the actual utilisation recorded only a small gain to 10.47 million acres from 9.15 million acres during the same period.

Federation's Criticism

The Federation of Indian Chambers of Commerce and Industry has delivered a broadside against official procrastination. The Committee of the F.I.C.C.I. "cannot help feeling that for some reason or other, neither the enthusiasm of the people, nor the opportunities which the challenge (emergency) has presented, have been as urgently and fully utilised as ought to have been done by the authorities."

Expressing its serious concern at the falling rate of industrial production and stagnation in agriculture, the Committee pointed out the existence of "an inexplicable indecisiveness and slackness" in official quarters. When Parliament met last month for a short session, the Defence Minister admitted that the Government had not yet fully worked out the implications of a defence-oriented production programme.

Take, for instance, the problem of the idle capacity in engineering industry. A recent official survey had indicated the existence of over 35 per cent idle capacity in nearly 75 industries. The Engineering Association of India claims a total of 341,852 machine-hour idle capacity a month in 79 engineering units. In view of the national emergency, one would expect the utilisation of this idle capacity for several lines of defence manufacture.

Certain postulates of the F.I.C.C.I. statement might be questioned or criticised, but all would agree with its demand that the administration must be geared "to a sense of urgency" over the present situation. In fact, already sensing a flagging of mass enthusiasm, the top Government leaders have been constantly alerting the nation. Not a single speech is made these days without underscoring the need for preparedness and sacrifice. The symbolic participation of the Prime Minister and several members of Parliament in the Republic Day parade, followed by an unending stream of citizens, could as well be called a promotional activity in that direction.

The F.I.C.C.I. will, however, find a redoubtable champion of its sentiments in Mr. T. T. Krishnamachari. Addressing the thirty-fifth annual general meeting of the Central Board of Irrigation and Power yesterday in New Delhi, the Minister for Defence and Economic Co-ordination described the present situation as "extremely illusory" and said: "Every minister claims that he has done something which he has not done. Even the intention to do a thing is supposed to be an achievement. That might be right if what he says in any way contributes to productivity. But ministerial pronouncements have not got even that certainty."

In a withering attack on the planners for their failure in the field of agriculture, he said: "The Planning Commission panel consisting of sixty people sat for two days and ultimately produced nothing!"

AFTERMATH OF BRUSSELS

MEETING OF COMMONWEALTH TRADE MINISTERS?

(From Our Own Correspondent)

LONDON, *1st February*

LONDON LETTER

THE breakdown of the Brussels negotiations has brought the practical economic politics of both Government and Opposition closer together than perhaps they have ever been. The chief British negotiator, Mr. Heath, for instance, declares that he is not at all downhearted; that England will still go on looking at the possibilities of a union with Europe and that, meanwhile, she has to battle her own way to salvation. This is what the Opposition leaders have been saying for a long time and the only difference is that one of the candidates for leadership of the Labour Party, Mr. Brown, is emphasising the desirability of a meeting of Commonwealth spokesmen in order to forge greater ties between the United Kingdom and the Commonwealth. But in Mr. Gaitskell's day, the Labour Party declared that they did not seriously regard the Commonwealth as a viable alternative to Europe; the Commonwealth was only part of the world economic field which the United Kingdom had to explore.

The United States has, of course, been tremendously keen on the U.K. entering into Europe. It was entirely concerned with the Atlantic Alliance and half of the Atlantic Alliance for them was a united Europe including the U.K. The U.S. has always been scared of a world-wide closer Commonwealth association; it feared a closed shop thus it has never encouraged the U.K. to knit itself more closely with Commonwealth countries, although such a possibility has not for years been a real issue. The U.S. has equally been scared of the possibility of a closed Europe—that was one reason why it wanted the U.K. to be in Europe because it felt that was the best guarantee against a Europe shut to U.S. exports.

The Main Argument

The Special Representative of the American President on trading matters has now arrived in London and his concern—absolutely on all fours with the policy of the Opposition—has been to get an all-round reduction of tariffs through the G.A.T.T. Such a reduction would naturally weaken the economic significance of Britain's entry into the Common Market. After all, the main argument for British entry had been that, without entry, the U.K. would face high tariffs into Europe, but, if right through the world there is going to be a reduction of tariffs, to that extent the loss from non-entry into Europe is diminished.

But if the U.K. and the Commonwealth countries were to concept together more closely —as Mr. Brown has suggested—and if out of this (most unlikely!) were to emerge a scheme for the lowering of tariffs between the Commonwealth countries but not to the outside world, then the U.S. would be intensely annoyed. The possibility is, therefore, that there may be a meeting of Commonwealth Trade Ministers to consider reductions in tariffs G.A.T.T.-wise rather than Commonwealth-wise. Perforce, therefore, the British Government will be operating in exactly the same way as a Government formed by the Opposition, if they successfully contest the Election.

It is perhaps because of this that the stock markets have reacted to the breakdown of the Brussels talks quite differently from the way it had been assumed. The general argument—advanced by people who are really at a loss for a precise answer—is that the breakdown of the Brussels talks has removed uncertainty, and uncertainty, they argue, is the worst possible thing for stock markets. So, taking a leaf out of Mr. Harold Wilson's book, the stock exchange has apparently said, "we are not going to be in Europe—that is fine, we know where we are and let's get on with it" and up have gone the quotations. Besides, the way in which the Brussels negotiations have broken down has brought at least as many feathers to the Government's nest as it has to that of the Opposition:

The British Prime Minister is now able to say, "look, we are not in Europe because of the attitude taken by one country; we will soon show that country that the U.K. is an economic force to be reckoned with on its own account." So that instead of the British Government being in a *weaker* position by virtue of the failure

TAXATION AND NATIONAL EMERGENCY

NEED FOR CAUTION BY FISCAL AUTHORITY

By P. C. Jain
UNIVERSITY OF ALLAHABAD

THE most important problem which faces the Indian Finance Minister in the preparation of the Government of India's budget proposals for 1963-64 is to find resources to finance the increased outlay on defence. It is expected that for 1963-64 he will have to provide at least Rs. 800 crores for defence expenditure as against a little over Rs. 450 crores for the current financial year. The Finance Minister has hinted that additional taxation will have to be imposed on the people to cover a good portion of this additional outlay. The unprovoked Chinese aggression has made it necessary to increase India's defence outlay from its present level of 2½ per cent to 5 per cent of the national income at which level it is expected to remain for several years in the future. The people must make sacrifices to defend the country against the enemy and, since the Government's outlay on the Plan projects in 1963-64 would be at a higher level than in the current financial year, the people should be prepared to bear additional sacrifices till "it hurts," to quote the Prime Minister.

Nothing definite is known as yet, but it is expected that, for 1963-64, the Finance Minister would propose additional taxation to the tune of Rs. 125 to 130 crores, out of which direct taxation—in the shape of income-tax and the corporation tax—would cover Rs. 25 to 40 crores and indirect taxation in the shape of Union excise duties, customs duties and the net contribution of public undertakings the rest of it. For only might the taxation exemption limit in the case of income-tax be reduced and the slabs be rearranged so as to secure a greater progression in taxation, but the rates of taxation on all slabs of income would also be considerably increased. Similarly, not only would the existing rates of indirect taxation be increased but also additional excise duties and customs duties might be levied on articles which have so far escaped lightly. It is certainly possible to reduce the adverse effects of excessive taxation to some extent by avoiding confiscatory rates of taxation on people in the higher income groups so as not to discourage the entrepreneurial class too much. It is also to some extent possible to make indirect taxes progressive by carefully selecting the commodities on which the additional excise duties and customs duties are levied. But, even when all this has been done, the burden of additional taxation of the order of Rs. 125 to 130 crores on the Indian economy in a single year would indeed be excessive. Would the Indian economy be able to stand this additional taxation without suffering irreparable damage?

Plan Targets

During the second Plan period, the additional taxation imposed by the Union and State Governments yielded nearly Rs. 1,050 crores, as against the Plan target of Rs. 450 crores and, in the process, the public revenues increased from nearly 7½ per cent of the national income at the beginning of the Plan to nearly 9 per cent at the end of it. The third Plan proposed that additional taxation, including measures to increase the surpluses of public enterprises, should be made to yield Rs. 1,710 crores—Rs. 1,100 crores for the Union Government and Rs. 610 crores for the State Governments—for financing the Plan outlay. In this process, it was expected that, "with the normal increase in tax yields as a result of rising national income" and the "additional taxation" of Rs. 1,710 crores, "the proportion of tax revenues to national income will go up to 11.4 per cent by the end of the third Plan."

The additional taxation levied by the Union Government in 1961-62 and 1962-63 is expected to yield over the Plan period additional revenues of Rs. 400 crores and Rs. 450 crores respectively, thus meeting "a little over three-fourths of the Plan target." In the sphere of State finances the additional taxation imposed in the first two years of the third Plan is expected to yield an additional revenue of Rs. 400 crores over the Plan period as against the target of Rs. 610 crores. This shows that, if additional taxation to the tune of Rs. 25 to 30 crores was levied by the Union Government in each of the remaining three years of the Plan, enough additional resources would have been raised to cover the remaining gap in the Union and State revenues from additional taxation. But this would have completely exhausted the taxable capacity of the people.

Additional taxation, including measures to increase the surpluses of public enterprises, was expected to yield an additional revenue of Rs. 1,710 crores without imposing an unbearable burden on the people, on the assumption that the national output would increase at the annual average rate of nearly 6 per cent over the Plan period. The rising *per capita* income would have increased peoples' taxable capacity to bear the additional tax burdens. But, in 1961-62, the net national output at constant 1948-49 prices increased by less than 2½ per cent and in 1962-63, for which complete data is not yet available, it is not expected to increase by more than 2¾ to 3 per cent. As a result the *per capita* income in 1961-62 remained unchanged at the 1960-61 level as the country's population has been increasing at about the same annual rate. In 1962-63, there would be a slight increase in the *per capita* income, but it would be much below the level expected by the Planning Commission and on which its proposals for additional taxation were actually based. This leads us to the inevitable conclusion that under the existing conditions, even additional taxation to the extent of Rs. 1,710 crores would impose an unbearable burden on the Indian economy.

Self-defeating

Any effort to raise a further additional revenue of Rs. 600 crores over the Plan period—that is a total of Rs. 2,310 crores, instead of Rs. 1,710 crores—through additional taxation is bound to defeat its own purpose. In an emergency, it is only to be expected that people would bear additional sacrifices till "it hurts." But, surely, the burdens should not increase to such an extent that "it hurts" the economic system itself. But this is precisely what is going to happen, if the Finance Minister insists on imposing additional taxation in 1963-64 to the tune of Rs. 130 crores or so. The adverse result of such a heavy taxation would be to kill the entrepreneurial incentives and to further push up the price level. Although enough data is not available in India to find out the precise effects of additional taxation on the price level, it is quite likely that, over the closing three years of the second Plan, the price level increased to the extent of 2½ per cent per annum on account of additional taxation. It would, indeed, be a great tragedy if excessive taxation in the closing years of the third Plan raises the price level at a similar or possibly a higher annual rate.

If we look at the problem somewhat differently, as the Finance Minister himself stated in a recent speech, it is necessary to increase the rate of national savings from the present level of 8 or 8½ per cent of the national income to some 15 or 16 per cent of the national income by the end of the third Plan period to maintain the rate of investment at a sufficiently high level in order to accelerate India's rate of economic growth and to effectively defend the country against foreign aggression. But, if the burden of taxation becomes excessive and if the retail prices which consumers actually pay for the different goods continuously increase—although the general price index might not show it—they cannot possibly increase savings. The different taxes, prices, fees and donations are paid from the same income from which savings are made. And, if the *per capita income* does not increase or increases very little, while the drain on it through additional levies of one kind or another continuously increases, it is obvious that the rate of national savings cannot possibly increase above the present level of 8 or 8½ per cent. The great danger is that, unless the fiscal authority is careful, the rate of national savings by the end of third Plan may actually fall.

It is sometimes argued that the people should rise to the occasion and make the necessary sacrifices to meet the national emergency. But it is not only a question of people's willingness to make sacrifices: they should also have the means to do so. If the above analysis is correct, the Indian people simply do not possess the taxable capacity to yield a further additional revenue of Rs. 600 crores from taxation over the remaining three years of the third Plan, in order to meet at least half of the additional defence expenditure amounting to over Rs. 1,200 crores. The temptation for the Finance Minister would, indeed, be too great to resist the levy additional taxation in the name of emergency and to appeal to the people to tighten their belts further. But, if he takes a comprehensive view of the matter, the Finance Minister would not decide to subject the Indian economy to irreparable damage through excessive taxation.

But, somehow, the country has to face the emergency and to raise internal resources to finance the increased defence budget which the unprovoked Chinese aggression has inflicted upon us. No sane person could possibly argue that the increased outlay should not be made. The only controversy is about the methods of raising the necessary resources.

Prohibition

There was a time when it did not probably do much harm to have the luxury of prohibition. But now when we are faced with a dire emergency there is no place for idealism in our economic policies. The question is not whether prohibition is good or bad—although in the opinion of most people it has failed to reduce the use of intoxicants in the country. The real point is whether, taking an aggregate view, the scrapping of prohibition would do more harm to the people or the excessive burden of taxation to which they must inevitably be subjected if prohibition is to continue. In the opinion of some, the public revenues in India would increase by Rs. 200 crores annually if prohibition is given up, while, according to the estimates of the Planning Commission, the additional annual revenues as a result of it would not exceed Rs. 50 crores or so. But it appears quite likely that public revenues in India would increase by at least Rs. 100 crores per annum—or Rs. 300 crores over the remaining three years of the third Plan—if prohibition is given up. In these circumstances there appears no sense in sticking to the policy of prohibition.

It is one of the biggest drawbacks of the Indian tax system that, first, there is in it a very large tax evasion which even at a conservative estimate is not less than Rs. 100 crores annually and, secondly, the waste of public money on fancy schemes and even on some essential Plan projects and in Government administration is of the order of Rs. 100 to 150 crores per annum. In the past, the Government probably did not see the express need for preventing tax evasion and practising rigorous economy in public expenditure because the system easily yielded the required resources through additional taxation. To levy fresh taxation is any day much easier and less unpleasant to the fiscal authority than trying to prevent tax evasion and eliminate all wasteful expenditure. But now, since the country is faced with a grave emergency, the Government should rise to the occasion and make the necessary effort which, in the remaining three years of the third Plan, would easily increase the resources available for development and defence by Rs. 600 crores, if not by Rs. 750 crores.

If the scrapping of prohibition and waste of all kinds in public expenditure, including postponement of non-essential outlay on the Plan projects, yields additional revenues to the tune of Rs. 1,000 to 1,200 crores in the next three years, it may not at all be necessary to impose further additional taxation, barring the additional effort that might be necessary to make the total yield from additional taxation Rs. 1,710 crores over the Plan period.

Another important consideration, in this connection, is that the strain on the limited resources available to the Government, because of its idealistic industrial policy which aims at the gradual replacement of the private sector by the public sector in India's economy, is excessive. Under normal conditions, there might have been some justification for this policy, but there is none now, as the private sector has shown itself capable of increasing the rate of economic growth and of helping the defence effort in all possible ways which are no less vigorous than the efforts made by the public sector. At a time when the Indian economy in faced with a great peril, it appears foolhardy to stick to an industrial policy which was drawn up under more normal conditions. We should make the best use of all the available resources, whether they are in the public or the private sector, in accelerating the economy's rate of growth and in defending the country effectively against the enemy. If the private sector is given a greater role in India's economic development than is provided under the third Plan, a sizable amount of public resources would be released which t Government could devote to the countr defence.

WHICH HOLDS THE GREATER LOAD ?

Modern construction projects, require scaffolding of far greater strength and safety than bamboo tied with coir.

Unaffected by rot, fungus and termites, Mills tubular scaffolding has a versatile use—storage racks, temporary buildings, open-air auditoriums or bridges—apart from its normal use as a construction aid.

The special spring-steel fittings quickly secure the tubes—with a ½" spanner as the only tool needed. The greater the load the firmer the grip of the fittings, since they are designed on the 'shackle grip' principle.

All fittings are made from special quality spring steel, by Guest, Keen, Williams, Ltd. and the tubes are manufactured by The Indian Tube Company (1953) Limited.

BANK ADVANCE AGAINST EQUITIES

By A Special Correspondent

THE stock markets in the country are in a state of confusion. Equity values are drifting lower and lower and there is hardly any business. It is usual for the market to be affected by budget jitters at this time of the year, but their present intensity is probably unprecedented. This is somewhat natural in the context of the disturbing news that the forthcoming Central and State budgets will contain a heavy dose of taxation to meet the needs of development and defence. This heavy taxation is going to be superimposed on an economy which has been showing symptoms of a slow-down even before the dawn of the emergency. Thus the economic outlook is far from rosy and the share markets, being 'barometers' of future winds of change, have been giving an advance forecast of what is in store for the economy in the immediate future.

It is in such an atmosphere that the stock exchange authorities have relaxed most of the trading restrictions and minimum prices are in force now in respect of very few shares. They had to do this because the minimum prices were found untenable even with the Life Insurance Corporation making purchases below the 'floor' levels. The effect of such a measure has been to force the weak 'bulls' out of the market. It was in these circumstances that a news agency report appeared last week that the Reserve Bank was purported to have issued instructions to scheduled banks recalling advances against shares. Subsequently, the news was denied but not before sufficient damage was done. The Bombay Shareholders' Association came out immediately thereafter with an appeal requesting the Reserve Bank to withdraw its credit restrictions on bank advances against equity shares or at least reduce the present margin of 40 per cent by 15 to 20 per cent.

The Association has urged that there could be no fear of banks taking undue risks or of credit inflation on any large scale, if credit restrictions were relaxed. This is because share prices are heavily depressed and, at such a low level, the removal or relaxation of credit restrictions will not exert any appreciable inflationary pressure on the total volume of bank credit. On the other hand, such a concession will provide the much-needed relief to hard-pressed investors and businessmen whose borrowing power has been seriously impaired by the steep fall in share prices. The credit restrictions on bank advances against equity shares, whatever their justification and efficacy in the conditions prevailing when they were introduced, had now entirely outlived their usefulness. It will be recalled, in this connection, that the Reserve Bank introduced credit restrictions against shares in March 1960, when scheduled banks were directed to keep a minimum margin of 50 per cent on all advances against equity shares above Rs. 5,000. The investment in *budla* transactions by banks was also prohibited then. The Bank relaxed the restrictions in January 1962 by reducing the minimum margin on advances against equity shares from 50 per cent to 40 per cent. The prohibition of participation in *budla* activity by banks continues now also.

Scheduled banks give two types of advances against shares, namely, loans or overdrafts to dealers and stock brokers and against the security of joint stock company shares. Such loans to the former as of 28th October 1962 amounted to Rs. 12.29 crores and Rs. 79 crores, respectively, or a total of Rs. 91.29 crores; on 25th January 1962 they stood at Rs. 84.45 crores. They constituted about 6.8 per cent of total bank credit in October 1962. When the limits were re-fixed by banks in November last to various brokers, etc., they represented, broadly speaking, about 10 per cent reduction over the limits in operation.

Before examining whether there is a case for relaxing the restrictions on bank advances against shares, it is necessary to note the character of the Indian stock markets. The Indian stock markets are dominated by speculative elements to a greater degree than is the case in similar markets abroad. The share markets are confined to a few cities and the market administration is inherently weak. It is only of late that some semblance of co-ordination and self-regulation or discipline is sought to be introduced by the Stock Exchange Unit of the Ministry of Finance, Government of India. This is probably the main reason why the markets overdo in the 'bull' phase. This point is best appreciated when a comparison is made of the behaviour of the Indian stock market with those abroad. During 1962, there was an unprecedented fall in share markets abroad, as there was in India. Over a period of six months, between 3rd January and 26th June last year, the Dow Jones' Index of Industrial Securities in the U.S.A. fell by about 26 per cent. On 28th May 1962, it came down by as much as 35 points which is the deepest nose dive since the great depression year of 1929. Approximately during the same period, the *Financial Times* Ordinary Share Index came down by about 19 per cent. Both these indices have subsequently retraced their losses to the extent of 17 per cent and 14 per cent, respectively. The decline in share markets in India was also spread over the last six months of 1962, although a major portion of it took place within a fortnight after the Chinese invasion on 20th October. The fall has been no more than 14 per cent which, in turn, shows the strong manipulations in the market by speculative operators. Later on, the bear hold on the market was weakened by the fixing of minimum prices and by the intervention of the Life Insurance Corporation.

It is broadly against this background that we have to see the case for relaxation of restrictions on bank advances against shares. It will not be out of place to quote the Finance Minister, Mr. Morarji Desai, who has ably summarised the official view on the speculative movements in the stock markets: "While individual speculators eager to cash in on a temporary falling market may come to grief in the present situation, the genuine investor who is interested in the yield of his shares has nothing to be afraid of. There is no doubt that the markets will steady themselves and normalcy will be restored soon."

There are several reasons in support of such a view. As pointed out earlier, the fall in Indian share markets is very much less than has been the case in markets abroad when a panicky situation prevailed. Even now, bank advances have not been drastically curtailed and they stand just some 10 per cent below the levels in October last. If any artificial stimulus is given as urged by the Bombay Shareholders' Association, the banks will be only burning their fingers especially with the budgets barely a few weeks from now onwards.

There is another factor. The downtrend in equity prices is but a reflection of certain major shifts which themselves are long overdue. It must be remembered here that the markets have been having a 'heyday' since Mr. Morarji Desai took over as the Finance Minister and introduced his first budget. There were fresh peaks in the markets in the last three years, that is, 1960, 1961 and 1962. It is reasonable to assume that the market has been forced to give up some of its heat and this is just but a healthy trend. It has been held by observers that the yield on equities in India should be at least 9 to 10 per cent, taking into account the scarcity of capital and the inherent risks involved in an economy dominated by shortages and dwindling profits. As against this, the equities now are yielding around 6 to 7 per cent. Perhaps, it is not in the interests of the economy itself artificially to prop up the share market in the interests of a few speculators.

Further, the finance supplied by banks is a small portion of the total funds required by the market for financing the transactions. It is primarily the *malabadliwalas*—passive investors interested in interest from settlement to settlement who supply the bulk of finance. Thus a little relaxation either way by banks is not going to alter the outlook for markets materially except to put such banks to unnecessary risks.

There is yet another point of view. With the banning of forward trading in almost all the commodity markets, including gold, it is likely that there will be diversion of speculative activity to sharebazzar. With massive expenditures envisaged on defence and development—the additional expenditures proposed during 1963-64 are variously estimated between Rs. 1,000 and Rs. 1,500 crores—there is the possibility of the economy being exposed to unprecedented inflationary pressures. The fact that the Government has been able to hold the price line so far, in the context of popular enthusiasm to fight the invader, is no guarantee that a similar situation will prevail in the context of huge budgetary expenditures. It is, therefore, obvious that prudence and caution demand that there should be no relaxation of restrictions against bank advances on shares.

The Truth about Man-Made Fibres...I

How Man-Made Fibres Can Help Conserve Foreign Exchange

83,00,00,000 RUPEES...enough foreign exchange to buy 450 jet fighters...were spent in 1961 alone on securing cotton and other fibres for the textile industry. In the crisis before us, full production of food and cloth becomes urgent. Increasing the production of textiles to meet India's needs is possible, but we need not pay so high a price for imports.

Man-Made Fibres Can Do It

A million bales of cotton worth Rs 70 crores had to be imported last year to meet deficiencies in India's production. This drain on foreign exchange can be stemmed if man-made fibres like rayon and nylon are more extensively used as substitutes or blends with cotton and other popular fibres.

Increasing the production of rayon filament yarn from the present 36 million kg to 70 million kg will contribute enormously to this end at the cost of a mere Rs 13.8 crores in foreign exchange. This alone will save Rs 13 crores spent annually on rayon yarn import and will also substantially reduce foreign exchange lavished on importing long staple cotton.

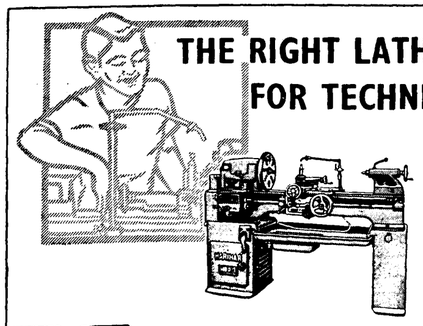
A further Rs 34 crores could be saved if rayon staple fibre were more widely used with medium and short-staple cotton. The present shortfall of 81,000 tonnes of cotton could be made up by increasing the production of rayon staple fibre from 30,000 tonnes to 1,00,000 tonnes. The foreign exchange component of this huge projected increase will be a mere Rs 15.4 crores for all plant and raw materials.

With progressive indigenous manufacture of rayon and nylon tyre-cord, huge additional savings in foreign exchange will be made possible.

Raw Materials No Problem

Initially the annual outlay of exchange on raw materials for filament yarn and staple fibre would be Rs 2.8 crores and Rs 9.1 crores respectively. This however will soon dwindle to a mere Rs 2.75 crores with self-sufficiency in wood pulp, caustic soda and sulphuric acid. The nylon industry today provides for its own raw materials through export. With a caprolactum plant in construction, it will soon be self-sufficient.

Exchange Will Be Earned



With optimum production of man-made fibres, the demand for fibres will be met and prices will stabilize. Self-sufficiency achieved, Indian textiles will gain new dimensions in texture and utility and will even earn a sizeable surplus in foreign exchange by entering the overseas markets at increasingly competitive prices.

Therefore, it stands to reason: if the entire textile industry can achieve self-sufficient production with Rs 29 crores of foreign exchange now, why must Rs 83,00,00,000 be wasted on imports every year?

Man-Made Fibres Meet India's Vital Needs

U.S. MARKET FOR INDIAN TEXTILE GOODS

FINDINGS OF SPECIAL STUDY

EVEN before the long-term world cotton textile agreement was evolved at the G.A.T.T. International Textile Conference, held at Geneva from 29th January to 9th February 1962, we had pointed out that some sort of protectionism was being introduced in textile trade which had been proceeding on a multilateral basis in most parts of the free world. *Commerce* had all along been of the view that, by agreeing to accept import restrictions through quotas by the U.K., it had yielded ground on a matter of vital principle which would, sooner or later, recoil on its textile exports. The Geneva Agreement, which came into effect on 1st October 1962, fully confirmed this conclusion, although Mr. K. C. Reddy, Union Minister for Commerce and Industry, as well as export circles hailed the agreement as something wonderful. They exaggerated the value of the agreement when they observed that Indian and other underdeveloped countries had been assured that there would be no reduction in their exports and that, on the other hand, efforts would be made to increase them. What they overlooked, whether by oversight or deliberately, was the fact that the agreement contained an escape clause in favour of the developed countries and to the detriment of underdeveloped countries.

Our conclusion has since been reinforced, thanks to the lead given by the U.S. It was this country which first used the escape clause (Section 3) of the agreement and restricted imports of certain varieties of cotton fabrics from Hong Kong under the pretext that their arrivals were threatening to cause the disruption of the domestic market. This action by itself would not have been a serious precedent, if it had been confined only to Hong Kong, which is by no means a country but only a free port belonging to Britain. But it was not so, for similar restrictive arrangements were subsequently completed with ten other countries. The U.S. Department of Commerce has now announced that negotiations on similar arrangements are currently under way with eight countries (India, Pakistan, Kuomintang, China, Japan, South Korea, Philippines, Poland and Yugoslavia). The official announcement, made on Wednesday last week (30th January), says: "The U.S. has moved to hold down 90 per cent of cotton textile imports reaching the American market to specific quantitative levels." Elucidating this point, Mr. Hickman Price, Assistant

Secretary of Commerce for Domestic Affairs, is reported to have said:

"Ninety per cent of imports will be covered when the current negotiations are completed. Already, a minimum of 75 per cent is under restraint and it is the Government's policy to apply restraints, if imports from any country in the world threatens to disrupt the American market."

Mission to Washington

In the light of the aforesaid statements, it is clear that the efforts of the Indian textile mission to Washington have failed; the mission included Mr. D. S. Joshi, Special Secretary, Department of International Trade, Mr. R. Doraiswamy, Textile Commissioner, and Mr. B. G. Kakatkar, Secretary-General of the Indian Cotton Mills Federation. Unfortunately, none of the well-known leaders of the Indian cotton mills industry was included in the delegation, thereby giving it a lower status in the eyes of the American. The reason for the non-inclusion of businessmen is said to be the Government's desire to save foreign exchange. If this is true—it has not been denied by the Government though sufficient interval has elapsed for doing so—the officials and ministers responsible for it deserve the criticism that they were extremely shortsighted and had indulged in a policy of penny-wise, pound foolish. Perhaps, the mission would have been successful had the original intention that Mr. Ramnath Podar should lead it been followed. Mr. Podar, it may be noted here, has personal acquaintance of Mr. Hickman and other U.S. leaders of consequence.

The despatch of this delegation to the U.S. followed the intimation of the U.S. Government, in December 1962, asking India to keep exports of certain specified varieties of textiles at the 1961-62 level. No formal notice was, of course, given by the U.S. as required under the G.A.T.T. agreement, but it was understood that the export curbs would be operative from 17th December 1962. The date was later extended by a month in order to enable the Indian mission to reach Washington to discuss the whole matter with the U.S. Administration. Barring some minor concessions here and there, the U.S. Government seems to have insisted on pegging cotton textile exports from India at the 1961-62 level of about 26 million yards, a meagre level indeed. The varieties of piecegoods that will be affected most are two, twills and satins, which have recently found a receptive market in the U.S.

Spirit of Understanding Ignored

The U.S. Government's decision to invoke Section 3 of the G.A.T.T. agreement for imposing curbs on textile imports from India, apparently prompted by the powerful pressure exercised by the domestic cotton industry, is

TABLE B: *Expenditure on Clothing in U.S.*

	1961	1960	1952	1947
Population (millions)	183.6	180.7	157.0	144.1
Gross national production (million $)	518,725	503,443	346,999	234,289
Personal consumption expenditure (million $)	338,058	328,536	219,774	165,409
Of which:				
Clothing and accessories excluding footwear (million $).	24,098	23,624	16,300	15,600
Percentage share in total	7.13	7.19	8.3	9.4
Per capita expenditure on clothing and accessories ($)	131.2	130.7	116.56	108.26

deplorable, especially because it comes at a time when this country is straining every nerve to earn foreign exchange which is so urgently needed to push through the defence and development programmes. The foreign exchange difficulty confronting India is acute. A solution to it lies only in boosting exports of traditional items such as cotton textiles. The U.S. Government has no doubt every right to invoke Section 3 of the agreement, but it must, at the same time, remember the spirit of the understanding reached at Geneva. Here is the relevant extract from the text of the agreement:

"All those participating countries that are still maintaining restrictions inconsistent with the G.A.T.T. provisions on cotton textile imports from other participating countries MUST relax those restrictions progressively each year with a view to eliminating them as soon as possible. No participating country shall introduce NEW import restrictions or INTENSIFY existing import restrictions on cotton textiles, in so far as this would be inconsistent with its obligations under the G.A.T.T."

Indeed, the agreement itself specifically lays down that the measures for restraining imports should be resorted to only sparingly.

A Bad Lead

The U.S. complaint that the increased tempo of textile exports from India is threatening to cause disruption in the U.S. market is hard to believe. It is true that cloth exports from India to the U.S. during the calendar year 1962 were much higher than in the previous year, being about 25.0 million yards, as against 7.0 million yards, but they were well below those in the previous years: over 33 million yards in 1960 and 32 million yards in 1959. At any rate, Indian shipments were considerably less than those of Japan, aggregating as much as 98 million yards in 1961. Even here, it would be wrong to treat India on a par either with Japan, which has a well developed economy and a modern textile industry, or with the colonial city of Hong Kong the textile exports from which consist, it is alleged, largely of goods imported from China and Japan. Surely, a quantity of 25 million yards of cloth that India is currently exporting (per annum) to the U.S. cannot be considered to be so heavy as to disrupt the American market which consumes more than 11,000 million yards of cotton piecegoods every year. If the U.S. Government continues to apply the restrictionist clause rigidly, India will find it difficult to build a permanent market for its textiles in the U.S. By playing into the hands of the American millowners, the U.S. Government has overlooked the point that it has given a bad lead to other developed countries in the free world.

No Need for Import Curbs

Is not the Kennedy Administration, we ask, committed to a programme of trade liberalisation? It may be true that the U.S. textile industry, which provides direct employment to two million workers—another two million are employed in furnishing requirements of the industry—continues to be faced with the problems arising from rapid technological change, shifts in consumer preference and increasing international competition. It may be noted in this connection that the aggregate U.S. textile import quotas from all countries for the year ended September 1962 under the Geneva short-term agreement amounted to 837 million yards, representing roughly 7.7 per cent of the domes-

tic production. If this level of imports were adhered to under the long-term agreement, there would be no need for the U.S. invoking the disruptionist clause of the agreement against countries such as India. For this level is well above the actual rate of imports in the past two years—the total in 1961 was no more than 254 million yards—so that textile exports from India may not be adversely affected at all.

In the aforesaid context, the special report on the outlook for Indian textiles in the U.S. market which the Economist Intelligence Unit (London) prepared in October 1962 for the Indian Cotton Textiles Export Promotion Council is highly topical. The Intelligence Unit no doubt admits that it is inconceivable that imports of cotton textiles, especially from the less developed countries, should be permitted to dry up altogether. Nevertheless, it observes:

"... No unrestricted wave of textile imports is likely to be permitted in the future, and there is, therefore, always a national limit upon the extent to which a successful Indian drive to enter new fields with their cotton goods would be permitted to succeed. It is for this reason that we believe that a controlled sales drive, aimed at modest success in a number of different product markets in the U.S.A., is the one most likely to yield the best results with the least political outcry. Similarly, by raising the quality of their products and lessening their present dependence on sales of greys, Indian manufacturers would be able to emaximise the dollar return from a given quantity or quota of cloth."

Exports of cotton textiles from India to the U.S. consist mainly of grey goods, with fairly substantial quantities of hand-woven Medias fabric, quilts and bedspreads. The Economist Intelligent Unit's assessment of the outlook for Indian textiles in the U.S. may be summed up thus:

"Best prospects for expansion lie in finished cloths over as wide a range as possible. Suggested fields are elegantly-designed furnishing fabrics, finished sheeting, towelling, denims and other fabrics demanded by the clothing industry destined particularly for the manufacture of woven sports shirts, trousers for work and sport, and sportswear, including playsuits for children. Indian manufacturers who can meet U.S. requirements as to design, quality and price should be able to expand their sales in these fields."

The study has laid special emphasis on the need for meeting the U.S. rapid standards of design, quality and finish. It recalls that a number of Japanese manufacturers are already

TEXTILE EXPORT GAINS AND LOSSES

MILLS NOT EAGER TO TAKE ADVANTAGE OF RE-EQUIPMENT SUBSIDY

From Our Special Correspondent

MANCHESTER, *29th January*

MANCHESTER LETTER

OVERSEAS trade of British manufacturers in cotton and allied products in 1962 showed, with only one major exception, a slightly more favourable trend than the two previous years had presented. In all departments, imports were lower, while minor successes in exports were obtained in each sector, apart from the important branch of cotton cloth shipments.

From the straightforward cash balance of payments aspect, the picture was scarcely promising. Earnings from exports of cotton yarns and manufactured goods decreased by yet another £10 million, from £56,524,209 to £46,461,644. Comparative imports cost £57,231,674, as against £72,539,996. Yet it is fair enough to say that some holding of the line was achieved last year, in spite of the many difficulties encountered throughout the trade.

As an additional cause for gratification, the figures for exports of man-made fibre yarns should be awarded due prominence. From barely 45 million lbs. in 1959 (which, incidentally, was just twice as large as the voume of cotton yarn exported in that year), shipments have risen steadily until a total of 68,335,000 lbs. was sent abroad in 1962, a rise of nearly 15 million lbs. on the previous year. Destinations of these goods covered a wide area, with Continental consumers just as anxious to buy British yarn as some of the Commonwealth markets. The chief outlets were Australia, China, Sweden, South Africa, Switzerland, India and Syria.

Cotton yarn exports, on the other hand, while smaller in total, were spread among fewer buying areas. Australia absorbed nearly 5½ million lbs. and Canada over 2½ million lbs., but, apart from New Zealand and the Irish Republic, both of which took more than 1 million lbs., supplies sent to other sources were negligible.

Cloth Shipments Decline

The steady erosion of cotton cloth shipments, which has continued in uninterrupted fashion for a full decade, took another downward dive of 50 million yards. Many traders engaged in such activities must clearly be asking themselves how long such a regrettable movement can possibly go on. Scarcely a country among the still lengthy list of those which procure cloth from Britain took larger quantities in 1962 than in 1961. Among the exceptions were Cyprus, Rhodesia and Nyasaland, the Sudan and the United States.

In contrast, reductions occurred in shipments to Nigeria (from 31,349,000 yards to 16,251,000 yards); to Ghana (from 23,745 000 yards to 19,373,000 yards); to South Africa (from 33,523,000 yards to 26 586,000 yards); and to New Zealand (from 21,780,000 yards to 16,267,000 yards). Australia regained first place as chief consumer, taking 30.077.000 yards, a drop of 1,600,000 yards on the 1961 figure.

Few major changes took place in the flow of man-made fibre fabrics from the United Kingdom to foreign outlets. Variations tended to even themselves out, so that smaller shipments to Rhodesia and Nyasaland, Australia, New Zealand and South Africa were offset by improved sales to Hong Kong, the Irish Republic and Sweden. Chief gains, however, were made in trade with the undesignated "other foreign countries" whose takings were more than doubled at 13,347,000 yards.

Curtailment of Imports

For several years past, it has been the practice to comment first on the trend of imports, leaving export trade trailing unhappily in the rear. The curtailment of arrivals from abroad, however, began to take shape in the final months of 1961 and, except for a brief spell late last year, imports were generally lower than in the corresponding month 12 months previously. In December, moreover, total shipments of cotton cloth from foreign sources reached only 37,619,000 yards, the smallest quantity received in any month since May, 1959. The figure compared with 41,765 000 yards imported in December 1961 and 58,000,000 yards in November last.

Within the totals of imports covering the full year, however, certain points should be emphasised. Almost the whole of the reduction of more than 150 million yards in the volume of arrivals was accounted for by grey cloth supplies alone. Finished goods imported showed a drop of little more than 10 million yards—from 154,845,000 yards to 143,973,000 yards.

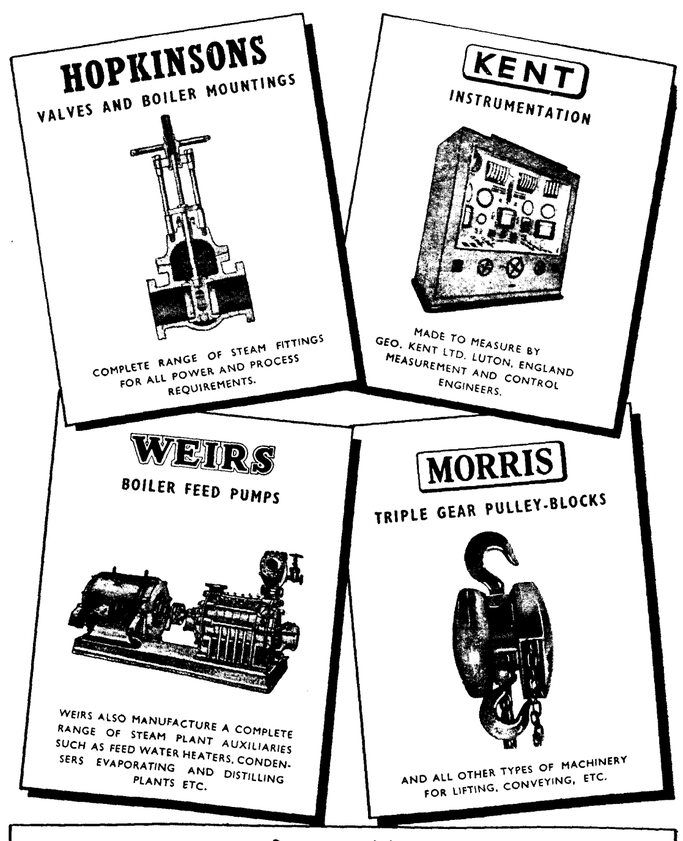
The Prices Paid

Comparative costs are also significant; the 431 million yards of grey cloth purchased abroad were valued at practically £26 million. Importers interested in finished fabrics meanwhile paid nearly £25 million for only 144 million yards of processed material.

As for the suppliers, cotton grey cloth imports from the three Eastern countries, which are either willing or unwilling signatories to the "voluntary" pacts, reached an aggregate of 287,308,000 yards in 1962, as against 285,594.000 yards in the previous year. Most ground was made by Pakistan, whose shipments increased from 23 million yards to nearly 38 million yards. Hong Kong, despite many complaints from the Colony, stepped up its sales from 85 million yards to almost 99 million yards. A sharp fall occurred in India's trade, from 177 million yards to 150 million yards.

Outside these sources, imports from Japan dwindled appreciably, from 60 million yards to 25 million yards. The change of atmosphere in the industry and the abandonment by many merchants of their world-wide search for supplies is amply portrayed in the reduction in arrivals from "other foreign countries" from 154 million yards in 1961 to 61 million yards last year.

Delay in Modernisation



Rather less than six months now remain for final contracts to be placed in order that Lancashire firms may take advantage of the re-equipment subsidy. Few can be blamed for delaying their commitments as long as possible considering the state of the general economic outlook both at home and abroad, but it must be recalled that installation of eligible plant must be effected before July next year.

The bigger firms in the industry tend to have more resources and can afford to spend more on modernisation projects of this kind. It is, therefore, no surprise to learn that the Lancashire Cotton Corporation has bought plant valued at about £4 million during the past three years, much of which will be eligible for the Government grant.

At the same time, according to Mr. Roger Lee, the Chairman, firm orders covering about £1,800,000 are still scheduled for inclusion in the scheme, but contracts are not being placed until the outlook is clearer. "We must proceed prudently in this matter and carefully weigh up general conditions of trade before embarking on this latter stage in re-equipment," he says, "so that we may be satisfied that the prospects of earning an adequate return on this expenditure are favourable."

Another Machinery Record

Thanks to a notable increase in trade in the final month of 1962, the year became the best ever in the value of textile machinery shipped abroad. Exceeding the previous year's peak performance by nearly £500,000, total earnings from such plant exported reached £62,511,445. The volume of machinery involved was also slightly larger than in 1961, the total being 1,560,945 cwt., as against 1.536,795 cwt. Big shipments to India, Pakistan and Israel were responsible for a sharp rise in exports in December, when 153,455 cwt were sent abroad, as against 121,804 cwt. in the same month last year.

PROSPECTS FOR WORLD COTTON CONSUMPTION

MORE COMPETITION FROM MAN-MADE FIBRES

THE main conclusions of the study of world cotton consumption prospects during the current (1962-63) season made by the secretariat of the International Cotton Advisory Committee, Washington (I.C.A.C.), were summarised in our last issue (*vide Commerce* dated 2nd February 1963, page 191). The latest (January 1963) issue of *Cotton*, the monthly review of the world cotton situation, published by the I.C.A.C., gives the facts and arguments supporting these conclusions.

Reviewing the long-term trends in cotton consumption, the I.C.A.C. points out that, despite the inevitable ups and downs in the textile cycle in individual countries, in the aggregate, the post-Korean period has been one of almost continuous expansion in cotton consumption. To a large extent, this can be attributed to differences in the timing of the textile cycle in the main consuming countries. In fact, the only break in the upward movement in aggregate cotton consumption, which occurred in 1957-58, was due to the fact that the downturn started simultaneously in the three main consuming areas, namely, U.S., Western Europe and Japan. In part also, the steady rise in consumption can be explained in terms of the rapid growth in cotton textile production in primary producing countries.

Free world cotton consumption during the last season, namely 1961-62, aggregated 32.48 million bales (of 478 lbs. each), bringing total world consumption, including the consumption of 15.7 million bales in Communist countries, to 48.19 million bales. The following table gives the world cotton consumption figures for the three years 1961-62, 1960-61 and 1959-60:

Cotton Consumption

(In '000 bales)

	1961-62*	1960-61	1959-60
Total Free World	32,479	31,645	31,214
Of which :			
United States	8,979	8,729	9,025
Mexico	510	500	485
United Kingdom	1,056	1,232	1,310
West Germany	1,395	1,500	1,472
France	1,312	1,397	1,373
Italy	1,047	1,040	1,023
India	4,925	4,620	4,450
Japan	3,286	3,441	2,939
Pakistan	1,139	1,125	1,100
U.A.R.	580	548	519
Brazil	1,300	1,250	1,185
Other free world	6,950	6,263	6,333
Total Communist Countries ..	15,715	16,365	17,138
Of which :			
U.S.S.R.	6,300	6,300	6,200
China (Mainland)	7,000	7,700	8,700
Eastern Europe	2,415	2,365	2,238
Grand total	48,194	48,010	48,352

* Preliminary.

Consumption during the current season is expected to continue at a relatively high level though probably lower than in 1961-62. Consumption prospects in individual countries vary from country to country. Consumption in the U.S. during the first three months of the current season (August 1962 to July 1963) has been running at an annual rate of about 8.25 million bales, as compared with the actual consumption of 9.0 million bales last season. Among the factors making for lower consumption of cotton in that country are the intense competition from man-made fibres and materials, the rising trend in textile imports and the continuing inequity in the price of raw cotton from the point of view of domestic mills. In fact, increased competition from synthetic fibres is a crucial factor in the cotton textile situation in the U.S. The magnitude of this problem was brought out in a recent report by the National Cotton Council wherein it was indicated that, if cotton had held the same sphere of the total market in the second quarter of 1962 that it held in the fourth quarter of 1960, mill consumption of cotton last season would have been at an annual rate of about 850,000 bales higher than it actually was.

The relative position of cotton *versus* man-made fibres also becomes evident in the official projections of *per capita* fibre consumption for the calendar year 1962. *Per capita* mill consumption of cotton is expected to have increased by 2.7 per cent in 1962 over 1961, as compared with the expected increase of as much as 13 per cent in the *per capita* consumption of man-made fibres. Competition from man-made fibres continues to be intense in Western Europe, too, and this is a factor affecting cotton consumption prospects in that region. In Western Europe, rayon production is estimated to have increased by 4 per cent and synthetic fibre production by 28 per cent during the first half of 1962 over the corresponding period of 1961. During this period, however, cotton consumption was significantly lower in many countries. For Western Europe as a whole, it was 5 per cent lower. On a world basis, the comparison is even less favourable to cotton. In the U.K., production of man-made fibres is at a record high level, in contrast to cotton. Viscose and acetate staple fibre have featured prominently in the expansion and the situation in respect of synthetic fibres continues to be strong.

The following table gives the free-world production of man-made fibres in the first half of 1962, as compared with that in 1961:

World Man-made Fibre Production

('000 metric tons)

Period	Cellulosic fibres: Filament yarn	Cellulosic fibres: Staple fibre	Cellulosic fibres: Total	Synthetic fibres	Total man-made fibres
1961					
1st half	404	537	941	355	1,296
2nd half	421	585	1,006	386	1,392
Total 1961 ..	825	1,122	1,947	741	2,688
1962					
1st half	440	594	1,034	459	1,493

Rayon production during the first half of 1962 was nearly 10 per cent higher than that in the same period of 1961, with the gain in the case of staple fibre, which is directly competitive with cotton, somewhat more rapid than in filament yarn. World production of synthetic fibres increased by nearly 30 per cent during the same period. The greatest percentage gains in production of man-made fibres have been made in the U.S. and Italy but the increase made in W. Germany, U.S.S.R. and the U.K. has also been impressive. In Japan, there has been a noticeable switch from rayon to other synthetic fibres which accounts for the rather small increase in total man-made fibre production in that country. The following table indicates the percentage increase in man-made fibre production in the free world during the first half of 1962, as compared with the same period of 1961:

Man-made Fibre Production

(Percentage change in some countries)

Countries	1st half of 1961	1st half of 1962	Percentage increase
United States	383.1	481.7	25
Japan	287.1	297.0	3
West Germany	150.5	173.5	15
United Kingdom	125.6	137.8	10
U.S.S.R.	121.0	136.0	12
Italy	101.1	124.0	23

As regards India, although competition from man-made fibres is destined to grow, at present, according to the I.C.A.C.'s study, it is of little importance to the cotton textile situation in the country. While everything points to the maintenance of a continued upward trend in cotton textile production, an element of uncertainty has been injected into the picture by the border conflict with China. In Japan, a marked decline in cotton consumption has occurred since the beginning of 1962 and, in rough terms, consumption is now running at about a quarter of a million bales per month, as compared with the 1961 peak of over 300,000 bales. In contrast to other countries, in Japan the entire textile industry has been affected in various degrees by the current textile recession with, for example, a major switch away from rayon and towards other synthetic fibres. In view of the high rate of curtailment of cotton yarn production and reduction in spinning capacity a decline in cotton consumption is expected this season.

To sum up, assuming that extraneous factors do not distort the situation, cotton consumption would continue at a relatively high level during 1962-63 though probably somewhat lower than in 1961-62. In the context of the increase in world production, however, any decline in total consumption that may occur would add to the carry-over stock at the end of the season.

TEXTILES

(Concluded from page 226)

meeting such standards and that some Hong Kong firms have greatly improved recently in this respect. In this connection, the study observes:

"If even a limited number of Indian mills are presently in a position to meet these standards, we would suggest that steps should be taken to ensure that only the output of these firms is used in the attempt to penetrate the U.S. market. This would mean the setting up of some form of organisation in India to ensure that quality standards were met under some form of brand name (and also preferably to ensue that sub-standard mills could not offer finished products in the U.S. market). This could perhaps be achieved through some further development of the managing agency system. At the selling end in the U.S.A., some form of joint effort would also be called for, through which the output of a group of mills could be promoted, again using the brand name. If the garment industry and the piecegoods markets are to be attacked successfully, stocks must be held locally and, if sales to cutters are made, collections would have to be made through the medium of a factor, whose rates drop significantly with the volume handled.

"In the most general terms, we would suggest that the logical way to approach the market for furnishing fabrics, towels, sheets and piecegoods would be direct with department stores, or through their buying offices (such as A.M.C. or Federated) in New York or abroad. In the case of fabrics, e.g. denims, for the clothing industry, it would be of great assistance to secure the interest of a store chain or major mail-order house, either of which would be in a strong position to influence the purchase of materials by the cutters supplying them. For sales to the cutters themselves, the services of an experienced wholesaler would be required. The sales effort should be concentrated in New York City where the apparel industry and major buying offices are concentrated, but cultivating the cutters and high quality stores of California and Texas may well yield dividends in the same way as it did to the importers of Italian twill-backed velveteens."

The Intelligence Unit has given a wealth of data pertaining to the U.S. textile consumption, production and trade; the broad trends emerging from these data are depicted in Tables A, B and C. The findings of the report reveal that, between 1947 and 1961, the total expenditure on clothing and accessories (other than shoes) in the U.S. rose by 54.5 per cent or the equivalent of 21.2 per cent on *per capita* basis, whereas the population increased by 27.4 per cent and personal consumption expenditure more than doubled. As clothing was the only important item for which prices did not rise sharply over the period, the increase in *per capita* expenditure on clothing reflected a modest improvement in the actual volume of clothing purchased per head of population. Women's and children's wear accounted for 63.4 per cent of total expenditure on clothing in 1961. The *per capita* expenditure on clothing is expected to rise from $131.2 in 1961 to $133.33 in 1970, when population will have gone up by a further 12-22 per cent. The share of expenditure on clothing in the total personal consumption expenditure is, however, expected to decline from 7.13 per cent to 6.30 per cent. It is anticipated that, between 1957 and 1970, the consumption of all fibres in the U.S. will rise by 15 per cent in the case of the clothing industry and by 45 per cent in respect of home furnishing sector. In view of the rising trend of demand for textiles in the U.S., the fear that domestic industry will suffer a distinct setback if no quota restrictions are imposed on exports from countries like India is clearly exaggerated.

FULLY AUTOMATIC LOOM TYPE NZ-100

The Howa-Automatic Loom Type NZ-100 was displayed and demonstrated for the first time in India at the Japanese Machinery Centre in Bombay on the 5th inst. This loom is fully automatic and is equipped with a 'Super Box-Magazine,' instead of the conventional circular hopper in which the maximum of 240 pieces of bobbins can be taken at a time. Because of such large numbers of bobbins, this loom can be operated continuously for 30 to 50 hours without any more feeding of bobbins. The work of picking and fixing the end of the yarn out of bobbins, disposal of waste yarn and cleaning, etc., are also mechanically performed instead of labour power. Consequently, there is no need of a labourer. Thus there is considerable labour saving; one labourer can easily take charge of 650 sets of looms. By utilising this loom, bobbin suppliers are decreased greatly when compared with those needed in case of using conventional shuttle change or cop change looms.

The new loom is easy in operation and also maintenance due to the elimination of complicated mechanisms such as air-suction and electric equipments. It is also equipped with ideal positive let-off motion feeding constant quantity of warp yarn regardless the size of wound beam dia., which makes the width and length of cloth to be woven keep a constant and unvariable tension. It is very easy to convert the conventional cop change loom into a fully automatic loom NZ-100 only by converting hopper and other minor parts.

PACE OF ECONOMIC LEGISLATION—I

AN ANALYTICAL STUDY OF POST-INDEPENDENCE PERIOD

By Dr. Raj K. Nigam, Ph.D. (Econ.) (London)

AN important question often asked in our country is whether our society and economy are over-legislated. The inquiring mind has no precise understanding and comprehension of the reality and bases its conclusions on over-generalised impressions and hunches. The political, social and economic scene in the country has undergone a revolutionary change during the last 15 years or so after the transfer of power in 1947. From a country groaning under the mills of political servitude and with its economy stagnating in the cess-pools of poverty and backwardness, compounded and aggravated by a rapidly increasing population and continuance of age-old conservatism of the people and their reluctance to draw lessons from more advanced and industrially developed nations of the world, consequent on the release of new social, political and economic forces on attainment of Independence in 1947, emerged a new India which set before itself new goals, objectives and values for the short and long-term development of the nation.

In our country before Independence the century-old suppressed human urges, energies and expectations spread over a wide area, covering all aspects of human life. Therefore, after the freedom on the political plane, administrative and political integration and the like matters were the urgent problems to be tackled. On the social and cultural side, to begin with, the scars of partition had to be removed, and then the work of social reconstruction of the society, its health and education, etc., had to be undertaken in right earnest. And, on the economic side, the most pressing thing was to strengthen the economy at the base and wipe out the shortages of food, essential raw materials and check inflationary pressures from aggravating the price situation in the country. It became the most pressing responsibility of the Government to lay the foundations of rapid industrial progress and to secure for the weaker and underprivileged sections of the society opportunities of maximum advancement.

A few years after Independence, the country was presented the first Five-year Plan and the Constitution which among many other things proclaimed the establishment of a socialist and Welfare State as the ultimate aim of the Government endeavours. It was to be a society in which there would be no concentration of income, wealth and economic power in the hands of the privileged classes of the society and in which the national income of the people would rise sufficiently so as to give a decent standard of life to the people. Further, as between various regions and States of the country, disparities in levels of development were also to be steadily reduced and the benefits of industrialisation were to spread evenly between the different parts of the country. These objectives have been succinctly stated in the second Five-year Plan in the following words:

"The task before an underdeveloped country is not merely to get better results than existing framework of economic and social institutions but to model and refashion these, so that they contribute effectively to the realisation of wider and deeper social values. ... Essentially, this means that the basic criterion for determining the lines of advancement must not be private profit, but social gain, and that the pattern of development and the structure of socio-economic relationships should be so planned that they result not only in an appreciable increase in national income and employment but also in greater equality in incomes and wealth. Major decisions relating to production, distribution, consumption and investment ... and in fact all significant socio-economic relationships must be made by agencies informed by social purpose. The benefits of economic development must accrue more and more to the relatively less privileged classes of society and there should be progressive reduction in the concentration of income, wealth and economic power. The problem is to create a milieu in which the small man who has so far had little opportunity of perceiving and participating in the immense possibilities of growth through organised effort is enable to put in his best in the interests of higher standard of life for himself and increased prosperity for the country."

Thus, in keeping with the need of the times, after political independence, and emancipation of people who came to be possessed, instantaneously, of a sense of rising expectations engendered by the formation of national Government and their subsequent pronouncements regarding the establishment of socialist society, there occurred a rapid growth of laws dealing with the different aspects of life in the country. Earlier, in the pre-Independence period in a dormant India its problems were attended to with the characteristic bureaucratic approach of the Government owing allegiance to a foreign country and not to the Indian people and the laws in that period naturally were few and simple. But, on the fixation of certain socio-economic objectives before themselves, the Government, in the post-Independence period, had to bring up a large number of legislative measures, which, because of the growing complexities of social and economic activities, became somewhat voluminous and complicated as well. Thus, insofar as the laws reflect the current mood of the society towards its problems and are to be used as a means for achieving certain ideals and social values, they could not but be complicated and large in number. A developing society on democratic lines cannot escape such an eventuality and has to learn to live with the laws of the land and co-operate with the authority administering them.

So, this is one approach to the growth of legislation in the country, an approach expressed against the background of the growing problems of the society and the attainment of certain ultimate basic objectives and ideals written in the Constitution of the country. But the opposite view regarding the "tyranny of legislation and the Executive" also deserves to be mentioned. Some sections of the society, including the intellectual fringe reputed for dispassionate and objective thinking, have given vent to a feeling that the framing and administration of laws have to be carefully watched, as, year by year, we were having steady, if somewhat imperceptible, inroads by the Executive into the citizens' basic freedom. There was a very perceptible and continuous drift towards authoritarianism which negatived the principles of human freedom and justice. The argument pertaining to encroachment on individual liberty is sought to be met on the ground that, in a Welfare State, the Executive must be allowed to take strong measures, in order to further the cause of social justice. But the over-abundance and complexity of the large number of new laws passed every year make the life of an ordinary citizen pretty uneasy. As one eminent authority supporting this view has said, "the citizen is duped into accepting the laws by the clap-trap of dynamic society and changing social and economic conditions." In the great hurry of law-making, laws are ill-conceived and ill-drafted and, as a result, they need amendments within a few months of their being enacted which makes it further difficult for the citizen who is lost in a statutory labyrinth. On the growing volume of legislation a joke has also been cut that "our laws multiply even faster (proportionately) than our population, which is saying a good deal. If the President of India should do nothing during his waking hours except digest and study the Bills which are reserved for his consideration and his assent, he would hardly have time to go through all the Bills."

Critics of the laws of the country take serious objection to the way in which the Constitution has, since its promulgation, been tinkered with to suit certain momentary needs and situations. Various amendments made to the Constitution, it is pointed out, have whittled down the fundamental rights to such an extent that "the fundamental rights are now only an abridged pocket edition of what they used to be. There is very little left of their original contents."

In this connection, repeatedly mention has been made by the critics of the amendments to Article 19 of the Constitution. Similarly, substantive provisions of certain Acts such as the Income-tax Act, Central Sales Tax Act, Companies Act have been cited as instances of laws that deprived the people of the rewards of their work and curtailed their personal liberties. It is, however, not proposed to deal in this article with the burdensome and irksome contents of the controversial substantive and amending legislation, as it would, indeed, require a very deep appreciation and assessment of the provisions of the various laws at work against the current socio-economic scene in the country and against the ultimate ideals and objectives that the society and the Government have adopted for future generations. The present article merely seeks to present to the readers a complete and comprehensive picture of the

Subs.—Substantive. Amend.—Amendment.

Note: In this series of three articles, the author has only attempted to present a dimensional view of the economic legislation enacted during the post-Independence period, the contents of which the author proposes to study and examine more comprehensively in the form of a book on which he is currently engaged. The purpose of this article is confined to making an objective study of the correlation between economic legislation and the contemporary economic problems of the country and to focus public attention and crystallise their thinking on the subject against an objective background. It may be also mentioned that the views expressed in this article are the personal views of the author.

laws passed since Independence and those which are in force in the country at the present moment. The period covered in this article is mid-August 1947 to end of March 1962. The latter date has been chosen to mark off the labours of the previous Parliaments from that of the new one which commenced business in the month of May 1962. (After March 1962, excluding Appropriation and Finance Acts, 41 Bills have been introduced in Parliament and, of these, 23 are Amendment Bills and 18 Bills of substantive nature). Apart from the coverage of the period specified, it needs to be made clear here that the present assessment of the progress of legislation in this article deals with the laws enacted by the Union Parliament only and those passed by the State legislatures in the constituent States of the Indian Union and administered by the State Governments are omitted from our review. As such the full burden of the Central and State laws on the shoulders of the people of this country cannot be assessed and it has to wait till such time that the information for the State laws is also collected and systematically processed in the same manner as has been attempted in the case of Central laws in this article. However, notwithstanding this, the present article discusses the position of the Central laws in sufficient details so as to help the reader in getting a clear picture of the contents of the same.

Now to come to the main theme of this article, namely, the progress of legislation during the period beginning with the attainment of Independence and ending with 31st March 1962, our examination of the legislative records reveals that the number of laws passed by the Central Government comes to a total of 1,001. This total includes 12 Constitutional amendments passed during the period under review but excludes the main Constitution. Thus, excluding the constitutional amendments, no less than 988 substantive and amending laws were passed during the post-Independence period. In other words, on an average, 67 Acts were passed every year during the post-Independence period as against 27 Acts a year in the quinquennial period 1935-39 and 30 Acts a year during the World War II and post-War years preceding Independence. This shows a significant increase in the tempo of legislative business transacted in the Central legislature and Parliament of the country. The largest number of Acts passed and assented to by the President of India was in the year 1956, when no less than 105 Acts were put on the Statute book. The next largest numbers of Acts passed were in the years 1952 and 1950, when 81 and 80 Acts, respectively, were enacted. In comparison to this record of the post-Independence period, the largest number of Acts to be passed in the preceding decade was 42 in 1939 and a like number in 1940. A year-to-year trend of the legislative work done by the Central legislature and Parliament in the country is depicted in table below; figures in brackets relate to the passing of the Constitution in 1950 and the constitutional amendments in the other years; these are in addition to the total figures given in the table.

Number of Acts passed by Central Legislature or Parliament (1935—March 1962)

Calendar year	No. of Acts passed	Calendar year	No. of Acts passed
1935	14	1948	67
1936	24	1949	66
1937	29	1950	80 (1)
1938	26	1951	71 (1)
1939	42	1952	81
1940	42	1953	55 (1)
1941	27	1954	56
1942	26	1955	57 (3)
1943	30	1956	105 (2)
1944	18	1957	68
1945	11	1958	59
1946	38	1959	62
1947 (upto 14th August 1947) ..	58	1960	66 (2)
1947 (15th August to 31st December 1947) ..	17	1961	61 (2)
		1962 (upto 31st March) ..	17 (1)

Besides the passing of 1,001 Acts, substantive as well as amending and constitutional ones, the Central Legislature and Parliament through the passing of Repealing and Amendment Acts in the years 1948, 1949, 1950, 1952, 1953, 1957 and 1960, repealed 608 Central Acts of which 492 Acts were repealed in toto and 116 Acts in parts. In addition, 110 ordinances and regulations promulgated during the World War II period were repealed by the Repealing and Amendment Acts, whereas 119 Acts were amended. Among the Acts which were totally repealed 104 Acts were substantive Acts and 388 Acts, Amendment Acts. Among the substantive Acts washed out by the Repealing and Amendment Acts, 46 Acts were passed before World War II, 18 Acts during World War II and immediately after that, and 40 Acts during post-independence period. The corresponding figures of the Amendment Acts pertaining to the three periods are 5, 78 and 305, respectively. A further study of the Acts under the two broad categories of economic and non-economic Acts reveals that, of the 104 substantive Acts repealed by the Repealing and Amendment Acts, 25 Acts were economic Acts and, among the 388 amendment Acts, 203 Acts were economic Acts. The numbers of non-economic Acts under the two categories of the totally repealed Acts and partially amended Acts were 79 and 185 respectively. Table 1 gives the details of the Central Acts repealed and amended under the seven Repealing and Amendment Acts passed during the period 1947-62.

Coming back to the 988 substantive and Amendment Acts separately passed during the post-Independence period, our analysis reveals that, out of this total, 523 are the substantive Acts and 465 Amendment Acts. Dividing the total Acts passed into two broad categories, namely, economic and non-economic Acts, it is seen that 554 are economic Acts and 434 are non-economic. Again, out of the 554 economic Acts, 291 are substantive Acts, whereas 263 are Amendment Acts. In the category of non-economic Acts which number 434, 232 are substantive Acts and 202 Amendment Acts. Here, while making a distinction between substantive and Amendment Acts, it needs to be mentioned that some of the Amendment Acts are so important in nature that their significance is as great as that of the substantive Acts. Further, taking the major amendments made to the substantive Acts through the passing of separate Amendment Acts and the minor amendments made through the passing of Repealing and Amendment Acts together, 614 amendments were made to the various laws of the country during the post-Independence period and, of these, 306 amendments were made to the economic laws and 308 to the non-economic ones. The classification of legislation into economic and non-economic categories in the post-Independence period is indicated in Table 2.

From among the substantive economic Acts, passed during the post-Independence period, if we exclude the Annual Appropriation Acts, Finance Acts and the like ones, the number of substantive economic legislation is reduced to 122. Further, if a similar adjustment is made in the number of Amendment Acts passed during the period under review, we find that their total comes to 210.

A detailed study of the Amendment Acts brings out interesting and revealing facts. During the period of study, the Indian Tariff Act 1934, has been amended the largest number of times, i.e., for no less than 30 times. The Reserve Bank of India Act 1934 has been amended 8 times (excluding the amendment made to the Reserve Bank of India (Amendment and Miscellaneous Provisions) Act, 1953); the Banking Companies Act 1949 has been amended 7 times, Central Excises and Sales Tax Act 1944, Essential Supplies (Temporary Powers) Act 1946 which was later on repealed in 1955 and the Insurance Act 1938 six times each. The Foreign Exchange Regulation Act 1947, Merchant Shipping Act 1923 the Imports and Exports (Control) Act 1947, Industrial Disputes Act 1947 and Minimum Wages Act 1948 has been amended five times each whereas the Income-tax Act of 1922 after being amended, also five times, was replaced by a new Act in 1961. Our study of the Amendment Acts passed during the post-Independence period further reveals that the Control of Shipping Act 1947, the Employees' Provident Fund Act 1952, Industries (Development and Regulation) Act 1951, the State Financial Corporation Act 1951, Sea Customs Act 1878 and Tea Act, 1953 have been amended four times, whereas the Sales Tax Act 1956, the Essential Commodities Act 1955, the Forward Contracts and Regulation Act 1952, the Indian Boilers Act 1923, the State Bank of India Act 1955 and Taxation of Income (Investigation Commission) Act, 1947 have been amended three times each. Among the Acts amended twice during the period under review, are the Air Corporations Act 1953, the Coal Mines Provident Fund and Bonus Act 1948, the Central Silk Board Act 1948, the Chartered Accountants Act 1949, the Dock Workers (Regulation and Employment) Act 1948, Electricity (Supply) Act 1948, the Indian Trade Unions Act 1926, the Inland Steam Vessel Act 1917, the Coconut Committee Act 1944, the Industrial Disputes (Banking Companies) Decision Act 1955, the Road Transport Corporations Act 1950 and the Tea Act 1953.

In all, 110 economic Acts were affected by the passing of Amendment Acts during the post-Independence period of which 5 Acts were amended five times and more, 8 Acts five times, 7 Acts four times, 6 Acts three times, 21 Acts twice and 63 Acts once only. As against this, the number of non-economic legislation amended during the same period came to 115. Among these the Code of Criminal Procedure and Criminal Law Act has been amended for the largest number of times, namely, for 16 times, whereas the Representation of People Act 1950 10 times, Code of Civil Procedure seven times, and the Administration of Evacuee Property Act 1950, six times. As against this, the Prevention of Corruption Act 1947 and the Cantonment Act 1924 and Law, the Preventive Detention Act, 1950 and the Prevention of Disqualification Act, 1954 have been amended five times. The Cinematograph Act, and the Indian Patents and Designs Act 1911, have been amended four times each. Further, our study reveals that the Abducted Persons (Recovery and Restoration) Act 1949, (later on repealed) the Displaced Persons (Compensation and Rehabilitation) Act 1954, the Indian Succession Act 1925, the Motor Vehicles Act 1939 and the Indian Penal Code have been amended three times each. Among the non-economic Acts which were amended twice are the Aircraft Act 1934, the Assam Rifles Act 1941, the Ancient Monuments and Archæological Sites and Remains (Declaration of National Importance) Act 1951, the Benares University Act 1915, the Census Act 1948, the Dentist Act 1948, the Delhi University Act 1922, the Drugs Act 1940, the High Court Judges (Conditions of Service) Act 1954, the Indian Nursing Council Act 1947, the Indian Lighthouses Act 1927, the Salaries and Allowances of Members of Parliament Act 1954, the Territorial Army Act 1948, and the Voluntary Surrender of Salaries (Exemption from Taxation) Act 1950. Our analysis discloses that while 5 non-economic Acts have been amended six or more times during the period under review, 2 Acts have been amended five times, 4 Acts have been amended four times, 6 Acts three times, 19 Acts twice and 73 Acts once during the same period.

MANAGING DIRECTOR

Shri Amrut Vithaldas Mody has been appointed Managing Director of the Company by the Company in general meeting held on the 28th October 1962, subject to the approval of the Central Government for a period of FIVE years from the date of approval on a remuneration of 5 per cent of the net profits as computed as laid down in Section 309 of the Act, with a minimum of Rs. 30,000 per annum in addition to sitting fees. Application to Central Government for approval to his appointment and remuneration will be made in due course.

BANKERS TO THE ISSUE

The Bank of India Ltd., Mahatma Gandhi Road, Bombay-1.

The United Commercial Bank Ltd., Dadabhai Naoroji Road, Bombay-1.

The Devkaran Nanjee Banking Co. Ltd., Horniman Circle, Fort, Bombay-1.

SOLICITORS

Messrs. Manilal Kher Ambalal & Co., 51, Mahatma Gandhi Road, Bombay-1.

AUDITORS

Messrs. B. D. Jokhakar & Co., Chartered Accountants, 8, Hamam Street, Fort, Bombay-1.

REGISTERED OFFICE

22, Bhulabhai Desai Road, Bombay-26.

FACTORY ADDRESS

Prabhat Estate, Jogeshwari (West), Bombay.

BRIEF HISTORY AND ACTIVITIES

The Company has agreed to acquire and take over as a going concern the business of "Unichem Laboratories" established in the year 1944 as the manufacturing chemists and dealers in Pharmaceutical Products with all the assets and liabilities including goodwill and carry on the same business. The sales of Unichem in the year 1962 have gone up above 120 lacs as against about one and a half lac in the year 1944.

The existing Unichem Laboratories is very well equipped with the necessary machinery and plant for Pharmaceutical formulations and synthesis of pharmaceutical chemicals.

Applications are made to transfer to the name of the Company the following now in the name of "Unichem Laboratories" (Proprietor: Shri Amrut V. Mody).

(i) Industrial Licences granted under the Development of INDUSTRIES ACT for the manufacture of both pharmaceutical products and various pharmaceutical chemicals—few of them with foreign collaboration such as:

ROSHKILDE Medical Company of Denmark.

SHOFU Dental Manufacturing Co. Ltd., Japan.

(ii) Import Licence quota as actual users.

(iii) Export—incentive quotas for imports against the exports to various countries.

DATES OF THE OPENING AND CLOSING OF THE SUBSCRIPTION LISTS

The subscription list will open at the commencement of banking hours on 11th February 1963, and will close at the close of banking hours on 16th February 1963 or earlier at the discretion of Directors, but not before the close of banking hours on 14th February 1963. Application will be made to the Bombay Stock Exchange for permission to deal in and for official quotations of the shares of the Company.

Application forms along with copies of the Prospectus can be had from the Company's Registered Office, from the Bankers and their main branches and from the Brokers whose names and addresses are given below. Applications will be received by the Company's Bankers at their offices mentioned in the form.

BROKERS

ENERGY PATTERN OF THE FUTURE

COAL WILL CONTINUE TO BE INDISPENSABLE

THE world's fuel requirements rose from about 1,550 million tons of coal equivalent in 1924 to about 4,700 million tons in 1962. One of the main causes of this increase was the growth of world population from about 1,900 million in the former year to roughly 3,000 million in the latter. Another main cause was the spread of industrialisation and urbanisation which raised the average annual fuel consumption per head from 820 kg. of coal equivalent in 1924 to 1,570 kg. in 1962.

What will be the world's fuel requirements up to, say, the year 2000, that is, during the next 38 years? If the increase in *per capita* fuel consumption should continue as before, and if the current demographic forecasts, suggesting a doubling of world population by the year 2000, are accepted, world fuel requirements would rise from the present level of about 4,700 million tons of coal equivalent a year to about 18,000 million tons in the year 2000, that is, at an average annual rate of 3.5 per cent. According to Mr. E. F. Schumacher, Economic Adviser to Britain's National Coal Board, who has worked out the above figures, the fuel requirement figure for the year 2000 is so large that, on the basis of present knowledge, it is hard to imagine that the dependence on coal would be any the less.

Oil Supplies

If, on the other hand, one's attention is confined to the first half of the period—the 19 years upto 1981—one finds that, by that time, world fuel requirements are likely to have grown to about 9,500 million tons of coal equivalent, that is, twice the present level. A question which has been raised, in this connection, is whether "oil"—one of the four principal sources of primary energy—can or will contribute a relatively larger share than at present to the total fuel supplies by 1981. The answer is in the negative, for the contribution of "oil" is not expected to cover more than 32 to 37 per cent of the world's total fuel requirements in 1981. This will be roughly the same percentage (36) as at present. Mr. Schumacher has worked out this estimate on the basis of the oil industry's own authoritative projections. The first projection, in this connection, is that the output of crude oil in 1975 would amount to about 2,000 million tons (or 3,000 million tons of coal equivalent). And the second projection is that the ultimate peak is likely to occur around the year 2000—about 2,700 million tons of oil a year. If it is assumed, on the basis of these two forecasts, that the amount of oil available in the early '80s will be, say, 3,000 to 3 500 million tons of coal equivalent a year, as compared with a current output of about 1,700 million tons of coal equivalent, it is apparent that such a contribution, in percentage terms, would be about the same as in the present pattern of supplies of primary energy. (See table below.)

Present Supplies of Primary Energy

Source	Million tons coal equivalent	Percentage
Hard coal, brown coal	2,200	47
Oil	1,700	36
Natural gas	700	15
Water power	100	2
Total ..	4,700	100

If thus the contribution of oil to the world's fuel supplies by 1981 is not going to be relatively larger than at present, it would mean that the contribution from all other sources of primary energy, of which the most important one is coal, would have to double in absolute terms during the next 18 years. If the other three sources of energy are not developed as fast as required and if, at the same time, the expansion of the world economy continues at the present rate, Mr. Schumacher fears, *a fuel shortage 10 to 20 years from now is far more likely than a fuel surplus.* Atomic power, according to him, is not going to make any difference to this situation, for it is now generally accepted that, in the foreseeable future, the overall contribution from this revolutionary form of energy will be insignificant in the light of the tremendous growth of energy needs. All this underlines the indispensability of coal in the foreseeable future.

Any shortage in the supply of this vital fuel would be disastrous, for it would involve a corresponding shortage in electric power which is the world's biggest user of coal and on which industrial economies are so heavily dependent. Two aspects of the phenomenal growth in electricity are particularly significant for countries whose chief source of primary fuel is coal. The first relates to the rates of increase in electricity consumption. It has been established, in this connection, that the more advanced industrial countries tend to double their electric power consumption every 10 years and that, *in countries still striving for industrialisation, the rate of growth is much faster.* A second aspect of this universal demand for electrification is that even countries which already produce vast quantities of electricity show no signs of reaching "saturation point." In the United States, for instance, about 180 million tons of coal—over 40 per cent of its total coal output—were consumed by power stations in 1961. Yet a resent estimate by the U.S. Bureau of Mines puts the coal requirements of power stations at no less than 700 million tons by 1980, out of a yearly total coal output envisaged to be some 900 million tons by that time. Over the next 18 years, the Soviet Union also intends to raise its coal output to over 1,000 million tons, again very largely to supply power stations. Thus, even in these two countries most richly endowed with oil, massive increases in coal output are envisaged to sustain the demand for electric power. In Britain, coal consumption by power stations is currently at the rate of 55 million tons a year. This is expected to go up to 200 million tons per annum by 1981, in spite of the massive nuclear power development under way in that country. It would, therefore, appear that coal-based power generation is the biggest single factor underpinning the indispensability of coal currently and in the foreseeable future. As electricity cannot be stored, power production systems are highly sensitive to interruptions in the supplies of coal required to operate them. This, again, shows what a crucial role coal plays in the world's energy pattern. The fact that the steel industry, the gas industry, and other industrial and domestic markets will continue to be large consumers of coal further enhances the vital importance of this primary fuel.

A Suicidal Cry

But currently, because of relatively plentiful and cheap supplies of oil, the coal industry is under heavy pressure in Britain, as well as in Western Europe. The cry has, therefore, gone forth for the abandonment of all coalfields which have become unprofitable owing to the sharp fall in the price of fuel oil. This, according to Mr. Schumacher, is a suicidal cry, for it ignores the likely world pattern of demand for primary energy and the maximum contribution which oil is expected to make to the world's total fuel requirements by 1981. It also ignores the possibility of an oil shortage which might hit such oil-importing countries like Britain and others in Western Europe. Mr. Schumacher's emphatic view is that the process of modernising and expanding the coal industry should not be slowed down under the influence of a temporary oil surplus, for a contraction of the coal industry would be, practically speaking, an irreversible step. What is done or not done to the coal industry in the sixties, he argues, will determine the amount of coal that can be made available in the seventies and the eighties—even as the long-term investment in reconstruction and mechanisation started in the fifties in Britain is paying dividends only now in terms of competitive coal production. Mr. Schumacher, therefore, has no patience with the advocates of a new energy policy with its "anti-coal bias." This is what he says about their proposals.

"At the moment, there are numerous proposals for a 'European Energy Policy' floating about on the Continent. These proposals, almost without exception, have a very strong anti-coal bias. They are innocent of any longer-term considerations, such as I have indicated, and base themselves entirely on the present-day situation. If it were not for the disastrous social consequences of a wholesale closing of collieries, the authors of these proposals would liquidate about half of the continental coal industries at once.... It has already been suggested that, if Britain joined into this 'European Energy Policy' one-third of the British coal industry should be abandoned as soon as ever possible.

"All this, if I may say so, strikes one almost like the manifestation of old Sigmund Freud's 'death wish.' ... These are not matters to be trifled with. Supplies of primary energy is the one matter on which an industrial society must play safe.... It is not wise to scuttle the boat in which you are sitting before another boat is actually there and certain to remain at your disposal. It is to be hoped, therefore, that the energy policy of the Common Market, when it does come—perhaps with British participation—will have more sense, more imagination, and more vision, than the doctrinaire proposals knocking about at present."

Where thus even the advanced industrial countries of Europe would be playing safe if they develop their coal industries further, an industrialising country like India, notwithstanding its substantial hydro-power potential, would need to expand its coal production much faster than it is doing now, if not as fast as Communist China has done in recent years.

FOREIGN CAPITAL FOR SHIPPING

The All-India Manufacturers' Organisation, it is heartening to find, has just taken a forthright stand on the question of foreign capital participation in Indian shipping companies. Its representation of 31st January to Mr. Raj Bahadur, Union Minister for Shipping, is to the following effect:

"Now that the National Shipping Board has endorsed the earlier resolution of the Executive Committee of the Congress Party in Parliament regarding the raising of percentage of foreign capital in an Indian shipping company, the All-India Manufacturers' Organisation requests the Government to take the necessary executive action as provided for in the Merchant Shipping Act, thus avoiding a time-consuming amending Bill. The Association urges this in view of the national emergency and the inability of the Government to provide foreign exchange for purchase of ships so as to accelerate the development of Indian tonnage towards a (possible) new target of three million tons. Further, considering that the prices of ready and building tonnage are now low, the organisation urges Government to raise the figure of foreign participation in shipping, as in other industries, to 49 per cent. This percentage should be applicable to all types of tonnage and not merely to tramps and tankers as suggested by the National Shipping Board, because such differential treatment will be found impracticable in working and will render normally impossible the economic working of composite shipping companies operating all types of ships with low overheads, as against each shipping company being forced to operate separately tramp, tanker, liner and coastal services. The Organisation hopes for an early announcement of Government policy in favour of 49 per cent foreign capital participation in shipping companies, so that Indian shipping might be in a position to meet emergency situations and make effective and energetic progress towards a target of three million tons by forming new companies."

The above representation, it will be seen, reflects enlightened business opinion. The powers-that-be should not hesitate to heed it, for prompt expansion of Indian shipping with foreign assistance will be in the larger interests of the nation.

PROGRESS OF NEYVELI LIGNITE PROJECT

Continued progress on all the projects based on lignite deposits at Neyveli was recorded during the year 1961-62, according to the annual report of the Neyveli Lignite Corporation. The total volume of overburden to be removed before the target of 3.5 million tons of lignite can be achieved is 27 million cubic yards. Full production at the targeted rate is expected to be achieved in the last quarter of 1965, when all the lignite-consuming units of the Integrated Project—thermal power station, the fertiliser plant and the briquetting and carbonisation plant—would be in operation.

Meanwhile, for increasing the annual production of lignite from 3.5 million to 4.8 million tons, in order to enable the expansion of the capacity of the thermal power station from 250,000 kw. to 400,000 kw. during the third Plan period, a project report has been prepared and global tenders have been floated for the procurement of the additional machinery required. Tenders have since been received and are under the scrutiny of the Corporation.

INDIAN OIL COMPANY

It is stated in the annual report of the Government-owned Indian Oil Company for 1961-62 that the Company constructed a storage capacity of 111,000 tons at the main ports, as against the target of 135,000 tons, during the year. Sales were being made from 23 inland depots by the end of the year under review. The quantity of H.S.D. sold was 61,675 kl., of which Government Departments and State Transport Undertakings accounted for 57,509 kl. The Company also sold a total quantity of 148,739 kl. of superior kerosene through co-operatives and Messrs. Hindustan Organisers (Pvt.) Ltd. Supplies imported from Russia during the year were 83,800 kl. of H.S.D., 170,400 kl. of superior kerosene, 7,300 kl. of A.T.F. and 11,300 kl. of furnace oil. It is claimed in the report that these imports, effected at considerably lower rates and on rupee payment terms, have substantially lowered the expenditure on imports and saved free foreign exchange.

LOCKHEED'S PERFORMANCE

The Lockheed Aircraft Corporation of the United States attained a level of production exceeding 1,700 million in 1962. By November last it had 81,200 employees on its rolls. The year under review was highlighted by new forms of flight and new penetrations of inter-planetary space. From pure scientific research to the designing of space vehicles, this aerospace company had its usual wide range of interests. The Corporation also manufactured during the year a new version of the world-famed C-130 Hercules transport aircraft. The Lockheed C-141 StarLifter, another big transport aircraft under development, is scheduled for its first flight before the end of 1963.

The first one-million-ton unit of the public sector refinery, which is under construction at Barauni in Bihar, is expected to be commissioned by September 1963. This information is contained in the annual report, just released, of the Indian Refineries Limited. The second one-million-ton unit, the report continues, is expected to be commissioned by the end of 1963 or early in 1964, while the third stage of construction, covering tube manufacturing facilities, is likely to be completed in 1964.

NEW PRODUCTS AND PROCESSES

S.R.C. Light Regulators for Fluorescent Lamps

A JAPANESE firm, the Tokyo Shibaura Electric Company, has developed a compact light regulator which by means of a silicon control rectifier element can regulate the intensity of light smoothly from 0 to 100 per cent. The conventional light regulator requires an auto transformer and other accessory equipment, occupying considerable space. In addition, the regulation is intermittent rather than smooth. By use of the S.C.R., the size of the regulators is sharply cut, they are lighter, performance is stable and a completely smooth regulating effect can readily be obtained. Toshiba has developed three regulating devices for use with 10 lamps, 50 lamps and a regulating unit. By connecting the regulating unit to the 50-lamp regulator, it is possible to regulate 500 lamps, 1,000 lamps or virtually any number. S.C.I. regulators for less than 10 lamps have been developed in the United States, but there have never before been units capable of handling 50 or more lamps. Toshiba is applying for patent rights over its basic system and five other features. The large types can be used for theatres, TV station auditoriums, hotel lobbies and banquet halls. For theatre use, many accessory devices have been developed, including a remote control system and different circuits giving various levels of brightness in accordance with the requirements of the scene. The smaller models can be used for hotels, dormitories, clubs and public halls, adjusting the light level for television viewing, watching movies or having a party. When the regulator is used for coloured fluorescent lamps, it can provide a mood by producing different colour effects—either hand operated or automatically operated.

Cheaper Power

Big reductions in electricity generating costs should follow improvements in efficiency offered by a new technique known as magneto-plasma-dynamic power generation. With this technique, hot gas from a combustion system is made conductive and passed at high supersonic speed through the field of a powerful magnet. In this way the gas behaves as the copper conductor in a normal generation machine and electrical power is generated. One of the most significant world experiments on this type of generation is being carried out in Britain. It is approaching the state at which it can be run to give power. In the closed cycle system adopted at the International Research and Development Company's laboratories, Newcastle-upon-Tyne, north-east England, purification of the helium carrier gas and full elimination of leaks from a circuit running at 2,000° C have been solved. Already, it is said enough experience has been gained to prepare a design study of an open cycle unit developing 200,000 kw. of heat from fuel oil and oxygen for Britain's Central Electricity Generating Board. Another application of the closed cycle system could be the Dragon high temperature gas-cooled reactor to boost its output and efficiency. Scientists, in fact, are already engaged on Dragon development work at Newcastle.

Bathyscaphe will Look for Fish 2,000 Metres Below

Preliminary blueprints are ready in Russia for a bathyscaphe capable of diving to a depth of two thousand metres. The design of the Soviet bathyscaphe represents a radical departure from foreign bathyscaphes which are modelled after airigibles and have cumbersome floats. The new bathyscaphe will be a compact vessel resembling a submarine, capable of sailing dozens of miles away from its base and staying under water for up to two days. The bathyscaphe will have a crew of two. Automatic control will enable them to devote nearly all their time under water to observations and studies. The bathyscaphe has triple safeguards to ensure its surfacing in case of malfunctioning. The new under-water laboratory will be used to study the fish stocks in seas and oceans. So far, oceans and seas are fished to a depth of not more than 700 metres. Soviet biologists believe that as a result only the young of the fish are caught because the habitat of adult commercial fishes lies much deeper. Studies with the bathyscaphe will help to confirm or refute this viewpoint. The rated speed of the bathyscaphe is 5 knots.

Chromatography Aid

The problem of coating glass plates for thin layer chromatography (TLC) with an absolutely uniform layer of substrate has been overcome, it is claimed, with a new, patented, apparatus recently introduced by a British company, Shandon Scientific Company Ltd., London. Called the Unoplan Leveller, it incorporates a rapid pneumatic method of bringing the top surfaces of a number of glass chromaplates into exactly the same plane. Chromaplates are slid into the leveller over rollers between two channel-section guide rails. An air bag under the rollers is then inflated by a few strokes of a rubber bulb, pressing the top surfaces of the chromaplates against the machined undersides of the guide rails. In this way, all top surfaces are automatically aligned in the same plane irrespective of slight variations in the thickness of the chromaplates. The leveller will take, in one loading, five 20 cm. x 20 cm., ten 20 cm. x 10 cm., or twenty 20 cm. x 5 cm. chromaplates.

Better Packing for Biscuits

Swallow and Ariell Ltd., of Melbourne, one of Australia's oldest and largest biscuit makers, is installingn new wrapping machines as part of its export sales campaign. Experiments are continually in hand at Swallow's plant to produce new and better biscuits and packagings suited to varying national tastes and any climatic conditions. For countries with high humidity, for instance, special wrappings are necessary to retain the freshness of the contents. The Company has now installed a special humidifier for testing biscuits and packagings under all climatic conditions and has developed a new type of double-wrapped heavy grade "Cellophane" pack. This pack is claimed to be better in many ways than vacuum packs of polyvinyl-chloride previously used. The "Cellophane" pack requires less handling and tests in the special humidifier have proved it an effective barrier against moisture. New machines now being installed to double-wrap the biscuits under the new process are fast and efficient.

Higher Speed for Ships

Ships may soon be driven at higher speeds without an increase in power if experiments by the Ship Division of Britain's National Physical Laboratory fulfil the promise already shown. A promising method for reducing hull resistance is a system of boundary layer control devices attached to the appropriate part of the hull. These have given good results in tank tests with model ships. Other lines of research are aimed at improving the efficiency a propellers in low-speed craft such as tugs and trawlers. One suggested method is to use ducts round the propeller which should reduce fuel consumption. Another factor which has been investigated is the fall-off in efficiency in ducted bow propellers fitted to some ships for easier manœuvring. It has been found that water movement past a ship travelling at only two knots reduced propeller power by almost 50 per cent. Here the remedy is to keep the duct area small and use contra-rotating blades.

Device to Reduce Car Exhaust Fumes

British engineering experts are studying closely a prototype "direct flame afterburner" designed to eliminate poisonous exhaust fumes from motor cars. From tests made with a sports car, the manufacturers, Joseph Lucas Ltd., Birmingham, say they have succeeded in reducing dangerous exhaust fumes by more than 70 per cent. The direct flame afterburner is fitted to the car's exhaust. As the carbon monoxide and hydrocarbons leave the engine they are trapped and reburnt, thus reducing the amount leaving the exhaust pipe to a comparatively harmless level. Tests are being made by scientists at the Motor Industry Research Association's centre at Nuneaton in Warwickshire. Cars fitted with afterburners from several makers have been test-run in the centre's wind tunnel, allowing the scientists to collect gases for analysis.

Light-weight General-purpose Rubber

Dunlop Rubber Company has developed a new light-weight rubber known as E.P.T. A vulcanised ethylene propylene rubber, the raw materials for which are abundantly available from oil refineries, it can be made at even lower cost from natural gas. The new rubber is at present being made only on a small scale for research and evaluation and, so far, has shown outstanding resistance to wear and cracking by weather and to many chemicals. The development has been made by a Canadian associate of Dunlop; but this research comes under Dunlop's central research headquarters in Birmingham, England. A Dunlop spokesman said of the discovery: "It brings to the field of general purpose rubber properties previously found only in expensive and specialty rubbers."

Low-cost Computer

A new computer, specially designed to bring automation within the reach of small to medium-sized businesses and organisations, has been announced by a British firm. International Computers and Tabulators, Ltd., London. The company describes it as a "break-through into low-cost electronic data processing" and expects to see it adopted by relatively small organisations. Known as the ICT 1,300, the new system is a smaller version of an existing computer made by the firm. It will cost £45,000, excluding magnetic tapes.

E.I.D.–PARRY LIMITED

ADDRESS BY MR. H. V. R. IENGAR, CHAIRMAN, TO SHAREHOLDERS

SIXTY-FIFTH ANNUAL GENERAL MEETING TO BE HELD ON 27TH FEBRUARY 1963

THE following statement has been circulated to Shareholders of E.I.D.-Parry Limited by the Chairman, Mr. H. V. R. Iengar:

When I accepted the chairmanship of the E.I.D.-Parry Group in May of last year, I was moved by three main reasons. In the first place, the group has, for generations, played a notable part in the industrial and commercial development of South India, and the name PARRY has become a household word, dating back to as long ago as 1788. I felt it would be an honour to be associated with a firm of this vintage and repute. Secondly, the late Mr. C. R. Srinivasan, the first Indian Chairman of the group, whom I knew well as a colleague on the Board of the Reserve Bank of India, and for whom I had great respect, was very keen that I should succeed him. Thirdly, the late Mr. Wonfor, who had been Chairman of the group for several years and was, at the time, Vice-Chairman in London, and also the two British Managing Directors, Mr. Noel-Tod and Mr. Hadfield, told me, on behalf of the British interests in the group, that they would welcome my appointment. Now that I have been functioning as Chairman for some months, I would like to say that I am very happy at the decision that I took to join the group, not merely because of its reputation and the fact that it is expanding its activities in tune with the rising tempo of economic development in the country, but also for the reason that, by a combination of tradition and structural relationship with the United Kingdom, it forms a pattern of Indo-British collaboration which can only be of great benefit to both countries.

Historically, the E.I.D.-Parry group was always British, ever since Thomas Parry landed on the shores of Madras in 1788. Many of you have probably read Hilton Brown's fascinating story of Parry & Company's fortunes during the British regime. The Directors, however, were keenly responsive to the winds of change that were sweeping across the country and, in 1947, two important steps in the Indianisation of the group were taken.

Board Reconstituted

Firstly, Parry and Company Limited (then the Managing Agents of this Company) which was wholly owned by British nationals, converted itself into a public limited company by an offer of shares made to the Indian public in February 1947, as a result of which 25 per cent of the ordinary share capital came into Indian hands. Secondly, immediately after independence, the control of this Company which had, up to that time, remained in London, was transferred to India; the circular issued to shareholders on this occasion explicitly stated that the change was felt to be in accordance with the changes in the Indian political scene. In addition to the change in the seat of control, the Board was reconstituted. In 1947, the Board consisted of five British and no Indians. The reconstituted Board consisted initially of two Indians and two British and now consists of five Indians and three British.

Further, in 1955, Mr. C. R. Srinivasan was appointed as the first Indian Chairman of this Company and, shortly thereafter, in March 1956, this Company acquired financial and executive control of Parry and Company Limited by the purchase of the whole of its ordinary share capital.

The structure of the Board is broadly in accordance with the structure of capital holding as between India and the U.K. Taking both the preference and equity capital into account, some 73 per cent of the capital is in India and 27 per cent in the U.K. It would not be correct, however, to think that the transfer of shares from U.K. to India has resulted in a reduction of the U.K. stakes in the group. In 1947, the U.K. investment in terms of nominal value of share capital held amounted to about £228,000, representing some 82 per cent of the total share capital. Today, this has increased to about £362,000. In other words, although there has been a decisive structural change in that the majority of the share capital, nearly 73 per cent, is held by Indians, the interest of the U.K. group in terms of the amount of capital investment has actually increased by some £134,000.

This should not be a matter for surprise, because it is in accordance with the whole tenor of the changes that have been taking place in the pattern of British investment in India since 1947. Naturally, the rapid development of industry that has been taking place in accordance with the Plans is, to a large part, attributable to Indian effort in terms both of capital formation and entrepreneurial effort. As a corollary, in terms of percentage of total business investment in this country, British investment has recorded a drop. But the point of interest is that this drop is not indicative of any slackening of interest in Indian industrial development by British interests. On the contrary, British investment has recorded a substantial rise since 1947. According to the figures published by the Reserve Bank of India, at the end of June 1948 the outstanding foreign investment in the private sector amounted to Rs. 256 crores, of which the British share was over 75 per cent. At the end of December 1960, the corresponding figure was Rs. 567 crores excluding investment from official sources such as the World Bank; in other words, the investment in India by private individuals and groups overseas had more than doubled over the period. Of the total investment at the end of December 1960, including investment in the private sector by official institutions, the investment of the U.K. was far and away in the lead, being just about two-thirds. It is worth noting that the figures given are those of investment and not of market value, which, in many cases, has recorded a considerable increase over the actual investment.

Foreign Capital

An annual meeting of shareholders is scarcely the time to generalise on problems of international relationships, but I will permit myself two observations. In the first place, I cannot help recalling that, during the grave crisis created by the Chinese invasion of our northern frontiers, the response of the U.K. was both immediate and unqualified, showing that, in the U.K., there exists an instinctive emotional feeling for the security of India. It is necessary that, in the task of economic reconstruction as well, this feeling should be mobilised to the maximum extent. We are at a stage of economic development where we are in need both of foreign capital and of technological assistance. I do think that in this situation the existence of companies such as E.I.D.-Parry, which have roots in both India and the U.K., must continue to provide a link which should be of great benefit, both politically and economically, to both countries. My second observation relates to the total quantum of capital attracted from abroad. Although, expressed as a percentage of rate of growth, the increase since 1948 is impressive, in absolute terms the quantum of foreign investment in India is almost insignificant. The average annual *net* outflow of long-term private capital in the last few years, from the main capital exporting countries, has been of the order of Rs. 1,750 crores. Out of this, India has been able to attract, net, only a little over Rs. 21 crores per year on the average, barely over 1 per cent. How to attract a larger inflow without creating, in future years, a serious imbalance in our external payments position is one of the important issues which Government would have to consider.

General Policy

A change in chairmanship offers a suitable opportunity for reassessing the policies of the Company and its organisational efficiency for the carrying out of these policies: and this I have naturally done. In the speech delivered two years ago at the Annual General Meeting, Mr. C. R. Srinivasan stated as follows:

> "Progressively the emphasis on the group's expansion has been on the industrial sector and, more and more, the pattern of our business is changing. As a result of this policy, we have been forced with great regret to dispense with some of our agency representations, in order to concentrate more of our finance and management resources on the administrative problems which are tied to the group's industrial progress."

This policy of growing emphasis on manufacturing activities is undoubtedly correct, but I think it requires a little elaboration in so far as the trading sector is concerned. Sound trading is one of the essential requisites for the smooth running of our economy—it is unfortunately not as common in India as would be supposed—and it would be a great pity if the expertise acquired over generations by our group was to be lost to the country. I visualise therefore that, although our manufacturing activities will increase—and, I hope, increase rapidly—our trading activities will be maintained at a satisfactory level. Necessarily, there will be a reduction in the trading of imported commodities, but I see no grounds for any reduction in the current level of our overall trading activities. Taking the figures for the last three years, the sales of merchandise produced outside the group were as follows:

1960	£4.8 million
1961	£6.0 million
1962	£6.3 million

These figures are, of course, exclusive of the sales pertaining to the 'managed companies'. The figures are also exclusive of sales upon which we merely earn a commission, that is to say, of goods which we sell on a consignment basis; and it is of interest to note that those sales in 1962 were approximately £5 million. Considering that we abandoned a number of agencies, the increase in our merchandising figures seems to be highly satisfactory. In regard to the sales of goods manufactured within the group, the figures are:

1960	£6.4 million
1961	£6.8 million
1962	£6.8 million

When Ennore is in full production, a point to which reference will be made subsequently, the sales of our own manufacture should record a very substantial rise. With the first phase of Ennore, the rise should be of the order of £2 million, and, when we complete the second phase, the increase should be of the order of £4 million. We are now actively engaged in the consideration of the problem of expanding the Ennore fertiliser factory; we have also under consideration certain other projects. We have already applied for an industrial licence for the manufacture of cryolite, making use of one of the by-products at Ennore. Shareholders will remember the reference in the Chairman's speech last year to the expansion of our pottery works in Ranipet and to our collaboration agreement with Doultons. This is going well. Although the financial investment, relatively to Ennore, is small, the profits from the pottery expansion should be substantial. Altogether, therefore, the pattern I visualise is that, while our own manufactures will show a substantial rise and therefore the sale of our own group products will form an increasingly large proportion of our total sales, our actual sales of merchandise produced outside the group, either on a commission basis or otherwise, should continue to be maintained at a satisfactory level.

Change of Name

This is the first Annual General Meeting under the new name of the Company, E.I.D.-Parry Limited. The old name suffered from the disadvantages that it did not adequately reflect the diversification of the Group's interests into the manufacture of fertilisers, pottery and sanitaryware and its close association with Parry and Company Limited under whose trade mark "Parry's" the Company's sugar, chemicals, sanitaryware and fertiliser products are marketed.

The change of name to E.I.D.-Parry Limited involves no change in the constitution, management and policies of the Company or in that of Parry and Company Limited.

Profits

In the year 1960, the group net profit before taxation amounted to £774 536. In 1961, this came down to £690 130 and in 1962 it has been further reduced to £648,473. As was explained last year, the reason for the reduction in the trading profit is primarily due to the expenses, including interest, in connection with the Ennore fertiliser project. This situation was always anticipated and, in fact, out of the profits of the year 1958-59, a dividend equalisation reserve was expressly created to enable the maintenance of dividend at a satisfactory level. It is gratifying that dividends have been maintained without the necessity to utilise any portion of the dividend equalisation reserve, in spite of the fact that the rate of corporate taxation was increased last year from 45 to 50 per cent.

In the normal course, our financial position should improve substantially with the commissioning of the Ennore fertiliser factory and the completion of our pottery expansion. It is necessary, however, to utter a word of caution, at this stage, in regard to the level of future profits. A new situation has been created in the country by the invasion of our northern frontiers by China. Although, at the moment, there are no precise indications of the magnitude of extra liabilities in the field of defence, it appears, from statements made by responsible ministers, that the increase in defence expenditure would be very substantial and that the country must be prepared for substantial increases in taxation. Quite clearly, Government are in a difficult position, and all sections of the community must be prepared to bear additional burdens. I can only express a hope, however, that, in regard to direct taxation, Government will not be moved merely by the immediate considerations of raising additional revenue, ignoring long-term effects on the economy. It is particularly important, for example, that, in the matter of taxation of companies engaged in industrial production, the fiscal burden is not so heavy as to discourage capital formation, that is to say, the accumulation of adequate profits and ploughing them back into business. There is a danger that, in the pressure of a crisis, steps may be taken which might place in serious jeopardy the long-term strategy of industrial development. I will only add, in this context, that I hope Government, in deciding on their taxation policy, will also take into account the fact that the burden imposed on companies by the Emergency Risks Insurance Acts is itself quite substantial.

Sugar

It would seem that the problems of the sugar industry are never ending. Hardly is one set of difficulties solved before other problems, not of the industry's making, arise.

In his speech last year Mr. Noel-Tod referred to the cut of 10 per cent in production imposed just before the start of the 1961-62 season. Your Company represented to the Government of India that the quota fixed for the Company would leave about 70,000 tonnes cane in the field without any means of disposal. In the event, the quota was increased to accommodate this cane and the Nellikuppam factory produced 35,395 tonnes sugar, incidentally, the highest on record for your Company. Since Government determine what quantity of sugar shall be sold each month and their policy was to release a season's production over 14 to 16 months, the carrying of this large stock together with the balance of the 1960-61 season's production posed problems of storage and finance. It was accordingly decided to offer for export 8,000 tonnes, over and above the export quota of 4,835 tonnes. The price realised on this voluntary export of 8,000 tonnes was approximately the controlled price fixed for U.P. and Bihar at which the Export Agency was then buying for export. Some other factories in the South, placed in the same position as ourselves, followed our example.

While this problem was solved reasonably satisfactorily, others have either not yet been solved or their solution is causing more difficulties.

Price Linking Formula

The Government of India published the Tariff Commission's findings on the Price Linking Formula. The Tariff Commission has condemned the formula. The Government of India have, nevertheless, decided that it would be "more appropriate, equitable and reasonable to apply the existing formula in a modified form with a more precise determination of the share of the cultivator." The matter rests there and the industry is yet to be told how much more is to be paid to the grower in the four years from 1958-59. The Tariff Commission, after urging the abolition of the formula, recommended in its report that, in future, payment for cane should be made on the basis of its quality. Accepting this recommendation, the Government of India issued a Press Note on 3rd July that, for the sugar year 1962-63, it had been decided to maintain the cane price at Rs. 1·62 per maund and to link it to a recovery of 9·8 per cent. And to link it to a recovery of 9.8 per cent. A be allowed on this price at the rate of 1.5 nP for every 0.1 per cent fall or rise in the average recovery for a prescribed duration during the 1961-62 season, subject to a minimum price of Rs. 1.50 per maund for a recovery of 9 per cent or less. The words "prescribed duration" were ominous and I regret to say that the fears of the industry—at any rate in the South—were confirmed when Government finally notified the price payable by each factory. The actual duration of the season at your Nellikuppam factory in 1961-62 was 201 days, from the start of the season on 19th November 1961 to its close on 7th June 1962. Instead of taking the recovery of 9.23 per cent over a duration of 201 days, in which case the price would be Rs. 41.12 per tonne, the Government of India has taken the best part of the season—121 days from December 1961 to March 1962—as the "prescribed duration." The recovery for this period is 9.8 per cent and the cane price works out to Rs. 43.40 per tonne. This bias in favour of the grower at the expense of the industry goes by the name of payment by quality. In effect, it means that the grower supplying low quality cane before December and after March gets the same price as the grower supplying the highest quality in the peak of the season. To your Company, it means an extra cost of Rs. 7.5 lakhs on the anticipated crop in the 1962-63 season.

Taxation Without Justification

Concurrently, the Government of Madras has increased the rate of cess on cane from Rs. 2 to Rs. 5 per tonne, the ostensible purpose being development of cane. Considering that only a fraction of even the present revenue from cess is spent on cane development, I cannot help feeling that the industry is being taxed once again without justification, for the purpose of increasing the general revenues of the State. With a sales tax of 3 per cent *ad valorem* and a cess of Rs. 5 per tonne, Madras has the distinction of charging the highest tax on cane in the country in terms of its incidence on the cost per tonne of sugar.

The cumulative effect of these imposts can well be serious and may compel us, at Nellikuppam, to consider restricting our crushing season. It would be with the greatest reluctance that we could take any such step, because it would cause hardship to agriculturists and reduce the income of our own labour force. Other companies may well find themselves in the same position. I do hope that this situation will not arise, but that would all depend on a more flexible approach by Government.

Representations have been made to the Government of India on the question of cane price and to the Government of Madras on cane cess and it remains to be seen what relief, if any, will be afforded.

Sugar Supply Position

Now turning to the all-India picture, the cut of ten per cent resulted in a production of a little over 27 lakh tonnes in 1961-62 against 30 lakh tonnes in the previous season. Together with the carryover of 12 lakh tonnes on 31st October 1961, 39 lakh tonnes were available of which 25.5 lakh tonnes went for domestic consumption, 3.3 lakh tonnes were exported, leaving a balance of 10.2 lakh tonnes as carryover on 31st October 1962. A situation has now arisen whereby large-scale diversion of cane to *jaggery* and *khandsari* is taking place in U.P. and Bihar and in some places in the South. As a result, production in 1962-63 is expected to be not more than 25 lakh tonnes. The available quantity will, therefore, be 35 lakh tonnes, of which 25 lakhs will be required for internal consumption; the country is committed to export 4 lakh tonnes; and the balance 6 lakh tonnes will be the carryover. This is the normal carryover; and, with judicious releases and distribution, I see no reason why there should be any shortage of sugar, provided Government do not commit themselves to larger exports in 1963-64. Some statements made by those in authority have been very ambiguous on this point, and I hope Government will not commit themselves to additional exports before a reasonably accurate estimate of production in 1963-64 can be made.

You will see from this review how the fortunes of the industry can fluctuate from year to year and how difficult it is to plan for the future when the various factors influencing the industry are beyond its power to control. I have already indicated that we may have to pay an extra Rs. 7.5 lakhs for cane. The increase in cess will cost your Company another Rs. 10 lakhs. The cost of the compulsory Emergency Risks Insurance is likely to be Rs. 3.5 to Rs. 4 lakhs to be added to the cost of sugar as there is as yet no way of recovering it as a separate charge. While thus the picture is somewhat gloomy, I can only hope that we will be able to absorb these shocks by realising a higher price for sugar in the coming months. The prices we have been realising in the last few months have been even below the erstwhile controlled price as a result of heavy releases in quick succession and competition among factories anxious to unload on a market unwilling to commit itself except on a hand-to-mouth basis.

Fertilisers

In his speech at the Annual General Meeting last year, Mr. Noel-Tod referred to the new ammonium phosphate factory at Ennore and indicated that the factory would be contributing in full measure to the group's profits in 1962-63. This hope has not been wholly realised. The factory, as is well known, is a complex unit, incorporating many new features in the manufacture of compound fertilisers and as is not uncommon with a highly complex modern chemical process, teething troubles have been encountered during the commissioning and running-in period. In no small measure these have been further aggravated by the inconsistent supply of electrical power, and, repeatedly, just as certain of the processes were about to be brought into balance, an interruption in electric supplies has upset conditions and almost a fresh start had to be made. As a result, instead of the works being in full production at the commencement of the present financial year, as anticipated, there has been delay, but I am pleased to be able to tell you that the major problems appear to have been overcome and the factory is now in full production and will make a substantial contribution to the earnings of the group during the current year.

In Mr. Noel-Tod's speech last year, he referred to the issue of a licence by the Government of India to a consortium of two well-known American companies and your Company to erect a fertiliser factory at Visakhapatnam. This project is progressing as well as can be expected under the present conditions; there are still some matters on which Government's decision is awaited. I hope that these will be settled at an early date. It is essential that the Visakhapatnam project, which is one of the major projects included in the third Plan, gets off to as early a start as possible.

Staff and Labour

Our relations with staff and labour have been good and I should like to thank all the employees of the Company for their co-operation during the year. As anticipated in the Chairman's speech last year, I am glad to be able to record that, after a series of direct negotiations with the unions concerned, satisfactory long-term settlements have since been concluded, covering terms of service and bonus, which will be effective until the end of 1965.

Mr. Noel-Tod

Mr. Noel-Tod is retiring from the Managing Directorship of E.I.D.-Parry Limited with effect from the 1st of April this year. I take this opportunity of paying a tribute to him for his distinguished service to the Company over the last 30 years. Some of the shareholders may be aware of the fact that his grandfather was Chairman of the Company when its headquarters was in London. Hilton Brown, in his book on Parry's, quotes this as "yet another example of Kipling's devoted families, since Noel-Tod's father and three of his uncles spent their service lives in India." I am glad to be able to say that Mr. Noel-Tod will continue to be a Director and Vice-Chairman of the Company and will also be Managing Director of our London subsidiary, Parry Murray & Company Limited, so that his vast knowledge of the Company's affairs and his experience will be available to the group for some more years to come. I am sure the shareholders will wish to congratulate him on his being honoured with a C.B.E. in the recent Honours list. It is an unusual occurrence that, in the same year, Mr. Edwards has also been honoured with an O.B.E.

Mr. M. J. Edwards, Deputy Managing Director, will become Managing Director, and Mr. John K. John, Deputy Managing Director, with effect from the 1st April.

Note: *The above statement is not a report of the proceedings of the Annual General Meeting, which will be held on 27th February* 1963.

FOREIGN EXCHANGE OPERATIONS OF U.S. GOVERNMENT

KEY WEAPON IN DEFENCE OF DOLLAR

[Some two years ago, the U.S. Government decided, for the first time, to resort to open market operations in the foreign exchange market in order to stabilise the movements in the forward and spot values of the dollar. This was a momentous decision. Why were such operations necessitated and how have they fared? These important questions are answered at great length in this article of two instalments, prepared by the Morgan Guaranty Trust Company of New York and published in its monthly, the Morgan Guaranty Survey. *The second and final instalment will appear in our next issue.—ED.]*

BEGUN just twenty-one months ago by the Treasury, and subsequently broadened by participation of the Federal Reserve System, the Government's policy of dealing in foreign currencies has quickly become a key weapon in the defence of the dollar. Transactions have been carried out in at least half a dozen currencies, and preparations have been laid down for undertakings in others as well, if need should arise. The operations to date are credited with helping to slow the country's gold losses, and the terms in which they have been reported and discussed by official spokesmen make it clear that further applications are intended.

While there is hardly warrant as yet for suggesting that "foreign exchange policy" may some day rank with monetary or fiscal policy as an instrument of Government influence in economic affairs, the scope of operations to date and the potential for further activity leave no doubt that an important element has been added to the international financial context.

Over the years, United States Government policy has generally been not to engage in exchange market dealings. There have been departures, but none so significant as the series of ventures that began in the spring of 1961. In this current break with tradition, one of the participating agencies has gone beyond the scope of activity normally associated with official intervention—even as practiced by countries long and consistently active in exchange operations. Whereas foreign official agencies normally concentrate their activity in the "spot," or current transaction, markets, the U.S. Treasury has been dealing also—in fact principally—in the "forward" markets, where currencies are bought and sold for future delivery.

Out of the Woods

The decision of the American authorities to enter the exchange markets was a response to immediate—and urgent—circumstances. More remotely, the move finds its background in the kind of international monetary code that was fashioned some eighteen years ago by the experts from 44 countries who met at Bretton Woods. The new U.S. approach to currency stabilisation can best be sketched in the perspective of Bretton Woods, and can, perhaps, best be understood, if viewed as an important change in the arrangements made at that meeting.

The group that gathered at the New Hampshire resort that summer of 1944 and worked out a plan to stabilise post-war international currency relationships assigned to the U.S. a role that was central but essentially passive. They designated the dollar as the fixed point of reference in the internantional monetary system. The currencies of the other member-countries of the International Monetary Fund, which grew out of the Bretton Woods meeting, were arrayed around the dollar. Each country was required to establish a par value for its currency in terms of either gold or the dollar—meaning, for all practical purposes, the dollar. Each also was bound thereafter to maintain the established dollar parity of its currency in the market where banks and others trade back and forth in the various moneys of the world.

This rule means an obligation on the country's central bank or other agency to buy its own currency if necessary in order to keep the market price in dollars from falling more than one per cent below par. It also means an obligation to sell its own currency, and buy dollars, if that should be necessary to prevent the market price in dollars from going more than 1 per cent above par. Leeway to change the par value of its currency—by devaluation or upward revaluation—is afforded each member-country by the I.M.F. rules, but only when needed to correct a fundamental disequilibrium in its balance of payments, and only after consultation with the Fund.

As for the dollar itself, the Bretton Woods conferees envisaged that its value would be maintained by the U.S. Treasury's readiness to purchase and sell gold at a fixed dollar price upon request by foreign Governments and central banks. Thus the agreements made it mandatory for other countries to intervene in the markets for their respective currencies but implied—without specifically providing—that the U.S. would not intervene.

Means of Support

Most of the leading industrial nations, after fixing par values for their currencies, made the permissible ranges of market fluctuation even narrower than those called for by the I.M.F. rules. Today, the typical range is about ¾ per cent on either side of par. The West German mark, for example, with a par value of 25 cents, is allowed to vary from a low of 24.814 cents to a high of 25.189 cents. Should the mark weaken and threaten to fall below a value of 24.814 cents, the Bundesbank would move to prevent the breakthrough by selling dollars in exchange for marks and thus affecting the supply-demand relationship between the two currencies. Conversely, should the mark strengthen in relation to the dollar and threaten to rise above a value of 25.189 cents, the Bundesbank would sell marks in exchange for dollars.

In practice, many foreign central banks intervene to "touch up" the market well before the rate has approached one of the margins. They do this as a preventive measure, designed to head off more erratic movements in exchange rates. It is easier to defend a currency well inside the permitted range than at the extreme edge.

The commitment to maintain parity applies only to spot markets. Bretton Woods imposed no obligation to stabilise exchange rates for forward transactions. Not all currencies have active forward markets, but most of the major ones have in response to the needs of commerce and finance for a means of hedging trade and investment transactions against the possibility of exchange rate fluctuations.

Leaving the monitoring of exchange rates to foreign central banks posed no problems for the U.S. until recently. Even in the middle 1950's, when dollars had for some time been flowing copiously into the hands of foreigners as a result of the U.S. payments deficit, private parties abroad were for some time content to retain a substantial portion of the dollars they earned. Hence exchange markets were not subjected to heavy dumping of U.S. currency, which would have tended to depress the dollar in relation to foreign units of money. Where such pressures did occur and foreign central banks had to absorb dollars in living up to their commitment to maintain the parity range, they too were usually satisfied to hold them instead of turning them in for gold at the U.S. Treasury.

Dollar Down

The willingness of foreigners to add to their supplies of dollars, however, was not without limit. This became evident in 1958. The U.S. payments deficit that year was especially large; additionally, interest rates in the U.S. fell sharply, discouraging investment by foreigners in U.S. money-market instruments and impelling some U.S. funds to go abroad for investment. Foreign central banks and Governments took $2.3 billion of U.S. gold in 1958, dramatising the imbalance built into this country's international financial position by heavy commitments to overseas military and economic-aid expenditures.

In this setting the exchange markets began to reflect uneasiness as to the future of the dollar in relation to other currencies. Then, at the end of 1958, fourteen European nations agreed to make their currencies convertible for non-residents. This meant that the dollar's uniqueness as a medium for investment was seriously diminished; it also foreshadowed a vast increase in the country-to-country mobility of liquid funds—a development that was to hit the dollar hard.

There was a brief respite in 1959, when rising interest rates in the U.S. drew in funds to mask a payments deficit worse than 1958's, but the full force of the European currencies' new strength struck the dollar in 1960. Recession in the U.S. brought interest rates down, inviting withdrawals of funds as rates rose in the United Kingdom and on the Continent. Pressure on the dollar reached a symbolic climax in the frenzy of the London gold market in October.

A relative calming followed President Kennedy's reaffirmation of U.S. resolve to maintain the dollar's value in gold, but it was nevertheless clear that the screws were on the dollar to stay until substantial improvement could be achieved in the balance of payments. Thus the problem became one of buying time while doing the necessary things to right the balance. Since the gold stock, even though it totalled $17.8 billion as 1960 ended, could not be counted on all by itself to buy enough time, other means had to be improvised. One of them, dictated by events of early 1961, was the venture into foreign exchange operations.

The Trouble with 5 per cent

In March 1961, the whole framework of international currency relationships was badly shaken by upward revaluations of both the German mark and the Dutch guilder. These adjustments—approximating 5 per cent in each case—were too small to convince onlookers that further changes in the parities of the two currencies would not be made; additionally, they aroused widespread anticipation that the par values of other currencies would be changed. In effect, the revaluations of early 1961 jolted the international financial community into realising that, although the U.S. was unswervingly committed against devaluation of the dollar, the equivalent of devaluation with respect to a particular currency might occur at any time by the action of some other major-currency country.

In this environment, a huge flow of funds to the Continent began, dwarfing any previous movement in the post-war period. At first, the heaviest movement was out of sterling, which—because of deterioration in the United Kingdom's balance of payments—had begun to show weakness even before the revaluations. But the pressure quickly affected the dollar as well. For one thing, the Bank of England had to sell substantial quantities of dollars in support of the pound. Also, the dollar figured as a "swing" currency in many of the private switches out of pounds, with pounds being sold for dollars and the dollars then being sold for marks or other currencies. This sequence of transactions strengthened the dollar against the pound but weakened it against Continental currencies.

With holders growing increasingly uneasy, there was heavy selling of dollars beyond that related to the movement out of sterling. The market pressure forced the dollar toward its support level against some European currencies, especially the mark. This required heavy purchases of dollars by the foreign central banks to keep the dollar from falling below the lower limit of the parity band.

Hedgers and Speculators

In the forward markets, where foreign Governments are under no obligation to maintain parity, the weakening of the dollar proceeded in full view. It was here that the pressure became critical. Europeans who had dollars coming in the future—from export proceeds, dividend payments, maturing investments, or whatever source—rushed to sell them forward to protect themselves against the capital losses they would suffer if their domestic currencies should be upvalued—or, in the case of the mark and the guilder, further upvalued. At the same time, non-Europeans who were going to have to make future payments in Continental currencies sought protection against a possible pricing-up of those currencies by buying them forward.

In addition to these hedging measures undertaken for specific commercial and financial purposes, there was considerable speculative buying of Continental currencies for future delivery by people who expected further exchange-rate adjustments to occur and were playing for a profit on them.

With the scramble to hedge—and to speculate—flooding the market with forward dollars, their price in terms of such currencies as the German mark and the Swiss franc was forced sharply down. The result was a widening gap between exchange rates in the forward market, where the dollar was on its own, and those in the spot, or current transaction, market, where official intervention by the foreign authorities was supporting the dollar. At one point in early March, it cost about two-tenths of a cent

TRAINING PROFESSIONAL MANAGERS FOR INDUSTRY

REQUIREMENTS OF PUBLIC AND PRIVATE SECTORS

IN the course of his inaugural speech at the Eighth Management Conference, organised by the Ahmedabad Textile Industry's Research Association at Ahmedabad this week, Mr. C. Subramaniam, the Union Minister for Steel and Heavy Industries, admitted frankly that the Government had now realised, "at some cost," that industrial management was vitally different from Government administration and that, without specialised training, civil administrators could not be expected to manage industrial undertakings successfully. This admission should serve to dispel the wrong notion that civil administrators are all-rounders who would do as well in business and industry as in administration. In fact, according to the Minister himself, a good many of the civil servants, who were appointed to top managerial positions in industrial undertakings in the public sector, did not prove a success as they could not adjust themselves to their new role and the new task of industrial management. In his opinion, this was not the fault of the men, but the result of the fact that it was difficult, even for distinguished and able officers, to change themselves at an advanced age to fit into a role that was basically different from the one to which they were accustomed during most part of their working life. The Government had also realised, the Minister continued, that the problem of having trained managerial personnel was as important as the problem of having trained technicians. He was of the opinion that the establishment of the two big management institutes, one each at Calcutta and Ahmedabad, was a step in the right direction and expressed the hope that, in a couple of years, the country would have a large pool of trained management personnel to man the growing industrial sector.

Mr. Subramaniam felt that the best talent should be utilised for the management of important and complex industries like iron and steel, which called for a high degree of managerial competence, and not for industries of comparatively lesser importance. On the question of remuneration, the Minister said that it was necessary to bring about a certain amount of parity between the salaries of top management personnel in the private and public sectors with a view to attracting managerial talent to the latter.

The aforesaid observations of the Minister raise certain issues which have a direct bearing on the management of public undertakings and the training of management personnel in general. They also offer a clear lesson to private employers who regard retired civil servants as the best recruits for senior managerial positions in business and industrial undertakings. It is no doubt true that there are, among civil administrators, men of exceptional ability and competence who shine as well in business as in administration. But this is not true of all. In a large number of cases, retired civil servants are appointed to top positions in industry because of their "contacts" with Government departments. This practice is a reflection as much on public as on business morality and deserves to be condemned in the strongest terms.

Costly Experiment

Be that as it may, it would be interesting to know what precisely is the cost of the lesson learnt by the Government that civil servants are unsuitable for industrial management. Was it necessary to undertake this costly experiment? In a sense, this was forced on the Government because, having taken over responsibilities in the industrial field, without regard to its ability and equipment to discharge them, it had little choice but to put civil administrators in positions for which they are largely unsuited by training and experience. This would not have been the case had the Government cared to assess before deciding to start an industrial venture, be it a steel mill, a fertiliser factory or a machine tool plant, whether experienced and qualified people were available to run them successfully. An underestimate of the problems and challenges of industrial management and an overestimate of the capacity and adaptability of the bureaucracy would appear to have led the Government to take a course which cost the country dearly. But it would not have been in vain if this experience were to discourage the Government from venturing further afield in industry until the essential conditions of successful management are fulfilled.

There is much to be said for Mr. Subramaniam's suggestion that there should be some parity between salaries in the private sector and the public sector. But it must be emphasised that the parity should not be confined to salaries alone, but should also encompass the entire range of operations, especially the ultimate performance and efficiency of the undertakings. The Minister is right in suggesting that the best talent should be utilised in such key industries as iron and steel but this should be done not by asking other industries not to recruit the best talent but by creating conditions in the industries which will attract to them the best talent in the country. Steel workers are the best paid in the U.S. and hence the steel industry attracts the cream of the labour force in that country. Incentives, not physical compulsion, should determine the flow of talent into different fields.

Training Facilities

The dearth of managerial personnel brings into focus the problem of creating adequate facilities for management training. No precise or authoritative estimate of the actual magnitude of the existing shortage or of future requirements in this field is available. According to Mr. Harshavadan Mangaldas, President of the Ahmedabad Management Association, who spoke at the aforesaid Conference, on the basis of the employment target of the third Plan, the country would require 150,000 managers during the Plan period. According to an estimate of Prof. R. Natarajan of the Indian Institute of Science, Bangalore, a 50 per cent increase in management personnel is required for doubling industrial production. Prof. Natarajan estimates that there are at present 8,000 registered factories in India as per the Factories Act employing 1.8 million workers. On this basis, there are at least 8,000 top managers. Assuming one first-line supervisor for every twenty workers and one middle-line supervisor for every 10 first-line supervisors, the number of first-line and middle-line supervisors works out to 90,000 and 9,000 respectively. The total number of management personnel belonging to the top, middle-line and first-line supervisors group, therefore, aggregates 107,000. A 50 per cent increase means an increase of 4,000 in top management, 4,500 in middle management and 45,000 in first-line management personnel. Prof. Natarajan estimates that, assuming that training of first-line management is the responsibility of the enterprises concerned, the cost of training 4,500 middle-management personnel and 4,000 top-management personnel would be Rs. 12½ crores. It is difficult to verify the accuracy of the above estimates but they give a broad idea of the magnitude of the problem of training adequate management personnel.

Fortunately, however, there is increasing awareness, both in Government and industrial circles, that the availability of technical and managerial personnel would set the pace of industrial development. Efforts are, therefore, being made for a more integrated and extensive programme of management development. In pursuance of the recommendation of the Special Committee on Management, appointed by the All-India Council for Technical Education in 1949, an Administrative Staff College was established at Hyderabad and a number of post-graduate diploma courses were instituted at universities and higher institutes of technology. An all-India Management Association was also established in 1960 to promote management education and training. A number of regional associations, affiliated to this apex body, were also started. In addition, various ad-hoc training programmes are being conducted by institutions such as the National Productivity Council.

Management Institutes

A study of business education in India was made by Mr. George Robbins, Dean of the University of California, in 1959. He had recommended the establishment of a management institute, with a full-time expert staff, to function as an all-India centre for both research and post-graduate studies in management. The Government of India accepted the recommendation but with the modification that instead of one, it would be desirable to start two all-India Institutes, one at Calcutta and the other at Ahmedabad. The Institutes came into being in 1961. The recurring rupee expenses of these Institutes will be met by the Government of India and the initial cost of land and buildings by the respective State Governments, namely, the Government of Gujarat and the Government of West Bengal. Both the Institutes are empowered to solicit funds from non-Governmental sources. The Ford Foundation has given substantial dollar grants to the Institutes to provide for visiting professorships, the training of Indian faculty abroad and acquisition of foreign library material. Under these grants, co-operative relationship has been established with the School of Industrial Management of the Massachusetts Institute of Technology in respect of the Calcutta Institute and the Graduate School of Business Administration of the Harvard University in respect of the Ahmedabad Institute. It may be noted here that the Calcutta Institute has already offered two courses, one on marketing planning and the other on financial planning and control, under its executive development programme. The Ahmedabad Institute is gradually getting into stride.

The establishment of these two Institutes marks a significant stage in management education in the country, for they will go a long way towards meeting the requirements of trained management personnel in the country.

U.S. STAKE IN COMMON MARKET

FATE OF TRADE EXPANSION ACT HANGING FIRE

BY torpedoing the U.K.-E.E.C. negotiations, the French President de Gaulle has administered not merely a rebuff to Britain, but also a severe blow to the concept of trans-Atlantic co-operation. It should be remembered, in this connection, that, for some time past, President Kennedy has been making all-out efforts to canvass support for the creation of a united and strong "Atlantic Community," with good response from several European statesmen, in contrast to President de Gaulle's opposition. The measures for expansion of mutual trade between the U.S. and Western Europe have assumed the place of a major plank in this concept of closer Atlantic co-operation. It is mainly with the object of expanding mutual trade that the U.S. Administration has conceived the Trade Expansion Act, which was passed by the Congress in October last. The Act, which has been acclaimed as a "trade statute which makes possible the greatest stride ever taken away from the tradition of protective tariff," has been designed by the U.S. for the purpose of securing reciprocal concessions principally from the Common Market. The negotiations under the Act might have led to sweeping reductions in the common tariff of the Common Market *vis-a-vis* the U.S., with corresponding concessions for other countries in the world in accordance with the G.A.T.T. provisions. But the suspension of negotiations between the U.K. and the Six has robbed the Act of much of its significance in its present form.

President's Special Powers

It is necessary to examine here the major features of the Trade Expansion Act, without which one cannot gauge its topical importance. The legislation bestows on the executive sweeping powers to reduce tariff rates—powers which were originally wielded by the Congress by virtue of the fact that tariffs are basically a tax. The Act gives the President general authority to cut tariffs to 50 per cent (of the July 1962 level). He is, in fact, empowered to reduce or entirely eliminate tariffs on goods of which the U.S. and the Common Market account for over 80 per cent of the total world trade in those goods. This provision, in particular, has been made with the tacit assumption that the U.K., along with the other E.F.T.A. members, would join the Common Market by the time actual negotiations begin (that is, by summer of 1964). In an expanded Common Market, twenty-six categories of manufactured products, ranging from aircrafts to tobacco products, might be eligible for abolition of tariffs. This authority, however, will be of limited significance if it is to be used in favour of only the Six existing members of the Common Market. For, in that case, in only one major category of goods, namely, aircraft, do the U.S. and the Six account for over 80 per cent of the value of world exports. Accordingly, if France does not retrace its steps and continue to resist the U.K.'s entry into the Common Market, the U.S. Trade Expansion Act will have to be amended in order to be of any practical use. Will the Congress agree to such an amendment? How long will it take for the Administration to get the approval of the Congress? We all know that the U.S. parliamentary procedure is so complicated that any legislation is a time-consuming affair. It may be recalled here that at the time of discussion on the Bill in the Senate, an amendment was moved to broaden the wording of this section of the Bill to embrace not only the Common Market, but also any of the E.F.T.A. countries. But it was defeated on the score that it represented an unwarranted broadening of the special authority. Viewed against this background, it looks as though it will not be easy for Kennedy Administration to get the Act amended even if it wants to.

So far as farm products are concerned, the position is slightly different. The U.S. Trade Expansion Act empowers the President to reduce or eliminate tariffs on farm products even when they do not meet the 80 per cent minimum, provided he is satisfied that this would maintain or expand the U.S. exports of agricultural produce. Under the Act, the President is also at liberty to reduce or eliminate tariffs on any tropical agricultural or forest products, if the commodities concerned are not produced in significant quantities in the U.S., and if the Common Market countries agree to follow suit. He has also been authorised to eliminate tariffs on commodities currently dutiable at a rate of 5 per cent or less.

Before entering into formal negotiations for reducing the tariff on any commodity or manufactured goods, the President will have to seek the advice of the U.S. Tariff Commission. Under Chapter 3 of the Act (Sections 221 to 226), the Commission should be furnished with lists of articles to be negotiated. The Commission will then hold public enquiries and study the question for about six months and advice the President as to its judgment of the probable economic effect of modifications of duties or other import restrictions on each article listed. The Commission has also extensive responsibilities, including preparation of findings on the criteria for determination of articles for tariff reduction.

Provisions for Safeguards

These proposals for tariff reductions are, of course, accompanied by certain provisions for safeguards to the domestic industry and to retaliate against foreign imposed trade restrictions. In addition to the general power to raise U.S. tariff rates by 50 per cent above the 1st July 1934 level and to impose other import restrictions contained in the negotiating authority, the President is directed to take certain action whenever "unjustifiable" foreign import restrictions impair the value of tariff commitments made to the U.S. The President is also required —notwithstanding any provision of any trade agreement under the Act—to impose duties or other restrictions, e.g. quotas, on the products of any country establishing or maintaining import restrictions described in the Act against U.S. farm products, to the extent he deems such action necessary and appropriate to prevent the imposition of the foreign restrictions or have them removed.

A further provision along the same lines enables the President to take retaliatory action in cases where foreign countries maintain "unreasonable" import restrictions which adversely affect, directly or indirectly, U.S. interests. The main purpose of this provision is to permit the President to deal with those instances where restriction against one foreign country's products cause a diversion of the affected country's trade to the U.S. markets and thereby substantially burdens the U.S. commerce. The provisions of previous trade legislation are maintained concerning restriction of imports which the President determines are threatening national security. A new authority empowers the President to seek to persuade other countries to negotiate agreements to conserve fish resources. If such agreement is not reached, he may then raise tariffs on fish from countries which violate fish conservation.

Adjustment Assistance

The Act also contains an escape clause, under which certain industries can seek for higher tariffs, if their interests are adversely affected by larger imports. Apart from this, positive solutions to safeguard the domestic industry are also envisaged by way of adjustment assistance. Thus, the President is given the possibility of selective action on receiving from the Tariff Commission an affirmative finding that imports are the cause of serious injury. Section 302 empowers the President to (1) provide tariff adjustment for the industry concerned, (2) provide with respect to the industry that its firms may request the Secretary of Commerce for certificates of eligibility to apply for adjustment assistance under Chapter 2 of the Act, (3) provide that the workers concerned may request the Secretary of Labour for certifications of eligibility to apply for adjustment assistance under Chapter 3, or (4) to take any combination of such actions. Under a Senate amendment agreed to by the House, he has a still further choice—he may negotiate international agreements, orderly marketing arrangements, as they are termed, with foreign countries limiting the export from such countries and the import into the U.S. of the article causing or threatening to cause serious injury to the domestic industry.

Detailed procedures and criteria for qualification for trade adjustment assistance are laid down in the Act. Authorised assistance to firms covers technical aid, loans, loan guarantees, or permission to carry back a net operating loss for taxation purposes for five years instead of the usual three. For workers, there are provided allowances subject to minimum qualification requirements, in the form of unemployment compensation of upto 65 per cent of the worker's average weekly wage (limited upwards to 65 per cent of the national average manufacturing wage) for up to 52 weeks. Older workers can qualify for an even longer period of payment, as do workers training for new jobs. The cost of such payments to workers will, under an amendment inserted by the Senate, be borne entirely out of Federai funds. No assessment of the likely cost involved in these two assistance programmes has been included in the bill, but figures quoted during the Committee hearings had indicated an amount of $75 to $150 million over the 5-year span of the Bill in payments to workers losing their jobs because of import competition. The amount required for assistance to firms is still speculative.

Liberalisation

On the whole, the move for tariff reduction, envisaged under the Act, is a commendable step in the direction of liberalisation of world trade. For the reductions (or abolition) of customs tariffs between the U.S. and the Common Market would have to be extended to other countries as well. Economically advanced countries, it is expected, will supplement these measures by granting similar tariff reductions. It is said that the benefit of all these tariff reductions will be given to developing countries, without their having to make reciprocal concessions in return. Thus, what is conceived under the Act is a comprehensive re-arrangement of world trade based on the principle of free and fair competition. But the French intransigence is bound to set at naught these objectives unless better counsels prevail on General de Gaulle. Apparently, the French Government wants to set up inward-looking common market with high trade barriers against the rest of the world, including the U.S., the U.K., and developing nations. Britain's entry will, on the contrary, facilitate the implementation of the Trade Expansion Act, the U.K. being in favour of a liberalised system of world trade and of closer links with the U.S. It is not without significance that Mr. Christian Herter, President Kennedy's special representative for trade negotiations, visited Brussels and some of the other European capitals, including London, during the last fortnight. In Brussels, he had preliminary discussions with the Common Market Commission on the question of starting Kennedy round of negotiations under the new Act. On the question of French *volte face*, he is reported to be of the view that there is no honourable alternative to Britain's entry into the Common Market—a view shared passionately by all the other five members of the Common Market. Time alone can tell whether France will modify its stand in the interests of European unity or stick to its guns.

ASIAN DEVELOPMENT INSTITUTE

An Asian Institute for Economic Development, with headquarters at Bangkok, is to commence operation early next year with the help of a $2.4 million five-year grant of the United Nations Special Fund. Additional contributions amounting to $1.8 million, in cash and kind, are expected from over 20 governments. The Institute will be an autonomous institution and have its own staff. It will be under the ægis of the United Nations Economic Commission for Asia and Far East (E.C.A.F.E.). The purpose of the Institute is to provide training, research and advisory services to Asian countries in economic development programming and the execution of their development plans.

The Institute's training programme, which will be the backbone of its activities, is due to begin early in 1964. It will consist of annual courses to be held in Bangkok, and short-term courses to be held in countries other than Thailand. The annual course of ten months' duration will provide instruction in development problems and policies, programming, formulation of projects and their evaluation, etc. Some 30 U.N. fellows are to participate in the first year's programme, 40 in the second year and 50 from the third year onwards, with additional fellowships from other sources. The short-term courses, of about three months' duration, will provide on-the-spot training of substantial numbers of personnel of the Government requesting the services of the Institute in conducting them. The training programme will be conducted in co-operation with specialised agencies and their training programmes. A limited amount of research work, consisting mainly in the preparation of teaching material, will be carried out by the Institute's teaching staff in co-operation with E.C.A.F.E. The Institute's staff will also be available for short-term advisory services to governments.

INDO-INDONESIAN TRADE PACT

India and Indonesia propose to sign a long-term trade agreement. This has been agreed upon in principle, following preliminary talks between a delegation, led by Mr. Manubhai Shah, Minister for International Trade, and an Indonesian delegation led by Mr. Umarjadi, Assistant Foreign Minister for Economic Affairs, at New Delhi last week. An aide memoire containing the gist of discussions between the two delegations was exchanged. Both delegations reiterated their desire to expand trade and economic relations between the two countries. A list of projects in which India could assist Indonesia by way of supply of goods, machinery and technical know-how was indicated. Both India and Indonesia would increase their purchase of goods from each other in a variety of products. Indonesia may purchase industrial machinery, machine tools, electrical and engineering goods, pharmaceuticals and drugs, besides cotton textiles, jute goods and other traditional items. India will purchase from Indonesia larger quantities of items like rubber, non-ferrous meta's, crude oil and petroleum products. An Indonesian trade delegation, led by the Indonesian Minister for Trade and Industry, is expected to arrive shortly for signing the agreement.

FIRST SETBACK IN PROFIT FOR VOLTAS

RECORD TURNOVER—OUTLOOK PROMISING

THE enviable record of Voltas Ltd. (Managing Director: Mr. R. F. S. Talyarkhan, Bombay) of having had a higher turnover together with a rise in gross profit in six successive years after the first year's working in 1954-55 has unfortunately been disturbed during the year ended 31st August 1962. Turnover in this eighth year has expanded further from Rs. 25.73 crores to Rs. 27.16 crores which is a new peak level, but gross profit has receded from Rs. 148.63 lakhs to Rs. 129.60 lakhs at which level it is only Rs. 3.51 lakhs higher than that for 1959-60. The ratio of profit to sales, which in 1959-60 had been maintained at 6.3 per cent, has declined further during the year under report by a full point to 4.7 per cent. At Rs. 48.53 lakhs, net profit—after providing Rs. 9.07 lakhs (Rs. 6.97 lakhs a year before) for depreciation and Rs. 71 lakhs (Rs. 66.50 lakhs) for taxation—is the lowest for the past four years and shows a setback of Rs. 26.63 lakhs over the immediately preceding year. It is only a substantial credit of Rs. 24.57 lakhs, as against only Rs. 6.59 lakhs in the previous year, representing transfers from, and write-backs of, past provisions that has reduced the effect of this sharp fall in profit on distributable surplus to modest proportion. Thus, together with the amount brought in from the previous year, the distributable surplus at Rs. 76.89 lakhs is only Rs. 9.11 lakhs less than that a year before. The dividend on the 100-rupee ordinary shares has been maintained at 14 per cent per annum, to which level it had been raised in the previous year from 13 per cent for 1959-60. But the net amount conserved this year is only a mere Rs. 7.41 lakhs as against no less than Rs. 30.65 lakhs last year.

The following table depicts the four-year progress of the Company:

(In lakhs of rupees)

	For the year ended 31st August			
	1962	1961	1960	1959
Proceeds of sales and services	2,716.32	2,572.59	1,986.46	1,712.21
Other income	21.21	16.97	15.99	2.69
Closing stocks	716.74	680.18	802.43	654.99
Cost of sales and services	2,234.62	2,106.58	1,590.74	1,345.87
Other expenses	373.32	334.35	285.19	262.87
Gross profit	129.60	148.63	126.09	106.14
Depreciation	9.07	6.97	5.68	4.41
Taxation	71.00	66.50	60.00	51.50
Net profit	48.53	75.16	60.41	50.23
Transfer from reserves and provisions and write-backs	24.57	6.59	13.14	8.69
To reserves and provisions	27.41	31.63	25.87	14.05
Development rebate reserve	1.65	1.82	1.69	0.89
Provision for gratuity, less amount paid during the year	10.21	13.04	11.29	9.66
Dividend	35.00 (14%)*	35.00 (14%)*	33.15 (13%)*	33.15 (13%)*
Carry forward	2.92	3.79	4.25	2.27
Equity shares' market value (In rupees):	1963	1962	1961	1960	1959
High	259.00	315.00	319.00	307.00	197.00
Low	238.00	223.00	247.00	183.00	132.50

* Subject to deduction of tax.

It will be seen from the above table that the increase in turnover during the year was of the order of Rs 1.43 crore, as against Rs. 5.87 crores a year before. *Prima facie*, the rate of growth seems to have been slower, but the Directors have explained that it has not been so. For large transactions financed under various credits do not appear in the Company's books as turnover, because, in many cases, though the business is secured by the company, the rules governing such Government-to-Government credits provide for invoicing and payment in the creditor countries and the Company, therefore, takes into account only the margins earned. The shift from imports to distribution of indigenously manufactured products has continued to rise from Rs. 7.03 crores in 1959-60 to Rs. 9.65 crores in 1960-61 and to Rs. 12.40 crores in 1961-62, with all divisions of the Company having participated in the increase. In certain fields, particularly pharmaceuticals and consumer products, the Company is said to be handling only locally produced goods. The percentage of Indian-made goods distributed to total turnover was 43 during the year under report, as against only 7 in 1954-55. The Company handles products of as many as 700 different groups.

Mr. J. D. Choksi, Chairman of the Company, has attributed the decline in profit for the year under report to two factors, namely, (i) longer delivery periods, particularly from the Common Market countries and Switzerland, as also time-consuming formalities in connection with business financed under Government-to-Government loans, and (ii) higher taxation. Mr. Choksi observes that but for these two reasons profit for the year would have surpassed that for 1960-61.

Speaking of outlook for the Company, the Chairman states that, in war and peace, the Company will give its best and is sure that its performance in the current year as also in the years to come will be such as to deserve the trust and confidence of the shareholders. He adds, "we are confident that, in spite of increasing difficulties, we shall maintain our position in the future because of the excellent relationships that have been established with our foreign associates and with our customers, supplemented by our flexible and efficient nation-wide services."

Mr. Choksi is critical of the official bias against the distributive trade as expressed in drastic cuts in the import quotas of distributors, notwithstanding that, fortunately in many of the Company's lines, holders of actual users' import licences, including Government undertakings, continue to avail themselves of the Company's services to make their purchases abroad and to import their requirements into India. He fears that the abolition of the Company's import quotas for spare parts may render it difficult for the Company to maintain its after-sale service and may lead to a situation of a breakdown and immobilisation of many crores of rupees worth of valuable equipment.

It will be recalled that the Company had worked out last year a programme for transferring and expanding its facilities and manufacturing operations from the restricted area of Chinchpokli to Thana. The programme still awaits execution, because of difficulties in acquiring land arising from the Land Acquisition (Amendment) Act of 12th September 1962. The Company could physically possess only 33 acres of the 120 acres of land which had been acquired for it by the State Government. However, proposals are under study for commencing manufacturing operations on this small plot. Meanwhile, production has continued at Chinchpokli and an administrative building has been put up near the workshop to allow for a reasonable expansion of the existing manufacturing schemes and for starting essential pilot plants for new ones. Satisfactory progress has been maintained in the production of air-conditioners, water coolers, certain equipment for central plants airconditioning as well as for the mining industry and electric starters. During the year, the Company had various new projects under consideration, some of which have since been finalised with collaborators abroad and licensed by the Government. Negotiations are under way with foreign manufacturers of repute to secure technical assistance for the manufacture and distribution of electrical equipment in replacement of the Brown Boweri representation which had been terminated in 1961.

Financially, the Company is in a sound position. It has a paid-up capital of Rs. 255 lakhs supplemented by reserves and surplus shown at Rs. 111.84 lakhs. Borrowed funds have increased from Rs. 377.87 lakhs to Rs 422.94 lakhs and, together with current liabilities and provisions standing at Rs. 12.20 crores, have raised the total indebtedness to outsiders to Rs. 16.43 crores from Rs. 13.94 crores a year before. However, this indebtedness is fully taken care of by current assets, loans and advances aggregating Rs. 18.67 crores and investments amounting to Rs. 25.67 lakhs. At Rs. 110.11 lakhs, the net block compares with a gross block of Rs 149.52 lakhs (Rs. 129.76 lakhs a year before) on which a total depreciation of Rs. 39.40 lakhs has been provided so far.

Currently quoted at Rs. 239 *cum-div.*, the Rs. 100 fully paid ordinary shares offer, on the *ex-div.* basis, a net yield of 4.2 per cent per annum.

NEW STANDARD ENGINEERING'S RIGHTS ISSUE

The recent rights issue of 25,000 ordinary shares of Rs. 100 each at a premium of Rs. 20 per share by the New Standard Engineering Company Ltd. of Bombay has been oversubscribed. In all, 30,500 shares, including 7,500 additional shares, have been applied for by the shareholders. The issue, which was in the proportion of one right share for every two shares held, opened on 17th November 1962 and closed on 31st January 1963. Considering that it had been made at the time when the stock market was in a very bad shape following the Chinese aggression, the response to it is indeed encouraging. The market value of the right fluctuated during the period of subscription between Rs. 25 and Rs. 40. Currently, the 100-rupee old shares are quoted at Rs. 146 *ex-right*. Following the rights issue, the issued ordinary capital of the Company has increased to Rs. 75 lakhs. The Company has also 25,000 9 per cent, taxable cumulative redeemable preference shares of Rs. 100 each.

SALES OF DALMIA IRON AND STEEL RISE

PROFIT-MARGIN DECLINES

THE results of the Dalmia Iron and Steel Ltd. (Managing Director: Mr. Ghanshyam Kejriwal, Rajgangpur, Orissa) for the year ended 30th September 1962 are good only in parts in contrast with the all-round progress reported in the previous year. Production and turnover are higher, but profit-margin has slipped back, because of the sharp rise in cost of production. Production of steel castings increased from 927 tonnes to 1,006 tonnes and so has that of spun iron pipes from 15,207 tonnes to 18,473 tonnes, though that of grinding media has declined to 3,560 tonnes from 3,879 tonnes to which level it had expanded in the previous year from 3,642 tonnes in 1959-60. On the whole, the trend in output can be deemed satisfactory, considering that the Company had been no exception to the power crisis in West Bengal during the year and had to content itself with much limited supplies of foundry grade pig iron. The overall larger output has reflected itself in the increase of Rs. 36.69 lakhs (Rs. 13.74 lakhs a year before) in the turnover at Rs. 180.21 lakhs. We are told that to the extent of Rs. 4.50 lakhs the rise in turnover has been due to the increase in the selling price of pipes following the increase in the rate of pig iron by Rs. 25 per ton.

The gross profit, on the other hand, amounts to only Rs. 33.65 lakhs, an increase of a mere Rs. 55,000 as compared with Rs. 33.11 lakhs earned in 1961-62, at which level it was higher by Rs. 13.24 lakhs than the profit for 1959-60. The failure of profit to expand together with turnover has been attributed by the Directors to the implementation of the third Engineering Tribunal's award, appointment of more technical personnel and payment of profit-sharing bonus to workmen and staff at increased rates. These new factors have led to an increase of Rs. 16.27 lakhs in expenses at Rs. 84.09 lakhs, including staff expenses which have gone up from Rs. 19.37 lakhs to Rs. 25.64 lakhs, but excluding the cost of materials consumed which has also been higher by Rs. 7.25 lakhs at Rs. 57.65 lakhs apparently because of the rise in production. With the profit having failed to keep pace with turnover, its ratio to sale proceeds has declined to 18.6 per cent from 23 per cent to which level it had improved from 15.3 per cent in 1959-60.

At Rs. 15.44 lakhs, net profit is actually lower by roughly Rs. 6 lakhs because of an increase in the provision for taxation by the same margin at Rs. 7.50 lakhs. The provision for depreciation is a shade higher at Rs. 10.71 lakhs as compared with Rs. 10.50 lakhs in the previous year. The dividend on the 10-rupee ordinary shares has been maintained at 10 per cent per annum, subject to tax, but reserves have got Rs. 3.50 lakhs less at Rs. 8 lakhs. The carry forward is Rs. 1.09 lakh, as against Rs. 1.65 lakh brought in.

The comparative table below gives a clear idea of the Company's progress in the past four years:

(In lakhs of rupees)

	For the year ended 30th September			
	1962	1961	1960	1959
Sale proceeds	180.21	143.52	129.78	66.14

* Subject to deduction of tax.

Productionwise, the Company is expected to fare better during the current year. It has, however, yet to get going with its expansion programme. The steel foundry expansion could not be taken up last year because the import licence for plant and machinery was delayed till December 1962. In the meantime, a new, indigenously procured, three-ton art furnace had been put into commission on 24th November 1962. But it has been running only 33 per cent of its capacity owing to insufficient power. More power and installation of imported equipments are expected to raise production of steel castings and grinding media to full annual capa-

Carry forward	1	14

Market value of equity shares (in rupees):	1962	1961
High	2.50	3.00
Low	2.45	2.60

Extracts from the Directors' report: *Coffee*: The area replanted in the recent years totals 240 acres including the 40 acres cleared and planted in the year under review. The hybrid *Arabica* young plants show a healthy growth and should yield a very satisfactory crop in future years. Area under Robusta remains the same.

Tea crop has been good during the year, but sale prices at the auction drifted downward after October 1961. This mainly accounts for the fall in the net profits of the Company as compared with the results of the previous year. The Directors feel that better conditions now prevail and prices will improve in the current year.

Factory: The machinery in the factory were maintained in good working order. Induced *Draft Fan* for the *Quality Dryer* and a *Winnower* to eliminate fluff remain to be installed as the accessories for the machines have not been completely received. These two machines will be erected during the current year.

Estimate for the Current Year

Tea: Estate crop	1,66,500	kgms.
Bought leaf	15,000	"
Total	1,81,500	kgms.
Coffee: Arabica	5	tonnes
Robusta	20	"
Total	25	tonnes
Cardamom	900 kgms. (2,000 lbs.)	
Tea seeds	60 maunds.	

Accounts in brief as at 30th June 1962 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	6,87,310	Gross block	18,66,835

* After providing Rs. 3,826 for additional preference dividend for the year 1958-59.
† Represents provision for bad and doubtful debts written back.

Extracts from the Directors' report: As per sanction of the Controller of Capital Issues obtained by the Company, 10,92,762 ordinary shares of Rs. 10 each were issued for cash at par. Out of this 5,46,381 ordinary shares were offered to the existing shareholders and the same have been fully subscribed. In terms of issue of the said new shares, dividend is payable on the same for the year ended 30th June, 1962 and accordingly the directors have recommended the payment of dividends on these shares. The balance 5,46,381 ordinary shares would be offered for subscription to Messrs. Kimberly Clark Corporation of U.S.A., in due course.

The production, during the year under review, was nearly the same as in the previous year. There was a further rise in the cost of raw materials, chemicals, power and fuel etc. The levy of excise duty by the Central Government on compressed gases, hessian and other goods as per the Finance Act, 1962 will be fully reflected during the current financial year's working.

As a result of the industry's representation, the Government has permitted an *ad hoc* increase of 6 nP per kg. in the prices of paper and board and discontinuance of rebate on reels with effect from 21st June, 1962.

The Directors are glad to report that according to the agreement for technical and financial collaboration entered into with Messrs. Kimberly Clark Corporation of Wisconsin, U.S.A., the Company has already started receiving technical advice and assistance from them.

During the current financial year, the workers resorted to an illegal strike and due to this the factory remained closed for a period of about three months. As a result of intervention by the Government, the factory has resumed work and it has been decided that all pending disputes, including those pending before the Labour Tribunals, be referred to the arbitration of a retired Supreme Court Judge.

Accounts in brief as at 30th June 1962 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	3,21,62,410	Gross block	7,17,13,707

Extracts from the Directors' report: The Mills continued to work in accordance with the working time agreement of the Indian Mills Association. Due to the acute shortage of raw jute the Mills were closed for 5 days at the beginning of September 1961. At the beginning of the period under review, 174 looms were working double shift 96 hours per week but the average for the year was 209 looms. By purchasing loom hours the number has been increased and at the time of writing 225 looms are running 96 hours per week.

The labour situation continued to be unsettled and several minor stoppages occurred and mill efficiency was not up to the standard expected.

The Wage Board has not yet completed its investigations into the wages structure of the jute industry but interim relief at the rate of Rs. 3.42 nP per month continues to be paid to all workers.

Modernisation of the machinery continues in the preparing and spinning sections of the Mills and should result in greatly improved efficiency and productive capacity as the most of this new machinery will work treble shifts.

With the raw material supply assured and more favourable trading conditions the Directors consider that the prospects for the current year are reasonably good.

Accounts in brief as at 31st July 1962 are as under:—

Liabilities	Rs.	Assets	Rs.

Extracts from the Directors' report: The Mills continued to work in accordance with the working time agreement of the Indian Jute Mills Association. Due to shortage of raw jute only 420 looms were working single shift of 48 hours per week at the beginning of August 1961, and the Mills were closed down for 2 weeks at the end of August and the beginning of September 1961, for the same reason. However, from 9th October 1961, double shift working was introduced in the weaving section with 250 looms running 96 hours per week. Thereafter, by purchasing loom hours, the number of looms working double shift was increased and 300 looms are so working at the time of writing.

Although several minor stoppages occurred due to disputes with sections of the workers, the labour situation was on the whole, quiet but mill efficiency continued to be below the standard required.

Modernisation of the mill machinery is continuing and it is hoped that this will result in increased efficiency and better production.

Owing to the situation of these Mills, the cost of obtaining suitable high grade fibre for the manufacture of *Broad Hessian* was found to be uneconomical, and difficulties were experienced for technical reasons in producing the cloth to the required standard. Numerous complaints were received from overseas customers and, consequently, it was decided to close down the *Broad Loom Installation* at the Mills. The machinery has now been leased to the Kelvin Jute Co. Ltd., in Calcutta.

Large jute crops last year and during the current season have made the fibre freely available at economic rates, and the Indian Jute Mills Association is co-operating with the Government to maintain prices and thus ensure an equitable return to growers by continuing the Quota System for Jute Purchases and by the formation of a Jute Buffer Stock Association in January 1962, which commenced buying Jute in April 1962. These heavy purchases of the raw material have placed a severe strain on the Company's financial resources as well as on its storage position for jute.

However, with the raw material supply assured and more favourable trading conditions the Directors consider that the prospects for the current year are reasonably good.

Accounts in brief as at 31st July 1962 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	35,15,000	Gross block	1,27,67,357
5% debentures	10,00,000	—Depreciation	81,17,119
Reserves and surplus	41,26,855		
Other liabilities	72,50,526	Net block	46,50,238
		Block in progress	6,01,241
		Current assets	93,11,028
		Investments	8,19,869
		Cash	5,19,005
	Rs. 1,50,61,381		Rs. 1,50,61,381

* Paid-up capital consists of 5,000 seven per cent. cumulative preference shares of Rs. 100 each and 3,01,500 ordinary shares of Rs. 10 each. Out of the above 2,01,000 ordinary shares are allotted as fully paid up by way of bonus shares by capitalisation of reserves.

(*Concluded from previous page*)

city of 3,600 tonnes and 6,000 tonnes, respectively, from 1,500 tonnes and 3,000 tonnes, respectively, as at present. The Calcutta Electric Supply Corporation has indicated the Company that it would be able to supply enough power to attain the mentioned capacity by the end of 1963. The Company is, however, trying to raise production of grinding media to 5,000 tonnes with whatever power is available. Due to the national emergency and uncertainty about the availability of foreign exchange as also funds for piped water supply to the various States, the Company had to put off its negotiations with French collaborators for its project to expand production of spun iron pipes. However, the technical personnel of the Company's staff had been able to fabricate the pipe spinning machine which is the main component of spun pipe plant in the Company's workshop. The first machine was commissioned in August and the second in December last year. More such machines are to be made to raise production to 45,000 tonnes per annum by 1963. Cost of the project at Rs. 10 lakhs is said to be much less than the accompanying profit.

The financial position of the Company is sound. The paid-up capital of Rs. 80 lakhs is supplemented by reserves and surplus amounting to Rs. 25.09 lakhs. The Company has reduced the I.C.I.C.I. loan by Rs. 4 lakhs to Rs. 35 lakhs and maintained bank borrowings at Rs. 40.45 lakhs. Current liabilities and provisions amounting to Rs. 46.51 lakhs and the bank borrowings make for an aggregate short-term indebtedness to outsiders of Rs. 86.96 lakhs which is adequately covered by current assets, loans and advances standing at Rs. 114.71 lakhs. The gross block has increased during the year from Rs. 125.47 lakhs to Rs. 139.75 lakhs. It has been written down to Rs. 101.71 lakhs and, inclusive of work-in-progress at Rs. 10.50 lakhs, is shown at Rs. 112.21 lakhs.

The Rs. 10 fully paid ordinary shares of the Company are currently quoted at Rs. 11.44 *cum-div.* On the *ex-div.* value, they offer a net yield of 6.5 per cent per annum.

THE MYSORE SUGAR COMPANY LTD.

TWENTY-NINTH ANNUAL GENERAL MEETING

SPEECH OF CHAIRMAN, MR. V. VENUGOPAL NAIDU

THE Twenty-ninth Annual General Meeting of the Mysore Sugar Company Limited was held at the Registered Office of the Company at Bangalore on Thursday, 31st January 1963, under the chairmanship of Mr. V. Venugopal Naidu. Moving the adoption of the report and accounts, the Chairman made the following speech:

LADIES AND GENTLEMEN,

I have great pleasure in extending to you all a cordial welcome to this 29th annual general meeting of your Company. The Directors' report, the audited balance-sheet and the profit and loss account for the year ended 30th June 1962 have been circulated to you and, with your permission, I shall take them as read.

As the balance-sheet and the profit and loss account have disclosed, I dare say this year has been quite satisfactory from the operational and financial point of view, considering the innumerable difficulties the sugar industry had to face.

The year 1961-62 continued to be one of anxiety for the sugar industry. The year started with a huge accumulation of stocks of sugar resulting from a record production of 30 lakh tons during 1960-61 and secondly stagnation in internal consumption at about 21 lakh tons. The Government of India, therefore, imposed a 10 per cent cut in production during 1961-62. In September 1961, they removed all controls on price, movement and distribution of sugar. Consequently, the production of sugar during 1961-62 declined to 26.59 lakh tonnes from the peak level of 29.81 lakh tonnes of the previous year. At the same time, offtake improved, with internal consumption going up by more than 4 lakh tonnes to 25.21 lakh tonnes. Exports also continued and 3.25 lakh tonnes were exported, earning a foreign exchange of Rs. 14 crores, though at a dear price.

Steep Fall in Sugar Price

Though the imbalance between the production and offtake has been thus corrected, the immediate effect of decontrol was a steep fall in sugar price and the effect of 10 per cent cut in production was a shortfall in acreage under cane. This, accentuated by large diversion of cane for *gur* and *khandsari*, has resulted in the cane supply position in some areas today to become so bad that the current year's production is unlikely to go beyond 24 lakh tonnes and this would hardly be sufficient to meet the internal demand. All these go to show that production and consumption patterns in the sugar industry are highly flexible resulting in cycles of overproduction and underproduction with their inevitable interaction. Both Government of India and the industry are alive to this situation and will no doubt take suitable remedial measures. The State Governments have already introduced Sugar Dealers' Licensing Order, under which sugar dealers are required to take out licences. But what is disturbing the industry is the fall in sugar price and the steady rise in the cost of production, with the consequent narrowing of the margin of profit. It is in this context that the establishment of a Sugar Marketing Board appears to be on the anvil. The full picture of this scheme is not yet available and it is to be hoped that the industry will be consulted in regard to the exact scope and sphere of operations of the proposed body. It is to be equally hoped that the Government will ensure that the industry gets a fair price for the sugar.

Cane Price Formula

Before I proceed to make a review of the working of the Company, I would like to refer to two recent events of great importance to the industry. The basic problem of the sugar industry continues to be the high cost of cane per ton of sugar and the need to bring down the same. A beginning in this direction has now been made with the decision to link the price of cane to recovery. For the current season, the price has been fixed on the basis of recovery obtained by individual factories during a certain duration of the previous season. This mode of payment is expected to create in the growers a sense of quality and an incentive to produce better cane. It is only by encouraging the growers to produce quality cane with high sucrose content that the ultimate aim of reducing the cost of sugar can be achieved. So far as the current season is concerned, Government of India have taken the recovery of only good months of the season as the basis for fixing the cane price. This has led to fixation of higher price in some cases. There is, therefore, a thinking that the price should be linked to the recovery of the current season, instead of the previous, and that too to the cane supplies made by individual cane growers, and if this is not immediately possible, by groups of cane growers. In your factory, as the number of individual suppliers is very large, the division of the cane supply area into suitable zones for this purpose is being examined in consultation with the Indian Institute of Sugar Technology, Kanpur.

As you are aware, the scheme for payment of deferred price for sugarcane according to the Price Linking Formula has been a subject of controversy for some years past. It is unfortunate that the Government of India have rejected the formula recommended by the Tariff Commission and have gone back to the old formula, with slight modifications. The amended formula does not give to the industry the relief for which it had been urging all these years. The hopes that had been raised following the reference of the issue to the Tariff Commission have not been realised. It has not yet been possible to assess the financial burden thrown by this formula on your Company.

Sugar Stocks

The sugar manufacturing operations in Mandya started on 14th July 1961 and closed on 27th April 1962. 3,85,016 tonnes of sugarcane were crushed during the period and 38,056 tonnes of sugar produced with an average recovery of 9.77 per cent. The corresponding figures for the previous season were 4,02,298 tonnes, 39,674 tonnes and 9.86 per cent, respectively. Cane supply was plentiful and the prolongation of the season beyond the month of March adversely affected the sugar recovery and this only underlines the need to limit the season to the period when the cane will be in its optimum condition. The year was notable for the large accumulation of sugar the factory had to carry, which at one time reached the alarming size of 2,81,500 bags. This has had a crushing effect on our storage space and financial position. We had to borrow huge amounts and at one time the overdraft stood as high as Rs. 134.32 lakhs. Consequently, we have paid this year interest of Rs. 5.7 lakhs.

Sugar sales rose from 26,730 tonnes in 1960-61 to 31,039 tonnes during this year, though the value of sales was only Rs. 3,17,26,885 as against Rs. 3,10,09,899 last year. As I have already explained, the immediate result of decontrol was that prices fell from pre-decontrolled level of Rs. 116 per bag to Rs. 106.50. The average price realised during this year was Rs. 100.02 per quintal, as against Rs. 114.18 in the previous year. In addition, under the Export Scheme, we had to export 7,180 tonnes. The year closed with an unprecedented large stock of 19,812 tonnes, but we made bold subsequently to export an additional quantity of 10,000 tonnes with a view to liquidating this huge stock.

Raw Sugar for Export

India has entered the world market with raw sugar for the first time. It is gratifying to record here that Mandya was the first factory to undertake to manufacture raw sugar successfully for export purposes. The world consumption of sugar is on the increase and, actually this year, the world sugar consumption has surpassed the production, with the result that there is a bright future for export of Indian sugar. World price of sugar is also on the increase. It is likely that Government of India may hereafter purchase sugar from factories for export on "no loss no profit" basis, thus helping the factories from loss. This, if it comes about, would be a welcome feature. Government of India have already entered into a firm commitment for export of 3.87 lakh tonnes during the next year and no doubt Mandya factory will have its share in this.

As you would have seen from the accounts, the operating results of the year disclose a gross trading profit of Rs. 36.59 lakhs, which compares with Rs. 38.92 lakhs earned in the previous year. The decline in profit in the face of an increase in sugar sales is to be attributed firstly to the lower price realised on sugar sales and secondly to a loss of Rs. 12.41 lakhs on exports. The net profit, after setting apart Rs. 8,26,735 for depreciation but before providing for taxation, stands at Rs. 14,13,626, as against Rs. 20,07,166 of last year. A word of explanation is due for the wide disparity between the gross profit and net profit as compared to the previous year. In the first place, interest charges amounting to Rs. 5,66,636 had to be paid. Secondly, increased provision had had be made for implementing the recommendations of the Central Wage Board for sugar industry. The total amount available for distribution is Rs. 22,77,414, including the balance of Rs. 63,788 brought forward from last year's accounts, as can be seen from the balance-sheet. The proposals of your Directors for disposal of this amount call for no special comment and I have no doubt that you will approve of them.

Rehabilitation

In the face of unstable sugar price and falling trend in profits and the competition that will have to be faced in future, the time has come when we have seriously to consider the question of ensuring the profitability of the concern's working by paying attention to improving efficiency of manufacturing operations. In the ultimate analysis, this problem is closely linked with the rehabilitation of our plant and its modernisation and expansion, to which reference has been made in the speeches of previous years. Our plant has now been working continuously for 30 years and it may well be said to have outlived its normal life. Our application for expansion is still with Government of India. Your Directors have apprised the authorities of the gravity of the problem and hope that needful assistance will be forthcoming and that it would be possible to take up ere long a new scheme of rehabilitation-cum-expansion on a planned basis.

The Paper Mills at Belagola, with whom we have entered into agreement for supply of bagasse for use in the manufacture of paper, has gone into production in recent months. The new boiler secured in terms of the agreement to facilitate the release of bagasse by burning coal is now under installation in our factory. However, we have during the year supplied them 6,083 tonnes of bagasse released from our existing boilers to enable them to go into production.

In my last year's speech, I had mentioned that agreements with well-known foreign col-

Notice

THE RAYALASEEMA MILLS LIMITED

Registered Office and Factory:
RAYANAGAR, ADONI P.O.
(Kurnool District)

NOTICE IS HEREBY GIVEN THAT THE SEVENTEENTH ANNUAL GENERAL Meeting of The Rayalaseema Mills Limited, will be held at the Registered Office of the Company at Rayanagar, Adoni, on Thursday, the 21st March 1963, at 11-00 a.m. (S.T.), to transact the business, details of which are contained in the notice that will be sent to each member individually in respect of the above Annual General Meeting.

The Share Transfer Books and Register of Members of the Company shall remain closed from the 7th March 1963 to 28th March 1963 (both days inclusive).

By Order of the Board,
For THE RAYALASEEMA MILLS LIMITED,
per pro RAYALASEEMA AGENCIES,
(Sd/-) M. SOMAPPA,
Managing Partner,
Managing Agents.

ADONI.
30th January, 1963.

Note:—ANY MEMBER ENTITLED TO ATTEND AND VOTE AT THE MEETING IS ENTITLED TO APPOINT A PROXY AND A PROXY NEED NOT BE A MEMBER.

laborators for supply of necessary equipment for our acetate project were being concluded and the foreign exchange loan applications were also submitted. There were some unexpected developments during this year. The technical know-how which we had secured for cellulose triacetate was not acceptable to Government of India and, consequently, we had to approach other manufacturing firms. There are hardly five or six manufacturers of cellulose triacetate in the world and, therefore, it was rather difficult for us to obtain suitable terms from any of them. However, I am happy to inform you that we have now secured the know-how from Gevaerts, the well-known Belgium firm, manufacturing films. I am equally glad to inform you that Hindustan Photo Films Manufacturing Company, Ooty, who are the prospective purchasers of our triacetate, have now accepted this know-how and, therefore, arrangements are being made to conclude agreements with them along with our American and Swedish collaborators.

Regarding foreign exchange credit, as I have already reported to you, we have approached the Industrial Credit and Investment Corporation of India, for a sterling loan of Rs. 75 lakhs and the Export-Import Bank of Washington for a dollar loan of Rs. 100 lakhs. I am hopeful that, within the next few months, these financial and technical arrangements will be finalised when proposals for forming a new company to undertake this venture will be taken up.

Before closing, I feel it my duty to make a reference to the national emergency. It is a happy augury that, in this hour of national crisis, the whole country is like one man determined to fight the enemy with a view to preserving our hard-own independence. Spontaneous contributions both in men and money are pouring in for the defence of our motherland. Your Company has not lagged behind and will make the utmost sacrifice in the interest of the country. Your Directors have decided to make a humble contribution of a sum of Rs. 2 lakhs from the Company funds to the National Defence Fund. A sum of Rs. 1 lakh has already been paid. The employees of your Company have also contributed more than Rs. 1,17,000 from their wages and bonus and, likewise, our cane suppliers have donated a sum of about Rs. 4 lakhs to National Defence Fund.

Labour

Our relationship with labour was as cordial as before. However, there were some differences in regard to details connected with the implementation of the Award of the Central Wage Board fixing revised scales of pay for the various categories of employees in the industry. These differences, I am happy to say, have just been resolved to the satisfaction of both parties as a result of discussions and negotiation over a long period. In response to the plea of the employees as put forward by their Association, your Directors have agreed to a scheme of wage increments to all employees of the factory and I am sure that this gesture on their part will be amply repaid. The question of bonus cropped up again in the shape of demand for additional bonus over and above the normal bonus of four months' pay already granted for 1959-60. As a result of negotiations, an amicable settlement has been reached under which an additional one month's bonus has been awarded in respect of the year 1959-60 in full settlement of bonus for the years 1959-60, 1960-61 and 1961-62. Now that the major issue with regard to wage scales has been satisfactorily settled, we look forward to a long period of industrial peace.

Before concluding, it is my pleasant duty to acknowledge the wholehearted co-operation and guidance which I have at all times received at the hands of my esteemed colleagues on the Board. I also desire to pay tribute to the officers, staff and workers of the office and factory for their loyal and efficient work. The cane suppliers have also co-operated with us and the thanks of the management are due to them. Finally, we are grateful to the Government of Mysore and particularly to our Chief Minister and Minister for Industries for their continued sympathy and support, which have been of inestimable value to the Company.

The report and the accounts for the year 1961-62 were adopted and a dividend of 30 per cent subject to deduction of tax was approved. Mr. T. Shamanna was re-elected as a Director and Mr. S. R. Aswath was elected as a Director in place of a retiring Director.

With a vote of thanks to the chair, the meeting terminated.

T. HANUMIAH,
Secretary.

BANGALORE,
31*st January* 1963.

Note: ***This does not purport to be a report of the proceedings of the general meeting.***

Notices

THE DURBHANGA SUGAR COMPANY LIMITED

NOTICE

NOTICE IS HEREBY GIVEN THAT THE Fifty-first Ordinary General Meeting, being the Annual General Meeting, of The Durbhanga Sugar Company, Limited, will be held at the Registered Office of the Company at Lohat on the 28th day of February, 1963, at 10.30 a.m., for the following purposes:—

(1) To receive and adopt the Directors' Report and Accounts for the year ended 31st August, 1962, and Balance Sheet and Report of the Auditors thereon.

(2) To declare a Dividend.

(3) To elect a Director in place of Shri K. Jha, who retires under Article 107 and, being eligible, offers himself for re-election.

(4) To appoint Auditors for the current year and to fix their remuneration.

AS SPECIAL BUSINESS

(5) To consider the appointment of Pandit G. M. Misra, who retires, as a Director and to declare that the age limit prescribed under Section 280 of the Companies Act, 1956, shall not apply to him.

(6) To sanction payment of remuneration to the Manager for the year ended the 31st August, 1962.

(7) To transact any other business which may be brought forward at the meeting with the permission of the Chairman.

By Order of the Directors,
W. F. MALDEN,
Secretary.

LOHAT,
DISTRICT DARBHANGA,
14*th January*, 1963.

Note:—

(1) A member of the Company, who is entitled to attend and vote, is entitled to appoint a Proxy to attend and vote instead of himself and the Proxy need not be a member.

(2) The Share Transfer Books of the Company will be closed from the 10th February to the 28th February, 1963, both days inclusive.

(3) Dividend Warrants will be posted to those Shareholders whose names stand on the Register on the 28th February, 1963.

Explanatory Statement pursuant to Section 173 of the Companies Act has been circulated with the Notice to the Members of the Company.

THE SOUTH KARANPURA COAL COMPANY LIMITED

NOTICE IS HEREBY GIVEN THAT AN Annual General Meeting of The South Karanpura Coal Company Limited, will be held at the Registered Office of the Company, Chartered Bank Buildings, Calcutta, on Thursday, the 28th February, 1963, at 11.0 a.m., for the following purposes:—

1. To consider and adopt the Audited Accounts of the Company for the year ended 31st August, 1962, and to receive the Directors' and Auditors' reports thereon.
2. To appoint Directors in place of retiring Directors.
3. To appoint Auditors and fix their remuneration.

The Share Transfer Register of the Company will be closed from 14th February, 1963 to 28th February, 1963, both days inclusive.

By Order of the Board,

Note: A member entitled to attend and vote at this meeting may appoint a proxy to attend and vote in his stead. A proxy need not be a member of the Company.

THE EAST INDIAN COAL COMPANY LIMITED

(Incorporated with Limited Liability in the United Kingdom)

THE DIRECTORS ANNOUNCE THAT THE consent of the Controller of Capital Issues, Government of India, has now been received to the issue of 144,000 new Ordinary Shares at a price of £1 13*s.* 0*d.* per share, including a premium of 13*s.* per share. Application has been made to the Reserve Bank of India for permission to allot shares to existing shareholders not resident in India to the extent of their respective entitlements and to enable such shareholders to dispose of their rights in this issue, if they so desire.

The new shares will be offered in terms of the Resolution adopted at the General Meeting of the Company held on 3rd October 1962 to the shareholders registered as on that date in the proportion of three new shares of £1 each for every five shares held as at that date. In respect of shares which have been the subject of dealings or have been transferred since 3rd October 1962. Letters of Right will be issued in favour of the person named as the registered shareholder on that date and the present holders will be required to obtain delivery of the Letter of Rights, free of charge, from such registered holders.

Letters of Right are expected to be despatched to shareholders to reach them not later than 15th February 1963 and the offer will remain open until 8th April 1963. Full details of the steps required to be taken by the shareholders, whether resident or non-resident and whether on the Calcutta or London Registers, will be included in the Letter of Rights when it is issued.

D. FORDWOOD,
Secretary.
Managing Agents and Secretaries.

Head Office:
4, CLIVE ROW,
CALCUTTA-1.
25*th January*, 1963.

MADURA MILLS COMPANY LIMITED

Registered Office:
NEW JAIL ROAD, MADURAI

NOTICE IS HEREBY GIVEN THAT THE Annual General Meeting of the Company will be held in Pandyan Building, West Veli Street, Madurai, on Thursday, the 21st March, 1963, at 3-30 p.m. The Share Transfer Books will be closed from 22nd February to 21st March 1963, both days inclusive. It is recommended that:

1. All persons holding shares on blank transfers should immediately arrange to have the shares registered in their own names, as the Company will pay any dividend declared only to the person (s) in whose name the share stands on the date of declaration of dividend.
2. Shareholders desiring dividends to be paid to Banks or other Mandatees should register the mandates with the Company before 22nd February, 1963.
3. Intimation of any change of address should be given to the Company immediately.

A. & F. HARVEY LIMITED,
Managing Agents.

MADURAI,
29*th January*, 1963.

EASTERN INVESTMENTS LIMITED

THE BOARD OF DIRECTORS HAS DECIDED to recommend to the forthcoming Annual General Meeting of the members of the Company the following Final dividend for the year ended 31st December, 1962, subject to deduction of tax—

On the taxable cumulative Preference Shares @ 4.1625% per annum less Interim dividend @ 2.08% already paid.

On the Issued Ordinary Shares @ 12% per annum.

By Order of the Board.
BIRD & CO. (PRIVATE) LIMITED,
Secretaries.

Registered Office:
CHARTERED BANK BUILDINGS,
CALCUTTA, 29*th January*, 1963.

NEWS IN BRIEF

THE Union Government has declared the coal industry to be a public utility service for the purposes of the Industrial Disputes Act 1947 for a period of six months.

The Assam State Government has given a prospecting licence to Oil India Ltd., to explore oil in about 1,290 sq. miles at Doomdooma in upper Assam. Seismic experts from the U.K. are expected to conduct a detailed survey of the area.

The Premier Automobiles Ltd. has signed a four-year agreement with the Chrysler International for the production of Chrysler motor vehicles in India. The new pact covers Chrysler products of American origin as well as products of its subsidiaries in various countries.

The Government of India has decided to dissolve the existing Standing Metric Committee and set up, in its place, a Directorate of Weights and Measures in the Ministry of Commerce and Industry. The new Directorate, which will have its headquarters at New Delhi, and four Regional offices in Bombay, Calcutta, Delhi and Madras, will commence work from 1st March next.

The Geological Survey of India has located three chromite-bearing areas in the districts of Nuggihalli, Hassan and Chitaldurg, in Mysore State. The location is the outcome of an intensive investigation of the Chromite deposits by the Department during the period 1957-61. Chromite is widely used in metallurgical, chemical and refractory industries.

The validity of all import licences which were affected by the recent maritime strike in the U.S. (from 23rd December 1962 to 26th January 1963) has been extended up to the 28th inst. Owing to the strike, it will be recalled, all export cargo movement from Atlantic and Gulf Ports of the U.S. had been interrupted and shipments against licences could not be effected.

A six-member team from Czechoslovakia, led by Mr. V. Novacek, Director of Asian Department, Ministry of Foreign Trade, has arrived in New Delhi to explore the avenues of purchasing manufactured and semi-manufactured goods from India. Czechoslovakia has agreed to accept in kind the repayment of some portion of the credits it has given to India for industrialisation. These credits fall due for repayment in the next two or three years.

A two-member delegation comprising Mr. R. L. Gupta and Mr. C. P. Srivastava, Chairman and Managing Director, respectively, of the Shipping Corporation of India, has left for New York on a fortnight visit to the U.S. to finalise arrangements for opening a regular cargo service between India and the U.S. The proposed service is expected to be inaugurated on April next. While in New York, the delegation will also hold talks for the operation of a 32,460 dwt. super tanker service. At present, the Scindia Steam Navigation Company is running a cargo service between the two countries.

Harsha Tankers and Shipping Agency, Bombay, general agents in India for the American Clipper Line (a non-Conference line), has reduced the freight rate on all cargoes handled by it in the Indo-U.S. route, with effect from the 6th inst. Disclosing this at a Press conference, Mr. H. J. Bhatt, Chief Executive of the Agency, observed the other day that this move would help promote exports to the U.S. Cashewnuts, exports of which have shown a declining trend of late owing to increasing competition from East Africa and Brazil, is one of the important export goods that will be benefited by the freight cut.

A scheme has been drawn up by the Government of India to train inland water transport personnel who have the requisite experience to qualify themselves as inland masters, serangs, drivers, etc. No facilities for such training exist in the country at present. Under the scheme, which will be implemented from April next, 360 men will be trained within a year in six batches of 60 each, the duration of the training being two months. Candidates from all the States will be eligible for admission to the training. It is expected that there will be no dearth of suitable personnel in the higher cadres of the inland water transport crew when the scheme gets into swing.

The Government of India has decided to set up a 18-member Committee with Mr. H. Sitarama Reddy, Chairman, Coffee Board, as Chairman, to advise it on measures for the development of the Cardamon industry. Among other things, the Committee will advise on measures for promotion and extension of cardamom plantation, improvement of the quality of cardamom and the productivity of the estates, making arrangements for the supply of fertilisers and ancillary equipment required by the industry, provision of adequate financial assistance in the form of working capital, credit, etc. for measures of improvement and in particular, the marketing of cardamom with a view of ensuring economic and reasonable prices to the grower and augmenting the foreign exchange earnings from exports.

Negotiations on the expansion of the one-million-ton Rourkela steel plant between India's state-owned steel combine, Hindustan Steel Ltd., and individual West German company delegations have been successfully completed. On the basis of these contracts, the German industry will deliver and install equipment to raise Rourkela's present capacity to 1.8 million tons annually by the end of India's third Five-year Plan period. The total cost of Rourkela steelworks expansion, to commence before the end of this year, is set at over Rs. 90 crores, about half of which over DM 450 million will have to come in foreign exchange in payment for the now agreed new deliveries. Publication of the new contracts, laid down in legally binding "letters of intent," is expected to be forthcoming in the near future, after last technical details are settled. Thus, with the required capacity production at Rourkela achieved at the end of last year already, another important pre-condition for the granting of additional credits by the Bonn Government, to finance Rourkela expansion, has been established. The "letters of intent" will become valid automatically, as soon as Bonn underwrites the credit.

* * * *

From Abroad

Japan had a surplus balance of payments to the extent of $355 million during 1962 in contrast with a deficit of $338 million in 1961.

The custom duties on all commodities in Spain have been reduced by 5 per cent. The reduction will not, however, be applicable to compensatory or transitory export duties or to duties established at 1 per cent *ad valorem*.

An oil refinery producing 600,000 tons per annum will be built in the Congo by a company to be formed jointly by the Leopoldville Government and the A.N.I.C., a subsidiary of E.N.I., the Italian National Oil Corporation.

A new trade agreement has been signed by the Governments of Japan and Soviet Russia. Under the agreement, Japan will import Soviet goods worth $115 million during 1963 (as against $105 million in 1962) and export goods worth $136 million.

The Governments of New Zealand and Japan have signed an agreement which seeks to avoid double taxation and prevention of fiscal evasion of taxes on income. The agreement lays down clear rules regulating profits, royalties and income, both personal and corporate.

A new investment company with the object of raising $50 million abroad for investment in Israel has been launched in Tel Aviv. Offers for the purchase of shares worth $14 million have already been received from foreign residents, while ten local groups, mainly leading banks, have agreed to invest $10 million.

France and Soviet Russia have entered into an agreement under which France will export to Russia equipment for chemical, cellulose, electronic and food industry enterprises, as well as machine tools, steel tubes, nickel and artificial fibres. It will import from Russia anthracite, oil and oil products, manganese and chrome ores, machinery, clocks and other goods.

PERSONAL

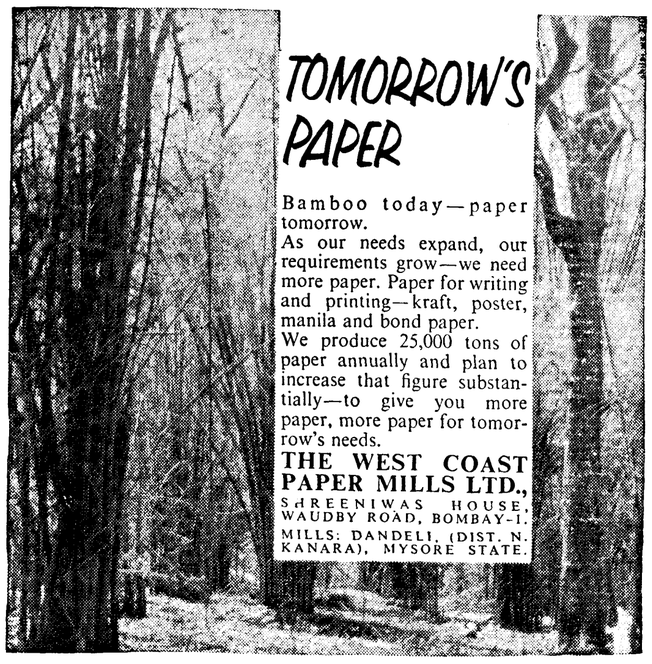
MR. Wilhelm Guntner Von Heydon, Minister-Councellor in the German Embassy, New Delhi, left for Bonn at the end of his term in this country.

Mr. James Hailey, an Executive Director of Lombank Limited, has been invited to join the Board of Banque Orca, S.A. Geneva, Switzerland.

Mr Atmaram Shridhar Naik, Joint-Secretary, Union Ministry of Commerce and Industry, has been appointed Chairman of the Forward Markets Commission.

Mr. Andrew Bolton Lloyd, a foundry consultant in Britain, has arrived in India to take up a two-year appointment as Adviser and Consultant to the Indian Investment Centre in New Delhi.

Dr. Wendell Von Orelli, of the Department of Clinical Research, Sandoz, Basle, has arrived in India to organise clinical research in the country.



Mr. W. E. Eadie, Chairman of the Burmah Oil Company, who is on a tour of the Group's offices and installations in the East, arrived in New Delhi on the 8th inst.

Mr. Khandubhai K. Desai, M.P., a nominee of the Government of India on the Board of Directors of Oil India Ltd. and its Chairman for 1962, has been nominated by the Burmah Oil Company to function as the Chairman of Oil India Ltd. for 1963.

Sir Hugh Foot has been appointed consultant to the United Nations Special Fund. Sir Hugh is expected to take up his new duties at United Nations Headquarters in New York in two months' time. His assignment, under the direction of Mr. Hoffman, will be to consult with certain Governments in the African region and elsewhere, in order to assist in ascertaining highest priority needs for development assistance.

The International Wheat Council has estimated the aggregate world wheat output (excluding mainland China) in the 1962-63 season at 228 million tons, that is 18 million tons more than what was actually harvested in 1961-62. The Council expects the World trades in wheat and flour in the current season to be considerably lower than the previous season, when it reached a new record of 47 million tons.

A Shipowner in Norway has placed orders for eight cargo ships to be built by the Hungarian Shipyards and Crane Factory, Budapest. This is the first time that Norwegian ship contracts have been placed in Hungary. The orders have been placed at fixed prices and at favourable credit terms. Two of the vessels, both single-deckers of 1,650 tons deadweight each, will be delivered this year.

TREND OF MARKETS

CALL RATE 5¾ PER CENT

(From Our Own Correspondent)

BOMBAY, *6th February*

Extremely stringent conditions prevailed in the short-term money market during the week under review, the inter-bank call rate advancing by another ¼ per cent to 5¾ per cent. While there was persistent pressure of demand for funds, the supply actually available was negligible. For a sizable amount was paid into the Reserve Bank of India by way of war risks insurance premium and this money did not come back to the banking system. Borrowers were, therefore, finding it very difficult even to meet their usual daily requirements. Conditions at Calcutta were tighter still, the call rate jumping up by a full one per cent to 6 per cent.

Despite the stringency of money, the response to the 91-day Government of India Treasury Bills, tenders for which opened on Tuesday the 5th inst., was more encouraging than in the past few weeks. The total amount offered was higher by Rs. 50 lakhs at Rs. 2.50 crores. The amount accepted was, however, equal to that invited, namely, Rs. 2 crores. The average rate of accepted tenders was higher at Rs. 2.360 per cent per annum, as against Rs. 2.355 per cent in the past five weeks. But the Intermediate Treasury Bills, which were on tap from 30th January to the 2nd inst., evoked poor response, the bills actually sold amounting to no more than Rs. 17.25 lakhs, as against Rs. 19.25 lakhs a week before and Rs. 35 lakhs two weeks before.

India's foreign assets fell again by Rs. 29 lakhs to Rs. 95.17 crores during the week ended 1st February 1963. The fall was accounted for entirely by balances held abroad which declined from Rs. 7.38 crores to Rs. 7.09 crores, while foreign securities held in the Issue Department continued unchanged at Rs. 88.08 crores. Loans and advances to scheduled banks spurted by Rs. 12.53 crores to Rs. 36.20 crores, of which those against usance bills alone aggregated Rs. 23.68 crores, a rise of Rs. 8.24 crores. Notes in circulation showed a modest increase of Rs. 1.83 crore to Rs. 2,166.68 crores.

The total scheduled bank credit went up by Rs. 7.67 crores to Rs. 1,470.55 crores during the week ended 25th January 1963. Deposits and inter-bank borrowings also improved, the former by Rs. 5.73 crores to Rs. 2,183.80 crores and the latter by Rs. 4.26 crores to Rs. 44.45 crores. Investments, too, advanced by Rs. 7.63 crores to Rs. 649.83 crores.

The Gilt-edged market continued to rule dull. Business put through was restricted, with values moving narrowly.

The Reserve Bank of India has announced that the following loans, the interest of which falls due for payment during February and March 1963, will be accepted by the Public Debt Office for payment of interest from the dates mentioned thereagainst:

Central Government Loans

3½ per cent Loan 1968: On and after 8th February.

3 per cent Conversion Loan 1946 and 2½ per cent Loan 1976: On and after 16th February.

State Government Loans

3 per cent Madhya Pradesh 1964, 4 per cent 1967, 1968, 1969 and 1971 loans, 4 per cent Bombay State Development Loan 1970, and 4½ per cent State Government Loans 1972: On and after 8th February.

3 per cent Uttar Pradesh 1961-66 and 4½ per cent Bombay-Mysore 1969: On and after 16th February.

The holders of these loans are advised to lodge their securities well in advance of the due dates to facilitate delivery of the securities and interest warrants on the due dates. In view of the heavy work involved, the period for delivering all securities tendered for payment of interest on or after the due dates will be extended to four clear working days during the busy season, lasting upto the end of April 1963.

The rupee in the foreign exchange market firmed up a little *vis-a-vis* the dollar, the banks' selling rate for ready T.T. dollars being Rs. 477.25 per $100, as against Rs. 477.50 a week before. Their buying rate (T.T.), however, was unchanged at Rs. 474. On the New York Exchange, the £ sterling strengthened in terms of the dollar, the spot rate rising from 280.350-280.380 cents to 280.430-280.460 cents and the rate for three months' forward from 279.890-279.920 cents to 279.910-279.940 cents.

* * * *

The total contributions brought into the Central account of the National Defence Fund at New Delhi upto the close of business on 2nd February 1963 amounted to Rs. 37.72 crores, including Rs. 25 lakhs received from the United Kingdom and Rs. 38 lakhs from other countries. In addition, contributions in gold and gold ornaments amounted to 1,385.198 grammes, approximately equal to 118.799 tolas.

GOOD ACTIVITY IN GOLD

(From Our Own Correspondent)

BOMBAY, *6th February*

With the proximity of the closure of Gold Bonds (the last date is the 11th inst.), there was considerable activity in the so-called unofficial trading in gold this week. Prices moved both ways and were a shade higher over the week. Silver, on the other hand, displayed a quietly steady tone.

It was difficult to estimate business in gold. However, according to trade circles, gold worth Rs. 75 lakhs had changed hands in the past fortnight or so, the buyers having exchanged it for Gold Bonds. Unofficial reports from New Delhi placed the total subscription to the Bonds at Rs. 2.5 crores; the last official estimate had put the figure at Rs. 1.09 crore, or 2,003,700 grammes, upto 18th January 1963. On the basis of unofficial reports, the second half of January must have witnessed an increase of Rs. 1.41 crore in value or 2,591,942 grammes in quantity in subscriptions. The subscriptions were said to have increased further during the week under review. This is indicated by the steady rise in the price of gold from Rs. 95-97 per 10 grammes on Thursday 31st January to Rs. 102-104 on Saturday the 2nd inst. After receding to Rs. 99 on the 4th inst., it moved up again to Rs. 101 today, as against Rs. 98 a week ago. The Government was reported to be considering extension of time limit for subscribing to Gold Bonds. Sovereign moved between Rs. 71 and Rs. 73; it was quoted at the higher level today.

Although the average daily arrivals of silver dropped to 16 bars this week from 70 bars last week and offtake was maintained at 10 bars, spot silver ruled quiet throughout the week. According to the Bombay Bullion Association, the price moved between Rs. 226 and Rs. 225 (the lowest level having been recorded only once on Monday the 4th inst.) and closed 50 nP lower than the last week's level of Rs. 226.50. The undertone, however, continued to be firm.

New York silver was stationary at 125.6 cents, though turnover was at times placed nearer 400,000 ounces. In London, spot silver improved slightly during the week from 107½*d.* to 107⅝*d.* and forward quotation edged forward from 107⅞*d.* to 108*d.* Ready gold eased to 250s. 11*d.*, after having been done at 250s. 2½*d.*, but was ¼*d.* higher over the week. The dollar price of gold moved up a little further to 35.07⅛ from 35.06⅞ a week ago.

The following table shows the trend of prices during the week under review:

	6-2-63 (closing)	High	Low	30-1-63 (closing)
	Rs.	Rs.	Rs.	Rs.
SILVER				
Ready (.996 fine) ..	226.00	226.00	225.00	226.50
London—				
Gold	250s. 11½d.	250s. 2½d.	250s. 11¼d.	250s. 1d.
Silver Ready	107¾*d.*	107¼*d.*	107¼*d*	107⅛*d.*
Silver Forward ..	108*d.*	108*d.*	107⅞*d.*	107⅛*d.*
New York—				
Silver	125.6 cents	—	—	125.6 cents

N.B.—The quotation for gold is per 10 grams (about 0.85 tola) and that for silver is per kilogram (85.7 tolas). London and New York quotations are per ounce.

An important development of the week was the decision of jewellers in Bombay to form a new association in order to make proper representation to authorities on problems arising from the promulgation of the Gold Control Rules. The new body is to be called the Bombay Jewellers' Association. According to Mr. B. S. Mahajan, Chairman of the *ad hoc* committee of the proposed Association, Jewellers have been seriously affected by two decisions of the Gold Control Board, namely, (i) to impose ban on fulfilling orders booked before the Rules came into force, and (ii) to prohibit sale of unsold stocks after 9th February 1963. The second decision, in particular, will lead to heavy losses to the trade. Mr. Mahajan feels that, since people will not go for converting their superior quality ornaments into 14 carat ones, there will be an acute shortage of gold in the market, hoarding will increase and prices will eventually rise.

There were renewed reports of jewellers and goldsmiths having been hit by the promulgation of the Gold Control Rules. In particular, they made three demands: (i) the time limit for disposing of unsold stocks of superior quality ornaments be extended beyond 9th February; (ii) the restriction on gold content in ornaments be raised from 14 carats to about 18 carats, and (iii) the affected goldsmiths be given by the authorities alternative employment.

From the discussions held by the Gold Control Board with the trade first at Calcutta and later at New Delhi during the week, it, however, appeared that no extension of the time limit for selling ornaments was to be granted to jewellers. It was reported that the Board would permit the goldsmiths and jewellers to return gold in excess of the quantity used in making ornaments to such of their customers as had placed orders with them to make ornaments before the Rules were announced. Mr. G. B. Kotak, Chairman of the Board, was reported to have said at New Delhi on the 4th inst. that the Board was considering the desirability of stamping 14 carat gold so that it could be distinguished from gold of other fineness. For the present, however, the licensed refineries would continue to supply 14 carat gold for the manufacture of jewellery.

TRADING IN JARILLA MAY STARTS

(From Our Own Correspondent)

BOMBAY, *6th February*

The most important development of the week in the cotton futures market was the commencement of trading in Jarilla May 1963 contract on Saturday, the 2nd inst., under the same terms and conditions as are applicable to the March contract. As expected, the contract opened Rs. 11.75 per three quintals higher than the March contract at Rs. 684.25, and, after improving fractionally to Rs. 685, receded at close to Rs. 682.25. The contract recovered in subsequent sessions and was quoted at Rs. 686 yesterday but closed lower at Rs. 685 today. The Jarilla March contract attracted good support and rallied. The support was prompted by the expectation of low tenders against the contract and better advices from the spot market. It rallied from last week's closing rate of Rs. 668 to Rs. 679.50, yesterday. The contract, however, receded today and wound up the session at Rs. 677, showing a net gain of Rs. 9 over the week.

The prospects for the new contract are regarded as generally good. With the recent relaxation of controls on cotton and a more favourable situation in respect of cotton supplies, the contract can be expected to have an uninterrupted career. Mills are also now in a position to resort to hedging on a wider scale, thanks to the lifting of the limitation on cotton stocks held by them and the improvement in the demand for cloth. The pace of new crop arrival will largely determine the trend of prices of the contract in the coming weeks.

In the spot market at Sewri, mill demand widened, following the improvement in the piece-goods market. Several mills bought substantial quantities of popular varieties such as L.147, Co2, Vijay and Digvijay. Prices consequently hardened. Fairly good export enquiries were reported for Bengal *Deshi*. But in view of the absence of a quota, business could not be put through except on a subject-to-licence basis. Shippers are awaiting a fresh quota for Bengal *Deshi*.

There was good spinner interest in American cotton early in the week. But demand dried up later, following the rise in price induced by reports of damage to the crop in the U.S. and reduced offers by shippers. Stray deals were put through in Sudan cotton and East African B.P.52.

The following are the latest available quotations—in rupees per candy of 784 lbs.—from the spot market at Sewri: Khangaon 1,000; L.147 1,150; Co2 1,580-1,590; American on sample 1,305; Elpaso 1,450.

Cotton futures in the Karachi market drifted lower during the week. Reduced domestic mill demand and slow export interest discouraged fresh support. Decline in ready prices, following increased arrival of new crop, also imparted weakness to the market. The N.T.R.G. March contract eased from the last week's closing rate of Rs. 71.80 to Rs. 69.75. The May contract declined by Re. 1.55 to Rs. 71.75.

Quietly steady conditions prevailed in the Liverpool cotton futures market during the week. In view of the continuing uncertainties about U.S. cotton policy, operators were not prepared to enter into fresh commitments. Buyers were unwilling to advance previous offers while sellers remained reserved. The following are the latest available quotations—in pence per lb. from Liverpool, the figures in brackets being last week-end closings: March 24.05 (24.05); May 24.00 (24.00); March 29 (29.25).

Cotton futures in New York ruled easy during the week. The move for new legislation favouring a one-price system for cotton and the prospects for a reduction in domestic mill consumption of cotton induced selling. Prices consequently receded. Spot cotton, however, continued to rule firm.

The following are the latest available quotations—in cents per lb.—from New York as compared with those a week and a fortnight ago.

(In cents per pound)

	5-2-63	28-1-63	22-1-63
March	34.56	34.60	34.67
May	34.70	34.71	34.70
July	33.86	33.98	33.78
New York Spot ..	35.25	35.20	35.10

ART SILK YARNS RALLY

(From Our Own Correspondent)

BOMBAY, *6th February*

There was a smart rally in art silk yarns this week, following revival of buying support and absence of selling pressure from stockists. In sympathy, staple fibre yarns were a shade better. Cotton yarns were well maintained at last levels.

Improvement in art silk yarns was all-round. 150D National Rayon spurted from Rs. 10.71 to Rs. 11.22 a kilo. 120D S.I. Viscose gained 20 nP to Rs. 12.85 and the 100D bright Century appreciated by 20 nP to Rs. 15.05. Among 2 x 40 staple fibre yarns, Century closed 7 nP higher at Rs. 7.15 and Kohinoor were a shade better at Rs. 8.12, as against Rs. 8.10 a week ago. But City slipped back by 4 nP to Rs. 7.70. Cotton yarns had hardly any feature.

The Tamilnad Millowners' Association has urged the Government of India to grant an increase of 15 per cent in the ceiling levels for 20 and 40 counts cotton yarns, in view of the rise in cotton prices. In a memorandum, the Association has pointed out that the continuation of current ceiling prices will force the mills to ignore them and sell goods at the ruling prices in the market.

The Central Board of Revenue has decided that a tolerance of one per cent may be allowed in length of cotton yarn cleared in hanks. The concession upholds the trade's contention that it is not practicable to ensure a standard length in each hank on account of error in reeling.

The following table gives the prices of rayon staple fibre and cotton yarns, today, as compared with those prevailing a week ago:

	6-2-1963	30-1-1963
	Rs.	Rs.
Art silk yarn (per kg.)—		
National Rayon 120D	12.10	11.68
Century 75D	17.80	17.40
S. I. Viscose 150D	11.26	10.80
Staple fibre yarn (40 x 2)—		
Kohinoor (per kg.)	8.12	8.10
Century	7.15	7.08
Cotton yarn (per bundle of 10 lbs.)		
10s Podar	17.50	17.50
20s Edward	21.75	24.50
26s Nandi	26.00	26.00
40s Hind	35.00	35.00
60s Finlay	67.25	67.25

Note.—Quotations for 120 and 150 Japan and Italy are not available, since there has been no trading in view of paucity of stocks.

OILSEEDS DECLINE

(From Our Own Correspondent)

BOMBAY, *6th February*

Trading in new contracts (July deliveries) in groundnut, groundnut oil and cottonseed is scheduled to commence tomorrow (Thursday the 7th inst.). The Forward Markets Commission is reported to have endorsed the suggestion of the Oilseeds Exchange to maintain the existing terms and conditions for trading without any alterations. It may be noted here that the January contracts in groundnuts and cottonseeds went off the board at the close of the month.

The oilseeds market which ruled firm last week turned depressed during the week under review, thanks to absence of follow-up support. Operators were hesitant to enter into fresh commitments, as they were awaiting a clear picture of the Chinese motive in refusing to accept the Colombo proposals without reservations. There were also the usual budget uncertainties. Groundnuts suffered a marked setback. Prices would have gone down still further but for some improvement in export business in H.P.S. groundnuts, groundnut oil and extractions. Castorseeds were subjected to persistent liquidation which brought down values. Linseeds and cottonseeds drifted lower in sympathy.

Groundnut April 1963 contract gave way from Rs. 212.37 to Rs. 204.87 on Monday, but staged a partial recovery to Rs. 207.87 towards the close. Nizam bold fell by Rs. 2 to Rs. 40; it was lower still at Rs. 39.50 earlier in the week. Khandesh quality eased by Re. 1.75 to Rs. 40.71. Oil ex-mill quality eased by Re. 1.75 to Rs. 40.71. Oil ex-mill dropped 65 nP to Rs. 16.55. Oil railway receipts receded by 50 nP to Rs. 16.40.

Castorseed June 1963 contract was marked down by Rs. 3.25 to Rs. 159. March 1963 contract fell by Rs. 2 to Rs. 157.75. Madras small was lower by 73 nP at Rs. 32.12. Oil B.S.S. shed 10 nP to Rs. 13.70. Oil commercial was dull at Rs. 12.85. Linseed June 1963 contract suffered a loss of Re. 1 88 nP to Rs. 32.37. Bold ready fell from Rs. 33.25 to Rs. 32.50, before closing at Rs. 32.62. Linseed oil softened by 45 nP to Rs. 13.25.

Cottonseed April 1963 contract dropped a rupee to Rs. 89.50. White too declined by a like amount to Rs. 18.75. Both non-white and berar shed 50 nP to Rs. 18.50.

The following table shows the closing prices of oilseeds and oils on Wednesday 6th February, as compared with those of two previous weeks:

	6-2-1963	30-1-1963	23-1-1963
	Rs.	Rs.	Rs.
Groundnuts			
April 1963 contract	207.87	212.37	206.87
Nizam bold	40.00	42.00	39.50
Khandesh quality	40.75	42.50	40.37
Oil ex-mill†	16.55	17.20	16.40
Oil commercial*	16.40	16.90	16.35
Castorseed			
March 1963 contract	157.75	159.75	159.25
June 1963 contract	159.00	162.25	161.50
Ready Madras	32.12	32.75	32.12
Ready Kanpur	30.62	31.50	30.37
Oil B.S.S.†	13.70	13.80	13.70
Oil commercial†	12.85	12.85	12.75
Linseed			
March 1963 contract	32.37	33.25	33.69
June 1963 contract	32.62	34.50	33.50
Bold ready	32.62	33.25	13.60
Linseed oil†	13.25	13.70	
Cottonseed			
April 1963 contract	89.50	90.50	90.00

* Rates include excise duty but exclude sales tax.
† Rates exclude both excise duty and sales tax.
N.B.—All quotations for futures contracts are per 250 kilograms, except linseeds for which rates are per 50 kilograms. Spot quotations of seeds are per 50 kilograms and oil per 10 kilograms.

PEPPER RISES

(Messrs. Parekh and Co.)

BOMBAY, *6th February*

Following the improvement at Singapore resulting from the news of political tension in North Borneo and Singapore and also of heavy rain and flood in Sarawak, Malabar black pepper (ungarbled) during the week improved from Rs. 246 to Rs. 252 and garbled rallied from Rs. 253 to Rs. 260. February delivery staged a recovery from Rs. 260 to Rs. 270 under pressure of short-covering and fresh buying. In Singapore, Lampong black edged higher to $105 from the recent low at $92½. Black pepper at Singapore is reported to have improved in sympathy with white which hardened to $162½, in sympathy with white which hardened to $162½, owing to reserved attitude of sellers and small arrivals from Sarawak.

Spot at New York improved from $0.32 to $0.35, with broadening of inquiries from the erstwhile inactive grinders who were excited to action by the news of political uncertainty in North Borneo, Singapore, Middle East, Berlin and Cuba.

The future of pepper depends upon the attitude of sellers in Singapore, Sarawak and Indonesia, as Malabar, left to itself, will not fail to raise its price immediately on the development of inquiries. India is at present in the midst of her harvesting season. As such present prices cannot be maintained unless continuous fair-size buying springs up either from the U.S.A. or Russia and East European countries to absorb at least half of the quantity of the expanding arrivals. Inland demand is political uncertainty and tightness in the money market. Recent bilateral agreements with Russia and other East European countries will in all probability encourage larger export of pepper and other spices to these countries during the year. Ready ungarbled pepper in the local market improved to Rs. 139 in sympathy with the coast markets. The important event of the month is the opening of the forwarding trading ring in ungarbled pepper at Bombay as from the 7th inst. Hedging facilities at Bombay are likely to make pepper more healthy, as the business on the exchange elsewhere has proved disappointingly poor and restricted.

METALS STEADY

(From Our Own Correspondent)

BOMBAY, *6th February*

Non-ferrous metals ruled generally firm during the week under review on sustained support in the face of tight supply position. There were good enquiries for zinc and lead and their values improved, albeit at a slower pace than last week. Tin spurted initially on lack of offerings, but sagged subsequently on reports that the State Trading Corporation had secured licences for the import of tin.

In the Bombay market, zinc put on Rs. 2 to Rs. 252 per 100 kg. Lead rose by a like amount to Rs. 166. Copper electrolytic wire bars were maintained at Rs. 365 and ingots at Rs. 320 per 50 kg. But copper electrolytic coils receded by Rs. 2 to Rs. 370. Tin rose from Rs. 303 to Rs. 305 per 10 kgs., before closing at the last week's level.

On the London Metal Exchange, non-ferrous metals staged a recovery, following the suspension of U.K.-E.E.C. negotiations over Britain's entry into the Common Market. Operators were relieved to note that the uncertainty over Britain's entry was ended at least for the time being. There was good offtake of tin and its prices were distinctly higher as compared with last week. Prices would have gone up still further, but for the delay in the announcement of U.S. policy regarding the disposal of surplus stocks. According to the latest Strauss Market Review, the delay reflected a disagreement between the U.S. administration and consuming interests. The State Department is anxious to protect world tin prices in order to retain the goodwill of such producers as Malaya, Indonesia and Bolivia. Powerful tin consuming industries in the U.S., however, are pressing the Government to evolve the policy in such a way as to bring down prices.

In the London market, spot tin rose by £4 to £855¾ per ton. Tin three months contract put on £2½ to £857. Spot zinc improved from £67-9/16 to £69¼ and three months contract from £68-1/16 to £69¾. Spot copper was maintained at the producers' price support level of £234¼ and three months metal at £233⅝.

FAIR DEMAND FOR TEA

[*Messrs. Forbes, Ewart and Figgis (Private) Ltd.*]

COCHIN, *31st January*

A total of 618,000 kgs. was offered in sale No. 5 held on the 29th inst. Quality in general was about maintained, but there were a few Nilgiri invoices which showed a decline. The market met with fair demand. There was fair support for low mediums and mediums, but these were irregularly lower by 20 nP to 25 nP with fanning under this category meeting less support than brokens. The best good mediums were firm, but others were in less demand and registered declines by up to 20 nP. Nilgiris were irregular and generally sold at lower rates with the exception of a few selected best quality teas which sold well. There was useful enquiry for clean black leaf descriptions, but these also inclined a little easier and so did while leaf grades. Unorthodox descriptions met with keen competition at fully firm rates and in some cases were dearer.

The quotations (per kg.) were:

	1963	1962
	Rs.	Rs.
Low mediums	4.25-4.65	3.85-4.05
Mediums	4.70-5.00	4.10-4.65
Good mediums	5.10-5.80	4.85-5.70
Nilgiri B.O.P.	5.75-9.90	5.75-10.60

The average price realised in sale No. 5 was Rs. 5.10 per kilo as compared with Rs. 5.28 a week ago and Rs. 5.11 in the corresponding sale last year.

In Dust sale No. 5 held today, 262,000 kgs. were offered. The market opened to a good general demand which continued throughout the sale. There was useful support for medium categories which sold at around last rates. Milled and stalky kinds continued in strong demand and registered advances. Highgrowns sold readily, but these were sometimes easier. There was good support for unorthodox descriptions which were fully firm. Clean black grainy descriptions were steady.

The average price realised in dust sale No. 5 was Rs. 4.23 per kilo as against Rs. 4.15 a week ago and Rs. 4.16 in the corresponding sale last year.

Colombo: There was fair general demand. Best dimbulas were dearer, but below best met with irregular support. Mediums and lowgrowns were well competed for at firm to dearer rates. Fannings in general were strong except light liquoring kinds.

London: *North Indian and other growths*: In Monday's sale, the market, after opening somewhat quietly, strengthened and prices were fully firm on last week's rates with the lowest descriptions receiving better support.

Ceylon and South Indians: 28,005 packages were offered in Tuesday's sale of which 8,964 packages were from South India. Brighter liquoring Ceylons were slightly dearer but lowgrowns were easier by 1d. to 2d. South Indians met with useful support at firm rates with the lower kinds tending dearer.

CLEAN TEA FANNINGS IMPROVE

(From Our Own Correspondent)

CALCUTTA, *5th February*

A marked improvement in the prices of clean fannings was the feature of leaf tea export sale No. 33 held here yesterday, when the 60,150 chests on offer evoked good support from buyers. Better liquoring kinds, particularly fannings with brighter liquors, from all districts were fancied even at improved levels, but B.O.Ps tended to ease. Plain orthodox descriptions had good inquiries. Medium C.T.C. brokens attracted ready demand and the best liquoring sorts, especially those showing a seasonal improvement in quality, hardened. Fibrous types were exceptionally inactive and irregularly easier. Legg cuts, although irregular, were generally dearer. Whole leaf grades were sold well at higher levels and so did tippy teas. Offers of the Darjeeling types were limited and easy to sell.

Quotations in rupees, including excise duty, per kilo were: Clean plain pekoe 4.90 to 5.10; plain B.P. 4 to 4.30, plain fannings 3.90 to 4.40, medium Assam C.T.C. B.P. 5.70 to 6.10; medium Assam C.T.C. 5.40 to 5.60; best Assam C.T.C. B.P. 6.20 to 6.40; best Assam C.T.C. fannings 6 to 6.30.

Internal demand at dust sale No. 32 held on Friday the 1st inst. was lower. Prices eased. Offerings aggregated 30,306 packages. While good C.T.C. teas evoked support at last levels, medium C.T.C. attracted demand only at a discount of 20 nP and the fibrous descriptions were neglected even at lower levels. Although easier at start, plain orthodox teas picked up towards the close on improved demand. But the medium orthodox types, with the exception of brighter lines, could be sold only at lower levels. Legg cut teas found buyers at 15 nP lower than last levels.

Quotations in rupees, including excise duty, per kg. were: Plain orthodox dust 3.90 to 4.15; medium Assam dust 4.20 to 5; legg cut dust 5 to 5.40; medium Assam C.T.C 5.50 to 6; good Assam C.T.C. 6.60 to 6.90.

Prices at last week's Mincing Lane sale were maintained, with plain teas fetching a penny more at 2-11 to 3-7 per lb. At 75,000 packages, the quantity offered was almost the same as in the previous two weeks. Demand was generally good. North Indian and other miscellaneous types were unchanged, with the exception of the lowest priced sorts turning a shade dearer and the less attractive liquoring teas becoming easier towards the close. Bright orthodox African teas were higher. The South Indian stuff was sold well, with the low kinds turning a little upwards in price. B.O.P. fannings from Ceylon were well supported and brighter liquoring types tended to be dearer, whereas low growns and plainer medium sorts shed a half to one penny at times.

SPURT IN JUTE GOODS AND FIBRE

(From Our Own Correspondent)

CALCUTTA, *5th February*

There was a rise in the prices of both jute goods and fibre during the week under review. The rise in jute goods followed good buying support induced by export business covering about 10,000 bales of AT twills and hessian cess (green) with Indonesia and the reported receipt of a Government of India tender for 14,000 bales of B twills. Some business with the U.S was also said to have been done. There were, besides, rumours regarding a possible upward revision in excise duty on jute goods, first levied in the 1962-63 budget. B. twills February delivery spurted by Re. 1.30 to Rs. 113.95 per 100 bags. Hessian (40" x 10 oz.) gathered 8 nP to Rs. 50.30. Ready B. twills advanced from Rs. 112.40 to Rs. 114.60. Hessian was fully maintained at Rs. 51.25.

Operators noted reports in the Press that the Union Government would soon introduce a self-financing, deferred payment scheme for speeding up the installation of more broad looms for the manufacture of carpet backing wide hessian. The scheme, which is estimated to cost Rs. 2 crores, is intended to cover the import of broad looms and ancillary spinning and preparatory machines required to match the indigenously manufactured broad looms. The financial and other related aspects of the scheme are being examined in consultation with the I.J.M.A. It is expected to take a couple of months to arrive at a fool-proof arrangement, though it is felt that the scheme will go through in view of the urgency of having more broad looms to cope with the rising American demand for carpet backing. It is understood that many mills are keen on taking advantage of the self-financing scheme, under which the period of deferred payment is proposed to be spread over two or three years.

The firmness of raw jute was engendered by steady buying by mills and the State Trading Corporation reduced arrivals and bullish advices from Pakistan markets. Traders felt that the upward trend of prices in Pakistan would check smuggling of raw jute into the Indian side. The expectation that the sowing of crop in the next season would be less by 30 to 40 per cent also imparted strength to raw jute. Since arrivals and demand position in Cossipore were all balanced, the floating stocks remained unchanged at 430,000 maunds (and not bales as was mentioned in the last week's report). Over the week, Assam bottoms at Cossipore improved by Re. 1 to Rs. 27.50 per maund. The Jungli mesta moved up from Rs. 22 to Rs. 23.50. In the contracts raw jute market, some quantity of Assam bottoms changed hands at Rs. 28.50 per maund for February-March shipment. Some business was done even at Rs. 30 on Friday the 1st inst. In the local market, Assam bottoms (February-March shipment) were quoted at Rs. 30, Northern bottoms at Rs. 29.50 and *Daisee* bottoms at Rs. 33.

The Government of India has advanced Rs. 1.55 crore to Bihar, West Bengal, Assam, Orissa and Tripura for the jute price support policy. Disclosing this, Dr. Ram Subhag Singh, Union Minister of State for Agriculture, stated at Patna the other day that the State Governments had been asked immediately to enter the market to purchase raw jute if its price fell from Rs. 30 per maund fixed for Assam bottoms in the Calcutta market. It would be good, he added, if the State Governments were to make purchases through co-operative societies.

FOODGRAINS LOOK UP

(From Our Own Correspondent)

HAPUR, 4th February

Foodgrain prices here recorded small improvement this week owing to *uncertain rabi* crop prospects because of inadequate winter rains.

Wheat prices advanced by 67 to 99 nP per quintal according to quality, with the farm quality quoted at Rs. 42.87 to Rs. 44 and the average quality at Rs. 40.19. Arrivals were negligible, while demand was good. Stocks, therefore, declined to 60,000 maunds. Rice ruled steady on better demand in the face of poor arrivals. The Mainpuri and *gadda* qualities improved by 67 nP per quintal. Stocks were poor around 20,000 maunds. Week-end prices were:—Rice *basmati superior* Rs. 80.38 to Rs. 91.09, *sela basmati* Rs. 75.02 to Rs. 80.38, *mainpuri* Rs. 50.91, *ramajwayan* Rs. 50.94, *raimunia* Rs. 61.62 and *gadda* Rs. 49.57, a quintal.

Demand for grams was good, while stocks were poor. Prices consequently improved a little, with the Punjab quality quoted at Rs. 41.53 and the local produce at Rs. 41.19 per quintal. Maize, on the other hand, continued depressed and lost 67 nP to Re. 1.34 per quintal on heavy arrivals at Rs. 25.46 to Rs. 28.80 according to quality. Arrivals were around 500 to 700 maunds a day, and local stocks increased to about 20,000 maunds. *Guwar* prices were almost stationary, while *juwar* sought lower levels. Barley also declined on poor buying support. *Bejhar* ruled quiet. *Bajra* ruled steady in the face of poor arrivals. Other coarse grains were listless. Week-end prices were:—*Juwar* Rs. 31.48, *guwar* Rs. 29.47 to Rs. 31.48, barley Rs. 23.78, *bejhar* Rs. 24.11, *bajra* Rs. 33.49 to Rs. 34.83, *methi* Rs. 58.94 and oats Rs. 34.83, per quintal.

In pulses, peas prices advanced by 67 nP per quintal at Rs. 28.13 for the *dara* quality and Rs. 30.81 for the farm produce. Peas *dal* was quoted at Rs. 33.49 a quintal. Demand was reported better. Stocks declined to 28,000 maunds. *Arhar* prices were almost stationary at Rs. 48.23 to Rs. 49.57 a quintal. *Urd* eased on better arrivals and was quoted between Rs. 58.94 and Rs. 66.98 per quintal. *Moong* prices also sought lower levels in sympathy with *urd*. Other *dals* were almost unchanged. Week-end prices per quintal were: *Arhar dal* Rs. 69.66, *urd dal* Rs. 72.34, *moong* Rs. 45.55 to Rs. 48.23, *moong dal* Rs. 61.62, *masoor* Rs. 50.91 to Rs. 53.58, *masoor dal* Rs. 58.94, gram *dal* Rs. 48.23 and moth *dal* Rs. 48.23 a quintal.

SUGAR RULES FIRM

(From Our Own Correspondent)

HAPUR, 4th February

Sugar prices here continued to rule firm this week on brisk buying support. Sentiment was mainly influenced by the likely shortfall of 2 lakh tons in the current season's sugar output at 25 lakh tons and fears of additional excise duty on sugar in the 1963-64 budget. To check this rising trend in prices, a special release of 20,000 tons was made by the Government to factories in Maharashtra, and this acted as a slightly depressing factor in the week-end when, after having gained from 75 nP to Rs. 2.25 per quintal early in the week, prices reacted by 67 nP. Despite increase in the cane purchasing price by 12 nP per maund by factories in this side, the supply position has not improved. Supplies have met only 66 per cent of the requirements which is disappointing, as the crushing season is likely to terminate in mid-February in some factories. Reports from Bihar also indicate that the crushing season there will not last longer than the end of the current month. Week-end prices here were:—Spot delivery Rs. 110.25, mill delivery (D29) Amroha Rs. 107.84, Seohara Rs. 107.84, Meerut Rs. 109, new Rs. 110.75 and (E29) Sinbhauli Rs. 110.50, per quintal.

A quietly steady trend was witnessed in sugar prices in the Muzaffarnagar market. The additional quota for Maharashtra acted as a sobering influence. Cane supplies to factories were far from satisfactory. Week-end prices were:—(A29) Iqbalpur Rs. 112.50, Mansurpur Rs. 111.50, A29 Rohana Rs. 110 Lhaksar Rs. 110.50, Mansurpur Rs. 110.50, A28 Khatauli Rs. 110.25, Iqbalpur Rs. 110, B29 Deoband Rs. 110.50, Saharanpur Rs. 108 Rohana Rs. 109 B29 Bijnore Rs. 107 Seohara Rs. 107.17 New produce Ramlaxman Rs. 109.75 and Meerut D30 Rs. 110.75.

Khandsari prices ruled firm earlier in the week on brisk demand from Punjab, Gujarat, Rajasthan and local stockists, but reacted in the week-end due to fall in demand at higher levels. Wet *khandsari* was now quoted at Rs. 85.74 to Rs. 93.77 and the dry superior at Rs. 96.45 to Rs. 102.48. *Khandsari* manufacturers were also facing shortage of cane and had to pay as much as Rs. 5 per quintal (Rs. 1.87 per maund) for it.

Gur prices were easy later in the week as loading was restricted to all destinations except Calcutta. Offtake in the past three days was 18 wagonloads to Assam. Daily arrivals were small at an average of 2,000 maunds part of which were being lifted by stockists to supplement the limited local stock around 15,000 maunds, though pansera *gur* stocks in the mofussil markets were large at about 2.5 lakh maunds. Total *gur* arrivals so far at Hapur during the current season were about 3.15 lakh maunds, as against 3.7 lakh maunds last season and slightly over 4 lakh maunds in 1960. *Gur* prices also sagged in Gulaothi and Siana markets where daily arrivals were small at an average of 1,000 maunds only. Week-end prices of *gur* here were:—Superior Rs. 52.90, average Rs. 51.58, dara Rs. 50.91 balty Rs. 50.91 to Rs. 52.90 and shakker Rs. 61.62, per quintal.

Following withdrawal of loading facilities *gur* prices reacted in the Muzaffarnagar market to the extent of 25 nP to 75 nP per 40 kilograms. Demand from the South was good and stockists made purchases on expectations of early improvement in loading facilities. *Gur* Chaku was quoted at Rs. 21.50 to Rs. 21.75 per 40 kilograms. Pansera continued to attract Punjab and Rajasthan support at Rs. 21 to Rs. 21.50 per 40 kilograms.

GOAT SKINS STEADIER

(From Our Own Correspondent)

MADRAS, 4th February

Arrivals of E.I. tanned cow hides here this week were moderate and clearance was slow. Inland demand for the lowest grade kips was small and so were inquiries, for shipment. Overseas buyers were not prepared to book orders at sellers limits, except for the lower selections of medium weight cow hides.

Demand for cowcalf was poor, but for buffcalf it was good. Importers in the U.K. and the U.S.A. did not show much interest in top class marks in buffcalf and were satisfied with secondary marks only.

The market for tanned goat skins was steady. Demand centered round light weights and 11/12 lbs. at firmer levels. Tanners were putting up the prices following several sales of pickled goat skins to East European countries at good prices. Inquiries for heavier average weights were poor. Demand for prime class sheep skins was in evidence and a few sales were put through. There was a moderate call for other tannages also, and the tone was steadier.

In the London tanned skins public sales held last week, good parcels realised current c.i.f. prices. The following were the ruling prices per lb. for all-round parcels in the local market:—

Tanned cow hides 8/8½ lbs. average Rs. 2.20 to 2.25, tanned cowcalf 1½/2 lbs. average Rs. 3.75 to 4, tanned buff hides 12/14 lbs. average Re. 1.70 to 1.75 and tanned buffcalf 1½/2 lbs. average Rs. 3.50 to 3.60.

FOREIGN EXCHANGE OPERATIONS OF U.S. GOVERNMENT

(Concluded from page 236)

more to buy a German mark for delivery in 90 days than to buy one for immediate delivery. This extra cost represented a premium on the forward mark—or, conversely, a discount on the forward dollar—equivalent to annual interest at a rate of more than 3½ per cent.

A spread of those proportions advertised the weakness of the dollar and thus gave speculation a further impetus. It also made hedging extremely expensive. The European selling dollars forward was getting a very poor rate for them, while the non-European buying Continental currencies forward was paying dearly. In response, European holders of dollar receivables due in the future soon began to seek protection, not by buying forward marks or francs, but rather by borrowing dollars and then selling them spot for their own currencies. Non-Europeans, including Americans, began to buy Continental currencies spot in anticipation of their future needs.

This switch in defensive methods transferred some of the dollar selling from the forward market to the spot, where it met supportive buying by the foreign central banks under terms of their I.M.F. and other commitments. But the support was not without a price to the U.S. As they gathered in the dollars streaming onto the spot market, the European central banks were accumulating potential claims on U.S. gold. Sooner or later, national policy as to the composition of reserve holdings would compel them to present some of those claims to the U.S. Treasury for settlement in gold. It was against this disturbing prospect that American authorities began to fashion a programme of intervention in foreign exchange markets.

If the U.S. had possessed substantial quantities of Continental currencies at the time, it could have sold them in the spot market to absorb the dollars that private parties were unloading. This would have been the same kind of support procedure followed by other nations in defence of their currencies under the Bretton Woods *agreements*. This technique was not available to the U.S., however, since virtually all of its international reserves were in the form of gold, supplemented by only very small amounts of foreign currencies. The U.S. had to make its main thrust in forward markets, where it could operate—at least for a while—without any actual inventory of Continental currencies.

Besides being the more available approach, action in the forward markets also had the virtue of going to the place where the trouble was concentrated. Furthermore, the U.S. authorities could be reasonably confident that their actions in forward markets would have effect in spot markets as well. The two are linked not only by the shuttling of hedgers from one to the other but also by the tendency of commercial banks to even out their foreign exchange positions through compensating transactions in one or the other of the two markets.

The first operation undertaken by the United States was in the market for forward German marks. This campaign—and the partly concurrent, partly subsequent programme carried on in forward Swiss francs—have taken on something of the character of "classic" cases, establishing patterns likely to recur. With the further unfolding in recent months of the official record of the transactions, it is possible to construct a play-by-play insight into the process of intervention.

Right on the Mark

In the German situation, the shift of commercial hedging from forward to spot markets, causing the Bundesbank to amass dollars, was the most urgent problem. Hence the U.S. objective was to provide an ample supply of forward marks on terms that would draw hedgers back to the forward market to secure their cover, thereby checking the heavy flow of dollars to the Bundesbank and the threat of conversions into gold. The accompanying reduction in the discount on the forward dollar would have the added benefit of allaying fears of a further change in the official dollar-mark parity.

Accordingly, the U.S. authorities began on 13th March to sell substantial quantities of marks for future delivery. Before the month was over, forward sale contracts totalling more than 450 million marks were outstanding. By mid-June, at the peak of the operation, the total was well in excess of one billion marks. Under the influence of these offerings, the premium on the forward mark, which had gone above 3½ per cent, was quickly pushed down to between 1½ per cent and 1¾ per cent, lessening the tendency of hedging pressure to spread to the spot market.

The crucial phase of the operation came in the latter part of June as the first of the forward contracts began to mature. At that point, some of the parties that had sold forward dollars to the Treasury found it necessary to go into spot markets for the dollars they were bound to deliver. The Treasury, for its part, was able to get the marks it needed without going into the market place. It had acquired some 400 million marks directly from the German Government in April as part of a large debt prepayment. Additionally, the Bundesbank had committed itself to supply directly any marks the Treasury might need to meet its obligations, the price in dollars to be the same as specified in the Treasury's forward contracts.

The Treasury's ability to get its marks outside the market at a time when the demand for dollars was rising helped to produce the first definite improvement in the spot dollar rate. The Treasury and the Bundesbank prodded the tendency along by co-ordinated intervention in the spot market, and by midsummer the Treasury could look forward hopefully to the orderly liquidation of its forward commitments.

Actually, the episode ended sooner than anyone expected. In August, the eruption of the Berlin crisis curbed the inflow of short-term capital to West Germany and heightened the improvement in the spot dollar rate. The need for new forward sales of marks by the Treasury disappeared, and the existing commitments were cleaned up handily.

(To be continued)

LONDON LETTER

(Concluded from page 220)

of its chief playing card, it is now in the public eye emerging in a sympathetic position by virtue of the resentment caused by the manner of the breakdown.

Britain at the moment is a country in *economic friendship* with all the world except France, frustrated from making the entry into Europe, in spite of the desires of five of the *Common Market* countries and obliged to look to its own economic salvation, with universal sympathy but without any positive support save the important *blessing* of the United States and the European five. And thus support is going to take the form of a bid for lower tariffs all the world round.

There is one important difference between the Government's approach to Commonwealth relations and the approach of the Opposition. The Opposition would be very glad to return to the regime of twelve years ago of long-term food and raw material contracts, Government-negotiated, with the Commonwealth countries. They argue that this is the best guarantee for cheap food and cheap raw materials for U.K. industries. Obviously, that kind of contract with Commonwealth countries, coupled with understandings from the Commonwealth of *not raising* tariffs against U.K. manufactures, coupled with world-wide G.A.T.T. reductions on industrial tariffs, would be the best possible recipe for U.K. economic prosperity. Maybe that is what the next few weeks will bring out.

MISCELLANEOUS STATISTICAL INFORMATION

Reserve Bank of India

Statement of Affairs for the week ended 1st February 1963

BANKING DEPARTMENT

LIABILITIES	Rs.
Capital paid-up	5,00,00,000
Reserve Fund	80,00,00,000

Note—Outstandings relate to end of period and do not include Indian Union's share of pre-partition liabilities: repayments, however, include those from the pre-partition holdings of Indian investors. A—Discontinued from July 1, 1953. B—Discontinued from June 1, 1957. C—Issued from June 1, 1957. D—Issued from May 10, 1954 to May 30, 1957. E—Including Defence Savings Bankr Deposits upto 1954-55. F—No sales from June 1, 1957. G—1st series issued from July 1954 to 1957 and 2nd series issued from January 1958. H—Outstandings in respect of items in column 9 marked 'E' are not included. J—Commenced from 2nd January 1959. N.B.—Five-year prize bonds were issued from 1st April 1960 and the total outstandings at the end of Nov., 1962 amount to Rs. [illegible]

STOCK & SHARE QUOTATIONS

Abbreviations:—D.—Deferred shares, P.O.—Preferred Ordinary shares. Y.—Accounts published yearly. H.—Accounts published half-yearly. P.—Company has Preference shares. T.—Company has Debentures. N.—Nominal quotations. x.d.—Ex. Dividend. c.d.—Cum. Dividend. i—Interim Dividend.

Shares:—If a company has different classes of shares—as for example, 'A' shares and 'B' shares—these are indicated by the same letters 'A' and 'B' under the columns 'Paid-up Ordinary Capital' and 'Paid-up per share.

Accounts:—Figures in the Accounts Closed column represent the months of the year in which the respective companies close their accounts, 6 and 12, for instance, indicate the months of June and December, respectively. Reserves include general and other reserves and all other funds which a company may have excluding depreciation fund, reserves for tax liability and provident fund. Block represents actual cost of land, buildings, machinery and all other items on which depreciation is allowed less sales, if any and stands for the gross figures except where otherwise indicated.

Dividends:—Dividends for completed years are shown as amount per share per annum, but where quoted for portion of a year they represent the proportionate dividend for that period. In the case of those companies which close their accounts yearly dividends shown are for their financial year.

MARKET GOSSIP

(*Concluded from page* 215)

small factories and establishments under the covered industries, employing below 50 persons but above 20 only on completion of five years of their existence.

The enhancement of the provident fund contributions is in pursuance of the recommendation of the Technical Committee, headed by Mr. M. R. Meher, appointed by the Ministry of Labour in May 1960 to examine which of the six industries, originally covered under the Act, could bear the additional burden involved in increasing the rate of provident fund contribution. The Committee submitted its report in respect of the aforesaid four industries wherein it recommended raising of the provident fund contribution from 6.25 to 8 per cent and this was accepted by the Government.

Along with the increase in the rate of contribution, the administrative charges levied on employers and inspection charges collected from employers of exempted establishments (that is, establishments exempted from the statutory scheme by reason of their having their own provident fund scheme, the total benefits available to employers thereunder being not less than those under the statutory scheme) have been reduced. Thus the new rate of administrative charges will be 2.4 per cent of total monthly provident fund contributions, as compared with the present rate of 3 per cent. Inspection charges will be 0.6 per cent of total monthly provident fund contributions, as against 0.75 per cent as at present.

The eligibility rules for membership of the Fund have also been modified. Hitherto, an employee in a covered establishment is eligible for membership provided his basic salary and dearness allowance, including cash value of food concessions, if any, do not together exceed Rs. 500 per month. This limit has been raised to Rs. 1,000 with effect from 31st December. The new limit, as we understand it, is applicable to all industries.

The reduction in administrative and inspection charges has obviously been made to lighten the burden on the industries called upon to pay the enhanced contribution. It may be noted, in this connection, that the Central Board of Trustees of the Employees' Provident Fund had considered the question of recommending a reduction in the charges. Members of the Board other than employers' representatives were not in favour of reducing the charges. The reduction now effected, therefore, indicates that the Government feels that, in respect of industries where the contribution is raised, there is a case for reducing the burden on employers by levying a lower rate of administrative and inspection charges.

It is difficult to estimate precisely, in terms of amount, the additional burden that will fall on employers on account of the higher rate. But, in terms of percentage, the incidence of provident fund will be up by 28 ; that is, where an employer has been paying Rs. 1,000 by way of provident fund charges, he will now have to set aside Rs. 1,280. It is thus certain that the wage bill of employers, in both exempted and unexempted establishments of the four industries in question, will go up to this extent. As the statutory minimum contribution has been raised, employers in exempted establishments will also be obliged to raise the rate of their contribution to bring it on a par with the statutory minimum rate. As on 31st March 1962, the Act applied to 3,739 factories and establishments in the four industries and the total number of subscribers in them aggregated 616,000. It is not known how many of these establishments employed 50 and more employees. Possibly, the majority of them are large-sized units liable to pay the enhanced rate.

Besides, this is only the thin end of the wedge. Progressively, more and more industries will be brought under the enhanced rate. The need for securing more savings for defence and development may conveniently be advanced as an argument for roping in all the industries now subject to statutory provident fund scheme. At present, the annual rate of investments in Central Government securities covered by the Provident Fund Act, including the collieries, are of the order of Rs. 30 crores. If all of them are made to pay at the enhanced rate of 8 per cent, it will mean a straight increase of Rs. 8.40 crores in the demand for Central Government loans.

Courtaulds' New Flame-proof Fibre

Courtaulds, the world-famous British textile firm, which successfully withstood a sensational take-over bid last year by another British industrial giant, namely, Imperial Chemical Industries (I.C.I.), has named its new, flame-proof, modacrylic textile fibre, launched a year ago, as "Teklan." This fibre, so far known under the code name of B.H.S., is the result of many years of research at Courtaulds' laboratories and is claimed to be one of the most important man-made fibre discoveries. It is said to have a silken texture and quick-drying and flame-proof properties. At present, the fibre is produced only as continuous yarn in a range of multi-filament deniers.

"Teklan" is expected to make its first important impact in children's wear on account of its flame-proof property. It is also suitable for a wide range of textiles—for men's and women's wear, household fabrics and industrial clothing. As the fibre has the qualities of silk, it is expected to play an important part in the manufacture of women's clothing, especially in such fabrics as crepe, georgettee and tafetta. In the field of apparel manufacture, the makers predict that it will prove popular and fashionable in making lingerie, cocktail dresses and full-length evening dresses. The first garments made from "Teklan" are expected to be on sale by the end of this year.

SOME TAXATION ISSUES

IN less than two weeks from now, the Union Finance Minister, Mr. Morarji Desai, will be unfolding to Parliament the Central Government's Budget estimates and proposals for 1963-64. There is already a spate of pre-budget speculation and also conflicting advice to the Finance Minister. If public interest in the forthcoming Budget is much greater now than on similar occasions in the past, it is because there is a general awareness that the financial needs of both development and defence are going to be unprecedentedly heavy. While there is undoubtedly some public sympathy for Mr. Desai, inasmuch as he is faced with the unenviable task of having to find more money for defence and development alike, there is also an undercurrent of anxiety, especially in the business world, on the score of possible heavy imposts on an already over-burdened economy. That fresh burdens are on the way is the general expectation, or fear, rather. But the fear is mingled with the hope that ways and means might be devised to mitigate the severity of the additional tax effort and enable industry to achieve a much higher level of production than in recent years.

This is not an unwarranted hope, for the Government knows, as well as anybody else, that the industrial sector is being called upon to subserve defence in terms of a wide range of goods and services and that, therefore, its production performance will be of strategic importance. The Finance Minister may thus be expected to weigh the advantages and disadvantages of additional taxation proposals against the background of defence-oriented industrial development in terms of both capacity and production. Some broad considerations may conceivably weigh with him. One such consideration is whether corporate enterprise, which is already contributing substantially to the National Defence Fund and subscribing to the emergency risks insurance scheme, can be reasonably expected to accept a further reduction in its net profit. If anything, in the context of the emergency, there is a case for increasing, by suitable fiscal rebates and concessions, the retained profits of corporate enterprises as much to facilitate their rapid expansion partly or wholly for defence production as to attract both domestic and foreign equity capital to new industrial projects or the expansion projects of existing undertakings. If a much higher rate of industrial growth—higher than the 7.0 to 7.5 per cent of 1962—is to be secured, as indeed, it must be, in the coming years, the Finance Minister has it in his power to ensure such growth through a judicious use of the weapons in his fiscal armoury.

Let us have a look, in this context, at the United States where the Kennedy Administration has just proposed a comprehensive programme of tax reduction and tax reform. As far as corporate enterprises are concerned, this programme envisages a reduction in the normal corporate income-tax rate applicable to the first \$25,000 of taxable corporate income from its present level of 30 per cent to 22 per cent in 1963-64, although the rate applicable to income in excess of \$25,000 is to continue at 52 per cent (including a surtax of 30 per cent). In 1964-65, the corporate surtax rate would be reduced to 28 per cent, thereby lowering the combined maximum corporate tax rate to 50 per cent. From 1965-66, the corporate surtax is to be reduced further to 25 per cent, thus lowering the combined maximum corporate tax rate to 47 per cent. That is not all, for business investment in scientific equipment is proposed to be given a more favourable tax treatment. The estimated loss (\$2.6 billion) of revenue under corporate income-tax, it is confidently expected, would be ultimately made good, as the speed-up in economic growth produced by the tax cut would yield more revenue within a few years than the Government would receive under the present tax rates.

Whether an identical result can be expected from a possible reduction in the incidence of Indian corporate income-tax by bringing down the present rate of 50 per cent to, say, 45 per cent is a relevant question that one may ask. There is no reason why it should be otherwise, for the need for, and the probability of, accelerated growth, which can be easily brought about by larger investment of retained profits in expansion, are common to both India and the United States. Moreover, if American private capital is no reason why it should be otherwise, for the try, the incidence of corporate income-tax cannot obviously be heavier than in the United States. This argument will apply equally to British private capital which, too, can now look forward to earning more within the United Kingdom itself, now that the idea of reducing the present maximum tax rate (53.75 per cent) on undistributed corporate profits in that country is being actively canvassed by an influential section of the Press, as well as business, opinion. Noteworthy, in this connection, is the view just expressed by Mr. S. P. Chambers, Chairman of Imperial Chemical Industries:

"High marginal rates of tax and tax burdens, which differentiate against industry, discourage enterprise, and Britain can no longer afford to do this. Apart from the direct effect upon privately-owned businesses and professional men, there is a psychological reaction all down the line, with far too many people vaguely aware that to earn profits or have an income beyond a certain fairly low point is not worthwhile. Material standards of living are certainly not everything, but the levelling effect of our excessively steep graduation of direct taxation creates an unfavourable climate for the bold enterprise we need today."

As India, too, stands in need of such bold enterprise and risk-taking, what is considered good for the economy in advanced countries must be deemed even more good for it. A reduction in India's high rate of corporate income-tax, even if accompanied by some re-adjustment in the structure of rebates and concessions, will still be attractive enough to foreign and domestic investors. It will be still more attractive if, as is proposed in the United States, the maximum (marginal) rate of personal income-tax, too, is brought down to 65 per cent, for the combined effect of both reductions is bound to be reflected in a speed-up of economic growth and, ultimately, in larger revenue. It would be relevant to quote the following passages from the *Monthly Letter* (February 1963) of the First National City Bank of New York:

"The steep rate progression poaches upon the rewards for working hard and accepting additional responsibility. It undermines private capital accumulation, wrecks the normal working of compound interest, and tells enterprising people that it is less useful to build taxable income than to search out ways to get around the tax laws and limit their tax liabilities. Being human, people respond to this perversion of incentive.

"The higher personal income-tax rates do not in fact produce significant amounts of revenue. They drive potential income away. In other words, the rates run well beyond the point of diminishing returns. Reduced rates, given time, would benefit the revenues."

Professor Kaldor, it will be recalled, had pleaded precisely for such reduction in the steep rate progression of Indian income-tax on the ground that it would greatly minimise tax evasion. But the more important argument is that it would help speed up economic growth which, in turn, would automatically produce more revenue even at the lower rates. This is another consideration that may conceivably weigh with the Indian Finance Minister. It may be politically inconvenient to reduce the maximum rates of personal and corporate income-tax without providing corresponding reliefs at the lowest slabs of income, too. It is here, again, that the current American proposal to reduce the tax rate on the first \$1,000 of a taxpayer's taxable income from 20 per cent to 14 per cent will be seen to have a great psychological value. But, in view of the conditions prevailing in India today, relief in personal income taxation may have to wait for more auspicious times.

If a speed-up in industrial growth can be brought about in the next one or two years by judicious readjustments in the structure of income-taxation, larger production would also automatically mean more revenue from the excise duties now levied on a wide range of commodities. But the immediate loss of revenue would be a discouraging factor at a time such as this when there is need for more tax revenue for financing additional defence expenditure. The Finance Minister may, therefore, have to consider whether the rates of some existing excise duties can be increased and also whether some new commodities can be subjected to this type of levy. But he is bound to be in a dilemma, for it may again be politically difficult for him to enlist support for increases in indirect taxation while providing, at the same time, some relief in direct taxation. Another consideration, which has been mentioned by Sir Norman Kipping, Director-General of the Federation of British Industries, at the end of his recent visit to India, is related to the additions to commodity costs caused by excise duties. Sir Norman Kipping's views, incidentally, are:

"The present system of levying excise duties on raw materials and components unduly pushes up export costs. The refund of excise duty to the exporter relates only to the last stage of the impost on the finished goods. The duty on various intermediary stages inevitably forms part of the export cost which makes Indian goods uncompetitive."

The cumulative cost incidence of excise duties on export commodities is thus a weighty consideration. Even the system of consolidated refund is not very helpful, for the labour involved in making the claim and collecting it is onerous and exasperating. But, on that score, it can scarcely be argued that the system of excise duties should be drastically revised. What may, however, be possible is a line of approach that would leave out intermediate products from the scope of additional excise imposts and single out articles of universal mass consumption within the country for the levy of new or additional excise duties. Common salt, for instance, is eminently eligible for such treatment. Several other commodities, which do not figure substantially in exports now and are not likely to do so in the near future, may well be identified by the tax authorities in their examination of possibilities. These can be brought under the excise levy. Further levies on domestic consumption of electricity, railway fares, all kinds of registered property transfers (if constitutionally possible for the Centre), and consumer durables may also be usefully considered. As transport

and power are more vitally required for industrial purposes, any restraint on their use for non-essential purposes would be perfectly justified.

Now the question that arises is whether the suggestions contained in this article are politically feasible in the present circumstances. Our thesis is that they are. What is required is political courage to recognise the pitfalls in the current fiscal policy and to give a new orientation that will spur the economy to new heights. Ours is not a plea to make the rich richer but to improve the lot of the poor through larger production and greater opportunities for employment. It is possible to combine this type of fiscal reform with the need for ensuring that the incentive to greater endeavour is not dissipated through bigger dividends and spending spree. This objective can be secured by imposing restrictions that will defer the enjoyment of enhanced corporate profits to the future when the country is free from the threats to its security or becomes strong enough to face them with equanimity.

STATES' TAX EFFORT

AT no time since the era of planning began in India twelve years ago was the need for the State Governments to mobilise resources through taxation and to effect economy by cutting down all unessential expenditure so urgent as it is today. With the emergency defence requirements superimposed on the Central Budget, it is now pretty clear that the States can no longer lean heavily on the Centre for large-scale assistance to fill the wide gap between available resources and actual expenditure (Plan and non-Plan). Indeed, Mr. Morarji Desai firmly told the State Finance Ministers when they met him at New Delhi on Tuesday last week that, since any increase in Central assistance to States (which has already been reduced by Rs. 50 crores) was virtually impossible, the latter had to make an all-out bid to raise resources. And quite bluntly he declared that political expediency should not be allowed to stand in the way of the States raising additional revenue to meet their Plan as well as non-Plan outlay. Echoing these words, Mr. Gulzarilal Nanda, Union Minister for Planning, stated at Lucknow three days later (8th February) that the States must change their approach to the problem of raising resources through additional taxation and other measures. The Planning Commission itself has urged the States to maximise their tax efforts during 1963-64, the third year of the third Plan.

Judged against this background and considering (*a*) the cut of Rs. 50 crores in Central assistance to States, (*b*) the increase of Rs. 27 crores to Rs. 750 crores in total outlay on State Plans for 1963-64 (as compared with the budget estimates aggregating Rs. 723 crores for 1962-63), and (*c*) the likely rise in expenditure under several heads because of the emergency, there seems to be no escape from heavy taxation for the States. It is, of course, gratifying to learn from Press reports that the State Finance Ministers have assured Mr. Desai of their willingness and ability to raise new taxes. But the question is whether the Ministers will stand by this assurance. One need not wait long for the answer, as the State budgets for 1963-64 are due to be presented in the next few days. The absence of any new taxes in the Bihar State Budget, which was presented a day after the State Finance Ministers' meeting with Mr. Morarji Desai, is, however, not in keeping with the undertaking given at New Delhi. Perhaps, the Bihar Finance Minister may come forward with new tax proposals later. But that would be an odd thing to do. Surely, he has had plenty of time to think about the subject. And, in any case, it was not necessary for him to be told about the urgency for finding additional resources by the Union Finance Minister.

There is no need at all for any exhortation to any State Finance Minister to mobilise resources through fresh tax imposts. They themselves ought to—and they do—know about it. The third Plan target of additional taxation for the States is Rs. 610 crores, or an annual average of Rs. 122 crores. The tax effort of the States in the first year of the Plan, that is, 1961-62, was very modest, probably because the Finance Ministers did not want to incur the displeasure of the public in an election year. Only ten States had proposed additional taxation yielding no more than Rs. 14 crores during 1961-62 and Rs. 20 crores in a full year or about Rs. 94 crores over the Plan period. The performance in respect of 1962-63 was, however, distinctly encouraging, in that twelve States introduced additional taxation measures together yielding Rs. 47 crores in that year and Rs. 71 crores in a full year or Rs. 260 crores over the Plan period. In other words, the tax efforts in the first two years provide for an additional yield of about Rs. 354 crores, leaving a gap of Rs. 256 crores to be filled in the remaining three years of the Plan. This works out to an annual average of Rs. 85 crores. In addition to this amount, the States will have to make up for the cut of Rs. 50 crores in Central assistance, besides meeting the increase in expenditure arising from the emergency. Viewed thus, the responsibility cast on the State Finance Ministers is indeed heavy and it is to be hoped that the Ministers will not shirk it, as the execution of the Plan is vital for the defence of the country. So far as the people are concerned, it may be said that they will bear the additional taxes ungrudgingly, for they are keenly aware that no price is too much for preserving the hard-won freedom.

The efforts of the State Finance Ministers to mobilise resources will necessarily have to be directed more towards tapping new sources of revenue based on development and income changes, as well as improving the recovery of current levies, than towards stepping up the rates of existing taxes the scope for which is restricted. But the agricultural sector can certainly be made to contribute liberally to the States' exchequers without in any way disturbing the social, political or economic balance in the countryside. This sector, it is common knowledge, has benefited considerably as a result of various development schemes such as irrigation, on the one hand, and increase in agricultural commodity prices, on the other. While the incomes of the agriculturists have registered an improvement, the amount paid by way of land revenue continues to be negligible. The State Governments have always fought shy of tapping this source. It is true that Andhra and Uttar Pradesh have made some attempts, but they do not go far enough. It is not surprising, therefore, that the aggregate yield of taxes on land in all the States put together during the year 1961-62 was no more than Rs. 100 crores, as against Rs. 93 crores in 1956-57. The Finance Ministers will do well to enhance the rates of land revenue. They need not be apologetic about it. There will, of course, be a hue and cry, but they will have to face the opposition by educating public opinion. At the same time, energetic action must be initiated to ensure speedier recovery of *taccavi* loans. Two other existing sources which can be made to yield larger revenue, particularly in urban areas, are sales tax and entertainment tax. Relaxation and rationalisation of prohibition on liquor may also yield a sizable additional revenue for those States which are either partly or fully dry.

The task of inducing people to accept additional tax burdens will be easier if the State Governments offer visible evidence of economy in their expenditure. Mr. Morarji Desai minced no words when he told the State Finance Ministers last week that the latter should "try to cut their coats according to the cloth in their possession" and to give up, if need be, the non-Plan and non-defence projects. Simultaneously, the State Governments should take vigorous steps to improve the efficiency of their administration and the profitability of all their commercial undertakings.

WHAT ABOUT CIVIL AVIATION?

THIS question is being deliberately posed on the eve of the Budget session of Parliament, in the hope that it will catch the eyes of the Government, as well as of Members of both Houses and that the requirements for expanding civil aviation will not be overlooked by those who are framing the budget for the next year. It has constantly been urged that, in times of emergency, civil aviation constitutes a useful and important second line of defence. So often, indeed, over the past ten years has this plea been advanced—and, particularly by those with their own, rather than national, interests in view—that it has come to be regarded with suspicion. The premise, of course, is sound enough but too often repeated, and used out of context, it becomes as wearisome and meaningless as the fabled cry of "wolf, wolf!" This is a pity, because, in the first real emergency this country has experienced since the war in Kashmir, it has been amply demonstrated that the demands made on commercial aviation are immediate and insistent. That commercial aviation responded to the best of its limited capacity can hardly be denied. For example, in spite of the somewhat step-motherly treatment which the independent air companies have habitually received at the hands of the Government, despite the "holier than thou" attitude of the two public sector corporations, when it came to the point, the independents—or what remained of them after ten years of gradual impoverishment—rose, by all accounts, nobly to the occasion.

It is said that eleven Dakotas, which probably is the total strength of the independent operators now, have been flying in support of military operations on the north-eastern frontier. Kalinga Airlines were particularly prominent, carrying out a large number of supply-dropping sorties in hazardous conditions —a form of flying, incidentally, which has cost them two aircraft and crews over the last twelve months. Jamair, Airways India, and Darbhanga also participated, flying arms and ammunition to the forward areas and helping to evacuate refugees from Assam and NEFA. One is constrained to speculate how much more effective their services might have been had they, over the past ten years, gained, rather than diminished, in strength and prosperity. One can only hope that, in the future, their services to the nation will be recognised by more liberal treatment and encouragement.

This, of course, is not to say that the air corporations in the public sector did not rise equally to the occasion. That, they certainly did. It is as regrettable as it is no doubt inevitable, however, that an outbreak of hostilities invariably claims, as its first victims, the services which commercial aviation affords the public. It was so in 1940. It was so again in 1948 when, it may be recalled, every available civil aircraft was required for military purposes. At the outset of the recent emergency, I.A.C. had to announce the immediate curtailment of most of its normal schedules. It looked as if history was about to repeat itself once again and, had the emergency continued at white heat, that, no doubt, is exactly what would have happened. In the event, it did not come to that. Thanks to lease-lend aircraft from the U.S.A. and the easing of the situation, I.A.C.'s services are now back to normal.

One does not, for a moment, seek to criticise any measures—the requisition of civil aviation services, for example—which have been, and may again be, found necessary in the national interest. If sometimes shortsighted, they are dictated by unprecedented and unexpected demands which can brook no delay. It is inevitable, in the circumstances, that these demands be met from the first available source. What one does seek to emphasise, however, is the fact that, in times of difficulty and stress, the country relies, perhaps more than is generally realised, on the capacity and efficiency of its commercial aviation. In spite of its past misuse, the term "second line of defence" is, in fact, no misnomer.

It would be a mistake, one suggests, to forget that fact. Even if a satisfactory border settlement is negotiated and there is no resumption of hostilities, there are—as is doubly less generally recognised—no grounds for complacency. The Government has stated its intention to direct all efforts towards strengthening the country's defences. The Defence Services, in that respect, rightly come first, as the forthcoming budget will doubtless demonstrate. But neither the country nor the Government should grudge a few crumbs from the rich man's table. Civil aviation should not be entirely forgotten.

In a statement to the Press at Madras towards the close of last week, Mr. K. N. Kaul, Financial Controller of I.A.C., disclosed that his Corporation was finding it difficult to lift all traffic with the existing number of aircraft. Out of the five Fokker Friendship planes ordered, only two have so far been delivered and three more are expected in a couple of months. The suggestion that I.A.C. should have three Caravelle aircraft has not yet received the Government's approval, though over a year has passed since it was made. This is a poor commentary on the authorities' sense of preparedness. Both I.A.C. and the independent operators deserve consideration at the hands of the authorities who are drawing up the budget for transport and communications. So far as I.A.C. is concerned, probably the most crying need is foreign exchange. Without this essential commodity, neither new equipment nor adequate spare parts for existing equipment can be procured. So far as the independent air companies are concerned, to ask for foreign exchange would be to ask for the moon. But there are, surely, other ways and means of adding to their strength and capacity. Their requirements are modest enough. Has not lease-lend made it possible to hand over to them half-a-dozen or more Dakotas? From the national point of view, this might prove to be an excellent investment.

MARKET GOSSIP

Bank Profits

ONE of the offshoots of planned development of the Indian economy in the last decade, with the help of a large dose of deficit financing in the last few years, has been the enormous growth in banking facilities. According to a recent study made by the Reserve Bank, the number of banking offices increased between 1952 and 1961 from 2.757 to 4.490; deposit accounts went up from 3.23 million to 6.52 million; deposits in scheduled banks rose from Rs. 918 crores to Rs. 2.049 crores and bank credit from Rs. 619 crores to Rs. 1,321 crores. The impressive growth in banking facilities was facilitated by an improvement in the profitability of banking operations. Thus, the gross earnings of scheduled banks, which amounted to Rs. 47.7 crores in 1952, were as large as Rs. 126.6 crores in 1961. Profits before taxes increased from Rs 11.4 crores for 1952 to Rs. 28.6 crores for 1961. However, as the ratio of expenses went up from 76.1 per cent to 77.4 per cent in roughly ten years, the ratio of profits before taxation to total earnings was lower at 22.6 per cent in 1961, as against 23.9 in 1952. Nevertheless, one must remember that the percentage for 1961 related to a higher base. On the whole, banks in India had done well under the first two Plans, with the years 1960 and 1961, in particular being quite favourable.

1962 was another prosperous year for the banking system. This statement holds good, notwithstanding the fact that almost all banks have reported slightly lower profits as compared with the previous year. The banking system was considerably strengthened thanks to the various reforms such as expansion of the equity base and institution of deposit insurance initiated by the Reserve Bank, but it faced also new responsibilities. The increase in deposits in 1962 was substantially higher, that is about Rs. 210 crores, as against Rs. 180 crores in 1961. Likewise, bank credit expansion amounted to Rs. 144.8 crores, as compared with Rs. 114 crores in 1961. The increase in bank credit in the first two months of 1963 too has been equally impressive and bank advances crossed the Rs. 1,500-crore mark for the first time last week. Deficit financing in 1962-63 is now expected to be over Rs. 200 crores as against Rs. 65 crores anticipated in the budget of the Union Government in May last. Industrial production has generally been higher by about 6 per cent in 1962 than in 1961, in spite of the appearance of several bottlenecks such as transport, raw materials and power. It is these two factors that principally explain the high levels of deposits and advances in 1962.

Yet bank profits for 1962, according to the preliminary statements of accounts published by the major commercial banks, show a slight setback as compared with those for 1961. The profits (after taxes) of the "big six" had registered an increase of nearly 37 per cent in 1961 over 1960. But in 1962, they suffered a slight setback of about 2 per cent over the 1961 level.

Among the "big six," the Bank of India and the United Commercial have reported just a marginal increase in the profit after tax. Even the State Bank has shown a small decline. The Central, the Punjab National and the Bank of Baroda have all reported slightly lower profits. This seems quite strange at first sight, because the rate of expansion in bank deposits was around 14.6 per cent in 1962, whereas in 1961 it was only about 11.5 per cent. The expansion in advances was less than the growth in deposits, with the result that the banks had no difficulty in meeting the credit demands made upon them. The return on Government securities was also better. The deposit rates were all pegged down at well below the 1958 levels under the Inter-Bank Agreement on Interest Rates revised in the middle of 1962; after this Agreement, the Reserve Bank initiated a "dearer money" policy by floating the Government loans at higher rates of interest. In the past year, banks had increased their lending rates all round and the average rate was much higher than in 1961. The Bank Rate was raised by ½ per cent on 3rd January 1963 to 4½ per cent. The banks have taken advantage of this upward change to push up the rates on their advances by ½ to 1 per cent. On the other hand, the rates they pay on various categories of deposits have been kept unchanged.

It is relevant to note here that interest payment on deposits accounts for about 50 per cent of the total expenses of a bank and 75 per cent of bank deposits are lent out as advances by the major banks. It is, therefore, obvious that the spread between the rate of interest earned and paid, which was reported by the Reserve Bank to have been around 4.2 per cent in 1961, must have shown improvement in 1962; at any rate, there could have been no contraction.

What then is the explanation for the setback in the profitability of banks in 1962 as compared with 1961? In the first place, there is the normal expansion in banking facilities through establishment of more branches. Even the State Bank, which has shown a somewhat slower pace of expansion than in the previous years, opened a large number of branches. Most of the other big banks spread the area of their operations, with each of them opening 35 to 40 branches on an average. A branch is now a costly affair. As the accent is on comfort for attracting customers, most of the bank branches in major cities are air-conditioned and a big show is made. The cost of opening a branch in a major city comes to Rs. 1 to 1½ lakh; in addition, there are the recurring expenses like salaries of staff, stationery and advertisement. All these expenses make a heavy draft on current earnings of banks at least in the initial period of two or three years. This has been one of the factors responsible for imposing strain on banks, but, since this is an investment on development, with an eye on better business and more profit, it is likely to yield rich dividends in future.

Another, perhaps the most important, factor which has pushed up the expenses is the "Bank (Desai) Award." It has meant an increase in the take-home pay of bank employees by about 8 per cent. The Award had retrospective effect from 1st January 1962. The banks were, therefore, obliged to pay the accumulated difference in wages before the close of the accounts for 1962. An idea of the increase in the wage bill can be had from the provision made for the bonus. The State Bank of India's provision for bonus, for instance, was Rs. 72 lakhs, as against Rs. 45 lakhs in 1961 and that of the Bank of India Rs. 32.5 lakhs, as against Rs. 19 lakhs in 1961.

A third factor responsible for the slight fall in profits of banks must have been the increase in the incidence of taxation. One has only to presume, in this connection, because the banks have ceased (with effect from 1961 in the case of most of them and from 1962 in the case of all them) showing their provision for taxation as part of their plan for building up the so-called secret reserves. But the presumption cannot be wrong, as, in the Union Government budget last year, the taxation on companies was enhanced by 5 per cent to 50 per cent. Since the budget was presented long after the banks had finalised their accounts for 1961, they could not make provision for the increase in taxation in their profits for 1961. They, therefore, had to provide for the additional taxation in their 1962 accounts, besides the provision for taxation on the 1962 profits at the enhanced rate. Again, after the declaration of the Emergency, the banks contributed sizable amounts to the National Defence Fund. All this must have come out of the earnings for 1962.

Then, there are the other essential provisions, such as those for depreciation (and maintenance) on fixed assets as well as on investments, and for bad and doubtful debts. These, too, must have been on the increase. For the cost of materials required for repairs and maintenance has been increasing; there has been a fall in the value of Government securities; and, with a higher level of advances, the allocation for bad and doubtful debts also has to be inevitably higher. Having regard to all these factors, it is no wonder that the banks' published profits for 1962 have fallen short of the high levels attained in 1961.

Most of the banks have widened their equity base in response to the exhortation from the Reserve Bank in 1962. Among the big banks, the Central Bank of India is an exception. This Bank has, of course, decided to raise the capital, but the implementation of the decision has been deferred in view of the big drop in share markets following the Chinese aggression. A larger paid-up capital means a larger sum even to maintain the level of dividend. With the exception of the Bank of Baroda which has reduced its dividend (both subject to tax) from 17 per cent in 1961 to 16 per cent in 1962, all the other big banks have maintained their dividends at the 1961 level on the higher capital. The total amount required by the "big six" to pay dividends for 1962 amounts to Rs. 3.6 crores, as compared with Rs. 3.3 crores for 1961 and Rs. 3.2 crores for 1960.

As for transfers to published reserves and other funds, they are, as a proportion of profits earned by the "big six," higher than the minimum statutorily required. For example, the United Commercial Bank has transferred as much as 35 per cent of its declared profits to its reserves in pursuance of the Reserve Bank's policy that banks should aim at attaining an equity-deposit ratio of at least 6 per cent. But, in most cases, the amounts set apart for reserves this year are lower than those last year.

What are the prospects for 1963? The current year promises to be another good year for banks. The combined impact of emergency and development expenditures will be felt in a few months in the form of more bank deposits; and the higher tempo of economic activity will mean a greater demand for bank credit. With a fresh push in the rate of interest on advances consequent upon the Bank rate increase early this year, it is likely that the profitability of the operations will remain unimpaired as in 1962 and 1961. No doubt, the scheduled banks have plans to open nearly 200 branches in 1963 and the cost of branch expansion programme will be an important factor. As against this, at least some of the branches opened in 1960 should start yielding profits, with the result that the profits made by the old and recent branches may offset, to a significant extent, the initial losses suffered by the new branches. There is, however, one imponderable. Probably, the scheduled banks cannot avoid an upward revision of rates of interest paid on deposits, because, after the Bank rate increase, the current rates have become unrealistic. If such a revision is made, the cost of deposits will go up, but this addition may be more than neutralised by the expansion in business. On balance, it, therefore, appears reasonable to conclude that, for banks, 1963 will be as prosperous as, if not more prosperous than, the past two years.

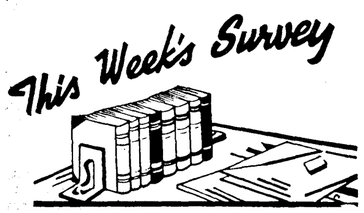
A Ticklish Issue for Britain

Politics and economics, short-term attractions and long-term advantages, oil *versus* coal and larger issues of trade and fuel policies are all mixed up in the ship-for-oil deal proposed by Soviet Russia to Britain. Russia has, of course, not officially told Britain that it would place orders for ships with British shipyards only if it purchased Russian oil in return. In fact, the Trade Minister of Russia has denied that Soviet purchase of British ships is linked to the sale of oil to Britain, but he has emphasised that what Russia is demanding is that Britain should take two to three million tons of oil as part of their mutual trade. It is, therefore, reasonable to presume that the Russian decision on British tenders for the supply of ships would be influenced by the British Government's attitude to the question of allowing Russian oil into the U.K. market.

The Soviet offer is cleverly conceived, as it is appropriately timed. Britain is now faced with heavy unemployment. The failure of the Brussels talks is a great disappointment to it. Naturally, it must be most receptive to trade offers from elsewhere. British shipbuilders are facing a critical period, thanks to shortening order books. Unemployment in the shipbuilding industry, in particular, is acute. The British Prime Minister, Mr. Macmillan, must be feeling quite embarrassed indeed. It is said that trade unions in the shipbuilding industry will support the proposal, though mine workers are expected to oppose it on the ground that it will hit the coal industry and affect employment in coal mines.

The advantages of the offer are, however, finely balanced by the disadvantages. The main disadvantage is that the entry of Russian oil into the British market will not be favoured by the U.S., the Middle East countries and the international oil companies which supply the oil requirements of Britain. At present, Britain is the second largest single market for oil in the free world, after the U.S. Barring small quantities of special grades, Russian oil has not so far penetrated into Britain. But the Common Market countries, Scandinavia, Japan and most of the underdeveloped areas have all been substantial buyers of Russian oil. For instance, during the first half of 1962, Italy imported 3.5 million tons of Soviet bloc oil, West Germany 2.2 million tons, Japan 1.6 million tons, Finland and Sweden 1.2 million ton each and Cuba 2 million tons and other free world countries together 2.9 million tons. If all of them can do so, why not Britain? Further, the quantity involved in the present Soviet offer is only small, being one to two million tons of fuel oil at the rate of £4 per ton. The annual consumption of oil products in the U.K. is estimated at 50 million tons. The import bill, after making allowance for re-exports, amounts to £418 million. The one to two million tons of fuel oil involved in the present offer is, therefore, only a fraction of the total imports of oil products, though, when compared with fuel oil consumption alone, which aggregated 21.5 million tons last year, the quantity is not insignificant. But it is not the quantity as such but the principle involved that is bound to produce sharp reactions. International oil companies, the Middle East producers and the U.S. regard the Russian offer as the thin end of the wedge.

Britain could, of course, argue, in defence of the deal, if it makes up its mind in favour of it, that it is not throwing open the British market wide for cut-throat competition from Russia but is allowing only a limited quantity and that other European countries are already large importers of Russian oil.



An important consideration that would influence the decision would be the probable impact of it on oil companies' orders for tankers placed with British shipyards. It is noteworthy that the orders which the British shipyards get from oil companies are many times the order worth £25 million involved in the present Russian offer. The U.K. Government will, therefore, have to consider the possibility of retaliatory action by oil companies. There is also the consideration that, since Russia has invited world tenders for ships, Britain might get only a portion of the £25 million order, even if it agrees to import Russian oil. Whether the British Government will risk the displeasure of traditional customers and the consequent loss of large business for an uncertain order of small value remains to be seen. The British Cabinet is considering the offer and no decision has yet been made upto the time of writing.

If Britain decides to import Russian oil, the problem of distributing it will surely arise. It will be interesting to watch how the British Government will handle this problem which caused a headache to Mr. K. D. Malaviya, our Minister for Mines and Fuel. There are at least four possible alternative courses open to the British Government. They are: (1) allowing the establishment of a Russian agency to handle imports and to compete in the open market, (2) allowing consumers to deal with the supplier direct, (3) appointment of an agency to import and distribute oil on the British Government's account, and (4) asking the oil companies already operating in Britain to handle the Russian oil. Each one of them has some flaw or other that will place the British Government in an embarrassing position.

Uptrend in World Commodity Prices?

Prices of primary commodities in world markets have shown a secular tendency to seek lower and lower levels during the post-war period, barring the short-lived Korean boom in the early fifties. The declining trend gathered further momentum in 1962 and prices of several commodities touched new post-war lows by August-September. But the last quarter of 1962 saw a break in the declining trend. In fact, prices of some of the major commodities, led by sugar, coffee, cocoa and non-ferrous metals, staged a smart rally. It is, indeed, a matter for some relief to world's primary exporting countries that this recovery is still continuing. The London *Financial Times*' index of sensitive world commodity prices (base 1952-100), which touched an all-time low of 74.62 in the beginning of September last (which meant a decline of as much as 25 per cent over a decade), rose to close the year 1962 at 79.06. The index has since risen to 80.63, which compares well with 77.32 a year ago and is the highest level for the last two-and-a-half years.

The actual improvement in commodity prices has been probably of a much higher order than what the aforesaid index indicates. For there has

THE SCIENTIST'S MORALE

THE Scientific Policy Resolution of 1958, it will be recalled, has laid down that it is the principal aim of India's scientific policy "to foster, promote and sustain, by all appropriate means, the cultivation of science and scientific research in all its aspects—pure, applied and educational." This policy also aims at (i) "ensuring that the creative talent of men and women is encouraged and finds full scope in scientific activity" and (ii) "encouraging individual initiative for the acquisition and dissemination of knowledge, and the discovery of new knowledge, in an atmosphere of academic freedom." These aims, like several others mentioned in the Resolution, are as laudable as they are ambitious. But, like so much else in this country, which has not singularly distinguished itself in effective implementation of its formidable economic, social or welfare legislation, some of them are in the category of ideals to which only lip-service is paid. To what extent "the creative talent of men," "individual initiative" in scientific research and "academic freedom" are stultified or frustrated by bureaucratic control and administration is a matter calling for objective study in any comprehensive inquiry which may be undertaken into the progress of scientific and industrial research, and utilisation of the results of such research.

There are not many brave, outspoken souls in this country who would stand up against bureaucratic excesses and turn the spotlight on administrative errors, for it is largely a matter of safeguarding one's job or career in the vast apparatus of scientific and industrial research today. Some exceptional scientists or scientific workers (may their tribe increase!) are, of course, there to call a spade a spade, and Professor J. B. S. Haldane, who has settled down in India as a naturalised citizen, is outstanding among them. Although this highly talented and renowned Professor in biology has already incurred the displeasure of the powers-that-be in the Union Ministry of Scientific Research and Cultural Affairs, he has chosen to stick to his guns and bring to light administrative omissions and commissions. Two glaring examples of administrative failure, cited by Professor Haldane in his speech on "Scientific Research and its Relations with Administration" at the Orissa Branch of the Indian Institute of Public Administration on the 9th instant, go to show that bureaucratic administrators in India are not only ignorant of the qualifications of scientists but also lacking in imagination and broad scientific understanding.

The first example is related to the death of some 50 men recently near Cuttack by very rapid decompression at bridge construction. Prof. Haldane himself, who had known work under water at high pressures, could have given useful guidance on a matter like this, but that was not to be "because nobody knew his qualifications, or, if they did, nobody was in a position to tell the officials concerned." The other example is connected with coconut research in which Professor Haldane's associate, one Mr. Davis, was engaged. That scientist, who was working on the physiology of coconut farms in the hope of finding out how to propagate the best ones, made the staggering discovery that trees whose leaves were arranged in a left-handed spiral gave higher average yield than right-handed trees. This discovery meant that coconut plantations could be raised to yield five to ten per cent more, without any more fertilisers or any special breeding programme. But, even after the research result, it was not the Indian administration that took steps to exploit it. On the contrary, it was the Ceylon Government that learnt of it and enlisted the services of Mr. Davis and had the benefit of his research.

So, that's that. There must be several other scientists who have had similar frustrating experiences in this country. If they do not speak out their minds, it must be because of the fear that their disclosures might endanger the security of their employment. If, as Professor Haldane has suggested, scientific personnel are chosen on the basis of research work accomplished and not on that of degrees obtained and if, at the same time, scientific workers have the freedom to conduct research, without interference by administrators, there will be more serious scientific research work in India, for, then, there will be little or no occasion for scientific workers to be engaged in intrigue against one another in their excessive preoccupation with such questions as seniority, promotion and job security. The fierce rivalry for jobs and posts in scientific establishments would need to be replaced by a healthy competition in research performance. The genuine scientist's morale cannot be maintained otherwise.

COAL TRANSPORT STUDY

The railways have doubtless brought about, through an increase in the allotment of wagons, some marginal improvement in the coal transport situation in the last one year. They have also brought into force, with effect from the 1st inst., the revised scheme of coal distribution, under which industrial consumers, each with a quota of 1,500 tons and above per month, are to be supplied with full trainloads of coal and those with smaller quotas may combine suitably for the purpose of receiving full trainloads or obtain coal from stockists maintaining dumps at places where such trainloads can be received. It is the Railway Ministry's hope that, when this scheme for bulk movement and coal dumps is in full operation and mechanised loading facilities are also created at major collieries, the coal transport position will improve further in the current year. But any substantial increase in coal haulage capacity can be expected to take place only over the next two or three years when some important railway schemes, scheduled under the third Plan, are completed. These schemes, incidentally, include doubling of the line between Allahabad and Kanpur, electrification of sections between Moghal Sarai and Gaya and between Chakradharpur and Bondamunda, dieselisation of non-electrified trunk routes carrying heavy coal traffic and programming of movements in box wagons and rakes. The proposed additional allocation of Rs. 145 crores to the Railways under the third Plan will enable them to carry out these and other schemes.

Even if everything goes well, the railways, by themselves, will not have all the capacity required for moving coal within and beyond the Bihar-Bengal area. It is here that roadways and waterways are being seriously thought of as two supplemental means of transport. But, as of today, the roadways are hardly in a position to provide relief to the railways on any significant scale, for the Government of India and the Government of West Bengal have only now finalised their scheme for improving a stretch of 120 miles of the Grand Trunk Road and the feeder roads in the Raniganj coalfield. The first part of the scheme, which envisages widening of the G.T. Road to 7 metres between Adisaptagram and Barakar with an 8-foot cart track on either side, is intended to facilitate coal traffic by heavy trucks to the Calcutta area. Its cost—Rs. 6.5 crores—will be shared equally by the Centre and the State Government. The cost of the other part of the scheme, which envisages the improvement of coalfield feeder roads, is estimated at Rs. 3.5 crores, and this, too, is to be shared equally by the Centre and the Government of West Bengal. If the entire scheme is completed as a matter of high priority within a year, it is just possible that at least five million tons of coal per annum will be moved more speedily and easily in the last two years of the current Plan, provided, of course, heavy trucks are made available in sufficient numbers.

As for the other supplemental means of transport, namely, waterways, not much can be expected therefrom, for the D.V.C. navigation canal, which was scheduled to go into operation with effect from July 1959, is yet to be fully commissioned for traffic. The technical drawbacks of this canal are stated to be too serious to permit of continuous navigation over its entire stretch. Nor is Mr K. D. Malaviya's scheme for exploiting the navigation potential of the Ganga expected to fare any better, for the utmost coal traffic through this means will range, on current indications, between 100,000 and 300,000 tons only.

It would thus appear that the coal transport situation, notwithstanding the temporary and marginal improvement expected therein during the current year, will continue to be extremely difficult. The Government has, therefore, done well to invite a Study Team from the World Bank for preparing a comprehensive report on the coal transport problem. The Team is expected to recommend measures for putting coal transport on a sound footing, having regard to the third Plan's coal programme and the projections for the fourth Plan. Its study, covering all available and possible means of transport, such as railways, roadways, waterways, coastal shipping, pipelines and ropeways, will have the following terms of reference:

(i) Consideration affecting the present and prospective magnitude and location of the demand for coal and other energy sources.

(ii) Techniques and equipment for facilitating the transport of coal by the railways through increasing line capacity, use of improved wagons, better marshalling and turnround facilities for wagons, dieselisation, electrification, etc. with specific attention to:

(a) movement in full train loads of bogie wagons for large consumers, including steel plants, thermal power stations and merchant coke-ovens, and for small consumers by setting up coal dumps at suitable points;

(b) improved manual/mechanical handling for rapid loading and unloading of full trainloads; and

(c) feasibility of pooling the output of groups of small collieries for facilitating movement in full trainloads.

(iii) Feasibility and comparative economics of short haul transport of coal by rail and means other than rail to consumers with special reference to:

(a) transport of coal from mines to coal washeries and thermal power plants; and

(b) disposal of middlings from washeries to power plants and other users.

(iv) In regard to movement by road, the study may specifically cover its economics, types of vehicles and loading and unloading arrangements.

(v) Principles affecting the apportionment of coal traffic between different modes of transport with special reference to relative costs and charges.

It is gratifying to find that the Study Team has got down to work without any loss of time. Its advance party is already in India and has just had preliminary discussions with the Coal Controller and the Joint Working Committee of the coal industry. The interim report to be submitted by the Team within the next four or five months will recommend suitable measures for maximisation of coal movement with the facilities which are already available or can be provided within the next one year. The final report, which is to be submitted within one year from now, will recommend sound, long-term measures for coal transport. Now that the World Bank has taken an active interest in the matter, it is reasonable to hope that, at long last, something systematic might be done to tackle this vexed problem on a long-term, as well as short-term, basis.

CEYLON—U.S. IMPASSE

A serious impasse has arisen in the economic relations between Ceylon and the U.S. The U.S. Agency for International Development has suspended, with immediate effect, the major part of American aid to Ceylon, following the failure of that country to provide appropriate compensation for the two U.S. oil companies (Esso and Caltex) the properties of which have been nationalised, along with that of Burmah-Shell, a British company. We advisedly say the major part, because the U.S. Government will continue to render the food aid it has promised. Only the economic aid of the order of Rs. 5 crores per annum has been withheld. And, as a retaliatory measure, the Government of Ceylon has called off negotiations with the oil companies and announced that it will proceed strictly in accordance with the provisions of the Ceylon Petroleum Corporation Act. The impasse could have been easily avoided but for the dilly-dallying tactics on the part of the Ceylon Government. Although it was early last year that the Government took over 83 petrol stations and other properties belonging to the three foreign oil companies, it has still not settled the question of compensation. If the U.S. Government has stopped virtually all economic aid to Ceylon, it cannot be accused of impairing the prospects of negotiation of a lumpsum settlement between the Ceylon Government and the oil companies, as it has extended full co-operation to the Ceylon Government to find a solution. Actually, the U.S. Government was required, under the so-called Hicklenloper Amendment, to take the action it now has on 31st January. But it waited for a full week in the hope that the negotiations that were in progress with the oil companies would be fruitful. Even now, the U.S. Government is ready to resume the aid, if the Ceylon Government quickly settles the issue of compensation.

The Ceylon Government ought to have known the specific provision in the U.S. Foreign Assistance Act of 1961 which lays down that the U.S. must suspend assistance to a country that nationalises American property and fails to provide adequate compensation *within six months*. After all, the U.S. Administration has to show respect for the statutory enactments made by the U.S. Congress. It may be noted here that the amendment referred to earlier came to be incorporated through a non-official Bill which had the overwhelming support of both the Houses of the U.S. Parliament.

No one, least of all the U.S., questions the sovereign rights of the Ceylon Government to nationalise private property. But what one questions is the way in which the Government has handled the whole issue of nationalisation of oil business. The Government has only expressed its willingness to pay compensation to the oil companies, but it has failed to take appropriate steps not only to settle the issue of compensation with the companies affected but also to make any payment to them. The Ceylon Petroleum Corporation Act contains a general provision for compensation, but it is a vague one and does not provide for prompt, adequate and effective compensation as is required by international law when property belonging to a foreign country is nationalised. The Government of Ceylon has not only flouted the spirit of international law but also exhibited utmost arrogance, as witness the following Press version of the extract from the official Press *communique*:

"The Ceylon Government are of the view that they must also show as much respect for the laws of their Parliament as the U.S. Government feel obliged to accord to their own laws."

Proceeding, the Ceylon Government gives a lecture to its people on the virtues of foreign aid as follows:

"Ceylon is aware that the loss of U.S. aid would necessitate the curtailment of the programme of economic development, unless the people of the country are prepared to make the necessary sacrifice to continue with that programme in an undiminished measure. In the view of the Government, if there is a lesson that the people of this country must draw from this experience, it is that they must rely on their own endeavours and on their resources in the main to promote the economic development of their country. Ceylon's experience in this instance shows that reliance on foreign aid could entail some measure of surrender of a country's freedom of action in regard to the adoption of policies which receive the full endorsement of its own nationals."

The stand taken thus by the Government of Ceylon is, to say the least, injurious to the people of Ceylon, which, as readers are aware, is one of the underdeveloped countries faced with the serious problem of acute scarcity of resources, trained manpower and technical know-how, as well as with a chronic balance of payments deficit. The latest move of the Ceylon Government will adversely affect the inflow of foreign private investments to the country. Why should a foreign investor risk his capital in a country where there is a possibility of the Government expropriating private property without reasonable compensation? The slow-down in the pace of foreign capital inflow and the cessation of sizable U.S. Government aid are bound to thwart the attempts of Ceylon to raise the depressingly low living standards of the Ceylonese. It behoves the Ceylon Government to live up to the hard realities of life, instead of heroically trying to implement its dogmatic socialist policies. Actually, the Ceylon Government is setting a bad example for the other underdeveloped countries. The only beneficiary of such policies will be the Communists. The Peking Radio is already playing up the incident, in an attempt to sway Ceylon into its camp. It would undoubtedly be a tragedy for the free world, including India, if Ceylon were to play into the hands of the communist powers. But it would be a bigger tragedy for the Ceylonese themselves.

NEW FERTILISER PLANT

The E.I.D.-Parry fertiliser plant, inaugurated last week at Ennore, near Madras, is, indeed, a show-piece of the private sector. It is the first plant in the private sector to take up the manufacture of compound fertilisers. The new plant, put up at a cost of Rs. 5 crores, is one of the major projects for chemical fertilisers assigned to that sector in the third Plan. The commissioning of this plant itself, to some extent, gives the lie to the charge made by the Union Minister for Steel and Heavy Industries, Mr. C. Subramaniam, who inaugurated the new plant, that there was considerable delay in the execution of private-sector projects for fertilisers. It is true that some of these projects in the third Plan are lagging behind schedule. But this has been due mainly to the protracted procedures adopted by the powers-that-be in approving foreign collaboration terms and in granting import licences for the requisite machinery and equipment. Mr. Subramaniam, no doubt, is aware of these procedural difficulties. It is certainly encouraging to hear from him that he would do everything possible to remove them.

It is quite clear to any observer of recent trends in fertiliser development that public-sector projects, too, have not come up to expectations, despite the apparently better consideration they receive at the hands of the Government. This is certainly a disturbing thought, considering the wide gap in the supply of, and demand for, fertilisers in the country. The vital need for arresting the recent declining trend in the production of some of the major crops, including foodgrains, only makes it imperative that fertiliser projects should receive top priority. It is against this background that one fails to understand the logic behind the inadequate attention given to the development of this industry. The third Plan has, no doubt, set a target of production for nitrogenous fertilisers at one million tons per annum (in terms of nitrogen). It would appear, however, that this target will remain unfulfilled. Mr. Subramaniam himself admitted at Ennore that it was difficult to attain the target of one million tons of nitrogen by 1965-66. He went a step further and observed that he was trying to see whether it would be possible to attain an annual output of at least 800,000 tons by the end of the third Plan. It would be a miracle, if even this reduced objective were realised. The gap between the development programmes drawn up by the planners and actual performance seems to be widening as the third Plan gains momentum. This is an ominous portent, especially in the context of mounting development and defence needs.

It is to be hoped that the private sector, as also the public sector, will not fail to learn some useful lessons from the speed and efficiency with which the management of the E.I.D.-Parry group has implemented its project. The Ennore plant is designed to produce about 52,000 tons of ammonium sulphate every year (or 8,250 tons in terms of nitrogen). Besides, the plant will turn out some by-products of commercial use, such as carbon dioxide and gypsum, and also secondary by-products, such as carbon black, ammonia and sulphuric acid. The capacity of the plant is proposed to be doubled in course of time. The manufacturing process is based on naphtha, a petroleum fraction, which will be obtained from the oil refinery at Visakhapatnam. The plant, it is said, is also equipped to use fuel oil in place of naphtha. The other two important raw materials are sulphur and rock phosphate, which have to be imported.

As Mr. H. V. R. Iengar, I.C.S. (retd.), Chairman of the E.I.D.-Parry Ltd., has pointed out, the project is a sort of international effort, for it has been built up with British, French, Italian and German machinery. Besides, technicians from various countries have helped in the installation of the plant. The E.I.D.-Parry group had also secured a loan from the Commonwealth Development Finance Company, Ltd., London, which was represented at the inaugural function by no less a person than Lord Godber, its Chairman. The C.D.F.C., it may be noted, incidentally, has so far invested in India Rs. 8 crores, spread over 17 major projects. This is about one-fourth of its total long-term loans of about Rs. 33 crores (for 46 projects) granted to the Commonwealth countries.

The prospects for the new unit can be regarded as bright, having been set up by the E.I.D.-Parry group, which has previous experience as pioneers in both production and marketing of fertilisers in India. Parry and Co., it may be recalled, put up its first plant for producing fertilisers at Ranipet, Madras, as early as in 1906, followed by a superphosphate plant and a sulphuric acid plant subsequently. The next stage was the establishment of continuous process superphosphate plants one at Ranipet and another at Tadepalli in Andhra Pradesh. Besides good management, the new unit is also assured of an expanding market for its production. It should thus be able to fare well and give a satisfactory return on investment, provided the powers-that-be do not upset the calculations of the Company by making changes in fiscal and price policies as is their wont.

A COMMENDABLE SCHEME

The National Loan Scholarship Scheme, just finalised by the Union Ministry of Education, is by far the biggest single and perhaps the most liberal and imaginative, effort on a national scale, so far made in this country. The proposal in principle was announced in Parliament by Dr. K. L. Shrimali, Union Minister for Education, during the debate on the Ministry's demands for grants last year, but its details have been finalised only now. The scheme will come into force with effect from the academic year 1963-64.

The main feature of the scheme is the provision for grant of loan scholarships, repayable in instalments, to meritorious students whose parents' income does not exceed Rs. 500 per month. The maximum limit of loan varies from Rs. 720 per annum to Rs. 1,500 per annum, depending on the course of study. But, in the case of students of engineering and other similar technical and professional courses, the upper limit will be raised by Rs. 250 per annum, that is, to Rs. 1,750. Repayment of loans is to be made in monthly instalments commencing from one year after the loanee secures employment. No interest is payable on the loans as long as the monthly instalments are paid on the due dates, but, in case of default, interest will be charged only on the defaulted amount.

The scheme has a twofold objective: to give financial assistance to needy and deserving students and to encourage bright students to enter the teaching profession. The latter objective is sought to be achieved by the provision in the scheme to write off the loan at the rate of ten per cent every year if the holder of a loan scholarship takes to teaching at the end of his studies. If he puts in ten years of service as a teacher, he will not be required to repay the loan at all.

Eligibility for scholarship will not be affected if a student is already in receipt of some other scholarship, except a scholarship awarded under the national scholarship scheme of the Union Ministry of Education. The amount of scholarship will, however, be taken into account while determining the limit of a loan. It is estimated that, during the next three years, 70,000 students will stand to benefit by the scheme. The cost of the scheme for the three years period is estimated at Rs. 9 crores. The Union Ministry of Education will advance funds to the State Governments for granting loans to deserving students. The loans will be given without any security or surety, except in the case of minors. Each recipient will be issued a loan scholarship book wherein all amounts paid to him and repaid by him will be entered. The procedure for applying for loan, it is said, will be simple enough to ensure that a selected candidate can claim and get the loan immediately on joining an institution as a full-time student.

Preliminary selection of candidates for the award of scholarship will be done by State advisory boards to be constituted for this purpose and the final selection will be by a National advisory board consisting of representatives of the Ministries of Education, Scientific Research and Cultural Affairs, Food and Agriculture, Health and Finance and the Planning Commission. It is to be hoped that selection will be purely on the basis of merit and that neither favouritism, nor parochialism nor communalism will be given any weightage.

The new scheme will considerably expand the scholarship facility available in the country. It has been calculated that, as many as 18,000 students will be beneficiaries of the scheme in the first year. Apart from students, the scheme will also enable teachers in schools to go in for advanced studies. This will help to increase the percentage of graduate teachers in schools which is at present low. Care, however, must be taken to ensure that only young teachers are selected for this purpose. The built-in incentive for scholarship-holders to enter the teaching profession is a well-thought-out feature. This innovation is obviously meant to ensure that at least a percentage of the students who are able to take advantage of the scheme become teachers. The present dearth of good teachers is responsible, to a large extent, for the deterioration in educational standards in the country. But a sustained flow of the best talent to the academic field and its retention there, both of which are very necessary for improving the quality of teaching in the country, cannot be ensured by this method alone. For that the attractions of the teaching profession, in terms of both material benefits and academic freedom, should be enhanced, so that talented young men and women, endowed with a spirit of service, will feel encouraged to enter and stick to the academic field with enthusiasm.

ENQUIRIES FOR INDIAN CAPITAL

MORE OIL IMPORTS FROM U.S.S.R.

From Our Special Correspondent

NEW DELHI, 12*th February*

DELHI LETTER

APART from gaining valuable insight into the current thinking of various Asian countries on the promotion if intra-regional trade, the recent discussions at the E.C.A.F.E. headquarters at Bangkok have been a rewarding experience for some members of the Indian delegation.

The report of the E.C.A.F.E. Secretariat, presented to this meeting of the Committee on Trade, strongly favoured division of labour and specialisation, especially in industrial production, on a regional basis. The establishment of industries on a wider and more diversified basis than provided in strictly national markets, it postulated, is essential if economies of scale are to be secured and exports to countries outside the region achieved.

But this is rather a difficult goal to achieve. In India's case, all the new lines of manufactures undertaken in recent years are, in the main, export-oriented. Any attempt at adjustment to accommodate another country, will directly hit her economy and, therefore, will not be countenanced. But, in regard to her heavy industries like steel and heavy machinery, she is likely to achieve surplus capacity some years later (if everything goes well) to meet the requirements of the region to a certain extent. Yet, the problem will remain over the imports from those countries, in the region which take our goods. However, the Indian participants are hopeful that, on a bilateral basis, these problems could be resolved, as has been done in the trade arrangements proposed with Indonesia.

A Significant Development

But a development of major significance for India took place in the corridors around the conference chamber. There were unofficial but persistent enquiries from some of these countries if Indian capital and engineering skill were available for joint ventures in those countries. Thailand was one of them, it is understood.

By its Promotion of Investment Act of last year, Thailand offers exemption of import duty and business taxes on raw materials and other necessary materials for the first five years' operation of the joint enterprise. Other concessions include exemption from income-tax on industrial profits for five years, guarantee against State competition and nationalisation, and the right of investors to ask for restriction on or prohibition of competing imports.

There is no ceiling on the participating foreign capital in Thailand. In some of the existing foreign or part-foreign promoted enterprises, the foreign capital ranges between the absolute (100 per cent) and as high as 99.96 per cent to 99.99 per cent.

In addition to the foreign capital from the industrially advanced countries like the U.S.A., U.K., West Germany, Italy, Switzerland, Netherlands, Denmark and Japan, foreign investments in Thailand have also come from several smaller Asian countries like Hong Kong, Singapore, Burma and Malaya. Of course, the Overseas Chinese occupy a major portion in the list of partnership ventures.

The existing foreign investments in Thailand cover a large variety of industries like steel rolling mills, aluminium products, automobile assembly and parts, cold storage, batteries and electric bulbs, radio receivers and electrical appliances, sugar, dairy products, textiles (both spinning and weaving), hotels, shipping, cement, ceramics, chemicals, glass, paints and inks, paper and rubber goods, among others.

Malaya is another country in the E.C.A.F.E. region which welcomes foreign capital investment and provides the investors with extremely attractive concessions. But the investors have fought shy of Malaya's offer and preferred Thailand for two main reasons: labour cost is comparatively higher in Malaya and its population of only 10 millions offer a rather restricted market.

Doubts are, however, expressed here whether the Indian Government will view such a proposal favourably under the present emergency conditions in the country, even if any possible joint venture of this nature is assured of a steady and substantial profit repatriation to this country.

Petroleum Developments

The Union Ministry of Mines and Fuel, it appears, is firm on its set path unmindful of any suggestion to the contrary. After having set its face against any further expansion of the private-sector refineries, it is now exploring the possibilities of doubling or even trebling petroleum imports from the U.S.S.R. under a new trade agreement scheduled for signing a month hence. At present imports from that country total upto 500,000 tons annually under a three-year contract which expires next year.

Arrangements have also been finalised for the expansion of the Barauni and Koyali refineries to three-million-ton capacity each. The Soviets are reported to have assured the completion of this task on a high priority basis within the third Plan as stipulated by the Government of India.

The Committee of Secretaries specially appointed to select the location for a two-million-ton refinery in South India, has opted for the offer of Philips Petroleum of U.S.A. as the most economical, it is learned. Pending Cabinet approval, Cochin has been preferred to Tuticorin as the site for the refinery. The Philips offer reserves 51 per cent shares for the Government, 25 per cent for itself and the remaining 24 per cent for an Indian firm of Calcutta, besides undertaking to export the refinery surplus to meet the cost of crude imports. It is felt that the terms offered by Philips would involve substantially less net outflow of foreign exchange both on account of crude imports and repatriation of profits.

In accepting this offer, the Ministry has rejected two others, one by the Shell International for a two-million-ton refinery at a cost of Rs. 10 crores and the other by ESSO for a capacity of 1.2 million tons at Rs. 9 crores.

The Government has, however, accepted equal partnership with the ESSO in setting up a lubricating oil plant of 0.5 million tons capacity in Bombay. It is proposed to launch a new company on the lines of Oil India for this purpose. The plant is expected to be commissioned within two years or a little over from the date of signing the agreement.

Meanwhile, Oil India has finalised its 1963 drilling programme in Assam. It plans to drill 34 wells during the year, the majority of them to be completed in the first six months. This *plus* the decision to increase Oil India's production capacity to three million tons by the year-end, are the results of the recent visit here of Mr. W. E. Eadie, Chairman of the Burmah Oil Company and his consultations with the Union Government.

TECHNOLOGY AND DEVELOPMENT

A unique conference, devoted to the problems of, and prospects for, "application of science and technology for the benefit of the less-developed areas" is being held at Geneva under the auspices of the United Nations. The conference, presided over by Prof. M. S. Thacker, Member, Indian Planning Commission, is attended by about 1,500 leading scientists and technologists from all parts of the world. It is intended to do some stocktaking of progress achieved in the field of world science and technology and the part played by planning in development, apart from suggesting measures for dovetailing scientific investigation to the requirements of economic development. The conference, which commenced on the 4th inst., will continue upto next Wednesday, providing a forum for exchange of views among world scientists and others. A conference of a short duration of this type, attended by hundreds of delegates, cannot be expected to make any substantial contribution to the realisation of the proclaimed objectives, unless the U.N. and its specialised agencies and the Governments concerned follow up the experts' suggestions and act in accordance with them. In this context a suggestion made at the conference to establish an institute under the ægis of the U.N. is certainly welcome. The proposed institute is expected to serve as a U.N. "brains-trust," assemble necessary information and help improve development policies in under-developed areas.

Numerous suggestions, covering a wide range of subjects have been made at the conference. On various scientific and technical matters alone, there have been as many as 2,000 papers prepared by experts on problems, ranging from soil conservation and artificial inducement of rainfall to development of atomic energy for peaceful purposes. Quite apart from technical papers, the Conference has devoted considerable thought to the question of planning and other organisational efforts needed by the less-developed countries in their efforts to provide a better standard of living for their peoples. The crucial need for planning in under developed countries was stressed by Mr. Philippie de Seynes, Under Secretary in charge of the U.N. Department of Economic and Social Affairs. Drawing a distinction between the economies of Western Europe and America, on the one hand, and of the less-developed countries on the other, he said that it was the less-developed countries that needed planning most. In North America and Western Europe, which had reached a certain level of economic maturity, development could continue without planning. But in under-developed countries, Mr. de Seynes said, things were different. For in these countries, development meant not merely a quantitative increase in production, but a change in the economic and institutional structure, for which the necessary impulse could not be provided by private initiative. The State, therefore, had to intervene both in the process of capital formation and in the orientation of investments.

The deliberations on planning, as was only to be expected, led to heated arguments on the nature and extent of official intervention in economic affairs. One view, dearer to the hearts of communist countries, favoured total Government control of the economy. On the contrary, another school of thought called for a liberal, guiding type of planning which could co-exist with the operations of supply and demand. The latter view received considerable support from the developing countries. A Harvard economist, Prof. Edward S. Mason, argued that developing nations should avoid extremes and, instead, seek "the proper mixture of centralised planning and decentralised decision-making." He made a striking point when he said that communist countries had never succeeded in finding a substitute for profits as a guide to sound economic planning, that they had in fact been moving farther away from the Communist theory, under which all investment and production decisions were handed down by Central Government planners, and that they were actually adopting measures for ensuring decentralised decision-making.

The developed countries, of course, can help the process of planning in underdeveloped economies by providing financial and technical aid. But this will be largely ineffective, if the developing countries themselves do not seek to provide favourable environment for private investment, a free market system and currency stability—a point highlighted by Mr. George S. Moore, President of the First National City Bank of New York. Equally relevant was the point made by Mr. Moore that, if the developing countries devoted greater attention to raising their agricultural productivity than at present, they would make significant progress towards their economic goals. Another important aspect relates to the need for ensuring judicious types of investment. Dr. J. H. Hollomon, U.S. Assistant Secretary of Commerce for Science and Technology, urged the developing countries to concentrate on the development of things which were more relevant to their own immediate needs rather than trying to produce others which were "less fundamental." He deprecated their tendency, to use their limited highly trained manpower in sophisticated endeavours such as atomic research, cybernetics and solid state physics, instead of training agriculturists, teachers and mechanics, whose services were essential to meet immediate local needs. This is an important point that developing countries should bear in mind, while framing the pattern of public investm...

NEWSPAPER AND SHIPPING STRIKES CAUSE A BILLION DOLLAR LOSS

From Our Special Correspondent

NEW YORK, 10*th February*

BUSINESS and financial opinion in the United States is greatly concerned these days with a number of developments. They include the hope of a tax cut, or the lack of hope; the alleged continued Soviet military build-up in Cuba; the ban of Britain from the Common Market and to a lesser degree the rift with Canada which toppled the Diefenbaker Government at Ottawa. All have profound economic implications.

In the tax cut struggle, there are two schools of thought. One points to the inevitable deficit financing and the inevitable Federal deficits tax reductions would incur initially, perhaps for several years, creating thereby most undesirable inflationary conditions. This view is held by the conservative diehards.

The antagonists say that the growth rate of the U.S. is unsatisfactory; the unemployment rate has been too high consistently; that there has been excess capacity in most industries for years; that there has been no inflation and there cannot be one under such conditions; that the economy needs a stimulus to reduce the rate of unemployment—averaging about 5 per cent of the labour force—and to reduce excess capacity; and that Budget deficits are strictly a matter of book-keeping.

There is much sympathy for either side and it is almost impossible to tell at this point which school of thought will prevail. There probably will be a compromise. Unfortunately, this matter arises at the time of minor domestic crises.

Not A Pretty Picture

The President made no bones about it at his last Press conference. Organised labour has been on a rampage and still is. At this writing, the major New York newspapers are still shut down and have been since 5th December. The economic losses have been staggering. Conservatively estimated, such losses are about $71 million in visible losses in advertising revenue, losses in circulation revenue, losses in wages and fringe benefits, losses to newsdealers and sales outlets.

Then there is the local drop in retail sales and the layoff by help in department stores, diminished restaurant and theatre trade, to mention only a few of the indirect losses arising from this strike. The National Retail Merchants Association reported that the newspaper strike has caused telephone and mail orders sales in downtown department stores to drop 75 per cent below normal. In Cleveland also, the newspapers are shut down.

I was told yesterday by a high official of one of the news syndicate services that, if the strike is not settled by 1st March so that the papers can get the Easter advertising business, there was no point in reopening before September. This is a radical view, but it makes some sense economically. Bitterness, of course, is increasing not only between management and the striking printers, but also between the printers who make it impossible for thousands of members of other unions to work.

The East and Gulf Coast shipping strike, however, has been settled, but that, too, resulted in staggering economic losses in terms of local and world trade. And there is now talk of serious rail and steel labour-management disputes to arise later this year. All this is a very unpretty picture which creates caution rather than optimism.

The economic loss from the shipping strike is estimated at $800 million at this point. Thoughtful people are beginning to ask the question how long the U.S. can afford such economic luxuries and at what point will the public rebel?

Over 55 Per Cent For Defence

All this is against the background of a Federal Budget of about $99,000 million of which $55,000 million, roughly, will go for defence and more than $5,000 million for space research. In other words, less than half will go towards productive economic purposes with the exception of the unforeseeable civilian fringe benefits which might accrue to technology, branches of other sciences and medicine from the vast defence expenditure.

There has been considerable ado about the breakdown of Common Market talks because of the non-admittance of the United Kingdom as a full-fledged member and by the curiously inconsistent and simultaneous pact of amity between France and Germany.

There are several stark facts to bear in mind. First, political opinion in the West varies greatly from commercial opinion. The Governments in all countries of the West are concerned greatly with the question of presenting a united front against Russia. Yet, after the rumpus at Brussels, the stock markets at London and all Continental exchanges registered appreciable price increases when gloom and price drops were expected.

De Gaulle and Adenauer

Another angle is a personal one, involving human nature. At certain periods during the last war, General de Gaulle created many problems for the Allied Governments. He was, therefore, not always treated with kid gloves by either Mr. Winston Churchill or Mr. Franklin D. Roosevelt. He never forgot that experience nor has he forgotten the old U.K. Empire attitude that Britain is not part of Europe. This is not conjecture. I know whereof I speak. Premier General de Gaulle has a long memory.

So far as Chancellor Konrad Adenauer of Germany is concerned, he was asked to remove himself as Mayor of the City of Cologne, because one of the majors of the British occupant forces considered him incompetent. Mr. Adenauer's memory goes back ten years longer than Mr. de Gaulle's. Besides, Mr. Adenauer's life dream has been to eradicate Franco-German enmity and he wanted to cement amity before his time was up. Superimposed on this emotional background is the undisputable fact that both Mr. de Gaulle and Mr. Adenauer are "benevolent" autocrats up to a degree, the same perhaps, as Winston Churchill, Franklin Roosevelt and Charlemagne.

Credit Policy

Out of this Common Market brew has come a spectacular turnabout in interest arbitrage. There has been much talk of a hardening of U.S. credit policy. It would be more correct to say there has been a slight change in the degree of ease in Federal Reserve credit. The net result of all this is that there is no more incentive to move funds from the U.S. to London, or elsewhere.

In fact, the opposite is true. The yield spread is now in favour of the U.S. If this trend continues, it should help the U.S. international balance of payments position.

Disastrous Winter

Sub-zero weather in this country and in Europe—this winter is called the worst so far in this century—led to many economic tolls. Workers were kept at home. Factories and schools were closed. Automobile assembly lines were shut down and steel production was below expectations. Crops were damaged by frost as far south as Florida and Texas in this country. Thus, bills for food may go up.

Industries benefitting from this winter were, of course, the oils and utilities. Petroleum runs in refineries were stepped up to meet heating demands. But the by-product was a build-up in petrol stocks which otherwise would not have occurred and was, in fact, unnecessary. Utilities also gained from greater demand for heating and lighting this winter.

G.N.P.

LONDON LETTER

BANKING THROUGH BANKERS' EYES

(*From Our Own Correspondent*)

LONDON, 8*th February*

IT is a poor year in which the chairmen of Britain's leading joint-stock banks do not have some special theme of broad interest on which to comment in their annual January speeches. This year the problems of banking in "a changing world" have taken pride of place and the remarks of Lord Monckton, the Chairman of the Midland Bank, have certainly developed the theme to its fullest extent. All his colleagues have had some comment or other to make upon it.

The first point that every banker notices is that, after much straining against the leashes of credit restriction, the banks have now found that having full freedom is not leading to the expansion in their business for which they had hoped.

Flow of Credit Money

Moreover, they, like every other form of institution, find that life is becoming more competitive. "In the past few years," says Lord Monckton, "funds have moved through other hands on a large scale." He instanced the habit of Local Government authorities to borrow on short-term from the public directly; the large investment in building societes—not by people who want to build a house but who simply find the interest offered by the society more attractive than that offered by the banks and the security adequate; the habit of overseas short-term lenders making deposits through accepting houses and overseas banks in London; also the growth of hire purchase as a means of obtaining credit. Finally, there is the Government ever increasing its own day-to-day resources by borrowing in one form or another directly from institutions and individuals. The result has been that the flow of credit money or, if one likes it put it, extra-bank deposits has grown more rapidly than the total of bank deposits. Hence the conclusion of the Midland Bank Chairman that the "part played by banking in the financial arrangements of the country is diminishing."

What has been the reaction of the banks to this movement? First, they have looked to see whether any of the competition they are facing is "unfair" and they obviously see that, when it is a matter of restricting financial activities, the banks are on top of the list and other financial institutions do not suffer as much pressure; that, of course, is a tribute to the pre-eminent position of the banks in the sphere of lending, but, in the face of competition, their concern is legitimate. Moreover, from the economic viewpoint, if the Government of the day is seeking either to attract or to expand the economy, it must apply its measures through all the effective channels and not only through the traditional ones.

Bank Charges Too Low

Next, the banks have considered whether they can face the competition for obtaining financial resources by increasing their own deposit rates. Such a move would inevitably lead to higher lending rates and this could not be to the advantage of the banks who can justly claim that—in the words of the Westminster Bank Chairman—they "remain by far the cheapest lenders to creditworthy borrowers, a function that is not to be lightly regarded." Nevertheless, an ominous note is struck by a suggestion that bank charges may be too low. At this point, of course, competition between the banks themselves becomes of paramount importance; the competition for deposits and to make loans is keen and, unless all banks begin to feel the pinch on their profits severely, it would be impossible for one bank to make a noticeable difference in its charges.

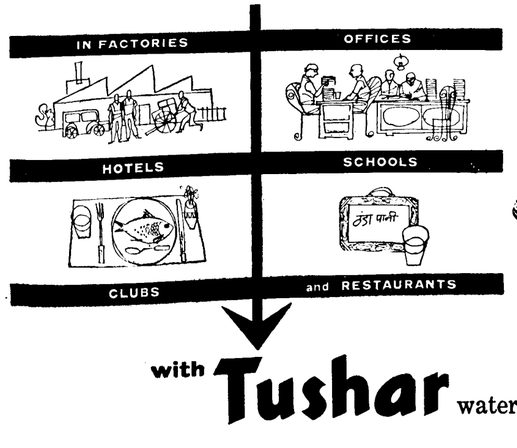
Yet, although the banks are noticing with concern the competition from outside institutions, they have to confess that the turnover on their own bank accounts is becoming more intensive and the use of the facilities they offer is becoming heavier. Indeed, the Chairman of Barclays, the bank which has now taken top place in deposits, is not perhaps as concerned as other of his colleagues, for he says: "If increased deposits were an end in themselves, they could easily be gained, at least for a time, by various unprofitable methods. We are seeking new ways to help the development of commerce and industry both here and overseas by channelling money from where it is available to where it is required. . . ." But the Chairman of the Midland Bank was responsible for giving what may become a classical analysis of the functions of banks in fields in which they are without competition: (1) in the unquestioned safety of funds entrusted to them; (2) in the efficient transfer of money; and (3) in lending for short-term at highly competitive rates.

These are the true fields of banking and any institution which succeeds in entering them would appear to have qualified as a bank. The bank chairmen appear unanimous that, like the cobblers, they should stick to their last and maintain their pre-eminence in the fields of activity they rightly regard as peculiarly their own and accept competition in the more adventurous realms beyond. The British joint-stock banks show no inclination to follow their Continental colleagues into fields of closer engagement in commerce and industry.

(*Concluded from previous page*)

cent, to $578,000 million in 1953, is somewhat higher than the annual gain since the turn of the century which is somewhere between 2½ and 3 per cent.

The President, in his Economic Report to the Congress, said however such a growth rate "would leave the economy well below the Employment Act's high standard of maximum employment, production and purchasing power."



The view of bankers, at this point, is moderately optimistic. A plentiful supply of funds is expected to be available for investment. There will be very heavy demand by the U.S. Treasury for refunding this year in addition to the financing of the anticipated deficit.

Competition in nearly all lines of endeavour is expected to be keen.

There is very little new in the United Nations. Points of concern continue to centre around Cuba, Indonesia and Africa. So far as the Congo is concerned, everyone is holding one's breath that the truce between Katanga and the Central Government will prevail and it is suggested, as a safety measure U.N. troops should remain for at least another year, though this would mean a considerable expense to the U.N.—*All Rights Reserved.*

FOREIGN EXCHANGE OPERATIONS OF U.S. GOVERNMENT—II

NEW ROLE MAY BE PERMANENT

[Readers will recall that, in the last issue of this journal, we published a part of the article prepared by the Morgan Guaranty Trust Company of New York on the decision of the U.S. Treasury and the Federal Reserve System to resort to open market operations in foreign currencies. The rationale for this decision and the experience of the U.S. Government and its central banking system were explained in that instalment. We now present the second and final instalment of the article. This contains a further account of the U.S. experience and a brief analysis of the implications of the U.S. departure from the principle of non-involvement in the foreign exchange market. It is pertinent to add here that the continuing balance of payments deficit has compelled the U.S. authorities to step up their acquisition of foreign currencies, in order to defend the dollar in foreign exchange markets. In January 1963, for instance, the U.S. Treasury sold to foreign Governments $213 million in special non-marketable securities in return for their respective currencies. The sales comprised: To West Germany $50 million in 3.13 per cent 15-month bonds and another $50 million in 3.18 per cent 18-month bonds; to Switzerland $30 million in 2.82 per cent 16-month bonds; to Canada $125 million in 3.10 per cent 15-month bonds; and to Italy $58 million in 3.125 per cent five-year notes. Earlier redemption of bonds is possible through special arrangements. Similar operations were conducted with Italy and Switzerland towards the close of last year. The latest bond sales supplement the Federal Reserve Bank's currency swap arrangements with 10 foreign countries and the Bank for International Settlements covering a sum of $1,050 million.—ED.]

THE Treasury's venture into the market for forward Swiss francs also was occasioned principally by the aftermath of the March 1961 revaluations. The flow of speculative funds to Switzerland was heavy, and the Swiss National Bank acquired dollars in considerable volume in fulfilling its obligation to maintain dollar-franc parity under terms of the European Monetary Agreement (neutral Switzerland has not joined the International Monetary Fund). The threat of large conversions into gold—in line with Swiss national policy of holding its reserves chiefly in that medium—was temporarily averted when the Swiss central bank lent a substantial portion of its dollars to Britain under the "Basle agreements," but the threat revived in midsummer as the U.K. repaid the Swiss with dollars drawn from the I.M.F.

In contrast to the German situation, where high premiums on the forward mark had diverted commercial hedging transactions from forward to spot markets, the Treasury's Swiss problem was that high premiums on the forward franc were discouraging investment in dollar media. It was too expensive for commercial banks and others in Switzerland to make short-term investments in the New York money market and buy the return trip into francs.

Short-term interest rates at the time were 1 per cent to 1½ per cent higher in the U.S. than in Switzerland, but the spread was more than offset by the then existing premium of 1¾ per cent to 2 per cent on an annual basis on the forward franc. On those terms, Swiss accounts acquiring dollars were likely to dump them on the market, from which they would find their way to the Swiss National Bank—and subsequently to the United States Treasury for redemption in gold.

As it had done in the case of the mark, the Treasury attacked the forward market. Beginning in July, it sold forward francs, at first on a relatively limited scale. When tension in Berlin prompted a new flow of funds to Switzerland, the Treasury stepped up its pace. The Swiss National Bank provided a sizable line of credit to help meet the forward commitments as they came due. This help, which was utilised to the extent of 200 million francs in October, greatly facilitated the operation.

As the Treasury kept pushing out forward francs, the premium over the spot rate came down, making hedged investment in dollar assets once more profitable to Swiss parties. By autumn the Treasury had forward commitments totalling some 650 million francs, and the premium had fallen to ½ per cent. Developing weakness in the Swiss trade balance eventually reinforced the Treasury's efforts, and, in the early part of 1962, the spot dollar rate improved sharply. The Treasury then was able to unwind its position comfortably and repay the francs it had borrowed from the Swiss National Bank.

The pattern set in the German and Swiss operations was repeated, on a much smaller scale, in the Treasury's intervention early this year in the market for forward Dutch guilders. The Swiss franc demanded attention again last summer, principally because devaluation in Canada and falling stock prices in the U.S. prompted a flow of funds into Switzerland and sparked demand for forward francs. The Treasury made some forward sales, but they did not approach in size the operation of 1961.

The Fed's Drawing Room

The Federal Research System first gave notice last February of its decision to put some of its resources into the exchange stabilisation effort. Even before that, however, Federal Reserve officials played an important consultative role in the Treasury's exchange operations, and they have continued to do so. The collaboration is natural: this country's central banking system has close ties with its counterparts abroad; also, the Federal Reserve Bank of New York, as fiscal agent of the United States, carries out the Treasury's foreign exchange moves as well as those of the Federal Reserve System.

In the more direct role it assumed last February, the Federal Reserve has followed an approach generally different from that of the Treasury. Staying out of regular forward markets, it has concentrated principally on negotiating, and utilising, "swap" arrangements with central banks of other countries. These are reciprocal credit facilities entitling either party to draw specified amounts of the other's currency for a limited period of time. Such compacts have been made with the central banks of nine countries (Austria, Belgium, Canada, France, Italy, the Netherlands, Switzerland, United Kingdom, West Germany) and with the Bank for International Settlements, sometimes called the central bank for central banks. The drawing rights gained add up to the equivalent of $900 million, matched by dollar drawing rights extended to the partners in the swap arrangements.

At various times in 1962, the Federal Reserve has availed itself of the swap facilities to draw Swiss francs, Dutch guilders, and Belgian francs. Drawings have occurred characteristically at times when the dollar was under pressure in the exchange markets and foreign central banks were taking in more dollars than they were likely to retain. The Federal Reserve has used the currencies obtained by swap to buy from the respective central banks dollars they otherwise might have presented as claims for Treasury gold. By this device the Federal Reserve presumably has been able to hold attrition of the U.S. gold supply to less than it otherwise would have been. As pressure in a given exchange market has eased, and foreign private parties have become more willing to hold dollars, the Federal Reserve has been able to sell dollars in the open market and thus get the foreign currencies in which the drawings at the foreign central banks must be repaid.

With its network of reciprocal arrangements, the Federal Reserve has the means of coping, at least initially, with temporary pressures on the dollar from any of the principal foreign currencies. It used these resources actively, for example, against exchange disturbances set off by the Canadian devaluation and by the sharp drop in stock prices in the U.S.

A Special Dollar

When the Federal Reserve makes a swap drawing, the other side of the transaction gives the foreign central bank an equivalent dollar credit on the Federal Reserve's books. This might appear to undo the effect of the Federal Reserve's purchase of dollars from the foreign central bank, since it leaves the latter's total dollar holdings unchanged. There is an important difference, however, between the ordinary dollar holdings of a foreign central bank and those created by a swap. The swap dollars carry, by the terms of the deal, the Federal Reserve's commitment to replace them at a set future time with the foreign currency which was drawn, and to do so at the same rate of exchange as prevailed at the time of the drawing. Thus the foreign central bank can hold swap dollars without incurring any risk.

This ability to create a special kind of dollar, more attractive to foreign official holders, makes the swap an ingenious and peculiarly useful device. Although it falls short of providing the gold guarantee which a number of foreign commentators have suggested the U.S. should attach to the dollar for the reassurance of foreign central banks—a suggestion properly rejected by U.S. officials—it affords a near-equivalent so far as swap dollars are concerned.

Success Within Limits

Exchange intervention by official U.S. agencies has had its moments of triumph, aided by circumstances that must be called fortuitous. It has been most successful when the difficulties to be dealt with were clearly of a temporary nature—as in the German and Swiss operations. Officials themselves have cautioned that there are limits to the effectiveness of intervention in effecting relationships between national currencies under conditions of currency convertibility. Eloquent testimony to the limitations can be drawn from developments in the authorities' current undertaking directed at strengthening the dollar in relation to the Italian lira.

A programme of selling forward lire, and of intervening in spot markets as well, was begun last January. There was no speculative flare-up to contend with, but the dollar had been "on the floor"—that is, at the bottom of its parity range—against the lira in the spot market for more than eight months. In those circumstances, the Bank of Italy was acquiring substantial quantities of dollars in support operations, and the Italian office of foreign exchange—which deals in forward as well as spot currency—was experiencing unusually heavy demand for forward lire.

The extent of the Treasury's operations in lire has not yet been made a matter of public record. It is known that at the beginning of the operation the Treasury took over a substantial block of forward lira contracts from the Italian foreign exchange office, and indications are that U.S. authorities have made sizable additional sales of forward lire in the interim. The Treasury has disclosed that it has drawn Italian lire worth $200 million under a line of credit extended by the Bank of Italy, presumably for use in executing spot transactions.

Despite the Treasury's operations of apparently substantial size, the spot rate for the Italian lira is still very close to the permitted upper limit. The stubbornness of the situation is further attested by the Treasury's recent announcement that its borrowings from the Bank of Italy, made originally on a three-month basis, are to be converted into a series of fifteen-month obligations, and by the Federal Reserve's disclosure that its swap with the Bank of Italy had been increased from $50 million to $150 million.

Some slight improvement in the spot dollar rate has occurred in very recent weeks, reflecting in part a change in Italian banking regulations on 1st November which permits Italian commercial banks to borrow more liberally abroad. But whether this recent development marks a significant and lasting improvement can not be judged as yet. Doubtless the Treasury action has had some effect in impeding accumulation of dollars by the Bank of Italy. Unless the dollar improves materially in the spot market, however, the flow of dollars to the Bank of Italy is only being postponed, not averted.

Striking Differences

There are striking differences between the Treasury's Italian operation and the earlier major ones in German marks and Swiss francs. In both the German and the Swiss cases, improvement in the spot rate came fairly soon after the Treasury's intervention in the forward market began. In both cases there were obvious reasons, besides the Treasury's action, for the improvement. Principally, there was a subsidence of the speculative fever that had been kindled by the revaluations of March 1961. With this temporary factor removed, and with the added help in one case of Berlin tension and in the other of a weakening in the Swiss balance of payments, the two potential crises were headed off.

No such accommodating turn of events has come in the Italian situation. More importantly, the pressure on the dollar in terms of the lira has its chief source not in temporary psychological factors but in the continuing surplus in the Italian balance of payments. Thus the lira operation clearly illustrates that official intervention in the exchange market—successful as it has been in coping with sudden strains and distortions—is by itself of limited force in striking at persistent trouble in a country's payments position.

Neither is it a dependable escape from the consequences of interest-rate differentials between countries. Under some circumstances, to be sure, a sizable and timely operation in the forward market may help deter the outflow of funds that an adverse differential tends to induce. Certainly the foreign currency dealings of U.S. official agencies in the past twenty-one months may be presumed to have encouraged the makers of monetary policy to try defending the dollar without resort to the standard defensive device of a general rise in interest rates. But intervention in foreign exchange is not a substitute for needed actions in the field of monetary policy. The forward exchange market directly affects only those capital flows that involve hedging. If an investor going out of dollars to earn a higher rate is willing to take the risk that getting back into them may involve some capital loss, he is not concerned with the price of forward dollars, and official intervention to drive that price up (by forward sales of the foreign currency) will not dissuade him from making the switch.

Inevitably the involvement of the Government and the central banking system in foreign exchange dealings provokes questions as to the risk of incurring capital losses. The risk is greatest in the forward markets, where parity maintenance commitments do not apply. The Treasury's typical forward operation thus far, however, appears to have been risk-free. In most if not all cases, the foreign currency has been sold forward at prices higher than the peak it can be allowed to reach in the spot market under I.M.F. and other stabilisation rules. There has been assurance, in other words, that maturing forward contracts could be covered at a profit by purchases in the spot market. An upward revaluation of the foreign currency in the interim would spoil the game, of course; but, if the central banks, as has been intimated, have some form of understanding against such surprises, the forward sale is, indeed, a safe one, so long as it is made at a price above the spot ceiling.

But if the Treasury makes forward sales of a foreign currency at prices below the spot ceiling—as it presumably might find reason to do under some circumstances—there is always a possibility that the covering purchases ultimately may have to be made at higher prices and a loss thereby incurred.

Two-way Street

Another potential cost of currency dealings by official agencies must be counted. The programmes as carried out have relied heavily on the co-operation of foreign Governments and central banks. A willingness to reciprocate when the hole is in the other fellow's shoe is at least implied in the arrangements that have facilitated U.S. operations in foreign currencies. Indeed, the Federal Reserve entered into a $250 million swap arrangement with the Bank of Canada last June, which the Canadians drew upon to assist them through the period of intense strain on their dollar. In this instance, no risk of loss to the U.S. from a possible devaluation of the Canadian dollar was involved, since repayment in U.S. dollars at the established rate was assured. But reciprocity could on some future occasion take a different form.

What this may eventually involve is too broad a question for meaningful conjecture and, in any case, the U.S. is likely for some time to be more beneficiary than benefactor in the workings of monetary alliance. For the longer run, however, it is important to recognise that official involvement of the U.S. in foreign exchange activity is not likely to end when this country gets the better of its own balance-of-payments problem. The broadening which has occurred in the monetary role originally assumed by the United States at Bretton Woods seems almost certain to become a permanent one.

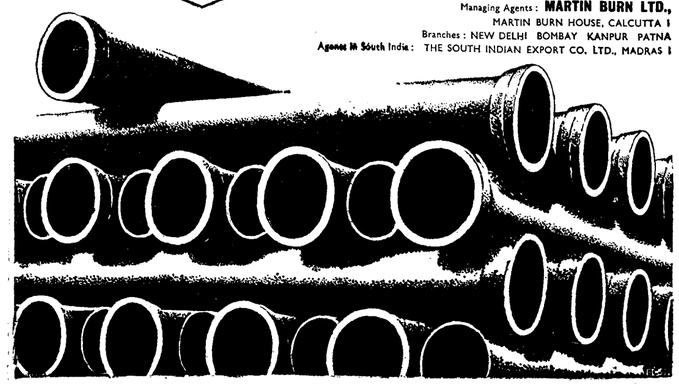
IISCO-STANTON Cast Iron Spun Pipes



Made to BSS 1211 of 1958 and Vertically Cast Pipes to BSS 78 of 1938.

IISCO pipes are used throughout the length and breadth of the country. Among the big projects that have already used IISCO pipes are: the Mattanchery Project at Ernakulam, 8,62,000 Rft; the Water Supply and Drainage Scheme in Madras State, 48,02,000 Rft and the Ajmer Water Supply Scheme, Rajasthan, 3,69,000 Rft. Today, IISCO pipes are being again employed at:

Patratu Water Supply Project A/c. Chief Engineer, P.H.E.D., Bihar, Patna.	4" to 30" Spun Pipes	1,36,050 ft.	5355 tonnes approx.	
Coal Mines Water Supply Scheme A/c. National Coal Development Corporation Ltd.	14" to 27" Spun Pipes	1,25,591 ft.	5456	"
Municipal Corporation of Delhi.	24" to 36" Spun & V.C. Pipes	53,613 ft.	11943	"
Ahmedabad Municipal Corporation.	60" V.C. Pipes	5,676 ft.	2345	"
Fertilizer Corpn. of India Ltd., Namrup Project.	16" to 24" Spun Pipes	22,874 ft.	1461	"
The Chief Engineer, L.S.G.E.D., Lucknow.	15" to 27" Spun Pipes	25,695 ft.	1448	"
Corporation of Madras.	21" to 33" Spun & V.C. Pipes	23,766 ft.	2135	"
The Executive Engineer, P.H., Visakhapatnam.	14" to 18" Spun Pipes	16,405 ft.	196	"
The Public Health Engineer, M.P. Bhopal.	30" to 36" Spun & V.C. Pipes	10,454 ft.	1375	"
Maharashtra State Electricity Board.	21" Spun Pipes	21,000 ft.	1761	"

INDIAN COTTON TEXTILES AND EUROPE

MISGIVINGS OF IMPORTING COUNTRIES UNFOUNDED

THERE are serious misgivings among the developed countries about India's exports of cotton textiles. The misgivings stem from their belief that the Indian goods constitute a low-cost product and as such they would, if allowed free and unrestricted entry, cause havoc to their domestic textile mills. This fear has been used as a pretext for reviving protectionism in the U.K., the U.S. and European Common Market nations. For some years now, the U.K. has been having an import ceiling agreement with India. The pressure tactics adopted by Lancashire millowners in order to secure for themselves a protective wall to cover their high-cost units and the misleading propaganda carried on by them have been chiefly responsible for creating a frightful image of Indian cotton textile industry among the other developed countries. The U.K.'s restrictive step has made it extremely difficult for India to secure any worthwhile concession from the Common Market countries which had all along been subjecting imports of cotton textiles from Asia to severe handicaps. For instance, in the latter half of last year, when India was negotiating with the Common Market countries for lowering the barriers against its cotton textiles, the textile manufacturers in these countries organised strong protest meetings and quoted, *in extenso*, Lancashire's wails in support of their resistance to any concession to Asian textiles. The latest developed country to initiate restrictive action against India's textile exports is the United States of America. The damage done by Lancashire millowners and trade unions to Indian cotton textiles is thus immense.

Viewed against this background, the pamphlet entitled *Indian Textiles and Europe —An Appraisal*, published by the Indian Embassy in France for the Indian Cotton Mills Federation for circulation in Europe, is, indeed, very timely. The publication provides an objective presentation of the textile industry in India, seeks to refute the allegation of competition from low-cost textiles, and impressively highlights the urgency of Western countries liberalising their policy as regards the entry of Indian textiles into their markets.

Six Vital Facts

Declaring that the roots of India's cotton textile industry lie buried deep in the dim antiquity of its enterprise, the study has brought out six vital facts. First, the industry as such, with facility to export a certain proportion of its output, is basic to the country's economy. Secondly, it is no part of Indian policy to flood overseas markets with its cotton textiles. Thirdly, the mechanics of this industry are such that domestic demand absorbs an overwhelming proportion of its cloth, leaving only a small percentage for export. Fourthly, unlike many other countries which export garments and finished cloth, by far the vast bulk of Indian exports consists of grey cloth in coarse and medium categories which is outside the manufacturing programme of most European mills. Fifthly, the cheapness of Indian cloth is a myth. And, finally, the access of Indian cloth to Western markets can cause no disruption.

That the fear expressed by Western countries that the Indian textile exports are having a serious impact on their domestic industry is absolutely unfounded, is evident from the data furnished in the pamphlet. The third Plan export target of 800 million yards represents no more than 10 per cent of the total production and this is not indicative of any desire on the part of India for dumping. The exportable surplus, it has rightly been pointed out, is only calculated to serve as a minimum essential source of foreign exchange, amongst other likely earners, to secure for India a basic competence to meet its international liabilities in commerce. Nor, in terms of quality, is there any real competition between Indian exports and the manufactures of highly developed countries in other textiles. Since Indian exports consist predominantly of grey cloth which is processed in the developed countries, they fall more in the category of raw materials than of finished products and serve, rather than rival, the industries of the latter countries. The proportion of grey cloth to the total exports of cotton piecegoods to the U.K. and the U.S. is about 96 to 97 per cent, and some 95 per cent of the cloth exported is of medium or coarse categories made mostly from yarns of counts lower than 25. In Europe, on the other hand, mechanical and technical superiority induces the manufacture of finer qualities of cloth which is also more attractive in providing a much higher return on capital and labour. Drawing attention to these aspects, the pamphlet makes the following interesting observations:

"So far as highly industrialised countries are concerned, it would not pay India to export cloth made from finer yarns. This type is almost totally earmarked for home consumption. Its manufacture requires imported cotton with its longer staple. The landed cost abroad would be so prohibitive as to make it almost impossible for it to enter any Western market. Finally, with its meagre capacity and the volume of domestic demand, Indian industry has hardly any margin for producing an exportable surplus of any dimension in this category of cloth. It follows, therefore, that, as regards Indian exports, a distinction must be drawn in two respects: (1) It is neither legitimate nor equitable to lump her exports of exclusively coarse and medium grey cloth in the general current of exports of all kinds of cotton textiles—including finished textiles, garments, etc. —from certain other sources; and (2) it is both unfair and untrue to invest this coarse cloth with an element of competition against the domestic industries of the more developed countries whose enterprise it is designed to serve, not to substitute.

"An assessment of these coarser qualities themselves has been confused by misconceptions as regards the Indian price structure. True, individual wages are comparatively low in India; but these are in fact invisibly inflated by fringe benefits such as cost of living allowances, health insurances, provident fund, gratuity, paid holidays, yearly bonuses, etc. Inefficiency of labour and low productivity; climatic conditions; obsolescence of machinery and technique; high incidence of charges on credit, energy, freight, and excise duties, all combine to pile up a bill of costs of which the uninitiated have little perception in their preoccupation with isolated but deceptive criteria of unfamiliar economics. The proof is that, in certain countries where Indian exports have been linked with quotas, these have remained inadequately utilised for reasons of high and uncompetitive prices. For example, a recent study of the price situation showed that, in certain standard categories of cloth, prices for Indian exports have been found higher than those quoted by China, Formosa, Hong Kong, Yugoslavia, Turkey, Japan and even France. It is, therefore, unfair to adumbrate commercial policies, even more to penalise the legitimate but modest enterprise of a friendly country, on the basis of imperfect generalisations."

The pamphlet has cited certain facts and figures about the conditions prevailing in the cotton textile industry. Although the objective of the pamphlet in giving such data is to enable the Western nations to appreciate the position of costs involved in Indian textile production, the data should also certainly serve to focus attention on the imperative need for expediting the modernisation of the industry. Almost a third of the total spindles working in India is over 40 years old and only 8 per cent of the looms is automatic, as against 60 per cent in Europe and almost 100 per cent in the U.S. The *per capita* productivity is very poor due to high labour turnover. The cotton mills in India employ on an average as many as 10.68 workers per 1,000 spindles and 70.12 workers per 100 looms, the corresponding figures for Europe being a bare 1.8 and 15.0, respectively. As productivity is poor, wage costs per unit of cloth and yarn are high. Taking the average monthly wages in Europe and India at £37 10*s.* and £10 10*s.*, respectively, in the case of spinners and £45 and £13 in respect of weavers, the monthly wage calculations give the following results:

	India	*Europe*
	£	£
Per 1,000 spindles	112-2½	67-10
Per 100 looms	900	675

In other words, on comparable mechanical operations in terms of labour, the wage costs in India are well above those in Europe to the extent of 60 per cent in spinning and 33 per cent in weaving. What is worse, India no longer enjoys the advantage of cheap cotton supply. Summing up the factors governing India, the pamphlet observes:

"The analysis ... discloses an economic scene altogether different from the one generally conjured up to exercise the imaginary menace of Indian competition. The price of Indian cotton is, in fact, above world parity. Wages are, in effect, higher than the ostensible figures of salary. Antiquated machinery, rising expenses, the fiscal pattern of a young but avid democracy, all combine to inflate a bill of costs which loads rather than lightens Indian initiative in foreign markets. It is invalid, therefore, for critics to flog the dead horse of Indian prices or to cry wolf behind the bogy of market disruption."

A very pertinent point which the pamphlet has emphasised is that a high level of exports is in the interests not merely of India but also of the developed countries themselves. To quote the pamphlet:

"And yet India must export—not only to achieve economic viability but also to make a success of the most spectacular experiment of democracy in history. It is to sustain her efforts in the consummation of this purpose that India has received such massive assistance from the friendly corners of civilisation. She has been given financial and technical aid for purposes of industrialisation, in order to increase her purchasing power and to improve the standard of living of her people. But loans have to be serviced, and purchasing power depends upon earnings. India must, therefore, export. More: the successive Five-year Plans, devised to give moral and material expression to India's democratic ideal, require an ever-expanding current of imports from the very countries which look askance at her efforts to earn the means of paying them. For India, therefore, exports are doubly vital. Looked at from the other side of the fence, the highly industrialised countries should be similarly, if not equally, interested in her exports. For, apart from the contemporary economics of commercial exchanges, in the measure in which India's needs and the means to satisfy them increase as a result of international assistance, the more advanced countries will accelerate the rhythm and widen the range of their own exports to India."

Factual Misconception

In support of its plea for international obligation to assist India's exports, the pamphlet has alluded to the provisions of the short-term and long-term international cotton textile agreement as well as G.A.T.T. Ministerial Declarations. Referring to India's position in the U.K. market with reference to the European Common Market and commenting on Lancashire millowners' exaggerated appraisal of the impact on them of the arrival of Indian textiles, the pamphlet says:

"The highly industrialised countries of the West, notably the E.E.C., sieve exports of Indian cotton textiles, for their own territories, through a factual misconception of the facts both as regards the Indian trade and the interests of their own industries. And, as regards the United Kingdom, the price of her admission to a club, new in fashion, has to be paid by those, India amongst them, who derive no privileges from this membership. ...

"It is obvious that India is not the prodigal daughter for whom the fatted calf in Lancashire is being killed. Even if imports from the three Asian Commonwealth countries (India, Hong Kong, Pakistan) are taken together, the erosion of their stakes by the inflow of competition from other countries stands out as a striking feature of the period 1956-61. For, while within this span of years the share of the Commonwealth countries in British imports of cotton textiles fell from 65 per cent to 44 per cent, that of 'other countries' rose from 35 per cent to 56 per cent."

Three important conclusions emerge from the aforesaid survey. In the first place, Indian exports constitute no threat whatever to the cotton textile industry of either the Continent or the U.K. The textile industry in the Common Market countries is equipped largely with modern equipment and are adopting rationalised methods of manufacture. Almost three-fifths of the total looms in place represent automatic looms. Conditions in the British industry have also improved significantly following the implementation of the £30-million reorganisation scheme. The second conclusion is that "the European countries should, in their own interest as much as of India," liberalise their policy as regards the entry of Indian cotton textiles. And the third is that the present favoured position of Indian textiles in the U.K. is incapable of bearing the impact of any tariff, however small. While the study under reference should enable the developed countries to view the problems of the Indian textile industry in their correct perspective, an important lesson for India also emerges from it. The lesson is that the competitive ability of the Indian cotton textile industry in world markets can be improved and sustained only by energetic action for reducing the cost of operations through introduction of more modern and up-to-date machines, judicial employment of labour and, above all, competent management.

APPEAL FOR CAMPAIGN TO HELP TEXTILE INDUSTRY

"IS IT MADE IN BRITAIN?" SLOGAN

From Our Special Correspondent

MANCHESTER, 5*th February*

MAYORS of Lancashire cotton towns, Members of Parliament, and textile union leaders heard an appeal for a campaign to help the Lancashire cotton industry. It was made at the opening of a new £100,000 Manchester factory by a director of a company which has already pledged its determination to use only cloth made in Lancashire in its products. As red roses—"a symbol of Lancashire's greatness"—were pinned on the lapels of 60 guests attending the official opening of the factory in Fairfield Street, Manchester, Mr. Bernard Terry told them:

MANCHESTER LETTER

"Now is the time to forget the past and look to the future. What we need now is a Red Rose campaign to show Lancashire cotton today as an enterprising, forward-looking industry. Let me say this to twenty million British housewives. When you buy cotton textiles put them to the Red Rose test and ask the shopkeeper: Is it made in Britain?"

Mr. Terry added: "Plans to spend £115 million on modern plant are going ahead and Lancashire mills will soon be among the most up-to-date in the world."

The company Customagic Manufacturing Company, decided on its "Lancashire only" policy after two Directors made a 30,000-mile tour of Hong Kong, India and Europe sampling overseas cloth. When they returned, they announced that Lancashire cloth was the best in the world and placed a 1,000,000 yard order worth £250,000. Mr. Terry said that more big orders would be placed. The new factory will find jobs for 100 girls producing loose covers for furniture.

Steam Era Ends

One of the last links with the early days of the Lancashire cotton trade, when steam generated power in the mills, will soon be broken. Mill enginemen and steam-power experts who have kept the wheels of cotton factories turning for more than a century have announced that their union—the National Engineers' Association —is to be wound up.

Mill closures and the advance of electrical power have put many men out of work and membership of the Association has fallen by 60 per cent since 1948. Now the 300 remaining members, including engine maintenance men and boilermen, have voted to wind up the association in the next few months.

The General Secretary, Mr. John Harrison, a former engineman, said: "We are very sad about it. Our union is one of the oldest in the country. But the cotton industry has contracted so much that our membership is constantly going down."

Members are being recommended to join the National Union of Enginemen, Firemen and Electrical Workers.

Export Price Trends

Always a good guide to the general trend of prices for cotton goods is the average level of earnings from exports. The diminishing volume of shipments abroad over the past 50 years has not necessarily meant that British spinners and weavers have received smaller returns for their supplies and, in fact, the variation in values has been very considerable at times. These movements are illustrated in the following table, which shows the average price obtained for cotton yarn and cloth exports in selected years over the past half century:

(Yarn *d.* per lb.; cloth *d.* per yard)

	Yarn	Cloth		Yarn	Cloth
1914 ..	16.09	3.31	1950 ..	86.33	29.53
1917 ..	30.11	5.44	1952 ..	119.25	33.87
1920 ..	77.71	15.92	1957 ..	107.15	32.29
1922 ..	31.53	7.93	1958 ..	96.85	32.97
1930 ..	25.35	5.91	1959 ..	88.42	32.77
1935 ..	18.91	4.71	1960 ..	96.06	32.31
1940 ..	26.79	7.38	1961 ..	95.32	34.23
1945 ..	43.47	14.71	1962 ..	83.89	33.70

After the big boom which followed the end of the First World War, earnings from shipments tended to fall away during the difficult times of the 1930's, reaching a position where export yarns were commanding barely 1*s.* 6*d.* a lb. and cloth was being sent abroad at less than 5*d.* per yard. Again, the incidence of hostilities brought rising prices and, in the post-war period, inflation has played its part in keeping values high despite the limited offtake to overseas markets.

Last year saw a rather noticeable fall in the average price of yarn exports, although the volume involved was slightly more than in 1961. A significant factor on the cloth side has been the very even trend of average prices throughout the past decade.

It is interesting to compare the relative cost of imports of cotton cloth, despite the preponderance of arrivals of greys for processing in the home market. The average price paid for all types of cotton goods imported last year was 21.22*d.* per yard, as against 20.85*d.* in the previous 12 months.

Within these totals, the cost of grey cloth showed some reduction in 1962 as compared with the previous year. Average arrivals were valued at 14.46*d.* per yard, as against 15.32*d.* per yard in 1961.

Demand for Cotton

Among the primary objectives of international cotton policy, as frequently outlined in the past, is the need to keep production and consumption of the raw material rising as rapidly as possible, yet in balance with each other. This summing-up of the global situation is emphasised by Mr. R. B. Evans, Executive Secretary of the International Cotton Advisory Committee, in the latest issue of the *Empire Cotton Growing Review* in a survey dealing with the future demand for cotton. Other aspects which require close attention are the maintenance of stocks at such a level that mills can be assured of being able to buy their supplies without difficulty, coupled with a reasonable degree of stability in price.

In recent years, Mr. Evans observes, both production and disappearance of cotton have been rising at a rapid rate, but the two have not been out of balance with each other in any given year by more than a small percentage. Only when production was allowed to exceed disappearance for several consecutive seasons in the early 1950's was a surplus of huge dimensions accumulated.

More Billions of Consumers

In a long catalogue of the vital factors which must sway future demand for the raw material, Mr. Evans mentions the fact that we are all living in the midst of a population "explosion." The peoples of the world have already increased from 1.8 billion in 1920 to 2.9 billion in 1960 and forecasts suggest that the figure may reach 6.9 billion by the year 2000. World consumption of all fibres in 1960 was 15 million metric tons; on the basis of this population expansion, even to sustain the same average consumption per head in 1980, the quantity of fibre required would be nearly 24 million tons.

So many other aspects have a bearing on the situation, including national incomes, the proportion of expenditure on textiles and the growth of indigenous manufacture of cloth and garments, that any detailed estimate of consumption 40 years ahead must be largely guesswork. At the same time, a special working committee, in which many of the world and regional organisations concerned with fibres participated, has gone on record with the view that the average annual gain of about 3 per cent in consumption of fibres between 1955 and 1961 will continue at around the same rate.

Two years of research by a famous Scottish cloth mill have resulted in the production of "new look" furnishing fabrics in pure wool. Described as revolutionary, they are tapestries with rich, glowing, multi-coloured patterns. Five leading British furnishing firms have taken them up. This is the first time that Henry Ballantyne and Sons, of England, internationally known for their wool coatings and suitings, have entered the furnishing fabric field.

COTTON SUPERVISORY SCHEME

CERTAIN CLAUSES HELD "ULTRA VIRES"

A JUDGMENT which is of great interest to cotton traders and millowners throughout the country was delivered by Mr. Justice Tambe and Mr. Justice Gokhale at the Bombay High Court on Saturday, the 9th inst. It concerns the constitutional validity of the supervisory scheme for cotton introduced during the current season, as per the notification issued by the Textile Commissioner in October last, which was questioned by a prominent cotton trader of Tirupur, Mr. E. R. Palaniswami Gounder, in a writ petition filed at the Court in November last. The Court held that certain important clauses of the Textile Commissioner's notification appointing cotton supervisors infringed the freedom of individual traders and were, therefore, "*ultra vires* and illegal." The Court also issued a writ against the Textile Commissioner directing him not to take any steps or proceedings in furtherance of the implementation of the clauses which were declared *ultra vires*.

It may be recalled that the petitioner had submitted that the notification issued by the Textile Commissioner, outlining the supervisory scheme, would eventually bring about a monopoly in favour of only those business houses which had been approved by the Government as supervisors and that the wide powers vested in the supervisors, especially the power to issue certificates, were likely to be utilised to the detriment of the petitioner. The notification, it was further contended, unlawfully deprived the petitioner of valuable rights and placed an unreasonable restriction on his right to carry on trade and business guaranteed by the Constitution and that the appointment of supervisors had no reasonable relation to the provisions of the Cotton Control Order and was, therefore, "arbitrary, unreasonable and palpably discriminatory." It was also submitted that, under the scheme, the Textile Commissioner had not even the power to appoint independent supervisors himself but was required to select supervisors only from the names jointly recommended by the Presidents of the Indian Cotton Mills' Federation and the East India Cotton Association. This, the petitioner had submitted, amounted to "virtual abdication of the functions of the Textile Commissioner."

Clauses Held Illegal

The Court held that the following clauses of the scheme were "*ultra vires* and illegal."

Clause 1(*d*) (i) to (vi) dealing with the mode of payment for cotton. The rule provided that the seller shall not directly receive from the buyer an amount exceeding 92½ per cent of the invoice value; that the amount received should be intimated by the seller to the supervisor along with a copy of the invoice; that the balance of 7½ per cent of the sale value should be paid by the buyer to the seller through the supervisors and the said 7½ per cent would remain deposited with the supervisors in the manner provided therein.

Clause 1(*e*) (i) and (ii) which provided that, if the supervisor found that the price agreed between the buyer and the seller did not conform to the ceiling price, then the supervisor should pay to the seller, only on the basis of the final valuation certificate.

Clause 1(*f*) which provided that if any party wanted to prefer an appeal to the *ad hoc* committee, intimation of such intention should be given to the supervisor within 48 hours of the date of valuation and until then the supervisor shall not pay the balance, pending the issue of final survey certificate.

Clause 1(*g*) (vi) which provided that the supervisor shall have powers of checking with the mills whether or not cotton was purchased against valid quota issued by the Textile Commissioner and the power to check whether weights indicated in the invoices were in order.

In view of the fact that some of the functions and powers entrusted to the supervisors were found to be *ultra vires* the Constitution, the Court suggested that the quantum of remuneration fixed for the supervisors should be reduced by the Textile Commissioner. As noted above, the Court also directed the Textile Commissioner not to take any steps or proceedings in furtherance of the implementation of the changes which were declared illegal.

The Court's decision has been hailed by the trade and a section of millowners, who had all along opposed the scheme, as a vindication of their stand. It has also provided them an opportunity to press for the abolition of the scheme. In fact, no sooner had cotton prices started finding levels below the ceilings, following larger arrival of new crop, than the opponents of the scheme started a vigorous campaign for the abolition of the scheme on the ground that it was no longer necessary and that it unnecessarily interfered with the freedom to trade. Although the Government did not pay heed to this plea, it quickly responded to the situation created by the large arrival of new crop and the consequent slight decline in prices by relaxing some of the curbs on cotton. This included relaxation in the provision concerning the mode of payment under clause 1 (*d*) (i) to (vi), which has now been declared *ultra vires* by the Court.

The Court's decision has necessitated a revision of the scheme so as to remove the clauses that have been held illegal. But the point is whether such modification will render the scheme ineffective. If it does, there is no use of keeping in force a scheme that will not serve the purpose for which it is intended. Other methods will have to be devised to ensure that deals in cotton above the ceiling prices are not put through. If, as is generally expected now, supplies really turn out to be adequate, there will be little need for any rigid control schemes. But as long as there are uncertain elements in the cotton situation, it is unwise to cast off all regulatory measures and throw the doors open for speculators to exploit the consumers and boost the prices.

CENTRAL COTTON COMMITTEE MEETING

Progress achieved in the implementation of the special measures for intensifying cotton production programme in various States during 1962-63 is one of the many subjects that would be discussed at the 87th meeting of the Indian Central Cotton Committee, to be held at Bombay on Saturday, 16th February 1963. Dr. Ram Subhag Singh, Union Minister for Agriculture, will inaugurate the meeting which will be presided over by Mr. A. D. Pandit, Special Secretary to the Union Ministry of Food and Agriculture and Vice-President, Indian Council of Agricultural Research.

The subjects for discussion also include suggestions for narrowing the gap between the floor and ceiling prices and for withdrawing the system of compulsory survey and the supervisory scheme. One of the important items on the agenda is a proposal for exercising stricter control over the cotton ginning and pressing factories for extermination of pink boll-worn pest. Reports of two special sub-committees constituted by the Central Committee to suggest measures for strengthening the supervision of field work relating to crop estimation surveys on cotton and to examine the question of enlarging the scope of seed testing stations in the country so as to bring within their purview the testing of cotton seeds also will be considered by the Committee. Besides this, the Committee will review the progress of its research schemes as well as of the Sea-Island Cotton Cultivation Extension Scheme.

COTTON RESEARCH

As many as 80 subjects included in the agenda of the 87th meeting of the Indian Central Cotton Committee, to be inaugurated at Bombay on Saturday the 16th inst. by Dr. Ram Subagh Singh, Union Minister for Agriculture, were examined, in the first instance, by six sectional Sub-committees of the Agricultural Research Sub-committee, on the 11th inst. at Bombay. The Agronomy, Physiology and Soil Science Sub-committee reviewed the progress made under the Regional Research Centres during 1961-62 and approved of the programme of work to be followed at these centres during the ensuing year relating to the Agronomy, Physiology and Chemistry Sections. It also considered the final reports on the scheme for cotton manurial trials in the Punjab and the Cotton Physiological Research at Dharwar. The three Plant Breeding Sub-committees considered the progress reports on the research schemes being financed by the Committee in the different States for the evolution of superior strains and also approved of the programmes of work to be followed under these schemes during 1963-64. Another important subject considered by these Sub-committees related to the question of enlarging the scope of seed testing stations in the country so as to include cotton seeds also within their purview and assess the facilities of staff, equipment, etc. required for the purpose. These Sub-committees also considered the proposals on a new scheme for the improvement of cottons in the Hagari area in Mysore and for the extension of eight existing research schemes.

The Pathology Sub-committee considered the proposals on a new scheme received from Andhra Pradesh for the study of the bacteria causing the blackarm disease in cotton with a view to devising suitable control measures against it. The Entomology Sub-committee also considered the proposals on a new scheme to be started in Madras and Mysore for study on the survey and control of the nematode parasites infesting cotton.

MANNESMANN
SPECIAL STEELS
We supply a wide range of special steels, manufactured by Mannesmann, including:
HIGH-QUALITY STEELS ● Spring steels ● Constructional steels, alloyed or unalloyed ● Tool steels, alloyed or unalloyed ● High speed steels ● Stainless and heat-resistant steels ● Magnetic soft iron in the form of—
TOOL BITS ● Cemented carbides and carbide tipped tools
DRAWN STEELS ● Round, octagonal, hexagonal, square, flat in a wide variety of sections ● High-speed free-cutting steels ● Steel shaftings ● Cold stamping nut bars
Sole representatives in India
Dodsal PRIVATE LIMITED

As industrialisation in India gains momentum, the need for technically trained personnel increases progressively. NSE, with its staff of highly qualified and experienced engineers, is excellently placed to provide training facilities.

The NSE training scheme was launched in 1958. Every year, 60 apprentices are recruited and trained at the NSE Technical School. Stipends are paid and incentives given. After two years of intensive training, many of the apprentices are absorbed as regular employees of NSE.

NSE thus offers gainful employment to hundreds, and creates a pool of technically trained men to serve India's industries and contribute towards national strength.

GROWTH IN INDIA'S TANGIBLE WEALTH

RESERVE BANK STUDY PROVIDES VALUABLE INFORMATION

THE Statistics Department of the Reserve Bank of India has made a painstaking study of estimates of tangible wealth in India; the results of the study are published in the January 1963 issue of the Bank's *Bulletin*. The estimates are, of course, essentially tentative in character, in view of the various assumptions involved in calculations and the different sources of data with varying degrees of reliability that have been utilised for deriving sector-wise estimates. Nevertheless, the estimates can be considered as a rough picture of the tangible wealth in the country. Only, those who wish to use these data in any controversy should be fair enough to mention the limitations from which the data suffer and the important qualifications to which they are subject.

For the purpose of its study, the Statistics Department has taken the twelve-year period 1949-50 to 1960-61, instead of the ten years covered by the first two Plans, that is, 1951-52 to 1960-61. This is because the available estimates of tangible wealth presented in the earlier two studies (one by Uma Datta and Vinod Prakash and the other by Mukherjee and Shastry) related to the year 1949-50.

Real Rise Appreciable

The data furnished in the study reveal a marked improvement in the total tangible wealth (depreciated replacement cost at current prices) in India. The estimate for 1960-61 (the last year of the second Plan) places the total wealth at Rs. 52,405 crores, which represents a rise of as much as 50 per cent as compared with 1949-50 when it stood at Rs. 34,940 crores. The bulk of the rise is, as is only to be expected, accounted for by reproducible tangible wealth which has gone up 100 per cent, from a bare Rs. 17,854 crores in 1949-50 to Rs. 32,164 crores, while wealth in the form of land has increased only marginally from Rs. 17,854 crores to just Rs. 20,241 crores. Even if allowance were made for the rise in the prices of capital goods that has taken place during the period—the extent of the rise is put at 20 to 25 per cent—the "real" increase in reproducible tangible wealth would be quite appreciable, being 75 to 80 per cent. Again, the ratio of this wealth to net domestic product shows a significant increase, from 1.8 to 2.2—while the corresponding ratio of total tangible wealth does not show any marked change (from 3.7 to 3.6) probably because of the fact that changes in land values are not completely reflected in the changes in agricultural commodity prices.

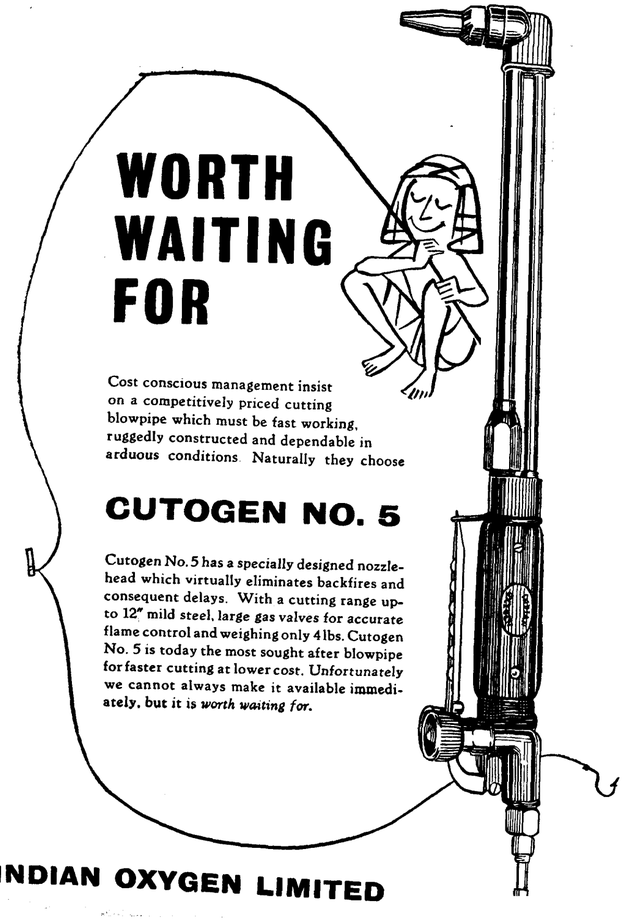
Of the total rise of Rs. 15,078 crores in reproducible tangible wealth during the period 1949-50 to 1960-61, the large-scale manufacturing (and mining) sector alone contributed Rs. 3,547 crores, its actual combined share increasing from Rs. 1,816 crores to Rs. 5,642 crores, whereas the share of small enterprises went up by only Rs. 437 crores to Rs. 1,200 crores. The tangible wealth in respect of agriculture, animal husbandry and allied activities rose by Rs. 3,547 crores to Rs. 8,783 crores, of house property by Rs. 2,708 crores to Rs. 7,113 crores, of transport and communications by Rs. 1,831 crores to Rs. 4,218 crores, of trade and commerce by Rs. 1,626 crores to Rs. 3,398 crores, and capital outlay in Government administration by Rs. 1,103 crores to Rs. 1,810 crores. The sector-wise estimates of tangible wealth are given in Table A.

TABLE A: *Estimate of Tangible Wealth in India*
(In crores of rupees)

Sector	1960-61	1949-50
Agriculture, animal husbandry and allied activities	8,783	5,236
Of which :		
Agricultural implements (including tractors)	860	363
Livestock used in farms	2,702	2,428
Sheds, barns, etc.	1,366	880
Improvements in land and irrigation works—		
Private	2,415	1,304
Public	1,365	229
Plantations other than tea	35	20
Forestry and fishery	40	12
Mining and manufacturing (large-scale)	5,643	1,816
Of which :		
Mining	183	110
Electricity generation and transmission	1,174	240
Tea plantations	282	133
Other factory establishments—		
Private	3,236	1,206
Public	767	127
Small enterprises	1,200	763
Transport and communications	4,218	2,387
Of which :		
Railways	2,746	1,574
Communications	198	93
Vehicles	839	281
Transport animals	394	356
Shipping and navigation companies	135	18
Airways companies	42	17
Other transport companies	64	48
Capital outlay in Government Administration	1,810	707
Trade and commerce	3,398	1,772
Of which :		
Wholesale and retail trade	3,260	1,704
Banks, co-operatives insurance companies, etc.	138	68
House property	7,113	4,405
Of which :		
Urban private	4,381	2,644
Rural private	2,732	1,761
Total reproducible tangible wealth	32,164	17,086
Value of land	20,241	17,854
Total tangible wealth	52,405	34,940

The estimates of wealth in the field of agriculture, animal husbandry and allied activities are based on certain assumptions. These are: The average annual expenditure per family on agricultural implements, machinery, etc., is Rs. 120 crores, half of which represents expenditure on repairs, maintenance and replacement; transport equipment such as bullock-carts constitutes one-fourth of the total of implements and machinery; about 12.8 per cent of the total livestock is assumed as being used for transport purposes; output of the fisheries sector during 1960-61 is estimated at Rs. 100 crores, as against Rs. 40 crores in 1949-50, a rise of 150 per cent.

The method of estimation adopted in respect of the large-scale mining and manufacturing sector is first to evaluate the value of net fixed assets (excluding land) of the companies covered by the R.B.I. studies and then to blow them up by paid-up capital to get the estimate of net fixed assets for the entire corporate sector. As the coverage of companies selected for R.B.I. studies is quite high, the estimates for the entire corporate sector may be regarded as fairly reliable. The estimates of net fixed assets thus obtained would represent only the depreciated book value at historical prices.



The value of land as on 31st March 1950 was put at Rs. 17,854 crores by Mr. Mukherjee and Mr. Shastry. The value of agricultural land had gone up considerably between 1949-50 and 1960-61 as a result of the development of irrigation resources, more area brought under cultivation and other improvements. Similarly, the price of industrial land also would be much higher in 1960-61, due to factors like growth of industries and pace of urbanisation. However, no statistics on the changes of land value are available. Even the little information thrown up by the Follow-up Rural Credit Surveys shows wide fluctuations between the different districts and hence cannot be made use of. In the absence of relevant data, it may not be unreasonable to assume that the land values would have changed in proportion to the changes in price level of agricultural commodities. The value of land thus obtained would, however, be an underestimate. The index of agricultural commodities has shown a rise of 13.37 per cent between 1949-50 and 1960-61. Applying this percentage rise to the value of land as on March 1950, the Reserve Bank study puts the value of land at 1960-61 prices at Rs. 20,241 crores.

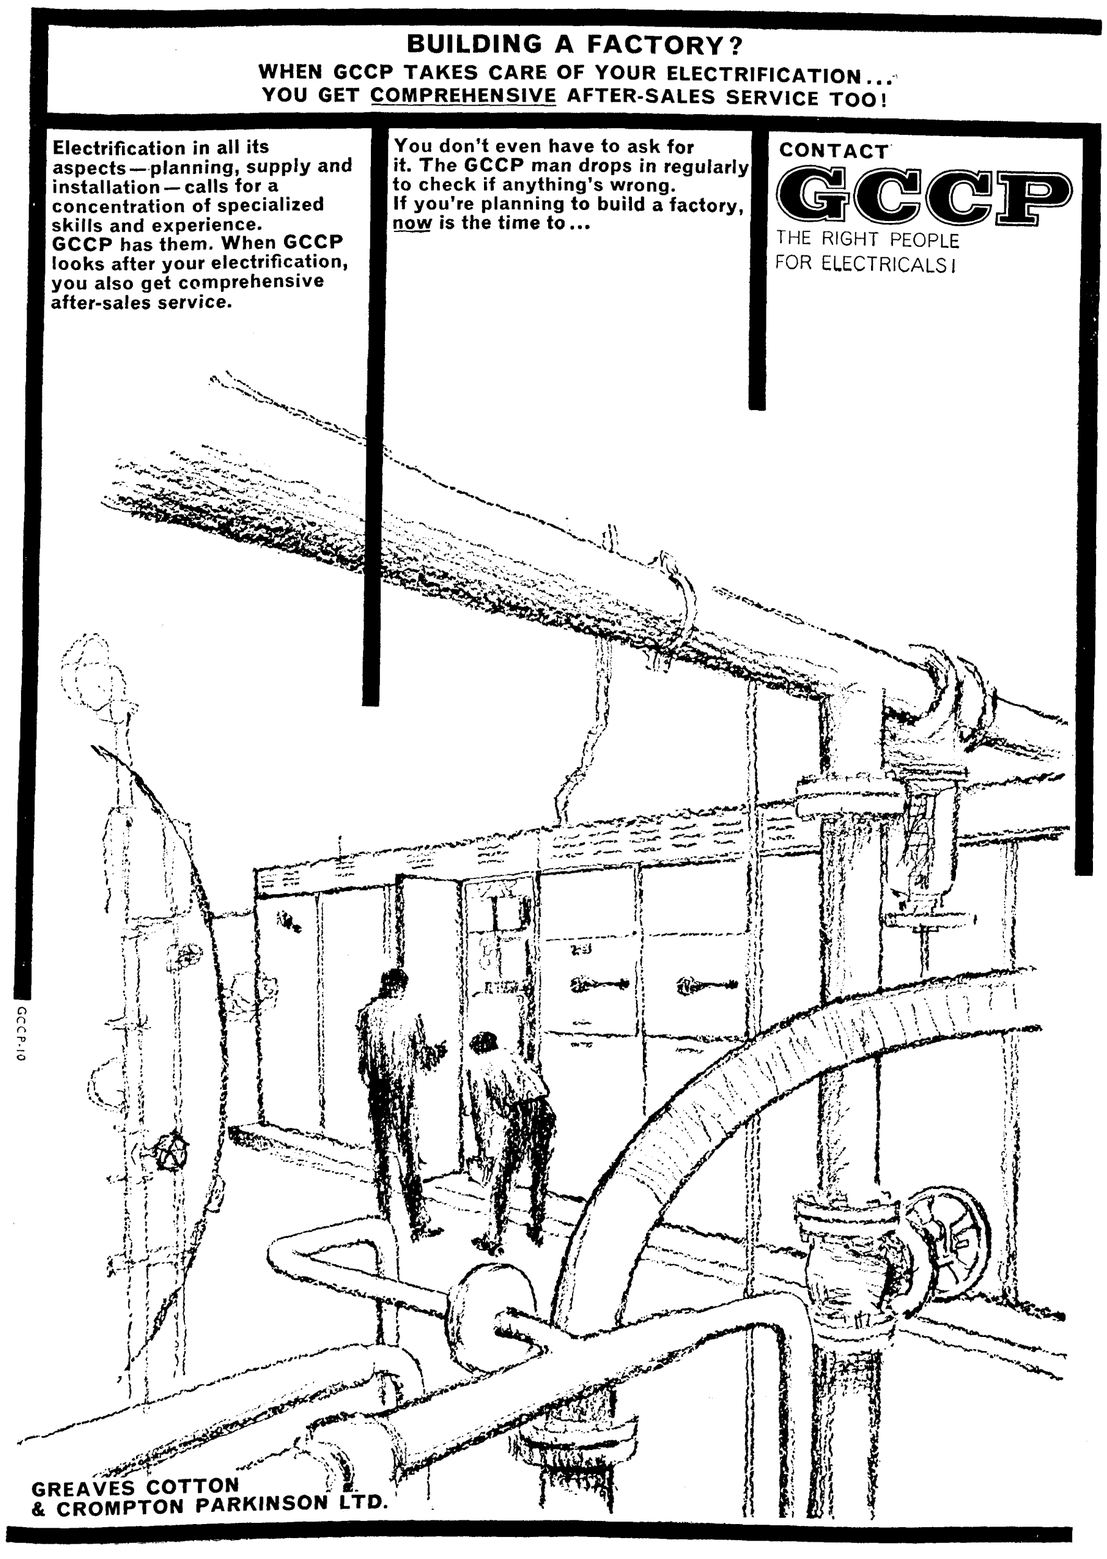


TABLE B: *Capital Formation*
(In crores of rupees)

Year	Gross capital formation at current prices	Net capital formation	
		At current prices	At 1960-61 prices
1950-51	1,122	480	602
1951-52	1,440	791	928
1952-53	1,119	443	525
1953-54	1,455	761	901
1954-55	1,492	779	928
1955-56	1,721	986	1,159
1956-57	2,393	1,662	1,888
1957-58	2,046	1,267	1,387
1958-59	2,510	1,680	1,786
1959-60	2,524	1,663	1,741
1960-61	2,871	1,959	1,959
Total	20,712	12,471*	13,804

* Excluding 1950-51, the total net capital formation for the two Plan periods works out to Rs. 11,991 crores, which is about 20 per cent higher than the Planning Commission's estimates of net investment (Rs. 10,110 crores) for the same period given in the third Plan document.

(*Continued on page 279*)

DEVELOPMENT OF PETROLEUM INDUSTRY

MASTER PLAN BASED ON REQUIREMENTS FOR ABOUT 8 TO 13 YEARS NEEDED

By W. B. Metre, F.N.I., F.G.S.
DIRECTOR, OIL INDIA LIMITED

[*The Annual Dinner of the Mining, Geological and Metallurgical Institute of India was held at Calcutta on 8th February* 1963. *Mr. K. D. Malaviya, Union Minister for Mines and Fuel, was the chief guest. Proposing the toast to the mineral industry, Mr. W. B. Metre, a Director of Oil India Ltd., in which the Government of India has a 50 per cent share with the Burmah Oil Company Ltd. and an expert in petroleum mining, delivered an illuminating address, covering the fundamental issues involved in developing the petroleum industry in India. The article on this page is virtually the full text of his address.*—ED.]

COAL being the eldest in the "mineral family," has naturally been the spokesman of the industry. The elder brother now seems to be quite fed up with putting forward the grievances of the coal industry and the job has now been entrusted to the younger brother, I mean the oil industry, to speak on behalf of the mineral industry. This is presumably due to the growing importance of oil as a source of power.

It is well known to all that, until the last World War and even until independence, the oil industry in India was quite insignificant, our production and consumption being very small. Since then, however, its importance to the economy of the country has been rapidly increasing. Our total oil consumption, which was then only about 2 million tons per year, has already increased to something like 9.6 million tons by 1962 and is expected to go up to about 17 million tons by 1966.

Exploration

Under the able direction of Mr. K. D. Malaviya, our exploration effort during the last 10 years has been quite impressive and the country is looking forward to producing more and more oil to meet the bulk of our requirements. The work so far done by the Oil and Natural Gas Commission needs special mention, particularly the discovery of oil in Ankleshwar in Gujarat. Incidentally, it is worth pointing out that the earlier geophysical work, which led to the drilling of the first test well in Gujarat, was carried out by the parent body—the Geological Survey of India. About a quarter of a century earlier, the G.S.I. had the unique distinction of drawing attention to the oil prospects of the Potwar region, near Chakwal, now in West Pakistan.

It is mainly due to Mr. Malaviya's efforts that we have become an oil-conscious nation. He has been doing everything possible to see that the public can thoroughly understand the implications of the various problems in the oil industry. This has also created a large number of writers and critics on the subject and it may not be an exaggeration to say that our oil-consciousness has grown up so fast that the coverage in inches the industry gets in the newspaper column exceeds the footage of oil column in the various wells we drill for finding more oil and gas.

Difficulties in Early Days

During the early days of oil exploration in this country, there were several difficulties in carrying out any geological and geophysical investigations, especially in the various Indian States and in the alluvial areas of Bengal and Bihar, the latter being under permanent settlement. A number of Indian States were strongly against allowing foreign oil companies to conduct any mineral exploration in their areas. Lest you find this difficult to believe, I will narrate an incident in which I was directly involved. In 1938, when I landed in Kutch with two other colleagues, after the Burmah Oil Company had obtained permission from the Agent-General, we were promptly offered two clear cut alternatives by the State Government, either to go to jail if we wished to stay there or get out of the State by the first available boat. We, of course, took the latter alternative. When a few months later permission was granted for carrying out geological work, this was on the definite understanding that no application for any exploration or prospecting licences would be entertained. In the Baroda State, the oil companies had great difficulties in obtaining permission for work to be carried out within the State territories; one oil company was, however, fortunate in obtaining the necessary permission on the distinct understanding "that His Highness's Government are under no obligation to give the company a prospecting or other licence." Even a certificate of approval was refused.

Things have certainly improved considerably and we are very grateful to our popular Minister, Mr. Malaviya, for encouraging research, exploration and development of our oil resources. We are justly proud of our recent achievements in the oil industry.

Saving Foreign Exchange

The progress, however, is not as fast as he would have liked it to be and the drain on our foreign exchange continues. For instance, our imports of crude oil and petroleum products has been costing the country between 60 and 100 crores of rupees per year. Even the lower figure exceeds our total export earning from all the other minerals, of which we export a very large quantity. In view of the present shortage of foreign exchange, the question of reducing the drain on account of imports of oil has become a problem of life and death. Our very existence depends on our capacity to achieve the objective. This can be done in two ways—firstly by increasing the indigenous production as rapidly as possible and secondly by increasing our refining capacity, well in advance of the requirements, so that imports of refined products are reduced to an absolute minimum.

Though exact figures are not readily available, it can be taken that a ton of imported crude costs us in terms of foreign exchange, about Rs. 65, whereas an equivalent quantity of major refined products costs us an average of over Rs. 110; the so-called minor products are much more costly. Even if we allow for the cost of refining, etc., the net saving in refining the crude within our country is of the order of Rs. 35 per ton, in addition to the great advantage of providing more employment and encouragement to minor subsidiary industries. If we want to take full advantage of this saving, we must calculate our requirements of the refining capacity not only for the various plan periods, particularly the third and fourth Plans, but for every year of the Plan, especially since our annual consumption of petroleum products will be increasing by about 2 million tons per annum in about two years' time and at the rate of 3 million tons in about five years. We must, therefore, have a master Plan based on our requirements say about 8 to 13 years hence and decide on the possible location of the various refineries and their target completion dates. The refining capacities should be adjusted to about 10 or better 20 per cent above the calculated requirements of refined products, in accordance with the practice in most other countries.

Capital Cost of Refineries

The capital cost of these refineries must also be given very serious consideration, especially since our refineries just completed or under completion seem to be costing us more than the refineries of equivalent capacities in other countries. This, as already explained by the Indian Refineries Limited is mainly due to inland locations, involving high cost of transport and construction of effluent pipelines and additional costs on account of housing, roads, water supplies, electricity, drainage, etc., and in some cases additional costly plants for manufacture of lubricating oils, etc. As a result of intensive research work carried out by the oil industry, especially in the West, the capital costs for the various refineries being planned in the neighbouring countries are showing a noticeably downward trend. For instance, there is a plan to build a 0.8 million ton refinery in Chittagong at a cost of less than Rs. 7 crores. The recently completed refinery in Karachi, with a capacity of 1.75 million tons, has cost Rs. 12 crores; another refinery planned for Ceylon, with a capacity of 1.4 million tons, is estimated to cost Rs. 10 crores only. The capital costs thus work out to be between Rs. 70 to 90 per ton of refining capacity. As a result of additional process research carried out very recently by one of the Western Oil Companies, various economies in the equipment requirements have become possible and it now seems possible to construct simple 2 million ton coastal refinery in India at a cost of about Rs. 9 crores, 60 per cent of which will be in foreign exchange, or, at about, Rs. 45 per ton of refining capacity. To this must be added the cost of housing, etc. It has been estimated that such a refinery could be constructed in 2 to 2½ years.

Lubricant Plants

Lubricants, without which industry and transport, cannot function needs special consideration. Currently the consumption of lubricating oils in the country is just over 300,000 tons per annum. By 1966, it will be over 500,000 tons and by 1971 over 900,000 tons.

Lubricants are the most expensive of oil products to import. They cost an average of around Rs. 400 per ton and, last year, India spent Rs. 10½ crores of foreign exchange on importing lubricants. Had there been adequate manufacturing capacity in the country to make lubricants from imported raw materials half of this foreign exchange would have been saved. The only lubricants manufacturing capacity in India to meet the present demand in excess of 300,000 tons is the plant at Digboi which produces less than 30,000 tons annually. A lubricants plant will be built at Barauni in due course with a capacity for which varying figures have been stated, but the highest seems to be 75,000 tons per annum. There is talk of a lubricants plant of 100,000 tons to be built at a new southern refinery. There have been reports for the last two years of a lubricants plant to be built by Esso with Government partnership with a capacity of 100,000 tons. The design work has not yet started on these two latter projects mentioned above and even if all these projects go ahead they will account for only 300,000 tons between them. They cannot now be completed before the end of the third Plan by which time consumption will be over 500,000 tons. This means that there must be a continued and unnecessary expenditure of foreign exchange on imports and India will be dependent for its lubricant requirements, both civil and military, on supply points located in Europe and the United States.

It is pertinent to point out, in this connection, that a lubricating oil plant with a capacity of 100,000 tons per annum could be added to any of the existing or future refineries, with an extra cost of about Rs. 5.5 crores, of which the foreign exchange component will be 60 per cent.

As is well known, the provision of additional capacities in existing refineries cost much less, the total investment for increasing the capacity of a coastal refinery by 2 million tons per annum may vary between Rs. 4 to 5.5 crores, of which about 70 per cent will be in foreign exchange.

Intensive Search Imperative

Turning to the more important subject of exploration and development of the indigenous resources of oil, I have already referred to the excellent work done by the Oil and Natural Gas Commission, who are carrying out exploration vigorously in various parts of the country, particularly in Punjab, the Gangetic plain, the Brahmaputra Valley, Gujarat and Madras. However, I should like to emphasise that our need to save foreign exchange is so great that we must do everything possible to find much more oil as quickly as possible. In view of the present emergency in the country this has become more imperative than any time before. Therefore, what matters most at this critical juncture is to find more and more oil, not who should explore or produce it. On account of shortage of technical labour in the oil industry, it would be necessary to allow some relaxation of the Mines Act (which defines an oil well as a mine) to ensure continuous employment of the limited number of drilling rigs we have.

It is pertinent to refer, in this connection, to the recent progress of the Oil India Limited, which is now owned equally by the Government of India and The Burmah Oil Company. In fact, we may regard this as a beginning of the "co-operative sector" in this country. Under the able guidance of its Chairman, Mr. Khandubhai Desai, Oil India Limited is run on a business-like manner, drilling is being carried out expeditiously and economically and the staff morale and *esprit de corps* are high. It will be ready to produce 3 million tons of crude per year as soon as the Barauni Refinery comes on stream. It will be recalled that, when the Government of India's share in this enterprise was increased to 50 per cent, it was agreed that the Government of India and The Burmah Oil Company would nominate the Chairman in alternate years. We are grateful to Mr. Khandubhai Desai for acceding to the request of The Burmah Oil Company, to remain Oil India's chairman during the second year. Under his guidance and advice, we hope to make still better progress.

It is generally appreciated that a nation cannot hope to accelerate its industrial development, or to conduct a war successfully, without an assured supply of oil. Considerable capital expenditure is involved in the discovery, development, refining and marketing of oil and, therefore, ways and means should be found, consistent with national interests, to attract international oil organisations to the Indian scene and to ensure closest co-operation between the private and public sectors—creating a "co-operative sector" wherever possible—in order to achieve success in the shortest possible time. I have no doubt that this can be achieved within the spirit of the Industrial Policy Resolution of 1958.

RAIL TRANSPORT IN EUROPE

STEAM RAPIDLY GIVING WAY TO ELECTRIC AND DIESEL ENGINES

A REVOLUTION is taking place in Europe in the matter of rail haulage: steam is giving way to electricity and to the diesel engine. Steam locomotives are no longer being constructed anywhere and, by 1975, steam haulage will have become negligible on most railway systems. This change makes for improved working conditions for the staff and increases productivity; it brings about a saving in locomotive costs, makes for greater flexibility of operation and reduces energy consumption. These general observations are contained in the opening paragraph of the second part of the report on the transport situation in Europe submitted by the Secretariat of the United Nations Economic Commission for Europe to the session of the Inland Transport Committee which is currently taking place at Geneva. The report is based on a great many statistical data taken from the latest Bulletin of Transport Statistics for Europe, which has just been published.

The progress made in the electrification of European railways is still only modest; thus, only 15 per cent of the total length of railway line has been electrified. But, as it has been carried out chiefly on heavy traffic lines, the percentage of transport electrically hauled, expressed in gross ton-kilometres, is about three times that figure. Unfortunately, the systems used for electrification in Europe are not uniform, some countries using 1,500 V, D.C. or 3,000 V, D.C. and others single phase, 16⅔ c.p.s. while the most recent 25,000 V, single phase, 50 c.p.s. system is being extended in many countries. In 1961, slightly over 3,000 km. of railway line, two-thirds of it in the U.S.S.R., were electrified.

Side by side with the conversion to electric and diesel traction, another process is taking place, though more slowly: this is the concentration of railway facilities. This concentration is indispensable, particularly in countries where the railway system has a high density, if the railways are to benefit fully from their ability to mass-produce ton-kilometres and passenger-kilometres.

Reference should also be made to the increased speed of movement, both for passengers and for freight. This increase improves the quality of transport and permits savings in staff and rolling stock. In spite of the increased energy consumption involved, it is profitable because energy tends to cost less and less in relation to rolling stock and particularly staff.

Line Capacity

Everywhere in Europe, narrow-gauge railways and railways laid on roads are disappearing except in mountainous regions. In Belgium, for instance, the network of the local railways fell from 4,326 km. in 1950 to 968 km. in 1960, while the standard-gauge network of the National Railways of Belgium fell only from 5,044 to 4,632 km. In countries, where the railway network is still not very dense, a few new lines are being constructed. In several countries, profitable lines are being duplicated to cope with increases in traffic, particularly international traffic; this has been, in particular, the case in Italy with the coastal lines; in many cases, however, the capacity can be increased simply by means of changes in the signalling system.

The relatively great importance of the railway as compared with other modes of transport and the great distances in the U.S.S.R. cause freight transport by rail in that country to have special characteristics. While in 1960 freight transport by rail reached the figure of 1,504,000 million ton-kilometres for the year in the U.S.S.R., it amounted to only 200,000 million ton-kilometres for Czechoslovakia, the Federal Republic of Germany, France, Italy and the United Kingdom together, which have an aggregate population equal to that of the Soviet Union. The average density of freight transport by rail (ratio of ton/kilometres annually to the length of line) in the U.S.S.R. is eleven times greater than in Western Europe and five to six times greater than in the other countries of Eastern Europe. In the U.S.S.R., over 15,000 kilometres of line carry a load of at least 40 million tons of freight annually, and certain sections carry a load of 90 million tons on double-track lines and 20 million tons on single-track lines. However, because of the great concentration of railway facilities (heavy trains in particular), the construction of new lines and the laying down of additional tracks can be kept within limits. In certain regions, which are not at present served, new lines have to be constructed; in recent years about 1,000 kilometres of new lines have been constructed annually.

It should be pointed out that international transport is increasing faster than internal transport. Since in Western Europe the Alps place a limit on the number of railway tracks linking the north to the south, the striking expansion in the transport of motor vehicles through the Alpine railway tunnels by shuttle trains (on the St. Gothard line 210, 197 private cars in 1961 against 90,832 in 1957) has given rise to traffic difficulties on certain lines. This has been the case in particular on the St. Gothard line, and several solutions have been envisaged, including the construction of a new railway tunnel at a much lower level than the existing one. A similar situation has arisen in respect of ferry boats. This is one of the reasons for the construction now being undertaken of a "straight line" railway from Denmark to the Federal Republic of Germany.

Handling Costs

The cost of thermal operations for freight transport in single railway wagons is very high and the percentage of the total cost of transport represented by terminal operations is in inverse proportion to the length of the haul. Because of the short distances of haul in Europe (except in the U.S.S.R.), it is imperative for the railways to reduce terminal expenses. This reduction is achieved in particular by programming transport through the development of private branch-lines, by increasing the capacity of stock and the tonnage of consignments (one consignment in a group of several wagons), by operating certain shuttle services with trains having a constant composition and by using combined transport equipment and special wagons.

The use of combined transport equipment involves the employment of containers or the carriage of road vehicles on wagons. For fifteen countries of Western Europe, the number of containers registered with the railway systems rose from 50,000 in 1954 to 116,000 in 1960 in the case of small containers (between 1 and 3 cu. m.) and from 70,000 to 86,000 in the case of large containers. The use of pallets for loading also makes it possible to reduce handling costs.

In those countries which furnish rolling stock statistics, the number and capacity of passenger rail cars remains more or less unchanged but a big renewal effort is being made; the number of rail cars and motor train sets has been increased and the rest of the stock lightened; as to freight rolling stock, its capacity increased by 10 per cent between 1950 and 1960. Over the same period, the productivity of passenger rolling stock (number of passenger-kilometres per available seat) increased by 20 per cent and the productivity of the freight rolling stock (number of ton-kilometres per ton capacity) by 70 per cent, but, in recent years, the increase has tended to slow down or even to level off, particularly for passenger rolling stock. The productivity of labour has also increased in most countries.

Railway freight tariffs, too, are undergoing profound changes. By degrees, special tariffs have become more numerous and the tonnage carried at the standard tariff has fallen; by degrees, too, reforms have been introduced into the standard tariff itself, the number of classes and the difference in the rates applied to the extreme classes have been reduced, rate differentiations based on tonnage conditions have been increased and new tonnage conditions for 20-ton consignments and for consignments loaded on groups of wagons or on shuttle-trains have been established. On most networks, it is true, the standard tariff is still an *ad valorem* one, but the reforms introduced have had the effect of bringing the tariff range into closer relation with the cost range. On many Western networks, tariffs have been rendered more flexible in order to permit the conclusion of tariff agreements. Lastly, the principle of the geographical equalisation of tariffs (identical rate for the same distance on all routes), which did not as a rule apply to minor networks and which was already subject to certain exceptions (surcharges for major bridges, tunnels, etc.), is being more and more departed from as a result of the multiplication of special tariffs and special agreements.

NEW PUBLICATIONS

The Undivided Hindu Family. By I. S. Gulati and Kuldip S. Gulati. Asia Publishing House, Ballard Estate, Bombay-1. Pages: 96.

THE Gulati brothers are neither sociologists nor lawyers or chartered accountants. Their study of the privileges enjoyed by the undivided hindu families in respect of income-tax is nevertheless a brilliant analysis of the law of income-tax applicable to the said unit of assessment. The conclusions drawn by them are based on the decided case laws and the statistical data collected by them.

The Hindu undivided family, known as the H.U.F. in legal parlance, is one of the characteristic features in the Hindu society. It is prevalent amongst all the castes in the Hindu community. It is becoming extinct slowly due to the industrial revolution taking place in the country and the Hindu Succession Act put on the Statute Book recently. The H.U.F. is found amongst other communities in spirit, though not by custom and personal law applicable to the said communities. The Hindu Code Bill, as it was originally drafted, aimed at the complete abolition of the H.U.F. The Hindu Succession Act, which had its origin from the Hindu Code Bill, has given life to the H.U.F. to a certain extent. It is certain that the H.U.F. will continue to have its influence in the society unless the Western idea of married sons separating from the parents takes root in this country. Though the said idea is spreading amongst the educated class, the accommodation shortage in big cities will quicken the death of the H.U.F.

One of the causes for the downfall of the H.U.F. is the neglect of ladies, especially widows, by the coparceners who constitute the H.U.F. The Hindu Women's Right to Property Act, 1937 was the beginning of the abolition of the H.U.F. by legislation. Under the Hindu Succession Act, the H.U.F. can grow in numbers only if the coparceners constituting the H.U.F. partition the H.U.F. and separate from the parent H.U.F. to form their own H.U.Fs.

The Gulati brothers opine that the H.U.F. has the maximum right and convenience to avoid tax under the Income-tax Act. The H.U.F., by adopting the methods suggested by them in their book under review here, can avoid tax to a very great extent. In fact, according to the Gulati brothers, it is beneficial for every Hindu to constitute H.U.F. and thus gain the advantage in these days of higher taxation. According to them, the H.U.F. is increasing along with the number of individual taxpayers. By adopting the suggestion of the Gulati brothers, the H.U.F. can, by partitioning the family completely amongst the coparceners and conducting the business in the newly formed H.U.Fs., avoid the tax. Gifts to H.U.F. members is another mode. Section 16 of the I.T. Act has no application to the members of the H.U.F., if the H.U.F. transfers property to the wives of the coparceners or the children in the H.U.F. Another mode of avoidance is to have only partial partition. Adopting the time service study of the H.U.F. assessees and income, the authors point out that the number of taxable H.U.Fs. has been increasing secularly at the rate of 1,000 per annum and also that the H.U.F. incomes as a whole have been expanding at the rate of Rs. 2 crores annually. The maximum possible tax avoidance, according to the authors, could be achieved by complete partition and transfers by gift. However, due to the Gift Tax Act, the gifts may be taxable for gift tax.

The authors conclude that in smaller incomes even over a long period of ten years the complete partition technique pays, whereas for higher incomes the mode of transfer pays. Table 29 indicates that in the case of the H.U.F. converted into two H.U.Fs. and one registered firm in 1957-58, the income-tax loss to the Government amounts to Rs. 80.3 crores.

However, it is for the Hindu assessees, and the Government to study the book by the Gulatis and to take the advice and save tax, or plug the loopholes and earn more tax. Such interesting research of the various topics of tax laws is bound to help the people and the country in the long run. In fact, the Universities and the Central Board of Revenue must have scholars to do research and benefit the community and the Government.

Fundamentals of Planning in India. By V. T. Krishnamachari. Published by Orient Longmans, Bombay. Pages: 267. Price: Rs. 12.

To be brief, "the basic aim of planning is to achieve a high rate of productivity within the shortest possible time and that, when production increases, controls and restrictions, many of which are needed because of short supply of essential commodities, will disappear automatically.... The experience gained so far affords grounds for confidence that, pursuing the policies it has set before itself, the nation will be able to achieve its objectives within the democratic framework and by remaining true to its traditions of peace and tolerance." In economic terms, the objective set is the doubling of the *per capita* national income by 1975-76, which itself is inadequate as a sound base for the high standard of citizenship required in a welfare State. These again underline the presence of enlightened leadership, on the one hand, and administrative and technical efficiency of a high order, on the other. In the wake of independence, economic development, as also social changes, became an imperative necessity of future progress. Planned development towards these objectives, in the Five-year Plans drawn up for the country, have been giving effect to the social and economic policies envisaged in the Constitution.

Mr. Krishnamachari, perhaps, had the longest association in planning the economic development of the country. The Prime Minister said, "for ten years, he laboured with great ability... and helped in giving really a foundation to all our planning." As Chairman of the Grow More Food Enquiry Committee, he formulated the ideas for rural progress in the shape of Community Development and National Extension Service Programmes. Again, as Chairman of the States Finance Enquiry Committee, he gained immense knowledge of the finance of the country and, later in 1949-50, in the Fiscal Commission Report he made the basic assessment of the economic conditions in the country and pointed out the possible lines of future development. He was appointed a member of the Planning Commission when it was set up in March 1950 and functioned as its Deputy Chairman since February 1953 to June 1960.

With his long association with the Planning Commission one cannot look for strong criticism of the planned programmes, but the importance of the book stems from the authority of the author whose personal experience is invaluable. For example, there are two opinions about the role of the Planning Commission—one, that it functions as a supercabinet and the other that it has no effective voice in the implementation of the Plans. The author rightly points out that the problems confronted with are varied and complex and "the roles of the Planning Commission and the Government are supplementary. The Planning Commission, viewing questions in the context of the economy as a whole and not being saddled with everyday problems of administration, can give useful assistance to Ministers in the formulation of projects and policies. The aim is that the Commission and Ministers should work together in close collaboration sharing their knowledge and experience. In this process, the principle that the Planning Commission should not give publicity to its differences with the Union and State Governments is useful and salutary. Once a Plan is accepted in Parliament, it becomes a national Plan which all should accept."

The book has been divided into two main divisions consisting of six parts. The social philosophy for which the Constitution of India stands and the pattern of welfare state which the Constitution has enjoined for being built have had a significant bearing on the planning of economic development, and this is dealt with in chapter one. Brief accounts of the first attempts at planning, such as the National Planning Committee (1937-41), the Bombay Plan (1944), the Advisory Planning Board, leading finally to the establishment of the Planning Commission in 1950, are then dealt with. Nearly five chapters are devoted to describe the composition and functions of the Planning Commission and its relations to the Cabinets in the Union and the States; similarly the composition and functions of the National Development Council and allied bodies with which the Planning Commission works in close contact are also dealt with. The author suggests improvements in planning and other procedures. With the experience gained in the last ten years, there is scope for decentralisation of planning and implementation, and the author indicates that the States should undertake greater responsibilities for planning in the spheres of activity assigned to them. The State plans should be split into district, block and village plans and entrusted to appropriate organisations who might watch implementation and record the progress each quarter. When such decentralisation at State and subsequent levels take place, the Planning Commission can devote more time to broader questions of policy.

The second part of the book deals with the three Five-year Plans and the results achieved in the first two. More important are the sections where an attempt is made to indicate the directions in which accelerated internal efforts are needed in each sector of the economy. Education, both qualitative as well as quantitative, should have the highest priority. Doubling the agricultural production in ten years and the *per capita* output in fifteen years should be the objective in agriculture and to this end the policy in regard to community development should be redefined. Regarding the machinery of Government it is sugested that there should be co-ordination of interrelated activities of specified ministries in the Union and States, steps for maintaining relations between Ministers and services and the creation of new all-India services.

It is perhaps inevitable that a book of this sort can only indicate in broad outline the directions in which accelerated efforts have to be made. The disturbance to the economy consequent on the border conflict with China is bound to affect the progress of the third Plan and consequently of the subsequent plans.

A Guide to the Income-tax Act. By A. Ramaiya. Published by Madras Law Journal Office, Madras. Pages: 573. Price: Rs. 15.

Mr. Ramaiya is a practising lawyer in the South and has established his reputation as a good commentator on the Corporate law. His book on the Companies Act is widely referred to by the bar all over India. It seems to be equally valued by businessmen also.

This book is not a treatise on the subject but only a guide. The author has quoted passages from the reports of the Law Commission of India and the Direct Taxes Enquiry Committee wherever necessary. The speeches, explanations and assurances given by the Finance Minister to the Parliament are also cited everywhere to explain the various provisions of the law. Case law on the subject, based on the 1922 enactment, is also given wherever it is required. Brief commentary on each section, with case law in simple understandable English, is provided by the author.

The book also contains the Rules under the Act, the Finance Act 2 of 1962, Income-tax Certificate proceeding Rules, Income-tax (Removal of Difficulties) Order 1962 and a comparative table and the usual index and table of case law. It is a good guide and a quite handy one as that, and serves the purpose for which it has been brought out. The book has been published by the Madras Law Journal which is well known for publishing standard commentaries on various enactments.

PASSPORTS TO WORLD TRADE

Three Banks have merged. Separately, they have large assets, a fine tradition and a wealth of experience. United, they offer a comprehensive service in all matters affecting business between India and any part of the world. Their advice and help are your surest "passports" to profitable trade with those areas.

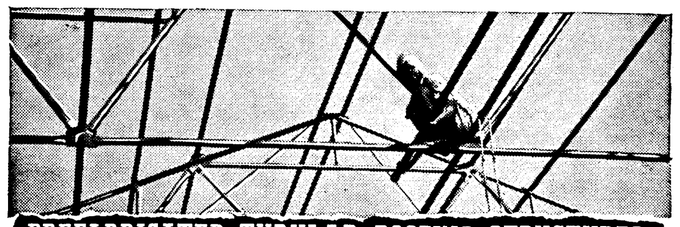
Managerial Problems in Public Enterprise. By Mr. A. H. Hanson. Published by Asia Publishing House, Bombay. Pages: 148. Price: Rs. 9.

Public enterprise *versus* private enterprise is a controversy in co-existence. Most of the managerial problems—as other problems—which public enterprise experiences are to be found in private enterprise, too, but there are some which assume significance for the specifically public status of public enterprise. Prof. A. H. Hanson is a well-known authority on Public Administration and functioned as a U.N. Expert. The present collection is a record of nine lectures in December 1959, seven of them delivered as visiting Professor at the Indian School of Public Administration and two at the Indian Institute of Public Administration. Prof. Hanson has attempted to cover, among others, the contemporary problems of organisational forms, parliamentary accountability, relations with Ministers, audit and efficiency and the price and profit policies of public enterprises.

The controversy uppermost is whether the public corporation is primarily a special form of governmental agency or a form of ordinary commercial enterprise subject to certain defined public responsibilities. "It does not matter very much whether that framework is called a Government department, a public corporation or a State company." According to Prof. Hanson, Government has the very important duty of providing the kind of basic organisational framework which will facilitate good management. The characteristic drawbacks of public enterprise—slowness, circumlocution, caution, excessive devotion to routine, precedent and so on—will disappear if their accountability to the Ministers and legislatures is curtailed considerably. Management, Mr. Hanson points out, cannot be made more competent by constant interference. Distinction is made between general policy and day-to-day advice and application of these should establish a satisfactory balance between autonomy and control. The functions of the public authorities should be to ensure that the public enterprise works within the limits of clearly defined public policy, periodically to check its efficiency as an instrument for the pursuit of that policy and to appoint top management. Prof. Hanson advocates a policy kind of board for a government industrial undertaking and the criterion for membership should be experienced in industrial and business lines. The advantage of this type of board is that "not being involved in management it can take a more objective view, of the manager's performance." At the same time, Prof. Hanson agrees with the Krishna Menon Report that members of Parliament should not be appointed to the boards of public enterprise for good and sufficient reasons.

Everything that Prof. Hanson has to say on public enterprise deserves careful reading. In these lectures he has covered topics such as the Board of Management, its functions, structure and management, organisation for enterprise, relation with staff, etc. The book deserves to be read by those interested in industrial management.



GROWTH IN INDIA'S TANGIBLE WEALTH

(*Concluded from page 274*)

The Reserve Bank study has also analysed the trends in capital formation in India. The procedure followed is to take as the starting point the estimate of reproducible tangible wealth for 1949-50 made by Mr. Mukherjee and Mr. Shastry and then to add to it the price-adjusted net capital formation during the period 1950-51 to 1960-61, as given in the blue book on capital formation issued by the Central Statistical Organisation (C.S.O.). The C.S.O. has prepared estimates of gross and net capital formation in India for the period 1948-49 to 1960-61. It has also worked out the figures of gross capital formation during this period at current and 1958-59 prices. By dividing the gross capital formation at current prices in each year by the corresponding figure of capital formation at 1958-59 prices, an implied price index of capital goods with 1958-59 as base is obtained. This index is converted again to the base 1960-61 and has been utilised for the purpose of stimulating tangible wealth as on 31st March 1961.

The value of reproducible tangible wealth as of March 1950 was estimated at Rs. 17,086 crores by Mr. Mukherjee and Mr. Shastry. The value of this at 1960-61 prices is obtained by making use of the price index of capital goods, which works out to Rs. 21,557 crores. The net capital formation at current prices in each year has been revalued at prices prevailing in 1960-61 by making use of the price index of capital goods with 1960-61 as base. The figures thus obtained for each of the years 1950-51 to 1960-61 are added up to arrive at the net addition to the reproducible tangible wealth during the period March 1956 to March 1961, which works out to Rs. 13,804 crores as shown in Table B. The total tangible wealth as of March 1961 is then taken as the sum of the reproducible tangible wealth as in March 1950, revalued at 1960-61 prices, and the net capital formation at 1960-61 prices during the period 1950-51 to 1960-61, that is Rs. 21,557 crores plus Rs. 13,804 crores or a total of Rs. 35,361 crores.

PREFABRICATED TUBULAR ROOFING STRUCTURES

All S & L Prefabricated Tubular Roofing structures are designed to the requirement of I.S. 806: 1957 code of practice for the use of steel tubes in general building constructions.

Entirely self-supporting S & L structures of the following spans and bay lengths are available ex-stock.

Type	Nom. Single Span	Bay Lengths
SLS/20	20 ft.	10 ft.
SLS/30	30 ft.	10 ft. and 13 ft. 4 in.
SLS/44	44 ft.	10 ft. 1/8 in. and 13 ft. 4.1/8 in.

KIRLOSKAR BROTHERS LIMITED

EXPANSION PLANS IN HAND COMPLETED

THE expansion plans in hand of Kirloskar Brothers Ltd., comprising the installation of a machine tool factory at Kirloskarvadi and a branch factory at Dewas, have been completed. Giving this good news to shareholders at their Forty-second Annual General Meeting which was held at Kirloskarvadi (District Sangli) on 28th January 1963, Dr. D. S. Sardesai, Chairman of the Company, added that assembly of vertical turret lathes at the Kirloskarvadi factory had been taken up and trial production had commenced at the factory at Dewas. The Company now proposes to manufacture components and other range of machine tools. Dr. Sardesai, however, cautioned shareholders against expecting startling results from the machine tool factories in the immediate future, as the trend of production would be determined entirely by the availability of raw materials and power. If the necessary supplies were forthcoming, he said, the prospects would be bright.

The following is the full text of Dr. Sardesai's speech:

LADIES AND GENTLEMEN,

I am happy to welcome you to this general meeting.

The Company's audited accounts and the Directors' report for the last year have been in your hands for some time and with your permission I shall take them as read.

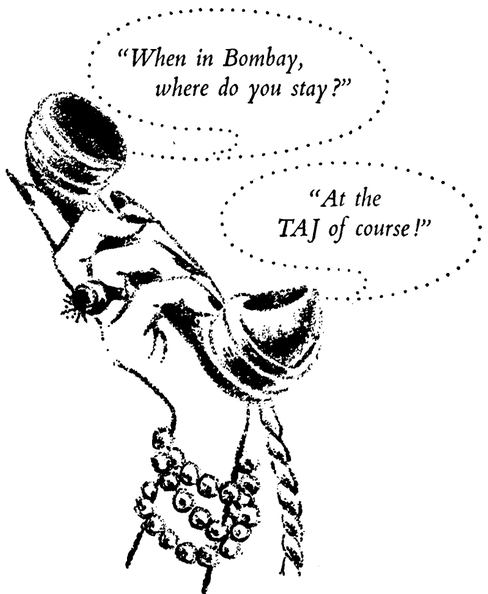
Expansion Plans

The examination of the accounts will show that last year was another successful year for the Company. The Company's turnover increased from Rs. 3.16 crores to Rs. 3.88 crores. The increase in the turnover of the Company's stores sales was more marked during the year than the increase in the turnover of the Company's goods. Apart from the increase in the Company's turnover, there has been a satisfactory increase in the investment and other income of the Company by way of dividend and royalty from Rs. 2.37 lakhs to Rs. 3.94 lakhs. While these figures are indicative of encouraging results of the Company's working last year, you will have noticed that there is a steep increase in the development rebate and depreciation which reflects the tempo of expansion. The expansion schemes comprise the machine tool factory at Kirloskarvadi and the branch factory at Dewas. The Dewas factory was completed during the year and started trial production in July 1962. The erection of the building of the machine tool factory was practically completed and a number of machines were also installed during the year. The assembly of the vertical turret lathes was taken in hand during the year and the first machine was completed. All these expansion programmes have made inroads on the profits of the Company by way of increased interest charges, depreciation and allocation to development rebate reserve and hence the balance of profit available for distribution is about the same as last year. In view of this, your Directors have not been able to recommend any increase in the dividend over 10 per cent, and I am sure that this is in the ultimate interest of the shareholders.

Having dealt with the accounts, I am sure you will want me to review the progress of the Company in the last year and the prospects for the future. Last year was a very eventful one for your Company. The Dewas factory was formally declared open by the Chief Minister of Madhya Pradesh at a function in Dewas on 22nd December 1962, at which the Governor of M.P., Mr. Pataskar, presided. On this occasion, the Company gave a donation of Rs. 25,000 to the National Defence Fund. The team of the Company's officers who have been deputed to Dewas has done an excellent piece of work there, having constructed the factory and put it into operation in less than one year despite difficulties.

Manufacture of Components

The production at Dewas at present is steadily going up and will soon reach the rated capacity, provided the supply of raw materials is assured. At present, the supply is not satisfactory and, while we are grateful to the Madhya Pradesh Government for its unstinted co-operation in securing controlled materials like coke and pig iron, I do not visualise appreciable increase in output at Dewas, unless actual supplies start arriving. The machine tool factory at Kirloskarvadi is now ready, and the assembly of vertical turret lathes from imported components has already been taken up. A phased programme of manufacture of components indigenously has also been taken up. When the machine tool plant is in full production in the next few years, we shall have achieved another landmark in the history of this Company. I would caution the shareholders not to expect startling results from the machine tool factory in the immediate future. The machine tool business has no doubt vast scope in our country, but there are numerous difficulties with which machine tool industry in India is bristled. This industry has been assigned a very important role in the third Plan and this role of the machine tool industry is further enhanced in the present national emergency. Mr. S. L. Kirloskar, the Chairman of the Indian Machine Tool Manufacturers' Association, who is also the Managing Agent of your Company, has correctly focussed the attention of the Government on the ills that plague this industry and has called upon the Government to evolve a co-ordinating machinery to eliminate delays and also to simplify the procedure. I sincerely hope the Government will give sympathetic consideration to his suggestions, especially in view of the importance of this industry in the present national emergency. Your Company is also considering taking up the manufacture of other types of machine tools in its factory. Another important event was the supply of electric power from the Koyna Hydro-electric Project in August 1962, which fulfilled a dream. There are still some teething troubles in the supply of power, but I hope they will soon be overcome, and we will be able to secure the full benefits for your Company.



Outlook Promising

This brings me to the prospects. You will, I am sure, agree with me when I say that the prospects are overshadowed by the present emergency resulting from the wanton aggression by the Chinese on our soil. It is, therefore, difficult to make any forecasts, and I feel it is rather too early to make any pronouncements about the future in view of the many unknowables, the most important of which is the supply of raw materials both indigenous and imported. The financial impact of the present emergency on the Central budget will be known in the next few days and it would be better to wait and watch the developments. I would like to stress here that the emergency conditions should be a blessing in disguise and instead of causing despondency the present situation should spur us to greater and speedier industrialisation. As far as your Company is concerned, it will play its part fully in speeding up its schemes of expansion, and if essential materials are made available in adequate quantities I look to the future with hope.

Before I conclude, I will like to refer to the changes in the Directorate of your Company. Mr. S. V. Kirloskar ceased to be a Director from April 1962. You will remember that, though he retired as Company's general manager in 1958, his wise counsel was available to the Company as a Director of the Company. You will join me in keeping on record the appreciation of the members of the Company of his great services to the Company.

Note: *This does not purport to be a record of the proceedings of the annual general meeting.*

RURAL PRODUCTION BECOMES WASTE— WHEN IT CAN'T REACH THE CONSUMER

A new road link to a village means a closer link with the world—and added prosperity. Village industries become more profitable, new agricultural schemes such as market gardening develop and the standard of living rises. ● Road Transport speeds perishable commodities to market, saving time and special packing costs; eliminating multiple handling and wastage. ● The Indian Roads and Transport Development Association, champion of an adequate and efficient transport service, has stressed the need for greater outlay on road construction and relaxation of restrictions on transport operation. A large part of the nation's produce is wasted each year because of the lack of roads and truck transport facilities. ● With better roads and modern vehicles, Road Transport operators can deliver the goods.

THE BETTER THE ROAD— THE LOWER THE COST

PERSPECTIVES IN ENGINEERING

MR. JEHANGIR GHANDY'S STIMULATING ANALYSIS

ENGINEERING industries will have a big role to play in what Mr. Jehangir Ghandy, Executive Director of the Tata Iron and Steel Company Ltd. calls "the exciting and still unfolding drama of Indian development." The scope for engineering industries, both general and electrical, may be expected to expand greatly in the years to come. For instance, if power development is to be stepped up, from 1965-66 onwards, at the rate of two million kilowatts a year in terms of generating capacity, it will call for not merely turbines and generators but also a wide range of distribution and transmission equipment to be produced indigenously. If increase in food production is to keep ahead of population, at least three new fertiliser plants of the size of Nangal would need to be established every year. In the field of oil refining, capacity will have to rise by two million tons a year between now and 1970. These along with parallel developments in other chemical engineering industries, make evident the need for large-scale manufacture of chemical process plants, such as pressure vessels, distillation columns, absorption towers and heat exchange units. Industrial services and facilities (that is, the infrastructure) will also have to expand correspondingly, and these will throw up further demand for a variety of engineering products, from road-rollers and other construction equipment to rails, trucks, wagons and locomotives to move the goods. All this expansion would be additional to the continuing demand for plant and equipment from existing industries, both for replacement and modernisation. All this, again, lends validity to the efforts that India has been making to develop indigenous capital goods industries as fast as she can. There is thus no disputing, in the opinion of Mr. Jehangir Ghandy who delivered the Pandya Memorial Lecture at the Indian Institute of Metals at Jamshedpur on the 4th instant, the need for vigorous development of engineering industries and for according them high priority in the overall national schemes.

Mild Steel and Pig Iron

But basic to the development of engineering industries is the iron and steel industry. The slow build-up of steel production in recent years has meant a continuing gap between demand for and domestic supply of steel—a gap which is barely covered by imports of a million tons or more per annum. Mr. Jehangir Ghandy foresees, in the lecture mentioned above, the continuance of this demand gap even after full output is achieved from the existing plants in both the private and public sectors. Unless the current expansion programmes are expedited, the gap will not be closed. As recent experience has shown, it takes a long time to build new plants and bring them into full production. In this connection, Mr. Jehangir Ghandy would like to see greater recognition accorded to such opportunities of expanding output as still exist. Also relevant, in this context, are the findings of the Raj Committee on Steel Control, for these show that the present pricing policies do not allow adequately for expansion and modernisation of older plants. These findings are:

"Regarding the general level of the price of steel allowed to producers, it is our view that the present retention prices do not allow adequately for the replacement of plant at current (or prospective) replacement costs. The gross block should not be underestimated simply out of the fear that the general level of price of steel will have to be raised or that the valuation at replacement cost might enable the older plants in private ownership to accumulate large surpluses. Though some consumers may need subsidy, there is no case for making steel producers supply steel generally at prices which do not cover costs of production and replacement. The older plants can be modernised and expanded only at current or higher costs; if they accumulate larger surpluses as a result of higher retention prices, but do not deploy them for modernisation and expansion, other measures can be contemplated (including, in extreme cases, even nationalisation) but it would be wrong to allow the fear of misuse of profits to be made the basis of a price policy which provides inadequately for replacement and expansion. We suggest, therefore, that the retention price of steel be adjusted taking into account current replacement costs of plant and equipment."

If thus the expansion possibilities of the private sector steel plants, too, are fully exploited, the availability of steel to engineering industries will become easier. There will still be the problem of pig iron supply in adequate quantities to these industries. Mr. Jehangir Ghandy is inclined to the view "that the responsibility for supply of foundry grade pig iron should increasingly be taken over by non-integrated units specially set up for the purpose." A modern high capacity blast furnace, with all its ancillary facilities, he continues, is a very expensive instrument which can hardly yield adequate return if a significant proportion of its capacity is utilised to produce an intermediate, low-cost product like pig iron. He, therefore, welcomes small iron-making units which can be operated on fuels which are unacceptable in standard blast furnace practice. Noteworthy, in this connection, are the technological possibilities unfolded by recent pilot investigations at the National Metallurgical Laboratory. A scheme has also been drawn up recently for the indigenous manufacture of the requisite plant and equipment with an import content as low as 15 per cent of the total cost. If this scheme materialises, it will facilitate progress on the several private and Government schemes now in view for pig iron manufacture in small-scale plants. Mr. Jehangir Ghandy, therefore, believes that the opportunity now exists for bridging the present gap between the demand for and supply of pig iron and also for ensuring additional supplies for the future, independently of integrated plants. Whether this optimistic expectation will be fulfilled is, however, open to doubt, for the economic feasibility of small-scale pig iron plants does not seem to have been firmly established. One will have to wait and see how many of the licensed pig iron plants (for an aggregate capacity of one million tons) are going to come up. Anyway let us hope, with Mr. Jehangir Ghandy, that supplies of foundry grade pig iron to engineering industries will improve as new capacity, large-scale and small, comes into operation.

Alloy and Special Steels

What about alloy and special steels—another vital requirement of the engineering industries? The supply prospects of these steels, according to Mr. Jehangir Ghandy, are decidedly uncertain. On the other hand, the demand for them is increasing all the time. Two subsectors alone, namely, industrial machinery manufacture and the automobile industry, will, between them, require as much as 109,000 tons of alloy and special steels, if their third Plan targets of machinery and vehicle production are to be achieved. The aggregate demand for these steels from the aforesaid and other industries is estimated to be about 200,000 tons by 1965-66. Is there any hope that demand of this magnitude will be met at least by the end of the third Plan? Mr. Jehangir Ghandy does not seem to have any such hope, as will be seen from his following observations:

"None of the three major schemes, each expected to contribute 50,000 tons, has made any headway. It will be inappropriate for me to comment here on the circumstances under which one scheme (with which I happen to be connected) has had to be abandoned but the position is really alarming because work on the other two projects—one of them sponsored by the Defence Ministry and the other by Hindustan Steel—has hardly begun because of the delay in sanctioning foreign exchange. According to newspaper reports, it is only this week that the Durgapur project is to receive final financial clearance from the Cabinet. One can understand and even sympathise with the Government's difficulties with regard to foreign exchange since the position never easy, has been exceptionally difficult in the past 12-15 months. Yet, this need not have proved an insuperable difficulty if the penalties of delay had been fully reckoned by those whose responsibility it is to ration our foreign exchange. *At this rate, no significant production of special steels is likely for four years or possibly five.* (Italics ours.) This must mean demand being met by highly expensive imports or keeping new and expensive productive capacity unutilised. One way or another, the shortfall here will defer the fulfilment of the hope cherished in respect of self-sufficiency in a number of important fields."

Non-ferrous Metals

Non-ferrous metals constitute another vital component of the materials base of engineering industries. As the huge shortfalls in non-ferrous metals can be met by substitution only partly, Mr. Jehangir Ghandy thinks that very substantial imports, particularly of copper and lead, will clearly be necessary in the years to come to sustain the manufacture of electrical equipment. If the burden of imports is to be reduced, something must be done to process locally cheaper secondary scrap. It is said that the United States, for instance, reclaims as much copper from scrap as that produced by the mines.

The development of engineering industries would also call for training of technical manpower on a larger scale. Mr. Jehangir Ghandy has pointed out, in this connection, an unsatisfactory trend. The trend is that the outturn of engineering graduates is running at a faster rate than that of diploma holders at the crucial craftsmen levels. The proportion of graduates to diploma holders normally obtaining in industry would require that the number qualifying for diplomas should be at least three times that of the graduates. But the actual proportion now is less than one is to two. It would, therefore, be necessary to set up more polytechnic institutes for expanding the output of diploma holders.

Expansion of facilities for indigenous design work, development of specialist consultancy services and project engineering groups, division of labour between the principal industries and their ancillary suppliers, strengthening the technical and managerial resources of small plants, pursuit of the consortium idea by a number of firms for the manufacture of industrial machinery, and better management of construction of engineering enterprises—these are some of the directions in which engineering industries would have to progress fast. Mr. Jehangir Ghandy's ideas on these aspects provide further perspectives for growth in a vital field. Engineering industries—general and electrical, heavy as well as light—have thus a good deal to do before they can measure up to Western standards.

STAINLESS STEEL INDUSTRY

A memorandum detailing the problems of the stainless steel industry was recently submitted by the All-India Stainless Steel Industries Association to the Union Minister for Steel and Heavy Industries. The industry, according to the memorandum, is facing a critical situation now, following the ban, announced in December last, on the imports of stainless steel sheets. (Imports in the January-October period of 1962, incidentally, were about 4,000 tons.) It is feared that this ban will lead to widespread unemployment in this industry which consists of about 400 predominantly small-scale units manufacturing utensils. The Association's board estimate is that as many as 25,000 workers will lose their employment. An estimated capital investment of the order of about Rs. 8 crores in the industry will also be rendered idle. The country will also lose the export market for stainless steel wares which, in 1962, fetched about Rs. 30 lakhs in foreign exchange.

The question, therefore, arises whether something cannot be done to ensure raw material supplies to the industry. The State Trading Corporation can, in the first instance, expedite its scheme to import 2,000 tons of stainless steel sheets against the export of manganese ore. The Iron and Steel Controller, who has abandoned an earlier scheme for importing some quantity against the export of ferrous scrap, would also do well to revive it. Unless imports are effected at least on such barter basis, the industry will be heading for disintegration.

NEW PRODUCTS AND PROCESSES

New Diaphragm Tank Wagon

A DIAPHRAGM device making tank wagons, adaptable for the alternate conveyance of a full load of two different products that should not be allowed to mix or contaminate one another without cleaning in between whiles, has been developed by a Swedish firm, Chr. Olsson i Falkenberg AB, Scandinavia's leading manufacturers of tank wagons. A tank wagon of this type was recently delivered by the Company to the Nigerian Railways. It has a loading capacity of 8,050 Imp. gallons, weighs 23 tons and is built for an axle load of 13 tons. The car is intended for traffic between the coast and the interior of Nigeria, carrying mineral oils in one direction and vegetable oils in the other. The tank wagon as such is of conventional design but is fitted with double filling and emptying arrangements. Suspended between the two longitudinal halves of the tank is a flexible separating wall of rubber. In principle, this diaphragm fits closely to one side of the tank wall for shipping one product, while being turned "inside-out" for fitting against the other wall when another product has to be transported. The tank will thus be divided into two separate compartments although both, for all practical purposes, retain the full volume of the tank. Since the internal surfaces of the tank that have been exposed to one product will not be exposed to the other, no dirtying or contamination will occur. The only cleaning necessary is that which will normally have to be effected in a tank of conventional design. The tank can also divided in'o several compartments or be fitted with separating walls. Besides being used for the conveyance of liquids it can also be adapted for carrying a liquid and a pulverised product. When carrying, at the same time, two different liquids with very diverse specific weights, one on each side of the diaphragm, the combined centre of gravity will theoretically be positioned in the vertical plane through the vertical axis of the tank. The diaphgram is further so designed so as not to be exposed to any specific stress other than what is normal to the surface even when being used in a tank with a certain amount of pressure. Nor does the fastening arrangement of the diaphragm affect the dimensions of a vessel based on design calculations of a normal cylindrical tank.

New Varieties of Hybrid *Jowar, Bajra* and Maize

By crossing a U.S. variety with Indian strains, the Indian Agricultural Research Institute, Pusa, has now developed hybrid *jowar*. Though the plants are somewhat shorter they bear bigger heads with larger grains. The yield from these varieties is 50 maunds per acre or double that produced from the best of the familiar varieties. *Jowar* is the second most important food crop of the country in terms of area, next only to rice. In terms of quantity wheat and *jowar* have a neck-and-neck race. *Jowar*, although called a coarse grain, is popular with peasants in many parts of the country. In 1961-62, it was grown in 43 million acres, the production being 7.7 million tons. Four varieties of hybrid maize, suitable for different parts of the country, have been evolved and released for cultivation by the Indian Agricultural Research Institute. They are: Ganga Hybrid Makka 101 and Ganga Hybrid Makka-1 for the northern plains, Ranjit Hybrid Makka for southern Rajasthan, Gujarat and Maharashtra and Deccan Hybrid Makka for the peninsular parts. Ganga 101 yields as much as 50 maunds per acre with the aid of fertilisers as against only 30 maunds per acre from KT 41—the best local strain produced so far. Though as a food crop it comes after rice, *jowar*, wheat and *bajra*, maize is the staple food of a large number of people particularly in the hilly areas. The production in 1961-62 was nearly 4 million tons of grain, the average land under the crop being about 11 million acres.

The Institute has now released a new variety of *bajra* called "Improved Ghana." It is an early variety and takes only 80 days to grow. The crop which was ready for harvest in the Institute's fields in the first week of October had been sown only in August. The grains of "Improved Ghana" are bold and compact and contain 14 per cent protein. The average yield of this hybrid is 25 to 30 maunds per acre, as against 10 to 12 maunds from local varieties. *Bajra*, which is another of the important crops of the country, is a native of Africa. It is now grown in all parts of India except Assam. The average annual area under *bajra* is about 27 million acres, the production in 1961-62 being 3.5 million tons of grain.

New Sensitive Water Current Meter

An impeller type of current meter, which makes use of an optical method to count the number of revolutions, has been designed at the Indian Naval Physical Laboratory, Cochin. The instrument is capable of measuring velocities of underwater currents as low as 0.1 ft./sec. In this, the limitation imposed by the load of the counter on the impeller is eliminated. In many of the water current meters an impeller, a cup system or a paddle wheel, is made to rotate by the current and the number of revolutions in a given interval of time (which is proportional to the velocity) is counted by a built-in counter or by an instrument located in the ship from which the current meter is lowered. Usually, a mechanism is coupled to the shaft of the rotating assembly, which operates a make-and-break switch or some other form of recorder. In all these arrangements the impeller has to operate it mechanically; this results in a load being imposed on the impeller which sets a lower limit to the velocity which can be measured by the instrument. In order to eliminate this limitation an attempt was made to design a counting device which would not offer any load to the impeller. The optical method proved suitable. The equipment is very simple and rugged and was fabricated in the machine shop of the Indian Naval Physical Laboratory, Cochin. An impeller with three blades, two of which are transparent and one opaque, is pivoted in such a way that it is free to rotate about a horizontal axis. On one side of the impeller is a source of light and on the other side a photovoltaic cell suitably mounted, so that, for every revolution of the impeller, the opaque blade interrupts the beam of light once and as a result there will be a negative pulse in the output of the photovoltaic cell. The number of negative impulses is counted. The velocity of the current can be read from a calibration chart.

New Cure for "Welding Glare"

Favourable results from the treatment of 3,000 cases of "welding glare" injuries with Xylocain eye drops are reported by the physician of the Swedish Kockum Shipyard, Dr. Knut Haglind, in a recent article in the *Swedish Medical Journal*. As an occupational injury, welding glare is becoming ever more frequent following the expansion and advancement of welding technique in industry. Noticeable symptoms of welding glare are intense wincing towards the light, eye friction, swelling and redness of the eyelids and difficulty in opening the eyes—as if there was sand in them. It has been compared with snow blindness. The irritation arises after only 3-4 hours of exposure to the intense ultraviolet light, and is most marked in the evenings and at night. When Xylocain was introduced at Kockums, up to 95 per cent of the patients who used it as a dose of 2 drops in each eye eight times in a day were able to work without irritation the following day. The eye drops neither harmed nor irritated their eyes and the ointment effect stopped pain. No after-effects were registered and nobody needed further medical treatment. Dr. Haglind points out that there are now fewer absences at Kockums than at other industries with the same problem. The good result is of great economic importance both to the employee and the Company.

Helium Turns Into Metal

Scientists of the Soviet Institute of the Physics of the Earth claim to have computed the pressure under which certain simple crystalline substances turn into metals. This pressure is 90 million atmospheres for helium and 20 million atmospheres for lithium hydride. Both substances were chosen by the scientists because of the relative ease with which their transmutation into the metallic phase can be computed. But helium and lithium hydride are relatively rare on the earth. Later on geophysicists intend to compute the pressure under which more complex and widespread substances turn into metals. The computations carried out by Soviet scientists for the first two substances are said to be highly accurate. They contend that the same technique can be applied to more complex substances. On the whole, these computations are essential to solve the problem of the origin and composition of the earth's core. One theory is that the core had formed out of non-metallic silicates which turned into metals under the pressure of the thousands of kilometres thick mass of the earth. To check this theory and to determine the intra-terrestrial pressure is exceedingly important not only to gain information about the interior of our planet but also about the structure of the cores of other planets. It is also necessary to solve this problem for future work in creating substances with tailored properties.

Substitute for Cement

Significant work has been done by the Central Laboratory at Neyveli on the utilisation of fly ash as substitute for cement in the making of hollow blocks and also concrete. The first unit in the 250 M.W. Thermal Station at Neyveli has recently come into production. From this Station are now available large quantities of fly ash, up to 20 tonnes per day. Previous experiments done on a small scale in the Central Laboratory at Neyveli indicated that fly ash could be used as substitute for cement in the making of hollow blocks and concrete. As soon as the bulk quantities of fly ash became available from the Thermal Station, experiments were conducted to find out how much cement could be substituted by fly ash. Tests so far conducted have indicated that in the preparation of hollow blocks, which are the main material used for construction of various buildings at Neyveli, nearly 50 per cent of cement could be replaced by fly ash. Further investigations are under way for using fly ash for making aggregate and also eliminating use of cement in making concrete and hollow blocks.

Polythene Damp-proof Wall Course

A new polythene damp-proof wall course, successfully tested at Britain's Building Research Station, has been developed by a British firm, British Cellophane Ltd. The manufacturers claim it as a new concept in the field of damp-course application. The new product is light, clean and easy to handle—it weighs only 3¾ lb. (1.5 kg.) per roll of 4 sq. yds. (3.3 square metres)—retains its flexibility under extremes of temperature, will not crack or extrude and is rot proof and chemically inert. With a tensile strength in excess of 2,000 lb. per sq. in. (140.6 kg. per sq. cm.) it requires only one-quarter of the storage space needed for traditional damp-course materials. In addition to new housing units it can also be used as a damp-course insertion in existing older structures.

Smoothing Chamber for Pumps

A new type of air chamber for smoothing out the pulsations of reciprocating pumps has been developed by a British firm, William R. Selwood, Ltd., Hampshire, England. It is based on a laminar flow principle that preserves the air cushion indefinitely and is effective over the whole range up to full vacuum. In general, air chambers gradually lose their air into the water, and either have to be topped up from an air pump or fitted with a float, which tends to jam when there are solids in the pumped liquid. They also have to be matched to the load, the air bottle being replaced by another of a different size when the load changes. The new unit needs neither topping up with air nor adjusting for varying loads.

Sharpening Grinding Wheels

Using the fact that a grinding wheel sharpens itself in use at low speeds, an American company has developed a system to vary wheel speeds to maintain optimum grinding conditions. At low speeds a wheel breaks down at its surface. Dulled, rounded abrasive grains are pulled out, exposing the sharper grains beneath and restoring the cutting action. The automatic system senses a lack of cutting power in the wheel and goes into action to reduce its speed. When the grinding surface is re-dressed the speed is brought back to normal.

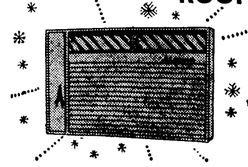
New Oil Heater

A new oil heater, which combines the advantages of cylindrical heater and convector heater, has been developed by a British firm, the Valor Company Ltd., Birmingham, England. The Chimney is insulated from the outer casing by a sheet-steel baffle, which ensures that the outside of the heater is never too hot to touch. Safety features include an arrangement that makes it impossible to close the heater door unless the chimney is locked in position, and a device that automatically extinguishes the flame when the door is opened.

Biochrome Stencil

A double-coated stencil for reproducing engineering drawings, advertising artwork, plans, posters and so forth has been developed by a British firm, Ellams Duplicator Company, Ltd., Watford, Hertfordshire. The top coat is blue and the base white. A style pen removes the blue, leaving a sharply-defined white line. The blue is surface-ruled in 1-in. (25.4 mm.) squares, which are sub-divided into ¼-in. (6.35 mm.) square as a guide for complicated drawings. The stencil can also be cut on a typewriter in the normal way.

Hardening Steel



A cheap and quick way of case-hardening steel components such as gears and parts for roller bearings has been developed by a Japanese concern. The component is placed in a bed of carbon powder which is "fluidised" by a stream of methane gas. Two electrodes are placed in the bed, the part electrically connected to them and an alternating current passed so that the temperature of the component rises. A hard high-carbon case of 0.036 inches is obtained in two hours.

COST OF FIRES TO INSURERS AND INDUSTRY

SOME LESSONS FROM BRITISH EXPERIENCE

BRITISH experience in respect of industrial fires offers some valuable lessons for India. Fire losses in Britain, which have been showing a consistently upward trend in recent years, rose to a record of £55.58 million last year, according to preliminary estimates made by the British Insurance Association. This figure is about £16.5 million higher than that for 1961 and £11 million more than that for the previous year, namely 1960. For some years upto 1958, annual fire losses in Britain varied between £25 million and £30 million but for the subsequent three years, 1959-61, the average was about £42 million. Last year's figure exceeded the three-year average by £13 million and was 4½ times the total fire losses in 1946.

These figures refer only to material damage to buildings, machinery and stocks of goods and raw materials. They do not take into account the millions of pounds of indirect losses caused by fires through disruption of business, including loss of export orders as also loss of employment and goodwill of firms affected by fires. The main reason for the record fire loss last year was the much greater number of fires than in 1961. Thus, there were 584 major fires, involving damage estimated at £10,000 each, as compared with 488 in 1961. The number of bigger fires costing over £100,000 each also went up from 39 in 1961 to 58 in 1962. Mr. R. L. Barnett, Chairman of the British Insurance Association, does not believe that fire losses of this magnitude are inevitable. "There is surely room," he says, "as part of the National Productivity year, for a determined drive to reduce fire wastage, particularly in industrial and commercial premises, where the more serious fires take place. Insurance companies' compensation does not replace the material assets lost in fires and the country cannot afford to watch its assets go up in smoke at the current rate of £100 every minute of the day."

Fire Protection

In Britain, fire brigades are now attending every year about 70,000 fires in buildings and those in industry are responsible for about 80 per cent of the total fire wastage bill. Although the rising value of property, equipment and materials has played a part in the growing cost of fire, the Association does not believe that this fully accounts for the 450 per cent rise in fire bill since 1946. The inadequacy of fire protection measures, lack of proper instruction in the principles of fire protection and poor coordination of efforts by the various agencies are largely responsible for the increase in the incidence of fire.

If this is the position in Britain, the situation in India is far worse. Comparable figures of the cost of fires in India are not available, but it is bound to be high, if the cost of fires in terms of material damage to buildings, machinery, stocks of goods and raw materials occurring every year were calculated. As property damaged by fire represents a total loss to the country, irrespective of whether or not compensation is paid by insurance companies, it is necessary to reduce fire waste to the minimum. British experience provides some guidance in regard to not only the causes of fires in industry but also the preventive measures that could be taken to reduce the incidence of fire. Modern factories are very much exposed to the spread of fire once it takes a firm hold. Many factories, such as those in the motor industry, require long stretches of unbroken floor space for mass production lines. As a result, they contain no adequate fire breaks to prevent the spread of a blaze. Human carelessness, especially with cigarettes and matches, is also one of the main causes of industrial fires. Small fires, originating in certain parts, often blaze into big ones, destroying entire factories. The British Fire Protection Association lists four reasons for small fires developing into big ones. These are: (1) delays in discovering fires and notifying the fire brigade, (2) absence of fire separation, permitting the fire to spread unchecked throughout a building, (3) absence of fire-resisting doors or failure to close them to stop fire from spreading, and (4) faulty roof construction.

An integrated approach to the question of fire prevention was recently outlined by Mr. N. C. Strother Smith, Director of the British Fire Protection Association, to the members of the Insurance Institute of Liverpool. Mr. Smith's suggestions and advice are relevant in the Indian context also. If adequate attention is devoted to the prevention of fire in planning new factories and plants that are being fast built in this country, the incidence of fire could be greatly reduced.

According to Mr. Smith, one of the most important factors which has emerged from a study of large industrial fires in Britain concerns the nature of the premises which are now being used to accommodate the greater volume of plants and products in factories. Single-storey, lightly clad, steel-framed structures covering vast areas are being used alike for storage and manufacture. These undoubtedly offer great advantages to industrial managements. They are, however, of a type that provides no means of limiting the damage when a fire breaks out. Equally undesirable from the point of view of fire risks are old premises put to new uses without necessary changes being made to make the premises safe from fire under the new conditions. In Mr. Smith's opinion, it is the failure of those concerned with fire protection to devise the sort of fire precaution that industry will adopt which is to be blamed for the reluctance of industry to protect itself. What can be done to remedy this defect? How can the necessary fire precaution be devised and applied? Mr. Strother Smith's answers to these questions are as follows:

Less Effective

"In Britain, fire prevention or protection against fires is the responsibility, to a varying extent, of insurance companies, fire brigades, industrial or fire protection staff, factory inspectors, Government departments, manufacturers of fire protection equipment, the Joint Fire Research Organisation and the Fire Protection Association. These various organisations influence standards of fire protection by means of differential insurance premiums, local and central Government regulations, codes of precautions drawn up by industrial fire protection staff, codes and standards agreed to by all through British Standards Institution's committees and information and advice offered by one or all. As a result of the work of the Fire Research Organisation and the Fire Protection Association, a body of knowledge and experience on fire prevention, in a form that can be used in industry, has also been developed. But it has not fully succeeded in creating an attitude in the public's mind conducive to improved fire protection and providing instruction in the principles of fire protection which industry needs. As a matter of fact, inadequate knowledge and lack of cooperation between the different agencies have made fire prevention work less effective than it would otherwise have been.

There is clearly, according to the Director of the Fire Protection Association, a serious need for instruction at two levels: one at senior management level and one at specialist level to those members of the staff who are responsible for advising senior management. A vital point that should be borne in mind in the provision of instruction, in Mr. Smith's opinion, is that it should be concerned primarily with the principles of fire protection rather than with the applications. The reason for this distinction is that it is in the principles that the chief deficiency in knowledge lies. Even though the body of legislation affecting fire has become more and more burdensome, it involves no serious difficulty in understanding, but, for its intelligent application, a thorough knowledge of the principles is essential. It is necessary to impart this knowledge not only to top managers but also to the plant designer, the architect, the builder and the production personnel. In fact, all must have a greater understanding of the basic principles of fire protection. Equally important is co-ordination of effort of the diverse groups in fire protection for bringing about an improvement in fire protection standards.

REPORT OF THE AUDITORS TO THE STATE BANK OF INDIA

We have examined the foregoing Balance Sheet of the State Bank of Indore as at 31st December, 1962, and also Profit and Loss Account of the Bank for the year ended on that date with the Accounts relating thereto of Head Office and with the unaudited Returns submitted and certified by the Agents, which Returns have been incorporated in the above Balance Sheet and Accounts.

We report that—

(i) in our opinion the Balance Sheet is a full and fair one, containing all the necessary particulars and is properly drawn up so as to exhibit a true and correct view of the affairs of the Bank, according to the best of our information and the explanations given to us and as shown by the Books of the Bank;

(ii) where we have called for any explanations or information such explanations and information have been given to us and have been found satisfactory;

(iii) the transactions of the Bank which have come to our notice have been within the competence of the Bank;

(iv) the Returns received from the Branches of the Bank have been found adequate for the purpose of our audit; and

(v) the Profit and Loss Account shows a true balance of profit for the year covered by such Account.

INDORE, 22nd *January*, 1963.

U.S. TO SUBSIDISE TOBACCO EXPORTS?

WORLD SUPPLIES EXPANDING FAST—POSITION IN INDIA ANALYSED

INDIA is one of the world's largest producers of tobacco, next in importance only to the U.S. and Communist China, besides being a fairly large exporter. India's exports of tobacco have been facing ever-increasing competition in recent years. On all accounts it would appear that there is no prospect of abatement of competition. On the contrary, indications are that the pressure of competition in world markets will become more intensive in the years ahead. The latest report from the U.S., which is the largest exporter of tobacco in the world, is certainly disturbing. The U.S. Government, according to unofficial reports, proposes to grant a new subsidy on exports of tobacco in a bid to reduce its stocks. The total surplus stocks of tobacco in the U.S. aggregate about 800 million lbs., equivalent to about 40 per cent of the U.S. tobacco output in 1962. A report from Rhodesia says that the subsidised U.S. tobacco is likely to be released on the market by next month, when the Rhodesian selling season starts.

Rhodesia's concern is understandable, since it is the closest competitor to the U.S. in the field of virginia flue-coloured tobacco. But there is nothing new in the U.S. decision to give subsidy. It may be recalled that it had given a twenty per cent subsidy on 1955 and 1956 crops also. This subsidy was not very effective in itself, as the quality of the surplus was rather low. It is said that the 1962 output also contains tobacco of indifferent quality. Be that as it may, the U.S. subsidy question is likely overshadow the deliberations of the first International Tobacco Trade Congress scheduled to be held next month at Salisbury, Rhodesia. The Congress, which will be held from 6th to 16th March 1963, will be attended by representatives of a large number of countries, including those of the Soviet bloc.

Record World Production

The major factor that threatens the stability of tobacco in world markets has been the uninterrupted increase in the output of tobacco in the U.S. and other countries, much in excess of the growth in world consumption. According to the latest estimate of the U.S. Department of Agriculture, the U.S. output of tobacco rose from 2,058 million lbs. in 1961 to 2,200 million lbs. in 1962, thanks mainly to an increase in the area under cultivation. Besides the U.S., several countries, such as India, Rhodesia and Nyasaland, Greece, Japan, Pakistan, Burma, Bulgaria, Philippines and New Zealand have also recorded higher outputs last year. On the other hand, there was a small decline in the output of Russia, Canada, Brazil, Turkey and Indonesia. The total world production of tobacco (excluding Communist China) has gone up by 343 million lbs. to set a new record of 9,078 million lbs. in 1962, as compared with that in the previous year.

The output of tobacco in some of the major producing countries in 1962 (with 1961 figures in brackets) was, in million lbs., as follows: the U.S. 2,200(2,058), Rhodesia and Nyasaland 270 (263), India 759(687), Pakistan 202(189), Greece 203(164), Brazil 274(338), Soviet Russia 375(385), Canada 193(210) and Turkey 215(219).

India's Exports

Although one of the leading producers of tobacco, India has not been able to make any significant headway in the field of exports. India's exports account for only about 15 per cent of total output, as against as much as about 70 per cent in the case of Greece, 60 per cent each of Cuba, Bulgaria and Federation of Rhodesia and Nyasaland, 50 per cent of Turkey and 26 per cent of the U.S. Still, tobacco has an important place in India's exports. Exports of unmanufactured tobacco amounted to Rs. 14.04 crores in 1961-62, which show a modest decline, as compared with Rs. 14.06 crores in 1960-61. This figure, however, is higher by about Rs. 4 crores, as compared with the exports five or six years ago. Shipments in 1962-63 have been of a higher order still. During the first eight months of 1962-63 (April to November 1962), these amounted to Rs. 13.6 crores, as against Rs. 9.3 crores during the corresponding period of 1961-62. It may be recalled that the peak touched so far was in 1951-52 (Rs. 16.14 crores), partly as a result of the Korean boom and partly on account of devaluation.

One of the major factors responsible for the impressive increase in India's tobacco exports during the current year (1962-63) has been the good offtake by Soviet bloc countries of virginia flue-coloured tobacco for cigarette manufacture. East European countries have started large-scale purchases from India for the first time. Thus, during April to November, East Germany bought virginia tobacco worth Rs. 118 lakhs, Poland Rs. 28 lakhs and Czechoslovakia Rs. 5 lakhs. Yugoslavia also imported Indian virginia tobacco worth Rs. 41 lakhs during the same period. Soviet Russia bought virginia tobacco worth Rs. 282 lakhs, as compared with only Rs. 39 lakhs during April-November 1961. There has also been some increase in exports to such traditional buyers as the U.K., Belgium and the Netherlands.

The larger exports were made possible by an increase in Indian tobacco output to a record level in 1961-62. The following table shows the trend of tobacco production in and exports from India during the last decade:

	Production (Million lbs.)	Exports (Rs. crores)
1951-52	461	16.14
1952-53	539	13.03
1953-54	600	11.02
1954-55	562	11.76
1955-56	667	10.65
1956-57	672	12.48
1957-58	528	14.62
1958-59	584	14.08
1959-60	629	13.61
1960-61	688	14.06
1961-62	750	14.04
1962-63 (April to November)	..	13.60

Some Suggestions

Despite the increasing trend in India's exports of tobacco in recent months, it is too early to say whether India will be able to increase its proportionate share of world markets. In fact, India's share in world tobacco trade has been declining during the last few years, from 7.1 per cent during the period 1948-1952 to 6.3 in 1958 and still further to only 5 per cent in 1959 and 1960. In order to increase exports and maintain them at a high level, India has to make all-out efforts to improve the quality of the commodity. At present, most of the Indian tobacco is unsuitable for commercial manufacture of standardised tobacco. In fact, more than 75 per cent of output consists of those meant for hookah, bidi, and chewing tobacco, which have little demand in the world market. The world demand is mainly for virginia tobacco, which accounts for less than 25 per cent of Indian output. Pointed attention to this anomaly in the pattern of tobacco production has been drawn in an article by Mr. R. K. Sharma on "Developing Tobacco Exports" in the latest issue of the *Agricultural Situation in India*, published by the Union Ministry of Food and Agriculture. Mr. Sharma suggests that the cultivation of virginia tobacco should be extended to more areas. He even considers that the increase in area by 25,000 acres under this variety envisaged under the third Plan is not sufficient. The Central Tobacco Committee will do well to redouble its efforts to improve the quality of tobacco produced in the country and initiate appropriate steps for diverting more land from the inferior to the superior variety. Equally important it is to increase the per acre yield of tobacco. India's yield of tobacco per hectare was only 7.7 kgs. in 1960-61; this compares unfavourably with 19 kgs. in the U.S., 13 kgs. in Rhodesia and the world average of about 11 kgs.

Another significant point stressed by Mr. Sharma relates to the need for maintaining stable markets abroad. As it is, India is gaining some new markets, but losing some traditional markets. India has, for instance, nearly lost some old markets for tobacco like Indonesia, Sweden, East Africa and West Germany. Further, exports to Hong Kong, Pakistan and Japan have also been declining. What is worse still, the establishment of European Common Market and its common agricultural policy is likely to affect adversely tobacco exports. Mr. Sharma, therefore, has urged measures for diversifying exports to Soviet bloc countries and the newly developing countries of Asia and Africa.

Not apathy but action!

National Preparedness

LEIPZIG TRADE FAIR

India will be participating in a big way in the forthcoming Spring Fair at Leipzig (East Germany) scheduled to be held from 3rd to 12th March 1963. Having established itself as an international market for engineering and consumer goods, the Leipzig Fair will present more than a million exhibits submitted by exhibitors from about 60 European and overseas countries. The forthcoming Fair is expected to be attended by Government and trade delegations from about 90 countries. Exhibits are grouped into 55 Fair branches accommodated in 300,000 square metre floor space, both at the Technical Fair ground and in the Fair buildings in the centre of Leipzig. This grouping of Fair branches makes it possible to draw parallels between products at an international scope, to obtain an all-round survey in a minimum of time, and to conduct business negotiations and transactions in a concentrated manner. Such fair groups as machine tools, metallurgy, electrical engineering, building machines, industrial measuring and control equipment, and precision mechanics and optics figure prominently and may be compared to independent specialised trade fairs of international character. The same can be said of the following trade groups of the consumer goods: textiles and clothing, foods and allied products, furniture and veneers and household goods.

India is participating in the Fair, with a comprehensive and rather wider range of export products than those which have been shown in the past. Besides the normal and the usual traditional export items, such as tea, jute goods, cotton textiles, spices, coffee, handicrafts, coir and coir products, etc., there will be a large range of engineering goods, such as refrigerators, electrical goods, hardware building materials, automobile parts, electrical goods, cables, oil engines, marine engines, sluice valves, electrical motors, small tools, lathes, laminated springs for automobiles, jute and textile mill accessories, water pumps, generating sets, diesel engines, shaping machines, steel files, saws and many other small and medium-scale engineering goods.

The Indian Pavilion will be divided into two sections, the trading and the non-trading sections. The trading section, will be represented by the trade representatives of different exhibits, formed into a trade team, to assist the Director of the Indian Pavilion in the conclusion of business. Over 105 firms, including the State Trading Corporation, Export Promotion Councils and Commodity Boards will participate in the Indian Collective Pavilion measuring 1,016 sq. metres of space. Besides the Indian participation in a collective way, seven leading export firms of textiles, tea, dried fruits, tobacco and handicrafts will participate in the Special Commodity Pavilion in the city and the total area taken by these firms is 123 sq. metres. Each of these firms will send a representative and try to book business not only from G.D.R. but also from many other exhibiting countries as well as from the visitors who come from all parts of the world.

AGENDA FOR WORLD TRADE CONFERENCE

A tentative agenda for the world trade and development conference proposed to be held early next year, under the auspices of the United Nations, has been approved by the 30 nation preparatory Committee, at its first session which came to a close at the U.N. last week. The agenda reflects the need for discussion of measures to strengthen the economic life of developing countries. It now remains to be approved by the U.N. Economic and Social Council, which will also decide the exact date and place of the conference. There has been general agreement among the members of the Committee that Geneva or any other European city is the suitable place for the proposed world gathering.

The tentative agenda now forwarded to the ECOSOC is important not only for what it contains but also for what it does not. During the session of the preparatory committee, the Soviet Union had, for instance, insisted that priority should be given to the consideration of questions relating to expansion of East-West trade and also that the conference should voice support for establishing a new international trade organisation. These Soviet demands have not been met in the agenda. The Committee has also declined to accept the Soviet demand that the conference should deal with what was termed "economic aggression" by industrially advanced countries.

Meanwhile, the Committee has decided to reassemble at Geneva for its second session in May-June. It is possible that another four new members will be admitted to the Committee; they are Indonesia, the Netherlands, Malaya and Rumania.

BIG FALL IN E.I.D.-PARRY'S NET PROFIT

OUTLOOK, HOWEVER, BETTER

WITH the sole exception of an increase of £405,100 in net sale proceeds (that is, excluding excise duty paid) to £12,609,632 which is a new peak, the newly named E.I.D.-Parry Ltd. (called the E.I.D. and Sugar Factories Ltd. until 7th November last) has been able to fare no better during the year ended 30th September 1962 than it did in the previous year. Gross profit has actually declined further by £7,408 to £322,275, and its ratio to net sales has moved down to 6.5 per cent from 6.8 per cent to which level it had dropped in 1960-61 from about 8.5 per cent in the preceding two years. It may be argued that there is some cause for consolation in that the extent of decline in profit and profit-margin is not as sharp as it had been in the previous year. All the same, it does mark an extension of the previous year's setback.

The rise in turnover is attributable to satisfactory sales of all the products of the Company. Mention may be made here particularly of chemicals which sold well in the face of severe competition. Sales of ceramics, too, were larger and would been greater still but for the planned shut-down of the kiln, manufacturing bazaarware and acid jars, for conversion to oil-firing system. It will be recalled that the Company had obtained relief from the 10 per cent cut in sugar production, which had been imposed before the start of the 1961-62 season, on the ground that it would have left 70,000 tonnes of cane in the field without any means of disposal. Although the quantity of cane crushed during the year was lower at 383,455 tonnes as compared with 392,151 tonnes in the previous year, production of sugar was higher by 1,278 tonnes at 35,395 tonnes, thanks to an increase in the average recovery from 8.70 per cent to 9.23 per cent.

The setback in profit is in no way a reflection on either the efficiency of the management or on the nature of the business of the Company which is so well diversified as to necessitate the change in its name as mentioned at the outset. In fact, to quote Mr. H. V. R. Iengar, the new Chairman and Managing Director, from his statement to the shareholders, the setback in profit primarily due to the expenses, including interest, on the Ennore fertiliser project of the Company for the manufacture of ammonium phosphate, "was always anticipated, and to counter its likely effect on dividend a dividend equalisation reserve of £150,000 was created out of the profits of 1958-59." Whereas expenses on the plant went on increasing, there was very little income from it last year, as it reached full production only last month, that is, three months later than earlier expectations. It being a complex unit, incorporating many new features in the manufacture of compound fertilisers, the teething troubles in its commissioning and running-in period are easily understandable. Although late by three months, the favourable effects of its working at full capacity on the Company's profit will be felt in the current year's profit.

A particularly disappointing feature of the results of the year under report is a big fall in net profit from £366,017 to £266,912 following the sharp increase in the provision for taxation from £324,113 to £381,561 as also in that for depreciation from £139,553 to £173,802. Whereas the dividend on the £1 paid ordinary shares has been maintained at 21-3/7 per cent per annum, subject to tax, on the increased ordinary capital of £1,127,700 following the issue for cash of 27,700 shares at a premium of 12s. 6d. per share to Messrs. Doulton and Company Ltd., the transfers to reserves have been cut from £108,787 to £88,200. At £21,999, the surplus to be carried forward is also much lower than the sum of £115,584 brought in.

A synoptical view of the Company's progress in the past four years is presented in the comparative table in column 1.

Besides the Ennore fertiliser project, the Company has plans to erect a fertiliser factory at Visakhapatnam in collaboration with a consortium of two well-known American companies. This project, Mr. Iengar says, is progressing as well as can be expected under the present conditions, and there are still some matters on which the Government's decision is awaited. It has also applied for an industrial licence for the manufacture of cryolite, making use of one of the by-products of the Ennore factory. Expansion of the pottery works at Ranipet is progressing well. In the light of these manufacturing activities and expectations of maintaining income from trading activities at a satisfactory level, the prospects for the Company are bright. On the other hand, during the current year, the Company is expected to bear an additional burden of Rs. 21 to 22 lakhs under the sugarcane price formula and the cess in Madras State and the compulsory Emergency Risks Insurance. The details of this burden were discussed in *Commerce* last week on page 215.

Financially, the Company is in a sound position. Only, its resources are fully stretched and the ratio of debt to own funds is pretty high, being as much as 67.6 per cent. Of course, all borrowings are amply covered, but the interest charges will take away a substantial part of the earnings. If the fertiliser project fails, for some reason or other, to yield the results expected of it, the profit-margin will be badly affected. Another point that needs to be borne in mind is that the Company will have to set aside a good part of its future profits for building up a fund to take care of the repayment of loans. In view of these points, one should not expect any significant increase in the Company's rate of dividend for some years to come.

Now to summarise the details of the Company's financial position. The paid-up capital of £1,327,700, including £200,000 in preference shares of £1 each, is supplemented with capital reserves aggregating £563,032 and revenue reserves standing at £1,534,749. There is also a reserve for future taxation which is shown separately at £56,125. Loan capital from the holding company and subsidiary companies has gone up from £906,277 to £1,946,818, the bulk of which (£1,507,500 as against £680,500 in the previous year) is on account of two types of debentures. Current liabilities and provisions amount to £4,839,931 and outside shareholders' interest is shown at £233,165. Excluding debentures, the total current indebtedness to outsiders amounts to £5,512,414 and is fully covered by current assets, loans and advances standing at £6,898,746 and investments of £139,701, including £126,301 which are quoted and command a market value of £324,554. The gross block, which has expanded from £2,379,427 to £2,471,124, has been written down to £1,035,197 and, together with capital expenditure on work-in-progress, the net block is shown at £3,463,073.

The £1 fully paid ordinary shares of the Company are currently quoted at Rs. 39.10 *cum-div.* and offer, on the *ex-div.* basis, a net yield of 5.4 per cent per annum.

TATA OIL MILLS' RIGHTS ISSUE

The Tata Oil Mills Company Ltd. has completed allotment of the 140,150 new ordinary shares of Rs. 25 each which had been offered to the existing shareholders in September last as right shares in the proportion of one for two at a premium of Rs. 15 per share. The date of allotment was 7th December 1962. Although the shareholders did not avail themselves of the opportunity, the issue was over-subscribed, as those who had applied for the rights shares had sought additional shares. In fact, the number of additional shares applied for exceeded the surplus available after allowing for acceptances and renunciations. Allotment against such extra shares has been made on the basis of 20 per cent of the ordinary shares held by the shareholders on 24th September 1962 corrected to the nearest integer or the number of additional shares actually applied for, whichever happened to be lower. For instance, shareholders who held seven shares and under were allotted one additional new share.

The Company is not issuing any letters of allotment, but the share certificates for the shares allotted are being despatched to the shareholders by registered post. Those shareholders who had applied for additional shares and had been made part allotment have been forwarded refund vouchers by the Company.

SHALIMAR WIRES TO DIVERSIFY

A new line, namely, the manufacture of Fourdrinier wiremesh which is an essential requirement for the manufacture of paper, is proposed to be undertaken by the Shalimar Wires and Industries Ltd. in collaboration with a Norwegian firm. At present, the paper industry in the country meets its requirements of such wiremesh through imports. Some progress in the project has already been made, as the Company has acquired land, buildings and a power house in Uttarpara, West Bengal. Limited production is to start in the latter half of 1963 and full production is expected to be reached in early 1964. The licensed capacity is 396,000 sq. feet of mesh per annum on a single shift basis.

The Company's authorised capital is Rs. 1 crore, made up of Rs. 80 lakhs in ordinary shares of Rs. 10 each and Rs. 20 lakhs in 9.5 per cent, taxable, preference shares of Rs. 100 each. The issued capital is Rs. 8 lakhs and is proposed to be raised to Rs. 30 lakhs by the issue of 72,500 ordinary shares to the Directors and their friends and 147,500 shares to the public sometime in March next. The additional capital of Rs. 22 lakhs will apparently go towards the new project.

NEW PLASTICS MACHINERY PROJECT

A new plant for the manufacture of plastics injection moulding and extrusion machines is being set up at Thana industrial estate by Messrs. R. H. Windsor India Private Ltd. This was announced in Bombay last week by Mr. R. E. G. Windsor, Chairman and Managing Director of the British firm, R. H. Windsor Ltd. of Surrey, one of the world's leading manufacturers of plastic machines. The new company, which has been formed by the Windsors in collaboration with a few Bombay industrialists, has a paid up capital of Rs. 25 lakhs. A feature of the collaboration agreement is that no royalty is involved in the manufacture of Windsor machines in India.

The factory is scheduled to go into production by early next year; it will manufacture about 100 to 150 machines per year, to begin with. The British firm will supply the major portion of the machine tools, jigs and fixtures, drawings, etc., as part of their capital contribution. Besides, it will offer training facilities for Indian engineers. Mr. R. E. G. Windsor is the Chairman and Joint Managing Director of the new company and Mr. A. K. Patel, Deputy Chairman and Joint Managing Director.

Notice

EASTERN INVESTMENTS LIMITED

NOTICE IS HEREBY GIVEN TO THE members of the abovenamed Company that an Annual General Meeting of the Company will be held at the Registered Office of the Company, Chartered Bank Buildings, Calcutta, at 4.00 p.m., on Monday, the 11th March, 1963, for the following purposes:—

1. To consider and approve the Audited Accounts of the Company for the year ended 31st December, 1962, and to receive the Directors' and Auditors' Reports thereon.
2. To declare the Dividends recommended by the Directors.
3. To appoint Directors in the place of retiring Directors.
4. To appoint Auditors and fix their remuneration.

The Share Transfer Registers of the Company will be closed from 25th February, 1963 to 11th March, 1963, both days inclusive.

By Order of the Board,
BIRD & CO. (PRIVATE) LIMITED,
Secretaries.

Registered Office:
CHARTERED BANK BUILDINGS,
CALCUTTA, *29th January*, 1963.

Notes:—

(*a*) A member entitled to attend and vote at this meeting may appoint a proxy to attend and vote instead of himself. A proxy need not be a member of the Company.

(*b*) The Dividends, if declared, will be paid on or after 22nd March, 1963, to those shareholders so entitled whose names appear in the Company's books on the 11th March, 1963, or to their mandatees. No application for dividend warrants will be necessary.

ANGELO BROS. PAY MORE

PROFIT HIGHER—RESERVES RAISED

ONE can readily agree with the Directors of Angelo Brothers Ltd. (Managing Agents: Messrs. Turner Morrison & Co. Ltd., Calcutta) when they say that the operations of the Company during the year ended 31st August 1962 were, "by all standards, most satisfactory." Larger turnover, better profit, a higher dividend and a sizable addition to reserves are the main features of the Company's performance in 1961-62. These are noteworthy, because they have been achieved in the face of a none-too-favourable Governmental policy in regard to lac and shellac, the products of the Company's business. It is regrettable to find from the Directors' report that, in this field of business also, the Government's policy penalises, unwittingly perhaps, the efficient producer and exporter. This result flows from its zeal to protect the hand-made products.

With a higher volume of shellac made and sold—which, incidentally, has so far been exceeded only once before—the Company's net sales realisation in 1961-62 spurted by as much as Rs. 38.53 lakhs to Rs. 200.04 lakhs, practically regaining the ground lost during the preceding year. The Company's products gained in popularity and reputation during the year under review. "A most remarkable feature of the year's operation," to quote from the Directors' report, was the marked acceleration of the distinction, in the minds of the resin users, growing since the shellac-based gramophone record started to die, between machine-made shellacs produced by the Company and the hand-made varieties." "It has now become quite evident," the Directors go on to claim, "that, for the most part, satisfied buyers choose the Company's products again and again for particular purposes in preference to a synthetic resin and that the bulk of the cottage industries grades have separate usages."

The economies of the larger production achieved during the year under report are fully reflected in the profits. The gross profit has improved by a third, or Rs. 6.00 lakhs, to Rs. 24.81 lakhs, as against Rs. 18.80 lakhs realised during the previous two years. The improvement in net profit, however, is only Rs. 3.38 lakhs to Rs. 10.81 lakhs due to higher appropriations to essential provisions, such as Managing Agents' commission, depreciation and taxation. The last mentioned item alone has absorbed Rs. 2.10 lakhs more at Rs. 10.70 lakhs. In appropriating the balance of profits along with the surplus brought forward from the previous year, the Directors appear to have taken a very balanced view of the need for retaining enough cash in the business, on the one side, and of benefiting the shareholders, on the other. For they have raised the credits to reserves from Rs. 0.81 lakh to Rs. 2.15 lakhs and have proposed a higher ordinary dividend of Rs. 2.80 per share of Rs. 10 each, as against Rs. 2.25 per share for the previous year, both subject to deduction of tax. Even the carry forward is higher at Rs. 2.35 lakhs as against Rs. 2.09 lakhs brought in.

The working results of the Company for the past four years are presented synoptically in the following comparative table:

(In lakhs of rupees)

	For the year ended 31st August			
	1962	1961	1960	1959
Sale proceeds (net) ..	200.04	161.51	201.13	171.90
Other income ..	3.15	2.90	3.38	1.93
Factory costs and other charges	165.82	134.47	174.20	149.35
Salaries	8.45	7.63	7.49	7.19
Other expenses	4.11	3.49	3.93	3.39
Gross profit	24.81	18.81	18.80	13.89
Managing Agents' commission	2.25	1.79	1.83	1.35
Provision for—				
Depreciation	1.05	0.99	1.03	0.97
Taxation	10.70	8.60	7.30	5.40
Net profit	10.81	7.43	8.64	6.16
To reserves	2.15	0.81	1.17	0.32
Dividend	8.40 (28%)	6.75 (22½%)	6.75 (22½%)	5.75 (22½%)
Carry forward	2.35	2.09	2.23	1.51
Market price of ordinary shares in rupees:	1962	1961	1960	1959
High	25.37	24.25	23.44	22.00
Low	20.00	16.52	18.31	18.31

Note.—Dividends are subject to deduction of tax.

The Company's financial position, as reflected by its balance-sheet as at 31st August 1962, is decidedly sound. The paid-up capital stands at Rs. 30.00 lakhs in 300,000 ordinary shares of Rs. 10 each. It is strengthened by Rs. 45.72 lakhs in reserves and surplus. Loans (secured or unsecured) are conspicuous by their absence. Current liabilities and provisions aggregate Rs. 35.83 lakhs and are amply covered by current assets, loans and advances all amounting to Rs. 92.93 lakhs. Fixed assets are carried in the Company's books at a cost of Rs. 41.40 lakhs but have been written down through the depreciation account to Rs. 13.34 lakhs, that is, to less than one-third of the cost of acquisition.

The following extract from the Directors' report regarding the working of the Company during the year under review and the prospects for the current year should prove useful to investors:

"The Company's trade was healthy, but unfortunately and basically for a reason most difficult to control—excess growth of lac—the same could not be said for the hand-made industry. Since the end of the year under review, the Government of India has taken a step designed to strengthen the weaker trade, namely liquidation of the State Trading Corporation's buffer-stock of seedlacs on a basis compulsorily linked to all exports, so that the S.T.C. may buy a fresh buffer-stock, which is currently making us buy from S.T.C. seedlacs which are unsuitable for the manufacture of our shellacs to our standards, the international reputation of which is the keynote of our high earnings of foreign exchange. Government's actions affecting lac have hitherto made no distinction between hand-made and machine-made shellacs; if adverse effects on our very substantial earnings overseas are to be avoided, as they must be, Government must become aware of the differing natures of the two lac trades and take care not to overlook the special case of the machine-made one, small in comparison to many but a model of high international reputation and realised export potential.

"The year's results would have been even better had not some potential production been lost by reason of bureaucratic delays to essential supplies of imported carbon and indigenous spirit and by the factory workers' impatience with the necessary moves preceding improvements in their pay. Higher pay for all workers was eventually brought into effect during the year and thereafter the co-operation of most of them was wholehearted.

"It seems inevitable that the other delays will always be with us to a degree, though we continue to do all we can to overcome them. Bulk transport of spirit by road-tanker is one major step to that end made since the season under review.

"The current seasons has even more uncertainties than usual; many of them indirect results of China's invasion of India. The Company will play to the full its part on the Home Front and in the no less important sector of earnings from exports."

At present the Rs. 10 ordinary shares of the Company are being quoted around Rs. 24.37 *cum-div.* The net return, on an *ex-div.* basis, works out to 8.8 per cent per annum.

(Concluded from next column)

but supplies of cane have lately been dwindling because of restricted plantation, poor yield per acre owing to deficient rainfall during the 1962 summer months and diversion of a sizable portion of the standing crop to *gur* manufacture. All this has led to a serious competition for the available sugarcane supplies and obliged the Company to raise its purchase price by 25 nP per maund from 25th January 1963. Further, the recovery of sugar has been lower; so far (up to 28th January) it has been only 9.54 per cent (as against 10.32 per cent during the year under review) on an average. Besides, under the Emergency Risks (Factories) and the Emergency Risks (Goods) Insurance schemes, the Company has to pay for the quarter ending 31st March 1963 a premium of 25 nP and of 15 nP per Rs. 100 of the insurable value for factories and goods, respectively. All this does not constitute an encouraging picture for the current season.

The paid-up capital of the Company, which has remained unchanged at Rs. 20.60 lakhs, comprises Rs. 4 lakhs in preference shares and Rs. 16.60 lakhs in ordinary shares. As against this, reserves and surplus aggregate Rs. 58.02 lakhs and cover the equity capital by more than three-and-a-half times. The net block, on the other hand, is shown at Rs. 35.80 lakhs and compares with the gross block of Rs. 86.06 lakhs (Rs. 81.69 lakhs a year before) on which depreciation provided so far totals Rs. 50.19 lakhs. Work-in-progress amounts to Rs. 5.50 lakhs, as against Rs. 2.88 lakhs in the previous year. Bank borrowings, current liabilities and provisions—all put together—amount to Rs. 89.62 lakhs (Rs. 66.99 lakhs a year before), but are more than matched by current assets, loans and advances shown at Rs. 125.92 lakhs. The Company has thus a sound financial position.

At their current market value of Rs. 30.37 *cum-div.*, the Rs. 10 fully paid ordinary shares of the Company give, on the *ex-div.* basis, a net yield of 7.4 per cent per annum.

RAMNUGGER SUGAR

DIVIDEND REDUCED

THE Sugar (Regulation of Production) Act, 1961, under which the Government imposed a 10 per cent cut on production by the industry, is primarily responsible for a mild setback of Rs. 1.33 lakh to Rs. 85.70 lakhs in net sale proceeds of sugar and molasses (that is, excluding excise duty paid) and a rather big fall of Rs. 5.86 lakhs to Rs. 20.13 lakhs in agricultural income as also of Rs. 6.19 lakhs to Rs. 23.03 lakhs in gross profit for the Ramnugger Cane and Sugar Company Ltd. (Managing Agents: Messrs. Anderson Wright Ltd., Calcutta) during the year ended 31st August 1962. For, under the Act, the Company was obliged to reduce production of sugar to 122,161 quintals from 130,679 quintals a year before by cutting down the total quantity of cane milled to 1,180,303 quintals from 1,357,890 quintals.

This is not to dispute the fact that the Act had been enforced essentially to help the industry tide over the crisis which had arisen from overproduction in the preceding season. Besides, notwithstanding the spurt in sugar prices at present, it is a debatable point whether, had production last season been allowed to be maintained at the preceding season's level, the industry will have succeeded in obtaining a reasonable price for all its production, for there might have actually been a fall in sugar prices. Nonetheless, there is the other side of the medal as can be seen, for instance, from the above data relating to Ramnugger. The Company's profit-margin for the year, measured in terms of ratio of profit to the total of net sales and agricultural income, has declined from 25.8 per cent to 21.7 per cent.

In addition to the lower production, we are told, a general rise in cost of goods and services as also in staff expenses following implementation of the Wage Board recommendations and grants of increments to the *zamindari* staff from 1st July 1961 have also been responsible for the drop in profit and profit-margin. A quantity of 15,944 quintals (as against 13,758 bags in 1960-61) of sugar was tendered for export at lower than market rates. As in the previous year, production of molasses was requisitioned by the West Bengal Government for supplying it to distilleries in the State, albeit at a slightly higher rate of Rs. 2.68 per quintal as compared with Rs. 2.65 before.

The following table summarises the Company's progress from 1959:

(In lakhs of rupees)

	For the year ended 31st August			
	1962	1961	1960	1959
Sale proceeds of sugar and molasses, less excise ..	85.70	87.03	38.63	67.47

* Subject to deduction of tax. † In quintals.

Unlike the gross profit, net profit shows a relatively smaller setback of Rs. 4.44 lakhs at Rs. 8.63 lakhs because of the relief of Rs. 1 lakh obtained in the provision for taxation at Rs. 8.80 lakhs and of some Rs. 48,000 in the Managing Agents' remuneration at Rs. 1.84 lakh. The provision for depreciation also is lower at Rs. 3.76 lakhs as compared with Rs. 3.93 lakhs a year before. All the same, the taxable dividend on the 10-rupee ordinary shares has been pruned by five points to 30 per cent per annum which was the level for 1959-60. The net amount conserved in business also is less at Rs. 3.17 lakhs, as against Rs. 6.49 lakhs a year before, excluding the carry forward of some Rs. 79,000, as against Rs. 61,000.

Currently, the factory is running smoothly at a capacity of 1,200 tons of sugarcane per day,

(Continued in previous column)

RAVALGAON SUGAR FARES BETTER

BUT DIVIDEND SAME

THE performance of the Ravalgaon Sugar Farm Ltd. [Managing Agents: Messrs. Walchand and Company (Private) Ltd., Bombay] during the year ended 30th September 1962 has been better than in any one of the three years preceding it. For, thanks to an improved offtake of sugar within the country, a higher sugar recovery and a bigger output of confectionary and sugarcandy, the Company was able to realise higher gross sales of Rs. 189.67 lakhs as against Rs. 162.38 lakhs, even though there was a perceptible drop in the quantity of sugar produced and in the price fetched by it. In consonance with the rise in sales, the gross profit has also expanded from Rs. 10.19 lakhs to Rs. 17.65 lakhs, or by over 70 per cent. If against this substantial recovery in gross profit, the net profit has risen by only Rs. 2.86 lakhs to Rs. 4.54 lakhs, it is because of higher provisions for taxation and Managing Agents' commission. The former has taken up Rs. 4.21 lakhs, as against *nil* in any of the three previous years, and the latter Rs. 1.06 lakh, as against a mere Rs. 25,000 for 1960-61. The provision for depreciation, however, has been lowered from Rs. 8.20 lakhs to Rs. 7.80 lakhs but the saving is not large enough to make any appreciable difference. To the aforesaid net profit have been added Rs. 3.41 lakhs transferred from past provisions and reserves and Rs. 0.16 lakh brought forward from the preceding year. From the sum thus available the Directors have transferred Rs. 3.41 lakhs to reserves and have set aside Rs. 1.10 lakh to meet the liability in respect of the preferred dividend for the year. They have also proposed the maintenance, for the third successive year, of ordinary and deferred dividends at 10 per cent and 7 per cent, subject to tax, respectively.

The changes which took place in the Company's fortunes during the past four years are brought out in the following comparative table:

(In lakhs of rupees)

	For the year ended 30th September			
	1962	1961	1960	1959
Sale proceeds (gross)	189.67	162.38	157.33	171.38

Low	55.00	60.00	112.00	63.50

Note.—All dividends are subject to deduction of tax.

The most significant change in the Company's financial position during the year under review was the issue of a third series of debenture bonds of an aggregate value of Rs. 42.14 lakhs partly to redeem the bonds of the first series and partly to repay bank and other borrowings which have declined from Rs. 96.36 lakhs to Rs. 55.68 lakhs, thereby reducing the total of secured borrowings by Rs. 7.99 lakhs to Rs. 108.37 lakhs. Unsecured loans, current liabilities and provisions total Rs. 37.18 lakhs, as against Rs. 42.73 lakhs a year before. As against these, own funds aggregate Rs. 97.16 lakhs comprising Rs. 20.00 lakhs in 5 per cent preference shares, Rs. 30.00 lakhs in ordinary shares, Rs. 4.00 lakhs in deferred shares and Rs. 43.16 lakhs in reserves and surplus. With the acquisition of new assets worth Rs. 3.69 lakhs the Company's block account has gone up to Rs. 165.99 lakhs which on deduction of the accumulated amount of depreciation of Rs. 82.02 lakhs yields a net block of Rs. 83.97 lakhs. Investments at book value stand at Rs. 17.65 lakhs and current assets, loans and advances amount to Rs. 133.31 lakhs.

The sugarcane crushed during the year was 120,962 metric tonnes as against 143,248 metric tonnes while the quantity of sugar produced was 142,690 bags as compared with 152,786 bags for the previous year. The average recovery of sugar was higher, being 11.63 per cent as against 10.48 per cent previously. The confectionery division produced 1,737 metric tonnes (1,653 metric tonnes in previous year) of confectionery and 910 metric tonnes (650 metric tonnes) of sugarcandy. Crushing for the current year commenced on the 7th November and early results are satisfactory.

The outlook, however, is not promising, because the Company's agricultural profit will completely vanish when, under the Land Ceiling Act, the Maharashtra Government takes away the Company's sugarcane farm. Referring to the implications of this Act, the Directors' report says:

"The Maharashtra Agricultural Land (Ceiling on Holdings) Act, 1961, it is learnt, will be implemented shortly and the Government of Maharashtra would be taking over the Company's agricultural lands in excess of the ceiling area on 1st April 1963. Under the provisions of this Act, the Government would be taking over agricultural lands together with structures, wells, embankments, permanent fixtures, standing crops on such lands, etc. The payment for all these things would be made in transferable bonds carrying interest at 3 per cent per annum either repayable during a period of 20 years from the date of issue by equated annual instalments of principal and interest or redeemable at par at the end of the period of 20 years from the date of issue. As a result of this Act, the agricultural profits of the Company would vanish."

The Rs. 50 paid ordinary shares of the Company are currently being quoted at about Rs. 56.00 *cum-div.* giving a yield of about 6.7 per cent per annum.

SELECTED SATGRAM COLLIERIES LTD.

The Majri colliery, situated in the Chanda field of Maharashtra, has been transferred to the Selected Satgram Collieries Ltd. This colliery had been taken by the Company under raising contract from 1st October 1961, pending the Government's approval for an outright transfer. The transfer has taken effect from 1st January 1963. It is said that, among all the units of the Company, this colliery has the largest reserve of coal. It is expected to contribute a rupee a tonne to the profit of the Company. Raisings from it in 1963 will aggregate 150,000 tonnes, as against a little less than one lakh tonnes last year. Mr. P. L. Kirloskar has joined the Board of the Company from 22nd December 1962.

Notice

BOMBAY POTTERIES & TILES LIMITED

NOTICE IS HEREBY GIVEN THAT THE Twenty-ninth Annual General Meeting of the Company will be held at the Registered Office of the Company, United India Building, Sir Pherozshah Mehta Road, Fort, Bombay-1, on Monday the 18th March, 1963, at 3-00 p.m. (S.T.), to receive and adopt the Directors' Report and the Audited Balance Sheet and Profit and Loss Account of the Company for the year ending 30th September 1962, declare Dividends on First and Second Preference Shares and Ordinary Shares, to elect Directors in place of those retiring by rotation, to appoint Auditors and to consider, and if thought fit, to pass, with or without modification, a SPECIAL RESOLUTION as per Notice dated 8th December 1962 which, together with the Explanatory Statement thereto and Report of the Directors and Auditors and the Audited Accounts, has been circulated to the members individually.

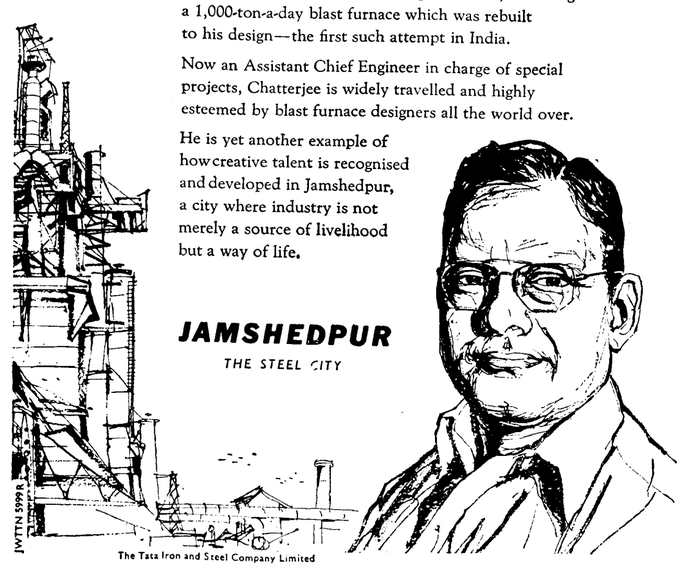
NOTICE is also hereby given that the Register of Members and the Share Transfer Books of the Company will remain closed from 20th February 1963 to 20th March 1963, both days inclusive.

A MEMBER ENTITLED TO ATTEND AND VOTE AT THE MEETING IS ENTITLED TO APPOINT A PROXY TO ATTEND AND VOTE INSTEAD OF HIMSELF AND A PROXY NEED NOT BE A MEMBER OF THE COMPANY.

Dated at Bombay this 8th day of December 1962.

By Order of the Board,
H. RAMAKRISHNAN,
Secretary.

Registered Office:
UNITED INDIA BUILDING,
SIR P. M. ROAD,
FORT, BOMBAY-1.



He never looked back...

In 1920, P. K. Chatterjee, a young man just out of school, joined Tata Steel as an apprentice draughtsman.

Full of ambition and zeal to learn, he entered the Company's Technical School which afforded the opportunity to study during leisure. Young Chatterjee was among the first to complete a three-year course in engineering.

Over the years, Chatterjee has worked his way up in the Engineering Department, and blast furnaces have been his enduring interest. He has helped to rebuild the blast furnaces in the Jamshedpur Works, including a 1,000-ton-a-day blast furnace which was rebuilt to his design—the first such attempt in India.

Now an Assistant Chief Engineer in charge of special projects, Chatterjee is widely travelled and highly esteemed by blast furnace designers all the world over.

He is yet another example of how creative talent is recognised and developed in Jamshedpur, a city where industry is not merely a source of livelihood but a way of life.

* Loss after providing for depreciation.

Extracts from the Directors' report: *Raisings and Despatches.*—2,08,133 tonnes of coal were raised and 2,06,787 tonnes despatched compared with 192,666 tonnes raised and 187,082 tonnes despatched during the previous year.

Raisings were affected adversely by power shortages, labour absenteeism and the irregular and erratic supply of wagons during the first half of this period.

Transport.—The Company's colliery started loading Box wagons in rakes with effect from May 1962 from which time the wagon supply position improved considerably. Stocks were, however, higher at the end of this period when compared with the corresponding time last year.

World Bank.—The Government of India approved of the project report which was submitted to the Joint Working Committee of the Coal Mining Associations/Federation in connection with the import of mining machinery and equipment to increase raisings at this colliery during the third Five-year Plan. The World Bank has now allocated foreign exchange equivalent to Rs. 12,45,000 for the purchase of this equipment. It is expected that most of this equipment will be delivered before June 1963 and that this will enable us to increase raisings considerably.

Accounts in brief as at 31st August 1962 are as under:—

§ Represents Rs. 1,00,000 transferred from general reserve and Rs. 74,796 being compensation on sugar requisitions by Government of India out of production for 1953-54.

Extracts from the Directors' report:

Production

Year	Hathua: Cane crushed Mds.	Hathua: Recovery %	Lauriya: Cane crushed Mds.	Lauriya: Recovery %	Distillery: Bulk gallons
1960-61	45,59,442	9.57	49,65,170	9.48	7,19,023
1961-62	40,56,096	9.35	45,43,976	8.77	6,47,911

Reference was made in last year's report to the Sugar (Regulation of Production) Ordinance, 1961, under which a 10 per cent reduction was made in the production quota for the year. In view of the said Ordinance, the Company's factories along with others in North Bihar commenced crushing late. The Ordinance also had its impact on the availability of cane resulting in a lower crush. While the recovery obtained by Hathua factory was better than the average recovery in North Bihar at 9.1 per cent, the recovery at Lauriya factory was lower due to the incidence of disease in cane. During the current season, diseased cane has been largely eliminated.

The crush at the Company's two units is expected to be substantially lower. However, the recovery both at Hathua and Lauriya should register improvement over last year.

The Company's factories were allotted by the Union Government an export quota of 3,911.2 tonnes of sugar out of last season's production. The incidence of lower realisations on exports is reflected under sales and closing stock in the profit and loss account. The export quota for the current season is expected to be considerably higher. The total export target has been fixed this year at 5 lakh tonnes against which actual sales commitments for about 4 lakh tonnes have already been made. Out of this, about 2 lakh tonnes are being exported in the form of raw sugar. The Company volunteered to manufacture raw sugar at Lauriya factory and a contract for supply of 7,500 tonnes of raw sugar has been entered into with the Export Agency Division of the Indian Sugar Mills Association. This is against the Company's own export quota as also that of Rohtas Industries Limited under an arrangement with them. Manufacture of raw sugar has started and the experience in respect of quality, recovery, etc. is satisfactory.

The Indian Standard Specifications for whiteness of sugar have been revised whereby 27 colour has been eliminated and 30 colour added to the standards. At Hathua factory 30-colour sugar will constitute a major proportion of the sugar produced.

The Indian Siwan Sugar Factory which was lying closed for several years has been purchased for Rs. 9,30,000 by the Company at a public auction. The sale is yet to be confirmed by the Certificate of Court. Proposals for installing this plant at Lauriya to augment its existing capacity or at any other site are under examination.

Accounts in brief as at 31st July 1962 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	58,00,000	Gross block	1,44,51,453

* Represents Rs. 1,068 transferred from reserve for bad and doubtful debts.
† This represents Rs. 41,000 transferred from provision for contingencies.

Extracts from the Directors' report: In spite of the various difficulties experienced, the Company has, indeed, continued to maintain steady pace and progress. The working results for the year under review have certainly shown a progressive achievement.

The Company is already busy with its expansion programme and the directors hope still further improvement in production, turnover and returns with intended replacements and renovations, provided no impediments emerge.

The Government has already sanctioned to the Company a substantial increase in the production capacity of railway wagons. The Company with a view to increasing the production of railway wagons has already made some additions to its existing plant and machinery. However, there is an absolute need for replacement and renovation of the existing plant and machinery which would, no doubt, involve huge expenditure.

The *Hydraulic Floor Cranes* and *Truck Cranes* which the Company has been now manufacturing for some time in collaboration with a renowned American firm are well received in the market. It is hoped that the Company may be able to expand further in this line also.

Concrete Vibrators, the planning, product development and production of which was in hand at the time of the last report, are now being manufactured for selling in the market.

The Company has also received an industrial licence for the manufacture of *Fork Lifts*. Negotiations are already under way for technical collaboration with leading foreign manufacturers in the line.

In the field of civil engineering, the Company was able to secure, among others, two big jobs which the Company has been busy carrying on a joint venture basis. In this line, apart from the competition from new entrants, there have been various other obstacles such as tightness of the supply position, transport difficulties and delays resulting from situations beyond the control of the management. It is still a satisfaction to say that the Company enjoys the reputation and confidence by virtue of which responsible and big jobs are entrusted to the Company.

Accounts in brief as at 31st July 1962 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	22,00,000	Gross block	44,17,690
Reserves and surplus	3,93,647	—Depreciation	28,57,240

THE PHALTAN SUGAR WORKS LIMITED

NOTICE

NOTICE IS HEREBY GIVEN THAT THE Thirty-first Annual General Meeting of THE PHALTAN SUGAR WORKS LIMITED will be held on Friday the 8th day of March 1963 at 4-00 p.m. (S.T.) at the Registered Office of the Company, Sangli Bank Building, 296, Bazargate Street, Fort, Bombay 1, to transact the following business:

1. To receive and adopt the Directors' Report and the Audited Balance Sheet and the Profit and Loss Account for the year ended 30th September, 1962.
2. To declare a Dividend.
3. To appoint a Director in place of Shri Arvind N. Mafatlal who retires by rotation, but being eligible, offers himself for re-election.
4. To appoint a Director in place of Shri Kantilal Nahalchand who retires by rotation, but being eligible, offers himself for re-election.
5. To appoint a Director in place of Shri R. B. Apte who retires by rotation, but being eligible, offers himself for re-election.
6. To appoint Auditors for the current year and fix their remuneration.

A member entitled to attend and vote at the meeting is entitled to appoint a Proxy to attend and vote instead of himself. A Proxy need not be a member of the Company.

By Order of the Board of Directors,
M. L. APTE,
Director.

Registered Office:
296, Bazargate Street,
Bombay 1.
Dated: *29th January*, 1963.

Notes:—(1) The Transfer Books of the Company are closed from the 28th January, 1963, to the 25th February, 1963, both days inclusive.

(2) Dividend when declared, will be payable through the United Commercial Bank Ltd., Fort, Bombay 1 on and after the 11th day of March, 1963, to those shareholders whose names stand on the Register of Members on the 28th January, 1963, to whom Dividend Warrants will be posted.

Registered Office:
NEW JAIL ROAD, MADURAI

NOTICE IS HEREBY GIVEN THAT THE Annual General Meeting of the Company will be held in Pandyan Building, West Veli Street, Madurai, on Thursday, the 21st March, 1963, at 3-30 p.m. The Share Transfer Books will be closed from 22nd February to 21st March 1963, both days inclusive. It is recommended that:

1. All persons holding shares on blank transfers should immediately arrange to have the shares registered in their own names, as the Company will pay any dividend declared only to the person (s) in whose name the share stands on the date of declaration of dividend.
2. Shareholders desiring dividends to be paid to Banks or other Mandatees should register the mandates with the Company before 22nd February, 1963.
3. Intimation of any change of address should be given to the Company immediately.

A. & F. HARVEY LIMITED,
Managing Agents.

Madurai,
29th January, 1963.

NEWS IN BRIEF

THE Budget session of Parliament will commence on Monday, the 18th inst. The Railway Budget for 1963-64 will be presented on the 19th inst. and the General Budget on the 28th inst.

The Annual General Meeting of the Indian Jute Mill Association will be held at Calcutta on 15th March next.

The second 50,000-kw. generator at the Neyveli thermal power station has been commissioned. It has been built with Soviet assistance.

The Aid India Club is expected to meet at Washington sometime in April next to consider India's foreign exchange requirements for the year 1963-64.

Export of tea from India during the month of January 1963 amounted to 55 million lbs. valued at Rs. 14 crores, as against 44 million lbs. valued at Rs. 11.17 crores in the corresponding month last year.

The Union Government has extended the time limit for the payment of the first quarter premium under the Emergency Risks Insurance Scheme up to the end of this month. The extension has been necessitated by certain difficulties experienced in the valuation of property.

A factory to produce laboratory meters and component test equipments is proposed to be set up at Palghat in Kerala; it is expected to go into production in January 1964. The project has been sponsored by the British Physical Laboratories and the Universal Refrigeration Corporation of Bombay in the share ratio of 49 : 51.

A five-member delegation from Afghanistan, led by Mr. Ghulam Mohamed Sherzad, Minister for Commerce, has arrived in New Delhi on a two-week visit to explore the possibilities of expanding trade between India and Afghanistan. Afghanistan is said to be specially interested in importing from India machinery and engineering goods.

Each region of the Maharashtra State will have a committee, comprising the Superintending Engineer (Irrigation), Superintending Agricultural Officer and Chief Executive Officer, to ensure the best utilisation of the efforts to intensify irrigation potential available in the State. A decision to this effect was taken at the third meeting of the High Level Agricultural Production Committee held at Bombay recently.

Czechoslovakia will supply to the Hindustan Aluminium Corporation an aerial ropeway at a cost of Rs. 15 lakhs for transport of bauxite ore from Lohardaga in Bihar to Pipri, where the factory is located. Details regarding part of the equipment which can be manufactured in India are being worked out. At present, the plant gets its bauxite supply from Amarkantak, in Madhya Pradesh.

The Ceylon Tea Board is seeking Indian participation in a joint "Drink Tea" campaign in Western countries, according to Mr. C. D. Coorey, Director of the Ceylon Tea Board. At present, India and Ceylon are jointly carrying on tea propaganda in Canada, the U.S.A. and West Germany. What they propose to do now is to extend this campaign to such countries as the U.K. where India is carrying on a campaign by itself.

A woollen textiles firm has requested the Government of Rajasthan to make available 50,000 acres of land for setting up a sheep-breeding farm, on the Australian model, to develop a new Merino crossbreed. It is proposed to make a start with 1,00,000 local sheep and 250 imported rams. The project may cost about Rs. 1 crore. Several sites have already been surveyed in Western Rajasthan for the farm.

The diploma in secretarial practice awarded by the Sydenham College of Commerce and Economics, Bombay, has been recognised as equivalent to the intermediate examination of a university, according to a Press note issued by the Department of Company Law Administration. The recognition will enable students to enroll themselves for the preliminary examination of the company secretaries examinations conducted by the Department.

A 16-member National Mine Safety Council, with the Chief Inspector of Mines as Chairman, has been constituted by the Government of India. The Council has been entrusted with the task of organising safety campaigns, promoting first aid training in mining areas, preparing and distributing literature, and recommending to the Government measures for promotion of safety in mines. The expenditure of the Council will be met from the statutory welfare funds for coal and mica mines.

The Government of Maharashtra has sanctioned a scheme for giving rewards to non-officials who discover new minerals and has authorised the Director of Geology and Mining, Nagpur, to grant such rewards subject to certain conditions. A discoverer of a mineral is required to inform the Director of Geology and Mining, in writing about his discovery and to make a declaration that, to the best of his knowledge and belief, the mineral so reported is a new one. For further details, the Director, Geology and Mining, Nagpur, may be contacted.

The Sindri Fertiliser factory established an all-time record production of ammonia during the month of January 1963, exceeding the rated capacity by 6. The actual output in the old group of plants was 9,753 tonnes, with a daily average of 314.6 tonnes, as against the rated capacity of 274 tonnes. Production of ammonium sulphate was 30,248 tonnes, with a daily average of 976 tonnes, as against the rated capacity of 974 tonnes. Production in the expansion plants maintained its upward trend, the output of urea and double salt being 1,867 tonnes and 5,181 tonnes, respectively.

The Government of India has decided to defer the formation of a statutory Salt Board. The Board was intended to minimise delays in the execution of capital and maintenance works, grant assistance loans to salt manufacturers and promote labour welfare measures. The decision to keep the proposal in abeyance is based on the feeling that, with the Central and regional advisory boards for salt already functioning, another statutory board would be redundant. Another consideration against the proposal is that the proceeds from salt cess are likely to be smaller than anticipated earlier.

The Indian Bureau of Mines recently conducted an inquiry into the working of kyanite mining in Bihar on the basis of a complaint about the harmful and mutually unfair methods employed by the companies engaged in that area. Kyanite is used in the manufacture of refractories and India is one of the biggest producers in the world. Although its investigations showed that the working of the mines was "in order," the Bureau is understood to have made certain recommendations to ensure better operations on the basis of which the Union Government is said to have directed the Bureau to undertake frequent inspections in the area to see that its recommendations are implemented.

The question of creating an authority for the Narmada river invested with greater powers than may be given to a river board is now being examined by the Union Ministry of Irrigation and Power. It is proposed to give the new authority sufficient powers to withstand political pressures which bedevilled the D.V.C. It is felt that, unlike a river board, the new body should not only assist the concerned States in preparing a master Plan for the river but also be responsible for its execution. While the two States directly concerned in the development of the river are Madhya Pradesh and Gujarat, through whose territories the Narmada flows, Maharashtra and Rajasthan have also offered to share the costs and benefits of the project. The claims of the four States are now being processed so as to avoid any controversies in future.

The Government of India has considered the Tariff Commission's report (1962) on the fair selling prices of sheet glass and fixed the selling prices of the commodity with certain modification. Accordingly, the fair ex-works selling price per 10 sq. m. is Rs. 41 for 2 mm., Rs. 58 for 3 mm., Rs. 83 for 4 mm., Rs. 107 for 4.8 mm. and Rs. 119 for 5.5 mm. These prices are exclusive of excise duty and State and local levies. As the production patterns of various sheet glass units differ, it is left to the manufacturers to work out the prices of the various cut sizes produced by them in each thickness group within the average ex-works selling price worked out for that group and obtain the Government's approval for the same. Retail prices should not exceed 20 per cent of the corresponding ex-works selling prices. These prices will remain in force till 31st March 1964, when the position of the industry is expected to be reviewed. The Government has also taken note of certain ancillary recommendations made by the Commission to safeguard the interests of the consumers for consideration and implementation as far as possible. One of these is that it will be desirable for the representatives of the industry to publish periodically in the Press their ex-factory, as well as retail prices at important centres and also ensure that their authorised and regular dealers display prominently in their premises the retail prices of various varieties of sheet glass.

From Abroad

The Sterling area's gold and convertible currency reserves recorded a rise of £21 million to £1,023 million during the month of January 1963.

The total output of copper and copper alloy manufactures, including castings and copper sulphate, in Britain during the year 1962 was 775,000 tons, 6 per cent less than in 1961.

A new Stock Exchange, claimed to be one of the most modern in the world, is to be built on the site of the present Exchange at St. Andrew's Square in Edinburgh, at a cost of £200,000.

West Germany's gross external reserves as on 31st January 1963 stood at DM 27,355.4 million and gold holdings amounted to DM 14,551.4 million, while external liabilities were of the order of DM 403.2 million.

Pakistan will negotiate separate trade agreements with the European Common Market countries in the very near future, according to Mr. Mohammed Shoaib, Finance Minister of Pakistan.

The Italian Government is said to be drafting stringent regulations covering packing, colouring matter and preservatives of foodstuffs. The regulations are on the lines indicated by the Brussels Commission and other international organisations.

A corporation to build Japan's first £3.5-million atomic powered ship is expected to come into being on 1st July next. Japan will be the fourth country in the world to own such a ship, the other three countries being the U.S., Soviet Russia and West Germany.

PERSONAL

DR. P. R. Saraiya and Mr. Premnath R. Khandelwal have been elected Chairman and Vice-Chairman, respectively, of the Western India Minerals Association for the current year.

Mr. W. S. Hindson, Managing Director of Wellman Smith Owen Engineering Corporation Ltd., London, has arrived in India to help and advise the Wellman Incandescent India Ltd. in its manufacturing and production plans.

Mr. N. F. C. Hilling, Director of Killick Slotted Angles Ltd., a subsidiary of Killick Industries Ltd., recently left for the U.K. for consultations with their principals, Dexion Ltd., England, in connection with the production of Dexion Slotted Angle in India.

Mr. G. D. Modi and Mr. N. J. Nair have been elected President and Vice-President, respectively, of the Association of Merchants and Manufacturers of Textile Stores and Machinery, India for the year 1963-64.

Mr. H. V. R. Iengar, a former Governor of the Reserve Bank of India, will soon take over as the Chairman of the National Productivity Council, *vice* Dr. P. S. Lokanathan who is relinquishing the post to become the Chairman of the Asian Productivity Council.

West German workers and employees had a 62.4 per cent share in the national income during 1961, the second highest share of the six Common Market member countries. The share of France was 62.6 per cent, Italy 52.4 per cent, the Netherlands 59.5 per cent, Belgium 52.2 per cent (in 1959) and Luxembourg 59.9 per cent (in 1960).

The gross national product of West Germany increased by 8.5 per cent in 1962 to reach DM 336,800 million at current prices. The rate of growth during the year was slower than that of 9.9 per cent in 1961 and 12 per cent in 1960. The unimpressive growth was due partly to price increases. At constant (1954) prices, the growth was 4.1 per cent, as against 5.5 per cent in 1961 and 8.8 per cent in 1960. "National productivity" (real output per active person) increased by 2.9 per cent, as against 4 per cent in 1961.

The gross hourly earnings of West German industrial workers recorded a more marked increase than those of workers in other countries since 1959, according to a survey of the *International Labour Review*. West German earnings increased by 36.4 per cent between 1959 and the second quarter of 1962, as against a growth of 9.1 per cent in the U.S., 8.7 per cent in Canada, 16.4 per cent in Britain, 22.6 per cent in France, 22.5 per cent in the Netherlands and 19.8 per cent in Italy.

The Soviet Government has decided to grant Cuba a long-term credit in 1963 on easy terms. Agreement on the credit followed the Soviet-Cuban commercial negotiations which concluded last week. Under the trade protocol for 1963, the Soviet Union will supply Cuba with oil, metals, fertilisers, chemicals, pulp, paper, cotton, machinery and equipment, wheat and other foodstuffs. Cuba will export sugar, alcohol, tobacco and other commodities of interest to the Soviet Union.

A new Education Division in the Department of Technical Operations of the World Bank, with Mr. Ricardo Diez-Hochleitner as its Chief, has been created to appraise educational projects submitted to the Bank and its affiliate, the International Development Association, for financing, and help the less developed member countries to plan their educational investments along lines designed to promote their economic development. In discharging these responsibilities, the new Division will maintain liaison with international, governmental and private educational agencies interested in these matters.

A British firm claims to have developed a vertical takeoff strike plane for use of aircraft carriers. The plane is the Hawker P. 1127. A company spokesman says that, by 1969-70, an improved version of the same plane will give Britain an aircraft capable of performing equally well for the Royal Air Force and the Navy. The development, according to him, can save huge amounts in research costs by removing the need to produce different aircraft for the two services. The super-manœuvrability of the new aircraft comes from four nozzles placed under the wing. By adjusting the nozzles, the pilot can make the plane stand still or even move backwards. In forward flight, the jet nozzles give the plane a speed of up to 710 m.p.h. at high altitudes.

Canada had a trade surplus of $79.50 million in 1962, only the second surplus in a decade, but the second in succession. Trade with Britain dwindled, but it increased considerably with the U.S.A. Newsprint remained Canada's biggest-selling product in world markets, despite a slight decline in sales. Wheat was next, followed by lumber and wood pulp with sizable gains in nickel and aluminium, crude oil, which took a big jump, then iron ore, copper and uranium. The U.S.A. became an even greater market for Canadian products in 1962, taking 59 per cent of all the country's exports, as against 54 per cent in 1961. Britain's share dropped fractionally to 14.7 per cent and the rest of the Commonwealth took 5.3 per cent. Sales to the rest of the world fell by 5 per cent with decreases in exports to Japan, West Germany, France, Belgium and Luxembourg as well as to Eastern Europe and Central America. Gains were noted in respect of Communist China, Australia, the Netherlands, Italy and Venezuela.

ASSOCIATED BATTERY MAKERS (EASTERN) LTD.

STATEMENT BY H. R. GREGSON, MANAGING DIRECTOR

BATTERY INDUSTRY VITAL FOR DEFENCE

THE vital contribution the battery industry makes to power, transport, communications and defence was ably highlighted by Mr. H. R. Gregson, Managing Director of the Associated Battery Makers (Eastern) Ltd., in the course of his statement to the shareholders at the Sixteenth Annual General Meeting of the Company held at Calcutta on Tuesday, 12th February 1963. Mr. Gregson claimed that the industry had made excellent progress to produce a wide and increasing range of products and that it was well equipped to meet the expanding demand. He, however, emphasised that the industry must have the necessary raw materials—lead, antimony, raw rubber, etc.—and that it should be placed in the list of high priority for this purpose. Prospects for the current year, he said, were reasonably encouraging. Nevertheless, he sounded a cautious note, in view of the increases in taxation and cost of raw materials.

The following is the full text of Mr. Gregson's statement:

It will be seen from the Directors' report and from the accounts that the year to August 1962 showed an appreciable increase over the previous year in gross profit and in improved sales of both this Company and of the subsidiary Chloride and Exide Batteries (Eastern) Ltd. However, the considerable added provision for the new rate of corporate tax which has had to be made, including the added amount required for the previous year, results in a net profit after tax lower than that for 1961. These results, particularly the increased sales and gross profit, can be considered satisfactory under the conditions prevailing when materials, power, fuel, etc., have not always been readily available.

In view of the overall results and the general position, the maintenance of the dividend at 15 per cent subject to tax would seem, in the view of your Board, to be a fair and equitable distribution.

Demand Strong

The demand for our various categories of storage batteries and components continues to be strong. In the automotive field, Exide and Dagenite batteries have earned an excellent reputation, and we are doing our utmost in the light of other important demands to meet this keen user requirement for cars, motor cycles, tractors, trucks and buses.

It is pleasing to report also a continued high level of initial equipment orders from the various vehicle manufacturers and for other types of internal combustion powered equipment now being manufactured in India. Your Company and Chloride and Exide Batteries endeavour to maintain supplies of a dependable product backed by a good service organisation throughout the country, for the benefit of both manufacturers and replacement users.

Industrial Batteries

The demand for industrial batteries for materials handling in factories, docks and other establishments, increased. We have also received good support for the well-proved railway cells of the Exide-Ironclad and Shednought designs, both of which are of the low-maintenance types requiring minimum attention throughout their useful life.

Stationary battery demand for telecommunications, power stations, sub-stations, railway electrification, railway signalling, telephone exchanges, emergency lighting and estate lighting, continues to be good for both our Chloride and Pritchett and Gold manufactures. We have increased our facilities to meet these demands and have further plans for indigenous development.

In the export field, efforts continued by overseas tours and maintained pressure with some success, and with further prospects. It should be noted that several of the countries to which we have exported batteries over the past few years have now established factories of their own. The remaining markets are very competitive.

It has been stated that the storage battery industry has been accorded a comparatively low priority in assessing industries as a whole throughout India. This is difficult to believe when the industry has made such excellent progress over the years to produce a wide and increasing range of products, which range and variety increases almost month to month, and when it has enabled the country to be almost completely independent of outside supplies. The various units—and your own has taken a lead in this—produce far more than many large factories in technically advanced countries. That is, they are more self-contained than many large battery factories in Europe, U.S.A. and Japan, for example. Our Exide factory at Shamnagar is a battery, rubber, plastics and metal recovery factory all on one site and produces a high grade finished product in each of these categories.

Storage batteries are needed for automotive use mostly by transport vehicles and, surely, with the increased necessary use of road transport, this is of great importance. If you refer back to the duties of stationary and railway batteries, you will see that these are required almost entirely for essential power, railway and telecommunications purposes. These cannot be regarded as of low priority.

Defence Needs

The battery industry has a vital part to play in meeting defence requirements in times of peace or of emergency, when increased supplies for many purposes are essential. Thus the industry is essential in the fields of transport, power, communications and defence all of which are of high priority in India today.

The modernisation programme of the factory has progressed, and increased covered floor space is now available for the handling and storage of components and finished products, and for the installation of improved plant.

We have yet to feel the full benefit of this programme but various economies in manufacture and in the use of materials were effected during the year, and this pattern should continue.

Additionally, we increased the range of manufacture of hard rubber containers in the larger sizes, these mouldings being outstanding examples of container design. The Porvic separator plant produced approximately one million separators per month during the year.

We are also commencing the manufacture of polystyrene battery containers for various requirements in accordance with modern trends which will help to meet the present unsatisfied demand for these various types of batteries. A high standard of moulding technique is required and, here again, we have the benefit of advice from our consultants, The Chloride Electrical Storage Company Ltd., whose group includes one of the leading plastic manufacturers in the United Kingdom, and for whose continued advice we are most grateful.

Engineering and Services

On the engineering and services side, major improvements have been effected during the year, including the complete reorganisation of our sub-station and the installation of a new main transformer. The commissioning of a duplicate main boiler has avoided the closing of our rubber factory—and consequent loss of production—as previously necessary during boiler maintenance and inspection periods.

The obtaining of adequate supplies of raw materials continues to be a problem and, to avoid dislocation, it is essential that sufficient allocation of lead and antimony be made for the industry. Great efforts will have to be made to assist in this by recovery methods as far as is practicable.

Excise Levies

Once again, a number of raw materials came under the new excise levies as from March 1962, thereby increasing costs, and it is impracticable to maintain the required number of separate bonded stores, etc., in order to avoid this addition to our overall cost. For example, sulphuric acid is piped throughout the factory and for this the bonded store system is just not possible.

As there is a 15 per cent excise duty on finished batteries, it seems unfortunate that costs are so increased year by year. To avoid the hampering of production by the present excise rules, it is to be hoped that a simpler procedure, whereby the whole factory can be considered one bonded store, will soon be made applicable to our industry.

A major stepping up of production of motor vehicles is proposed, particularly of trucks, and various large foreign exchange loans have been made to leading vehicle manufacturers for the implementation of these programmes.

Industry's Requirements

The battery industry is well equipped to meet this increased demand, as it has proved by past performance, but, for this, it must have the necessary raw materials, lead, antimony, reclaim, raw rubber, etc.

We trust, therefore, that our industry's requirements will be considered very carefully, in view of the essential contribution that we make to transport and communications.

Prospects for the present year are reasonably encouraging, but increased tax and cost of raw materials, coupled with the greatly increased requirement of special batteries on us, at this time, makes it necessary to sound a cautious note.

The year has been one of considerable pressure for all levels of employees in your Company and in the subsidiary company, and I feel sure that the shareholders and the Directors would wish to join me in thanking them for their support and good work during the year.

COMPANY NOTES

PERMANENTS MAGNETS STARTS PRODUCTION

Commercial production by Permanents Magnets Ltd. has commenced at Borivli, a suburb of Bombay. Formal inauguration of the plant is, however, scheduled to take place at the hands of Ravishankar Maharaj, a noted Sarvoday leader from Gujarat, on Saturday the 16th inst. Mr. G. D. Birla is to preside over the function and Mr. Y. B. Chavan, Union Defence Minister, will be the chief guest. Mr. Morarji Desai, Union Finance Minister, and Dott. Gusto del Giardino, Italy's Ambassador to India (the Company's collaborators are from Italy) are also expected to be present at the function. At its rated annual capacity of 180 tons, the plant will turn out 3.6 million finished permanent magnets which represent the present requirements of the country. Suitable provision for expansion has been made. Messrs. Centro Magneti Permanenti, which has collaborated with the Company in its project, has informed it that the quality of the first samples of its products have conformed to the international standards. The collaboration agreement permits unrestricted exports.

TRICHY STEEL ROLLING MILLS LTD.

Subscription lists for the public issue of Rs. 22 lakhs in ordinary shares of Rs. 10 each by the Trichy Steel Rolling Mills Ltd. have opened on Friday the 15th inst. The issue is to be closed on the 25th inst. In addition to the public issue which is fully underwritten, the Company has issued shares worth Rs. 15 lakhs to the promoters, Directors and their friends. The Company is setting up at Tiruchirapalli (Madras State) a steel rolling mills which will turn out 15,000 tons rolled sections. Later, it proposes to erect an arc furnace for the production of billets to feed its mill. The manufacture of special sections used in automobiles, which are not presently made in the country, is also a part of its plan. Factory buildings have been erected and 80 per cent of the plant and machinery have arrived at the site. Production is to start some four months hence. The total outlay on the project is estimated at Rs. 69 lakhs, including Rs. 30.15 lakhs on plant and machinery. Mr. T. S. Krishna, Chairman of T.V. Sundram Iyengar and Sons (Private) Ltd., is the chairman of the Company.

PREMIER FERTILISERS LTD.

The Premier Fertilisers Ltd., which has set up a modern factory at Cuddalore (Madras State), with an installed capacity of 45,000 tons a year of superphosphate, has gone into production. The trial runs have shown that the quality of the product conforms to the high standards prescribed for fertilisers. In view of the national emergency, the Company has waived the inaugural formalities.

TREND OF MARKETS

CALL RATE 6 PER CENT

(From Our Own Correspondent)

BOMBAY, 13th *February*

Conditions in the short-term money market continued to be extremely stringent during the week under review, with inter-bank call rate standing ¼ per cent higher at 6 per cent. Supply of floating funds was very short, while the pressure of demand was pretty strong. Indicative of the tight money situation is the marked rise of Rs. 7.62 crores in the credit obtained by scheduled banks from the Reserve Bank during the week ended 9th February. Of this rise, the loans and advances against usance bills alone accounted for Rs. 4.04 crores. The total advances taken from the Reserve Bank was of the order of Rs. 43.72 crores. Conditions at Calcutta were also tight, with borrowers over at 6 per cent.

In view of the persistent stringency of money, it is not surprising that the response to the 91-day Government of India Treasury Bills, tenders for which opened on Tuesday the 12th inst., was less encouraging than in the previous week and the Government had to pay more. The total amount offered was just Rs. 2 crores, as against Rs. 2.50 crores last week. This was equal to the amount invited and the whole of it was accepted. The average rate of accepted tenders went up from 2.360 per cent to 2.365 per cent per annum. The Intermediate Treasury Bills, which were on tap from 6th to 9th February, however, evoked a slightly better response, the Bills actually sold amounting to Rs. 78 lakhs, as against Rs. 17.25 lakhs a week before and Rs. 19.25 lakhs two weeks before. Sales of both the types of Bills are being continued. Although the average rate of the Bills on the tender system has gone up, the authorities have not raised the return on the Intermediate Bills; it remains unchanged at 2.296 per cent per annum.

There was a notable improvement of Rs. 3.57 crores to Rs. 99.74 crores in India's foreign assets during the week ended 8th February 1963. The improvement was due entirely to the rise in balances held abroad which aggregated Rs. 10.66 crores, while foreign securities continued unchanged at Rs. 88.08 crores. Notes in circulation jumped up by Rs. 44.14 crores and crossed the Rs. 2,200-crore level to reach Rs. 2,210.82 crores.

The total credit made available by scheduled banks spurted by Rs. 21.33 crores to Rs. 1,491.88 crores during the week ended 1st February 1963, while deposits declined by Rs. 4.61 crores to Rs. 2,719.19 crores and inter-bank borrowings by Rs. 5.51 crores to Rs. 38.94 crores. In order to meet the increased credit demands of their clients, the banks had to have recourse to larger borrowings from the Reserve Bank which rose by Rs. 11.97 crores to Rs. 35.93 crores, of which those against usance bills accounted for Rs. 23.68 crores, an increase of Rs. 8.19 crores. The banks had also to sell a part of their investments the total of which declined by Rs. 12.80 crores to Rs. 637.03 crores. The fall in deposits and investments noted here apparently reflects the transfer of Rs. 10 crores of P.L. 480 funds from the State Bank to the Reserve Bank.

Activity in the Gilt-edged market continued to be restricted. Both Central and State loans were quoted more or less at the last week's levels. Some stray transactions were reported in the 6½ per cent 1977 gold bonds at Rs. 116, that is, at premium of 16 per cent. The yield on these bonds at this rate works out to 5.05 per cent.

The rupee in the foreign exchange market eased a little *vis-a-vis* the dollar, the banks' selling rate for ready T.T. dollars being Rs. 477.50 per $100, as against Rs. 477.25 a week before. Their buying rate was Rs. 474.25, as against Rs. 474. On the New York Exchange the £ sterling softened in terms of the dollar, the spot rate declining from 280.430-280.460 cents to 280.320-280.350 cents and the rate for three months' forward from 279.910-279.940 cents to 279.840-279.870 cents.

* * * *

The total contributions brought into the Central account of the National Defence Fund at New Delhi upto the close of business on 9th February 1963 amounted to Rs. 39.93 crores. This sum included Rs. 27 lakhs received from Britain and Rs. 40 lakhs from other countries. In addition, contributions in gold and gold ornaments amounted to 1,470.440 grammes.

FIRM TONE IN BULLION

(From Our Own Correspondent)

BOMBAY, 13th *February*

If one were to ignore the renewed mad rush to buy 22 carat jewellery on February the 8th inst.—the last day for jewellers to dispose of their stocks of such superior quality ornaments—one finds that nothing spectacular happened in the bullion market here, during the week under review. The tone of the market, however, continued to be firm, especially in the light of the revival of buying spree in gold ornaments which clearly underlined the people's craving for gold. The extension of the closing date for the Gold Bonds from the 11th inst. to the 28th inst. in a way sustained the firm tone, as it provided further scope for persons having black money to buy gold and exchange it for the Bonds. The extension of the time limit for declaration of individual gold holdings in excess of the free limit of 50 grammes for an adult and 20 grammes for a minor had, on the other hand, no adverse effect on the price trend, as declaration was not to imply either sale by individuals or confiscation by the Government.

It was not gold, but silver which attracted more attention. As against last week's closing level of Rs. 226, the white metal opened higher at Rs. 228 and gradually advanced to Rs. 230 by Monday the 11th inst. and moved narrowly thereafter to close at that level, that is, four points higher over the week. The opening level was the lowest rate for the week. The average daily arrivals and offtake were unchanged at 16 bars and 10 bars, respectively.

Gold came in for a narrow market of two points between Rs. 99 and Rs. 101, with the higher level appearing towards the close. Last week, the price was Rs. 100. Sovereign opened unchanged at Rs. 73, but dropped to Rs. 70 the next day. Thereafter, it recovered fully to Rs. 73.

According to reports, subscriptions to the Gold Bonds up to the 1st inst. have aggregated Rs. 5 crores in gold valued at Rs. 62.50 per tola. The Madras Government is likely to set up 14 carat gold jewellery manufacturing units in the State in order to provide employment to goldsmiths rendered idle owing to the Gold Control Order. An assurance to this effect is said to have been given by Mr. Kamraj Nadar, Chief Minister of the State, to a deputation of goldsmiths.

A division bench of the Madhya Pradesh High Court dismissed on Friday the 8th inst. a writ petition challenging, under Article 226 of the Constitution, the order of the Superintendent of Central Excise, Jabalpur, prohibiting the redemption after that date of gold ornaments of more than 14 carat purity pledged with gold dealers as security for loans. The order had also asked dealers to furnish lists of all such pledged ornaments in their possession.

In their judgment, Their Lordships Naik and Pandey, said that the petition arose out of uncertainty caused by a memorandum issued by the Deputy Superintendent of Central Excise in reply to a query made by the petitioner, Seth Rajmal Bhura, President of the Safora Bazar Committee, regarding certain points in the Superintendent's original order banning redemption of pledged ornaments. Their Lordships held that the respondents were right in claiming that the memorandum on which the petitioner's case was based contained only the opinion of the writer of the memorandum against whom a writ of *certiorari* did not lie. Their Lordships added that nor was there any threatened act against the petitioner which could be restrained by writ, order or direction, prohibiting the respondents from interfering with the business of the petitioner relating to the pledging of ornaments.

New York and London silver prices were unchanged over the week, with moderate demand met by adequate offerings. The trade in New York was believed to be waiting for Congressional action on the Kennedy Administration's move to end the Silver Purchase Act as also the profits tax on silver dealings, and to issue Federal reserve notes to replace the one dollar silver certificates. It may be noted here that the Western Silver States want continuation of the profits tax. Ready gold, in London, moved between 250s. 1½d. and 250s. 2d. and closed at the higher level, as against 250s. 1½d. a week ago. The dollar price of gold was, however, unchanged at 35.07½.

The following table shows the trend of prices during the week under review:

	13-2-63 (closing)	High	Low	6-2-63 (closing)
	Rs.	Rs.	Rs.	Rs.
SILVER				
Ready (.995 fine) ..	230.00	230.00	228.00	226.00
London—				
Gold	250s.2d.	250s.2d.	250s.1½d.	250s.1½d.
Silver Ready	107⅜d.	—	—	107⅜d.
Silver Forward ..	108d.	—	—	108d.
New York—				
Silver	125.6 cents	—	—	125.6 cents

N.B.—The quotation for gold is per 10 grams (about 0.85 tola) and that for silver is per kilogram (85.7 tolas). London and New York quotations are per ounce.

COTTON FUTURES EASY

(From Our Own Correspondent)

BOMBAY, 13th *February*

The cotton futures market, which ruled subdued on the opening day of the week, picked up strength in the subsequent three sessions. Renewed buying support by local and upcountry operators induced by better demand in the spot market led to a mild rally in prices. The Jarilla March contract firmed up from last week's closing price of Rs. 674.25 (per three quintals) to Rs. 686.50 on Monday. The May contract advanced from Rs. 682.50 to Rs. 696. These levels could not be maintained for long. Profit-taking and speculative selling, prompted by reports of the possibility of an Indo-U.S. barter deal involving exchange of manganese ore for cotton, led to a slight decline in prices. The losses were extended in yesterday's and today's sessions. Sentiment was favourably affected by the release, on the 12th inst. of a further quota for 75,000 bales of Bengal Deshi cotton and 25,000 bales of cotton of staple length ¾" and below, although it did not have any bullish effect on the market.

(In rupees per three quintals)

		13-2-63	*High*	*Low*	6-2-63
Jarilla	March ...	672	686	672.50	674.25
,,	May ...	680	696	682.50	682.50

In the spot market at Sewri, good demand was reported for popular varieties, especially Vijay, Digvijay, Kalyan, Surti, 197/3 L.147 and CO2. The first-mentioned three varieties were very much in demand by Bombay and Delhi mills. Consequently, their prices hardened. Prices of Wagad and Kalyan cotton, however, tended to decline, following reports of quality deterioration.

The trade was pleasantly surprised at the announcement made on Tuesday night, releasing a further export quota for 75,000 bales of Bengal *Deshi* and 25,000 bales of short staple cotton having a staple length of ¾" and below. Although the trade had strongly urged an additional quota, it did not expect that the quota would be so large and issued so soon, especially because there were of late conflicting reports about the Bengal *Deshi* crop. As for the quota for short-staple cotton, it was really a bolt from the blue. Exporters are, however, disappointed that an unusually large share of the quota (20 per cent. as against the customary 5 per cent) has been reserved for co-operative societies. The shipment period of both the quotas will expire on 31st August 1963.

Spinner interest in foreign cotton was largely confined to U.S. growths. Higher grade Elpaso and Californian were in good demand. But actual business put through was not large, thanks to the small quantities offered by shippers. Selected East African and Sudan cotton attracted the attention of mills.

The following are the latest available quotations—in rupees per candy of 784 lbs.—from the spot market at Sewri:

Ganganagar 800; CO2 1.600; Khamgaon 940; American on Sample 1,310; Sudan G2L 1,370.

Firm conditions prevailed in the Karachi cotton futures market during the week. Renewed export inquiries and good domestic mill interest imparted strength to the market. The N.T.R.G. March contract firmed up from last week's closing rate of Rs. 69.75 to Rs. 71.15. The May contract improved by Re. 1.45 to Rs. 73.20.

Cotton futures in Liverpool recorded handsome gains during the week. Although uncertainties about U.S. cotton legislation continued to act as a restraining influence, futures ruled firm, thanks to trade support and mill covering prompted by the brisk activity in spot. Both the American and American type contracts were marked up. Sudan cotton contract at Liverpool, however, ruled quietly steady. The following are the latest available quotations—in pence per lb.—from Liverpool, the figures in brackets being last week's closing prices:

March 24.25 (24.05); May 24.05 (24.00). Sudan March 29.00 (29.00).

The New York cotton futures market depicted a firm trend during the week. The firmness was induced mainly by the strength of ready prices which reflected the tightening supply position. The decision of the Department of Agriculture to keep the support prices for the 1963-64 crop unchanged also imparted strength to the market. The rise in futures prices would have been more marked but for the continued uncertainty about cotton legislation.

The following are the latest available quotations—in cents per lb.—from New York as compared with those a week and a fortnight ago.

(In cents per pound)

	12-2-63	5-2-63	28-1-63
March	34.58	34.56	34.60
May	34.85	34.70	34.71
July	34.32	33.86	33.98
New York Spot ...	35.40	35.25	35.20

ART SILK YARNS REACT

(From Our Own Correspondent)

BOMBAY, 13th *February*

The past three week's recovery yielded place to a small reaction in art silk yarns this week. Staple fibre yarns, on the other hand, maintained a firm tone. Cotton yarns disclosed no particular change, despite the Indian Cotton Mills Federation's decision to revise prices upward with effect from the 6th inst.

Absence of adequate buying support was responsible for the reaction in art silk yarns. The setback was spread over all the indigenous yarns. For instance, 150D National Rayon fell by 12 nP to Rs. 11 a kilo, 120D S.I. Viscose lost as much as 70 nP to Rs. 12.15, 100D bright Century receded from Rs. 15.05 to Rs. 14.74. Among 2 x 40 staple fibre yarns, Centurys advanced further from Rs. 7.15 to Rs. 7.22, but Kohinoors shed 7 nP to Rs. 8.05.

The problem of disposing of the large quantity of imported staple fibre is likely to be discussed by the Union Government with the representatives of cotton textile mills and spinners of staple fibre yarn sometime next week at New Delhi. It will be recalled that, in order to counter shortage of cotton, the Government had planned last year to import about 100,000 bales (of 400 lbs. each) of staple fibre valued at Rs. 8 crores. Actual imports so far are placed at 30,000 bales worth roughly Rs. 2.5 crores, and more quantity is yet to arrive. The quantity actually distributed is, however, very small.

The problem of allocating the undistributed quantity has become all the more difficult because of two factors. First, thanks to better crop position in the country, the mills have been able to obtain their requirements of cotton and, therefore, even those mills which had expressly sought definite quantities of imported staple fibre have now turned reluctant to lift the available supplies. Secondly, in distributing the imported material, care has to be taken to see that the interests of indigenous manufacturers are not in any way affected. Even in the case of indigenous staple fibre, mills have shown poor response. The Textile Commissioner is believed to have issued so far for the January-June 1963 period permits for the supply of only about 14.6 million kg. of staple fibre (as against the expected production of 20 million kg.), out of which actual acceptances by mills to manufacturers amount to 8.1 million kg.

Sometime ago, the Indian Cotton Mills Federation had suggested allocation of imported fibre partly on a voluntary basis and partly under a compulsory quota. The mills have found the proposal rather impracticable. It has been suggested by the industry that those mills which had expressly sought the fibre alone should be forced to take it and the surplus should be disposed of in the open market (which implies re-

duction in price and, therefore, difficulties in apportioning the loss). Staggering of further imports in consultation with the indigenous manufacturers is another way of finding disposal of the quantity which has already arrived. It remains to be seen whether the expected talks at New Delhi will lead to a readily acceptable solution.

The following table gives the prices of rayon staple fibre and cotton yarns, today, as compared with those prevailing a week ago:

	13-2-1963	6-2-1963
	Rs.	Rs.
Art silk yarn **(per kg.)—**		
National Rayon 120D	12.01	12.10
Century 75D	17.67	17.86
S. I. Viscose 150D	11.61	11.26
Staple fibre yarn **(40 s 2)—**		
Kohinoor (per kg.)	8.05	8.12
Century	7.22	7.15
Cotton yarn (per bundle of 10 lbs.)		
10s Podar	17.50	17.50
20s Edward	21.75	21.75
20s Nandi	26.00	26.00
40s Hind	35.50	35.00
60s Finlay	67.25	67.25

Note.—Quotations for 120 and 150 Japan and Italy are not available, since there has been no trading in view of paucity of stocks.

METALS FIRM

(From Our Own Correspondent)

BOMBAY, 13*th February*

The non-ferrous metals market displayed firm tone during the week under review. Offerings were small, whereas enquiries were larger on account of fears that metals might be subjected to fresh imposts in the ensuing Budget. Zinc and lead were in good demand. Copper also ruled distinctly steady. Tin, which ruled easy last week, elicited fresh enquiries and staged a smart rally.

In the Bombay market, zinc spurted by Rs. 23 to Rs. 275 per 100 kgs. Lead put on Rs. 6 to Rs. 172 per 100 kgs. In the copper section, electrolytic coils rose by Rs. 8 to Rs. 378 per kg., electrolytic wire bars by Rs. 3 to Rs. 368 and blister by a rupee to Rs. 315. Tin price increased by Rs. 7 to Rs. 310 per 10 kgs.

In contrast, metals in London were depressed. Tin encountered persistent selling. The report that tin consumption in the U.K. rose in 1962 by 4 per cent to 22,400 tons, as compared with 1961 did not enthuse the market. This increase in consumption was due to better demand for tinplate, which rose 10 per cent to 10,300 tons, and a 20 per cent rise in solder usage to 2,540 tons. Production of refined tin in the U.K. in 1962, however, fell by nearly a quarter to 18,750 tons, but imports rose sharply to 9,200 tons. Imports of ores and concentrate also fell by 20 per cent to 17,400 tons. The move of mine workers in Malaya to go on a strike to press their demand for an annual bonus did not also have any perceptible effect on the market. Lead prices too, moved down, despite reports that the U.K. lead consumption rose by 3 per cent to 379,000 tons (on account of increased demand for lead cables, car batteries, and anti-knock compounds for petrol). Copper prices were weak, following reports that the U.K. consumption of copper fell by 5 per cent to 649,000 tons in 1962.

In the London Metal Exchange, cash tin fell by £3 to £854 per ton. Three months metal eased by £2¾ to £854¾. Spot lead declined by £¼ to £54-5/16. Three months metal lost £¼ to £54-11/16. Three months copper receded by £¼ to £233¾. Cash copper was maintained at the support price of £234¼ on account of large buying by producers.

GROUNDNUTS DECLINE

(From Our Own Correspondent)

BOMBAY, 13*th February*

Oilseeds ruled easy during the week under review, barring linseeds which elicited good speculative support. Operators were generally hesitant to enter into fresh commitments either way because of pre-Budget uncertainties. Groundnuts encountered persistent selling, despite reports of good export demand for groundnut oil and for extractions. Spot were distinctly easy, on fears of large new crop arrivals in the near future. Hedge contracts, however, moved up, as some operators extended good support on hopes of revival of U.S. enquiries for castor oil. Fluctuations in cottonseeds were narrow.

On Thursday last, trading in new contracts in groundnut, groundnut oil and cottonseed commenced on Thursday the 7th inst. The terms of trading are similar to those governing the previous contract. Thus the July 1963 groundnut contract in any week (from Monday to Saturday) should not exceed Rs. 5.50 per 250 kgs., the corresponding limit for groundnut oil hedge contract being 80 nP per tin of 16 kgs. Besides, no member is permitted to have at the close of any trading day a net long or short open position in excess of 5,000 tonnes in the case of groundnut contract and 78,000 tins in respect of oil contract. As regards the cottonseed contract, no such restriction is imposed, though the limit on price increase in the course of a week is fixed at Rs. 3.50 per 250 kg.

Groundnut April 1963 contract fell by Rs. 3.87 to Rs. 204. Business in July 1963 contract opened at Rs. 214 on Thursday. The contract declined to Rs. 212. Nizam bold receded by 50 nP to Rs. 39.50. Oil ex-mill, however, picked up 5 nP to Rs. 16.60.

Castorseed Madras small and Kanpur eased by 12 nP each to Rs. 32 and Rs. 30.50, respectively. Oil B.S.S. lost 20 nP to Rs. 13.50 and oil commercial 5 nP to Rs. 12.80. Castorseed March 1963 contract, however, closed higher by Re. 1.75 at Rs. 159.50. June 1963 contract put on a like amount to Rs. 160.70.

Cottonseed April contract was quiet at Rs. 91; it had gone up to Rs. 92 earlier. White shed 25 nP to Rs. 18.50. Both non-white and berar were featureless at Rs. 18.50.

The linseed June 1963 contract rose by Re. 1.38 to Rs. 34. March 1963 contract improved by 25 nP to Rs. 32.62. Linseed oil hardened from Rs. 13.25 to Rs. 13.40, before closing at Rs. 13.30. Bold ready improved initially from Rs. 32.62 to Rs. 32.75, but closed on a subdued note at Rs. 32.50.

The following table shows the closing prices of oilseeds and oils on Wednesday 13th February, as compared with those of two previous weeks:

	13-2-1963	6-2-1963	30-1-1963
Groundnuts	Rs.	Rs.	Rs.
April 1963 contract	204.00	207.87	212.37
Nizam bold	39.50	40.00	42.00
Khandesh quality	40.12	40.75	42.50
Oil ex-mill*	16.60	16.55	17.20
Oil commercial*	16.50	16.40	16.90
Castorseed			
March 1963 contract	159.50	157.75	159.75
June 1963 contract	160.75	159.00	162.25
Ready Madras	32.00	32.12	32.75
Ready Kanpur	30.50	30.62	31.50
Oil B.S.S.†	13.50	13.70	13.80
Oil commercial†	12.80	12.85	12.85
Linseed			
March 1963 contract	32.62	32.37	33.25
June 1963 contract	34.00	32.62	34.50
Bold ready	32.50	32.62	33.25
Linseed oil†	13.30	13.25	13.70
Cottonseed			
April 1963 contract	91.00	89.50	90.50

* Rates include excise duty but exclude sales tax.
† Rates exclude both excise duty and sales tax.
N.B.—All quotations for futures contracts are per 250 kilograms, except linseeds for which rates are per 50 kilograms. Spot quotations of seeds are per 50 kilograms and oil per 10 kilograms.

NILGIRI TEAS DEARER

[*Messrs. Forbes, Ewart and Figgis (Private) Ltd.*]

COCHIN, 7*th February*

Offerings in sale No. 6 held on the 5th inst. comprised approximately 618,000 kgs. Quality of Nilgiri teas was generally slightly inferior, while the teas from other districts were a little irregular. There was good demand throughout the sale. Selected best quality Nilgiri teas sold readily at dearer rates, but the lesser kinds were easier, following quality. Good medium descriptions ruled about firm with the brighter sorts occasionally dearer, whereas there was less competition for low medium and medium brokens which came to a lower market. Medium, low medium and plain fannings, however, were well supported and came to a firm to dearer market. Plain brokens ruled easier. Black leaf brokens were about steady but fannings suitable for the Middle East sold at enhanced rates. Whole leaf grades were well supported while tippy sorts eased in price. Teas of unorthodox manufacture were about steady.

The quotations (per kg.) were:

	1963	1962
	Rs.	Rs.
Low mediums	4.25-4.65	3.85-4.05
Mediums	4.75-5.00	4.10-4.65
Good mediums	5.10-5.80	4.85-5.50
Nilgiri B.O.P.	5.75-11.10	5.60-10.90

The average price realised in sale No. 6 was Rs. 4.97 per kilo as compared with Rs. 5.10 a week ago and Rs. 5.13 in the corresponding sale last year.

In dust sale No. 6 held today, 291,000 kgs. were offered. The market opened to a strong general demand which eased slightly as the sale progressed. Highgrowns and C.T.C. types elicited irregular demand. All medium categories sold well at enhanced rates. Clean black grainy exportable types met with a good demand and sold at above last prices.

The average price realised in dust sale No. 6 was Rs. 4.27 per kg. as against Rs. 4.23 a week ago and Rs. 4.02 in the corresponding sale last year.

Colombo: Just under 6¾ million lbs. were offered and there was strong and more general demand for the offerings which were mainly brighter. Dimbulas were irregularly dearer with the lesser B.O.Ps often 25 cents higher. Good mediums and Uvas advanced 20 cents, whilst others were 5/15 cents and lowgrowns 3/5 cents dearer. Fannings were in strong demand at only slightly above last rates.

London: In Monday's auction, there was good demand, although medium C.T.Cs were irregular and sometimes easier but all other descriptions were firm.

Ceylon and South Indians: In Tuesday's auction, plainest descriptions were firm, but others were irregular and a little easier.

As we go to press, Messrs. Forbes, Ewart and Figgis (Private) Ltd. wire as follows:

"*Sale No.* 7: 621,000 kgs. offered. Good general demand. Low medium and medium brokens easier. Fannings irregularly dearer. Good mediums and highgrowns steady with quality. Unorthodox fully firm."

EXPORTABLE TEAS EASIER

(From Our Own Correspondent)

CALCUTTA, 12*th February*

An easier trend developed at the tea export sale No. 34 held here yesterday owing to slack demand. Offerings amounted to 72,921 packages. Plain orthodox descriptions evoked sufficient response to be sold at fully firm rates and "teas for price" were slightly dearer, but the brighter Doars and medium Assams had an easier market, with the better liquoring Assams and B.O.Ps turning weak even at the risk of being withdrawn and O.Fs disclosing losses up to 40 nP a kilo. Inquiry for the medium C.T.C. types was limited. B.Ps declined by 20 nP. Fannings were weak and withdrawn often. Best sorts were 20 to 30 nP lower. Fibrous kinds were irregular. Legg-cut descriptions met inquiry only at lower levels. Whole leaf grades were exceptionally steady, but the more stylish sorts and tippy teas were irregular and easy. Darjeelings sold well.

Quotations in rupees per kilo, inclusive of excise duty, were: Clean plain pekoe 4.80 to 5, plain B.P. 4 to 4.30, plain fannings 4 to 4.40, medium Assam C.T.C. B.P. 5.60 to 5.90, medium Assam C.T.C. fannings 5.20 to 5.50, best Assam C.T.C. B.P. 6 to 6.20 and best Assam C.T.C. fannings 5.80 to 6.10.

In contrast with the export sale, the internal dust tea sale No. 33 on Thursday the 7th inst. attracted good demand and competitive bidding. Offerings aggregated 30,120 packages. Medium C.T.C. were a feature and the brighter liquorings, too, sold well at higher rates, but the rest of the offerings tended to be irregular and generally easy. Plain orthodox teas met with keen competition, medium orthodox types received fair support and some selected lines among legg-cuts were dearer.

Quotations in rupees per kilo, including excise duty, were: Plain orthodox 4 to 4.30, medium Assam 4.30 to 5, medium Assam C.T.C. 5.50 to 6.10, good Assam C.T.C. 6.70 to 7.10 and legg-cut 5 to 5.40.

At 73,000 packages, the quantity on offer at last week's Mincing Lane auction was slightly small. The trend was easier. Bright liquoring teas and other cheaper sorts among the North Indian and other miscellaneous offerings failed to maintain early steadiness. The better quality South Indian stuff fetched, however, 1d. to 2d. more per lb., but the rest of this growth could be sold only at last levels. With the exception of the low grown sorts which ruled steady, the offerings from Ceylon were easier due to slack demand.

Tea stocks in the U.K. as at 1st February 1963 aggregated 143,262,710 lbs., as against 144,517,856 lbs. in the previous week. The quantity expected to have landed on the 1st inst. was 18,304,928 lbs. Deliveries during the week totalled 10,756,350 lbs. and landings 9,501,204 lbs. Total afloat was 42,167,640 lbs. The average price realised at last week's auction was lower at 50.42*d.* per lb., as compared with 51.70*d.* in the previous week and 52.38*d.* in the corresponding period last year.

Tea crop prospects in Assam were rated fair, although dry weather continued in upper, central and lower Assam, especially North and South Cachar, East and Central Dooars region, Darjeeling and Terai.

Prof. N. Simura, leader of a five-member Japanese team on a Brooke Bond India-sponsored tour of tea plantations in this country, said at Madras on Saturday the 9th inst. that Indian tea was better than the Japanese growths. He suggested proper manuring and destruction of very old bushes for improving yield in some of the high-bred varieties. Copper compound insecticides can, according to him, effectively combat "blister blight"—the disease affecting tea plantations. The team is to submit its report next month.

Ceylon is to seek India's participation in extension of the joint "drink tea" propaganda from Canada, West Germany and the U.S. to other areas in the West, including the U.K., where India alone is carrying on a campaign. Mr. C. D. Coorey, Director of the Ceylon Tea Board, who is in this country at present, will negotiate the proposal with Mr. A. S. Bam, his counterpart in India.

India's tea exports from January to November show an improvement at 416.42 million lbs. over 398.65 million lbs. and 370.50 million lbs. in the same period of 1961 and 1960, respectively. Notwithstanding a drop of roughly 4 million lbs. in its offtake at 234.61 million lbs., the U.K. has continued to be the largest importer. Exports to the U.S. have improved from 20.43 million lbs. to 23.16 million lbs., but those to the U.S.S.R. have moved down slightly from 23.54 million lbs. to 22.42 million lbs. The U.A.R.'s offtake has shot up from 28.75 million lbs. to 37.13 million lbs. and Australia has lifted 7.31 million lbs. more at 10.61 million lbs. Shipments to Turkey have moved down from 7.43 million lbs. to 3.83 million lbs. and so have those to the Sudan from 12.88 million lbs. to 10.97 million lbs. Exports to East Europe have improved, but those to the Persian Gulf countries, except Iraq, have declined.

JUTE GOODS SPURT AGAIN

(From Our Own Correspondent)

CALCUTTA, 12*th February*

Jute goods continued to rule firm during the major part of the week under review, thanks to renewed rumours of higher excise duty and inquiries for hessian from Soviet Russia. Reports of Central Government tenders for A twills also aided the sentiment of the market. Consequently, both sackings and hessians recorded further gains in values. Even the decision of the I.J.M.A. to continue the maximum level of production up to the end of next month in spite of increased stocks failed to dampen the bullish fervour. Later in the week, however, jute goods developed a sagging tendency, due to profit-taking at higher levels and poor overseas inquiries. Nevertheless, the closing prices today were above those prevailing a week ago, as the following figures show:

	12-2-1963	5-2-1963
	Rs.	Rs.
Futures (February)		
B. twills (100 bags) ...	116.20	113.95
Hessian (40″ x 10 oz.) ...	50.90	50.30
Ready		
B. twills (100 bags) ...	116.20	113.95
Hessian (40″ x 10 oz.) ...	51.62	51.25

In sympathy with the rise in the prices of jute goods, the fibre market ruled firm. Daisee bottoms improved by a rupee to Rs. 34 per maund. Assam bottoms (February-March) were fully steady at Rs. 30 and Northern Bottoms at Rs. 29.50. In the contracts market, Assam Bottoms picked up Re. 1.50 to Rs. 30. At Cossipore, Assam Bottoms hardened by a rupee to Rs. 28.50. Jungli mesta gathered 50 nP to Rs. 24.

The minimum operative price of raw jute for the next season commencing from July next will be announced in a fortnight's time. This was disclosed by Mr. Sriman Narayan, Member of the Planning Commission, at Calcutta on Thursday the 7th inst. Mr. Narayan also disclosed that the Government of India was introducing a rotating fund to enable the jute growers to tide over their difficulties without selling their stocks to middle-men at low prices. Incidentally, he stated that the State Trading Corporation would buy jute only from co-operatives.

KIPS RULE STEADY

(From Our Own Correspondent)

MADRAS, 11*th February*

The Madras kips market ruled steady this week. E. I. tanners were not keen to sell, as they had sufficient orders on hand to be executed. Importers offered resistance to the local prices. Inquiries for top marks were small and those for secondary marks in light weights and fourths and fifths medium weights in cowhides were moderate. Demand for cowcalf was good, but the availability of stocks was small. Prices of buffcalf were firmer following several sales of all average weights to the U.K. and the U.S. buyers.

Trading in goat skins was irregular and tanners were not able to buy raw stocks at economic levels because of the competition from exporters of chrome and pickled goat skins to the East European countries which paid attractive prices. There was good call for tanned goat light weight lower ends. As regards tanned sheep skins, the market was quiet, except for light weights in middle class tannages.

Shipments (in bales) in January last were 1,818 tanned cowhides, 156 cowcalf, 539 buffcalf, 350 goat and 245 sheep skins to the U.K.; 53 cowcalf, 43 buffcalf, 653 goat skins and 255 sheep skins to the Continent, 5 buff hides, 159 buffcalf, 173 goat skins and 45 sheep skins to the U.S.A., and 9 goat and 225 sheep skins to Japan, besides 379 cases chrome and pickled goat skins to East European countries.

FOODGRAINS BETTER

(From Our Own Correspondent)

HAPUR, 11*th February*

A steadier trend continued in foodgrains here this week, as due to the absence of winter rains and strong westerly winds in the last three days the *rabi* crop prospects deteriorated further.

Wheat prices here remained stationary at Rs. 40.19 for the average quality and at Rs. 42.87 to Rs. 44.21 for the farm produce. Arrivals were negligible, while demand was good. Local stocks consequently declined to 55,000 maunds. Rice attracted better consumer demand. Arrivals from producing areas were small and stocks were modest around 16,000 maunds. Prices, therefore, stayed steady. Week-end prices were:—Rice *basmati* superior Rs. 80.38 to Rs. 91.09, *sela basmati* Rs. 75.02 to Rs. 80.38, *mainpuri* Rs. 51.58, *ramajwayan* Rs. 58.94, *raimunia* Rs. 61.62 and *gadda* Rs. 49.57, a quintal.

Gram prices were higher, as arrivals from Punjab were negligible. Maize ruled easy on selling pressure from stockists and poor demand. Arrivals averaged around 500 maunds a day and stocks were around 22,000 maunds. Prices were quoted between Rs. 24.11 to Rs. 28.13 per quintal. Barley and *bejhar* drifted further lower levels. *Bajra* and other coarse grains remained subdued in the absence of buying support. Week-end prices were:—*Jowar* Rs. 31.48, *guwar* Rs. 29.47 to Rs. 31.48, *bajra* Rs. 32.15, gram local Rs. 40.87, Punjab quality Rs. 41.53, *methi* Rs. 58.94, barley Rs. 24.11 and *bejhar* Rs. 24.78, a quintal.

SUGAR PRICES SAG

(From Our Own Correspondent)

HAPUR, 11*th February*

Sugar prices developed a sagging tendency this week, as demand from the South subsided following release of an additional quota in Maharashtra. A monthly release of 2.25 lakh tonnes ordered by the Union Government had also a depressing effect on the price trend. Cane supply position to factories was very unsatisfactory. Most of the factories will be forced to close their crushing season by the end of the month. Sugar production is likely to decline considerably. The State Government is anxious to increase cane supplies to factories, but the overall cane crop has been poor. Week-end prices of sugar here were:—Spot delivery Rs. 110 per quintal, retail Rs. 1.06 per seer, mill delivery D 29 Amroha Rs. 107.17, Meerut new Rs. 110.25, Simbhauli E 30 new Rs. 110, Dhampur D 29 Rs. 107.17, E 30 Rs. 106.50.

Khandsari prices sought lower levels due to absence of demand at higher prices. Cane supply to the crushers manufacturing *khandsari* was far from satisfactory even at Rs. 1.75 per maund. While the moist inferior *khandsari* was quoted at Rs. 83.06 to Rs. 91.09, the superior dry was quoted between Rs. 92 and Rs. 99.80 per quintal. Crystal *khandsari* was lifted at Rs. 92.43 to Rs. 99.13 and *boora* at Rs. 106.45 to Rs. 112.45 per quintal.

Gur prices suffered a sharp decline of three rupees per quintal on restricted loading facilities. Loading to the South was completely restricted and was available for only Assam and Calcutta. Arrivals were about 2,000 to 2,500 maunds a day, which were partly lifted for outside despatch and partly for stock formation. Stocks here, therefore, increased to about 17,000 maunds. Stocks of *gur* in the mofussil areas were around 3 lakh maunds. Week-end prices of *gur* were:—*Gur* superior Rs. 50.24, average Rs. 49.57, dara Rs. 48.23, *bakhi* Rs. 47.56 to Rs. 49.22 and *shakker* Rs. 57.60, a quintal.

PERSPECTIVES & PROJECTIONS

(Concluded from page 261)

the sight of a cloud is a signal for ecstatic delight which is shared by human beings also. Did the selectors of the national bird also have in mind the significance of the peacock as the enemy and eater of the serpent, the latter at the present time being synonymous with the Chinese Dragon? If this symbolism had, indeed, predominated, the choice could have been the Garuda, the brahminy kite which could swoop down on the cobra (though that might have overstated the relative positions) but it would not have given scope for conveying our love of display which is truly peacockish.

* * * *

Tailpiece :

"The Village Volunteer Force programme has been designed to be the ideological answer we have been seeking. The concept is yet in the air but will soon come down to the ground. You have been charged to act the high priest with the very best you can commandeer out of yourself. . . . I am attaching to this a small brochure, the *Blood Red Pamphlet* as we call it, on the new programme of Community Development in the present crisis. It is the briefest printed document of which I have had the privilege to be the author. It has cost me relatively the heaviest investment of time. . ." (*Extracts from a letter from the Minister for Community Development Panchayati Raj and Co-operation to States' Development Commissioners.*)

STATE BANK OF INDORE

(Concluded from page 260)

at Dabra, Barwaha, Basoda and Sendhwa branches, bringing the total number of such branches to seven. Arrangements to assume these functions at two more branches shortly are complete.

During the year, the Bank opened five new branches in Madhya Pradesh under the expansion programme. Three of these branches were opened to take over the business of the Bank of Dewas Ltd. The State Bank subsidy for the full amount of losses in respect of new branches opened by the Bank after 4th March 1959 is expected to aggregate some Rs. 90,000 for the year under report (as against some Rs. 48,000 for the previous year) and has been taken into account.

In all 51 small-scale units (as against 55 a year before) were sanctioned credit limits for an aggregate amount of Rs. 28.19 lakhs (Rs. 34.68 lakhs), the amount outstanding being Rs. 13.70 lakhs (Rs. 17.22 lakhs). The number of accounts of credit facilities against warehouse receipts dropped from 101 to 47. Consequently, the aggregate limit sanctioned declined from Rs. 24.63 lakhs to Rs. 8.19 lakhs as did the outstanding balance from Rs. 4.77 lakhs to Rs. 2.39 lakhs. The Bank commenced assisting the co-operative sector during the year. Eight units in this sector were granted credit limits up to Rs. 11.45 lakhs and the amount outstanding at the year-end was Rs. 3.79 lakhs. On its rolls, the Bank had, as at the close of 1962, 791 employees, including 38 temporary seasonal appointments, as against 683, including 31 temporary seasonal appointments, a year before.

Notice

SHREE CHANGDEO SUGAR MILLS LIMITED

Mercantile Bank Building, 60 Mahatma Gandhi Road BOMBAY 1

NOTICE

THE TWENTY-THIRD ANNUAL GENERAL Meeting of Shree Changdeo Sugar Mills Ltd. will be held on Thursday the 7th March 1963 at 4 p.m. at the Registered Office of the Company, Mercantile Bank Building, 60 Mahatma Gandhi Road, Bombay 1, to transact the business mentioned in the Notice posted to the shareholders at their registered address along with the Explanatory Statement thereto.

Notice is also hereby given that the Transfer Books of the Company will be closed from 11th February 1963 to 27th February 1963 (both days inclusive).

A member entitled to attend and vote is entitled to appoint a proxy to attend and vote instead of himself, and a proxy need not be a member of the Company.

The dividend if declared will be paid on and from 1st April 1963 to those shareholders whose names are on the Company's Register on 27th February 1963.

Shareholders are requested to intimate change, if any, in their registered address.

By Order of the Board of Directors,
GAUTAMLAL A. SHAH,
Secretary.

BOMBAY:
Dated the 31st January 1963.

COMMERCE

"For Commerce, though the child of Agriculture, fosters his parent Who else must sweat and toil and gain but scanty fare."
William Blake.

VOL. CVI. No. 2705 BOMBAY, 23rd FEBRUARY 1963 PRICE Rs. 2

THE RAILWAY BUDGET

IN more ways than one, the Railway Budget for 1963-64, presented to the Lok Sabha this week, represents a bold and promising turn in the direction of prudent financial management. There are at least four features which invest the Budget with this significance. First and foremost is the proposal to increase the rate of dividend payable by the Railways to General Revenues from 4.25 per cent at present to 4.50 per cent for 1963-64 and for each of the later two years of the third Plan. On the capital-at-charge, as of 1963-64, this increase will add Rs. 4.05 crores to the aggregate dividend, incidentally taking it to the record level of Rs. 80.61 crores. Another welcome feature is the proposal to make an additional provision, from gross traffic revenue, of Rs. 10 crores for appropriation to the Depreciation Reserve Fund in 1963-64 and in each of the subsequent two years of the current Plan. Thirdly, the Development Fund, which is built up solely from the annual railway surplus, is to be augmented by an additional contribution of Rs. 5 crores so as to bring it to the level of about Rs. 30 crores per annum, on an average, over the rest of the third Plan period. Fourthly, the estimated increase of about Rs. 16 crores in ordinary working expenses in the budget year—an increase which also includes essential expenditure incidental to the present Emergency—bears a reasonable proportion to the additional revenue of about Rs. 31 crores expected, even at the existing rates and fares, from the increases in goods and passenger traffic. Some economy measures, such as a reduction in administrative overhead costs, strict control over contingent and travelling expenses, postponement of routine maintenance of buildings where possible, limiting the construction of buildings to the most essential requirements and reducing building costs to strict austerity standards, have been instituted in this connection; these constitute a salutary development.

Such prudent allocation of resources, as well as of their conservation, has been rendered possible as much by the Emergency as by the buoyancy in traffic revenues (including the proposed modest increases in goods and parcel freight rates to which we shall presently refer). The Emergency has decreed that additional resources be provided by the Railways to General Revenues for the defence effort. The proposed increase in the rate of dividend to the Exchequer, from the 4.25 per cent laid down by the Railway Convention Committee of 1960 to 4.50 per cent in the Budget for 1963-64, is justified even otherwise, for the annual borrowing rate of the Central Government has already gone up to 4.50 per cent (even the *de jure* Bank rate has gone up to 4½ per cent from 3rd January of this year) and additional capital resources for an expanded programme of railway development in the third Plan might, perhaps, cost even more. Above all, the increased dividend is an index of more profitable railway operations.

Likewise, the proposed addition of Rs. 10 crores per annum to the Depreciation Reserve Fund in the remaining three years of the third Plan period derives its economic justification from the need for more rapid replacement and modernisation (*vide* the special article on the next page). Moreover, as pointed out by the Railway Minister, Sardar Swaran Singh, in his budget speech, the average annual provision of Rs. 70 crores recommended by the Railway Convention Committee of 1960 for depreciation in the third Plan period cannot be viewed merely in relation to the average capital-at-charge of about Rs. 2,000 crores in that period, for the Depreciation Reserve Fund has also to bear the replacement cost of assets originally financed otherwise than from capital as, for instance, from the Development Fund. It is heartening to find that the Railways clearly recognise, in the words of the Minister, "that the Depreciation Reserve Fund has to provide at any time for the full replacement cost, at present-day high prices, of assets which are due to be replaced, in addition to having amounts calculated up-to-date for accrued depreciation in respect of other assets to be retired and replaced in later years, and that the Fund is thus, in effect, a combined Depreciation and Renewal Reserve Fund." If this wholesome principle is followed, or allowed to be followed, uniformly by all public-sector and private-sector enterprises, the stage will be set for more economic and efficient operations all round, and the tendency to live on capital curbed to the point of extinction. More immediately, the Railway Ministry deserves to be complimented for having woken up, albeit belatedly, to the desperate situation in the matter of replacement and renewal—a situation which is undoubtedly responsible for frequent accidents, delays in the running of goods and passenger trains, operational inefficiency, and so on.

RAILWAY BUDGET AT A GLANCE

(Rupees in crores)

	Actuals 1961-62	Budget 1962-63	Revised Estimate 1962-63	Budget 1963-64

(b) In lieu of Passenger Fare Tax	12.50	12.50	12.50	12.50
Net Surplus	24.40	23.22	23.20	31.00

* Includes additional provision of Rs. 10.00 crores for appropriation from Revenue to Depreciation Reserve Fund as also Rs. 4.05 crores in respect of Dividend on Railway capital-at-charge, according to the Budget Proposals for 1963-64.

The proposal to strengthen the Development Fund by adding Rs. 5 crores from the estimated net surplus in the budget year involves another wholesome departure from the recommendation of the Railway Convention Committee of 1960 which had foreseen financing of works chargeable to the Fund only to the tune of Rs. 23 crores annually, on an average, over the third Plan period. This Fund has necessarily to depend on current revenue surpluses, for the works to be financed by it are mostly of an unremunerative character. Such works, incidentally, relate to provision of amenities to passengers and other railway users, staff welfare works estimated to cost individually more than Rs. 25,000, improvements in signalling and train controlling equipments and other safety measures. Though unremunerative or only indirectly remunerative, these are nonetheless essential works, and it is, therefore, good that the Railway Budget has proposed to augment the Development Fund. To add to it thus is to budget for a larger net surplus which, as will be seen from the table in this article, is estimated at Rs. 31.0 crores in 1963-64, as compared with Rs. 23.2 crores in 1962-63 (Revised).

The increase in gross traffic revenues (from about Rs. 550 crores in the Revised Estimates for 1962-63 to about Rs. 600 crores in the Budget for 1963-64), which has rendered possible the aforesaid savings, is, of course, accounted for partly—to the tune of Rs. 19 crores, to be precise—by the proposed additions to goods and parcel freight rates. As the net railway revenue itself has gone up from Rs. 104.4 crores in 1962-63 (Revised) to Rs. 124.1 crores in 1963-64 (Budget) and as this increase corresponds, more or less, to the estimated yield from the additional levies, it may be taken that the normal buoyancy in gross revenues at the existing rates has taken care of the entire additional provision for depreciation. The fall in the operating ratio (that is, ratio of 'gross expenditure' to 'gross traffic receipts') from 78.0 per cent in 1961-62 (Actuals) to 76.5 per cent in 1963-64 (Budget) is another heartening trend, for it shows that the Railways are trying to keep down working expenses as much as possible, in spite of the annual addition to passenger and goods traffic and the consequential increase in expenditure on that account. This is certainly an index of improving operational and financial performance.

While sections of trade and industry may be justified in arguing that the additional levies—increase of the present surcharge on goods freight rates by five per cent, and levy of a surcharge of 10 nP per rupee in the case of parcel traffic in goods other than vegetables, milk and newspapers—are not strictly required by considerations of revenue expenditure, they may not grudge the increase, for it is mostly calculated to benefit the General Revenues at a time of mounting defence expenditure, as also the Railway Development Fund. Some sections, however, may deplore the absence of proposals, in the Budget, for increasing the passenger fares which continue to be uneconomic from the point of view of the expenses-earnings ratio in the sector of coaching services (*vide* the next article in this issue). Notwithstanding the Railway Ministry's failure to effect increases in passenger fares and thereby avoid increases in freight rates, trade and industry have otherwise much to enthuse over the Budget, as it provides for a capital expenditure of Rs. 325 crores on works, machinery and plant and rolling stock, as compared with about Rs. 308 crores in 1962-63 (Revised), and for developing further capacity to increase coal haulage at an ultimate cost of Rs. 120 crores. This fresh outlay, together with further capital expenditure on account of the expected increase of 10 million tons in general goods traffic over the earlier estimate, will take the Railways' third Plan outlay from the original level of Rs. 1,325 crores to Rs. 1,535 crores. This larger allocation for the Railways under the third Plan is bound to be widely welcomed in industrial circles, for it will go some way towards removing the transport bottleneck in vital sectors.

PERFORMANCE OF RAILWAYS

FOR some time now it has become an annual practice to compare the physical and financial performance of the Indian Railways in the latest completed year with that in 1950-51, the pre-first Plan year. In keeping with this practice, the Railway Board has just issued a statistical review assessing the improvement in railway performance in 1961-62 over 1950-51. This review is in three parts—one pertaining to traffic and earnings, another relating expenditure to performance and a third appraising the efficiency of operation. From the maze of statistics in which the official review is steeped, some relevant figures have been brought together in two tables accompanying this article—Table I providing a consolidated picture of physical performance in terms of goods and passenger traffic handled and Table II dealing with the financial results of the Railways' working. Comment on an interpretation of the figures contained in these two tables would not, however, exhaust the theme, for anything like a complete picture of railway performance in all its aspects can be had only from a diligent study of the official brochure with its innumerable statistical tables. But any such study is bound to be a time-consuming enterprise. To those who may have neither the time nor the patience for wading through that blue book this article would come in handy as a lighter alternative.

Let the reader have a rapid look at Table I. It will be found therefrom that the originating traffic had increased from 93.0 million tonnes in 1950-51 to 160.5 million tonnes in 1961-62, that is, by 72.6 per cent. In terms of tonne kilometres, the performance was even more substantial, for the increase in goods traffic, so measured, was as much as 106.8 per cent. Broadly speaking, the Railways seem to have nearly doubled their goods haulage capacity over the 11-year period under reference. This is good in so far as it goes, all the more so because the non-revenue traffic in Railways' own coal, stores, etc., in 1961-62 represented the same percentage (21) of all originating traffic as in 1950-51. In other words, the Railways' own demand on the haulage capacity, under the Railway Plans, had not increased disproportionately, as compared with the demand of other sectors. But this does not mean that the Railways have fulfilled the targets envisaged in the Plans and that the oft-repeated complaint of shortage of railway transport is not factually correct. It must be remembered, in this connection, that the Railways might have been strained to breaking point if there had been 100 per cent fulfilment of the production targets for coal, iron and steel, cement, and agricultural commodities in the first year of the third Plan. One can easily imagine, for instance, what might have happened if the Railways, which had actually moved 96.1 per cent of the 56.1 million tonnes of coal produced in 1961-62, had been confronted with an aggregate coal output of, say, 64 million tonnes in that year, which was the target under the Plan. The distinctly slower tempo of industrial and agricultural production in the second Plan period, in general, and in 1961-62, in particular, had thus provided some relief to the Railways.

As for passenger traffic, the Railways carried nearly 32 per cent more passengers in 1961-62 than in 1950-51. This rate of increase was substantially more than the rate of increase (about 22.5 per cent) in population over the 11-year period. But it must be noted that the increase was largely due to the steep rise in suburban passenger traffic consequent on further industrialisation and urbanisation. Here the trends since 1955-56—the year in which the suburban traffic carried in steam trains on the Eastern, Southern and Central Railways was added to the figures of suburban traffic handled by elective multiple unit services on the Central, Western and Southern Railways—show that suburban traffic, in terms of number of passengers, had increased by about 53.0 per cent over the next six years, as compared with an increase of about 17.6 per cent in non-suburban traffic over the same period. As the number of non-suburban upper class passengers had remained constant at 15 million per annum during the period, two inferences are possible.

One is that a part of the increase which would have normally taken place in upper class passenger traffic might have been diverted to the airways. (It may be noted, in this connection, that air travel, though costlier, is any day more comfortable and speedier than upper class railway travel with its increased fares and reduced amenities.) The second inference is that the other part of such normal increase might have been diverted to the Railways' third class with its sleeper berths, reserved seats and increased amenities. There is no doubt that some persons who could afford to travel upper class have taken to third class travel, because of better facilities given to this class. If third class fares are raised further, these passengers belonging to the upper middle classes could certainly afford to pay them. But, then, it might be argued that passengers belonging to the poorer classes would also be penalised. The answer to this argument is that some of these poorer-class passengers, who are now herded like cattle in overcrowded unreserved bogies, can take to bus travel over short, or even medium, distances, if they do not wish to pay the higher third class fares. That way the passenger pressure on the Railways can be reduced while, at the same time, increasing the revenue now contributed by the third class. The need for reducing such pressure, which is caused especially by short-distance travel, should be apparent from the fact that passenger traffic, in terms of passenger kilometres, had increased only by about 23 per cent since 1950-51, as compared with the 32 per cent increase in terms of number of passengers. If thus more people have taken to short-distance railway travel than ever before, they must be discouraged from doing so by a further increase in third class fares.

Besides, as third class fares are relatively cheap, especially in the context of higher incomes and larger purchasing power in the hands of people, there is a heavy movement of people from one end of the country to the other. This may be a good thing from the point of view of national integration, but it means a strain on the Railways' capacity which can be better utilised for the twin objective of defence and development. Nowadays, there is too much of non-essential long-distance travelling and the only way to curb it is to raise the third class fares substantially. There are other advantages to be had by adopting this solution. It will reduce overcrowding and make the journey comfortable for those who feel that they must undertake it for an essential purpose. It will compel people, who now think nothing of travelling from Delhi to Tirunelveli near Cape Comorin or from Bombay to Calcutta to attend the marriage of a niece or a nephew or to spend an annual vacation there, to save; and savings, as we all know, are desirable. And, thirdly, it will induce those who have migrated from long distances in search of a living to mingle with the local people more freely and to develop a feeling of oneness with them. The Railways may also think of introducing higher fares for the peak season. The fact that people are prepared to pay a premium of anything between 20 and 50 per cent to buy tickets in the black market in the summer months for long-distance travel (as, for instance, from Bombay to Cochin or to any other place in the South, North or East) suggests that both the capacity and the readiness to pay higher fares are there.

That passenger earnings from third class would have to increase further is also supported by the relevant figures in Table II. It will be seen therefrom that upper class passenger earnings had increased by 27.5 per cent and third class earnings by 58.5 per cent, and both together by 54.0 per cent, over the 11-year period from 1950-51. During the same period, the rate of increase in goods earnings was 114.6 per cent, that is, more than double the rate of increase in passenger earnings. At the same time, the proportion of expenses to earnings in the sector of coaching services had increased from 89.6 per cent in 1950-51 to 112.0 per cent in 1961-62, while the relevant proportion in the sector of goods services had come down from 95.2 per cent in the former year to 83.8 per cent in the latter. In effect, thus, the goods sector has not only been subsidising the coaching sector but also been contributing most to "net traffic receipts." Partly because of the increase in the quantum of goods traffic and partly because of successive increases in freight rates, the goods sector has been in a position to make good the working losses in the coaching sector.

How long can this situation continue is the question. Successive increases in freight rates are bound to be cumulatively reflected in higher costs of production in the industrial sector, and such higher costs will have their impact on the Railways' own expenditure on both current and capital accounts. They will also make the task of export promotion more difficult than it already is. Low passenger fares may be good for politics, but they are definitely bad from the economic point of view. Somewhere a line must be drawn, so that future increases in earnings can come from the coaching sector which has been deplorably lagging behind. Unless this is done, there will be harder times for the Railways which, by all accounts, have been providing much less for depreciation than is necessary. It may be recalled, in this context, that the Railway Convention Committee of 1960 had recommended a provision just about sufficient to cover the estimated expenditure on replacements foreseen to be necessary in the third Plan period. This provision, it has been recognised, would not be adequate from the long-term point of view, for there is still much leeway to make up in overdue renewals of rolling stock and other assets acquired several decades ago. Moreover, progressive modernisation of railway equipment, according to the Railway Minister himself, may necessitate some replacements before the normally accepted lives of assets, thus requiring additional provision to cover obsolescence. As operational efficiency, and through it, to some extent, net traffic receipts too, can be improved significantly only by more rapid replacement and modernisation, more liberal depreciation provision year after year is certainly called for. Otherwise, the Railways, with their considerable numbers of over-age engines, defective tracks, worn-out sleepers and bridges in several areas, will creek and crumble by stages. The travelling public must, therefore, be made to foot the bill.

TABLE I—*Physical Performance of Indian Railways*
(1950-51 to 1961-62)

	1950-51	1955-56	1960-61	1961-62	Variation in 1961-62 over 1950-51 (Per cent)

(iii) Proportion of expenses to earnings (per cent)	95.2	90.7	82.4	83.8	..

MARKET GOSSIP

Pre-budget Markets

FOR some days past, a firm trend has been prevailing in the share markets. Many scrips have registered handsome gains. Sellers are scarce, though buyers are keen. Turnover has, therefore, been only of modest proportion, the extent of rise in values being disproportionate to the volume of business put through. Four factors have been responsible for the change in sentiment: (1) There is a growing belief that the Union Finance Minister will not be as harsh to share markets as was feared at one time earlier. (2) For some time now, most people have been of the view that, after the budget, equities would stage a rally, even if the burden of taxation turned out to be pretty high. The rationale for this view is that, with the uncertainty about the budget over, those who were waiting to invest their savings would begin to act. In any case, this has been the pattern of share markets ever since Mr. Morarji Desai became the Finance Minister and there is no reason to think, so runs the argument, that it will be different this time. The holders of this view had recommended to their clients to invest at least half of the amount they had in mind in select counters at the prevailing low levels and the other half after the budget, so that they could make sure of "not missing the bus." It looks as though quite a few have been acting on this advice. (3) No fresh short-sales have been allowed by the stock exchange authorities, ever since the crash after Chinese aggression. There is a powerful minority among the operators which does not share the view that the budget would be light. In fact, it has serious misgivings, but it is unable to translate its conviction into action on the stock exchanges because of the ban on short-sales. And (4) some astrologers have predicted that March would be a distinctly bullish month for equities.

Much of the buying in recent days appears to be of a speculative nature. If the budget turned out to be really bad, there might, therefore, be a big fall in prices, especially as the cushion usually offered by the shorts would be absent. But, if it were otherwise, there might be a big jump in values, particularly because the floating stocks are thin, thanks to the large purchases made by the Life Insurance Corporation in the closing months of 1962 and early in January.

Many are the reasons for the share market's latest feeling that the Central budget would not be bearish. In the first place, the Railway budget presented to Parliament this week contained only a mild dose of fresh burden. The possibility that this might have been deliberately done, in order to enable the Finance Minister to impose heavy taxation on individuals and companies, has not found favour with many. Secondly, the State Governments which ought to have imposed new taxes have not cared to do so, despite the Prime Minister's repeated observation that it would be necessary to tax ourselves till it hurt. This has given rise to the inference that Mr. Morarji Desai, too, might do likewise. Thirdly, the trend elsewhere in the world is to reduce taxation and, since India has to attract private capital from abroad and since taxation in India is already one of the heaviest in the free world, the Government would not be so unrealistic as to be out of step with the rest of the world. And, fourthly, being a realist (except perhaps, in regard to prohibition and similar fads), Mr. Morarji Desai would not fail to recognise that the country needs defence in depth, by which it is meant that there would have to be a much stronger industrial base than now and that, for this purpose, the private sector has to be nourished and not impoverished.

All this sounds quite sensible to us and there are, of course, ways in which the additional resources required for defence could be found without reducing the incentive to savings, hard work and enterprise. But it remains to be seen whether these views are shared by the Central Cabinet. Most of the Indian economists, as well as some of the distinguished foreign economists who have visited this country after the emergence of the emergency, have expressed themselves in favour of heavier taxation.

Banking Service Charges

The maximum rates of interest on deposits payable by banks are limited through an inter-bank agreement. The minimum rates which banks should charge on advances are also determined by a similar agreement. So the only principal means of competition among banks are the service charges. There has been a proposal for quite some time now that these, too, should be regulated through mutual understanding among banks. The Indian Banks' Association has considered it on quite a few occasions in the past, but no agreement could be reached. Now that the issue of minimum lending rate is out of the way, the problem of service charges is being vigorously tackled. When it came up before the meeting of the relevant committee of the Association a few days ago, it met with considerable opposition. The small banks and medium banks were not sure that it would be to their advantage. One of the big banks was very lukewarm to the move. The exchange banks were instinctively against it. Apparently, they must have felt that standardisation of the whole range of service charges would not be feasible from the point of view of faithful implementation. The State Bank of India, as also its associates, is said to have been silent so far, probably because it wants to wait and see whether the others would be able to come to an agreement at all.

Undaunted by the unwillingness of some banks to agree to its move, the Indian Banks' Association is continuing its task of finding common ground. The issue will be taken for discussion at the Association's Committee meeting this week-end at Calcutta. This is the first time since the Association was formed that the Managing Committee is meeting at Calcutta. Evidently, the members of the Committee at that end must have prevailed upon their Bombay confreres to hold some of their meetings in a year in the other principal cities, so that the bankers in those centres might feel that they were not being neglected. That at any rate is the fashion of the day. Even the Presidents of Stock Exchanges have been ahead of the bankers in following it.

Will not an inter-bank agreement on service charges be regarded as fresh evidence of the growing desire among banks to indulge in restrictive practices that are injurious to a vigorous and healthy growth of private enterprise? The bankers in this country do not think so. In their anxiety to ensure for themselves a comfortable cushion, they are oblivious of the political implications of their steps. They may not always have a Finance Minister to back them in what they are doing and protect them from the danger of being accused of indulging in monopolistic practices.

It may be interesting to note, in this connection, that only a few days ago, the U.S. Government initiated proceedings against 20 Minnesota banking and financial institutions alleging rate-fixing. This is the first time that the provisions of the Sherman Anti-trust Law are being invoked against banks. The charges against banks are that they have been fixing loan terms and interest rates for banks in smaller towns, and service charges for customers, including those for cheque accounts and loans. This is apparently a test case to find out the extent to which anti-trust laws apply to banking. If the charges are upheld by the Court, each defendant "could be fined $50,000 in criminal actions." In India, of course, there are no anti-trust laws. But who knows they will not be enacted?

Coffee and Cocoa Costlier

The two beverages, coffee and cocoa, have contributed much to the recent revival in world commodity prices, as pointed out in these columns last week. There are still no signs of abatement of the uptrend in the prices of these two commodities. In fact, there has been a further increase in their prices last week, taking them to levels which are close to the peaks attained four years ago. In the London market, Uganda robusta coffee, for instance, is currently quoted at 192s. per cwt. or an increase of as much as 10s. over the week. The main reason for the sustained upward movement of coffee prices is the tight supply position of the robusta variety. Stocks with some of the African producers are said to have been completely exhausted at least for the time being. Besides, the current coffee crop has turned out to be much lower in the ex-French territories in Africa, partly because of the shift in cultivation in some places from coffee to cocoa and partly to the fact that some African producers have been content with producing less in the context of better prices secured for coffee. It has now become clear that the French purchase of about 5,000 tons of Uganda coffee a few weeks back was prompted by reduced supplies from its ex-colonies in Africa. The latest report from East Africa indicates that the coffee crop there is over a month behind time this year.

Bullish reports from West Africa have pushed up the price of cocoa also in the London market by about 8s. in a week to 195s. per 50 kilos. The major factor behind the increase in prices is the news that Soviet Russia bought last week 10,000 tons of cocoa from Ghana. Rumours that the total purchase of the new crop from growers by the Ghana Purchasing Board was much smaller than in the last season has also induced some strength in the market, for this lent credence to the general belief that the current Ghana crop would turn out to be much smaller than that in the past season.

It is too early to say to what extent Indian coffee has benefited by the revival of the upward trend in world price of coffee. Sales made for export upto the first week of this month have been well below those in the previous year. Thus, according to the latest figures made available by the Coffee Board, coffee sold for export upto the first week of this month from the 1961-62 crop was about 20,000 tonnes; this is lower by about 10,000 tonnes, as compared with the sales of the 1960-61 crop during the corresponding period of the previous year.

Czech Trade Mission

India's economic and commercial relations with Czechoslovakia have been much closer and far more extensive than those with other East European countries, barring, of course, the Soviet Union. India, it may be recalled, had a fairly large volume of trade with that country even during the immediate post-war years, when trade with other East European countries was at a low ebb. Among the East European countries (except, again, Soviet Russia), Czechoslovakia has been India's largest trading partner, in terms of both exports and imports. The mutual trade has increased considerably, following the conclusion of a three-year trade agreement in November 1960 which came into force from 1st January 1961. Under this agreement, payments between the two countries are being made in non-convertible rupees. As this agreement is to expire this year, a new trade agreement is expected to be signed shortly. The dominant theme of the new agreement also will be expansion of trade between the two countries further.

In this context, the visit of the Czechoslovak Purchase Mission (leader: Mr. Novacek of the

Czech Foreign Trade Ministry) to this country should be considered quite timely and appropriate. The object of the mission is to undertake a detailed on-the-spot study of the goods available in India for export to Czechoslovakia. The Mission has already held discussions with Mr. Manubhai Shah, Union Minister for International Trade, and representative sections of the business community. It is interested particularly in finding out prospects of buying non-traditional goods from India. Some of the new products which could be exported from India, according to the mission, are canned fruits and juices, canned fish, casings, walnuts, various chemicals and chemical raw materials, ilmenite and various types of textiles. Czechoslovakia has already been importing from India mainly such traditional goods as iron and manganese ore and agricultural and plantation products, particularly vegetable oils, spices, coffee, tea and oilcakes. More recently, jute goods, semi-finished leathers, handicrafts and coir products also have figured in the list.

Unless Czechoslovakia buys more from India, its own efforts to increase its exports to this country cannot succeed on account of the need for balancing the bilateral trade. In fact, Czechoslovakia, being industrially much advanced, is in a position to supply more and more of capital goods like industrial plants, machinery and other engineering goods to this country. Already, India's imports from Czechoslovakia have been running much ahead of exports to that country. In 1961-62, for instance, India's imports from that country reached a record level of Rs. 14.20 crores, whereas exports were of the order of only Rs. 8.10 crores, leaving an adverse trade balance of Rs. 6.10 crores. During the previous year, India's adverse balance was no more than Rs. 1.46 crore, with imports at Rs. 8.78 crores and exports at Rs. 7.30 crores. There is no indication of a halt in this trend towards growing trade gap. For, during the first eight months of the current financial year (latest period for which data are available), the adverse balance of trade rose to a new peak level of about Rs. 6 crores (an annual average of Rs. 8 crores), as against only about Rs. 3 crores during the corresponding period of 1961-62. During this period, imports rose from about Rs. 9 crores to about Rs. 13 crores; exports too improved but at a slower pace, that is, from Rs. 5.6 crores to Rs. 6.6 crores.

This growing adverse trade gap is in distinct contrast to the trend witnessed a decade ago. In 1952, for instance, India's exports to Czechoslovakia aggregated Rs. 2.9 crores, but imports from that country were only Rs. 1.6 crore; there was thus a favourable trade balance of Rs. 1.3 crore. It may be noted from these figures that exports have been lagging behind imports, though both have increased. There is every possibility that the study of the Purchase Mission will go a long way towards rectifying this imbalance in the growth of trade.

Five State Budgets

Five State Governments have so far published their budget estimates for the ensuing financial year (1963-64); they are Maharashtra, West Bengal, Uttar Pradesh, Bihar and Andhra. But it is only the Finance Ministers of the first two States who have come out with positive measures to raise additional revenue through taxation to the extent of Rs. 95 lakhs and Rs. 3.5 crores, respectively. The Finance Ministers of the other three States have not proposed any fresh taxes, though they have indicated that they will come forward with new tax proposals later. The Finance Minister of Andhra has clearly stated that he would bring the legislation during the current session to augment revenues by Rs. 6.0 crores. The U.P. Finance Minister has not committed himself to any figure. It is difficult to understand as to why the Finance Ministers of these States have not incorporated the tax proposals in their respective budgets.

With the yield of Rs. 95 lakhs from the new tax proposals of the Maharashtra Government, the estimated deficit of Rs. 91 lakhs on revenue account for 1963-64 will be converted into a small surplus of Rs. 4 lakhs. Adjusting the surplus to the deficit of Rs. 16.58 crores on capital account, the overall deficit comes to Rs. 16.54 crores. This is proposed to be covered by miscellaneous capital receipts, by borrowings from the capital market and by withdrawal from reserves. Out of the additional tax measures, the imposition of a sales tax on bulk purchases of electricity (made by distributing licensees) and users of electrical energy exceeding five million units energy per year alone is expected to yield Rs. 55 lakhs. Simultaneously, the rate of electricity duty on L.T. industrial consumers is to be raised from 0.8 nP to 1 nP per unit. This measure, together with the changes in Electricity Duty Schedule for removing anomalies, will yield Rs. 18 lakhs. The sales tax on certain goods which frequently enter into inter-State trade such as spare parts of cinematographic equipment, gramaphones and records, watches and their spares, tyres and tubes, and spares of motor cars is being enhanced to 10 per cent, yielding an additional revenue of Rs. 15 lakhs. Another sum of Rs. 7 lakhs is to be obtained by extending the tax on goods carried by public carriers to private carriers.

One may ask as to why the Finance Minister of Maharashtra has limited the fresh tax proposals to yield just Rs. 95 lakhs. The answer is obvious. It may be recalled that the State Government has already levied in the years 1961-62 and 1962-63 new taxes of sizable magnitude calculated to yield an extra revenue that more than covers the third Plan target of additional taxation fixed for the State.

The West Bengal budget provides for the upward revision in the rates of sales tax and widening its net (estimated yield put at Rs. 2.50 crores) and increase in the rate of duty on electricity consumed by industries (yield Rs. 1.00 crore). The Finance Minister has not given details of changes in sales tax, but he has indicated the following measures: (*a*) some exempted goods will now be made liable to tax; (*b*) manufacturers of tax-free goods will no longer be permitted to purchase raw materials free of tax; (*c*) taxes on luxury goods will be raised; (*d*) some goods now taxed at the last point of retail sale will be taxed at the first point of wholesale sale.

The table below gives at a glance the budgetary position of the aforesaid five States, as well as the quantum of Plan outlays fixed for 1963-64 as compared with those for the current (1962-63) and previous (1961-62) years:

	1963-64 (Budget)	1962-63 (Revised)	1961-62 (Actual)
Maharashtra :			
Revenue	159.71	145.13	113.78
Expenditure	160.62	144.73	124.44
Overall surplus (+) or deficit (—)	—17.31*	+1.39	—3.28
Plan outlay	81.25	67.17	55.23
Andhra :			
Revenue	118.36	116.43	85.80†
Expenditure	118.26	118.01	91.57†
Overall surplus (+) or deficit (—)	+9.60	N.A.	—8.65†
Plan outlay	55.27	50.00†	48.50†
West Bengal			
Revenue	117.05	105.74	101.70
Expenditure	109.79	115.27	102.48
Overall surplus (+) or deficit (—)	+10.72	—19.75	—50.24
Plan outlay	61.53	61.42	46.10†
Uttar Pradesh			
Revenue	201.82	182.39	153.99
Expenditure	206.79	193.16	155.11
Overall surplus (+) or deficit (—)	N.A.	—0.13‡	+12.24
Plan outlay	92.64	80.00†	71.50†
Bihar			
Revenue	87.80	85.90	79.80
Expenditure	85.50	91.20	81.00
Overall surplus (+) or deficit (—)	+0.50	+0.20	—6.60
Plan outlay	50.50	61.40	55.30

* Without taking into account receipts from open market loans and new taxes. † Revised. ‡ Budget estimate only.
N.A.—Not available.

It will be seen from the above table that the budgets of three States show surpluses on revenue account, namely, West Bengal (+Rs. 7.27 crores), Bihar (Rs. 2.30 crores) and Andhra (Rs. 10 lakhs), whereas the Maharashtra budget reveals a deficit of Rs. 91 lakhs and U.P. budget of Rs. 4.97 crores. The third Plan outlays budgeted for the coming year (1963-64) are higher than the revised outlays for 1962-63 in respect of all the States excepting Bihar. The rise is particularly marked in the case of Maharashtra, being of the order of Rs. 14.08 crores. This State can certainly look back with reasonable satisfaction on its performance concerning the implementation of the development Plan. Incidentally, in the budget for 1963-64, a sum of Rs. 4.00 crores (including capital expenditure of Rs. 1.5 crore) has been set apart by Maharashtra for meeting unforeseen expenditure arising from the present emergency. The aggregate Plan outlay at Rs. 81.25 crores for 1963-64 includes Rs. 24.70 crores on revenue account and Rs. 56.55 crores on capital account.

PERMANENT MAGNETS' PLANT INAUGURATED

The one-crore-rupee plant of Permanent Magnets Ltd., which went into production recently (see page 292 of *Commerce* dated the 16th inst.), was formally inaugurated at Borivli, a suburb of Bombay, on Saturday the 16th inst. by Ravishankar Maharaj, the noted Sarvodaya leader from Gujarat. Welcoming the increasing pace of industrialisation in the country, Ravishankar Maharaj spoke on the lines of Mahatma Gandhi's trusteeship theory, when he urged industrialists to shun wealth and riches and the profit-motive in the wider interest of mass welfare and well-being. In his welcome speech, Mr. Madanmohan Ruia, Chairman of the Company, said that the Government was to be shortly approached for expanding the present production capacity of the plant of 180 tons, that is, about 3.6 million numbers of finished permanent magnets, which represent the existing domestic requirements. New varieties of magnets, popularly known as ferrite and ceramic magnets, were also proposed to be made from powder metallurgy.

Mr. G. D. Birla, who presided over the function, welcomed the trend towards broadbased industrialisation and wide share ownership in the country. Mr. Birla congratulated Mr. Kantilal Morarji Desai, the promoter of the project and Managing Director of the Company, and wished he would emerge as a permanent magnate in the industrial field. Mr. Y. B. Chavan, Defence Minister, who was the chief guest on the occasion, welcomed the first ever manufacture of permanent magnets in the country, the significance of which had been all the more enhanced in the present political situation in the country in view of the use of magnets in defence production, electronic and radar system, besides other industries. Dott. Gusto Giusti del Giardino, Italy's Ambassador, and Dott. Ing. Antonio Sevesi, Managing Director of Centro Magneti Permanenti, which is collaborating with the Company in its project, also spoke on the occasion. Mr. Morarji Desai, Union Finance Minister, was among the special invitees.

INDO-AMERICAN ELECTRICALS' ISSUE

The Indo-American Electricals Ltd., which has obtained technical collaboration from the International General Electric of the U.S., a division of the world-famous G.E.C., and financial backing of the Indo-Burma Petroleum Company Ltd. for its project for the manufacture of super-enamelled copper wires, popularly known as winding wires, has announced a public issue of Rs. 17.50 lakhs in 125,000 ordinary shares of Rs. 10 each and 5,000 9.3 per cent cumulative redeemable preference shares of Rs. 100 each. The issue has been fully underwritten: preference shares equally by the L.I.C. and the Industrial Finance Corporation of India and equity shares by three firms of stock-brokers. Subscription lists are to open on the 14th of next month and close within four days.

The Company is setting up a 60-ton-a-month plant at Durgapur where it has been allotted 10 acres of land. Adequate power will be supplied from the Durgapur Project. Besides, the West Bengal Government has permitted the Company to install its own generating station as a stand-by. Production, we are told, will start by the end of 1963.

TREND OF SHARES

BRAVE SHOW BEFORE BUDGET

(From Our Own Correspondent)

BOMBAY, 21*st February*

WITH the sentiment having already undergone a perceptible change for the better last week, stock exchanges succeeded this week in putting up a brave show, pending the presentation of the Union budget for 1963-64. During the week, more and more counters participated in the recovery phase, as activity broadened and covered almost the entire list. Even cash scrips, which had been practically neglected last week, rallied on good support. To the extent that short selling was still prohibited, the recovery was exaggerated. But the tendency even in the spot market seemed to be to buy and not sell. An indication of the strong manifestation of bullish fervour was the imposition of the automatic interim margin of Rs. 37 per share against bulls in Arun on the Ahmedabad Stock Exchange yesterday (for the first time since the debacle which followed the Chinese perfidy), for, at Rs. 650, the scrip was more than 10 per cent higher than its clearing rate of Rs. 576. This share is, however, an isolated case in the sense that the spurt in it was due to support based on reports that the Kasturbhai group of mills were to make rights issues up to Rs. 10 lakhs—a limit for which no sanction of the Controller of Capital Issues is necessary. Nonetheless, the trend was clearly upward, and closing prices disclosed handsome gains.

Firmness a week before the Union budget may seem incongruous. What has gone into its making, however, is the market's own exaggerated fears of new taxation earlier. Until a fortnight ago, marketmen were heard talking of additional taxation up to Rs. 150 crores, with increase in corporation tax and imposition of excess profit tax and ceiling on urban income. Now they rule out a heavy tax effort and also the measures they had feared. Apparently the belief that Mr. Morarji Desai will do nothing that may unnecessarily upset confidence in the capital market has come to prevail now. This belief has reaffirmed itself more particularly in the light of the Railway budget and the budgets of five States announced so far. We may draw readers' attention to what we wrote in this column three weeks ago under the caption "Some limit to tax fears." Today, the stock market is quite prepared for a little extra sacrifice for the emergency. If the burden is to prove excessive, the barometer of the economy is likely to indicate a drop.

Two weeks ago, we had explained the need for lifting minimum prices for whatever shares that had been maintained. It is heartening that this week the authorities of the Bombay, Calcutta and Ahmedabad Stock Exchanges removed almost simultaneously the minimum levels for all the remaining few shares, except Indian Iron in Calcutta. Compulsory carry-over of business has, however, been maintained in Tata Steel Ordinary, Century and National Rayon in Bombay, in Indian Iron and G.K.W. in Calcutta, and in Tata Steel Ordinary, Atul, Calico and National Rayon in Ahmedabad. Unless the budget gives unexpected shocks, the market authorities may not hesitate to remove this last vestige on stock markets of the Chinese aggression and also lift the ban on short-selling.

The Union Government has granted, with effect from Saturday the 16th inst., recognition to the Bangalore Stock Exchange under Section 4 of the Securities Contracts (Regulation) Act, 1956, for an initial period of five years within the jurisdiction of the municipal area. Section 13 of the Act, which renders contracts other than those entered into between members of a stock exchange illegal, has been applied to the new Stock Exchange. Transactions have to be on spot delivery basis, with delivery and payment to be made within 14 days of the date of contract. The recognition involves doubling the membership security deposit to Rs. 5,000. There are now eight stock exchanges in the country, three of them working exclusively on spot delivery basis.

* * * *

Both forward and cash shares were in demand on Dalal Street. Selected Engineering and Miscellaneous issues were, however, in the forefront and recorded good gains. To mention a few, T. Maneklal spurted 45 points to Rs. 690, Indian Dyestuff Rs. 41.25 to Rs. 412.50, Colour Chem Rs. 37.50 to Rs. 382.50, S.L.M. Maneklal 11 points to Rs. 152, Synthetics 10 points to Rs. 156, Bombay Burmah eight points to Rs. 639, Voltas five points to Rs. 253, T.E.L.Co. four points to Rs. 290 and Hindustan Motors 36 nP to Rs. 17.64. Textiles were also active, with Standard rising by 26 points to Rs. 772, S.I. Viscose by 23 points to Rs. 153, Century by 14 points to Rs. 543, Baroda Rayon by nine points to Rs. 123.50 and National Rayon by Rs. 8.50 to Rs. 390.50. Among Steels, Tata Ordinary were up by Re. 1.50 at Rs. 119.50 and Indian Iron by 20 nP at Rs. 21.40.

* * * *

Unlike Dalal Street, the market in Calcutta staged a slow improvement, with support more evident for popular scrips. Among cleared shares, Orient Paper rose by Re. 1.10 to Rs. 36.10, Texmaco by Re. 1.25 to Rs. 21.50, Dunlop by 75 nP and Indian Cable also by 75 nP to Rs. 33.75, while G.K.W. declined further from Rs. 33 to Rs. 32.25. In the Cash section, Bengal Coal were up by Rs. 9 at Rs. 299, Budge Budge and Kelvin Jute by Rs. 8 at Rs. 187 and Rs. 204, respectively, and Burn Engineering by Rs. 9 at Rs. 504.

* * * *

Plantings recorded further gains in Madras. Thus, Consolidated Coffee closed 33 nP higher at Rs. 15.93, Ouchterlony Valley 24 nP higher at Rs. 4.30 and Kil Kotagiri 20 nP higher at Rs. 5.15. Mettur, among Textiles, fell by 18 points to Rs. 324. In the Miscellaneous section, while Mettur Chemical gained 25 nP to Rs. 13.35, Aluminium Industries, which became ex-right at Rs. 21.26 on the 18th inst., closed a shade better at Rs. 21.40 *xr*.

PERSPECTIVES & PROJECTIONS

By Mercator

A Phase of Intolerance?

FANATICISM of one kind or another has been a normal feature of our political scene, but even those who did not expect anything better from the Socialist Party will feel peeved by the display of discourtesy towards the President when he addressed the opening session of Parliament. Only recently we had reason to feel pleased by the withdrawal of the D.M.K.'s old boycott of the Madras Governor's addresses; but, in U.P., ugly scenes were enacted when the Governor expressed his inability to read his address in Hindi. Parliament had been spared this kind of exhibitionism so far; but there is an element of goodness in the latest incident, since it helped to bring out the unanimous disapproval of all other sections and isolate the noise-makers. Most members were sorry about such conduct; some were concerned perhaps only with its effect on the Hindi cause. The latter have reason to feel a sense of disappointment over the Prime Minister's recent reiteration of his assurance regarding the continuance of English as an associate language after 1965; the determination to carry through the Bill in the Budget session has been welcomed in all other quarters.

It frustrates the tacit understanding to shelve this Bill under the guise of the emergency while giving the highest priority to the amendment of Article 19 (to ban secessionist talk), even though this latter provision remains suspended during the emergency, which will last quite long if present intentions succeed. But one cannot be too sure of this result. Intolerance shows every sign of growing and inevitably it is likely to breed more of its kind. The other day the Prime Minister took the Hindi Press to task for writing in a language which even the Hindi-knowing public could not understand; that criticism applies equally to textbooks prescribed in high schools, which many whose mother tongue is different have to study, and to many technical Hindi terms coined with apparent official approval.

This trend is in contrast to the increasing simplicity in style with which writers in other Indian languages are conducting their communication with the common man with a view to increasing their influence and circulation, though I suppose *pundits* teaching languages in Indian schools are everywhere fastidious about abstruse points of grammar which scare most students. The explanation for this contrasting attitudes is, I think, to be found in the fact that, while writers in other languages are not seeking any position of primacy or superiority and are content if they appeal to those having the language as their mother tongue, Hindi is in an aggressive phase and like all aggressors can't help throwing its weight about, even if it is injurious to its long-term interest and often self-defeating. Hindi champions will be the first to repudiate any suggestion that their attitude is against the spirit of Hinduism, which, without becoming a proselytising creed like Islam or Christianity, was able to extend its religious and cultural influence widely in South-East Asia and leave permanent marks of it. Creating a sense of conflict induces adverse reactions, but agitators rarely understand history.

* * * *

In Shackles?

To what extent is the Indian Press ruled by monopolies? And how badly is it cramped in its freedom or style by self-imposed shackles? These questions crop up again and again and a Delhi Seminar sponsored by the newly set up Press Institute of India and the India International Centre provided opportunity for discussing them—though most such discussions tend to follow beaten paths. Newspaper proprietors will point to the large degree of competition in the industry among the various groups, chains, established individual newspapers and the many struggling small ones; there is enough to provide a variety in which the scope for suppression of facts or relevant opinions is reduced to the minimum. The validity of this view is often ignored because of blind prejudice and dogmatic approaches; I believe that the theory of consummate proprietors, scheming all the time to regulate views or news published by his employee editors (or the even more mighty sub-editors), overrates the capacity or tenacity of purpose of the owners we happen to know in real life. This, of course, does not rule out occasional hints to go soft on or step up some line of criticism, but I think most proprietors have the intelligence to realise that truth will be out in a free country and there is wisdom in not distorting it to the point of shaking the faith of the reader. Those who have consistently overlooked this point are not the shrewd proprietors, but official spokesmen who have to speak to a brief and therefore tend to deny everything else not coming within its scope!

Editors, on the other hand, are too often preoccupied with the spectre of Government, not because they are not aware of employers' attitudes but because authority is more powerful, better armed and less predictable in its ways. There are genuine misgivings now about the powers under the Defence of India Act and Rules, though it cannot be said that there are not instances of provocative Press conduct where their application by the Government may be fully justified. One view is that big national newspapers may not have reason to fear, but that local papers, trying to expose abuses and scandals, may be silenced with this sledge hammer. Here again, one must not ignore the fact that action under the law, however arbitrary, may still be more civilised than some of the methods adopted by politicians in power at local levels to intimidate critics or opponents into submission.

* * * *

Mote and the Beam

There are self-imposed shackles for the Press and the most recent example often cited is the treatment accorded to the Vivian Bose report on the frauds committed by some companies. I think there are comparable instances in which political, not merely business, interests have also similarly used their influence,

In Thought, in Word and in Deed, SERVE INDIA

Considering the amount of matter that ordinarily goes into newspapers, such breaches are rare, though indefensible in principle, and should not be exaggerated out of proportion. Mr. Nehru has often asked, almost dispargingly at times, whom the increasingly anonymous editor represents, the proprietor, himself, or the public, to justify the unfettered freedom that he claims for his work. An answer is not easy, since the editor, like the politician, leads public opinion as much as he reflects it and has a right for the freedom to do so. Just as a Minister is not expected, because he is elected, to act according to the uninformed prejudices of his constituency or his country but only by his own enlightened judgment and convictions, the editor also should feel free. We understand a politician in power acting according to the predominant opinion in the party which has elected him as a leader, even though the party may in turn be influenced by the prejudices of particular sections of the electorate or the sources of its funds. No one, I think, has said that a political party is not deserving of freedom to canvass for popularity merely because it has to make extravagant promises to some sections or take donations from companies and other financial interests which may not believe in giving money away for nothing in return. How much freedom of expression do party and political leaders deserve in the light of these considerations? The answer is, of course, as much as the Press, which cannot be wholly separated from its business side. The tendency to see the mote in the other man's eye while ignoring the beam in one's own is universal and so it has been in this case of Press freedom.

* * * *

Elections Around?

While the Government considers that the emergency has to continue for a long time to come, the Election Commission has decided to go ahead with by-elections for Parliament and State legislatures. Some may deplore it as a distraction from the war effort and diversion of resources required for it. But the key issue is whether the complete freedom of expression essential for electioneering purposes will be assured under the shadow of the emergency. The party in authority will have to be freely criticised for failures, real or fancied; that is part of the political game and cannot be waived even now, if elections are not to become a farce. Some criticisms are bound to be exaggerated, for example, forced collections for the war effort. In some other respects also, the party in power will be in a relatively weak position to face its critics since it cannot give out information on some aspects of defence preparedness which is bound to be called in question.

Such handicaps notwithstanding, it was a bold decision to go ahead with by-elections to give proof that there can be no long interruption in our democratic ways of life. The report that by-elections will be held before the gruelling heat of summer and the subsequent rainy spell may be particularly discouraging to those who will have to defend Mr. Morarji Desai's heavy taxation in the coming Budget. But the most embarrassing question the Government will have to face is why the emergency, which can be so completely waived for election purposes, should continue in other respects. The chief advantage is the ability of the administration to act under summary powers without being questioned at every stage by the courts; another is the Centre's authority to issue directions to the States. That the former can sometimes be abused is insufficient reason for denying them when there is a job to be done quickly; it is only an argument for greater vigilance.

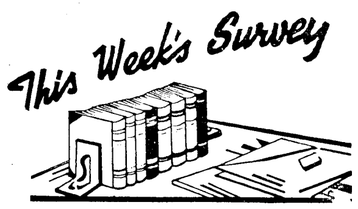
BOOSTING ASSAM'S ECONOMY



The Centre is now closely examining an integrated scheme to boost Assam's economy. The fighting in N.E.F.A. has brought to the surface the urgent need for an all-round strengthening of the economic base in this border State.

Costing Rs. 55 crores, the scheme includes, among others, extension of the broad-gauge railway track from Siliguri to Jogigopeh (about Rs. 42 crores), installation of three power stations (Rs. 10.5 crores), setting up of a string of warehouses to store foodgrains both for the civil population and defence personnel stationed there (about Rs. 2 crores) and the construction of a number of road bridges to facilitate road transport.

The broad-gauge line between Calcutta and Siliguri was completed last year with the addition of the 168-mile Farakka-Siliguri section. Besides, the Assam link railway itself has been extended beyond Dibrugarh.

The State Government had asked for a massive build-up of its economy in a memorandum submitted last month to Mr. T. T. Krishnamachari. The Union Minister for Economic and Defence Co-ordination is understood to have approved these schemes and recommended their implementation on a priority basis.

In its memorandum, the Assam Government said that, in view of the Chinese threat and the magnitude of defence preparations necessary to meet that threat, it was imperative to take adequate steps to develop economic overheads like power, transport and communications, ensure stability in agriculture through effective protective and developmental measures and to exploit the rich resources of the State to build up an industrial structure on a scale related to its potential.

ECONOMIC SURVEY OF KONKAN

NOT all regions in the State of Maharashtra are as industrially advanced and prosperous as the Bombay-Poona region. There are quite a few areas, such as Konkan, Marathwada and some parts of Vidarbha, which are economically very backward. Such underdevelopment in a large part of the State is, however, concealed by its (the State's) average rate of economic growth—a rate which, incidentally, is higher than the average for the nation as a whole. So long as the backward regions of the State remain untouched by development in the major sectors, it would be no consolation to be told that Maharashtra is renowned for its industrial advancement. The depressed areas or backward pockets of even the most advanced country like the United States, may it be noted in passing, weigh heavily on the conscience of, and constitute a challenge to, its federal administration.

So it is in the case of the Maharashtra Government which has been seeking, of late, to promote balanced development in the State as a whole through some special attention to backward areas in the scheme of planning. But any such special attention should involve, as a preliminary, investigation of investment and development possibilities. It is gratifying to find, in this connection, that the Indian Merchants' Chamber, which was encouraged by the State Government to make a beginning in the process of investigation, has just completed a survey of the Konkan—a region mapped out by the Planning Commission itself as the most underdeveloped region of the State on the basis of all relevant indicators. The conclusions and recommendations of the survey, which were presented by Mr. Pravinchandra Gandhi, President of the Chamber, to the Chief Minister of Maharashtra on the 18th instant, bear out the "very heavy back-log of economic progress to be achieved in the region."

The Konkan—covering the districts of Thana, Kolaba and Ratnagiri and having a coastline of 300 miles—has a population of 4.5 million. Its population density is higher than the State average, and its *per capita* income is very low. Transport facilities in the region are wholly inadequate. Koyna power is not yet available to the region on any significant scale. If the two economic overheads—transport and power—are provided on the scale required for industrial development and some special concessions are also offered, entrepreneurs are bound to be attracted to this region. The findings of the survey point to several promising possibilities, namely, cultivation of cash crops in Ratnagiri district, establishment of forest-based industries, further development of the fishing industry, exploitation of the extensive mineral deposits such as iron ore, bauxite, ilmenite, silicate sand and clay, establishment of chemical industries based on sea salt, etc. As the resources potential of the region is found to be substantial, the Government of Maharashtra should lose no time in constituting, as recommended by the survey team, a high-powered body to be called the Konkan Development Corporation. If a corporation of the kind, with non-official representatives thereon, is established forthwith to provide guidance both to entrepreneurs and the Government in the matter of industrialisation, the Konkan is bound to attract both capital and entrepreneurial talent from the industrial and financial capital of Bombay which is not far away from the region.

STATE FINANCIAL CORPORATIONS

The fifteen State Financial Corporations together sanctioned loans to the extent of Rs. 11.95 crores during the year ended September 1962, taking the total loans sanctioned since their inception to Rs. 49.25 crores. The aggregate of loans outstanding as on 28th December 1962 stood at Rs. 28.88 crores, a rise of Rs. 7.56 crores over the previous year. This increase was greater than in 1960-61, when it was Rs. 5.33 crores. Three of the Corporations have been able to pay the guaranteed minimum dividends on their shares out of their own profits. The Corporations have also begun to interest themselves in other types of activities than mere grant of loans to industries. One of them has underwritten shares of Rs. 5 lakhs and the undertaking of such types of business is engaging the attention of others. All these facts, which Mr. P. C. Bhattacharyya, Governor of the Reserve Bank of India, gave in his speech at the ninth annual conference of the representatives of State Financial Corporations held at Calcutta on Monday this week, do indicate that the Corporations have been enhancing their usefulness to the economy. Nevertheless, the leeway still remaining to be made up before the Corporations can claim to have successfully played the role assigned to them, namely, accelerating the tempo of activity in the small-medium industrial sector, is considerable. Mr. Bhattacharyya himself admitted that the quantum of assistance provided by the Corporations had not been commensurate with the need for it. Indeed, he urged the introduction of "a new vigour" into the operational methods of the Corporations. That this exhortation is quite timely will be evident from the following observations of Mr. Bhattacharyya:

"Defence mobilisation necessitates increased economic development, and the need for increasing industrial production to supply defence requirements as well as to keep the economy on an even keel by lessening the inflationary impact of such a situation cannot be overemphasised. The State Financial Corporations as purveyors of term-credit to industry have a vital role to play in this situation. Industrial development is fostered not only by the policies of the Government and the attitudes of the entrepreneurs but also by the facilities offered by financing institutions. This is particularly so in an underdeveloped economy like ours where term-lending is subject to a larger element of risk, but the demand for institutional credit is almost insatiable. The State Financial Corporations have to make up their mind to play a more active part in this situation in the industrial development of the country. The national emergency calls for a more decentralised location of medium and small industries, especially those with a defence aspect and this would provide the State Financial Corporations not only with added opportunities but, which is more important, added responsibility. I have no doubt that they will rise to the occasion."

The confidence expressed by Mr. Bhattacharyya that the Corporations would rise to the occasion seems to be quite justified. As he himself pointed out, the Corporations have now been placed in a better position for purposes of conducting their business. Their lending powers have been raised from Rs. 10 lakhs to Rs. 20 lakhs in the case of public limited companies and co-operative societies. Their borrowing authority has also been increased. Further, the Refinance Corporation for Industry now extends its facilities of refinance to loans granted by the State Financial Corporations. What is more, the Government of India has extended the Guarantee Scheme for loans to small-scale industries throughout the country with effect from the beginning of this year. Currently, proposals are under consideration to facilitate the financing of the development of coal industry by these Corporations and commercial banks. While all these are steps in the right direction, there is an imperative need for the Corporations to function in a business-like manner by utilising the funds gainfully and by avoiding wastage of resources. It would also be worthwhile examining whether there is need for one corporation for each State and whether it would be more advantageous to merge them into fewer corporations on a regional basis.

WOOLLEN GOODS EXPORTS

Although the woollen textile industry in India has expanded both quantitatively and qualitatively in recent years, the progress in the field of exports continues to be none too encouraging. Not more than 435,000 yards of woollen-worsted fabrics worth about Rs. 49 lakhs are now being exported (annually). This quantity is well below the actual shipment of 640,000 yards valued at Rs. 81 lakhs effected in the calendar year 1959, as well as the third Plan export target of two million yards. In the light of this meagre export performance, the constitution of the Export Promotion Panel for Woollen Goods is a step in the right direction. The inaugural meeting of the Panel was held on Thursday last week. The Panel will act as a channel of communication between the Government of India, the Development Council and the exporting interests so as to facilitate the discussion of problems facing the export of the entire range of woollen goods and to make recommendations regarding the best means and methods of augmenting exports to both traditional and non-traditional areas. It will also promote interest among the manufacturers of woollen goods in the expansion of sales overseas, besides advising the Government on the nature and type of export promotion incentives and the working of the export promotion scheme with a view to stepping up exports.

The exporters of woollen goods enjoy the incentive of cent per cent f.o.b. value of exports. Even so, they have not been able to avail themselves of this incentive fully because of keen competition in overseas markets. The competition can be countered successfully only through the supply of high quality fabrics at attractive prices. This involves speedier rehabilitation and modernisation of woollen mills. But as Mr. R. Doraiswamy, Textile Commissioner, who inaugurated the Panel, said, exports "cannot possibly wait until rehabilitation and modernisation are completed; indeed, the industry should earn the foreign exchange necessary for importing the machinery and their object should be to step up exports to this level." How is this to be done? That is the question before the Panel. It will be interesting to see how successfully the problem is tackled. The first thing to be done is, of course, to bring down the cost of production by full utilisation of capacity. This implies that the Textile Commissioner will do his bit for securing for the industry adequate supply of raw materials through relaxation of import restrictions. And, secondly, the industry must improve its salesmanship through co-operative efforts, if need be. And, thirdly, the industry must have sufficient capacity to take care of the defence needs before it can embark on a vigorous export drive. On behalf of the industry, Mr. R. K. Birla held out the welcome assurance that, once the defence requirements were stabilised, the industry would do its utmost to increase exports.

"WILD-CAT" STRIKES

A unique feature of the labour situation in Britain is that, although "official" strikes sponsored and led by trade unions are few and far between, unofficial strikes or "wild-cat" strikes, as they are called, are not infrequent. In fact, much of the man-days lost in Britain on account of work stoppages is due to unofficial strikes. The nature of the strike does not, however, alter its consequences to the economy. The British Government is, therefore, taking a serious view of the recent increase in the incidence of wild-cat strikes. Speaking in the House of Commons the other day, Mr. John Hare, the British Minister for Labour, hinted at a new development in Government policy for curbing wild-cat strikes. He gave trade unions to understand that, if they were unable to prevent such strikes and ensure that their members honoured collective agreements, the Government would be forced to take legislative action in the national interest. Pointing out that there was already a strong body of public opinion, which was by no means based on party politics, in favour of such action, Mr. Hare warned that, if the trade unions did not put their house in order, the situation would be serious. He did not indicate the lines on which legislation would be undertaken, if and when the Government made up its mind to do so. But he left no one in doubt that the Government was concerned about the frequent occurrence of wild-cat strikes and would not hesitate to take legislative action, if need be. He expressed the hope that trade unions would assert their leadership and responsibility and do the needful.

Unofficial strikes, whether in Britain (where many such strikes breakout even in industries in which collective agreements exist and in which means have been provided for the handling of grievances and disputes) or in India (where all strikes not preceded by notice are illegal) reflect a problem related to the internal administration of the trade unions and reveal a gap between union leaders, on the one hand, and shop stewards and rank-and-file workers, on the other. The gap is due not only to the complexity of trade union structure but also to the impatience and lack of knowledge and understanding on the part of some of the union members. Those who have studied the question feel that prevention of such strikes is partly a question of closer contact with union members and partly one of ensuring more disciplined behaviour by them. In other words, while the problem is chiefly one for the leadership of unions to tackle, the general body of union members as a whole has to take active interest in the affairs of their respective unions. This will be possible only if the workers are educated in the rights and responsibilities of union membership. They must be told, through appropriate means of communication, that the privileges of trade unions will be in jeopardy, unless they are vigilant enough to protect them against the irresponsible actions of some aggressive elements among them. The fact that, in India, unofficial strikes still occur in spite of their being illegal indicates that the problem does not easily lend itself to a legalistic solution. However, Britain's efforts to tackle the problem will be watched with interest in India, as they may offer some useful lessons for this country.

ASIAN ATTITUDE TO E.C.M.

Developing countries of Asia have always been sceptical about the growth of the European Common Market and its effect on world trade. The breakdown of Brussels negotiations, which precludes the U.K. from the Common Market at least for the time being, seems to have only confirmed their fear that the Six would develop into an inward-looking and discriminatory trade bloc. This is the impression one gets from the discussion on the Asian attitude to the Common Market which took place at Bangkok a few days ago under the auspices of the U.N. Economic Commission for Asia and the Far East. Several delegates to the session, organised by the E.C.A.F.E. Committee on Trade, expressed fears that the Common Market's import restrictions might affect exports of Asian agricultural products and simple manufactured goods. In particular, Ceylon was concerned about the effects of E.C.M. common tariffs and other trade restrictions on coconuts and tea, Thailand on rice, Indonesia on sugar and Pakistan on jute and cotton, etc.

The concern of Asian countries was fully reflected in the speech of Mr. U. Nyun, the Executive Secretary of the E.C.A.F.E., who stressed that, unless industrialised countries like those of Western Europe adopt liberal trading policies, underdeveloped countries could not at all hope for rapid economic development. Mr. U. Nyun made a fervent plea to the E.C.M. countries that they should not in any way discriminate against the trade of Asian countries which had been making strenuous efforts to improve their economic conditions. He urged them instead to recognise the special trade promotion needs of developing countries and grant adequate concessional terms for expanding their trade. More or less the same view was expressed by Dr. Ram Gopal Agrawal, India's representative, who called upon the E.E.C. countries to grant unilateral concessions to developing countries for their semi-manufactured and manufactured products. Mr. Agrawal pointed out that regional groupings were justified only if they were outward-looking. He regretted, in this context, that the G.A.T.T. had not been able to make much progress in its efforts to reduce tariff discrimination practised by industrialised countries against less-developed countries.

The British representative at the E.C.A.F.E. meeting, Mr. R. Fell, fully appreciated the fears expressed by Asian countries. He observed that Britain's accession to the Common Market would have strengthened Europe's role in the Atlantic alliance and helped underdeveloped countries in securing better terms. It would, however, be a tragedy, he conceded, if the Common Market turned towards a policy of self-sufficiency, a fear expressed by several Asian countries' representatives. Defending the E.C.M. policies, the leader of the French team, Mr. Bernard Bochet, denied that the Six intended to become self-sufficient in agricultural or industrial products. He conceded that some structural changes, as suggested by some delegations, might be necessary to ensure speedy industrialisation of developing countries. But he was of the opinion that such a change was already taking place and pointed to the shrinkage of European cotton and jute textile industries in recent years. It is, of course, true that some of the West European countries have curtailed the output of some processed goods, because of compelling causes. But the fact remains that these industries are still protected by high tariff walls, thereby hampering the trade and industrial development of primary exporting countries. The common external tariffs of the Common Market on processed and manufactured goods also aim at virtually shielding uneconomic units within the bloc. There is, therefore, much truth in the statement of the U.S. representative, Mr. Saul Baran, that the most effective means of reducing discriminatory effects was through multilateral reduction of trade barriers within the framework of the G.A.T.T. Will the Common Market countries, particularly France, heed Mr. Baran's advice?

There was general agreement among the Asian delegations that they should have joint representation at Brussels, the headquarters of the E.C.M., to keep track of relevant developments taking place there. There were also proposals for closer regional co-operation in Asia, particularly for increasing intra-regional trade, and for the establishment of a regional bank, a regional standards institute and an Asian Chamber of Commerce. These measures deserve the close attention of the Governments concerned, for such efforts may lead eventually to closer and closer regional co-operation to the mutual benefit of the countries of this region.

CENTRAL COMMITTEE FOR CARDAMOMS

The constitution of a development and marketing advisory committee for cardamom by the Government of India has come not a day too soon. Cardamom, which has so far been relegated to the backbench in development programmes, has thus been assigned a place along with the three other plantation crops, namely, tea, coffee and rubber, which have been under the Central Government's direction for quite some time. The Cardamom Committee has before it a number of problems to solve. In fact, it owes its origin itself to the serious setback suffered by the cardamom plantation industry in recent years. The major difficulty of the industry relates to the decline in prices during the last two years which has caused much concern among planters. Mr. H. Sitarama Reddy, Chairman of the Cardamom Committee, was not exaggerating in the least when he pointed out, at the first meeting of the Committee held at Bangalore last week, that cardamom planters had started thinking of abandoning the cultivation of this crop altogether because of the uneconomic prices. It is indeed strange that such an unenviable situation should have arisen in India, which has so far held a virtual monopoly over this commodity in world markets.

The decline in cardamom prices has been the result of growing competition in traditional overseas markets from new exporters. Cardamom in India is an export-based crop, as much as about 95 per cent of total output being taken up by markets abroad. Although cardamom is native to this country, it is cultivated in Ceylon, Indo-China and Central America as well. Thailand and Gautemala have also been fairly large producers. Some countries like Tanganyika have also begun experimental cultivation of this cash crop of late. Of these coun-

But what can I do to help?

There is so much that every Indian woman can do, *now*, to strengthen and defend the Home Front. Take part in Defence through local women's organisations. There is plenty to be done. Contribute, and *encourage* contribution, to National Defence Fund and buy Defence Certificates. There are, too, the many personal efforts you can make—in discipline, behaviour and attitude:

• *Wage war on waste; check thoughtless buying and resist inflated prices.* • *Do not buy gold. Give your gold for country's cause.* • *Be resolute in work, whatever it may be, because each task done just that little more efficiently helps the national drive, strengthens India's position.* • *Rouse youself from apathy, and Take Action.*

BE VIGILANT—*take part in national preparedness*

REGIONAL PLANNING AND NATIONAL DEVELOPMENT—I

ESSENTIAL FOR ACHIEVING OPTIMUM PROGRESS

By Neil McInnes

IT has often been debated whether the problems of *national* development, as they confront a whole country like India, are analogous to those of *regional* development, as known in backward areas within, or on the immediate fringes of, the advanced Western World. Reviewing the literature on the question this year, Professor Piatier reported that the majority of experts inclined to answer negatively, and yet, for all that, he himself "persists in the belief that, except for matters of detail, the two problems are of the same sort." No doubt, one would hesitate to carry too far a parallel between the economic situations and prospects of India, on the one hand, and, those of Scotland, Brittany or Auvergne, on the other. Yet that is less because the two sets of circumstances are proven to be qualitatively different than because all the magnitudes are so grotesquely disproportionate; the Scots, Bretons and Auvergnats are poorly off by British and French standards but they are not sunk in the miserable existence accepted by millions in this country. One would, for that very reason, have much less hesitation in drawing an analogy between Indian conditions and those of South Italy, for these latter are *in absolute terms* worse than in several parts of India.

There are various motives for refusing to take this analogy too seriously. On the one side, many people are anxious to set economic underdevelopment in a political context: to maintain, specifically, that it is the consequence of colonialism, and that the distortions seen in formerly dependent countries are the direct result of imperialist domination. Obviously, for them to admit that very similar conditions exist, not only in Asian and African countries that have never been under the heel of an imperialist, but actually within the territories of former imperialist powers, would undermine their case. On the other side, other people are no less anxious to connect underdevelopment with racial and religious factors, that is to say, with psychological and social "inadequacies" peculiar to African and Asian peoples. Equally obviously, they are reluctant to confess that "it can happen here," that genuine underdevelopment can persist among white Christian communities.

The "Modern" Part

A motive more respectable than either of these is the vague feeling that development problems cannot be as grave, or as recalcitrant to treatment, when they occur right next-door to prosperous industrial centres. Yet that feeling betrays a quite incomplete theory of the causes of underdevelopment. Mere scarcity of natural resources is no more important among those causes than the disequilibrium introduced into an economy by its relations with a vastly more advanced industrial economy—and that disequilibrium can be more marked on regions nearer centres of prosperity than on regions further removed. What happens in the backward economy that, is drawn into the orbit of an external industrial power is that the original balance of its socio-economic structure is broken, and the first attempts at development take place along two parallel lines that never meet: on the one hand, there is an export sector draining off raw materials to be processed abroad, and, on the other hand, there is an import sector supplying the region with goods from abroad. These two sectors make up the "modern" part of the economy, in evident contrast to the rest which remains archaic, but that modern part is quite fragile and provides no basis for economic development because there is no link between trade in raw materials and trade in finished products, i.e., no local industry. As this situation hardens, the establishment of a local industry becomes more difficult, for the economy is not simply underdeveloped but distorted. Now, this can happen in regions right alongside major industrial areas as well as in regions far removed, provided there is some fissure in the social structure that prevents stimulating influences from spreading from one part of the country to the other. South Italy, Brittany and Auvergne suffered *more* from their proximity to nodes of industrial expansion than from their poverty in material and human resources.

Still, it will be replied, the fact that such regions fall within the same political unit as the centres of industrial expansion must make development much easier. It is sufficient answer to point out that South Italy has been within the Italian State from its foundation, and yet its economic conditions have gone on deteriorating as fast as those of, say, Afghanistan in the same period. The reason, one of them at least, is clear: political unity facilitates acceptance of the dogmatic liberal case—if people are poor down there, let them migrate up here where there is work. Thus, to economic distortion is added the social cancer of migration of the region's best and most enterprising men, a bloodletting that has been spared Asian economies, at least since the end of the indentured-labour system. It is true, of course, that, once the nation decides to attack regional underdevelopment, it has at hand means that are not available when the question is international. Rome can pass a law directing that a part of Milanese capital must be invested in Naples and it can collect taxes in Turin to transfer to Sicily; but there is no authority to channel American or European money to India.

Two Observations

However, two observations must be made about this. Firstly, Rome did not think to do this until the question of national development had become a global issue: the need to develop South Italy was seen at the same time as the need to promote development in Asia and Africa, and for identical reasons in each case. There was, in fact, more opposition from politicians and economic interests to transferring North Italian resources to the south than to transferring French resources to Africa. It sounds easier to "pass a law" than to stimulate the international flow of capital, but in reality they both happen about the same time and for similar reasons, and against similar opposition. Secondly, the resources thus marshalled have to be put to work within the framework of a development plan, for it is never just a matter of pouring money into a backward area, be it a whole nation or a region. The apparent ease with which a nation can gather funds for regional uplift does not alter the fact that these funds are sterile without a plan, which is exactly the same sort of plan as has to be devised to promote national development. Successive Governments in Rome may have been Liberal-Conservative coalitions which only today are reluctantly accepting the idea of indicative national planning—but, when they sought to develop the South a decade ago, they had to write a plan that resembled like a twin the programmes adopted in various underdeveloped countries.

Even if, in the face of these arguments, we continue to hold that national development is intrinsically different from regional development, we have to face another serious objection. It is this: can a national plan work in a country the size of India, without being broken up into regional plans? Small countries, small both as to area and population, of the order of Morocco or Ceylon, might be able to implement unitary national plans, but by the time we are dealing with medium-sized countries like France, we see an irresistible pressure to break down the global totals into regional programmes. The reasons are numerous: provinces differ ethnically and socially, resources are unevenly distributed by nature and progress has been unevenly distributed by history, global or national objectives are too remote, too abstract, whereas regional programmes are more easily understood and thus attract more enthusiastic cooperation. All of these considerations apply with a hundred times the force to a nation of the proportions, and the variety, of India. There is no question of abandoning planning at the national level, for, without a national framework, regional plans would become anarchic. It is a question of passing as quickly as possible from conception at the national level to implementation at the regional level. To the extent that we do so, we re-discover just those problems of regional development that some people regard as radically different in nature from national development. South Italy, then, might not be comparable with India, but, when Delhi tries to see how the progress of the Punjab fits into the national plan, it finds itself before problems not so different from those Rome is dealing with in the poor South.

This is only half the story. Supposing that Delhi persists in scattering steel mills, oil refineries and community development projects around the country in the name of a "national" approach (in reality, in response to random political pressures and provincialist jealousies), it will still be led, by considerations of mere efficacy, to recognise the problem of *nodes* of development. For it is a fact that none of these ventures will give good returns, if they are isolated from each other, instead of being located in the same general region. The country as a whole will get less benefit out of a steel mill in Bihar, an oil refinery in Assam and a community development scheme in Kerala than out of those three enterprises undertaken in close proximity to each other, say, in Bombay. The whole country, we repeat, and not just Bombay; Bihar, Assam and Kerala, in the hypothetical example chosen, would benefit more in the not so long run by sacrificing the illusory advantage of an isolated project, in favour of a regional concentration of effort in a place where things were already beginning to move.

Complexity of the Problem

The multiplicity of stimulants to development—industrial, social, educational, agricultural—have to be applied, it is recognised, at the same time; hence the complexity of the development problem. It is less commonly realised that they have to be applied in the same place, when we are dealing with an economy that is not yet structured, integrated and coherent, as the underdeveloped economy is not. Heavy industry projects, agricultural experts, aid to small industries, loans to family businesses and the like all have less effect when they are distributed hapazardly around the country than when they are given a precise geographical specification. Their success will depend less on their cost and scope than on the precision of their impact on the terrain. This is where we are forced back to study of regional development plans such as are being implemented in South Italy, because there the intention is consciously to weave a tissue of social and economic support around the skeleton of big industrial projects or multi-purpose agricultural schemes. It is not enough even to ensure that an industrial investment is connected upstream and downstream with the industries that will supply its requirements and transform its products (though this elementary fact is often overlooked in national planning); it is also necessary to prepare all around it the social and agronomical and psychological context in which it can flourish and *reverberate*. In other words, successful planning is inevitably regional.

It is not being suggested that every instance of regional planning must occur in the one region, e.g., that all the attempts to set industrial projects in a receptive context must take place in, say, Bengal, to the neglect of Madras. (Nevertheless, some regional inequalities, deliberately caused, and accepted as temporary disadvantages, will probably have to be faced if national development is to prosper.) We are not urging the paradox that regional development should be undertaken at the cost of creating exactly the sort of unbalance that regional plans in Europe and America are devised to remedy. Various widely separated regions might benefit from the regional approach that is suggested, but, in each case, the attitude will be just what it is in regional planning as undertaken within advanced economies: namely, "we are seeking to get going at the same time and in the same place a number of interdependent activities, concentrated here and now rather than scattered around the whole country." Regional planning in the West accepts this geographical concentration of effort, because it does not have to worry about the rest of the country, which, by definition, is more advanced; regional planning in India would have to accept it, because it is recognised that development takes place in nodes, and love, labour and money are wasted if cast too wide. The motives might be different, but practice comes down to the same thing: national development cannot escape the regional approach and thus has much to learn from regional planning abroad.

(To be concluded)

The U.S. Sugar Board has reduced the surcharge on sugar by 14s. to 4s. 8d. with effect from the 12th inst. The cut, the second to be announced since this year began, has been made possible by the continued rise in the world market price of sugar. The surcharge is normally levied to cover the difference between the world market price and the price—varying between £47 and £48—which the Board pays to Commonwealth suppliers.

Switzerland exported last year (1962) watches worth Sw.Frs. 1,429 million, as compared with Sw.Frs. 1,313 million in 1961. Watch exports represent 14.9 per cent of its aggregate exports. Europe was the largest buyer (Sw.Frs. 528 million) followed by America (Sw.Frs. 505 million) and Asia (Sw.Frs 296 million).

DENA BANK FORGES AHEAD

"OWN FUNDS"-DEPOSITS RATIO UP

AN all-round expansion in income and deposits and a substantial improvement in the liquidity position are the outstanding features of the statement of accounts of the Devkaran Nanjee Banking Company Ltd. (Managing Director: Mr. Pravinchandra V. Gandhi, Bombay) for the year ended 31st December 1962. Advances, too, have gone up, but slightly. The balance-sheet total—a fair measure of the Bank's growth—is higher again by some Rs. 6 crores at Rs. 62.99 crores, with the increase in the liabilities side being (as in the previous year) entirely on account of the growth in deposits.

The aggregate income has gone up from Rs. 224.83 lakhs to Rs. 264.87 lakhs, with interest and discount earned improving from Rs. 183.08 lakhs to Rs. 217.38 lakhs and earnings by way of commission, exchange and brokerage increasing from Rs. 31.44 lakhs to Rs. 36.21 lakhs. On the expenditure side, interest paid on deposits, borrowings, etc., shows a rise of Rs. 23.74 lakhs to Rs. 121.88 lakhs, staff expenses have increased by Rs. 9.76 lakhs to Rs. 74.90 lakhs and other expenses by Rs. 7.66 lakhs to Rs. 38.93 lakhs. The provision for depreciation has been raised again from Rs. 4.13 lakhs to Rs. 5.08 lakhs. The increase in expenses, as readers are aware, is a common feature with banks as a whole for such reasons as the higher cost of deposits for medium banks in particular, deposit insurance scheme and the implementation of the Desai Award.

It need not surprise anyone, therefore, that the Bank's declared profit for the year is lower at Rs. 24.08 lakhs as compared with Rs. 26.15 lakhs a year before. Indeed, but for the expansion in the Bank's activities during the year, the profit would have been still lower. Thanks to a substantial surplus of Rs. 13.51 lakhs brought in from the previous year, the distributable surplus is, however, higher at Rs. 37.59 lakhs as compared with Rs. 34.01 lakhs a year before. More than 60 per cent (Rs. 23 lakhs to be precise) of this amount (as against 44 per cent, or Rs. 15 lakhs, in 1961) has been appropriated to the reserves which, including Rs. 11 lakhs under share premium account and Rs. 26,000 under development rebate reserve, now stand at Rs. 100.26 lakhs, a level which is more than equal to the paid-up capital of Rs. 100 lakhs. Readers will recall that, during the year under review, the Bank doubled its paid-up capital by issuing 100,000 ordinary shares of Rs. 50 each at a premium of Rs. 2 per share. As a result of the larger plough-back to reserves and the issue of additional capital, the ratio of "own funds" to deposits has gone up from 2.9 per cent to nearly 4 per cent, but is still well below the 6 per cent goal set by the Reserve Bank towards the close of 1961. There is, of course, no time limit for reaching this goal. All that a bank is required to do under the law is to set aside every year 20 per cent of the declared profit for the statutory reserve fund. Nevertheless, since all banks have accepted the Reserve Bank's recommendation under a gentleman's agreement, the Bank will have to continue the conservative appropriation policy for several years to come.

The dividend has been maintained at 11 per cent per annum, subject to tax, with the new shares qualifying for a quarter of it. In the dividend for the current year, however, the new shares will participate fully. Other things remaining the same, there should be no difficulty in maintaining the dividend for the current year on the higher capital, as the Bank's business is steadily growing thanks to the forward-looking policy of the management. Out of the profit for the year under report, a sum of Rs. 4.50 lakhs, or about 18.75 per cent, has been provided towards bonus to staff.

The following comparative table mirrors the Bank's progress in the past four years:

(In lakhs of rupees)

	For the year ended 31st December			
	1962	1961	1960	1959
Interest and discount earned ..	217.38	183.08	163.53	126.83
Commission and exchange ..	36.21	31.44	27.21	22.01
Other receipts	11.27	10.31	9.46	7.73
Interest paid	121.88	98.14	93.05	79.44
Staff expenses	74.90	65.14	55.84	41.32
Other expenses	38.93	31.27	25.22	20.67
Depreciation	5.08	4.13	2.54	2.10
Profit	24.08	26.15	17.20	15.30
To reserves	23.00	15.00	8.00	6.00

* Subject to deduction of tax.
† Unencumbered portion only.

The Bank's deposits have grown substantially from Rs. 43.15 crores to Rs. 51.07 crores. With deposits thus well over Rs. 50 crores the Bank has attained the status of a "big bank" under the inter-bank agreement governing the rates of interest on deposits. Accordingly, the Bank will not be able to enjoy the "privilege" of paying ½ per cent more than the "standard rates" of interest for attracting deposits from 1st May next, unless the agreement happens to be revised, which is unlikely. This advantage is confined only to "medium-banks."

Following the impressive expansion in deposits, it has been possible for the Bank to reduce its dependence on "borrowings from other banks." Thus, as at the close of the year, this item on the liabilities side of the balance-sheet is only Rs. 71 lakhs as compared with Rs. 218.75 lakhs a year before and Rs. 400 lakhs two years before. Advances, which had expanded by some Rs. 6 crores in the previous year, have gone up only slightly from Rs. 30.06 crores to Rs. 31.74 crores. On the other hand, investments, which had been static in the previous two years at a level much lower than the one in 1959, have spurted from Rs. 12.75 crores to Rs. 16.02 crores. Consequently, while the credit ratio has dropped by more than seven points to 62.1 per cent, the ratio of investments (unencumbered portion only) to deposits has expanded by more than five points to 29.9 per cent. At Rs. 671.71 lakhs, the aggregate cash balances at the end of the year are higher by some Rs. 2 crores, and their ratio to deposits has moved up by two points to 13.1 per cent. The liquidity ratio now is as high as 43 per cent as compared with 35.4 per cent a year before. The high level of liquid assets is apparently due to the slackness in the demand for funds in the initial months of the current busy season, which has since proved to be a passing phase.

To sum up this review. For the Dena Bank 1962 was undoubtedly a good year, a year of expansion, though the profit-margin was somewhat lower. Five branches were opened during the year—all in Greater Bombay—bringing the total to 112. An equal number of safe deposit vaults were also opened in Greater Bombay, bringing the total to 34. Expansion of the activities of the existing branches continued. Apart from contributing Rs. 1.5 lakh to the National Defence Fund and subscribing Rs. 50 lakhs to the National Defence Loan, the Bank has been serving the country in the present national emergency by placing the services of all its 112 offices for receiving contributions to the N.D.F. free of charge and extending the required facilities to the employees who wish to join the defence forces, the Territorial Army and the Lok Sahayak Sena.

WORLD BANK LOAN TO PAKISTAN

The World Bank has granted a loan of $20 million to the privately owned Pakistan Industrial Credit and Investment Corporation Limited for meeting the foreign exchange needs of industries whose establishment or expansion it is helping to finance. This is the Bank's fourth loan to the Corporation. The loan does not have a fixed schedule for repayment or a fixed interest charge. Each part of the loan committed for a particular project will be repaid by semi-annual instalments according to a schedule determined at the time of the commitment. Interest will be applied to each portion of the loan at the Bank's rate prevailing when that portion is committed for one of the Corporation's projects. The loan is guaranteed by the Government of Pakistan.

The Corporation is one of the chief institutions in Pakistan providing medium and long-term finance for industry. It was founded in 1957 by private interests in Pakistan, together with investors in Canada, Japan, the United Kingdom and the United States; its shares are now held in Germany as well. Since its establishment, the Corporation has approved 318 loans amounting to Rs. 40.1 crores ($48.2 million) to a variety of industrial enterprises. In addition, at the end of 1962, it held Rs 1.4 crore worth of shares in industrial companies and had underwritten offerings of Rs. 1.5 crore. It has also helped to find $10 million of foreign investment for Pakistan enterprises, comprising some $7.5 million in loans and $2.5 million in equity capital.

The Corporation's resources as at 31st December 1962 amounted to Rs. 48.22 crores ($101.2 million), made up of Rs. 3.0 crores of paid-in share capital, of which 60 per cent is held by Pakistani investors and the balance by American, British, Canadian, German and Japanese private interests; Rs. 6.0 crores in advances from the Pakistan Government; Rs. 57 lakhs of surplus derived from earnings; and Rs. 38.65 crores ($81.2 million) of foreign exchange derived from the Bank's earlier loans ($29.2 million) and from loans by the United States, Germany, Japan, France and the United Kingdom.

(Concluded from next column)

Mortgage Bank by subscribing to its debenture issue and by granting advances against such debentures. The Bank's holdings of such debentures stood at Rs. 78.18 lakhs at the end of the year. Warehouses of the Gujarat State Warehousing Corporation and the Central Warehousing Corporation are established at three centres in Saurashtra within the operational jurisdiction of the Bank and the local offices of the Bank have been extending credit facilities against warehouse receipts at these centres. The total of such credit limits increased during the year from Rs. 2.35 lakhs to Rs. 5.58 lakhs.

STATE BANK OF SAURASHTRA

RESULTS DISTINCTLY BETTER

SLIGHTLY better are the results of the State Bank of Saurashtra (General Manager: Mr. R. L. Sopariwala, Bhavnagar) for the year ended 31st December 1962. Although the earnings by way of commission and exchange have receded slightly from Rs. 9.03 lakhs to Rs. 8.78 lakhs, the aggregate income from banking business has improved by Rs. 3.51 lakhs at Rs. 78.38 lakhs. Income from other sources has also increased from Rs. 3.52 lakhs to Rs. 5.10 lakhs. The higher banking income contrasts with the slightly lower outward interest of Rs. 42.32 lakhs as compared with Rs. 43.10 lakhs a year before. At Rs. 4.74 lakhs, the declared profit is, however, lower by Rs. 2.42 lakhs. This setback has been mainly due to the heavy incidence of salaries consequent on the implementation of the Desai Award, a revision of the scales of pay and allowances of officers and the premium paid under the Deposit Insurance Scheme. The effect of all this is an increase of Rs. 7.98 lakhs in aggregate expenses to Rs. 34.18 lakhs. Staff expenses alone have gone up from Rs. 20.55 lakhs to Rs. 26.50 lakhs.

Following the decline in profit, the dividend has again been passed over. Transfer to the reserve fund has been reduced from Rs. 6 lakhs to Rs. 2.50 lakhs, but even at this much lower level it is more than 50 per cent of the declared profit, as against only 20 per cent suggested for a scheduled bank. The reserve fund now stands at Rs. 60 lakhs and is 60 per cent of the paid-up capital. But with the paid-up capital remaining unchanged at Rs. 100 lakhs, the ratio of "own funds" to deposits has shrunk from 11.5 per cent to 10.7 per cent, although it is much above the 6 per cent goal for a scheduled bank.

The balance-sheet as at 31st December last shows further growth in deposits from Rs. 13.57 crores to Rs. 14.94 crores and the rate of expansion is faster than in the previous year when the increase had been of only Rs. 19 lakhs. At the same time, however, borrowings from banks have also increased from Rs. 82.53 lakhs to Rs. 119.80 lakhs. As the aggregate outward interest is lower, it may be presumed that the borrowings must have increased only towards the close of the year. Advances, which at the end of the previous year had stood at Rs. 7.28 crores as against Rs. 7.93 crores in 1960, are shown higher at Rs. 8.85 crores. Consequently the credit ratio has fully recovered from 53.6 to 59.2 per cent. Investments, too, are higher at Rs. 7.02 crores as compared with Rs. 6.75 crores a year before. But, taking the unencumbered portion, the investments-deposits ratio has dropped by nearly five points to 38.9 per cent. At Rs. 107.01 lakhs, the aggregate cash at the end of the year is lower by Rs. 30.84 lakhs. The cash-deposits ratio has, therefore, gone down by nearly three points at 7.2 per cent. Although lower over the year by 7.7 per cent, the liquidity ratio is still as high as 46.1 per cent. The fall in this ratio over the year only reflects the better utilisation of the Bank's resources.

The following table shows the Bank's progress in the past four years:

(In lakhs of rupees)

† Unencumbered portion only.

The Bank is conducting Government business at 19 branches (11 a year before) at all of which currency chests are being maintained. Nine more branches are proposed to be run on a similar basis, and at one of them a small coin depot is to be opened. The number of the Bank's offices has risen by three to 67, of which 37 are branches and 30 pay offices, as against 27 and 37, respectively, in the previous year. A programme of opening new branches at seven centres is on hand.

The number of small-scale units financed by the Bank during the year rose from 39 to 66 and so did the aggregate credit limits from Rs. 5.05 lakhs to Rs. 43.41 lakhs. An extensive survey of such units is nearing completion and expected to yield satisfactory results.

Co-operative and land mortgage banks continued to receive from the Bank special facilities on liberal terms for collection of bills and discounting of drafts, etc. The Bank maintained its support to the Gujarat State Co-operative Land

LONDON LETTER

ECONOMICS OF EXPANSION

BUDGET TO BE PRESENTED EARLIER

(From Our Own Correspondent)

LONDON, 16*th February*

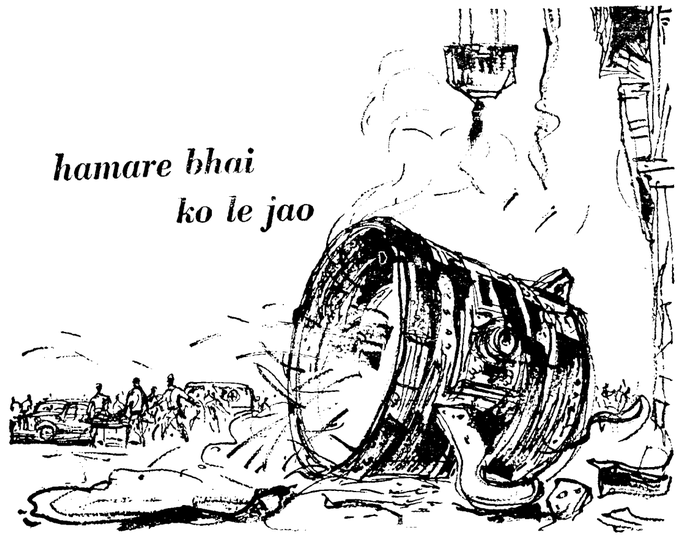
POLICIES are in the melting pot since the failure of the Government's negotiations with the E.E.C. The Prime Minister has agreed that some increase in personal demand is necessary: the point is how and how much?

The independent National Institute of Economic and Social Research—financed by private donation and supported by economists and businessmen—has produced a *Review* for the year behind and the year ahead which is extremely pertinent: its conclusions are already being widely quoted.

Already the Government have announced that they are going to have an early Budget—before the end of the fiscal year—not as some commentators have assumed as a prelude to an early Election but because the Chancellor, Mr. Maudling, is convinced that there is no time to be lost, that pump priming is the order of the day and the Budget is the right place to do it.

The National Institute *Review* points out that basic unemployment, allowing for the seasonal factors and the cold spell, is probably over 550,000 *and rising*. In addition, there is a substantial body of persons not seeking work who would be in the market if the pressure and inducements were sufficient. The conclusion is that *employment* (allowing in this for the new flow of school leavers) can rise by nearly half a million before any excess demand for labour arose. Plant capacity presents the same picture: there is plenty of leeway before more plant or more labour to work the existing units is required.

Taking account of the measures which the Government have already taken to pump purchasing power into circulation, national output is estimated to rise about 3½ per cent in the year 1963 or substantially more than it has risen in either of the past two years. *But* such an increase would do no more than absorb present machine capacity and the flow of new labour on to the market without touching the basic core of unemployment.



The conclusion is irresistible that, if the Government are to make a dent in the unemployment figures, they have got to take far more positive action. The danger is that such positive action, such reflation, will cause increasing imports and turn the balance of payments adverse. How great is this danger?

For 1962, there is likely to be a current surplus of £150 million on balance of payments account, but, after allowing for capital investment abroad, there may be a deficit of £75 million. This in itself is a figure the country could take in its stride.

State Initiative Recommended

With this background, the National Institute recommends that the Government set their sights above the figure of 4 per cent recommended by the National Economic Development Council (this figure was to relate to the years 1961-66 and we are half-way along that road without the figure being reached) to 5 per cent. Such an increase in production would absorb most of the basic core of unemployment and might cost no more than £75 million in imports, pushing the deficit on balance of payments up to £150 million. This figure must be read against the overseas currency reserves which the United Kingdom has, not only its gold reserves but also its drawing rights on the I.M.F. It would not amount to 10 per cent of the country's overseas resources—which Your Correspondent recently estimated at £2,750 million.

There is no doubt that the fear of weakening the balance of payments is holding back a positive policy both in this country and in the United States. There is equally no doubt that the test of statesmanship is to know when to take a risk and how far. The dollar and the pound have special responsibilities attaching to them, of which the respective Treasury Departments are too painfully aware. Yet, the risks of no action are greater than the risks of action. Concerted action between the two Governments would be more effective still. But, short of that, a calculated risk to let the balance of payments deficit in the United Kingdom in 1963 run as high as £150 million is surely one to be taken, but, in order to make certain of the rise in output by 5 per cent., which is the prerequisite of an active economy in the year ahead, the National Institute declares that the Chancellor must pump spendable income into circulation to the tune of some £400 million in the immediate future. This could be done by reducing National Insurance contributions which automatically increases every wage packet in the country; it could be done by the Government reducing its own contribution to the National Insurance fund and using the difference in tax reliefs; it could be done by cutting indirect taxes; and, if Purchase Tax on all commodities other than liquor, tobacco and petrol (which are the big revenue spinners) were cut by 10 per cent, £200 million of purchasing power would be released; finally, there is the straightforward expedient of reducing income-tax. Between these various measures, the Chancellor would have no difficulty in three weeks' time in pushing up to £400 million into circulation fast. To the question whether all this will lead to the need for "Stop" measures in eighteen months' time, the National Institute says that this risk can be avoided by a policy which is constantly looking nine or twelve months ahead. The present Government has little to lose by bold measures and everything to lose by being too cautious: all the signs point to an **expansionist Budget.**

It happened some years ago in the steel melting shops at the Jamshedpur works. A large ladle, carrying 75 tons of molten iron, suddenly crashed to the ground with a deafening noise from an overhead crane. The spattering sparks and red-hot metal seriously injured a number of brick-layers working at what seemed to be a safe distance. The air was rent with the frenzied shouts of the men and the hissing of steam.

The first ambulance could remove only five of the injured to the hospital. General Manager Keenan could take only three more in his car. He chose the three who had a better chance of survival than the rest. One of these men, a Hindu worker, however, refused to go. "Do not take me away", he said. Disregarding his own agony, he feebly nodded towards a half-burnt Muslim colleague, and said: "*Hamare bhai ko le jao.*" As Keenan recalls, "The Hindu who was in pain and danger of death remembered, not that the Mohammedan was of a different faith, but that he was his brother."

This feeling of comradeship, born of the common bond of labour, is the spirit that characterises Jamshedpur, where industry is not merely a source of livelihood but a way of livelihood.

PROGRESS OF RUBBER GOODS INDUSTRY

PRODUCTION EXPANDS MARKEDLY, BUT EXPORTS POOR

THE past few years have witnessed a significant expansion in, and development of, the rubber goods manufacturing industry in India. Not only have the capacity and actual output gone up appreciably but the range of production also has been diversified to include several items for the supplies of which the country was entirely dependent on outside sources till recently. The progress achieved has been remarkable in all the four sectors of the industry, namely, tyres and tubes (automobile, cycle, tractor, aero, cab, A.D.V. and off-the-road), footwear, dipped rubber goods (toys, balloons, nipples, valves, teats, etc.), and other rubber products (radiator, vacuum brake and other types of hoses, fan and industrial V-belts, rubber ply transmission and conveyor belting, rubber components of railway fittings, ebonite sheets, rods and tubes, waterproofed fabrics, latex foam sponge and camel back). The aggregate production of all rubber goods rose by as much as 150 per cent over the ten-year period covered by the first two Plans. Since the third Plan began in April 1961, production has increased further, the current rate of output being 8 to 10 per cent above the level of 1961.

The notable rise in output has followed the marked increase in capacity as a result of the substantial expansions carried out by existing factories and establishment of several new units. Thanks to such expansion, the industry is now meeting a large part of the additional demand for the various rubber goods that has been generated on account of the implementation of Plans, thereby saving for the country much precious foreign exchange which would otherwise have been spent on imports of finished goods. The total anticipated internal demand covering the needs of original equipment and replacement as well as exports by 1965-66 is estimated at 5.5 million automobile tyres and tubes and 30.9 million bicycle tyres and tubes. The production targets fixed to be achieved by 1965-66 more than cover the anticipated demand. The industry has also been able to ensure self-sufficiency with regard to diverse rubber goods needed in the home market, except in the case of certain specialised items which are being imported in very small quantities. The manufacture of rubber footwear is said to be the most important single item providing the largest employment and accounting for a substantial consumption of rubber. Given adequate supplies of polyvinyl chloride, a partial switch-over from rubber, it is said, can be envisaged in this field, if supplies of rubber are inadequate. The accompanying table indicates the progress made by the rubber goods industry since 1951.

Outlook for Exports

While the growth of the industry is phenomenal, no serious attempts seem to have yet been made to build up an export market for rubber goods. This is indicated by the very low level of exports. The total value of all rubber goods actually exported during the first nine months of 1962-63 was no more than Rs. 57 lakhs. The poor export performance is attributed to four important factors: high cost of raw materials, high freight charges, inadequate publicity and salesmanship abroad, and lack of closer touch with overseas importing agencies. If these handicaps are removed and if the industry endeavours its best to offer quality goods at competitive prices, the rate of exports can certainly be stepped up.

The task of developing an export market is an arduous one, involving as it does a careful study of the conditions obtaining in the importing countries, a survey of the share of business conducted by other countries, and an assessment of factors relating to quality, price, freight structure, credit facilities and the like. It is to undertake all these that the Chemicals and Allied Products Export Promotion Council recently sponsored a delegation to the Middle East and East Africa to explore the possibilities of exporting rubber goods to these regions. The delegation, which was led by Mr. L. M. Jamnadas, Managing Director, Cosmos India Rubber Works, Bombay, visited Iran, Iraq, Lebanon, Syria, Jordan, Sudan, Tanganyika and Kenya. The delegation had been asked:

(*a*) to acquaint the customers with the types and quality of such products as are being manufactured in the country with particular reference to those items which are already being exported or are likely to be exported through physical display and make an on-the-spot study of the markets for particular rubber products;

(*b*) to fix up agents for manufacturers and exporters of rubber goods in India, collect information useful to exporters, besides selecting and recommending to the Council the correspondents in each country, and

(*c*) to effect on-the-spot sales of goods.

Price and Quality

The findings of the delegation have still not been published. Meanwhile, Mr. A. T. Mathyoo, Secretary, Association of Rubber Manufacturers in India, Calcutta, who was one of the members of the delegation, has come out with a report on his personal findings. A perusal of the report reveals that there is vast scope for augmenting exports of Indian rubber goods to Iran, Iraq, Lebanon, Syria and Jordan, provided, of course, our prices and quality are suitable. This proviso is a very important one, considering the keen competition offered by East European countries and China. "The communists," to quote Mr. Mathyoo, "have no system of costing and their export prices are simply a certain percentage less than those of their keenest competitors in any market! Quality of their products also varies, likewise, to suit the type of competition they face, and it was reported that no agents work for them for any long period. A constant shift of agency arrangements, they seem to assume, will ensure a steady offtake of their exports, however dissatisfied with their goods any one agent may become." Mr. Mathyoo has, therefore, urged Indian rubber goods manufacturers to give constant and unremitting attention to the quality of their products meant for each of the aforesaid markets and to adjust their prices to meet the stiff competition. The possibilities of export to the different countries as highlighted by him are summarised below:

Iran: A vast potential market exists for exploitation by India. The major items of imports are automobile and cycle tyres and tubes, hoses of all kinds, beltings, retreading materials, hospital rubber goods and railway rubber fittings. Last year, Iran imported (from all sources) auto tyres worth Rs. 6.5 crores and cycle tyres worth Rs. 50 lakhs. There is no import restriction on rubber manufactures, though an import duty is levied on most, if not all, items. At 9*d*s. (including a dealer commission of 3 to 5 per cent) per set of cycle tyre, Indian tyres can find a substantial market in Iran. The Iran railways are willing to give favourable consideration to any offers to supply from the Indian manufacturers of railway rubber fittings.

Iraq: Iraq is keenly interested in Indian products. The Indian rubber delegation has been assured of every facility in promoting trade with Iraq. Except for rubber footwear for which a well-planned Bata factory (as well as a few others) exists, there is no restriction on imports of rubber manufactures. Soles and heels, however, are permitted entry. There is talk of setting up an automobile tyre plant, but changes of its materialising in the near future are remote. Large demand exists for auto tyres and tubes, cycle tyres, hoses, belting, sports goods, foam rubber and camelback. An enquiry was received whether any Indian entrepreneur would be prepared to collaborate with an Iraqi firm in setting up a foam rubber plant. Cycle tyres, as in Iran, from India are in good demand and, if Indian exporters can meet the competition of U.K., Germany and Japan by working out special export prices, they can secure a substantial market. Foam rubber also enjoys a good market in Iraq. The standard size for Iraq is 1 x 2 metres. If India can offer at competitive rates, it has a good chance of capturing a market of nearly Rs. 25 lakhs. Another item which offers scope for India's exports to Iraq is sports goods such as football bladders and tennis balls. Other goods such as hospital sheetings and surgical rubber goods also have a market.

Lebanon: Imports of rubber goods into Lebanon during 1961 included automobile tyres and tubes from almost every country manufacturing them (except India), of a total value of 5.5 million Lebanese pounds equivalent to approximately Rupees one crore. Cycle tyres, foam rubber and rubber soles and heels also have a sizable outlets in this market. Batas and a few other local plants manufacture footwear.

Jordan: Under the barter arrangement now existing between India and Jordan, out of a total production of 650,000 tons of phosphate by the Phosphate Company of Jordan, India takes 150,000 tons at a cost of £650,000. The Phosphate Company's large requirements of rubber conveyor belting can be met by India to offset, in part at least, this accumulated sum of money in its credit. Because of Jordan's terrain, cycles can hardly be used and, therefore, there is no worthwhile market in this area for cycle tyres. Automobile tyres and tubes of almost every manufacture in the world are represented in Jordan. China and the East European countries also have their share in this market. Roads are extremely poor and overloading of trucks is a common feature. Road haulage to Kuwait means traversing sandy tracks for long distances and truck drivers have to resort to deflation of their tyres for effective movement. This deflation of tyres results in the sides of two tyres rubbing against each other and the sides wearing out. Importers of tyres in Jordan stated that they would appreciate any tyre manufacturer in the world undertaking a study of this problem so that they can evolve a tyre to suit this particular type of usage. However, they stated that their offtake of tyres was not large enough (approximately Rs. one crore in value last year) for any single manufacturer to expend large sums of money in finding a solution.

Syria: At present, very little rubber goods are exported from India, but scope does exist for supplying, as in the rest of the Arab world, automobile and cycle tyres, hoses and belting and foam rubber. Competition is stiff. All the European countries are exporting their products and lately China has also entered into competition with the rest. A number of importers have expressed their wish to import various rubber items and some of them have also offered to act as agents for any manufacturers interested in offering their agencies.

Sudan: Sudan, which has a free import policy, offers a good market for India's rubber manufactured goods. There is great friendliness for India and the Director of Commerce, Industry and Supply categorically assured the Indian rubber delegation of his Government's preparedness to give India every facility to market its goods in Sudan. Theirs, however, is a stiffly competitive market and Indian manufacturers/exporters have to meet this competition with special prices for Sudan. There is a large market for 10.50 x 16, 8 ply and 12 ply (sand tread) tyres with tubes. The Sudan Government has standardised a 2/5 ton truck which uses single rear tyres of enormous size and, when India is in a position to export, auto tyres manufacturers should be able to offer to the Sudan market this size with reasonable prospects of acceptance. Hospital rubber sheeting sells at 3*s*. per metre after payment of duty at 40 per cent. Canvas rubber shoes of the value of £610,000 were imported last year, though Batas and two others (National Footwear Company and Leather and Rubber Shoe Company) have factories for local manufacture with a total production of two million pairs. A duty of 50 per cent is levied on canvas footwear. Indian exports can be stepped up considerably only by our manufacturers making an effort to meet the price competition from China, Hungary and Czechoslovakia. The other items of imports are cycle tyres and tubes, hoses, belting and railway rubber fittings.

East Africa (Tanganyika, Uganda and Kenya): Demand exists for rubber manufactures of all kinds: automobile tyres and tubes, cycle tyres, hoses and belting, rubber footwear, rubber sheetings, and sports goods, including tennis balls. Michelin (France) is in the process of setting up an automobile tyre plant in Tanganyika. Avon Tyres of U.K. and Bata both manufacture cycle tyres locally for this market, besides Bata manufacturing footwear both in Dar-es-Salaam (Tanganyika) and at Limru (Kenya). Despite supplies from these local plants, cycle tyre imports in 1961 into East Africa were valued at £186,000 or Rs. 25 lakhs, of which India appeared to have a very small share.

Rubber Goods Manufacturing Industry at a Glance

TEXTILE WORKERS WANT HIGHER WAGES

MILLS COMPLAIN OF LOW PROFIT-MARGINS

From Our Special Correspondent

MANCHESTER, 12*th February*

MANCHESTER LETTER

A BIG drop in yarn and cloth output from British cotton textile mills in 1962 was reported by the Cotton Board. Final figures for the year show that production of all types of cloth fell by 229,570,000 yards as compared with 1961 and yarn output dropped by 74,830,000 lbs. Although the labour drift from the mills has slowed down in the last few months, figures also show that, during 1962, more than 18,200 workers left the industry.

A new application for a wage increase is to be made by 150,000 Lancashire textile workers. At a meeting in Manchester the executives of three powerful union groups—the Cardroom Association, the Operative Spinners' Amalgamation and the Northern Counties Textile Trades Federation—decided to ask for a meeting with the employers to discuss a pay increase. No amount was mentioned. The unions at the meeting, representing workers in the spinning and weaving sections, are also to ask for the setting up of an industrial redundancy scheme—a proposal which has already been rejected once by the employers.

It is only just over four months since the industry was awarded a 3 per cent rise. This was in reply to a union claim for a 10 per cent increase.

Mr. Lewis Wright, General Secretary of the Weavers' Amalgamation, said that the pay of cotton workers had gone up by 1 per cent a year over the last three years. He described this as "derisory", and said that they wanted wage increases to be nearer those of industry generally.

Traders throughout the market, encouraged by the brief spurt of consumer reaction which took place towards the end of last year, have spent the first few weeks of 1963 back in the doldrums. Those firms which still retain useful order lists make the point that the margins on which this business was booked were scarcely remunerative and since then prices have been squeezed further still.

As in the past, a lookout is being kept for any sign which might provide a spring-board on which an impetus to freer trading could be mounted. Oddly enough, in these days of rapid change and widespread economic development, the motivation for any upswing in buying pressure seems more remote. Consumers have become almost impervious to the persistent rise in overheads of one sort and another, so that they are inclined to take relatively little notice of factors which in the past might have led to a larger offtake.

Limited Price Changes

Raw material price variations, on which much former activity was based, have been on a limited scale for some years, ever since Governments adopted restrictionist measures to control crops and distribution. At the same time, the firmer position of the New York market may have a bearing on future events when read in conjunction with the American Administration's latest efforts to find a way out of its agricultural subsidy impasse.

President Kennedy's first attempt to reintroduce a one-price system failed to clear the barrier of the Tariff Commission and his latest plan is to pay the American mills in kind rather than cash. Cotton drawn from the Government's stockpile would be delivered to make up the difference between the world and the domestic price under the new proposals. The subsidy would represent about 5 cents per lb. to allow for the cost of transport involved.

Minimum support price for the new American crop is the same as that set for last season's harvest, so that the continuation of a subsidy is clearly to be the policy carried out by the Administration. Taking on the role of the critic who so often complains about the inefficiency of Lancashire cotton mills, it is reasonable to point out that the subsidy system in the United States leads equally to the bolstering up of the inefficient farmer who retains every incentive to remain in business.

Purchases of raw cotton invariably reflect the trend of events within the industry, bringing a larger offtake when supplies are needed and showing an inevitable reduction when the animation in the mills is generally small. Following the pre-Christmas rush of orders, the quantity of the raw material obtained from abroad in the first half of the current season has shown a marked expansion compared with the same period 12 months previously.

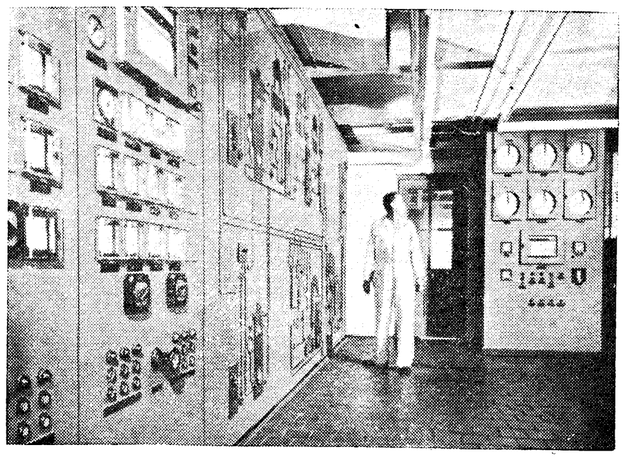
During the whole of the 1961-62 season, arrivals barely exceeded one million bales, being the lowest figure recorded for more than a century. On the assumption that a similar movement can be expected in the second half of the current season, there should be no reason to suspect that the quantities received in British ports will fail to reach the one million bale mark. The following table shows comparable arrivals during the last three seasons, as well as last season's total:

(In bales)

	1st half 1962-63	1st half 1961-62	1st half 1960-61	Total 1961-62
American	68,758	164,334	220,737	294,011
Mexican	48,858	30,818	26,671	58,396
Nicaraguan	2,186	866	3,247	23,084
Brazilian	84,175	35,296	20,683	61,141
Argentine	50,252	10,076	2,402	23,932
Peruvian	27,595	27,338	34,122	56,741
Egyptian	4,351	5,396	3,115	22,048
Sudan	67,016	56,163	81,565	98,912
East African	6,619	10,719	15,759	20,102
Nigerian	9,740	25,895	36,151	49,119
Congo	3,055	7,513	2,520	22,416
Turkish	67,251	32,696	22,094	71,476
Syrian	9,477	7,000	4,624	21,634
Iranian	50,208	18,018	*	69,779
Pakistan	795	4,830	335	7,515
Russian	6,783	3,076	22,475	8,975
Others	43,678	24,627	78,866	95,660
Total	560,169	469,404	577,427	1,017,463

* Included in "others."

In view of the pronounced uncertainty connected with the United States raw cotton position and the belief that some legislation will eventually be enforced to re-establish a one-price system, the sharp decline in arrivals from America is scarcely surprising. At the same time, the fact that purchases from this source are now less than one-third of those procured in the first half of the 1960-61 season must give producers in the States cause for considerable alarm.



On the other hand, the point which springs to the eye at once is the much larger purchases from South America and the Middle East at the expense of suppliers in Africa. In particular, the big rise over the past year or two in the quantities of Brazilian and Argentine cotton acquired and a similar expansion in business with Turkey and Iran is a matter which must give the traditional cotton growers food for thought.

Re-equipment Plans

Very little has happened since the final applications were submitted to the Cotton Board claiming the re-equipment subsidy to stimulate more modernisation in the mills. The economic position of the country as a whole has become even more obscure following the breakdown of the Common Market talks, while the effect of many additional thousands of unemployed on purchasing power must be an adverse factor.

Nevertheless, from week to week, individual firms announce their plans which provide some answer to outside denigrators of the trade, and indeed, already more than a modest amount of modernisation has been put into practice. According to the Board of Trade, the total value of claims for grants submitted by the end of last month involved expenditure by appropriate firms of £24,377,163. Up to this point, the Treasury had paid out £4,155,072 against approved claims.—*All Rights Reserved.*

The cotton textile mills' production in India during the month of January 1963 is provisionally placed at 73 million kilograms of cotton yarn and 375 million metres of cotton cloth. At the end of January 1963, the composite mills of the industry held an estimated cloth stock of 214,000 metric bales of cloth as unsold and 201,000 metric bales as sold (unlifted).

Look what you get with

HONEYWELL instrumentation

Far more than just instruments, you get a complete control system, custom designed for your specific needs, by men who know your processes.

You get expert, interested assistance every step of the way, with your initial planning and long after your instruments are installed. Blue Star assume full responsibility for the engineering, installation and start-up of your system.

You get training for your instrument technicians in the most up-to-date maintenance methods at the tuition-free Blue Star-Honeywell Instrumentation Education Centre at Bombay.

You get prompt, competent service from your nearest Blue Star office and immediate replacement of emergency repair parts.

These are but some of the plus-values that comprise Instrumentation by Honeywell... and they apply regardless of whether you buy a single instrument, a replacement part or a complete control system.

FAILURE TO INCREASE COTTON PRODUCTION

GOVERNMENTAL MACHINERY LARGELY RESPONSIBLE

THE vexed question of achieving a permanent increase in cotton production was dealt with at some length by Dr. Ram Subhag Singh, Union Minister for Agriculture, in his inaugural address to the eighty-seventh meeting of the Indian Central Cotton Committee held at Bombay on Saturday, 16th February. Dr. Singh had little of his own to add to the various measures for increasing production that have been suggested so often. Like his predecessors, he, too, recommended more intensive and widespread use of fertilisers, better seeds, extension of irrigation facilities and more effective control of pests and plant diseases for increasing the yield per acre of cotton which alone, he was convinced, could bring about a marked improvement in output. He congratulated the Indian Central Cotton Committee for the doubling of cotton production during the decade 1950-51 to 1960-61 (from 2.9 million bales to 5.4 million bales).

There was, however, one disturbing factor in the situation, he said. This was the wide year-to-year fluctuation in cotton production. He attributed it to weather which continued to exercise too great an influence on production, despite the fact that the irrigation potential had been raised by about 36 per cent during the past twelve years as a result of the various major and minor irrigation projects undertaken as part of the Plan programmes. The Minister, therefore, felt that it was necessary to find out as to why cotton did not get its share of the benefits from the irrigation projects. One possible reason, in his opinion, was that cotton and oilseeds were being treated essentially as dryland crops and the tendency in all States was to take up cultivation of only wet crops, such as sugarcane and paddy, wherever irrigation facilities become available. This certainly was not happy outcome, opined Dr. Singh, and required to be corrected if production of cotton and oilseeds were to be increased.

Lack of irrigation and fickle weather alone could not explain the low yield per acre in the country. The Minister pointed out that even in those areas, where cotton was grown under irrigation, average yield had not exceeded 250 lbs. per acre, as compared with 450 lbs. in the U.S. and Egypt and 600 lbs. in U.S.S.R. Per-acre yield in rainfed conditions, he went on to add, was admittedly low. In fact, there were vast areas which produce hardly 50 lbs. of cotton per acre. It was these areas which were acting as a drag on average yield and total production. The real problem in these areas was moisture conservation which could be effectively tackled only through a broad programme of contour field bunding and adoption of dry-farming on an extensive scale. Soil conservation, the Minister recalled, had been given a high priority in the third Plan and substantial provision existed in State plans for this purpose. But the implementation of soil conservation schemes, he admitted, was slow and they did not, therefore, benefit cotton to any significant degree.

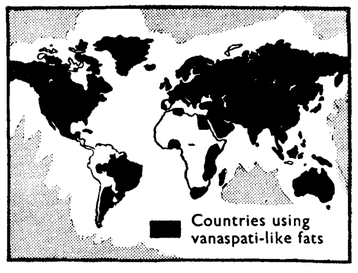
Plan Target

Against this background, the Minister discussed the prospects for achieving the third Plan target for cotton, namely, seven million bales, to be achieved in the 1965-66 season. Assuming that the current season's production would be about 5.6 million bales (including non-commercial output)—an assumption that appears to err on the high side—it was evident that cotton production would have to be increased by 1.4 million bales, or 25 per cent during the remaining three years of the Plan. This meant an average increase of 8.3 per cent per annum. According to the Minister, this rate of increase could be easily achieved, if adequate steps such as supply of fertilisers, protection of the crop from pests and diseases and adoption of improved agronomic techniques were taken. The 'if' here is a big one, for past experience does not warrant optimism that these conditions will be satisfied. To take one instance, namely, utilisation of fertilisers. Total utilisation of fertilisers, according to the figures quoted by the Minister himself, amounted to less than 100,000 tons which are hardly sufficient for 800,000 to 900,000 acres out of a total cultivated area under cotton of 18 million acres. Of course, not all the land devoted to cotton is suitable for application of fertilisers. But at least the irrigated areas are. If one remembers the fact that at least two million acres are under irrigation, which permit liberal use of fertilisers, the extent of inadequacy of fertiliser application is clear. The scope for getting larger production of cotton through use of fertilisers can be expanded further by bringing more land under irrigation.

Whose Fault?

To take the case of control of pests and diseases. It is estimated that, if two major diseases, namely, black-arm and wilt and two serious pests, namely, jassids and boll-worm, could be eradicated, it would add 700,000-800,000 bales annually to production. This quantity, it may be noted, is nearly equivalent to the average annual imports of cotton into the country in the past few years. These imports have been costing the country between Rs. 54 and 81 crores in foreign exchange annually, depending upon the staple length and the actual quantity involved in a year. It is not clear what is still standing in the way of minimising the loss through pest damage and who is responsible for it. The same story is true of supply of improved seeds. Much of what goes by the name of improved seed, on the Minister's own admission, is seed of poor quality and doubtful purity. Who, again, is responsible for this sorry state of affairs? If they are the State Governments, how does Dr. Ram Subagh Singh propose to tackle them more effectively than his predecessors had done? Has not the Hon'ble Minister had sufficient time ever since he took office nearly a year ago to think and give out his answer to these questions? To be candid enough to admit the drawbacks is, of course, a good quality. But the time is long past when the country can be content with frankness on the part of Ministers. What is needed is action clearly spelt out in terms of time for actual performance, the authorities to whom the responsibility is entrusted and the penalty to be paid by them in case of failure to reach the goals. Unless these basic conditions for increasing production are satisfied, no amount of monetary incentive, in the form of higher prices for cotton, will result in higher production and higher productivity. The Minister had nothing encouraging to say in this respect beyond expressing the pious hope that efforts would be intensified by the concerned departments of State Governments and the Indian Central Cotton Committee.

Remunerative Prices



Dr. Ram Subagh Singh referred also to the role of remunerative prices in achieving plan targets for cotton. The floor price for cotton (basic variety) was raised from Rs. 495 to Rs. 600 per candy in 1961-62 and the ceiling from Rs. 820 to Rs. 945 per candy during the current season. By the rise in the ceiling price of cotton, it was expected, the Minister pointed out, that cotton growers would realise better prices. But judging from the numerous representations received it appeared, he said, this expectation did not materialise. This conclusion is wrong. Growers have, in fact, been receiving good value for their produce; at least, the mills have been paying higher prices than they did last year. This is evident from the fact the current ruling prices are only a few rupees below the higher revised ceilings. The representation in this regard only shows the tendency to regard the ceiling price as the price which farmers are entitled to receive and to raise a hue and cry when prices tend to fall below the ceiling prices. It is conveniently forgotten that floor and ceiling prices are only the broad limits within which prices are to fluctuate according to the forces of supply and demand. So long as the actual price is not below the floor, grow-

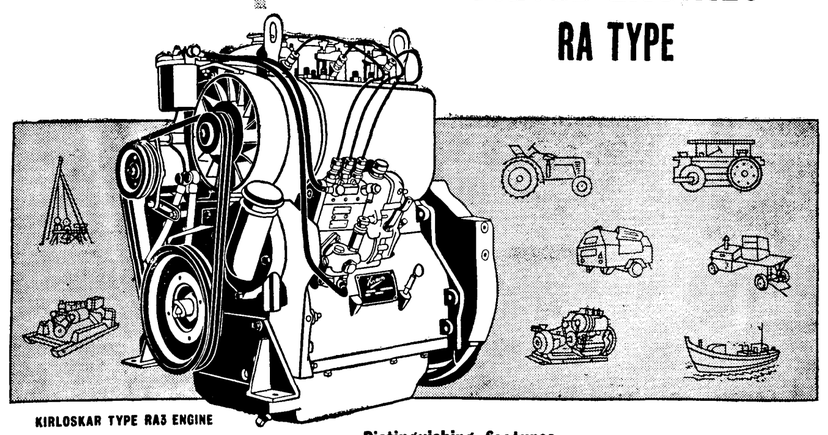
Around The World It's VANASPATI!

VANASPATI and fats like Vanaspati are used throughout the world; including those countries with the highest living standards. These fats have greater demand than milk fats even in the butter-rich countries of Denmark, Holland and U.S.A.

Before Vanaspati was introduced to the world, the only cooking fats available were animal fats including milk fats and vegetable oils. Animal fats were limited in supply. And oils, besides being liquid fats, contain many impurities on the one hand; and no vitamins on the other. This led to a world-wide search for a low-cost, nutritious, semi-solid cooking fat. The result: VANASPATI!

Vanaspati is vegetable oil which has been refined, hydrogenated, deodorised and vitaminised. Refining removes the objectionable slime, dirt, free fatty acids and colour, which are always present in crude vegetable oils. Hydrogenation changes the liquid oil into a semi-solid fat and, at the same time, it improves the keeping properties of the oil. Deodorisation removes the malodorous and unpalatable constituents. And vitaminisation makes Vanaspati nutritionally superior to vegetable oil; and places it on par with the purest milk fat obtainable.



Vanaspati is much more than a low-priced, semi-solid cooking fat—it's a valuable food, too! It provides us with 2½ times as much energy as wheat or rice. Then again, it reaches you in exactly the same condition as it leaves the manufacturer—clean, fresh and wholesome. Every gram of Vanaspati contains a generous amount of growth-promoting skin- and eye-protecting Vitamin A.

VANASPATI AND VANASPATI-LIKE FATS ARE USED THROUGHOUT THE WORLD!

PACE OF ECONOMIC LEGISLATION—II

ACTS PERTAINING TO AGRICULTURE, TRADE AND INDUSTRY RECALLED

By Dr. Raj K. Nigam, Ph.D. Econ. (London)

A STUDY of the various legislation passed in this country reveals that, of the 113 substantive Acts of economic nature, including the Finance Appropriation and Taxation Acts, etc., passed during the post-independence period, 12 Acts were repealed during the same period. Besides these, 40 non-economic Acts were also scrapped in the period under review. After excluding these repealed Acts, the number of Central Acts in force in the country as on 31st March 1962 totalled 718, of which 266 were economic legislation and 452 non-economic Act. Detailed break up of economic legislation shows that there were 25 land and agricultural Acts, 54 Acts pertained to the field of commerce and industry, 71 Acts were financial and fiscal, five Acts were concerned with irrigation and power, 35 were Labour Acts, 6 mines and mineral Acts, 45 transport and communications Acts and 25 banking and currency Acts. On the non-economic legislation side, 135 were administrative Acts, 13 Constitutional Acts, 33 Defence Acts, 31 Health Acts, 35 Judicial Acts, 60 Legal Acts and 16 Parliamentary Acts, 11 Acts related to relief and rehabilitation work, 26 Acts concerned education and 92 Acts pertained to social activities, etc. The Table A below presents a statistical view of the economic and non-economic legislation in force in the country as on 31st March 1962.

Now, as this article is primarily concerned with economic legislation, we propose to confine our attention to economic Acts only. Among the economic Acts, agricultural Acts have special significance, as our country has traditionally been an agricultural country and even today, after the migration of a bulk of the rural population to the industrial and urban centres, nearly 85 per cent of the country's population resides in the villages and is engaged in agriculture. In the aggregate national income of the country, agricultural products account for nearly 75 per cent of the total. Compared to the importance of agriculture in the country's economy, the number of Central agricultural Acts at present in force are rather small, but here one has to remember that, apart from the 25 agricultural Acts passed by the Central legislature and Parliament, there are scores of such Acts in force in the various States of the country passed by the respective State legislatures, as, under the Constitution, agriculture is a State subject. Even before the present Constitution came into force, agriculture was a State subject under the Government of India Act, 1935. Among the Central agricultural Acts the oldest one on the Statute Book is the Cattle Trespass Act passed in 1871 and the latest Acts which were passed in 1960 concern the land reforms in the Central Government Territories of Delhi, Manipur and Tripura. The latest additions to the list of Central agricultural Acts are the Delhi Land Holdings (Ceiling) Act, 1960, the Manipur Land Revenue and Land Reforms Act, 1960 and the Tripura Land Revenue and Land Reforms Act, 1960. It may be mentioned here that, of the 25 Central Acts relating to agriculture, six Acts have been passed during the post-independence period and among these, the most important one in the present context of the need to improve the food situation in the country is the Agricultural Produce (Development and Warehousing Corporations) Act of 1956 under which warehousing corporations have been set up in the various States of the country to organise a network of warehouses for the storage of foodgrains in the areas under their respective charge. In addition to the four Acts passed during the post-independence period just named above, the other two Acts passed during this period are the Delhi, Ajmer Merwara Land Development Act, 1948 and the Prevention of Cruelty to Animals Act, 1960. In passing, it may be mentioned that, under the subject head "Agriculture and Land" Acts, we have included all the Central Acts relating to agriculture, land, fisheries, forests, co-operative societies and preservation and protection of animals and birds.

In the field of commerce and industry, 54 Central Acts are at present in force and, of these, 28 were passed in the pre-independence period and 26 during the post-independence period, 1947-62. The latest Act to be passed under this subject-head is the Sugar (Regulation of Production) Act, 1961 and the oldest Act now in force is the Bengal Indigo Contracts Act of 1836. Among the 28 pre-independence Acts, some important ones are the Indian Contracts Act of 1872, the Negotiable Instruments Act, 1881, the Indian Companies (Foreign Interests) Act, 1918, the Indian Sale of Goods Act, 1930, the Indian Partnership Act, 1932, the Trade Marks Act of 1940, the Rubber Act, 1947, the Capital Issues (Control) Act, 1947 and the Import and Exports (Control) Act, 1947. The last two Acts were passed on the eve of Independence, that is, a few months before the 15th August, 1947. With regard to the Capital Issues (Control) Act, it may be noted that the control over capital issues was, for the first time, instituted in 1942 through an Ordinance directing the financial resources in such industrial directions which furthered the war effort. At the end of the war, in order to accelerate the development of the country in a systematic manner, the Capital Issues Control Act of 1947 was brought on the Statute Book as a peace-time planning measure and it provided for control over issue of capital which included issuing and creation of any securities, whether for cash or otherwise, and the capitalisation of profits or reserves for the purpose of converting partly paid-up shares into fully paid-up shares or increasing the par value of shares already issued.

Import-Export Control

In 1947, another important Act, viz. the Import and Export (Control) Act was passed which confers powers on the Government to prohibit or control imports and exports for such period as the Government may like. The first economic Act pertaining to trade and industry in the post-independence period was passed in 1948. It was the Industrial Finance Corporation Act passed for establishing the Industrial Finance Corporation of India for the purpose of making medium and long-term credits more readily available to industrial concerns, particularly in circumstances where normal bank accommodation was inappropriate or recourse to capital issue methods was impracticable. For the purpose of this Act, industrial concerns mean any public limited company or co-operative society which is engaged or is to be engaged in the manufacture or processing of goods or in shipping or in mining or in the generation or distribution of electricity or any other form of power or in such other industries specifically named from time to time. With the passing of this Act, one of the lacunæ in the Indian economic structure, namely, the absence of a properly organised system of industrial finance, which included investment trusts, issue houses, etc., was partly met and the industrial enterprises have been assured of some financial succour at times when the raising of financial resources was found to be difficult, due to financial stringencies in the capital market. In 1951, a supplementary legislation to the aforesaid Act, namely, the State Financial Corporations Act was also passed and, under its ægis, financial corporations came to be set up in the various States of the country with almost the same functions as the Industrial Finance Corporation of India was to discharge.

The passing of the Tariff Commission Act in 1951 was a landmark in the history of the large-scale industry in this country. The purpose of this Act has been to provide for the establishment of a permanent Tariff Commission, with wider powers in place of the old *ad hoc* Tariff Boards, as per the recommendations of the Fiscal Commission which stressed the necessity of relating the application of protection to the planned economic development of the country. The functions of the permanent Tariff Commission have been defined in Section 11 of this Act. The Commission is to inquire and report on (*a*) the grant of protection for the encouragement of any industry, (*b*) an increase or decrease in the customs or other duties in relation to the protection of any industry, (*c*) action to be taken in relation to the dumping of goods in the market occasioned by excessive imports or otherwise, (*d*) action to be taken where an industry is taking undue advantage of the tariff protection granted to it, particularly with reference to the question whether the protected industry is charging high prices for its goods or acting in a manner which results in high prices being charged to consumers through limitation of quantity, deterioration in quality or inflation of cost of production and the like or acting in restraint of trade to the detriment of the public, and (*e*) further action to be taken in relation to the protection granted to an industry with a view to its increase, decrease, modification or abolition according to the circumstances of the case.

Tariff Commission

The Tariff Commission can also be asked, on a reference from the Central Government, to inquire and report on (*a*) the effect of protection on the general level of prices in the country, cost of living to any specified section of the community and the different sectors of the country's economy, (*b*) the effect of tariff concessions in trade or commercial agreements on the development of any specified industry, (*c*) any anomalies that may result from the working of protection or revenue duties, and (*d*) the prices of particular commodities whether protected or not. Also the Act casts a duty on the Commission to investigate at such intervals as may be prescribed into the manner in which protection to any industry has been working, with particular reference to the cost and quality of production of the protected commodity, scale of output and prospects of future expansion of the protected industry, the relative competitive position of the industry and the factors, including the one having a bearing on the usefulness of the industry to the country's economy, entering into it, etc. Principles which are to be taken into account in making an inquiry, particularly under Section 11 of this Act, are detailed in Section 14. Thus the Act assigns very wide functions to the Commission and some of the provisions of the Act confer such wide powers as are contained in the Anti-Trust and Anti-Monopoly legislation in the U.S. and the U.K. Further, the Act empowers the Commission to enquire, on a reference from the Central Government, into the cost structure of industries and to recommend fair ex-works prices, as well as fair consumer prices.

Industries' Development

Another important act, namely, the Industries (Development and Regulation) Act, 1951, as its title suggests, was passed for the development and regulation of industries and for giving powers to Government to exercise effective control over the private sector which came to be felt as necessary under the Five-year Plan. It is under the provisions of Section 10 of this Act that the owner of every existing industrial enterprise has to get it registered and under Section 11 a licence has to be taken for starting a new industrial undertaking in this country. Section 15 of the Act confers power on the Government to cause an investigation to be made into the affairs of any scheduled industry. Section 18A confers power on the Government to assume management or control of the industrial undertaking if it was managed in a manner detrimental to the scheduled industry concerned or to public interest. Further, Section 18G confers power on the Government to control the supply, distribution, price, etc, of the articles already named in the Act or which may be notified later. Thus, this Act is also one of the landmark Acts passed during the post-independence period, the like of which did not exist on the Statute Book of our country before.

The Forward Contracts (Regulation) Act, 1952, which was a new legislation on the subject, was passed to provide for the regulation of forward contracts and the prohibition of options in goods. Under the provisions of Section 3 of this Act, a permanent Forward Markets Commission—a completely new regulating body —was established with such functions as (*a*) to advise the Central Government in respect of recognition of or withdrawal of recognition from, any commodity association, (*b*) to keep forward markets under observation and to draw the attention of the Central Government to any development taking place in such markets which is of sufficient importance to deserve the attention of the Central Government, (*c*) to collect and publish information regarding the trading conditions in respect of goods to which the provisions of the Act apply, (*d*) to make recommendations with a view to improving the organisation and working of forward markets, and (*e*) to undertake inspection of the accounts and other documents of any recognised commodity association whenever it considers necessary, etc.

Stock Exchanges

Four years after the passing of the aforesaid Act, another legislation of a complementary nature concerning contracts in stocks and shares, etc., was passed in 1956. The legislation in question was the Securities Contracts (Regulation) Act, 1956 meant for preventing undesirable transactions in securities and regulating business and dealings therein by prohibiting options and by providing for certain other matters connected therewith. This Act was passed after the working of the stock markets had been thoroughly examined by the Thomas Committee and the Gorwala Committee. The latter Committee in particular underlined the need for having a Central Act which prescribed uniform by-laws and regulatory provisions for the proper working of the stock exchanges in the country. The Act confers very wide powers on the Government in this matter. Under Section 4 of the Act, only those stock exchanges which are recognised by Government can function, and this recognition, which was not necessary prior to the coming into force of this Act, has to be given by Government, if it is satisfied that the rules and by-laws of the stock exchange applying for recognition were in conformity with such conditions as may be prescribed with a view to ensuring fair dealing and protection of the interests of investors. Section 6 of the Act requires that every recognised stock exchange shall furnish to the Central Government periodical returns relating to its affairs as may be prescribed and that the recognised stock exchange and every member thereof shall maintain and preserve for such periods not exceeding five years such books of accounts and documents as the Central Government may prescribe in the interests of the trade or in the public interest. Section 21 of the Act confers powers on the Central Government to compel listing of securities by public companies if it is necessary or expedient in the interests of the trade or in the public interest. Section 9 requires a recognised stock exchange to frame its by-laws with the approval of the Central Government which are to provide for certain specific matters as per provisions of sub-section (2) of the same section. It may be mentioned here that the Government, in consultation with the stock exchanges, have framed a set of by-laws which have been adopted by all the recognised stock exchanges in the country. It will thus be seen that the affairs of stock exchanges have now been put under closer surveillance of the Government which was absent in the past and had led to the growth of serious abuses in stock markets.

In 1953, the Collection of Statistics Act was passed, repealing the earlier Industrial Statistics Act of 1942. The purpose of this new Act is to facilitate the collection of statistics relating to industries, trade and commerce by Government. A broad indication of the statistics that could be collected by the Government under this Act is contained in the provisions of Section 3 of the Act. Valuable data relating to industrial enterprises are being collected by the Government under this Act and are published in the volumes entitled *Census of Manufacturing Industries*, through the Central Statistical Organisation.

Essential Commodities

In 1955, the Essential Commodities Act was passed which, in the first instance, was presented in the form of an Ordinance on the expiry of the Essential Supplies (Temporary Powers) Act of 1946. This Act confers powers on the Central Government to control production, supply and distribution of trade and commerce in certain essential commodities in the interests of the general public. The purpose of the Act is very precisely set out in Section 3 which says: "If the Central Government is of opinion that it is necessary or expedient so to do, for maintaining or increasing the supply of any essential commodity or for securing their equitable distribution and availability at fair prices, it may, by order, provide for regulating or prohibiting the production, supply and distribution thereof and trade and commerce therein." The essential commodities are named in Section 2 of the Act and these include cattle fodder including oilcakes, coal, component parts and accessories of automobiles, cotton and woollen textiles, dyestuffs, edible oilseeds, iron and steel and its products, paper including newsprint, petroleum and its products, raw cotton and raw jute. The powers under this Act have been very freely used by the Government.

The year 1956 saw in our country the passing of the biggest Act in its past and present history of legislation. It was the Companies Act, 1956 which lays down a very comprehensive code of conduct for the corporate bodies and confers very wide regulatory powers upon the Government of India to exercise vigilance over the corporate sector. The assemblage of powers vested in the Government under this Act is enormous and has probably no parallel elsewhere. But these powers, it has been claimed by the Government, are intended to help and not hinder the working of companies. For dealing with matters relating to managerial personnel such as their appointment, remuneration, tenure, etc., the Act has provided for the creation of a statutory Advisory Commission under Section 411 of the Act. It may also be mentioned here that the provisions of the Act aim at checking concentration of economic power within the corporate sector. This Act has also imposed numerous curbs on the managing agency system and, as a result, the nature of this institution has undergone a complete transformation.

Apart from the Companies Act, 1956, another important Act dealing with trade and industry passed in that year was the Standards of Weights and Measures Act, under which the units of weights and measures in our country were switched over to the metric system. This Act has repealed the two earlier Central Acts, namely, the Measures of Length Act, 1885 and the Standards of Weights Act, 1939, and a number of State laws on the subject which are named in Schedule 2 of this Act.

Besides the foregoing Acts, the other Acts dealing with trade and industry passed during the post-independence period are the Central Silk Board Act, 1948, the Chartered Accountants Act, 1949, the Khaddar (Protection of Name) Act, 1950, the Iron and Steel Companies (Amalgamation) Act, 1952, the Indian Standards Institution (Certificate of Marks) Act, 1952, the Tea Act, 1953, the Coir Industry Act, 1953, the Spirituous Preparations (Inter-State Trade and Commerce) Control Act, 1955, the *Khadi* and Village Industries Commission Act, 1956, the Rice Milling Industry (Regulation) Act, 1958, the Trade and Merchandise Marks Act, 1958, the Cost and Works Accountants Act, 1959, the Sugar Export Promotion Act, 1958 and the Sugar (Regulation of Production) Act, 1961.

(To be concluded)

TABLE A: *Substantive Economic and Non-economic Acts in Force as on 31st March 1962*

Economic Acts			Non-economic Acts		
Subject head	No. of Acts		Subject head	No. of Acts	
	Total	Passed during 1947-62		Total	Passed during 1947-62
1. Land and agriculture	25	6	1. Administration	135	69
2. Commerce and industry	54	26	2. Constitutional	13	8
3. Financial and fiscal	71	38	3. Defence	33	17
4. Banking and currency	25	11	4. Health	31	12
5. Labour	35	17	5. Judicial	35	14
6. Irrigation and power	5	3	6. Legal	60	....
7. Transport and communications	45	15	7. Parliamentary	15	15
8. Mines and minerals	6	6	8. Relief and rehabilitation	11	11
			9. Education	26	15
			10. Social	92	30
	266	122		452	191

Note. The reader's attention is invited to the footnote on page 229 of *Commerce* dated 9th February 1963, carrying the first instalment of this series of three articles. The final instalment will appear in the next issue of *Commerce*.—ED.

PLEA FOR A STILL HIGHER CANE PRICE

U.P. AND BIHAR SUPPORT PRICE SPIRAL

IT is indeed regrettable that sugarcane continues to be the plaything of politicians in the States of Uttar Pradesh and Bihar. It is all the more regrettable because persons in high authority go on pampering the cane growers, as if the economic position of growers of this crop alone is miserable. And the pity of it is that the Governments of the two States off and on openly advocate higher and higher prices for sugarcane, disregarding the national interest which lies in holding the price line. Only on Thursday last week, the Chief Minister of Uttar Pradesh, Mr. C. B. Gupta, revealed in the State Vidhan Sabha that the Governments of both U.P. and Bihar had recommended to the Centre a higher sugarcane price for the next crushing season. Meanwhile, the State Government, he added, had drawn the attention of sugar mills to overcome the shortage of cane by offering higher prices.

By pleading for a higher sugarcane price, the U.P. and Bihar Governments have, in effect, urged for the modification of the new cane price policy which has been in force just since November 1962. Under this policy, cane growers are assured of a much higher price than they were getting before. Even the minimum cane price of Re. 1.44 per maund fixed for the seasons 1953-54 to 1958-59 was too high in relation to the prices of other agricultural commodities. The price was raised to Re. 1.62 in 1959-60. Although the Government of India had then stated that the enhanced price was for 1959-60 only, it continued the same price in the two subsequent seasons. When the Government announced the new policy in July last year, the enhanced price of Re. 1.62 per maund was continued again, albeit with a scheme of discount or premium depending on variations in the recovery per cent of sugar in cane. What was worse, the price was linked to a lower recovery of just 9.8 per cent, and not the usual basis of 10 per cent that had been regarded as the norm for a long time. In effect, therefore, the minimum price of cane with 10 per cent recovery is now Re. 1.64-2/5 per maund, a rise of another 2.4 nP, or an additional cost incidence of 24 nP per maund of sugar produced.

Heavy Incidence of Cane Cost

How heavy is the incidence of cane cost in the total cost of sugar production is clearly brought out in the following statement relating to the total works cost per maund of D-29 grade sugar in North India on the basis of 123 crushing days and 9.89 per cent recovery:

	Rs.
Raw materials—cane*	16.85
Power and fuel	0.18
Chemicals and filter cloth	0.41
Salaries and wages	2.31
Repairs and maintenance and consumable stores	0.84
Depreciation	0.71
Overheads	0.63
Packing	0.55
Total conversion charges	5.63
Adjustment for extras due to grade differentials.	(—)0.14
Balance for basic grade D-29	5.49
Less credit for receipts	0.11
Balance	5.38
Add extra cost on cane	0.27
Cost excluding cane, commission on cane, cess and excise duty	5.65
Cost including cane, commission on cane and cess but excluding excise duty	22.50

* The price of cane has been taken at Government fixed rates. Driage, commission on cane and cess have been taken at the average for the year 1957-58 of the costed units in each region.

Source: Tariff Commission Report 1959.

It will be seen from the above table that the cost of cane (excluding commission and cess) alone accounts for as much as 75 per cent of the total cost of sugar production. Can the spokesmen for the U.P. and Bihar Governments mention any other country where the incidence of the cost of raw material for sugar industry is so heavy as this? The minimum price of Re. 1.64-2/5 per maund with 10 per cent recovery ensures a gross return of over Rs. 670 per acre to the agriculturists in U.P. (on the basis of the average yield of 15 tons in 1961-62) which is much more than that obtained from alternative crops, say, Rs. 595 in the case of rice and Rs. 330 in respect of wheat, assuming that the actual cost of cultivation is the same in regard to all the three crops. It must, however, be noted that the return from rice and wheat has been estimated on the basis of two crops in a year. Similarly, in Bihar, the cane growers get a handsome return from a given area of land which compares quite favourably with the return obtained from lands devoted to other agricultural crops. In view of such attractive returns, larger and larger areas of land have been brought under sugarcane in recent years. Thus, between 1958-59 (when the minimum price of cane was only Re. 1.44 per maund) and 1961-62, the area sown to cane has gone up from 2,747,000 acres to 3,595,000 acres in Uttar Pradesh and from 405,000 acres to 469,000 acres in Bihar. Would the agriculturists have devoted an increasingly larger area to the cultivation of sugarcane, if the price had not been more attractive than that on other crops?

Few will deny the cane grower a fairly attractive price for his product, but the price should not be such as to raise the price of sugar or to encroach upon the minimum margin of profit to the sugar mills. It will be quite pertinent to recall here that the Sugarcane Control Order of 1955 specifically required the Central Government to fix cane prices having regard to (*a*) the cost of cane production, (*b*) the return to grower from alternative crops and general trend of prices of agricultural commodities, (*c*) the availability of sugar to the consumer at a fair price, (*d*) the price at which sugar produced from cane is sold by producers of sugar, and (*e*) the recovery of sugar from cane.

A Regular Vote-catching Device

It is not the anxiety to ensure better cane supplies to mills that has prompted the U.P. and Bihar Governments to urge for a higher cane price. For even during times of bumper cane crops in the past, the two Governments had asked the Centre to fix a higher price. Like the proverbial Oliver Twist, they have always been demanding a higher price for sugarcane in order to sustain their popularity with the agriculturists. It is a regular vote-catching device.

In the U.P. Vidhan Sabha the other day, Mr. Dau Dayal Khanna, the State's Minister for Cane Development, said:

"Almost every mill is experiencing cane shortage and many have voluntarily offered higher purchase price for cane. The Government has permitted cane growers to enter into agreement for supplying cane to the mills upto 85 per cent of their production. A shortfall of 20 per cent in sugar output is expected in the current season. The State Government's income from cess is likely to fall by rupees one crore."

The shortfall in sugarcane supplies in the current season has nothing to do with the price. It is due chiefly to adverse weather and other natural causes of a cyclical nature. If the U.P. and Bihar Governments had cared to provide regular irrigation facilities and effective protection from floods, the cane crop would have withstood the cycle of agricultural fortunes in a better manner. Another reason why sugarcane supplies to mills have been adversely affected is the high level of *gur* prices and the successful competition from *gur* producers for the available supplies of cane. Neither the present shortfall in cane supplies to the factories nor the fact that circumstances have forced some of the sugar mills to pay more for sugarcane as a lesser evil is an excuse for demanding a further upward revision in the statutory minimum price for sugarcane. But the U.P. Government is impervious to all sense of reason so far as price for sugarcane is concerned. It seems to have impressed upon Mr. S. K. Patil, Union Minister for Food and Agriculture, "the imperative need" for raising the price of cane in the next season. Mr. Patil, who was recently at Lucknow, met the Chief Minister of U.P. and discussed with him the problems confronting the sugar industry. It is not known what transpired between them on the issue of sugarcane price for the next season. One, therefore, has to wait and see. In his talk to pressmen, Mr. Patil dwelt on an issue which is less important because of the time element. He said:

"The immediate problem is to increase, if possible, the production of sugar because, luckily, the international price of sugar has just now increased and there is a possibility of earning a little foreign exchange. As it is, at this stage, the only thing that can be done is to divert the substantial part of sugarcane from *gur* to sugar production. It is not easy to do so, because a substantial part of the season is already over. But, if any eleventh-hour attempt could be made, we are trying to explore the possibilities of it. U.P. now produces 65 per cent of the total sugar production of the country and, in any increase per acre yield of sugarcane and of the sucrose content in canes, U.P. is bound to affect in a very substantial measure the sugar production of the country. We both, the U.P. Government and the Central Government, have been considering practical measures by which this could be achieved."

What is the good of Mr. Patil or other spokesmen of U.P. and Bihar Governments saying now that the problem of cane supplies is not easy as the season is almost over? Well before the crushing operations commenced in November 1962, it was abundantly clear that, since the sugarcane crop in both U.P. and Bihar had been damaged by premature dry weather and heavy floods earlier, the actual yield would suffer a distinct setback. It was also clear that, in view of the setback to cane production and the markedly high prices of *gur* and *khandsari*, there would be an unduly large diversion of cane supplies to the manufacture of these brown sugars. But neither the State Governments nor the Centre did anything effective to check such a tendency. If only the Governments had taken stern measures in time to ban *gur* and *khandsari* making in and around factory areas and to check the speculative rise in the prices of these items, the sugar mills would certainly not have been in such a quandary as at present. The Forward Markets Commission slept over the issue of banning forward trading in *gur* until it was too late. It would not wake up to the realities of the situation even when its attention was drawn in good time. It was only five weeks ago that it decided to stop futures trading in *gur*. But by that time the damage had been done. It is actions of this type and open support to the price spiral by the U.P. and Bihar Governments that bring discredit to our economic policies. It is high time U.P. and Bihar Governments realised that the rest of India, which consumes most of the *gur* and sugar produced in their States, has also a say in this matter. There is a limit upto which the interests of consumers can be sacrificed to buttress the position of politicians in these two States.

THIS HAND KEEPS THE INDUSTRY RUNNING

Millions of hands like this are reaching eagerly every day for a glass of cool water. ACCOOLER water cooler has the proud privilege of supplying them plenty of cool water—as a matter of fact, as much as they need.

ACCOOLER

NEW PUBLICATIONS

Business Organisation Reconstructed. By V. P. Varma, Gyanpeeth Private Limited, Patna. Pages: 363. Price: Rs. 7.

THE art of management has assumed greater importance in recent years in view of economic development and the increasing potentials of enterprises and industrial undertakings. In such a context, any analysis of the art of management from different lights is welcome. It actually fulfils a felt need under such a set-up.

Business Organisation Reconstructed is one such attempt wherein the different aspects of business and its management are clearly explained and well brought out. The impact of business on the business situation and of business situation on business is great. It is true that businessmen shape environment by their own decisions and actions, but while managing their business enterprises, they have also to adjust their activities to the changing environment, both social and economic. Keeping this in view, the author has treated the subject with a different discipline and succeeded in providing a changed framework for studying business organisation.

Business should be a sound mingling of the principles of social service and personal acquisition of wealth. But considering the way in which present-day business has developed, one has to say it has become wayward. Social productiveness should be the guiding star of all business endeavour. Having this in mind, the author has opened the book on the ethics of business. He is of the opinion that business should be ever evolving through continuous differentiation and integration caused by the changes in the social structure, environments and social sentiments. A true business should adjust its existence to the growth of society so that it may not become anti-social or even at least indifferent to society.

The theme is taken in a continuous thread of analysis with the division of business from the point of view of the nature of work the business is engaged in and from the point of ownership of business. It is followed by a critical analysis and examination in Chapter V of the functions of the entrepreneur from the two different points of view of what he performs and what he should perform. The tendency towards larger and larger association of individuals in business, paving the way for the joint stock enterprise is actually an evolution of small business to big business. A historical and analytical review of the different stages of growth of this evolution is discussed in the subsequent chapters. The capital of a company is a question of great importance both from the point of view of those who contribute towards it as also from that of the business. Considerable attention has been devoted to this problem and an analysis of the determinants of the company capital is another significant aspect of this work.

In the later chapters a critical evolution of several problems like the rights of the shareholders, the functions of the director of a company and the growth of the Managing Agency system, are given in detail. In recent days the pattern of relationship between Government and business in most of the countries of the world has changed, and we are living in one of those epochs of history in which the government is engaging in business enterprise. The author's ingenuity in devoting a sizable chapter to the analysis of the government as a business enterprises is worth noting.

Though, thus, the topics dealt with are great both in quantity and quality, the production side of the book is not quite impressive. As the author himself has mentioned in his introduction, the work has been done in a hurry and with many handicaps. But this cannot be taken as an excuse for glaring spelling mistakes and printing errors. Having taken this into consideration, one should not, however, hesitate in making the remark that it is a good experiment, well carried out in spite of obstacles.

Practical Salesmanship, Sales Management and Advertising. By R. S. Davar. Published by the Progressive Corporation (P) Ltd., 51, Mahatma Gandhi Road, Bombay 1. Pages: 421. Price: Rs. 10.85.

Salesmanship is of vital importance in any stage of growth both at the individual level and at the social. From cradle to grave, all our motives are directed towards selling something either in return for something else or for its own sake. We may not all be experts or professional salesmen, but all of us at some time or other have utilised in our daily contacts the principles of salesmanship. Having this element in view, Mr. Davar has brought out in his book all the essential requirements of salesmanship, sales management and advertising from a practical point of view, with a number of illustrations of actual sales talk, meeting objections raised by prospective customers etc.

Opening the book with a background analysis of the origin of salesmanship and the definition of the term, the author takes the reader through the realms of the role of psychology in the remaining chapters. A full treatment of the various potentialities of salesmanship and the scope for such trained people in a growing economy like ours are dealt with effectively. The different stages of a sales transaction and the possible obstacles that one will find in the process are dealt with in greater detail. Case histories have been analysed with a view to drive home the essential points of salesmanship and the possible pits into which they may fall during such an operation. Another aspect of this book is the comprehensive treatment of sales management and advertising at the same time.

Modern sales management practices the principles of scientific management. It, therefore, involves adequate planning upon the basis of facts, the setting up of appropriate objectives, the execution of the plan and an analysis from time to time to determine how effectively the plan has been executed. The sales manager is not only expected to have a thorough knowledge of salesmanship but also of the science of management and control of the employees under him and his organisation. He is the guiding and driving force of the sales department. He must not only know how to recruit his staff but should be able to guide, encourage and control them. These and other aspects required of scientific management have been dealt with in a persuasive style. A full discussion of the legal implications of selling and different cases where they have been used are effectively sandwiched between the chapters, which enables the reader to have a full picture of the art of selling and its pitfalls.

Although advertising is a study by itself, it forms part of marketing. In fact, with respect to many products, such as consumer goods, it is the most important of the several tools of marketing. Yet even in such cases, if advertising is to perform with maximum effectiveness, it must be co-ordinated and integrated with all other marketing activities and specifically with selling. With this view, the book takes the reader through the different elementary rudiments of advertisements and outdoor publicity which is backed with illustrations and case histories to make the point clear. The motivation research, the essentials of copy writing, mass communication tools, press advertising, and films and slides are some of the items which are given much prominence in this section.

An essential of good leadership is the ability to handle people, which is only salesmanship by another name. The principles underlying the ability to handle people are of universal application. Thus the study of this book is useful not only to salesmen but even to those who never intend becoming salesmen from a professional point of view, but desire leadership, whether in business or in a profession, or in the political or social field. This is a welcome addition to the sales literature that has recently started coming in both from the professionalists and from academicians.

Secretarial Practice in India. Sixth Edition. By J. C. Bahl. Publishers: N. M. Tripathi Private Limited, Princess Street, Bombay-2. Pages: 701. Price: Rs. 15.00.

The present work is yet another edition of a well-thought-out book by an eminent professor in commerce in India. In lucid style he has succeeded in presenting the task and responsibilities of a company secretary within the purview of the Indian Companies Act. In simple and clean manner the various theoretical and practical aspects of secretarial procedure have been discussed, in our country's conditions, by Prof. Bahl. Utilising ably the enormous information derived from actual business methods obtaining in the country, the author has done well to emphasise the need for the effective and correct secretarial procedure ideally suited for a developing and new commercial structure like ours.

As the author himself says in his preface, this edition is an improvement on the earlier one in several respects. The book has been revised in the light of the Companies (Amendment) Act, 1960. Several forms, important from the secretarial point of view, have been included in this edition. Thirdly, the Central Government rules regarding issuing of share certificates and the Supreme Court rules regarding proxies have been embodied. Another important change is the incorporation of an appendix containing revised scales of fees payable by companies to the Central Government and to the Registrar and another containing important definitions as amplified by the Companies (Amendment) Act, 1960. All these additions have enhanced the value of the publication to all concerned.

This book will be of great assistance to managers and secretaries of business concerns who will have much to do with secretarial practice in their day-to-day activities.

Income-Tax, Past and Present. By K. B. Jindal. Published by Kitab Mahal Private Ltd., 56-A, Zero Road, Allahabad. Pages: 896. Price: Rs. 35.

Most of the commentaries on the taxation laws in this country have been the exclusive writings of practising lawyers and accountants. Recently a few of the officers from the Revenue Department of the Government of India have sought the coveted place. For those practising in the taxation field it is interesting to study these commentaries to find out how the various provisions of the Act have been dealt with inasmuch as there is a general feeling amongst the assessed and those who represent them that the Revenue officials always favour the Government even if the benefit of doubt can be given to the assessee. Mr. K. B. Jindal is from the Indian Revenue Service.

The Law Commission, while making its report on the Indian Income-tax Act 1922, stated: "There is hardly any Act on the Indian Statute Book which is so complicated, so illogical in its arrangement, and, in some respects, so obscure as the Income-tax Act." The draftsmen of the 1961 Act have taken pains to remedy these defects from the Act but the nature of the enactment is such that there are always bound to be defects. The draftsmen, however, must be complimented for trying to simplify the various provisions of the Act. This piece of legislation has grown from 66 sections in the 1922 Act to 258 sections in the 1961 Act. In this connection, one cannot forget the Companies Act which also became bulkier on its recodification and consolidation.

There seems to be some similarity in these two enactments, that is, the Income-tax Act and the Companies Act. The Companies Act, after it came into force within its short span of life, underwent major amendment. So also the Income Tax Act. Even before the Act of 1961 came into force, the Government had it amended by the Finance Act 2 of 1962. The Scheme and the basic principles of the Act, however, remain intact. The limitation for reopening the completed assessments has undergone complete change, the maximum period has been made sixteen years from the date of assessment and the escaped income should be more than fifty thousand rupees in that year. The "representative assessee" has been defined, thus making the representative of a deceased an "assessee" within the meaning of the word. Dirtibution of preference shares by way of bonus has been included in the definition of "dividend." The confusion regarding "casual visit" in Section 6(1) (b) & (c) has been clarified. There is change in the provisions regarding the taxation of charities. There is a new term "short-term capital" introduced in the Act which provides for the assessment of gains in the said capital. This gain will hereafter bear the tax on the basis of income-tax instead of capital gains. New hotels get tax holidays. There are other numerous changes in the tax law which call for careful study and understanding.

This book by Mr. Jindal is quite a fair commentary on the law. The author has taken pains to trace the new sections to the past, to 1939. As the author says, the going back to the past beyond 1939 is only academical and not practical. The reasons for the change in the provisions of the 1922 Act are provided wherever necessary. Each page gives the section under discussion and it also mentions the equivalent of the 1922 Act which is very useful to practitioners who are today more conversant with the old enactment than with the new one. Case law from the old Act is cited with facts of the cases in detail. There is a separate chapter under the heading "Departure from the past," which brings out the salient features of the new Act. The book, in addition, gives the Rules framed under the Act, the agreements for double taxation relief and a table containing the parallelism of the old to the new and *vice versa*. The only handicap to a busy practitioner is that the author has failed to provide an index to the book. In all other respects, the book could be regarded as one of the best commentaries so far published.

Economic Research for Small Industry Development. By S. Nanjundan, H. E. Robinson and Eugene Staley. Published by Asia Publishing House, Bombay. Pages: 316. Price: Rs. 18.

Development of small-scale industries is an integral part of the programme for economic development of India and has been assigned a distinct place in the Five-year Plans. Given a shape in 1954, a comprehensive programme for stimulating the modernisation and growth of small manufacturing enterprises has been in operation since then. The programme includes technical advice and consultation on improved methods of production, economic guidance and information to help the small industrialist to choose promising lines of production and to expand his marketing activities in right directions, management consultation and training, financial assistance on reasonable terms and provision of good factory accommodation through industrial estates. Under this programme, trained economic investigation teams have been appointed to provide information and analysis for two broad purposes, namely, to guide the planners and administrators of the small industry programme in shaping it more effectively and to assist small entrepreneurs, directly or through industrial extension officers, in taking better economic decisions.

The International Industrial Centre of the Stanford Research Institute had been interesting itself in several studies in the small-scale industries field and the present one was undertaken with the assistance of the Ford Foundation. The main thesis of economic research is illustrated mainly by the experience in India, rather the publication represents a description of the types of economic research which the Government of India has incorporated into the programme and discusses some additional types for which there appears to be a definite need.

The chapters have been well planned to deal with the several facets of the programme. Any such programme is bound to have problems relating to organisation, staffing, methodology, coverage etc. The Indian experience brings out vividly the facts one has to face. The demands for the service of economic investigation and economic information services staff have increased considerably. At the same time, there appears to be imbalance between the tasks assigned to the economic units and the staff available for executing these tasks. One would, however, feel that to give better results, better planning and organisation is necessary. One topic of immediate interest is the role of small-scale industries in a pattern of decentralised development, particularly the scope for encouraging development of small-scale industries around small and medium-sized towns and the rural industrial project.

The authors have done well to focus attention on one of the generally neglected aspects in any large programme, namely, research and guidance. Equally important, like the main text, are the eighteen appendices which cover nearly half the book.

COAST-BASED STEEL PLANTS

PROS AND CONS OF PROPOSAL DISCUSSED

THERE is general recognition that India must go in for a "bold and imaginative" steel development programme for the future. The possible establishment, as part of such a programme, of coast-based steel plants using indigenous iron ore and imported coal, has been actively canvassed in this connection. The Union Government itself, according to an announcement made by Mr. C. Subramaniam, Minister for Steel and Heavy Industries, at the recent International Symposium on Iron and Steel-making held at Jamshedpur, has been giving consideration to some proposals for establishing such plants. Experts have also discussed, at the symposium, the feasibility of siting future steel plants on the coast. The proposition is, of course, attractive on the face of it, but there is no unanimity among experts that it is feasible.

Some experts, who have made out a case for coast-based steel plants, have highlighted, at the outset, the fact that, whereas India has 20,000 million tons of high-grade iron ore available, the total reserves (after allowing for mining and washing losses) of coking coal are estimated at only 1,600 million tons. Since more than a ton of coal is required to produce a ton of iron, from the long-term point of view, the country's reserves of good quality coking coal are relatively very limited. Of course, these limited supplies can be stretched out through the upgrading of high ash coals by washing, by petrographic preparation to permit a large mixture of weakly coking coals in the blend, by the use of prepared burden and fuel injection in the blast furnace, and other technological improvements to reduce specific coke consumption. But, according to Dr. M. N. Dastur, even when all these steps have been taken to conserve the known supplies of coking coal, it will still be necessary to augment our resources by imports because of the basic imbalance in our resource endowment.

Arguments For

According to this expert, there are two possible ways of using imported coal, namely, (i) blending it with local coal, and (ii) using it exclusively at a plant on the seaboard. The argument here is that, if only one-tenth of the foreign exchange required for the import of steel (currently running at the rate of one million tons per annum) is used for importing coal, it will help to produce an equivalent tonnage of steel within the country. Importing coal would not be uneconomic, for, if low-volatile and low-ash coals are imported, they can, with advantage, be blended with our high-volatile, high-ash coals to give an economic coking blend. It may be noted, in this connection, that the bulk of the limited reserves of coking coal in India has high-volatile matter (upto 34 per cent) and high ash content (upto 30 per cent) and the selected low-ash coals of Jharia are also being fast depleted.

These arguments in favour of importing coal for blending are equally applicable to the case of coast-based steel plants using 100 per cent imported low-ash coking coal. The other advantages claimed for coast-based steel plants are:

(i) As transport will be a major factor in the future development of additional capacity in the existing iron and coal belt, seaboard location of new steel plants would mean avoidance of transport bottlenecks.

(ii) Export promotion will be facilitated, for it would be more advantageous to convert a part of the current or prospective iron ore exports into pig iron at the coast-based plants and then export it. Exports of iron and steel, and the products made therefrom, would diversify and increase the country's exports.

(iii) Import of good coking coals would render possible economies of scale through fair-sized iron and steelworks located at such sites as Goa and Visakhapatnam. To smelt the ore with local non-coking coals would be to limit the size of future plants to a rather uneconomic level.

(iv) In India, iron ore is available on the coast either locally or within a short distance of mines located further inland. It would be more advantageous to import low-priced foreign coal to suitable coastal locations than to transport, over long distances, washed Indian coal of lower quality to such locations.

(v) Economics of imported coal would be further improved if a boat-shuttle between India and Europe or America could be run to transport our high-grade iron ores (which are in demand overseas) and bring coal on the return journey.

The idea of basing future steel plants on imported coal involves the abandonment of the usual assumption that 100 per cent indigenous raw materials should be used by the iron and steel industry. To give up this assumption would merely be to emulate some advanced countries which are increasingly relying on imports of essential raw materials for sustaining the tempo of advance. For instance, Japan imports two-thirds of its total requirements of iron ore and about one-half of its requirements of coking coal. All the European steel producers import one or other of the essential raw materials. Even the United States has to import all its manganese requirements and over 35 million tons of iron ore per annum. New steel plants are being increasingly located at coastal sites in several countries, for raw materials of better quality can be assembled at low delivered cost, as compared with indigenous sources. The newer steel works at Newport (England), Dunkirk (France), Bremen (West Germany), Ijmuiden (Holland), Cornigliano, Piombino-Bagnoli and Taranto (Italy), and Karachi (Pakistan) represent the iron and steel industry moving to the coast nearer the overseas sources for its coal and ore. This has been rendered possible by the changed situation of sea transportation in terms of increased tonnage and speed of ships, their specialised construction and utilisation, and improvement of port equipment. Taking a longer view, Dr. M. N. Dastur, who has advanced all the arguments mentioned so far in this article, has come to the conclusion that import of coal, as well as location of some future steel plants on the coast, would be unavoidable if India's iron and steel industry is to develop at a rate necessary for the country's economic growth.

Arguments Against

The above thesis by Dr. M. N. Dastur is based on the assumption that India's reserves of coking coal, being extremely limited, would not last for more than 40-50 years. But, according to another expert, Dr. A. Lahiry of the Central Fuel Research Institute, who participated in the Jamshedpur symposium, this assumption is not quite valid. On the basis of the detailed investigations carried out by his officers in conjunction with the Geological Survey and the Indian Bureau of Mines, he has claimed that the reserves of coking coal are many times more than what have been assumed. He has also questioned the feasibility of blending imported coals with local ones on the ground that the existing steel plants in India, barring perhaps one, have no facilities for such blending.

Another expert, Mr. S. K. Nanavati, has taken the line that the country could ill-afford the foreign exchange outlay on imported coal, although the delivered cost of foreign coal at a location like Goa might be the same as or less than that of coal sent from Jharia. In his view, exchanging imported coal from Australia with Indian iron ore, as suggested by Sir Charles Goodeve, Director of the British Iron and Steel Research Association, in his paper supporting the idea of coastal steel plants, is no solution, for the idea of spending the badly-needed foreign exchange earnings from iron ore for coal imports would not be realistic. Moreover, according to Mr. Nanavati, a strategic industry like steel should not, if possible, be dependent upon the uncertainties of import. Further, coke-oven batteries designed for low-ash coal would not be able to produce enough if high-ash Indian coal were to be used in an emergency in the place of imported coal. These objections have been upheld by Sir Henry Clay, a partner of a large British consulting firm.

The objections raised by Mr. Nanavati have, however, been rejected by Mr. Lalkaka who belongs to the consulting firm, Messrs. M. N. Dastur & Co. (Pvt.) Ltd. According to Mr. Lalkaka, coastal plants can carry at least six months' supply of imported raw material as in the United States, and can switch over to domestic coal, should an emergency prove to be of a longer duration. But he has himself admitted that the loss of efficiency in the event of using domestic coal would have to be faced. Another argument advanced by him is that the foreign exchange involved in coal imports would be more than offset by import savings on steel. According to a study made by his firm for the Union Ministry of Steel and Heavy Industries, a half-million-ton iron plant in Goa could achieve foreign exchange viability, even if it exports only 25 per cent of its output. Such viability would improve, if an integrated steel plant is set up at Goa and higher-cost steel exported, instead of iron ore.

It would be seen from the foregoing review of the arguments relating to coastal steel plants that opinion among experts on their feasibility and economics is divided. The Government might, therefore, have to set up a technical committee to examine this question thoroughly before it takes a policy decision thereon.

NUCLEAR POWER FOR DEVELOPING COUNTRIES

The prospects and problems of nuclear power in developing areas have been discussed in a paper presented, on the 5th instant, by the International Atomic Energy Agency to the U.N. Conference on Science and Technology at Geneva. The paper summarises the power reactor types already in commercial use and those which seem particularly promising for the future. It gives the following conclusions on the basis of current technical and cost data:

(a) The possibility of producing nuclear electricity on an industrial scale has been demonstrated on several reactor systems operating under conditions of great reliability and high utilisation factors. It is about to be confirmed for several other types expected to start operating in the near future.

(b) The generating costs expected to be achieved by some of the large reactors under construction in advanced countries would be competitive with those of conventional stations of the same size operating in relatively high-fuel-cost areas. These estimates still have to be fully tested since no power reactor has been in operation for more than seven years and, in most cases, much less.

(c) An intensive effort at developing reactors of smaller size in the 50 M.W. range is yielding important results. The variety of the systems investigated leads to a rather wide range of costs, all of which are considerably higher than for large reactors.

(d) The question of introducing nuclear power reactors for developing countries with limited resources of conventional energy is, therefore, beginning to change from one of principle to one of suitable timing.

(e) The problem of timing is, however, of fundamental importance and the best possible investment of large capitals depends on its correct solution. This solution must be based on a careful analysis of existing domestic energy resources, of forecasts of future electric power demand and of the costs of alternative plans for meeting this demand. It must, at the same time, make allowance for the relatively long period required for the bringing into operation of a nuclear power plant, as well as for the importance of this plant for the future nuclear power programme of the country concerned.

On the materials side, says the paper, attention should be paid to the availability of uranium, thorium and beryllium in the face of a likely future nuclear power expansion. Total known resources of uranium recoverable at an economic price are estimated at one million tons in the free world. The present production trend is downward and stood at 35,000 tons in 1961, which figure will be voluntarily reduced in the next five years. Estimates for the immediate future assure a surplus of supply over demand. The thorium reserves are also estimated at one million tons, with demand considerably less than that for uranium. For beryllium, however, it is considered likely that the reserves and production will be inadequate to meet future needs, but the situation would improve if beryllium minerals could be economically concentrated.

The paper concludes: "The coming decade, designated as the Decade of Development, will be very important for nuclear power. By the end of that period, if expectations are correct, nuclear power will cease to be a question of experiment and of testing of prototypes and will become an established part of the world's industry. The Agency is prepared to perform its role in this development."

SONE BRIDGE PROJECT

The Grand Trunk Road (National Highway No. 2) is the direct route connecting Delhi with Calcutta. This highway is bridged throughout its entire length except at the point where it crosses the river Sone at Dehri-on-Sone through a causeway. As heavy accumulation of sand takes place after every flood, this causeway has not been giving satisfactory service. Consequently, through traffic between Delhi and Calcutta, at present, has to detour from the Grand Trunk Road via Arrah-Patna-Baktiyarpur and cross the river Sone on the road decking provided under the railway bridge at Koelwar, thereby covering an additional distance of 120 miles.

This difficulty will be removed when the proposed high-level road bridge at Dehri-on-Sone is completed in 2½ years from now. The foundation-stone for this two-mile-long bridge, which will cost Rs. 2.7 crores, has just been laid by Mr. Jagjivan Ram, Union Minister for Transport and Communications. The project is to be financed and administered by the Union Ministry of Transport and Communications. It forms part of the scheme that has been undertaken with the help of the credit of $60 million (Rs. 29 crores) received from the International Development Association for improving certain selected National Highways in India. When completed, the Sone road bridge, which will be the longest in Asia, will help speed up road transport between north-western and eastern India.

NEW PRODUCTS AND PROCESSES

New Type of Deck Crane

A NEW and compact type of electro-hydraulic deck crane has been developed by AB Hägglund and Söner, Ornsköldsvik, a Swedish engineering company specialising in industrial equipment. The crane includes a Swedish-invented hydraulic high-torque, low-speed motor requiring no gearing. The cone-shaped deck crane is designed as a self-contained unit with all the machinery enclosed in the crane housing, thus being completely protected and taking up a minimum of space. All crane movements are hydraulically driven, which affords smooth operation with infinitely variable speeds. The system also ensures a rapid operating cycle with simultaneous combination of all movements of hoisting, luffing and slewing. The cranes, which can be erected on a mounting base welded to the deck, are manufactured in standard units with load capacities of between 3 and 15 tons. The maximum jib radius is 24 metres. The crane is supported on a ball bearing slewing ring. The top part of the cone contains the operator's cab with selector levers, a cabinet for electric equipment and a panel for pressure readings. The jib is an all-welded box construction made from high-quality steel plate and the rope pulleys are carried in SKF ball bearings. The drive consists of a vertically mounted electric three-phase motor, which drives three hydraulic pumps, one for each movement of hoisting, luffing and slewing. The gears and pump assembly, with valves and piping, are attached to the bottom of the lid of the oil tank. The pumps supply oil to the three low-speed hydraulic motors for the hoisting winch, the luffing winch and the slewing mechanism. The motor for the hoisting winch is flange mounted direct on the drum, the rope speed—controlled by a lever—being continuously variable from zero to maximum in both directions. The luffing winch and the slewing winch have the same type of motor. The high-torque motor used in this crane is based on a system developed by the Swedish inventor Carl-Ivar Wadefelt. It is a radial piston type motor delivering constant torque at all speeds, thus dispensing with the need for speed reducers. Since the starting torque is equal to the maximum torque there is thus no need for over-sized pumps in the installation to compensate for reduced starting torque. Besides for deck machinery, it is reported to be suitable for a wide variety of purposes where high torque with maximum efficiency is required, such as in conveyors, heavy machine tools, locomotives, mixers, etc.

Reeds Reproduce also by Seed

New facts on the reproduction of reeds have been disclosed by Professor Ake Gustafsson, internationally known plant genetician at the Royal Swedish School of Forestry, Stockholm. Contrary to what has been believed, reeds produce seed, he maintains. Up to the present time it has been an accepted fact that reeds reproduce only through their stems and roots. In an interview in the Stockholms-Tidningen, Professor Gustafsson relates how he and his collaborator Dr. Milan Simak by means of an X-ray method developed by them as early as 1933 succeeded in finding reed seed. Before applying this method—originally developed for investigating forest seed—Professor Gustafsson had been studying reeds in many parts of the world; along Sweden's coasts, in North America, the Sahara and India, without finding a single seed. However, when X-raying 3,000 reed flowers in 1960, Professor Gustafsson and Dr. Simak discovered 116 seeds. Less than 3 per cent of the plants contained seeds with mature embryos. In 1962, the analysis of 2,700 flowers produced only five seeds and none of them contained embryos. The seeds were sown at the School of Forestry and grew into plants which provided the final proof that even reeds have "sex life." The fact that reeds do not reproduce more often through seeds is probably due to the genetic homogeneity of the tight-growing reed stands, Professor Gustafsson says. This gives rise to self-sterility.

Vacuum Plating Technique

Development of a new process that prevents embrittlement of steel parts caused by cadmium plating, long a serious engineering and manufacturing problem, was announced by the Lockheed-California Company, U.S.A. Steel-weakening hydrogen embrittlement can be eliminated completely by using a vacuum cadmium plating technique perfected by the Lockheed-California Company in conjunction with Anadite Inc., engineers of the firms reported. It replaces the conventional electrolytic cadmium plating method which, despite a number of good qualities, has the major drawback of producing hydrogen embrittlement. The new vacuum plating technique, it was pointed out, meets the requirements of all military specifications, including durability, adhesion, and corrosion-resistance. Now being used successfully on various steel parts for Lockheed aircraft, vacuum plating can be employed for items ranging in size from a tiny pin to a huge landing gear segment. In the new process, the steel parts are plated by condensation of vapourised cadmium upon them in a vacuum chamber. No electrical current passes through the parts at any time and they remain at practically room temperature throughout the operation. The throwing power of the vacuum process exceeds that of conventional plating and a uniform coating is obtained in high, low or recessed areas according to the engineers.

New Building Technique

Despite several weeks of severe weather, which considerably reduced building site activities in Britain, one construction firm, Richard Costain Ltd., London, using a new building technique, has continued normal working. This is the Jackblock method, whereby the roof and top storey is built first and raised by hydraulic jacks. The other storeys, reversing the usual order, are then built and raised by jacks. At the Jackblock site in Coventry, where a 17-storey block of flats is being built on these lines, no men have been laid off, there has been no short-time working, and building progress has been maintained to schedule. Cladding of the upper floors is completed at low level so that the finishing trades operate in the dry. Surrounding the three lower floors is a large plastic tent which keeps out the weather, and blower heaters are installed for use when it is cold. This winter's freeze-up has tested the efficiency of the system. With the site covered in snow and temperatures below freezing, the pouring of concrete has continued without a hitch.

Spring-locking Bolt

A bolt that will spring-lock immediately in place, should its nut vibrate off in aircraft, missile, or a 25,000-m.p.h. space vehicle has been developed by the Lockheed-California Company. Invented by Lockheed engineer, Mr. Charles D. Stewart, the new "fail-safe" bolt is as simple as the paper clip or safety pin—and potentially as important. Lockheed engineers believe the self-retaining bolt will have widespread application in aerospace technical areas where vibration is a problem. This would include planes, missiles, other spacecraft and engines. The bolt features an integral, hairpin-type spring clip whose legs compress into grooves in the threaded portion of the bolt when the nut is tightened. Should the nut loosen, the legs merely expanded so that the bolt cannot slip from its mounting hole. Tests have shown, note engineers, that the spring clip bolt will be more reliable and foolproof than safety devices in use now—cotter key-pins, safety wires, and lock nuts.

Machine for Stitching Wood

Vickers-Armstrongs (Engineers) has introduced two new machines for wire stitching timbers used in packaging. The first, for wire stitching on the flat—slats to battens—produces a wire stitch of a form which has been proved to have substantially the same holding power as the conventional type which leaves exposed wire points. But both wire points are buried deeply in the material, says the company. This leaves both surfaces free from objectionable projections and the appearance of the wire stitching is the same when viewed from either side. The second machine is for making up the flats ready for packing and to secure the lids after packing. Tests are said to have shown that the force required to disturb the hold of such a stitch in light timber is ample to give satisfactory loading specifications for man-handled packages.

High Tenacity Staple Fibre

The Birla Education Trust has succeeded in discovering a new process of manufacturing high tenacity staple fibre, thereby overcoming one of the handicaps of staple fibre vis-a-vis raw cotton. The research was undertaken by the Trust at the instance of the Gwalior Rayon Spinning, Weaving and Manufacturing Company Ltd. Unlike raw cotton, staple fibre, when wet, loses its tensile strength and the management of Gwalior Rayon has long been engaged in finding some way of getting over this handicap so as to facilitate a freer use of staple fibre in place of raw cotton. At last, after considerable research, the Pilani Education Trust has been able to discover a special process. The process, which has been patented by the trust, has been assigned to Gwalior Rayon. The new process should facilitate increased use of staple fibre in the country in place of imported long staple cotton costing crores of rupees.

Safe Electric Socket

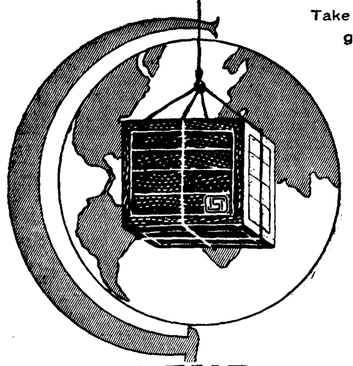
After several years of research, a Swiss electrician has just produced a safe electric socket. The "LIWA" device is suitable not only for ordinary two-pin plugs but also for three-pin plugs (one for earthing); it is designed in such a way that the current cannot begin to flow until the plug is pushed fully home; it is, therefore, impossible, if the wires are properly connected according to the wiring diagram, for anyone to receive an electric shock. It is no longer possible, for instance, for a child to get an electric shock by inserting a metal object such as a nail, screwdriver, pencil, etc. into one of the holes of the socket, just as it is impossible to be electrocuted by inadvertantly touching the two pins, when inserting or removing the plug. The "LIWA" safety socket, which has been approved by the appropriate trade organisations, is already on sale in the Swiss market.

Greater Mine Safety

Greater mine safety against coal dust explosions can result from a British portable nucleonic instrument shown at the Physical Society's Exhibition in London recently. Coal dust can be made non-explosive if it is overlaid with a layer of limestone powder, and the instrument enables an immediate check to be made without bringing samples to the surface. The instrument uses the principle that limestone can "back scatter" beta particles from a radio isotope better than coal dust, and in this way can be calibrated to give a safety officer an immediate warning of danger. It can also be used—with different detector heads—on other mineral mixtures as an aid to prospectors.

ISI AND EXPORT DRIVE

Boost India's exports. Create confidence in the goods sent abroad by assuring the overseas customer that he would receive quality.



This is possible if the goods exported conform to accepted standards.

The Indian Standards Institution (ISI) has developed over 2000 standards for industrial and consumer goods. It also provides for the certification of products through ISI Certification Marks Scheme. The ISI Mark on a product is a third party guarantee of dependable quality to the consumer and a symbol showing that the product has been made according to a well-defined system of quality control.

Take advantage of this scheme. Produce goods to accepted standards. Get the licence to affix ISI Mark on your goods.

Build for yourself a name for quality in overseas markets.

MONTHLY ECONOMIC REVIEW OF U.K.

BREAKDOWN OF TALKS WITH E.E.C.

BRITAIN SHOULD STRIVE FOR GENERAL TARIFF REDUCTIONS

By W. T. C. King
EDITOR OF *THE BANKER*, LONDON

BY far the most important development in this past month has been the final breakdown of the long negotiations between Britain and the Six to determine a basis on which Britain could join the European Economic Community within the terms of its establishment by the Treaty of Rome in 1957. This breakdown has shattered the hopes of the British Government and of a wide sector of the British public, who saw Britain's adherence to the E.E.C. as in the clear line of progress, provided only that the requisite conditions were such as would enable her to meet her obligations to the other members of the Commonwealth, to her fellow members in the European Free Trade Association, and to her own agriculturists.

The blocking of this line of progress must have far-reaching implications, political and economic, not only for Britain and her associates in these two wider groupings but for the whole Western alliance. It will inevitably be some time, however, before any but the most general assessment of the likely effects becomes feasible. No clear picture has emerged, as this letter is being written, within a few days of the final collapse in Brussels.

Circumstances of Collapse

The prevailing uncertainty is partly attributable to the circumstances of the collapse. In the words of the Prime Minister, Mr. Harold Macmillan, the 16-month-long Brussels talks broke down "not because they were going to fail, but, curiously enough, because they were going to succeed." In spite of the immense technical difficulty of reaching a basis of detailed economic conditions acceptable to the Six and at the same time consistent with the threefold pledges Britain had given, the Government was confident that the requisite formula would be found. But for that very reason, it seemed, President de Gaulle stepped in and brought the whole exercise "firmly and rather brutally to an end." A clear warning that this might happen had indeed been given a fortnight before, at the President's astonishing Press conference held on 14th January. He then said, among many other things, that, if Britain entered the E.E.C. then other countries of the E.F.T.A. might enter, and that this would "completely change the whole of the actions, the agreements, the rules which have already been established between the Six, because all these States, like Britain, have very important peculiarities. Then it will be another Common Market...." Such a community might grow further and "ultimately it would appear as a colossal Atlantic community under American dependence and direction...not at all what France is doing or wanted to do...." For this overriding political reason, the way was blocked by the French Government, in spite of all appeals from its five partners in the Treaty of Rome.

British spokesmen have said that this exclusion at this juncture will not divert the ultimate course of history, that the wider partnership is likely to be developed in the end, and that, in the meantime, Britain must not and will not turn her back on Europe. President de Gaulle himself did, indeed, throw out the suggestion of an "accord of association designed to safeguard exchanges"—by which he presumably meant trade between Britain (and her partners) and the Six. It is much too soon to guess whether any arrangements of that sort will be thought desirable, if feasible. But the Prime Minister has made it plain that the Government had not formulated any alternative to its European policy "in the sense of a ready-made plan"; and that consequential decisions would be taken after taking counsel again with the nations of the Commonwealth, of E.F.T.A., and with the United States. The broad aims of policy will still be the same, however, as those that encompassed the approach to the E.E.C.; above all, there will be no swingback into protectionism. The underlying purpose, as defined by the Chancellor of the Exchequer in his first public speech after the breakdown, would be to "build a modern, highly efficient economy...dedicated to the principle of expanding trade throughout the world on the most free and liberal system attainable."

It is everywhere recognised that the task of building the efficient economy will now be more difficult in most ways than it would have been had Britain entered the E.E.C. The dismantling of tariffs within that Community will create for the manufacturers within it a greatly enlarged market, not only giving them opportunities for E.E.C. trade, but, by that process, making them more efficient to compete in third markets. As this economic evolution proceeds within the Six, British manufacturers will have to face the keener competition in third markets, without participating in the special opportunities within the markets of the Six.

The Most Proximate Effect

At the moment, the process of tariff dismantling within the Six has run half its course. The last reduction took place at the end of October, bringing tariffs as between the Six down to 50 per cent of their original basic level. The next planned reductions, of 10 per cent each, are due on 1st July next, at the end of 1964, and at the end of 1965; the residual 20 per cent is due to disappear at the end of 1969, but there is a proposal to extinguish it three years before then. The failure of Britain to join the E.E.C. at this juncture does not mean, therefore, that British industry will be suddenly exposed to any major new competition. The most proximate effect, indeed, will be to save it from competition, in the home market, that would otherwise have developed as Britain, on joining the E.E.C., brought its tariffs into line with the reductions already made by the Six. That expected spur to efficiency in British industry will not now be applied automatically. On the other hand, that same spur is already being applied to manufacturers within the Six, and it will become progressively more effective.

On the other hand, two other consequences in the sphere of tariffs will have advantages for Britain and for other members of the Commonwealth, at least on a short view. The dismantling of the system of Commonwealth preferences to which Britain would have been committed had she joined the E.E.C. will not now take place. Britain's balance of payments will not, therefore, be burdened with the deterioration in the terms of trade that would have resulted from any consequential switching of food imports to higher-cost European sources of supply, nor will Britain's domestic price level be saddled with the extra cost of either such imports or of the levy that would have been imposed on any continuing "cheap" food imports from the Commonwealth. Secondly, the process of establishing the common external tariff around the Six will not be wholly disadvantageous to British trade; the common tariff is being achieved by levelling down the above-average tariffs as well as by levelling up the low ones, so that, for certain products in certain markets within the Six, British manufacturers will experience some offset to the disadvantage they face through the improved position of their competitors.

A Vital Point

One of the few conclusions to emerge from a first survey of the new circumstances is, indeed, the importance for Britain of striving for tariff reductions generally—in part in the hope of keeping down the common tariff of the E.E.C. Necessarily, the lower that particular tariff wall is the less will be the loss of opportunity for British manufacturers from their exclusion from the free trade that will obtain within the E.E.C., and the less will be the relative advantage enjoyed by their E.E.C. competitors either within the Six or in third markets. This vital point has, indeed, been quickly taken up by the British Government. On the morrow of the breakdown in Brussels, President Kennedy's special representative for trade negotiations, Mr. Christian Herter, who was in Europe to explore the next steps in liberalisation, added London, at the British Government's invitation, to his itinerary and had discussions with the Chancellor of the Exchequer, the President of the Board of Trade, and the Foreign Secretary. In these talks, Mr. Herter was assured that Britain wished to work "clearly and urgently" with the United States in the drive for lower tariffs. The next official moves on this front will be those in preparation for the so-called "Kennedy round" of negotiations for tariff cuts within the framework of the General Agreement on Tariffs and Trade (G.A.T.T.), a round made possible by the wide new powers obtained by the President under the American Trade Expansion Act passed last autumn.

The other clear conclusion in principle is that it is more than ever important now for Britain's economy to be organised for maximum efficiency; but it is far from clear yet what, if any, new measures may be devised to reinforce existing policies aimed in this direction. The principal gap caused in this sphere by the Brussels breakdown arises from the disappearance of the threatened spur of sharper foreign competition within Britain's home markets. One of the most important questions now, therefore, is whether some alternative spur could, or should, be applied. In the present climate of underemployment in the domestic economy, the weapon of disinflation is no longer appropriate as the means of intensifying competition. Some unofficial commentators, accordingly, are already advocating for this purpose unilateral tariff cuts by Britain if agreed reciprocal reductions prove to be insufficient or too long delayed. Such a policy, it is contended, would provide one of the best ways of underwriting the effort now being made to expand the domestic economy—by helping to ensure that rising demand benefits efficient rather than inefficient producers, and that a fuller utilisation of productive resources really does bring about a reduction in unit costs.

MEETING INDIA'S DEMAND FOR ELECTRONICS EQUIPMENT

In order to meet the big demand in India for electronic communications receivers, the Racal Electronics Ltd. of Bracknell in Berkshire (England) has concluded a licensing agreement with the Bharat Electronics Ltd., Bangalore, for the manufacture in India of Racal RA. 17 communications receivers. The agreement includes, as well as the receiver, various auxiliary units for extending the facilities of the equipment. The Racal will supply a number of complete units of the equipment, followed by sub-assemblies and later kits of components to Bharat Electronics in accordance with a phased programme. Ultimately a large proportion of the components will be made in India by the Bharat Electronics. Besides supplying manufacturing information, the Racal will aid the Indian firm by providing technical assistance at Bangalore and training facilities for Indian engineers in Britain.

Trade with Canada

If you are interested in Canada as a field for trade or business expansion, you will find The Royal Bank of Canada a useful ally. Branches from coast to coast. Specialized services for foreign traders available. Ask your banker. Enquiries invited. Correspondents the world over.

London Offices—6 Lothbury, E.C.2. B. Strath, Manager.

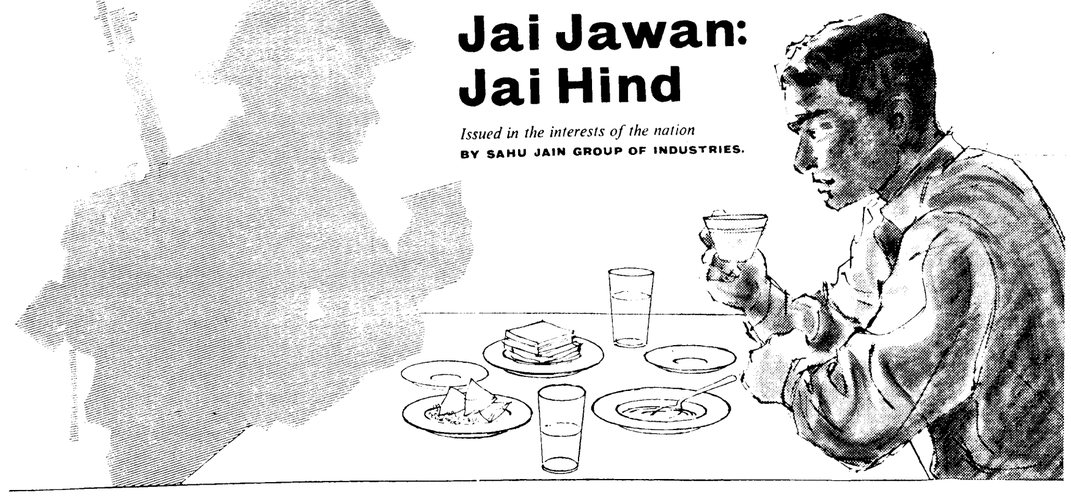
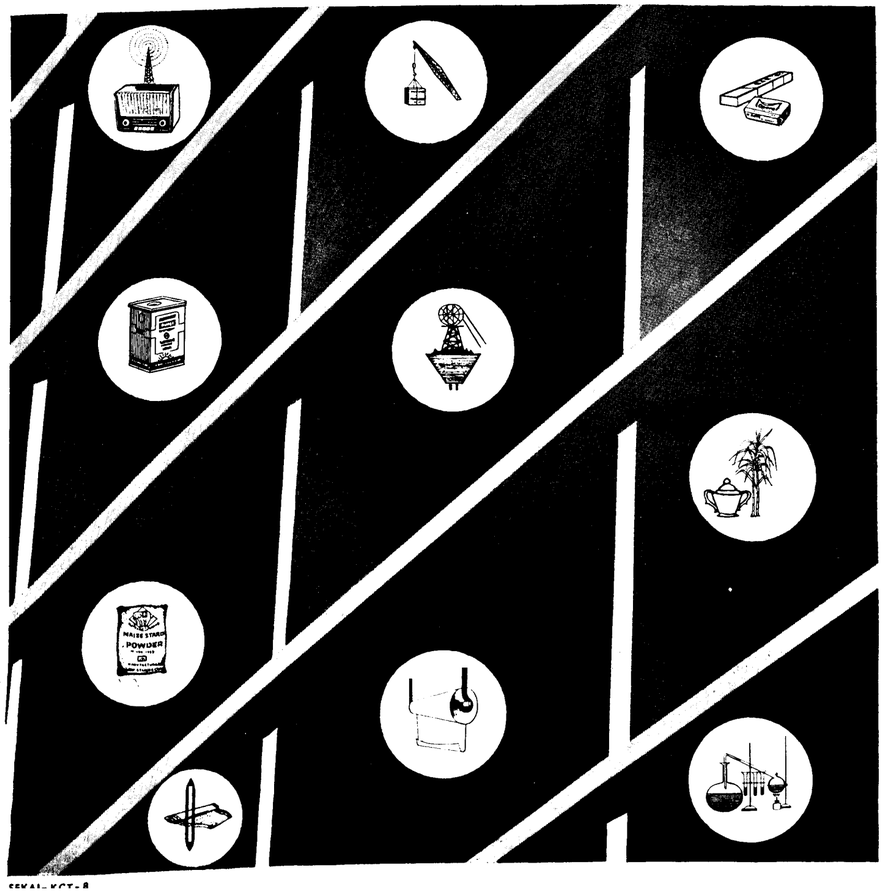
THE ROYAL BANK OF CANADA



Incorporated in Canada in 1869 with limited liability.
Over 980 branches in Canada, the Caribbean area and South America.
HEAD OFFICE: MONTREAL. OFFICES IN NEW YORK AND PARIS
Assets exceed $4 500,000,000



An adventure with austerity

Little things count a lot. A small self-denial here, a certain measure of austerity there, and we have the moral weapons that it takes to throw back the Chinese aggression. Even sitting at table for lunch or dinner can in itself turn out to be a quaint adventure with austerity. To feel the presence of an unknown, nameless, but nevertheless courageous jawan sitting with us to share our meal can be an exalting experience. Even if we personify our entire defence effort in one such individual, feel his presence intensely, realise the lengths to which he is prepared to go to safeguard our freedom, our hearth and home, our way of life, we have begun to press into service our secret weapon—austerity.

REAR WINDOW...

If you take a rear window view of the House of Thapar, you will discover that our manifold business activities have grown in response to the requirements of our Country's developing economy. The pattern of demand is getting diversified, and we, in our humble capacity to meet the expanding demand in the country, have increased our activities. This is the secret of our growth, our expanding network of offices and factories. Today, we produce a variety of goods which the country needs—paper, sugar, textiles, radios, electricals, chemicals and industrial equipments, to name only a few, of our activities. In addition, we have a division devoted to imports and exports.

MARTIN BURN LOOK BACK TO OVER
180 YEARS OF SERVICE TO INDIA

... TO BE ABLE TO COMPUTE THIS SERVICE BY DECADES, not by years alone ... to recall that our creed has consistently been the development of our country's resources through engineering and allied enterprises ... to take pride in planning that makes the many units in our organization fall into a rational and complementary group and each one a leader in its particular field, a position which some of them, early pioneers in India, held even in the last century. For us looking back is a worthwhile proposition—an incentive to *move forward*.

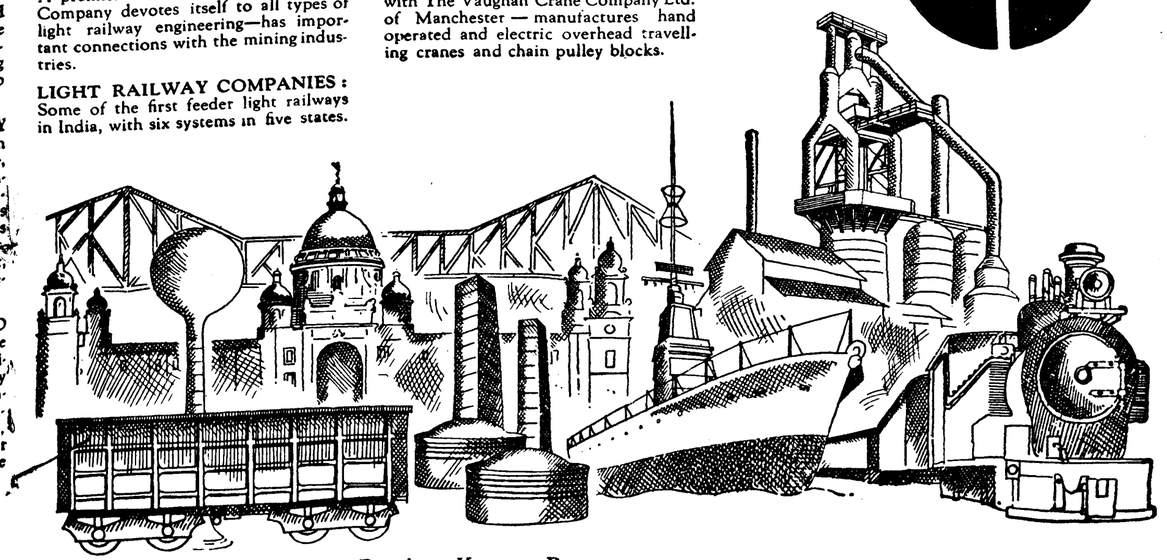
AMONG THE COMPANIES IN THE MARTIN BURN GROUP ARE :

THE INDIAN IRON & STEEL CO. LTD. : With a million ton integrated steel plant at Burnpur, the largest foundry in the Commonwealth at Kulti and its own collieries and iron ore mines, IISCO has an enviable record in production efficiency.

BURN & CO., LTD. HOWRAH WORKS : Pioneers in foundry practice in India, in structural steelwork fabrication and the manufacture of rolling stock—the origins of the Company go back to the year 1781.

BURN & CO. LTD., REFRACTORY & CERAMIC GROUP : Apart from stoneware pipes and chemical stoneware, the works of this group—eight in number and located in four states—manufacture nearly all types of refractories to meet the requirements of India's steel industry, power undertakings, railways, ordnance factories—in fact, any industry requiring refractory material for the maintenance of furnaces.

THE INDIAN STANDARD WAGON CO. LTD., SANTA : The oldest Indian unit started for the specific purpose of manufacturing railway rolling stock—has been mainly responsible for building up the wagon building industry. Also manufactures springs, forgings, pressings and stampings for heavy industry as well as automotive components.



THE HOOGHLY DOCKING & ENGINEERING CO. LTD. : Established in 1819, the Company has a shipbuilding yard, a dry dock and extensive workshops at Salkia.

ROBERT HUDSON (INDIA) LTD. : A premier concern in its own field, the Company devotes itself to all types of light railway engineering—has important connections with the mining industries.

LIGHT RAILWAY COMPANIES : Some of the first feeder light railways in India, with six systems in five states.

ELECTRIC SUPPLY COMPANIES: Pioneers again in the generation and distribution of domestic power in India—serve 45 towns in Uttar Pradesh and Madhya Pradesh.

THE VAUGHAN BURN CRANE COMPANY LTD. : A collaboration with The Vaughan Crane Company Ltd. of Manchester — manufactures hand operated and electric overhead travelling cranes and chain pulley blocks.

THE PLACE OF POWERLOOMS IN INDIA

TASK BEFORE ASOKA MEHTA COMMITTEE

By A Special Correspondent

THE appointment of a committee to examine, among other things, the structure and growth of the powerloom industry in India will be widely welcomed, since the investigation will give a good opportunity for making a realistic reappraisal of the Government's policy towards the three branches of our cotton textile industry, namely, the mills, the handlooms and the powerlooms. The history of powerloom industry of this country does not date back to more than five or six decades. It began its career modestly and small-scale units came into existence in various parts of the country, more especially in the former Central Provinces and Berar, the Punjab, Hyderabad and Mysore. The Bombay Province, however, won the pride of place among them by becoming the home of the largest number of powerlooms. The ready availability of power and yarn and the excellent transport facilities were most helpful for their proliferation.

Doubtful Figures

No two authorities appear to agree on the actual number of the powerlooms that exist and operate in the country; but there is no conflict of opinion that the expansion of this sector has been phenomenal. The Bombay Industrial Survey Committee, reporting in 1939, stated that there were only 2,500 powerlooms in the province, but, in August 1941, the Fact-Finding Committee (Handloom and Mills) was authoritatively informed that the number could not be less than 6,400. The all-India figure was stated to be 15,000. The Committee, which reported in 1942, noted that the growth of this enterprise adversely affected both the mills and the handlooms. Ranged against the organised sector, the small powerloom factories enjoyed a distinctive advantage by turning out certain speciality fabrics not suitable for mass production. Their position was much stronger in relation to the traditional handlooms which, on account of their non-viability and technological backwardness, could not hold their own against the newcomers.

The Textile Enquiry Committee, better known as the Kanungo Committee, which reported in September 1954, stated, on the basis of the statistics made available to it by the Textile Commissioner, that there were 24,071 powerlooms operating on cotton yarn. Drawing attention to the fact that this sector was free from price and distribution control and from the obligation to pay the excise duty, the Committee said that, since 1951, the installation and the working of powerlooms had been stringently controlled, in order to ensure "the maximum possible share to the handloom industry from out of the meagre available supplies of yarn." Its most striking recommendation, however, was for the gradual conversion of handlooms into semi-automatic looms or plain powerlooms, to be operated in the decentralised sector. The process of conversion was to be gradual and should be completed within a period of fifteen to twenty years at an estimated cost of Rs. 12 crores.

The Working Group for Handloom Industry, in its Report of September 1959, evaluated the progress made with the Kanungo Committee's conversion scheme and concluded that it was most disappointing. It pointed out that, as on 31st March 1959, out of 13,377 looms sanctioned for 12 States and two Union territories, only 1,118 looms had been received in five States and 572 installed and production commenced. "We consider," wrote the Committee, "that a realistic estimate of the number of powerlooms that can be installed by the end of the third Five-year Plan would be only about 13,000, including those installed in the second Plan period." Since the installation of 13,377 looms had already been sanctioned, the Committee urged that no further sanction was called for.

Plea Rejected

In view of this recommendation and the declared policy of the Government to extend greater concessions to the labour-intensive handloom sector, the handloom interests pleaded with the authorities to stop the increase in the number of powerlooms. In a resolution, passed by the All-India Handloom Convention on 20th November 1960, the Government was asked, among other things, "to stop further introduction of powerlooms; to place the existing powerlooms on par with mills and to scrap all unauthorised powerlooms." But the plea was rejected.

The uncertainty both about the Government's policy and the extent of powerloom industry persists, despite official statements and statistics. According to the figures furnished to the Lok Sabha on 13th March 1961, there were 18,712 unauthorised cotton powerlooms in the country, the number of non-cotton powerlooms belonging to this category being 11,540. In June 1962, the Union Minister for International Trade told Parliament that 12,482 unauthorised powerlooms had so far been regularised and that similar steps were being taken in the case of the rest. It was, however, not evident from the Minister's statement why the work of registration had taken such an enormous time, despite the fact that the census of these looms was claimed to have been completed as long ago as in the last quarter of the year 1960. Besides, anyone with the slightest acquaintance with the industry could say that the official figures relating to the unauthorised powerlooms were patently underestimated.

There cannot be any doubt that the Government's original policy of restricting the number of powerlooms so that the handlooms may receive larger quantities of free yarn has suffered an eclipse. Explaining the latest official policy on this issue, Mr. Manubhai Shah stated in Parliament on 23rd January 1963 that powerlooms were not being allowed to be installed except for "vocational purposes." He pointed out that the scheme for the conversion of handlooms into powerlooms was in operation till September 1961 when it was discontinued except in the case of irrevocable commitments made earlier. At the same time, the Minister explained that powerlooms were being allotted to State Governments for distribution among the co-operative societies formed by the handloom weavers.

The conclusion to be drawn from these official pronouncements is that there has been a continual addition to the number of powerlooms, which, according to an unofficial but dependable estimate, now total 110,000 in the country working on cotton. According to the same source, 75 per cent of these powerlooms are situated in Maharashtra. The point for consideration is whether all these looms have been registered, whether deliberate attempts are not being made to increase the number of powerloom workshops in order to secure exemption from excise duty, and whether the production of cloth by such a large and expanding sector can be only 350 million yards to 400 million yards a year. These are vital issues and it is to be hoped that the newly-appointed Committee will gather ample and authentic information about each of them.

Production Figures

If no accurate figures can be given about the number of authorised and unauthorised powerlooms, it is even more difficult to assess the output of cloth by this sector. The practice of giving separate statistics relating to handloom and powerloom production was abandoned by the Government in 1960, presumably to avoid the embarrassment of proving their accuracy. Nevertheless, the Union Minister for Commerce stated in Parliament in August 1961 that the volume of cloth produced on handlooms in 1960 was 1,860 million yards. The total cloth manufactured by the decentralised sector in that year was estimated at 2,200 million yards. Can it be seriously suggested that the powerlooms, numbering probably nearly one lakh in that year and capable of producing ten times the output of handlooms of that number, were content to turn out a paltry 340 million yards? It would, perhaps, be more reasonable if the split-up of 2,200 million yards is given thus: 800 million yards by handlooms and 1,400 million yards by powerlooms.

Surely, it cannot be the intention of our policy-makers that the various benefits that are being extended to handlooms at the cost of mills, should be allowed to be appropriated by the powerlooms which are in no need of official spoon-feeding. The disabilities imposed on the mill sector in order to patronise the handloom weaver are indeed all-comprehending. To mention some of them:

1. No mill can produce a new article without a license from the Government.
2. No mill can acquire or install or sell or dispose of any spindle or loom without official sanction.
3. No mill can produce printed cloth, if it did not do so in the basic period. If it was producing printed cloth before that period, it is not free to manufacture more than the allotted quota.
4. No mill can produce *dhotis* over and above a specified percentage of its production in the prescribed basic year.
5. No mill can produce those varieties of cloth which have been reserved exclusively for the decentralised sector.

The result of these restrictions is that the mill industry is denied the benefit of resilience and has, therefore, to suffer from extreme rigidity and stagnation in its working.

Nor is this all. The policy of fragmentation that is being so vigorously pursued by the powerloom sector is rewarding to it not only in exempting it partially or wholly from the excise duty, but also in immunising it from various other obligations. Small powerloom workshops are bound by no factory legislation so that they incur no obligations or liabilities concerning the hours of work, holidays and welfare measures. Nor are the wages paid to powerloom operators amenable to statutory legislation. Social benefits like provident fund, Employees' State Insurance, gratuity and bonus which, together with the other non-wage elements, account for more than 25 per cent of the wage cost in the mill sector, are not extended to powerloom factories.

Financial Obligations

Fragmentation is helpful to powerlooms in making no or small contribution to the excise revenues. Assuming, as the Indian Cotton Mills' Federation does, that one powerloom produces 946 square metres of cloth in one month on one shift a day, the excise duty which the mill sector has to pay for this quantity of cloth is: coarse Rs. 80; lower medium Rs. 110; higher medium Rs. 139 or Rs. 140 in round figures; fine Rs. 298 or say Rs. 300, and superfine Rs. 424.7 or Rs. 425. In addition, mill cloth attracts yarn compounded duty at the rate of 1.2 nP per square metre, for coarse; 1.8 nP for medium categories and 2 nP for fine and superfine categories.

Compared to this levy, the imposition on powerloom establishments is most lenient. Establishments having not more than four powerlooms pay no excise duty at all, while those in which more than 49 but upto 300 powerlooms are employed pay only half of the appropriate rates for cloth produced by the mills. Since the lightness of the excise incidence is in proportion to the smallness of the powerloom factories, a great impetus is given to this sector to escape or to minimise its financial obligations to the Government by having recourse to fragmentation.

Committee's Task

The steps so far taken to stop fragmentation in the powerloom sector have proved ineffective. This is because of the Government's strange reluctance to enforce its decisions with firmness. When in 1958 factories employing more than 100 cotton powerlooms were precluded from taking advantage of the compounded rates of the excise duty, the powerloom interests vigorously protested against the measure on the ground that they were taken unawares and that imposition of standard rates of duties would drive their factories out of business.

The Government responded to their plea and declared in March 1959 that units employing more than 100 but not more than 300 powerlooms would be required to pay only the compounded duty. It was, however, made clear that the concession was being given only for a temporary period in order to enable the powerloom units belonging to this category to readjust their economy, the time granted being till the end of February 1960. But the concession was not withdrawn after that date. When the Central Budget for 1962-63 was presented on 23rd April 1962, the duty on powerloom factories having 50 or more looms was required to be paid at standard rates and not the compounded duty as before.

The powerloom interests refused to accept the change in the levy and, in response to their representations, the rates of duty on grey fabrics produced on powerlooms in one or more factories under the same proprietorship, having 50 and not more than 300 looms, were scaled down so that they amounted to half the rates applicable to similar varieties of mill cloth. This rate of reduction was to be in force upto 28th February 1963. Thereafter, that is, from 1st March 1963 till 29th February 1964, the duty was to be three-fourth of the rates applicable to mill cloth. It is clear that these measures are not calculated to encourage the creation of viable units in the powerloom sector. Since, under the present dispensation, factories with less than 50 powerlooms attract lower duties, the process of fragmentation continues without any check.

In the light of these facts, the only way by which the small powerloom units can be compelled to get into the co-operative fold is to withdraw the exemptions altogether and to grant them concessions fully or partially only if they join the co-operative societies. Formation of such societies will make it possible to bring about organisational reforms and to evaluate the strength and the weakness of the reformed units with precision. It will also facilitate the collection of statistics relating to every aspect of this sector.

The tasks that lie before the newly-appointed investigating body are thus clear. Besides making recommendation for bringing about this reform, the Committee should also examine the financial structure of this sector. A number of city-dwelling merchants are reportedly engaged in financing powerloom production in order to be able to buy cloth cheaply and to make abounding profits by selling it at competitive prices. One of the methods employed by them is, it is alleged, to supply yarn to the powerloom operators and have the cloth of their specification produced by paying the operators only the weaving charges. Not infrequently such cloth is understood to be palmed off to the consumer as mill cloth.

The matter calls for a thorough investigation. If this practice really exists and if it is allowed to flourish, then the very *raison d'etre* of encouraging the powerloom sector is defeated. The object of galvanizing and diversifying the rural and semi-urban economy by setting up small-scale enterprises in the countryside will not be realised, if the fortunes of such industries are dominated by city financial interests.

In conclusion, in a country like India, where the problem of unemployment is acute and where the economic planning bids fair to raise the level of living of her people, there is scope as much for the powerlooms as for the other two sectors. But it is in the interests of none if they are allowed to function either on the sly or without restraint. It is earnestly to be hoped that the Asoka Mehta Committee will make practical suggestions on how best the working of this sector can be regulated.

Is there anything to do now ?

Yes, There is so very much to be done to make sure that complacency and apathy do not rob us of the sense of national unity, of the spirit and will to accomplish and achieve which has inspired the nation. With fresh determination make your individual effort, your individual dedication to service and discipline.

- *Resolutely avoid unnecessary expenditure and forego luxuries.*
- *Ceaselessly wage your war on waste—in the office, in the home, at all times.*
- *Be resolute in work, whatever it may be, because each task efficiently done helps the national drive.*
- *Give your gold in the country's Service—Buy Gold Bonds. Rouse yourself from apathy, and Take Action.*

BE VIGILANT

—take in national preparedness

U.P. LETTER

UTTAR PRADESH FINANCES BUOYANT

GREAT REGIONAL DISPARITIES IN U.P.

From Our Special Correspondent

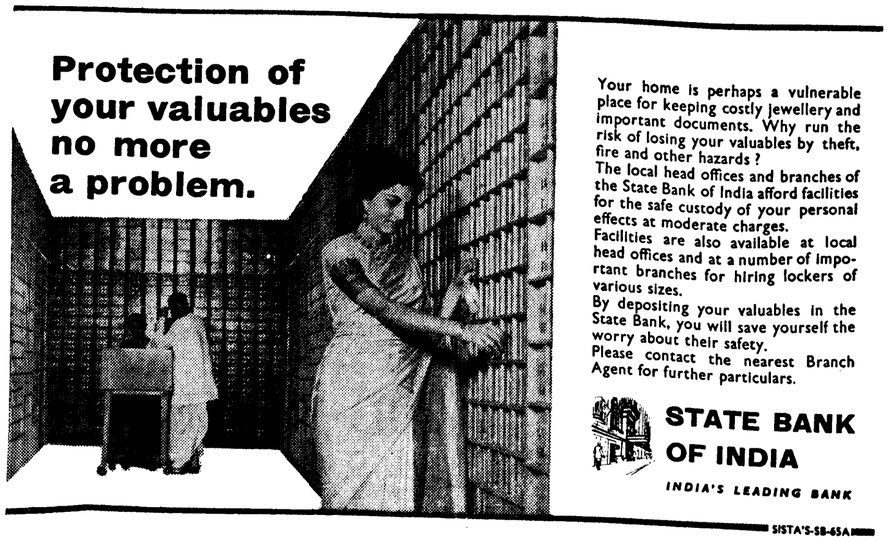
LUCKNOW, 16*th February*

THE U.P. Budget for 1963-64, which the State Finance Minister, Mr. Kamlapathi Tripathi, presented to the Vidhan Sabha on 15th February, shows that, excluding both the subventions and expenditure on account of the Plan projects, the total revenues of the State would amount to Rs. 184.82 crores, as against a total revenue expenditure of Rs. 172 crores, thereby showing a sizable surplus of Rs. 12.82 crores. But, including the Plan outlay in the third year of the third Plan at Rs. 90.64 crores and taking into account the Central Government's assistance and subventions, the total revenue in 1963-64 would amount to Rs. 201.82 crores as against a total revenue expenditure of Rs. 206.79 crores, thus showing a deficit of Rs. 4.97 crores. But, in spite of this deficit, the budget shows a marked improvement in the State Government's finances as the original deficit, without taking into consideration additional taxation, was Rs. 8¼ crores in the 1961-62 budget and Rs. 13¼ crores in the 1962-63 budget.

A remarkable feature of U.P. finances is that, in spite of the fact that the *per capita* income in U.P. has declined from Rs. 265 in 1955-56 to Rs. 260 in 1960-61 (at constant 1948-49 prices), the U.P. Government proposed additional taxation to the extent of Rs. 5.21 crores in 1961-62 and Rs. 13.07 crores in 1962-63 which are expected to yield an additional tax revenue of Rs. 4.10 crores in 1961-62 and Rs. 4.57 crores in 1962-63. The yield from additional taxation in 1962-63 would have been much greater but for the fact that the tax laws imposing the new levies were enacted too late in the current financial year. But the effect of these tax measures would be fully felt in the budget year. Partly because taxation has already been increased in the first two years of the third Plan and partly because the deficit of Rs. 4.97 crores cannot be considered excessive and is within the State Government's means, the Finance Minister has not proposed any additional taxation for 1963-64. But additional taxation in 1963-64 has not been ruled out and the Finance Minister has made it quite clear that in the budget year it might be necessary to levy additional taxation, if the attempts to collect old arrears, for which continuous efforts are being made, do not produce good results. It is unfortunate that the U.P. Government has not fully appreciated the fact that economy in public expenditure, both on the Plan and non-Plan outlays, might help to reduce the total revenue expenditure and thus to reduce the deficit. In the budget some economy measures have been included which would save the Government a sum of Rs. 1.25 crore in 1963-64, but, according to expert opinion, the scope for economy is much greater and it should be possible to save Rs. 5 crores instead of Rs. 1¼ crores which the Finance Minister has proposed, without in any way reducing the efficiency of Government departments.

Another method of reducing the budget deficit would be to reduce somewhat the Plan outlay. In the original draft of the third Plan for U.P., the total Plan outlay for 1963-64 was fixed at Rs. 103 crores, with Central assistance at Rs. 65 crores. The Plan outlay has now been reduced to Rs. 90.64 crores, with Central assistance at Rs. 57½ crores. This compares with the Plan outlay of Rs. 85 crores with Central assistance at Rs. 58 crores in 1962-63. Since U.P. is a border State it has become necessary to incur an expenditure of Rs. 7.09 crores on emergency measures such as the formation of Home Guards, organisation of the *Prantiya Rakshah Dal* force and Village Defence Force and the strengthening of the civil defence organisation and the police force. In view of this additional outlay on 'defence' measures, it would have been quite in order if the total Plan outlay had been kept at the same level, namely Rs. 85 crores, as in 1962-63 when the actual outlay on the Plan is not expected to exceed Rs. 80 crores.

Realism on Prohibition



A remarkable feature of U.P. finances, which distinguishes Uttar Pradesh from all the other States, is that the Government have shown the courage to scrap prohibition for all practical purposes. Before December 1962 11 districts and three pilgrimage towns in U.P. were completely dry and it was expected that more districts would become dry in the current year. But instead the U.P. Government have introduced 57 dry days in a year in the entire State. There are now no dry districts. In this way, it cannot be said that U.P. is not falling in line with the Congress policy of prohibition, but, in actual fact, the U.P. Government has scrapped prohibition. It has done the right thing, because this would not only increase Government's revenues but also safeguard the health of people who were taking to harmful intoxicants in the dry districts. It is an open secret that the policy of prohibition has failed and, instead of producing any useful results, it is causing all-round harm. It is to be expected that the other State Governments would take a hint from the example set by the U.P. Government.

Why is Eastern U.P. Backward?

Uttar Pradesh is an economically backward State. The *per capita* consumption of electricity, road mileage, industrial production, to mention only a few indicators, in U.P. is much lower than for the country as a whole. As a consequence, the *per capita* income in U.P. in 1961-62 was only Rs. 265, as against the all-India average of Rs. 292 (at constant 1948-49 prices). What, however, is worse, the State is not uniformly developed and the eastern districts of the State are exceedingly backward. Although adequate statistical data are not available, it is reasonable to estimate that the *per capita* income in eastern districts of U.P. does not exceed Rs. 240. Not only is the incidence of unemployment high, the wages of agricultural labour is as low as 25 nP per day, and the productivity of land much lower than the all-India average, the people of eastern U.P. are subjected to great devastation by floods, famine and epidemics every year. All these facts were brought to the notice of the eight-member study team of the Planning Commission and the U.P. Government under the chairmanship of Mr. B. P. Patel which recently visited the eastern districts.

Why have the eastern districts of U.P. remained relatively more backward than the rest of the State? It is a patent fact that the economic prosperity of any area depends on the rate of industrialisation. Except for sugar industry, the eastern districts of U.P. did not succeed in attracting industries partly because of an extraordinarily weak infrastructure with poor means of communication, low supply of electricity, lack of banking and other facilities in the area. In the other regions, the process of industrialisation was facilitated by the fact that some local industrialists living in a particular area thought up schemes and promoted them. As bad luck would have it, the eastern districts of U.P. have not produced entrepreneurs from the local population. The absence of suitable facilities and unhealthy conditions failed to attract outside entrepreneurs to set up enterprises in this area. It would have been expected that the Government of India and the U.P. Government would do something to fill this lacuna. But enough was not done in the first two Plans to industrialise this area. The Pant Study Team was asked by witnesses to consider the setting up of glass, paper, jute, distillery, and *khandsari* sugar industries in this region and to recommend that roads and bridges might be built and the supply of electricity to this area be increased. If concerted efforts are made, it is possible to industrialise this region, as there is plentiful supply of cheap labour, low cost land, and some consumer demand.

In the eastern districts of U.P., there is not only an absence of industries but agriculture too is not prospering. One reason is, as was pointed out by many witnesses to the Pant Study Team, that over 90 per cent of the land holdings are uneconomic and most of them are of less than half-acre each. Secondly, this region is subject to serious annual devastation by floods which makes it impossible to increase the agricultural output. Finally, the co-operative movement has made much less progress in this region as compared to the other regions of U.P. It is only when simultaneous attention is paid to all these aspects of agricultural development that it would be possible to make agriculture a profitable occupation in this region. The appointment of the Study Team has been responsible for focussing public opinion on the sad plight of people in this economically backward region and it is hoped that, by the end of the fourth Plan at least, it would be possible to secure a balanced growth of this backward region.

Your home is perhaps a vulnerable place for keeping costly jewellery and important documents. Why run the risk of losing your valuables by theft, fire and other hazards?
The local head offices and branches of the State Bank of India afford facilities for the safe custody of your personal effects at moderate charges.
Facilities are also available at local head offices and at a number of important branches for hiring lockers of various sizes.
By depositing your valuables in the State Bank, you will save yourself the worry about their safety.
Please contact the nearest Branch Agent for further particulars.

CUSTOMS UNION BETWEEN U.K. AND E.C.M.?

COMMONWEALTH NO ALTERNATIVE TO COMMON MARKET, SAYS MR. MACMILLAN

THERE is much speculation in Western European capitals on the nature of alternatives before Britain, now that the negotiations over its bid to join the Common Market have collapsed. In fact, the Common Market countries themselves, with the sole exception of France, are devising several measures designed to bring Britain into their club by circumventing President de Gaulle. Belgium, for instance, is reported to have prepared a plan seeking to establish a customs union for industrial goods between the U.K. and the Common Market. A customs union of this sort is intended to be only a temporary device, the ultimate object being to make the path easy for granting full membership of the Common Market to Britain. The customs union plan, no doubt, relates only to the reduction of tariffs between the U.K. and E.C.M. (and that too on non-agricultural goods alone) and imposition of common tariffs on industrial goods; this apparently does not ensure Britain the status of an active participant, economically and politically, in the evolution of a new Europe unfolding itself on the Continent. But this drawback in the customs union plan is sought to be removed to some extent by providing for a system of ministerial consultations possibly within the framework of Western European Union, pending the U.K.'s eventual entry.

It is so far not known whether the U.K. will fight shy of a plan for customs union as it did in the case of de Gaulle's undefined and vague offer of associate status. Britain, of course, has been emphasising for quite some time that it is prepared to accept the Rome Treaty without much reservations and it wanted nothing less than full membership of the Common Market. It, therefore, remains to be seen whether it will be ready to accept the customs union plan as the second best solution in the changed circumstances. Irrespective of the question of Britain's acceptance, the Common Market countries themselves are not in a position to take a unanimous decision on the new plan. There is no likelihood of France accepting the plan in its present form, since it has always been against the exclusion of British agriculture from any tariff reduction plan. Then there is the question of Commonwealth countries. What will their position be in the British market in a customs union of the sort proposed by Belgium?

Terms for Fresh Talks

Unless there is unanimity among the Six on any new plan, the U.K. is not likely to enter into fresh negotiations with the Common Market. This is one of the points made clear by Mr. Edward Heath, Lord Privy Seal, and the leader of the British delegation to the abortive Brussels talks, in his speech at the House of Commons last week. Without mincing words, he laid down the conditions for any new talks thus: "We agree that, if there is to be any alternative arrangement—whatever it may be—it must come from the whole Community. Secondly, it cannot involve another long negotiation. Thirdly, the good faith of all those in the negotiation must be demonstrated from the beginning, and the will to succeed must be there, as apparently it was not there in our negotiations for full membership."

Coming as they do from a person who has borne the brunt of French rebuff, these words are quite important. But there is no reason to believe that the U.K. is going to take up any uncompromising stand on this issue. Mr. Heath himself made it clear that Britain's policy would continue to be governed by the two considerations, namely, the desire to join wholeheartedly in the building of a wider Europe and to do nothing to obstruct it. His idea is to keep open and enlarge the channels of communication and consultation with Europe. He added: "We shall do everything possible to move closer together to the European countries and to work with them to create the sort of Europe which we want to see."

Britain's determination to keep open the door for negotiations with the E.C.M. does not mean that the U.K. has not taken to heart the reverse suffered at Brussels. Britain's mood was correctly interpreted by the Chancellor of the Exchequer, Mr. Reginald Maudling, when he observed that, with the suspension of the U.K.-E.E.C. negotiations, the U.K. was facing a great disappointment, but not a disaster. Hoping that the collapse of negotiations would not be of a permanent nature, Mr. Maudling expressed the view that the whole logic of history means that "we must see developing a united Europe in the long run within an Atlantic Community." He added, significantly enough, that "as science compresses our globe more and more, and as the Chinese millions stalks across the Eastern world more and more, the world will see the folly of European disunity."

Disappointment, but no Disaster

Despite his faith in the European unity, Mr. Maudling was realistic enough to concede that, with French intransigence, one road towards this goal was closed. He, therefore, said that Britain had to plan, for the time being at any rate, on the assumption that it was not becoming a member of the European Community. It was not enough, he observed, to say that other markets (other than the Six) were open throughout the world and that 84 per cent of U.K.'s trade was not affected by the Common Market. Drawing attention to the possibility of intensive competition in world markets from the Six, he urged the need for redoubling efforts to expand exports. He reminded all concerned that "what we face is a giant competitor, the size of the U.S., with a wage level not three times that of our own (as in the U.S.) but approximately the same." That means, he emphasised, the U.K. should hold down its prices to compete effectively with the Six in export markets.

A good part of the opening speech by the Prime Minister, Mr. H. Macmillan, was devoted to the question of promoting Britain's exports. Mr. Macmillan felt that Britain would have to increase exports without the competitive stimulus of European imports into the U.K. He was confident about creating that stimulus from within the domestic economy, partly by modernising the structure of industry and partly by encouraging a general climate of competition at home. The U.K., according to him, should enlarge the home market by all the measures of expansion which could increase consumer demand without undue pressure upon imports. Mr. Macmillan went a step further and said that it might be possible to find methods of helping exporters which would not conflict with international obligations. In effect, he was prepared to consider the question of granting some incentives to exporters.

Commonwealth Trade

Apart from strengthening the domestic economy, Mr. Macmillan was conscious of the need for consolidating and expanding trade with the Commonwealth and E.F.T.A. countries. He announced, in this connection, that a meeting of Commonwealth Trade Ministers would be held in London before the forthcoming ministerial session of the G.A.T.T. due to take place early next summer. Although he had no new plans up his sleeves to expand Commonwealth trade, he felt that the meeting could consider all economic matters of common interest. He further stated that he proposed to meet the Premiers of Canada, Australia and New Zealand very shortly. The Canadian Prime Minister, Mr. Diefenbaker, it may be recalled, had announced during the last Commonwealth Prime Ministers' conference at London that he had an alternative plan to Britain's move to enter the E.C.M. But, as Mr. Diefenbaker's own future is now in the melting pot and a general election is due in Canada very shortly, it is doubtful whether it is realistic for one to expect an elucidation of this alternative until the elections are over. Besides, there is little reason to believe that any argument of Mr. Diefenbaker (assuming he is returned to power) would convince Mr. Macmillan that there is large scope for expanding Commonwealth trade. The British Prime Minister has already discounted any such hope and expressed the view that a Commonwealth Prime Ministers' Conference would serve no purpose.

That there is no Commonwealth alternative to Britain's entry into the Common Market has been made amply clear by Mr. Macmillan. The Commonwealth, he said in Parliament, could not be a single economic unit in the sense of any other trading community (for instance, the U.S. or the Common Market) because of different stages of development and the different types of trade in which it was engaged. He went on to say:

"This is not to say that trade between Britain and Commonwealth countries cannot be extended. It must be. It is only to say that a uniform system cannot be applied between the Commonwealth countries because of the very variations which on the political and moral side represent its strength. This is an attitude shared by all the Commonwealth countries.

"It means, therefore, that neither an immediate Commonwealth Prime Ministers' Conference, nor any other conference, can devise, either in their interests or ours, a substitute for what we had hoped to obtain for us and for them through Europe."

Twofold Purpose

Mr. Macmillan is of the opinion that the Commonwealth would nevertheless serve a twofold purpose. Elucidating this point in Parliament, he said:

"What we must do in the Commonwealth falls into two categories. First, individual consultation, where special arrangements are under review or there are trade agreements to be made or renewed, and secondly, general consultation in any problem in which we can play a joint part.

"On the second aspect, that is, where we can have a corporate approach. There is a special field where we can and should work together. That is the approach to some of the problems presented by the various world agreements."

By the term corporate approach, Mr. Macmillan was referring mainly to the Kennedy round of negotiations for reciprocal tariff reduction envisaged under the U.S. Trade Expansion Act. He also recognised the need for granting special concessions to remove the obstacles to the trade of less developed countries. This is not merely a task of tariff reduction, but also covers, as Mr. Macmillan emphasised, quantitative restrictions and revenue duties "which inhibited the growth of trade not only for primary tropical products but also manufactured goods." These questions will come up for consideration at the proposed Commonwealth Trade Ministers' Conference to be held at London in April next. Mr. Manubhai Shah, Minister for International Trade, will represent India at this conference.

SOVIET-JAPANESE TRADE PACT

Japan and the Soviet Union have signed a new trade and payments agreement which replaces a similar pact signed in 1960. The new agreement, which covers ten important articles of trade and will be valid upto 1965, contains a list of commodity schedules to be exchanged between the two countries on an annual basis. The list provides for the exchange of commodities valued at $670-700 million both ways. Under the agreement, Japanese exports to Russia in 1963 are expected to touch $136 million (f.o.b., excluding those on deferred payment basis), which represents an increase of about 13 per cent over the target for 1962. Imports from Russia are expected to be of the order of $115 million during the current year, or an increase of 9.5 per cent. The target for exports from Japan has been fixed at a higher level than imports with a view to enabling Japan to make good, as much as possible, an estimated deficit of about $62-67 million in Japanese trade with Russia during 1960-62.

The following table shows the trend in Japan's exports to, and imports from, Russia since 1959:

(In thousands of U.S. dollars)

	1959	1960	1961	1962 Jan.-Nov.
Exports				
Agreement value (f.o.b.)	35,000	65,000	85,000	120,000
Customs cleared value (f.o.b.)	23,027	59,976	65,380	136,371
Imports				
Agreement value (f.o.b.)	35,000	60,000	75,000	105,000
Customs cleared value (c.i.f.)	39,491	87,025	145,409	133,094
Balance				
Agreement value		+5,000	+10,000	+15,000
Customs cleared value	−16,464	−27,049	−80,029	+3,277

The major items exported by Japan to Soviet Russia are cargo-boats, tankers, machinery, plants and equipments, iron and steel, rayon filament yarn and chemicals. Among articles of export added to the new list are fishing boats, chemical plant and equipment, fishing equipment and appliances and construction machinery. Imports from Russia include lumber, coal, pig iron, crude oil, heavy oil and potassic salt.

At the same time, the two countries have exchanged notes which seek to increase trade in consumer goods between the Far Eastern regions in the Soviet Union and Japan. Under the terms of these notes, Japan will export, in 1963, $4 to $5 million worth of fishing net, textiles, tableware, optical instruments and vegetables and import marine products worth the same amount.

BOMBAY POTTERIES AND TILES

COMPETITION TELLS ON PROFIT

HEAVY competition, necessitating drastic cuts in selling prices from time to time, has marred the otherwise brilliant performance of the Bombay Potteries and Tiles Ltd. (Chairman: Mrs. Kusumbai Motichand Shaha) for the year ended 30th September 1962. Thus, although production went up, profit has come down sharply. It is, however, gratifying to learn from the report of the Directors that they have since taken steps to face the keen competition by marketing the products through well-established and influential dealers and by effecting a substantial reduction in prices without affecting quality or quantity of the sales.

As just mentioned, the overall production showed an increase of 22 per cent from 2,217 to 2,696 tonnes. This was due entirely to a sharp rise in the output of glazed tiles from 1,021 to 1,634 tonnes. For the production of refractories receded from 315 to 277 tonnes, of vitreous tiles from 51 to 41 tonnes and of miscellaneous products from 63 to 54 tonnes due to a 50 per cent cut in the already meagre quota of coal, the supplies of which again were irregular. The output of sanitaryware and insulators also declined from 686 to 615 tonnes and from 81 to 75 tonnes, respectively, following the shut-down of the furnace for some time for urgent modernisation, which also affected the outturn of miscellaneous products. Following modernisation, however, the production rate has improved.

Reflecting the progressively lower selling prices, sales realisation recorded an improvement of only 1.4 per cent from Rs. 41.75 lakhs to Rs. 42.37 lakhs, in striking contrast to a 22 per cent rise in production. The minor improvement in sale proceeds (in the previous year, the increase was as much as 22.3 per cent) proved of no consequence against increases in the cost of raw materials consumed from Rs. 3.82 lakhs to Rs. 5.21 lakhs and in expenses from Rs. 20.46 lakhs to Rs. 22.86 lakhs, including staff expenses which went up from Rs. 11.42 lakhs to Rs. 12.64 lakhs. Consequently, gross profit declined from Rs. 18.46 lakhs to Rs. 15.99 lakhs, and its ratio to sales fell to 37.7 per cent from 44.2 per cent to which level it had improved in the previous year from 40.9 per cent in 1959-60.

The provision for depreciation was raised from Rs. 1.79 lakh to Rs. 2.71 lakhs, but that for taxation was reduced (because of the lower profit) from Rs. 7.50 lakhs to Rs. 6.85 lakhs. Net profit works out to Rs. 6.43 lakhs, a drop of about 30 per cent as compared with Rs. 9.17 lakhs earned in 1960-61. Despite the setback in profit, the dividend on the 100-rupee ordinary shares is proposed to be maintained at 15 per cent per annum, subject to tax, to which level it had been raised in the previous year from 12.86 per cent for 1959-60. But this could be done only through a drastic cut in the transfer to reserves from Rs. 6.64 lakhs to Rs. 2.72 lakhs. Even at the reduced level, the net profit conserved works out to 42.3 per cent. This is by no means a small proportion. Moreover, the dividend level itself is not extravagant; none can say that 15 per cent is undeservingly high for a Company now in its thirtieth year.

The following comparative table gives a clear idea of the progress made by the Company in the past four years:

(In lakhs of rupees)

	For the year ended 30th September			
	1962	1961	1960	1959
Sale proceeds, less returns	42.37	41.75	33.32	30.03
Closing stocks	2.10	1.24	1.02	1.03
Other income	0.83	0.75	0.88	1.00
Raw materials consumed	5.21	3.82	3.59	4.00
Expenses	22.86	20.46	16.96	14.64
Gross profit	15.99	18.46	13.65	12.05
Provision for—				
Depreciation	2.71	1.79	1.08	0.98
Taxation	6.85	7.50	6.00	5.60
Net profit	6.43	9.17	6.57	5.47
Excess provisions written back	..	0.14	0.05	0.11
To short provisions	0.99	..	..	..
To reserves	2.72	6.64	4.11	3.14
Dividends—				
6.5% preference	0.07*	0.07*	0.07*	0.07*
4.5% preference†	0.56*	0.50*	0.55*	0.55*
Ordinary	2.13 (15%)*	2.13 (15%)*	1.82 (12.86 %)*	1.82 (12.86 %)*
Carry forward	0.03	0.07	0.10	0.04
Market value of ordinary shares (in rupees):	1963	1962	1961	1960	1959
High	197.50	217.50	100.00	197.00	150.00
Low	197.50	179.00	185.00	143.00	119.50

* Subject to deduction of tax. † Revised to 6.5 per cent.

The Company's main expansion programme, envisaging a cent per cent increase in the annual outturn of glazed tiles to 1,800 tonnes, was completed during the year, but its benefits were realised only from June (when the new furnace was commissioned), that is, in the last quarter of the year under review. In order to improve quality of the products further, it had, however, been proposed last year to add some equipments to the main plant and machinery under the expansion programme. For that the Company had been sanctioned a foreign exchange loan of Rs. 3.60 lakhs by the I.C.I.C.I. and had applied on the strength of that loan for the necessary import licences. But the Government made the issue of the licences conditional to a guaranteed export performance up to the value of the licences, a condition the Company could not promise to fulfil in the absence of any order from prospective overseas buyers in spite of the substantial price reduction. In view of the present emergency, the issue of any licence is considered doubtful by the Directors, though they have been pursuing the matter. No light is thrown by the Directors' report on the last year's scheme of expanding the production of electrical procelain, as desired by the Government, in order to meet the shortage in the country and to obviate the need for imports.

The completion of the main expansion programme and the working of the modernised furnace for sanitaryware, insulators, etc., will bring about a further increase in the overall production this year. But, as coal supplies continue to be irregular, one cannot take a rise in production for granted. Besides, it remains to be seen how effective the measures adopted for marketing the products will prove to be. From the drop in profit-margin for the year under report, it appears that the competition is serious. The new steps, therefore, may not produce any startling results. Moreover, there is nothing to prevent others from following similar measures. In that case, the competition will become all the more acute, unless demand picks up, as it well may.

Financially, the Company is in a sound position. The paid-up capital of Rs. 24.54 lakhs, including Rs. 9.76 lakhs in two types of preference shares, is supplemented by reserves and surplus aggregating Rs. 20.95 lakhs. Current liabilities and provisions standing at Rs. 19.05 lakhs are adequately covered by current assets, loans and advances shown at Rs. 32.67 lakhs. Following the completion of the expansion programme, the gross block has expended from Rs. 43.66 lakhs to Rs. 51.29 lakhs. Total depreciation provided on it amounts to Rs. 19.82 lakhs. Together with dies and blocks worth Rs. 21.860, the net block is shown at Rs. 31.69 lakhs.

The Rs. 100 fully paid ordinary shares of the Company are currently quoted at Rs. 197.50 *cum-div.* On the *ex-div.* basis, they yield a net return of 5.6 per cent per annum.

(*Concluded from next column*)

Rs. 12.96 lakhs. It will thus be noted that the Company's financial position is strong.

The factory crushed an aggregate of 114,951 metric tonnes of cane during the season and achieved a production of 134,446 bags, that is, 352 bags above the production quota fixed by the Government. This was due essentially to the improvement in the average recovery of sugar which improved from 11.62 per cent to 11.71 per cent. This, in turn, was possible because of more efficient working of the plant with lesser stoppage for machinery breakdown.

There has been a reduction in the area under cultivation of cane. This fact, coupled with the diversion of cane for *gur* making, is expected to affect cane supplies during the current year and consequently lead to a lower overall crushing.

The Rs. 12.50 paid ordinary shares of the Company are being quoted at present at Rs. 27.75 *cum-div.* On the *ex-div.* basis, the net yield on the scrip works out to 6.7 per cent per annum.

The Utkal Machinery Ltd. of Kansbahal, 10 miles from Rourkela, is to manufacture 40 per cent in the value and 50 per cent in tonnage the fourth blast furnace for the Rourkela steel plant and save to that extent foreign exchange out of an estimated cost of Rs. 3.2 crores. The furnace, with a rated capacity of 1,500 tons daily (maximum 1,800 tons), was ordered by the Hindustan Steel Ltd. from the G.H.H. engineering concern of West Germany in January last. G.H.H. is one of the five shareholders of the Company and is to supply the balance of the equipment.

SHREE CHANGDEO SUGAR

SAME DIVIDEND—FINANCES STRONG

DESPITE the statutory cut in production at 10 per cent of the average output for the two years immediately preceding, Shree Changdeo Sugar Mills Ltd. (Managing Agents: Messrs. A. H. Bhiwandiwalla and Company [Bombay] Private Ltd., Bombay) has reported fairly encouraging results for the year ended 30th September 1962. Consequent on the increase in internal consumption and a conscientious export drive, the Company has been able to sell a larger quantity of sugar and this, notwithstanding the slump in price, has been mainly responsible for the increase in gross realisation from sale of sugar and molasses by as much as Rs. 21.29 lakhs to Rs. 138.84 lakhs, the highest level ever to be reached during the past several years. Side by side with this increase in turnover, there has been a welcome reduction in practically all items of expenditure. Thus, the cost of raw materials and stores consumed declined, for obvious reasons, from Rs. 67.00 lakhs to Rs. 62.34 lakhs while the expenditure on account of excise duty, cane cess and purchase tax has been lower, albeit slightly, at Rs. 38.18 lakhs as against Rs. 38.70 lakhs earlier. The wage bill has also decreased from Rs. 8.27 lakhs to Rs. 8.11 lakhs and so have other expenses from Rs. 8.80 lakhs to Rs. 7.68 lakhs. If despite this all-round reduction in expenditure the gross profit shows a slight drop of Rs. 0.34 lakh to Rs. 27.11 lakhs, it is because the Company has had to bear a heavier loss of Rs. 3.32 lakhs (Rs. 2.10 lakhs in the previous year) on the 17,149 bags compulsorily exported under the Sugar Export Promotion Act, 1958.

The decrease in gross profit is reflected in the provision for Managing Agents' commission which has been pruned from Rs. 1.58 lakh to Rs. 1.48 lakh. This small gain has, however, been completely wiped out by the substantial increases in other essential provisions. Thus, the transfer to depreciation has been raised from Rs. 2.78 lakhs to Rs. 2.92 lakhs and that to taxation, by as much as Rs. 2.10 lakhs to Rs. 12.00 lakhs. Consequently, the net profit has registered a drop of Rs. 2.48 lakhs to Rs. 10.71 lakhs. In conformity with this decline in the distributable profit, transfers to reserves have also been scaled down from Rs. 5.34 lakhs to Rs. 3.07 lakhs. But the ordinary dividend has been maintained at 20 per cent subject to deduction of tax and this absorbs, as before, Rs. 7.50 lakhs.

The operating results of the Company for each of the past four years are presented synoptically in the following comparative table:

(In lakhs of rupees)

	For the year ended 30th September			
	1962	1961	1960	1959
Sale of sugar and molasses	138.84	117.55	110.27	129.46

Low	21.48	23.72	28.25	27.00

Note.—All dividends are subject to deduction of tax.

There has been no change during the year under report in the share capital of the Company which continues to stand at Rs. 37.50 lakhs, all in three lakh equity shares of Rs. 12.50 each. This is supported by Rs. 28.94 lakhs in the reserves and the surplus account. Secured loans, comprising 6½ per cent mortgage debentures issued during the year and bank borrowings, have decreased approximately by Rs. 10 lakhs and now aggregate Rs. 27.55 lakhs. In addition, there are current liabilities and provisions totalling Rs. 53.49 lakhs. On the assets side, a gross block of Rs. 90.86 lakhs, inclusive of additions during the year and capital work-in-progress, has been well written down to a net block of Rs. 22.56 lakhs. Current assets, loans and advances all together amount to Rs. 111.95 lakhs, while the book value of investment is

REPORT OF THE AUDITORS TO THE STATE BANK OF INDIA

We, the undersigned auditors of the State Bank of Saurashtra, appointed under Section 41(1) of the State Bank of India (Subsidiary Banks) Act, 1959, report on the Balance Sheet and Accounts of the Bank as at 31st December, 1962.

We have examined the foregoing Balance Sheet of the State Bank of Saurashtra as at 31st December, 1962, and the Profit and Loss Account of the Bank for the year ended upon that date with the Accounts relating thereto of Head Office and with the Returns submitted and certified by the Branch Managers, which Returns have been incorporated in the foregoing Balance Sheet and Accounts.

We report that :—

(1) In our opinion, the Balance Sheet is a full and fair one containing all the necessary particulars and is properly drawn up so as to exhibit a true and correct view of the affairs of the Bank, according to the best of our information and the explanations given to us and as shown by the Books of the Bank;

(2) where we have called for any explanation or information such explanation and information have been given to us and have been found satisfactory;

(3) the transactions of the Bank which have come to our notice have been within the competence of the Bank;

(4) the returns received from the Branches of the Bank have been found adequate for the purpose of our audit; and

(5) the Profit and Loss Account shows a true balance of profit for the year covered by such account.

N. M. RAIJI & CO.,
Chartered Accountants.

Dated, 5th February, 1963.

SYNOPSES OF COMPANY REPORTS

Eastern Investments Ltd.

[*Secretaries*: Messrs. Bird & Co. (Private) Ltd., Calcutta.]

Annual General Meeting—11th March 1963.

Working Results:

	For the year ended 31st December (In thousand rupees)	
	1962	1961
Income—By dividends and interest on investments (Net)	8,30	12,99
Gross profit	11,22	17,30
Transfer to Secretaries' remuneration	6	6
,, ,, taxation	6	6
Net profit	3,96	7,77
Balance brought forward	7,29	9,47
Adjustments (credit items)	2,68	3,19

Transfer to general reserve	10	2,00
To dividends (taxable): Preference	1,01	1,11
,, ,, ,, Ordinary	9,25*	7,17†
	(12%)	(14%)
Carry forward	1,32	2,68

* Represents dividend on the increased ordinary capital of Rs. 76,80,000.

† Dividend is on the ordinary paid up capital of Rs. 51,26,000.

§ Represents excess provisions for taxation and profit on sale of investments.

Extracts from the Directors' report: *Investments.*—The Company's portfolio is representative of investments which are quoted on the Calcutta Stock Exchange with the exception of certain shares costing Rs. 78,178 for which no quotations are available. The total of the market value of the investments for which quotations are available together with the unquoted investments as valued by the Directors, exceeds the book value at 31st December 1962 by Rs. 71,03,034.

The Company has taken up the majority of its entitlement of *Rights Shares* in the recently increased issued share capital of the Titaghur Paper Mills Company Limited. The proceeds of the recent issue of *Rights Shares* by the Company has enabled the Company to secure that position.

Share Capital.—During the year under review, the issued and subscribed equity share capital of the Company was increased to Rs. 76,89,000 by the issue of 25,630 *Right Shares* of Rs. 100 each at a premium of Rs. 10 per share.

Accounts in brief as at 31st December 1962 are as under:—

LIABILITIES	Rs.	ASSETS	Rs.
Capital*	1,01,89,000	Investments	1,65,86,036
Reserves and surplus	65,30,745	Current assets	2,22,067
Other liabilities	11,08,524	Cash	10,19,566
	Rs. 1,78,28,269		Rs. 1,78,28,269

* Paid-up capital consists of 76,890 Ordinary shares of Rs. 100 each fully called up and 25,000 five per cent. taxable cumulative preference shares of Rs. 100 each fully called-up.

Oudh Sugar Mills Ltd.

(*Managing Agents*: The Cotton Agents Private Ltd., Bombay.)

Thirtieth Annual General Meeting—Held on 31st January 1963.

Working Results:

	For the year ended 31st July (In thousand rupees)	
	1962	1961
Sales (gross)	8,77,87	8,40,37
Closing stocks—finished goods	2,17,66	2,27,41

Amount per share	[Rs. 20.00]	[Rs. 20.00]
Carry forward	21	32
Market value of equity shares (in rupees):		
High	195.00	200.00
Low	173.50	178.00

Extracts from the Directors' report: The crushing of sugarcane during the year was lower as compared to the previous year on account of restriction imposed by the Government on production of sugar under the Sugar (Regulation of Production) Ordinance, 1961 reference to which was made in the last Directors' report. The yield of sugarcane was poor compared to the previous year owing to unfavourable climatic conditions. This also affected the sugar recovery.

The Government of India has announced that during the current year no restriction will be placed on production of sugar but due to poor yield and diversion of sugarcane to *gur* and *khandari* a crushing of about 3.36 lakh tonnes (90 lakh mds.) only is expected.

During the current year the Government of India has linked the price of sugarcane with recovery. Until last year the price of sugarcane was fixed irrespective of the recovery.

The Government of India allotted an export quota of 3,284 tonnes of sugar out of the production of the season 1960-61. The export quota out of the production of the year 1961-62 is expected to be considerably more than last year.

The production of the Distillery shows an appreciable fall due to shortage of coal. During the current year efforts are being made to improve the supply position of coal.

The working results of the Ice Factory were affected adversely owing to lower production which too was due to shortage of coal.

The production at the Oil Mills at Sitapur was considerably lower as the supplies of groundnut were inadequate and the lower production affected the working results.

The working results of the Farms were adversely affected owing to lower yield of cane per acre which was due to excess rains.

Though the production of the Vanaspati Factory was maintained, the working results were adversely affected due to high cost of raw materials without corresponding increase in selling prices owing to keen competition.

The production in the different units of this Company has been as under:—

	(In Tonnes/Bottles) 1961-62	1960-61
Cane crushed	4.24 lac tonnes (1.14 crore mds.)	4.67 lac tonnes (1.25 crore mds.)
Sugar recovery	9.34%	9.49%
Power, alcohol and spirits	51 lac litres (11.22 lac gallons)	65.36 lac litres (14.38 lac gallons)
Groundnut oil	480 tonnes (12,000 mds.)	770 tonnes (20,600 mds.)
Own farms cane	16,200 tonnes (4.40 lac mds.)	23,140 tonnes (6.28 lac mds.)
Vanaspati	15,000 tonnes	15,000 tonnes
Ice	320 tonnes (8,700 mds.)	470 tonnes (12,600 mds.)

Accounts in brief as at 31st July 1962 are as under:—

LIABILITIES	Rs.	ASSETS	Rs.
Capital*	77,52,210	Gross block	2,93,14,275
Reserves and surplus	93,62,930	—Depreciation	1,67,93,792
Other liabilities	3,12,11,525	Net block	1,25,20,483
		Current assets	3,56,51,671
		Investments	2,64,008
		Cash	3,90,443
	Rs. 4,88,26,665		Rs. 4,88,26,665

* Paid-up capital consists of 77,455¼ ordinary shares of Rs. 100 each, fully paid; 92 coupons of Rs. 25 each, fully paid and 52 coupons of Rs. 12.50 each, fully paid. Amount paid up on shares forfeited is Rs. 3,710.

COMPANY MEETINGS AND DIVIDENDS

VOLTAS LTD. Eighth Annual General Meeting, Bombay, 25th February 1963. Dividend: 14 per cent or Rs. 14.00 per share, subject to deduction of tax, payable on and after 4th March 1963. Transfer books were closed from 15th January to 4th February 1963, both days inclusive.

INDIA'S GREAT INDUSTRIAL AND COMMERCIAL COMBINE

IKO/1/63

NEWS IN BRIEF

A MEETING of chairmen and/or top executives of Indian banks is scheduled to be held at Bombay in March next to discuss the problems confronting the banking industry.

All the minor ports in Maharashtra State which are at present administered by the Collector of Central Excise will be brought under the direct control of the State Government from 1st April next.

New Delhi is the venue of the F.A.O.'s technical meeting on marketing aspects of implementing agricultural price policies that is scheduled to be held there from the 26th inst. to 8th March next.

The World Bank Study Team on coal transport, which is in India now, has begun collecting data from individual collieries. It has issued a 31-point questionnaire divided under four heads, namely, general, working conditions, details like loading, dispatching and storage capacity and miscellaneous. The team will visit the coalfields and the collieries later.

The Oil and Natural Gas Commission has decided to start intensive exploration in the Punjab, the Gangetic basin, West Bengal, the Cauvery basin and Assam. It has also decided to increase the present Ankleshwar oil production from 1,500 tons to 2,000 tons a day and to expedite the exploration test of the rock layers in the Kalok area near Ahmedabad.

An additional loan for the development programme of Indian railways is being sought from the World Bank. Mr. D. C. Baijal, Chairman of the Railway Board, left New Delhi for the U.S. to hold negotiations with the World Bank. The loans so far granted by the World Bank for the Railways amount to $378 million. The last loan of $50 million was signed in October 1961.

The Central Government has awarded contracts worth Rs. 59 lakhs to Simon-Carves (Simon Engineering Group) for setting up two nitric acid reconcentration plants and two associated sulphuric acid reconcentration plants. The design and supply of all equipment will be carried out jointly by Simon-Carves of Calcutta and its U.K. principals.

An eight-member trade delegation led by Mr. S. L. Kirloskar, Chairman of the Engineering Export Promotion Council, has left for Western Europe to explore the possibilities of exports of engineering goods. The delegation, which will visit Rome, Milan, Munich, Frankfurt, Dusseldorf, Berlin, Hamburg, Amsterdam, Brussels, Paris, London and Birmingham, is expected to return in the last week of next month.

The Punjab Government has set up a corporation, called the Punjab State Small Industries Corporation, to promote development of small industrial units. The Corporation will help these units to improve their methods of production, management and marketing. It will also supply machinery on hire-purchase basis to industrialists and undertake the distribution of raw materials such as aluminium, copper, zinc, art silk and steel.

The Union Government has extended the Forward Contracts (Regulation) Act to Pondicherry with effect from 29th December last. Under the Act, no association concerned with regulation and central control of forward contracts in any commodity and in existence as on 29th December last is entitled to carry on business beyond 28th June 1963 unless it applies for certificate of registration before that date to the Commission. Similarly, no such association which came into existence after 29th December shall commence business until it applies for and obtains such certificate of registration. Any violation of these orders would attract the penal provisions of the Act.

Gammon India Ltd. of Bombay has been awarded a £2 million contract for the design and construction of a road bridge linking Bombay City with the district of Thana. The Company, a member of the British Gammon group specialising in constructional and engineering work in Commonwealth countries, is expected to import much of the plant and equipment required for the work from Britain. The bridge will be 6,015 ft. long and will be completed in four years' time. Spanning the Thana creek, it will provide a fast route from Bombay City to the new industrial region of the district of Thana and open up what is at present an isolated agricultural area.

From Abroad

The British Prime Minister, Mr. Macmillan, has now personally quashed the recent wave of political speculation about an early British general election by his strong tip to a Young Conservatives conference that there will be no appeal to the country this year.

A World Food Congress, sponsored by the Food and Agricultural Organisation as an integral part of its world-wide Freedom from Hunger campaign is expected to be held at Washington from 4th to 18th June next, according to Dr. R. Lyle Webster, Executive Secretary of the Congress.

Canadian exports to Cuba touched the lowest level for the past 15 years during 1962, when the actual exports amounted to no more than $10.8 million, as compared with the record of $31.1 million in 1961. Officials predict a further drop this year, possibly to $4 million or even less.

The Bank of Tokyo has concluded a new correspondent contract recently with the Bank of China in Peking, allowing direct exchange of letters of credit between the head offices of the two banks. Hitherto, transactions were being handled through the London offices of the two banks.

The Government of Burma has decided to nationalise the entire rice and paddy trade from next year. In the current year, private traders will be allowed to deal in local distribution of rice but at Government controlled rates and the private rice millers have been asked to mill Government paddy at fixed milling rates.

The World Bank has announced a loan of $15 million to the Philippines for setting up a development corporation to assist private industry in that country. The U.S. Agency for International Development (A.I.D.) has also made available to the Philippines a sum of 27.5 million pesos from the funds generated by the sale of U.S. surplus farm commodities.

An international tobacco trade congress is scheduled to be held in Southern Rhodesia from 6th to 16th March next. The different grades and types of tobacco grown in many parts of the world will be on display. A section of the Congress will devote exclusively to the history of the industry and the development of smoking since earliest times.

At a meeting of businessmen and industrialists held at Rangoon on the 15th inst., Gen. Ne Win, Chairman of the Revolutionary Council, announced that in future, the economic functions of procurement, production, distribution and export of goods would be taken over by the State, that the setting up of new private industries would be disallowed and that the existing industries would be permitted to operate only until such time as they were nationalised. Similarly, businessmen would, he added, be allowed to carry on export and distributive trade only during the transition period.

The preparatory committee of the proposed world trade conference has decided to hold its second session at Geneva from 21st May to 28th June next. It has also adopted an interim report containing the provisional agenda for the conference which covers: expansion of international trade and its significance for economic development; international commodity problems; trade in manufactures and semi-manufactures; improvement of the invisible trade of developing countries; implications of regional economic groupings; financing for an expansion of international trade; and institutional arrangements, methods and machinery to implement measures relating to the expansion of international trade.

PERSONAL

MR. H. V. R. Iengar, a former Governor of the Reserve Bank of India, assumed charge as Chairman of the National Productivity Council at New Delhi on Monday this week.

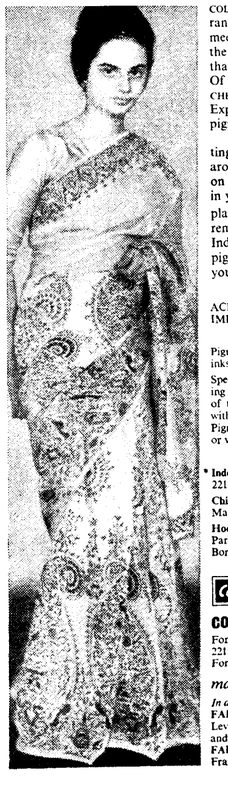
Mr. David Rockfeller, President of the Chase Manhattan Bank, arrived in Bombay last week. During his stay in this country, he will meet prominent industrialists, financial experts and bankers.

Mr. Lala Bharat Ram, Chairman, the Delhi Cloth and General Mills Ltd., has been unanimously elected President of the Federation of Indian Chambers of Commerce and Industry for the year 1963-64.

Mr. Purushottam Kanji has been appointed a Director of the State Bank of India by the Union Government to fill up the vacancy caused by the resignation of Mr. Hasham Premji.

Mr. Ranchhoddas Jethabhai and Mr. Hasham Premji have been elected President and Vice-President, respectively, of the Rice Merchants' Association, for the current year.

Mr. M. G. Patel and Mr. Jayantilal H. Shah have been elected President and Vice-President, respectively, of the Calcutta Tea Merchants' Association for the current year.



Mr. N. Swami, I.A.S., has taken over charge as the Joint Textile Commissioner with effect from 12th inst. in the Office of the Textile Commissioner to the Government of India, Bombay.

Dr. T. R. Govindachari, a former Principal of the Presidency College, Madras, has been appointed Director of the new CIBA Centre for fundamental chemical and biological research at Goregaon, Bombay.

Mr. R. M. Hajarnavis, Deputy Minister for Mines and Fuel, has been appointed Minister of State in the Ministry of Home Affairs in place of the late Mr. B. N. Datar.

Sir Andrew Cohen, Director-General of Britain's Department of Technical Co-operation who is on a tour of a number of Colombo Plan countries, arrived in New Delhi on the 20th inst. He will have talks with Ministers and officials on various aspects of British technical assistance to India, including employment of British experts to assist in the implementation of development plans.

ARE YOU WEARING Colour-Chem ?

Look around. It's just possible that COLOUR-CHEM is in your clothes, or on the painted walls of your room, or in the fascinating tapestry of your drawing room, and may be in these very printed words you are now reading.

Colour is so much around us that quite often we are not even aware of it. But the pleasant contribution it makes in colouring our 'existence' into a thrill, is a fact—as true as the fact that COLOUR-CHEM is an enterprise very much drenched in colours! Making colours is the sole business of COLOUR-CHEM.

Colour making is a basic industry, in that it lends a dynamic strength to our mammoth Textile Industry by making available an abundant supply of colours of countless kinds and varieties. It's a vital industry, too, being an integral part of the Chemical and Pharmaceutical Industry.

COLOUR-CHEM's speciality is "Pigment" colours, a particular kind that is supremely popular for printing textiles all over the world—besides being a prime material for such industries as Paints, Printing Inks, Rubber and Plastics.

This is a highly technical job, the making of "Pigment" colours. But the technicalities posed no problem, because when COLOUR-CHEM thought of making pigments in the country, they brought the experience of Germany's oldest leaders in the manufacture of dyes and pigments—who not only lent a helping hand, but actually participated in the project. That's how German technical 'know-how' and Indian skill combine and work continuously, giving perfection to the pigments before they are released for the markets. And they are working across the seas, too, for in the laboratories of German collaborators, unceasing research goes on and the benefit of all new discoveries and improvements in the processes is at once shared.

The introduction of indigenous makes of "Pigment" colours by COLOUR-CHEM in 1959 made history in the realm of textile printing in India, because the pace of popularity it set in motion for itself, shows no sign of relaxing. Pigment prints are the preference of the people—more and more, and, more and more. Nothing abnormal, nothing like a passing-phase, for printing with pigments is popular all over the world, and easily snatches a lion's share of the total print order. In countries like Japan it is fantastic.

COLOUR-CHEM cannot yet meet the total demand. A few essential raw materials and foreign exchange are the handicaps beyond control. But one thing is certain, that despite all the limitations COLOUR-CHEM produces a wide range of "Pigment" colours to meet the increasing demands of the consuming industries and that too, at a reasonable price. Of course indirectly COLOUR-CHEM is also very much in Exports—through exports of pigment printed fabrics.

So, when you see the fascinating world of man-made colours around you—spectacular prints on your fabrics, colourful inks in your favourite magazines, red plastic balls for children—remember that COLOUR-CHEM, India's largest makers of famous pigments, is so much a part of your day to day life.

THE BANK OF INDIA LIMITED

Registered Office:
70/80, Mahatma Gandhi Road,
BOMBAY-1.

NOTICE

THE FIFTY-SEVENTH ANNUAL GENERAL Meeting of the Shareholders of The Bank of India Ltd. will be held at Kishinchand Chellaram College Hall, Dinshaw Vachha Road, Bombay-1, on Friday, the 22nd day of March, 1963, at 4 o'clock in the afternoon, to transact the following business:—

(1) To receive the Report of the Directors and the audited Balance-sheet and Profit and Loss Account for the year ended 31st December, 1962.

(2) To declare a Dividend.

(3) To elect a Director in the place of Mr. A. D. Shroff, who retires by rotation, is eligible and offers himself for re-election.

(4) To elect a Director in the place of Mr. Krishnaraj M. D. Thackersey, who retires by rotation, is eligible and offers himself for re-election.

(5) To elect a Director in the place of Mr. Madanmohan Mangaldas, who retires by rotation, is eligible and offers himself for re-election.

(6) To elect a Director in the place of Mr. Girdharilal Mehta, who retires by rotation, is eligible and offers himself for re-election.

(7) To appoint Auditors and to fix their remuneration.

SPECIAL BUSINESS

To consider and if thought fit to pass, with or without amendment (as may be permissible), the following resolutions as Ordinary or Special resolutions as specified below:—

ORDINARY RESOLUTIONS

(8) RESOLVED that, pursuant to the relevant provisions of the Companies Act, 1956, including Sections 257 and 258, Mr. Pratap Bhogilal be and he is hereby elected and appointed a Director of the Company.

(9) RESOLVED that, pursuant to the relevant provisions of the Companies Act, 1956, including Sections 257 and 258, Mr. S. P. Godrej be and he is hereby elected and appointed a Director of the Company.

(10) RESOLVED that:

(a) The accounts for the year 1963 of the branches of the Company at Amritsar, Bombay, Delhi, New Delhi, Gwalior, Hyderabad (Deccan), Indore, Jamshedpur, Jullundur, Kanpur, Ludhiana, Margao, Nagpur, Poona, Sholapur and Vasco-da-Gama (including any branches at the said places or any of them which may be opened hereafter) shall be audited by the Company's Auditors, Messrs. A. F. Ferguson & Co. and Messrs. S. B. Billimoria & Co., Chartered Accountants, in such manner as may be arranged between themselves.

(b) The accounts for the year 1963 of the branches of the Company in India at places other than those specifically provided for (including any branches at such places or any of them or at any other place in India which may be opened hereafter) shall be audited either by the Company's Auditors, Messrs. A. F. Ferguson & Co., or Messrs. S. B. Billimoria & Co., or by persons qualified for appointment as auditors of the Company under Section 226 of the Companies Act, 1956, as may be decided upon by the Board of Directors and that the Board of Directors be and they are hereby authorised from time to time to appoint one or more qualified auditors for audit of the accounts of the said branches or any one or more of them as they deem fit, in consultation with the Company's Auditors, and to fix the respective terms and conditions of appointment and the remuneration of such auditors.

(c) For the audit of the branches referred to in the foregoing resolutions Messrs. A. F. Ferguson & Co. and Messrs. S. B. Billimoria & Co. shall be respectively paid such remuneration (over and above the remuneration they may receive as the Company's Auditors) as the Board of Directors may fix.

(d) The accounts for the year 1963 of the branches of the Company in countries outside India (including any branches which may be opened hereafter) shall be audited by persons qualified to act as auditors of the accounts of each such branch in accordance with the respective laws of the country in which such branch is situate and that the Board of Directors be and they are hereby authorised from time to time to appoint one or more qualified persons for audit of the accounts of the said branches outside India or any one or more of them as they deem fit, in consultation with the Company's Auditors, and to fix the respective terms and conditions of appointment and the remuneration of such auditors.

(e) The Board of Directors be and they are hereby authorised to exercise all such powers and to do all such acts, deeds and things as may be deemed necessary by them for the purpose of giving effect to these resolutions.

(11) RESOLVED that the Company's Auditors shall be entitled at such times as may be agreed upon between themselves to visit for any one of them, at least once in every calendar year, every branch in India and all or any of the branches outside India for test inspection and that a report on such test inspection shall be submitted to the General Manager of the Company and that for such work the Auditors shall be paid all out-of-pocket expenses that they may incur for travelling, board and lodging and otherwise and that such payment shall be in addition to the remuneration fixed for the said Auditors.

SPECIAL RESOLUTION

(12) RESOLVED that, pursuant to the provisions of sub-section (1) of Section 163 of the Companies Act, 1956, the Company hereby approves that the registers of members, the indexes of members and copies of all annual returns prepared under Section 159 of the said Act, together with the copies of certificates and documents required to be annexed thereto under Section 161 of the said Act, or any one or more of them, be kept either at the Registered Office of the Company and/or at the Company's premises in Air Lines Hotel Building, Jamshedji Tata Road, Bombay.

By Order of the Board of Directors,
T. D. KANSARA,
General Manager,
THE BANK OF INDIA LTD.

BOMBAY, *7th February*, 1963.

A MEMBER ENTITLED TO ATTEND AND VOTE IS ENTITLED TO APPOINT A PROXY TO ATTEND AND VOTE INSTEAD OF HIMSELF AND THE PROXY NEED NOT BE A MEMBER. The instrument appointing a proxy and the Power of Attorney, if any, under which it is signed should be deposited at the Registered Office of the Company not less than forty-eight hours before the time for holding the aforesaid Meeting as provided by Article 79 of the Company's Articles of Association.

Note:—(a) The Transfer Books of the Company will be closed from Saturday, the 2nd March, 1963, to Friday, the 22nd March, 1963, both days inclusive.

(b) The Dividend, when sanctioned, will be payable on and from Wednesday, the 27th March, 1963, to those Shareholders whose names are on the Register of Members on 22nd March, 1963.

(c) Dividend Warrants will be posted to Shareholders at their registered addresses. Early intimation should be given to the Company of any change of address.

(d) The Explanatory Statement as required under Section 173 of the Companies Act, 1956, has been forwarded to the members of the Company.

MARTIN BURN LIMITED

NOTICE

THE BOARD OF DIRECTORS OF MARTIN Burn Limited has today recommended payment of dividend at the rate of Rupees Two and Fifty nP per share on the Ordinary Share Capital of the Company for the year ended 30th September, 1962. This dividend awaits the sanction of the Shareholders at the ANNUAL GENERAL MEETING to be held on Wednesday, the 27th March, 1963, at 12 noon. The dividend if declared will be paid under deduction of tax at the prescribed rates on or after the 1st April, 1963, to the Ordinary Shareholders whose names are on the Company's Register of Members on the 27th March, 1963 or to their mandatees.

The Ordinary SHARE REGISTER and TRANSFER BOOKS of the Company will be closed from the 14th to 27th March, 1963, both days inclusive.

By Order of the Board,
MARTIN BURN LIMITED,
A. G. GIDLEY,
Secretary.

Registered Office:
12, MISSION ROW,
CALCUTTA,
15th February, 1963.

SURVEY

(*Concluded from page* 303)

tries, exporters of any significance are mainly Ceylon, Thailand and Gautemala. Their share of the market is still negligible, as compared with India's. In 1961, for instance, India exported 2,200 tons of cardamom, as against only 155 tons by Ceylon and 120 tons by Thailand. But the pressure of supplies from India's competitors has been steadily growing. It is said that Gautemala and Ceylon have been able to produce cardamom at a cost much less than in India and, therefore, offer this commodity at highly competitive prices.

The growing competition is reflected in the prices fetched by Indian cardamom. During the first nine months of 1962-63 financial year (April to December), India exported about 1,700 tons of cardamom earning just less than Rs. 2.0 crores, whereas, during the corresponding period of the previous year (April-December 1961), as much as Rs. 2.6 crores was secured from the export of almost the same quantity. Taking the whole of 1961-62, it is seen that the quantum of exports rose from 2,000 tons (in 1960-61) to 2,300 tons, but the value fell from Rs. 3.7 crores to Rs. 3.6 crores. The average export value of cardamom has been falling persistently in recent years, that is, from Rs. 23,900 per ton in 1956-57 to Rs. 20,900 in 1957-58, Rs. 20,600 in 1958-59, Rs. 19,400 in 1959-60, Rs. 18,500 in 1960-61 and further to about Rs. 15,600 in 1961-62.

India still accounts for about 90 per cent of world exports of cardamom. Major importers are Sweden and Middle East countries, particularly Saudi Arabia, Kuwait, Baharein, Iran, besides West Germany, U.K. and the U.S. Soviet bloc countries have also started buying fairly large quantities of cardamom of late. World consumption of cardamom has been going up because of increasing demand for edible and industrial purposes. Cardamom is generally used in Asia in curries and also for chewing with betelnut and in the Middle East for flavouring coffee. In Europe, it is used as a mixed pickling spice, and in Sweden especially for baking. Cardamom oil is used in perfumery, for flavouring liqueurs and bitters, in the preparation of tinctures and as a stimulant.

In order to take advantage of the growing world demand, the cardamom plantation industry should strive to increase its competitive position. With this object in view, the new Committee, which is an adjunct to the Coffee Board, will devote particular attention to the marketing aspects. Cardamom, it may be noted, is generally cultivated along with coffee. Kerala accounts for about half of the total output in India; Mysore is another major producing State, followed by Madras and Maharashtra. The Coffee Board's experience in marketing coffee will be advantageous in the marketing of cardamom. But the Committee cannot hope to secure reasonable prices for producers unless efforts are also made to reduce cost of production. This is largely a matter of improving productivity through prevention of plant diseases and supply of fertilisers and credit—problems which have been so far neglected. Another drawback which needs to be removed is the absence of sufficient data on production, stocks, etc., which are vital for drawing up development and marketing plans. Side by side, efforts must be made to take up market surveys at least in some of the advanced countries in co-operation with the Export Promotion Council for spices, besides conducting some promotional campaigns to exploit potential markets abroad. These measures designed to stimulate overseas demand and improve productivity should be given priority of consideration. The question of extension of cultivation (one of the terms of reference of the new Committee) can wait, until the aforesaid conditions are fulfilled. Indiscriminate extension of cultivation and further increase in output will only depress prices further, unless there is scope for expanding the export outlets.

TREND OF MARKETS

MONEY SUPPLY TIGHT

(*From Our Own Correspondent*)

BOMBAY, *20th February*

Demand for money continued to be very strong throughout the week under review and, since floating funds were scarce, borrowers in the inter-bank section found it exceedingly difficult to obtain their requirements. Both renewals and fresh money for day-to-day requirements were maintained at the high level of 6 per cent per annum. Conditions at Calcutta, however, were a little better, with the call money rate there receding by ½ per cent to 5½ per cent.

Thanks to the persistently extreme stringency of money, the 91-day Government of India Treasury Bills, tenders for which opened on Tuesday the 19th inst., evoked little or no response. The total amount offered was just Rs. 2 crores, same as in the previous week, which was also the amount invited and accepted. The fact that the amount offered was no more than the amount invited suggests that the response to these bills continued to be from "special quarters" interested in keeping these going. The average rate of accepted tenders was unchanged at Rs. 2.365 per cent per annum. The Intermediate Treasury Bills, which were on tap from the 13th to 16th inst., fetched a smaller sum of Rs. 54.25 lakhs, as against Rs. 78 lakhs in the week before.

India's foreign assets registered a further sharp rise of Rs. 6.35 crores to Rs. 105.09 crores during the week ended 15th February 1963. The rise was accounted for entirely by foreign securities in the Issue Department which jumped up by Rs. 7.00 crores to Rs. 95.08 crores. As against this increase, there was a small fall of Rs. 65.84 lakhs to Rs. 10.01 crores in balances held abroad. Loans and advances to scheduled banks receded by Rs. 6.17 crores to Rs. 37.55 crores, of which those against usance bills alone amounted to Rs. 25.52 crores, a decline of Rs. 2.20 crores. Notes in circulation showed a nominal fall of Rs. 2.28 crores.

There was a further rise of Rs. 17.57 crores to Rs. 1,509.40 crores in the total credit made available by scheduled banks during the week ended 8th February 1963, while deposits declined again by Rs. 10.66 crores to Rs. 2,168.53 crores and inter-bank borrowings by Rs. 35 lakhs to Rs. 38.59 crores. Naturally, the banks were compelled to rely more heavily on borrowings from the Reserve Bank, which went up by Rs. 7.20 crores to Rs. 43.13 crores, as well as to sell some more portions of their investments; the total of these investments was lower by Rs. 14.86 crores at Rs. 622.16 crores.

The Gilt-edged market ruled steady during the week under review. Among Central loans, 3 per cent 1970-75 improved by 15 nP. Among State loans, 4 per cent 1967 Maharashtra attracted special support and advanced by Re. 1.25. The 6½ per cent 1977 Gold Bonds were firm at Rs. 116, as sellers were reserved. The yield on these Bonds at this rate works out to Rs. 5.06 per cent.

In the foreign exchange market, banks' selling rate for ready T.T. dollars was unchanged at Rs. 477.50 per $100. Their buying rate, however, was lower at Rs. 474, as against Rs. 474.25. On the New York Exchange, the £ sterling (spot) was a shade better *vis-a-vis* the dollar, the latest available rate being 280.330-280.360 cents, as against 280.320-280.350 cents, while the rate for three months forward softened from 279.840-279.870 cents to 279.830-279.860 cents.

* * * *

The total contributions in cash brought into the Central account of the National Defence Fund at New Delhi upto the close of business on 16th February 1963 amounted to Rs. 41.81 crores. This sum includes Rs. 27 lakhs received from Britain and Rs. 41 lakhs from other countries. In addition, contributions in gold ornaments amounted to 1,509,708 grammes approximately equal to 129,478 tolas.

SILVER AT NEW PEAK

(*From Our Own Correspondent*)

BOMBAY, *20th February*

Trading this week in the local bullion market was highlighted by spot silver which touched a new peak of Rs. 240.50 per kilogram yesterday. At this level, it was Rs. 8.50 higher than the previous best level recorded on 16th January 1963. Gold and sovereign, too, closed with small gains.

Persistent upcountry buying, limited supplies and proximity of the marriage season were the factors responsible for the spurt in the price of silver. Limitations on buying gold, except for the purpose of exchanging it for Gold Bonds, also seemed to have turned buyers' attention to silver. After opening at Rs. 230 on Thursday the 14th inst., spot silver steadily rose by yesterday to a new all-time high level of Rs. 240.50. In terms of 100 tolas, which was the trading unit before the introduction of metric system, the all-time peak touched this week works out to Rs. 280.53. Today, spot silver opened lower at Rs. 238, recovered to Rs. 239.50, and closed at Rs. 239, that is, nine points higher over the week. Incidentally, the 1962 highest and lowest levels were Rs. 224.85 and Rs. 187.80, respectively.

On 2nd January 1963, the price of ready silver was Rs. 212.70. Within fourteen days, the price had improved to Rs. 232, but reacted to Rs. 219 in five days thereafter. Since then, the trend has been upward.

The daily average arrivals of silver during the week under review improved by five bars to 21 bars and the offtake expanded by two bars to 12 bars.

On Monday the 18th inst., Mr. Chandulal Kasturchand, President, and Mr. Dhursingh Shekhavat, Vice-President of the Bombay Bullion Association, met Mr. A. S. Naik, Chairman of the F.M.C., with a request that the Commission might recommend to the Government removal of the ban on futures trading in silver. It will be recalled that the Government imposed the ban on 9th January 1963. While appreciating difficulties in resuming futures in gold, the Association's office-bearers informed the F.M.C. chief that the ban on futures trading in silver had been primarily responsible for the spurt in the spot price. They explained to Mr. Naik that futures trading in silver was essential because of the large turnover of Rs. 10 crores in the metal every year. Besides, futures trading in silver was necessary to keep the Association going, as it had found it impossible to meet its expenses only from its other activities like the maintenance of safe deposit vaults and refinery for gold and silver. Mr. Naik is said to have assured them that he would take up their plea with the authorities shortly.

Ready gold opened unchanged at Rs. 101, eased to Rs. 99 on Saturday the 16th inst., but improved thereafter to close higher over the week at Rs. 104. Sovereign moved between Rs. 74 and Rs. 76 and closed at the higher level, as against Rs. 73 a week ago.

Spot silver in New York and London remained unchanged at 125.6 cents and 107⅝d., respectively, but the forward quotation in London closed a shade higher at 108¼d., as against 108d. a week ago. Ready gold gained 2d. at 250s. 2d., and the dollar price of gold improved further from 35.07½ to 35.08⅜.

The following table shows the trend of prices during the week under review:

	20-2-63 (closing)	High	Low	13-2-63 (closing)
	Rs.	Rs.	Rs.	Rs.
SILVER				
Ready (.996 fine) ..	239.00	240.50	230.00	230.00
London—				
Gold	250s.1d.	250s.4½d.	250s.3d.	250s.2d.
Silver Ready	107⅛d.	—	—	107⅛d.
Silver Forward ..	108¼d.	108¼d.	108d.	108d.
New York—				
Silver	125.6 cents	—	—	125.6 cents

N.B.—The quotation for gold is per 10 grams (about 0.85 tola) and that for silver is per kilogram (85.73 tolas). London and New York quotations are per ounce.

* * * *

The Gold Control Board has decided that bank advances against non-ornament gold can continue only if a declaration is made, as required under the Gold Control Rules, irrespective of whether such gold is covered by the exemption limit of 50 grammes per adult and 20 grammes per minor or not. In respect of existing advances against non-ornament gold, if the owner has not already declared such gold, the bank itself must declare it. Moreover, every bank must declare, within the permissible time limit up the 28th inst., the total amount of non-ornament gold pledged with it. A bank can sell the gold pledged with it and declared to the Board through a licensed dealer in order to recover its dues. A pawnbroker or moneylender (not called dealer under the Gold Control Rules) who has given loans against gold ornaments can return the ornaments on repayment of loans. Gold jewellery for export will be of 14 carat and less purity, except in the case of the special scheme for export of ornaments made out of imported gold (of superior quality) under special licence. The Board has also decided to allow non-licensed small goldsmiths to melt ornaments they receive strictly for making 14-carat jewellery and keep with them a small quantity of 14-carat gold during the process of making such ornaments.

In order to check smuggling and to prevent under-invoicing of exports and over-invoicing of imports, the Government has promulgated certain rules under the Defence of India Act. The rules prohibit one from possessing or in any way carrying, removing, harbouring, selling or purchasing smuggled goods like gold, diamonds, manufactures of gold or diamonds and watches. On a seizure of such goods from a person, the onus of proof will lie on that person and not on the prosecution as is the case normally. False statements to the customs in regard to goods presented for clearance constitute an offence under the rules. Contravention of the rules is punishable with imprisonment extending to seven years, or fine, or with both. The punishment will be in addition to any confiscation of goods or penalty liable under the Sea Customs Act of 1878. Under the same rules, the Government can prohibit, restrict or impose conditions on clearance, whether for home consumption or for shipment abroad, of any goods or class of goods imported into India.

COTTON FUTURES FIRM

(*From Our Own Correspondent*)

BOMBAY, *20th February*

The cotton futures market ruled distinctly firm during the week under review. A number of factors combined to transform the easy undertone witnessed towards the close of last week into a bullish fervour. Prominent among these bullish factors were (1) the strong probability that the floor price of cotton would be raised, (2) the expectation that tenders against the maturing March contract would be small, (3) sustained mill demand for spot cotton and the consequent hardening of ready prices, and (4) the warning given by Mr. Madanmohan Ruia, President of the East India Cotton Association, against undue speculation which was held responsible for the recent erratic fluctuation in futures prices. In fact, Mr. Ruia's warning, coming as it did at a time when the market was in the grip of bears, gave a bullish twist to the market. The statement of Mr. S. K. Patil, Union Minister for Food and Agriculture, that mills would be compelled to buy cotton, if they did not lift the crop by the end of March, was also bullishly interpreted. Extensive short-covering and heavy fresh buying prompted by these considerations led to a rally in futures prices. The following table indicates the trend of prices of the contract during the week:

	20-2-63	High	Low	13-2-63
Jarilla March ..	689.50	691	—	672
Jarilla May ..	697	698	681.50	680

In his presidential speech at the 41st annual general meeting of the E.I.C.A., Mr. Madanmohan Ruia referred to the recent trend of the cotton futures market. He pointed out that price fluctuations in the last few weeks were rather erratic and that the decline in prices was causing concern among the farmers who apprehended that they might not get the full ceiling price for their cotton as they generally got during the last two or three seasons. Representations from various centres were being received in this connection by the Government which wanted steady markets and was concerned at the erratic movements in prices. The Government had hoped, he pointed out, that the issue of export quota on the 12th inst. would act as a steadying influence on prices, but, actually, the price of the hedge contract had declined substantially. Such erratic movements in prices were generally attributed to undue speculative activity which, Mr. Ruia averred, Government was in no mood to tolerate at the present juncture. He cautioned that, if undue speculative activity resulted in price fluctuations unwarranted by the normal trading factors, futures market in cotton might not be permitted to function. He, therefore, urged upon all to exercise great restraint in trading in the futures market so that "half the bread which is available might not be lost."

In the spot market at Sewri, there was brisk mill demand for ready cotton. Extensive buying of popular varieties such as Vijay, Digvijay, Surti, 197/3, L.147, CO2 and Kalyan was reported. Prices consequently hardened. The warning by Mr. S. K. Patil, Union Minister for Food and Agriculture that the Government would compel mills to buy cotton if they did not lift the cotton arriving in the market by the end of March, would also appear to have prompted mills to go in for new crop varieties in a big way. The fear that cotton prices might go up if the floor prices were raised, as was now suggested, also encouraged mills to cover their requirements early.

An important issue relating to marketing of cotton, namely, removal of the supervisory scheme and the system of compulsory survey, was discussed at the eighty-seventh meeting of the Indian Central Cotton Committee, held at Bombay on Saturday, the 16th February. During the discussions, it was pointed out on behalf of the growers that, as far as the supervisory scheme was concerned, it was wanted neither by the growers nor the trade while it served no purpose to the industry also when prices were below the ceiling. Pressing for the abolition of the survey system also, the growers pleaded that, if this was not possible, at least 50 per cent representation might be given to the growers on the survey committees so that their interests would be given due consideration. In this connection, a plea was also put forward for the use of machine tests in the evaluation of cotton. It was, however, pointed out that the hand test and visual examination system was still followed in the United States of America by the cotton trade, although machines for various tests had been developed in that country in recent years. It was said that even the International Cotton Advisory Committee, which recently considered the question of introducing machine tests for the evaluation of cotton, felt that it would not be practicable for the present. It was agreed that the request for adequate representation of growers on the Survey Committee might be forwarded to the Government of India for consideration.

The Committee emphasised the need for announcing the cotton price policy for each season well in advance of the sowings so as to enable the grower to make his crop plan accordingly. Stress was also laid on the need for proper classification and grading of *kapas* in the upcountry markets by posting trained persons and for fixing the floor and ceiling prices for different varieties of *kapas* for various upcountry centres. It was agreed that the Agricultural Marketing Adviser to the Government of India might carefully study the problem and submit a scheme for classifying and grading of *kapas* in the upcountry markets and working out the parity prices of *kapas* for various centres on the basis of the lint prices fixed for the Bombay market.

Bengal *Deshi* elicited good export inquiries. Substantial business was reported in fine and superfine Bengal *Deshi*. Export sales registered so far against last week's quota for 75,000 bales of Bengal Deshi were unofficially estimated at 25,000 bales. There was, however, little export interest in short-staple cotton (¾" and below), for which a quota of 25,000 bales were issued simultaneously with the Bengal *Deshi* quota. Among foreign varieties, U.S. cotton was in the limelight. Mills bought substantial quantities even at advancing prices. Limited interest was also noted for East African and Sudan cotton.

The following are the latest available quotations—in rupees per candy of 784 lbs.—from the spot market at Sewri:

Moglai Jarilla 890; Kalyan 940; Digvijay 1.018; L147, 1.173; CO2 1.535; Sudan G2L 1.380; Busoga (U.N.U.G.) 1.200; Elpaso 1.485.

Cotton futures in Karachi ruled quietly steady during the week. Values fluctuated narrowly reflecting general lack of interest. The N.T.R.G. January contract closed unchanged at Rs. 71.25, same as last week-end and the May contract at Rs. 73.40, 20 nP higher than last week's closing price of Rs. 73.20. Spot prices too depicted a steady trend. The following are the latest available quotations—in rupees per maund of 82 lbs.—for a few popular varieties of Pakistan cotton prevailing at Karachi:

Sind *Deshi* 72.00; Punjab *Deshi* 67.00; 4F Punjab Roller 76.60; S.G. 81.60; L.S.S. Punjab

Roller 78.60; S.G. 83.10; N.T. Roller 82.60; S.G. 87.10.

Steady conditions prevailed in the Liverpool cotton futures market during the week. Futures prices ruled practically unchanged in thin and featureless trading. Offers of near and distant deliveries at prevailing prices found buyers reserved. Uncertainty about U.S. cotton legislation continued to prevent operators from entering into large commitments. The following are the latest available quotations—in pence per lb.—from Liverpool, the figures in brackets being last week-end quotations:

March 24.25 (24.25); May 24.05 (24.05); March (Sudan) 29.00 (29.00).

Cotton futures values in the New York market were well maintained during the week. Although the proposed new legislation for cotton was still hanging fire, sentiment was favourably influenced by the sustained firmness of spot prices, which reflected the growing tightening of free supplies. The nearby March contract attracted short-covering and firmed up; other positions, however, ruled steady.

The following are the latest available quotations—in cents per lb.—from New York as compared with those a week and a fortnight ago.

(In cents per pound)

	19-2-63	12-2-63	5-2-63
March	34.65	34.58	34.56
May	34.87	34.85	34.70
July	34.32	34.32	33.86
New York Spot ...	35.60	35.40	35.25

PEPPER RISES

(Messrs. Parekh and Co.)

BOMBAY, 20*th February*

Malabar black pepper during the week ruled steady to firm under pressure of buying by New York dealers who were said to have accepted all offers at progressively higher prices from $0.30½ to $0.31½, as Singapore became reserved sellers in view of the threat of economic confrontation by Indonesia. The political uncertainty in North Borneo was also responsible for the present hardening tendency in both Sarawak and Lampong pepper. Ungarbled moved up from Rs. 250 to Rs. 258 and garbled from Rs. 257 to Rs. 268. February delivery went off the board at Rs. 270. March delivery rallied from Rs. 272 to Rs. 280, as owing to *Ramzan* the flow of arrivals from the interior, particularly from North Malabar, was interrupted.

On forward ring at Bombay, *Chaitra* delivery, after opening at Rs. 297 went down to Rs. 286 before improving to Rs. 300. *Vaishak* delivery also continued to move up and down in line with *Chaitra* delivery, commanding a premium of Rs. 4 per quintal.

Singapore showed improvement from $100 to $107½ for black pepper and from $152½ to $160 for white pepper.

Spot in New York spurted from $0.32 to $0.37, with sellers not pressing, as they were unable to replace at cheaper prices from the origins.

The future of pepper depends on the political situation in Malaya, Indonesia and North Borneo.

Ready pepper in Bombay is selling at Rs. 140 to Rs. 142.

FAIR DEMAND FOR TEA

[Messrs. Forbes, Ewart and Figgis (Private) Ltd.]

COCHIN, 14*th February*

A total of 621,000 kgs. was offered in sale No. 7 held on the 12th inst. Quality of Nilgiri teas was irregular and generally inferior, whilst teas from other districts were maintained. The market met with fair general demand. Low medium and medium brokens were easier, but their fannings attracted better support and were irregularly dearer, buyers emphasising more on the brighter kinds. Best good mediums were dearer to buy, but others in this category sold at around last rates. A few selected lines among highgrowns encountered keen competition and sold at enhanced rates, whereas all others were in less support and were sometimes lower with quality. Clean black leaf descriptions sold readily, though they were easier slightly. There was useful enquiry for unorthodox descriptions which were fully firm and sometimes dearer. Orange and flowery pekoes were well supported and sold at around last rates, but pekoes were slightly easier. Tippy teas, although sold readily, inclined easier.

The quotations (per kg.) were as follows:

	1963	1962
	Rs.	Rs.
Low mediums	4.20-4.65	3.85-4.05
Mediums ...	4.70-5.00	4.10-4.75
Good mediums	5.10-6.00	4.85-5.60
Nilgiri B.O.P.	5.75-13.40	5.70-11.70

The average price realised in sale No. 7 was Rs. 5.03 per kilo as compared with Rs. 4.97 a week ago and Rs. 5.44 in the corresponding sale last year.

In dust sale No. 7 held today, 239,000 kgs. was offered. The market opened to strong demand which continued throughout the sale. Low mediums and mediums were well supported at firm rates, the brighter descriptions under this category met better support and were dearer. Good mediums, particularly those with useful colour were also dearer to buy. Highgrowns sold readily at around last rates but a few best invoices inclined a little easier. Clean black grainy descriptions sold at higher rates and there was useful support for milled and residual grades. True C.T.Cs and C.T.C. types were about firm whilst legg cut types advanced in prices.

The average price realised in dust sale No. 7 was Rs. 4.28 per kilo as against Rs. 4.27 a week ago and Rs. 4.18 in the corresponding sale last year.

Colombo: The market met with strong demand. Dimbulas were irregularly dearer, buyers following quality. Mediums and uvas were also dearer by 5 to 10 cents. Good liquoring B.O.P. fannings were dearer to buy, but others tended easier.

London: *North Indian and other growths*: There was good general demand. Plain descriptions elicited keen enquiry. Better descriptions, although they met with irregular support may be quoted steady.

Ceylon and South Indians: 24,958 packages were offered in Tuesday's sale, of which 7,674 packages came from South India. There was fair general demand for both Ceylons and South Indians and prices for these ruled steady.

As we go to press, Messrs. Forbes, Ewart and Figgis (Private) Ltd. wire as follows:

"*Sale No. 8*: 460,000 kgs. offered. Strong general demand. Plain and low medium fully firm, occasionally dearer. Good mediums dearer. Highgrowns firm with quality. Unorthodox stronger."

YARNS STEADIER

(From Our Own Correspondent)

BOMBAY, 20*th February*

Excepting art silk yarns which displayed an irregular trend, the yarn market ruled steadier this week on improved upcountry demand largely owing to fears of increase in excise duty in the ensuing Union budget which also explained the better offtake recently in the local piecegoods market. The week's trading was featured by notable gains in staple fibre yarns. Certain select count cotton yarns also closed a little higher over the week. In art silk yarns, some varieties recovered, while some others lost further ground.

Among 2 x 40 staple fibre yarns, Centurys advanced from Rs. 7.22 to Rs. 7.48 a kilo and Kohinoors gained 13 nP at Rs. 8.18. In the art silk yarn section, 150D National Rayon rallied from Rs. 11 to Rs. 11.13 and 120D S.I. Viscose from Rs. 12.15 to Rs. 12.91. But 150D S.I. Viscose receded from Rs. 11.61 to Rs. 11.22. 100D bright Century also eased further from Rs. 14.74 to Rs. 14.72. Among cotton yarns, 10s Podar picked up 25 nP to Rs. 17.75, 10s Petlad and 20s Gokak hardened by 50 nP each to Rs. 19 and Rs. 24, respectively. 40s Meenakshi, however, showed a loss of one point to Rs. 37.50.

At a meeting of the representatives of the Indian Cotton Mills Federation with the Union Government at New Delhi on Monday the 18th inst. to discuss the problem of distribution of imported staple fibre (see report in last week's *Commerce*), the Government is understood to have authorised the Federation to arrange the distribution in such manner as would remove the glut facing the industry. According to reports, the Chairman of the Federation, Lala Bharat Ram, has turned down suggestions from some mills for selling imported fibre in the open market and for stopping or staggering further imports on the ground that the proposal of open sales is designed only to bring down the price and that stoppage of imports is not possible as the Government has already made commitments.

A Press note issued by the Indigenous Art Silk Yarn Distribution Committee (Bombay) on Wednesday the 13th inst. says that actual users in the powerloom sector will have an additional allotment of art silk yarn at 15 per cent of their allocations made for the October 1962-March 1963 period. All the customers of Century Rayon and other powerloom factories in the Punjab, Maharashtra and Gujarat will get their supplies from the Century Rayon. Factories in West Bengal, Mysore and Madras will be served by the Century Rayon and the Kesoram Industries. The units in M.P., U.P., Andhra and Delhi will meet their requirements from the J.K. Rayon. The additional quota will lapse after 15th March 1963.

During the week, the South Indian Yarn Dealers' Association and the Sholapur Yarn Merchants' Association appealed to the Union Finance Minister, in the course of a written memorandum, to merge sales tax on yarn with excise duty. Similar plea has been made often in the past by the trade in other centres. The trade is against sales tax because the lack of uniformity in the rate of tax in different States has particularly affected inter-State business. In order not to lose yet another source of revenue accruing directly to them, the States have opposed the idea of merging sales tax on yarn with excise duty.

The following table gives the prices of rayon staple fibre and cotton yarns, today, as compared with those prevailing a week ago:

	20-2-1963	13-2-1963
	Rs.	Rs.
Art silk yarn **(per kg.)—**		
National Rayon 120D	12.10	12.01
Century 75D	17.60	17.67
S. I. Viscose 150D	11.22	11.61
Staple fibre yarn **(40 x 2)—**		
Kohinoor (per kg.)	8.18	8.05
Century	7.48	7.22
Cotton yarn **(per bundle of 10 lbs.)**		
10s Podar	17.75	17.50
20s Edward	22.25	21.75
26s Text	29.25	28.50
40s Hind	35.50	35.50
60s Finlay	87.25	87.25
80s Minerva	80.00	80.00

Note.—Quotations for 120 and 150 Japan and Italy are not available, since there has been no trading in view of paucity of stocks.

GROUNDNUTS FIRM

(From Our Own Correspondent)

BOMBAY, 20*th February*

Mixed trends prevailed in the oilseeds market during the week under review. While groundnuts and cottonseeds ruled firm, castorseeds and linseeds encountered selling. Groundnuts were in the limelight in that they staged a smart rally from the low levels touched last week. The rally was induced partly by good export demand for groundnut oil from Spain and partly by fears of increased excise duty on groundnut oil in the ensuing Central budget. Poor arrivals also imparted strength. In constrast, castorseeds were subjected to persistent selling pressure, thanks to arrivals of new crop from major producing centres and prospects of larger inflow in the near future. At the same time, the export outlook for castor oil continued to be bleak, domestic prices being out of parity with world prices. Linseeds, too, drifted downward on fears of heavy offerings of new crop from upcountry centres within a fortnight. The current season's linseed crop is placed higher by 75,000 tonnes at 400,000 tonnes.

The aggregate world production o soyabeans during 1962-63 is placed at 1,084 million bushels, as compared with 1,092 million bushels in 1961-62, according to the preliminary estimates issued by the U.S. Department of Agriculture. Linseed output is placed at 130.9 million bushels (as against 117.3 million), of cotton seed at 24.14 million short tons (23.00 million tons), of sesame seed at 1.55 million short tons (1.54 million), of castor beans at 609,200 short tons (588,500), of sunflower seed at 7.21 million short tons (7.21 million) and of rape seed at 4.50 million short tons (428 million).

Groundnut April 1963 contract advanced by Rs. 3.62 to Rs. 207.62. July 1963 contract rose by a like amount to Rs. 215.62. Nizam bold closed Re. 1.50 higher at Rs. 41. Khandesh quality improved by Re. 1.38 to Rs. 41.50. Oil ex-mill hardened by 40 nP to Rs. 17 and oil railway receipts by 35 nP to Rs. 16.85.

Cottonseed April 1963 contract put on 50 nP to Rs. 91.50. Cottonseed July 1963 contract closed on a firm note at Rs. 92.50. Berar gathered 30 nP to Rs. 18.80. White and non-white also strengthened by a like amount to Rs. 18.80.

Castorseeds, as already mentioned, ruled easy. July 1963 contract fell by Re. 1 to Rs. 159.75. March 1963 contract lost 62 nP to Rs. 158.87. Madras small improved initially from Rs. 32 to Rs. 32.62, but receded subsequently to close at Rs. 31.75. Oil commercial shed 5 nP to Rs. 12.75. Oil B.S.S. was quiet at Rs. 13.50.

Linseed March 1963 contract fell by 81 nP to Rs. 31.81. June 1963 contract eased by 50 nP to Rs. 33.50. Bold ready suffered a loss of Re. 1.50 to Rs. 31. Linseed oil softened by 45 nP to Rs. 12.85.

The following table shows the closing prices of oilseeds and oils on Wednesday 20th February, as compared with those of two previous weeks:

	20-2-1963	13-2-1963	6-2-1963
	Rs.	Rs.	Rs.
Groundnuts			
April 1963 contract	207.62	204.00	207.87
Nizam bold	41.00	39.50	40.00
Khandesh quality	41.50	40.12	40.75
Oil ex-mill*	17.00	16.60	16.55
Oil commercial*	16.85	16.50	16.40
Castorseed			
March 1963 contract	158.87	159.50	157.75
June 1963 contract	159.75	160.75	159.00
Ready Madras	31.75	32.00	32.12
Ready Kanpur	30.62	30.50	30.62
Oil B.S.S.†	13.50	13.50	13.70
Oil commercial†	12.75	12.80	12.85
Linseed			
March 1963 contract	31.81	32.62	32.37
June 1963 contract	33.50	34.00	32.62
Bold ready	31.00	32.50	32.62
Linseed oil†	12.85	13.30	13.25
Cottonseed			
April 1963 contract	91.50	91.00	89.50

* Rates include excise duty but exclude sales tax.
† Rates exclude both excise duty and sales tax.
N.B.—All quotations for futures contracts are per 250 kilograms, except linseeds for which rates are per 50 kilograms. Spot quotations of seeds are per 50 kilograms and oil per 10 kilograms.

BUFFCALF FETCH MORE

(From Our Own Correspondent)

MADRAS, 18*th February*

Arrivals of tanned cowhides here this week were on the usual scale and of calf skins small. Clearance was good at unchanged prices. Export business was better than in the last week. Inquiries were mostly for the lower ends in 8/8½ lbs. cowhides and all selections in light weights, and all average weights in buffcalf and cowcalf. A few sales of buffcalf were made to the U.K. at higher levels. Buyers in the U.S. were still reserved.

Tanned goat skins market ruled firm. There was persistent call for 11/12 lbs. run and thirds and fourths selections and also for the lower grades of 5½/6 lbs. average. Prime class sheep skins were in good demand and prices hardened to 33s. Inquiries for the middle class sheep skins continued for shipment to the U.S. and the Continent at unchanged prices. Due to active buying by the exporters of pickled goat skins, prices in the raw centres have been increased abnormally and tanners have been unable to buy goods at economic prices to cover their export orders.

Prices per lb. for all round parcels were: tanned hides 8/8½ lbs. average Rs. 2.10 to Rs. 2.15, tanned cowcalf 1½/2 lbs. average Rs. 3.80 to Rs. 4, tanned buffhides 12/13 lbs. average Re. 1.70 to Re. 1.80 and tanned buffcalf 1½/2 lbs. average Rs. 3.50 to Rs. 3.60.

COPPER MOVES UP

(From Our Own Correspondent)

BOMBAY, 20*th February*

Non-ferrous metals, except tin and zinc which were a shade lower as compared with the high levels reached a week ago, continued to make headway during the week under review on sustained buying enquiries. Fears of a further increase in excise duty on some metals also pushed up prices. Copper and copper products ruled distinctly firm, thanks to better demand in the face of shortage of supplies. Lead and brass scrap too firmed up.

In the Bombay market, copper conductor wire advanced by Rs. 4 to Rs. 400 per 50 kgs. Copper electrolytic coils and wire bars rose by Rs. 2 each to Rs. 380 and Rs. 370, respectively. Electrolytic ingots put on a rupee to Rs. 321. Lead (per 100 kgs.) improved by Rs. 3 to Rs. 175. On the contrary, tin eased by Rs. 10 to Rs. 300 per 10 kgs. Zinc fell by a rupee to Rs. 274 per 100 kgs.

In the London Metal Exchange, metals moved up during the week under review. Zinc elicited good demand induced largely by reports that the U.S. consumption of zinc had risen in 1962 by as much as 7 per cent over 1961, the largest increase since 1956. The total consumption of slab zinc in the U.S., according to the U.S. Bureau of Mines, touched about one million tons in 1962. Mine production also increased by 7 per cent to 498,000 tons. Lead was well maintained. Copper, too, ruled steady, following reports of labour unrest at Union Miere mine in Katanga. Tin, however, was quiet, on reports of a fall of 3 per cent to 76,000 tons in tin consumption in the U.S. during 1962, as compared with 78,250 tons in 1961.

Spot zinc improved by 5s. to £69-9/16 per ton. Three months metals increased by 8s. to £69-11/16. Spot lead rose from £54-5/16 to £54-7/16 and three months metal from £54-13/16. Three months copper picked up by 4s. to £234. Three months copper was fully maintained at £233. Tin Spot copper was fully maintained at £233½. three months metal was a shade higher at £855. but spot quotation declined by 4s. to £852.

EASY TREND AT TEA EXPORT SALE

(From Our Own Correspondent)

CALCUTTA, 19*th February*

The tea export sale No. 35 held here yesterday saw a further decline in prices. The 73,030 packages met slightly better demand, but only at lower rates for the majority of varieties on offer. Medium C.T.C. descriptions attracted attention at levels 10 nP to 20 nP lower than in the previous sale. Likewise, the brighter Dooars, medium Assams and legg-cut teas found ready buyers at a little lower levels. B.Ps came in for more competition than their equivalent fannings. Whole leaf grades and tippy sorts followed the general trend. Plain orthodox descriptions sold well at slightly lower rates, though the exportable fannings and the plainest kinds were dearer. The few end-of-season Darjeeling teas on offer were readily absorbed.

Quotations in rupees, inclusive of excise duty, per kilo were: Clean plain pekoe 4.70 to 4.90, plain B.P. 4 to 4.20, plain fannings 4 to 4.30, medium Assam C.T.C. B.P. 5.50 to 5.70, medium Assam C.T.C. fannings 5.20 to 5.50, best Assam C.T.C. B.P. 5.90 to 6.10 and best Assam C.T.C. fannings 5.70 to 5.90.

Firm conditions continued at the internal dust sale. Offerings at the No. 34 sale held here on Friday the 15th inst. amounted to 30,033 chests. Buyers fancied the brighter medium C.T.Cs at even dearer rates. However, the lesser kinds, particularly fibrous, in this description, were irregular and easier. Good C.T.Cs, too, were shaded. Smaller descriptions among the plain and medium orthodox teas commanded a premium over the rest. Support for legg-cut teas was good, and the brighter kinds particularly sold well. Darjeelings commanded higher prices following improvement in the quality.

Quotations in rupees, inclusive of excise duty, per kilo were: Plain orthodox 4 to 4.20, medium Assam 4.30 to 5, legg-cut 5 to 5.30, medium Assam C.T.C. 5.50 to 6.10 and good Assam C.T.C. 6.60 to 7.

Except for the slightly lower quantity on offer at 71,000 packages, last week's tea auction at London had no special feature. The market for the bulk of the North Indian offerings and other miscellaneous growths was firm up to 48*d.* a lb. and the price indication for the plain tea was a penny higher at 36*d.* to 43*d.* South Indian teas were well supported. Offerings from Ceylon had a more general demand and ruled firm.

SUGAR BULLISH

(From Our Own Correspondent)

HAPUR, 18*th February*

The bullish trend in sugar prices continued this week due to reluctance of factories to sell their stocks on fears that excise duty on sugar would be increased in the forthcoming Union budget. Release of the increased monthly quota of 2.25 lakh metric tons and that too a week ahead of the scheduled time failed to check the upward trend in prices. Cane supply position to factories further deteriorated. A few mills in the neighbouring district have already closed their crushing season and the rest are likely to do so by the week-end. The State Government has offered incentives to increase cane production and has urged the Union Government to increase the cane purchasing prices. Latest release of sale of sugar is of the D30 quality which is reported superior to the D29 quality. Prices in the week-end were: Spot delivery Rs. 113.50 per quintal; retail Re. 1.09 per seer, mill delivery D30 Meerut Rs. 111.25, Amroha Rs. 109.50, Bijnore Rs. 109.25, Dhampur Rs. 110.17, Seohara Rs. 110.52, E30 Simbhauli Rs. 111.25 and Saharanpur Rs. 110.50.

Due to brisk buying support from Punjab, Rajasthan and stockists induced by fears of a likely enhancement of excise duty on *khandsari*, prices of this commodity spurted by Rs. 4 to Rs. 7 per quintal to new heights. Producers in some areas were paying higher prices for cane up to Re. 1.75 per maund. *Khandsari* production will continue till the end of the current month. Week-end prices here were: Inferior Rs. 87.05 to Rs. 96.45, superior Rs. 97.79 to Rs. 106.50, crystal Rs. 97.79 to Rs. 106.50 and *boora* Rs. 107.17 to Rs. 115.45 per quintal.

Ready *gur* prices sought lower levels, as loading facilities were restricted throughout the week. Daily arrivals of *gur* dropped to an average of 1,500 maunds which were mostly lifted by stockists. Local stock here was around 25,000 maunds and in mofussil markets around 3.15 lakh maunds. Cane sowings for the next season are being done these days and thanks to some incentives given by the State Government, the acreage is likely to increase. Week-end prices of *gur* here were: Superior Rs. 50.54, *dara* Rs. 48.23, *balti* Rs. 49.22 to Rs. 50.24 and *shakker* Rs. 58.94 per quintal.

Gur chaku advanced by Re. 1.50 to Re. 1.62 per 40 kgs. in Muzaffarnagar. Other qualities were also better. The rise in prices was mainly attributed to the availability of loading facilities during the week. Daily arrivals were at an average of 12,000 maunds. Local stock was put around 2 lakh maunds; corresponding figure last year being much lower at 40,000 maunds.

FOODGRAINS STEADY

(From Our Own Correspondent)

HAPUR, 18*th February*

Foodgrain prices here ruled steady during the week, although the crop prospects were brighter due to the fairly heavy rains over a wide area in Punjab and U.P.

The average quality wheat was quoted at Rs. 40.19 and the farm superior at Rs. 42.87 to Rs. 44.21 per quintal on good demand. Arrivals were almost *nil* and local stocks declined to about 53,000 maunds. Rice prices hardened on better consumer demand in the face of poor arrivals from producing areas. Prices improved 67 nP to Re. 1.34 per quintal according to quality. Week-end prices were: Rice *basmati* superior Rs. 83.06 to Rs. 91.09, *sela basmati* Rs. 75.02 to Rs. 83.06, *mainpuri* Rs. 52.92, *ramajiwayan* Rs. 60.28, *raimunia* Rs. 62.96 and *gadda* Rs. 49.57. per quintal.

Gram prices also hardened by 32 to 67 nP per quintal according to quality owing to the poor stock position. The Punjab quality was quoted at Rs. 41.53 and the local produce at Rs. 41.19 per quintal. Local stocks declined to 4,500 maunds. Maize sought higher levels and moved up by 67 to 99 nP per quintal to Rs. 24.78 to Rs. 29.47. Arrivals averaged 300 to 500 maunds a day and local stocks were around 22,000 maunds. Barley and *bejhar* prices looked up to Rs. 24.78 and Rs. 24.78 per quintal, respectively. *Juwar* and *guwar* ruled steady and *bajra* steadier at Rs. 32.15 to Rs. 32.82 per quintal. Week-end prices were: *Juwar* Rs. 32.82, *guwar* Rs. 29.47 to Rs. 33.49, *methi* Rs. 58.94 and oats Rs. 34.83 per quintal.

JUTE GOODS REACT

(From Our Own Correspondent)

CALCUTTA, 19*th February*

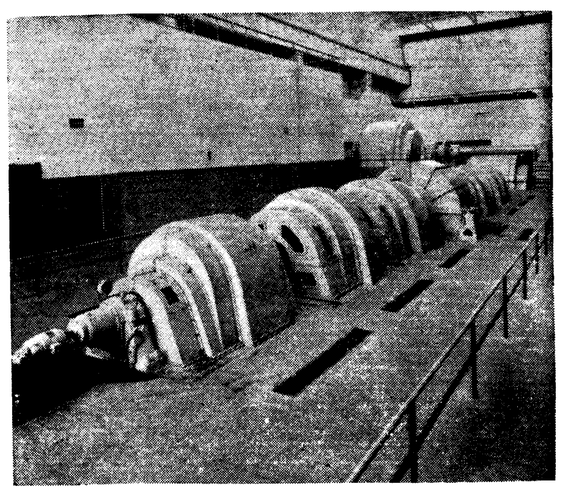
The firm trend noted in the jute goods market during the past three weeks abated during the week under review. In fact, a distinctly easy tendency was in evidence, with sustained speculative selling. The chief bearish factor responsible for such selling was the report of a marked fall in the offtake of jute goods for export from 81,400 metric tons in December 1962 to 63,700 tons in January this year. The fall was attributed to the reduction in the U.S. burlap consumption from 74 million yards to 67 million yards. The news regarding the rise of three million yards to 280 million yards in U.S. burlap stocks also affected the sentiment of operators. Consequently, prices suffered a sharp setback. In the futures section, B. twills February delivery moved down from Rs. 116.20 to Rs. 113.30 per 100 yards and hessian (40" x 10 oz.) from Rs. 50.90 to Rs. 49.46. Ready B. twills fell by Rs. 2.20 to Rs. 114. Hessian dropped Re. 1.37 to Rs. 50.25.

The raw jute market also ruled distinctly easy, with prices drifting lower. Assam bottoms (March contract) declined by a rupee to Rs. 29 per maund. Even at this lower level, business actually put through was restricted, as mills showed no interest in buying. At Cossipore, Assam bottoms lost 50 nP to Rs. 28. Jungli mesta was quoted at Rs. 23, as against Rs. 24 a week before.

The downward trend of raw jute, according to market circles, may not persist. Actually, a rise in prices is expected. The expectation is based on reports that the stocks of superior quality raw jute with farmers has been almost exhausted and that holders are demanding a premium. The gradual decline in arrivals, it is further felt, will also impart strength to the raw jute market. Meanwhile, the operators are eagerly awaiting the official announcement of the minimum operative price of raw jute for the next season commencing from 1st July next.

Notice

THE CHAMPDANY JUTE COMPANY LIMITED



NOTICE IS HEREBY GIVEN THAT THE Share Register of the Company will be closed from 16th March, 1963 to 31st March, 1963, both days inclusive, for the purpose of returning to members paid-up capital to the extent of Rs. 50 per share.

Repayment will be made to the registered shareholders whose names appear in the Share Register on 16th March, 1963 or to their mandatees. ABBREVIATIONS. N—Nominal. (*f*) Income-tax free. * Loans held entirely by the Trustees. † Bombay State Transport.
A—Held by Government of India. B—Taken up by State Bank of India. C—Held by Commissioners. D—Domestic Loan not marketable.
††Rate of Interest reduced from 6 to 3 per cent with effect from 1st June 1944. ‡ Rate of Interest reduced from 6¼ to 4 per cent with effect from 1st April 1935.
f—Interest free for first 12 years. t—Interest free for first 7 years. Z—Ex Ten instalments but inclusive of accrued interest.
M—At the option of the Government after three months' notice. K—On September 1986 or later at the option of the Government after three months' notice.
T—Liability taken over by Madhya Pradesh.

STOCK & SHARE QUOTATIONS

Abbreviations:—D.—Deferred shares. P.O.—Preferred Ordinary shares. Y.—Accounts published yearly. H.—Accounts published half-yearly. P.—Company has Preference shares. T.—Company has Debentures. N.—Nominal quotations. x.d.—Ex. Dividend. c.d.—Cum. Dividend. i—Interim Dividend.

Shares:—If a company has different classes of shares—as for example, 'A' shares and 'B' shares—these are indicated by the same letters 'A' and 'B' under the columns 'Paid-up Ordinary Capital' and 'Paid-up' per share.

Accounts:—Figures in the Accounts Closed column represent the months of the year in which the respective companies close their accounts, 6 and 12, for instance, indicate the months of June and December, respectively. Reserves include general and other reserves and all other funds which a company may have excluding depreciation fund, reserves for tax liability and provident fund. Block represents actual cost of land, buildings, machinery and all other items on which depreciation is allowed less sales, if any and stands for the gross figures except where otherwise indicated.

Dividends:—Dividends for completed years are shown as amount per share per annum, but where quoted for portion of a year they represent the proportionate dividend for that period. In the case of those companies which close their accounts yearly dividends shown are for their financial year.

DELHI LETTER

BUDGET SESSION OF PARLIAMENT OPENS

DEFENCE TO COST RS. 326 CRORES MORE

From Our Special Correspondent

NEW DELHI, 19*th February*

THE Budget session of Parliament opened on Monday with a solemn reminder from President Dr. Radhakrishnan that "the first duty of the nation in these circumstances was to meet this aggression effectively and to prepare the country to that end." He set the theme note with his exhortation to the joint session that Chinese aggression has been, and continues to be, the overriding issue before the country and everything else has to be considered in that context.

The day before, the Prime Minister told his party members that the nation must bear heavy burdens, if India was to face the dangers confronting it successfully. "We must make our weapons ourselves," he said, and this would require greatly expanded economic development.

But for an ugly incident created by the Socialist walk-out, "premeditated and preplanned," as the Speaker said, the consensus in parliamentary circles is that for once the session will be fully dominated by economic issues. Bitter criticism of the planning and implementation aspects, rather than of the policy aspects, of the various economic measures adopted by the Government in the wake of and since the emergency can be safely promised. It is to be expected all the more, since the Opposition this time may not find it easy to attack the Government's spending programme, most of which is geared to defence. However, stray sniping cannot be completely ruled out.

The Opposition parties, it is reported, have tentatively worked out their strategy in respect of the inevitable heavy tax burden. Their main tactics are to be directed towards securing its wider distribution so as to absorb any stunning shock.

Among others, the measures relating to gold holdings, novel as they are, will take a prominent place in the forthcoming debates. A major talking point is the plight of the unemployed goldsmith who does not seem to be satisfied with the assurances of assistance by the Chairman of the Gold Board. The much discussed problem of falling exports, foreign exchange shortage. Common Market and trade restrictions by developed countries are other subjects of abiding interest.

Allocation for Defence

The allocation for defence will, however, be the focal point of all the discussions. Mr. Desai has earlier hinted that defence expenditure in 1963-64 must rise from the present level of 2.5 per cent of national income to 5 per cent. The defence spending in the current financial year is to be of the order of Rs. 423.37 crores. If the projected allocation is to be equal to 5 per cent of national income, the amount has to be of the order of Rs. 750 crores. In other words, the coming year's defence budget has to be higher by Rs. 326 crores and there is, therefore, the need for massive taxation.

Meanwhile, concern is expressed here over the shape of the State budgets for the coming financial year. Two of these, of Uttar Pradesh and Bihar, have avoided imposition of fresh levies, although U.P.'s Finance Minister has indicated his intention to come forward with some additional taxation measures at a later stage.

At the State Finance Ministers' conference early this month, Mr. Desai had advised the States to resort to additional taxation to implement the third Plan and meet the defence requirements. He had made it clear that there was little prospect of the Centre increasing its assistance beyond Rs. 400 crores. At his suggestion, the State Finance Ministers had agreed to improve the level of additional taxation from their earlier figure of Rs. 35 crores to Rs. 40 crores. Even this would leave a gap of Rs. 78 crores between the States' resources and the new outlay of Rs. 750 crores.

Now, on the other hand, certain State Governments are reported to be pressurizing the Centre for larger assistance in order to lower their own local tax obligations. West Bengal has laid claim to larger grants to save the tempo of development, although it has been sanctioned Rs. 26 crores for 1963-64. Assam's demand is said to be Rs. 11 crores, in addition to the Plan allocation of Rs. 20 crores. But Assam's case, due to Chinese invasion, stands on a slightly different footing. The other States clamouring for larger subventions over and above the sanctioned limits include Uttar Pradesh and Maharashtra.

Depressing Reading

The eleventh report of the Colombo Plan Consultative Committee makes rather depressing reading. It says that the current trends in the world economy are uncertain and not altogether favourable for the countries of the region. Evolution of economic groupings and continued restrictions on imports into advanced countries of the manufactured goods of developing countries has brought an "element of uncertainty into the trading prospects of the Colombo Plan countries." It has pointedly referred to the growing tendency in the developed countries to economise raw materials, using synthetic substitutes, which exert a downward pressure on prices of primary products, the main foreign exchange earners for the developing countries.

The Colombo Plan report has underlined the need for lowering tariffs, removing or reducing quota restrictions by advanced countries, and creating export markets for both primary products and manufactured goods from developing countries. It has asked for adherence to the principle of advancing untied credits to developing countries. Tied loans, it says, does not allow full exploitation of the already installed capacity, because it restricts its utilisation only for import of capital equipment. Foreign aid should be productive and, in a well-regulated economy, it should normally be possible to use a part of the expended output to increase foreign exchange earnings with which to service external aid.

The Committee has also proposed special trading arrangements among developing countries of the region to break the vicious circle of restrictions by many developing countries on imports from other developing countries. It says: "The Colombo Plan can provide the basis for new patterns in regional co-operation. These new patterns can improve the capacity of the countries of the region to attack hunger, want, ignorance and disease."

Power Failure

The teams of experts from the Ministry of Irrigation and Power, which recently toured various States to assess the progress of power projects, have now returned to headquarters somewhat dejected. Their impression is that, since the revised third Plan target of 13 million kw. may not be achieved, the original target of 12.7 million kw. might have to be restored.

The Centre has accorded top priority to eight power projects in different States so as to complete them by coming June. It has asked the State Governments and Electricity Boards to step up their construction by diverting resources, arranging for additional shifts and even offering bonus to contractors who complete the work before the targetted dates. The projects are Barauni thermal station in Bihar, Shahpur thermal station in Gujarat, Panniar hydro project in Kerala, Koyna hydro project (stage 1) in Maharashtra, Gandhisagar (fourth unit) in Madhya Pradesh, Hirakud (sixth unit) in Orissa, Kanpur (extension) in Uttar Pradesh and Delhi "C" station.
