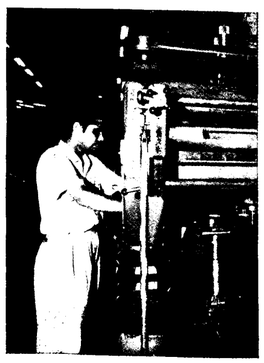
Regd. No. C2
July 1963
Rs. 5 Per Copy

Features:

COMPACT: Controls within easy reach Mimic diagrams at a glance

CONSTRUCTION: Panels of 14 SWG sheet steel give extra strength Independent structural members give full extensibility Bolted construction aids modification Removable doors for easy access Channel iron base for floor mounted panels

HIGH QUALITY COMPONENTS: For accurate reliable performance



WIRING: Arranged for extensibility, accessibility and easy identification Functional marking of wires to Indian Standard

IIC-89 A

OUTSTANDING INDUSTRIAL EQUIPMENT

HOLMAN CLIMAX
Pneumatic Plant and Equipment

Air Compressors, Rock Drilling Equipment and Pneumatic Tools.

Repairs carried out at site saving costly replacements and production losses.

"METALOCK"
Precision Cold Repairs to Fractured Machinery

TEXTILE MACHINERY
Of international repute

Platt Bros. (Sales) Ltd., Prince Smiths & Stells Ltd., Parks Cramer (Gt. Britain) Ltd.
Complete Spinning Plant for Cotton, Synthetic, Woollen, Worsted and Waste Mills.
Sellers & Co., (Hudds.) Ltd.,
Carpet & Textile Dyeing and Finishing Machinery.

"The Engineer's Choice"
Vertical or Horizontal, Standard or Packaged, Coal or Oil Fired.
Duties up to 30,000 lbs. per hour.

COCHRAN BOILERS
For Industries and Technical Institutions

LOCOMOTIVES AND COLLIERY WINDING SAFETY DEVICES

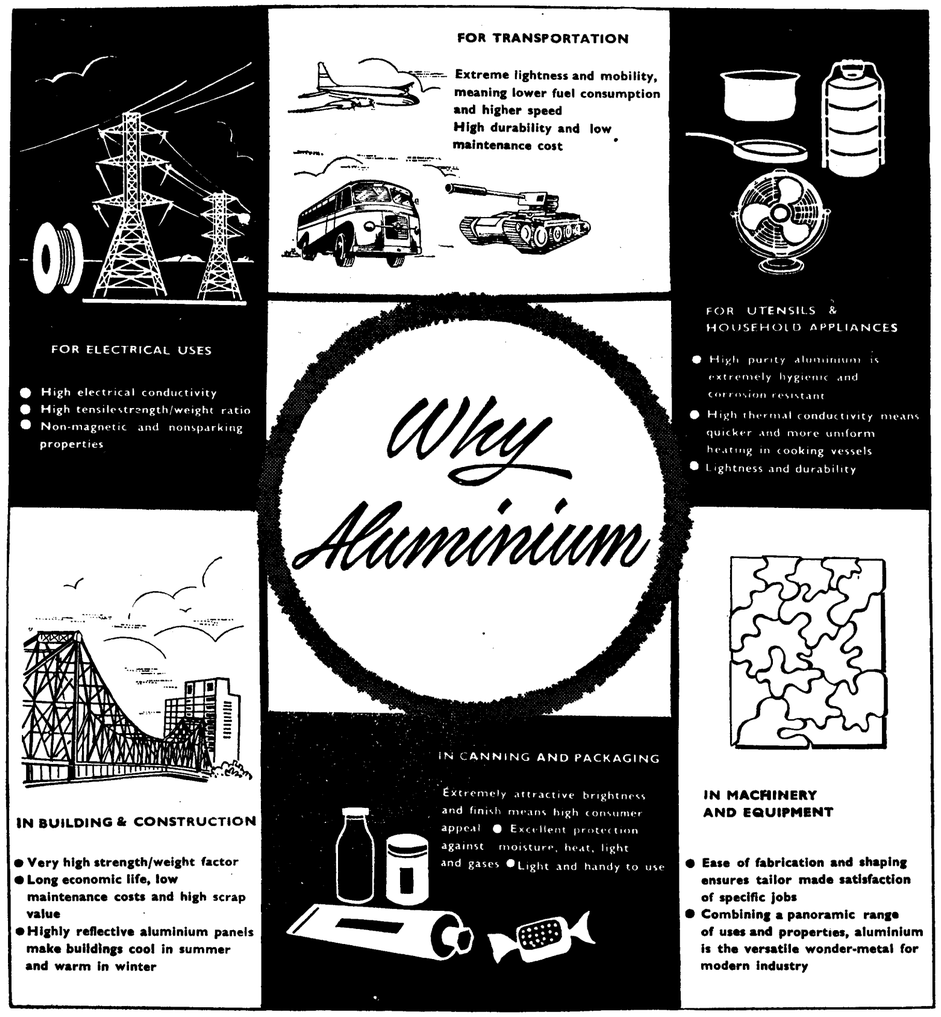
Andrew Barclay Sons & Co., Ltd., Scotland.
Renowned for :
Diesel Hydraulic and Mechanical Shunting Locomotives and Automatic Brake Gearing for Colliery Winding Engines.

High Head and Submersible Pumps and Motors.
Hydro Electric Plant.
Electric Drives for Continuous Process Mills.

HARLANDS
Pumps, Turbines and Drives

TOOL STEELS
Cutting Tools and Crushing Plant

Edgar Allan & Co., Ltd., Sheffield.
High Speed and Special Alloy Tool Steels.
Tungsten Carbide Tipped Tools.
Full Range of Crushing and Screening Plant and Cement Manufacturing Plant.



John Folkes (Lye Forge) Ltd., England.
Forgemasters of Carbon and Alloy Steels up to 30 tons weight and 42 inches diameter.

FORGINGS
For Shipbuilding, Sugar, Steel and Heavy Engineering Industries

The Rs. 200 million Birla-Kaiser aluminium project at Rihand has, since December 1962, attained the present target capacity of 20,000 tonnes of high quality COMMERCIAL & E. C. GRADE ALUMINIUM INGOTS AND WIRE BARS per annum. Fabrication facilities to manufacture sheets, plates, circles, extrusions and wire rods, and expansion of the primary production capacity to 50,000 tonnes per annum are being undertaken, to keep the fast growing national industries on their march to progress and prosperity.

Random thoughts on BANKING...

● The strength of the Nation depends on the vitality of its economy. That means more and quicker production and distribution of goods. Banking service is indispensable for promoting the higher pace in industry and commerce.

● The price line must be held. This is as much the responsibility of the State as of every citizen. Idle money, in the form of cash in hand, is the devil in the price spiral.

● Money put in a bank remains active in the service of production and distribution of goods and facilitates keeping the price line under control.

● Individual well-being is linked with national prosperity and only planned efforts can ensure both in the shortest possible time. Planning for its success, largely depends on savings, —individual as well as national.

● Saving in the form of Bank Deposits provides resources for the National Plan.

● A thrifty person saves to-day and saves his to-morrows while a spendthrift spends to-day and spends away his to-morrows as well.

● With some it is a question of judiciously investing their money, with others it is a question of holding back a few fleeting naya paise. Both are often hard tasks. The UNITED BANK is there to help you in your money matters.

● The Gift that grows with the child and comes handy in good time, is a UNITED BANK pass book in his (or her) name.

● Spending or Saving, do it through a bank and help us increasingly to serve the Five Year Plans.

Factors Determining High Capital Costs of Steel Plants

By

H. BHAYA

Secretary, Hindustan Steel Ltd

THE doubts and misgivings about India's ambitious steel programme seem to have been laid to rest at last, mainly because of the overall success of the second plan projects. The significance and sweep of the decisions taken by the Government of India during 1953-56 grow more and more in stature as the steel industry moves forward. The country's need for steel in peace, as well as in war; the need of an expanding steel base for engineering and industrial activities on which alone the superstructure of a new economy can be created; the direct saving in import of steel, the employment opportunities and skills generated—such broader considerations have finally outweighed earlier caution on grounds of financial and physical limitations.

Apart from India's own needs, the logic of world economy dictates the long overdue exploitation of India's iron ore reserves. The following table[1] illustrates the position:

(In million tons)	Direct shipping ores	Ores needing beneficiation	Iron content
India	21,300	85,000	37,940
World	119,137	250,000	132,000

Individually, India has the richest iron ore reserves, a fact which one cannot overlook.

Major Doubts

But there is no room for complacency. The major doubts which have been voiced during the last decade, namely, the economics of such capital-intensive programmes for a poor country like India, the immediate problems of transport, power and raw materials, are still worring the country. The experience of the second and the third plan periods has, in fact, brought them into sharper focus. But they are no longer barriers to India's will to produce steel on a massive scale: India has to brave them with all her skill and ingenuity.

The financial aspects of this venture—the heavy capital outlay, its source, the return on it, the financial profitability of the new steel plants —have been uppermost in the minds of many. Public interest and criticism in this field have been wide, although not deep. It is hoped there will be more expert interest and writing on the subject than there is today, to guide thinking and understanding. An idea of the magnitude of capital requirements may be had from the following estimates[2]:

INVESTMENT EXPENDITURE IN STEEL IN THE U.K.

(In £ million)	1946-55	1957-62
Replacement investment	130	175
Expansion investment	340	425
Gross fixed investment	470	600
Investment in stocks, etcetera (working capital)	90	90
Total investment	560	690
Average annual rate of expenditure	56	138

The capital employed in the U.S. steel industry was estimated as follows[3]:

(In $ million)	1953	1959	
Net fixed capital	1,994	2,880	
Net working capital	337	696	
Total capital	2,331	3,576	
Capacity in million tons	37.5	41.9	
Working capital a ton of capacity	8.99	16.61	+84.8%
Fund capital a ton of capacity	53.16	68.74	+29.3%
Total capital	62.16	85.35	+37.3%

India's expenditure on steel expansion is broadly estimated as in the following table[4]:

(In Rs. '000,000)	Second plan	Third plan	Fourth plan	Fifth plan
H.S.L. (excluding alloy steel)	5,880(3,110)	4,160(1,800)	+	+
Bhadravati		70(30)		
Bokaro		1,000(800)	4,000(2,450)	2,000(1,000)
Expansion of private-sector plants	–	–	+	+
New plants	–	–	+	+
Replacements		–	–	+
Capacity	3.03+3 mt.	9+	11.5+	13+

The figures in bracket indicate the foreign exchange element.

These figures are an indication of the magnitude of the task. I have not deliberately attempted any conversion lest there is temptation to make incorrect comparisons. It is now necessary to look at it in terms of investment per tonne of capacity of crude steel a year.

The same source[5] estimates an outlay of £100 (Rs. 1,333) a ton of output capacity for an integrated steel works in 1956.

An analysis of capital employed per tonne in India was given earlier. An estimate of gross block per tonne at the rated capacity has also been made by the Indian Tariff Commission as follows[6]:

(In rupees)	As on March '62	Full commissioning	Further expansion
T.I.S.C.O.	931	1,169	
I.I.S.C.O.	754	982	
Durgapur	1,802	1,728	1,436
Rourkela	1,697	2,349	1,834
Bhilai	1,564	1,734	1,229
Average H.S.L.	1,679	1,936	1,469
Total average	1,121	1,362	1,207
Capacity (million tonnes)	5.85	6.06	8.97

Bokaro's expectations in this matter are understood to be as follows:

	(In million tons)	(Capital employed per tonne)
Step: I	(1.4)	2,707
II	(2.5)	1,958
III	(4)	1,603

The gross block on salable steel will naturally be higher by 30 percent to 40 percent. One can extrapolate for oneself the outlays required for the next three foreseeable plan periods.

It would be obviously wrong to draw any but general conclusions from these broad estimates, but it is clear that even granting economies of scale, one should be prepared for an investment in the region of Rs. 2,000 per tonne of annual ingot capacity in the present pattern. The prewar investment in steel in the private sector will form an increasingly negligible proportion of the large programme of investment in steel expansion. Economy in the employment of capital in steel is, therefore, a vital consideration for India's future programmes.

Capital invested (1961-62) in India's major steel plants are:

(In Rs. '000,000)	T.I.S.C.O.	I.I.S.C.O.	H.S.L.	Total
Net fixed capital	1,091	*639	*5,411	7,141
Net working capital	144	100	880	1,124
Total capital	1,235	739	6,291	8,265
Capacity (annual ingot)	2 million tons	1 million tons	3 million tons	
CAPITAL PER TONNE OF INGOT	T.I.S.C.O.	I.I.S.C.O.	H.S.L.	Total
Fixed	546	639	1,804	996
Working	72	100	293	155
Total	618	739	2,097	1,151

(*Inclusive of capital works in-progress).

Capital employed per ingot ton

	Five U.K. steel groups £	U.S. Steel Corporation £
1950: Fixed assets	16.1	20.8
Net current assets	5.5	5.6
Total capital employed	21.6	26.4
Ingot production	7.3 million tons	28. million tons
1955: Fixed assets	25.8	24.6
Net current assets	7	7
Total capital employed	32.8	32.5
Ingot production	9.5 million tons	31.5 million tons
Percentage increase in production, 1950-53	30	12
Percentage increase in capital, 1950-53	52	23

Imported Plant and Spares

It has been stated authoritatively that the imported plant and spares will cost today about 150 percent more than in the country of origin, largely because of ocean freight and Customs levies; on the other hand, India has an advantage in construction costs which are estimated to be 15 percent lower than in the industrialised West where labour costs are high. It is hoped that with the formation of a steelworks construction company in the public sector, the latter advantage will be maintained and improved upon. But the former is of greater importance. It is stated that at the end of the third plan period, the heavy engineering complex in Ranchi will produce a steel mill every two years to start with, and two every three years subsequently. The Russian example in this matter is worth scrutiny. Their investment in iron and steel making equipment plants have been almost equal and parallel to that in steel plants.[7] The investment in the Heavy Engineering Corporation is about Rs. 136 crores only, with of course a prospect of expansion. But the supporting organisations are not conspicuous. The Corporation will be the makers of specific equipment, but they will not probably fulfil the rôle of a main equipment contractor who will take up the responsibility of procuring and matching equip-

IOC-68

a commonwealth of industry

Brought together on their pages are reports of important developments at various Dunlop factories. What has Kobe done to reduce tyre abrasion ? How is Hanau strengthening tyre casings ? Or an idea from Sahaganj to reduce cord friction in tyres.

Every item of information is given careful attention at Sahaganj, every suggestion is considered worth studying, for it is not known which will spark off a train of new ideas, start a new chain of developments that will result in a better Dunlop product.

There are also frequent training and refresher courses arranged by Dunlop companies in other parts of the world, where participating technicians from India come across fresh ideas which they can put into use in their own factories. It is this constant international exchange of ideas which makes the Dunlop organisation truly a "Commonwealth of Industry".

The publications lying on this official's table at the Dunlop factory at Sahaganj are marked "PRIVATE & CONFIDENTIAL". Published by Dunlop, U.K., they represent a medium for the continuous exchange of technological ideas that goes on between Dunlop factories the world over.

DUNLOP

have the longest tyre manufacturing experience in India

DC-567 A

ment beyond its own capacity. This rôle can better be performed by a design consultant. It is doubtful if the Central Engineering Design Bureau of Hindustan Steel and the only other consulting firm in India, by themselves can fulfil this rôle for the massive task in coming years. The Central Design Institute in Ranchi is meant, it is understood, primarily for the machine tool industry. For countrywide co-ordination of wholly indigenous production of iron and steel mill equipment, central organisations, like the Gipromez and the Tyazhpromexport of Russia, may well be necessary.

While higher capital cost a ton of output, especially at the pre-steel making stage, is a trend all the world over, in India the capital investment will tend to be higher still, because of investments in new townships, social amenities, captive mines and quarries and sometimes partially in developing transport, power and water facilities. All these have to be borne by the new steel plants.

To find sources of capital for investments of this magnitude is a problem not only for India but even for countries like the United Kingdom. The possible sources can be any or all of the following (i) external aid (ii) government loans (iii) risk capital from the market and (iv) capital generated from the cash surplus of a steel enterprise. So far generous foreign loans have been available for meeting most of the capital requirement, even loans to repay loans have been available, but aid on this scale cannot be expected beyond a point. In any case, both the import of steel and external capital aid can, in future, continue only within India's means —as a deliberate choice and not by compulsion. The rate of national savings and capital formation is such as to rule out the possibility of getting adequate risk capital from the market. Future expansion has to depend, therefore, mainly on governmental investment and internal resources of the industry.

Question of Profitability

This raises the question of the profitability of the new steel plants or the lack of it. The British industry was able to find from its own resources 66 percent of the total investment needs during 1946-55 and hoped to find 50 percent only during 1957-62. The German industry's contribution to self-financing during 1952-57 was estimated at 64 percent. The use of profits in 1955 in the British and U.S. steel industries was as follows :

	Five U.K. steel groups (Per ingot ton)		U.S. Steel Corporation	
	s d	%	s d	%
Taxation	55	37.4	85 4	36.2
Retained in business, including depreciation	76 5	51.9	114 11	48.7
Dividends	9 2	6.2	33 7	14.2
Loan charges	6 7	4.5	2 0	0.9
Total profit	147 2		235 10	(8)

The dilemma the British industry faced because of the gap between the heavy capital needs and the internal resources of the industry in spite of 52 percent of retained earnings, is not basically different from that confronting India. The parallel is worth quoting* in the context of comparisons often made in India about the efficiency and profitability of the public and private-sector plants.

> "A new plant is bound.... to have capital costs per ton of output substantially higher than the average on which the return reckoned in the price is calculated. Only if the running costs are so far below the average as more than to offset the disadvantage of higher capital costs will it pay to install new plant. In other words, only if the total costs per ton are below average total costs will it be able to earn more than average return earned by the normally efficient plant depreciated half-way through its life, which is taken as the basis of price fixing. Any new plant built today would be at an even more serious disadvantage as far as capital costs a ton of output are concerned."

Can the running costs of a new plant be substantially lower than the average ? The British industry's experience in 1957 is as follows :

> "Today in many crucial sectors, the use of major new techniques has been expanded fairly recently so that a new plant would now embody relatively few technical advances as against the best existing plants. On such products, a new plant will be most unlikely to reap a sufficiently big advantage on running costs to offset its extra capital cost burden. Though highly efficient in a technical sense, such a plant would fail to earn the average net return envisaged by the Iron and Steel Board while fixing maximum prices in the light of average costs.
>
> "The dilemma exerts a powerful influence to restrict the development of entirely new plants in favour of maximum expansion at existing sites even at some sacrifice of possible economies in running costs. The influence is greater, the larger the capital investment required, so that it is particularly relevant to the consideration of projects for major new integrated plant."

In India's decision for developing the industry during the third plan, the force of the arguments of the last paragraph is already evident The contention in the previous paragraph is true in relation to new plants in India, present as well as future. The remedy suggested for the British industry is one which, if adopted, can improve the results of the public-sector companies.

> "While the dilemma exists, it is not enough to set a price adequate to provide enough money for the finance of development over the industry as a whole. On those products where a new plant would have total costs a ton above the average, the new price must be related to these new plant costs if enough development is to be put in hand to meet agreed needs. In other words, even if it is desired to keep the present average cost the basis of pricing over the industry as a whole, it will be essential to move some way towards a marginal cost basis of price determination in all such cases".

The pipe plant at a steelworks

Project Evaluation

The question really is not one of a private-sector or a public-sector plant but one of new and old plants. The fact that the older plants in India are in private ownership and the new ones are in the public sector merely sharpens the contrast in their inherent economics. There are today highly sophisticated methods of project evaluation[10] and various criteria and ratios for evaluating economic productivity. These must have been applied to the existing steel projects, but even a primary arithmetic can reveal certain fundamental misgivings. Take, for example, the three public-sector steel mills. On full production of 3 million tonnes, assuming full sales at the current retention prices, the net earning after deducting excise duty will be Rs. 130 crores. Deducting interest on the Government loan amounting to Rs. 18 crores, and deducting depreciation at 5 percent on Rs. 664 crores amounting to Rs. 33 crores, only Rs. 79 crores is left for meeting the production and other expenses for 2.96 million tonnes of salable iron and steel material, including semis, as well as give a return on the equity capital. T.I.S.C.O.'s expenditure in 1961-62 was Rs. 73.20 crores for a production of 1.7 million tonnes of total salable products. The cut in expenses cannot radically alter the picture unless either the earnings are increased or the loan charges are eliminated (in Russia initial capital for such industries is free) or provision for depreciation deferred or ignored. In such a situation, the margin of profitability is not so much determined by works costs, as by the price and finance structure, both of which being controlled by the government can also be altered and losses eliminated. This has, in fact, been done in Russia on more than one occasion. In a mixed economy like India, it may not be as simple. Profitability or economic return in the conventional sense is, therefore, no longer the only criterion for a decision on capital investment in new steel plants, so apparent losses need not deter or discourage one. Even in Bokaro, according to the U.S. steel techno-economic survey, the cumulative cash deficiency at the end of ten years of operation may be about Rs. 130 crores; in step II it may be Rs. 68 crores. It is only after 20 years that the cumulative cash may equal the gross investment.

In a study[11] of the United Steel Companies of the U.K. for the period 1918-50, the authors come to the conclusion that the orthodox concepts of marginal productivity and of "a business man deciding the precise extent of his capital expenditure with reference to its marginal earnings", do not appear to be operative in the capital development of steel. "The broad conclusion from this study is that earnings requirements are decisive influences for what are, on the whole, relatively minor expenditure upon replacements on grounds of obsolescence ... Looking at the matter from the point of view of total outlay then, the conclusion would be that most capital expenditure is decided on general policy grounds and is more a matter of the general development of the company and of the growth of its output than of factors relating narrowly to the particular project's earning power.

Equalising Returns

"There is, however, no question of equalising the returns from all capital expenditure at the margin. Capital expenditure should then be described as involving large discrete

'doses' in any particular line of investment, so that marginal productivities, in fact, might vary considerably, and individual projects should be simply described as passing or failing the earnings tests".

Decisions on steel expansion are, therefore, not basically "earnings justified" decisions, but they are usually made on the basis of actual needs of an economy.

The authors of the study referred to conclude that "the levels of demand and of costs would then emerge as the effective determinants of capital expenditure". The model will be valid for the expansion of India's steel industry too now and in the future. The demand estimates in detail have been attempted on various premises and they do vary in details. Some of the estimates are" as follows :

1965-66

	Finished steel (In million tons)	Ingot at 75 percent yield
N.C.A.E.R.	7.17	9.56
Department of Iron and Steel	7.33	9.77
Mr. R. N. Dutt	6.00	8.00
The Planning Commission	5.50	7.33
U.S. techno-economic survey team	6.91	9.22

The projections made by the U.S. techno-economic survey team are as follows :

1970-71	11.24	14.78
1975-76	17.00	22.61
1980-81	24.00	32.00

Figures of 12 million, 19 million and 28 million tonnes of ingot as targets for the third, fourth and fifth plans, respectively, have also been mentioned. Against this background, the creation of additional steel-making capacity to the extent capital resources can be mobilised, is an assured and essential activity for years to come. There is agreement in every quarter that this expansion will be mainly in flat products. Similarly, the demand for foundry iron is outstripping supply. This fact has set in an interesting trend which is likely to have important effects in coming years. Iron-making is being thought of in terms independent of integrated steelworks and in scales and methods different from the conventional. Much work is being done in the National Metallurgical Laboratory in this field. A new range of methods for using the rich iron ore reserves of the country are likely to be employed. The making of sponge iron in rotary converters has also been thought of. Decentralisation of iron-making will thus be a special feature in our country in the future.

[12] *Product Pattern of the Steel Industry.* By R. N. Dutt, Calcutta 1963.

Cost Break-up

It was pointed out earlier that advantages gained in running costs of newer plants can hardly offset the heavier capital investment a ton of capacity. This is because in a processing industry like iron and steel, given the technological design capacity, the prime costs of conversion of raw materials and semis are within fairly rigid and known margins. The cost break-up in terms of percentage of total expenses are available for many steelworks in different countries but absolute comparisons are difficult. To take salaries and wages, it was 21 percent in the U.K. (1957), 21.9 percent in T.I.S.C.O. (1961-62), 16 percent in I.I.S.C.O. (1961-62) and about 14 percent in H.S.L. (1961-62). Material consumption was 43 percent in the U.K. (30 percent on raw materials), 32.73 percent in I.I.S.C.O. and 54 percent in H.S.L. (15 percent on spares and maintenance). Fuel in the U.K. accounted for 20 percent of expenses.

There is obviously some scope for reducing operating costs in the last two spheres. Technological skill in every country is directed towards making a significant break-through in these areas. Each country has to contend with its raw material problems, many of which are common. It is not surprising that capital intensity in the pre-steel making stage has risen with the increase in exploitation of less and less easily available ore, coal and fluxing material reserves and the increase in the scale of operations.

The financial aspects have been discussed in order to bring out some of the compulsions which give direction to the technological advances in the industry. Much has already been written on India's problems of matallurgical coke, its lack of balance compared with iron ore reserves, the search for blendable coal, washing of coal and the work being done in this direction. Similarly, the problem of fines and impurities in iron ore, the need for pre-treatment and agglomeration are already familiar to the public. Much work is being done on sintering and the setting up of sinter plants but the full economic gain from the use of sinter is yet to be achieved. The exploitation of limestone for the industry has to catch up with the needs. Its conservation and treatment for better quality are also necessary. The pressing need for the conservation of metallurgical coal and the reduction of coke-rate not only focusses attention on improved economics of blast furnace burden charges but on alternative fuel as well. Since 1947, because of the coal shortage, the use of fuel oil in the steel industry in the U.K. has steadily increased. Experiments are being carried on in the Indian furnaces also.

In steel-making, India is adopting the modern practices of large open hearths, extensive use of oxygen, basic roofs and the L.-D. process. The new steel units in India are mostly planned to use their own mill scraps to the extent of 20 percent to 25 percent, but if cheap scrap can flow back to the steel mills more economies can be expected. Continuous casting is, however, still a thing of the future for this country. The increasing use of electric furnaces in cheap power locations for special steel-making in smaller scales is a direction in which new paths may be broken. The making of special and alloys steel is, however, a subject by itself.

For the shaping of steel, India's fast rolling mills and high capacity blooming and slabbing mills are the most modern one could wish to have in the new mills of India. These by themselves to some extent predetermine the expansion of balancing capacities in steel-making and more or less set the minimum unit for integrated steelworks in the future.

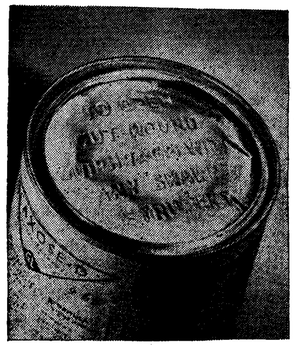
With an expansion programme like that of India, the trend of dispersal from the traditional coal-based plants to ore-based or power-based or coast-based plants cannot but continue. Experiments in different location of new plants will call for greater ingenuity for solving attendant problems. It is an exciting challenge for the new generation of engineers and metallurgists.

Use of Waste Materials

The use of waste materials like slag and the by-products of coal carbonisation will have an effect on costs in the important pre-steel making stage. This, however, is dependent on other industries coming up rapidly. Finally, there is another area of supporting investments necessary for the growth and sustenance of the expansions, which could again be approached through a financial alley. From the annual reports of the new steel plants, it will be seen that their working capital is high[13] and is represented mostly by inventories of raw materials, spares, rolls, refractories, and finished and semi-finished stock.

In the new plant, initial investment in spares is heavy because they are almost entirely imported. There is capacity for the manufacture of spares in the plant itself but a vast amount of work is necessary to establish the manufacture of nearly the full range of spares. Otherwise, this burden will have to be carried for years. Apart from the financial implication, the presence of a large stock of spares is also likely to inhibit good maintenance, repair by replacement being easier and quicker. The large investment in spares is also unlikely to match actual needs due to the inadequate experience of working a new mill and its initial wastage rates. But the task is very great indeed both in magnitude and complexity, the multiplicity of designs being a further complicating factor.

Capacity for the manufacture of rolls is being installed in the H.E.C. and in the expanded Bhilai plant. With the work of standardisation of rolled sections proceeding slowly and the indigenous availability of rolls being uncertain, the plants may perforce make heavy and idle investment in imported rolls.



Need for Basic Refractories

Refractories again constitute a major share of both operating and replacement costs in a steelworks, particularly in steelmaking costs. The need for basic refractories will rise. But known raw material deposits at present are situated at two extremes of the country, one of them not worked yet. Multiplicity of shapes, sizes and specifications beset speedy progress in this sphere too.

An ever-expanding steel industry is now an established fact in this country. To mobilise capital for steel expansion is difficult even in advanced countries, let alone in a poor country. Even so, expansion schemes are launched. Capital development in steel is not an "earning-justified" decision, it is need-based. One need not, therefore, judge such plants entirely by their financial balance-sheets and be disheartened. It is ultimately a matter of social accounting whether a public steel enterprise should be allowed to accumulate sufficient cash surpluses for self-financing or its surplus over expenses taken at the source and merged in the general revenue, the need for fresh capital being met from such sources as the national economy commands, when it is wanted. Meanwhile, the only test for such enterprises for efficient working, according to the chairman of the United Steel Companies Ltd of the U.K., is "the elimination of waste material, waste effort, lost time, idle machinery and idle capital".

Engineering Progress Hampered by High Costs and Heavy Taxes

SOME remarkable advances on the engineering front have been made in the second year of the third five year plan. Production of salable steel increased by one-third over the 1961-62 level and by March 1963, both Durgapur and Rourkela had joined Bhilai in reaching their full rated capacity. Aluminium production almost doubled during 1962-63, while the production of machine tools—another important indicator—rose by about 45 percent. On the other hand, progress in other important sectors such as pig iron, steel castings, and forgings, and alloy and tool steels has been disappointing. Of course, some unevenness of development and recurring shortages may be difficult to avoid wherever measures are taken to force the pace of industrial growth.

By
B. A. TARLTON

What is important is that central planning should be flexible and sensitive to changing circumstances and should rely less on physical controls and directives, and more on an intelligent distribution of incentives.

During the past year, there have been some encouraging signs from New Delhi. Recent changes in import policy, for example, give licence holders some discretion to vary the quantities of different items to be imported, provided their allowance of foreign exchange is not exceeded. There is also some hope, following the interim report made by the Raj Committee, that certain bureaucratic controls over the distribution of iron and steel will be removed, and a less rigid pricing policy may improve the supply of better quality steel and of scarce matching sizes and sections. The shortage of good quality hard coke may be regarded as a classic instance of how a rigid price control can create an artificial scarcity of an important product. Quite apart from the acute shortage of high grade pig iron, the engineering foundries of India have been starved for many years of low ash-content coke without which it is very difficult to produce good quality castings. On the other hand, there has been no incentive for coke-plants to incur the extra cost of producing coke with low ash-content as they have been allowed the maximum price for hard coke with ash-content of up to 24 percent (which is double the maximum ash-content specified for foundry quality coke in the U.S.A., France and other countries).

Coal and Coke Pricing Policy

The coal and coke producers' associations made several representations to the Government for a more flexible pricing policy. Early in 1963, however, the situation threatened to become still worse. The only plant in the country producing low ash-content coke was about to cease production as its attempts to cover the additional production costs by adding a "service charge" to its bills was subject to legal challenge from the Government. Accordingly, in February 1963, the Indian Engineering Association submitted a memorandum to the Government emphasising that higher prices paid by the foundries for good quality coke would be more than offset by the resultant economies in fuel consumption, lower fuel transport costs, higher standards of casting, and so on. The Government was at last convinced, and on 1st March, 1963, the price of coke with 20 percent ash-content or less was decontrolled. Since this measure of decontrol, arrangements have already been made by several coke-plants in India to produce better quality coke and the present shortage of such coke should soon be reduced if not removed altogether.

However, there are two disturbing trends in the present Government policy where the problems of the engineering industry are still subject to a rigid and doctrinaire approach. These trends are to be found in the policy of encouraging State trading and of promoting engineering exports without due regard for the actual consequences.

Expansion of State Trading

A recent instance where State trading has been extended in the engineering industry is the Government's decision to channel all imports of bearings, other than for actual users, through the State Trading Corporation. This decision was ostensibly taken in the interest of consumers on the grounds that imported bearings were being sold at excessive prices. There is no doubt that certain dealers have been selling bearings at very high prices. Delay in the supply of a particular bearing can be extremely costly in terms of idle machine hours, and for this reason, most firms are prepared to pay exorbitant prices to any dealer who can give delivery from stock. There is little evidence, however, to show that the profiteers have obtained their stocks from the quotas given to established importers rather than from other sources.

On the other hand, there is little evidence to show that the State Trading Corporation is competent to trade in finished engineering products such as bearings. The experience of the engineering industry has, in fact, been to the contrary. The State Trading Corporation, for example, has a monopoly of engineering imports from the so-called "rupee-payment" countries. In one particular case, which reads rather like a fairy tale, a large engineering firm in Calcutta was told to obtain its requirements of bearings through the State Trading Corporation early in 1961. The very substantial requirements of the company were planned on supplies from Yugoslavia, Czechoslovakia and Russia, and the company was directed to apply to the respective importing agents as approved by the State Trading Corporation. In 1963, two years later, the company has still not succeeded in obtaining a firm quotation for the Yugoslav bearings. In the case of the Czachoslovak and Russian bearings, quotations were obtained and the orders placed, respectively, in May and August 1961. But here again, the company has still not received a single bearing against the orders placed two years ago. Yet the State Trading Corporation's monopoly has now been extended to cover all imports of bearings from the "non-rupee payment countries" as well. The Corporation has in turn decided to share its quota out to a variety of dealers, but has stipulated that the profit margin on the imports should be not more than 25 percent, of which 10 percent should be paid to the Corporation (this may be compared with the 2½ percent commission taken by the State Trading Corporation on all imports from the rupee payment countries).

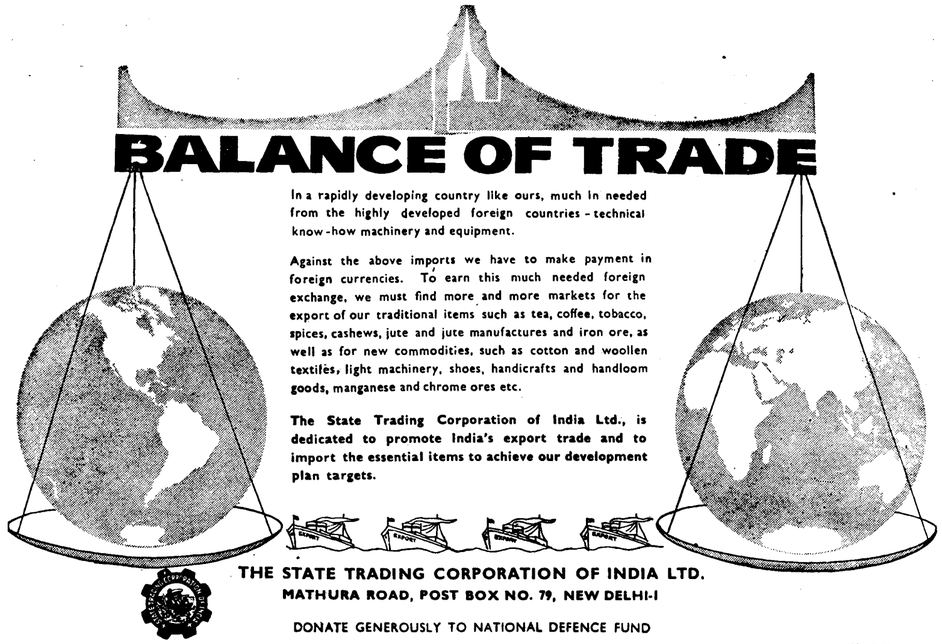
Narrow Profit Margin

This stipulation of a narrow profit margin of 15 percent is quite unrealistic and it may safely be assumed that the profiteering will continue under the counter with only the book transactions conforming to the margin laid down. The result is that the engineering industry will still have to pay high prices for its bearings (or go without) and the Government will lose its taxes on the unseen cash transactions. The only new feature is the introduction of another middle man who, having a monopoly of imports, is taking a 10 percent cut on each sale in return for little or no service other than the distribution of patronage. The engineering industry has, in fact, been saddled with a new tax and is being deprived in the process of the technical advice and after-sales service available previously through certain established importers.

The proper solution in this particular case would have been to increase the import quotas given to the accredited agents of foreign manufacturers of bearings. These agents have been quoting controlled prices for their limited supplies, and at the same time providing the engineering industry with proper technical advice and after-sales service, and endeavouring to maintain a comprehensive stock of bearings to meet emergencies. The actual result, however, has been to reduce the import quotas of these agents and narrow profit margins are being prescribed which will make it difficult for them to retain the specialist staff to advise and serve their customers.

Another disturbing trend in Government policy is the tendency to encourage or even to compel engineering units to export their products regardless of the cost or the consequences. It is not denied that the export drive is of primary importance or that the engineering industry, with its unique scope for diversifying exports, has an important part to play in earning foreign exchange for India. What is to be deplored is the indiscriminate nature of the pressure which is being exerted to increase engineering exports.

In the first place, it should be noted that the engineering industry is already making a most important contribution to the balance of payments position by producing an increasing range of capital and semi-capital goods which are essential for the industrial growth of the country and which must otherwise be imported. The demand for such goods within the country is tremendous and care should, therefore, be taken to see that the country's industrial development is not hampered by the export of engineering goods which are urgently required within the country. There is quite clearly no sense in exporting engineering products, often at a sacrifice, if the same products must then be imported, at higher prices, to make up for the deficiency.



A current instance of this is the export of welding electrodes at a time when many fabricating units throughout India are facing a virtual shutdown of welding work for lack of electrodes. Despite a 16-fold increase in local production of electrodes during the first and second five year plans, and further large production increases during the present plan, the demand for welding electrodes seems to have been growing still faster, even though the structural fabricating industry has been working at only 50 percent capacity (on a single shift basis) for lack of matching steel.

Nevertheless, electrode manufacturers are still being encouraged to export and licences for new units are being granted only if the licensee will guarantee that a certain percentage of the licensed output will be exported. At the same time, the shortage within the country is so acute that large-scale imports of finished electrodes have been sanctioned and some quantities required for defence purposes are even being brought in by air-freight. Meanwhile, severe production losses are being sustained. In April 1963, for example, one of the largest wagon-building works in the country was forced to close down completely for one week when the supply of welding electrodes ran out completely: the loss here alone was from Rs. 15 to Rs. 20 lakhs of railway wagons.

Engineering Exports

To put the question of engineering exports into proper perspective, it is worth noting that despite the special export incentives offered to engineering firms, the value of engineering exports in 1962-63 was a little under Rs. 10 crores. This is less than 1.5 percent of the country's total export earnings of Rs. 686 crores, and may be compared with 41.5 percent earned from the export of tea and jute. Moreover, if allowance is made for

BALANCE OF TRADE

In a rapidly developing country like ours, much in needed from the highly developed foreign countries - technical know-how machinery and equipment.

Against the above imports we have to make payment in foreign currencies. To earn this much needed foreign exchange, we must find more and more markets for the export of our traditional items such as tea, coffee, tobacco, spices, cashews, jute and jute manufactures and iron ore, as well as for new commodities, such as cotton and woollen textiles, light machinery, shoes, handicrafts and handloom goods, manganese and chrome ores etc.

The State Trading Corporation of India Ltd., is dedicated to promote India's export trade and to import the essential items to achieve our development plan targets.

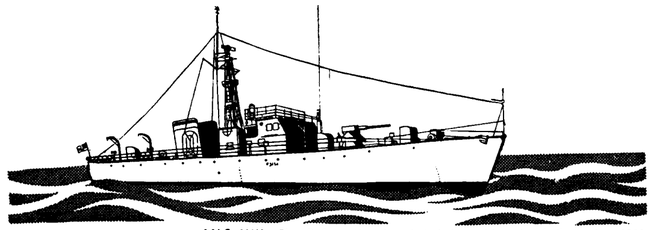
the fairly high import content of certain engineering exports (for example, the import content of a bicycle is approximately more than 40 percent of the local cost of production and exports are being made at prices substantially below the cost of production), the net foreign exchange earnings from engineering exports may be found to be considerably less than 1.5 percent of the total.

From this, it will be seen that even if engineering exports are doubled, it would still have only a marginal effect on the country's export earnings. On the other hand, indiscriminate pressure on engineering firms to achieve this marginal increase might well result (as in the case of welding electrodes) in damage to the economy at home which is more than marginal. It should also be appreciated that international markets are far more competitive for engineering products than for most other products which are exported from India. Exports of products such as tea or jute, for example, face competition from a limited number of other countries. Considerations of soil, climate, etcetera, however, are relatively insignificant in determining the location of engineering units, and accordingly exporters of engineering goods must face potential competition from almost every other country in the world. On the other hand, many engineering industries in India are still largely in the cradle or the nursery, or are as yet unborn. At this stage, a great deal of protection is required to enable these new industries to grow, and it may take years in some cases, before the new units acquire the strength, efficiency and experience to compete successfully in export markets.

Exporting at Loss

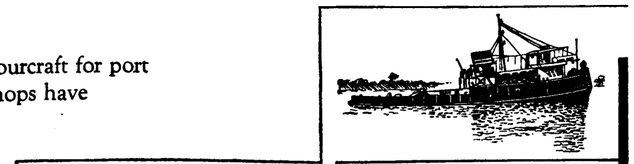


Largely because of these factors, coupled with the very high costs of production in India, it is at present impossible for many engineering units in the country to export except at a loss. Such exports are being encouraged, however, and are generally regarded as a patriotic duty, on the grounds that the exporters should cover their losses by the profits made on sales in the home market.

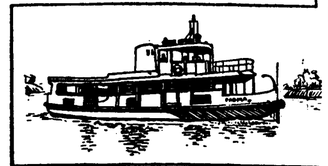
This practice of exporting at a loss can only be justified on economic grounds if it enables the exporter to establish himself in a particular overseas market and subsequently to maintain his position there without continuing to sell at a loss. If this is not the case and the exporter must continue to subsidise his exports, the effect is self-defeating. For whatever the way in which the exports are subsidised, whether by increased taxation, a cess on production, or charging higher prices in the home market, the subsidy represents yet another addition to production costs within the country. In turn, as production costs go up, so the export subsidies must be increased, and a vicious upward spiral is generated. From this it can be seen that if the practice of exporting engineering goods at a loss becomes a widespread practice, and is continued for any length of time, the result can only be a continuous increase in production costs and a corresponding decrease in the ability of engineering units to compete in export markets.

Consideration should also be given to the moral and political arguments against a general policy of exporting at a loss. Many other countries, for example, are bound by Article XVI Section B4 of the General Agreement on Tariffs and Trade which states that

> "contracting parties shall cease to grant either directly or indirectly any form of subsidy on the export of any product other than a primary product which subsidy results in the sale of such product for export at a price lower than the comparable price charged for the like product to buyers in the domestic market."



It is recognised that India, engaged in the struggle to develop her economy and to increase her exports, is not yet in a position to follow this code of international trading ethics, but this should still remain as a long-term objective. Japan, for example, has



I.N.S. AJAY—First Defence Vessel made in India and launched in September, 1960.

already signed the G.A.T.T. "stand-still" undertaking not to introduce any new subsidy on exports and is expected very soon to assume the obligations of a full G.A.T.T. signatory.

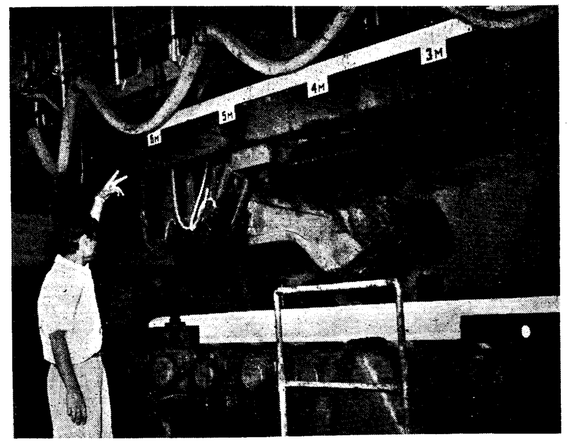
India should, therefore, proceed cautiously in introducing new export subsidies and in encouraging exporters to adopt systems of double pricing to recoup at home what is lost abroad. If this short cut to boosting exports, itself of dubious economic value, is relied on too heavily, the result may be a loss of goodwill for India among the G.A.T.T. nations, who are now being asked to remove, unilaterally, their own import tariffs against products exported by the less developed countries. It should be remembered that the practice of exporting goods below the true cost of production, or at "give-away prices" may be referred to less politely at the receiving end as "dumping", and the sympathy of other exporting countries to India's efforts to overcome her foreign exchange crisis may begin to wear a little thin. The aid-giving countries might also ask how India can afford to give, through her subsidised exports, what is virtually a subsidy to the economies of the importing countries.

The Need to Reduce Costs

So the only proper and permanent solution to the problem of engineering exports is to bring down production costs to competitive levels. This is primarily a challenge to be met by management, but it is also important to examine some of the special factors in India today which are contributing to high production costs and which are largely outside managerial control. The most important of these factors are the shortages of raw materials, fuel, power and transport which make it generally impossible to run plant and machinery at optimum capacity. A current instance of this is the acute shortage of pig iron. Many foundries throughout the country have been allocated this year a share of the country's pig iron output which is equivalent only to 25 percent of their requirements. Until their balance requirements can be supplied, whether from increased imports or improved local supplies, the overhead costs of the foundries cannot be spread properly over a reasonable output. The result is to increase the cost of castings and of the many engineering products in which castings are used. A point which is worth noting here is that despite repeated representations by the engineering industry, more than a quarter of the country's output of pig iron is still being reserved for the manufacture of railway sleepers, for which other materials such as concrete could be used.

Likewise, there is considerable idle capacity throughout the structural fabricating industry in India largely because of an acute shortage of matching steel. If this shortage is overcome, the output from many large units could be doubled even without running a second shift. There are undoubtedly great possibilities here for spreading overheads over larger output, and so reducing costs. If the existing resources here could be fully utilised, the present delays in implementing important construction projects could be substantially reduced, and there would be very good prospects for the export of fabricated steel work at competitive prices.

Heavy Indirect Taxation



Another important factor in the cost of production is the very heavy burden of indirect taxation which tends to inflate the prices of raw materials, components and finished products throughout the whole economy. The excise duty on steel ingots, for example, averages about Rs. 50 a ton of salable steel and the further excise duty on salable steel materials averages about Rs. 35 a ton; an average of another Rs. 30 a ton is taken by the equalisation fund surcharge and other items of indirect taxation on the steel industry may add up to a further Rs. 20 or more a ton. Thus a total of Rs. 135 or more a ton has been added to the price of the principal raw material used by the engineering industry.

It can therefore, be seen that cost-cutting in the public sector could contribute a great deal to cost-cutting in the private sector. Economy in public expenditure and improved efficiency in Government operations is a necessary supplement to the efforts of industry as a whole to reduce its costs of production. There is already an encouraging sign here that the Government is paying more attention to the profitability, and not merely to the output, of the public sector undertakings. Thus a target of a 15 percent reduction in production costs has been set for the three public sector steel plants during the year 1963-64. This trend would be still more encouraging if it is extended to the non-industrial sphere of the public sector as well.

Other obstacles to lowering the cost of production include the tying up of working capital (that is, in stocks of steel which cannot be used for lack of matching sections, or in goods which cannot be despatched promptly for lack of railway wagons), the delays and difficulties in obtaining licences, permits, quotas, etcetera, the difficulty of obtaining spare parts for maintenance, the high costs of internal transport and ocean freights, insurance against emergency risks, and so on. A further difficulty, though there are notable exceptions, is the generally low level of labour productivity resulting from indiscipline, absenteeism, numerous holidays, a tropical climate, low levels of nutrition, health and education, and a "sour grapes" philosophy of the restriction of wants (rather than working harder to satisfy them).

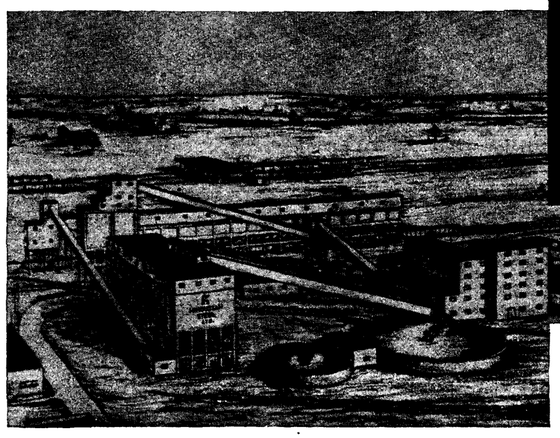
Disincentives to Efficiency

To overcome all these obstacles and to reduce production costs to the level required for the successful export of engineering products is a formidable task for management in India today. Radical changes in Government policy will also be necessary to assist the general drive to increase productivity and efficiency. More recognition should be given to the fact that the profit margins of engineering units are a direct measure not only of the demand for their products, but also of the efficiency of those units in keeping down their costs of production. If these profits are unduly eroded by taxation and other imposts, fresh investment capital will not be attracted in the directions where demand is the greatest, with the result that

Shearing of blooms in a steel mill

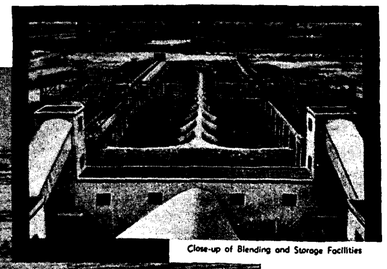
shortages will constantly recur, and the incentives towards greater efficiency will be reduced.

A great deal has been said and written, for example, on the disincentive to efficiency of a graduated tax on profits such as the recent super profits tax. More attention might also be paid to the disincentive to managerial efficiency of compelling employers to pay a share of profits, over and above any incentive or production bonus, to their labour. The Indian Engineering Association has taken a very consistent stand here before the Bonus Commission and has argued that compulsory profit sharing, as a widespread practice in industry, should be progressively eliminated. One of the dangers here is that if the Bonus Commission recommends (as it is expected to do) the continuation of profit sharing in some form or other, the present annual bonus system might then be consolidated by legislation. The next logical step would then be to legislate for some form of "copartnership" in industry, for if workers are to depend on profits for part of their income, they will naturally expect to participate in management decisions which very largely determine the quantum of profits. In such a situation, where managerial responsibility is divided, the prospects of effective cost-cutting in the engineering industry would appear to be very poor.



However, such speculation about the future may be unduly pessimistic. The immediate objective should be to encourage the export of engineering goods, on a selective basis, wherever it is possible to do so without impairing industrial development at home and without selling below the true cost of production. At the same time, continuous efforts should be made to reduce production costs elsewhere, so that the range of exportable engineering products is continuously increased.

Free Trade Zone Proposal



Substantial progress in this direction may take many years to achieve and there would seem to be no short cut towards reaching the objective. An interesting proposal, however, which has recently been put forward by the Export Sub-Committee of the Indian Engineering Association, is that a "free export zone" should be established in Haldia south of Calcutta. Unrestricted imports free of duty would be permitted into such a zone, the only condition being that the entire products assembled or manufactured in the zone, or an agreed percentage, should be exported. Likewise all "exports" from India into the zone would be at concessional export prices and would qualify for drawback of duties and other export incentives. Apart from Indian firms, foreign firms wishing to have a base in this part of the world would be encouraged to set up units in the zone. Their requirements of staff and labour, raw materials, components, electric power, etcetera, could be supplied from the industrial hinterland, thus providing India with an export market right on the doorstep.

A free export zone of this kind would provide a useful testing ground for Indian enterprise to show, right alongside foreign enterprise, that production costs can be brought down to world competitive levels once there is free access to imported raw materials, components, etcetera, at world prices, the opportunity for full capacity working, and exemption from heavy indirect taxation in the form of import duties, excise duties, etcetera. At present, within the protected walls of the Indian economy, inefficiency is difficult to detect or remove while efficiency is being discouraged in a number of ways. A free export zone of the kind proposed would provide a quick method of setting standards of productivity and efficiency for the rest of India to follow and attain as a long-term measure. This proposal should, therefore, be given serious consideration as a means of promoting exports and of raising living standards throughout the country as a whole.

N.B.—The views expressed in this article are the personal views of the writer and do not necessarily represent the views of the Indian Engineering Association.

DUGDA COAL WASHERY ENGINEERED, FABRICATED AND ERECTED BY OUR FOREIGN COLLABORATORS, McNALLY-PITTSBURG.

Close-up of Blending and Storage Facilities

Hindustan Steel Limited

. . . is located at Dugda, India, in the western region of the Jharia coal fields. Their coals are collected from 26 collieries located in the Bhagga, Mahuda and Katras sectors. Despite a great variance in the characteristics of the various products, the McNally installation produces high-grade coking coals for making steel and middlings for generating electrical power.

Just the blending and storage facilities maintaining the 600 tph production are a striking example of McNally experience and ingenuity. Four piles, totaling 30,000 tons of raw coal, are filled in layers by shuttle conveyors to provide for blending before washing. The two types of washed coal, blended in 4,000-ton drainage bins, are conveyed to 2,500-ton bins for simultaneous loading out through motorized gates to ten railroad cars. Middlings are conveyed to 1,000-ton loading out bins.

If you're concerned with maintaining profitability in your operations, you'll want all the details. Please write:

Glass Output Rises but Production Costs Have to be Cut

ALTHOUGH of comparatively recent origin, the Indian glass industry has taken giant strides and mirrors, on the one hand, contemporary economic progress and, on the other, brighter aspects of modern life in India. The use of glass is universal. To mention a few uses, glass containers are required for pharmaceuticals, dairy and food preservation, safety glass for railways and motor-vehicles, lampwares for electrification, table tops and pressedwares for offices and homes, scientific glass for laboratories and sheet glass for constructional purposes. Indeed glass, a versatile material, has continued to fascinate the modern civilisation by its infinite capacity to serve mankind.

The history of glass in India can be traced back to the days of Mahabharata. At the behest of Lord Krishna, the great demon engineer and city planner Moi built for King

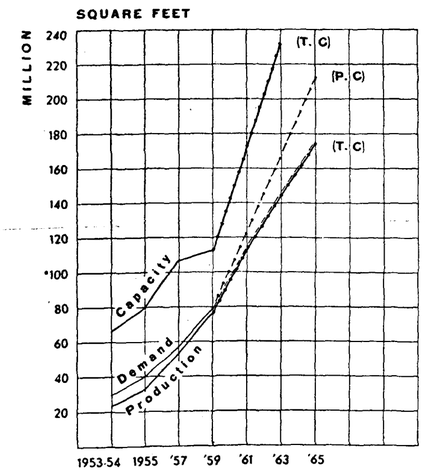
P. N. TALUKDAR

Managing Director, Hindusthan-Pilkington Glass Works Ltd

Yudhistira a 5,000-foot long courtroom in which there was a lily-pool with stairs and walls made of glass tiles so transparent that the invited kings who went round to inspect it could not distinguish between the water and the floor and were about to step into the pool. Glass figured in ancient India as mirrors and artistic bangles. Images of beautiful goddesses in the temples of India are seen absorbed looking at the mirrors in their hands. The art of bangle making is believed to have originated in India, and the industry reached the height of its glory during the Moghul period. The artistic work of the Sishgars of Faizabad in U.P. is renowned. Even as late as 1930, the main outlet for glass was the bangle. The period following the second World War experienced great diversification in glass production. The industry continued to offer a wide variety of products never before manufactured in India. The industry is now in a position to produce important items, namely, sheet glass of various thicknesses, toughened and laminated glass, wired, figured and cathedral glass, glass tubes by automatic drawing, glass building blocks, glass wool and fibre glass, glass syringes, heat-resisting glass, narrow-mouth thermos flasks, foam glass, glass bricks and tiles and scientific glass.



Change in Technique

As fashions kept changing and consumers became increasingly quality-conscious, old techniques yielded place to new. Cottage-scale operation proved uneconomic. Refinement and precision became the order of the day. Hand operation led to substantial wastage. In some items like sheet glass, automatic machines became a must.

Indeed, a striking feature of development of the industry is the wide application of advanced foreign technology. Great improvements have been made in the structure of the furnace, techniques of annealing, etcetera, for producing glass of superior quality. The system that has generally been followed in India for the production of sheet glass is known as "fourcault" process. Recently, a modern and more productive one—the Pittsburg plate glass process—better known as the "P.P.G." process has been introduced in one unit with the result that the quality of its product has greatly improved and can compare with the best produced anywhere in the West. During the second plan, production in the mechanised sector of the industry went up from about 45,000 tons to 90,000 tons. There is also a definite shift of demand for glasswares made by automatic machines.

Glass melting is done by either coal or furnace oil. The factories in Bombay and Madras being far off from sources of coal depend largely on oil as fuel. Glass goods are fragile and are of small value relative to their bulk. Proximity to the markets and sources of raw materials and fuels has, therefore, greatly influenced the location of the glass industry, which is heavily concentrated in Uttar Pradesh, West Bengal and Maharashtra. Of 97 working factories in 1961, Uttar Pradesh had 28, West Bengal 24, and Maharashtra 22. Factories situated in Calcutta and its vicinity account for nearly one-third of the total installed capacity. It follows that the average factory size in the Bengal zone is bigger. Early location of glass factories in U.P. was influenced by the local sources of silica sand—a most important raw material. Factories situated in West Bengal and Maharashtra were attracted by factors like the nearness of market and sources of fuel, banking, insurance and port facilities. Although sand had to be procured from U.P., this did not pose any serious problem as transport requirements were easily met.

Capacity, Demand, Production of sheet glass

P.C: Planning Commission Estimates
T.C: Tariff Commission Estimates

Capacity shown thus ——
Demand " " ——
Production " " — — —
Dotted portions indicate forecasts

Locational Advantages

Such locational advantages around Calcutta, Bombay and Madras have, however, suffered a serious setback because of the increase in the railway freight rates since 1949 coupled with the inadequacy of transport facilities. Arguments have recently been put forward for wider dispersal of the industry in the backward and undeveloped areas. An essential prerequisite for such guided location of industry is the creation of proper "infra-structure" of industrial development in the backward areas. As the glass industry, more than any other, is transport-orientated, location will have an important bearing on the cost of making glass. Moreover, at the industry's present capacity level, it can offer only limited scope to the plan objective of balanced regional development.

A break-up of the industry's total output shows that almost 70 percent of its production consists of glass containers and sheet glass. The share of bottles and phials alone is 51 percent in the total.

PRODUCTION OF GLASS
(In metric tonnes)

	1951	1956	1961
Bottles and phials	50,640	62,413	11,5518
Other glasswares	36,710	56,326	68,547
Sheet glass	5,800	24,848	42,025
Total	93,150	143,587	226,085

Demand Prospects

The demand for glass and glasswares continued to increase at an average annual rate of 17 percent during the second plan till it reached 200,000 tons by 1958-59 from a level of 136,000 tons at the end of 1955-56. The demand is expected to be 440,000 tons, including export requirements of 15,000 tons by the end of the third plan. The demand for sheet glass increased from 46 million square feet in 1956-57 to 100 million square feet in 1960-61. According to the Tariff Commission, the demand is expected to go up by 15 million square feet a year.

The rate of increase in demand for glasswares is not, however, expected to be as high during the third plan period as in the past for the following reasons: (a) the shortage of tinplate necessary for containers will not be so great because of increased production during next several years, (b) the increased use of substitute materials like plastics in the field of packaging and pressedware, (c) larger availability of bottles for reuse as production reaches a higher level and (d) the extension of Prohibition leading to the diminution of demand for wine bottles. To the extent that glass is a commodity with a more or less elastic demand, any increase in its price is likely to react on its sales. Goods are subject to excise duties which vary from 5 percent on laboratory glassware to 15 percent on glasswares in general. The surcharge of 20 percent imposed by the new Budget on sheet and plate glass and of 10 percent on other glasswares will further stoke up the prevailing supply prices of glass. As most of the industrial customers for glass containers find the cost of containers already high relative to the total ex-factory price of their products, glass goods will face greater consumer resistance.

These factors certainly call for extra caution in creating new capacity particularly when there is looming dominance of excess capacity in many sections of the industry. In spite of the impressive progress of the sheet glass industry, the veiled threat of excess capacity has also dogged its steps. Of late, additional capacities have been licensed ignoring the progress of utilisation of the existing capacity. An analysis of current trends will show that while capacity shot up at

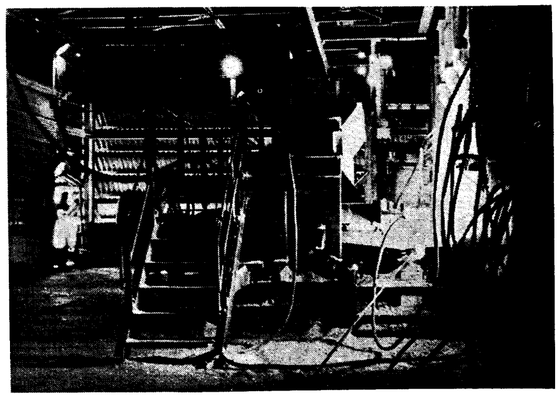
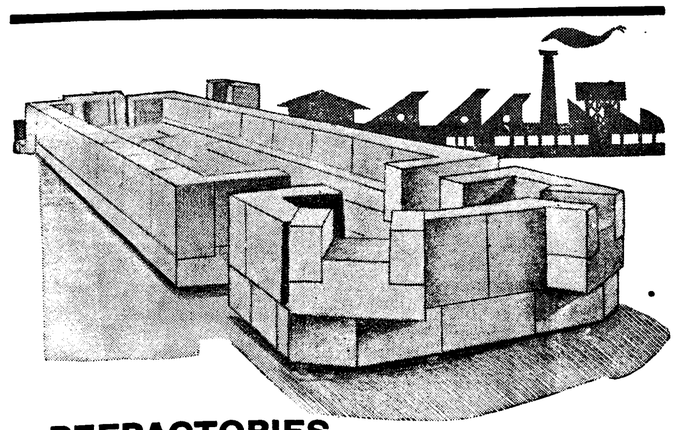
certain great gallops during 1953-63, the demand followed in low canter. Production, however, moved up to match demand as the graph on page 19 shows. Thus compared with a capacity of 100 million square feet and the production of 81 million square feet in 1957 and 1958, the industry appears to have in 1963-64 a capacity of 232 million square feet, against a volume of domestic demand only half as much. Conceding that some capacity of the glass industry may remain unused for technical reasons, there is, nevertheless, need for caution so that no wastage is caused through misallocation of scarce capital resources. To the extent, however, the licensed capacity differs from the effective capacity—and indeed such cases may be many—a false impression of adequacy gains ground. The surer way, therefore, to a closer relationship between the two is to expand the existing units instead of setting up altogether new units. The licensing policy also needs to be orientated towards greater diversification of production in newer fields.



Import Replacement

Imports of glass goods declined from Rs. 1.63 crores in 1955 to Rs. 72 lakhs in 1959. This, however, rose to Rs. 1.20 crores in 1960 and fell to about Rs. 91 lakhs during April-December 1961. Imports of glass during these years consisted mainly of tubes and rods, optical glass, plate glass, wired glass, toughened glass, silvered plate glass and scientific glass. Significant replacement of imports during 1958-61 was achieved in glass containers, sheet glass, safety glass, bottles and phials, beads and pearls, bangles, fibrous glass, tumblers, etcetera.



Glass is a non-traditional item of export. It is natural, therefore, that the indigenous industry will have to grapple for some time to come with the hurdles of competitive sales to have a fair share of the export markets. The export performance of the industry has remained as yet far below expectation. In fact, exports have been almost stationary, varying between Rs. 25 lakhs to Rs. 30 lakhs in the past ten years. Exports during April-December 1961 amounted to about Rs. 22 lakhs. The major export items during 1958-61 were bottles and phials, beads and bangles, scientific glassware, tubes and rods, etcetera. The prospects of Indian glass exports to the Middle East and African countries have been reported by a recent trade delegation to be bright, and current efforts of Capexil are directed towards increasing exports in the major potential markets abroad. An export target of Rs. 50 lakhs was fixed for 1962. Indian glass is, however, a high cost commodity. The prices of Indian products are said to be 30 to 50 percent higher than those of comparable products from other countries. The reasons are not far to seek.

Main Obstacles

The production of glass has to depend on widely dispersed sources of raw materials and fuels, namely, silica sand, limestone, soda ash, felspar, dolomite, coal, furnace oil, etcetera. A steady flow of raw materials from divergent points to the factory and a continuous outflow of goods from the factory to the markets invariably require adequate and timely transport. Thus, for various reasons, transport holds the king-pin in the cost structure of the industry. A steep increase in the minimum weight for wagon loads and the withdrawal of owners' risk rate since October 1958 affected glass goods which have very low freight-bearing capacity. It has been pointed out that while the cost of heavy soda ash delivered at factory site in the U.K. ranges from Rs. 118 to Rs. 145 a ton, that in India amounts nearly to Rs. 550 a ton. Position is similar in case of limestone and sand. A striking feature of transport requirements of the industry is that such demand originates at certain selected places. For instance, the industry is heavily dependent on silica sand of U.P. supplied mostly from Shankargarh, Lohagarh and Bargarh, and any disturbance of loading facilities at these points will dislocate glass production completely. Non-availability of wagons for the despatch of glass goods has become a regular feature. As the glass is a continuous process industry, the furnace temperature needs to be constantly maintained at as high a level as 1400° centigrade for 24 hours. Any large variation of temperature is most likely to affect the structure of the furnace and, of course, the quality of the product. It is necessary, therefore, to have an unhindered supply of fuel of high efficiency. The variation in fuel efficiency of coal often causes serious disadvantages to the glass manufac-

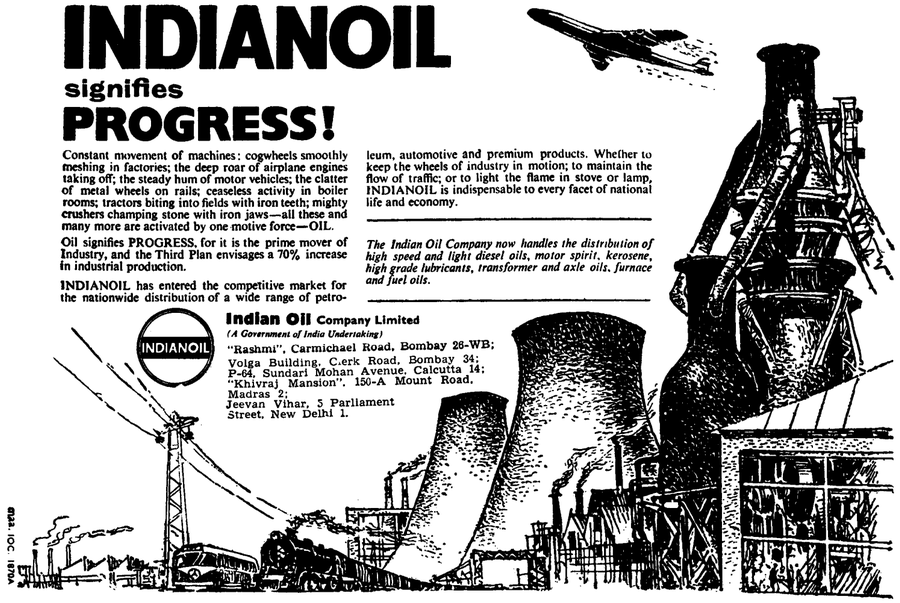
INDIANOIL
signifies
PROGRESS!

Constant movement of machines: cogwheels smoothly meshing in factories; the deep roar of airplane engines taking off; the steady hum of motor vehicles; the clatter of metal wheels on rails; ceaseless activity in boiler rooms; tractors biting into fields with iron teeth; mighty crushers champing stone with iron jaws—all these and many more are activated by one motive force—OIL.



Oil signifies PROGRESS, for it is the prime mover of Industry, and the Third Plan envisages a 70% increase in industrial production.

INDIANOIL has entered the competitive market for the nationwide distribution of a wide range of petroleum, automotive and premium products. Whether to keep the wheels of industry in motion; to maintain the flow of traffic; or to light the flame in stove or lamp, INDIANOIL is indispensable to every facet of national life and economy.

The Indian Oil Company now handles the distribution of high speed and light diesel oils, motor spirit, kerosene, high grade lubricants, transformer and axle oils, furnace and fuel oils.

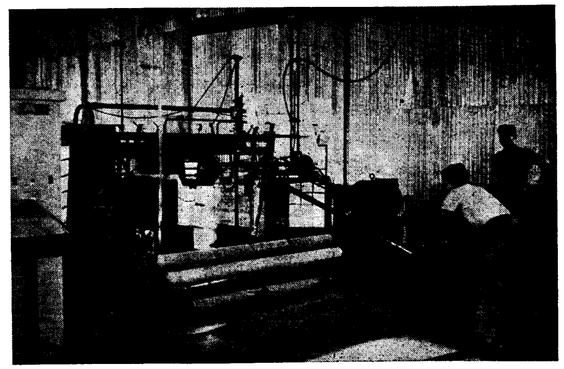
"MUKAND [redacted] IS STEEL"

turers, particularly in view of the shortage of Grade A coal.

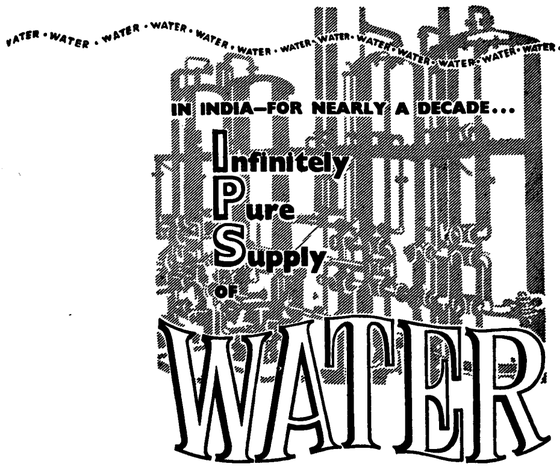
Of the important raw materials, soda ash—light and heavy—deserves special mention. The physical and chemical characteristics of soda ash vary largely, and in the absence of any dependable indigenous source of supply, the requirements of soda ash have so long largely been met through imports. Supplies of heavy soda ash to the glass industry including sheet glass, during 1957-60 ranged from 45,000 to 52,000 tons a year. By 1960, the indigenous capacity licensed for heavy soda ash was of the order of 72,000 tons a year. The indigenous heavy soda ash now available for the industry is not yet of requisite quality nor of required quantity and the prices charged are much higher than the international price. These are presumably the reasons which prompted the Tariff Commission to observe: "If we continue to import for some time to come light soda ash to fill the gap between the domestic and indigenous production of soda ash, we see no reason why a somewhat higher quantity of heavy soda ash cannot be imported to meet the full requirements of the sheet glass industry and the quota of light ash fixed for sheet glass diverted to other consuming industries which can use it without difficulty" (the Tariff Commission Report, 1960, page 13).

The industry's requirements for suitable refractories and superior grades of sand are not also adequately met. An average glass factory—it has been pointed out—has to pay nearly Rs. 7 lakhs to Rs. 8 lakhs more now to get the same volume of production as in 1946.



INDEX OF INCREASE IN PRICES OF IMPORTANT RAW MATERIALS
(1946 = 100)

	1961	1962
Soda ash ...	215	275
Sand ...	154	154
Coal	133	143
Furnace oil ...	223	231
Limestone ...	110	122



Cost Structure

Viewed in this background, the cost structure of the sheet glass industry deserves careful study because sheet glass is a protected industry. Since 1960, the cost of production of sheet glass rose cumulatively. As the prices of sheet glass are now centrally controlled by the Government on the basis of the Tariff Commission's recommendations, the industry is faced with a serious crisis. The Government has recently fixed the prices of ordinary quality sheet glass. The prices so fixed are lower than those recommended by the Tariff Commission and have not been commensurate with the rise in cost, particularly in those units who have made heavy capital expenditure on technological improvement and have also changed the fuel-base from coal to oil. Rising costs on the one hand and aggregative control of prices, on the other, threaten seriously to slash returns on capital to an unattractive level and stop a further flow of risk capital into the industry at a time when a larger share of company income is going to be liquidated through the super profit tax.

The glass industry of India stands today at the cross-roads, and there is need for proper integration of its future development. A healthy growth of the industry calls for careful dove-tailing of the mechanised and non-mechanised sectors that will make possible the attainment of desirable optima of employment and income. The third plan has set forth a capacity target of 615,000 tons for the industry. For this, a capital investment of about Rs. 11 crores will be required. The total foreign exchange component of this investment will be Rs. 4.5 crores, and the additional employment during the period is expected to be 25,000. Thus by 1965-66, the progress of the industry will be phenomenal. The industry has at present broadly the following major sectors: (1) the traditional sector producing beads and bangles, (2) the modern art goods sector producing glass and pressedwares for interior decoration, (3) the principal consumer goods sector producing bottles and phials, etcetera, (4) the scientific goods sector producing laboratory and optical glass and (5) the building materials sector producing sheet and plate glass, safety and laminated glass, etcetera. Investment during the third plan and the intensity of national emergency will have a significant impact on the overall growth of the industry. Current trends, however, indicate that the last two sectors will expand conspicuously to become the leading lights of the Indian glass industry during the next decade. As the standard of living rises in the country, the industry will need new conception of design and better forms of expression, for no other material can render more charm to our surroundings and lend our lives brightness and good cheer.

Production of Structurals Affected by Power and Matching Steel Shortages

STRUCTURAL engineering covers a very wide field, and includes railway and road bridges, factory and residential buildings, power houses, blast furnaces, coke oven plants, fertiliser and chemical plants, sluice gates, transmission towers, aerial ropeways, wharf and overhead travelling cranes. Railway wagon and coach building is allied to structural engineering, but is excluded from this survey.

The structural engineering industry is the oldest organised industry in India, and plays a vital part in any industrial undertaking, as it is the starting-off point providing the "shell" for the manufacturing process involved. It is a highly specialised industry, and as its products are largely "tailor made", efficient design and drawing offices are essential in addition to well-equipped workshops.

In the fabrication of heavy bridges and heavy buildings for steel works, the member firms of the Braithwaite Burn and Jessop (B.B.J.) group have demonstrated India's ability to manufacture to standards which bear comparison with the best in the world.

By
A SPECIAL CORRESPONDENT

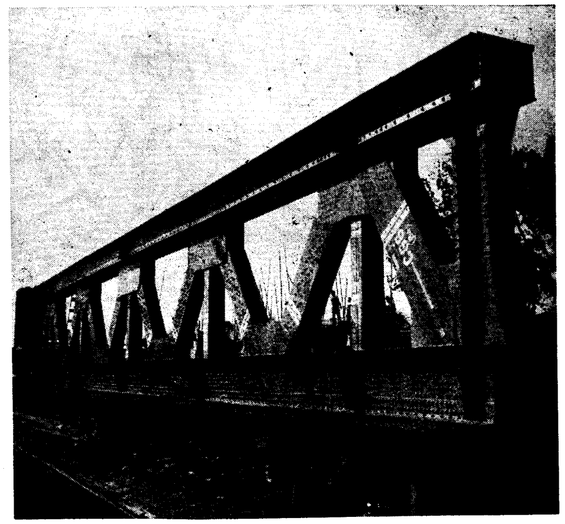
Large bridges constructed across the Hooghly, the Ganga, the Brahmaputra and the Sone, and 85,000 tons of heavy steel work fabricated for the Tata Iron and Steel Co. Ltd, Jamshedpur, and the Indian Iron and Steel Co. Ltd, Burnpur, bear testimony to India's achievement in this branch of heavy engineering.

With the increased pace of industrialisation, the demand for fabricated steel work has risen enormously, and in view of this, the Government has licensed a large number of new units. At the end of the first five year plan, the licensed capacity was 126,000 tons, which was expanded to 395,000 tons a year on a single shift basis by the end of the second plan.

Due mainly to the shortages of matching steel, the production of fabricated steel work for the last seven years has been (figures in tons) :

1956	90,000
1957	85,000
1958	113,000
1959	110,000
1960	130,000
1961	160,000
1962	170,000

The demand by 1965-66 for all types of fabricated steel work has been assessed by the Planning Commission at 850,000 tons, and the licensed capacity on a single shift basis at 695,000 tons. The shortfall of 155,000 tons in fabricating capacity is being made up by a balancing second shift. It is, however, most unlikely that actual output will reach this target figure, and there may be a considerable shortfall.



The structural fabricating industry has, since 1946, faced the most serious shortages in matching steel, and this continues to be the single factor limiting any substantial increase in output. This has created an embarrassing situation since there is a famine amidst plenty—an abundance of orders but a famine of matching steel. The position can perhaps be better appreciated by reference to the fabricated steel required for the foundry forge in Ranchi. Out of the total requirement of approximately 28,000 tons of steel work to be fabricated by the B.B.J. Group, orders were placed progressively from January 1962 for 28,000 tons of plates and sections required for this work, but because of many delays, only 4,300 tons have been received at the end of April 1963, and all of this tonnage is unmatched. Similarly, 26,500 tons steel work for the alloy steel project in Durgapur, and 32,000 tons for railway bridges also being fabricated by the B.B.J. Group, are held up as the necessary matching steel has not been received.

The Government of India is aware of the great idle capacity which exists because of the shortage of matching steel, and is trying to take remedial action. The Indian Engineering Association is also actively investigating this problem, and a special committee has been formed to find ways and means of easing the problem. A preliminary survey has shown that until such time as the steel mills have been expanded to produce the country's requirements, considerable economy can be effected by restricting the range of sections being rolled by eliminating those sizes where the demand is small. It is expected that the recommendations of this committee will be forwarded to the Government before the end of July 1963.

Welded Steel Work

In keeping with progress in other countries, the use of welded steel work is now being extended. This, of necessity, demands steel to A.S.W. quality, in which the carbon content must not exceed 0.2 percent as against 0.25 percent for mild steel. Here again, the demand exceeds the supply and interminable delays in supply occur. Yet another serious bottleneck which has developed is the supply of hand welding electrodes, the main reason for this being the supply of low carbon rimming quality steel for the core wire.

The supply of electrodes has progressively deteriorated over the last six months, and this has had an adverse effect on a large number of firms. The Government is importing a large tonnage of billets for drawing into core wire. This will give temporary relief, but the problem will persist until such times as the Indian steel mills are able to supply billets to the specification which they at present find difficult due to poor quality of coke and limestone.

A huge span crane gantry girder at a steel works

Scarcity of Electric Power

Since April 1961, an acute shortage of electric power has developed in West Bengal, and for one reason or another, the position has slowly deteriorated, and this has added to the difficulties of structural fabricators. At present, sections of industry are being subjected to massive load shedding three times a week, which will have an adverse effect on production. Even allowing for the additional 50 MW which will be available from the New Cossipore generating station of the Calcutta Electric Supply Cor-

poration towards the end of 1963, 75 MW from the Durgapur power station of the West Bengal Government early in 1964, and a further 75 MW from the same station in July 1964, there can be no real improvement until the Bandel station of the West Bengal Government is in production towards the end of 1964. It must, however, be remembered that by this time both the industrial and domestic requirements will have risen.

Records kept over many years show that in the structural fabricating industry in India, the average output is 1 ton a man a month, against 1 ton a man a week for similar work in the U.K. There are many reasons for this wide difference in productivity, but the main ones are the high incidence of non-productive to productive labour, climate and nutrition. The introduction of generous production bonus schemes has resulted in a progressive rise in productivity, but it has not been possible correctly to gauge the fullest possibilities of such schemes due to the fact that the structural fabricating industry has for many years run at 50 percent of its installed capacity due to the shortages of matching steel.

It seems reasonable to assume that given adequate orders, with full supplies of matching steel and electrodes to provide full utilisation of installed capacity without interruption due to cuts or restrictions in the supply of electricity, it would be possible to achieve a 50 percent rise in productivity, that is, to 1½ tons a man a month.

A further rise in productivity can be achieved by the use of rolled broad flange beams of the types extensively used in the United States, and now being rolled in some of the British steel mills, in place of built-up riveted plate girders. Alternatively, welded broad flange beams built up of plates could be used for this purpose as and when adequate supplies of steel to the correct specification are available from the mills together with the necessary specialist welding plant and electrodes. Considerable assistance can be given to increase productivity if designers would make sections of steel work identical to permit fairly large tonnages to be fabricated without trivial variations.

For the fabrication of steel work for medium-heavy factory buildings, considerable economy in freight and time can be effected by site fabrication. This method necessitates the setting up of a small fabricating unit complete with cranes at site where all raw materials are delivered. The materials are straightened, cropped, sawn or guillotined to size and assembled in a jig for welding. All connections for the columns, roof trusses and girders are drilled for bolted connections. Jessop and Company has over the last three years, site fabricated some 4,000 tons of steel work for the various expansions and additions to the Company's works in Dum Dum by this method of site

A 14-span bridge in Bihar

fabrication, thereby freeing capacity in its structural works for other orders.

Capacity and Output

It will be appreciated that there are always considerable gaps between the licensed, installed and actual capacity of any industry, as the granting of an industrial licence does not always result in a new unit going into operation, nor does a unit always reach its installed capacity. Indeed, frequently licences are cancelled because nothing is done. There can be no doubt that there is a very substantial unsatisfied demand for fabricated structural steel work, but because of the shortages of matching steel, electrodes and power, newcomers are

IN STEP WITH TOMORROW

New processed foods, new pharmaceuticals, and many more new products are coming on the Indian market every day. They create new packaging problems ■ At Poysha, one of the leading tin container makers in the country, they are always geared to meet the requirements of their customers. In 1961 they pioneered the manufacture of 5½ oz juice cans. Soon these will be lithographed too. Next on the agenda is a much wider expansion of the range of packaging material. What is more, plans are ready for the setting up of subsidiary factories in the heart of the fruit and vegetable growing areas to help the canners with quick and economical canning facilities. Poysha are indeed always in step with tomorrow.

hesitant to invest large sums of money in establishing capacity which will not be fully utilised, thereby getting a poor return on their money. There is also an acute shortage of skilled man-power and supervisors. Established units are likewise reluctant to expand their capacity, until such times as the present chronic shortages are removed.

It is not possible to give any real indication as to when the present difficulties will be resolved, but assuming that the shortages of matching steel and electrodes can be substantially corrected by the time electric power supply is available from Bandel, that is, by the end of 1964 there seems little or no prospect of the structural fabricating industry producing the output set by the Planning Commission, namely, 695,000 tons by 1965-66.

As soon as regular supplies of steel are available in matched quantities, together with electrodes and power there will, within a period of four to six months, be a sharp rise in production. There will, of necessity, be a time lag before the industry is producing to capacity due to the necessity of engaging additional skilled men and supervisors, who are in very short supply. The setting up of a second shift does not necessarily mean there will be a 100 percent rise in output, as many firms have found that the efficiency of a full night shift on structural steel work is considerably lower than that achieved on the day shift, and is not more than 60 percent.

One contributing factor is the high rate of absenteeism which is normally a serious problem in industry, as the average on a day shift varies from 10 percent to 12½ percent. This figure, however, rises to an average of 15 percent to 17 percent on the night shift, and at certain periods of the year, goes up to 25 percent. The need s for additional tonnages of steel work to be prepared and drilled ready for assembly, and it is for this reason that a full second shift can rarely be justified as the final assembly work s carried out at faster rate. What is needed, therefore, is a balancing night shift in which all the machines are manned. If this is well organised with adequate and competent supervision, an overall rise of 40 percent in output can be achieved. Large-scale welded work almost inevitably demands a full second shift to make the fullest use of the plant, and to a somewhat lesser degree, this is also necessary for riveting.

Raising Structural Production

Given favourable conditions to develop production to its full present installed capacity, it is possible for the structural industry to reach an output of 320,000 tons on two shifts within a year, if matching steel and power is made continuously available. While the demand for light and medium categories of structural steel work can be met, most serious shortfalls in fabricating capacity for the heavy categories must arise, as due to the interminable delays which have occurred in the past, there is a huge backlong of at least 140,000 tons of heavy steel work for the foundry forge, alloy steel plant and railway bridges. This work will fully absorb the existing capacity of the small number of firms in Calcutta and Bombay, who are equipped for this class of fabrication, and any new demands for extensions to the steel mills both in the public and private sectors, and the heavy electrical plants, etcetera, will either have to be imported or delayed.

One solution to the problem would be to import as early as possible the greater part of the plates and sections required, and thus utilise the idle capacity more especially of the heavy units, so as to enable them to participate in the demands which must arise for the extension to the steel plants, and the setting up of two heavy electrical plants, etcetera.

As stated before, there seems little chance of adequate supplies of power being made available before the end of 1964. Nevertheless, a bold step in the substantial easing of the problem of matching steel before December 1963 would enable the fabricating firms to make a start towards increasing output which is so badly needed.

Export Possibilities

A start has been made in exporting transmission line towers and pressed steel tanks. There is a market in east Africa for building steel work and bridge work; but as always, price plays a deciding part. An attempt is being made by some firms to enter this market, but it is too early to assess the results. The supply of such products as a major bridge, railway wagons, railway coaches, wharf cranes, electric overhead travelling cranes, road rollers, would immediately demonstrate India's ability to supply capital goods, and it is essential that great effort should be made to export some of these products.

It must, however, be remembered that in a number of countries in Asia, there is still a preference for buying American, European and Japanese products, and a long period of rehabilitation will be necessary in order to give ample proof of India's ability to supply quality goods. Another important point which has to be given very serious consideration is that of price; for even allowing for preferential prices of steel utilised in the export of engineering goods and other incentives, the industry's productivity in terms of tons per man per month has to increase considerably, in order to be competitive in the open market.

Cement Production Lags behind Demand and Plan Target

CEMENT and steel are fundamental to a nation's economic progress and stability. In India, the cement industry as well as the steel industry are the most stable ones and their growth potential will be tremendous, if the planned objectives of economic development are fulfilled.

In India, the *per capita* consumption of cement, which is often taken as an index of the industrial progress of a country, is far below that of industrially developed countries. To reach anywhere near these countries in cement production, measured in terms of *per capita* consumption, looks well-nigh impossible, especially in view of the enormous population of the country, which is increasing almost explosively. One must, therefore, discard the *per capita* yardstick of measurement, but concentrate on increasing the absolute quantities of manufacture of cement and

By
R. R. HATTIANGADI
Managing Director, Cement Agencies Limited, Managing Agents of the Associated Cement Cos. Ltd., Bombay

cementitious materials by expeditiously harnessing every kind of raw material to gainful use.

In 1962, India produced about 8.6 million tonnes of cement, against an installed capacity of nearly 9.6 million tonnes, which is a fairly good record considering the numerous difficulties of transport, foreign exchange, etcetera, now confronting this industry. The progress can be gauged from the following figures:

Year	Installed capacity (million tons)	Actual production (million tons)
1951-52	3.7	3.3
1955-56	4.9	4.6
1962	9.6	8.6

Nevertheless, even this progress falls considerably short of the targets. The target of installed capacity by the end of the third five year plan has been fixed at between 15 million tonnes and 16 million tonnes, so one has to study how best this target can be achieved, if at all.

Large Capital Requirements

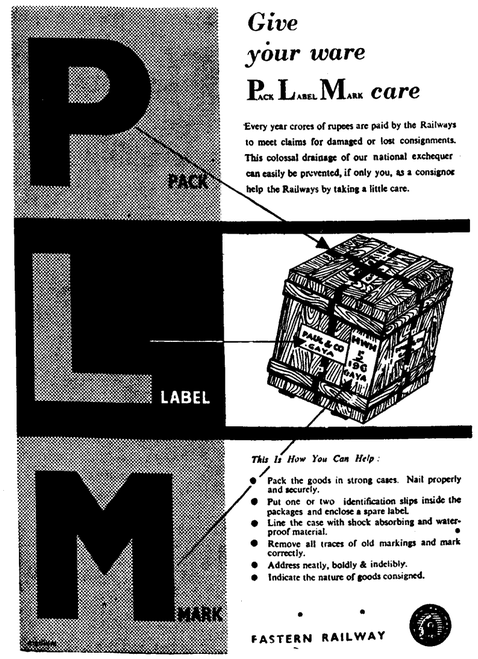
The cement industry is capital-intensive. Unless there are sufficient incentives, capital will not be attracted as adequately as the situation demands. Cement is at present in short supply, and it is paradoxical that the growth of the industry is not as vigorous as it ought to be. The industry suffers from being over-controlled growth-wise, price-wise, distribution-wise and even to the type of packing to be adopted, etcetera. Such controls naturally stifle the growth of an industry and, to some extent, discourage new entrepreneurs entering the field. To achieve the target capacity of 16 million tonnes a year during the third five year plan, it may be necessary for the Government to change the policy in order to stimulate entrepreneurs to establish new factories or to expand old ones.

Under the second five year plan, the target of cement capacity was set at 16 million tonnes, and the production target at 13 million tonnes. Licences were issued by the Government in the second plan for the industry to reach a capacity of about 15.5 million tonnes. However, due to difficulties of foreign exchange, internal finances and proper investigation of raw materials availability, some of the licensed schemes did not materialise within the plan period. Some other schemes did not materialise, due either to unsatisfactory nature of limestone deposits they proposed to work on or to lack of railway transport facilities. Now, in the third plan, the target capacity has to go up from, say, 9.5 million tonnes to about 16 million tonnes, and will require investment of a huge capital, especially in view of the present-day increasing costs. Roughly, it can be taken that investment per tonne of annual capacity is of the order of Rs. 150 to Rs. 160 for a new factory of 600 tonnes a day capacity (that is, 200,000 tonnes a year capacity) and about Rs. 110 to Rs. 130 in the case of expansion of existing factories by a similar capacity.

Taking an average of Rs. 140 per tonne of annual installed capacity as capital expenditure, the capital requirement will be of the order of Rs. 80 crores, which is a very large sum of money. The foreign exchange component of this could be easily in the neighbourhood of Rs. 15 crores to Rs. 20 crores. But the moot point is whether this target can be achieved with the best will in the world. Everything considered, it is difficult to conceive that the installed capacity at the end of the third five year plan period would be more than 13 million tonnes, but even to do this, it will be necessary to take certain urgent steps, such as: (a) the encouragement of expansion of existing factories on a priority basis; (b) harnessing the know-how of existing manufacturers by encouraging them to come forth and put up factories—at least for the time being—and not be governed by "shibboleths" that only new entrepreneurs must be encouraged to the exclusion of existing companies, whatever be their size; (c) a more flexible approach in foreign exchange allotments; and (d) the encouragement of manufacture and use of new kinds of cementitious material conforming, of course, to specific standards.

When the cement industry was started in India about 50 years ago, all the know-how had to be obtained from abroad; the top management and supervisors were mostly foreigners. It is gratifying to note that the country now has all the know-how of making cement, and very little foreign technical help is necessary. On the whole, it appears the industry is in a safe position as far as technically qualified personnel are concerned.

Raw Material Problems



Having dealt with finance and personnel aspects, one comes to the last point, namely, materials. Cement-making entails the use of: (a) raw materials such as limestone, clay, gypsum; (b) coal or fuel oil; and (c) stores and spares for machine maintenance.

Limestone is the main raw material for the manufacture of cement, but unfortunately, in the sub-continent of India limestone which is found in abundance in some areas, is not strategically located. It is not generally available in large quantities near the main consuming centres or near coal-producing areas; as such both coal and cement entail long transport. At some places, limestone of suitable quality may not be available, but limestone of a little poorer quality may be available in abundance and this can be used by beneficiating it.

For setting up a new factory, detailed geological prospecting and a survey of the deposit will have to be carried out to make sure that sufficient reserves of materials of suitable quality are available at the proposed site. Some schemes have come to grief for lack of proper prospecting. For a new entrepreneur in the field, it may not be possible to provide experienced geological staff for proper prospecting. This aspect has received the attention of the cement manufacturers, cement machinery manufacturers and the Government, and it may be possible for the cement machinery manufacturers to provide help in geological prospecting.

Importance of Gypsum

Although used in very small proportion to correct the setting time of cement, gypsum is a very important raw material for making cement. The deposits of gypsum are not very extensive, and the quality, although suitable for making cement, is not very high. All efforts must be made to conserve the gypsum deposits of India, and the industry should see to it that it is used as economically as

possible commensurate with the quality of cement produced.

The next material of great importance is coal or fuel oil. The quality of coal made available to the cement industry has been gradually deteriorating over the last few years—better quality coals are being reserved for the steel industry. Moreover, transport of coal specially to far-off coastal factories in the west and in the south, has been posing serious problems to the Government as well as to the industry. Some of the factories in such areas have already been converted to oil firing, and some others will be converted sho tly. Due to lower quality of the coal now available to the industry, it has become more and more difficult to keep up the quality and quantity of output, and some of the factories may have to consider the partial use of fuel oil seriously, even though it would entail a higher cost of production.

Transport Difficulties

The question of transport of coal and cement is very vital to the industry. It is gratifying to note that the transport of coal has improved considerably of late, and fairly good stocks have been built up at the various manufacturing units. Both the railways and the coal control organisation are to be congratulated on their efforts to ensure an adequate supply of coal. Transport of cement has also improved, except at one or two units. The railways have taken steps to move cement even in open wagons when necessary. In order to alleviate the strain on the railways, the industry has had to encourage the despatches of cement by road, and one big organisation has moved more than 1 million tonnes of cement by road, which constitutes about 30 percent of their production last year. Some smaller units have done even 40 percent and more. More and more efforts must be made to increase the transport of cement by road. The commodity is a bulky material, and thousands of wagons are required every day to move cement. As such, the railways play a very big part, and this aspect must receive continuous attention of all concerned. In spite of ever-increasing efforts from all sides, transport is a major bottleneck in the manufacture and distribution of cement.

Cement manufacture entails the use of heavy as well as delicate machinery. Until about 15 to 20 years ago, all the machinery was imported. A start was made some time in 1942 to manufacture kilns and mills in India, and 19 kilns with an integrated capacity of about 2.5 million tonnes of clinker have been manufactured in the country since then. During the last two years, six or seven concerns with foreign collaboration have come up to manufacture cement-making machinery. This will definitely help conserve foreign exchange, but it will take some time for the cement machinery manufacturers to achieve full production.

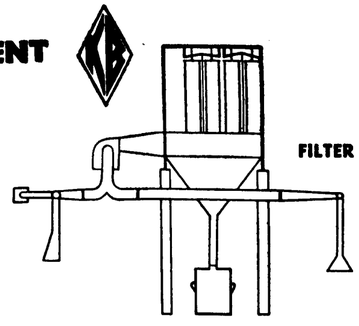
Earth-moving Machinery

Earth-moving machinery plays an important part in cement manufacture, as 1.6 tonnes of raw materials are to be raised and moved for manufacturing 1 tonne of cement. These machinery are mostly imported, and the spare parts required for maintenance and overhaul have to be imported. The Government has been releasing foreign exchange from time to time on an *ad hoc* basis, and the industry itself is trying its best to manufacture locally as many spare parts as possible.

In India, ordinary Portland cement forms the bulk of cementing material produced, followed by Portland blast furnace slag cement, demand for which is gradually picking up. Manufacture of Portland blast furnace slag cement not only makes available an additional cementitious material just as good as ordinary Portland cement, but it also uses slag from the steel works which would otherwise be a national waste. Research is at present going on for increasing cementitious material by making Pozzolanic cement. It was as a result of research that one of the manufacturers was able to make cement from fertiliser sludge, for which large sums of money were demanded by foreign firms merely to give the know-how. In the same way, various products have been developed by individual research, such as white cement, oil-well cement, hydrophobic cement and Portland blast furnace slag cement, etcetera.

Need for Intensive Research

In view of the fact that the cement industry has to evolve and manufacture different types of cement by different processes and that these different types of cement have to be used in different types of jobs, and also in view of the fact that civil engineering designs have advanced considerably, such as in prestressed concretes, shell structures, etcetera, it is very necessary that intensive research should be carried out, both fundamental and applied, in the manufacture and use of cement. In fact, one of the major cement manufacturers has already started work on the construction of a central research laboratory near Bombay.



The industry has now formed a Cement Manufacturers Association which, it is hoped, will resolve any differences of opinion in matters of policy among cement manufacturers, will place agreed views on various aspects of the industry before the Government and the public, and will attend to the various public requirements in a more co-ordinated manner. Thus, with the co-operation between cement manufacturers and all the various Government and semi-Government departments connected with various aspects of cement manufacture, distribution and research, it is expected that the cement industry will progress rapidly.

Prospects and Problems of the Automobile Industry

By

SIR L. P. MISRA

THE motor-vehicle industry has come to be looked upon in the present-day world as a key industry for the economic development of a country. The reason is not far to seek. It has a strategic importance of its own. It further leads to the rapid growth of ancillary industries which in their turn create subsidiary industries for feeding them. Development of the motor-vehicle industry has, therefore, been likened to nuclear fission which sets in its train one reaction after another for a continuous increase in production. Every developing country naturally wishes to establish the motor-vehicle industry within its limits as soon as possible; but in spite of its intrinsic merits and the Government's desire to develop it, only about 18 countries in the world, including India, have so far succeeded in producing motor-vehicles mostly out of their resources and four or five of them are still in the initial stages. Even leading European countries, after having fully established their motor-vehicle industries many years ago, find it still necessary to continue to protect them by effective restrictions on imports of foreign vehicles.

Improvement in Quality

As a result of the first World War, considerable improvements were made in the reliability and quality of motor-vehicles with the result that their use increased greatly for civil requirements in the third decade of the twentieth century. On account of a number of handicaps which are fairly well known and need not be recapitulated here, the market for motor-cars in India became stagnant. Imports into India during the three decades from 1923 to 1953 averaged about 20,000 to 21,000 vehicles a year, of which about 50 percent used to be commercial vehicles. The imported vehicles were generally either in a condition to be readily put on the road or in completely finished components to be assembled and put on the road. This was a great handicap for the manufacturers who started producing vital components like engine, gears and the axles of their models.

It is not generally realised that useful as this industry is, it is not easy to develop it. A motor-car generally consists of about 4,500 parts made to the highest standards of tolerances and specifications evolved by scientists for industrial production. It uses 55 percent of the elements known to science. Leading manufacturers of the world seldom make more than 60 percent of the parts of a motor-vehicle. The rest have to be procured from ancillary industries. It has generally been the experience of all countries which have established the industry that in the absence of ancillary industries, the manufacturer of a motor-car has, in the early stages, to undertake the production of many components, which are later farmed out to ancillary industries to supply when the manufacture of the vehicle is on its legs. India has passed through the first stage. With the encouragement of the Government, the ancillary industries are now rapidly developing. Their annual production during the last five years has increased five times.

The year 1962 will be looked upon as a very important landmark in the history of the development of the motor-vehicle industry in India, for in this year the associations of "Indian Automobile Manufacturers" and of "Ancillary Industries" have finalised, with the approval of the Government, the fields for their respective development, i.e., what parts are to be left over for development exclusively to the ancillary industries. The motor-car manufacturers have taken upon themselves the production of components peculiar to their own models. As a result of this concerted effort by these two associations, the indigenous contents of motor-vehicles being produced in India have steadily risen as shown below. With the understanding reached in 1962, the development of ancillary industries should be more rapid in future.

A view of a motor-car plant in West Bengal

Indigenous Content

The percentage of indigenous content in the models of motor-cars and commercial vehicles manufactured in India in 1962 is as follows:

	Percent*
Cars:	
Hindustan Ambassador	74.49
Fiat "1100"	49.01
Standard Herald ...	43.82
Commercial vehicles:	
Dodge/Fargo (195" W.B.) ...	76.24
Tata Mercedes Benz (195" W.B.)	70.00
Bedford (167" W.B.) ...	53.55
Leyland 'Comet' (176" W.B.)	51.88

Note:* There have been further improvements since in all the above percentages.

* Precise information in relation to each vehicle is not readily available. The industry as a whole imported 30 percent from abroad.

Reports of the Tariff Commission in 1953 and 1956, which were accepted by the Government, clarified many of the issues and laid the foundation for the rapid progress of the industry with the result that in spite of the limited foreign exchange available during the last four years for the import of parts not yet being manufactured in the country, the production of motor-vehicles during the last seven years has been as shown below:

Year		Production
1956	...	32,138
1957	...	33,058
1958	...	26,788
1959	...	35,500
1960	...	52,116
1961	...	54,454
1962	...	57,817

Production in 1962, gratifying as it may appear, is far from satisfactory from the point of view of the country's requirements. The target for 1965 laid down by the Government for the third plan was 60,000 commercial vehicles, 30,000 motor-cars and 10,000 jeeps, i.e., 100,000 motor-vehicles a year. Even this programme, satisfactory as it may have appeared three years ago, has become quite inadequate for requirements of the country in 1965 on account of the following factors:

(i) the lifts required for the targets of production laid down for 1965 in the third plan are *far in excess* of the capacity likely to be available out of a production of 60,000 commercial vehicles a year.

(ii) the Chinese aggression involves much higher defence requirements than what could have been envisaged three years ago when the annual target of 100,000 motor-vehicles was fixed.

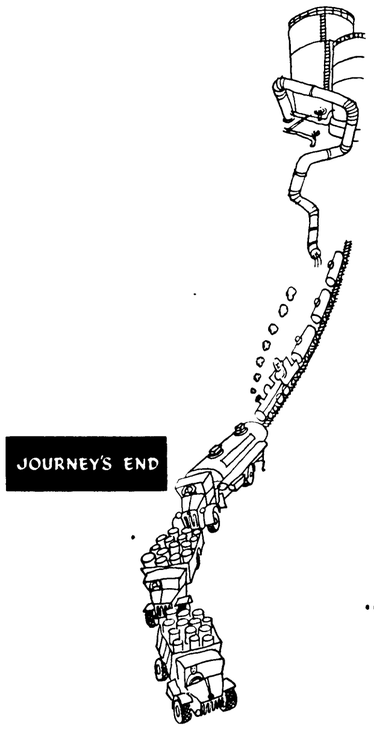
Even then no scientific data had been collected for fixing the target of production of commercial vehicles. It was based on empirical estimates given by departments and institutions conversant with the problem.

The Rising Demand

The present position is: (a) The first two plans have now materialised and the expenditure of Rs. 11,000 crores or Rs. 12,000 crores incurred on them is now fructifying in the pockets of the people and creating demand for transport *far in excess* of what could have been estimated at the time of the commencement of the first two plans.

(b) The Government has, after consulting all concerned, laid down a third plan which is equal in size to the first two plans combined and involves the lifting of 350 million tons on its own.

(c) The Chinese aggression has further increased the transport requirements which could not be envisaged at the time of framing the third plan. It is almost certain that even if the third plan does not reach its full production target, the additional expenditure provided for defence requirements will more than make up for any short-fall in the third plan, if it occurs.

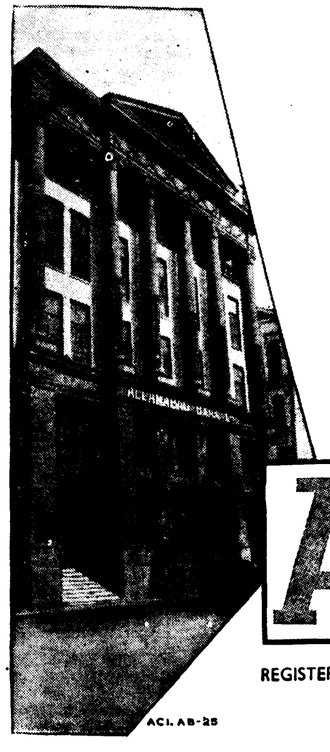


The estimates of transport requirements made in 1960 have become out of date and must be revised. An overall picture of the total transport facilities likely to be available from all systems of transport in the country in 1965-66 and also from year to year is, therefore, *essential*.

During last 11 years of economic planning in the country, the technique of planning has improved from plan to plan. Many hurdles which appeared to be insuperable at the start have been surmounted, and decades have been compressed into years. The foreign exchange shortage raised its ugly head in the middle of the second plan; but it has been fairly met and the third plan adjusted according to what appeared to be practicable.

The second bottleneck, the shortage of power, had also been carefully studied. The country and the Government now know fairly approximately what the power requirements will be for achieving the plan targets and are devising ways and means to cope with the task ahead. Unfortunately, the shortage of transport, which in many ways is the severest stumbling block, has not yet received the attention it deserves.

Transport Shortage



It will be hardly safe to assume that once the targets of production have been fixed, and foreign aid and local resources found, implementation of the plan will follow as a matter of course. It cannot be over-

"The provision of sufficient quantities of the required products in the right place and at the right time often produces serious problems and to solve these necessitates a careful but flexible organization, an elaborate system of transportation, storage and distribution. There are more than 3,000 Burmah-Shell petrol dealerships and over 1,600 kerosine agencies, besides nearly half a lakh kerosine sub-dealers in India's 5½ lakh villages"

emphasised that unless facilities are *provided from day to day* for the transport of raw materials, semi-finished and finished products to their destinations, not only will production suffer but the cost of production will also invariably increase. This has been the experience of the second plan. Annual reports of established industries bear an eloquent testimony to it, if a testimony was ever needed. They bitterly complain of the lack of transport facilities leading to a serious fall in production and the consequent losses. Same remarks apply to agricultural and perishable products as well. It is, therefore, of vital importance that the experience of the second plan, in which the lack of transport facilities caused a serious dislocation of production, is not repeated in future. A scientific analysis of what happened during the past four or five years and how the mistakes made in the past should be avoided now has acquired a special importance of its own. Transport facilities must precede and not follow the demand if the resources available are to be developed to their full extent.

At the commencement of the second five year plan, the railways were asked to carry what they could and produced a scheme for carrying 184 million tons. This was subsequently reduced to 162 million tons. Although about 235 million to 240 million tons needed to be transported in the second plan, no decision was taken as to how the additional traffic left over from the railways was to be dealt with. This omission resulted chiefly from the non-existence of active transport cells in any of the Ministries concerned. If the mistakes of the second plan are to be avoided, it is absolutely essential that *active* transport cells are created in the Central Ministries of Railways, Transport and Communications and the Planning Commission. The function of the Planning Commission Transport Cell should be to get regular information from the railways and the Transport Ministries about the capacities available from time to time, coordinate their activities and arrange for meeting their shortfalls. These cells should *not only lay down the respective targets for the last year of the plan but also watch the progress of transport requirements as they develop in the course of each year.*

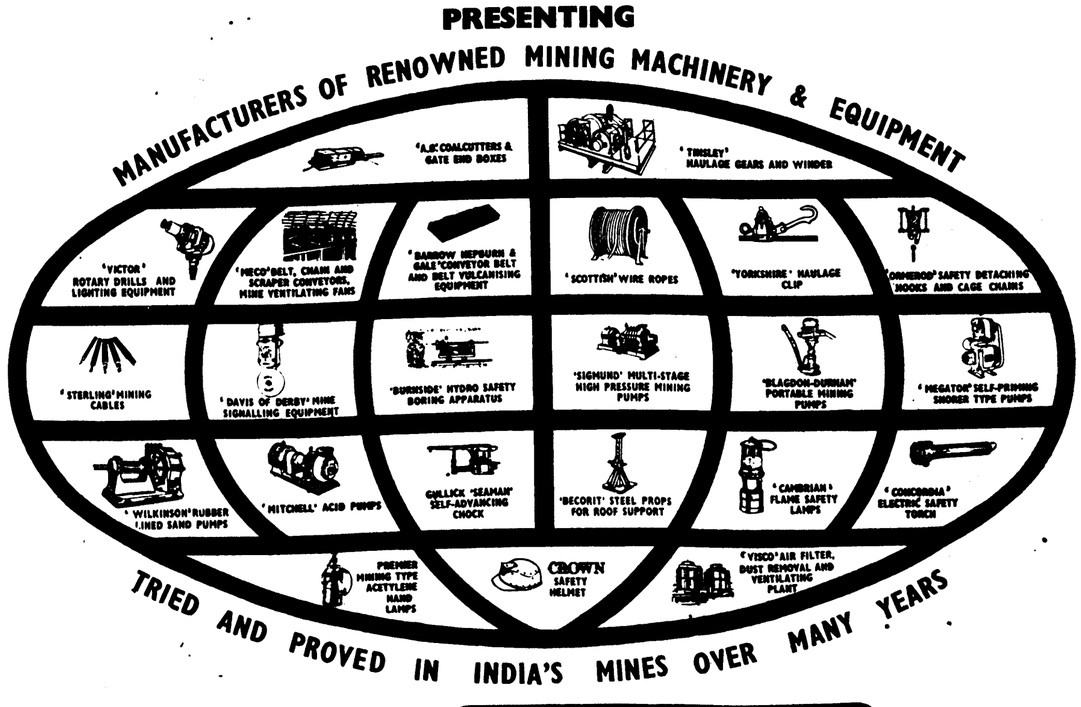
Third Plan Targets

How the third plan targets will develop from year to year, what will be the annual increase in traffic from the demand created by the first two plans and defence requirements, need careful attention not only of the Government but also of those interested in the implementation of the third plan.

Not much relief to transport requirements can be expected from air, for it still remains a class traffic. The water routes have been so hopelessly neglected in the past and the amount sanctioned in the plan for their development (Rs. 5 crores, against Rs. 50 crores asked for in the Gokhale report) is so small that not much increase can be expected during the next three years in their transport capacity. Even assuming that water routes will take 10 million to 15 million tons, the balance left over from the railways and water routes will amount to about 85 million tons and has to be thrown on the roads *in addition to* what may be required for defence needs. Unfortunately, no detailed statistics are available of what the road transport carried from year to year. The general estimate is that it carried 12 million to 15 million tons in 1962 with about 188,000 commercial vehicles.

The figures given in the above statement are mere estimates made by knowledgeable quarters. Even allowing, with improved facilities, for an annual lift of about 20 million tons with the existing commercial vehicles on roads in India, another 650,000 additional commercial vehicles will be required to meet the balance of about 65 million tons left from the railways, waterways and the present number of commercial vehicles on the road. With the best efforts by manufacturers, additional vehicles put on the road by them in the three years (1963, 1964 and 1965) will not be more than 150,000 by 1965. If the economy of the country is not to be dislocated, arrangements have to be made for another 500,000 of commercial vehicles for carrying the balance of the traffic left over from all forms of transport in the country. It is not possible to mention here all the details of suggestions made to the Government embodying the most practical method by which additional 500,000 vehicles can be put on the road without unduly straining the foreign exchange resources available to the Government and adding about Rs. 300 crores to its annual revenue from the taxes in force.

As for motor-cars, the production has been more or less stagnant as shown in the table below:



Year		Production
1961	...	21,662
1962	...	23,326

This production is further likely to be reduced to some extent by the 25-percent cut in the foreign exchange sanctioned for production in 1963-64, for importing components (for the cars) not yet produced in the country. The period of waiting which was about six to nine months from the date of the registration of an order for a car has, in the majority of cases, already gone up to 18 months to two years. It will be observed from the above that as for cars and commercial vehicles required by the public, the demand is likely to remain much more than the supply during the currency of the present plan. *The prospects of further development of the industry are, therefore, bright.*

Some Difficult Problems

As for the problems facing the industry, they are difficult but not insoluble as explained below :

(1) *Issue of licences:* At present, the licences given for the import of components required for a year or half-year are not issued at the commencement of the period to ensure an even flow of production from month to month. In the past, the

licences have generally been issued long after the commencement of the period leading to considerable dislocation of production. In case the Government is not in a position at the commencement of the year or the half-year to know the total amount of foreign exchange which will be available for the period, an interim licence amounting to one-third of what was issued in the previous year should be given to the manufacturers to maintain an even flow of the import of components and of production from their workshop till the actual licences available have been determined and issued. Such an arrangement will avoid dislocation of production and will involve no risk for the Government, for after all it will retain full power to reduce the total licences to what may be available before the expiry of the period.

(2) A serious problem facing the manufacturers at present is the supply of service parts for the maintenance of the vehicles which they have put on the road. The Government and those in the trade know the average amount of replacement of the parts in a commercial vehicle or a motor-car on the road. Unless these parts are available for the motor-vehicles on the road, they go out of commission and the owners suffer financial loss. The manufacturer gets the blame for not supplying these parts.

From all points of view, it is important that the vehicles over which capital has been sunk should not be allowed to go out of commission for want of the maintenance parts required. The manufacturers who sold these vehicles have a moral responsibility for the supply of these parts. During the last three years, the number of vehicles in commission on roads has steadily increased but the licences issued to manufacturers for the import of parts (not manufactured in the country) for keeping their vehicles in commission have gone on decreasing seriously. An impression prevails that as the percentage of indigenous contents of a vehicle produced in the country increases, there should be less demand for the import of parts for maintaining it on the road. It is generally not realised that the problem facing the manufacturers whose vehicles are running on the road, is not only to meet the demands of the *models under production* but of the old models as well which were assembled mostly out of imported parts.

Import of Replacement Parts

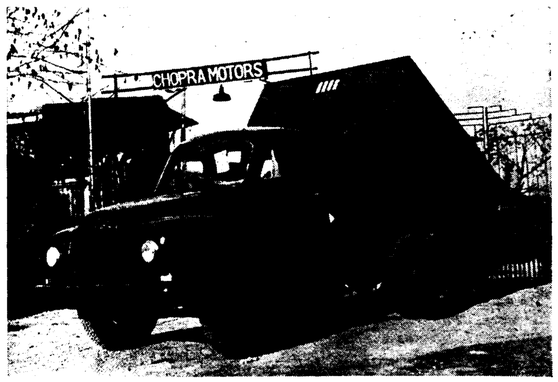
Even in the case of the present models, a certain percentage of components has still to be imported for their final assembly as they are still not manufactured in the country. Replacement parts not yet manufactured in the country will, therefore, have to be imported even for the current models as well. Out of about 600,000 motor-vehicles on the road, more than 60 percent have been supplied by the present manufacturers. They are, therefore, not only legally but also morally responsible to meet the demand for service parts required for maintaining these vehicles. The import of these parts should, therefore, be given the first priority over all others, for there would be no point in producing new vehicles for sale and allow the vehicles previously sold to get out of commission for want of parts required for their maintenance. Failure to supply these parts causes the greatest dissatisfaction against the manufacturers who supplied these vehicles. In the interest of the owners of vehicles who have invested large capital in the vehicles and are paying very heavy taxes, it is essential that the manufacturers should be placed in a position to supply the parts as and when required.

Prices of Motor-vehicles: In developing a planned economy in a country, inflation cannot always be avoided. In India, it has increased more on account of her works, costing large amounts, having remained unproductive for many years. Naturally, the cost of production in general has increased quite out of proportion. The price of a motor-vehicle depends upon the following factors:

(I) The cost of imported components not yet manufactured in the country; also the import duties levied by the Government on them;

(II) the price of components purchased from ancillary industries;

(III) the cost of production of components in the factory of the manufacturer; and



(IV) the taxes levied by the Government before the manufactured motor-vehicle is put on the road.

Cost of Imported Components

Item No. (I): cost of imported components: As the percentage of indigenous contents of motor-vehicles manufactured in the country is steadily increasing, the importance of item No. (I) will go on decreasing till it disappears altogether. This item is, therefore, not of much significance in the present state of affairs.

Item No. (II): purchase from ancillary industries: As mentioned above, a motor-vehicle manufacturer generally produces in his factory about 60 percent of the total components of his model. The rest have to be purchased from ancillary industries. At present, the prices charged by ancillary industries are on average about 75 percent higher than the price of imported components. Consequently, the higher the percentage of components purchased from ancillary industries, the greater will be the prices of motor-vehicles put on the market. Many of our ancillary industries have been recently started and have not yet acquired the efficiency of production of their foreign competitors. Those coming into existence in the future will also have to face the same teething troubles. So, whatever improvements are made by the previously established ancillary industries, will be swallowed up by those coming into existence in the near future. This is, however, a situation which has to be faced in India in the general interest of the country, for it is ancillary industries alone which can raise the indigenous contents of a motor-vehicle to 100 percent.

Item No. (III): cost of components produced in a motor-vehicle manufacturer's own factory: The cost of production in the factory of a motor-vehicle manufacturer depends a good deal on the outturn of his factory, for the industry develops efficiently only on a mass production basis. Till the number of vehicles produced increases sufficiently to justify a general use of automation, the cost of production will remain high. Fortunately for the country, there is an increasing demand for more vehicles but it cannot be met without the additional equipment required for increased production and more licences for importing components not being manufactured in the country. Till manufacturers are helped with bigger licences on both these counts, the prices of components produced in the factory will continue to be higher in comparison with those imported.

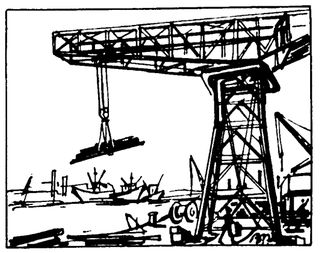
A lorry with a special unloading device

High Taxation

Item No. (IV): taxation by the Government: It has been calculated that in India one-third of the price of a motor-vehicle manufactured and put on the road is on account of the taxes paid to the Government. This was before the last Central Budget. With the rough calculations made of the new imposts in the Budget for 1963-64, this percentage is expected to increase by another 4 percent to 5 percent.

No mention of the problems of the motor-vehicle industry will be complete without taking into consideration the taxes which the vehicles sold will have to pay for their use on the road, for the development of the motor-vehicle industry depends a good deal on the scope for using the vehicle after sale. About 600,000 motor-vehicles, exclusive of motor-cycle and scooters, are contributing to the coffers of the Governments more than Rs. 200 crores a year, giving an average of Rs. 3,333 per motor-vehicle a year. If the amounts are worked out separately for cars and commercial vehicles, the average yearly contribution to the revenue of the Government before the last Central Budget by a commercial vehicle comes to about Rs. 5,600. For a car or a jeep, it was about Rs. 1,400. With the increase in taxes on petrol, diesel oils and excise duties, etcetera, in the last Central Budget, the levy on existing vehicles and the new vehicles to be produced in 1963-64 will increase by Rs. 142.47 crores as shown below:

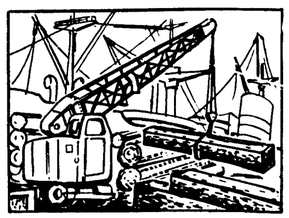
Total number of commercial vehicles ...	289,277
Total number of cars ...	350,944
These, together with the products of 1962-63 estimated at	8,000 jeeps, 20,000 cars, and 25,000 commercial vehicles



will, as shown below, give the Government a yield of Rs. 142.47 crores and not Rs. 54 crores as envisaged in the Budget.

	(In rupees)
A. Levy on new vehicles produced ...	10,92,75,000
B. Increased levy on the operation of existing trucks and buses ...	119,64,60,000
C. Increased levy on the operation of existing cars and jeeps ...	11,90,00,000
The estimated total revenue to the Govment as a result of new levies ...	142,47,35,000

At present, the taxes levied are passed on to the consumer and it is he who suffers most and reduces his consumption. The result is that the transport provided by the existing vehicles on the road is not used as much as it would have been if the cost of operation had not increased to what it is at present. It is a tragedy of the situation that although so many committees appointed by the Central Government to consider the taxation on motor-vehicles have urged a special reduction to cheapen motor transport on the road, reduce the prices of motor-vehicles, the tax on them in India has gone on increasing and is already the highest in the world. It is estimated that, on average, a motor-vehicle pays an overall tax, including that on fuel, of over Rs. 3,300 a year, against Rs. 1,300 in the U.K., Rs. 800 in France and Rs. 500 in the United States.



Motor transport having been treated as a "concurrent" subject in the Constitution of India has militated in the past against the accepted recommendations of the Central Government committees. They could not be implemented on account of their non-acceptance by the States. Time has arrived to increase the scope of functions of the Inter-State Commission and make it responsible for the removal of the present handicaps and anomalies under which motor transport has to operate in India.

Planning TOWARDS
A BETTER PORT

As the life-line of Eastern India's trade and commerce, the Calcutta Port faces recurring problems every year. The emphasis on industrial progress in the Second Five-Year Plan period has considerably changed the type of cargo to be handled. Steel and mechanical equipment, heavy machinery and huge plant form a considerable bulk of the import. On the export front it is coal or ore.

To-day's well-equipped Port needs be made into a better Port to-morrow. But this is possible not by more equipments alone. The Calcutta Port needs most the whole-hearted co-operaton from all fronts,—from those who use and also from those who serve it.

Achieving Plan Targets for Organic Chemicals

By
C. J. DADACHANJI

THE growth rate of organic chemical industries has slowed down of late, principally because of delays in establishing production of basic chemicals in the country. The latter include acetylene, ethylene, propylene, butane and butylene, methanol, industrial alcohol, benzene, toluene, o-xylene, and naphthalene. They provide the source materials for dyestuffs, drugs, pesticides, plastics, synthetic rubber and numerous organic solvents and chemical intermediates. It is already clear that industrial alcohol, benzene from coal carbonisation and acetylene derived from calcium carbide, cannot meet the demand. Therefore, petroleum feedstocks—and particularly naphtha from the refineries—are the principal sources available in India for basic chemicals.

From the standpoint of planning, the third plan targets are now of academic interest only. Unless schemes are already under way, there is little likelihood of new plants going into production by the end of the third plan. Attention must, therefore, be concentrated on the fourth plan targets. The Development Council for Organic Chemical Industries has already prepared forward estimates for 1970-71 and has placed the requirement of ethylene at 165,000 tonnes. Based on this estimate, approximately 700,000 tonnes of annual naphtha throughput in cracking capacity will have to be developed by the end of the fourth plan.[1]

The targets as set by the Development Council have subsequently been confirmed by the Petro-chemical Committee which submitted its report to the Government at the end of 1961. Later, the Oil and Natural Gas Commission of the Central Ministry of Mines and Fuel appointed a French team headed by Dr. Henney of the Institut Français Du Petrole to plan and recommend the pattern of petro-chemicals development. Its report has recently been submitted to the Government. Some important aspects of planning need particular emphasis and they are reviewed below.

Naphtha Cracker Schemes

In 1960, two schemes for naphtha crackers were submitted to the Government in the Bombay area. One of these was for a merchant cracker associated with an oil refinery while the other was integrated with polyethylene manufacture. The latter scheme involving 60,000 tonnes of annual naphtha throughput has only recently obtained clearance, and construction work is about to begin. The merchant cracker scheme has finally been withdrawn by the original applicant and a decision is to be taken by the Government from several new proposals received from the private sector. Even if this decision is taken immediately, the industry cannot make up for the three years lost since the first merchant cracker proposal was submitted to the Government. Nor can the loss in momentum be made up until several years have passed. This is very unfortunate because the proposed merchant cracker in Bombay was planned to be linked with schemes for manufacture of phenol and acetone, high density polyethylene, polypropylene, polybutadiene or polyisoprene, dodecyl benzene, acrylonitrile, etcetera. The momentum is lost since all these schemes have also been set back by three years because of the lack of availability of basic chemicals. Similarly, schemes based on methanol are delayed because the plan to establish methanol capacity within the country is behind schedule. Applications for manufacture of methanol were invited by the Government from various private firms about two years ago, but no action was forthcoming until the recently disclosed decision to build a 100-tonne-a-day plant in the public sector. This will be associated with the Trombay fertiliser project and is estimated to commence operations in 1964.

These examples of delay point to the need to make prompt decisions particularly when the entrepreneur is in a position to obtain technical collaboration and foreign equity. The entrepreneur has often given the assurance that the annual foreign exchange liability against borrowings will be offset by earnings through the export of a proportionate amount of indigenous production. Even if the decision made by the planners turns out wrong on occasion, it is often expedient to move ahead with as high a percentage of correct decisions as possible. Schemes for the chemicals industries are inter-linked, and unless prompt decisions are taken and plants built on schedule, the entire industrial development is retarded. It is, therefore, not only important to plan but also to be conscious of timing and ensure that schedules are maintained.

In recent years, there have been many contributions in literature to approximate methods for estimating fixed investment and plant costs. One empirical method for determining fixed capital as a function of production capacity involves the following formula:

$$I_B = I_A \left[\frac{R_B}{R_A}\right]^{0.7}$$

where $_A$ = known fixed capital investment in plant A
I_B = fixed capital investment in plant B, to be determined
R_A = annual production rate in plant A
R_B = annual production rate in plant B

This method is actually an adaptation of the six-tenths factor rule which is well known in estimating equipment costs[2]. While any such method is approximate, the power term 0.7 generally applies to chemical processes and will, therefore, be employed in the analysis that

follows. The exercise has been undertaken with the sole objective of demonstrating how important it is to build chemical plants on as large a scale as practicable.

Expert Report

In the report of the Petro-chemical Committee, Chapter VI refers to investment in plant and equipment and the foreign exchange component[3]. It is estimated that at the end of the fourth plan, the investment in plant and equipment will be of the order of Rs. 317 crores in relation to basic feedstocks and the more important derived products. The foreign exchange requirements will be of the order of Rs. 165 crores. Moreover, the investment in finished products and associated facilities up to the consumer level will bring the total investment close to Rs. 600 crores. The Committee states: "This underlines the fact that the petro-chemical industry is a capital-intensive industry". A very careful study needs, therefore, to be made of the economics of size. The larger the plant, the lower the investment per unit of production and the lower the plant cost. The economics of size is of fundamental importance and vital in a country which has a stringent financial position and is short of foreign exchange. To illustrate the economics of size, although by empirical methods, reference is made to Table IV, Chapter VI in the Petro-chemical Committee's report. This is reproduced below as Table I. Capacities per plant as they appear in this table may be compared with the average sizes of commercial plants in the U.S.A. as provided in Table II on page 43.

In Table III (on page 43), some typical organic chemicals have been taken and the two cases compared. Case I covers unit plant capacities as indicated by the Petro-chemical Committee and reproduced in Table I below. Estimates of total fixed investment are those shown in Table I.

In Case II the yardsticks for unit plant capacities are the average commercial U.S. plants indicated in Table II (on page 43). For example, where the Committee has shown additional P.V.C. capacity requirements at 80,000 tonnes, instead of dividing this capacity between 12 units (Case I), the capacity per plant is maintained at 27,000 tonnes and divided between 3 units (Case II). This particular exercise is, of course, academic since during the third plan period, the Government has already licensed five P.V.C. units. In general, however, the total economic picture could be improved very considerably by confining production to plants of such size as would bear favourable comparison by international standards. This is illustrated in Table III where the empirical formula $I_B = I_A \left[\frac{R_B}{R_A}\right]^{0.7}$ has been employed to determine fixed investment for Case II production capacities based on investment figures for Case I capacities. Reductions in fixed investments range from 5 percent to 36 percent. Obviously, if this exercise were further projected to cover all fourth plan organic chemical requirements, there would be considerable reduction not only in the fixed investment estimate approximating Rs. 600 crores but in its foreign exchange component also.

Plant costs would also be reduced considerably. In the first place, all the foregoing reductions in fixed investment will entail proportionate reductions in amortisation and interest charges per unit of production. In the case of P.V.C., assuming straight line depreciation at 9 percent of fixed investment and a 6 percent interest rate, the sum of these charges per tonne of P.V.C. would come down from Rs. 322 (Case I) to Rs. 215 (Case II). This is all the more important when it is realised that today the international price for P.V.C. is Rs. 1,700 a tonne and the sum of amortisation and interest charges in the smaller unit will, therefore, amount to 19 percent of

[3] Report of the Petro-chemical Committee (Ministry of Commerce and Industry, New Delhi, December 1961).

sales value. This will be reduced to less than 13 percent in the larger unit.

High Raw Material Costs

The plants in India are also rendered uneconomic because of high raw material costs. Most P.V.C. plants employ acetylene derived from high-priced indigenous calcium carbide instead of the more economic routes available *via* ethylene or a combination of the two processes with full utilisation of HCL. Of five licences granted, only one is based on ethylene. Large-scale plants taking full advantage of the cheaper routes would make a much better showing by world standards.

The size of operations also bears direct influence on manufacturing costs and general expenses.[4] Total charges for raw materials, utilities, shipping, and packaging vary in direct proportion to the capacity as they are essentially constant percentages of output. Fixed manufacturing costs, maintenance and plant supplies tend to vary as the same power of the capacity as investment, namely, 0.7 in the present exercise. Labour costs are more difficult to analyse but generally vary as the 0.25 power of the capacity for plants when higher output is achieved through larger sizes of equipment. On the other hand, in operations where plant capacity is increased by equipment multiples, the labour requirement increases in nearly direct proportion to capacity. General expenses, which include such post-manufacturing expenses as selling, administration overheads, and distribution charges, are also proportionately reduced with increased plant size. In a recent representation to the Central Board of Revenue for relief on excise duty, the plastics raw materials manufacturers obtained a 12½ percent reduction on the assessable market value, the deduction representing average general expenses. Substantial economies in these expenses could, therefore, be expected in large-scale plants and such reductions should materially contribute to bringing the price down.

The graphs in Figures I and II (on page 39) illustrate this point further in examples of chemical plant cost variation with size of operations.[5]

With reference to plant costs, it should be noted that the highest production rate in a plant does not necessarily yield the maximum return on investment. The highest production rate should yield the largest amount of earnings but beyond the point of maximum return, the earnings rise at a lower rate than the investment in working capital, increasing yield losses, etcetera. However, the factor which has the most direct bearing on plant cost is plant size as may be readily seen from the foregoing illustrative examples. It is, therefore, vital that any decision involving the size of chemical plants should be based on economic considerations. Regional considerations dilute the effort. Instead of cutting the pie up in many small pieces as is often done in this country, it would be better from the standpoint of industrial development to install large-scale industries of specific types in different regions. This would mean that instead of a particular region having industrial units representative of every industry, there would be in each region specific industrial units only, and these would be built on a practical scale so as to introduce such economies as would contribute to the welfare of the region concerned, as well as the country, as a whole. As for small-scale units, these should be confined to spheres of industrial activity which are labour-intensive rather than capital-intensive. Consequently, small-scale industries need have little impact on the overall organic chemicals planning.

Raising Exports

The next consideration—and one of prime importance—is the question of exports. In a recent meeting of a special study group for export of chemicals, the export target for chemicals was set at Rs. 200 crores by the end of the fourth plan, compared with the current export level of Rs. 7 crores. It will indeed be difficult to achieve such an ambitious export target by the concept of "voluntary sacrifice" which implies taking a loss on such production as is allocated to exports. This will make the economics of indigenous production go from bad to worse. What is really needed in the indigenous plants is low cost of production, comparable to what is achieved by manufacturers in other countries who compete for the same world markets.

Although export incentives are already available to industry, low production cost is a prime necessity if the volume of exports is to reach the target levels. Otherwise, a manufacturer's voluntary exports will generally be confined to whatever quota of his total output he judges as the expedient minimum under the prevailing conditions. Other alternatives involve compulsory exports through legislation or compulsory contribution to the export effort by way of a cess on industry. These may achieve the ultimate objective, but at great expense to the domestic economy.

Finally, there is the consideration of personnel requirements which is also linked to the all important matter of size of chemical units. Every unit installed in India must have its share of management personnel; production personnel; engineers—chemical, mechanical and civil; research chemists; plant operators; machinists; skilled workmen, etcetera. To take the case of chemical engineers alone, Indian universities are turning them out at a rate of 500 a year. Classes are becoming unmanageable and while the country is striving to meet numerical targets, it may sacrifice quality. Also, India cannot get away from the fact that no matter how many she produces, in the key positions she must wait at least ten years for the requisite experience which alone can make men contribute their true worth. The problem of personnel may, therefore, become acute. Already new organisations raid older ones for filling key positions. The complexity of this problem will increase directly as the number of chemical units installed rise, and this in turn will be dependent on the size of units ultimately planned for the industry. It is, therefore, evident that the time has come to discard the expression "minimum economic size" units and orient one's thinking to "maximum practical size" units.

Example of Japan

Japan plans to raise ethylene facilities to 400,000 tonnes by 1963; 1 million tonnes by 1965 and 2 million tonnes by 1970. There are now seven petro-chemical centres. These are so far mainly combinations of oil and chemical industries, but steel and power companies have begun to participate in these centres. The steel industry supplies gas from coke ovens and furnaces to the chemical companies in return for oil from the refineries. The power plants receive oil for their generating plants in exchange for power for refineries. The Japan Development Bank is to set aside more than the equivalent of Rs. 8 crores for aid to the chemical industry in 1963. Of this amount, almost 40 percent will be allocated to producers employing naphtha feedstocks and approximately 33 percent will be granted to chemical companies which convert to petro-chemical based raw materials. The Ministry of International Trade and Industry has recommended this policy to help meet the challenge of chemical producers in the E.E.C. A further sum of approximately Rs. 2 crores is to be set aside for the development of chemical processes and research.

The idea of such industrial centres is not new to India. According to the Petro-chemical Committee, four petro-chemical centres are to be established in association with oil refineries in Bombay, Gujarat, Barauni and the new refinery to be set up in south India. Bombay is expected to have at least 200,000 tonnes capacity for naphtha cracking by the end of 1966. However, the Gujarat cracker of equal capacity may not be in operation before 1969. It is too early to say whether the other two crackers will be in operation during the fourth plan. Since Bombay and Gujarat are expected to have naphtha cracking installations of the order of 400,000 tonnes throughout per year, only half the fourth plan requirements of basic chemicals are in sight. It may, therefore, be expedient as well as economic to expand cracking capacity in the Bombay area in a second phase, to the maximum practical level. This should preferably be completed by the time the Gujarat cracker goes into operation.

Furthermore, in building such petro-chemical centres in Bombay, Gujarat, etcetera, Japan's example should be carefully reviewed, particularly the idea of mutual pooling, whenever practicable, general facilities and services and the necessary personnel to maintain and operate such a pool. Co-operation would be required from State Industrial Development Boards for facilities in terms of land, power and water, and industrial zones should be set aside for the development of the petro-chemical centre. With the resultant economies and the complete utilisation of the full output of every unit either in the form of a finished product or as a raw material or intermediate for a member unit, such a petro-chemical centre should be able to produce economically and compete with the best. It would then have wider horizons so that every part of the world becomes a potential market for its products.

PRODUCTION OF TEXTILE MACHINERY RISES SHARPLY

THE manufacture of textile machinery in India is responsible, to a large extent, for ushering in the machine-building industry in this country. History has repeated itself because the industrial revolution in England and in the West was generally the result of the multi-spindle power-driven spinning frames and the powerloom. Subsequent inventions of the steam engine and the organised large-scale engineering industry were necessary to meet the demand for the large-scale manufacture of textile and allied machinery. In this country, prior to 1947, there was hardly any large-scale engineering industry, particularly for machine-building. The only big engineering factories were a few Government-owned ordnance factories and railway workshops and a few isolated engineering industries.

The house of Birla showed considerable foresight when the Belgharia works was acquired just before the

By
J. C. AGRAWAL
Deputy General Manager, Textile Machinery Corporation Ltd

second World War for the manufacture of textile machinery, but this works was taken over for defence production by the Government and only handed back at the end of the war. The manufacture of textile machinery was started in 1946-47 in Textile Machinery Corporation, and this was the first major unit to start the manufacture of textile machinery. Subsequently, more units were set up but progress was very slow till about 1953 when the first five year plan put the very necessary emphasis on the machine-building industry. Table No. I gives the production of the more important items of spinning and weaving machinery from 1954 to 1962.

Table No. I

	1954	1955	1956	1957	1958	1959	1960	1961	1962
Blow-room	—	—	—	—	—	—	—	5	10
Carding engines	472	649	726	1,023	1,148	763	1,073	1,308	1,501
Draw frames	8	44	24	34	9	40	47	75	61
Speed frames	6	28	29	33	28	21	45	70	45
Ring frames and doubling frames	358	863	1,110	1,364	877	1,077	1,127	1,340	1,686
Winding machines	—	—	—	2	—	—	25	22	47
Warping machines	—	—	—	1	—	—	5	4	10
Plain looms	1,880	2,787	2,873	2,552	3,151	3,875	5,177	7,487	5,419
Auto looms	276	70	161	316	36	356	374	67	540

In value, this comes to a production of Rs. 11.89 crores worth of spinning and weaving machinery and Rs. 2.79 crores worth of processing machinery, i.e., a total of over Rs. 14.68 crores worth of machinery in 1962. This is quite a large amount of production. These figures do not include the manufacture of stores and spares which are produced by other small and large-scale units for the textile mills. The production figures for only machinery have been considered in Table No. I.

Further impetus was given to the industry when, at the instance of the Central Minister for Industries, six standing committees were set up in 1959 to assess the industrial requirements of the country for various industries. The Committee No. 5 set up under the chairmanship of Mr. K. K. Birla was for machine manufacture for textiles (including cotton, wool, silk and jute) and synthetic fibre industries. Its terms of reference were the following:

1. The likely requirements and production by the end of the second five year plan.

2. The requirements by the end of the third and fourth five year plans.

3. To work out the lists of machinery and equipment and the quantity that can be taken up for manufacture immediately by the various units. Also to recommend as to how many new units should be established to cover the requirements as in (2) above.

The annual requirements for the purposes of replacement and expansion, as worked out by the committee, are given in Table II on this page. These requirements were based on a *per capita* cloth consumption of 17.5, 19 and 21 yards a year at the end of the second, third and fourth plans, respectively, and normal exports.

Subsequently, the Government made other assessments and these figures were revised. The new figures published by the Textile Commissioner's office are given in Table III along with the present licensed capacity in the country.

Table No. III

	Requirements	Licensed capacity
Blow-room lines	86	24
Carding engines	3078	2976
Comber sets	63	—
Draw frames	238	498
Speed frames	581	738
Ring frames	3025	3252
Winding machines	235	940
Warping machines	68	60
Auto looms	9950	8700

Total Requirements

The total requirements of textile machinery during the third plan, it has been estimated, will amount to

Table No. II

Item of machinery	Annual requirements for expansion as well as replacement		
	Last two years of second plan	Third plan	Fourth plan
Blow-room lines	45	42	58
Carding engines	1,400	1,230	2,040
Comber sets	25	21	41
Draw frames	118	108	158
Speed frames	330	304	431
Ring frames	1,440	1,325	1,840
Winding machines	40	49	57
Warping machines	39	38	46
Plain looms	2,475	1,650	1,225
Auto looms	3,000	4,700	8,250

Rs. 309.54 crores, of which about Rs. 129 crores will be provided from indigenous sources. It is expected that production from the major textile machinery units within the country will reach Rs. 36 crores a year by the end of the third plan. The actual licensing of new textile units is being done on this basis, and licences to the extent of 6.2 million spindles, 3 million for expansion and 3.2 million for replacement have been issued or are in the process of being issued in this plan. Table IV gives the value of textile machinery manufactured, imported and exported from India during 1958-61.

Table No. IV

(In lakhs of rupees)

	Production	Imports	Exports
1958	765.93	1089.62	1.60
1959	884.91	937.53	9.89
1960	1108.46	1612.01	3.47
1961	1294.24	2036.78	19.13

It is obvious from the tables above that there is still a very large amount of licensed capacity which is unproductive and a considerable amount

of valuable foreign exchange is being spent for the import of machinery. Some of this is unavoidable to keep the existing machinery in textile mills running at maximum rate. But, at the same time, the installed capacity must be increased in order to achieve the production which is licensed. It was estimated by the Committee No. 5 that the textile machinery industry will require approximately Rs. 10 crores worth of machine tools and equipment to come up to its licensed capacity by the end of the third five year plan. The industry is facing many problems today. Some of these are the following:

Ancillary Units

Lack of ancillary units: It is a well-known fact that, unlike in India, no textile machinery manufacturer abroad makes everything in his own works. There are a number of ancillary workshops and factories which specialise in the manufacture of various parts needed for the assembly of the completed machines. These are non-existent in India. Thus in Japan, for instance, textile machinery manufacturers do not make spindles, rings and a number of other components. These are purchased from specialist firms. The same is true of machinery manufacturers in Germany and other countries including the U.K. where many items are manufactured in centralised manufacturing facilities, *e.g.*, castings, spindles, and fluted rollers.

Such diversification and help of ancillary units assists a manufacturer in stepping up production in a rather short time with lesser capital. There is wide scope in this country for such small units which can cater to the demands of the major textile machinery units, leaving them free to develop and manufacture the basic components in bigger quantities.

Design and developments: It is an unpalatable truth that machinery manufactured in India today is not up to the same standard of modern design as made by other leading textile machinery manufacturing nations. The machine-building industry in India (this applies to all machine-building industries and not just textile machinery) does not have the requisite skill for making and developing new designs to suit the special conditions obtaining in the industry in this country. With the rapid growth and production prospects in the next few years, it is necessary that the industry has its own research and design facilities to evolve the latest machines based solely on indigenous designs. There are a number of research associations for textiles in this country, but these have to develop considerably to take up research and design work for better and more modern textile machinery. There is nothing in this country comparable to the Shirley Institute or T.M.M. Research in the U.K. or the Southern Regional Research Laboratories of America. There is a definite requirement and need for some such institute and for suitably trained technicians to undertake this kind of work.

Plant and Equipment

Plant and equipment: The mass production techniques of textile machinery manufacture require special purpose and automatic machinery of the latest types. Tolerances and precision of manufacture of today's modern textile machinery approach ball bearing and machine tool standards. If a fraction of the foreign exchange which is at present spent on the import of textile machinery is diverted to the import of special-purpose machine tools by various textile machinery manufacturers, the ultimate benefit to the country and the industry as a whole can be much greater. The industry must reduce its cost of manufacture by employing the latest high production machine tools and equipment and become competitive in its costs of manufacture with the machinery manufacturers in other countries. This is more important now than ever before with the emphasis on export of India-made textile machinery.

Availability of proper quality of raw materials: Special sections and quality of steel and the proper grades of pig iron, coke, etcetera, are very essential for the manufacture of quality machines. This is a serious problem, and very often the manufacturers are not able to get the quantities and qualities they require. There is a general shortage and all machine-building industries suffer to a large or small degree, but the degree of priority to an important industry like the textile machinery industry could be higher.

Diversification of production: The textile industry in India is liable to serious ups and downs and there have been two recessions in the last eight or ten years. This is a cyclic factor and the production of textile machinery is linked to the varying fortunes of the textile industry. The machinery manufacturers have still not forgotten the recession in 1959-60 when almost all the manufacturers had to cut down production and retrench or lay off labour. But for this serious setback, the progress of the industry would have been more rapid. As a safeguard against such a contingency in the future, it is essential that the production programmes of textile machinery units are more diversified. This is true not only of this country but also of other countries. Thus the manufacture of machine tools, refrigerators, motorcars and other industrial machinery is often carried out in the same plants as the manufacture of textile machinery and the fall in demand for textile machinery is made up by increasing production in other spheres.

To quote Mr. Manubhai Shah, Central Minister for International Trade, the textile machinery industry has now "come of age", and there is every reason to hope that the industry will prosper and grow from strength to strength. The rate of growth of the industry has not been matched by any but the machine tool industry in independent India. The industry is intrinsically sound and any increase in national income and a higher standard of living will see a much bigger and more efficient textile machinery industry.

Viewing the world through glass

With GLASS it's more view and more room too ! Wherever it goes Glass opens up exciting new possibilities. Gone is that cramped, confined, closed-in feeling. The bright, cheerful, open look is in.

And glass goes everywhere. To homes, hotels, hospitals—to offices, schools and stores. In windows and doors, in buses and cars.

Manufactured in India by Hindusthan-Pilkington Glass Works Limited, quality tested sheet glass is available in a wide variety of sizes and thicknesses to suit every purpose.

For the finest, most durable glass you can depend on

FOREIGN EXCHANGE SHORTAGE HAMPERS EXPANSION IN CHEMICALS

THE advancement of chemical industries may be taken as an index of a country's industrial progress. In India, although the chemical industry has developed on a broad front in the last 15 years, leading to larger units and greatly increased output of certain basic chemicals as well as the manufacture of a number of sophisticated products, there are still significant gaps and unbalances in many sectors, particularly organic chemicals.

An attempt is made here to give a broad picture of the scope of the industry in India, its growth in the post-independence period, the targets set under the third plan, the difficulties arising from controls, foreign exchange shortage, industrial licensing policies, low productivity and lack of technical resources and, lastly, to assess the outlook and future prospects.

The chemical industry developed in India only after the second World War. Prior to it, production was mostly confined to sulphuric acid and by-product sulphate of ammonia; they were associated with the coal and steel industries. Some simple

By
A SPECIAL CORRESPONDENT

tar distillates as also one or two other chemicals were produced in a small way. By and large, however, there was almost nothing, and the big expansion of the industry dates only from the early years of the second World War.

Immediately before the war, a small electrolytic caustic soda/chlorine plant was started outside Calcutta; during the war a soda ash plant was erected in the Punjab, now in Pakistan, and another was struggling to establish itself in Saurashtra. At present there are four soda ash plants with an annual capacity of 260,000 tonnes and 18 separate plants all over India producing 132,000 tonnes of caustic soda a year. In spite of this expansion, output of alkalis is still short of demand and imports are arranged by the State Trading Corporation. Manufacturing costs in India are high; the industry is handicapped by the uneconomic size of units and by not having satisfactory supplies of salt, lime and fuel within easy access. Sulphuric acid production, which is often taken as an index of a country's industrial activity, now amounts to 450,000 tonnes a year, produced in all by some 50 separate plants. Although production continues to increase, a restraining factor is the dependence on imported sulphur.

The Sindri Factory

During the war, a British mission recommended the setting up of a synthetic nitrogen factory in Sindri. It started production in the early 1950s, with a capacity of 70,000 tonnes N (Nitrogen) as s/ammonia and has since been expanded to 120,000 tonnes N. Crop yields in India being extremely low (and fertiliser consumption is only 2·5 lbs an acre of arable land, compared with 271 lbs in Japan), the Government fully realises the importance of nitrogenous fertilisers for increasing food production. Twelve factories are now in existence with a capacity of 370,000 tons N, and other projects are designed to bring the total capacity to 800,000 tons N by 1966. The additional output is planned from natural gas, petroleum naphtha and waste gases from coke oven plants as compound fertilisers so that a part of the phosphate requirements will also be met simultaneously.

Producing Farm Chemicals

Along with this, single superphosphate capacity has now increased to 500,000 tonnes, although production has not yet exceeded 400,000 tonnes a year. Progress has also been made in manufacturing agricultural chemicals such as benzene hexachloride (4,600 tonnes), D.D.T. (2,500 tonnes) and copper fungicidal compounds (5,000 tonnes). Dyes, of which none was made in India before the war, are now manufactured over a fairly comprehensive range, including azos, naphthols, vats, etcetera, and production has now reached 5,000 tonnes. Further expansion to 10,000 tonnes by 1966 is planned. This includes more sophisticated dyestuffs.

Pharmaceutical manufacture has increased considerably, and a variety of products are now made from fairly advanced intermediates. The plan is ultimately to go back to basic materials, but the serious delay in the completion of a central primaries and intermediates plant, to be established in the public sector, has prolonged the dependence of both the dyestuffs and pharmaceutical industries on imported raw materials. Sulpha drugs produced in the country now amount to 152 tonnes, and it is planned to produce 1,000 tonnes by 1966. Penicillin, streptomycin and other antibiotics are now produced on a large scale by the Government factory in Pimpri, near Poona. Four projects in the public sector for the manu-

for its distinctive aroma

From the world's finest Coffee Plantations in India, where ideal conditions for growing superior Coffee exist, INDIAN COFFEE goes to cheer up millions of Coffee lovers in France, Italy or Germany, in U. K., U. S. A., or U. S. S. R.—in fact all over the World!

The expansion of Indian Coffee industry has been rapid in the last decade as can be seen from these figures:-

PRODUCTION HAS NEARLY TREBLED in the last eight years: from 23,943 tonnes in 1952-'53 to 67,925 tonnes in 1960-'61. The target of production by the end of the Third Five-Year Plan is 80,000 tonnes.

CONSUMPTION IN INDIA HAS INCREASED from 26,000 tonnes in 1955-'56 to over 35,523 tonnes in 1960-'61.

EXPORT HAS GONE UP FIFTEEN TIMES since 1952: from only 2,200 tonnes in 1951-'52 to 32,271 tonnes in 1960-'61.

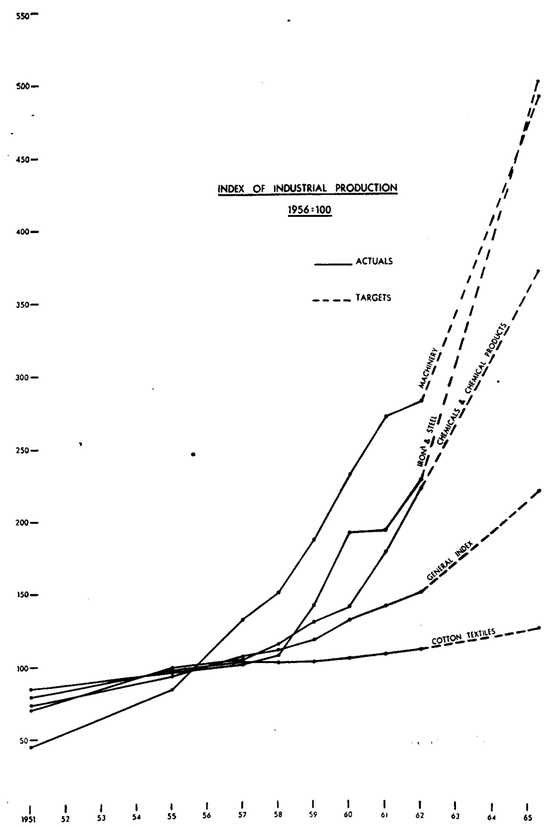
facture of synthetic drugs, antibiotics, phytochemicals and surgical instruments have been undertaken with Russian assistance.

Plastic Manufacture

In the plastics field, there are now two plants making polythene, with a total capacity of 8,000 tonnes a year. This is expected to rise to 18,000 tonnes by 1966. There is one unit making 2,500 tons of p.v.c. a year, and four new plants of a total capacity of 32,000 tonnes are planned by 1966. One plant is producing 3,700 tonnes of polystyrene a year from imported monomer. On the whole, the pattern so far in the plastics field, as in that of dyes and pharmaceuticals, is one of too many small plants with the result that none of them is large enough to achieve costs of production comparable to world standards.

There is a synthetic rubber plant with a capacity of 30,000 tons a year, which has just been started in Bareilly, U.P. This has been located in a sugar area to use alcohol as its raw material, whereas there is a body of opinion which considers that it would have been better to have based this plant on oil. The manufacture of synthetic fibres has until recently been represented by rayon, of which there is now capacity for 62,000 tonnes a year. Two plants are spinning nylon from imported monomer, and schemes are in hand for the manufacture of polyester fibres, and nylon monomer. In addition to the above developments, capacity in the highly specialised fields of commercial explosives and safety fuse, has been set up during this period.

Among the new items, production of which has started in recent years, are formaldehyde, hydrogen peroxide, sodium hydrosulphite, camphor, phosphoric acid, synthetic resins, heat treatment salts, acetic acid, acetone, organic solvents and vitamins. A rubber chemicals plant is about to start production near Calcutta. Some progress has also been made in the design and fabrication of chemical plant and equipment in the country.



Rate of Growth

These developments are broadly reflected in Table I below, and also in the significant rise in the index of production of chemicals and chemical products from 100 in 1956 to 226 in 1962, compared with the increase in the overall index of industrial production to 149 only.

TABLE I

GROWTH OF CHEMICAL INDUSTRY IN INDIA

	1950	1960
Number of factories	244	458
Total number of employees	35,591	107,279
Value added by manufacture (Rs. crores)	9.7	68

Third Plan Targets

The third five year plan seeks broadly to achieve a quicker rate of growth in the chemical industry than the first two plans did, with greater emphasis on basic raw materials so that further developments could be supported increasingly from the country's own resources. In Table II, actual production in 1962-63 is compared with the third plan targets.

Although several projects, big and small, both in the private and public sectors, are in the planning or construction stage, the overall picture emerging at the middle of the plan period gives little hope that the targets will be attained. There are many factors to which the shortfalls may be attributed.

Although there has been a marked shift in the attitude of the Government towards investment in this industry and the way is now open for private enterprises in all its sectors, there has been an unfortunate tendency on the part of the Government to license schemes on a scale too small to be viable. With a view to combating monopoly and meeting regional demands liberally, enough attention has not been paid to the economies of scale and the economies of location. The basic processes of the chemical industry start from primary raw materials yielding products which serve as a starting point for further processes; because of this, a certain degree of integration is inevitable, if economic operation is to be achieved and wasteful transport of raw materials and manufactured products avoided.

The high cost structure of the Indian chemical industry has in part been aggravated by a change in the fiscal policy leading to the imposition of excise duties on raw materials and intermediate products. There is also some justification for the complaint that the Government has been taking an unconscionably long time in making up its mind when and where to begin in petrochemicals, which provide a wide raw materials base for the organic chemical industry. The cost of failure to make an immediate start is estimated at Rs. 50 crores by 1966 and Rs. 140 crores by 1971 in terms of imports.

TABLE II

PROGRESS OF UNITS IN THE CHEMICAL INDUSTRY TOWARDS THE THIRD PLAN TARGETS

	Unit	Actual Production		Third five year plan targets
		1959-61	1962-63	(1965-66)
Sulphuric acid	('000 tonnes)	99	460	1,500
Caustic Soda	('000 tonnes)	11	125	340
Soda Ash	('000 tonnes)	45	220	450
Fertiliser N	('000 tonnes)	9	180	800
Dyestuffs	('000 tonnes)	—	5	10
Sulpha drugs	(tonnes)	—	152	1,000
Petroleum products	(Million tonnes)	—	7	17
Plastics	('000 tonnes)	—	19	74
Synthetic fibres	('000 tonnes)	2	59	100

Production Costs

Taking the chemical industry as a whole, about 40 percent of its capital equipment and raw materials have to be imported at present. The balance of payments difficulties leading to drastic cuts in the imports of raw material, spares and balancing equipment has created production bottlenecks and inadequate utilisation of capacity in many sectors of the industry, notably dyestuffs and paints. Apart from raw material shortages, proper attention has not so far been paid to the efficient layout of plants and lowering of labour costs. Even if the cost a head for labour appears to be cheap, labour costs are only truly low if the output a head is high, and it is here that the need for improved productivity is felt.

This catalogue of difficulties should not, however, obscure the positive results which have been obtained in the establishment of a substantial chemical industry in India and although in terms of price its products do not compare, on the score of quality, they adequately replace the imported materials giving the desired savings in foreign exchange. Looking ahead, there are hopeful signs that the national emergency has focused attention on the chemical industry's key rôle in a defence-orientated economy and has brought about a narrowing of ideological differences between the Government and the private sector. This is exemplified by the expansion of oil refining capacity in the private sector, which had languished through ideological conflict until the recent decision to permit some expansion.

The importance of increasing productivity has also received gratifying recognition by the appointment of the Emergency Production Committee under the chairmanship of Professor M. S. Thacker. It was perhaps no accident that work study, which is one of the most valuable techniques for productivity, was born in the chemical industry, where the need to employ skill effectively is of special importance. In a few years, its use has spread to many industries in countries all over the world.

Summing up, the chemical industry has a long way to go in order to reach the basic objectives for the third five year plan, and its fortunes will depend in the next few years to a large extent on the mobilisation of all resources of technical man-power and continuing strong support from friendly countries.

HIGH RAW MATERIAL PRICES RAISE COSTS OF VANASPATI INDUSTRY

THE processed food industry in India has not still assumed the vast dimensions it has acquired in affluent western societies with their self-service stores and supermarkets. Nevertheless, with the growth of industrialisation and the accelerated tempo of living, the modern Indian housewife, particularly in urban areas, like her counterpart in the West, appears to be less inclined to undertake backbreaking and often senseless labour that goes under the name of domestic duties. She has demonstrated by her new purchasing habits a preference for food presented to her in a finally processed form, of standard quality guaranteed by the manufacturer and packaged in convenient and attractive containers, which she can transport to her home for instant use.

Vanaspati has been a pioneer in the processed food industry in India and continues to occupy first place among processed foods with its annual production being 369,000 tonnes in 1962. In its manufacture, it utilises today

By
A SPECIAL CORRESPONDENT

edible oils in the proportion of groundnut oil 87½ percent, cottonseed oil 7½ percent and sesame oil 5 percent; the first two oils are hydrogenated after refining and bleaching and then deodorised; finally liquid refined sesame oil along with prescribed quantities of vitamins A and D are added so that the finished product acquires the consistency, the vitamin content and the melting point of the best quality *ghee*. The *raison d'être* claimed for the industry is that it provides a cheaper alternative to *ghee* by using less popular edible oils which are restricted in their consumption to very limited areas because of their peculiar flavour or colour and so assist in solving the dietary problem of general scarcity of edible fats, particularly of milk fats.

Principal Cooking Medium

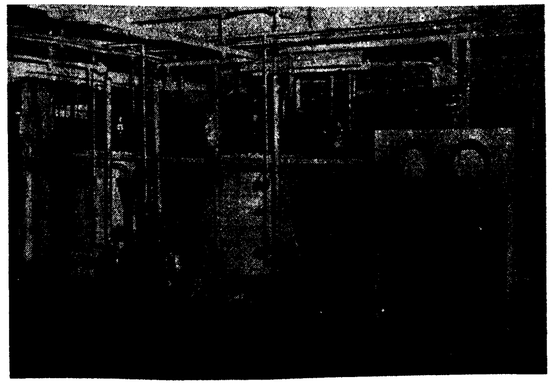
Vanaspati, known as shortening in the West where it forms today the principal cooking medium, made its first appearance in the Indian market some time after the first World War, perhaps in 1918. By 1928, the volume of imports, mainly from Holland, exceeded 28,000 tonnes, the usual pattern of trade being for India to export the bulk of the groundnut crop for crushing abroad and to import a part of the oil after hydrogenation in the form of *vanaspati*. Since the raw materials—mainly edible oils—were readily available within the country, the natural development was for India to set up its own *vanaspati* industry. So the first factory was set up in 1930 in Bombay and by 1939 the number of factories had risen to nine with an annual output of 52,000 tonnes.

The most rapid expansion, however, took place during the second World War, when the Government became the industry's most important customer; large quantities were purchased on Government account to feed the allied armed forces. There was also an appreciable increase in civilian consumption on account of the scarcity and high price of *ghee*, with the result that by the end of the war, 21 factories were in full production marketing 102,000 tons of *vanaspati*.

The future prospects of the industry appeared assured. The Government, while drawing up plans for postwar reconstruction, estimated an annual output of 400,000 tons of *vanaspati* by 1950 and accordingly adopted a liberal licensing policy, licences being issued for establishing a total of 62 factories with an annual capacity of 500,000 tons. In actual fact, by 1950, 48 factories were built with a total capacity of 380,000 tons but, unfortunately, the Government could not have foreseen the partition and its economic consequences, for in 1947 the industry lost a very important market in the hard fat consuming areas in West Pakistan. About the same time, another unfortunate event occurred. There was scathing criticism in Parliament against the nutritive value of the product, creating grave misgivings in consumers' minds against the product and, as a result, production, far from attaining 400,000 tons as anticipated, stood at 172,000 tons in 1950.

Nutritive Value

Meanwhile, in 1947, the Government had taken the decision to enquire exhaustively into the nutritive value of *vanaspati* consumed under Indian dietary conditions, and had set up a committee for the purpose; which after two years of detailed nutritional researches, involving animal experimentation, the study of human metabolism and large-scale feeding, found itself in full agreement with similar researches abroad on margarine and shortening. It pointed out that *vanaspati* is a nutritious dietary fat with no injurious effect on human health.



Thwarted in their attempt to condemn *vanaspati* as an injurious product, its opponents next launched an attack on the product on the alleged ground that it formed the main ingredient for the adulteration of *ghee* and contended that it should be coloured. Once again, the Government set up a Commitee, the Ghee Adulteration Committee of 1950, to make an exhaustive study of the whole problem and, on the basis of its report submitted in 1952, the Government arrived at the conclusion that there was sufficient protection against adulteration of *ghee* with *vanaspati* due to the Vegetable Oil Products Control Order which made it compulsory to add 5 percent of sesame oil to *vanaspati*. Sesame oil imparted to *vanaspati* a latent colour so that the presence of *vanaspati*, if mixed with *ghee*, could be easily detected by the simple chemical test known as the Baudouin test. The Vegetable Oil Products Controller for India inspected at regular intervals the *vanaspati* output of different factories to ensure that every batch of *vanaspati* offered for sale conformed to specifications.

Thus, armed with a clean bill of health and the problem of colouring out of the way at least for the time being, the industry could, by the commencement of the first five year plan, look forward with a certain measure of confidence to new vistas of development. The Government too was not slow in recognising the importance of the industry's rôle in the economy under the five year plans. So the industry was brought under the Industries (Development and Regulation) Act, 1951, for expansion, its production rising from 165,000 tonnes in 1950-51 to 293,800 tonnes in 1955-56, against the first plan target of 300,000 tonnes. The rate of growth, however, could not be sustained during the second plan period when production rose to 357,600 tonnes, against the plan target of 400,000 tonnes, showing an increase of only 62,000 tons in the second plan period, against 128,000 tonnes under the first plan. A mere 22-percent growth in the second plan period has indeed been a poor performance, particularly when it is contrasted with the 40-percent increase in industrial production during the same period. Besides, this was a telling commentary on some of the problems inhibiting the growth of the industry and preventing it from attaining its full productive capacity of 550,000 tonnes. Among these problems confronting the industry, the first place must be given to the difficulties created by the inordinate rise in the price of raw materials; the price of oilseeds in six years from 1956-61 rising by as much as 37 percent, against the rise of 11 percent in the price of foodgrains during the same period.

Surplus Capacity

The *vanaspati* industry is the major purchaser of edible oils in the country as can be gathered from the fact that in 1962 it consumed 340,000 tonnes of groundnut oil, 24,000 tonnes of cottonseed oil and 21,000 tonnes of sesamum oil, and they form as much as 75 percent of the cost of the *vanaspati* marketed. The industry is naturally very sensitive to any fluctuations in the oilseeds market. As is well known, these fluctuations can indeed be very considerable, for groundnut oil is among the most speculative of commodities. Besides, the *vanaspati* industry, having a large surplus capacity, is highly competitive with the result that manufacturers have experienced considerable difficulty in holding the price stable against a significant rise in the price of groundnut oil. This intimate linkage of oil and *vanaspati* prices has been appreciated by the Government in the past and, when price control was introduced into the industry during the second World War, the price was varied whenever the cost of groundnut oil to the industry changed by Rs. 70 a ton. Following this precedent, the industry has attempted to impart some sort of stability to *vanaspati* by varying its price only when oil prices fluctuated beyond Rs. 75 a ton. But, in the present Budget, once again price control has been introduced fixing it at Rs. 64 above prices ruling on 1st February. Obviously, the prices will have to be varied with the oil prices, and it is to be hoped that the Government would set up a flexible machinery to achieve this.

Apart from price fluctuations, the really important problem before the industry is the high price of oil. Although for several years now, the Indian Central Oilseeds Committee has been concerned with the improvement of oilseeds cultivation in the country—and no doubt a great deal of attention is now paid to oilseeds than ever before—the problem of high prices continues to remain. The solution evidently depends on either increasing the overall acreage under oilseeds—a difficult proposition in view of the keen competition from food crops—or by increasing the

yield an acre by improved agronomic practices. Surely, it is ridiculous for India, the largest oilseeds producer in the world, to continue to have an average yield of 640 lbs an acre whereas the world average exceeds 900 lbs an acre. Even if the country succeeds in increasing the yield by half as much by bringing it on a level with, say, Uganda (average yield 950 lbs an acre), it is likely to have an appreciable effect on oilseed prices in the market without impoverishing the farmer who will be the beneficiary of the higher yield from his acreage.

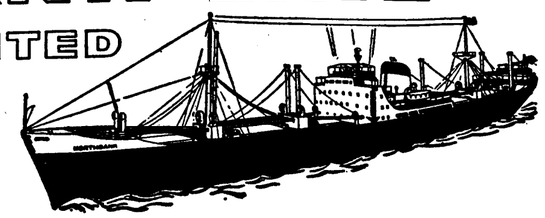
Another problem inhibiting the development of the industry has been the highly discriminatory taxes. Every industry has to bear its share of taxes in a state of emergency, such as the present one. The industry has no desire to be considered an exception, but neither does it like to be singled out for special treatment in view of the fact that it manufactures a popular consumer product and any tax on it further enhances its price which is already inordinately high in view of the high prices of oilseeds. In the latest Central Budget, while the excise duty on raw oil has been removed, that on *vanaspati* has been further increased by Rs. 184 a tonne, bringing the duty to a grand total of Rs. 384 a tonne. Besides edible oils, *vanaspati* uses a number of other raw materials for its manufacture, such as caustic soda, bleaching earth, nickel catalyst, vitamins, filter cloth and particularly, for packaging, tinplate; the prices of all these have continued to climb adding to total costs. An interesting feature is that each one of these products pay taxes at one stage or other so that adding together the contributions made by the industry to the Government at various stages of *vanaspati* manufacture, such as excise duty, sales tax and octroi duty, they reach the magnitude of Rs. 700 a tonne, about 25 percent of the cost of the product to the consumer, making it all the more difficult to provide an edible fat to suit the pocket of the middle-class citizen for whom the product is especially manufactured.

Shortage of Tinplate

An acute problem of particular immediacy to the industry is the present shortage of tinplate, forcing the manufacturers to use second-hand tins resulting in additional expenditure incurred on account of collection, cleaning and repair.

The future prospects of the industry are intimately linked with oil prices, for there is a danger of *vanaspati* being priced out of the market. It also depends on fiscal policy adopted by the Government, for any further rise in taxation is very likely to destroy the industry's profitability. A more optimistic view is, however, possible if one bears in mind the acute edible fat shortage in the country, for according to the Indian Nutritional Advisory Committee a man requires about two ounces of fat in his daily diet to maintain normal health whereas in India recent investigations have shown that the Indian daily average consumption of fat a person does not appear to exceed half an ounce. Therefore, when politicians clamour for this kind of favoured fat or that, what they fail to realise is that the vital problem confronting national health is the rationalisation of India's fat resources to satisfy minimum requirements. Every kind of edible fat has a place in man's diet and every avenue in India for its increase must be explored, and this explains, to some extent, the leading place the *vanaspati* industry occupies in the food processing industry in India and its inclusion as an industry for development in all the three five year plans.

Ghee is India's traditional dietary fat but, as in western countries, so in India, the producton of milk fats has not kept pace with the rapid increase of population and the rising standard of living, demanding not only more dietary semi-solid fats but more milk. Besides, although India has the highest cattle population in the world, the scarcity of fodder and the lack of an organised dairy industry have been responsible for Indian cattle being of mediocre quality and its milk yield extremely low. This is reflected partly in the soaring price of *ghee* and butter, the scarcity of which even in Europe in the first instance had led the scientists to look for an alternative source of semi-solid fat resulting in the invention of margarine and shortening.



Using Cottonseed Oil

Edible vegetable oils consumed throughout India form another important source of fat, but here again their limitations are evident, for their characteristic flavour confines them to particular areas and in any case, in many forms of cooking, they cannot be used as an alternative to *ghee*. But the *vanaspati* industry converts the cheapest of these oils, the groundnut oil, into a universally acceptable product by the process of hydrogenation after refining and deodorising. Another important part that the industry plays in the oil economy of the country is the increasing use it has made of cottonseed oil which, although a highly nutritious oil, finds little favour as a cooking medium but is readily acceptable when hydrogenated. The dietary requirement of 2oz. fat a person a day works out approximately to 1.66oz. a day *per capita* or the enormous total of 7.3 million tonnes of edible fat annually to meet the requirements of its 443 million people. The following figures indicate that at present India produces hardly a third of its actual fat requirements even if one assumes that all edible fats produced in the country are used for dietary purposes, which is hardly the case:

Oils-fats	Quantity produced in 1961-62 (tons)
Groundnut oil	1,055,000
Linseed oil	115,000
Rape-mustard oil	397,000
Sesamum oil	108,000
Coconut oil	156,000
Minor oils (kardi, cottonseed, etcetera)	150,000 (estimate)
Ghee	500.000 (estimate)
	2,481,000

So the challenge of the edible fat scarcity must be met if Indians are to be assured of a balanced diet necessary for the maintenance of national health.

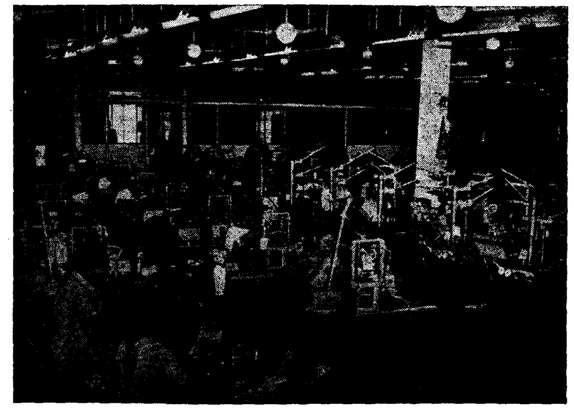
MANUFACTURE OF RADIO AND ELECTRONIC EQUIPMENT MAKES PROGRESS

THE word electronics is generally associated with radio receivers, public address equipment and radio transmitters, etcetera. The electronic industry, however, covers a much wider field. It comprises various electronic test and service instruments, industrial control instruments, nuclear instruments, transmitters for broadcast of radio and television frequencies, radar equipment, various nuclear gadgets, electron microscopes, x-rays and several other allied items. A general survey of the radio industry, as it exists in India today, and the prospects of the manufacture of other electronic instruments and apparatus is made in this article.

The radio industry is a branch of the electronics industry. It made a start in India in 1948 with the assembly, from imported components, of about 25,000 radio receivers a year. From this modest beginning, the production not only of the finished radio receivers but also of the various components, which go to make a radio set, has been increasing steadily. In India there are, at present, more than 20 large established concerns producing about 350 000 radio sets a year. Due to the encouragement and support given by the small-scale industries authorities in the various States, it would be safe, in the absence of accurate statistics, to put the number of small-scale radio manufacturers at 200, who would be producing at least 125,000 sets a year, bringing the total number of radio sets manufactured in the country to 475,000 a year. Among the larger units, production a year ranges from 1,000 sets to 120,000 sets. The total investment in the larger units is estimated to be about Rs. 5 crores employing a total number of 10,000 men and women with an annual turnover of over Rs. 7 crores.



By
P. K. KAPRE
Industrial Director,
Philips India Ltd

Third Plan Target

While the production of radio receivers exceeded the second five year plan target of 300,000 sets, it has yet to go quite far before it reaches the third plan target of 1 million sets a year by 1966. Under normal conditions, such a target is within the reach of the industry not only because of the increasing popularity of radio but also because of the increasing capacity of the people and the increased number of broadcast transmitters, which are being installed in the country. While there is a demand for radio sets and other factors are also favourable, the main bottleneck is the foreign exchange shortage. In spite of very concerted and strenuous efforts on the part of the various manufacturers to make as many radio components in the country as possible, the radio-components industry has not yet been developed to a point where the assembly of radio sets can reach the target figure without involving foreign exchange expenditure. The Government of India, during the last five or six years, has licensed a number of parties, irrespective of their previous experience in this specialised field, to manufacture radio components in order to make the radio industry self-sufficient; however not many have been able to make much headway because of the lack of experience and adequate know-how. The table on page 57 gives an approximate idea about the position concerning the capacities licensed for important components.

Licensed Capacities

The above licensed capacities are, no doubt, adequate but, as pointed out above, the establishment of component manufacture takes considerable time, money and technical know-how. It is understood that only a third of the parties licensed have taken "effective steps", and actual

The component assembly department in a radio factory

GEC/G/395

Radio assembly lines in a Calcutta factory

production in most components with the exception of valves, loudspeakers, a few condensers and possibly resistors, is about one-tenth of what is licensed. Another difficulty is the foreign exchange required for the import of capital goods. Not all of the licensees are in a position to secure foreign loans on a long-term basis and this has resulted in quite a few licences not fructifying. As in so many other specialised industries, this industry is now trying to make up for the lost time. In the absence in India of proper laboratories and development work, it is still necessary to import foreign technical know-how.

The foreign parties who are in possession of technical know-how, which is really worth while not only from the point of view of technical efficiency but also from the point of view of the experience the foreign parties have of imparting such know-how under the Indian conditions, are willing to render assistance, if only adequate technical assistance fees are obtainable. Of late, there have been some difficulties in the matter. It must be realised that even in the matter of radio receivers, the science and technology is advancing very rapidly and if India has to get the latest information on circuitry, technical designs, etcetera, she should be prepared to pay for such know-how. Simultaneously, of course, it is very desirable that all parties concerned must try to develop their own designs and know-how in the country as soon as possible. It would be only pertinent to point out here, that while the radio broadcast receiver industry, according to the interpretation of the Industrial Policy Resolution of the Government of India, is still within the purview of the private sector, two important components, namely, valves and transistors, are manufactured in one of the Government factories in Bangalore with the technical know-how of a well-known firm in Europe.

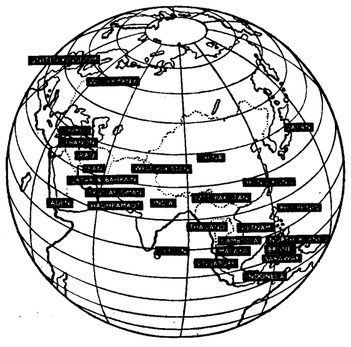
With the rapid development of the electronics industry in India, some of the private sector units will have to take up the manufacture of these difficult items in the foreseeable future, since one factory in the public sector alone is not likely to meet adequately the total demand for these important items. There are, of course, a few very small units, which have been granted manufacturing licences to make transistors, but it remains to be seen how far they will be able to make headway in this direction.

Shortage of Raw Materials

Various panels have been set up by the Government of India from time to time to find out the ways and means of developing the electronics industry. Apart from the manufacture of broadcast receiver and public address systems by the private sector, the Government of India centralised the manufacture of all types of specialised transmitting, receiving, measuring and control equipment in one factory in the public sector. It is obvious that for a large country like India, one factory cannot offer everything, even in peacetime, much less when there are emergency conditions, as prevailing today. The country will require, at the earliest, not only more broadcast receivers and test equipment but also specialised types of portable trans-receivers, control instruments and equipment for the use of the police, domestic aviation, postal traffic, etcetera. These problems are further aggravated due to two important factors essential in the development and manufacture of civil and defence equipment. The first factor is the acute shortage of some raw materials inclusive of ferrous and non-ferrous metals which go into the manufacture of high quality components. It is impossible for a nation, however advanced, to develop adequately the electronics industry without the simultaneous and corresponding growth of the allied industries so essential for its progress. Therefore, for the manufacture of high quality electronic components, it is also equally important to have high quality metallurgical products, chemical materials, etcetera.

The second important factor, which threatens to be a problem more acute than the first, is the scarcity of technical talent. While there are a number of candidates willing to take up a telecommunication career, there are not enough technical institutions staffed with capable teachers to build up such talent. This shortage of technical talent cannot be met within a short time, so long-term planning for developing the potential of the required technical personnel is necessary.

National Emergency



As a result of the emergency situation created since 20th October of last year due to the unwarranted Chinese invasion of India, quite a few illusions have been exploded. One of them has been that everything that is required for the defence purposes in the electronics field can be manufactured in the public sector. It is heartening, therefore, to note that the Government of India is gradually inviting the private sector to meet some of the electronics requirements so urgently needed for India's defence. In the shadow of this emergency, it is very likely that there will be reorientation of industrial priorities in favour of those industries which can meet defence requirements. Some of the obligations which are imposed upon the country in this situation can effectively be met by the electronics industry, if the difficulties mentioned earlier are taken care of and solved without inhibitions towards the private sector. If the Government can mobilise effectively all sources like private industries, technical institutes and universities and keep an open and liberal mind concerning technical assistance fees required for the import of know-how and give priority to the import of such raw materials as are essential to ensure quality production, then it will not be too optimistic to state that the prospects for the electronics industry are indeed bright in the country.

Demand for Machine Tools Rising: Plans for Expanding Output

MACHINE tools are often described as "mother machines", because they produce other machines, and thus form the basis of industrial development. The demand for machine tools in India has naturally been rising with the progress of her industrialisation. The demand has been examined in detail by different methods. The comparative figures of the assessment of the demand based on (i) past demand, (ii) gross investment in industry and (iii) installed capacity of 40 major engineering industries, are summarised below:

MACHINE TOOLS
(Rs. crores)

Year	Estimates based on past trends	Estimates based on gross investment in industry	Estimates based on installed capacity of 40 major engineering industries
1961	25.5	22.2	21.8
1962	31.25	26.2	25.2
1963	38.40	30.8	29.0
1964	47.10	36.2	33.4
1965	57.75	42.6	38.6
	200	158	148

It will be seen that the estimates as projected from the trends of demand in the past, are at variance with the demands as estimated by the other two methods. The estimates based on past trends are

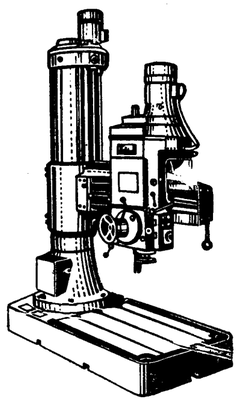
By Our
NEW DELHI CORRESPONDENT

higher by 25 percent than those based on gross investment and by 33 percent than those based on installed capacity in the engineering industries. It is felt that the first estimate at Rs. 200 crores, with the demand in 1965 at Rs. 58 crores, may be somewhat high. The figures by the other two methods seem to be rather low. This is all the more true on account of the fact that during the current plan period, the manufacturers are required to step up the indigenous content substantially. In these circumstances, it is regarded more appropriate to take the average of the three figures computed by different methods to arrive at the demand for 1965. This works out to Rs. 169 crores or say Rs. 170 crores.

Taking the demand for 1960 at Rs. 20.8 crores (average equivalent demand), the annual increase works out to 17 percent a year, so as to bring out the total outlay on machine tools at Rs. 170 crores during the third plan period. The year-by-year demand on this basis for the third five year plan would, therefore, be as shown in the table at the foot of the previous column.

Year	Annual demand (Rs. crores)
1961	24.3
1962	28.4
1963	33.2
1964	38.8
1965	45.3
	170

It is considered that the above figures of demand ending with the figure of Rs. 45.3 crores for 1965, are realistic in the context of effective utilisation of machine tools. In order to estimate the demand for other workshop machinery, it has been assumed that the ratio of machine tools to other workshop machinery will continue to be as in 1960. On this basis, the demand for other workshop machinery in 1965 works to Rs. 15.5 crores. The total estimated demand for machine tools and other workshop machinery for the year 1965 will be:



(i) Machine tools	Rs. 45.3 crores
(ii) Other workshop machinery	Rs. 15.5 crores
	Rs. 66.8 crores

Prince Norodom and Madame Sihanouk at a State machine tool plant

A "lead-screw" making machine in operation

The development programme for the machine tool industry in the third five year plan visualises capacity and production targets of Rs. 30 crores for 1965-66. This is exclusive of the contribution from the small-scale sector, reckoned at about Rs. 5 crores in that year. Production during 1962-63, it is expected, will be Rs. 12 crores. In addition, the small-scale industry may be able to contribute Rs. 3 crores to Rs. 4 crores worth of machine tools. Compared with the production of Rs. 2.5 crores in 1957, this represents a six-fold increase in production during the course of the past five years.

PATTERN OF MACHINE TOOL DEMAND

Machine tools—metal cutting and selected metal forming machines	Installed 1954 (Nos.)	Imported and manufactured 1955-59 (Nos.)	Installed 1959 (Nos.)	Demand 1961-65 Nos. and percentage	
Automatic	518	245	763	1,600	1.0
Boring	1,089	1,659	2,748	4,500	2.8
Broaching	44	24	68	800	0.5
Drilling	10,118	8,394	18,512	22,400	14.0

Tapping	260	349	609	800	0.5
Bending other than rolls	235	1,488	1,717	2,240	1.4
Polishing	1,519	2,789	4,308	5,600	3.5
	62,464	58,110	1,20,574	1,60,000	100.0

Output by Third Plan End

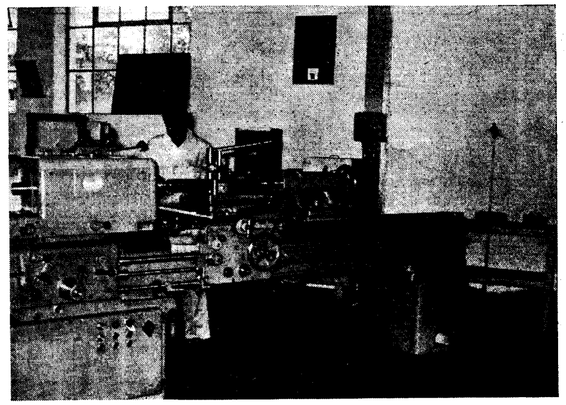
Public sector: Hindustan Machine Tools Ltd completed the construction of the second unit in Bangalore in May 1961, and is now fast building up production. It will be seen that the H.M.T. at present is working at the production rate of 1,300 to 1,400 machine tools a year. The build-up of production of the two units of the H.M.T. in Bangalore, it is visualised, will be as follows:

	Approximate number of machine tools to be produced	Approximate value in Rs. crores
1962-63	1,500	6.0
1963-64	1,800	7.0
1964-65	2,000	7.5

The construction work of the third unit of the H.M.T. in Pinjore intended to manufacture 1,000 machine tools, costing about Rs. 3.5 crores, is progressing satisfactorily. It is planned to produce the milling family of machine tools, which, it is expected, will begin to be produced during the current year. By a quick building up of production, an output of about Rs. 2.5 crores to Rs. 3 crores worth of machine tools may possibly be reckoned from this unit by 1965-66.

It is proposed to set up another machine tool factory in the public sector in Kerala during the course of the third plan. Its planned capacity is 1,000 machine tools a year. The estimated cost of the factory is Rs. 7.50 crores with a foreign exchange cost of Rs. 1.75 crores. The plant capacity can be doubled by an additional capital investment of Rs. 3 crores, out of which Rs. 1 crore will be in foreign exchange. The implementation of this project has been entrusted to the Hindustan Machine Tools Ltd, Bangalore. The Company has indicated that this factory will go into production in about 2½ years after the Government makes available the necessary foreign exchange. The H.M.T. has, however, indicated that the finances required for the implementation of the Kerala factory will be met from the internal surpluses of the Bangalore factory and the Pinjore factory which is likely to accrue during the last three years of the third five year plan.

Working Results



The latest balance-sheet of the Hindustan Machine Tool Factory shows that the enterprise has been working quite satisfactorily. The net profit of Rs. 2.15 crores earned by the H.M.T. for the year 1962-63 represents a return of 33 percent on the share capital of Rs. 6.56 crores, compared with the return of earlier years of 24 percent (Rs. 1.27 crores) in 1961-62 and 13.9 percent (Rs. 74 lakhs) in 1960-61. This is about the only public undertaking with a good working result record. The gross revenue for 1962-63 increased to Rs. 7.68 crores from Rs. 5.32 crores during the previous year. The domestic sale prices of all H.M.T. machines fixed in September 1960 at 10 to 20 percent below the then landed cost of European machines of equivalent quality were maintained throughout the year, in spite of substantial increases in sale prices in Europe since 1960. The current selling prices in force from 15th April, 1963, are uniformly 15 percent below the current landed cost of European machines of equivalent quality.

Bangalore factories nos. I and II: The production of the two machine tool factories in Bangalore registered a record output of 165 machines during November 1962, following the declaration of the emergency, against the previous record production in any month of 145 machines during March 1962. This rate of production of 165 machines a month was maintained for the remainder of the financial year and since, thereby achieving substantially the full production capacity of 2,000 machines a year for the combined factories, 15 months after the inauguration in July 1961 of the second factory by the Prime Minister and 17 months ahead of schedule.

Third machine tool factory, Pinjore, Punjab: Work on the third machine tool factory in Pinjore, Punjab, commenced with ground levelling operations on 2nd May, 1962. As some ten million cubic feet of earth had to be moved, the levelling operations took several months in spite of heavy earth-moving equipment being employed for the purpose. The main factory buildings, however, will be ready for installation of the machines by the middle of the year 1963. Plant and machinery has commenced arriving at the site. The construction of the permanent training centre in Pinjore was completed in February 1963, and the training centre was commissioned in March 1963. In addition, an advance temporary training centre was set up earlier in Chandigarh from August 1962. The training facilities available in Bangalore were also utilised extensively for the Pinjore project. The recruitment and training programme for the 3,000 personnel to man the factory is proceeding according to schedule. The factory is expected to be ready for production before the end of the year 1963.

The Kerala Factory

Fourth Machine tool factory, Kalamassery, Kerala: A fourth machine tool factory and township is to be built by the H.M.T. in Kalamassery in Kerala, eight miles from the Cochin harbour, at an estimated cost of Rs. 7.5 crores and the approval of the Government of India for this project was obtained on 1st April, 1963. Approximately 900 acres of land is being acquired in stages for this project, and is being made available by the Kerala Government as a gift. A portion of the land measuring about 60 acres for the factory was made available to the Company by the Kerala Government in April 1963, and ground levelling operation on the factory site commenced in the same month. The master plan for the main factory as well as the township are under preparation and the construction of the factory and the township is expected to commence immediately after the monsoons. A temporary training centre with 200 places in two shifts was established in Trivandrum in the factory space made available in the Government engineering workshop of the Kerala Government, which was inaugurated by Mr. C. Subramaniam, Central Minister for Steel and Heavy Industries on 10th May, 1963, when he

Some machine tool factory trainees at work

also presented the appointment orders for the first batch of 534 recruits for technical training for the Kalamassery project. Recruitment of the remainder of the 3,000 personnel required to man the first phase of the factory is proceeding according to schedule. The total capital cost of Rs. 7.5 crores for this fourth machine tool project is expected to be provided entirely from the internal resources of the Company. The fourth factory, like its two predecessors, will also be planned, built and commissioned entirely by Indian personnel.

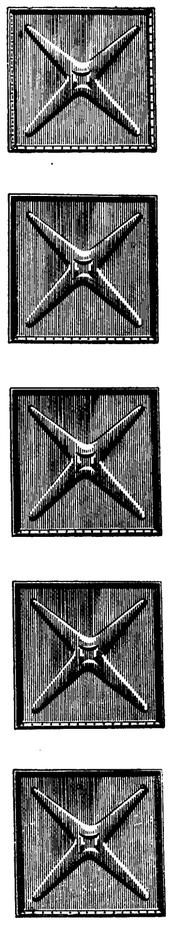
Fifth machine tool factory, Sanatnagar, Secunderabad: A proposal to establish a fifth machine tool factory in Sanatnagar, Secunderabad, with the foreign exchange credit to be made available by the Government of Poland, is under examination and discussion. When all the five machine tool factories are in operation, it is intended to decentralise the various production lines in Bangalore, and permit each factory to specialise in one or two families of machines in order to ensure greater efficiency and lower cost. The total output of the five factories at full production is estimated at Rs. 25 crores a year.

Initially intended to manufacture machine tool accessories and precision items, the Praga Tools Corporation, Secunderabad, is being expanded and a co-ordinated programme for the production of machine tools and accessories has been formulated. Praga Tool is now manufacturing drill press, bench lathes, lathe and drill chucks, machine vices, precision items and small tools. It has also started the production of tool and cutter grinder in collaboration with A. A. Jones and Shipman of Leicester. It is felt that provided their milling machine programme with the Elliots and lathe chuck programme with the Pratts are allowed to go ahead without delay, the output of Rs. 2.5 crores, as expected from this unit by 1965-66, may materialise. The break-up of this Rs. 2.5 crores worth of production is expected to be on the following lines:

	(Rs. lakhs)
Drill presses	44
Bench lathes	5
Tool and cutter grinders	50
Milling machines	70
Lathe and drill chucks	60
Machine vices	15
Small tools, precision items	10
	254 or Rs. 2.5 crores

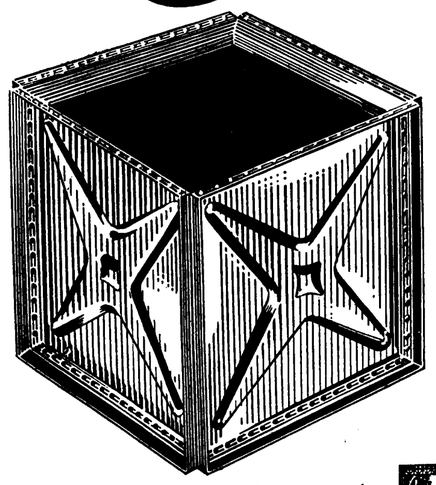
Expansion Schemes

The expansion schemes approved by the Government for the manufacture of drill chucks, lathe chucks, and tool and cutter grinders in the Praga Tools Corporation Ltd in technical collaboration with three U.K. firms are now in different stages of implementation. In addition, certain proposals for the manufacture of milling machines and two other types of machine tools with export possibilities with Polish aid and technical collaboration are being considered. A sum of Rs. 1.45 crores has tentatively been set apart from the Polish credits for this purpose.



The heavy machine tool plant of the Heavy Engineering Corporation in Ranchi is intended to produce annually 10,000 tons of certain diverse types of heavy machine tools in sizes and types different from those which have so far been produced in the country. According to present expectations, the plant may go into trial production in 1965-66, and is likely to give a sizable output only in the fourth plan period.

The position of the public sector units may thus be summarised as follows:



Unit	Output by 1965-66 visualised in the development programme (Rs. crores)	Likely output by 1965-66 (Rs. crores)
H.M.T., Bangalore	7.0	7.5
H.M.T., Pinjore	3.0	3.0
Pragas	2.5	2.5
Heavy machine tool factory, Ranchi	3.0	Nil
Ambernath prototype factory	1.0	Nil
	16.5	13.0

Private Sector Production

Units in the private sector with a total capacity of Rs. 13 crores have been in production. Output worth Rs. 15 crores may possibly be expected from these units by 1965-66.

BRAITHWAITE & CO (INDIA) LTD

ANGUS WORKS HOOGHLY — CALCUTTA-43 — CLIVE WORKS CALCUTTA

A worker-trainee at a machine tool plant

The following factors are, however, important in this connection:

(i) Most of the machine tool manufacturers in the private sector have got other engineering items in their production programmes and in a number of concerns machine tools form a minor part of their production activities. Tendency for switching over to other engineering products giving better returns is detrimental to the progress of this industry. The units should not, therefore, alter their planned programme of machine tool manufacture.

(ii) It is found that in most cases, the licensed capacity does not conform to the actual capacity created by the units.

As on 1st January, 1962, 74 licences with a total capacity of Rs. 13 crores worth of machine tools were yet to start production. A number of schemes have also been approved during 1962. Out of these schemes, Rs. 4 crores to 5 crores worth of capacity is probably covered by foreign exchange clearance. As no effective action was taken concerning about 30 licences, notice of revocation has had to be served. It is necessary to weed out the parties which have been unable to make progress and encourage others who may be more serious to enter the field. Some of the licensed units, it is reported, are making good progress, and may make some contribution towards the output in 1965-66.

Of the two principal raw materials—quality pig iron and rolled steel—the supply position of quality pig iron to the machine tool manufacturers is reported to be somewhat unsatisfactory. It is stated that production can be increased if timely supply of required quality and quantity of pig iron, steel and coke is effected to the manufacturers. Various measures to increase pig iron and coke production have already been considered. In particular, it is necessary that the parties to whom licences for the production of pig iron in small units have been given, should take energetic steps to implement their schemes.

The indigenous content of machine tools, which have been in production in the country for some time, is more than 95 percent, and excepting alloy steel, bearings, clutches, nuts, bolts, screws, in the metric system, the rest of the components are all indigenous. By the end of the third plan period, some alloy steel may be available indigenously. Production of metric fasteners needs to be organised. In this connection, the machine tool manufacturers can work out a programme for bulking the quantity on order of metric fasteners of each type on a co-operative basis, so as to make it attractive to undertake the production of this item. Bearings and clutches may have to be imported for some time longer. In the case of difficult types of new machine tools taken up for manufacture, the imported content, in the first instance, may come to as high as 40 to 50 percent.

Instead of manufacturing all the components in the main factory of the machine tool industry, it is advantageous and economic to subcontract the simpler components, which do not require heavy equipment or very high degree of skill and technique, to small-scale ancillary feeder industries. Greater effort is urged on the part of the organised units to get increased quantities of simpler components and parts from the small ancillary feeder industries so that at least 30 percent of the components are thus procured.

Needs of Feeder Industries

Assistance should be available to these feeder industries to maintain the quality of their products by regular inspection and in other ways. The number of small-scale units in the country is estimated to be more than 600. These units are mostly concentrated in the Batala and Ludhiana areas in the Punjab. Machine tools manufactured by these units are of the ungraded type, but due to the great scarcity of machine tools in the country their products find ready market. It is, however, felt that in time to come, it will be difficult to market products not manufactured in accordance with standard specifications and not conforming to a specified quality. Ungraded machine tools will produce inferior quality of manufactured goods and are, therefore, to be discourged. Measures for improving the quality of the products of the small-scale sector up to acceptable standards may be considered at the meeting.

Shortage of skilled workmen and trained supervisory staff is experienced in the machine tool industry. Most of the organised machine tool units have instituted training programmes to meet their requirements of skilled personnel. But in majority of cases, the training arrangements could be improved further. Moreover, competition on the part of the different concerns to secure the better trained workers complicates the situation.

Technical know-how of majority of the machine tools now under manufacture in the country was obtained from foreign countries, and for some time to come, this arrangement is likely to continue. To establish the machine tool industry on a sound footing, it is, however, necessary that India should be self-sufficient in technical know-how as early as possible. Skeleton design cells are found to be working in some of the organised units, and it is considered appropriate properly to equip these design cells and to establish them in case of those where there are none.

Machine Tool Institute

It may be mentioned that the Machine Tool Institute to be set up in Bangalore and the National Mechanical Engineering Institute in Durgapur will assist in developing self-reliance in machine tool design. But it is important that the organised major units should also build up their own design cells as quickly as possible.

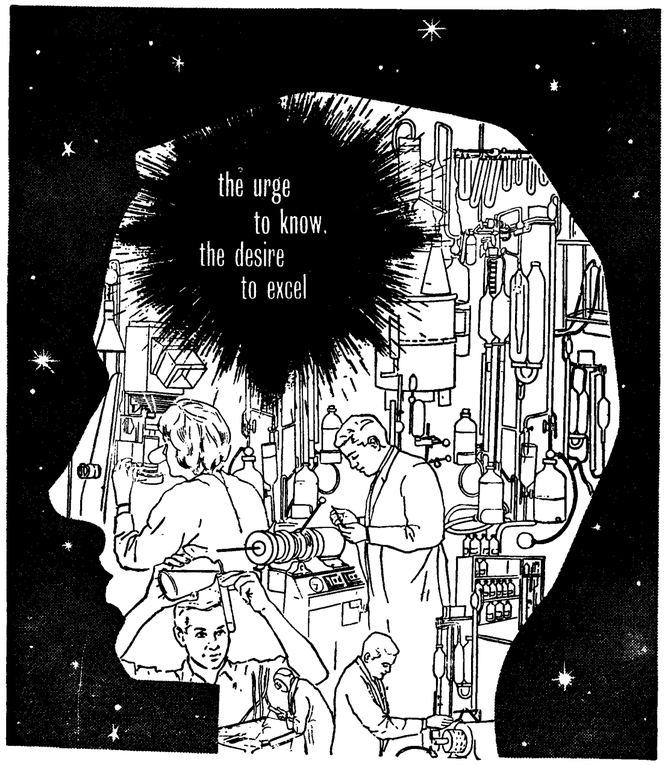
a challenge well met

On the 3rd January, this year, the 'E' blast furnace at the Jamshedpur steel works was blown out for relining and enlarging. It was a big job involving 2,100 tonnes of refractories, 1,700 metres of piping, 7,600 metres of electric cables and 1,100 tonnes of steelwork and castings.

When the original schedule was halved from 180 days to 90, many thought it to be impossible. But a team of Tata Steel engineers, technicians and workers took up the challenge and completed the operation in 84 days, 6 days ahead of the drastically revised schedule.



The 'E' blast furnace, with an original capacity of 315 tons a day, was bought second-hand from the U.S.A. 45 years ago. Its rated capacity has now been stepped up to 660 tonnes of pig iron a day without sinter burden, or to 725 tonnes with sinter and sized iron ore.

The record-breaking achievement is another demonstration of efficient team-work, technical know-how and sustained efforts to attain greater productivity with the minimum outlay that characterize a city like Jamshedpur, where industry is not merely a source of livelihood but a way of life.

Output of Rayon Fabrics Goes Up But Fair Prices Needed

By
T. R. RAMACHANDRAN

TWELVE years is a short span in the life of any industry, but the rayon industry in India has taken just that short period to achieve success. From a mere 5 million lbs in 1951, the production of viscose filament yarn reached the impressive level of 57 million lbs in 1962 while the output of staple fibre was more than 70 million lbs in the same year. This steady increase in production helped reduce viscose rayon imports from 34.6 million lbs in 1957 to 19 million lbs in 1962, thus saving valuable foreign exchange. In fact, the reduction in imports so far has made up for Rs. 32 crores of the initial foreign exchange expenditure involved in the setting up of rayon manufacturing plants.

The industry's quick progress is attributable to the growing need for clothing as much as to the popularity of man-made fibres. It is significant that the cotton mill industry continues to face difficulty in securing adequate raw cotton supplies while the rayon industry has stepped in to fulfil a long-felt need to raise the *per capita* consumption of cloth. Today, one in every five families in urban areas uses rayon, and there is obviously a growing desire to extend rayon purchases. Even under-privileged occupational groups are beginning to enter the rayon market. Results of an all-India survey by the Marketing Research Corporation of India, New Delhi, reveal that the demand for rayon fabrics comes largely from families with monthly incomes between Rs. 100 and Rs. 400. This is because a large variety of fabrics are today available in various price ranges to suit the pockets of different sections of the community.

Two Distinct Groups

Man-made fibres can be classified into two distinct groups—cellulosic and synthetic fibres. The basic materials of cellulosic fibres are beach or pine wood and cotton linters from which pulp is first made. The chief fibres of this group are viscose, cuprammonium and acetate rayon. Various chemicals derived from coal and oil are also used in making synthetic fibres and their sub-groups, which offer a wide range of fibre products, such as nylon, terylene, acrylic, vinyon and poly-propylene.

The fibres now manufactured in India are viscose and acetate rayons and nylon. Eight factories are already manufacturing viscose rayon and some of them have also started making tyre cord and high tenacity viscose rayon yarns. Acetate rayon is now manufactured by only one plant.

TABLE I

INDIA'S PRODUCTION, IMPORTS AND REQUIREMENTS OF MAN-MADE FIBRES DURING 1957-62
Production, Imports and Requirements in terms of quantity (figures in '000 lbs)

Year	Viscose rayon			Acetate yarn			Imports of other rayon and synthetic yarn		Total production of man-made fibres	Total imports of man-made fibres	Total requirements of man-made fibres
	Production	Imports	Total viscose requirement	Production	Imports	Total acetate requirement	Cuprammonium (imports)	Synthetic yarn (imports)			
1957	21,388	34,640	56,028	3,598	2,010	5,608	10,200	1,285	24,986	48,135	73,121
1958	29,510	25,680	55,190	4.088	1,813	5,901	5,986	2.669	33,598	36,148	69,746
1959	33,054	34,153	67,207	3,169	2,864	6,033	7,510	2,626	36,223	47,153	83,376
1960	41,441	30,886	72,327	4,243	4,083	8,326	6,346	2,918	45,684	44,233	89,917
1961	47.255	27,302	74,557	4,483	3,309	7,792	9,167	4,293	51,138	44,071	95,809
1962	57,719	19,437	77,156	3,080	2,930	6,010	7,643	7,982	60,799	37,992	98,791

Besides these rayon plants, plans for manufacturing nylon, acrylic, olefin fibres and glass fibres are under way.

The early beginnings of the industry date back to the 'thirties when protection on cotton fabrics was still a rage and Japan, a powerful competitor, used to dump goods on the Indian market. Until then, the Indian handloom industry was interested in weaving mixed fabrics of cotton and rayon, and rayon was being imported, although inadequately. The handloom industry got a fillip when the Government imposed import duties in 1933 to protect the Indian cotton textile industry. Under this tariff wall, powerloom factories after the Japanese model sprang up in the country and pure rayon fabrics were manufactured. The import of rayon fabrics was, however, restricted during the second World War and after, and the rayon weaving industry received further impetus to develop.

Production Trends

Today the nation's consumer requirements are steadily growing on account of the increase in population, trend towards urbanisation, massive investment programmes, and the general striving for a higher standard of living. Keeping pace with the increasing requirements, the production of viscose rayon has more than doubled between 1957 and 1962, and the percentage of production to total requirements has gone up from 38 to 75. Imports, however, continued, although at a steadily declining rate. In addition, partial imports of acetate yarn to supplement local production and full imports of cuprammonium and synthetic yarn had to be maintained to meet the expanding needs of the industry. A complete statement of the amount of production, imports and requirements of the various man-made fibres during the last quinquennium is given in Table I above.

As for the production of viscose filament, it is evident that the rayon industry should be given further scope for adequate development and expansion. During the second plan period, the industry was able to add to its capacity for spinning yarn only 30 million lbs a year. The capacity at the end of the first plan was 22.3 million lbs of yarn. Three units were in operation—National Rayon Corporation, Travancore Rayons and Gwalior Rayons. The first two accounted under the second plan for 26.7 million lbs of viscose filament ; and three new units which came into production during this period, namely, Century Rayons, J. K. Rayon and Kesoram Rayon, accounted for 21.6 million lbs. Thus the total output in the second plan aggregated 48.3 million lbs of viscose filament, and another 4 million lbs of cellulose acetate filament. This clearly fell short of the second plan target of 68.3 million lbs. Production in 1962 came to 57.7 million lbs, and as consumption was considerably in excess of indigenous production, imports were permitted.

The staple fibre output, however, recorded excellent gains and hardly had to depend on imports. The two units engaged in its manufacture are Gwalior Rayon and South India Viscose, which have achieved the second and third plan targets with remarkable ease. Gwalior Rayon increased its capacity to 48 million lbs, against the second plan target of 32 million lbs ; and its production in 1962 was as high as 63 million lbs. South India Viscose accounted for 8.2 million lbs of viscose staple fibre in 1962. This total of 71.2 million lbs for last year has already overshot the third plan target of 64 million lbs.

Table II below indicates the breakdown of production of the respective individual companies for viscose filament, staple fibre and acetate yarn in 1962.

Revising Third Plan Targets

During the current plan period, on account of the shortage of foreign

TABLE II

CAPACITY OF THE UNITS AND PRODUCTION IN 1962
(In million lbs)

Units	Date of commencement of production	Licensed capacity a year	Installed capacity a year	Production in 1962
Viscose filament :				
National Rayon Corporation	March 1951	19.8	19.8	18.8
Century Rayon	Sep. 1956	15.4	15.4	14.9
J. K. Rayon	July 1959	4.4	4.4	3.8
Travancore Rayon	Jan. 1950	7.7	5.5	4.7

Synthetics	10	10
	140	184
Staple fibre :		
Viscose	64	130
Acetate	8	8
Synthetics	3	3
	75	141
Total	215	325

Problem of Pulp Supplies

While foreign exchange will be necessary for some import of rayon and synthetic yarn for a few more years, the availability of Indian-made rayon grade pulp is another important step in the industry's programme for self-sufficiency. Indigenous production so far has been in the realm of cellulosic fibres only. Cellulose pulp—the chief raw material—has had to be imported from countries, such as North America and Scandinavia. It has naturally been stressed that serious efforts should be made to produce rayon-grade pulp in order to eliminate the dependence on imports. The Government has already licensed several units for manufacturing wood pulp either from bamboo or cotton linters. The total licensed capacity for the manufacture of wood pulp from bamboo is of the order of 255,000 tons a year and that from cotton linters is about 36,600 tons a year. The Rs. 1-crore pulp plant of Travancore Rayons, with a capacity of 10 tons daily, has recently gone into production, manufacturing good quality pulp out of cotton linters. The Gwalior Rayon unit, completed at a cost of Rs. 8 crores in Kerala, has recently increased its capacity of (bamboo) wood pulp from 100 tons to 150 tons a day. Other projects include those of National Rayon for erecting a factory in Mysore with a capacity of 30,000 tons and of West Coast Paper with a capacity of 27,000. The pulp from these sources should enable a significant reduction in imports in a short period.

The supply position of other raw materials, such as caustic soda and sulphuric acid, is fortunately not a serious problem due to the care bestowed on developing them in the third plan. Some of the rayon units have their own plants for manufacturing these chemicals. With increasing supplies of indigenous wood pulp and the basic raw materials, the industry should be able to weather the storm with relative ease.

But the question is whether the industry is really making huge profits. Contrary to popular belief, the industry is, in fact, making moderate profits. The Reserve Bank's survey of 1,001 leading companies shows the average profits (percentage of net worth) to be 10·8 percent. Against this, the rayon yarn spinners' average is less—around 9 percent. The reasons for this are obvious. As Mr. A. R. Ramanathan, chairman of the Man-Made Fibre Industry, recently declared, the rayon industry for the present "is in the grip of a controlled economy." The selling prices of yarn have been frozen at the 1957 level, and have, in effect, been reduced by the absorption of excise duty. In addition, rising production costs and a high rate of obsolescence have made further in-roads into profitability. The situation is worsened when the market prices sag and yarn is not lifted, which results in huge piling up of stocks.

Price Revision Needed

In the circumstances, therefore, the need to fix fair prices for rayon textiles is important. Qualitatively, Indian rayon is now equal to the world's best ; in price, it is cheaper in all deniers than that of most other countries, as the following table will show :

TABLE IV

COMPARATIVE WORLD PRICES OF RAYON YARN

Countries	Domestic prices of 150-denier yarn in Rs a kilogram
Switzerland	9.08
U.S.A.	8.79
Britain	8.27
Italy	7.80
Sweden	7.80
France	7.76
India	6.94
Japan	5.50

With the progressive rise in the cost of raw materials, electricity charges, maintenance expenditure, wages and salaries, it is uneconomical for the units to operate with the existing 1957 price level. The Government's instructions to the Tariff Commission to conduct a thorough probe into the cost structure of man-made fires, it is hoped, will ensure the supply of synthetic fibre to consumers at reasonable prices and offer a fair return to the industry. As, however, the present structure is likely to continue for at least another year pending the Tariff Commission's recommendation, the industry's claim to an *ad hoc* price revision is justified. As the stepping up of cotton production is time consuming, the man-made fibre industry should be assisted to maximise output, stabilise prices and meet a substantial proportion of the country's ever growing requirements.

Air-conditioning Industry Worried by Rising Costs

IN a country like India, there is an urgent need to understand the influence of humidity and temperature on human activity. Study of subjects like thermodynamics, physics and heat transfer is not a new thing, but research in these and their development is fairly new. Experiments have shown that reactions, of not only human beings, but also of animals, insects, foods and metals subjected to different conditions of temperature and humidity are different. An interesting experiment once made on animals of the same kind and age brought up at different temperatures showed that the one at the lowest temperature was most active with the sharpest memory, while the one at the highest temperature was the slowest in actions. In everyday life, the same is witnessed. Favourable conditions of humidity and temperature generate in a human being vigour and energy, while unfavourable ones pull him back in lethargic bondage.

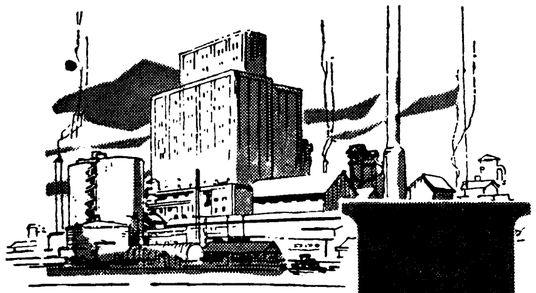
Unlimited application of controlled temperature and humidity does not stop with human beings and food.

By

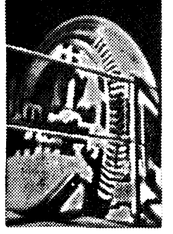
S. K. MADAN

Production Manager, American Refrigerator Co. Ltd

The advance of the technology and science of refrigeration during the last few years has been very great indeed. During the past few years, its expansion has covered in chemical, textile, printing, tea, machine tools, aircraft and many other industries. It becomes a must for satellites, missiles, rockets, supersonic aircraft and electronics. Modern weapons and spacecraft not only call for a wide range of "tailored" atmosphere, but also for precise dew-point control and temperatures within close tolerances. Controlled atmospheric conditions have to be provided in an aircraft flying at 40,000 feet above sea level. Food preservation, however, remains a major user of refrigeration.



Heat and Humidity

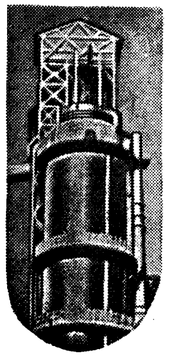


In India, unfortunately, throughout the year humidity and heat sap the people's energy. Economic considerations have also retarded the wider application of refrigeration in the food industry. No accurate figures can be given, but it is estimated that 25 percent of the total food production goes waste for lack of arrangements for preservation. If there were adequate storage facilities for food, the country would have been already self-sufficient.

The refrigeration industry in India is still in its infancy. The production of refrigeration equipment was not thought of until a few years ago when import restrictions were introduced. All the dealers in such equipment were importers, distributors or traders. They had to look for alternative sources to keep their business going when imports were slashed. The solution did not lie in starting research and development, or in starting from scratch to produce the equipment. The only course open was to depend on their foreign associates for collaboration, both financial and technical. Thus many leading concerns in the trade went into the manufacturing business on a joint venture or technical-know-how-or-royalty basis about seven years ago. The production of domestic and commercial equipment was undertaken. Substantial progress has since been made, and now many units are turning out products with more than 95 percent of indigenous material.

Manufacture of Components

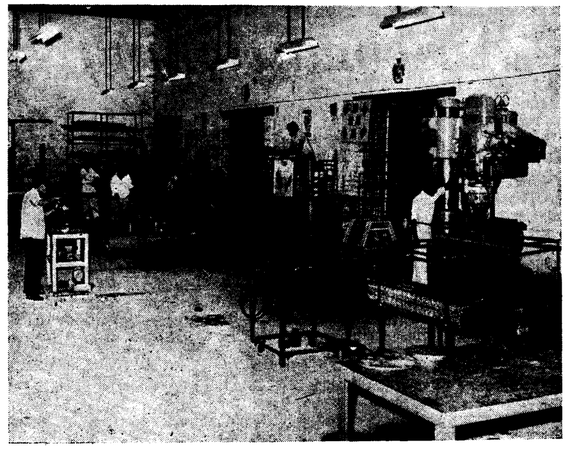
Controls are still being imported while sealed compressors are being manufactured on a small scale. But high production costs have offset any advantage that may have accrued due to the local manufacture. Two or three schemes to make controls have been approved. Few more projects with foreign collaboration may be forthcoming in the next two or three years. Ten to 12 different schemes to manufacture different components are already under way and after next four to five years, the industry is not only expected to be self-sufficient, but would also be saving for the Indian exchequer a few crores of rupees in foreign exchange. For the third five year plan, the Development Council has set the following targets of domestic and commercial refrigeration and air-conditioning. The figures for com-



A BASIC MATERIAL

With the progressive implementation of their expansion programme, Tata Chemicals aim to produce 400 tons of Soda Ash per day. This very important product is bound up with our Country's industrial progress. Not only is it a basic material for making Caustic Soda and other alkalies—which serve many industries—but the glass industry too depends on the use of dense Soda Ash, which is also made in Mithapur, along with light Soda Ash.

As India's Five Year Plans raise our standard of living, Tata Chemicals make their contribution through comprehensive expansion. Yesterday's planning results in today's progress and in tomorrow's chemicals.



TATA CHEMICALS LIMITED

Bombay House, Fort, Bombay.

mercial and industrial equipment are not available.

Products	Targets for 1965-66
Refrigerators	50,000 units
Air-conditioners	50,000 units
Water coolers	20,000 units

No particular capacity of the unit is fixed. Manufacturers produce units according to demand. To achieve the above output in time, does not appear to be a difficult proposition, provided the conditions are favourable. To meet the requirements of food preservation in unelectrified areas, the manufacture of kerosene-operated refrigerators has been undertaken. Two absorption type refrigerator models are already in the market. The production of air-conditioners for motor-vehicles is being done with imported compressors. There is no dearth of air-conditioners and refrigerators in the market. Probably, supply is far more than demand. The customer is not likely to be interested in the technical problems of the refrigeration and air-conditioning industry as in certain other questions. When would an average man in India be able to afford a refrigerator and an air-conditioner ? Is it possible to manufacture a domestic unit within Rs. 500 ? If other countries having more expensive labour can produce such low-priced units, why cannot India ? If these are to become part of the Indian's everyday living, then prices must be brought down. But the Indian manufacturers are neither in a position to do that at present, nor will they be for many more years to come. Low productivity of the worker is a problem which can be met by efficient management, proper training schemes and by creating working conditions as are provided in some of the advanced countries.

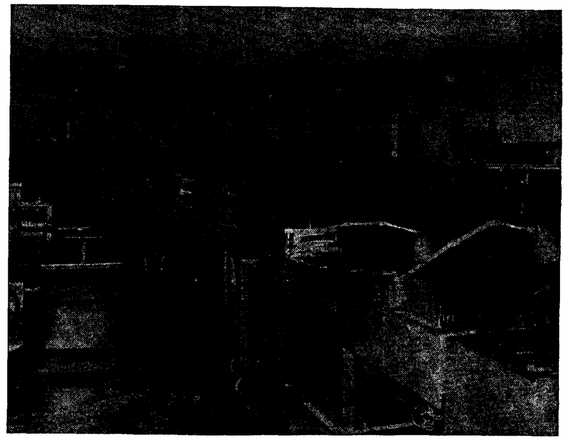
An air-conditioned tool room

Expensive Raw Materials

The major part of the selling price is on account of the expensive raw materials. The basic materials used in any refrigeration machine are copper, steel and aluminium, and all the Indian manufacturers pay for these 1½ to 2 times the price of what his counterpart pays in foreign countries. India has practically unlimited iron ore resources in the country and has some very modern steel plants. Labour also is cheap, yet the Indian steel is among the dearest in the world. The country has little resources in copper; but it can be imported at the international price. Unfortunately, the Government has created monopoly by issuing just two to three licences for re-rolling and redrawing the metal. The finished raw material is being sold at exhorbitant prices.

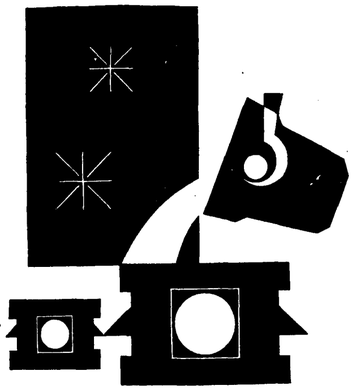
There is plenty of bauxite in the country; but aluminium is expensive. Manufacturers blame the high cost on power. India is producing only 30,000 to 40,000 tons of aluminium a year, while a small country like Japan, having no bauxite whatsoever, and starting from scratch after the second World War is producing over 300,000 tons of aluminium a year. In foreign countries, steel is being replaced by chemicals like plastic and nylon. These industries in India have still to make a proper start.

Indian manufacturers have adopted batch production methods, which are definitely more expensive than mass production methods used by West Germany, Japan and the U.S.A. Moreover, there is a tendency among Indian manufacturers to make all the components themselves as the delivery and quality of small-scale industrial units are not reliable. This is a big stumbling block in the way of achieving higher productivity. Individuals cannot set up mass production units to manufacture just few pieces of components for themselves. Encouragement to small-scale industries is necessary. Also co-ordinated efforts are required and each organisation should manufacture certain components. This would certainly cut down the cost to some extent. Big units can concentrate on production and development if the supply of small components is regularised to feed the big units. It should not only cut down the capital investment for them, but also help them increase production, enable them to reduce manufacturing costs. High quality is possible only, when there are standardisation of product, improved techniques of production, more competition and sufficient raw materials.



Beginning in Export

Two years ago, the refrigeration industry in India embarked on export. An association called the Air-conditioning and Refrigeration Council of India was formed. Considerable progress has been made; but the product is being exported at a low or on a no profit basis. The problem is to be tackled at root. Some means to manufacture the goods at competitive prices must be devised. During 1961-62, the refrigeration industries produced equipment worth Rs. 6 crores out of which goods worth only Rs. 1 lakh were exported.



During this emergency a big problem has arisen. Foreign collaborators are reluctant to invest freely and the Government has started pressing the industry from two sides, mainly, by increasing taxes and by increasing excise duty. Customers' purchasing power has been cut by the heavy increase in taxes and this would retard the development and expansion of the industry. The Government still considers air-conditioning and refrigeration a luxury without realising the industry's importance.

Continuous efforts are being made to find out methods of producing cold economically. In the industrial field, turbo comp is fast replacing reciprocating compressors. The turbo comp running at a speed of 18,000 r.p.m. is already in production. Research has also been undertaken on the thermo-electric refrigerator or Peltier effect. Borg Warner of America has brought out a 2.5 cubic feet refrigerator, which is costing approximately Rs. 3,000. But the lack of availability of toluride is preventing its manufacture on a commercial scale. In India, the people would have to depend on solar energy obtained from the Sun's rays or the earth's crest.

With the new developments in the offing, the Indian industry cannot afford to sit quiet. The refrigeration technologists need to re-equip themselves. They must have sound knowledge of thermodynamics and heat transfer, not only to understand the new developments, but also to undertake research to produce something suited to Indians conditions. There is very little co-ordination between Indian industries and engineering institutions. There is a general tendency among engineers to be too theoretical while more practical training is needed. This can be achieved by increasing the duration of compulsory practical training and by giving more incentive to those who work in the factories. Young engineers should be allowed to visit some of the advanced countries. That is where they can pick up new research and production techniques, which are very essential to cut down costs. Institutions like the Indian Society of Refrigeration Engineers have made some efforts at starting schools to train technicians; but the development of institutions like schools always depends on the help of the Government, the trade and industry, which unfortunately is lacking.

High Costs Retard Aluminium Expansion

IN 1962, world aluminium production was 5.5 million tonnes and Indian production 35,000 tonnes. As a percentage, India's share was 0.7. This immense difference between the world and Indian production is ample evidence of how small the aluminium industry in this country is today, and the long road that has still to be travelled before India can claim to be on the aluminium map of the world. The current third five year plan target has been fixed at 120,000 tonnes, and it is expected that out of it about 70,000 tonnes will be in production and with some luck the figure may even reach 100,000 tonnes. During the next plan there will have to be substantial expansion and the final figure will greatly depend on the offtake of the electrical industry and the extent to which aluminium could be substituted for other imported non-ferrous metals,

By

A. L. SABHARWAL

particularly copper. It will thus be seen that in the coming years, the industry will occupy a prominent place, not only in India's economy but also on the world aluminium map.

People are familiar with the economic problems of small industries. Small industries are unable to reap the benefits of large-scale operations and the consequent advantages resulting from such operations. As such, it is not necessary to spend time in trying to enumerate these problems. In addition, the industry in India is beset with some additional burdens such as the high costs of power, raw materials, transport, and of imported equipment.

Reducing Power Rates

There are at present no indications that the Government is trying to reduce power rates or the railways the freight rates. The various States of India are also not likely to refrain from imposing electricity duties on power consumed by the industry. These are handicaps to which there does not appear to be any immediate solution in sight, but if the industry is to move forward, it is essential that not only these problems are resolved but also economies are effected internally.

Aluminium produced in India is among the world's most expensive. Some of the causes contributing to this situation have been observed above. In addition, there are other reasons which the industry will have to tackle. Unless these are tackled and the industry's costs of production reduced, Indian aluminium will be priced out of the world market, no matter what incentives or subsidies the Government may offer. To illustrate the seriousness of the situation, aluminium ingot is being offered in the south Asian markets at about Rs. 2,054 a tonne, against an internal price which ranges between Rs. 3,170 and Rs. 3,500 a tonne. The position of rolled products like sheets is no better. An important reason for the high cost of aluminium production in India is the generally low level of productivity. Indian labour is not as efficient as their western or Japanese counterparts. The low productivity of Indian labour, in turn constitutes one of the many tangible elements in the cost of production.

I would like to substantiate my point by quoting Mr. H. V. R. Iengar, who in his statement at the recent annual general meeting of the Indian Aluminium Co. Ltd, said: "It is not enough that we aim at a sufficiency of aluminium production in the country. A stage has been reached in our development, where we must endeavour to reduce costs of production. We are conscious of the factors influencing the industry's high cost of production, particularly the high incidence of electric power and some of the other locally procured raw materials, but nevertheless we should employ all means at our disposal to achieve maximum economies of production. Latest management methods must be adopted, means of increasing productivity must be developed, and care must be taken to plan new projects on the soundest economic grounds possible. The size of new units must be planned bearing in mind the economies of quantity production. Their location must take into consideration such basic economic factors as transport requirements for raw materials and finished products, local availability of supplies and services and potential for future expansion. The co-operation of Government authorities at both the Centre and State levels is also essential in viewing these efforts in the light of the national needs rather than regional. It is also imperative that we secure the co-operation of the trade unions and industrial workers in order to achieve a standard of productivity which is comparable to those outside India. The full economic potential of modern equipment must be realised. This will require the understanding and co-operation of all concerned in rationalising labour agreements so that higher productivity made possible by modern plants is achieved. This is essential in the overall interest not only of the Company and its employees but also of the national economy. It is only through the fullest efforts of all concerned that the aluminium industry will ultimately reach the goal of reducing costs of production."

Plant and Equipment

Another reason for high cost against which preventive steps must be taken is that the machine utilisation in the Indian industry generally is not as high as their western counterparts. Either complete lack of modern equipment and factory design or a partial lack of the latest equipment and techniques is responsible for this in most cases. It is true that the units producing aluminium in India have recently expanded or have been newly established. All new equipment installed have been, by and large, of the latest types. But the mere installation of the latest equipment will not help in reaching higher levels of productivity. This equipment will have to be fully utilised, which means that each plant will have to be well rounded so that maximum economies can be effected. For example, if a plant is equipped with a hot mill which can turn out 50,000 tonnes of hot-rolled slabs and has only installed sufficient ancillary equipment to produce 20,000 tonnes of semi-fabricated products, then the plant is not well rounded. Further plant expansion design will have to incorporate plans and methods which will ensure optimum use of all the installed machinery. If this is done, it will be a great step forward in the overall objective of cost reduction of the Indian product.

Then again, certain legislation also creates problems for the industry. One of them is the difficulties where the issue of prospecting licences are concerned, as a result of which companies with expansion plans have to face enormous difficulties. Although there is some general knowledge about the quality, quantity and location of bauxite in this country, considerable exploration and prospecting has still to be done to determine their exact nature and extent. These prospecting activities have, however, to be carried out by the industry itself. Unfortunately, in many cases the Government has leased out such lands to people who are in no way connected with the aluminium industry. These people are individuals, who at some time or other got a lease for some bauxite land and have done or do some hand-mining and sell bauxite to the chemical industry. Some of these properties are very valuable for the aluminium industry. The result is that the latter has either to buy the bauxite from the lessee, who in most cases has not the equipment, know-how or capital to do geological exploration or adopt sound methods of mining with a view to conserving the deposits. The lessee, therefore, offers to sell his rights to the industry at unreasonable prices. Furthermore, there has recently been a tendency in some parts of India to reserve for the State itself all mineral rights, and if this is applied to existing companies and other companies seeking to establish themselves, it will slow down the expansion of the industry. No investors will be willing to lay out the large sums involved in aluminium production, unless they control the reserves of the basic ore. Lopsided planning is another problem.

Primary Aluminium Production

The estimated output of primary aluminium in India as far as one can see today at the end of the third plan will be as follows:

ESTIMATED PRODUCTION OF ALUMINIUM BY 1965-66

(In '000 tonnes)

	1963	1964	1965-66
Indian Aluminium	25.5	25.5	30.5
Hindustan Aluminium	20.0	20.0	20.0
Aluminium Corporation	7.5	7.5	7.5
Madras Aluminium	—	—	10.0
Total production	53.0	58.0	68.0
Demand	80.0	90.0	100.0
Shortfall	27.0	32.0	32.0

This shows that there will be recurring annual shortfalls unless more capacity comes into production. This will happen in spite of the great attention the Government is paying to the industry. Even inadequate production is not the only result. Contradictory situations, wasteful of economic resources, occur. With an overall shortage of aluminium products in the country at the end of 1962, the Indian market found itself starved of aluminium semi-fabricated and other products, whereas there was a glut of ingots awaiting to be lifted from the producers' warehouses. This is the result of not paying sufficient attention both by producers and the Government to the fabricating side of production, when planning the growth of the industry. Again, I shall quote Mr. H. V. R. Iengar, who

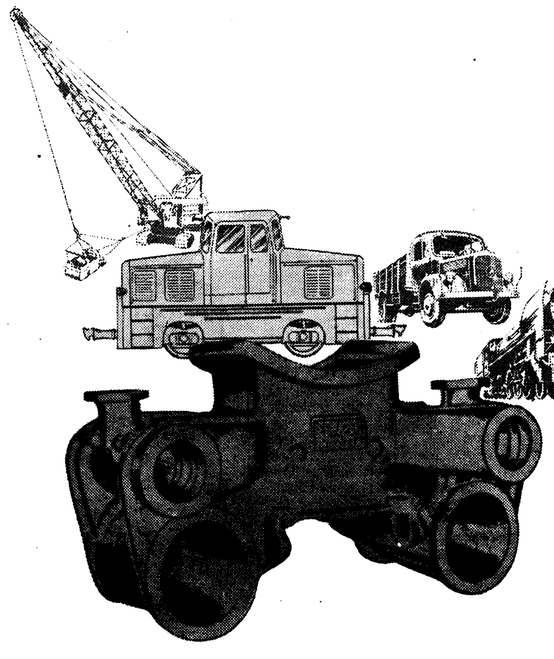
said in the same statement: "Impressive as the record of our development is, we cannot rest with past achievements. India is developing rapidly and, even to maintain our share in contributing to the national economy, we have to take fast strides. This does not mean that we should run helter-skelter without thought or plan; but we do have to condition our thinking with a sense of urgency. This sense of urgency is not only to be directed towards further expansion but also towards better use of our present facilities and resources. We have to co-ordinate our efforts with the Government and the new aluminium producers so that idle capacity in the plants imposed by artificial circumstances can be eliminated; so that the industry is able to offer metal and fabricated products in a form matching the demand; and so that a soundly based industrywise programme of development can be pursued. I shall illustrate the need for such co-ordination by mentioning an instance in 1962 when there was a national surplus of metal in ingot form concurrently with a shortage of metal in the form of wirebar, rod and billet. Similarly, there are other areas in the planning of the growth and development of the aluminium industry where close co-ordination between the Government on the one hand and the industry on the other will bear fruit".



Technological know-how and facilities for basic research have yet to be developed by the industry to reach the standards of major aluminium producing countries. It is true that in the last 25 years, the industry has made tremendous strides in the field of developing technical personnel. A very large smelter in this country was erected and commissioned entirely by Indian personnel with only token foreign assistance in 1962. This is high testimony but is it enough? Know-how for both production and technical development is still underdeveloped in India. Even for application know-how, this country is, to some extent, dependent on outside assistance. Since these services have to be procured at a price, needless to say, they inflate the cost of production of the indigenous metal and in turn the product to the ultimate consumer.

Basic Research

In the field of basic research on aluminium, hardly any facilities exist in the country. It was announced some time ago that some western producers were developing a technique by which aluminium could be produced directly from bauxite without the intermediary alumina stage. Research on such a large scale is, of course, enormously expensive and inconceivable for India in the foreseeable future. But a start must be made by the industry to develop research facilities. If these are established, scientists and technicians could experiment with new techniques, find indigenous substitutes for imported raw materials, improve day-to-day production techniques, new products and so on with special emphasis on conditions prevailing in India, as well as resources indigenously available.

A decade ago, aluminium was merely a pots and pans metal. Today, it has become an industrial metal, and absolutely vital in such a basic sector of the Indian economy as power. Nevertheless, the use of aluminium in India is not as widespread as in western countries. The growth in this sphere has been hampered by the absence of technological skill in the consuming industries, i.e., those who eventually convert the semi-fabricated aluminium to its final form. Many of these manufacturers operate on a small scale, without adequate resources to employ qualified technicians. Even some of the larger users lack proper personnel and facilities. All of them could do a better job of what they are doing already, as well as help to expand the use of aluminium in other fields, if they were well organised. In western countries—or at least in some of them—there are associations which furnish technical advisory services on various applications of the metal to its members. These associations—in the United Kingdom it is called the Aluminium Development Association—are formed by members more or less on a co-operative basis. A move has recently been made in India by some of the primary producers to set up such an association and if it is properly nourished and run during the initial stages, it will go a long way to filling the serious gap which exists today, and thus help in reducing the cost to the ultimate consumer.

To use an oft-repeated phrase, the aluminium industry has now reached the "take-off" point, after struggling for nearly a quarter of a century. Substantial spade work has been done to bring the industry to its present status. Now the industry has, in common with other basic industries, not only to run fast to stand in the same place, but also has to keep running faster and faster to keep pace with the overall development of the economy.

High Capital Costs Impede Mechanisation of Farms

By
I. CHATTERJEE

UNTIL quite recently, there was an influential school of thought in this country which seriously questioned the benefits of mechanisation in Indian agriculture on the grounds that the use of agricultural machinery was not likely to increase output appreciably. It was also argued that mechanisation will diminish the prospects for rural employment. At different stages of development in other parts of the world, similar doubts were expressed and removed in the course of technological development. But it was felt by sceptics in India that their considerations were of great importance since the country is rapidly becoming overpopulated to saturation point. To this writer, the problems which may arise from the mechanisation of agriculture in India are utterly remote under the present conditions, since she is not likely to reach a stage at which agricultural machinery will be available in quantity for decades. It is, therefore, perhaps more realistic to examine what effect the present limited mechanisation of agriculture in this country has had on food output and to estimate whether India's plans for the future manufacture of machinery will be of any assistance in helping agriculture to attain the third five year plan objectives, which have been worked out on population requirements, and in reducing her food imports.

Distribution of Tractors

If the impact of mechanisation is to be estimated in terms of agricultural production, a clue may be found in the distribution of the total number of tractors in the country. About 40,000 tractors are distributed zonewise as shown in Table I below:

TABLE I

Area		Percentage of total
(i) North zone:	Punjab, Rajasthan, Delhi and Uttar Pradesh.	53
(ii) South zone:	Madras, Andhra Pradesh, Mysore and Kerala.	17
(iii) Rest:	Madhya Pradesh, Gujarat, Maharashtra, West Bengal, Orissa, Bihar and Assam.	30

A further illustration is available from Indian statistics covering the distribution of tractors in various States, as shown below:

TABLE II

Statewise tractor distribution up to 1961

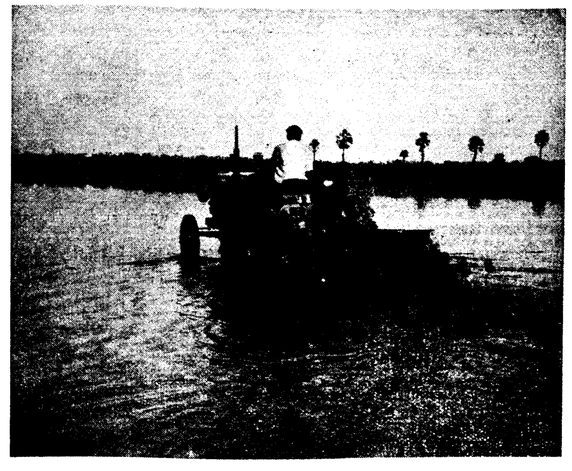
Punjab	7,840
Uttar Pradesh	7,115
Rajasthan	4,183
Andhra Pradesh	2,460
Madhya Pradesh	2 047
Gujarat	1,862
Bihar	1,793
Maharashtra	1,412
Madras	1,390
Mysore	934

While the figures given in Tables I and II are not meant to be conclusive evidence, it will be seen that one of the many factors contributing to a State's agricultural productivity is undoubtedly its degree of mechanisation. Following the recent land reforms, the acreages held by farming households in the country emerged in the form which is shown in Table III below:

TABLE III

Size of holdings (acres)	Percentage of total number of households (65 million households)	Percentage of the total area operated
Nil	6.3	Nil
0.01—2.49	48.5	5.9
2.50—4.99	15 9	10.9
5.00—7.49	9.3	10.5
7.50—9.99	5.6	9.1
10.00—14.99	5.5	12 6
15.00—24.99	4.9	17.7
25.00 and above	4.0	33.3
	100	100

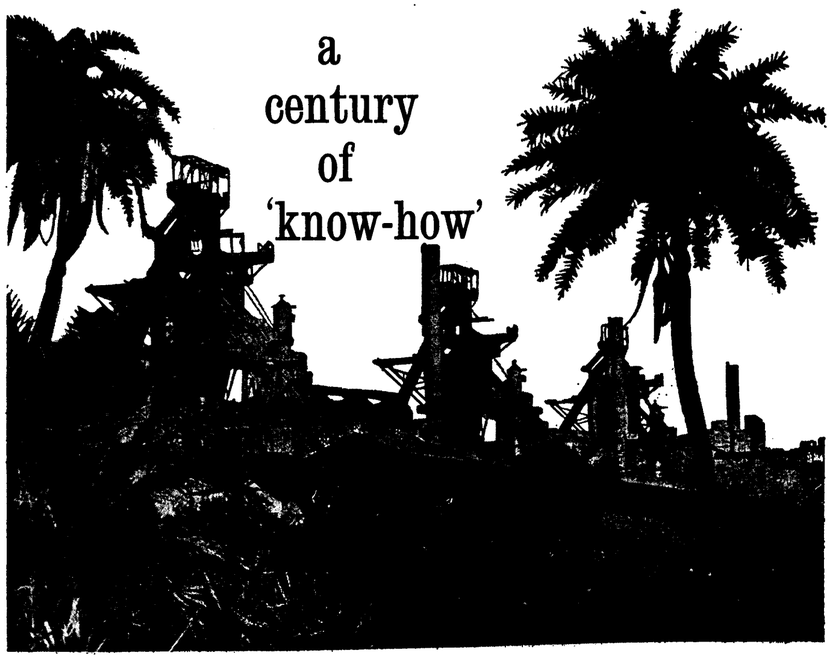
The extensive literature and statistics tend to show an interesting link between the size of holdings and the degree of mechanisation and farming incomes. It is possible to deduce that, on the whole, the economic viability of larger holdings has made it possible for farmers in this rural bracket to adopt a limited degree of mechanisation and to use other farming aids. If one has to make a forecast on the shape of development in Indian agriculture in the future, it is probable that the section of farmers who at present hold 33.1/3 percent of the total cultivable area in lots of 25 acres and above will gradually increase their agricultural output through mechanisation and in time to come, there may be a most undesirable gap between the living standards of *sections of the rural population*. Surveys have been carried out which indicate that with enlightened encouragement and credit facilities, farmers in the privileged rural bracket can absorb over a million tractors, provided certain technical facilities are also made available and the cost factors are reasonable.



It will become increasingly clear to the planners in India that unbalanced rural development can only be avoided if effective steps are taken to improve the economic condition of farmers in the small holding brackets from the state of poverty in which they have been permitted to stagnate for several centuries. Although the backwardness of the Indian farmer is almost certainly due to well-known economic factors, it is strange to find that various "mystical" reasons, including fatalism and a lack of physical vitality, have been mentioned as contributory factors. Any thorough investigation will establish that the basic reasons for the Indian farmer's lack of motivation is due to the ruthless exploitation which he has experienced for centuries and to the utter lack of economic incentives. A great deal has been said in Parliament and in the popular Press on the subject of price support for foodgrains, but the really effective measure will entail the removal of an entire army of small traders, or middlemen, who rigidly control the prices paid to farmers. Under this system, the farmer obtains little incentive for increasing his output. This, however, is a basic obstacle, the removal of which will be extremely difficult for any democratic country which has political considerations to take into account.

Providing Incentives

The other factors which militate against the provision of incentives to farmers are the common custom of sharing crop still favoured by landowners, the existing land legislation, and the lack of sufficient credit facilities. However, the logical conclusion is that until the small farmer can increase his income through fair prices and larger outputs, the country will not have the basis for the uniform mechanisation of agriculture in India. A cycle has to be created by which the farmer invests his surplus income in machinery, which in turn permits him to increase his earnings.



An entire volume can be written on the subject of the Government-sponsored schemes to provide credit in the form of *taccavi* loans which are repayable on a long-term low interest basis. These loans have undoubtedly stimulated agricultural production in many parts of the country, but are not developed adequately for a country of this size. There is a movement, mostly on paper at this stage, to spread co-operative systems which will undoubtedly assist in the creation of facilities for India's rural population but it will be at the cost of setting up bureaucratic machinery and procedures, which may have some of the undesirable features of collectives.

Apart from the above nursery credit developments, there exists a vast field in which private enterprise can offer financial resources for the rural population, which in turn will lead to the gradual mechanisation of agriculture. Of these potential schemes, the building up of farmers' syndicates is an attractive method of avoiding the disadvantages of collectives. Private enterprise can also do a great deal in the way of extending credit to rural areas, through hire-purchase systems. It would be entirely wrong for industrial planners, with a background of manufacture in urban areas, to contemplate the mechanisation of agriculture on the lines which are feasible in purely industrial undertakings. The human factor in relation to traditions are of great importance in matters concerning agricultural affairs, and no responsible Government can be expected to rush through reforms, however desirable these may appear to be superficially, at the risk of dislocating a nation's way of living and an established political system. The other factors which have a considerable bearing on rural organisation are related to the very complex nature of soils and the vagaries of climate and weather which all tend to create uncertainties in agriculture which are not present to the same extent in urban industry. The lack of economic incentives and sufficient

HEAD WRIGHTSON

Head Wrightson have almost a century of experience in the design and manufacture of plant and equipment for the Iron & Steel Industry.

The extensive engineering facilities of the Company ranging from initial research, through design and manufacture to erection, commissioning and after sales service, enables Head Wrightson to offer a technical service to the Iron & Steel Industry that is second to none.

Head Wrightson Supply: Ore Preparation & Sinter Plants, Pelletising Plants, Blast Furnaces; Oxygen Steelmaking Plant, Fume Removal Systems, Ladles, Casting Cars, Clay Guns, Gas Valves, Tube Making Equipment, Continuous Electrolytic Tinning & Galvanising Lines, Shearing, Cut-up, Coiling & Annealing Lines, Sheet & Plate Levellers, Steel Rolls.

HEAD WRIGHTSON INDIA LTD.,

21, Netaji Subhas Road,

CALCUTTA-1.

rural credit facilities have led to a slow growth of mechanisation, as shown in Table IV, and the overall effect has been to produce an unsatisfactory rate of increase in food production.

TABLE IV

Year	Number of tractors on Indian farms
1945	4,524
1951	8,631
1956	20,980
1961	35,000
1962	40,000

The use of animal power with improved implements is not an entirely satisfactory substitute for mechanisation for many reasons. India's bovine livestock is of poor quality and any substantial improvement in this direction will call for controlled breeding measures over sustained periods. It must also be remembered that any substantial increase in the bovine population of India, especially if quality is to be improved, will mean the additional provision of food and labour for the supervision of the animals.

Whereas tractors are perhaps fundamental for any modern mechanisation methods in India, one of the other main drawbacks has been the continued use of agricultural implements developed in the hoary past. In the last few years, implements have been imported with tractors but there is a vast field for redesigning them to suit Indian conditions as the imported items are meant almost entirely for European and American conditions. The main concentration has been in recent years on the use of ploughs of various types, cultivators and harrows but these are mainly still foreign in design and if mechanisation is to increase progressively, implements will have to be developed which are suitable for the alluvial soils of north India, the black cotton soils of central India and the hard and stony soils of the south.

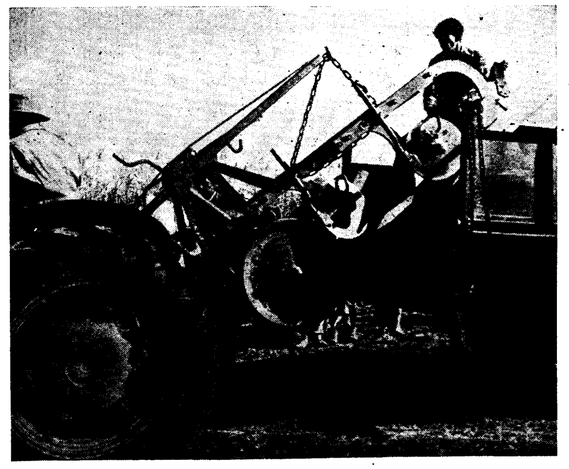
Tractor Designs

As far as tractor designs are concerned, India may import technology from the West in as much as the latest developments are now available for the agricultural machinery manufacturing industry. A modern tractor is a most versatile machine, with considerable toughness for working under rural conditions with accessories and attachments for many auxiliary uses. The tractors which will be available in India will have such features as adjustable front axle and rear wheels, hydraulic lifts, rear end tool bars, easily replaceable engines, and power take-off attachments. The tendency in this country has been to concentrate on the import of tractors in the 20 to 30 D.B.H.P. range but as shown later on in this review, the Government of India has wisely licensed the manufacture of machines in three distinct horse-power categories which are intended to cater to the requirements of small, medium and large acreage farms and for their use on land reclamation schemes.

It is safe to forecast that for a long period, the manufacture of agricultural equipment will continue on the lines envisaged in the Government-licensed projects, but the full mechanisation of agriculture will involve the use at a later stage of rural electrification and increasing familiarity with such farming aids, as land rollers, seed drills, planting machines, fertiliser distributors, harvesting machinery, crushing machines, pest control operators and dairy machinery. Following a series of agricultural surveys, which were carried out by the Government of India with the assistance of advisers from the private sector, it became obvious that from the long-term point of view, the official policy would have to be to stimulate the indigenous production of tractors; otherwise, the large-scale mechanisation which must take place in the future will place an intolerably large load on the country's exchange resources on account of continued imports. One can only sympathise with the Government of India for the difficulty faced by it in taking the final decision to license a number of units for the manufacture of tractors and agricultural implements. The current position in relation to the licensed tractor manufacturers is as shown in Table V below:

TABLE V

Messrs Eicher Tractor Corporation of India Ltd, Faridabad	2,000 Nos. a year (for tractors in the 12/18 and 20/30 D.B.H.P. range).
Messrs Tractors and Bulldozers (P) Ltd, Baroda	2,000 Nos. a year (for tractors in the range of 35 D.B.H.P. and above).
Messrs Tractor and Farm Equipment Ltd, Madras	3,500 Nos. a year (for tractors in 20/30 and 35 D.B.H.P. and above).
Messrs Mahindra and Mahindra Ltd, Bombay	3,500 Nos. a year (for all three ranges).
Messrs Ghaziabad Engineering Ltd, New Delhi	3,500 Nos. a year (up to 35 B.D.H.P.).
	14,500



All the industrial concerns which are listed on Table V are also licensed for tractor-drawn implements.

TABLE VI

	Annual Capacity for tillers
Messrs East Asiatic Co. (I) Ltd, Bombay	24,000
Messrs Testeels Ltd, Bombay	1,200/6,000
Messrs Engineering Development (P) Ltd, Calcutta	1,200

A number of smaller firms in various parts of the country have also been issued licences for the manufacture of agricultural implements and accessories for both A.D.V. and tractor applications. These small firms have, in many instances, made remarkable progress.

Briefly, the crux of the problem with which the Government and the private sector alike are faced with may be summed up on the following lines. It will be seen that five manufacturers have been licensed for the production of tractors in a horse-power range extending from 12 D.B.H.P. to 35 D.B.H.P. and above. Presumably, the reason behind the licensing pattern is to introduce an element of competition into the production and supply of tractors. It is hoped that the competition between the respective manufacturers will have the effect of keeping prices down to reasonable levels. However, a factor which is likely to operate against the above view is that the quantities for which the respective manufacturers are licensed are too small to permit of economic production, in terms of the horse-power range are produced in costs at which tractors of equivalent Europe and North America.

A 35 horse-power tractor

Defence Preparation

The Governmentt of India may also be faced with a situation, particularly during the current stress on defence preparation, in which it may be difficult to provide foreign exchange for the implementation of the licensed phased manufacturing schemes, even though one of the stipulations for indigenous production is that a 50-percent deletion content must be attained by each manufacturer from the start of operations. Even if the defence needs were not present, the tractor industry would still have been faced with a difficult period during which foreign exchange will be required simultaneously for food imports and for tractor components. It would appear that as far as tractor manufacture is concerned, the main *saving* in foreign exchange will come about at a stage when there are sufficient tractors in operation in the country to effect a definite saving in the foreign exchange which is wanted for food imports.

Under the above circumstances, it is fairly clear that during the initial stages of the tractor manufacturing programmes, the cost of machinery may work against the large-scale adoption of mechanisation by Indian farmers, unless certain definite steps are taken both by the Government and private enterprise to make credit available on reasonable terms for machinery purchases. If the Government is sufficiently determined to encourage the expansion of agricultural machinery production in the country through the principle of competition, it may be advisable to think in terms of abolishing the capacity restrictions after sufficient time had been given for the manufacturers concerned to reach their initial target capacities with the highest possible indigenous content. If at this stage, each manufacturer is permitted to produce as many tractors as he can market, it will almost certainly be an inducement to the entire industry to embark on the sort of large-scale production which will lead to a real reduction in cost and thereby permit the introduction of mechanisation on an effective basis. Naturally, the main condition prior to lifting capacity restrictions will be to limit the amount of foreign exchange, which this country cannot spare from its meagre resources. It is only by a bold imaginative step of this description that the tractor industry in the future is likely to be placed on an economic basis. In this connection, it must be remembered that whereas different conditions prevail, say, in the motor-car industry, where the cost factor is not of such vital importance because the purchasers belong largely to the upper classes, tractor costs are extremely important as the consumer belongs to the lowest income-bracket in the country. The five licensed manufacturers are likely to attempt to minimise the effects of high initial costs by planning production, with a view to reducing capital cost to the bone.

The Government has already attempted to persuade manufacturers either to standardise the parts used on various types or to pool their manufacturing resources to the greatest extent possible. It is unlikely that the above rationalisation will take place, not only because of the very nature of private enterprise which is basically competitive, but also on account of the fact that the Indian manufacturers will produce tractors to the designs of their foreign collaborators, who will not wish to have their tractor components

A tractor at work

standardised with those of other types. To counteract the effects of high capital cost, it will be necessary for the main manufacturers of agricultural machinery to resort to sub-contracting on a much larger scale than has been attempted hitherto. The sub-contracting process may be either entrusted to the other companies in a manufacturer's group of industries, in which case the problems are somewhat simplified, or else it will be necessary for the main manufacturer to stimulate the growth of small-scale and medium industries which can take on sub-contracting adequately.

Lack of Control

Unfortunately, sub-contracting in India has not always been a happy experience, but this is almost invariably due to lack of control over the manufacturer's processes and quality and to inadequate inspection of his products. In India, the main manufacturers may succeed in sub-contracting by setting up engineering departments which concentrate solely on guiding sub-contractors in manufacturing processes and in controlling the quality of their output. Whereas the above methods may give some reduction in cost due to intensive capitalisation, the main solution for the tractor manufacturer will lie in increasing his volume of production, that is, by developing larger markets, as quickly as possible. For this purpose, it is probable that the tractor manufacturer will aim at the potential demand for machines which exists with land holders of 25 acres and above, who apparently still hold 33½ percent of the cultivable areas in the country. An imaginative approach to this problem will almost certainly mean that the private sector will have to extend credits to the above class of farmers through hire-purchase systems.

If private enterprise is to undertake the expansion of agricultural mechanisation, to the extent necessary, some incentives will have to be provided by the Government by which the industry can develop without the crippling tax restrictions which in their present form are quite likely to discourage the growth of medium and large industries. In general terms, some of the technical problems which will be faced by the agricultural machinery industry are the following: although in the initial stages, some of the five licensed manufacturers will receive machinery and tooling as the capital contribution of their foreign collaborators, it is apparent that capital equipment cannot be permitted to be imported indefinitely, whereas increasing quantities are likely to be wanted as the industry expands. One can short circuit this particular problem by saying that capital requirements will be met by the growing machine tool industry in India, but the fact of the matter is that equipment of this nature is not likely to be in ready supply indigenously for many years. The answer here is probably to make the best possible use of the surplus production capacity in the country, on the assumption that agricultural production will enjoy the highest priority next to defence.

List of plant and machinery (general terms) required for the manufacture of tractors.

(a) *Machine shop:* 1. Bar capstan lathes, chuck capstan lathes, centre lathes, automatic lathes, combination lathes and vertical turret lathes.

2. Pillar drills and radial drills.

3. Vertical millers, horizontal millers, hydromatic millers and high-power millers.

4. Grinders, including tool and cutter grinder, disc grinder, drill grinder, surface grinder, post tool grinder, external and internal grinders and universal grinders.

5. Miscellaneous machines such as horizontal borer, lapping machine and broaching machines.

(b) *Gear cutting:* This section would require hobbers, shavers, chamfering machines, broaching machines and a set of gluson equipment as also gear checking equipment.

(c) *Heat treatment:* This section would require the usual furnaces and special presses.

(d) *Pressing:* Power presses, press brakes, shears and other miscellaneous equipment.

(e) *Foundry:* Besides the cupola, the usual core making and handling equipment.

(f) *Forge shop:* It is rather difficult to envisage the exact size of the hammers required in as much as sub-contracting of certain items could considerably reduce requirements under this head.

(g) *Tool room:* Jig borer, horizontal borer, die sinker, drilling machine, lathes and milling machines.

The fact that most of the agricultural machinery manufacturers are linked financially or technically to foreign firms with highly sophisticated products may present some manufacturing difficulties in the initial stages of production. This is because whereas most of the sophisticated products concerned are undoubtedly the best of their types internationally, the capital cost of producing to these advanced designs will not be encouraging with low market volumes.

Materials required (approximate quantities) for the manufacture of 100 tractors in the 20-30 D.B.H.P. range.

	(In tons)
Special alloy steel	35
Carbon steel	45
Cast iron	90
Non-ferrous metal	4
Proprietary items (tyres, batteries, etcetera)	28
Castings	150
Forgings	32
Pressings, including wheels	25
	409

It will perhaps be necessary for many of the indigenous manufacturers to carry out investigations with their collaborators into the problems of redesigning their products to make the maximum use of Indian materials, and to readapt production processes to those suitable for general-purpose machine tools. These are problems of considerable technical magnitude, but unless some attempt is made to obtain solutions on the lines mentioned above, the combined effects of restricted component imports and high capital cost may well prolong the time required for this industry to reach the take-off stage.

Service Facilities

One of the main technical problems which the Indian manufacturers will doubtless appreciate fully in the course of a few years will be the setting up of a vast network of service facilities wherever their tractors are sold. At present, one of the inhibiting factors preventing sales is that the farmer in the remoter areas very often has no servicing facilities nor sources from which he can obtain spare parts conveniently. This aspect is so crucial that mechanisation may well not register any progress at all, particularly because farmers are born sceptics, until the entire present outlook on servicing is brought into line with modern ideas. It is a matter of speculation as to whether the Government's import policy in recent years, during which tractors of numerous types have been imported freely from many parts of the world, will not hamper the mechanisation of agriculture. The servicing of so many different miscellaneous machines, plus the maintenance of a wide range of spare parts, may prove to be an expensive proposition, as a result of which the useful working life of these tractors may be somewhat reduced.

In this article, an effort has been made to touch the fringe of the many problems which the agricultural machinery manufacturing industry will have to solve within the next few years, if mechanisation is to make any progress whatsoever. It is to be hoped that the Government will not increase this burden by stressing that manufacturers should export, until the internal market provides a sufficiently large volume of production to allow competition in manufacturing costs with foreign products. The effect of subsidising exports will mean a higher indigenous cost which will reduce the internal demand and thus establish a vicious cycle. Exports will, therefore, be possible only when the industry has broken through the "capacity barrier" and has gone beyond the economic breakeven point.

The mechanisation of agriculture will, it is hoped, make it feasible to raise India's food output by intensifying the cultivation of her existing arable land, and with the use of larger machines a simultaneous operation can be launched for land reclamation. It will inevitably be a slow process. But this process must take place and the country will, meanwhile, have to endeavour to produce sufficient food for a growing population through progressive mechanisation.

Fertiliser Industry Lags Behind Third Plan Target

THE Chinese invasion of India has created a new situation. The economic development of this country which was geared to peace-time methods, has to be set on a war footing. It is not enough if only the armed strength is increased and the defence-orientated industries are made to work at full speed. The armed forces as well as the people who work behind the lines have to be fed and clothed so that they are fit to fight the enemy. The civilian population has to be fed and clothed. All this calls for rapid increase in agricultural production.

The progress of agricultural schemes has been rather slow during the first two years of the third plan. The increase in food production is only 1 million tons over the figure reached at the end of the second plan. The agricultural sector has belied the expectations and it is now necessary to work out programmes for increasing production at a much more rapid pace than was visualised at the time the third plan was drafted. Planning for raising agricultural output has now to be done on a war footing.

By

C. R. RANGANATHAN

Executive Director, The Fertiliser Association of India

The National Development Council at its meeting held in early November 1962, decided that a high priority should be given to agricultural production programmes, especially to those measures which would result in rapid increases. The Council also decided that the targets for minor irrigation and soil conservation programmes should be stepped up by 50 percent at the all-India level and the target for dry farming should be stepped up from 22 million acres to 50 million acres. Arrangements for the distribution of seeds and fertilisers are being strengthened. Greater attention is also being paid to the increased production of rice, millets and pulses. Special programmes for increasing the output of cotton and oilseeds on the package programme basis have also been undertaken in areas most suitable for these crops.

Priority for Fertilisers

One of the quick means of raising crop production is increased use of fertilisers. The results are visible immediately after harvesting the crop. It is, therefore, right that fertiliser use has been given the highest priority in the third plan, in as much as 25 percent of the increase in food production is to be derived from this source. The third plan accordingly sets targets of fertiliser consumption at 1 million tons of nitrogen, 400,000 tons of P_2O_5 and 200,000 tons of K_2O to be achieved by 1965-66. These targets are considered to be the minima for achieving the agricultural production targets, and any shortfall in consumption will be reflected in a corresponding decrease in farm output.

The progress of fertiliser consumption is not what it is desired to be. If the present rate of progress is merely maintained, it is likely that only about 50 percent of the targets will be achieved. The following table shows the position during the three plans:

TABLE I

CONSUMPTION OF FERTILISERS
(In tons)

		Target	Achievement	Percentage achievement
First Plan (1955-56)	N	175,000*	110,000	63
	P_2O_5	25,000*	13,000	55
	K_2O	10,000*	10,000	100
N plus P_2O_5 plus K_2O		210,000	133,000	63
Second Plan (1960-61)	N	370,000	219,000	59
	P_2O_5	120,000	53,000	44
	K_2O	30,000	35,000	117
N plus P_2O_5 plus K_2O		520,000	307,000	57
Third Plan (1965-66)	N	1,000,000	600,000**	60
	P_2O_5	400,000	200,000**	50
	K_2O	200,000	100,000**	50
N plus P_2O_5 plus K_2O		1,600,000	900,000**	56

* Target fixed by the Central Ministry of Food and Agriculture.
** Estimated.

If the farm production targets are to be achieved, it is essential that fertiliser consumption targets are reached. The present national emergency has underscored the need to step up agricultural production at a very fast rate. Fertiliser promotional programmes should be undertaken with zeal and enthusiasm.

Assuming that the consumption targets will be achieved, it is necessary to make available to the farmer all the fertiliser required by him. The third five year plan assumes a production of 800,000 tons of nitrogen and 400,000 tons of P_2O_5 by 1965-66. This leaves a balance of 200,000 tons of nitrogen to be imported. All the potash needed has to be imported as there are no known deposits of potash of fertiliser grade. Fertiliser production must be geared up to target levels, but, whether or not, it is, there must be no change of plans for reaching the consumption targets. The deficiency between the consumption targets and domestic production must be made good by imports.

Two important raw materials used in the manufacture of fertilisers, namely, rock phosphate and sulphur, are entirely imported. There seems to be no alternative to importing these materials unless deposits are found in the country. Meanwhile, fertiliser production must not be allowed to suffer because of inadequate imports. It is estimated that 1,440,000 tons of rock phosphate and 385,000 tons of sulphur will be required to manufacture fertilisers up to the target levels. All this quantity has to be imported in addition to 200,000 tons of nitrogen and 200,000 tons of K_2O. At the present import price of these commodities, the foreign exchange requirement will amount to Rs. 56.9 crores by the end of the third five year plan. Even assuming that a part of the imports could be arranged through barter or link deals, still the foreign exchange commitments will be substantial. In the present national emergency, everything should be done to conserve as much foreign exchange as possible. At least nothing should be done to put back the production programme, resulting in shortfalls in production and the consequent need for larger imports of fertiliser materials.

Production in Private Sector

Before the third plan started, it was the policy of the Central Government to license new nitrogen (N) fertiliser factories in the public sector and allow the private sector to develop production of only phosphatic (P_2O_5) fertilisers. The Government subsequently changed this policy and decided to allow production of 200,000 tons of N in the private sector. The policy has been further revised and eight factories have been licensed in the private sector with a capacity of 480,000 tons of N and 220,000 tons of P_2O_5. One factory has since then surrendered its licence and another factory with a capacity of 100,000 tons of N is in the process of being licensed. Since licensing, two factories in Ennore and Sahupuri have gone into production.

All single superphosphate factories are in the private sector with the exception of those in Bihar and Kerala. Licences have been granted for complex fertiliser factories both in the public and private sectors. The licensed capacity of nitrogen exceeds 1.3 million tons N and that of P_2O_5 540,000 tons N. The question is, are all these factories going to come up before the end of the third plan so that production targets will be achieved?

At the present rate of progress, it is evident that all the nitrogenous and complex fertiliser factories licensed will not go into production during the third plan. It is also unlikely that the target of nitrogen and phosphatic fertiliser production will be achieved. It is a matter of opinion how much of the targeted production will be actually reached. Government circles put the figure a little high while private circles put the figures a little low. But what is the correct situation?

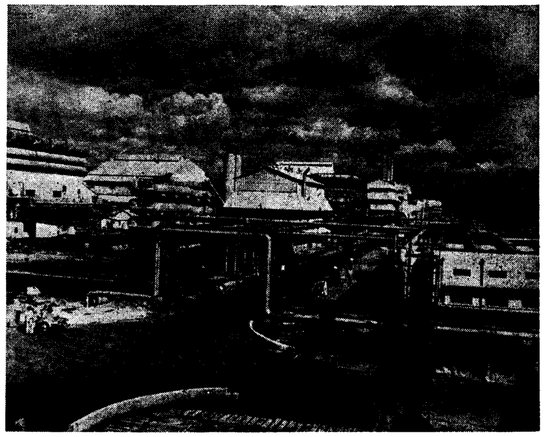
According to the United Nations Fertiliser Survey Mission report,

TABLE II

ESTIMATED PRODUCTION OF FERTILISERS BY 1965-66
(In '000 tons)

Factory	N Capacity	N Production	P_2O_5 Capacity	P_2O_5 Production	Product	Remarks
(1) Sindri	117.0	110.0	—	—	A/S, Urea A/S/N	In production
(2) F.A.C.T.	60.0	60.0	26.4	26.4	A/S, A.P., A.C., S/P	Third stage expected by 1964
(3) By-product and Belagula	16.0	16.0	—	—	A/S	In operation
	80.0	75.0	—	—	C.A.N.	In operation
(4) Nangal	120.0	60.0	—	—	C.A.N.	In operation
(5) Rourkela	16.4	16.0	20.6	20.0	A.P.	In operation (second stage not taken into account)
(6) Ennore						Expected to go into production in 1965-66. 50 percent capacity taken into account
(7) Trombay	90.0	80.0	45.0	40.0	N.P. & Urea	
(8) Neyvell	70.0	35.0	—	—	Urea	
(9) Superphosphate (existing)	—	—	112.0	108.0	S/P	90 percent capacity assumed
(10) Superphosphate	—	—	74.8	37.4	S/P	50 percent capacity assumed
	569.4	452.0	278.8	231.4		

the final decision to construct the factory, setting up of contractors' bids, review of bids, ordering, construction, erection to completion and start-up take anything from 44 to 60 months, even assuming that all preliminary work on the project and decision to proceed with it including preliminary processes and specifications have been completed. According to the Mission, this process should normally take 28 to 38 months. Work on only two of the projected factories is under way. They are the Trombay and Neyveli schemes. All other projects are still in the preliminary stages of planning, and construction is yet to be taken up.



(In '000 tons)

Public Sector Factory	Capacity N	Capacity P_2O_5	Private Sector Factory	Capacity N	Capacity P_2O_5
F.A.C.T. (expansion)	33.3	19.8	Visakhapatnam	80.0	73.0
			Kothagudem	80.0	—
Neyveli	70.0	—	Ennore (expansion)	8.2	10.3
Trombay	90.0	45.0	Gujarat	96.0	56.0
Nahorkatiya	45.0	—	Tuticorin	63.3	79.2
Gorakhpur	80.0	—	Sahupuri (expansion)	10.0	—
Durgapur	58.0	—	Hanumangarh	80.0	—
Madhya Pradesh (to be licensed)	45.0	—	Mangalore (to be licensed)	95.0	25.0

Slow Progress

With only three years of the plan left, even if the process of setting up of the factories is expedited to the normal level, the factories will go into production only towards the end of the third plan. So the projects on which work has not yet started could be written off for the third plan period, unless immediate steps are taken to start the construction of these factories and the construction work is speeded up above the normal level. Assuming that the Trombay and Neyveli projects will go into production during the third plan, and that some superphosphate factories will also go into production during this period, the table below gives an estimate of the likely production of N and P_2O_5 during the third plan.

This means that against a target of 800,000 tons N and 400,000 tons of P_2O_5, only 452,000 tons N and 231,000 tons of P_2O_5 will be produced, leaving a gap of 348,000 tons N and 169,000 tons P_2O_5. It is doubtful that the necessary foreign exchange can be found for importing these additional quantities of fertilisers. It is imperative that the country should itself produce the required quantities. Even at this late stage, it will be possible for at least some of the projects licensed to go into production in the last year of the third plan, provided the necessary climate is created for setting up the factories and the whole process of construction

The urea, nitric acid and double salt plant at Sindri

speeded up on a war footing. The following table gives the factories licensed, but not in production, both in the private and public sectors together with their capacities.

Of the factories in the public sector, those in Neyveli and Trombay as well as the F.A.C.T. (expansion) are expected to go into production during the third five year plan period. With the possible exception of the Visakhapatnam and Kothagudem factories, none of the private sector factories is expected to go on stream by 1965-66.

Progress of Private Sector

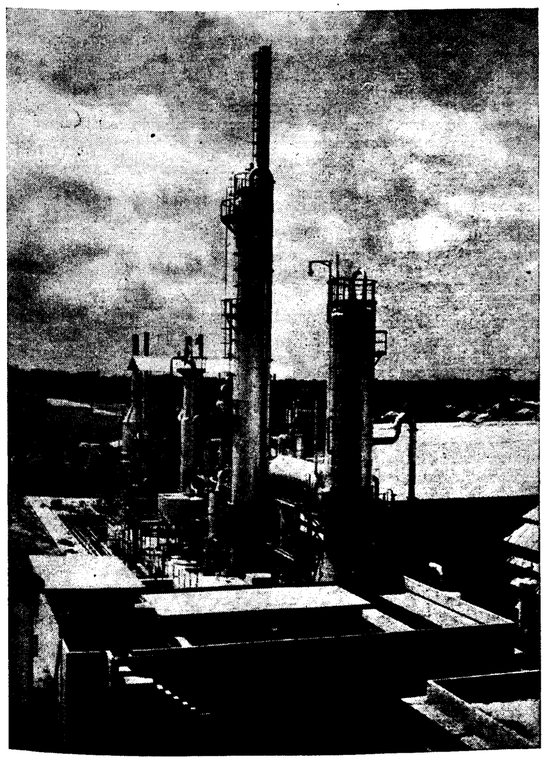
Of late, there has been criticism that the private sector factories are not progressing according to schedule. What is the reason for the slow progress of these factories? A nitrogen or complex fertiliser factory with an installed capacity of 80,000 to 100,000 tons of nitrogen costs anything between Rs. 25 crores and Rs. 30 crores. The private sector cannot obviously invest such large sums, without looking into the profitability of the projects. Before the private sector undertakes the construction of a factory, it will have to examine the following factors:

(i) Are the necessary raw materials required for the stepping up of a factory such as water, electricity, etcetera, available nearby cheaply and in abundance?

(ii) Are transport facilities available adequately to carry the fertiliser produced, in time to the consumer?

(iii) Is the market system conducive to efficient distribution?

(iv) Can the product be made cheaply so that all that is produced can be marketed and the market further developed?



(v) Can foreign collaboration be secured under the existing taxation policies of the Government of India?

Before the construction of a factory is undertaken, a careful survey has to be made about the availability of requisite quantities of electricity and water, and necessary raw materials for the production of fertilisers. The licensee proceeds with the project on the strength of the assurances given by the State Government or the public bodies concerned. But it sometimes happens that there are delays in making available the necessary raw materials with the result that the project is also delayed.

Discrimination in Wagon Supply

Wagons are in short supply and low priority is given for the supply of wagons to fertilisers marketed by private manufacturers. Wagon supply carries the higher priority "C" when the fertilisers are sponsored by the Central and State Governments, whereas fertilisers marketed by the private manufacturers carry the low priority "E". Since fertilisers produced in the public sector move on Government account, that sector gets wagons more easily. The fertiliser manufactured by the private sector is thus placed at a disadvantage. The private manufacturer has to wait for wagons in a state of uncertainty or lift the fertilisers to the destination during the off-season or during the season by road; both processes involve higher expenditure and the consequent increase in costs. The Government has now agreed to supply an adequate number of wagons to the private manufacturers under priority "E", but as long as the differential priority for the supply of wagons remains, privately produced fertilisers will be at a disadvantage *vis-à-vis* the fertilisers manufactured by Government factories.

The present distribution arrangements do not enthuse private manufacturers to venture into the production of nitrogenous fertilisers. The distribution of straight nitrogenous fertilisers is the monopoly of the

A complete view of F.A.C.T.'s new oil gasification plant

Central and State Governments and of the co-operative organisations which enjoy Government patronage. All nitrogenous fertilisers, both internally produced and imported, are taken into what is known as the "Central Fertiliser Pool" and distributed through the State Governments and their agents —the co-operatives—to the cultivator. Normally, the "Pool" is expected to take over the entire production of the nitrogenous fertiliser produced by the manufacturers at a retention price which varies from factory to factory depending on their costs of production. The system has the following disadvantages in so far as the private manufacturers are concerned.

Distribution Arrangements

(i) Although the Central Fertiliser Pool, it is expected, will take over the entire output, the private manufacturers cannot be sure of this happening especially when all the nitrogenous fertiliser projects go into production and there will be abundant supplies of fertilisers. Although there is adequate demand for ammonium sulphate, the same cannot be said to be true of new fertilisers like calcium ammonium nitrate and urea which are going to be produced in large quantities in future. The same problem arose when Nangal went into production, and consequently, the factory had to curtail production for some months. While a Government factory can afford to do this, a private manufacturer will not be in a position either to shut down his factory or go slow with the production.

(ii) Under the Pool system, a certain retention price is paid to the manufacturer, the price paid depending on the cost of production. This system places the efficient manufacturer on the same footing as the inefficient one, tending to undermine the efficiency of production. Progress is possible only under competition and the industry is likely to stagnate if allowed a price which covers inefficiency. A private manufacturer will like to operate in a free market.

(iii) It is a legitimate desire of the manufacturer to develop his own markets. This has the double advantage that the manufacturer will know his market situation well and adjust his production accordingly, and that he can benefit from the profits of marketing his own product, which is denied to him under the existing system of marketing.

It is not known how long the present system of distribution of fertilisers under the "Fertiliser Pool" will continue. With greater supplies of fertilisers, the inadequacy of the existing system of distribution of nitrogenous fertilisers will become evident. The current thinking seems to be that the "fertiliser pool" should be replaced by a "fertiliser marketing corporation". The shape and form which the marketing corporation will take is not known. If it is going to be another "fertiliser

AND OTHER INDUSTRIES

A general view of the electrolyser plant at the Nangal fertiliser factory

pool" with a different name, it will hardly improve matters.

The U.N. Fertiliser Survey Mission, considering all aspects of the existing system of distribution of fertilisers, recommended that the distribution of fertilisers should be left to the manufacturer himself. In view of the fact that the scarcity conditions for nitrogenous fertilisers are gradually disappearing and giving place to more abundant supplies, either from internal production or imports, the reasons for starting the fertiliser pool, namely, equitable distribution of limited supplies of nitrogenous fertilisers, will soon cease to exist. Free trade in fertilisers should, therefore, be allowed.

Consumption Targets

An abundant supply of fertilisers is essential to reach the plan targets of fertiliser consumption. Adequate supply of fertilisers cannot be ensured without the country producing sufficient quantities as the availability of foreign exchange for imports is limited. Production by itself will not solve the problem, unless adequate demand is created and for this purpose fertilisers should be cheap. The crux of the problem, therefore, is that adequate quantities of fertilisers should be produced cheaply, so that the commodity is within the reach of the small farmer and he can apply larger and larger doses of the material.

Fertilisers in India are very costly. There are many reasons for this. Imported raw materials and imported fertiliser plants are costly. Under the present system of distribution, costs of marketing the products are high, because of the intermediary agency of the "Pool" and the State Governments who keep certain margin to meet contingencies such as administrative charges or charges for offsetting any future losses.

The Indian farmer is perhaps one of the poorest in the world, yet the fertiliser supplied to him is the costliest. This perhaps acts as a brake on the increased consumption of fertilisers. Cheaper fertilisers are, therefore, the solution for their increased use. The costs of production should be reduced by working the factories efficiently.

The Government's taxation policy is also responsible for the high cost of fertilisers. The Finance Bill of 1962 levied certain excise duties on the intermediate raw materials used in the manufacture of fertilisers. They are:

(1) Nitric, hydrochloric and sulphuric acids (including fuming and anhydrous thereof), all sorts	10 percent *ad valorem*
(2) Compressed, liquefied or solidified gases, namely,	
(i) Oxygen	10 percent *ad valorem*
(ii) Chlorine	10 percent *ad valorem*
(iii) Ammonia	10 percent *ad valorem*
(iv) Carbonic acid (Carbon dioxide)	50 percent *ad valorem*

Taxation of Industry

These taxes are unique in the sense that in no other country are taxes imposed on intermediate materials used in the manufacture of fertilisers. Their burden on the fertiliser industry would have been much higher but for the fact that the tariff values fixed for various products above have been kept low by a subsequent notification of the Government of India. By this notification, ammonia and carbon dioxide "utilised in the manufacture of fertilisers within the factory of production are exempt from so much of the duty of excise leviable thereon as is in excess of Rs. 25.00 a metric tonne".

The result of these taxation proposals is that the cost of fertilisers increased anything from Rs. 5 to Rs. 34 per metric tonne. If the taxes are passed on to the farmer, it means a further increase in the cost of the fertiliser to the farmer, and may be resisted by him. While the Government can afford to absorb the taxes—which, in effect, will mean collecting the tax from one Government source and passing it on to another—the private industry has no other alternative but to pass on the burden to the cultivator. Added to all these, under the recent taxation proposals, the Government of India has imposed further burdens on the fertiliser industry. The 1963 Finance Bill contains two proposals which affect this industry directly. They are:

(a) an increase in the import duty on machinery and

(b) the proposed imposition of a "super profits tax".

Import duty: A surcharge of 10 percent has been levied on all imported machinery. By classifying fertiliser machinery at a concessional machinery rate instead of the previous practice of classifying it under ordinary machinery rate, the import duty will remain the same at 15 percent. The surcharge will impose a burden of an additional 1.5 percent of the value of imports.

Fertiliser manufacturing plants, if they are to be capable of producing cheap fertilisers, require expensive specialised modern plant, the greater part of which has to be imported. The effect of the increase in the cost of import duty will, therefore, make an increase (estimated at Rs. 15 lakhs for a plant costing Rs. 27 crores with imported machinery worth Rs. 10 crores) in the capital cost of any new fertiliser plant. This, in turn, will increase the cost of finished fertilisers because of the enhanced monetary value of the depreciation of the plant, and also because of the additional burden of interest.

Super profits tax: The tax will bear more harshly on industries or individual industrial units with a highly geared capital structure (the fertiliser industry is one) than it will on others. While the shareholders expect a dividend of at least 6 percent, the balance of 4 percent in income and 40 percent left after paying super profits tax on income over 10 percent, is just not enough to meet the unabsorbed losses of the first three years when the factory is under construction, to meet the loan commitments it would have entered into at the time of construction of the factory, and to build sufficient capital reserves to replace capital equipment a high proportion of which will be nearing the end of its useful life in ten years' time. With the profitability of the project being limited and with restricted scope for honouring loan commitments, the foreign investor will think twice before investing his funds in the fertiliser industry.

The need for finding additional resources for financing the defence efforts and the plan programmes cannot be questioned. But it is feared that the new imposts will have an adverse effect on the development of the fertiliser industry, and consequently, on agricultural production. It is necessary that the fertiliser projects should not be allowed to go slow. Everything should be done to speed up the plan projects, in both the private and public sectors. The necessary climate for speedy execution of the projects will be created when the taxation policy is so framed as to attract foreign and domestic investors and when factories are given the freedom and responsibility to market their own products on a competitive basis.

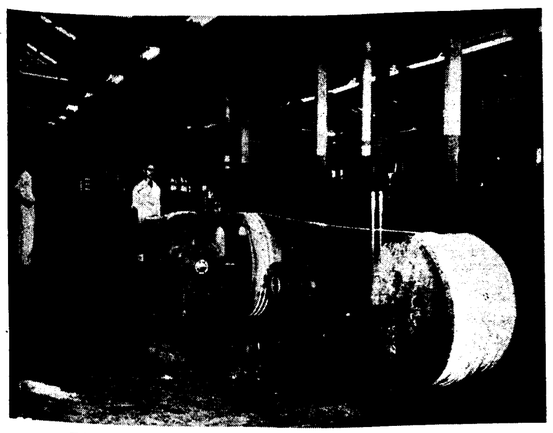
Cable Output Rising, but Raw Material Worries Remain

By

V. G. G. NAYAR

General Manager, Aluminium Industries Ltd, Kundara

DURING the third plan period, nearly 8 million kilowatts of power is planned to be added to the electric power generating capacity. The Indian cable industry is at present engaged in an all-out drive to meet the requirements of cables for transmitting and distributing this extra power production. The country is now more or less self-sufficient in most types of power and communication cables. But future needs will make more exacting calls on the industry. So it has launched a programme of all-round modernisation, diversification and expansion.



The Indian Cable Co. Ltd (I.C.C.), owned and managed by a leading British group, was the only unit engaged in cable-making in India when the second World War broke out. The National Insulated Cable Co. of India Ltd (N.I.C.C.O.) was set up during war time. I.C.C. and N.I.C.C.O. have, during the past two decades, substantially expanded their capacities for most types of cables.

Demand for Power Cables

The I.C.C. made a *début* into manufacture of paper-insulated underground power cables towards the end of the second plan. Realising the increasing demand for power cables, the Government granted licences for additional capacity for this type of cable to various other units. Among the latter, the Cable Corporation of India has already gone into production and the plant of Asian Cable Corporation will be commissioned shortly. The licences issued by the Government also take care of the country's requirements of pyrotenax fireproof cables, paper and cotton and other covered magnet wires, army field cables, carrier frequency cables, co-axial communication cables and other specialised lines. There are at present about eight major units manufacturing bare copper conductors and 40 units making rubber-plastic insulated cables and different types of winding wires. Almost all the big names in the world cable field, like B.I.C.C., Enfield, Philips, Phelps Dodge, A.E.I., Siemens, Standard Telephone Co., Sumitomo Electric, Showa Electric and Johnson and Philips, are associated with one or other of the units of the industry in India (see Table 1 on this page).

The first plant for the exclusive manufacture of plain and steel-cored aluminium conductors and accessories was set up by the Aluminium Industries Ltd which commissioned its plant in Kundara (Kerala State) in 1950 in technical collaboration with the Aluminium Ltd group of Canada. This unit was also the first to introduce the manufacture of insulated aluminium cables in the country. At present, there are 12 units scattered widely over the country with a total annual capacity of over 40,000 tonnes of A.C.S.R. and all-aluminium conductors. The manufacture of enamelled wires was started for the first time in the country by N.I.C.C.O. The application of polyethylene and P.V.C. for cable insulation and protection has also come to stay in India.

To meet the growing demands of telecommunication cables in a developing economy, the Government of India has set up the Hindustan Cables Ltd (H.C.L.) in the public sector in Rupnarainpur, West Bengal, for manufacturing paper-insulated dry-core telephone cables. The increasing requirements of small wires and cables have led to the setting up of a number of small-scale units. They are concentrated mainly in the Delhi and Bombay regions. These entrepreneurs have, with considerable ingenuity, themselves fabricated several machines which, although not comparable in technical refinements, versatility and precision with modern equipment, have still been contributing a substantial percentage to the output of small wires for house services and building wires in the country. These units enjoy special patronage at the hands of the Central and State Governments.

P.V.C. extrusion over polythene-covered aluminium

Power Production

Electrical power production in the country will expand at the rate of at least cent percent every five years during the next few plan periods. The cable industry is faced with the opportunity and the necessity of expanding fast and soon to cope with this rate of power expansion. In due course, the industry will have developed itself into a well-established, properly diversified and broad-based complex so that the minimum requirements and the many and varied types of cables that the newly industrialised nation needs could be easily met from within the country.

At the end of the second plan, about 84,000 circuit miles of transmission lines of voltage 11 kV and above have been strung, and to this another 65,000 circuit miles is proposed to be added during the third plan period. Spectacular progress is being made in rural electrification: the number of villages electrified up to the end of the first plan was 10,000; 13,000 villages were added to this during the second plan period; and a further 30,000 villages are pro-

Aluminium being drawn into wire

posed to be electrified during the third plan period. The total outlay on power schemes in the third plan is estimated at Rs. 1,200 crores, out of which over Rs. 325 crores will be required for transmission and distribution schemes. All this is of direct interest to the cable industry. The licensed capacities and the planned production targets (1965-66) for the various items of cables and wires are summarised in Table II on this page.

Supply of Raw Materials

The supply position of various essential raw materials for cable making is as follows:

Copper: imported in the shape of electrolytically-refined 250-lbs wire bars. The prospects of adequate supplies from within the country are meagre for the next few years.

Aluminium: the output of aluminium in 1962 was 29,800 tonnes and the target towards the end of the third plan is 125,000 tonnes. More than 70,000 tonnes will be required by the wire and cable industries.

Lead and tin: fully imported.

Rubber: natural R.M.A.I.X. smoked rubber sheets are obtained from indigenous sources as well as from Malaya. Synthetic rubber is imported fully from the U.S.A.

Polyethylene: ready-mixed compounds to suit particular applications are available from units already in production in the country.

P.V.C.: indigenous production has already commenced. But the present price is artificially high (almost double the imported material cost) but is expected to come down to a more reasonable level when more units come into the field.

Textiles, hessian and rubber fillers: these are available from within the country.

Insulating paper: imported at present, but is likely to be available very soon from indigenous sources. Requirements are about 2,000 tonnes a year.

Enamels: these are available from indigenous sources.

Rubber chemicals: imported at present, but are expected to be available within the country during the current plan period.

Steel strips and armour wire: currently imported, but capacity is being built up by indigenous units.

If price and availability considerations were not to complicate matters, copper would have been preferred for making cables for technical reasons. Nevertheless, aluminium is a conductor in its own right, due to its lightness, high mass conductivity and corrosion-resistant characteristics. For conductors of equal resistance, the current-carrying capacity of aluminium will be greater than that of copper because of the increased size and hence the greater rate of heat dissipation. Authorised current-carrying capacity, section for section, is 70 percent to 80 percent for aluminium conductors in comparison with copper, against 60 percent to 62 percent conductivity based on resistivity of the same section. An aluminium conductor of the same current carrying capacity as equivalent copper section weighs only 42 percent of the copper conductor.

The Obvious Choice

Price advantage and easy availability make aluminium the obvious choice in all applications where its slightly extra bulk (39 percent more than copper for the same current-carrying capacity) does not pose manufacturing and application problems. In any case, for low and medium voltage applications where the size of the conductor is 8 S.W.G. and above, aluminium does offer substantial economies. The Indian cable industry and the Government have already set in motion a vigorous drive for the substitution of copper by aluminium in the cables and wires industry. This substitution programme, which has been taken in hand after mature deliberations and detailed discussions between the Government and experts from the T.C.M. and other similar international organisations, and representatives of cable-makers, is likely to result in due course in the most thorough switch-over from copper to aluminium in the electrical industry that has been planned or executed in any country.

The substitution programme is being phased out into three stages so that within the next two or three years, practically all power and housewiring cable produced in the country will have aluminium conductors. Special applications like control cables, mining cables, trolley and traction cables will, however, continue to be made in copper. Most of the established manufacturers originally based on copper are progressively switching over to aluminium. All the implications of the switch-over are being explored in a systematic and businesslike manner by both the industry and the Government and the results so far achieved in this campaign are encouraging and impressive. The readiness with which the electrical engineers in the country co-operated with the cable industry in this direction, and willingly and widely modified their practices to suit the new material, is a pleasant and reassuring chapter which does credit to all concerned.

Among the expansion schemes already licensed by the Government is a project for the manufacture of "Solidal" cables—a new type of cable designed and developed recently for underground applications, both in industrial installations and in power supply. This cable incorporates three sector-shaped solid aluminium conductors in the fully soft (annealed) condition. The fourth neutral (or earth) conductor is combined with the armouring by making use of hard rectangular aluminium wires in the form of a concentric layer. Each phase conductor is insulated with P.V.C. and the three lapped together with the P.V.C. tape. The concentric neutral layer is covered with aluminium foil to equalise current distribution in the rectangular wires and served with barium-chromate linen tape of chemical protection to the wires against the possibility of soil electrolytic corrosion. Over this is extruded the final sheath of black P.V.C. Compared with conventional cables, "Solidal" is strikingly light and compact. The cable is suitable both as a three-phase low-voltage distributor cable or as a three-phase three-conductor cable for balanced loads. The low cost associated with "Solidal" makes it an economic alternative to open the wire overhead low voltage distribution system, whether installed underground or as an aerial cable.

TABLE II

	No. of recognised units	Production in 1961	Capacity available as on 1st January, 1962 (licensed)	Total licensed capacity (including capacity installed already)	Estimated capacity at the end of 1965-66
Bare copper conductors	6	8,000 tonnes	18,000 tonnes	18,000 tonnes	18,000 tonnes
A.C.S.R. and all-aluminium conductors	7	25,000 tonnes	19,300 tonnes	45,040 tonnes	69,000 tonnes
Rubber and plastic insulated cables	17	263 mil. metres	264 mil. metres	840 mil. metres	1,000 mil. metres
Enamelled wires	7	5,880 tonnes	4,500 tonnes	19,000 tonnes	25,400 tonnes
C.C./P.C. wires and strips					30,500 tonnes
Paper-insulated power cables	2	1,654 km	1,600 km	7,040 km	10,500 km
Plastic-insulated alum. cored power cables (Solidal)	1	nil	800 km	800 km	*
Paper-insulated telecom. cable	1	1,733 km	1,930 km	3,220 km	4,020 km
Coaxial cable for telecommunications	1	322 km	483 km	483 km	483 km

(*Figures not available)

Standardisation and Specifications

The Indian Standards Institution has brought out specification for all types of cables currently manufactured in the country. These specifications have been mainly based on British standards, and the development trends in the country have also tended to follow British practices. However, the I.S.I. of late is taking note of cable developments in other countries particularly in the U.S.A. and Germany and formulating standards for the modern ranges and designs of cables. Besides bringing out amendments to most of the specifications for cables providing for substitution with aluminium (where copper was specified originally) on a rush basis, the I.S.I. has taken the lead in provoking technical discussions on the implications of the switch-over to aluminium in the recent I.S.I. Convention in Calcutta where "aluminium for electrical purposes" was one of the important topics dealt with.

Most of the established units are licensed to use the I.S.I. certification mark, guaranteeing quality and conformity to the relevant standards of the goods produced by them.

Although in the early years, most of the units of the industry were equipped with plant of British manufacture, the present trend is to buy more of machinery of east European or American make, thanks to the assistance available to the country through barter arrangements and the programmes of the U.S. Agency for International Development and quicker deliveries offered by manufacturers in these countries. All the leading manufacturers have equipped themselves with adequate testing facilities comparable with similar facilities available with their counterparts anywhere in the world. Some of the units have even instituted modern methods of quality development and assurance programmes incorporating statistical quality control methods.

All types of aluminium rod rolling processes are adopted, but very soon the major portion of aluminium rod fabrication in the country will be by what is known as the "Properzi" continuous casting and rolling process. Among specialised lines of copper wire processing may be mentioned the manufacture of grooved copper conductor for electric traction for the Indian railways. Some of the recent rubber cable units employ continuous vulcanising process, and one of the units has a versatile continuous vulcaniser-*cum*-extruder which could handle rubber as well as plastics. However, some of the older rubber-insulated cable producers apply rubber insulation in two or more layers by the conventional longitudinal process.

The equipment used for polyethylene and/or P.V.C. insulation and sheathing covers various types of extruders, including the most modern and complete lines incorporating a spark-testing and diameter-eccentricity control unit.

Communication cables: Hindustan Cables Ltd has, in collaboration with the Standard Telephone Co. of the U.K., developed capacity for the manufacture of paper-insulated multi-core communication cables. They have subsequently taken in hand expansion programmes for incorporating co-axial cables with polyethylene insulation capable of providing multichannel communication circuits of up to 960 channels in each cable.

The range of cables proposed to be manufactured by H.C.L. include Stalpeth and Alpeth plastic insulated communication cables which will be substantially cheaper than equivalent paper-insulated lead-sheathed cables. However, there is at present an acute shortage of communication cables within the country, compared with the relatively easy position in small sizes of building wires and power cables. It is, therefore, a matter of conjecture whether like the power cables sector, private industry should not have also started the manufacture of communication cables. Instead of continuing to expand the communication cable capacity at a rate at which they could fulfil the country's full requirements, H.C.L. is, on the other hand, planning to set up the manufacture of power cables as well.

Enamelled wires: Enamelled wire and winding wire requirements are a good indicator of a country's motive power development in the form of electric motors and transformers. The industry is developing very fast in a determined bid to meet the rapidly increasing demands of motor and transformer makers. All the main types of winding wires, and cotton, silk and paper-covered wires and P.V.A. polyester and polyurethene type enamelled wires are produced in the country. The major units which account for a substantial percentage of the output, are the Electrical Industries Corporation, Indian Cable Co., N.I.C.C.O. and Asian Cable Corporation.

Future Development

Nearly a million villages await electrification in this vast and power-hungry country. However, even the modest programme of electrifying 30,000 villages during the current plan period is expensive and ambitious and will need thousands of million metres of cables and wires. So the importance of adoption of materials and methods which will tend to improve efficiency, ensure reliable performance and reduce the overall cost in such large-scale appilcation cannot be overemphasised.

Referring again to Table II on (page 82), it will be seen that there has been an overemphasis on paper-insulated power cables. This is mainly because India has been used to the British practice of using only paper-insulated cable for all underground usage for low and medium tension installation. The cable team sponsored by the National Productivity Council of India, which recently visited Japan, the U.S.A. and other countries, saw a different trend in these highly developed areas. The stress is invariably on plastic and rubber insulation for medium voltage up to 15 kV. Paper is used only for special types of high-voltage oil or gas-filled cables. Low voltage cables are more or less fully P.V.C. and/or polyethylene insulated. In the higher voltage range, synthetic rubber and polyethylene have already taken over from paper insulation. In Germany, P.V.C. insulation is issued for voltages up to 15 kV. There are several installations in the U.S.A. employing polyethylene insulated cables for voltages up to 69 kV.

Another increasingly popular type of construction that has come to stay in L.T. distribution cables is aluminium sheathing. A substantial percentage of the underground cables used for L.T. systems in Germany in recent years is aluminium-conductored and with aluminium sheathing by continuous extrusion, the aluminium sheath also acting as the neutral. This particular development is reckoned to yield a saving of nearly 40 percent in cable cost alone.

In a poor country like India, productivity of capital and resources should be optimum before the country can afford to put in more investment for further development. It should also guide future development along economic and modern lines. It has the advantage of short-circuiting quite a lot of historical progress and achieving goals without going through the devious and costly detours in technical development pursued elsewhere. In this as well as in the country's overall determination to further its planned progress, it has the benefit of assistance and guidance from practically all well-developed countries of the world. The rest depends on the people: it is up to them to use these great advantages and strive forth in channels which are modern, productive and technically efficient.

Difficult Problems

Raw materials: To the extent that copper and even aluminium have to be imported, the industry faces acute scarcity right round the year,

HEAVY DUTY PVC CABLES

1) Unarmoured Single Core PVC Cable upto 400 Sq. mm. to ISS 1554
2) Unarmoured Twin Core PVC Insulated and PVC Sheathed Cable upto 70 mm. sq. (Overall dia. 1.4") to ISS 1554
3) Unarmoured 3-core PVC Insulated and PVC Sheathed Cable upto 50 mm. sq. (Overall dia. 1.3") to ISS 1554
4) Unarmoured 4-core PVC Insulated and PVC Sheathed Cable upto 50 mm. sq. (Overall dia. 1.413") to ISS 1554
5) PVC Insulated and PVC Sheathed Flexible Cable upto 4-core 162/0076 660v grade
6) PVC Multicore Control Cable to ISS 1554

and this is all the more discouraging in the face of the heavy and increasing demand for cable that has to be met. The Government is aware of this situation particularly in relation to demands for conductors for high voltage lines, but the planning for supply for indigenous units in meeting their raw material requirements cannot be said to have done justice either to the industry or consumers. The country faces today the tantalising situation of oversupply of the aluminium metal in the form of ingots with very meagre rod rolling capacity. This is an eventuality which was foreseen by the industry, but the authorities apparently refused to look at the problem in the face. So the country is passing through a crisis which will entail considerable loss due to delays and otherwise. The heavy expense involved in the proposed scheme to export Indian ingots to distant countries for conversion and bring the same back to India in the form of rods could have been avoided with a little more co-ordination and forward planning.

Idle capacity: Similar lapses in planning and procedural delays at Governmental level are responsible for the idle capacity in the cable industry. Many of the units work only intermittently for a few weeks at a time, and then close down for want of raw materials. Very few of the units work continuously on a three-shift basis as is being done for maximum productivity with cable plants elsewhere in the world. Simultaneously, expansion schemes in various sectors are being processed without any near-prospect of better utilisation of the existing capacity.

Quality assurance: The licensed units of the industry, as already referred to, have equipped themselves with suitable testing facilities so that the output of cables from their factories is first class from the safety and reliability point of view. The same cannot be said of the rather nebulous and far from properly engineered small-scale units operating all over the country. In advanced countries like Japan, deterrent and effective legislation prevents people who are not competent and who have not got the minimum manufacturing and testing facilities from entering the field of manufacture of electrical equipment and appliances like cables. Even in a highly developed country like the U.S.A., it is estimated that about 60 percent of all fires are electrically caused and a significant percentage of these are attributed to poor wiring. The situation could be worse in a country like India in its present stage of development with only few contractors having the know-how and organisation for proper cable installation and wiring practices. Most consumers are also ignorant of the dangers inherent in defective material and workmanship. It is, therefore, considered imperative to initiate proper legislation to ensure that only wires and cables which have been certified to be in conformity to minimum specifications and standards are produced and put on the market. The Government of India and the small-scale industries directorates in the various States would be doing a great service to the consumer of electricity if they initiate suitable restrictive statutes on the one hand and, on the other, assist the small-scale sector of the industry with setting up testing facilities either on a co-operative basis or on a subsidised basis under Govermental auspices so that the several hundred million metres of cables now being made by the small-scale sector are tested for safety before they find their way into the hands of the wiring contractor.

Reverse Trend

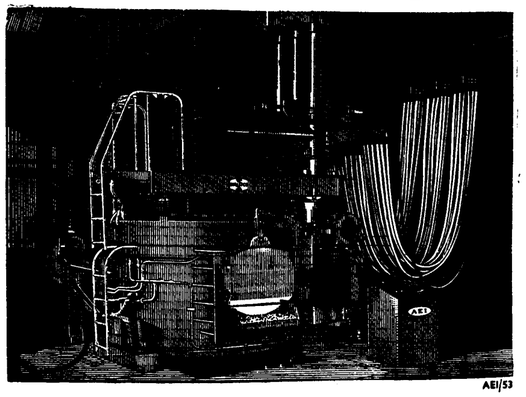
The present policy of the Government, on the other hand, points to a reverse trend. To some extent, a premium is being put on poor quality in the form of subsidies of so many kinds and relaxation and rebates in the Central excise and other levies. It is difficult to understand the logic behind the recent notification by the Central excise authorities announcing a reduction of 20 percent in the rates of excise duty payable by manufacturers who are not registered under the Industries (Development and Regulation) Act, and who produce cable not conforming to Indian or other standard specifications, nor carrying any certification mark.

These observations are made not in an attitude of unhelpfulness, nor with any intention to hamper the development of a sector which has a rôle to play in the nation's economy. Larger units of the cable industry in India are more than willing to follow the pattern which has developed all over the world in order to enable smaller units to tie-up with one or other of the bigger units so that they are assured of adequate raw materials supplies and could even look up to such units for technical, financial and other assistance, besides even sharing in their prosperity by being ancillary manufacturers of items which the smaller units could handle at a cheaper cost.

Lop-sided taxation: It will be seen from Table III that basic raw materials for this equally basic engineering industry are heavily taxed at the source itself. Taxation on plastics appears to be out of all proportions (actual incidence of the duty amounting to approximately 105.84 percent) and is apparently the result of some notion on the part of the authorities concerned that plastics are a "luxury" item and not a basic raw material for industry. Thus, although plastic-insulated cables can perform the same duties as rubber-insulated cables of the same rating, the invidiously heavy rate of duty on both imported and indigenous plastics material has virtually priced plastics-insulated cables out of the market. This is in spite of the fact that all plastic materials required are available from indigenous sources while a substantial portion of the rubber requirements have to be imported from abroad.

Simplifying Excise Levy

The Government has recently thought fit to simplify the excise levy on steel by confining the duty to the billet stage. It is only logical that a similar policy be followed in relation to the cable industry whose raw materials are in any case heavily taxed. A small surcharge on the levy should have fetched much more than could be accounted for by the 5 percent levy on finished cables. This would have saved considerable expense to the Government by way of machinery for collection of the levy at the hundreds of units all over the country, besides saving the industry from the agonising procedures and delays which have now become inevitable due to the excise levy formalities and their administration in practice.



The Indian cable industry presents an interesting study to any student of cable engineering, when one comes across units big and modern as well as small and probably outmoded—covering almost the full range of sizes and types of cables required for power and communications. The best is yet to be. In the next quarter of a century, the cable manufacturing capacity in India would have multiplied itself many times over. It is in planning for this development and in attaining the targets that the country must show resourcefulness and vision. Cable makers in India are already increasingly aware of the needs of adopting more efficient methods within the industry and using the latest and best in techniques from all over the world. A nucleus of an industry for the manufacture of cable-making equipment will be a *fait accompli* during the next five years. With the basic requirements thus properly established, the industry will be in a position not only to meet its commitments to India's electric power industry, but also to meet the needs of her lesser-developed neighbours in the Middle East and the Near East.

TABLE III

Rate of duty levies on important raw materials for electric cable manufacture

Description of material	Import duty	Central excise levy
Copper and copper alloys		Rs. 300.00 a tonne
Aluminium rods and ignots	16.50% *ad valorem*	Rs. 360.00 a tonne
High carbon steel rods		Rs. 69.35 a tonne
High tensile galvanised steel wire	Rs. 92.03 tonne	Rs. 69.35 a tonne
Plastic materials	60.00% *ad valorem* 10.00% surcharge	24.00% *ad valorem*

BIRLEFCO ARC FURNACES
MADE IN INDIA by AEI

AEI/53

Birlefco Arc Furnaces are profitable investments. They can convert cheaply low-grade scrap into good steel. Used worldwide, Birlefco Arc Furnaces are now manufactured in India.

Furnace installations supplied worldwide by Birlefco and its two parent organisations during the last 50 years:
Over 660 arc furnaces—combined ratings exceed 1,300,000 kVA
Nearly 470 high frequency furnaces—combined ratings exceed 95,000 kW
Over 760 Channel-type furnaces—combined ratings exceed 105,000 kVA
Nearly 80 mains frequency coreless furnaces—combined ratings exceed 30,000 kVA
Over 120 induction heaters—combined ratings exceed 40,000 kW

Supplied, commissioned and serviced by:

ASSOCIATED ELECTRICAL INDUSTRIES (INDIA) PRIVATE LIMITED
HEAD OFFICE: CROWN HOUSE, 13, RAJENDRA NATH MUKHERJEE ROAD, CALCUTTA-1

HIGH PRODUCTION COSTS AFFECT CONFECTIONERY INDUSTRY

By
J. S. PRABHU
Director, Parrys Confectionery Ltd

ALMOST everyone has a sweet tooth. Any difference is only one of degree. To see how long the Indian sweet tooth is (in terms of branded confectionery), the greatest sweet-eaters in the world—the British—provide a scale to compare with. In Britain, the *per capita* consumption of confectionery is 227 grams a week. In India, this is 40 grams a year. This may be further compared with the 158 grams a week of America and the Continent's consumption of almost half that of Britain. It will be seen that the Indian sweet tooth is a pigmy in size.

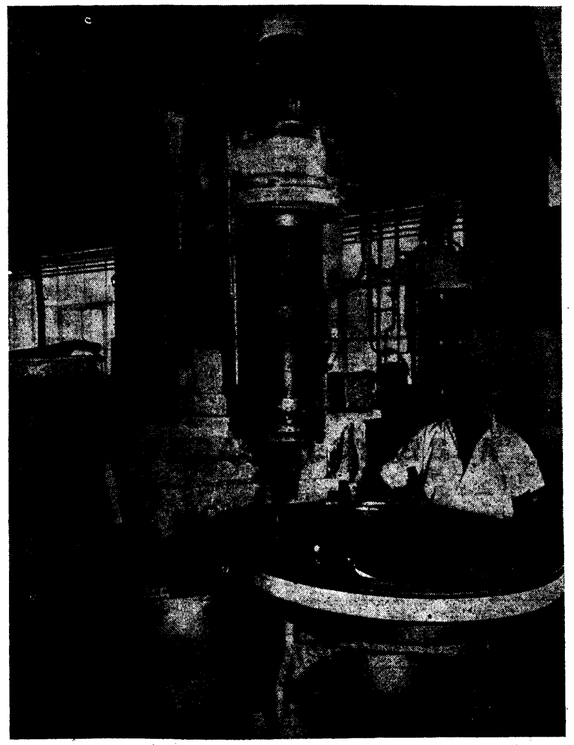
The sugar confectionery industry in India has, however, not remained stunted in relation to its own beginnings. In the last two decades much growth has taken place and the present annual installed capacity of the units registered with the Government is estimated at 52,000 tonnes on a single shift basis. But capacity, at least on the face of it, far outstrips production. The third five year plan lays down a target of 25,000 tonnes. In 1961, production was about 16,000 tonnes and in the following year, 18,000 tonnes. The plan target is certainly not beyond achievement, but what of the considerable production capacity lying idle? Is this capable of looking after the country's growing sweet tooth in the future without special attention to the industry? The answer is an emphatic no. The problem breaks down into three aspects.

Modernisation

Mass production is not necessarily acceptable production. Confectionery sells, or rather is bought, on impulse. And impulse means eye-appeal. Trends and ideas keep changing and nowhere more so than in the field of consumer lines. To keep up-to-date is a serious problem to the confectionery maker in this country. New flavours, different tastes, attractive and handy wrapping—both for the individual sweets and as a pack containing a take-home quality—are all required to capture the market. Seeing production from one angle alone, a sweet can be wrapped in at least seven ways—conventional twist, fold, bunch, basket, sachetti, crimp and carrot wrapping. The latest in machinery can alone cope with such variations. In India, apart from the first three, the rest are either relatively or totally unknown. Taking another aspect, sweets can be wrapped in cellophane, waxed paper (with or without foil) or with a wide range of understrips. A new world of packaging ideas has opened abroad with laminates of various kinds. These are, as yet, new to this country.

Wrapping is assuming ever-growing importance because a consumer line like confectionery, displayed on the dealer's counter, has often to sell itself. Counter-space is at a premium with so many products competing for it and only the fastest moving product has a chance to survive on it.

India has remained insulated for some years now, through import restrictions, from the advance western countries have made in packaging, and has been able to carry on with traditional methods. But the confectionery industry is on the threshold of breaking into foreign fields, and will not only have to review its methods but also be provided with the means to compete on level terms with progressive manufacturers abroad. When new ideas are implemented for export markets, they are bound to find their way into the home market also. For there can be no question of separate production for export alone.



Rationalisation

The industry has not had the opportunity to keep pace with even the slow rise in the standards of living in the country. Its foundations lie in a different period when cheapness was the supreme virtue. To cater to those who had little mind or money to spend, manufacturers designed their factories mainly with a view to producing plain unwrapped boiled sweets that could be turned out in their thousands. In this lies the root of the confectionery industry's troubles. When standards are improving and it is coming to be recognised that an article of food wrapped on a machine by the maker is more hygienic and less susceptible to the ravages of time and distance, the industry that has as its broad base plant for making unwrapped confectionery, is finding itself ill-equipped to wrap the sweets. This is not, however, the result of bad planning. The wrapping capacity of confectionery factories was adequate to meet the demand for wrapped sweets at that time. When the buyer has now become choosy, the industry has to reckon with import restrictions. Immediate replacement of existing plant, which in most cases is over 20 years old, is also necessary.

Unhealthy Competition

The industry has always faced unhealthy and unfair competition from cheap confectionery made under unhygienic conditions with ingredients of doubtful quality. It is in the interest of national health that such harmful goods that pass under the guise of sweets are not allowed to be sold in the market. The Government now appears to be intent upon stricter enforcement of the Prevention of Food Adulteration Act. In future, the accent will be more and more on a product of recognised brand that is packaged immediately after manufacture, and has the fairest chance possible to retain its factory freshness and purity when it reaches the consumer.

Alongside of the buyer's increased interest in confectionery whose safety he can take for granted, is a growing awareness of its importance as part of a balanced diet. As a ready source of energy, thanks to its high glucose and sugar content, confectionery makes available at low cost and in handy form, nutrition that anyone can buy almost anywhere. The demand that this recognition will bring in its wake can reasonably be expected to be for wrapped confectionery.

Microfilm cooker for boiling sugar

Unbalance is, therefore, highest between making the sweet and wrapping it. In the context of the attempts now being made to export sweets, the problem assumes even greater seriousness. There can be no question of exporting anything other than wrapped sweets and wrapped in a fashion that will appeal to the sophisticated foreign buyer familiar with latest packagings.

The Government has been, and is being enjoined, at every level of approach, individually by units, collectively by the Indian Confectionery Manufacturer's Association and as co-members of Export and Development Committees, to solve this pressing problem.

Foreign Exchange Problem

While the present serious foreign exchange situation is certainly appreciated by the industry, it must get over its difficulties if it is to make headway, particularly at a time when a large part of its wrapping capacity goes to meet defence needs. There are signs that the Government is willing to recognise the industry's difficulty. This is borne out by the recent development whereby import entitlements against export, which hitherto could be used for only raw materials, can now, in part, cover machinery also. This, however, is still not a complete solution for it presupposes large exports which do not obtain at present.

Another point is that with the latest high speed machines, the cost of production will come down. The existing wrapping machines, for instance, are capable of a speed of about 350 sweets a minute whereas the latest plant can wrap over 600 sweets a minute.

Need for Long Inventories

Speaking of the cost of production brings us to the next point, namely, packing and raw materials. As the confectionery industry has to cater to the vagaries of human tastes, its list of packing and raw materials is very long. Colours, flavours, essential oils, milk in various forms, sugar, tartaric acid, glucose, fillings for centres and

a hundred other items have to be stocked—some individually, just for one or two varieties of sweet. But it is such attention that can make all the difference between a good sweet and just another sweet. Then there are packing materials, tins of different sizes for bulk packing, fancy tins with different designs, cardboard cartons, both outer and inner, polythene bags and linings, wooden cases, tea-chests and so on, for the finished product. Individual wrapping materials like cellophane, waxed paper with foil, printed waxed paper, foil understrips have all to be stocked by the tonne. This is by no means an exhaustive list, but it gives some idea of the magnitude of the problems of manufacture. The main problem relating to raw and packing materials now is ensuring continuity of supplies. Many items have still to be imported (waxed paper with foil, tartaric acid, gum arabic, soya lecithin, menthol, etc.) and to get enough of everything on a limited import licence is virtually impossible. Recourse has to be taken to buy part of the requirements locally from established importers, but at what damage to carefully planned budgets!

In the event of tinplate shortage, which the industry is likely to face, alternatives like cardboard and polythene can be employed to a certain extent, but never in total substitution; often they cause a reduction in sales appeal and shelf-life.

High Production Cost

As stated earlier, the per capita consumption of confectionery in India is about the lowest in the world. Partly, insufficient realisation of the value of confectionery in a balanced diet is responsible for this .The chief reason, however, is the high cost of confectionery and this, in turn, stems from the high prices of packing and raw materials. Sugar, glucose and wrapping paper cost twice as much in India as abroad. The high cost of production not only inhibits its consumption within the country but also makes it virtually impossible for the industry to develop the export market, in spite of the best intentions of both the Government and industry.

Sugar is the basic raw material that accounts for more than 40 percent of the total production cost. The industry has been pressing for a long time for supply of sugar at subsidised prices. This suggestion is not new, since supply of sugar for industrial purposes such as for use in the preserved foods industry is made at subsidised prices in countries like Australia. The simplest way would be to exempt sugar used in confectionery manufacture from the excise duty. The resultant loss to the exchequer would be negligible, as the quantity of sugar involved cannot be more than 8,000 tonnes—an insignificant percentage of the total production in the country. On the other hand, such a step would enable the industry to effect a sharp reduction in the prices of its products and thus stimulate demand for them. It will help the industry to stabilise its position and ensure more economical working.

Likewise, another important ingredient, liquid glucose, which is now available from indigenous sources, is almost twice as costly as in the other confectionery-producing countries. Effective steps must be taken to reduce the price of indigenous glucose. Wrapping paper is yet another item for which the industry pays a much higher price than its counterpart in other countries. In the latest Budget, the basic Customs duty on cellophane has been increased by 10 percent with a surcharge thereon. On imports of cellophane a countervailing duty equal to the excise duty on indigenous production is also levied and an element of surcharge has been introduced. The cumulative effect of all these levies is to increase the duty payable on cellophane from 70 percent to 105 percent on c.i.f. cost. This will further put up the cost of confectionery and aggravate the industry's difficulties.

Export Potential

Confectionery is ideally suited to earn foreign exchange. It had done so on a modest scale in the Middle and Far East till 1948-49. Thereafter, exports progressively came down mainly because of the inability of the industry to compete with the cheaper products of other countries. The exports of confectionery in the first ten months of 1962-63 are estimated higher than last year. This, however, is unfortunately not an indication of a major break-through, but is more likely the result of greater response on the part of more manufacturers to the Government's exhortations. The difficulty continues and it centres on price. Quality is not the obstacle. With the experience that Indian manufacturers have gained in making confectionery suitable for tropical climates (and the exports will be mainly to such regions), they are now in a position to match the best available from elsewhere, except perhaps in the latest techniques of wrapping. When it comes, however, to the cost of production, a wide disparity between the foreign manufacturer and the local industry becomes apparent.

Although in response to the constant urgings of the industry to reduce the disparity in costs, the Government of India does allow a drawback of import duty on imported raw materials and rebate of excise duty on indigenous raw materials used in the exported product and a further cash subsidy of 10 percent on the value of goods exported, they do no more than bridge the gap nominally.

Need for Subsidised Supplies

The industry has urged that sugar, the main raw material, should be made available to it at international prices, for manufacturing goods for the export markets. Other packing, wrapping and raw materials, imports of which are not permitted but are obtained at much higher cost from indigenous sources, should also be made available at prices obtaining abroad. Either local manufacturers of these items should be made to offer them at a concession or import of such materials should be permitted. In either case, the facility can be limited to such items as are used in the confectionery that is exported.

At least one major manufacturer has the assistance of a separate export department, but exports of confectionery have so far been only small in relation to the potential, as almost all lines of enquiry come to a stop on the question of price. The industry continues to hope that better times are ahead, particularly when the sugar price abroad has risen. It remains to be seen, however, how far foreign manufacturers are going to allow the impact of this to affect their export prices.

Summing up, the future prospects of the industry depend, to a large extent, on the efforts the Government may make to set right present machinery unbalances and the high cost of production. In a growing economy, the demand is bound to rise.

USE OF REFRACTORIES IN STEEL MAKING

FOR a product of such vital importance as refractory materials, there is surprisingly little public appreciation of what their functions are and what they are made of. The usual inadequate definition is that they withstand high temperatures. Perhaps a more appropriate definition is that they are capable of withstanding the destructive effects and the temperature of molten steel. That steel production calls for application of intense heat is common knowledge. However, the layman knows little about the material used for making the container which holds the molten steel. The answer is, of course, refractories.

High temperature is singularly destructive. Most commonly known materials of construction like cement, building bricks, timber or steel will melt, oxidise, burn or distort under the effect of high temperature. It is here that refractory materials make their big contribution. Refractory materials offer insulation to heat. In order to develop a concentrated source of high temperature inside a structure where, for example, steel is melted,

By
SUBHAMAY BANERJEE
General Manager, Asian Refractories Ltd, Calcutta

the heat has to be carefully retained within and shielded from the outside atmosphere. Certain materials like steel or copper are particularly ineffective for this purpose. The refractory materials are so made that they prevent the conduction of heat, making it possible to retain it where it is most needed and also incidentally helps to reduce the cost of generation of the heat.

Basic Material

From the introductory remarks, it will be clear that refractories are basic to the production of steel. Other uses are not difficult to imagine; they are legion. They are produced in large numbers of standard as well as non-standard sizes and shapes just like any other building material. Their chemical and physical properties differ widely from type to type, tailored to suit the exacting needs of the users. Important types are fire clay, high alumina, silica and basic refractories. Many types of specialities and special ceramics are being added to the list every-day.

Since the steel industry uses more than half of the total refractories produced even in a highly developed industrial economy, recent development trends in refractories have been closely following those in the steel industry. For the last decade or so, the steel industry has been passing through revolutionary changes which outshadow the developments of the last hundred years of its history. It is, therefore, appropriate that this article should begin with the story of steel. In the race for technical supremacy in the international field, a relentless increase in the steel output has been the basis of industrial planning all over the world. The supremacy of the open-hearth process for steel-making, which has survived one hundred years of scientific developments, has lately been challenged by new competitive processes made possible through the production of cheap oxygen. The economic success of these so-called pneumatic processes has been due to their ability to produce steel at a very fast rate. The natural reaction of the open-hearth man to this has been to go faster, and for this he used the same tool, namely, cheap oxygen to achieve a higher temperature in the furnace. The open-hearth man depended on the refractory-maker for bricks to suit the new conditions and the latter tried to provide the answer by replacing the silica bricks in the open-hearth roof with basic chrome magnesite bricks.

Chrome magnesite bricks, although capable of withstanding somewhat higher service temperature, have nevertheless some other inherent disadvantages compared with silica, most serious among them being their comparative heaviness and their tendency to spall or peel off as the roof is alternately heated and cooled in service. The increased weight calls for specialist design of the bricks as well as the roof. However, with all the shortcomings of chrome magnesite, it is obvious that the basic roof for the open-hearth has come to stay and the silica brick-maker has to face a shrinking market. The prospect for the brick-maker is more frightening than what the above indicates. The new competitors to the open-hearth process, namely, the pneumatic processes, are very economical in the matter of refractory consumption. Although the increase in world steel production has been quite considerable in recent years, the refractory

consumption per ton of steel has been gradually going down.

Struggle for Survival

Effort is, therefore, being made now to convert more roofs to basic in the struggle for survival of the open-hearth. Chrome magnesite bricks are about three times dearer than silica bricks except in Russia where their price is stated to be only 15 percent higher. The economy of a furnace operation is, however, determined not by the cost of individual parts of the furnace but by what is known as furnace availability. It will be appreciated that the keeping down of the first cost and consumption of refractories is only half the battle. What matters, in fact, is the time which a furnace can be made available to perform its function. It has now been established beyond any doubt that because of highly increased availability of an "all-basic" furnace, the overall cost of production per ton of steel is lower with "all-basic" furnaces, compared with silica roof basic furnaces even though the roof itself may be cheaper to build when silica is used. Today more than 70 percent of the world steel output by the open-hearth process is done under a basic roof and it is significant that the "all-basic" furnaces have been accepted without any reserves in both the U.S.A. and Russia, the two major steel-producing countries of the world.

Electric Furnaces

The trend in steel production is, however, to have larger electric furnaces supported by the new pneumatic process furnaces. The two will work in a team—one, melting the scrap and the other, tackling the hot metal. It is possible that the open-hearth process will eventually disappear. As long as it stays, however, the roof is likely to be basic, and the dripping old silica roof is already on its way out. By converting to all-basic construction, the downtakes, slag pockets and top checker courses of the open-hearth furnaces require re-designing, and new materials to match the higher gas temperature and velocity are being increasingly used. Forsterite bricks, which had little scope in the past, are coming into prominence in this field.

Before leaving the subject of basic bricks, a word or two will be appropriate to assess the position of dolomite bricks. A large tonnage of the dead-burnt material is used for fettling and ramming liners and the bottoms of steel-making vessels. The chief shortcoming of this material is its tendency to hydrate when exposed to moist air. The dead-burnt dolomite is, therefore, invariably produced by the steel plant melting shop departmentally. The refractory manufacturer has, therefore, been trying to produce dolomite bricks which have been adequately stabilised to withstand hydration during transport and use. Considerable progress has already been made in this field and it is believed that extensive use of this material may be possible in future not only because of the lower cost but also because of the abundance of this material all over the world, compared with magnesite.

The next big consumer of refractories in the steel plant is the casting pit. The future trend in this direction is difficult to predict. The so-called castables and rammables have been increasingly found suitable in smaller size ladles and it is possible that the field of their use will extend in future to larger sizes. The general practice is, however, to use factory-made bricks and shapes. As for ladle bricks, there are two schools of thought. One advocates a low or medium alumina composition which may vitrify or even partially bloat in service. Another prefers high-alumina composition. All schools, however, agree, that low porosity, low permeability, rigorous dimensional accuracy and uniform, if not high, resistance to corrosion and erosion are properties of paramount importance. The quality of ladle bricks is improving every day, so is the cost of production from the brick makers' point of view.

Another casting pit problem child is a twin, the stopper and the nozzle. The large variety of types which are available indicates the complex nature of the problem. The duty of the twin in a 200-ton plus ladle is severe indeed and premature failure may be very costly. Performance probably depends as much on design as on the material of construction and no real success has been achieved so far.

In reheating furnaces and soaking pits, increasing tonnages of castables and rammed refractories are being used in recent years. An unconventional material used here is semi-silica which is a hybrid between silica and fireclay refractories. Like all hybrid characters, they need extreme care in manufacture, and when well made they retain the best qualities of both. With an indifferent technology, they may be worse than either. They have been used in reheating furnace roof regenerator chambers and furnace doors. They have excellent resistance to thermal shock. It has been reported that good results have been obtained by using fused pure alumina refractories in these furnaces in positions where the bricks are not exposed to excessive thermal shock. Unlike the conventional high alumina refractories, slag penetration into these impervious blocks is negligible and the result has been encouraging.

Synthetic mullite grogs are being spoken of in connection with blast furnace and other uses outside steel plants. Mullite is a mineral substance which is formed in limited amounts when fireclay or sillimanite is heated and is largely responsible for all the goodness of these materials. Synthetic mullite is manufactured by heating a chemical mixture of appropriate composition to temperatures above 1750°C. The alumina content is maintained at 72 percent minimum and porosity at 10 percent maximum. A brick-maker who has such material as this to put into his bricks will certainly have nothing to complain about.

Commercial Availability

One definite modern trend is the commercial availability and use of purer raw materials in making refractory compositions. It is well known that a slight decrease in the alumina impurity in silica bricks gives excellent properties to them. The silica content in chrome magnesite bricks appears to be connected with resistance to attack by slag and iron-oxide. Extensive trials so far indicate, however, that they may not be the final solution. In this connection, technologists are talking of pure magnesia bricks.

Another group of refractories that has made remarkable progress is the high alumina, pure mullite and pure alumina refractories. The only restriction to their wider application now is their high price. Pure alumina is the end-product of a number of costly unit processes demanding close technical control. Recrystallised, it may be made completely impervious to gas. Because of its ability to withstand very high temperature, it is an indispensable tool for research and development work in high temperature processes of all kinds.

Hotface insulation bricks, particularly in the high alumina field, is an old *récipe* being churned up anew. Hotface silica and semi-silica insulating bricks are also not unknown. In intermittent kilns like ceramic kilns and small kilns for manufacturing specialities, the kiln walls are heated and cooled alternately and the fuel waste is heavy. Modern trend is to use strong but highly porous bricks for the hot walls inside a totally steel encased structure. Considerable saving in fuel and weight of bricks is effected by this technique. The latest in hot face insulation is the bubble alumina brick where pure fused alumina is shaped into hollow spheres and bonded like a sponge cake having a high load-bearing capacity at 1800°C. A discussion on modern trends will be incomplete without mentioning "metal ceramics" or "cermets". Both housewives and engineers agree that ceramic materials have two main disadvantages, namely, brittleness and low mechanical strength. In recent years, great efforts have been made to combine metals with ceramics to produce the so-called "cermets". The most outstanding material in this field is silicon nitride which combines all the goodness of a good refractory material, including high resistance to thermal shock with very reasonable mechanical strength. Used alone or as a bonding material for silicon carbide, it has a variety of uses, including furnace linings, crucibles, gas turbine blades, rocket nozzles and launching pads and high temperature electrical applications.

The shrinking market for refractories, tonnagewise, in the steel industry has been a matter of great concern for the refractory industry in the recent past. Planning becomes difficult when the demand fluctuates rapidly, and there have been many casualties of unrealistic planning lately all over the world. There is, however, just one silver lining in the desperate situation that the refractory industry faces today. This lies in the fact that all industries including iron and steel will demand higher and higher quality in the future and pay higher and higher prices for it.

ECONOMIC RESEARCH

- is an essential part of modern commerce. But it is
- not always easy to obtain. The ordinary business
- house does not usually possess the records, statistics
- and archives which are the raw material of research.
- CAPITAL'S RESEARCH & STATISTICAL DEPARTMENT
- has a long record of service to Chambers of Commerce,
- Industrial Associations and private business concerns.

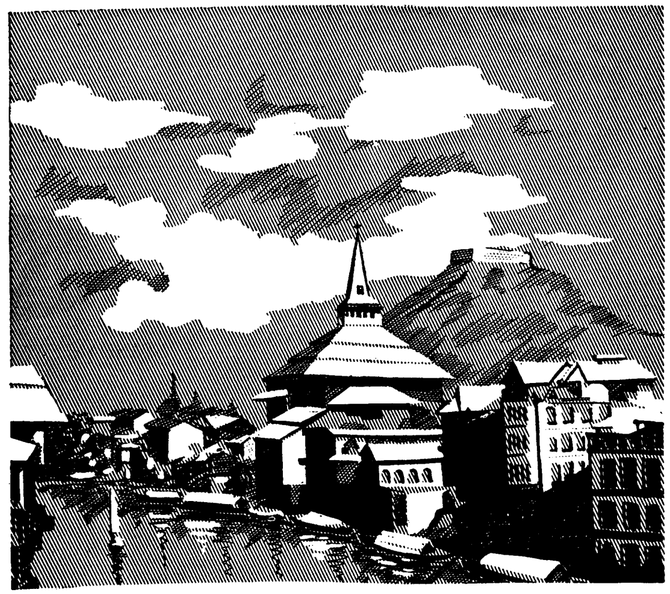
Rise in Costs Affects Export Prospects for Iron Ore

By R. SONDHI

THE rapid industrialisation of a country depends on the growth and development of heavy industries which, in turn, have to be supported by increased steel production. As envisaged in the second and third five year plans, the basic emphasis must, therefore, be on steel production. That India has a long way to go in this direction can be assessed from the present *per capita* consumption of steel of 10 kilograms, compared with 550 kilograms in the United States.

One of the most important tasks of the Planning Commission was to assess the country's future requirement of steel and then to create adequate capacity for its production. According to the estimates made by the Commission, the consumption of finished steel in the country will be about 18 million or 20 million tonnes a year by the end of 1971. The formidable task ahead of the country, if the entire requirement is to be met from internal production, will be readily appreciated when it is remembered that the target for steel production at the end of the second five year plan was set at 6 million tonnes a year and is likely to be achieved only at the end of the third five year plan. Achieving the fourth plan target means an almost four-fold increase of the present production capacity in the country.

The Internal Demand



Between 1.6 and 1.8 tonnes of iron ore are required for producing a tonne of steel, and this means an internal consumption of iron ore of about 30 million tonnes a year by 1971. In addition to meeting the internal demand, iron ore producers will be required to meet export commitments which are estimated at about 20 million tonnes a year by the end of the fourth plan. The total annual extraction of iron ore in the country by 1971 will, therefore, have to be increased to about 50 million tonnes from the current production of about 23 million tonnes, including Goa which produced approximately 7 million tonnes last year.

India is fortunate in having virtually unlimited reserves of iron ore of high quality. Although the estimated proved reserves of different types of iron ore have been assessed at 6,500 million tonnes, the actual reserves are considered to be about 21,000 million tonnes, of which hematite ores form the major portion. The important deposits being worked today are the Singhbhum (Bonai iron formation) in Bihar, the Bose iron formation in Madhya Pradesh, and the lateritic formation in Goa. The Singhbhum reserves are among the world's richest, since the average iron content of the ore ranges between 60 percent and 69 percent, compared with 50 percent in the United States and 40 percent in Europe. The major mines being worked in this belt are Barsua, Bolani, Noamundi, Gua, Joda and Thakurani. The Bose iron formation deposits include Rajhara, Dhalli, Rowghat and Bailadila. So far there has been no systematic prospecting of the iron ore reserves in Goa, but this task is now engaging the attention of the Geological Survey of India. Although the iron content of these deposits is somewhat lower, varying between 53 percent and 62 percent, from a general study of a few working mines it can safely be presumed that there are enormous virgin deposits still to be tapped in this area.

The present requirements of iron ore of the Indian steel industry are met by mines both in the private and public sectors. The Rajhara mine in Madhya Pradesh—owned and operated by Hindustan Steel Ltd—meets the entire requirement of the Bhilai steel plant. This mine is being expanded in order to meet the increased requirements of the steel plant which will consume about 5 million tonnes of iron ore a year by 1966. The iron ore requirements of the Rourkela plant are also met by a captive mine, Barsua, which, by virtue of the size of deposit and the quality of ore, is considered to be one of the richest mines in the world. The production from Barsua is also being increased to meet the entire requirements of the expanded Rourkela plant. The Durgapur plant is presently obtaining the major portion of its requirements from the Bolani mine, located in the Barajamda area, and this mine has in hand an expansion scheme designed to produce 2 million tonnes of lump ore and 1 million tonnes of beneficiated iron ore fines (sinter feed) a year from 1966 onwards. The latter will meet the entire requirement of the sinter plant which is an integral part of the Durgapur plant's expansion.

Ore from Captive Mines

The private sector steel plants in Jamshedpur and Burnpur, namely, the Tata Iron and Steel Co. Ltd and the Indian Iron and Steel Co. Ltd obtain the major portion of their blast furnace grade iron ore from captive mines. The complete mechanisation of the Tata Iron and Steel Co. Ltd's Noamundi mine will shortly be accomplished, thereby increasing the output to about 2 million tonnes a year. The Indian Iron and Steel

Co. Ltd's Gua mine is also employing mechanised mining and will shortly be despatching up to 1.5 million tonnes a year.

Apart from the above-mentioned mechanised mines feeding the integrated steel plants, the National Mineral Development Corporation's Kiriburu mine in Orissa, developed with Japanese technical aid, is a fully mechanised unit, expanded to achieve its production target of 2 million tonnes of sized ore per year from early next year. The Kiriburu project entailed the construction of a rail link with Visakhapatnam, and the Rs. 32-crore foreign exchange requirement has been financed by the U.S.A. and Japan. The Bailadila deposit in Madhya Pradesh is also being developed as a fully mechanised unit by the National Mineral Development Corporation and is expected to achieve a production of 6 million tonnes a year by 1966. The Orissa Mining Corporation's Daitari scheme, which envisages an export of about 2 million tonnes a year from Paradeep port, is also expected to be in production by 1966. In Goa, due to the physical characteristics of the ore body and the present limited knowledge of ore reserves, large-scale mechanisation has not been effected.

As mentioned earlier, the target set for the production of iron ore by 1971 means doubling the present capacity within the next seven years. This can only be done by large-scale mechanisation as selective mining will be wasteful and impracticable. Modern blast furnace practice demands a uniformly sized and graded ore in order to achieve the maximum economy. Preference is now being given to ore within the size range of ⅜in. to 2½in., and this material can only be produced in such large tonnages if mechanical crushing and screening is employed.

Progress of Mechanisation

Mechanisation in Indian iron ore mines has been introduced only during the last decade, and one of the major problems arising from mechanisation is the disposal of fines. To understand this better, it should be explained that open-cast mining on an extensive scale entails large diameter (up to 6in.) deep hole drilling. The holes are charged with conventional explosives, although recently liquid oxygen cartridges and ammonium nitrate are also being widely used and all the material resulting from the blast is loaded by diesel or electric excavators (bucket capacity up to 4½ cubic yards) on to dump trucks (20/35 tonnes' capacity) which feed the ore crushing plants. The material fed into the plant varies in size from dust to large boulders which are crushed to the required maximum size of the product. The crushing operation is generally carried out in two stages by either jaw crushers or gyratory crushers or a combination of both. During crushing further fines are generated and depending upon the nature of the ore, the ratio of salable screened ore to rejected fines (under 3⅛in. in size) may be as high as 1:1. In the context of the enormous tonnages being produced, the magnitude of the problem can be assessed, as apart from handling and transporting these fines, storage areas for their disposal have also to be earmarked.

Until very recently, these fines were considered as waste but in keeping with world practice, the beneficiation of this material is now contemplated in India. As the fines content at times is up to 52 percent to 53 percent of iron content, it is evident that if these continue to be rejected there will be a tremendous waste of the country's natural resources. Admittedly, India's iron ore reserves are extremely large, but their economical use is nevertheless desirable. Various agglomeration processes have been adopted throughout the world, the more common ones being briquetting, pelletising and sintering of the fines. The National Metallurgical Laboratory in Jamshedpur has devoted considerable attention to this problem during recent years, and their research has definitely established the economic feasibility of sintering in India. This laboratory has also prepared layouts of beneficiation plants for various Indian iron ores, and it is estimated that with the adoption of beneficiation a recovery of approximately half the material presently discarded as fines will be achieved. Sinter being fragile should not be transported over large distances, so the sinter furnaces are jointly located at the steel plants. The expansion plans of all the three public-sector steel plants in India include the establishment of sinter plants. As for the production of sinter feed at present, the first large-scale beneficiation plant to be set up will be at the Bolani mine which will produce a uniformly graded sinter feed, having an iron content of up to 62 percent. The fines to be used by the Bhilai and Rourkela steel plants for their sinter furnaces will not be beneficiated to the same extent. Apart from better utilisation, the benefits of feeding sinter into the blast furnaces are twofold, since there is a reduction of as much as 40 percent in the coke consumption and the blast furnace capacity is also increased by up to 60 percent. The cost of production of sinter is, therefore, more than compensated for by the resulting economies in the blast furnace operation.

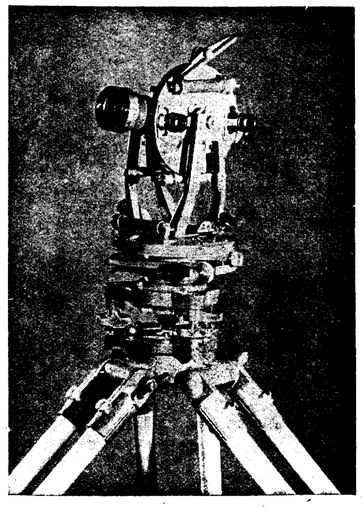
Plant and Machinery Needed

The successful mechanisation of iron ore mines in India is being severely handicapped by lack of manufacturing facilities within the country for the plant and machinery required. Mechanised open-cast mining requires large air compressors, excavators, portable drills, dumpers, bulldozers, motor graders, scrapers and other earthmoving equipment in addition to the crushing and screening plant. Although a start is being made—particularly for the production of air compressors, excavators and bulldozers in India—other mining equipment will have to be imported for several years to come. With the present foreign exchange shortage and the consequential import licensing procedure, there is a prolonged delay in obtaining essential equipment, and the maintenance of existing machinery provides a very serious problem due to the lack of sufficient spare parts in the country. As a result, at times very expensive machines are idle for prolonged periods awaiting imported spare parts. It is not practicable to maintain stocks of all the essential spare parts at the mines as individual machines comprise as many as a thousand different components. Besides the lack of spare parts, there is a dearth of specialised workshops for the maintenance of this type of equipment and above all an acute shortage of experienced skilled technicians. It is, however, most heartening to learn that extensive training schemes are being brought into operation in order to meet the future manpower requirements of the industry.

The implementation of mechanisation means a capital investment of about Rs. 2 crores for an output of 1 million tonnes a year. In order to produce iron ore economically, it is, therefore, imperative that the maximum use of machinery is achieved, since due to the comparatively short life of mining machinery, the cost on account of depreciation alone will be about Rs. 2 a tonne of output. Due to the present shortage of skilled operators, the maximum use is not being achieved and in spite of the very heavy capital investment due to the low productivity, a larger number of operatives have to be employed than would be necessary in a comparative mining operation in a more developed country.

At the same time, welfare measures and labour laws have been formulated in keeping with those prevailing in advanced countries. The Government of India has recently set up a Wage Board for the Iron Ore Industry. Its recommendations, it is anticipated, will further increase the cost of production. The Iron Ore Mines Labour Welfare Cess Act, 1961, contemplates the imposition of a cess of 50nP a tonne of output which is expected to be enforced shortly. The accumulations of this levy are to be used for extending welfare measures to labour employed in iron ore mines. The rate of royalty on iron ore despatches was increased last November to Re. 1 a tonne for ore containing up to 62 percent of iron and Rs. 1.50 a tonne on ore containing a higher percentage of iron. It is to be noted that the higher royalty is generally applicable to exports as the export grade contains a higher iron percentage. Apart from these impositions, there have been increases in Customs duty and the surcharge on imported spare parts and components and in the excise duty on fuel oils. These, together with the impositions on tyres and lubricants, have substantially increased the cost of production of Indian iron ore at a time when there is an all-round depression in world steel production, thereby seriously affecting the export potential of Indian iron ore.

Plight of Small Mine Owners



The plight of the small mine owners is really most unenviable, since apart from the aforesaid impositions, the labour element on their cost is very much higher. At the same time, the State Trading Corporation has curtailed purchases during the last few months. It is estimated that only 5 percent of the smaller mines in eastern India are currently in operation, raising barely 1 million tonnes a year. Large stocks have accumulated at pit-heads and loading stations, and the depression has been further aggravated since due to the reduction in price accepted by the S.T.C. on exports to Japan, the Corporation, in turn, is now offering a reduced price.

In fact, the effect of this reduction is appreciably more on the mine owners as no consideration has been given to the increased rate of royalty of Rs. 1.50 a tonne nor for recent increases due to additional excise levies. In Goa also, there is a crisis in the mining industry where the production figure for small mine owners has dropped from 3 million tonnes in 1961 to 500,000 tonnes in 1962. Production during the first few months of the current year has been virtually nil. Representatives of the S.T.C. have proceeded to Goa to make a first-hand study of the position in order to assess whether the trade could be canalised through the S.T.C., thereby according some relief to small mine owners. If large-scale unemployment in the iron ore mining areas is to be avoided, adequate measures must be taken immediately to improve the situation. To achieve this, a long-term solution is required, and it is suggested that serious consideration should be given to the amalgamation of small mines by forming co-operatives, since otherwise the small mine owner will neither be able to afford mechanisation nor the cost of additional welfare measures and the increased royalty rates.

Exports of iron ore from India (excluding Goa) during 1962 totalled 3.4 million tonnes, compared with 3.5 million tonnes in 1961 and 3 million tonnes in 1960. During the same years, Goa exported 5.3 million tonnes, 6.5 million tonnes and 5.6 million tonnes, respectively. As mentioned earlier, exports during the fourth five year plan target (excluding Goa) have been estimated at 20 million tonnes a year and the S.T.C. has been entrusted with the monopoly for exports. Iron ore exports on a long-term basis poses certain special economic and technical problems. The Central Ministry of Commerce and Industry has, therefore, recently decided that it will be more advantageous to set up a separate corporation for the export of mineral ores.

Exports to Japan

Currently Japan, whose total imports of iron ore are about 22 million tonnes a year, is the largest buyer of Indian iron ore. During 1962, Japan imported about 4.5 million tonnes of iron from India, including 2.9 million tonnes from Goa. As a result of recent negotiations in Tokyo, the S.T.C. has been obliged to accept a reduction of 7s a tonne on exports to Japan during 1963 because of the present depression in the Japanese steel industry. USHA

HELPS NATIONAL PROGRESS

Usha is playing a vital role in actively assisting the country to earn valuable foreign exchange. The largest exporters in the light engineering field, Usha sewing machines and fans are warmly welcomed in about 50 countries around the world. Besides giving technical know-how to other countries, Usha have taken a major step forward in export promotion by setting up sewing machine assembly plants in Saigon and Colombo.

We look to the future with confidence and in a spirit of dedication to serve the country well.

1964 onwards, an additional 2 million tonnes a year from the National Mineral Development Corporation's Kiriburu project will be exported to Japan under a ten-year agreement. The Corporation's Bailadila project in Madhya Pradesh originally contemplated a production of 4 million tonnes a year by 1966 in order to meet the 15-year commitment with Japan under a separate agreement signed in March 1960. The project is now proposed to be expanded to give a production of 6 million tonnes a year enabling it to take over the export commitment of the Kiriburu project as Bailadila ore is expected to have a lower f.o.b. cost. After the expansion of Bailadila, raisings from the Kiriburu project will be diverted for internal consumption. Kiriburu is now being considered as the major source of supply for the proposed Bokaro steel plant. The Orissa Mining Corporation's Daitari project envisages a production of 2 million tonnes a year for export to Japan through Paradeep port. It will be seen that Japan is, therefore, expected to continue as India's major buyer. But India cannot afford to be complacent as Australia is shortly entering the export field in a big way and has already negotiated to sell nearly 45 million tonnes of iron ore to Japan by 1970.

Exports to Czechoslovakia

Czechoslovakia ranks second as an importer of Indian iron ore and exports to that country are currently at the 2-million tonnes a year level. The S.T.C. is currently giving a greater emphasis on exports to western countries and agreements have recently been concluded for the export of iron ore to Rumania, Yugoslavia, Poland and Hungary. Negotiations have also commenced for the export of nearly 2.5 million tonnes to Germany and Italy during the current financial year.

To conclude, there can be no doubt about the enormous development potential in the Indian iron ore industry. However, if the industry is to be developed on a sound long-term basis, a complete assessment of the problems, both present and those likely to be faced in the future, must be made by the Government. The proposed expansion of the industry during the next decade will be no easy task. This can only be achieved if there is proper co-ordination, providing facilities for the additional machinery, power, water and transport requirements. The planners must constantly keep in mind the competition likely to be faced from other iron ore exporters, and the development of the ore reserves should be planned on economic rather than ideological principles. Governmental levies and labour welfare measures should be carefully considered before their imposition. Above all, there must be close co-ordination between the State and the Central Government's policies for developing the industry. It is felt that unless a realistic attitude is taken, the Indian iron ore industry might find itself in the same dire state as is facing the manganese mining industry. The latter's present plight could largely be attributed to penal labour welfare laws, royalties, freights, export and rail-ment quotas while there is a world-wide boom in the manganese trade and India holds a virtual monopoly.

Footwear Output Rising, but Higher Production Costs Cause Concern

TO West Bengal must go the credit of having been the cradle of the Indian rubber manufacturing industry, of which the production of footwear is the second largest constituent. The emergence of the industry from its early tribulations has been ably traced in the report of the Tariff Board, 1951, which may interest students of industrial history. Developments since are hardly less distinguished; the State has the largest tyre factory in India and possibly the largest rubber footwear factory in the whole of Asia, if not in the world.

Although structurally it spans two vital sectors—agriculture (rubber) and industry—in the country's economy, the position of footwear manufacture in the Indian industrial hierarchy has been somewhat indeterminate; neither so big as to be called major nor so minor as to be thought small, the industry has not had the advantages of either classification. What is certain, however, is its economic value. In two related but rather

By
J. VYORAL
Managing Director, Bata Shoe Co. Private Ltd

different matters, the industry is important to India; it serves a vital social need and is an industrial asset. Apart from absorbing an appreciable amount of unemployed labour, the footwear industry, by fostering the growth of many ancillary industries, opens up wider fields of employment. Increasing revenues to the State which, incidentally, has had to resort to deficit financing, is another merit. And, above all, as an industry, it has, although slowly, mitigated the improvidence of imports.

Great Interdependence

India is in the singularly happy position of having a rubber plantation industry side by side with a manufacturing one large enough to absorb her raw rubber output. Between the two industries, technical and economic interdependence could scarcely be more complete. As synthetic and synthetic-natural products are entering the field, there will inevitably be greater selectivity. This makes all the more essential what the Estimates Committee suggested some time ago: a co-ordinated approach between the Rubber Board and the appropriate Development Wing. Indeed it could with advantage be carried further into a competitive-collaborative relationship between producers of tree-grown rubber and manufacturers of the synthetic variety. Meantime, efforts should be made to produce high quality rubber at the lowest possible cost. The prosperity of the natural-rubber industry will depend, as Dr. L. Bateman, Controller of Rubber Research, Malayan Rubber Fund Board, said relatively recently "not on producing less and selling less at high prices but on producing and selling more at competitive and reasonably stable prices".

Although the aim is to assess approximately the totality of achievement in the manufacture of footwear, pre-war points of reference, however comforting, are so distant and were themselves so exceptional in several ways that they help little. Statistics for subsequent years show that from being a small and somewhat neglected sector, the footwear industry has been gradually projecting itself on the Indian economy, if not on a spectacular scale, yet on a fairly widespread and impressive basis. From this, several advantages have accrued. Production in many lines has not merely mitigated the pressure of demand but also reduced imports. In sum, there has been a broadening of the industry's whole economic base. Although the extent to which an industry can alter the range of production to adjust itself to temporary or long-term changes in demand is somewhat limited, the industry in India has improved upon traditional, and developed new, techniques and produced goods to suit ever more exacting requirements. The industry stands to benefit from research now in progress. Developments abroad will require to be watched and assessed from time to time bearing in mind that several synthetic materials have already some impressive achievements to their credit.

Manpower Needs

The manpower needs of the industry over the next few years are likely to increase substantially. A stable labour force has to be built up. The emphasis which the Chief Minister, Mr. P. C. Sen, laid recently at the annual general meeting of the Institution of Rubber Industry, Indian section, on the need for increasing and improving facilities for technical training is both just and opportune. Inaction now may soon result in a grievous shortage. The industry calls for a fairly high standard of technical knowledge and skill, particularly from those in charge of manufacturing processes. Companies now can survive only on the basis of their efficiency.

Several extraneous elements over many of which the industry under the present economic system could have no control have pushed the cost of production up to levels at which survival seems difficult; a singularly unfortunate state of affairs for which the rising costs of labour, raw materials, machinery and distribution seem primarily responsible. Sooner or later such inflationary factors, not the least being the last Central Budget, are bound to affect what the Government is desperately trying to promote, namely, exports. The overall picture is certainly not one of easy profits. It is obvious that the fight against rising costs will for some years at any rate be the main concern of the footwear industry. Only if that fight is won, can the industry hope to play a significant part in the national economy; and to win, there has to be a constant search for economies in cost and for the type of product which will command a market. Increasing dependence on research, particularly chemical, to find cheaper materials and substitutes is indicated. Experience has shown that increases in production do not mean much by themselves. To be truly beneficial, they must take place within the framework of an appropriate fiscal policy. Authority has shown little desire to move towards a fiscal system which gives adequate scope for incentives. The level and incidence of taxation and the high freight rates on raw materials and finished products weigh the scales heavily against the supply of further risk capital; a circumstance all the more unfortunate as the Government periodically avows awareness that industrialisation is both an economic and military necessity. Already substantial, the industry's contribution to defence requirements has been increasing in both volume and variety. How far it will rise further is still difficult to prophesy, for the national defence programme has not been revealed adequately to facilitate the assessment of demand. The need is for a pragmatic policy of liberal aid and incentives to the industry. Properly devised, they could help surmount some of the more grievous handicaps; the scarcity of suitable leathers for the manufacture of leather footwear and the difficulty in importing—due largely to the shortage of foreign exchange—essential machinery and equipment. The costs of ignoring costs could well be calamitous.

Expanding Market

The end of the second World War released a good deal of delayed demand, and the rise in the standard of living since, however slow, has kept consumption at a fairly high level. Even assuming no basic change in the general conditions of the economy—and this is a very large assumption—future levels of offtake will be governed largely by the in-

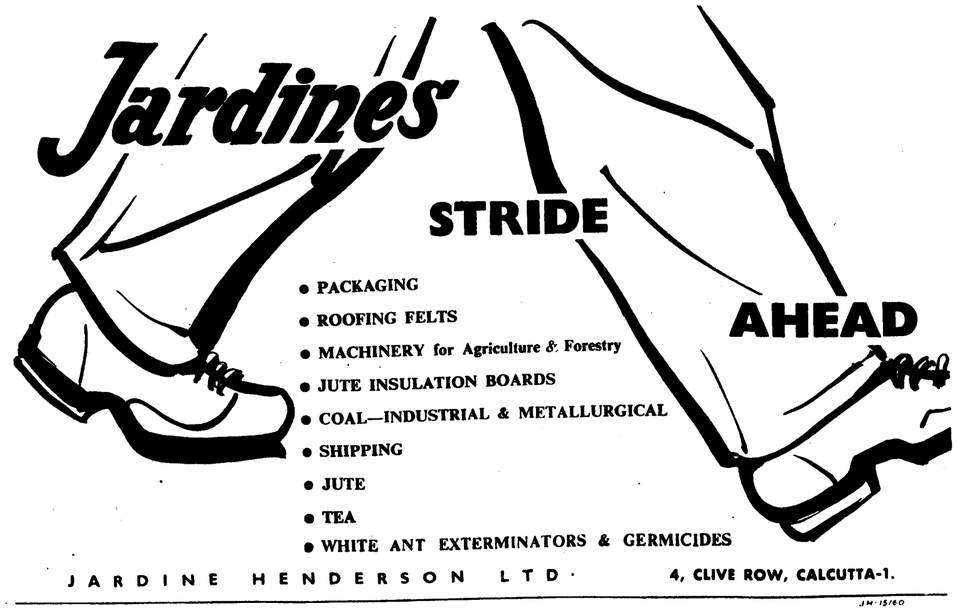
crease in population. A wide internal market—and an expanding one at that—has provided reasonable stability. Even at the somewhat illiberal computation of one pair of shoes a year a head for the population which is increasing at an awesome rate, the prospective demand provides ample scope for all three possible lines of advance; development of the small-scale and cottage industry, the setting up of modern manufacturing plants and a substantial expansion of units already in existence. The Government's emphasis on the development of the cottage industry is understandable. So is the third plan's insistence on the continuance of stimuli. Evidently, the employment potential of this sector is the principal justification. But a solitary advantage, however politically profitable, should not obscure considerations hardly less vital. One of them, and indeed the most dominant, is the simultaneous development, through proper incentives, of the large manufacturing sector whose contribution to both the growth of the footwear industry as a whole and the country's economy has been significant and substantial. Harmonious development seems all the more necessary in view of the growing collaboration within the industry between the large manufacturing concerns and the cottage units. Besides purchasing regularly large quantities of footwear made by these units to supplement its own output, the mechanised sector has been assisting the cottage industry sector in many ways. Among the more notable forms evolved to achieve acceptable standards of quality are technical guidance and practical advice on new developments in footwear styles and designs. Such increasing interdependence emphasises a moral; that any attempt to promote one sector at the expense of the other will damage the industry as a whole. The industrial imbalance, which a doctrinaire approach will inevitably create, is not easily corrected.

In the market, preferences exist for one shape or another. Such tastes are largely local and traditional and sometimes personal and subject to current fashion. In several cases, assessments of quality can only be impressionistic, which is obviously hazardous. Accepting it for want of an alternative, it seems quality varies from manufacturer to manufacturer. That there has been an improvement, however, is indisputable. Indian industry has gone a long way on the road to good design.

Raising Exports

Mere self-sufficiency will be a narrowing and foreshortening of the horizon, so exports must be included in the reckoning. The industry is competing successfully in such difficult markets as the United States, Canada and the United Kingdom. Exports evidently are earning foreign exchange, especially welcome now as there is much need for capital goods for which Indian capacity is yet to develop. South-east Asia, in particular, is an area where markets are likely to expand and economic activities to increase. Its pattern of imports, as this process takes place, will change. Possibilities in this region are now being explored. Some countries under the urge to conserve currency resources and to rectify their trade balance are either increasing import duties, both revenue and protective, or imposing a system of quantitative regulation against which competitive efficiency is impotent. Even so, basically the market for Indian footwear overseas, though partly governed by the scale of total world trade, is what manufacturers and traders choose to make it, by their readiness to meet customers' requirements, their keenness to sell, their speed in delivery and their willingness to take risks. The more far-sighted Indian manufacturers are aware of these factors and their implications. The problem is essentially one of expert marketing—pushing Indian goods almost to the point of preference. There is need for a detailed study of those markets in which there have been adverse changes on a scale which may be regarded as abnormal and in which there is reason to suspect that new powerful forces are at work.



There has undoubtedly been progress in the footwear industry. The need now is to maintain the pace and fulfil the promise of the last few years. The industry has a legitimate and encouraging opportunity to enlarge its field both inside and outside India; but it is an opportunity which must be courageously seized. Its record inspires hope that products and processes will keep up with the technical advances taking place and that production will rise to new peaks—developments fully in conformity with an expanding economy.

VOLTAS-J.K.SMIT Diamond Bits to meet any drilling conditions

VOLTAS-J.K. SMIT Diamonds Bits—made in India in collaboration with the renowned firm of J.K. Smit & Sons, London—are designed and constructed with mechanical precision to ensure fast drilling rates and higher diamond recovery value resulting in low cost per foot drilled.

Outstanding features:

- Specially selected Industrial Diamonds, set in tungsten alloy matrix and tungsten carbide matrix to suit all rock formations
- Available in DCDMA and metric sizes to suit all diamond core drills of any make and capacity
- Special bits can be specifically ordered to suit unusually difficult ground conditions

Resetting Service: VOLTAS operate an efficient resetting service, which is available for bits of any manufacture. This resetting service will help you to keep down drilling cost. Please send us your worn bits for resetting.

COMPULSORY SAVINGS: THE DIFFICULTIES AHEAD

THE formal inauguration of the compulsory savings scheme on Monday has not yet been commemorated by the chaos which most people have been confidently expecting. But that does not mean that the danger of chaos has passed altogether; on the contrary, the worst is yet to come. The Government has taken the best part of four months to sort out what the scheme is about, and how it might be implemented. In the circumstances, it is hardly surprising that prospective compulsory savers are still baffled and confused about what precisely they are supposed to do. This bafflement is at the root of the fact that post offices and banks have not yet been besieged by the angry victims of the scheme. Their reluctance to visit these noble institutions straightaway for knowledge and advice is accentuated by the suspicion that the institutions, too, in turn, might not have any clear idea of what they are supposed to do; after all, until a few hours before the formal introduction of the compulsory savings scheme, the Finance Ministry itself was running round in circles and continually changing its mind about who was to collect what, how, when, where and from whom. The chaos that the midsummer madness almost certainly would have precipitated has now been postponed by the simple device of allowing a longer period for compulsory savings to be deposited. There is no reason yet, however, to revise the general belief that the success of the scheme as a whole is in doubt. The strong opposition it has attracted from the very start is only a faint indication of the difficulties that lie ahead. Criticism of the scheme has come not merely from the opposition Parties, but even from within the Congress itself. After the recent by-election defeats, not a few Congressmen will be having nightmares about the electoral storm they will face now that the irritants of the compulsory savings scheme have been added to those of the gold control rules.

Some of the objections to the scheme have been legalistic, although that does not make them any the less important. Doubts still persist, for instance, about whether the scheme is *ultra vires* the Constitution, considering that although the latter gives the State the power to collect taxes, it does not give it the power to compel people to save any part of their income. The opinion expressed on the subject by the Attorney-General, on the reluctant invitation of a Finance Minister harassed by hair-splitting lawyers and constitutionalists, is generally considered to be ambiguous. The former gentleman, it seems, was of the view that Parliament was competent to pass the Compulsory Deposits Bill; but that the terms of the scheme embodied in the Bill might infringe the citizen's fundamental rights. While the emergency continues for reasons not unrelated to the Government's private convenience, it may not be easy to question the scheme in a court of law. After the emergency is over, however, the constitutional validity of the measure might well be challenged. In the circumstances, it is odd—perhaps significant—that the Government has not taken the precaution of sounding the Supreme Court for its views. According to some, the reluctance to do so may be inspired by (a) the intention that the emergency should continue forever; or (b) the suspicion that the Supreme Court's verdict would be adverse.

The process of chopping and changing that the compulsory savings proposals have undergone since their birthday four months ago has been far-reaching. The process was dictated first by political cowardice, and later by administrative necessity. The series of amendments to the Compulsory Deposits Bill which Mr. Desai announced in April were intended to serve the former purpose. Having earlier given the impression that compulsory savings represented a brilliant new instrument to siphon money out of the pockets of the reckless, the extravagant and habitual non-savers, he later proceeded to exempt several million people belonging to precisely these categories. In particular, prodded by Congress members of Parliament and State Governments, Mr. Desai suddenly remembered his Party's electoral interests and proceeded to exempt a large number of agriculturists.

The two-and-a-half months which have gone by since then have been marked by the leisurely discovery that even the modified and much-watered-down scheme is going to be extremely difficult to implement. At first, it was assumed that the burden of gathering in the compulsory savings could coolly be shoved on to the post offices, with the State Bank and the Reserve Bank hanging around the fringes. Only gradually has the news percolated through to the Finance Ministry that the post offices remain what they have always been—cesspools of sloth and inefficiency which can never be expected to cope with a scheme of this magnitude. A number of commercial banks have, therefore, been brought in now to collect compulsory savings on behalf of the Government. More and more of the administrative work arising out of the scheme has been made the explicit or implicit responsibility of the employers. After four months of slumber, the Finance Ministry has discovered that even the forms and deposit books necessary for recording compulsory savings have not been printed. The happy suspicion arises that the day may not be far off when employers will be invited to donate not only clerks, nor only pens, pencils, ink, and stationery, but also beds, bromides and barbiturates for running the compulsory savings scheme—and in course of time the entire Finance Ministry.

The chaos which is incipient now—and which threatens to grow rapidly in the coming weeks and months—serious though it is, may not prove to be the worst consequence of the scheme. On a longer view, the worst consequence might be that the scheme will turn out to be an expensive failure, in the sense that a lot of money will have been spent but the sum total of savings will not have increased. Much idle talk has been heard to the effect that the expenditure on collecting compulsory savings will be kept down by restricting the recruitment of new staff; and that existing staff,

in the post offices especially, will instead be invited to work longer hours and paid at over-time rates. No one has explained how, if over-time rates are generally well above normal rates of payment, the proposed system can be described as "economical".

The Government, furthermore, claims that the scheme will bring it Rs 60 crores, out of which the Centre will keep Rs 25 crores and Rs 35 crores will go to the States. In view of the administrative deficiencies, however, there is a fair chance that these estimates will turn out to be too optimistic. Those who pay their taxes honestly will be squeezed for all that is due from them. But, for others, the incentive to evade taxes—and compulsory savings—by understating their income or turnover will be greatly increased. Where compulsory savings are based on assessments made by State Government authorities (for example, on land revenue or on sales tax), evasion is likely to be particularly widespread. In the end, it may be found that the compulsory savings are coming mainly from people who were saving voluntarily anyway. The consumption expenditure of the higher-income groups will not necessarily be reduced. Unrest among the middle classes, which have already been squeezed to penury by taxes and inflation, will grow. To it may be added the already incipient unrest among industrial workers subject to the compulsory savings scheme—unrest the consequences of which will be visited primarily and directed upon the employers who have been charged with the legal responsibility of collecting the savings.

TRADING WITH THE E.C.M.

THE apprehensions felt in individual Asian countries over the European Common Market's trade policies often have to be played down because bickering hardly makes a good introduction to pleas for more aid and larger trade opportunities. This was very much the case when Professor Hallstein, president of the Commission of the European Economic Community, visited India last April. His claims that the E.E.C's policies were outward-looking and specifically designed to expand trade with the underdeveloped world were listened to politely by officials in New Delhi; only a polite attempt was made to show that Indian experience ran counter to this claim. The U.N. Economic Commission for Asia and the Far East obviously suffers from no such inhibitions, and its latest annual *Economic Survey* comes out flatly with the indictment that the trade expansion claimed by the E.E.C. "has not been realised" by the developing countries of south Asia. Indeed, the region's raw material exports to western Europe fell by about 15 percent during the second half of the 'fifties.

Western Europe is a market of the greatest importance to the E.C.A.F.E. region. Apart from long-established political and economic ties such as those of the Commonwealth, the resource pattern of the region is complementary to that of western Europe, which provides a sure basis for profitable exchanges. One-third of the region's exports go to western Europe (including the U.K.), and the latter in turn supplies the largest share of imports of the region. It follows, therefore, that a stagnation in the E.C.A.F.E. countries' exports to western Europe must impair their viability at a time when their balance of payments is already under serious pressure. Against an export surplus of $1,000 million in 1928 and $500 million in 1938, the E.C.A.F.E. region had an import surplus of $400 million in 1948, and this has more than trebled in the subsequent decade. The trend is a reflection of the rapidly growing import needs, spurred by postwar development plans, and the stagnation in commodity exports which account for more than 75 percent of the region's trade with the E.E.C. Although there has been a rapid rise in exports of manufactured goods to western Europe, chiefly from the Asian Commonwealth countries to the U.K. where preference gives them an assured market, the increase has been too small in quantitative terms to offset the decline in commodity exports. In the specific case of the Six, total exports of the E.C.A.F.E. region actually fell by 5 percent during 1955-60, confirming that the changing structure of exports has not proceeded far enough to maintain export earnings, much less to permit the increase so desperately needed for viability.

The E.C.A.F.E. study sees in the E.E.C.'s policies "many protectionist elements" which adversely affect the Asian region's exports. It concedes that many kinds of raw materials, which are either not produced in the E.E.C. countries or for which no effective substitutes are available, are admitted duty-free or at low tariffs. But many other primary commodities are not, because of the measures adopted to protect either domestic agriculture or trade arrangements with associated States overseas. Apart from the tariff disabilities, the fact remains that the demand for primary commodities is growing very slowly because of improvements in manufacturing techniques to economise on raw material inputs or because of the emergence of substitutes. Even rubber, where Asian producers have no competition to fear from associated States, may be faced with inelasticity of demand even though there are no tariff hurdles to negotiate. In any case, the availability of synthetics cannot but exert a downward pull on the price of natural rubber, which may have the same effect as stagnation in the volume of exports.

From this analysis, the E.C.A.F.E. study sees only "limited" prospects of export expansion along traditional lines. It, therefore, urges the region's developing countries to follow the Japanese example of relying more and more on processed and manufactured goods in which world trade is rapidly expanding. But before such diversification can achieve tangible results, major changes would be necessary in the trade policies of the developed countries whose tariffs are designed to raise the level of protection as primary materials are carried forward into successive phases of processing. The E.E.C.'s common external tariff (to be implemented in stages by 1967) suffers as much from this feature as the individual régimes now in operation; the average duties proposed for manufactured consumer goods will be the highest for any commodity groups. In contrast, the U.K. preference margin for manufactures from Commonwealth sources is often quite considerable, and far higher than that applicable to other goods and materials. Not surprisingly, therefore, the U.K. buys far more Asian manufactures than the considerably larger and faster-growing Community. This leads the E.C.A.F.E. study to the conclusion, endorsed by both official and business opinion, that any sudden loss of Commonwealth preference would be a major setback to Asian trade.

The damage from protective tariffs is compounded by quota restrictions limiting not only the imports of textiles and other low-cost products, but also those of newer items like fans and sewing machines. In early postwar days, these quotas were perhaps necessary for balance of payments reasons, but there is little justification for them in the completely altered situation of today when several European currencies are stronger than the dollar. The General Agreement on Tariffs and Trade has been working towards a liberalisation of quotas, but so far to little effect, as is frankly conceded by its special committee looking into the export problems of developing countries. France, for instance, insists on limiting imports of vegetable oils from Asia to protect her olive-growers; Belgium operates an unofficial ban on Asian jute goods for internal consumption but is nevertheless a large importer for purposes of re-export. In cotton textiles, the long-term international agreement providing for a modest annual increase in import quotas is an improvement, but it still falls far short of the expectations of developing countries. In fact, without a clearly agreed time-table for the inefficient cotton and jute textile industries of Europe to shift their resources to more sophisticated fields of manufacture, the problem cannot even begin to be solved. The experience so far shows how easy it has been to invoke the trade disruption clause of the agreement to prevent any upsurge in textile exports.

Even in the case of tea, where tariffs are to be withdrawn from next year, the benefit will remain very limited because of the high incidence of internal taxes, which are twice as large as the import duty in West Germany and are equal to the duty in France. There is also the factor that the tariffs of individual countries and the E.E.C. common external tariff have customarily discriminated in favour of coffee to give a stimulus to the coffee sales of the associated African States. It is facile to think that the powerful interests behind coffee in the E.E.C. will stand by idly while tea gains an advantage. The enthusiasm with which Mr. Manubhai Shah, India's Minister for International Trade, greeted tariff abolition seems, therefore, premature unless a clearer picture emerges which takes into account tea's relative position *vis-à-vis* coffee in firmer ground, however, when he pins his hopes for expansion of trade on the likely outcome of next year's Kennedy round. The preliminaries in Geneva this year did reveal a growing realisation of the need to enlarge the export opportunities of the developing countries because this would directly augment their importing capacity to the benefit of the advanced nations. A worldwide move towards trade liberalisation cannot leave the E.E.C. nations untouched, and their policies should, in consequence, become more outward-looking. The recent slowing down in the E.E.C.'s growth rate may also contribute to this result because of the need to find additional markets overseas for underemployed industrial capacity.

TRENDS IN GENERAL INSURANCE

IN the *Indian Insurance Year-Book, 1962*, which has recently been published, the Controller of Insurance has for the first time introduced a paragraph containing information about the trend of gross direct business written outside India by insurers during 1960. Indian insurers operating abroad, it is estimated, incurred an overall loss of Rs. 74 lakhs in 1960 on the gross direct business written by them outside India. The unfavourable result seems likely to reflect on India's foreign exchange position. The gross direct premium income of Indian insurers in 1961 was Rs. 10.65 crores in fire, Rs. 6.30 crores in marine and Rs 14.32 crores in miscellaneous insurance, giving a total of Rs. 31.25 crores. Compared with this, the gross direct premium income of non-Indian insurers was Rs. 5.63 crores in fire, Rs. 2.93 crores in marine and Rs. 3.49 crores in miscellaneous insurance, giving a total of Rs. 12.05 crores. The aggregate of gross premium income on business written direct in India, therefore, came to Rs. 43.30 crores.

The gross premium income on business written direct outside by Indian insurers amounted to Rs. 9.55 crores. Added to Rs. 43.30 crores, this means that a total of more than Rs. 52 crores of premium income came from business written direct in India by non-Indian insurers and direct in India and outside by Indian insurers. The figure is satisfactory, but the proportion of fire premiums to the total gross premiums written direct in India by Indian insurers fell from 45 percent in 1956 to 34 percent in 1961. The proportion of marine insurance also declined, from 24 percent to 20 percent. In contract, the proportion of miscellaneous insurance increased from 31 percent in 1956 to 46 percent in 1961. The figures show that miscellaneous insurance has been growing faster than fire and marine insurance. The gross premium written direct outside India by Indian insurers shows more or less the same trend. Thus the proportion of fire insurance declined from 35 percent in 1956 to 26 percent in 1961 and that of marine insurance from 32 percent to 22 percent. The proportion of miscellaneous insurance, however, rose from 33 percent in 1956 to 52 percent in 1961.

The trend has been an unsatisfactory feature of Indian general insurance for many years. Miscellaneous business includes not only the insurance of motor-cars and public and private carrier vehicles, but also all sorts of guarantee business. A hot debate has been going on whether this class of guarantee business is really insurance or a financial hazard, although no one denies that it has come to stay in this country. Its overall implications and the final results cannot be foreseen in a developing economy which is passing through an inflationary phase. But if the economy suffers a recession, it will be necessary to evaluate the results with great care. Knowledgeable circles fear that the results then may be adverse, perhaps even disastrous. Meanwhile, however, it is consoling to find that, for the first time in many years, in relation to the net premium income of Indian insurers, there was an underwriting balance of 3.6 percent in miscellaneous insurance in 1961. This was primarily because of an increase in the rates for public carrier vehicles, the insurance of which brings the bulk of the premium income of the miscellaneous department.

In the fire section, Indian insurers had a balance of 12.2 percent, against 22 percent in the case of non-Indian insurers. In the marine section, the loss was sizeable—7.3 percent of the net premium income for Indian insurers—but there was a credit balance of 6.3 percent for non-Indian insurers. From 1956 to 1961, the claims experience of non-Indian insurers was better than that of Indian insurers in all classes of general insurance. As before, non-Indian insurers paid a higher percentage of commission in all classes of general insurance during this period (except for fire insurance in 1956 and 1959). Management expenses, including taxes and miscellaneous outgo, were a higher percentage of the gross premiums written direct in India for non-Indian insurers than for Indian insurers in all classes of general insurance (except miscellaneous insurance in 1957). As for fire insurance, on the total gross premium income in India in 1961, Indian insurers had a balance of 22 percent, against one of 35 percent for non-Indian insurers. In marine insurance, the respective balances were 8 percent, against 11 percent; and in miscellaneous business, the balances were 24 percent, against 16 percent. The adverse result in relation to the net premium income in India of Indian insurers is primarily attributable to their foreign business, whether direct or otherwise.

The total income of all Indian insurers amounted to Rs. 40.18 crores. This was made up of the net premium income in India of Rs. 23.50 crores; the net premium income outside India of Rs. 15.97 crores; interest, dividends and rents of Rs. 67 lakhs; and Rs. 4 lakhs from miscellaneous sources. The total outgo was Rs. 34.76 crores, of which Rs. 19.34 crores related to claims, Rs. 5.53 crores to net commission, Rs 9.10 crores to expenses and Rs. 79 lakhs to miscellaneous outgo. Of the balance of Rs. 5.42 crores, Rs. 3.57 crores were absorbed by the increase in reserves for unexpired risks and additional reserves, while Rs. 1.85 crores were transferred to the profit and loss account. From this profit of Rs. 1.85 crores was deducted the deficit of Rs. 4 lakhs brought forward from the previous year (after the payment of Rs. 98 lakhs as dividends). Adding Rs. 1.21 crores earned by way of interest, dividends and rents (not relating to any particular class of insurance business) and Rs. 44 lakhs of miscellaneous income, the total came to Rs. 3.46 crores. This total was appropriated as follows: management expenses Rs. 12 lakhs, taxes paid and provided for Rs. 1.42 crores, transfers to particular funds or accounts Rs. 59 lakhs, dividends for 1961 paid or provided for Rs. 30 lakhs, miscellaneous outgo Rs. 20 lakhs and the balance carried over Rs. 83 lakhs.

DISTRIBUTION OF ASSETS OF INDIAN INSURERS

(In Rs. lakhs)

Particulars	1960* Amount	1960* Percentage of total assets	1961* Amount	1961* Percentage of total assets
Central Government securities	573	9.0	556	7.6
State Government securities	173	2.7	196	2.7
Foreign Government securities	183	2.9	193	2.7
Municipal, Port and Improvement Trust securities	32	0.5	27	0.4
Debentures of Indian companies	234	4.4	317	4.4
Preference shares of Indian Companies	350	5.4	374	5.1
Ordinary shares of Indian companies	1 225	19.0	1.603	22.1
Land and house property	130	2.0	146	2.0
Deposits, cash and stamps	1 527	23.7	1.631	22.4
Loans on mortgage of property	52	0.8	65	0.9
Loans on stock and shares	7	0.1	6	0.1
Other loans	16	0.3	9	0.1
Agents balances, outstanding premium and amounts due from other insurers	1 363	21.2	1.604	22.1
Accrued and outstanding interest	27	0.4	30	0.4
Miscellaneous	491	7.6	506	7.0
Total	6 433	100.0	7.269	100.0

* As on 31st December of the year.

The number of groups (parent and subsidiary companies taken together) of Indian as well as non-Indian insurers who contravened the provisions of Section 40C of the Insurance Act in 1961 was less than in the previous year. About one-third of the groups of insurers who contravened the provisions in 1960 were given a warning in terms of Section 64M(2) of the Insurance Act. Of the total of 116 groups of both Indian and non-Indian insurers who transacted business in 1961, 32 groups contravened the provisions four or more times during the years from 1956 to 1961 and 23 of these groups were warned once or more during the period 1956 to 1960. The groups of insurers who spent less than the basic limits in terms of Rule 17E of the Insurance Rule, 1939, wrote a greater proportion of the total gross direct premium income in India in 1961, compared with 1960. The aggregate experience of all groups showed that there was a sharp rise in savings in 1961, compared with 1960.

NET PREMIUM INCOME OF INDIAN INSURERS

(In Rs. crores)

	In India	Outside India	Total
1956	9.06	10.53	19.59
1957	11.06	11.59	22.65
1958	12.98	12.02	25.00
1959	15.02	13.32	28.34
1960	18.58	14.44	33.02
1961 (Estimated)	23.64	15.97	39.61

Current News and Comment

New Government Loans

The Government of India has announced the second instalment of its borrowing programme. Early in May, two loans—4 percent 1969 Loan at an issue price of Rs. 99.50 and 4½ percent 1986 Loan at par—were offered for converting the 3½ percent 1963 Loan and the 3 percent 1963-65 Loan. The total subscriptions amounted to Rs. 138.79 crores. Of this, the short-dated loan mopped up Rs. 85.69 crores and the long-dated one Rs. 53.10 crores. Since the 1963-64 Central Budget has provided for a total borrowing of Rs. 393 crores, including Rs. 6 crores collected from the National Defence Bonds, it was expected that the Government would soon float further loans for cash subscription to complete the borrowing programme. Now that money market conditions have become easier following the commencement of the slack season, the time is ripe for floating the new loans. During the past week or so, the Reserve Bank has been grooming the market. It had stopped selling Government securities and raised its purchase prices for some selected ones. So the announcement of the new loans has had little effect on the market.

Two loans are now being offered. A further tranche of the existing 4 percent Loan 1969 has been issued at Rs. 99.50, repayable on 8th May, 1969. The other is a 4½ percent Loan 1973, which is being issued at par and is repayable on 22nd July, 1973. In addition to cash subscriptions, the holders of several State Government loans have been given the option to convert their existing holdings, which have matured, into the new loans. It may be recalled that during 1963-64, the State Governments will not borrow on their own account, but will be allocated Rs. 100 crores out of the total borrowings by the Central Government. The State Governments will have to repay some of their existing loans to the extent of about Rs. 39 crores.

The terms and conditions of the new loans are in line with market expectations, except for the fact that this time the Government has not floated any long-dated loan. The sum of Rs. 225 crores, which is to be borrowed now, is also somewhat below earlier expectations. Whether this has been deliberately done in order to borrow again later in the year, it is premature to say now. The running yield of the 4 percent 1969 Loan works out to 4.02 percent and the redemption yield to 4.10 percent. The 4½ percent 1973 Loan is being offered at par. Hence the terms and conditions are broadly in line with comparable existing securities, although the issue prices are somewhat lower than the prevailing quotations.

The response to the new loans is more or less assured, considering that the banking community has recently been keen on increasing its investment portfolio to conform to the legal requirements of liquidity. Banks are likely to invest substantially in the short-dated 4 percent 1969 Loan. On the other hand, the Life Insurance Corporation, provident funds and other financial institutions are expected to be the major subscribers for the 4½ percent 1973 Loan. This loan meets the requirements of investors who have hitherto supported the State Government loans. Although the total borrowing of the Government so far is somewhat lower than the budgeted figure, the money market is likely to feel its impact for some time to come. The busy season has ended, but banking funds continue to be well employed. Actually, there has been a shortage of credit due to the fact that the pace of deposit growth in recent months has fallen behind the demand for funds.

Prospects for State Finances

During the past few years, some State Governments have not only depleted the securities in their cash balance investment account but have also resorted to unauthorised overdrafts from the Reserve Bank. So the total negative balances of the State Governments increased by Rs. 10 crores in 1962-63 and are expected to rise further by Rs. 61 crores in the current financial year. The Central Finance Minister, Mr. Morarji Desai, warned the State Governments in his Budget speech that in future such unauthorised overdrafts would not be honoured by the Reserve Bank. But in spite of this warning, the State Governments—especially those of Kerala, Bihar and Madhya Pradesh—continue to overdraw. The Reserve Bank has warned them that they have crossed the ceilings fixed for granting them overdraft facilities. This is a disquieting situation and should not be allowed to continue. The State Governments are having deficit Budgets, and the total overall deficit in the first three years of the third plan for all the States taken together is expected to be Rs 170 crores, against only Rs. 114 crores for the entire second plan period and Rs. 85 crores for the first plan period. In order to meet the deficit, the State Governments have obviously resorted to overdrafts.

The best thing for the State Governments to do would be to increase their tax revenues and economise on their expenditure. In their 1963-64 Budgets, the State Governments levied fresh taxes or increased the rates of existing taxes to yield an additional revenue of Rs. 33 crores. Including the additional taxation levied in the first two years of the third plan, it is expected that the State will be able to raise an extra revenue of Rs. 435 crores over the third plan period, against the target of

Rs. 610 crores. There seems to be still some scope for an increase in taxation in such States as Bihar which have not levied any new taxes in their 1963-64 Budget. However, since the Central Government has already imposed heavy, fresh taxation in the 1963-64 Budget in addition to introducing the compulsory deposit scheme, the scope for further taxation by the State Governments has been reduced to some extent.

The Central Government is reported to have agreed to give the States special loans to clear their overdrafts with the Reserve Bank on condition that such special loans should be repaid in instalments before the end of the third plan. For this purpose, the former had given special loans to the latter amounting to Rs. 30 crores in 1961-62 and Rs. 74 crores in 1962-63. But they have not yet been returned even in part. It is, therefore, doubtful whether the States will be in a position to return such loans proposed to be granted now. In view of the changing situation, there is a case for a fresh consideration of the financial relations between the Centre and the States in order to avoid excessive deficit financing by the State Governments in future and to prevent their taking unauthorised overdrafts from the Reserve Bank.

The State Governments, meanwhile, should economise on their development and non-development outlay. In their 1963-64 Budgets, some State Governments announced economy measures in their non-plan outlay by postponing constructions of a non-essential nature, curtailing travelling allowances and other facilities to Government officials and by reducing the staff strength in certain departments. But these measures cannot reduce the total expenditure of the State Governments by more than Rs. 10 crores in 1963-64. With more vigorous effort, it has been estimated, it should be possible to slash their expenditure up to at least Rs. 30 crores.

Woollen Industry Serving Defence Needs

The chairman of the Federation of Woollen Manufacturers in India, Mr. R. K. Birla, addressing the Federation's annual meeting last week, said that the entire installed capacity of the industry had been geared to defence production. The industry has been entrusted with the responsibility of purchasing its own raw materials for which the requisite foreign exchange has been made readily available. Production and exports of woollen fabrics have shown a welcome improvement in 1962-63, which suggests that the industry can do the job if it is supplied with the requisite materials. Although India produces about 72 million lbs of raw wool, the industry continues to be dependent almost entirely on imports for the manufacture of fabrics because Indian wool is good only for carpets, and at best for making rough tweeds and blankets. But imports of wool have had to be restricted because of the acute foreign exchange shortage with the result that until the emergency, the industry was unable to use even half of its installed capacity.

The supply of raw materials of the right quality is not the only major problem of the industry. It is badly in need of modernisation and rehabilitation, which, on the basis of current prices, will cost nearly Rs. 15 crores, against the third plan estimate of Rs. 10.5 crores. In his address to the Federation, Mr. Birla said that the industry had the capacity and the know-how for making fine goods, and could compete with the best in the world, but this would not be feasible unless the industry was given the facilities to modernise its machinery. The industry is being asked to earn the foreign exchange needed for modernisation and rehabilitation through the export of its fabrics, hosiery and yarn. But the question is how can the industry successfully compete in the export markets when its existing machinery is obsolete and outdated.

The export target for woollen goods, excluding raw wool and carpets, has been tentatively fixed at Rs. 5 crores of hosiery, Rs. 2.5 crores of fabrics and Rs. 50 lakhs worth of blankets, yarn, etcetera. The moment this target is achieved, the problem of raw material will be automatically solved. But considering that the exports of woollen goods, excluding raw wool and carpets, are at present of the order of less than Rs. 1 crore, it would perhaps be too optimistic to think that the Rs. 8-crore target could be realised in the near future. Improved combing facilities within the country will, however, enable the industry to consume more of indigenous wool, but it will be many years before India is able to produce good quality wool comparable with the Australian or New Zealand "marino". Imports of quality wool for making fine fabrics for domestic and foreign markets will, therefore, have to be continued for quite some years.

Mr. Birla referred to the industry's voluntary control over the prices of finished products, but he was frank enough to admit that the prices of woollen and worsted cloth in India were quite high in comparison with international prices of similar types. However, he held out the assurance that Indian prices could be brought down through modernisation and rehabilitation and larger production. Mr. Birla was very critical of the installation of unauthorised combs, spindles and looms, as the present installed capacity for all kinds of spindles and looms was sufficient to achieve the third plan targets. The Textile Commissioner, Mr. R. Doraiswamy, assured the Federation that the Government would not allow unauthorised installations to exist and that such unauthorised combs, spindles and looms would be sealed soon. Mr. Doraiswamy welcomed the industry's decision to amalgamate the existing two associations into one strong body.

Accelerating Economic Growth

The speech of Mr. Bharat Ram, president of the Federation of Indian Chambers of Commerce and Industry, at the Federation's Regional Conference in Hyderabad contains some practical suggestions for accelerating the rate of India's economic growth. It is disquieting that in the first two years of the third plan, the growth rate in India was only 2¼ percent, and the trend in the first quarter of the current financial year shows that it might not be much higher than 2¼ percent in the third year of the present Plan. Because of a number of adverse factors, India's industrial and agricultural production is not showing the desired buoyancy. Unless some definite measures are taken, it might be difficult to lift the economy out of the morass into which it seems to have fallen..

Mr. Bharat Ram's suggestion that the present imports of foodgrains worth Rs. 130 crores a year could be reduced if some Rs. 20 crores were diverted to importing fertilisers and fertiliser plants is basically sound. According to his calculations, since 1 lb of fertilisers would increase the production of foodgrains by 10 lbs to 15 lbs and since the prices of foodgrains and fertilisers a ton are more or less equal, an import of one unit of fertilisers would do away with imports of at least 10 units of foodgrains. In the process, agricultural production in the country would be increased, thereby quickening the rate of growth. But the snag in this is that merely importing fertilisers or even distributing them over the country would not suffice. The important thing is to make proper use of the fertilisers to increase the productivity of land. To solve this difficulty, the president of F.I.C.C.I. has suggested for the first time that "we, in the non-agricultural sector, should take a deeper interest in our agriculture and consider whether we could also, in some manner, participate in agricultural development schemes".

Indian agriculture is in the private sector, but private enterprise proper has not yet taken a keen interest in the rehabilitation of farming. If entrepreneurs take some interest in agricultural development, there is no reason why the productivity of land should not increase. In further support of his argument, Mr. Bharat Ram pointed out that industrialists and business men have a direct interest in the development of agriculture, since the market for their own product must ultimately depend on an increase of the agriculturist's purchasing power. It remains to be seen what efforts the president of F.I.C.C.I. will make to give a practical shape to his otherwise excellent suggestion.

Concerning industry, Mr. Bharat Ram pointed out that, as against the monthly average of 112 new licences granted in 1961, the number declined to 103 in the first half of 1962 and further to 80 in the second half. The number of licences recently revoked on account of non-implementation has reached a rather alarming level. The main reason for the non-implementation of these licences was not unwillingness on the part of industrialists or lack of enterprise, but their utter helplessness. The new taxes proposed in the last Central Budget have unduly increased industrial costs in the country.

The restrictions which the Government has placed on the profitability of the corporate sector, have done great harm to India's economy. Mr. Bharat Ram's plea that the tax system should be rationalised in the interests of accelerating the rate of growth, deserves careful consideration of the Government. The increase in industrial production is closely related to an increase in the country's foreign trade. In this connection, Mr. Bharat Ram has emphasised the need for removing all tariff and non-tariff barriers to the trade of developing countries like India.

Road and River Transport

Unlike the railways and shipping which have kept up a fairly steady rate of expansion, the progress made by inland water and road transport has been rather slow, although because of the Chinese aggression, there has been a noticeable spurt in road-building activity over the past few months in the northern States of Bihar, Bengal and Assam. India has still less than 40 miles of road and 50 vehicles for every 100 square miles of area, while the U.K. and the European countries have over 200 miles of road and 2,000 to 7,000 vehicles for the same area. In his presidential speech at the annual meeting of the Indian Roads and Transport Development Association in Bombay last week, Dr. F. P. Antia stated that production visualised in the third plan would generate demand for 330 million tons of long-distance transport to which emergency has added another 75 million tons. The railways have been geared to handle about 260 million tons, and the remaining 115 million tons has inevitably to be carried by road and inland water.

Even if inland water and road transport were to double their capacity of the second plan during the current five-year period, there would still be a gap of some 75 million tons. Dr. Antia observed that road transport would need to expand over eight times to fill the gap between demand and availability. He listed various factors which had been impeding the development of roads and road transport, and made a pointed reference to the heavy burden of taxation. In 1951, the road transport industry contributed less than Rs. 50 crores to the Government's revenue, but at present its contribution is of the order of about Rs. 240 crores. Dr. Antia stressed the need for a change in the approach of the Central and State Governments towards road transport and the vehicle manufacturing industry "from one of suspicion and hesitation to one of extending healthy and positive encouragement to them."

The Central Minister for Shipping, Mr. Raj Bahadur, assured the Association that the Government was fully aware of the importance and the need to develop roads and road transport in the country but expansion was being held up mainly because of inadequate financial resources. He said that the industry's proposal for setting up a road board on the lines of the Railway Board bristled with many difficulties, and it would be premature to give it a final shape at the present time. Meanwhile, the Government is constituting a study team with representatives of the Central and State Governments to examine how "irritation and delay", which taxation at several points on inter-State routes causes, can be avoided and what arrangement can be made to assess and recover all the taxes at the terminal points of an inter-State route, and divide the proceeds thereafter on a basis acceptable to all the States concerned. Mr. Raj Bahadur added that the Government was trying to remove some of the vexatious restrictions from which inter-State transport has suffered, in order to facilitate the flow of trade and traffic within the country.

Moreover, since the manufacture of motor-vehicles was not increasing at the rate at which it should in order to achieve the plan target of

60,000 vehicles, the Government, Mr. Raj Bahadur said, had recently taken measures which would shortly lead to a rapid increase in the output of vehicles and indigenous components. Manufacturers had been asked to step up the indigenous content of the vehicles to at least 90 percent by the end of 1963-64. The required foreign exchange for importing capital goods has already been released, and the necessary equipment and machinery is expected to be received and installed in the course of the current year. Steps are also being taken for developing ancillary industries by similar assistance in the import of capital goods. Referring to the transport industry's complaint about heavy taxation, Mr. Raj Bahadur observed that taxation was related to the "paying capacity", but if the industry felt that the strain had become unbearable and a stage had been reached when any further levy would prove a disincentive, it had better establish its case with adequate data supported by factual studies.

As for inland water transport, the Minister said that in India, unlike in most other countries, the claims of irrigation had necessarily to be reconciled with those of navigation. Moreover, the waterways, except in Kerala and Assam, were fed mostly by the monsoon. Effective steps are being taken to develop inland water transport in Kerala and Assam. The Government is considering the possibility of controlling the flow of water on the Brahmaputra, and extending navigation by mechanised craft up to Dibrugarh. As for the Ganga, an experiment in push-tow, which is in vogue in the U.S.A. and Europe, has been tried and found to be technically feasible, but it remains to be seen whether river transport can commercially hold its own against the well-developed rail and road transport systems in the region. The Government proposes to set up a directorate to study how best inland water transport can be developed and in which parts of the country it will be welcomed widely.

Gold Control Rules Amended

Contrary to Mr. Morarji Desai's claim, the Gold Control Rules have not succeeded in either bringing down the price of gold in India to the international level or in stopping smuggling. The amendments to the Rules, which came into force from 24th June, have undoubtedly filled some gaps, but they are unlikely to help achieve the main objectives of bringing down the price of gold and of preventing smuggling. Although the amended Rules have removed "some difficulties", as has been claimed by the Central Finance Ministry, they have also created some new ones for goldsmiths and dealers. The amended Rules lay down that all gold refineries should restrict the purity of any primary gold they produce to 14 carats. The production of primary gold of higher purity, except in special cases and with the permission of the Gold Control Board, has been made illegal. Furthermore, the existing stocks with refineries and dealers and any stocks which they may acquire should also be converted into gold of a purity not exceeding 14 carats within a period of seven days. The object of this restriction is to prevent smuggled gold from finding its way into the hands of refiners and dealers.

The amended Rules have imposed undue hardship on gold dealers and refiners. The period of seven days, allowed for converting all stocks into 14-carat gold, was much too short. There is not enough capacity in India, especially in the interior areas, for refining gold. Although the amended Rules provide for the licensing of non-power refineries in areas which are not yet served by refineries, it will take some time to create additional refining capacity. Some dealers, especially in big cities, have to supply 24-carat gold to industrial consumers and other permit-holders. The amended Rules should have allowed these dealers to hold high purity gold to the extent of their commitments without the necessity of obtaining a permit, since the consumers concerned already hold a permit from the Gold Control Board. One of the results of the amendment has been that a market for 14-carat gold has already come into existence in bigger towns. Gold of 14-carat purity, it is reported, is now selling in Bombay at Rs. 66.50 to Rs. 67 for 10 grams whereas in the past different dealers were charging different prices.

An important provision in the amended Rules is that the manufacture or sale of ornaments and the lending of money against gold and gold ornaments should be carried on in separate premises. The object of the provision is apparently to prevent gold ornaments of higher than 14-carat purity from being manufactured and then passed on as pawned articles. The amended Rules also empower the Government to regulate the return of pledged or pawned gold ornaments to the extent necessary to check the evasion or contravention of various provisions of the law. But there is nothing in the original Gold Control Order or the amended Rules to prevent smugglers from bringing into India gold ornaments of 22-carat or 24-carat purity.

Moreover, although the Rules prohibit the manufacture of ornaments of more than 14-carat purity, a satisfactory method has not yet been devised to enforce it. It is an open secret that such ornaments continue to be manufactured on a large scale. Although the original Order as well as the amended Rules provide for "any officer authorised by the Board to stop any vehicle, animal or vessel or, in the case of an aircraft, compel it to land, or even to fire upon it and to search, capture and confiscate," the Government has not evolved an honest and efficient enforcement machinery.

Maharashtra Financial Corporation

In rendering financial assistance to the corporate sector, especially the small and medium-scale concerns, the Maharashtra State Financial Corporation can take credit for having played an increasingly important rôle, as the rise in the number of applications and the total amount involved testify. The Corporation had crossed the Rs. 10-crore mark for sanctioned loans by the end of March last, and the total loans disbursed since its inception up to March 1963, aggregated Rs. 6.28 crores. The Corporation was able to pay the guaranteed dividend out of the year's profits without having to seek any subvention from the State Government. While the demand for funds has been growing, the resources at the disposal of the Corporation have been limited. Last year, the Corporation has had to replenish its resources by borrowing from the Reserve Bank and from the Refinance Corporation for Industry. The Corporation has also started accepting deposits.

Speaking at its annual meeting last week, the chairman, Mr. Purushottam Kanji, indicated that the Corporation proposed to raise about Rs. 1 crore through public deposits to meet the current year's financial needs estimated between Rs. 1 crore and Rs. 2 crores. He referred to the suggestion made at the conference of State Financial Corporations held in February, that the needs of these institutions might be considered and included in the loans floated by the Central Government so that the Corporations are relieved of the difficulties of tapping the market. He also referred to the rising trend in the rates of interest and suggested that the Corporation should fulfil the main purpose of making resources available at reasonable rates even when the rates of other commercial banks may be relatively high. He reiterated his earlier suggestion for setting up unit trusts to give financial assistance to the fast-growing industries in the country.

Mr. Kanji said that last year the Corporation had a branch in Aurangabad which is an industrially backward area of the State. In opening this branch, the Corporation was not prompted by the profit motive but by the desire to come in close contact with the industrialists in that area. The Corporation has plans to open more branches in the near future. Since its inception, 343 concerns have received financial assistance from it, out of which 61 concerns have repaid their borrowings in full; this suggests that the concerns receiving loans have been doing well.

M.P. Financial Corporation

The Madhya Pradesh Financial Corporation reports fair progress in its activities during the year ended March 1963. It received 138 applications for loans for a total amount of Rs. 4.54 crores, against 127 applications for Rs. 1.83 crores in the preceding year. Total disbursements at Rs. 94.90 lakhs set a new record, and showed an appreciable improvement over the previous year's figure of Rs. 33.68 lakhs; disbursements in 1961-62 were limited mainly because of lack of adequate funds. The total number of applications for loans sanctioned by the Corporation since its inception up to 31st March, 1963, is 221 for an aggregate sum of Rs. 5.82 crores, and disbursements amounted to Rs. 1.99 crores to 116 applicants. Loans outstanding at the end of the year ended March 1963 amounted to Rs. 1.51 crores. The Corporation has made a profit of Rs. 4,18,633 for 1962-63, against Rs. 4,11,448 for the preceding year. Out of this, a sum of Rs. 41,000 has been credited to special reserve account, leaving a net profit of Rs. 4.11 lakhs.

The directors have decided to augment the Corporation's resources by borrowing Rs. 1.5 crores in order to meet the growing demand for loans. Negotiations for a loan of Rs. 50 lakhs have already been concluded with the Reserve Bank, and bonds worth Rs. 1 crore are likely to be issued some time in August. According to certain rough estimates of the Corporation's financial requirements, it will need to borrow Rs. 1 crore in 1963-64, Rs. 1.5 crores in 1964-65 and Rs. 2.5 crores in 1965-66. The Board has decided to impose a commitment charge of 1 percent for every six months' extension of the sanctioned loan, if it is not availed of within one year of communication of the sanction. In granting loans, the Board has decided to give top priority to defence-orientated industries. The second priority is to be accorded to industries which have good export potential and involve minimum of foreign exchange expenditure.

Dollar Stocks in the U.K. Treasury

THE British Treasury releases no more than the minimum of information concerning its holdings of dollar securities, but the sale of 2½ million shares in the Shell Oil Company of New York was too big to be kept secret. It has drawn attention to an element in the sterling area's reserve that is undoubtedly important but difficult to assess, and it has raised demands for fuller information on the dollar holdings. The Treasury has, of course, denied that there is any particular significance in that particular transaction. It did not offer the shares for sale: the Royal Dutch/Shell group, already controlling Shell Oil, approached the Treasury with a proposal to buy them. But some people in the City of London believe that the Treasury was glad of the opportunity to diversify its holdings and to make its portfolio of dollar securities more flexible.

The proceeds of the sale, about £36 million, are not added to the published reserve of gold and convertible currencies; they are reinvested in other dollar securities. The Treasury's dollar securities were acquired in special circumstances, and they have always been regarded, hitherto, as a special category of reserve. They were acquired during the second World War, when the British Government had to provide collateral for a loan from the United States; the Government requisi-

P. Post.

tioned all private British holdings of dollar stocks. The loan was repaid in 1951, but the collateral has been retained, as a special reserve against some such special contingency. The reserve is managed as an investment trust. The value of the particular loan for which this special security was required —in 1941—was $425 million. The present value of the Treasury's dollar investments is probably well over $1,000 million. The only relevant information given in the Treasury's statistical statements has shown the value to be in the $750 million to $1,250 million range. What stocks the investment trust comprises has not been revealed since 1951, and the portfolio has doubtless been extensively changed in 12 years. In 1951 it included General Motors, Standard Oil of New Jersey, Sears Roebuck, Woolworth and others to a total of more than 60. The City believes that changes are infrequent, but, even so, they could alter the character of the portfolio over a period of years.

If an investment trust of such size were used for short-term operations, secrecy might be necessary. But secrecy detracts from the psychological value of this reserve, and the City feels that as a policy it is wrong. The British taxpayer, if fully conscious of his rights, might feel that the Treasury should publish a list of the holdings at least once a year, so that he could see how competently, or otherwise, a part of the nation's resources was being managed. Evidence of competent mangement would impress opinion abroad. At present the world is not very interested in this important supplement to the published reserve. The holdings of dollar stocks would never be regarded as equivalent to the holdings of gold and currency. About nine-tenths of this reserve is gold, and devaluation of currencies, in terms of gold, could only increase the value of the reserve; whereas external influences—specifically, the movements of prices on Wall Street—change the value of the dollar stocks in either direction. Nevertheless, supplementary reserve that is approximately one-third of the value of the published reserve is an important factor in the sterling area's finances, and it should be recognised as such.

However, the effective value of this supplementary reserve is at presented restricted by a policy that treats it as a reserve for exceptional contingencies such as war. The City feels that it should be available for more normal financial contingencies such as a flight of foreign funds from London. And it will surely be needed to support the British Government's plans to restore London as a centre of international lending. It is arguable that the techniques of international collaboration in monetary affairs which have been developed comparatively recently have diminished the importance of first-line national reserves. But these techniques are intended to maintain the stability of currencies, and to promote international trade, rather than to help individual countries to achieve their national aspirations, such as Britain's aspiration to become again an important source of capital for foreign lending. The three-year loan of $20 million to the Belgian Government that attracted attention recently was financed through the Euro-dollar market, with short-term U.S funds. A long-term, even a medium-term, capital market could not be developed far on such an unstable basis.

It is necessary to strengthen the first-line reserve of the sterling area if London is to be promoted as a centre of international lending, and if sterling is to be used more extensively as a reserve currency abroad and as a medium of international trade. Inclusion of the dollar stocks in the first-line reserve would strengthen the whole financial position. Meanwhile, this huge investment trust is a valuable national asset on its own account. Properly managed, it is an important source of income, in an era when income from foreign investment is needed to strengthen the current external accounts of the nations that manage the reserve currencies. Whether the transaction that started this discussion—the sale of part of an investment in a major oil company—was wise in the particular circumstances cannot be sensibly debated in the absence of fuller information on the deal. But if it implies that the authorities are handling this investment trust more flexibly, it must be, in principle, approved.

CORRESPONDENCE

THE FOG OVER BOKARO

(To The Editor of "Capital")

Sir,

It was with "capital" interest that I read your pen portrait, as it were, of "The Fog over Bokaro" and I write to take my hat off to you for the following very appropriate comment :

> "Mr. J. R. D. Tata has gone out of his way to urge the U.S.A to support Bokaro during his recent visit to that country. Mr. Bharat Ram, president of the F.I.C.C.I. also lent a hand when he was recently in New York."

But the tragedy remains that the good-natured and highly sensible efforts of these leading industrialists to carry conviction to the U.S.A. are neutralised and nullified by the indiscretions of our politicians who are seldom as gracious and grateful as they might have been and, indeed, should have been in their frequent references to that great country which, without any political obligation to do so, has helped India much more than all the Commonwealth countries put together. It is a pity that we Indians never see ourselves in a mirror; we seldom pause to reflect on the likely effect of our words and deeds on well-meaning foreign Governments and people, and we usually tend to be niggardly in our expressions of gratitude, as if a liberal use of the more pleasant expressions in the English language would eat up our foreign exchange. Incidentally, Mr. Krishna Menon's record in irritating America is equalled —I sometimes think, even excelled—by the performance of more than one public figure in this country. American hesitation and half-heartedness is inevitable.

Our wooing of America has not been gentle—or gentlemanly. No girl likes to be told that there are other girls waiting for one to flirt with. And not all girls are overfond of long coats and *chooridar pyjamas* and a cap that not merely covers but covers up much. If we Indians are a sensible, practical people, our approach (in the case of our politicians) to the English language and western clothes would have been more rational than national. And if it had been, we would have got along much better with the West.

With renewed appreciation of your exemplary editorial efforts.

Yours etcetera,
C. Balan

New Delhi, 21st June, 1963.

DIRECTORS OF AGRICULTURE

THAT the Government of India are waking out of their sleep is evidenced by the fact that thoroughly-equipped Directors of Agriculture are being appointed to every Province, but I would like, incidentally, to observe that these Inspectors and Directors are not to be considered as immaculate in all their opinions, nor should the Government treat the dictum of an Inspector-General on any particular question as being of an absolutely infallible nature, and frame their action accordingly. The manner (short sighted, I believe it to be) in which they recently treated the suggestion that some experimental machinery for crushing cotton seed, should be obtained from America, with a view of opening up a large industry in oil and cotton-seed in India,—an industry which would enable India to retain the by-products for cattle food and for manuring the land, is by no means reassuring. If their attention had been called to some new gun for the destruction of life, it would have been indented for with alacrity. The Inspector-General of Agriculture is not the man whose opinion ought to have been sought in this matter at all. He has got to see how the largest crops of the best quality can be produced. Their future manipulation belongs to another class of experts altogether. The Government ought to listen to the recommendations of the Chamber of Commerce for Upper India, and get the experimental machinery referred to without any delay.

FROM
CAPITAL

A Ditcher's Diary

As one looks at the all-powerful provincial satraps—Nadar in Madras, once Roy in West Bengal and Chavan in Bombay—one gets the notion that New Delhi's authority is dwindling daily. And the list of things New Delhi has not been able to persuade various States to accept is indeed long. Yet signs to the contrary are not altogether lacking which brings me to the unseemly row in progress between Kerala's Chief Minister and its State Congress President. The latter referred the allegations against the former to Mr. Nehru, while Mr Shanker himself proceeded to the capital. This double Delhi-ward look does not necessarily mean that New Delhi is supreme; but it does show that when the opposing forces in a State are evenly divided and neither is obviously decisive New Delhi has a part to play. The part may not, however, be decisive, for it is not easy to see Mr. Nehru giving a firm verdict. Will Mr. Lal Bahadur Shastri? I don't know. In retrospect it seems by no means doubtless that the Centre acted decisively in dismissing the communist ministry and introducing President's Rule. The issues decided themselves in Kerala itself where under Mannath Padmanabhan the agitation assumed considerable proportions. While the Congress can be utterly uncompromising with other political Parties, and it usually is, it can be equally hesitant about resolving disputes between factions within. It is difficult, for instance, to believe that, at a given point, the Congress will know whether to back, in West Bengal, Mr. P. C. Sen or Mr. Atulya Ghosh. (I imply no rivalry between the two.) Similarly, in Kerala, New Delhi may find it hard to choose between Mr. Shanker and Mr. Govindan Nair. In Bihar, with the deaths of the two Sinhas, Srikrishna and Anugrahanarayan, the two factions did not disappear; they still flourish under other leaders. The Congress High Command looks on. In Andhra Mr. Sanjeeva Reddy and Mr. Sanjeevaya fight an open duel. There is no referee. These instances would be multiplied almost indefinitely. The more one look at the Congress, the more a Yeats quotation presses itself upon me: "Things fall apart/The centre cannot hold". Messrs Shanker and Nair may yet have to go back to Trivandrum and fight it out there. New Delhi will bless the winner, whoever he may be.

It seems as yet uncertain whether Sirajuddowla of the Battle of Plassey or Mr. Serajuddin of the Battle of Bhubaneswar will have a more lasting place in Indian history. The manner in which Mr Biju Patnaik, Chief Minister of Orissa, and Dr Harekrushna Mahatab, former Chief Minister of the same great State, have been washing in public the dirty linen of each other is making it daily more difficult to decide just who washes blackest. It seems pretty obvious, however, that some business men in India have been distributing largesse to politicians almost as indiscriminately as Miss Christine Keeler distributed her rather different sort of favours. Since so many have so much to hide, it is not easy to take Dr. Mahatab altogether seriously when he says that, if Mr. Patnaik goes any further, he will demand a judicial enquiry, although I am all for it. The more we know of these goings-on the more we must feel how much more we don't know. But when I hear too many chuckles in business circles I get an uneasy feeling that not all the mud is sticking to politicians alone; the "image" of business has suffered too. When these individual cases have been settled, as they will be one way or another, the question of finding funds for political Parties will still remain. The Congress has become an enormous and highly expensive organisation; even if everything were above board and everybody honest, it would still require a good deal of money to work between and during elections. Where is this money to come from? Membership fees add up to little. The Congress has no T.U.C., as the Labour Party in Britain has; trade unionism is still undeveloped and the unions themselves need money and probably get it from political Parties or other patrons. There are no legal objections to donations from companies; many raise moral objections. Like Damon Runyon's bums, Indian political Parties do the best they can for living; and the best is not always good. As the largest Party in the country, it is for the Congress to find an answer to this basic question; and let us hear in Parliament what ideas the Opposition has on the subject. Particular scandals are far less important than the main dilemma.

When Australia goes over to a decimal coinage, which will be shortly, Britain alone among the richer countries of the world will be left with the old system. My guess is that she will not be able to retain it for much longer: and there has already been a good deal of discussion as to what name to give a new unit to replace the pound. But why replace the pound at all, one may ask; surely it is possible to have a decimal coinage without? So it is: but the general opinion seems to be that the pound is rather a large unit for modern use and that one equivalent to half its value would be more appropriate. I am inclined to agree, but that is where the question of a name comes in because simply to affix the old one would give the impression of devaluation externally and might lead to inflation internally. Some of the names suggested so far have been plainly factitious: "tenner" and "quidlet" for example. No doubt a new unit will attract its nicknames, but for normal purposes a more dignified title is needed. Some have suggested a "royal", or an "elizabeth", perhaps inevitably seeing this is a British affair. I have also heard "britannia", or its shortened form "brit". Not very inspiring these at all. Personally I would prefer "crown". It is a name which has been connected with the British coinage in past years, and, because it is still remembered as having had the equivalent value of five shillings, it could presumably claim psychological advantages for the same reasons as to call the new unit a pound would have disadvantages. It is also short, and would satisfy the British passion for involving royalty. "Sterling" might be another good title, although from the financial journalist's point of view it has the drawback that it would halve the present choice of words used to describe Britain's currency. But then, why not "new pound"? India used this form for her *paise* and France for her reformed franc. It is a bit cumbersome, perhaps, but the adjective can always be discarded later when everybody has got used to it. I think it would be a pity to drop the word pound altogether; as originally referring to a pound-weight of silver, it can be traced back to the Roman *libra*. But whatever title is chosen, I doubt now whether it will ever be a "mac".

So "the pill" has arrived at last. I am told that it is already on sale in Britain, although so far only against a doctor's prescription. The question now is how soon it can be made available here, because if we are in for some years of acute food shortage, and I suspect we are, it might help a little. I specify a little for the good reason that whatever happens at the lower end of the population scale, "the curse of western medicine" will continue to ensure an expansion at the upper end for some considerable time yet. The best that can be hoped for is that the rate of population growth might be slowed down slightly, and even that would be welcome. I suggest that, for a start, New Delhi might put the pill at the head of its list of foreign aid requirements for the future, because in military and economic terms it could be worth several fully equipped army divisions or even a steel plant or two. For several reasons the official attitude towards contraception in India has been rather less than wholehearted, although it has not been as lukewarm as in some other countries where the population problem is no less serious. This is perhaps natural enough. Birth control comes up against some pretty fundamental instincts in human beings. Even in the

West the advent of the pill has not been without its reactions. One of the most interesting is that it might lead to a radical change in the balance of population between East and West if one half of the world takes it and the other half does not. My only answer to this is that, pill or no pill, the next few years are going to see a huge, disproportionate growth of numbers in favour of the East anyway. Besides, the history of contraception so far surely proves that in itself it makes little difference to long-term population trends. It merely permits families to be controlled according to economic circumstances; when incomes increase so then do families, usually. The proof of this is the fact that the U.S. birth-rate has increased steadily since the 1930's and at present France, Germany and Britain are all recording their highest birth-rates for generations. In themselves, numbers are of neither economic nor military value; it's the quality behind them that counts. That is why I never have had time for people who seek to rationalise their primitive unconscious prejudices against birth control in specious arguments about the greater opportunities for division of labour and the more ready availability of cannon fodder.

THE STRACHEYS, I AM AFRAID, WILL NEVER GET India out of their system; and John Strachey, Labour M.P. for Dundee, could not resist the temptation of including in his latest book, *The Strangled Cry*, a few pieces on India. He writes of Indian architecture with a measure of becoming diffidence; but I find him constantly interesting in the essay called "A Temple of Love". He does not write of Konarak alone and has tantalising asides on Calcutta and New Delhi. The latter he compares with Akbar's Fatehpur Sikri. "In fact I am", he says, "inclined to think that it is only that apparently unavoidable snobbery for the old, from which we all suffer, that prevents us comparing the New Delhi buildings quite favourably with Akbar's job at Fatehpur Sikri . . . The truth is that neither New Delhi nor Fatehpur Sikri are major works of art; they are both handsome and splendid public works". He dismisses Calcutta as "semi-commercial" but observes: "It is true that in Calcutta our Governors and Governor-Generals were continually being potted at by pious Bengali nationalists; but then they seldom hit them. Instead we set up a bogusly Viceregal establishment at New Delhi. It was aesthetically a success, politically an error: the opposite of the usual British form". Strachey then refers to the many theories he heard, frequently from Indians, on what might have prevented Britain from "losing" India and correctly rejects them all. He was a member of the British Government that passed the Independence of India Act and says, " . . . the fact is that we left India because, in the inimitable Chinese phrase, we had 'exhausted the mandate of heaven'." I rather like this divine theory of decolonisation, although I remain of the view that the story might have been very different if a Tory Government had been returned in 1945. The end of the story is not in doubt; there is a certain inevitability about these things; but the manner and speed of reaching it would have differed materially. Incidentally, Strachey has a couple of interesting pieces on Professor Galbraith too, with whom he went to Konarak, although the U.S. ambassador is not mentioned by name. You know it just the same from the references to Harvard and his extraordinary height!

THIS INSTRUCTIVE REVIEW OF A CUBAN HIT AT THE Moscow Circus some time ago comes from *Moscow News*:

"The plot's simple; a gay carnival suddenly terminates in a murder—the popular teacher Juan is mortally wounded; a handful of saboteurs are setting fire to sugar plantations. The people decide to root out the counter-revolutionaries. Pepe the fisherman and his friend Pedro get into the enemy's stronghold and cut off their retreat by blowing up a rock. The People's Army soldiers come to their aid, disarm the saboteurs and the remnants of the routed gang drown in a gushing waterfall."

THE DITCHER

Guide for Investors

McLEOD TEA GROUP: ALL BUT ONE FARE WELL

THE results of the McLeod group of tea Companies for the year ended December 1962 have been published. The profit of Bhatkawa Tea Co. Ltd (a Dooars garden) has increased from Rs. 2.95 lakhs in 1961 to Rs. 5.78 lakhs in 1962, after providing Rs. 1.30 lakhs (against Rs. 1.24 lakhs) for depreciation. The taxable ordinary dividend has been raised from 15 percent to 20 percent, absorbing Rs. 1.80 lakhs. The yield is 11.1 percent at the present price of Rs. 18 a share of Rs. 10 each. Taxation is allocated Rs. 2.36 lakhs, of which the super profits tax is Rs. 2,254. Tax provision was Rs. 1.22 lakhs for 1961. Development rebate reserve absorbs Rs. 1,334 (against Rs. 1,296). The carry-forward is Rs. 4,365, against Rs. 7.095 brought in. The crop rose from 593,617 kilograms to 700,569 kilograms, and the average sale price rose from Rs. 4.42 to Rs. 4.68 a kilogram. The 1963 crop has been estimated at 616.885 kilograms at a cost of Rs. 23.99 lakhs.

The profit of the Tyroon Tea Co. Ltd (an Assam garden) has improved from Rs. 2.55 lakhs to Rs. 7.11 lakhs, after transferring Rs. 1.82 lakhs (against Rs. 1.98 lakhs) to depreciation. The taxable ordinary dividend has been increased from 15 percent to 25 percent, absorbing Rs. 1.30 lakhs. It offers a yield of 7.6 percent at the present price of Rs. 33 a share of Rs. 10 each. After including Rs 90,000 for the super profits tax, tax provision is Rs. 4.26 lakhs (against Rs. 78,500). General reserve absorbs Rs. 270,000 (against Rs. 1 lakh), leaving a carry-forward of Rs. 1,024, against Rs. 66,662 brought in. The crop rose from 590,423 kilograms to 651,147 kilograms, and the average sale price from Rs. 5.14 to Rs. 5.76 a kilogram. A crop of 671,300 kilograms has been estimated for 1963 at a cost of Rs. 27.40 lakhs.

The Rajahbhat Tea Co. Ltd (a Dooars garden) has earned a profit of Rs. 2.15 lakhs, against Rs. 95,945, after providing Rs. 57,116 (against Rs. 60,779) for depreciation. A taxable ordinary dividend of 6 percent has been declared, absorbing Rs. 36,000. The dividend for 1961 was passed. The yield works out to 4.9 percent at the present price of Rs. 12.31 a share of Rs. 10 each. Taxation is allocated Rs. 75,500 and general reserve Rs. 45,000. The carry-forward is Rs. 4,384, against a debit balance of Rs. 47,427 brought in. The crop was 391,886 kilograms, against 363,864 kilograms, and the average sale price rose from Rs. 4.36 to Rs. 4.70 a kilogram. A crop of 362,900 kilograms has been estimated for 1963 at a cost of Rs. 15.14 lakhs.

The Bormah Jan Tea Co. (1936) Ltd (an Assam estate) has maintained the taxable ordinary dividend at 15 percent to absorb Rs. 1.13 lakhs. The yield is 10.5 percent at the present price of Rs. 14.25 a share of Rs. 10 each. The profit has risen from Rs. 1,52 lakhs to Rs. 1.87 lakhs. Taxation absorbs Rs. 2.08 lakhs (against Rs 89,000), development rebate reserve Rs. 2.215 (against Rs. 1,610) and machinery and buildings reserve Rs. 1.80 lakhs. The carry-forward is Rs. 14,236, against Rs. 1.29 lakhs brought in. The crop fell from 303,665 kilograms to 300.721 kilograms but the average sale price rose from Rs. 5 to Rs. 5.85 a kilogram. The 1963 crop has been estimated at 308,400 kilograms at a cost of Rs. 12.46 lakhs. The Tea Board has agreed to grant a long-term loan of Rs. 5.11 lakhs to the Company for expansion.

The profit of the Baghmari Tea Co. Ltd (an Assam garden) is Rs. 1.88 lakhs, against Rs. 1.61 lakhs, after transferring Rs. 1.01 lakhs (against Rs. 1.05 lakhs) to depreciation. The taxable ordinary dividend has been halved to 7.5 percent, absorbing Rs 41,250. It offers a yield of 6.3 percent at the present price of Rs. 12 a share of Rs. 10 each. Taxation is allocated Rs. 1.10 lakhs (against Rs. 66,000), buildings and machinery reserve Rs. 90,000 and development rebate reserve Rs. 1,500, (against Rs. 2,600). The carry-forward is Rs 2,926, against Rs. 54.594 brought in. The crop fell from 353,284 kilograms to 320,928 kilograms, although the average sale price was higher at Rs. 5.99 a kilogram, against Rs. 5.32 a kilogram. The Tea Board will grant a long-term loan of Rs. 4.49 lakhs to the Company for expansion.

The Ranicherra Tea Co. Ltd (an Assam garden) has earned a profit of Rs. 1.60 lakhs (against Rs. 1.90 lakhs), after providing Rs. 1.05 lakhs (against Rs. 90.733) for depreciation. The taxable ordinary dividend has been halved to 7.5 percent, absorbing Rs. 57,375. The yield is 5.5 percent at the present price of Rs. 13.62 a share of Rs. 10 each. Taxation is allocated Rs. 71,000 (against Rs 74,000), general reserve Rs. 1 lakh and development rebate reserve Rs 10,000 (against Rs. 80,000). The carry-forward is Rs. 2,737, against Rs. 77,666 brought in. The crop was 476,526 kilograms, against 503,638 kilograms. The average sale price rose from Rs. 4.32 a kilogram to Rs. 5.07 a kilogram. The Tea Board has agreed to grant a long-term loan of Rs. 5.92 lakhs to the Company for expansion.

Expansion Scheme of Goodyear India

IN his address at the annual general meeting of the Goodyear India Ltd in Calcutta last week, Mr. R. E. O. Carey, Managing Director, said that the rights issue had been deferred, not cancelled. (Fuller details are printed on a later page in this week's issue of *Capital*). The expansion scheme sanctioned by the Government is under the active consideration of the directors. Commenting on the outlook, Mr. Carey pointed out that the industry's productive capacity might be 4.5 million tyres and tubes a year by 1965 while the Planning Commission has estimated the demand at 3.5 million tyres and tubes a year by that time. So keen competition is welcome. Goodyear India is confident of selling all its products. Mr. Carey refers to the present unremunerative price structure for tyres and tubes. Since the prices have remained unchanged for a long time, the profits of the industry have been squeezed due to the rising production costs. The Government, it is hoped, will raise the prices in the near future. The Company has taken active steps to promote the export of its products.

Referring to the loss of Rs. 57 lakhs incurred during the year ended December 1962, Mr. Carey said that it had been due to the operations of the Ballabgarh factory which had to work below capacity due to the power shortage. Tyre curing is a continuous process which admits of no interruption. The processed raw materials have to be scrapped if a stoppage occurs. Mr. Carey hoped that the power shortage was temporary because active steps were now being taken to remove it.

The ordinary dividend has had to be passed again, but the financial position of the Company remains sound. The Company's equity capital is Rs. 2 crores backed by a surplus of Rs. 1.5 crores. It has adopted a profitable programme for the diversification of activities. Apart from the traditional lines of automotive accessories, industrial products, chemicals and adhesives, the Company has been marketing a new and wide range of products made to its specifications and design by small-scale industries. These products comprise bells and locks for bicycles, dock fenders and automotive batteries.

Bengal Paper Expands and Modernises

THE expansion and modernisation schemes of the Bengal Paper Mill Co. Ltd have made satisfactory progress. Most of the equipment have arrived or have been shipped. The new paper machine is expected to start production before the end of the current year. Commenting on the working of the Company (fuller details are printed on a later page in this week's issue of *Capital*) for the year ended December 1962 in his chairman's address at the annual general meeting in Calcutta last Friday, Mr. N. D. Bangur, said that in spite of higher production and larger gross profits, the Company's net profit is lower mainly because of heavier taxation. (The speech was read by a director since the chairman was absent at the meeting.) The costs of expansion and modernisation have moved up due to the increased Customs duty and higher prices of domestic cement and steel. So the ordinary taxable dividend has been cut from 27.5 percent to 20 percent. The Company has arranged to borrow more funds to finance expansion and modernisation.

Commenting on the prospects, Mr. Bangur said that at the end of 1965, the output capacity of the industry might not be more than 550,000 tons, against a planned target of 711,000 tons. The shortfall is due to the fact that several new units may not come into existence due to the high capital investment required and because of the unattractive return to the industry. The prices of paper and boards have been unrealistic in view of the rising production costs. So it is hoped that the Government will soon raise the prices to a more economic level. As for the supply of raw materials, Mr. Bangur has asked the authorities to grant long-term leases of forests to the paper industry for scientific development and exploitation. The Government of West Bengal should consider allocating sufficient waste lands to the industry for developing timber and grass plantations. Steps should be taken to ensure an adequate supply of other essential raw materials such as chemicals and dyestuffs at reasonable prices.

The Company's working has suffered due to the shortage of imported wood pulp, although production was 21,588 tons in 1962, against 19,627 tons in 1961. Measures have been taken to promote the export of the Company's products.

T.E.L.C.O. Repeats Dividend

NOTWITHSTANDING the Government's helpful policy for the motor-vehicle manufacturing industry under the stress of emergency and the Company's satisfactory progress in the implementation of its expansion schemes, the shares of the Tata Engineering and Locomotive Company were subjected to heavy bear pressure during the past few weeks. The selling was attributed to fears of a cut in the Company's dividend for the year ended March 1963. Although these fears have turned out to be wrong, the directors' decision to maintain the gross dividend at Rs. 14.50 a share has failed to impress the market as the quotation for T.E.L.C.O. shares has not noticeably recovered after the dividend announcement. This is partly because the net dividend works out to 87nP a share less than in the preceding year, and partly because the preliminary figures about the Company's working results suggest that the Company has not done quit so well.

The total turnover is higher at Rs. 43.64 crores, against Rs. 41.65 crores, but the profit before tax is appreciably lower at Rs. 3.28 crores, compared with Rs. 3.79 crores in the previous year. It is unfortunate that the directors should have omitted the figures for managing agents' commission and depreciation because the comission makes it difficult to assess the performance properly. However, the picture which emerges from the preliminary report appears rather unencouraging. The Company has had to draw Rs. 6 lakhs from the general reserve No. 1 for the payment of the proposed dividend, whereas in 1961-62 a sum of Rs. 25 lakhs was credited to this reserve. After providing Rs. 1.65 crores (against Rs. 1.88 crores) for taxation and Rs. 27.47 lakhs (against Rs. 40.18 lakhs) for development rebate, the net profit for 1962-63 is shown at Rs. 1.16 crores, compared with Rs. 1.51 crores in the preceding year. With Rs. 3.62 lakhs brought forward and transferring Rs. 6 lakhs from the general reserve No. 1, the disposable surplus amounts to Rs. 1.25 crores. The directors have taken Rs. 1.25 crores to the dividend reserve out of which are to be paid the proposed dividends which absorb Rs. 1.25 crores, leaving a sum of Rs. 15,000 to be carried forward. The gross distribution of Rs. 1.16 crores to the equity shareholders includes Rs. 24.57 lakhs, being profits under Section 84 of the Income Tax Act 1961, while the corresponding tax-free profit of the previous year was Rs. 47.61 lakhs. The result is that the net dividend in the hands of the shareholders works out to Rs. 11.07 a share, against Rs 11.94 a share in the preceding year.

Elphinstone Goes Ahead with Modernisation

LIKE several other units in the textile industry, the Elphinstone Spinning and Weaving Mills fared badly in 1962. The gross profit fell by nearly 28 percent from Rs. 48.78 lakhs to Rs. 35.24 lakhs, and the gross dividend was cut down from 22 percent to 18 percent, partly because the Company has had to provide a large amount for bonus concerning earlier years. The chairman, Mr. N. K. Jalan's speech at the

shareholders' annual meeting holds out little hope of any improvement in the Company's working results for the current year, unless, of course, the industry's plea for higher cloth prices is accepted by the Government. (A fuller version of the chairman's speech appears on a later page in this week's issue.) Profits in 1962 were affected by higher manufacturing costs and the pressure on profit has increased further this year. Mr. Jalan has mentioned at length the all-too-familiar factors contributing to the mounting pressure on profits.

The shareholders might, however, take some comfort from the chairman's statement that in spite of several handicaps, the management has been continuously modernising the mills "with a view to be able to hold its own even in the most difficult times". Machinery worth Rs. 20.45 lakhs was installed and put into commission in 1962. Out of a total of 6,288 additional spindles permitted, the Company has been able to install only 2,240 spindles on account of the delay in the deliveries of indigenous ring frames. The Company has applied for a licence for putting up additional 6,087 spindles for balancing purposes. In the weaving preparatory department, the Company has modernised nearly half the winding and warping sections.

With a view to completing the modernisation of this department, it is considering the installation of the latest automatic high-speed winding and warping machinery, incorporating revolutionary changes in the winding technique. One automatic warp tying machine was received last year, and orders for further such automatic machines are being considered. In the weaving shed, 48 automatic looms were installed in replacement of old plain looms and installation of further 96 automatic looms is under consideration. In the processing section, the installation of the mercerising machine and screen printing has increased the salability of the Company's products which are now made in a larger number of varieties. As for the leather cloth division, the Company has ordered out one of the most modern and up-to-date equipment with the object of producing leather cloth of international standard, and the Company has also made arrangements for availing itself of the services of foreign technical consultants to advise on the latest techniques in leather cloth manufacturing. With new equipment, the Company hopes to be able to compete successfully in export markets for this product.

Rights Issue by Ambika Silk

THE Ambika Silk Mills did exceedingly well in 1962, with sales up by nearly 43 percent from Rs. 1.25 crores to Rs. 1.78 crores, and gross profit rising by about 48 percent from Rs. 19.23 lakhs to Rs. 28.54 lakhs. But the directors were unable to step up the dividend as the Company had to give away as much as 68 percent of the profit by way of taxation. It is, therefore, hardly surprising that the chairman, Mr. Ravindra Maganlal, should have devoted his speech almost entirely to the Government's taxation policy. His criticism of the Government's fiscal policy runs along familiar lines, but it merits attention. Few will disagree with him when he says that "all the incentives, assistance, bounties and subsidies for export remain only a tall talk, if charges and surcharges, tolls and taxes, levies and duties, together go on adding indefinitely to the cost of production". His suggestion will be widely endorsed that a high-power commission should be appointed to study the entire tax structure both at Central and State levels, to find out and suggest ways and means of having a flexible structure and also collecting such taxes without the least possible irritation to the tax-payers.

Mr. Ravindra Maganlal said very little in his speech about the prospects for Ambika Silk except that the Company has been able to improve upon its profitability in spite of the rise in prices of raw materials and other costs which have caused a considerable strain on corporate profits. The chairman attributed his Company's improved performance to the management's strict vigilance and check on every aspect of manufacturing activity. This is certainly very reassuring to shareholders. In order to finance the renovation and replacement programme, the Company proposes to increase its paid-up capital from Rs. 20 lakhs to Rs. 25 lakhs by issuing rights shares in the ratio of one share for every four held. The Company has placed an order for one stentering range at a cost of Rs. 5 lakhs, and this is likely to be installed during the current year.

Simplex Mills Pays Less

THE directors of Simplex Mills Co. Ltd have proposed a cut in the dividend for the year ended March 1963, from 22 percent to 16 percent, that is, from Rs. 11 to Rs. 8 a share of Rs. 50, less tax. The preliminary report on the Company's working shows that the performance has been quite disappointing because, while sales are down by only 6.5 percent from Rs. 3.22 crores to Rs. 3.01 crores, the gross profit had declined by as much as 24 percent from Rs. 54.73 lakhs to Rs. 41.53 lakhs. Apart from the general squeeze on the cotton mill industry's profits because of the higher manufacturing costs, the working results of Simplex Mills are said to have been affected due to a certain amount of dislocation as a result of the installation of new machinery.

Out of the year's gross profit of Rs. 41.53 lakhs, the directors have had to provide as much as Rs. 17.04 lakhs for bonus for 1957, 1959, 1960 and 1961. Depreciation absorbs another Rs. 18.74 lakhs, against Rs. 16.14 lakhs. Allocation to the development rebate reserve has been reduced from Rs. 13.90 lakhs to Rs. 6.40 lakhs. The directors have had to withdraw a sum of Rs. 9.62 lakhs from the general reserve to provide for the payment of the proposed lower dividend which absorbs Rs. 9.68 lakhs (against Rs. 13.31 lakhs). After bringing in a surplus of Rs. 27,000 from and writing back excess provisions amounting to Rs. 68,000, there is a balance of Rs. 24,000 to be carried forward. The Company installed during the year plant and machinery of the value of Rs. 32.91 lakhs, against Rs. 18.39 lakhs in 1961-62 and Rs. 11.66 lakhs in 1960-61. Outstanding orders for machinery at the end of the year amounted to Rs. 9.45 lakhs. The Rs. 50-paid share of Simplex Mills is currently quoted around Rs. 124, offering a gross return of about 6.7 percent.

Encouraging Outlook for Digvijay Cement

SHREE Digvijay Cement Company made a good showing in 1962, with production, sales and profit setting new records. The dividend, however, was only maintained at 10 percent. The chairman's speech at the Company's annual meeting last week holds out the prospect of still better results in the current year. The asbestos products factory which went into production in November last has got over all its teething troubles, and the plant is now steadily approaching towards capacity production. The asbestos pressure pipes and asbestos sheets turned out by the factory have been well received in the market, and it is hoped that endeavours to maintain the momentum already achieved would improve the earning prospects of the Company.

The work relating to the expansion of the production capacity of the Sikka cement factory by 200,000 tonnes a year is reported to be making satisfactory progress. The civil construction for foundations and buildings has reached an advanced stage of completion. The major portion of the plant and machinery have arrived at site, and all efforts are being made to complete the expansion programme by the end of the current year. The Company has decided to switch over to oil firing in place of coal firing, and arrangements have been made to effect complete changeover by 1964. The Company's subsidiary—West Coast Paper—is reported to be making satisfactory progress, with production maintained at the optimum level. The quality of paper made by West Coast continues to enjoy high reputation.

Referring to the recent general increase of Rs. 2.75 a tonne in the retention price of cement with effect from 1st June, the chairman pointed out that in all fairness, the increase should have been retrospective. Since the last announcement of higher retention prices, there have been increases in the cost of various items of production which have not been taken into account in the recent price rise. He has expressed the view, which is widely shared, that the Government should announce a specific formula to provide for automatic escalation for increases in the cost of fuel and power and increases due to Government measures. The chairman described the present system of fixing packing charges as quite unsatisfactory and urged the Government to fix packing charges on a "on profit no less" basis.

Dalmia Cement Maintains

SPEAKING to the shareholders of Dalmia Cement (Bharat) Ltd at the annual general meeting of the Company held in Dalmiapuram, Madras State, last week, Mr. V. H. Dalmia, chairman, says that the performance of the Company during the year ended December 1962 was satisfactory. (A fuller version of the speech is printed on a later page in this week's *Capital*.) Although the gross profit is higher, the net profit has been squeezed by heavier taxation which has mopped up more than 74 percent of the increased profit. The dividend has, however, been repeated after transferring a sum of Rs. 13.50 lakhs to general reserve. Cement continues to be in short supply since the output in India in 1962 was only about 3.5 percent higher than in 1961. He anticipates a continuing shortage during the third plan period, although the idle capacity of the industry is being used due to the improved supply of coal and transport. It is a good idea to promote the use of slag cement. Mr. Dalmia says that the present system of computing packing charges has placed a heavy financial burden on the producers, and hopes that the Government will take steps to improve it.

The price of iron ore has been depressed due to a recession in the world steel industry, and because of the large-scale development of new sources of ore supplies. It is encouraging that the State Trading Corporation has concluded a long-term contract for the supply of ore to Japan. Dalmia Cement hopes to make further supplies of high-grade iron ore from its mines to Japan through the State Trading Corporation. The port facilities in India should be improved to facilitate iron ore exports.

If the iron ore mining industry is to mechanise its production, Mr. Dalmia points out it should be assured of long-term purchase contracts. Referring to the recession in deadburnt magnesite, Mr. Dalmia says that Dalmia magnesite Corporation in which Dalmia Cement is a partner has suffered following the depression in the commodity. The demand for deadburnt magnesite has fallen behind supply because the expansion of the steel industry has not been as great as was expected earlier. Considering that the steel industry is switching to L-D and other oxygen processes for producing steel, the demand for deadburnt magnesite needs to be assessed cautiously. In the meantime, the Government should encourage the export of this commodity.

Commenting on the decision of the Government to levy capital gains tax on the conversion of deferred shares into ordinary ones, in the proportion of one ordinary share of Rs. 10 each for every four deferred shares of Re. 1 each held by the shareholders of Dalmia Cement, he says that the imposition is unfair and inequitable since the shares have not changed hands. It is hoped that the Government will exempt the converted shares from the tax to encourage companies for converting their deferred shares into ordinary ones.

Prospects for Modern Mills

PRESIDING over the annual meeting of the Modern Mills, the chairman, Mr N. D. Sirur, stated that the current year's working is tending to reflect the increase in manufacturing costs, but the Company is hastening with the installation of additional spindles and looms as well as processing equipment, which would enable it to effect economies in costs and produce better qualities of cloth. Mr. Sirur assured shareholders that the Company would have little difficulty in servicing the increased capital during the current year. The Company will have a reduced tax liability because of the cumulative payment of bonus for the previous years. It is also unlikely to attract any super profits tax this year because of the substantial increase in the paid-up capital which has been almost doubled. Besides, the addition of 12,000 spindles at Mill No. 2 is expected to provide sufficient additional profit-earning capacity to justify the increase in capital.

The Company will soon be installing 200 automatic looms at Mill No. 2, and these will produce export varieties and enable the Company to earn valuable cotton import entitlement. It is endeavouring to introduce in export markets its coarse and medium quality yarn produced at Mill No. 1, which is a purely spinning unit. The Company has installed the latest German single process blow room line in this mill, which is also concentrating on sewing thread. Arrangement has been made for the import of automatic screen printing machines and orders have been placed for a compressive shrinkage range from the U.S.A. Mr. Sirur has expressed the hope that within a couple of years, the Company will be able to produce fine and superfine fabrics comparable with those manufactured in Ahmedabad.

The chairman informed the shareholders that good progress had been made on the processing of application for $3 million loan from the Agency for International Development. This loan, if sanctioned, will cover the major part of the foreign exchange cost of the cellulose acetate flake plant, which is proposed to be established in Harihar in Mysore State in collaboration with Hercules Powder Company which will be providing the technical know-how as well as the balance foreign exchange requirements for the plant by making available key portions of the plant, against preference shares of the Company in the rupee equivalent of $650,000. Out of the daily production of 10 tons of cellulose acetate flake, only about 55 percent will be converted into acetate rayon by the Company. The remaining 45 percent will be made available to the plastic and photo film industries.

The total capital expenditure contemplated by Modern Mills on the expansion of the weaving capacity and on the processing equipment for the years 1963 to 1965, is estimated at Rs. 65 lakhs. The chairman says that the Company will need to supplement the capital raised by increasing its long-term borrowing, particularly because the recent cumulative payment of bonus for previous years has made some dent into the Company's liquid resources.

Oriental Fire Does Well

THE Oriental Fire and General Insurance Co. Ltd reports satisfactory progress in its operations during 1962. The total combined net premium income of all the departments—fire, marine and miscellaneous—shows an increase of a little over 13 percent from Rs. 4.34 crores to Rs. 4.92 crores. Net claims were higher at Rs. 2.76 crores, against Rs. 2.12 crores. Commission and expenses of management increased by Rs. 20 lakhs to Rs. 1.60 crores. The increase in underwriting reserves amounted to Rs. 34.09 lakhs, against Rs. 77.39 lakhs, and the underwriting profit was up at Rs. 35.32 lakhs, against Rs. 13.94 lakhs.

The net premium income of the fire department increased from Rs. 1.21 crores to Rs. 1.35 crores, and net claims paid from Rs. 34.99 lakhs to Rs. 47.14 lakhs. After meeting commission and expenses of management amounting to Rs. 47.59 lakhs, against Rs. 43.94 lakhs, the Company made a net addition of Rs. 7.29 lakhs to its underwriting reserve, compared with Rs. 16.97 lakhs in 1961. The working of the department showed a profit of Rs. 36.68 lakhs, against the previous year's figure of Rs. 27.38 lakhs. The net premium income of the marine department was up at Rs. 64.02 lakhs, against Rs. 53.84 lakhs, and net claims paid were higher at Rs. 59.72 lakhs, against Rs. 51.93 lakhs. Commission and expenses of management increased from Rs. 8.97 lakhs to Rs. 11.82 lakhs. The increase in the underwriting reserve amounted to Rs. 10.18 lakhs, against Rs. 12.17 lakhs in the previous year. The working of the department resulted in a loss of Rs. 14.75 lakhs, compared with with one of Rs. 16.97 lakhs in 1961. The net premium income of the miscellaneous department rose from Rs. 2.60 crores to Rs. 2.93 crores; net claims paid increased from Rs. 1.26 crores to Rs. 1.69 crores, and commission and expenses of management increased from Rs. 87.78 lakhs to Rs. 1.01 crores. The net addition made to the underwriting reserve amounted to Rs. 16.62 lakhs, which was very much lower than the previous year's figure of Rs. 48.25 lakhs. The underwriting profit rose from Rs. 10.76 lakhs to Rs. 13.39 lakhs.

After taking credit for Rs. 9.17 lakhs, being interest and dividends earned on funds not apportioned to any department, profit on the sale of investments, profit on the sale of vehicles, etcetera, bringing in the surplus from the previous year's accounts and making certain other adjustments, there is a balance of Rs. 44.69 lakhs, against Rs. 20.50 lakhs in 1961. The directors have set aside Rs. 3.52 lakhs (against nil) for investment reserve, Rs. 25 lakhs (against Rs. 12 lakhs) for taxation, Rs. 8.75 lakhs (against nil) for general reserve, Rs. 76,000 (against Rs. 1.61 lakhs) for reserve for doubtful debts and Rs. 6.60 lakhs (against nil) for dividend reserve which is to be used for the payment of the proposed dividend of 6 percent (the same).

After making various appropriations, there remains a small surplus of Rs. 6,000 to be carried forward, against Rs. 29,000 brought in. The Company's paid-up capital and reserves at the end of 1962 stood at Rs. 1.70 crores, against Rs. 1.58 crores a year before. The total insurance funds show a rise from Rs. 2.50 crores to Rs. 2.84 crores. The Company's total funds thus show an increase of Rs. 46 lakhs. The Company's investments valued at or below cost stood at Rs. 3.97 crores at the end of 1962, and the market value was below the book value. The depreciation in investment is, however, fully covered by the investment reserve which amounted to Rs. 6.70 lakhs at the end of the year.

Shreeniwas Cotton Profit Falls

SHREENIWAS Cotton Mills made a poor showing in 1962. The gross profit fell by nearly 24 percent from Rs. 83.49 lakhs to Rs. 63.30 lakhs, and the Company had to cut down the dividend from Rs. 20 to Rs. 14 a share; the dividend for 1962 was, however, on the increased capital of Rs. 1 crore, against Rs. 90 lakhs in 1961. In his annual speech to shareholders, the chairman, Mr. Gokulchand Bangur, has held out the hope of better results in the current year. His optimism is based on the benefit that the Company is likely to derive from its rehabilitation and modernisation programme for which it has been spending large amounts year after year. Out of the additional 20,000 spindles which the Company has been permitted to install, 5,300 spindles have already started working. Another 10,000 spindles are expected to be put into operation by the end of the current year. The balance will be installed in 1964. Besides, the mill is stated to be fully covered concerning its requirements of foreign cotton. The modernisation and renovation of the Company's subsidiaries are being carried out according to schedule.

The chairman, however, mentioned in detail how the production costs in the cotton textile industry had recorded an increase of about 15 percent since 1961, whereas the cloth price had remained unchanged at the September 1960 level. The Tariff Commission's report on which the Government has yet to take a decision had become out of date because of the subsequent rise in manufacturing costs, said Mr. Bangur. He urged the Government to evolve a price structure which would enable the industry not only to pay reasonable dividends, but also provide funds for rehabilitation and modernisation which was essential to improve the industry's competitive position, particularly in world markets. The chairman assured the shareholders that the Company's modernisation programme on which large amounts have been spent would pay good dividends. He ruled out diversification of the Company's activities unless the existing expansion programme has been completed. As for the Company's export performance, the chairman stated that since January, the Company had exported cloth worth Rs. 20 lakhs, and it had further orders worth Rs. 9 lakhs on hand.

Sri Ramakrishna Mills Maintains

IMPROVED sales, a small rise in the net profit and the maintenance of the dividend highlight the working results of Sri Ramakrishna Mills (Coimbatore) Ltd for the year ended March 1963. The profit amounts to Rs. 12.72 lakhs, after providing Rs. 4.39 lakhs for depreciation. The previous year's profit was Rs. 12.48 lakhs, after providing Rs. 4.70 lakhs for depreciation. With Rs. 2,896 brought forward from the previous year, the total available for appropriation comes to Rs. 12.75 lakhs. Out of this, development rebate reserve gets Rs. 33,100, provision for taxation Rs. 6.62 lakhs (against Rs. 4.50 lakhs), provision for gratuity Rs. 25,000 (the same). A sum of Rs. 50,000 (against Rs. 99,639) has been transferred to machinery modernisation reserve. The proposed dividend of 23 percent accounts for Rs. 3.53 lakhs. The balance of Rs. 2,327 is carried forward.

The directors' report says that the cost of production of yarn had increased during the year. In spite of adverse factors, the Company has earned a fair profit due to its production of combed yarn of good variety.

Digvijay Woollen Fares Well

SHREE Digvijay Woollen Mills Ltd reports encouraging results for the year ended March 1963. Sales are up by nearly 11 percent from Rs. 136.15 lakhs to Rs. 1.51 crores, and the gross profit at Rs. 45.19 lakhs shows an increase of about 10 percent over the previous year's figure of Rs. 41.12 lakhs. What is more, the profit has been arrived at after providing Rs. 3.09 lakhs for donations and charities, compared with Rs. 61,957 in the preceding year. The Company's improved performance has enabled the directors to raise the dividend from 15 percent to 17 percent, involving a distribution of Rs. 6.79 lakhs, against Rs. 5.99 lakhs in 1961-62.

After providing Rs. 1.36 lakhs (against Rs. 3.26 lakhs) for depreciation and Rs. 27 lakhs (against Rs. 19 lakhs) for taxation, the net profit amounts to Rs. 13.40 lakhs, against Rs. 15.74 lakhs in the previous year. The provision for development rebate has been stepped up from Rs. 5,135 to Rs. 35,320. While no provision has been made for general reserve and rehabilitation reserve which had received Rs. 5 lakhs and Rs. 3 lakhs, respectively, in 1961-62, a sum of Rs. 5 lakhs has been set aside under a special reserve. The proposed dividends—ordinary and preference—absorb Rs. 8.51 lakhs (against Rs. 7.71 lakhs), leaving a small sum of Rs. 6,329 to be carried forward, against Rs. 53,467 brought in.

The directors observe that the mills are working almost entirely on defence production, and will continue to do so until the end of the current year to execute the orders already placed by the Government of India. As a result of the increased raw material supplies following the grant of import licence worth Rs. 5.5 crores to meet the requirements under the emergency, the mills are working three shifts. In view of the increased production, the results for the current year, it is expected, will be encouraging. The directors add that no progress could be made in modernising the plant and machinery as the import licences could not be received. However, as a sequel to a barter deal between the State Trading Corporation and a British firm, the woollen industry has been assured of supply of machinery and spares worth Rs. 50 lakhs. At its current quotation of Rs. 18 *cum*-dividend, the Rs. 10-paid share of Digvijay Woollen offers a gross return of over 10 percent.

Sri Ramnarayan Mills Earns More

THE working of Sri Ramnarayan Mills Ltd for the year ended December 1962, shows a profit of Rs. 3.51 lakhs, after providing Rs. 2.68 lakhs for depreciation and Rs. 23,980 for development rebate reserve. The profit for the previous year was Rs. 2.28 lakhs, after providing Rs. 2.59 lakhs for depreciation and Rs. 99,143 for development rebate reserve. With Rs. 3,066 being the excess provision of income tax for 1960, the amount available for appropriation comes to Rs. 3.54 lakhs. Out of this, provision for taxation comes to Rs. 2.08 lakhs (against Rs. 1.10 lakhs). The dividend of 10 percent (the same) will absorb Rs. 1 lakh. The balance of Rs. 46,311 is used for reducing the unabsorbed development rebate loss of previous years.

During the year, the mill worked for 297 days in double shifts with an installed capacity of 12,384 spindles spinning higher counts cotton yarn, both carded and combed in hanks and cones. Products of the mill met with a good demand. Both turnover and profits showed a rising trend. Sales of yarn during the year amounted to Rs. 28.22 lakhs, compared with Rs. 25.81 lakhs for the previous year.

Alexandra Jute Earns More

THE profit of the Alexandra Jute Mills Ltd has increased from Rs. 2.58 lakhs in 1961 to Rs. 22.41 lakhs for the year ended December 1962, after providing Rs. 3.40 lakhs (against Rs. 2.99 lakhs) for depreciation. The taxable ordinary dividend has been raised from 20 percent to 42.5 percent, of which an interim of 20 percent was paid earlier. It is more than nine times covered and offers a yield of 14.2 percent at the present price of Rs. 300 a share of Rs. 100 each. Taxation absorbs Rs. 15.85 lakhs, of which the super profits tax is Rs. 4.15 lakhs. A sum of Rs. 1.48 lakhs has been provided for taxation for 1961. General reserve is allocated Rs. 3.50 lakhs and development rebate reserve Rs. 91,200, leaving a carry-forward of Rs. 32,706, against Rs. 1.40 lakhs brought in. Sales declined from Rs. 2.38 crores to Rs. 2.17 crores. Gunny stocks fell from Rs. 8.37 lakhs to Rs. 7.94 lakhs.

The modernisation of the preparing and spinning sections has contributed to the improvement in production. The directors say that the Government's pressure on the Company for buying raw jute has strain-

ed its finances. There has also been a shortage of the jute-storing capacity. The Indian mills have now begun to feel the effects of competition from the Pakistani industry which has made considerable inroads into their traditional markets, particularly for sacking

Nil from Usha Martin Black

IN their report for the year ended December 1962, the directors of Usha Martin Black (Wireropes) Ltd, say that the first phase of setting up the steel wire and wire ropes plant with a capacity of 3,600 tons of wire ropes a year, has been completed. The wire drawing and ropery sections have begun to operate at their rated capacities. The production of wire ropes amounted to 996 tons. Although the Company has earned an operating profit during the latter part of 1962, there has been a loss during the full year because it has not been possible to offset the various expenses incurred earlier. The Government has approved in principles the Company's import application for completing the second phase of the project to produce 7,200 tons of steel wire and wire ropes a year, subject to obtaining the necessary foreign exchange. The directors have been trying to get a foreing exchange loan.

There has been a loss of Rs. 1.42 lakhs, against one of Rs. 1.46 lakhs in 1961, after providing Rs. 2.39 lakhs for depreciation. Bringing in a debit balance of Rs. 1.46 lakhs, a total debit balance of Rs. 2.88 lakhs has been carried forward. The dividend has been passed. Although development rebate reserve has not been provided for, Rs. 6.10 lakhs estimated on this account will be created in due course when the Company makes sufficient profits.

Hercules Insurance Repeats

THE Hercules Insurance Co. Ltd has maintained the taxable ordinary dividend at Rs. 26.25 percent for the year ended December 1962, absorbing Rs. 6.30 lakhs. The yield is 10.9 percent at the present price of Rs. 24.19 a share of Rs. 20 each, of which Rs. 10 has been paid up. After providing Rs. 8.83 lakhs (against Rs. 6.52 lakhs) for taxation and Rs. 30,000 for the super profits tax, the disposable balance is Rs. 12.50 lakhs, including Rs. 3.94 lakhs brought in. General reserve is allocated Rs. 5.50 lakhs (against Rs. 2.25 lakhs) and staff retirement benefits reserve Rs. 50,000 (against Rs. 1.50 lakhs). The carry-forward is Rs. 20,229. The surplus of the fire department has been shown at Rs. 7.02 lakhs and that of the accident department at Rs. 2.28 lakhs. The marine department has earned a surplus of Rs. 2.26 lakhs.

Bengal Bonded Warehouse Earns More

THE Bengal Bonded Warehouse Association has earned a profit of Rs. 1.24 lakhs for the half-year ended April 1963, against Rs. 1.15 lakhs in the previous half-year, after meeting all expenses. A taxable ordinary dividend of 9 percent has been declared, absorbing Rs. 1.21 lakhs. The yield is 7.4 percent at the present price of Rs. 122 a share of Rs. 100 each. The building and repairs fund is allocated Rs. 2,000 (the same). The construction of the new building of the Association has made satisfactory progress and it is likely to be completed before the end of the current year. The directors say that because of the super profits tax, the net profit available for the distribution of dividend in the next half-year is likely to be affected.

Great Pyramid Insurance

THE Great Pyramid Insurance Co. Ltd has not transacted any business during the year ended December 1962. The certificate of registration granted to the Company was cancelled by the Controller of Insurance with effect from 14th March, 1960. The premiums, refunds and losses shown in the accounts relate to insurance business underwritten in 1956 or earlier from foreign treaty companies, Indian Insurance Companies Association pool and local facultative arrangements with other insurance companies. The fire department shows a loss of Rs. 13,837, the marine Department Rs. 1,014 and the accident department Rs. 51,329. After making all adjustments, there has been a profit of Rs. 99,536. A taxable ordinary dividend of 12nP a share of Rs. 10 each, of which only Rs. 2.50 has been paid-up, has been declared, absorbing Rs. 48,000. Taxation for 1960-61 is allocated Rs. 36,410 and the dividend equalisation fund Rs. 15,000.

Kanoria Chemicals to Make Caustic Soda Chlorine

KANORIA Chemicals and Industries Ltd has incurred an expenditure of Rs. 1.91 lakhs on account of construction during the year ended June 1962. The total expenditure on this account comes to Rs. 2.17 lakhs. The Company has acquired land near Pipri, Uttar Pradesh, for building a caustic soda chlorine factory. Trial production of the project may begin before the end of 1963. The shares of the Company have been enlisted by the Calcutta and Bombay Stock Exchanges.

Indian Printing Machinery: A New Venture

INDIAN Printing Machinery Co. Ltd is a new Company which has been promoted by Mr. P. R. Ramakrishnan in collaboration with Michle Gross Dexter of Chicago, to undertake the manufacture of a wide range of printing machinery. The factory, which it is proposed, will be located in Coimbatore is expected to go into production towards the end of next year. In the initial stages of production, the Company will manufacture only small items of printing machinery. Machines will be imported from the United States in a knock-down condition and assembled at the Coimbatore factory. Progressively, all the components will be manufactured indigenously, which will take some three years. It is estimated that after three years, the production of printing machinery at the Company's plant will be of the value of about Rs. 1 crore.

At present, India imports printing machinery worth about Rs. 5.5 crores a year. The promoters expect to be able to export substantial quantities of machinery to the Middle East and Far East in due course. The project is estimated to cost about Rs. 60 lakhs, which it is proposed to meet by the issue of Rs. 30 lakhs of equity shares and by borrowing the balance of Rs. 30 lakhs. The Company will have an authorised capital of Rs. 50 lakhs, of which Rs. 30 lakhs—all in equity shares—is to be issued in the beginning. Half of the issued capital will be taken up by the U.S. firm which is collaborating in the venture. The Indian promoters and their friends will take up shares worth Rs. 7.5 lakhs and the balance of Rs. 7.50 lakhs will be offered for public subscription some time in October. The U.S. firm will have 50 percent representation on the board of directors, which will be headed by Mr. T. Niggli who is the vice-president of Michle Gross Dexter of Chicago. The technical direction of the project will be in the hands of the U.S. firm for a period of five years.

Roller Bearings from Antifriction

THE Rs. 10-paid shares of the Antifriction Bearings Corporation virtually go abegging around Rs. 7. It is not that the Company's production plans have been seriously upset; nor can one say that there has come about an appreciable change in the outlook for the products which the Company is making and proposes to undertake. The huge discount reflects mainly the general feeling of despondency which pervades the investment market. In his chairman's speech at the second annual meeting of the Company, Mr. C. C. Desai, has informed the shareholders that there has been a significant improvement in the production and sale of thrust bearings during the year. The Company's order books are stated to be full for the next five or six months and given the required raw materials and components, last year's production will be improved upon. The chairman attributed the improvement to the protection granted to the industry last year.

The chairman stated (the speech was read out by Mr. J. V. Patel, a director of the Company as the chairman is abroad) that the manufacture of roller bearings which was expected to start early in the year commenced only in March. The Company hopes to place the first roller bearing in the market some time in July. Initially, the bearings will have certain imported components but by the end of the year, these will be completely indigenous. The production of roller bearings will mean a considerable saving in foreign exchange to the country, and Mr. Desai urged the Government to extend protection to this industry at the earliest. As for steel balls (grinding media), however, Mr. Desai stated that due to restricted demand in the country and the consequent low level of production, indigenous products are finding it difficult to compete with imported products. But steel balls is a subsidiary activity for Antifriction, and will become more so with the increased production of roller bearings. However, the chairman added that if the proper indigenous raw materials were made available and if protection was extended to this industry, the technical difficulties faced in the manufacture of quality products at a suitable price could be satisfactorily resolved. Mr. Desai also informed shareholders that due to the latest increases in excises and import levies, the total outlay on the Company's project was expected to go up. The Company had, however, already imported nearly 50 percent of the capital equipment before the last Central Budget.

James Finlay Maintains

IN his statement with the accounts of James Finlay and Company, whose main interests are in India and Ceylon, Sir John Muir says that the trading results showed some improvement last year. But this was more than offset by the reduced investment income. Apart from Calcutta and Nairobi, all overseas branches reported satisfactory results. In the current year, some investments have been sold to reduce bank indebtedness, which appears in the group balance-sheet at £1,180,000. Because of a change in the accounting procedure, comparative group figures are not given this year, although the available net earnings appear to have declined from £345,000 to £258,000. As previously indicated, the total dividend is held at 11 percent. Reviewing the major commodities in which the group is interested, Sir John says that as far as jute is concerned, the results for the current year are most satisfactory. But the outlook for the Indian industry must continue to be overshadowed by expansion of the industry in Pakistan, which has a great advantage in cheap, good quality jute and an export subsidy.

There was a slight decline last year in the world tea crop, although London tea stocks are higher than a year ago. But the possibility of overproduction remains. A new tea packaging company—in which the Finlay and Tata groups are partners—has been enlarged to embrace the production of instant tea direct from the green leaf. Kannan Devan Hills Produce, a Finlay group Company, will provide the necessary leaf fo the project.

Share Offer by Farm Refinance Body

THE Agricultural Refinance Corporation is offering 5,000 fully paid-up shares of Rs. 10,000 each for subscription. The list will be open from 1st July, 1963 to 31st July, 1963. (Details appear on a later page in this week's issue of *Capital*.) The full price of the shares applied for must accompany an application. The Corporation's authorised capital is Rs. 2.5 crores divided into 25,000 fully paid-up shares of Rs. 10,000 each. The shares have been guaranteed by the Central Government as to the repayment of the principal and the payment of a minimum dividend of 4½ percent. The Reserve Bank will subscribe for 2,500 shares. The remaining 2,500 shares may be subscribed by the central land mortgage banks, State co-operative banks, scheduled banks, the Life Insurance Corporation, insurance and investment companies in certain specified proportions.

Jaipur Metals Cuts Dividend

THE Jaipur Metals and Electricals Ltd has produced satisfactory results for 1962. Sales improved substantially. The profit has risen from Rs. 16.23 lakhs in 1961 to Rs. 23.79 lakhs in 1962. The taxable ordinary dividend has, however, been cut from 10 percent to 6 percent because of heavier taxation and bigger reserves. Taxation absorbs Rs 6.65 lakhs, against Rs. 3.91 lakhs. Out of this, super profits tax is Rs 52,000. In his chairman's address at the annual general meeting of the Company held last week, Mr. R. H. Kamani has expressed the hope that the super profits tax is an emergency measure and should be withdrawn when the emergency is over. (The full text of his speech is printed on a later page in this issue of *Capital*).

Commenting on the development and expansion programmes of the Company he has pointed out that the bulk of the equipment for producing components for meters have arrived. The Company hopes to be self-sufficient in the manufacture of meters in the near future. The output of these products was fairly encouraging in 1962. The Company has switched over to the production of all aluminium conductors. It has obtained industrial licences for manufacturing enamelled copper wires and cotton, silk and paper-covered wires and strips. It is hoped that the Government will permit the Company to import the necessary equipment. In 1932, rights ordinary shares were issued at a premium of Rs. 15 a share. The Industrial Finance Corporation has sanctioned a further loan of Rs. 65.26 lakhs to the Company for expansion.

Keytuo Chemicals: A New Venture

KEYTUO Chemicals Ltd is a new company which has been promoted to undertake the manufacture of various inorganic basic chemicals, styrene emulsions and other products. Initially, the Company will start with the production of styrene emulsion paints, better known as latex paints or plastic paints. It is claimed that the Company will be the first of its kind in India to take up large-scale production of styrene emulsions. The factory will be located in Bombay and trial production is expected to start before the end of this year. The initial capacity of 1,000 litres a day is to be progressively raised to 5,000 litres. The Company also proposes to manufacture plastisol from P.V.C. and the production of this item is expected to start before the end of 1964.

The technical know-how for these two projects will be provided by Shri Ram Institute of Industrial Research. The Company also proposes to undertake the manufacture of basic chemicals like pottasium chloride, magnesium carbonate, sodium sulphate and table salt. The factory will be located in Bhavnagar. The Bhavnagar Central Salt and Marine Technical Institute will provide the technical know-how. At a later stage, the Company will take up the production of bromide chemicals and sodium sulphide. The estimated annual capacity of all the chemicals which the Company proposes to manufacture will be around 7,000 tons. The Company has an authorised capital of Rs. 10 lakhs in equity shares of Rs. 100 each, the whole of which is being initially issued. Out of this, promoters and their friends will take up Rs. 5.1 lakhs, and the balance of Rs. 4.9 lakhs will be offered for public subscription some time in September. The board of directors includes Mr. Dinesh J. Mody (chairman), Mr. Kalyanji J. Shah, Mr. Ebrahim A. Patel and Mr. Morarji H. Dedhia.

Prospects for Bhartia Electric Steel

THE results of the Bhartia Electric Steel Co Ltd for the year ended December 1962 are satisfactory. Production rose by nearly 40 percent over the level of 1961. Addressing the annual general meeting of the Company held in Calcutta last Friday, Mr. Rameshwar Tantia, chairman, referred to the heavy impact of the super profits tax. Taxation has mopped up about 70 percent of the profit of the Company. (A fuller version is printed on a later page in this issue of *Capital*.)

Dealing with the expansion scheme, he stated that the Company had already applied for a licence to double the production to 12,000 tons a year. It is proposed to set up a new factory near the existing Ballygunge works. It is hoped that the Government will permit the import of the necessary equipment. The prospect for the steel foundry industry is considered encouraging in view of the ambitious wagon-building programme of the railways. The Company has been executing an order worth Rs. 2 crores for centre buffer couplers. He said work was interrupted due to the power shortage.

Maiden from Zenith Steel

THE shareholders of Zenith Steel Pipes Ltd have good news from the Company. It was only in May 1962 that the Company started commercial production. The performance has been encouraging enough to enable the directors to declare a maiden dividend of 60nP a share of Rs. 10. The preliminary report on the Company's working shows that it has made a net profit of Rs. 11.69 lakhs for the year ended April 1963. The profit has been arrived at after providing Rs. 4.86 lakhs for depreciation, Rs. 12.68 lakhs for statutory development rebate, Rs. 4.19 lakhs for development expenses and brokerage. With Rs. 30,640 brought forward from the previous year, the disposable surplus amounts to Rs. 11.99 lakhs. The directors have set aside Rs. 7.50 lakhs for the general reserve fund. The proposed maiden dividend absorbs Rs. 4.20 lakhs, leaving Rs. 29,382 to be carried forward.

The Company is entitled to a tax holiday under Sections 84 and 101 of the Indian Income Tax Act, and this is estimated to be on an income of Rs. 5.13 lakhs. Zenith Steel is stated to have reached its full rated capacity at the end of the year; and it could have attained the rated capacity earlier had enough steel been made available to it. The raw material situation is said to be much better now, except in case of zinc, and the factory is reported to be working satisfactorily. The Rs. 10-paid share of the Company is quoted around Rs. 13.36.

National Tannery Raises Output

PRESIDING at the annual general meeting of the National Tannery Co Ltd in Calcutta last Friday, Mr. Sanjoy Sen, referred to the satisfactory results achieved by the Company during the year ended December 1962. (A fuller version is printed on a later page in this week's issue of *Capital*.) The Company's production and sales continued to rise and the profit was maintained at a satisfactory level. Production was expanded to meet the growing internal and external demands. As for the progress of the expansion scheme, the Company has begun to relay the entire vegetable tanning section. The output of finished leather, it is hoped, will increase substantially. The chairman referred to the increased demand for the Company's products. National Tannery has introduced "double tanned picking bands" which are expected to meet with a large demand from textile and jute mills.

The Company has greatly increased the export of its products. Since raw goat skin exports have been restricted, the Indian industry should be encouraged to raise its tanning capacity for finished leather. National Tannery has substantially raised its production capacity for finished leather. It is proposed to raise it further by importing the required balancing plant. But in spite of a recession in the world leather market, Mr. Sen said, the domestic prices of hides show no signs of weakening. In fact, the shortage of raw hides has been keenly felt. So the authorities must pay attention to increasing the supply of raw hides. Meanwhile, steps should be taken to liberalise the import of machinery for modernisation and balancing. The chairman referred to the adverse impact of the super profits tax. The latter has made it difficult for the Company to plough back sufficient funds for rehabilitation and development.

Good Results from New City Mill

ALTHOUGH the shareholders of the New City of Bombay Manufacturing Co. Ltd have had to go without a dividend for the fifth year in succession, the Company's working results for 1962 show an impressive improvement over that of the previous year. Sales of cloth, yarn and waste, etcetera, have risen by about 30.7 percent from Rs. 1.95 crores to Rs. 2.25 crores, and the gross profit has shot up by as much as 84 percent from Rs. 11.01 lakhs to Rs. 20.23 lakhs. The provision for depreciation has been stepped up from Rs. 5.09 lakhs to Rs. 9.23 lakhs, and that for development rebate from Rs. 3.11 lakhs to Rs. 3.99 lakhs. Out of the remaining surplus of Rs. 7.01 lakhs, the directors have transferred Rs. 7 lakhs to the general reserve, against nil in 1961. Improvement in the Company's working results seems to be due mainly to the renovations and modernisation that the Company has been carrying on. New machinery worth Rs. 26 lakhs was installed in 1962, and machinery of the value of Rs. 5.09 lakhs was under installation at the end of the year. A further sum of Rs. 20 lakhs is likely to be spent in the current year on modernisation and renovation. The directors expect better results for the current year.

Godfrey Phillips Cuts Dividend

IN their report for the year ended December 1962, the directors of Godfrey Phillips, India, Ltd take a cautious view of the prospects. The consumption of cigarettes, it is feared, may decline due to heavier taxation which has led to higher prices for the commodity. Sales rose from Rs. 4.57 crores in 1961 to Rs. 5.51 crores in 1962. The profit is Rs. 46.26 lakhs for 1962, against Rs. 46.19 lakhs in 1961, after providing Rs. 5.49 lakhs (against Rs. 5.75 lakhs) for depreciation. The taxable ordinary dividend has been reduced from 40 percent to 30 percent. It is covered more than three-and-a-half times and offers a yield of 9 percent at the present price of Rs. 33.25 a share of Rs. 10 each. Taxation is allocated Rs. 32.13 lakhs, of which the super profits tax is about Rs. 7.63 lakhs. Tax provision was Rs. 24.50 lakhs in 1961. Development rebate reserve absorbs Rs. 16,000 (against Rs. 14,000) and general reserve Rs. 26.50 lakhs, leaving a carry-forward of Rs 38,310, against Rs. 17.01 lakhs brought in.

Straw Products Skips Again

THE Straw Products Ltd has again passed the dividend for the year ended December 1962. It has earned a trading profit of Rs. 16.97 lakhs, against Rs. 18.45 lakhs in 1961. General reserve is allocated Rs. 11 lakhs (against Rs. 8 lakhs) and depreciation Rs. 6.15 lakhs (against Rs. 1.92 lakhs). But no depreciation or development rebate reserve has been provided for the paper mills due to the insufficient profits. The carry-forward amounts to Rs. 43,575, against Rs. 61,899 brought in. As for the straw board factory in Bhopal, the directors point to sales of Rs. 1.29 crores (against Rs. 1.02 crores). They add that due to the levy of the excise duty on a slab system, the Company, along with other big producers of straw boards, has been placed in an unfavourable position compared with small producers. So it has become difficult for the former to compete with the latter. The J. K. Paper Mills in Orissa started production towards the close of 1962. Its output in 1962 was 1,312 tons.

McDowell Reduces Dividend

A DRASTIC cut in the dividend because of a substantial drop in sales and net profit, feature the trading results of McDowell and Co. Ltd for the year ended December 1962. The net profit for 1962 amounts to Rs. 1,71,436, (against Rs. 3,93,754) after providing Rs. 1,45,575 (against Rs. 1,36,926) for depreciation and Rs. 95,000 (Rs. 2,61,585) for taxation. Adding to the net profit, the brought forward amount of Rs. 34,494, Rs. 305 being excess provision for doubtful debts and a sum of Rs. 503 transferred from unclaimed dividends, the total available for appropriation comes to Rs. 2,06,763. Appropriations include, Rs. 22,000 to development rebate reserve (against Rs. 10,000), and Rs. 57,533 to general reserve (against Rs. 1,50,000). The interim dividend on preference shares at 3.90 percent, taxable, absorbs Rs. 15,600. The final preference dividend at 3.90 percent absorbs Rs. 15,600. The directors have now recommended a dividend of 6 percent on ordinary shares (against 12½ percent), and this will absorb Rs. 96,000.

Travancore Rubber Maintains

TRAVANCORE Rubbers Ltd has earned a net profit of Rs. 1.41 lakhs for the year ended December 1962, compared with Rs. 1.26 lakhs for the previous year. With the amount of Rs. 1,840 brought forward, the total surplus comes to Rs. 1.43 lakhs. Out of this, provision for taxation amounts to Rs. 63,000 (against Rs. 57,000), and provision for doubtful debts amounts to Rs. 450. The proposed dividend of 12 percent (against 12 percent), will absorb Rs. 72,000. The balance of Rs. 2,872 is carried forward. The rubber crop harvested during the year amounted to 222,990 kilograms and the all-in-cost of production was Rs. 2.67 a kilogram. The average price realised a kilogram amounted to Rs. 2.91. The estimated rubber crop for 1963 is 206,818 kilograms. During the year, 50.35 acres of low-yielding old rubber was replanted. The Company intends to replant in 1964 a further 109.45 acres, now under slaughter tapping. The Rs. 10 paid-up shares of this Company are now quoted in the market at Rs. 10.50 *cum*-dividend.

Lucky Valley (Nilgiri Hills) Repeats

A LARGER crop and an increase in the average sale price of tea resulted in higher profits for Lucky Valley Tea Estates for the year ended December 1962. The dividend is maintained at 10 percent. The profit for the year before taxation amounts to Rs. 1,66,239, compared

with Rs. 96,485 for the previous year. Out of this, the provision for taxation comes to Rs. 92,000, which is much higher than the previous year's tax provision of Rs. 45,000. The increase in tax provision is due to higher corporation tax and also due to the super profit tax provision of Rs. 9,000. The net profit after taxation amounts to Rs. 74,239.

With the amount of Rs. 32,559 brought forward from the previous year, and with a sum of Rs. 4,850 being excess provision for taxation no longer required, the total surplus comes to Rs. 1,11,648. Out of this, a sum of Rs. 25,000 is transferred to general reserve (against nil). Development rebate reserve gets Rs. 72 (against Rs. 1,604). The proposed dividend of 10 percent will absorb Rs. 50,000. The balance of Rs. 33,576 is carried forward. The total crop for the year amounted to 3,43,350 lbs (against 3,05,757 lbs), which was only slightly less than the record crop of 351,427 lbs obtained in 1960. The estate cost of production for tea during the year amounted to Rs. 1.41 a lb, compared with Rs. 1.55 a lb for the previous year. The price realised was higher at Rs. 2.42 a lb, against Rs. 2.31 a lb last year.

Aspinwall Cuts Dividend

IN spite of improved sales for the year ended December 1962, Aspinwall and Co. Ltd has reported a lower profit. The ordinary dividend has, therefore, been reduced to 6 percent from the previous year's 9 percent. The net profit for the year amounts to Rs. 3.5 lakhs, after providing Rs. 1.19 lakhs for depreciation and Rs. 2.91 lakhs for taxation. The net profit for the previous year amounted to Rs. 3.49 lakhs, after providing Rs. 1.21 lakhs for depreciation and Rs. 3.33 lakhs for taxation. With Rs. 23,326 brought forward from the previous year, the total comes to Rs. 3.28 lakhs. Out of this, the additional provision for taxation for the previous year amounted to Rs. 37,500. Development rebate reserve gets Rs. 658 (against Rs. 7,746). The dividend at 6.66 percent, subject to deduction of tax on preference shares, amounts to Rs. 14,252. The proposed ordinary dividend at 6 percent will absorb Rs. 2.15 lakhs. The balance of Rs. 60,219 is carried forward.

Progress of Southern Brick

THE first annual report of Southern Brick Works Ltd says that the construction of factory buildings like circular kiln, natural dryer, artificial dryer, press shop, intermittent kiln and overhead tank is proceeding satisfactorily. The major portion of the machinery required for the first stage of manufacture of bricks has arrived, and the directors expect that erection of the machinery will be shortly taken on hand. The directors are confident of starting the first stage of production in the mechanised unit by about September 1963. Due to the revised import duty, the additional liability, it is expected, will be about Rs. 3.50 lakhs.

Dring the year, the Company manufactured stock bricks and other bricks required for the construction of factory buildings. The working for the period ended March 1933, has resulted in a net profit of Rs. 7,206.45 after meeting all expenses and after providing depreciation. Out of this, development rebate reserve gets Rs. 2,472.35, and provision for taxation comes to Rs. 2,600. The balance of Rs. 2,134.10 is carried forward. The shares of this Company, which are Rs. 100 each, of which only Rs. 75 is paid up, are quoted officially at par.

Venkatesa Mills Cuts Dividend

THE net profit of Sri Venkatesa Mills Ltd for the year ended December 1962 is about the same as in the previous year, but the dividend has been reduced to 20 percent from 24 percent in the previous year. Sales have improved to Rs. 1,91,62,258 from Rs. 1,74,33,078. The net profit for the year 1962 amounts to Rs. 19,35,083 after providing Rs. 9,02,375 for depreciation, compared with the previous year's net profit of Rs. 19,59,558 after providing Rs. 8,93,329 for depreciation. With the amount of Rs. 8,541 brought forward, the total available surplus comes to Rs. 19,43,624. Out of this, a sum of Rs. 1,33,539 is transferred to development rebate reserve (against Rs. 2,61,163). The provision for taxation amounts to Rs. 10,75,000 (against Rs. 9,40,000). Gratuity reserve gets Rs. 50,000 (against Rs. 50,030). The preference dividend at 7.80 percent, taxable, accounts for Rs. 3,900. The proposed dividend on ordinary shares at 20 percent will absorb Rs. 6,74,978. The balance of Rs. 6,157 is carried forward.

Manimala Estates Skips

NO dividend is recommended for the year ended December 1962 by the directors of the Manimala Estates Ltd. This is the second year in succession. The net profit for the year amounts to Rs. 2,674.78. After deducting this profit amount from the brought-forward loss of Rs. 48,836.78, there is a balance of loss amounting to Rs. 46,162.01, which is carried forward. The directors state in their report that development work was continued during the year and the works undertaken were necessarily intended to produce permanent and long-term results rather than immediate results. In spite of expenditure on such work, it is reported that the profit trend was maintained. The report says that the Company's produce of rubber is being sold to Ruby Rubber Works Ltd at the standard rates. The shares of the Company which are Rs. 10 paid-up, are quoted at Rs. 8.75 (nominal).

Bharat Vijay Profit Falls

A SUBSTANTIAL decline in the net profit features the trading results of the Bharat Vijay Mills Ltd for the year ended December 1962. The net profit amounts to Rs. 1,81,058, after providing Rs. 4,06,913 for depreciation, Rs. 2,27,888 for statutory development rebate, and Rs. 2,88,000 for taxation. The net profit for the previous year amounted to Rs. 13,50,014, after providing Rs. 2,63,095 for depreciation Rs. 1,21,604 for development rebate reserve and Rs. 100,000 for taxation. With the amount of Rs. 1,05,155 brought forward from the previous year and with a sum of Rs. 1,70,000 transferred from general reserve, the total comes to Rs. 4,56,213. Out of this, a sum of Rs. 75,000 is transferred to special reserve. Under-provision for taxation for 1961 amounted to Rs. 1,66,500.

Last year, a sum of Rs. 6 lakhs was transferred to general reserve and Rs. 4 lakhs was transferred to dividend equalisation reserve. But this year, the directors have had to transfer Rs. 1,70,000 from the general reserve in order to pay the dividend. The dividend at Rs. 6.25 a share on 3,500 5 percent taxable preference shares accounts for Rs. 17,500. The dividend at Rs. 2.86 a share, taxable, on 4,500 5 percent (tax free) freference shares accounts for Rs. 12,870. The proposed ordinary dividend at Rs. 15 a share will absorb Rs. 1,80,000. The balance of Rs. 4,343 is carried forward.

The report says that the Company's plans for renovation, modernisation and expansion are in the course of implementation. The management has received permits for the installation of 192 automatic looms by way of replacement of plain looms. The question of placing orders for automatic looms against these permits is said to be engaging the attention of the directors. Sales amounted to Rs. 1,13,20,370 during the year, compared with Rs. 1,12,80,477 in the previous year.

Gnanambikai Mills Cuts Dividend

DESPITE higher sales, the net profit of Gnanambikai Mills Ltd for the year ended December 1962, is lower, compared with that of the previous year. Consequently, the directors have reduced the dividend to 7½ percent from the previous year's 10 percent. The net profit for 1962 amounts to Rs. 2,71,044, after providing Rs. 1,08,844 for depreciation. The previous year's net profit was Rs. 3,51,269 after providing Rs. 90,511 for depreciation. Out of the net profit of Rs. 2,71,044 for 1962, the directors have provided Rs. 27,023 for development rebate reserve (against Rs. 27,642). The dividend on 8.45 percent preference shares, taxable, accounts for Rs. 1,749. The proposed dividend at 7½ percent on equity shares will absorb Rs. 69,540. The provision for taxation amounts to Rs. 1,72,732 (against Rs. 1,98,158).

The directors' report says that during the year there was an increase in the raw material costs. Production costs as a whole also rose. The price of yarn, however, remained unchanged. As a measure of modernisation, the directors have decided to replace the machines with more up-to-date equipment. It is said that the conversion materials ordered at a total cost of about Rs. 3,85,000 for spinning frames have been arriving. Orders have been placed for converting roving frames, and the directors expect that the modernisation programme will be completed by the end of the coming year.

Elpro Will Start Production Soon

MR. Joseph Whittington Whiteside, vice-chairman and technical director of Elpro International Ltd which is setting up a factory in Chinchwad (Poona District) for the manufacture of lightning arresters, pellet and thyrite types, x-ray equipment for medical and industrial appliances, Alnico magnets for domestic and industrial appliances and calrod heating elements, told newsmen in Bombay recently that the factory was expected to go into production in October this year. More than 60 percent of the plant and machinery has already been shipped by General Electric Co. of the U.S.A., and shipments of raw materials are likely to arrive soon. Under the phased programme of manufacture, the import content will be 80 percent of the value in the first year, and it will be progressively reduced to 15 percent by the end of the fifth year. Production is expected to be of the order of about Rs. 50 lakhs during the first year, and would increase to around Rs. 3.50 crores by the end of five years.

According to the directors of the Company, nearly 40 percent of the country's x-ray equipment requirements, 50 percent of lightning arresters and magnet demand and 60 to 70 percent of calrod demand would be met by Elpro International when the factory goes into full production. The Company is likely to take up the manufacture of other light electrical equipment such as switchgears and other specialised transformers at a later date. It has been jointly promoted by the General Electric Company of the U.S.A. and Tatas' Investment Corporation of India, and it is raising Rs. 21.25 lakhs—all in equity shares of Rs. 100 each—through public subscription. The authorised capital of the Company is Rs. 2 crores, and the paid-up capital Rs. 35,000. The present issue is for Rs. 84.65 lakhs, of which Rs. 42.50 lakhs is being taken up by the U.S. firm which is collaborating in the project. Shares of the value of Rs. 12.40 lakhs are being absorbed by the Investment Corporation and its associates, directors and friends and shares worth Rs. 8.50 lakhs are being taken up by the employees of the International General Electric Company (India) Private Ltd, which is a subsidiary of General Electric.

New Capital Issues

FIVE companies have been authorised by the Controller of Capital Issues to raise capital totalling over Rs. 2.10 crores. One company is issuing part of its capital on a rights basis to its foreign collaborators. One is issuing equity plus preference shares. One company is a public sector enterprise. The consent in all cases is valid for 12 months. The following are the details:

Saund Zweirad Union (India) Private Ltd, Delhi, a company registered last year to manufacture motorcycle, mopeds and allied products in collaboration with Zweirad Union AG, Nurnberg, West Germany, has been accorded consent to issue capital of Rs. 20 lakhs divided into 20,000 equity shares of Rs. 100 each. Out of this, shares of the value not exceeding 24.99 percent will be offered to foreign collaborators, against import of plant and machinery and the balance for cash at par.

Hindustan Machine Tools Ltd, Bangalore, a Government of India undertaking, is raising further capital of Rs. 1.44 crores, divided into 14,400 equity shares of Rs. 1,000 to be subscribed privately by the Government of India.

Everest Cycles Ltd, Gauhati, will issue capital of Rs. 10 lakhs divided equally into equity and preference shares of Rs. 5 lakhs each. The capital is required for repayment of loans for acquiring a factory in Gauhati for the manufacture of bicycles.

Reichhold Chemicals India Ltd, Madras, is to issue further capital of Rs. 20 lakhs, divided into 20,000 equity shares of Rs. 100 each, to be issued privately for cash at par. Out of this, shares of the value not exceeding Rs. 9 lakhs, will be offered to its U.S. collaborators, on the rights basis. The money will be used for manufacturing synthetic resins.

The Commercial Printing Press Ltd, Bombay, with a paid up capital of Rs. 16,50,000 will issue capital of Rs. 16,50,000 in equity shares of Rs. 1,000 each for cash at par. The proceeds of the issue would be used for the purchase of land and construction of building for the printing press.

The Stock Markets

SUPPORT CONFINED TO SELECTED CLEARING SHARES

Wednesday Evening.

THE Calcutta stock market has closed on a steadier note during the past week. Support has largely been confined to Indian Iron which have fluctuated widely on alternate bouts of buying and selling. Speculation has largely been concentrated on the Company's forthcoming dividend. The bulls have been inspired by its higher production during the year ended March 1963. The bears, however, think that it will be difficult for the Company to improve upon its past dividend because a substantial part of the profit will be squeezed by heavier taxation, including the super profits tax. Towards the close the scrip have reacted on smaller production in June, compared with May. The output of pig iron has declined from 116,102 tons to 112,028 tons and that of steel ingots from 91,208 tons to 86,413 tons. The production of salable steel has been smaller at 61,612 tons, against 65,015 tons. Despatches have, nevertheless, improved from 60,978 tons to 68,910 tons.

The cheerfulness in Indian Iron has helped to attract attention to a few clearing shares. Operators have been encouraged because, contrary to earlier fears, there has been no sign of selling pressure following the resumption of forward trading. Although reports of fresh incursions into Indian territory by the Chinese had depressed prices earlier, the pressure was light and temporary. Considering that share prices have fallen substantially during recent months, the possibility of a further sharp decline in the near future is considered remote. But the stock market may find it difficult to go ahead in view of various uncertainties.

For the time being, attention is concentrated on the new Central Government loans which are expected to mop up a considerable volume of funds. Lyons Range has interpreted bullishly the outcome of the talks this week between representatives of the Central Finance Ministry and the leading financial institutions, including the Life Insurance Corporation, the Industrial Finance Corporation and the Industrial Credit and Investment Corporation, in Bombay. The conference discussed the prevailing sluggishness of the capital market. It has generally been agreed that it is urgent to activate the investment market, if industrial development is not to suffer. There has been some disappointment because Mr. Morarji Desai, Central Finance Minister, has reiterated that the super profits tax is not a temporary measure, although it may have to be scrapped if industrial development is hindered by it. The fact that several companies have been forced to cut dividends as a result of the heavy impact of the tax should impress upon the Finance Minister the need for scrapping it. As a result of the deliberations at the conference, it is expected that the rules and regulations concerning capital issues will be liberalised. This matter is likely to be finalised when the Advisory Committee on Capital Issues meets at the end of July. It is also hoped that after the new Government loans are subscribed, the Life Insurance Corporation will begin to support the equity market. The reduction in the emergency risks insurance premia during the current quarter has been ignored. Lyons Range seems to think that the need for continuing the emergency risks insurance scheme has placed an unnecessary burden on industry and trade.

Among engineering shares, support has been extended to Guest, Keen, Williams, Braithwaite and Jessop. Jute shares have been sluggish and turnover has been small. The lack of foreign buying in jute goods has been a major restraining factor. Scattered business has passed in Birla, Barnagore, Champdany and Howrah. Cotton mill shares have been subdued since the profit outlook has become uncertain. Coal shares have been neglected and stray business has been done in Burrakur, Bengal and Central India.

The prices of selected miscellaneous shares have hardened somewhat towards the close on replacement buying. Prominent scrip have been Hindustan Motors, Indian Copper, Indian Aluminium and Hindustan Aluminium. New shares have generall weakened on a predominance of sellers. India Carbon, Asiatic Oxygen and Dr. Paul Lohmann have been freely offered. Among paper shares, Orient have recovered on short-covering. Titaghur and Sirpur have been quiet. Sugar shares are difficult to deal in. Bank and electric company shares have evoked little support. Stray business has been done in tea shares. Although advices from the auctions held in Calcutta this week have been cheerful, investors have been disturbed by developments along the borders.

Government securities have been steady but turnover has been limited because of the shortage of sellers. Attention has been diverted, for the time being, to the forthcoming new Central Government loans. Since the short-dated 4 percent loan 1969 has been offered at an attractive price, banks are expected to show keen interest in it.

Tata Steel ordinary shares have recovered to Rs. 136.50 and Indian Iron to Rs. 22.60 on support from Lyons Range. After an earlier decline, Tata Locomotive have gained on short-covering. Larsen and Toubro, Premier Construction and Alcock Ashdown have been neglected. Motor-vehicle shares, such as Hindustan Motors and Premier Automobiles, have improved towards the close.

Cotton mill shares have generally been easier in the absence of support, although prices of selected scrip have closed slightly above the lowest levels touched earlier. Replacement buying has helped to improve Century, Svadeshi, Bombay Dyeing, India United ordinary and Tata Mills Standard, Gokak and Morarjee have been freely available. Turnover in miscellaneous shares has been small and fluctuations have been narrow. In the cement section, scattered interest has been taken in Associated Cement and Digvijay. Sugar shares have been quietly steady. Belapur and Phalton have been transacted.

Mining shares have been subdued, and Shivrajpur Syndicate have been freely offered without attracting support. Among steamship company shares, Scindia Steam have recovered on short-covering. Rayon shares have generally been quiet. National Rayon have reacted further on pessimism concerning the future outlook. Baroda Rayon have been weaker. Except for scattered interest in Tata Chemicals, chemical shares have been sold freely. Indian Dyestuff have been easier, but Colour-Chem have attracted attention

Bombay

MIXED TREND IN DALAL STREET

GOOD SUPPORT FOR STEEL SHARES

Wednesday Evening.

THE Bombay stock market has shown a mixed trend during the past week. The earlier decline in share prices was due to nervous liquidation following reports of the Chinese build-up on the northern border. There was also evidence of short-selling because bears took advantage of the loopholes in the new margin requirements. Bulls are required to pay margins on purchases, while bears need not deposit any margin if they can show that selling is being made against actual holdings. Towards the close, there has been a fair recovery and prices of selected forward scrip have improved on replacement buying. The support has been especially marked in steel shares on hopes that the working results of the steel companies for the year ended March 1963 will be satisfactory. The high-level conference between the Central Finance Minister and the leading financial institutions held in Bombay this week, to discuss the present sluggish conditions of the capital market, has been regarded as an encouraging factor.

at the current price. Bombay Burmah have improved on short-covering.

Tata Oil have lost on cutting the taxable ordinary dividend from 23 percent to 22 percent. Zenith Steel Pipes have been steady on paying a maiden ordinary dividend. Turnover in bank shares has been small. Among insurance shares, New India Assurance have been steady. Electric supply company shares have met with scattered support. Ahmedabad Electric and Tata Power have been taken.

Madras

DULL CONDITIONS PREVAIL

SECURITIES REMAIN STEADY

Tuesday Evening.

SLUGGISH conditions have prevailed in the Madras stock market during the past week. Although selected planting shares have attracted support due to dividend prospects and good crop reports, turnover has, on the whole, been negligible. Clearing shares have been transacted cautiously because of the absence of support from outside sources. Interest in cotton mill shares have been subdued due to pessimism about the profits for the current year. Fears of power cuts have restrained activity. Investors have generally been cautious because the prices of several shares have been much higher in relation to the dividends paid. Operators have been discouraged by the growing shortage of funds. The flotation of the new Central Government loans will siphon off a large volume of funds.

Government securities have been steady, although turnover has been small. Prices of selected State Government loans have hardened. There has been keen interest in good preference shares, which have been in short supply. Scattered business has been done in bank shares. Canara have been transacted at Rs. 80.50 and Indian Overseas at Rs. 142.

Among electric supply companies, West Coast have been steady at Rs. 18.37. Sugar shares have been easier, and E.I.D. have softened to Rs. 36.75. Despite prospects of the issue of bonus shares in the proportion of one for each share held, United Breweries have attracted little attention. In the planting section, Blue Mountain have been taken at Rs. 2.30 and Consolidated Coffee at Rs. 17.60. Periakaramalai have been placed at Rs. 3.05 and Ouchterlony at Rs. 3.65. Devon have been bought at Rs. 12.66 on paying a taxable ordinary dividend of 10 percent. Interest has been taken in Nilambur, Thamarapally, Nelliampathy, Peermade, Coffee Lands and Mysore Coffee.

Textile shares have been weaker. South India Viscose have weakened to Rs. 119.50 and Travancore Rayon to Rs. 22.75. Lakshmi have been barely steady at Rs. 134 on paying a taxable ordinary dividend of 20 percent. Cambodia have been transacted at Rs. 13 on declaring a taxable ordinary dividend of 9 percent. Bangalore Woollen have been quoted at Rs. 230 and Buckingham at Rs. 261.

Except for scattered interest in selected cement shares, the miscellaneous section has generally been neglected. Aluminium Industries have been freely available at Rs. 16.80 and Ashok Leyland at Rs. 7.35. Among cement shares, Dalmia have been steady at Rs. 13.10 and India Cement new at Rs. 5.49. Mettur Chemical have been done at Rs. 12.35 ex. Standard Motors at Rs. 11.87. Kirloskar Electric have been steady at Rs. 20 and Spencer at Rs. 21.50. Textool have come to hand at Rs. 145 and Tube Investment at Rs. 235.

THE WEEK'S TRANSACTIONS

London

OPERATORS MORE ACTIVE

SELECTIVE BUYING IN EQUITIES

London, 3rd July.

POLITICAL uncertainties were less of a factor in the stock market last week, and investors were a little more willing to open commitments. The highlight of the week was the announcement of the oil take-over bid by B.P. and Shell for Burmah Oil. Everyone was waiting for the decision by the board of Burmah Oil. Burmah shares, although now below the best, were sharply up on a week ago. Gilt-edged had a quiet time and eased in response to the rise in interest rates in the U.S.A., which could mean a rise in the U.S. Bank rate. There was selective buying of equities and at one time, shipping shares were well favoured, but the statement from the chairman of Cunard that the property development project has been dropped brought a sharp setback in Cunard and other shipping shares. Insurance shares went ahead on the news of the further premium increases. A number of leading equities edged forward. Dollar stocks reflected trend of the transatlantic market which was mainly against holders. Gold shares were quiet, but later tended to move up under the lead of U.S. gold shares, the buying of which appeared to be due to the further drain in the U.S. gold reserve. Coppers were dull while tins moved erratically. Plantation shares were quiet, but rubbers met with selective support at times.

AGRICULTURAL REFINANCE CORPORATION

(Incorporated under the Agricultural Refinance Corporation Act, 1963 (10 of 1963)

ISSUE OF SHARES

Authorised Capital — Rs. 25,00,00,000

Divided into: 25,000 fully paid-up shares of Rs. 10,000 each

Present issue: 5,000 fully paid-up shares of Rs. 10,000 each

Under Section 6 of the Agricultural Refinance Corporation Act the shares of the Corporation have been guaranteed by the Central Government as to the repayment of the principal and the payment of a minimum dividend of 4¼% per annum.

The issue of shares is being made under the provision of the aforementioned Act. In terms of sub-section 2(a) of Section 5 of that Act, the Reserve Bank of India will subscribe for 2,500 shares. In accordance with sub-sections 2(b) and (c) of Section 5 of the above Act, the remaining 2,500 shares may be subscribed for by central land mortgage banks, state co-operative banks, scheduled banks, the Life Insurance Corporation, insurance and investment companies in the proportions specified below, subject to the condition that no institution will be allotted more than 10% of the shares reserved for the class of institutions to which it belongs:

Central Land Mortgage Banks and State Co-operative Banks	1,500
Scheduled banks, the Life Insurance Corporation, Insurance and Investment Companies ...	1,000

Applications will be received from the 1st July, 1963 to 31st July, 1963, both days inclusive at

(a) the Head Office of the Agricultural Refinance Corporation, 2nd Floor, Amar Building, Bazargate Street, Fort, Bombay 1.

(b) the branches of the Reserve Bank of India, Bombay, Calcutta, Madras, Bangalore, Kanpur and New Delhi.

No subscriber can make more than one application.

Copies of the prospectus giving full particulars of the shares offered and the form of application can be had free of cost at any of the above mentioned offices. Tender of the full purchase price of the shares applied for must accompany applications.

Payments must be made by cheques or draft on a bank situated at the place at which the application is being made. Cheques and drafts should be drawn in favour of the office at which the application is presented.

V. SIVARAMAN,
Managing Director.

THE CALCUTTA MONEY MARKET

FAIR INCREASE IN ADVANCES

Wednesday, 3rd July

THERE has been a fair increase in the aggregate level of advances in the Calcutta money market during the past week. The credit requirements of the cotton and jute mills are unchanged, while those of the sugar factories are slightly lower. But there has been a fair rise in the category of miscellaneous advances; the demand from the iron, steel and engineering industries, and from the foodgrains and seeds trade, has also increased. In the interbank market, conditions have been easy and the call rate is quoted around 1½ percent.

The exchange market has been more active. The supply of tea bills shows a further seasonal increase, while there have been a moderate number of gunny bills too. Sterling has improved in relation to all the major currencies except the Swiss, Danish and Swedish.

SILVER WAS QUIET IN CALCUTTA during the past week. The price declined from the previous week's level of Rs. 260.25 to Rs. 259.75, quoted today for ready delivery. There was no business in forward. The London and New York prices were 110½d and 127.8 cents. Gold was not transacted.

DURING THE WEEK ENDED 28TH JUNE, Government of India Treasury bills for Rs. 249,77,50,000 were sold in favour of the Reserve Bank.

TENDERS FOR RS. 2 CRORES OF 91-DAY Government of India Treasury bills were opened on 2nd July. The total amount offered was Rs. 2 crores. Tenders at Rs 99.415 percent were accepted in full. The total amount accepted was Rs. 2 crores only, the average rate of acceptance being Rs 2.340 percent a year. Tenders for Rs. 2 crores of 91-day Government of India Treasury bills will be received at all centres up to the close of business on 8th July. Successful tenderers should make payment on 12th July at all centres.

IT IS STATED THAT 91-DAY Intermediate Treasury bills will be sold from 3rd July to 6th July at Rs 99.431 percent. Sales can be stopped at any time without notice if the Government thinks it necessary. These bills sold from 26th June to 28th June amounted to Rs. 2.40 crores.

ACTIVE NOTES FELL BY RS. 15.69 crores to Rs 2,259.50 crores and the total note issue by Rs 8.51 crores to Rs. 2,299.61 crores, according to the return of the Reserve Bank of India for the week ended 28th June, 1963. The currency contraction was adjusted by reducing foreign securities by Rs. 5.75 crores to Rs. 99.83 crores and rupee securities by Rs 4.24 crores to Rs.1,966.70 crores in the paper currency reserve. These changes were made by making relevant transfers to the Banking Department in which balances held abroad declined by Rs. 53 lakhs to Rs. 6.51 crores while investments rose by Rs. 2.98 crores to Rs. 269.82 crores. Deposits of the Government of India increased by Rs. 13.96 crores to Rs. 65.07 crores and those of State Governments by Rs. 2.21 crores to Rs. 12.28 crores. Balances of scheduled banks at Rs. 94.38 crores showed a rise of Rs. 5.22 crores and their loans from the Reserve Bank were only Rs. 1.17 crores, against Rs. 1.30 crores, of which advances against usance bills amounted to Rs. 9 lakhs (Rs. 46 lakhs). Ways and means advances stood at Rs. 30.94 crores, against Rs. 40.22 crores.

THE RETURN OF THE STATE BANK OF India for the week ended 21st June, 1963, shows a drop of Rs 52 lakhs to Rs. 565.54 crores in total deposits. Investments in Government securities are up by Rs. 6.04 crores to Rs. 249.86 crores while other authorised investments remain unchanged at Rs. 9.34 crores. Advances, including loans, cash credits, overdrafts and bills discounted and purchased have fallen by Rs 5.83 crores to Rs. 279.32 crores. Cash and balances are, in consequence, shown at Rs 23.30 crores or Rs. 1.42 crores higher.

THE STATEMENT OF THE POSITION OF scheduled banks for the week ended 21st June, 1963, shows Demand and Time liabilities at Rs. 1,036.22 crores (Rs. 29.07 crores on account of borrowings from banks) and Rs. 1,288.91 crores (Rs. 21.17 crores), compared with Rs 1,028.56 crores (Rs. 33.86 crores) and Rs. 1,284.48 crores (Rs. 20.94 crores), respectively, in the previous week. Cash has fallen by Rs. 1.42 crores to Rs. 53.57 crores, while balances with the Reserve Bank have increased by Rs. 5.60 crores to Rs. 85 crores. There is a rise of Rs. 10.38 crores to Rs. 642.82 crores in investments. Advances and bills discounted at Rs 1,531.38 crores show a drop of Rs. 17.50 crores. The ratios to total liabilities of cash and balances, and of advances and discounts are, in consequence, shown at 6 percent and 65.9 percent, against 5.8 percent and 70 percent.

TREASURY BILL MATURITIES

Details of 91-day bills outstanding with the public on 5-7-63.

Issue Date	Maturity Date	Amount (000's Rs.)	Average Acceptance Rate

THE BENGAL PAPER MILL CO. LTD.

CHAIRMAN REVIEWS PROGRESS

The following speech of the Chairman, Mr. N D. Bangur, read in his absence by a Director, Mr B. D. Bangur at the Annual General Meeting of the Company held at its Registered Office at 14, Netaji Subhas Road, Calcutta at 3 P.M. on 28th June, 1963.

Gentlemen,

I have great pleasure to welcome you to the Annual General Meeting being the 139th Ordinary General Meeting of your Company. The Directors' Report and the Audited Accounts for the year ended 31st December, 1962 have been in your hands and with your permission I take them as read.

We are passing through a period of National Emergency promulgated as a result of the Chinese Aggression on our country. The whole nation rose as one man to defend their Motherland and offered contributions in various forms. The practical impact of the emergency on the paper industry has been in the increased demand of particular varieties of paper and paper boards for defence purposes. Your Company supplied the defence requirements on priority basis and requested the co-operation of its civil customers in maintaining the price line.

Third Five-Year Plan and Price Policy

You are aware that in the beginning of the Third Five-Year Plan, the annual capacity of paper and paper board industry stood at 4,16,360 metric tonnes. The actual production during 1961-62, i.e. the first year of the Third Five-Year Plan was, however, only 3,67,000 metric tonnes. On the basis of an estimated progressive increase in demand at 12½% per annum during the Third Five-Year Plan period, the Planning Commission estimated the demand during 1962/63 at 5,15,000 metric tonnes and during 1963/64 at 5,80,000 metric tonnes. The progress made during the last two years is not satisfactory in the context of the target fixed by the Planning Commission for the Third Five-Year Plan period and even in case the annual indigenous production increases by as much as 70,000 to 80,000 metric tonnes during the next three years the total production would only reach a level of 5,50,000 metric tonnes against the target of 7,11,000 metric tonnes fixed by the Planning Commisson. This heavy shortfall between the targetted capacity and actual production is due mainly to non-materialisation of the new units licenced by the Government of India which may be due to high capital investment and inadequate returns because of the Government's present price fixation policy.

It is, however, gratifying to note that the Government have now realised the situation created in the Paper industry which is one of increasing costs and decreasing returns. The Development Council of Paper and Allied Industry have already appointed a Technical and a Finance Committee with a view to investigating the difficulties confronted by the industry. In the meantime, the Joint Committee of the Paper Industry submitted a memorandum to the Central Government for an upward revision of the paper and paper board prices. I hope the Government will give due consideration to the memorandum and will announce their decision for increasing the paper and paper board prices at an early date. It is suggested that Government should evolve some formula whereby any increase in the cost of production should automatically increase the selling prices of the paper and paper boards.

Raw Materials

In my last year's speech I had pointed out the necessity on the part of the States and Central Governments to grant long term leases of forests to paper industry with a view to foster both plant development and scientific exploitation. I regret that no concrete steps appear to have been taken by the authorities in this regard. On the other hand, there is a tendency in many States to grant long term leases of their forests only to those industries which are situated within their own States. This trend is not conducive to the wider national interest and I would, therefore, again appeal to the authorities to take necessary steps to ensure regular and adequate supply of raw materials, viz., bamboo, grass, timber, etc. to the paper industry on long term basis and also to take steps to establish extensive plantations and reafforestation work in hand more vigorously. There is yet another important point which I would like to touch upon and that is while considering proposals for setting up new units of pulp and paper the Government should see that the existing units are in no way adversely affected as far as their raw material supplies are concerned.

The paper mills situated in the States of West Bengal have more handicaps as they are dependant for their raw material supplies mainly on the neighbouring States. Suggestions were made to the Government of West Bengal to allocate sufficient waste lands to the paper industry for development of timber and grass plantations, and their final decision is still awaited. I would, therefore, appeal to the Government of West Bengal to take cognizence of the serious situation and take appropriate steps to ensure adequate supply of raw materials so that the tempo of increased production is maintained.

Considerable difficulties continued to be experienced in obtaining paper industry's full requirements of essential chemical like Caustic Soda, Sodium Chloride, Sodium Sulphate and Dye Stuffs from indigenous sources. Secondly, the prices of these chemicals have gone up and the paper industry finds it difficult to absorb the extra burden in view of the fixed selling prices of paper and paper boards. The Paper Makers' Association has requested the Government to stabilize the prices of essential chemicals and raw materials. I, however, regret to state that no satisfactory solution has as yet been found.

Sales

All the varieties of paper manufactured by your Company continued to be in good demand. I informed you last year that your Company successfully made Cable grade paper but regret that we could not continue its manufacture due to non-availability of the required type of Wood Pulp the import of which has not been permitted by the Government and for which our application for Import Licence has been rejected. The Government should reconsider this matter and allow import of required quality of pulp for converting into Cable grade paper as such a step would result in considerable saving of foregin exchange to the country.

The method of assessment of Excise Duty on various classes of paper still remains complicated causing hardship to the industry as well as to the consumers. There are cases where one type of paper is assessed and levied at a higher rate of duty which is reduced later to be again reassessed at higher rate with retrospective effect. There are also instances of one Mill being assessed at a higher rate of Excise Duty (while others have been charged lower rates of Excise Duty) on the same type of paper. I trust that Government would remove the cause of such anomalies at an early date.

The Paper Industry is also keenly interested in export promotion and your Company in its desire to explore export potentialities sent a senior executive to Far Eastern countries. Your Company's export promotion efforts have seen a ray of success and I am glad to inform you that the first consignment of Tiger Brand paper has already been shipped for overseas market during this month.

Recently the Indian Paper Makers' Association jointly with the Indian Paper Mills Association and the Federation of Paper Traders Association have also agreed to depute 3 delegations to selected countries of the Far and Middle East countries to investigate the possibilities of export of paper to these countries. I am glad to inform you that a senior executive of your Company will lead one of these delegations.

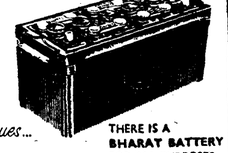
Operation and Financial Resources

The production and gross profit during the year were 21,588 metric tonnes and Rs. 60 lakhs compared to that of 19,627 metric tonnes and Rs. 55 lakhs during the previous year. The nett profit, however, declined to Rs. 16 lakhs during the year compared to Rs. 22 lakhs during the previous year. The decline in nett profit has been due to increased provision for taxation which stood at 31 lakhs during the year against Rs. 19 lakhs during the previous year. The new taxation measures have greatly affected the financial resources of your Company and have also increased the cost of expansion and modernisation scheme due to custom duty on imported plant and machinery having been raised and prices of indigenous supplies of items, viz. cement, steel and capital equipment having gone up.

After considernig the various aspects, your Directors have recommended a dividend of 20% on the Equity Shares for the year under review against a dividend of 27.5% paid last year. Your Company is taking steps to arrange further borrowings to meet the increased cost of expansion and modernisation scheme.

Expansion and Modernisation Scheme

Our expansion and modernisation scheme faced many difficulties due to shortage of cement and steel and also delayed shipments. Most of the consignments of paper machine and auxiliaries are either on sea or have arrived in India. The shipments of auxiliary equipment from U.S.A. met with delay due to a strike by the Eastern Seashoremen of the United States, but the most unfortunate delay has been with the shipment of main turbine which, while being transported from factory to the port of shipment in the United States, met with a truck accident, resulting in damage to the lower half of the unit. The extent of damage is presently under investigation by our suppliers, Messrs. Worthington Corporation but on very rough estimates, a delay of approximately 3 months in the shipment of this important equipment is indicated. However, arrangements are being made to obtain extra power supply from D.V.C. to run the paper machine and other auxiliary equipment for a short duration.



The buildings for the new paper machine, multistage bleaching plant and finishing house are nearing completion and satisfactory progress is being made with regard to the construction of Recovery and Coal Boiler buildings and Turbine house. During the period under review, a block of 1 room quarters and a Water Clarifier of 8 million gallons' capacity were constructed.

The erection work of the new paper machine is going on in full swing with the help of foreign Erectors. I hope that the new paper Machine would be ready for production before the end of the current year. Erection of Coal Boiler, Multistage Bleaching Plant and Recovery Boiler has also been taken in hand and all these equipments except the Recovery Boiler, which is likely to start functioning in the early part of 1964 would be ready for start-up on schedule.

The relation with staff and workers continues to be cordial and I would, on your and on my behalf, like to express our appreciation of their sincere services rendered to the Company.

NOTE : This does not purport to be the proceedings of the Annual General Meeting of the Company.

THE ELPHINSTONE SPG. & WVG. MILLS CO. LTD.

CHAIRMAN, MR. N. K. JALAN'S ADDRESS

Chairman's address by Mr. N. K. Jalan at the Annual General Meeting of the Elphinstone Spg. & Wvg. Mills Co. Ltd., on the 27th June, 1963, at Bombay.

Gentlemen.

It gives me great pleasure to welcome you all to this Fortyfourth Annual General Meeting of your Company. The Directors' Report and the Audited Statement of Accounts have been with you for some time now and with your permission, I shall take them as read.

In the year under review, the gross trading profit was Rs. 35,24,501/- I hope you will consider the working results of the year quite satisfactory especially in the face of a number of adverse circumstances in the working caused by the very difficult availability of cotton and the consequent high prices that had to be paid for cotton, increased labour charges, increased cost of stores, electricity, etc. although the price of cloth remained the same on account of voluntary price control.

Taxable dividend on Ordinary Shares has, therefore, been reduced to 18% from last year's 22%.

The year under review was marked by lower output mainly on account of paucity of cotton and generally slack demand. A very grave situation arose with cotton mills out of the malaise of accumulation of stocks which started from the month of May, 1962 and, steadily deteriorating month by month, reached a crisis at the close of the year. The long drawn-out crisis during the last quarter of the year was mainly a crisis of confidence generated by war psychosis, which was also responsible for panicky trading conditions during this period.

At the same time, the production cost went up considerably on various counts. There was an acute shortage of cotton supplies during the year resulting in runaway prices. The Government in-

Mr. N. K. Jalan

creased the ceiling prices of Indian cotton by Rs. 125/- per candy of the cotton crop of 1962-63 season and most of the varieties of Indian cotton were ruling around their ceilings. Excise duties on several chemicals and dyes had been imposed in the year. Losses had to be incurred on account of the obligatory export scheme voluntarily accepted by the industry—as a result of heavy undercutting of prices by the mills selling for export. A surcharge of 10.5% was levied on power bills with effect from July, 1962. Basic wages were increased by a flat rate of Rs. 2/- per month per worker from January, 1962. Average dearness allowance payable to workers reached the highest figure of Rs. 95.76 nP. for 26 working days. Employer's contribution under the Employees' State Insurance Scheme was doubled from 1¼% to 2½% with effect from the 1st April, 1962.

Bonus

It will be noticed from the Report and Accounts that a sum of Rs. 6,50,000/- has had to be transferred from General Reserve to enable your Directors to pay the dividends as recommended. This transfer was effected mainly on account of heavy inroads made into the profits of the year by the additional provison that had to be made for bonus to employees for a sum of Rs. 12,76,359/- in respect of the years, 1959, 1960 and 1961 under an Award issued consequent on the decision given by Shri Y. B. Chavan, the former Chief Minister of the State of Maharashtra who had been appointed as the mediator in the disputes for bonus for these years.

It is a matter of serious consideration whether such extraordinary disbursements by way of bonus to the employees are really justified at a time when the needs of the industry to plough back profits are high for the purpose of modernisation of its plant and equipments.

It is also urged for the consideration of the Bonus Commission appointed by the Government, whether in the case of composite companies owning factories belonging to different industries like yours, bonus payable to workers should not be assessed in respect of each factory, although the Balance Sheet of the Company is one covering the working of the factories together. The profits and the prior charges can be allocated between the different factories of the same company and the assessment of bonus payable to workers of different factories should not be difficult.

Cloth Exports

In spite of the fact that the industry volunteered to bind itself to a minimum export performance, results achieved so far have not been satisfactory. India's export of cloth during the year 1962 stood at 508 million yards worth Rs. 40 crores as compared to 572 million yards worth Rs. 46 crores in 1961, 690 million yards worth Rs. 54 crores in 1960 and 810 million yards valued at Rs. 55 crores in 1959, evidencing a steady decline in the country's exports in the last few years. Your Mills could maintain its export at the preceding year's level of about 14% of the production of the year.

Although quality control, diversification of products and market research, as part of a three-phased programme of expansion of exports might help in the export drive, one has to go to the root of the problem by studying the practical difficulties being faced for correcting the present unfavourable trends. One of the primary needs of the industry has been rationalisation and modernisation of plant and equipment. The competitive ability of the industry in the international market has to be bolstered up by reduction in prices and by economising cost with the help of modern machines and judicious employment of labour.

Besides, the steady increase in the cost of raw materials has also proved highly unfavourable in successfully tackling the export problem. It will be increasingly difficult for the industry to sell in export markets if it cannot procure raw materials at economic prices.

It is also unfortunate that under the last budget the benefit of rebate has not been extended to the cotton textile industry if its manufactures are not directly exported by the producers themselves.

Cotton

It is ironical for our country where the problem of cotton supplies is so acute that this is the fifth successive year in which world production has risen to a new record with the help of the exceptionally high world yield of 285 lbs. of lint per acre as compared to the poor Indian record of 112 lbs. per acre. The yield per acre during 1962-63 in the U.S.A., Egypt and Pakistan is 455 lbs., 583 lbs and 219 lbs. respectively. In our country, on account of low productivity, we are constrained to live a hand-to-mouth existence with regard to the requirements of cotton. It is only to be hoped that with the establishment of a permanent organisation of cotton research as proposed by the Bangalore Session of the International Cotton Advisory Committee, the level of productivity will increase and we will be able to attain self-sufficiency in this essential raw material in due course especially when the area under cotton cultivation in India is the highest in the World.

Besides, the prices payable for cotton continue to remain at a high level. Either there is a failure of crop and the prices payable by the mills are very high as for the season 1961-62, or there is a good cotton crop but the prices payable are all the same very high on account of the Government raising the ceiling prices as in the case of the crop of the current season. It is keenly felt that it should serve the purpose of the country better, if instead of the farmer being encouraged to develop a sort of vested interest in the low level of his production, serious efforts are made to tackle the problem of increasing the productivity. The prices of Indian cotton varieties are at present above the world parity and the advantage of relative cheapness which obtained to the Indian Cotton Textile Industry in the past is now almost entirely lost much to the detriment of export promotion.

Leather Cloth Division

As mentioned in my speech last year, the working of this division was not as satisfactory during the year under review as that in the preceding year, mainly on account of drastic cuts effected by the Government in the import licences for the essential raw materials required in the manufacture of leather cloth. Owing to very much restricted imports, the raw materials had to be purchased from indigenous manufacturers at prohibitive prices with the result that the profitability of this division was very much affected.

On account of drastic cut in the import of P.V.C. raw material and the highly irregular policy adopted in regard to distribution of Plasticizer by the only manufacturer, working of our plant was stopped for about three months.

I consider it my duty to refer to another serious handicap that is militating against our economic growth. Ours being a composite company, we have to pay textile wages to the workers of Leather Division also, whereas other concerns manufacturing exclusively Leather Cloth are not bound by such

imposition and hence we have to work under such handicap.

Expansion

After the purchase of the block of Moon Mills was completed as referred to in the last year's Report, negotiations were started with the National Industrial Development Corporation Ltd., for a loan from them for equipping this newly acquired unit with the latest types of spinning and other required machinery. The negotiations are still in progress.

High Cost Structure

You will naturally expect me to give some idea about the current working and the future prospects. In this connection, I am constrained to say that while the prices of cloth have remained the same as a result of the voluntary price control in force from September 1960, the cost of production of this Industry has only been steadily increasing. Apart from the heavy incidence of new financial burdens on the industry effected in and from the year under review as mentioned in the foregoing paragraphs, several other measures have contributed to a much steeper cost of production in the current year which are more or less of a permanent nature. Duties on several important items of stores have been increased. Machinery will cost more on account of customs duty on capital goods. Import duty on raw cotton has been reimposed. Freights and Inter-State sales tax have been increased. The Power Supply company effected a further increase of about 26% in their tariffs from last May in addition to a surcharge of 10.5% imposed in July 1962. The financial commitments involved in the Emergency Risks Insurance Scheme which was brought into force from the beginning of the current year will also make sizeable cuts into the profits of the company. Several tax measures have been introduced by the State Government inclusive of increase in sales tax on cotton and certain important items of mills stores, chemicals, etc. The cost of borrowings has increased as a result of the increase in the Advance Rates of Banks.

In order to help the Government in holding the price line, the mill industry has so far pegged down its prices to the level of those prevailing at the end of 1960. With all these additional burdens since 1961, however, it is difficult to say how the mills will be able to run economically if the Government does not allow an upward revision in the prices of cloth.

Modernisation and Renovation

In spite of several handicaps, the management has been continuously modernising your mills with a view to be able to hold its own even in the most difficult times.

During the year under review, machineries worth about Rs. 20.45 lakhs have been further installed and put into commission. These include one Mercerised Plant, 48 Textima Automatic Looms, 3 High Speed Drawing Frames, 1 Cockers High Speed Slasher Sizing Machine, 1 Polymerising Machine, 1 Warp Tying Machine and 5 N. M. M. Ring Frames. Further, after the close of the year, 2 High Speed Drawing Frames, 1 Chemic Machine, 1 Comber, 1 Acid Ager and 11 Constant Card Strippers have already been received and installed.

We further expect early delivery of 4 OM/RKI Ring Frames and 1 Dornamat Continuous coating Plant.

As for the spinning Section, I am glad to inform you that your Company was granted permission last year to install 3,088 additional spindles for balancing purposes in addition to 3,200 spindles granted in the previous year. Orders for indigenous ring frames have been placed but deliveries have been rather disappointing and we could complete the installation of only 2,240 new spindles. We have also applied for a licence to put in 6,087 additional spindles for balancing purposes.

Difficult Position

In view of the difficult position of supply of new Ring Frames, the Company continued during the past year its programme of converting its existing Ring Frames to longer lifts and to the latest systems of High Drafting and equipping them with Pneumafil Simultaneously the Company also carried out the conversion of some of the existing speed Frames to High Drafting and Can-Feed on experimental basis. The Company succeeded in obtaining Import Licence for 2 Simplex Frames of the latest model from Japan and applied for import of further 4 machines of the same type. Subject to the availability of import licences the Company has a programme to change its entire old Blow Room machineries, Draw Frames and Speed Frames in course of time.

The installation of 5 New High Speed Draw Frames was in useful replacement of old machines and it was completed during the year under review. In the year 1960, the Company installed 4 High Speed Combers to enhance the combing capacity for the production of goods of superior quality. The combing capacity has now been further supplemented by one more High Speed Comber of the latest type installed this year.

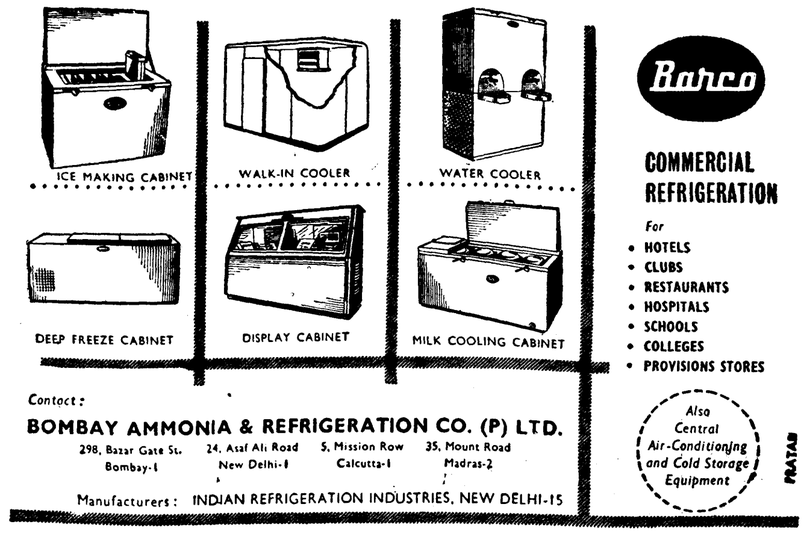
An experimental super High Draft Frame of indigenous make was also installed during the year under review and further orders for 4 Super High Draft Ring Frames were placed for delivery this year. The Company already has a Super High Draft Plant of 8,000 spindles working since 1956 and additions of Super High Draft spindles are now being made, with a view to effecting further economies in the working of the Company.

In the Weaving Preparatory Department, one High Speed Sizing machine was installed in addition to one machine installed in the previous year. The Barber Colman Spooler & Warper which were installed and put into commission in the year 1961 have modernised about half the Winding and Warping Sections. With a view to completing the modernisation of this Department, the Company is now considering the installation of the latest Automatic High Speed Winding & Warping machinery incorporating revolutionary changes in Winding technique. One Automatic Warp Tying machine was received last year and orders for further such automatic machines are under consideration.

Automatic Looms

In the Weaving Shed, 48 Automatic Looms were installed in replacement of old plain looms and installation of further 96 Automatic Looms is under consideration. The Company could not finalise order of further imported Automatic Looms last year and is now considering the purchase of indigenous looms which are being made with foreign collaboration and are now available.

In the Processing Section, the Company made the extension of this department for improving the layout and reducing the labour cost in handling. The Mercerising machine was installed last year and the Screen Printing Section was also put into commission. These two additions have increased the saleability of the Company's products which are now made in greater variety and finish to meet the demands of the market.



It is, however, paradoxical to note that we have to modernise our mills with so-called new machineries which are in fact out-dated. You will be interested to learn that rapid scientific improvements such as continuous Automatic Spinning Equipments, Jet Looms, etc. are being introduced in other progressive countries whereas we have to remain content with out-dated 8" Lift Spinning Frame and old type of Automatic Looms.

Unfortunately, the Government is placing limitations in regard to replacement of ordinary looms with Automatic Looms. For instance, the condition of compulsory export against installation of Automatic Looms is so drastic that Mills are finding it difficult to replace ordinary looms with Automatic Looms. It is imperative that the cost of production should be brought down so that our products may compete in the world markets against many other advanced countries. Further, the cloth must be of superior standard and one of the prerequisites for the production of quality cloth is to have Automatic Looms.

For the Leather Cloth Division, we have ordered out one of the most modern and up-to-date equipments with the object of producing Leather Cloth of international standard and we have also arranged for availing the services of foreign technical consultants to advise us on the latest techniques in the field of Leather Cloth manufacture. With the arrival of the new equipment, we also hope to compete successfully in the export markets of this product.

In conclusion, I have to sincerely thank my colleagues on the Board and to express my appreciation to the executives, staff and workers of the Company for the valued co-operation extended by them during the year.

N.B. This does not purport to be the proceeding of the Annual General Meeting.

GOODYEAR INDIA LIMITED

POWER SHORTAGE AFFECTS GOODYEAR TYRE PRODUCTION

TYRE PRICE INCREASE DESIRABLE, SAYS MR. R. E. O. CAREY

Addressing the shareholders of Goodyear India Limited at the Annual General Meeting held in Calcutta on 28th June, 1963. Mr. R. E. O. Carey, Managing Director of the Company, said :

Gentlemen :

I have pleasure in welcoming you to the Second Annual General Meeting of your Company. The Director's Report and the Annual Accounts have been with you for some time and with your permission I should like to take them as read.

Review of Company's Performance

The year's trading, as you will have seen, has resulted in a loss of over Rs. 57 lakhs. In view of this the Directors of the Company have recommended against the payment of any dividend for this year.

Sales of your Company's products during 1962 showed a marginal decline of less than 2.61% against those of the previous year due to below-capacity production at the Ballabgarh Factory. No provision for taxation is required this year, and after the transfer of Rs. 8 lakhs from the Development Rebate Reserve and a write-back of Rs. 94,955 on taxation account, the amount carried forward is Rs. 3,68,052. The Development Rebate Reserve presently stands at Rs. 17,93,341 and the General Reserve of Rs. 100,00,000 set up in 1961 remains untouched.

Despite the trading loss sustained in 1962 and the inability of the Company to pay a dividend, the figures I have quoted indicate that Goodyear-India's financial position remains sound, with an equity capital of Rs. 2 crores and a surplus of very nearly Rs. 1.5 crores. Shareholding continues to be very wide —your Company has nearly 38,000 shareholders—reflecting, unmistakably, widespread confidence in our good name.

Power Shortage

While it is not my purpose here today to minimise the extent of our disappointment at the trading result for 1962, I would like to dwell a little on the circumstances that led to it. First and foremost it is important to underscore the fact that the trading loss for the year arose wholly from the operations of the Ballabgarh Factory.

What were the reasons for the operational loss of the Ballabgarh Factory ? The chief problem—I referred to this when we met last year—continued to be the overall power shortage and the widely erratic nature of the power supply at Ballabgarh. In 1962, which was the first full year of working at Ballabgarh, power outages at the factory averaged over 56 a month, or a total of 678 for the year. When you consider that there are only 289 working days in a year, this factor must be regarded as being a major contribution to production loss. The power shortage in this area affects all industrial units and is not confined to the Goodyear factory ; also, strenuous and continuing efforts are being made by the Punjab State Electricity Board to improve the situation. Nevertheless, the hard fact is that the effects of power outages on rubber tyre manufacture are far more damaging and far-reaching than on most other manufacturing processes.

Whereas in the majority of industries a power outage means a suspension of the manufacturing process without loss of the basic raw material and without an extension in the total elapsed time expended on manufacturing a given item, with us it is different. Tyre curing is a continuous process that admits of no interruption : when a stoppage occurs the partially processed material has to be scrapped. This results in heavy loss of the basic raw materials—and parallel losses in time and human energy spent on the scrapped material up to the point at which the process was halted.

This, then, is the size of the unfortunate circumstance that has inhibited production at Ballabgarh. Whilst it is obvious that the power shortage is a factor beyond our control it should also be apparent that by its very nature it is and must be a temporary problem. Your Directors have full confidence that with the unabated efforts of the Punjab State Electricity Board on the one hand, and the greater adaptability to the situation displayed by factory management and operatives alike on the other, the power problem will be contained, if not wholly surmounted, in the near future.

Your Directors have been vigilant and fully cognisant of these problems ; so prompt and effective measures have been taken to meet the needs of the situation.

In fact you will be glad to know that in the first couple of months of 1963 the Ballabgarh factory achieved the monthly rated capacity of production based on the annual installed capacity of 210,000 tyres and tubes a year.

Product Diversification

Large as our stake is in the future of the tyre industry, it is no greater than our faith in India's developing economy. This is reflected nowhere more clearly than in our programme of profitable lines of diversification which as a general company policy began as early as 1946. In 1963, therefore, apart from our own famous and traditional lines of automotive accessories, Industrial Products, Chemicals and Adhesives, we are actively marketing a new and wide range of products manufactured to our specifications and designs by small scale industry ranging from items as simple as bells and locks for bicycles to precision products like dock fenders, and automotive batteries.

While helping to broaden the base of our own operations these activities serve to further the growth of many small industries. Not only are these industries placed on a sounder footing by having to produce to Goodyear's exacting standards but they are also able to take advantage of our nationwide marketing setup which they could not possibly match themselves.

During this first year of our operations in our own factory, we have been sustained by the constant help, advice and guidance received from the Goodyear Tire & Rubber Co. of Akron and also from other units of the worldwide Goodyear organisations.

Tyre Industry in India

The strength of our international associations is an important ingredient in Goodyear-India's steadfast resolve to play a leading role in the growth of the tyre industry in this country. There are today, as you know, seven units with a total capacity of approximately 3 million tyres and tubes a year. Four more units have asked for licence with a combined capacity of a little over 1.2 million tyres and tubes. It is estimated therefore that the aggregate capacity of the tyre industry as a whole may be 4½ million tyres and tubes per annum by 1965 by which time it is also estimated that 750,000 automotive vehicles will be on the road. Although the Planning Commission felt that a target of 3½ million tyres per annum would be adequate to meet the country's needs by 1965, the tyre industry should be producing well in excess of it by that time and fully competitive marketing conditions will be restored.

We in Goodyear-India welcome competition because we believe that it is the mainspring of industrial advancement and economic progress. We are confident that it will not be difficult for us to acquire our rightful share of the market, for after all, we possess the incomparable virtues of a good name and a good product.

Fair Tyre Price Increase Necessary

Having emphasized this, I cannot let this opportunity go by without sharing with you a doubt, if not an anxiety, about the restrictive pricing policy under which the tyre industry is currently operating and which, in my opinion, will seriously impede its growth unless revised.

As you all know, a cut-back on tyre prices recommended by the Tariff Commission in 1955 severely pruned industry profits. Since then, while tyre prices have remained constant (except for enhancement directly resulting from increased excise duties) every single raw material has become dearer—varying from a marginal to an alarming degree. So much so that today even gross profit before taxes has dwindled to the point where, unless the ceiling on tyre prices is lifted, the industry cannot possibly register a healthy growth. (It must be remembered in this context that the tyre industry currently has approximately 14 crores 21 lakhs in equity capital—nearly nine times what it was in 1955.)

I am glad to be able to tell you that the problem is engaging the attention of all tyre manufacturers in the country and a joint appeal for a fair price increase is under consideration by Government. If sanctioned—as we hope it will be—it will provide a much-needed fillip to this vital industry.

Goodyear Answers the Call

Goodyear-India is proud of serving the nation, as it is of serving the common man. Since the outbreak of hostilities on India's borders Goodyear-India has been called upon to produce certain types of tyres exclusively for defence needs.

In another area calling for urgent national effort, namely the promotion of exports, Goodyear-India made a small beginning in 1962 with the export of bicycle tyres, followed later by passenger car tyres. I hope when we meet next year I shall be able to report to you that the products of Goodyear-India are helping to earn a sizeable volume of foreign exchange.

Expansion Programme and Issue of Further Capital

There is just one other aspect of our operations I would like to refer to before I conclude. This is the misapprehension which has found currency in certain quarters that Goodyear-India's proposal of introducing a rights issue has been cancelled. I would like to state emphatically that our plans in this regard have not been cancelled but have only been postponed as a result of a decision taken at a Special General Meeting of Shareholders held in March 1963. This decision arose directly from the unsettled market conditions existing at that time. Along with several other tyre companies contemplating expansion at the time we thought it wise to make haste slowly on this scheme. I would like to assure you that the proposal for expansion is still under very active consideration by your Board, sanction for the expansion having already been approved by the Central Government.

1962 has been a testing time for Goodyear-India and its wide circle of dealer friends. It is my privilege to acclaim their devotion and loyalty to us in times that have been sometimes thwarting and almost always strenuous. We owe them all a debt of gratitude.

I would also like to thank the employees of Goodyear-India, all my colleagues and staff who have passed through these anxious times with fortitude, courage and high spirits. I know you will wish to join me in expressing my appreciation of their splendid teamwork.

N.B. This does not purport to be a record of the proceedings of the Annual General Meeting.

THE NATIONAL TANNERY COMPANY LIMITED

CHAIRMAN, MR. SANJOY SEN'S REVIEW

Mr. Sanjoy Sen, Chairman, delivered the following speech at the Annual General Meeting of The National Tannery Co. Ltd. held on 28th June, 1963, at Calcutta.

It gives me pleasure to welcome you to this Annual General Meeting. The Directors' Report and the Statement of Accounts for the year ending December 31, 1962, have been circulated and with your approval, I shall take these as read.

Our Production continues to rise and our overall sales have exceeded last year's figures. A small increase in prices for our finished leather and the various corrective measures taken during the year have given the necessary fillip required to maintain our profits at a satisfactory level. During the year under review, we have again been fortunate in receiving our quota of import licences for hides and chemicals from the Ministry of Commerce & Industry in spite of the difficult foreign exchange position for which we are extremely grateful. This has enabled us to continue expanding our production to meet the growing internal and external demands.

We are well on the way to completing the firs' phase of our Expansion Programme and at the moment we have practically completed our building programme. This has made it possible for us to re-lay our entire Vegetable Tanning Section according to our Master Plan. We have also been able to house our modern finishing Department for Chrome, Chrome re-tanning and Vegetable Tanned leather in its new location and we are certain that this will enable us to increase our productivity in respect of finished leathers substantially. Water and electric supply has been augmented according to Plan and this will obviate future bottlenecks in our increased production drive.

Raising Production

A steady demand for our large range of coloured corrected grain finished chrome re-tanned leather and Bunawar and Katai has grown and we are actively considering increasing our production for these items. During the year we have successfully introduced our double tanned picking bands and we anticipate a large demand for this product from the Textile and Jute Mills.

At the moment, the Indian economy is tied to Defence and Export. Your Company has, therefore, taken steps both to promote its exports and to cater to the Country's Defence requirements.

On the export side approximately 80,000 tanned goat skins have already been exported by us since March 1963 to Centrotex in Czechoslovakia and we are presently contemplating signing a long-term contract with this firm for the supply of these skins. According to Centrotex, their demand for these goat skins will be in the region of half a million during 1964 rising upto one million in 1965. Due to the Government of India's policy of restricting exports of raw goat skins, the East European countries are actively engaged in importing a large part of their requirements in the form of chrome tanned skins in the wet blue. The East European countries use approximately 10 crores worth of raw and processed goat skins and it is anticipated that under the present bi-lateral agreements at least 50% of this figure will have to be imported in terms of processed and tanned skins. This will help the Indian tanning industry substantially in tapping its idle chrome tanning capacity.

In order to take advantage of this situation, the Indian tanners will have to make minor changes in their tanneries in order that they can convert their chrome tanning capacities for cow hides to goat skins. We have already taken up the work of this conversion and we anticipate that by the end of this year, we should be in a position to raise our monthly soaking of these skins to approximately 80,000—90,000 pieces. We hope to double this figure during 1964 and in anticipation we have made the necessary application for import of a small balancing plant which we are hopeful of obtaining shortly. At the moment, we are processing dry salted skins but we feel that ultimately it may be more beneficial to work with wet skins. The main obstacle in using wet skins is the lack of transport and storing facilities Unless the wet skins can be brought an soaked at the tanneries within a certain period of time, there is every chance of putrefaction. Whilst working with wet skins during the hot season may be a problem we should, during the winter months, try to use this raw material to eliminate the laborious operation of drying.

Exchange of Technical Personnel

One of the principal features of our proposed Agreement with Centrotex is the exchange of technical personnel. At the moment, we have an expert from Czechoslovakia and we shall be shortly sending one of our tanners to Czechoslovakia to study the subsequent processing on skins tanned by us. Satisfactory formulation of chrome tanned leather in the blue can only be achieved if the subsequent processing abroad and the end use to which the leather is put to is known. Interchange of personnel will allow Centrotex and us to develop the leather of their choice out of the Indian raw material.

Since the latter part of 1962 the world leather market has been in a very depressed state. Consequently there has been a downward trend in raw hide prices also. It has, therefore, become extremely difficult to export finished leather from India to the United Kingdom and the Continental Markets. Unfortunately, raw hide prices in India show no signs of weakening. The increasing internal demand for and the lack of availability of raw hides has artificially maintained a high internal raw hide price over the last few years' having no relation to the world prices. This makes it all the more difficult for Indian tanners to compete with their finished leather abroad.

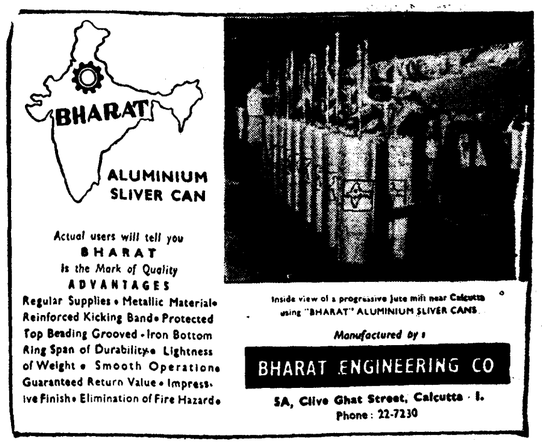
The Government of India has recently established a Finished Leather and Leather Goods Export Promotion Council in Kanpur on a commodity basis. We welcome the establishment of the Finished Leather Council as we feel that such a Council could help in enlarging the finished leather exports abroad by studying the problem deeply and taking the necessary corrective action. Already a list of entitlements of finished leather and leather goods has been established and this should go a long way to help tanners in their export. Modern finishing demands plastic finishes most of which at the moment are indigenously unavailable. The incentives will allow tanners to satisfy their export customers by importing the necessary finishes and lacquers.

The new entitlements allow 10% of one's export promotional import licences to be used against import of plant and machinery for modernization and balancing. Whilst this new feature will certainly help the export oriented tanning industry over the years some immediate steps should be taken by the Ministry of Commerce and Industry enabling the tanneries to rehabilitate and modernize their finishing departments. With our exports of East India leather and skins practically remaining stationary it is essential that our finished leathers are capable of meeting world competition in order that our overall exports of 30/40 crores is maintained and even bettered.

State of Emergency

The State of Emergency has placed a heavy burden on the leather industry in the way of supply of leather for ammunition boots and other leather goods required for military personnel. We have recently received substantial orders from the D. G. S. & D for different types of vegetable tanned leather and have also been asked to tender for further quantities. In order to satisfy this added demand from the D. G. S. & D. we are making the necessary arrangements, as we feel that this demand will continue for quite some time and it would not be fair for us to completely cut ourselves out from the Indian market. The biggest problem we face in executing Defence Orders is the limited availability of suitable materials. Whilst the demand for tanned leather in India has been continuously on the rise during the different Plan Periods, the same cannot be said of the raw hide production. We have now reached a stage where the demand for tanned leather far outstrips the local availability as is shown by the increasing import of raw hides into the country. Most of the Defence Requirements are in respect of Buffalo hides and the availability of this hide, in India and abroad, has its limitations. It may, therefore, become necessary for us to think in terms of using ox-hide sole leather instead of Buffalo sole leather for Defence requirements. At the moment, a large number of D. G. S. & D. specifications indicate the use of Buffalo leather only. It will be possible for the tanneries to import cheap ox hides, for this purpose from Australia, New Zealand, U.S.A., South America or the East and West African countries against their export entitlements.

Unless immediate steps are taken by the Government to plan for the added defence requirements there will be an acute shortage in the internal leather market. In the face of growing exports of shoes, leather goods and leather we cannot afford to cut into their requirements. The Development Council should immediately study the overall requirements and make its recommendations on how best this situation can be tackled.



Effects of the Central Budget

The repercussions of the central budget have yet to be assessed. It is certain that the leather industry will not be in a position to absorb the additional cost of chemicals and finishing materials arising out of additional excise duties and enhanced import duties by either raising its overall productivity or introducing economy measures. A small increase in the prices of our finished leather is therefore inevitable as soon as the incidence of indirect taxes on our products are known. Whilst S. P. T. is not applicable to our Company during the year our future development and expansion will be seriously handicapped if this tax was to continue due to our inability to plough back sufficient profits. The general effect of S. P. T. on the leather industry would be to retard its rehabilitation and development on modern lines.

In fully endorsing the Finance Minister's view on the need for additional revenue and wholeheartedly supporting the quantum proposed to be raised for the defence of the country we fervently hope that he will ultimately find a way of raising his requirements without harming the industrial growth and development of the country which is also so vital to its social uplift and defence.

Before concluding I would like to complement the technical personnel and the workers for smoothly carrying out production under very trying conditions of building reconstruction and relocation of plant. I also take this opportunity of thanking our customers, my colleagues, staff and workers for another year of unstinted support.

DALMIA CEMENT (BHARAT) LIMITED

CHAIRMAN, MR. V. H. DALMIA'S REVIEW

Summary of the speech of the Chairman, Mr. V. H. Dalmia delivered at the Eleventh Annual General Meeting of the Company held at Dalmiapuram (Madras State) on 28th June, 1963.

Gentlemen,

It gives me great pleasure to welcome you to the Eleventh Annual General Meeting of your company. Since we met last, many eventful developments have taken place. The most significant, of course, was the unprovoked aggression on our northern frontiers towards the end of last year.

Your company was quick to respond to the emergent situation. Apart from the contributions to the Defence Fund, special attention is being given to maximising the production. The Joint Production Committee consisting of representatives of the employees and the Management has done a good job in raising the production at your Dalmiapuram Works to a record level.

I am sure you must have received with satisfaction the working results of your company for the year ended 31st December, 1962. The gross profit has risen from Rs. 84.02 lakhs to Rs. 146.62 lakhs—an increase of Rs. 62.60 lakhs. At the same time, the provision for taxation has gone up by Rs. 46.50 lakhs. Taxation will take away over 74% of the increased profit made in 1962, partly due to the newly levied Super Profits Tax. It is, however, a matter of satisfaction that despite the heavy burden of taxation, it has been possible to maintain the dividend as also to strengthen your company's Reserve position by transferring Rs. 13.50 lakhs to the General Reserve.

Raising Output

Cement continues to be in short supply throughout the country and the position has somewhat worsened with the increased requirements of the Government on account of Emergency. The expansion of cement industry has not, however, kept pace with the demand for various reasons including the difficulty in procurement of essential plant and equipment. In 1962, the installed capacity touched 9.728 million tonnes against 9.4 million tonnes in 1961, an increase of barely 3.5%. The available estimates of the likely expansion of the production capacity within the Third Plan period would indicate a continued shortage of cement. I am glad to inform you that there has been a distinct improvement in the utilisation of the installed capacity by the removal of such impediments as inadequate supply of coal, wagons for supply of raw materials and despatch of the finished product, etc. The government is also giving active consideration to encourage the manufacture of blended cements by the admixture of fly ash and other pozzolonas and blast furnace slag. Blended cements are used widely in other countries and an early start should be made in our own country also to mitigate the persisting shortage of cement.

The cement industry is being put to considerable loss by the recent changes made by Government in the system of computing the packing charges. The packing charges announced by the Government on a quarterly basis are determined as an average of the prices of new and second-hand bags. In making out the average, the proportion of second-hand bags was raised by Government with effect from the quarter October-December 1962 from 25% to 50% without consulting the industry. This envisaged the procurement of something like 90 million second-hand bags for cement packing, which would not be possible. Besides, insistence on extensive use of second-hand bags would lower the standard of packing, which would not be in the interest of the consumer. Nor would it be desirable to permit the wastage of this important commodity, which is in short supply, through avoidable seepage. Despite the best efforts made by the Industry, it could procure and use second-hand bags during 1962 to the extent of only 34% of the total packing. I would urge the Government to review its decision at an early date and at least revert to the earlier practice of taking the usage of second-hand bags at 25% for determining the average packing charges.

Coal Raisings

Since I spoke to you last, here has been a marked improvement in the raisings of coal and its distribution, on which Government, the Railways, and the Coal Industry are to be congratulated. One of the factors, which have undoubtedly contributed to this improvement, is the carriage of coal by the rail-cum-sea route. I regret, however, that I am unable to express myself with equal satisfaction over the performance of the authorities in the implementation of the scheme, which was announced by the Government of India on 1st August, 1961, to subsidise the movement of coal by sea so as to equate approximately the cost of sea-borne coal with coal carried by the all rail route. In February 1963, the Coal Controller has postulated a formula for the computation of coal subsidies which, while effecting a simplification in procedure, has aggravated further the gap between the subsidy which could thus be realised and what should be given if the cost to the consumer of sea-borne coal is to be, more or less, the same as the cost of coal transported by the all rail route. It is to be hoped that the Government will rectify this defect and, at the same time, arrange for a very expeditious payment of subsidy claims.

Partial recession in the Steel Industry on a worldwide basis and large scale development of new sources of iron ore have tended to depress the international prices of iron ore and have greatly increased the competition which India must face in world markets. However, the State Trading Corporation of India had concluded a contract with the Japanese Steel Mills for export to Japan of 2.54 million tons of various grades of iron ore in 1963-64 and 2.65 million tons in 1964-65, including the supply of certain quantities of high grade iron ores. Your company may now hope to make further supplies of high grade iron ore from their mines to Japan through the State Trading Corporation of India.

Simultaneously with the development of new sources of iron ore and the consequent extension of the supply lines, the steel industry in various countries and particularly in Japan are faced with the urgent need to lower and stabilize transportation costs and to secure reliable supply routes. This has led to a growing trend towards the building of larger and faster exclusive ore-carriers capable of taking 40,000 tons and more of ore. Unfortunately, Indian ports are, by and large, not equipped to handle such large ore-carriers and therefore, India will continue to be at a disadvantage *vis-à-vis* those countries, such as South Africa and South America, at some of whose iron ore ports larger ore-carriers can be accommodated. I am sure that the Government of India will rise to the occasion and that the port facilities in our country will be developed as rapidly as possible to meet this challenge. Until such time as the major developments required for the accommodation of such carriers are carried out, I would suggest that ports, such as Cuddalore, be improved rapidly to allow of their handling smaller ore-carriers of 20,000 to 30,000 tons.

It is gratifying to note that the Railways have increased their capacity for the transport of iron ore by the all meter gauge route from the Bellary-Hospet region to Cuddalore port and we may expect that they would be able to increase this still further to keep pace with the development of Cuddalore Port.

Scope for Mechanisation

There is an urgent need of a greater sense of security being given to the iron ore mining industry and particularly to those mines who are supplying ore for exports. Given reasonably long term contracts for supplies of iron ore, some of the mineowners could introduce a degree of mechanisation in their mines and, where necessary, instal ropeways for the carriage of the ore from the mines to the rail-heads thereby reducing costs of operation and transport. This together with other measures, which Government will doubtless plan and implement, would enable Indian iron ores to meet competition in international markets more effectively.

I am sorry to advise that, contrary to expectations, there has been a recession in the deadburnt magnesite industry which is reflected in the working results of M/s. Dalmia Magnesite Corporation, in which your company is a partner. This is due mainly to the fact that the Steel Industry, which directly or indirectly through the refractory industry consumes nearly the entire output of deadburnt magnesite in the country, has not progressed according to the Plan target. It is now apprehended that the Steel Industry may be able to reach a production of barely six million tonnes per annum by 1965-66 instead of the target of 10 million tonnes, to which the deadburnt magnesite industry, as part of the refractory industry in the country, was gearing itself. While there was thus a tapering off of the demand for deadburnt magnesite, the installed capacity of the industry was increased substantially by the commissioning, last year, of a new plant with a capacity of 18,000 tonnes per annum. Exports of deadburnt magnesite would be facilitated if special export incentives were granted to the industry and if a substantial rebate in Railway freight to the ports for the exported material were allowed. I must also strike a note of caution in estimating the future demands for deadburnt magnesite, due to the growing preference for L.D. and other Oxygen processes for the manufacture of steel. The industry must, therefore, wait for reliable advice on the trend of the future expansion of the steel industry before planning for any further substantial increases in its own capacity.

Conversion Scheme

I would now like to refer to the Scheme for conversion of the deferred shares of your company into ordinary shares by the issue of one ordinary share of Rs. 10/- in lieu of every four deferred shares of Re. 1/- each. The Central Board of Revenue has taken the view that Capital Gains Tax will be attracted in the event of the conversion of the deferred shares into ordinary shares. Representations have been made to the Board by the Chambers of Commerce that the law should be amended, if necessary, to take such conversion of shares out of the purview of the Capital Gains Tax, since it would be unreasonable to levy Capital Gains Tax when the shares are not disposed of and continue to be held by the same person though the nature of the holding is changed. I hope that Government would relieve shareholders from the levy of Capital Gains Tax on the conversion of the deferred shares into ordinary shares in view of the considerations that I have just mentioned. It is desirable to encourage such conversion and eliminate the deferred shares so as to streamline the capital structures of the companies.

In their report, your directors have explained how interest paid by the company to your subsidiary, Dalmia Cement Limited, on the amounts due to the latter has been disallowed in the tax assessments of your company. The value of the assets taken over by your company from Dalmia Cement Limited has, ever since the scheme came into effect, been shown as due and payable to the latter company and interest has been paid on the outstanding amounts in the usual course of business. It appears to me to be taking too narrow and legal a view to suggest that interest on such outstandings is not allowable as the same does not pertain to capital borrowed for the purpose of business. In such matters, an appreciation of the real nature of the transaction should be made and the arrangement should be viewed from the commercial point of view. When the interest is being treated as income in the hands of the recipient, it is unreasonable not to allow it as a deduction in the tax assessment of the payer. A representation has been made to the Central Board of Revenue and it is my hope that an equitable view will be taken in this matter and relief granted to your company.

Before I conclude, I would like to express on your behalf and on behalf of your directors, our appreciation of the services rendered to the company by all the executives, staff and workers and for the goodwill and co-operation which continue to mark the relations between the employees and the management of the company.

CHAIRMAN, MR. R. H. KAMANI'S SPEECH

The following Speech of the Chairman Mr. R. H. Kamani delivered at the 19th Annual General Meeting of the Shareholders of the Company on 29th June, 1963 at Jaipur.

It gives me great pleasure to greet you and welcome you on behalf of my colleagues and myself to this Nineteenth Annual General Meeting of your Company.

Since we met last year, we have been passing through grave national crisis caused by the unprovoked and dastardly violation of our country's border by the Chinese which has made it absolutely necessary for all of us, as true Indians, to keep ourselves fully prepared for any situation that may arise. This crisis however shall not stop us from contributing our mite towards building our national economy and bringing prosperity through industry to our people. We have already offered our services to the Government in these critical times and I am confident that your Company will be able to serve the country in many ways. I am really happy to inform you that during the year under review, the workers, and the staff have voluntarily contributed a sizeable amount which along with your Company's contributions amounted to Rs. 87,000/- to the National Defence Fund.

I cannot but mention the novel tax —the Super Profit Tax—which has come into force from the beginning of the current financial year for the first time in India. Plenty of criticism has been made on this legislation which is likely to have very far reaching effects on the Corporate Sector. No doubt the Government require very large funds for the defence and development of the country and we do not grudge towards paying the same. However the rigours of this tax are rendered slightly less unbearable due to various concessions provided by the same. Since it is an emergency measure, I earnestly hope it will be withdrawn when the emergency no longer exists.

The Directors' Report, Audited Balance Sheet and Profit & Loss Account for the year ended 1962 have been with you for some time past and with your permission, I propose to take them as read.

Accounts

The working of the Company for the year under review has shown satisfactory results with sales and profits touching new heights. The earnings of the Company during the year under review amount to Rs. 23,79,314/- as against Rs. 16,22,825/- of the previous year.

Allocations include Rs. 1,48,499/- for the Managing Agents' Remuneration as against last year's remuneration figure of Rs. 1,02,919/- and Rs. 7,38,247/- for Depreciation as against Rs. 4,33,709/- for the previous year. The provision for taxation has been increased from Rs. 3,90,685/- to Rs. 6,85,000/- (including Rs. 52,000/- for Super Profit Tax) and Development Rebate Reserve has increased from Rs. 3,05,000/- to Rs. 3,50,000/-. A sum of Rs. 1,22,049/- has been added to the general Reserve.

The Directors in their Report forwarded to the members of the Company have recommended a dividend of 6% on Ordinary shares which is 4% less than the previous year's owing to higher appropriation on accounts of Depreciation, Development Reserve, General Reserve and Taxation including Rs. 52,000/- for Super Profit Tax. The Directors have also recommended a dividend on Preference Shares. After providing Rs. 3,39,694/- for the proposed dividend, a sum of Rs. 5,068/- has been carried forward as against Rs. 7,561/- brought in.

Production

The production of "JAIPUR" Meters has been very encouraging. It has reached a record production which is about 20% more over the production in the previous year. The production of "SIEMENS" Meters which was taken in hand only during the last quarter of the year 1961 has maintained the same average during the year under review.

As far as the working of the Metals Division is concerned, 1,817 metric tons of material was produced as against 1,717 metric tons in the previous year. As the Government did not allocate any copper for the manufacture of Copper Conductors from March 1962, the above production was achieved due to your Company having secured orders on conversion basis.

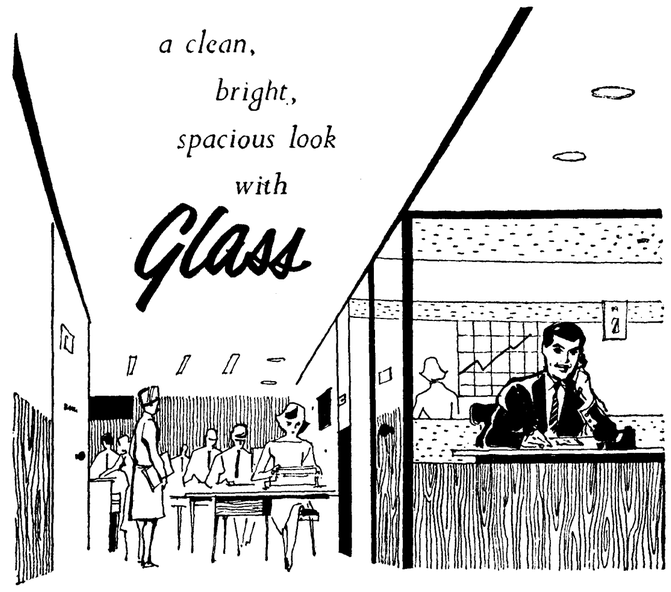
Development and Expansion

You will be happy to know that a major portion of machineries for the manufacture of Cyclometers and Magnets—most important components for the manufacture of JAIPUR Meters —has arrived and the balance is expected in a few months. The Company hopes to be nearly self-sufficient in the manufacture of JAIPUR Meters in the very near future.

You will be happy to note that the Company has commenced production of A.C.S.R. and All Aluminium Conductors thus switching over to Aluminium from Copper as per the directive of the Government of India who desire to minimise use of copper in order to save foreign exchange.

The Company has already obtained industrial licences for the manufacture of Enamelled Copper Wire and Cotton Silk & Paper covered Wires and strips. It is hoped that the Import Licences for machineries for the manufacture of these two items, for which applications have been made some time back, will soon be received and the Company will be in a position to manufacture these items as early as possible. This opens fresh sources of income to your Company.

You will also be happy to note that the Industrial Finance Corporation of India have approved a further loan of Rs. 65.26 lakhs to the Company for implementation of the above development and expansion programme.



During the year your Company issued 25,000 Equity Shares of Rs. 100/- each at a premium of Rs. 15/- per share by way of Right Shares. All the Shares have been fully subscribed and paid for.

Research

In order to improve the existing high quality and workmanship of the products manufactured by your Company as also to achieve still higher production and better efficiency, the technical personnel, are always experimenting and improving on the methods of production. The increase of more than 20% over the previous year's performance in case of Jaipur Meters is entirely due to this.

Our present achievements and hopes for a bright future are a result of good efforts, co-operation, devoted service and loyalty of workers and the staff of your Company and the encouragement and appreciation that your Company has received from all of you from time to time for which I thank you all.

Note: This does not purport to be the record of the proceedings at the Annual General Meeting.

Office space seems to grow when cumbersome partitions are replaced with glass. Rooms look lighter, brighter and so much more elegant. It's not surprising glass is finding its way into more and more homes, stores, schools and restaurants —wherever light and space are important considerations.

Glass is so practical too. It keeps out noise and dust and lets in natural light. And keeping glass clean is the easiest thing in the world.

Available in a wide variety of sizes and thicknesses, and quality tested at every stage of manufacture, there's an HPG sheet glass to suit every purpose.

For the finest, most durable glass you can depend on HPG

BHARTIA ELECTRIC STEEL CO. LIMITED

SATISFACTORY WORKING RESULTS

PLANS FOR DOUBLING PRODUCTION

The following speech delivered by Mr. Rameshwar Tantia, M.P., Chairman, Bhartia Electric Steel Co. Ltd. at the 34th Annual General Meeting of the Shareholders of the Company held on 28th June, 1963, in Calcutta.

Gentlemen,

It is my pleasure to address you on the 34th Annual General Meeting of the Company. The Directors' Report and audited accounts of your Company have been with you for some time and with your permission I shall take them as read.

The year under review has been a momentous one for the country. The earlier parts of the year had shown a note of buoyancy in the industrial activities of the country; but, the unprovoked Chinese aggression and the declaration of National Emergency, about which much has already been said by our leaders, has brought about a radical change in our economy, which was primarily based on the emphasis on heavy industry, and has now had to be changed towards a more defence-oriented foreign-exchange earning basis. The effect of the Emergency has been specially felt by the steel industry which has been called upon to shoulder further burdens. The perilous task ahead of us has been fully realised and the industry has willingly come forward to bear its share of the new responsibilities. Many steps have been taken, and mostly with success, for better national preparedness by the people at the helm of the affairs in the industry. The workers' awareness of the seriousness of the situation has evoked overwhelming response by way of additional working days, increased production, lesser industrial disputes and, last but not the least, donations in money and blood. As far as your Company is concerned, within this short space of time, we have been able to increase our production by nearly 17% and have been able to maintain the price line even at a little sacrifice.

Foundry Industry

During the year 1962, steel foundry industry in general has shown good results. Production has increased considerably and most of this can be attributed to the ambitious wagon building programme of the railways, who continue to be the largest consumer of our products. The big leap that the country plans to take through its various 5-year plans has caused a still heavier demand for our products. Though quite a number of foundries have been, in previous years, licensed for manufacture, very little progress has been made by the new entrepreneurs in the field. Your Company's works at Ballygunge have, however, contributed quite handsomely to this increased production. 90% of your Company's products have been consumed by the Indian Railways, either directly or through wagon builders and locomotive workshops. An order received by your Company for the manufacture of Centre Buffer Couplers and valued at Rs. 2 crores, and to be delivered in 1963-64, is a feature I would like to mention of the tremendous progress being made by the Indian Railways who contemplate adding about 30% more rolling stock to its present fleet within this plan period.

Expansion Programme

In the context of these heartening demands, your Company has applied for a licence for doubling production to 12,000 tons per annum and a letter of intent indicating the agreement of the Government in allowing this expansion has been received by us. Due to acute shortage of space at our existing Ballygunge Works, it is proposed to set up a new factory within a radius of 15 miles and transfer the finishing processes there. We have already made some progress in drawing up the plans and further work is being pursued vigorously. While we wish to proceed with speed on our plans for expansion, it is my fear that the stringent import policy of the Government may affect them somewhat. The necessity for such a stringent policy in the present foreign exchange crisis is realised fully; but, I must say that if the industry is to adequately meet the challenge of increased production in a very short time, it must receive Government's active assistance and understanding of these problems specially in respect of import of essential maintenance and balancing equipment. It is very necessary in the case of your Company where the plant and equipment are old and spares for them are not being manufactured in the country at present.

Exports

Exports for engineering goods have risen rapidly; but, unfortunately, steel foundry industry is not in a position to take an active part in it. The industry, however, must take credit for the valuable saving in foreign exchange effected by it by manufacturing a number of new products within the country.

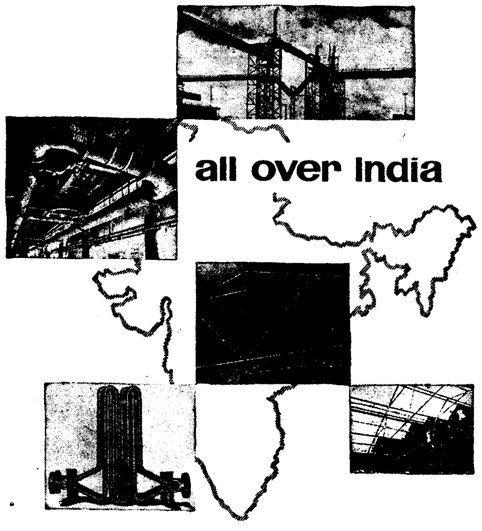
Working Results

The working results of your Company for 1962 have been satisfactory. Total production has increased by nearly 40% in value. Our production has been gradually switched on to more important and specialised items.

As you see from the accounts, we have had to provide Rs. 22,30,000/- for taxation as against Rs. 4,65,000/- for the previous year. The higher tax provision has been, as already explained in the Directors' Report, due to the introduction of the Super Profit Tax. As long as this tax remains on the statute book, the Company will be paying about 70% of its profits as taxes.

Scrap Policy

I would also like to add a further note of caution. The Government has in the course of the year de-controlled our basic raw material i.e. scrap and has been charging as much as 250% of the last de-controlled prices while at the same time, it has been pressing the industry to maintain the price line.



Power Shortage

The power shortage being experienced by this part of the country is another factor which requires grave consideration of the Government and unless power available is adequate, our industry may experience set back in production. Had the power cut not been experienced in the year under review, the results would have been still better.

In conclusion, I have to sincerely thank my colleagues on the board and to express my appreciation to the executives, staff and workers of the Company for the valued co-operation extended by them during the year.

SONE VALLEY PORTLAND CEMENT CO. LIMITED

CHAIRMAN, MR. A. K. JAIN'S ADDRESS

The following speech delivered by Mr. A. K. Jain, Chairman, Sone Valley Portland Cement Co. Limited at the Fortieth Annual General Meeting of the Shareholders of the Company on 28th June, 1963:

Gentlemen,

I extend to you all a cordial welcome to the Fortieth Annual General Meeting of the Company.

The Directors' Report and the Audited Balance Sheet and Profit & Loss Account have been circulated and should have been in your hands for some time now. You would have noted therefrom the details of the working of the Company in the last year.

During the last year, both production and despatches have been the highest in the last ten years and stood at 2,20,377 tonnes of clinker and 2,34,640 tonnes of cement. The Tariff Commission assessed the average capacity of your plant at 2,15,000 tonnes. It is an achievement that this was exceeded during the year. I mentioned in my last year's speech about the various difficulties encountered by the Company in regard to transport facilities for coal, raw materials and cement. The difficulties in this respect have more or less been overcome. Your Company also continued its policy of careful repairs and maintenance which has been an important factor in the achievement of higher production during the year.

Continuous Rise in Costs

The advantages of such increased production have not, however, been reflected in the financial results. This has been due to the continuous increase in the costs beyond the control of the Company but mainly due to governmental action. While fixing the prices for cement in October, 1961, the Government had assured that the prices would be in force till 31st March, 1966 "subject to adjustments whenever called for, for variations consequent on governmental action including escalation for fuel and power". Right from the time of the last price fixation the trend of rising costs was set in motion. But the Government of India did not take notice of same and fulfil the assurances held out to the industry towards compensating the rise in costs. Neither an escalation for fuel and power was devised nor any other *ad hoc* price increase granted by the Government and the entire incidence of increased costs had to be borne by the industry.

It is a matter for regret that in spite of a categorical assurance, the Government did not deem it proper to take timely action. Repeated representations to the Government from individual manufacturers and the industry as a whole for implementation of the escalation clause did not produce any result. It was only as late as October, 1962 that Government referred the matter to the Chief Cost Accounts Officer. The Government did not take any action on his report for a long time. It was only on 1st June, 1963 that they announced revision of prices. The price of your Company's cement has been increased by Rs. 2.75 nP. per tonne.

Since the rise in costs has been due to definite causes known to the Government and as a result of their own actions, it is possible for them to immediately assess the extent of the increases in costs their action has led to. There is thus no necessity to go through the elaborate process of individual unit cost examination. Moreover, Government have also not been influenced in their decision to revise prices by the actual figures of costs determined by the Chief Cost Accounts Officer. Even after the examination of individual costs the Government have only fixed prices on *ad hoc* basis. Therefore, with the awareness of the increased cost through their own action, it is possible for the Government to take immediate action in allowing suitable revision in the prices on an *ad hoc* basis without elaborate and formal enquiry of individual costing of the cement manufacturing units. The Government have assured to have an escalation for fuel and power the object of which is to cover rises in costs when they occur. This purpose is defeated if the Government take action after a period of a year and then also they do not give retrospective effect to their decision.

Price Increase Inadequate

Apart from the delay in allowing compensating increase in price, the price increase now allowed is entirely inadequate and does not cover the actual increase in cost that occurred since 1st November, 1961. The total of such cost increases since 1st November, 1961 works out to about Rs. 6/- per tonne. The delivered price of coal including freight has alone increased by over Rs. 4/- per tonne pushing up the cost of cement by approximately Rs. 2/- per tonne. Besides, there has been increase in the rate of Railway Freight, Royalty on Limestone, Dearness Allowance, contribution to Provident Fund, Employees' State Insurance and introduction of Emergency Risk Insurance. Further increases in costs have by no means been checked and unless the Government introduces automatic escalation to cover increases under major heads like fuel, power, transport, etc., the industry will be constantly faced with this problem of rising costs without any adequate coverage for same in the prices.

The present formula for fixation of quarterly packing charges is also causing considerable financial loss to the industry. In the computation of packing charges, the Government have assumed the use of 50% old bags against 25% previously and has taken the price of old bags at 65% of the average price of new bags within the previous 3 months. The assumption of the use of old bags as well as that of the price of the old bags in unrealistic. With 50% use of old bags, there must be a 100% return of new bags despatched, which is impossible. The return of the second-hand bags from the Government sources is very difficult and in spite of several circulars by D.G.S. & D. and State Trading Corporation, the response from the government consumers is very poor. With the scarcity of bags in the market and desire to use the specified quantity, there is competition amongst the buyers resulting in higher prices which works out to 85% of the cost of the new bags. Apart from this loss to the industry, consumer also suffers on account of the repeated use of old bags resulting in shortage in the weight of cement through seepage. It is, therefore, necessary that Government should take a realistic view in fixing the packing charges. The year's results as compared to the previous year have been substantially affected on account of this also.

Incentive Scheme

The Government have recently introduced a scheme of incentives by which a cash benefit will be available on cement produced in excess of the highest level of production in the last three years. In the case of your Company, the cash incentive is Rs. 2.50 nP. per tonne and the base level is fixed at 2,35,000 tonnes. The basis on which the incentive has been fixed would yield no practical benefit to the industry as the benefit is available only in respect of the excess production over the highest production and not over the average production of equated cement. Some companies including yours have been able to achieve large production of cement this year because of the improvement in the transport position and through utilisation of clinker stocks accumulated in the previous years when there was transport inadequacy. This position is not likely to exist now and the incentive offered will not induce higher production and make available larger supplies to meet the needs of the consumers.

The need for cement is ever-growing. The pressure of demand for cement will only become more acute. If this steadily growing demand is to be met, there has to be accelerated development of the industry. This development as is evident from the current trends is not possible of achievement. The targets set out at the commencement of the Third Five Year Plan were for achieving a capacity of 15 million tonnes and a production of 13 million tonnes. In the light of the emergency and further rise in demand, it appears that even these targets have to be pushed up But with the existing capacity of 9½ million tonnes, the capacity possible of attainment through the licensed schemes under active execution being completed will be 11.2 million tonnes. Even if we include some more schemes licensed as likely to be completed during the Third Plan, the capacity cannot possibly exceed 12.5 million tonnes. We are thus short by 3 million tonnes for the targetted capacity which itself, as I have stated, has to be revised on account of the mounting demand now. It takes at least three years for a plant to go into production. Therefore, unless licensed schemes are put into execution immediately, further rise in capacity is not likely to be achieved by any means in the Plan period. It is no longer scarcity of foreign exchange that is holding up expansion. Indigenous cement machinery manufacturers have made sufficient progress and have assured supply of machinery by 1964-65. With only 40 per cent imported components 3-4 plants have been promised delivery in 1964 provided orders are confirmed immediately. Further plants have been promised delivery from 1965 onwards even with lesser percentage of imported components. But orders for new plants are not coming up consistent with the demand and for this the price and taxation policies of Government are alone responsible. The price policy pursued by Government does not allow any scope for internal finance and where in a few cases some surplus is available it is being siphoned off by the new tax measures. The cement industry is a startegic one and it has to be helped to develop at an accelerated speed. Unless the Government follows an appropriate price policy that encourages expansion, development of the industry cannot take place and we will be faced with continuing scarcity in respect of an essential basic material as cement. This fundamental problem has, therefore, to receive more earnest consideration at the hands of the Government leading to effective and prompt action.

I thank you all. I also thank, on your behalf and on my own, all the members of the Organisation at different levels.

Note: This does not purport to be a report of the proceedings of the Annual General Meeting.

AVB announces

TECHNICAL COLLABORATION AGREEMENTS WITH

FULLER/TRAYLOR, U.S.A. &

KLOECKNER-HUMBOLDT-DEUTZ W. GERMANY

TRAYLOR ENGINEERING & MANUFACTURING, a division of Fuller Company, are one of the leading manufacturers of cement machinery in the world and have over 50 years experience in the line. Traylor have made some of the largest Grinding Mills and Steel Plate Jaw Crushers in the world. Traylor's outstanding know-how, research and laboratory facilities will now be at the disposal of AVB for designing machinery for the Cement, Mining and Metallurgical Industries.

The Humboldt Air Suspension Pre-Heater is an invention that has revolutionised the manufacture of cement by the dry process. Comprising basically a series of cyclones through which hot gases emerging from a considerably shortened kiln are passed and into which the finely ground dry raw material is introduced, the Air Suspension Pre-Heater rapidly raises the temperature of every particle. This system results in considerable fuel economies, and is recognised as the most efficient cement making process in existence. The Pre-Heater has very few moving parts, is trouble free and simple to operate. Kloeckner-Humboldt-Deutz have manufactured and sold more than 115 plants all over the world during the last 15 years.

Crushers

Driers

Mills

Feeders

In addition to the Fuller equipment that AVB are already manufacturing under licence, viz., Fuller Grate Coolers, Fuller-Kinyon Pumps, etc., the range of Fuller/ Traylor equipment that they will now make includes: Apron Feeders, Crushers, Rotary Kilns, Rotary Coolers and Driers, Mills, Air Separators.

Humboldt's expertise in fuel economy is now available to the Indian cement industry through

AVB

a powerful partnership for progress

HELP FOR BOKARO TO BE PART OF U.S. AID FOR THIRD PLAN

(FROM OUR NEW DELHI CORRESPONDENT)

THE misunderstanding over the Bokaro steel plant is mounting day by day. From the outset, the Americans were lukewarm over the project. Their attitude is understandable. They have been waging an ideological war with Russia, who has already built a first-class steel plant in Bhilai. Their main anxiety is that the U.S. plant should on on account be inferior to Bhilai. If it is, it will be a disaster for the U.S.A. not only in India, but all over Asia and Africa. The U.S. Ambassador to India, Professor J. K. Galbraith, tried hard to push through the Bokaro project as early as possible. He referred to it at his first Press conference held in New Delhi. Since then, Bokaro has been the main topic of conversation.

Credit is due to Professor Galbraith for frankly stating that the finance for Bokaro should have to come from the general economic aid from his country. This created misgivings and the U.S.A. was accused of cutting down its aid to India. A spokesman of the Central Ministry of Finance also said that any assistance from the U.S.A. for the public-sector steel plant in Bokaro would be part of the overall U.S. aid to India for the third plan. As in the case of West German aid for the Rourkela steel plant and British assistance for Durgapur, U.S. aid for Bokaro, when it comes, will be part of the "Consortium aid" for India for the third plan.

On this point, there has been no misunderstanding between the Governments of India and the U.S.A., Mr. Galbraith declared. The Finance Ministry spokesman said that India had informed friendly countries that she would need Rs. 2,500 crores in foreign exchange to implement the third plan. This included Rs. 100 crores for Bokaro. The steel plant which the U.S. technical team had recommended was much bigger than the one India had originally visualised. So the cost of the project would now be more, although much of the expenditure would inevitably be carried over to the fourth plan.

Asked to comment on Mr. Galbraith's statement that any U.S. assistance for Bokaro from the overall third plan aid would affect the execution of other plan projects, the spokesman said that the statement should be taken as a friendly warning. He said that the U.S. Government had not made any firm commitment of assistance for the third plan as a whole. Assistance by friendly countries was given on an annual basis. So it is still a matter of conjecture as to what assistance should be given for the fourth and fifth year of the third plan. If Bokaro, which is now a big project, is undertaken, it may affect others, although the matter has to be fully examined.

This has led to re-thinking in New Delhi which had assumed that the U.S. aid for Bokaro will be in addition to other economic and military aid to India. "If the U.S. view were accepted, it is stated, "additional foreign exchange to the tune of Rs. 116 crores shall have to be found or some other projects shall have to be dropped." But the question is: what has happened to Rs. 100 crores earmarked for Bokaro in the third plan? It could be that either the original estimates of foreign exchange were under-estimated or new projects outside the plan had been added to it. It is time the Central Steel Ministry made a clarification on this point.

COMPULSORY DEPOSIT

Procedural Changes

In a Press note on the compulsory deposit scheme, the Government of India says: "With a view to simplifying the working of the income tax department and the employees compulsory deposit scheme, which is coming into force with effect from 1st July, 1963, and to relieve the congestion at post offices and the branches of the Reserve and State Banks of India, the Government of India announced a number of important procedural changes. These are briefly summarised below.

"It has been decided that scheduled banks having an all-India character may also—on the recommendation of the Reserve Bank—be authorised to maintain the accounts of compulsory deposits in the same way as in the post offices and branches of the Reserve and State Banks of India. The banks are: (1) the Central Bank of India, (2) the Punjab National Bank Ltd, (3) the United Commercial Bank, (4) the Bank of Baroda, (5) the Bank of India, (6) the Devkaran Nanjee Banking Company and (7) the United Bank of India. Meanwhile, in so far as the compulsory deposits recovered during July 1963 are concerned, the period within which they should be remitted to the deposit offices is being extended from 14 days to 45 days. In order that this extension may not involve any loss of interest to the depositors, interest on all such deposits will be allowed with effect from 1st August, 1963.

"It has been furthed decided to allow factories and establishments, which have been exempted under Section 17 of the Employees Provident Funds Act, to maintain the individual accounts of compulsory deposits recovered from their employees. They will have to open only a single account in the name of the factory or establishment with a head post office, or with the Reserve Bank or the State Bank or its subsidiary banks conducting Government treasury business in which the amounts recovered by them from month to month will be credited in lump. Detailed instructions on this point will be issued separately.

"It has also been decided to waive the requirement for getting an application form filled by individual employees. As the only purpose of the application form was to establish a direct link between the depositor and the post office, or any other authorised office where the account is maintained, to facilitate withdrawal of the amount, and as withdrawal is ordinarily permissible only after five years, it is not considered necessary to delay or complicate the opening of accounts by getting applications individually filled at this stage. Accordingly, employers can get the accounts opened in the name of their individual employees by applying to the deposit offices.

"The facilities outlined above will materially reduce the pressure of work at the post offices and other authorised offices and minimise inconvenience to individual depositors as well as to employers who have the responsibility of collecting these deposits from a large number of employees."

Explaining the Press note, an official spokesman said that the Government had no intention of roping in such persons as did not pay income tax or were outside the provident fund schemes. A very large number of motor-car or taxi drivers, fruit sellers and others will remain outside the purview of the scheme. So it is the honest people who are called upon to bear an onerous burden.

The compulsory deposit scheme will undoubtedly depress the standard of living of the people. This is obvious to everybody except some "progressives" in New Delhi. The last taxation proposals have raised taxation, say, by 25 percent. Even Mr. Gulzarilal Nanda, Central Minister for Planning, Employment and Labour, has given up his effort to hold the price line with the result that the cost of living in many parts of the country has already gone up by about 25 percent. So how can a person of fixed income save? Savings are obviously possible only at the cost of the standard of living.

RAILWAYS

Progress in Electrification

It has been possible to accelerate the pace of railway electrification during the third plan. During 1961-63, the Gomoh-Moghalsarai and Nimpura-Tatanagar sections were commissioned, bringing the total A.C. electrified length to 1,075 route kilometres (2,518 track kilometres). By 1966, the entire main line section from Howrah to Kanpur and Howrah to Rourkela *via* Kharagpur and Asansol is expected to be completed. In addition, the Igatpuri-Bhusaval section in the western region and the Madras-Villupuram section in the southern region are also being electrified.

One hundred and ten A.C. broad-gauge mixed traffic type electric locomotives are now operating in the eastern zone. Altogether about 330 locomotives are required for dealing with goods services in this area. Chittaranjan is expected to manufacture 138 locomotives during the current plan. The remaining are being imported.

In order to cater to the needs of the increasing traffic in and around Calcutta, particular care has been taken for the electrification of the existing lines in the metropolis. The suburban sections proposed to be brought under A.C. electrification total 440 route kilometres (905 track kilometres). The following table indicates the targets planned at present:

Sealdah-Ranaghat; Dum Dum-Bongaon; Ranaghat-Krishnagar city; Kalinarayanpur-Shantipur; Bandel-Naihati	August-December 1963
Saktigarh-Dankuni; Dankuni-Dum Dum and C. C. Link; Dum Dum-Chitpur Dankkuni-Belur	December 1964
Sealdah South-Baruipur Jn. Ballygunge Jn.-Budge Budge Sonarpur-Canning Baruipur Jn.-Lakshmikantapur Baruipur Jn.-Diamond Harbour	March 1965

The Howrah-Kharagpur section is expected to be electrified by the end of 1966. In addition, the existing electrified Howrah-Bandel-Burdwan sections, including the Tarakeshwar branch, are proposed to be progressively converted to the A.C. system by the end of the third plan, thus making possible the unified working of the railway lines around Calcutta. Fast electric multiple unit services are proposed to be introduced in this area by employing nearly 540 electrical multiple unit coaches. In the early stages, locomotive hauled trains are being introduced in the Sealdah area.

Simultaneously, considerable progress in developing indigenous manufacture of electric traction equipment has been planned and achieved, with a view to saving foreign exchange. For equipping railway tracks with 25 kV overhead wires and other ancillary items (excluding copper), the foreign exchange required has already been brought down from Rs. 25,000 a track kilometre in 1958 to about Rs. 3,000 a kilometre. In order to attain self-sufficiency in the manufacture of A.C. rolling stock, the Integral Coach Factory in Madras has commenced turning out broad-gauge E.M.U. trailer coaches. Prototype motor coaches are now being constructed and, after necessary trials, it is expected that the factory will be in a position to commence production of A.C. motor coaches from early 1965.

For building electric locomotives, capacity has already been created at the Chittaranjan Locomotive Works, which is currently handling an order for 21 broad-gauge D.C. electric locomotives. These are expected to be completed very shortly, after which the delivery of A.C. locomotives will commence. During the third plan, Chittaranjan is expected to build 138 A.C. freight type electric locomotives and reach an output of six locomotives a month by 1965. The mechanical parts for these locomotives are being manufactured in Chittaranjan while the major part of A.C. electrical equipment is expected to be manufactured by Heavy Electricals (India) Ltd, Bhopal. As a result of these measures, it is hoped that the foreign exchange content in rolling stock as well as other equipment required for electrification will progressively come down during the next few years.

With the establishment of manufacturing capacity of electric locomotives in Chittaranjan, electrical multiple unit coaches at the Integral Coach Factory, electric traction equipment in Bhopal and the production of components for overhead and other associated equipment indigenously, it is hoped that the Indian railways will be able to bring more and more railway lines in dense traffic areas under electrification. If as estimated, the originating goods traffic goes up from 260 million tons in 1966 to 400 million tons by 1971—and the rate of increase in traffic is likely to be maintained at this level—it is felt that the tempo of electrification of railways in India may have to be increased.

Electric traction on the Indian railways dates back to 1925-30 when about 388 route kilometres of track were electrified on the 1500 volt D.C. sys-

tem. This was mostly confined to the western region around Bombay except for a small length of 29 route kilometres in Madras.

The electrification of the Howrah-Bandel-Burdwan section was taken up during the first five year plan and completed during 1958 on the 3000 volt D.C. system. At about this time, contemporary developments in the field of high voltage single-phase A.C. electrification in some railways, notably in France, attracted India's attention. Before embarking on large-scale electrification, the Indian railways, felt that it would be prudent to go into the question of choosing the correct system of electrification. As a result of detailed technical and financial investigations, it was decided in 1957 to adopt 25,000 volts single-phase A.C. system at the industrial frequency as the standard for future electrification in the country. Besides being more economical, the A.C. system affords the advantage of co-ordinated development of railway traction and other general electrical loads in the country. It permits maximum benefit to be derived from the existing and future sub-stations and transmission lines. Furthermore, the performance and capabilities of an A.C. electric locomotive are much superior to that of its D.C. counterpart.

For planning, executing and co-ordinating the railway electrification programme, which is more or less confined to the eastern zone, a central electrification organisation was set up with headquarters in Calcutta, under the charge of a General Manager and Chief Engineer. The guidance of the French National Railways, which are the pioneers in the field of single-phase A.C. electrification, was also sought.

During the second plan, 218 route kilometres (642 tracks kilometres) in the eastern zone comprising the Dangaoposi-Rajkarswan and Waria-Asansol-Gomah sections were energised on the A.C. system.

PATENTS

Notifications Issued

Under the Defence of India Act, the Government of India has taken power to authorise a corporation owned or controlled by the Government or any other person specified "to make use of or exercise any invention in relation to which an application for the grant of a patent has been received or a patent has been granted, for the purposes of the corporation or such other person from such date as may be specified therein."

"Where any invention has been made use of or exercised, in accordance with an order, the corporation or such other person, as the case may be, shall pay such compensation to the applicant or the patentee as the case may be, as may be agreed upon between the corporation or such other person and the applicant or patentee. In the event of any dispute as to the amount of compensation, either of the parties may refer the matter to the Central Government whose decision on it shall be final. Provided that before giving its decision, the Central Government shall afford a reasonable opportunity to the parties concerned to make any representation in the matter."

An earlier notification on the same subject is as follows: "Where, either before or after the coming into force of the Ordinance, an application has been made to the Controller for the grant of a patent or the registration of a design, the Controller, if he is satisfied that it is expedient for the defence of India and civil defence or the efficient conduct of military operations or the maintenance of supplies and services essential to the life of the community so to do, may, notwithstanding anything contained in the Indian Patents and Designs Act, 1911 (2 of 1911), at any time before the grant of the patent or the registration of the design, by order, prohibit or restrict,

"i. the publication of information in relation to the subject matter of the application; or

"ii. the communication of such information to particular persons or classes of persons.

"Every order made by the Controller under sub-rule (2) shall be reviewed by the Central Government and upon such review, the Government may direct that the Controller shall comply with such directions."

"If, in the opinion of the Central Government, it is necessary or expedient for the defence of India and civil defence or the efficient conduct of military operations or the maintenance of supplies and services essential to the life of the community so to do, the Central Government may, notwithstanding anything contained in the Indian Patents and Designs Act, 1911 (2 of 1911), direct the Controller, in relation to any applications for the grant of patents for inventions of such nature as may be specified in the direction, to abstain from doing, or delay the doing of, anything which he would otherwise be required to do in relation to such applications, and the Controller shall comply with such directions."

The Indian Patents and Designs Act, it is explained, lays down a specific period within which the owner of a patent is required to manufacture the article covered by such patent. The Government has power to license compulsorily the manufacture of such article if it is not developed within the specified period.

The present controversy was started by the Central Health Minister, so the Government has taken powers referred to earlier. Maybe, the Russian-built drug factory in Rishikesh is likely to need such a procedure. It is also suggested to expand the scope of "compulsory licensing" to manufacture patented drugs without any payment of compensation as it is required by the existing law. A Bill to give effect to this plan has been drafted.

In Italy, no patents are granted for making food, drugs and pharmaceutical articles.

Meanwhile, the two notifications and the proposed legislation have created grave apprehensions among diplomatic circles, particularly among those of the U.S.A., the U.K., West Germany and Switzerland. It is contended that the powers now assumed by the Government are wider than those contemplated by the Central Ministry of Health. They strike at the very root of know-how agreements and international principles governing patents. One view here is that the two notifications could affect the investment climate for India.

The atomic energy legislation enacted during the last session of Parliament also ignored the international obligations. Foreign Governments, it is expected, will make representations against the two notifications.

OIL

New Take-over Bid

Shell International and British Petroleum have offered to acquire the total shareholding of Burmah Oil Company. They have offered their holdings of Burmah Oil Company plus some money in lieu of its assets to the shareholders of Burmah Oil Company on a *pro rata* basis. Their plan is to retain the individuality of Burmah Oil Company, of which they will become equal partners.

Burmah Oil Company holds 24.5 percent of the shares of British Petroleum and about 3 percent of the shares of Shell International. In addition, it is the cent percent owner of the Assam Oil Company and through it, it is a partner with the Government of India in Oil India Ltd on a a 50:50 basis. It owns 50-percent shares and assets of Burmah-Shell Refineries in Bombay and Burmah-Shell Oil Storage and Distributing Company. It has also acquired a small oil Company, Lobitos and has certain interests in Canada and Australia.

It will thus be seen that the Burmah Oil Company is both a holding and operating Company. If the proposal made by Shell and British Petroleum were accepted, it will cease to be a holding Company and its operating functions will be shared equally by Shell and British Petroleum. In Oil India, Ltd, for example, British Petroleum and Shell will hold 25-percent shares each. Similar changes will take place in the pattern of ownership of Burmah-Shell Oil Storage and Distributing Company and the Refinery. The Government of India is not likely to raise any objection to this change. It may even welcome it because both Shell and British Petroleum would be partners with the Indian Government and in that capacity will provide India with two international Companies prospecting oil in Assam and elsewhere, if permitted, with the latest equipment and most experienced personnel. This will also afford an opportunity to the personnel of Oil India Ltd to get training in Europe and America.

TAXATION

Effect on Education

An unequivocal criticism of the Government's latest taxation structure came from the Education Secretary, Mr. P. N. Kirpal. Addressing a conference of State Education Secretaries, Mr. Kirpal said: "Another factor which requires consideration is whether in view of the greater percentage of national income that is now going into Government revenues through a higher level of taxation and compulsory savings scheme, the volume of private financial support to education is likely to be reduced. In the third five year plan, it was estimated that contribution from non-Government sources was likely to be of the order of Rs. 120 crores to 130 crores a year. Any shortfall in the volume of private contributions will affect the rate of expansion, particularly at the secondary and collegiate levels where private enterprise has been most active."

Two aspects of this problem are worth considering. Firstly, the drying up of the non-Governmental resources to finance social services will impose a bigger burden on the Government. By eliminating private agencies in the field of social services, including education, there will be greater Government control and management in this sphere.

KOYALI REFINERY

New Indo-Soviet Pact Signed

An agreement for the supply of about 15,350 tons of equipment and materials required for the Koyali refinery in Gujarat was signed last week between the Oil and Natural Gas Commission and the Tiajpromexport, Moscow. The agreement also provides for the deputation to India of Russian specialists to assist in the construction of the refinery and the training of Indian personnel in the Soviet Union. The establishment of the project is provided for in the 112.5 million roubles (Rs. 59.53 crores) credit agreement between the Government of India and Russia for establishing industrial enterprises and other projects in India.

The value of the equipment and materials to be delivered under the contract is about Rs. 6.6 crores. The overall cost of the Gujarat refinery project, including process units, a 24 megawatt power-house, water works, land, township, etcetera, is estimated at about Rs. 30 crores. The agreement concluded last week provides for the phased delivery of equipment and materials from Russia so as to complete the first stage of the refinery, namely, a processing capacity of 1 million tons before the end of 1964 and of the second stage by mid-1965.

A protocol was signed on 25th May, 1963, between the Russian and Indian Government for the expansion of the Koyali refinery from 2 million to 3 million tons of crude oil a year with Soviet economic and technical assistance. The expansion is expected to be completed by 1965.

In finalising the present agreement for the supply of equipment and materials from Russia, every effort has been made to maximise the use of Indian equipment and materials. In the case of the Barauni refinery, about 40,000 tons of Russian equipment and materials were involved and the cost was around Rs. 14 crores, against an estimated cost of about Rs. 40 crores.

A significant part of the necessary construction drawings for the Koyali refinery will be prepared by Indian engineers in Baroda, with the assistance of a team of Russian design engineers.

SUPER PROFITS TAX

Deduction from Net Profits

Section 349 of the Companies Act, 1956, lays down the manner in which the net profits of a company are to be determined for purposes of computing the remuneration of the managing agents, managing directors, etcetera. Clause (d) of sub-section (4) of Section 349 provides that in determining the net profits, "any tax notified by the Central Government as being in the nature of a tax on excess or abnormal profits shall be deducted." In accordance with this provision, the Central Government has decided to notify the super profits tax chargeable under Section 4 of the Super Profits Tax Act, 1963, as being in the nature of a tax on excess or abnormal profits. The notification on this was published in the *Gazette of India* of 29th June, 1963.

In terms of this notification, the companies concerned will be required to deduct the super profits tax chargeable for the financial years ending on or after 29th June, 1963, in computing their net profits of the said financial years under Section 349 of the Companies Act, 1956.

EMERGENCY RISKS

Premium Rates Revised

The rates of premia under the Emergency Risks (Goods) Insurance Scheme and the Emergency Risks (Factories) Insurance Scheme for the next quarter beginning from 1st July, 1963, have been revised. The rate under the Emergency Risks (Goods) Insurance Scheme will be 7.50nP and 11.25nP under the Emergency Risks (Factories) Insurance Scheme for every Rs. 100 or any part thereof of insurable value. The rates for the previous two quarters were the following:

	Goods	Factories
First quarter	15	25
Second quarter	10	15

These rates were for every Rs. 100 or any part thereof of insurable value.

MINERALS

Pact on Export to U.S.A.

The Governments of India and the U.S.A. have entered into an agreement to facilitate the export of ferro-manganese, manganese ore, beryl ore and mica from India to the United States in exchange for American cotton. The total value of commodities covered under the agreement will amount to Rs. 20 crores each way, making a total turnover of about Rs. 40 crores.

Under the agreement, India will be able to export to the U.S.A. during the next 18 months 128,000 tons of ferro-manganese, 300,000 tons of manganese ore, 6000 tons of beryl ore and mica worth Rs. 1 crore. In exchange, India will import about 275,000 bales of cotton.

The agreement will be operated on behalf of the two Governments by the Commodity Credit Corporation (C.C.C.) in Washington and the State Trading Corporation of India. The details of the sales and purchase contracts with firms in the U.S.A. and India necessary to implement the agreement will be finalised through the two agencies.

COAL

Making Mining Machinery

An agreement for manufacturing certain special items of coal mining machinery in India was signed by the Heavy Engineering Corporation Ltd with Mavor and Coulson of the U.K. The machinery, including items like Samsons crawler and mounted coal cutter, is required by the National Coal Development Corporation Ltd and will be produced at the Bharkhakana workshop of the N.C.D.C. The agreement provides for the supply of designs and technological documentation for these items as well as for the training of Indian engineers in the Glasgow works of Mavor and Coulson.

The new manufacturing programme is in addition to the coal mining machinery plant in Durgapur, which has been undertaken with Russian collaboration for manufacturing diverse equipment for the coal industry in India. The manufacture of prototypes of items like pumps, conveyors and booster fans has already begun at the Durgapur plant.

PAPER

New School of Technology

A school of paper technology is to be set up in Saharanpur, Uttar Pradesh, with Swedish technical assistance. The Swedish Government will contribute the foreign exchange cost of the project. The machinery and laboratory equipment and spare parts to be supplied are estimated to cost 1,650,000 Swedish kroners (Rs. 15 lakhs). The rupee expenditure on the project will be met by the Government of India and the Uttar Pradesh Government.

The school—the first of its kind in India—will have a training capacity of between 180 and 200 persons when in full operation. With the help of Swedish experts, it will impart training in pulp and paper manufacture, instrument engineering for the paper industry, operation and maintenance of plant and equipment for the paper industry and paper and pulp laboratory techniques. In addition the school will, as far as possible, render consultative and advisory service to existing enterprises. It is expected that, in five years, which is the duration of the agreement, the technical and operational functions of the school will be taken over from Swedish personnel.

SWITZERLAND

Aid for Farm Project

The Swiss Government has decided to allot a large sum within the framework of bilateral technical assistance for financing development projects in India. The Government will grant 1,640,000 Swiss francs for carrying out the first stage of a farming development project in Kerala. The whole project will be implemented in 12 years. During the first three-year stage, rational forage methods will be introduced for the development of the milk industry and for stock farming. The project will help the population in that densely populated region to solve the problem of malnutrition.

The first experiment will be carried out on a surface of 200 hectares and will include a forage station, two farm-breeding stations and an artificial insemination station in Munnar. Training courses will be organised by a Swiss agricultural expert.

SUGAR

Creating Additional Capacity

The Government of India has decided to resume the licensing of additional capacity in the sugar industry. A special committee representing the departments concerned has been set up for scrutinising these applications and advising the Central Ministry of Food and Agriculture concerning the suitability or otherwise of the proposals in the light of the availability of sugarcane, economy of existing units and new ones which may be set up, and the prospects of early completion of the projects. The aim is to achieve the creation of an additional capacity of 500,000 tons during the next two or three years. The committee is expected to complete its work in about three months' time.

LAND

Acquisition by Companies

The Government of India has notified the rules governing the acquisition of land for private companies engaged in an industry or work which is for a public purpose. These rules which have been framed under the Land Acquisition Act, 1894, as amended in 1962, have a three-fold object namely, (1) to ensure that acquisition of land for private companies is made sparingly and only where a company has failed to acquire land through private negotiations; (2) to avoid, as far as possible, the acquisition of good agricultural land, and (3) to eliminate delays in paying compensation.

With a view to ensuring that the acquired lands are properly used, the agreement to be executed by the company with the Government will include the following conditions:

(a) that the land will not be used for any purpose other than for which it is acquired;

(b) that the building or work shall be constructed or executed within three years of transfer of the land to the company, although the period may be extended if justified by circumstances;

(c) that if there is a breach of these conditions, the land or the unused portion of it will revert to the appropriate Government and an amount not exceeding one-fourth of the amount paid by the company for acquisition will be forfeited as damages. Transfer of the acquired land or any part of it by sale, mortgage, gift, lease or otherwise by the company is forbidden except with the previous sanction of the appropriate Government. The rules also stipulate the conditions under which the Government may sanction such transfer.

HEAVY ELECTRICAL EQUIPMENT

Prospect for Self-sufficiency

Mr. K. B. Mathur, chairman of the Heavy Electricals Ltd, said at a Press conference that India was unlikely to achieve self-sufficiency in heavy electrical equipment before the end of the fifth plan because of the shortage of trained technical personnel and industrial raw materials. Effective steps have already been taken to remove these handicaps, he said. Reviewing the progress at the four public-sector projects, being set up with foreign collaboration, Mr. Mathur said that while the boiler plant in Tiruchi and the power equipment unit in Hyderabad were expected to go into production by the end of third plan, the Hardwar unit of the Heavy Electricals would commence production in the first or second year of the fourth plan.

The detailed project report for the Rs. 50-crore unit in Hardwar has just been received and the Russian experts are expected here shortly to finalise details of the scheme. Negotiations with the Russian experts will be completed within a month or so, and work on the project may begin in August.

The Hardwar project will manufacture hydraulic turbines and generators of 100,000 kilowatts, capacity, steam turbines and turbo-generators of 50,000 kilowatts, 100,000 kilowatts, and 200,000 kilowatts, capacity and heavy and medium-sized A.C. and D.C. machines.

The Hyderabad project has been somewhat delayed because of the Government's belated decision to undertake the manufacture of 100 megawatt turbines instead of the 60 megawatt turbines as initially decided. The revised project report has been received from Czechoslovakia, and the project is expected to go into production in about two years.

This Czech-aided project is estimated to cost Rs. 27.5 crores. It will manufacture electrical equipment worth Rs. 14 crores a year.

MACHINE TOOLS

Five Factories Planned

The Government is considering a proposal to establish a fifth machine tool factory in Sanatnagar, Secunderabad, with the foreign exchange credit to be made available by the Government of Poland. When all the five machine tool factories are in operation, it is intended to decentralise the various production lines in Bangalore, and permit each factory to specialise in one or two types of machines in order to ensure greater efficiency and lower cost. The total output of the five factories at full production is estimated at Rs. 25 crores a year.

A chain of five machine tool factories will be built, each employing 3,000, every alternate factory being financed from the internal resources of Hindustan Machine Tools. Ltd It is a promising prospect that after the fifth factory, all future factories will be financed from internal resources, at the rate of one every 18 months.

HINDUSTAN STEEL

Order for Norwegian Firm

The Norwegian firm, Ingenior Gunnar Schjelderup, Industriovner, Oslo, has secured a contract worth 15 million kroners (£750,000) for delivery of eight electric soaking pits to Hindustan Steel. The soaking pits, in which steel ingots are heated to the required uniform temperature for rolling, are to be installed at the Durgapur alloy steels project.

GOVERNMENT OF INDIA

4 PER CENT. LOAN 1969—ISSUE PRICE RS. 99.50 PER RS. 100 (NOMINAL) REPAYABLE ON 8TH MAY, 1969.

4½ PER CENT. LOAN 1973—ISSUE PRICE RS. 100.00 PER RS. 100 (NOMINAL) REPAYABLE ON 22ND JULY, 1973.

Subscriptions to the above loans will be received simultaneously and will be limited to a total of Rs. 225 crores (approximately). Subscriptions may be in the form of (i) cash/cheque or (ii) securities of 2½ per cent Hyderabad Loan 1953-63, 4 per cent State Development Loans 1963 of Hyderabad, Bihar, Bombay, Madhya Bharat, Madhya Pradesh, Mysore, Saurashtra, Travancore-Cochin and Uttar Pradesh, 4 per cent Loan 1963 of Madras and West Bengal or Mysore Government 4 per cent Conversion Loan 1953-63. All loans other than 2½ per cent Hyderabad Loan 1953-63 will be accepted for conversion at par. 2½ per cent Hyderabad Loan 1953-63 will, however, be accepted for conversion at Rs. 85.00 per Rs. 85.71 (O.S. Rs. 100).

Interest on the 2½ per cent Hyderabad Loan 1953-63, 4 per cent. Hyderabad State Development Loan 1963 and Mysore Government 4 per cent Conversion Loan 1953-63 tendered for conversion will be paid at the respective rates upto 21st July, 1963. On the other loans offered for conversion, interest will be paid at the rate of 4 per cent per annum upto 14th July, 1963 and for the period 15th to 21st July, 1963, at the rate applicable to the new loan as applied for.

Interest on the new loans, which will be subject to tax under the Income-tax Act, 1961, will accrue from 22nd July, 1963. Interest on 4 per cent Loan 1969 will be paid on 8th November, 1963 for the period 22nd July to 7th November, 1963 and thereafter at half-yearly intervals. Interest on 4½ per cent Loan 1973 will be paid half-yearly on 22nd January and 22nd July.

Subscription lists will open on 22nd July, 1963 and close on 27th July, 1963 or earlier without notice.

Applications for the loans will be received at:—

(a) Offices of the Reserve Bank of India at Bangalore, Bombay, Calcutta, Madras, Nagpur and New Delhi;

(b) Branches of the subsidiary banks of the State Bank of India conducting Government treasury work; and

(c) Branches of the State Bank of India at other places in India.

For full particulars apply to any of these offices or branches.

London

INCREASING THE SUPPLY OF SKILLED WORKERS IN U.K.

(FROM OUR LONDON CORRESPONDENT)

BRITISH industrial employers were warned recently by Mr. R. A. Banks, chairman of the Industrial Training Council, of the danger of delaying the intake of apprentices until the Government's plans were fully known. During the first four months of this year, 29 percent of boys (29,000) leaving school entered apprenticeships, compared with 5 percent (39,000) for the corresponding period last year. The 1962 figures, Mr. Banks pointed out, were a record. There were 121,500 new apprenticeships—a total 34 percent higher than for 1958, the last pre-bulge year. It did not seem likely that such an intake would be achieved this year. He appealed to employers, however, not to lose momentum. There had been instances of firms deciding to wait and see what contribution the Government was going to make to the training of apprentices; but to adopt a wait-and-see attitude could be very serious.

In its recent booklet on craft apprenticeship, the Industrial Training Council pointed out that the increasing demand for craftsmen resulting from the expansion of industry had not been met by the intake from apprenticeship and other sources and, as a result, the U.K. has been faced with a persistent shortage of skilled workers in many trades. It also stressed the need for considerable improvements in the quality of apprenticeship training so that the general standard of training throughout industry could be brought much closer to the high standard already found in many companies.

The Government's White Paper on industrial training indicates that its case for action rests on the failure of the present arrangements for industrial training to produce the skilled workers which the country requires, and on the need for improvements to be made in the overall quality of industrial training. It also points out that the shortages of skiled manpower have held back economic expansion in the past, and are likely to do so even more in the increasingly competitive conditions which British industry will have to face in the future.

It is expected that the demand for skilled workers will continue to rise along with the general growth of production and employment. An important new field of employment is also appearing for workers who have been specially trained for jobs calling for considerable skill in the operation of plant and equipment as distinct from manual dexterity or craft skill. These requirements for substantial increases in the supply of skilled workers can only be met by an expansion of apprenticeship and other forms of training, including the retraining of adult workers.

Apprenticeship Training

The Council's booklet was directed towards improving the standards of apprenticeship training, including integrated further education, in all industries. It has now followed up with a statement whose aim is to emphasise ways and means by which the apprenticeship system should be developed in the future as part of the general need for improvement and modernisation of the country's industrial training arrangements, so that full advantage can be taken of technological and other advances in industry.

One of the objectives of the White Paper on industrial training is to enable decisions on the scale of training to be better related to economic needs and technological developments, and here the requirement is to ensure that the numbers trained are sufficient for the needs of different industries. Very few industries have, however, carried out any kind of assessment of their skilled manpower requirements on the lines suggested in the Carr Report and, in fact, most industries suffer from a general lack of reliable statistics which would enable them to assess the number of apprentices they will require in future years. This deficiency, which goes to the very root of the problem, must be remedied if any worthwhile start is to be made in planning future training requirements.

One of the aims of the White Paper is that industries should undertake the planning of their long-term requirements for skilled labour at regular intervals, and that training programmes should be worked out accordingly on a national basis. This is an important and urgent task which the Council fully supports. It believes, however, that there is at the same time a need for regular assessments of our overall requirements for skilled manpower to be made as part of the Government's long-term planning for industrial expansion, particularly in view of the spread of some crafts over many different industries, and that the results of such assessments should be widely publicised.

After determining their skilled manpower requirements in the way suggested, industries must then assess the skills required in the various jobs as a basis for planning the appropriate training, on the lines suggested in the Council's booklet. In doing so, they should have full regard to the need for all the skilled workpeople to become better fitted to meet technical changes in industry. A broader based training over a wider range of skills than at present, would not only make this possible, but would also give them a greater sense of satisfaction and security for the future.

The Council is convinced that the adoption of more systematic and intensive methods of training, can lead to reductions in the length of apprenticeship in most if not all industries. It believes that the period of apprenticeship training in every industry should be related far more closely than it is to standards of achievement, and that arbitrary periods of apprenticeship training can no longer be justified. While it will be necessary for industries to specify a minimum period of apprenticeship training, this should be based upon a clear analysis of the training requirements for the job, and should also be linked with a systematic assessment of the level of attainment, agreed on an industry basis for each craft or trade, to determine standards of proficiency.

The Council appreciates that the periods of apprenticeship are determined by collective agreements between employers and trade unions, but it considers that these agreements should, where necessary, be modified to take account of any developments which are needed to improve the quantity, quality and appropriateness of apprenticeship training.

Most nationally agreed schemes of apprenticeship training include some provision for young people to begin their apprenticeship at a later age than the normal starting age, and many schemes provide for remission of part of the apprenticeship period to be granted to those who have followed an approved course of study at school, or at a further education establishment before or during apprenticeship.

Some Flexibility

Although in parts of the country, there is some degree of flexibility for entry to apprenticeship up to about the age of 17 plus, the provisions of the national schemes are not generally applied at the local level as widely as they should be. The growing tendency for young people to stay on at school for a further year or to enter pre-apprenticeship or pre-employment courses at technical colleges is resulting in better educated and more adaptable young persons being available for craft apprenticeship. The Council, therefore, believes that every industry should ensure that its apprenticeship arrangements are sufficiently flexible, both in theory and in practice, to allow suitable boys and girls to enter apprenticeship at a later age and to receive such remission of the apprenticeship period as may be justified. This will, of course, necessitate the use of more systematic recruitment and selection procedures on the part of individual companies, along the lines suggested in the Council's apprenticeship booklet.

The recent report of the National Economic Development Council, which underlined the persistent shortage of skilled workers, stressed the need for the development of training arrangements for workers who have to change their jobs at more advanced ages, i.e., beyond the normal age for apprenticeship, and for an expansion of adult training facilities to meet the demand for labour of various types and degrees of skill. It pointed out that most of the training and retraining of adults was done within industry, but that it provided comparatively few opportunities for retraining skilled workers who needed to change their employer as well as their occupation.

The Council, therefore, considers that industries should examine the need and possibility of introducing special arrangements for adult retraining which would enable either skilled workers in a redundant trade or other adults to be retrained for work in skilled trades. In its craft apprenticeship booklet, the Council recommended that apprenticeship training programmes should make provision for the progress of apprentices to be assessed periodically during each stage of their training. A few industries have gone further than this, and have laid down provisions for practical tests for apprentices both during their training and at the completion of the apprenticeship period. At present, however, success in the final test is not a condition of obtaining skilled status.

The Council considers that all industries should establish and maintain standards of apprenticeship training for each craft or trade covering practical training on the job and appropriate theoretical knowledge, and that day release for further education should be an integral part of apprenticeship. Industries should also introduce tests or other systematic methods of assessment to ensure that satisfactory progress has been made at different stages of the training and that agreed standards have been reached on completion of apprenticeship.

Essential Investment

The Council has on more than one occasion emphasised that training and apprenticeship are an essential investment by industry, and that the cost of not investing in them is one that industry cannot afford in terms of such factors as reduced efficiency; increased labour turnover; higher accident rates; greater damage to expensive equipment; poorer industrial relations; and the expenses involved in recruiting adult labour.

In addition, if developments in British industry are impeded by the shortage of skilled workers, this will also reduce at considerable cost to industry the opportunity of making the best use of inventions, of management ability and initiatives, and of capital investment. Many companies, both large and small, operate first-class apprenticeship training arrangements, and have found to their advantage that training not only pays in the short-term, but that it is also a sound long-term investment. But there are still far too many companies of every size in all industries who could, but do not, play their part in helping to recruit and train the skilled labour force required by their own company and by their industry. They rely instead on recruiting adults whom other companies have trained. Such an irresponsible attitude on the part of such companies commands no sympathy from the Council.

The Council appreciates that in some industries, there are companies whose size or operations may make it difficult for them to train apprentices. Such companies should be required to contribute in some way towards the cost of training apprentices in their industry. If industry is to continue to exercise the responsibility which it claims for the actual training of its own workpeople, then every industry must see that that responsibility is shared by each company in the industry. This means that any company employing skilled craftsmen has a direct obligation to train apprentices to meet its own future requirements or to participate in some way in the training of the skilled craftsmen who will be required by the industry. In this way, the Council welcomes the emphasis in the White Paper on the need for the cost of training by employers to be more fairly spread between all companies in an industry.

While appreciating that some features of foreign systems of apprenticeship training are not applicable to the U.K. system of training, the Council believes that there are many aspects of Continental and other overseas systems which industries in Britain would do well to examine, and lists a number of them. If the U.K. is to maintain, let alone improve, its industrial position in the world, its industries must become more efficient, more effective and more competitive.

Jute

SLUGGISH TREND IN GUNNY MARKET PERSISTS

SINCE the second week of June, the trend has been sluggish in the manufactured goods market in Calcutta. Sentiment has been depressed because of a quick succession of discouraging news. A small increase in production during May was followed by a rise of 4,900 tonnes in stocks at the end of the month. A decline in the offtake accentuated the bearish trend. Besides, overseas enquiries and business have declined appreciably. The lack of buying advices from the U.S.A., which is the biggest purchaser of burlap, has been a major damper.

During the five months ended May 1963, U.S. intake of Indian hessian is higher than the corresponding figure for any comparable period during the last decade. At 357.7 million yards during January-May, it is 60.5 million yards more than the intake during the first five months of 1962. Consequently the average monthly intake is higher this year at 71.5 million yards. Exports of hessian to the South American countries during the period have also been higher around 77.3 million yards against 62.7 million yards for the first five months of 1962.

But since the end of May, fewer orders have been received in India indicating that burlap bag producers in the U.S.A. are sitting out and waiting for lower prices. Meanwhile, their stocks have been going down. It seems that the U.S.A. has already covered about 80 percent of its July-September requirements and there is little incentive to buy forward. Among other hessian consuming countries, Russia, Argentina and the U.K. have also taken a good deal. So the trade appears to be taking a cautious view of the export possibilities.

Poor Outlook for Sacking

The outlook for sacking too does not inspire much optimism. Domestic buying has been below expectations. The Defence Ministry does not seem to have made any purchases recently. As for foreign enquiries, the prospects are discouraging. Out of an indent for 80,000 bales, Cuba has bought 15,000 bales to 20,000 bales of Heavy Cees from Pakistan. The latter has also bagged some other orders, such as the bulk of the Australian order for 5,000 bales or 10,000 bales of cornsacks and woolpacks for all positions up to March 1964, the West African tender for 8,000 bales or 10,000 bales for June-July shipment and the Chilean indent for 6,000 bales or 8,000 bales for July-September shipment. A Burmese order for several thousand bales of D.W. flour bags and heavy goods has gone to Pakistan. It seems that India cannot expect any big sacking order apart from those which Pakistan cannot supply.

Cheaper and better quality fibre, lower wages and the grant of the export bonus subsidy are the factors which help that country in competing with India. The latest deliberations of the Pakistan Jute Association in Dacca clearly indicate the pressure of competition which India may have to reckon with even to retain her existing markets. Pakistan intends to enter the more lucrative burlap market by setting up wide looms. It is time the Indian authorities took effective measures to meet the threat posed by Pakistan. The attention of the G.A.T.T. and the I.M.F. should again be drawn to the unethical aspect of the export bonus scheme. Every effort should be made to improve the quality of jute and make it available to the industry at reasonable rates.

Self-sufficiency in Jute

A strong plea to consolidate the efforts for achieving self-sufficiency in jute has been made by Mr. William Ure, while presiding over the annual general meeting of the East India Jute and Hessian Exchange in Calcutta last week. Mr. Ure said that modernisation of age-old agricultural practices must go hand in hand with the modernisation of industry. The continual rise in living costs must be met by increased yields from both the farm and the factory. Pakistan and Thailand produce more and better jute an acre. As a result, their cost of production is lower and both can undersell India in raw jute and the former in jute goods also. The problem of increasing the yield and conserving land for foodgrains is being tackled by the Government through its various agencies. However, the subsidising of raw materials, whether direct or through the industry by fixing the minimum price, can only be a short-term expedient. There is a danger of a steep decline in the exports of jute goods as a result of competition from countries which can produce the fibre at a lower cost.

Mr. Ure referred to the significant achievement of the jute goods industry in earning Rs. 152 crores of foreign exchange during the past year, or more than 16 percent of India's total foreign exchange earnings. Overseas demand was high because of the backlog of unsatisfied demand in 1961. Exports of hessian rose considerably and in addition to the increased offtake by India's traditional markets, substantial shipments were made to the E.C.M. countries and Russia. The demand for special quality wide hessian as carpet-backing material has risen steeply and the industry is now more than doubling its capacity for this fabric.

Speaking about the activities of the East India Jute and Hessian Exchange, Mr. Ure said that the utmost vigilance was shown in its day-to-day working to ensure that manipulations prejudicial to the interests of the trade were dealt with immediately. Emergency measures were more or less non-existent during the year. There was an appreciable decline in kerb trading. Previously non-members were prone to indulge in excessive speculation. Mr. Ure said that a declaration form has since been drawn up to facilitate the operation of such non-members in the hedge market.

Call to Support Prices

The Indian Jute Mills Association has asked its members to extend the maximum possible support to the raw jute market by keeping their purchases at the highest level. The request was made following a recent discussion on the market situation between the Jute Commissioner and the I.J.M.A. representatives. Preferring voluntary action by the mills, the former is reported to have indicated that the issue of any compulsory purchase quota would depend on the extent to which the price level was maintained in the market.

Imports of Machinery

Liberal licences for importing spinning machinery and captive power generating sets are to be issued by the Government of India to help step up the production of jute goods. With the installation of more wide looms, the mills will need more balancing machinery. Certain special facilities are proposed to be offered to mills which are able to arrange for credit with foreign suppliers. Import licences will be issued freely and remittances permitted in two equal annual or four half-yearly instalments. The first payment will be made on installing the machinery. If necessary, an initial payment of up to 20 percent will be permitted on order or on shipment of machinery. Interest will be allowed up to 6 percent on the outstanding amounts.

Quality Control of Jute Goods

Compulsory quality control and preshipment inspection of jute goods will be introduced soon. The Jute Commissioner has advised all jute mills to set up quality control units in their establishments. The step is being taken with a view to stabilising the export demand for Indian goods. It may be recalled that an Indian Standards Institution Committee, with the Jute Commissioner as convener, has already drawn up draft specifications for various grades of sacking and hessian.

Complaints about Woolpacks

The Australian Jute Goods Association has again expressed its concern over the woolpacks shipped by India in May. Out of a total of 15,600 bales inspected, 4,500 bales were rejected, resulting in the short shipment of 1,234 bales. Excessive moisture, underweight, irregular weight and undershotting were among the common defects detected in the rejected lots. The I.J.M.A. has asked its members to exercise great caution and enforce rigorous quality control in all stages of production, including finishing in the "interest of safeguarding the most important woolpack market in Australia". They have been reminded that they run the risk of being debarred by the Australian Jute Goods Association in case they continue producing sub-standard products.

Manufacture of Newsprint

There is much scope for using jute stick pulp as the basic material for manufacturing newsprint and cellulose acetate yarn, it is learnt. Pilot plant experiments at the Indian Central Jute Committee laboratory and other research and manufacturing establishments have conclusively proved the cellulosic properties of jute sticks, which are available in plenty all over the jute-growing areas in India and Pakistan. One paper mill near Calcutta is using 50 tonnes of jute stick pulp a day for manufactur-

ing writing and printing paper. Another plant in the same area is using jute stick pulp for blending purposes. Cheap writing and printing paper has also been made with 100-percent jute stick pulp as the raw material. A well-known match factory has succeeded in producing match-box wrapping and packing paper using 70 percent of this pulp.

The I.C.J.C. laboratory has developed processes and technique for producing card boards of various specifications from this pulp. Three card board mills near Calcutta are using 50-percent jute stick pulp as raw material. Besides, a West German manufacturer has succeeded in making hard boards—the hardest ever made—using 100-percent jute stick pulp as the raw material. A Calcutta firm was negotiating a collaboration agreement with this party for setting up a hard board plant. But its application for industrial licence has been turned down by the authorities. The project involved a foreign exchange outlay of Rs. 40 lakhs.

What is needed at the moment is a techno-economic survey by qualified people, followed by the preparation of machinery and plant design by an experienced house of paper-making machinery designers and fabricators. The valuable data already collected by the I.C.J.C. laboratory and the factories where jute sticks are being used as raw material, will eliminate the need for expensive surveys. Large quantities of jute sticks are available every year in the seven contiguous Gangetic districts of West Bengal alone. Profitable use of this material, which is wasted now, will make jute-growing more remunerative to the farmers.

Prospects of Bumper Crop

Weather conditions have been satisfactory during the past week all over the jute-growing areas in the Gangetic districts of West Bengal, Bihar, Assam, Tripura, Orissa and Andhra Pradesh. The sultry atmosphere has benefited the standing plants. Weed growth has been arrested and plants have matured satisfactorily. No appreciable damage has been done by the swelling of the northern rivers. Harvesting has already commenced in the early-sown areas. Adequate retting water is available. Reports from upcountry centres indicate that the quality of the fibre is better than average. The acreage too has risen by about 10 percent. Arrivals of the new crop in the agency centres are about 2,000 maunds a day. Some consignments have already arrived in Cossipore. But the poor offtake has been worrying the trade. They fear that when jute starts coming to the market in heavy lots after a month or so, it will be difficult to arrest a further downtrend in prices.

Reports from East Pakistan say that, following the imposition of restrictions on acreage by the authorities and due to the damage caused by the recent cyclone and and floods in the coastal and northern districts, there has been a shrinkage in the crop. But the main difference this season is likely to be a lower production of White Jat and a higher output of Tossa. This is partly due to selective sowing. So the price differential between the two grades is likely to be narrower. The fibre trade has been awaiting official sanction to start business in the new crop.

THE JUTE MARKETS

Manufactured Goods: Dull conditions prevailed in the Calcutta jute goods market during the past week. Sentiment was disturbed by the virtual absence of overseas enquiries or business. Concern was felt over the approach of due date and operators showed a tendency to keep their commitments light. Earlier in the week a shortage of lighters developed because of the offloading of Pakistani cargo in Calcutta. Reports of poor demand for jute freight space during early July were an additional deterrent. Towards midweek there was a short-lived and minor rally on due-date covering and squaring up of short positions on unconfirmed reports of a cut in working hours. But the demand tapered off towards the close. Mills were keen on replenishing their bookings but the price levels made them hesitant. There was a predominance of sellers, particularly for ready and near positions, as a result of which prices drifted further. All due-date transactions were completed satisfactorily. Scattered business in hessian came from the U.S.A. for July-August delivery, 100 bales of hessian from Burma, small lots of A Twills and Heavy Cees July position from Indonesia, 2,000 bales of sacking from Rangoon and a Central Government tender for 5,000 bales of B Twills. Despite the slack trend, selling pressure was absent in the spot market. In the futures market, business was dull following tired long liquidation, but all offers were absorbed by bears at low levels. The week closed with minor losses in both spot and futures markets. Turnover was small and the undertone hesitant at the close.

Wednesday's quotations were as follows :

	July	Aug.	Sept.	Oct.-Dec.	Jan.-March
40in. 7½oz	35.10	35.20	35.20	34.90	34.65
40in. 8oz.	37.75	—	—	—	—
40in. 10oz.	47.85	47.60	47.35	46.85	46.35
B. Twills	108.65	109.40	109.55	109.80	109.40
Cornsacks	111.75	112.25	112.25	112.25	111.75
Heavy Cees (Plain)	108.75	—	—	—	—
A Twills	133.75	134.00	134.00	134.50	134.00
Liverpools	122.50	123.00	123.00	123.50	123.00

Raw Jute: The raw jute market was dull in Calcutta during the past week. With enough stocks in their warehouses, mills showed no interest in business. But reports of satisfactory new crop conditions induced holders to offer their stocks of off-grade old crop fibre at a heavy discount. Arrivals at the agency centres averaged 2,000 maunds of new crop a day. Some lots were delivered in the Cossipore market. All new crop offers were well-absorbed for they were mainly of the selected grades. Prices remained depressed—well below the official minimum. Turnover was small around Rs. 27 a maund, f.o.r. Calcutta ready, for the old crop, and Rs. 29 a maund, f.o.r. Calcutta ready and July delivery, for the new crop, basis Assam and Northern Bottoms. The corresponding rates for Daissee Bottoms were Rs. 32 a maund for both crops. The futures market lacked interest. Earlier in the week, prices moved within narrow grooves with little business passing. Since midweek nominal transactions took place at around the floor rate. Turnover was small and the undertone hesitant at the close.

Wednesday's quotations were as follows :

	Landed at Mills (Basis Bottoms) Current Prices		T.S.D. Minimum Prices	
	Rs. A Qtl.	Rs. A Md.	Rs. A Qtl.	Rs. A Md.
Assam-Agartala Jute	76.36	28.50	80.38	30.00
Northern Jute	75.02	28.00	79.04	29.50

Pakistani N. C.	88.00 a bale			

THE PAKISTANI JUTE MARKETS

FIBRE MOSTLY UNCHANGED

(FROM OUR DACCA CORRESPONDENT)

THE river levels went down during the past week. Since reports from Gauhati indicated a considerable fall in river levels, it was expected that within the next day or two, rivers in the jute-growing areas in East Pakistan would also fall. During the same period, there was little or no rain, and the sunshine proved very beneficial to the midland crop, although it might be too late to help the lowland crop, most of which has been harvested. The meteorological reports indicate that this normal monsoon weather may be expected to continue, that is to say, irregular rains with frequent sunny periods.

If it does, it may be expected that a majority of the early white lowland crop about 25 percent of the total crop, will be rather short and possibly even croppy. The midland crop, approximately 50 percent of the total crop, about half of which is tossa, is expected to be of good length and fairly good quality—quantity with reasonably light roots due to early heavy rains.

As for the highland crop this is very seldom seriously affected in any way. It may, therefore, be expected that there will be better white jute later on also; there may be a larger percentage of higher grades in the tossa as well as a good quantity outturn from tossa. If, however, there is a repetition of last year's heavy floods in August, these could do considerable damage to the quality and some damage to the quantity of the midland crop, which constitutes 50 percent of the total.

Locally, transactions in cuttings continued at unchanged rates at the equivalent of approximately £35 10s —f.o.b. There was also small business reported at about £4 a ton higher for as far forward as January-February. The largest holder of cuttings in the local market who has had a long position for nearly the whole season, has liquidated slowly his position, and another large baler is now a heavy buyer at current prices. He is reported to have bought 15,000 bales during the past week, and has large sales on his books at low prices for the United States.

In long jute of the old crop, little or no business is reported. There is some slight buyer interest at the following rates, but sellers consider these too low : Export Hearts £63; Outport Tossa 4s £65; Outport Tossa 4½s £75s 10s and Dacca Tossa 6s £92, 10s. These prices are all f.o.b. East Pakistan ports.

From overseas, occasional business is reported mostly in the region of the minima, but without any commission for the agents and mostly in Export Lightnings and Dundee Tossa 4s.

The Pakistan Jute Mills Association held its annual general meeting at which the Governor of East Pakistan was the guest of honour. The president of the P.J.M.A. in his speech suggested that the controls on internal transactions and on the export of raw jute should be withdrawn. On this point, the Governor was very definite that no such thing would be considered by the Government. It appears, therefore, that price control will remain, and it can only be hoped in the interest of the trade that the market will maintain levels at or above the minima, since when the market falls below this, malpractices must creep in which are unhealthy for the trade.

The overall acreage under jute in Pakistan during the 1963-64 crop season has been about 15 percent less than that in the last season, says the Pakistan Jute Board in its review for May. The weather remained favourable till the end of the month, and the crop position was satisfactory. Heavy downpour throughout East Pakistan thereafter may have retarded the growth of the plants to some extent in certain low lying areas. Some rivers are in spate submerging the basins. As a result early harvesting may have to be resorted to in these areas.

Pakistan's export sales of jute goods during May amounted to 2,38,254 bales, bringing the total to 36,11,843 bales. The latter figure was 3,10,000 bales lower than the corresponding figure for the previous season. Mesta sales amounted to 11,085 bales for the month and 1,24,994 bales for the 11-month period. Egypt was the best customer with an intake of 38,657 bales, followed by Japan with 26,854 bales, Belgium with 15,442 bales and Yugoslavia with 14,970 bales.

THE U.K. JUTE MARKETS

ACTIVITY IN FIBRE RESTRICTED

(FROM OUR DUNDEE CORRESPONDENT)

THE raw jute market was quieter in Pakistan last week. Offers of both old and new crop were being freely made, but spinners were still remaining out of the market where shipment jute was concerned. With the start of the new season on 1st July, some announcement about minimum export rates has been expected for some time, but so far, no statement has been made. Trading licences for next season have also not been issued. This lack of information from Pakistan was disconcerting and gave the impression that a large crop of jute is expected, and it may be very difficult to maintain prices at their present levels. Buyers generally were remaining out of the market, because of the prospect that prices of many grades of jute will decline.

A small business took place in Dundee, but this was confined to ex warehouse or ex quay parcels. The prices being paid were under current shipment rates. A fair quantity of jute was still available on spot Dundee, and this was a "bear" factor on the market. There were sellers of new crop at £108 for Mill Lightnings, at £94 for Mill Hearts and at £80 for Grade Hearts, c.i.f. U.K. for August-September shipment. Grade Tossa-2/3 was named at £117 and Grade Tossa-4 at £106. Outport Tossa-2/3 was at £98 and Outport Tossa-4 at £88, October-November. Old crop offers were being made at £111 for Mill Lightnings, at £94 for Mill Hearts and at £78 for Grade Hearts. Grade Tossa-2/3 was at £121 and Grade Tossa-4 at £107. Outport Tossa-2/3 was lowest at £93/15s and Outport Tossa-4 at £84, c.i.f. U.K. June-July. Cuttings were about unchanged at £54 for S.N.C. and at £47/10s for N.C.

The Siam jute market was steady, but irregular with very few offers of old crop being made. Prices being quoted were still considered to be too high, compared with other raw materials. New crop grade A was at £72 and grade B at £67, delivered mill Dundee for November-December shipment.

The Calcutta goods market became much easier at the beginning of the week, but prices later recovered some of the loss. Quotations were at 73s for 40in. 10oz. and at 53s for 7½oz. a 100 yards f.o.b. Calcutta for June shipment, at 73s and 53s 6d July-September and at 71s 3d and 53s 3d October-December. B Twills are at 165s 6d, 166s 9d and 168s 3d for the respective shipment periods.

PROVIDING LONG-TERM FINANCE FOR AGRICULTURE

BY A SPECIAL CORRESPONDENT)

LONG-TERM finance plays a significant rôle in raising agricultural production. In India, long-term loans for agriculture are now routed through land mortgage banks. There is one land mortgage bank in each State, except in Jammu and Kashmir, and several varieties of organisation at the primary level. During the last three years of the third plan, it was proposed to set up 173 primary land mortgage banks, in addition to 160 branches of central land mortgage banks. A target of Rs. 150 crores was fixed for long-term outstanding loans at the end of the third five year plan; in contrast, the outstanding loans at the end of the second plan and the first plan stood at Rs. 13 crores and Rs. 38 crores, respectively.

The loans are given by land mortgage banks for a variety of purposes, such as improvement of land, purchase of costly agricultural implements, construction of wells and redemption of old debts. The land mortgage banks largely depend for their resources on debentures floated from time to time in the market. The Life Insurance Corporation, the Reserve Bank and the State Bank subscribe to such debentures in certain proportions. The emphasis in the first two plans has been on the provision of short-term credit and not so much on long-term finance which is evident from the outstanding loans.* It has now been decided that the criterion for giving loans should no longer be the discharge of old debts. They should rather enable cultivators to undertake productive expenditure. Recently, for instance, it has been decided in Madras that from the current year, 70 percent of long-term loans in that State should be given for productive purposes; naturally, the rest only will go for the redemption of old loans.

Several Drawbacks

It has, however, been realised that the type of assistance provided by land mortgage banks does not by itself help raise agricultural production. The loans provided by them suffer from several drawbacks. For instance, the loans are required to be repaid in equated instalments spread over ten to 15 years, the first instalment of repayment starting after one year. Amounts which could be given against the mortgage of land are limited—they are between Rs. 10,000 and Rs. 15,000 in different States. They are not tailored to specific needs of cultivators. Furthermore, such assistance left beyond its purview bigger projects spread over a long period and with a prolonged gestation period. It is with a view to filling these important gaps in long-term agricultural finance that the Agricultural Refinance Corporation has been set up.

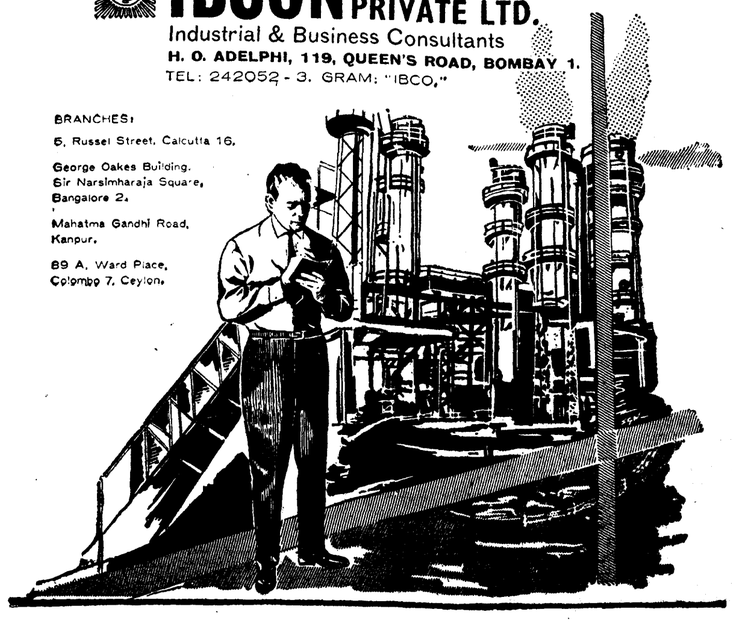
The Corporation is being set up in an atmosphere of stagnation in India's agriculture. It is expected that the type of finance made available by the Corporation will help land reclamation under new irrigation projects. It has been the country's experience that while new dams are built up, the water cannot be used by cultivators for want of irrigation or link canals. In such instances, the period of gestation for the productive use of finance is likely to be long, namely, five or six years. The finance provided by the Corporation will necessarily be dovetailed to individual projects so that the financial bottleneck standing in the way of using the irrigation potential might be eliminated.

Some of the cash crops like rubber, tea, coffee and other plantation products also require long-term finance, that is, spread over 35 to 40 years in big amounts. Plantations are financed mostly by commercial banks. Advances by scheduled banks to plantations as on 29th March, 1963, amounted to Rs. 51 crores or a little over 3 percent of the total scheduled bank credit. Such advances are of a short-term nature and they are offered mostly against the hypothecation of standing crops. The Corporation will, therefore, assist commercial banks to make headway in the provision of long-term finance for agriculture, thereby opening a new avenue for commercial banks. To what extent the latter will be able to take advantage of the new opportunity will depend on their resources position which is, however, none too comfortable at present.

Wide Scope

The Corporation will finance a wide range of agricultural activities. In addition to the two lines mentioned above, assistance will also be made available for the introduction of mechanised farming, use of electricity through pumping sets, development of animal husbandry, dairy farming, pisciculture and poultry farming. This is an impressive list by any criterion, although the risk element varies from activity to activity. The Corporation will also guarantee deferred payments for capital goods imported by eligible institutions against Government guarantee. This requirement can, however, be waived where adequate collateral security is provided. Central and State land mortgage banks as well as scheduled banks, which will be members of the Corporation, are eligible for refinancing facilities.

The Corporation has been provided with adequate resources. In the first instance, it has been empowered to issue 5,000 shares of Rs. 10,000 each, against its authorised capital consisting of 25,000 shares. Two thousand and five hundred shares will be subscribed by the Reserve Bank, 1,500



* Against the meagre outstanding amount of long-term loans the short-term outstandings at the end of the first and second plans amounted to Rs. 22 crores and Rs. 89 crores, respectively.

help conserve nations fuel

FUEL is in short supply and expensive too. It forms a substantial part of the budget in every Industry. Efficient use of FUEL has therefore become imperative, whether you want to cut costs or plan to increase your production. Our FUEL experts have devised ways and means of getting 10 to 20% more out of the FUEL you use without costly capital investment.

by the central land mortgage banks and the State co-operative banks. The remaining 1,000 shares will be subscribed by scheduled banks, the L.I.C. and insurance and investment companies. The Government has guaranteed the repayment of the principal and the payment of minimum dividend each year. The shares will also be deemed as trustee securities. In addition, the Government is providing an interest-free loan of Rs. 5 crores, the repayment of which will start after 15 years from the date of issuing the loan. The Corporation will raise resources through deposits for periods exceeding 12 months and through the issue of bonds and debentures. The Corporation will function in close co-operation with the Reserve Bank. This is sought to be insured by appointing the chairman and the managing director of the Corporation from the Reserve Bank.

But the question is: will the provision of finance boost agricultural production? It is difficult to be sure. Since the central land mortgage banks and the State Finance Corporations are supported from above, the institutional structure requires to be considerably strengthened before entrusting it with additional responsibilities. This is especially so because there are misgivings whether or not land mortgage banks will be able to fulfil the target of long-term finance (Rs. 150 crores) to be provided for usual agricultural activities. Furthermore, in several cases the State Governments have shown a lukewarm attitude towards recovering loans or supervising activities connected with loans provided by the Reserve Bank or a semi-Government agency. The rubber plantation scheme, assisted by the Reserve Bank in Kuttinad in Kerala, is a case in point. Instead of supervising the project to become viable with the Reserve Bank's assistance, the Kerala Government simultaneously launched an independent financing scheme of its own to assist the rubber plantations. This has led to avoidable overlapping, and both the schemes are reported to be in difficulties.

Outside Guidance

Evidently, the success of the Corporation depends on the interest taken by the States. The Corporation does not have any technical experts of its own. The idea is to use the services of agricultural experts available in different States. But can the Corporation depend on outside guidance for the evaluation of the risks? This seems to be an unsatisfactory state of affairs because outside experts might easily let down the Corporation. Even from the initial stages, the Corporation will do well to evolve its own independent technical panel so that it is not exposed to undue risks. The Corporation should steer itself from the initial teething troubles, especially in a field where there are wide regional divergences within the country.

DIPLOMACY OF ECONOMIC DEVELOPMENT

The Diplomacy of Economic Development and Other Papers. By Eugene R. Black. (Published in Canada by McClelland and Stewart Ltd. Price $1.25, pages 176.)

This book contains three lectures delivered by Mr. Black at the Fletcher School of Law and Diplomacy (originally published in 1960). Also included are some important addresses delivered by the former World Bank president in the past few years. In the lectures, Mr. Black analyses the factors which have led to the "revolution of rising expectations" in the underdeveloped countries. The latter are showing greater awareness of the benefits of science and technology in striving for economic progress. The task their leaders face in steering their people through the vast complexity of choices before them is without parallel, the main problem being one of bringing modern economic life to a society inhibited by tradition. A new sense of vocation is required of the West, and Mr. Black examines how this challenge can be met, not only to assist the underdeveloped world but also to serve effectively the ideals of freedom and tolerance so that the "balance of hope" is maintained.

This growing together requires constant constructive contact, which indeed is the main theme of "development diplomacy". The development diplomat's contribution lies not in imposing solutions, but in illuminating the choices available by weighing benefits against costs, so that politicians and planners are aware of the consequences of their actions before they decide, not after. Economic aid does not merely subsidise people; it can also influence events. It follows that the development diplomat must be given a new status in what Mr. Black calls "the big tent of diplomacy".

While patriotism stirs up energy which can be mobilised for economic development, Mr. Black in his addresses warns against the pitfalls of intense nationalism. Isolation and the rejection of outside aid and skill can retard progress, just as excessive control by the Government of economic and political power can endanger the very rights of the individual which the Government is supposed to uphold. Mr. Black also discusses the new adventure represented by the European Common Market. He vividly brings out the essential interdependence of nations, rich and poor, the experiments towards a working partnership through patience and understanding, the obstacles—real and imaginary—in the path to progress, and the ultimate aim of spreading a democratic way of life. The book closes with an up-to-date note on the World Bank.

Considering the importance of foreign assistance in India's development, these lectures by a man who for 14 years served as president of the World Bank is of special significance to readers in this country. It is invaluable for an introspective examination of current attitudes and objectives in the context of national and international affairs.

JOINT-STOCK COMPANIES

Alphabetical Lists of Joint-stock Companies in India. (Compiled by the Research and Statistics Division of the Department of Company Law Administration, Ministry of Commerce and Industry, New Delhi. Published by the Manager of Publications, Delhi. Pages 217+XXVII.)

The Department of Company Law Administration has to be complimented on bringing out the alphabetical lists of joint-stock companies operating in India. The present volume is complementary to the Department's other publication entitled *Joint Stock Companies in India, Part II*, which gives data for 1958-59. The purpose of the supplementary volume is to give the names of new companies registered between April 1959 and March 1962. It makes the alphabetical lists up-to-date in the light of statistical returns furnished by the Registrars of Companies in various States.

BUSINESS ORGANISATION

Business Organisation. By B. B. Ghosh. (Published by A. Mukherjee and Co. (Private) Ltd, 2 Bankim Chatterjee Street, Calcutta 12. Price Rs. 14, pages 676.)

Dr. Ghosh's *Business Organisation* is a standard work on the subject and has been prescribed as a textbook for B. Com. and M. Com. students by many Indian universities. Although some books on the subject have recently been brought out, they are not as comprehensive as Dr. Ghosh's work which covers all facets of business organisation. The fact that the latest is the eleventh edition of the book testifies to its popularity. A dynamic subject like business organisation requires constant revision of facts and figures. In the latest edition, the author has largely re-written the book and incorporated new data, wherever required. The best chapters of the book are undoubtedly those relating to the Companies Act and the operation of stock exchanges. Furthermore, business principles, practices and procedures have been analysed in great detail. Some sections of the book, such as currency and banking and international trade, are not as detailed as the other ones, but this is presumably due to the author's effort to confine the scope of his work strictly to university syllabi. Considerable changes in the latter, as is well known, have been introduced in the three-year degree course. This has necessitated the recasting of chapters in the light of recent developments. Indian universities are now attaching greater importance to business organisation in the curriculum for commerce education. The book—in its enlarged and revised edition—will meet this need adequately.

MAKING STEEL

Steel: An Expanding Industry. (Issued by the Publicity Department of the Dunlop Rubber Co. (India) Ltd, 57B Free School Street, Calcutta 16. Pages 25.)

The Publicity Department of Dunlops has brought out an interesting pamphlet on India's expanding steel industry. It contains a *resumé* of the industry's progress through more than a decade of development and analyses the prospects for its further expansion. There is also a useful section on the industry's raw material base. Written in a forceful and lucid style, the pamphlet, within its short compass, contains a mine of information on India's steel industry. Readers will be grateful if such pamphlets on other major industries of India are brought out on the same lines.

Commodity Markets

TEA PLANTERS ASKED TO PRODUCE MORE

HIGHER EARNINGS FROM EXPORTS

(BY A SPECIAL CORRESPONDENT)

THE Central Minister for International Trade, Mr. Manubhai Shah, while declaring open the new tea auction room in Calcutta last week, told his audience that 1962 exports produced Rs. 62 crores more in foreign exchange than the previous year. Mr. Shah again asked planters to increase production and the distributors were asked to pack better and to change over from bulk handling to presentable small packets. He expressed the opinion that the problem with tea was one of more production than of consumption and sale, and went on to say that two-thirds of the world remained to be initiated into the tea drinking habit. The Minister referred to the present period as the "beverage age" in which tea should have pride of place, but more publicity and propaganda was necessary on methods of preparing and serving tea.

The Minister thought yields could be raised through artificial irrigation, improved fertilisers, replanting and new planting. He further stated that he had approached the Chief Ministers of the tea-growing States, and they had assured him of co-operation. He expressed the view that it would not be difficult to sell more tea. One devoutly hopes that such will prove to be the case. A massive tea promotion programme is necessary to win new markets, and he called upon the industry to spend more on a propaganda drive which would have financial support from the Government. Tea costs 25 percent less than coffee; therefore, the potential markets in both eastern and western Europe were considerable.

The Tea Plantation Wage Board had some sittings last week. The West Bengal Government placed its views before the Board. The Assam Government and the Indian Tea Association held sessions and discussions were continued until Thursday. It is understood the Board has already visited several stations in north and south India, and the report is expected to be out soon. It will be interesting to note if Sir Percival Griffiths's appeal not to overburden the industry with still higher costs will receive any sympathetic consideration from the Wage Board.

Schemes for research on tea are making good progress. Of the total cost, the Tea Board will provide 50 percent and the balance will be shared equally by the industry and the Council of Scientific and Industrial Research.

The new season's tea up for auction on 24th June at Sale No. 4, met with a strong demand for leaf teas. Plain descriptions and mediums from Assam and Dooars sold readily with a somewhat better tendency. Good C.T.C.s were dearer. Some Darjeeling sold well, but higher grades received less attention.

In London, there was a fair demand for the best liquoring teas. For other descriptions, the market was irregular with rates generally lower by ½d to 1d a lb. Later auctions have enjoyed active competition, but because of small sales, quotations have not been given.

Production in north India up to 15th June was 74.87 million lbs. Last year, it was 89.32 million lbs on the same date. The average over the past three years for the period is 81.72 million lbs.

COMPANY AND PUBLIC NOTICES

SHAW WALLACE & COMPANY LIMITED

Dividend on Preference Shares

THE Directors have declared a First Interim Dividend of Rs. 2.4975 per share (i.e. Rs. 3.00 per share increased in accordance with the provisions of the Preference Shares (Regulation of Dividends) Act, 1960 less Income Tax at the Company's rate of 25% in accordance with the Finance Act, 1963) subject to deduction of tax under Section 194 of the Income Tax Act, 1961 on the Company's Preference Shares in respect of the year ending on the 31st December, 1963 payable to Members whose names appear in the Preference Shares Register of the Company on the 15th July, 1963. Warrants will be posted on or after the aforementioned date to the addresses or in accordance with the instructions recorded in the Company's books.

The Transfer Register of the Preference Shares will be closed from the 8th to the 15th July, 1963, both days inclusive.

By Order of the Board,
D. A. HOUGHTON,
Calcutta Director & Secretary.

Registered Office:
4, Bankshall Street,
Calcutta 1.
Dated the 28th June, 1963.

THE BOMBAY BURMAH TRADING CORPORATION, LIMITED

NOTICE is hereby given that an Extraordinary General Meeting of the Company will be held at the Tata Auditorium, Bombay House, 24 Bruce Street, Fort, Bombay-1, on the 25th day of July, 1963, at 4-30 p.m. (I.S.T.), for the purpose of considering and if thought fit passing with or without modifications the following resolutions as Ordinary Resolutions, namely:—

I. (a) RESOLVED that, subject to the approval of the Central Government, The Bombay Burmah Trading Corporation, Limited be and is hereby authorised to subscribe in its own name and/or in the names of nominees for the whole of the capital to be issued at par by Wallace Bay Limited, a Company incorporated in North Borneo with an authorised equity capital of Ten Million Malayan Dollars (M. $10,000,000) divided into 10,000,000 equity shares of M $1 each and which Company will be a wholly owned subsidiary of The Bombay Burmah Trading Corporation Limited notwithstanding that the aggregate of the trade investments may exceed 30 per cent of the subscribed capital of the Company

(b) RESOLVED further that the Board of Directors be and are hereby authorised to take such steps as are necessary for obtaining the approval of the Central Government as also to agree to such modifications or conditions as the Central Government may prescribe in relation to such investment and in general to take all such steps as are necessary to implement the foregoing Resolution.

II. RESOLVED that The Bombay Burmah Trading Corporation, Limited (hereinafter referred to as "the Company") hereby consents and authorises its Board of Directors to sell, transfer or otherwise dispose of to Wallace Bay Limited such substantial part of the undertaking and assets of the Company in North Borneo as the Directors may consider are required for the continuance of the Company's business in North Borneo at their book values as shown by the audited accounts of the Company as at 31st May, 1963 and that the consideration for such sale, transfer or disposal of the said assets shall be the issue to the Company at par by Wallace Bay Limited of such number or amount of equity shares of M $1 each credited as fully paid up of Wallace Bay Limited as shall be equivalent in nominal value to the total book value of the Company's assets transferred.

By Order of the Board,
WALLACE & COMPANY,
Secretaries and Treasurers.

Registered Office:
9, Wallace Street,
Fort, Bombay 1.
Dated: 29th June, 1963.

Notes:

COAL COMPANIES

O., Po., F. and Dd Indicate Ordinary, Preferred Ordinary, Founders and Deferred Shares respectively. 'P' next to the name of the company indicate that the company also has Preference Shares. Figures in "accounts closed" column indicate the months of the calendar year in which accounts are closed. For Managing Agents refer to the Key (last page) under the numbers indicated.

POPULATION, PRICES UP: THE REST STAGNATES

A LONG-AWAITED Press conference began in New Delhi last week with the arrival, metaphorically speaking, of a lorry-load of sackcloth and ashes. Out of it rose the tall, gaunt figure of Mr. Gulzari Lal Nanda, deputy chairman of the Planning Commission, to announce that the third five year plan was showing signs of cracking up. The Planning Commission, said Mr. Nanda, had expected that India's population would increase at the rate of 2 percent or 2.2 percent a year. Some experts now thought that it was going up at the rate of 2.4 percent a year. In this statistical tribute to the relentless fecundity of the Indian people lay a major threat. The Planning Commission. diligent as ever, would invite its best academic talents to "check up" whether the new estimate was correct. And if it was—Mr. Nanda implied—the Commission would consider declaring straightaway what to everybody else is by now common knowledge—that the various targets in the third plan stand an excellent chance of going completely awry. Mr. Nanda saved himself the embarrassment of explaining how the checking would be done—through the time-honoured practice of statistical jugglery. for instance, or through a brand-new national Census? Nor did he explain why, in the short term, if the population was rising too rapidly, the production of steel or fertilisers or food should be rising too slowly. The implication could not be true that the population growth has so intensified national hunger that the people have taken to a menu of blast furnaces and ammonium sulphate factories.

The theme-song of Mr. Nanda's Press conference was a long moan about the rise in prices. Many among his audience sadly recalled that no more than eight months ago—at the height of the Chinese invasion—the same Mr. Nanda had proudly announced on his Government's behalf what was flatteringly described as a price policy. He was informed at the time that the price policy was not a policy at all; it consisted of hints, threats, assurances and warnings, all of which were liable to be blown to oblivion by the wind of the Government's own verbosity. That sorry state of affairs has now come to pass, and Mr. Nanda has been compelled to admit that the rise in wholesale prices over the past year has amounted to no less than 4.9 percent. Mr. Nanda forgot to mention that the official statistics on which this estimate is based traditionally understate the extent of the rise; that the increase in prices at the retail level has been a good deal more; and that the rise in recent months has been particularly sharp. Instead, he sought refuge under an umbrella of disingenuousness by claiming that only rice, pulses, sugar and *gur* have become much costlier; and that the prices of other commodities have hardly increased. Whatever may have been the impression conveyed by the Planning Commission's *khansamas*, that is certainly not the general experience. A casual visit to the markets suggests that the rise in prices, especially since the Central Budget was presented, has been sharp, widespread and indiscriminate.

Mr. Nanda rode an old hobby-horse by insisting last week that, to the extent that prices had risen, it was because the trade had not "done its duty." The fact is that the trade never does; if it were to do what Mr. Nanda considers to be its duty, it would have to start by organising a series of political assassinations first in the Planning Commission, and then in the Food and Finance Ministries. After more than 20 years of inflation, the Government comes forward with the pathetic discovery that the failure of its price policies is due to business morality at the wholesale and retail level being poor. One would have thought that enough time had passed for the lesson to be learnt that in a situation of growing shortages, prices cannot be reduced unless demand is depressed or supplies increased.

The recent trouble with prices starts with the fact that for more than two years, foodgrains production has stagnated, and rice output has actually gone down quite sharply. The growth of industry too has suffered, the supply of essential consumer needs such as cloth and sugar being particularly erratic. The Government meanwhile has been merrily pumping more and more money into the economy through the time-honoured device of deficit financing. Such financing was especially lavish after the Chinese invasion; to it has more recently been added a rollicking Budget which has sent costs and prices zooming upwards. For the Planning Commission to have thought that. in these circumstances, inflation could have been stopped by establishing a wider network of fair-price shops and consumer co-operatives was plain eyewash. Eight months after he announced that the country would be plastered with such shops and co-operatives, Mr. Nanda has woken up to the formidable organisational difficulties involved. He has now come round to the view that, to be effective, they would have to handle 20 percent or 25 percent of the trade in a particular commodity—which is as good as saying that they will not be effective for the rest of the twentieth century.

Committed as it is to a strongly inflationary budgetary policy, there is perhaps little that the Government can do to check the rise in prices immediately. The Food and Agriculture Minister, Mr. S. K. Patil, has already done his best: sped off to the United States and returned with the promise that rice shipments under the P.L. 480 programme will be speeded up. His deputy, Mr. A. M. Thomas, has done his best too: assured the people that the Government has more than enough rice stocks in hand—if only everybody would please start eating wheat. Eaters of pulses are presumably to be left to fend for themselves; but for sugar a brave new target has been announced which visualises the miracle of a 50 percent increase in production next year with the aid of incantations from New Delhi. The general impression left by the variety performance is that the Government proposes to do nothing except sit quietly with its fingers crossed, hoping that when the winter crops move into the markets prices will drop temporarily and shouts of joy will rend the air.

As most people outside the Government and the Planning Commission have long been aware,

there is a crucial need for India to intensify her drive for increasing agricultural production. Never has the need been greater than it is now if the Government is serious about saving something from the wreckage of the third plan. Mr. Nanda last week spoke with youthful enthusiasm of the fact that several agricultural teams have been touring the States, and have returned with expert reports on the changes necessary in agricultural administration in order to increase farm productivity. He understandably did not consider it advisable to add that the number of reports on the subject already in the Government's possession is legion; all enjoy the happy fate of lying unread as they gather dust in secretariat pigeon-holes, and it remains to be seen whether the latest ones will fare any better. For the Planning Commission to talk airily, as Mr. Nanda did, about grandiose targets for the fourth plan might be more reassuring if even a few of the major targets of the third plan were in sight of being achieved.

PRODUCING MORE SUGAR

IT is to be hoped that the Government of India's decision to license wholesale dealers in *gur* and *khandsari* will be followed by more effective measures to make these commodities cheaper. According to an official Press note, the prices of both have been rising "without any justification", so it has become necessary to keep a watch over the trade. The Government is worried that sugar production has fallen sharply during the current season because the crop was small and the limited supplies of cane were diverted to *gur* and *khandsari* manufacture. The diversion is wasteful considering that about half the sugar content of the cane is not extracted under the crude and primitive methods of milling employed by *gur* and *khandsari* manufacturers. It also tends to reduce sugar output by depriving the factories of cane. If the present high prices of *gur* and khandsari continue, the supply of cane available for sugar production during the next season may again be too small.

Mr. G. M. Modi, president of the Indian Sugar Mills Association, has already issued the warning that because of the high prices of *gur* and *khandsari*, power crushers and *gur* manufacturers will start crushing early in October, while the sugar factories will have to wait for the cane to mature so that they can get a recovery of at least 8 percent. Thus by the time the sugar factories start working, a substantial quantity of cane in northern India will already have been converted into *gur* and *khandsari*. Sugar, being a farm-based industry, is subject to the vagaries of nature. During a lean year, the shortage of cane is accentuated as supplies are diverted to *gur* and *khandsari* manufacturers, who can pay more for the raw material since their products are not subject to price control. Sugar factories are subject to price control, so they cannot afford to buy cane at high prices. On the other hand, during a bumper year, the industry does not get the benefit of cheap cane since it has to pay the minimum prices fixed by the Government. The quantity of cane available to the industry meantime increases as *gur* and *khandsari* production declines with the fall in their prices. This is one reason why the sugar industry has been subject to a recurring cycle of glut and shortage.

Apart from the need to meet the increase in domestic demand, the Government's anxiety to step up sugar production arises from its export potential. In 1962, exports totalled 373,000 tons and earned Rs. 14.82 crores in foreign exchange. The export commitment for 1963 is 500,000 tons, which may fetch about Rs. 30 crores. Mr. S. K. Patil, Central Minister for Food and Agriculture, claims that India is now assured of a ready market for at least 750,000 tons next year. He told a Press conference in New Delhi recently that the U.S.A. had offered to buy 500,000 tons every year and would allot a permanent sugar quota to India. Japan, he added, had agreed to buy 250,000 tons. However, the snag is that Indian sugar will have to be competitive in price—which is possible only if the present high production costs are drastically reduced. Japan is no doubt a major importer of sugar, her intake being 1.2 million to 1.4 million tons a year. India has been able to enter this market—some 90,000 tons have already been exported—since she started producing raw sugar this year. But considering the present cost structure, one is inclined to doubt Mr. Patil's assumption that 250,000 tons of raw sugar could be shipped to Japan every year.

To meet the increased requirements at home and abroad, the Government has decided to license an additional capacity of 500,000 tons, which will take the third plan target from 3.5 million tons to 4 million tons. The total licensed capacity at the end of March this year was 3.35 million tons. The Government's partiality for co-operative societies is well-known, but there is no reason why it should influence the licensing policy. Reports suggest that a sizable part of the new capacity may go to the co-operative sector. A major factor that will have to be taken into account is that many of the existing factories do not have optimum capacity. In order to benefit from the economies of scale, they should be allowed to expand. Furthermore, expansion would be more economical and would involve less foreign exchange expenditure than the setting up of new mills. The price of sugar should allow sufficient margin to cover the costs of expansion, rehabilitation and modernisation of the existing units. No less important than expansion is the fuller use of existing capacity. There is a large volume of idle capacity in the industry, which can be used only if adequate supplies of cane are ensured over a longer period. This calls for the sowing of early and late maturing varieties of cane.

A stable long-term policy to increase sugar output has yet to be formulated. So far there has been too much reliance on short-term measures such as controls. As Mr. M. N. Pittie stated in his presidential address at the last annual general meeting of the Indian Sugar Mills Association, "the history of sugar is one of control, decontrol, recontrol, partial control and control again." The Government's objective is to raise output by over 50 percent during the next season and produce a minimum of 3.3 million tons, against 2.15 million tons during the current season. Spokesmen of the I.S.M.A. have pleaded for an increase in the price of cane, coupled with concessions in excise duty and the cane cess. But there is no justification for raising the price of cane; all it would do is to divert land from food crops to cane. The main need is to produce cane of better quality and increase the yield an acre. The system of linking cane prices with the sucrose content is a step in the right direction. The price differentials now need to be widened so that the incentive for growing high-quality cane is greatly increased.

EXPORT AMBITIONS

AN increase of 5 percent in export earnings is implied by the target of Rs. 745 crores adopted by the Board of Trade at its meeting in New Delhi last week. Considering that exports have risen by about 10 percent in the last two years, this is a modest enough goal, especially with a Rs. 20-crore deal in prospect under which the United States is expected to resume purchases of manganese ore and ferro-manganese. While there is much to be said for realism in setting targets, progress at this rate is clearly insufficient if even the limited objective of earning enough to pay for the economy's maintenance needs is to be achieved. The third plan document assumed that exports would bring in Rs. 3,700 crores over the five-year period, against which maintenance imports would cost about Rs. 3,650 crores. Even before the emergency intervened, it became clear that requirements of maintenance imports had been seriously under-estimated. One example of this was the assumption that domestic steel output would expand quickly enough to permit a drastic cut in imports, and a sum of only Rs. 230 crores was provided in the foreign exchange budget for the entire five-year period. Against this, the actual outlay on steel imports in the first two years of the plan was Rs. 194 crores. The same kind of unwarranted optimism was seen in the case of fertilisers, heavy chemicals and other goods. On top of this, the import deficit has been appreciably enlarged by the new demands arising out of the emergency. Military hardware may come in under special aid arrangements, but most of the stores and supplies (such as petroleum products, metals for ordnance factories and transport equipment) have to be procured through normal commercial channels.

Even if the immediate strain is relieved by a larger inflow of non-project aid, the pressures on India's balance of payments make the outlook for the future very uncertain indeed. With something like 15 percent of export earnings pre-empted for debt servicing already, a further increase in repayment obligations may impose an intolerable strain unless it is offset by a substantial improvement in exports. As things stand, there seems to be little chance of achieving even the low third plan target of Rs. 3,700 crores for exports. The actuals for the first two years (excluding the contribution from Goa, which was not taken into account while setting the target) come to Rs. 1,370 crores, leaving a balance of Rs. 2,330 crores to be earned in the remaining three years. At Rs. 745 crores (including Goa, which added Rs. 16 crores to last year's earnings), the target set by the Board of Trade last week may be judged as falling far short of what circumstances require.

Admittedly, the mere announcement of a higher target would achieve nothing. The Board may have considered it unrealistic to aim at anything more than Rs. 745 crores under the present circumstances. But must the Board take circumstances as given? The whole point in setting up such a high-powered body was to obtain its help in reorienting economic and trade policies so that the pre-conditions for a more vigorous export effort were created. Its rôle seems to have been confined so far to considering the mechanics rather than the broad policies which impinge on exports. In large part, the Board's narrower framework derives from the fact that the Ministry of International Trade, as at present constituted, does not have much stature or authority. In this sense, Mr. Manubhai Shah, Minister for International Trade, deserves sympathy because the present allocation of responsibilities is not of his making. It remains to be seen whether the forthcoming Cabinet reshuffle will improve matters. But unless it does, it would be idle to go on pretending that the export effort takes top priority, next only to agriculture, among the tasks of the third plan.

In India, foreign trade is still an unfamiliar field where know-how at the policy-making level can make a big difference to the export efforts. While considering a possible reorganisation of the Ministry, it would be a mistake to think that the promotional work can at any point be isolated from the rest of the economy. In this sense, the Ministry's responsibilities can never be wide enough to cover all aspects of policy which affect exports—from railway freights and port charges to agricultural yields and labour costs. Its proper rôle should be viewed, therefore, as that of co-ordinating the strands of policy although the primary responsibility in many cases rests elsewhere. This function of co-ordination may be best achieved by setting up an inter-ministerial committee perhaps at the Cabinet level, so that the benefit from one set of measures, such as the abolition of export duty, is not cancelled by others which raise export costs back to the old level. This is exactly what has happened in the tea industry.

The device of a Cabinet sub-committee has much to recommend it in order to overcome the delays in putting through the policy changes required to increase exports. For many months, it has been clear that sacking exports are suffering because of Pakistan's natural cost advantages and her export bonus scheme. New Delhi, persuaded at last that the problem deserved attention, appointed a committee last year to look into the jute industry's long-term prospects. The wide-ranging enquiry was not strictly necessary for considering the urgent and more limited problem posed by Pakistan's bonus vouchers, but this need not have done any harm if the committee's report had been expeditiously completed and considered. Instead, present indications are that the report has been shelved, and New Delhi is now awaiting the results of a further study conducted by a separate group. It may not be wrong to assume that the second enquiry has been instituted, not to uncover facts which the first had overlooked, but to gain time while the Ministers concerned can resolve their difference on what should be done to help the jute industry. A less time-consuming method of settling differences may be a Cabinet sub-committee which collectively takes the final responsibility for ensuring the success of the export drive.

Judging from the record of recent years, it is plain that no major increase in exports will be achieved without a substantial re-ordering of the domestic economy to produce exportable surpluses at competitive prices. Judging from the occasional references to the need for a separate export sector, New Delhi is not wholly oblivious of the point. One can, however, hardly imagine the export sector coming into being unless several ideological hurdles are first removed. Among these is New Delhi's much-publicised concern over concentration of economic power which plays havoc with licensing policies. In private, the Ministry of International Trade readily concedes that export units have to be as large as the entrepreneurs dare to make them so that they can compete effectively with giants abroad. It also agrees that foreign collaboration should be welcomed in setting up such units, not merely to meet the immediate foreign exchange cost of capital goods but also to take advantage of the collaborators' export know-how. But these views have little chance of acceptance with individual Ministers busy scoring points off one another. Such conflicts might well be discouraged if responsibility for export promotion were vested in stronger hands.

FOREIGN INVESTMENT TRENDS

RESERVE Bank data included in the annual *Report on Currency and Finance*, which was published recently, suggest that the inflow of private foreign investment into India may have reached an all-time high in 1962. The inference could perhaps be drawn from the fact that consents for capital issues granted during the year included Rs. 55.3 crores earmarked for foreign participation, constituting 25.2 percent of the total. There was thus a distinct improvement over 1961, the corresponding figures for which were Rs. 33.8 crores and 18.2 percent. In drawing such an inference, it is assumed, of course, that the Rs. 100 crores of investment through equities and debentures that actually materialised during the year—about 61 percent of the amount approved for issue—included broadly the same proportion of foreign capital as in the case of consents. A study made by the Department of Company Law Administration of 55 new issues of a total value of Rs. 21.73 crores—or a fifth of the year's total—supports the assumption. Foreign capital constituted 23.2 percent of the total capital issued by the 55 companies, as against a share of only 7.9 percent shown by a similar study covering 1951 flotations.

While it is necessary to wait for more definite conclusions until the Reserve Bank periodic survey of foreign investment trends is published, the data so far available do not support the impression that foreign investment interest in India has declined in 1962. It is true that far fewer collaboration agreements were concluded last year than in 1961—only 299, against 402. But this may well have been because the scope for new enterprises has been narrowing as the issue of industrial licences approaches the limit of the capacity required under the third plan. There are, for instance, 211 industries which are on the banned list for licensing. The sectors still open are very often those requiring bulky investment, such as fertilisers, alloy, tool and special steels, heavy chemicals and intermediates. Any modest satisfaction over the inflow of foreign capital in 1962 needs, furthermore, to be tempered by the realisation that India still fails to attract much more than 3 percent or 4 percent of the total capital exported to developing economies. Anxiety about the future inflow is heightened by the fact that the economic climate here has deteriorated sharply in recent months. The foreign investor cannot overlook the possibility that the huge increase in defence expenditure will aggravate the strain on the country's resources, including those of foreign exchange; it might even necessitate a further curtailment of private commercial imports. In the event, expensive new capacity created through joint ventures could be partially wasted. The phase of uneasy peace on the northern borders means that the continuing diversion of resources to defence could damage the economy.

Doubts such as these have passed through the investors' minds and compelled them to take a second look at any new proposals they may have been considering. Mr. Morarji Desai's super profits tax has strengthened apprehensions, especially since the total of company taxes is now in a number of cases 70 percent or more. Some investors may decide that the tax concessions for new undertakings will see them through the period of the emergency, after which rates of taxation can reasonably be expected to come down to more normal levels. But others wonder whether the novelty of a progressive tax on corporate incomes does not after all presage a permanent change in India's tax policy. Mr. Desai himself has contributed lavishly to the prevailing confusion. In the Lok Sabha, he tried to distinguish the super profits tax from routine taxation by making it the subject of a separate Bill, implying thereby that it was to be regarded only as an emergency measure. But the favourable impression thus created has been blurred by a subsequent statement in Kanpur that the new tax is the kind of measure which promotes equity. Mr. Desai may have high political ambitions which require him to seem to be tough to business, and one can sympathise with the need to strike popular postures. But responsible Government spokesmen cannot afford to forget that what is said for domestic consumption often causes alarm and confusion abroad. Some investors have begun to ask whether the super profits tax is the beginning or the end of New Delhi's impositions on private enterprise.

While such anxieties affect investment intentions, they do not wholly explain why India should have received only a fraction, for instance, of the capital West Germany has exported to Latin America. India's political stability, her record in honouring foreign obligations and her economic discipline compare favourably with the runaway inflation and political uncertainties that afflict several Latin American countries. Above all, the size of the Indian market and its growth prospects make investment here more desirable than in many other developing economies, especially because there is little chance now of maintaining sales to this country from outside unless a start is made with local manufacture to get round import controls. Yet fresh foreign investment, as distinct from the larger proportion accruing through the plough-back of profits, has remained disappointingly small in relation to the opportunities waiting to be taken up. For this, many factors are responsible, and chief among them is the growing fussiness in administering controls. The Federation of Indian Chambers of Commerce and Industry has often protested against the Government's dilatory procedures but the situation shows no signs of improving. A detailed analysis made by the Federation shows that it takes more than three months before the industrial licensing committee considers a proposal for the first time. In a number of cases, applications are referred back to the sponsors or sent to inter-departmental committees, such reviews requiring an average of two to three months. Once a case has been decided, it may take six weeks before the licence is issued. But this is only the beginning of the entrepreneur's troubles since it may take him another six months or a year before he gets clearance from the Capital Goods Licensing Committee. The F.I.C.C.I. plea for less red tape and quicker decisions will be readily endorsed.

Western collaborators, unaccustomed to bureaucratic meddling in their affairs at home, are appalled by the delays they face in India. As they see it, there may be some justification for the basic principle of scrutinising investment proposals but there can be none at all for the pettifogging which is increasingly becoming the fashion. In many sectors of the economy, the type of collaboration needed has to come from the smaller western industrial enterprises, which have neither the time nor the resources to follow up a proposition in New Delhi over many months of waiting for the nod. The frustrations and disappointments which the investors have to suffer often persuade them to invest their money elsewhere.

Current News and Comment

Investment Disputes

While the World Bank's activities now largely consist of providing long-term loans to member-countries in the under-developed regions, they also include the provision of technical assistance and advice for promoting conditions for rapid economic growth—in other words, for creating a favourable investment climate. Private capital is not flowing in sufficient volume to the developing regions, one of the serious deterrents being political risks such as nationalisation and governmental interference, which may deprive the investor of the control or benefits of his investment. The establishment of the rule of law in international investment is thus a major pre-requisite for stimulating the free flow of capital.

India's Resources
are Precious
WASTE NOT,
WANT NOT

The World Bank, by virtue of its integrity and prestige, is ideally suited to sponsor work in this direction. Mr. A. Broches, general counsel of the World Bank, in his address to the World Conference on World Peace through Law last week in Athens, referred to a proposal to offer institutional facilities for settling investment disputes through voluntary conciliation or arbitration. The machinery would be linked in some way to the World Bank, but the latter would not itself engage in conciliation or arbitration. The composition of the conciliation commissions and arbitration tribunals that would be set up and the rules to be followed by them would be determined primarily by the parties concerned, namely, the host governments and the investors. While the use of these institutions would be entirely optional, their decision or awards would be binding on the parties, once they have consented to go to it.

According to Mr. Broches, to be fully effective this scheme should be embodied in an international convention, which should contain provisions to prevent the parties who have agreed to seek the help

Post.

of this machinery from refusing to co-operate with its proceedings. The convention should also make arbitral awards enforceable in the territories of all participating countries. The scheme contemplates that, given the consent of the host government, the investor would have direct access to the conciliation and arbitration facilities without the intervention of his national government. Furthermore, once the submission of a dispute to arbitration has been agreed upon, the investor should be deemed to have forgone his right to seek the protection of his home government, and the latter would not be able to take up his case. This scheme is still in the proposal stage and is being studied by the World Bank. According to Mr. George Woods, president of the Bank, this approach to the solution of investment disputes "deserves the support of both capital-importing and capital-exporting nations".

Long-term Credit for Agriculture

Inaugurating the Agricultural Refinance Corporation in Bombay last week, Mr. Morarji Desai, Central Finance Minister, observed that although during the past ten years the number of land mortgage banks in India had increased from 5 to 18 and that of the primary units from 280 to 535, the long-term credit made available by these institutions for purchasing land or for liquidating indebtedness had not really helped increase agricultural production. It is partly because India's agriculture is still backward. One cause for this backwardness and the slow progress of farm development schemes, according to the Reserve Bank Governor, Mr. P. C. Bhattacharyya, is the gap between the "financial needs" and the "financial resources" of the farmer. The Agricultural Refinance Corporation which came into existence on 1st July, 1963, will help to meet the long-term credit requirements of agriculture. As in the case of the Refinance Corporation for Industry, the new Corporation will not provide direct financial assistance to agriculturists; it will do so indirectly by offering re-finance facilities to certain recognised institutions which finance agricultural projects.

The Agricultural Refinance Corporation will naturally prefer big schemes which are compact, economic and open to close supervision; schemes involving large amounts of capital, which cannot be easily financed by banking and co-operative institutions, will be aided. Assistance will be available for schemes to reclaim and prepare land and increase food production; it will also be offered for schemes to improve the output of such special crops as tea, coffee, jute, arecanut, coconut, cashewnut and cardamom. In this way the Corporation is expected to make an impact on the whole field of agricultural production.

Uniform Customs for Documentary Credits

From 1st July, 1963, banks all over the world have for the first time agreed to subscribe to a uniform set of rules governing documentary credits called Uniform Customs and Practice for Documentary Credits (1962 revision) produced under the aegis of the International Chamber of Commerce. Banks in India also agreed to subscribe to the Uniform Customs, and it is pleasant to hear that this particular change will not result in any increase in bank charges to customers. International trade, and to an increasing extent internal trade, is often financed by means of letters of credit established through bankers. However, the discussion here is confined to the international aspect of letters of credit or—as bankers would term it—documentary credits. In international trade, the terms on which goods are to be sold or bought are settled by a mutual exchange of views. A documentary credit facilitates payment for the goods by substituting the good name and high standing of the banker for the merchant buyer. The banker guarantees payment at stipulated rates on submission of documents proving the despatch of goods to the buyer. Throughout the transaction, the banker does not concern himself with the goods (except in so far as he retains a lien on them until the documents are paid for and taken delivery of by the buyer). The banker is concerned only with documents and is discharged of his liabilities as long as payment has been made in strict accordance with the terms of the credit.

The growth of international trade and the appearance of indigenous banks have highlighted the need for standardising practices and establishing a common language in order that misunderstandings and disputes may be avoided. The International Chamber of Commerce has long felt the need for an uniform approach towards documentary credits. It codified the customs and practices relating to documentary credits as early as 1933 and revised them in 1951. Although about 60 nations successfully followed these rules since their introduction, U.K. banks as well as banks in the Commonwealth patterned on U.K. traditions stood outside the Uniform Customs. They apparently felt that it was impossible to deal satisfactorily with all the problems arising out of documentary credits by referring to a book of rules; the infinite variety of commodities and conditions involved did not lend itself to any uniform approach or treatment. British and Commonwealth banks, therefore, stuck to what was known as the "London practice" built on long tradition and experience and administered in the absolute discretion of the banks concerned. This, however, did not mean that the "London practice" was a hotch-potch of chaotic and contradictory systems. Far from it, for through custom and practice there had developed a fair body of unwritten conventions almost as rigid as any set of printed rules.

U.K. and Commonwealth banks, which had all along refused to subscribe to the Uniform Customs and Practice, have been reconsidering the matter in recent years. All was well as long as the bank at the other end was either a branch, or an affiliate, or a branch of one of the banks operating in the U.K. But the rapid rise of indigenous banks in the former colonies and dependencies made standardisation of practice and approach imperative. Thus were born the negotiations and discussions that led to the Uniform Customs and Practice for Documentary Credits (1962). The revised text is the culmination of several years of work and full recognition has been given to the long practical experience of U.K. and Commonwealth banks. As a matter of fact, wherever the 1952 Uniform Customs differ from London practice, the new rules tend to follow London practice, although no side has had to give in on any point it may have regarded as thoroughly unacceptable.

WATER POWER OF INDIA

IN his recently published work upon Chota Nagpore Mr. Bradley-Birt incidentally draws attention to a matter of the highest importance to engineers, in mentioning the falls on the Subarnarekha, some thirty miles S.W. of Ranchi in the Singhbhum plateau. Although the volume of water is not stated, the mere fact that the drop is 300 feet shows that, if necessary, we have available, by "harnessing" (as with the Cauvery falls in Mysore) an initial motor equal to 50,000 horse power capable of transmitting unimpaired energy to a distance of ninety miles in any direction, whence minor installations could distribute it, in but slightly diminished power, still further afield. As each successive mail from Europe and America brings us intelligence of the increasing substitution of the electric current for fuel-fed power, either by direct application by wire or in the form of accumulators, we ought to witness the vanishment of the smoky noisy locomotives from our midst and, mayhap, a series of aquaducts led into a reservoir would furnish sufficient power to work all those factories on the other side of the Hughli at much less cost than at present, besides ridding us of the nuisance caused by the incessant belching forth of the sulphurous fumes so much complained of. There may be other and perhaps nearer means of generating power, but we certainly have in that put before us, one whose capabilities are assured, and we sincerely trust these will be taken advantage of. Beyond the range of direct transmission of power the ordinary locomotives could be brought into requisition, but our impression is that with the upper affluents of the Mahanuddi and Godavari brought under control, the Bengal-Nagpur line, at all events, could entirely dispense with coal for at least two-thirds of the Journey hence towards Bombay.

A Ditcher's Diary

IF MR. MACMILLAN REALLY EXPECTS TO LEAD HIS Party at the next general election, and I still cannot believe he is serious in wanting to do so, it seems to me that he might be making a great mistake. It may be possible for his supporters to put down the rebellion among Conservative backbenchers for the time being, but if the Party has any doubts about the effect on the electorate of an obvious split in its ranks, then it would do well to remember what happened to Labour in 1959. I agree that it would be a pity if the end of Mr. Macmillan's brilliant career were linked too closely with the sordid Profumo scandal. But to reason one stage further and overlook his part in it altogether is surely too dangerous. What was the rôle he played? He was complacent in accepting the word of a colleague in a matter which might have involved security; that much he has admitted. As head of the security services he must take responsibility for their negligence in not reporting all relevant matter to the highest possible authority —namely himself—and his efforts publicly to pass the blame down the line were scarcely edifying for a Prime Minister. Finally, Mr. Macmillan has now come to represent something that Conservative backbenchers fear will be the 22-carat vote loser in the Britain of the future, namely, aristocratic dilettantism. They argue that his gullibility in accepting the unsupported word of Mr. Profumo was a frightening example of the "old boy" system in operation, and they point to the remarkable number of relatives and aristocrats in his Government as added proof of his nineteenth century, undemocratic leanings. In other words, the revolt is as much anti-establishment as anti-Macmillan. Writing from Calcutta, I do not feel myself competent to pass judgment on such views, especially when I have always been something of an admirer of Mr. Macmillan and his commendable grasp of long-term essentials. But for the leader of a Party which has always put unity above practically everything else, his decision to cling to office does seem to me to be a strange one. Personally I find it hard to believe the excuse that there is no acceptable alternative, and I must say it is one I never expected to hear from Westminster.

THE SHREWD POLITICIAN THAT HE IS, I FIND IT HARD to believe that West Bengal's Chief Minister, Mr. P. C. Sen, may not have adequately prepared the ground for the passage of the Calcutta Municipal Amendment Bill. The Bill has taken a long time to see the light of day, and is a greatly watered-down version of the numerous proposals for reforming the civic administration made over the years. Yet, if the stories one hears are to be believed, it is in for a severe mauling at the hands of a Congress Party rump before it ever goes through the lagislature. No measure can have been inspired by a nobler motive—to deliver this city from the clutches of the rapacious buffoons who adorn its municipal council. Yet it seems a pity that so worthy a venture should have been marked by so timid an approach, in that the wings of the Corporation council and standing committees are not to be clipped more ruthlessly. I appreciate that Mr. Sen has his problems, the biggest of which may be Mr. Atulya Ghosh; and that the West Bengal Congress has dividends to draw by maintaining a semblance of unity. But the issue of who is to run Calcutta, and how, is in my view important enough to justify firmer leadership than the provisions of the Bill make likely. The separation of the so-called "policy-making and deliberative functions" from the administrative ones does not go far enough for a Corporation whose policy, deliberation and administration has long been confined to the single aim of lining the pockets of its influential busybodies. In fact, I would go so far as to say that all pretensions to democracy in running the city's affairs should be openly and frankly dropped for a time; supersession, not reform, is what the Corporation needs.

THE PROGRESSIVE NATIONALISATION OF INDUSTRY does survive as an item in the official policy of the British Labour Party, even if there is a tendency to try and forget it these days. So I suppose it is not surprising that it should have been concerned about the apparent indifference with which the Conservative Government appeared to regard the possible loss of its controlling interest in British Petroleum. The Government's stake of 51 percent would have been reduced to 48 percent if the takeover bid for Burmah Oil, made jointly by B.P. and Shell, had gone through in the form planned. Because the control has never in fact been exercised, this reduction in the proportionate holding would really have been no great loss. But the point I want to make here is that the British Government's controlling interest in B.P. has always been an embarrassment to the Company; it has kept it out of certain very profitable areas and markets—Venezuela is one—and restricted its activities in others. This is because some countries, understandably, do not approve of foreign governments being active in their oil industries. Here is something the Indian Government might usefully ponder. There may be little likelihood of India's State-owned organisations becoming involved in activities abroad for some time to come, although there has been talk recently that they might go prospecting in Iran. But when they do decide to enter this particular foreign-exchange-earning field, it is only reasonable to expect that their official connections are going to prove just as restricting as the British Government's holding has been to B.P. I wonder whether uncritical supporters of Mr. Malaviya's policies have ever sufficiently grasped the fact that they may be forever condemning India's oil industry to predominantly domestic activity. Government interference in oil can at best be a source of unnecessary irritation between nations and at worst a cause of dangerous friction. Those who do not believe me have only to recall what happened at Abadan.

THE TIME AND ENERGY THE AMATEURS ARE ABLE TO find for theatrical productions in Calcutta sometimes evokes my admiration; no group, as far as I can remember, has been quite so prolific on the English stage, certainly not in the last ten years at least. Their latest presentation, Jean Anouilh's *The Waltz of the Toreadors*, staged at the Hindi High School last week in aid of the Cheshire Homes, was a fair success. The play is a difficult one, but is made the more manageable for an amateur group by the smallness of its cast. The plot centres on the frustrations of an amorous general saddled with a wife he has ceased to love. Fond of the good things of life, and determined not to be cheated of them, he plans to marry a mistress who arrives at his house after a patient wait of 17 years. But providence (or is it improvidence?) and his secretary (who finally turns out to be his illegitimate son) conspire to rob him of his beautiful prize at the very hour he has firmly decided on divorce. For the general, proud, vain and boastful as he is, the culmination is visibly painful, but consolation is sought where it can always be found—in the company of a buxom house-maid. Reduced in this way to its barest outlines, the theme sounds pedestrian, I admit; but the merit of the whole play lies in the wit and nuances of the Anouilh dialogue, which The Amateurs' production highlighted suitably. Angus Rotchell played the rôle of the general with skill and confidence. The supporting cast gave a uniformly good account of itself, although Anne Leighton as the general's wife deserves special mention. I gather we shall be seeing The Amateurs again on the stage some time next January; something of the quality of *A Passage to India*, presented earlier this year, would be well worth looking forward to.

when I read that efforts are now afoot to secure a white rhino from Kerala and two white deer from Dewas. These too may be rare; I am not an expert on, among so many other things, animals; but reports say that the idea is to have a white colony in Delhi Zoo. It has, of course, never been true that this country has no colour prejudice; one has only to see the demand for fair brides in matrimonial ads. Yet to carry discrimination, on grounds of colour, to the animal kingdom seems, to say the least, an original idea. Dr. Nkrumah, I can well imagine, will see in the Delhi craze an affront to the African personality; and we should be careful because Ghana is one of the Colombo "Powers". And then, how may these newcomers to Delhi Zoo feel about it all? Nobody should be surprised if they consider their stay, under black or brown supervision, truly galling—as Mr. Winston Field of Southern Rhodesia feels about the slightest possibility of African rule in the next thousand years or so. In the captions to recent photographs in the papers the white tigers are variously described as cheerful, sullen or angry. If they are capable of these emotions, as they obviously are, it is by no means certain that they have no political ideas. They may have heard that, although the Central African Federation is destined to end before the year is out, intrepid souls like Mr. Field and Dr. Verwoerd have by no means thrown up the sponge. They are determined not to let Africa return to darkness, which is what black rule means to advocates of *apartheid*. It seems to me quite on the cards that the Rewa tigers will one of these days demand a new keeper. As it happens, there's a good man going: Sir Roy Welensky, whose occupation will be gone as surely as Othello's before too long. He needs a job, for he can't go back to professional pugilism at his age. India shouldn't forget that he offered her copper to beat the Chinese back, when many another obvious friend sat firmly on the fence.

I WONDER HOW MANY REMEMBER GENERAL SIR Douglas Baird, who was General Officer Commanding, Eastern Command, up to 1940 and died recently at the age of 86. Not many, I imagine; I don't. In the past too I have seen in the *Statesman* longish obituary notices of people who had served in India in one capacity or another many many years ago and then died in some obscure village in Britain. I often wondered whether this was not recalling the old days a bit too much. I know better now. I should not be surprised if there are some old men in or around Barrackpore who came in contact with General Baird in the late 'thirties and were privately sorry to learn of his death. There was a level of Indo-British contact which I have rarely seen discussed; and yet there must be many a human story at that level. Only a few die-hards may be sorry that British rule is no more in India. But, personally, the parting was emotionally painful for many on both sides. I was talking the other day to a very old employee of this office, who retired some years ago. It was touching to hear him recall, with nothing but kindness and gratitude, a Ditcher before my time. In my cynicism I thought the feeling a shade overdone and even silently attributed it all to the old man having been favoured in the matter of increments. It was nothing of the sort. He remembered my predecessor by an incident it would never have occurred to me to consider extraordinary. The latter was chucking things into the waste-paper basket, as all editors have to; but he was carefully detaching pins every time there was one. Economy? Again, no. He explained to the clerk that he had acquired this habit after he had once seen a sweeper bleed profusely because, casually, he had shoved his hand into the basket and the pins stuck into his fingers. Nothing sharp was, therefore, to be put into the basket. To the retired employee this consideration for a mere sweeper seemed an index of his master's essential kindness. This is a long way from General Baird; but, as I read of some old I.C.S. or I.P. hand dying in Britain, I think of an old deputy magistrate or a constable shedding a silent tear for a man he had once worked under. You'd be surprised how this personal tenderness is reciprocated in faraway England. One of the first questions I am asked by someone in London is, "How's old Hari and how is Ghosal Babu doing?"

THE DITCHER

Guide for Investors

SATISFACTORY RESULTS FROM BURN

THE ordinary shares of Burn and Co. Ltd have been steady around Rs. 572 partly because of the decision to issue bonus shares in the proportion of one for every share held and partly because of satisfactory results for the year ended April 1963. The taxable ordinary dividend has nevertheless been cut from 28.5 percent to 25 percent, presumably on account of bigger tax provision. The dividend is more than six times covered and offers a yield of 4.4 percent at the present price of Rs. 572 a share of Rs. 100 each. The profit is Rs. 1.43 crores, against Rs. 1.40 crores in 1961-62, after providing Rs. 32.46 lakhs, against Rs. 24.26 lakhs, for depreciation. Taxation is allocated Rs. 98.25 lakhs, against Rs. 92.50 lakhs. Of the total tax provision, a sum of Rs. 25.75 lakhs has been earmarked for super profits tax for the year ended April 1962.

No provision for super profits tax has been made in relation to current profits. The directors consider it inequitable that provision for super profits tax for two years should be made out of the profits of one year; secondly, if provision in the first year of the new tax be made relating to the profit for two years then, in the final year of this tax, there would be one year's excess provision on the books. They anticipate a final year because, at the time the super profits tax was introduced, it was indicated that the tax might not necessarily be permanent. Provision in the accounts for income tax and super tax, calculated at the rates in force for the 1963-64 assessment year, has been made in the usual way against liability for the 1964-65 assessment year.

Development rebate statutory reserve absorbs Rs. 12.68 lakhs, against Rs. 4.50 lakhs, capital profits reserve Rs. 22,038, against Rs. 2,131, works reconstruction and expansion reserve Rs. 5.25 lakhs, against Rs. 5 lakhs, and Salem project reserve Rs. 4.03 lakhs, against Rs. 11.46 lakhs.

The directors point out that work for setting up a new factory to manufacture the products of A. Reyrolle and Company of the U.K. has begun. The Howrah works has done well, considering the various difficulties. The present reconstruction and modernisation programmes concerning the Lalkoti and Gulfarbari works may be completed during the current year. Although the output capacity for ordinary fireclay has been excessive in this country, Burn is in a position to meet the competition. The first stage of the new factory in Niwar has been completed and production has commenced. It has been pointed out that the export prospects for magnesite depend largely on reducing the cost of production; but the prices of basic commodities have continued to increase steadily. The Salem factory for the manufacture of magnesite shapes has been facing initial difficulties, but there has been considerable improvement lately. The factory, it is hoped, will start producing steadily in the near future.

Duncan Group Tea Company Results

THE results of the Duncan group of tea companies for the year ended December have been published. The profit of the Patrakola Tea Co. Ltd has improved from Rs. 25.69 lakhs in 1961 to Rs. 77.15 lakhs in 1962 due to the shortfall in the East Pakistani tea crop resulting in a more satisfactory internal market. The taxable ordinary dividend has, however, been cut from 40 percent to 15 percent. The dividend now proposed and those for the previous years will be declared as soon as the remittance of profit sufficient to cover these dividends is obtained from Pakistan. Depreciation for a sum of Rs. 2.82 lakhs has been provided before arriving at the profit figure. Out of the profit, taxation absorbs Rs. 51.83 lakhs, including Rs. 6.84 lakhs for super profits tax. The tax provision was Rs. 24 lakhs for 1961. Development rebate reserve is allocated Rs. 1.16 lakhs, leaving a carry-forward of Rs. 26,078, against Rs. 2.41 lakhs brought in. A sum of Rs. 13 lakhs has been transferred from revenue reserve. The crop fell from 2 million kilograms to 1.8 million kilograms, but the average sale price rose from Rs. 5.03 a kilogram to Rs. 8.16 a kilogram. The 1963 crop has been estimated at 1.9 million kilograms at a cost of Rs. 70.31 lakhs. The directors mention that the start of the new season has been adversely affected by a severe drought. However, there has been substantial rainfall subsequently, and the crop condition has improved.

The Gungaram Tea Co. Ltd (a Terai garden) has repeated a taxable ordinary dividend of 12.5 percent to absorb Rs. 1.68 lakhs. At the present price of Rs. 131 a share of Rs. 100 each, the yield works out to 9.5 percent. The profit has risen from Rs. 31.59 lakhs to Rs. 33.22 lakhs, after providing Rs. 1.13 lakhs for depreciation. Taxation is allocated Rs. 2.16 lakhs, revenue reserve Rs. 1.85 lakhs (against Rs. 13.50 lakhs), development rebate reserve Rs. 10,000 (against Rs. 6,000) and investment reserve Rs. 25,000 (against Rs. 40,000). The carry-forward is Rs. 10,812, against Rs. 39,063 brought in. A sum of Rs. 25,000 has been transferred from development rebate reserve. The crop fell from 794,331 kilograms to 722,909 kilograms and the average sale price increased from Rs. 4.01 a kilogram to Rs. 4.63 a kilogram. A crop of 730,000 kilograms has been estimated for 1963 at a cost of Rs. 28.91 lakhs, but the start of the new season has not been satisfactory due to the drought.

The profit of the Rungamattee Tea Co. Ltd (a Cachar garden) has fallen from Rs. 83,414 to Rs. 33,759, after transferring Rs. 55,680 (against Rs. 52,096) to depreciation. A taxable ordinary dividend of 5 percent has been maintained to absorb Rs. 26,250. It offers a yield of 4.7 percent at the present price of Rs. 53 a share of Rs. 50 each. Taxation is allocated Rs. 37,109 (against Rs. 36,905), revenue reserve Rs. 25,000 (against Rs. 6 lakhs) and development rebate reserve Rs. 2,500 (against Rs. 3,600). The carry-forward is Rs. 4,316, against Rs. 21,983 brought in. A sum of Rs. 12,000 has been transferred from development rebate reserve. The working has been adversely affected by drought and hailstorm. The crop fell from 307,903 kilograms to 279,277 kilograms, but the average sale price rose from Rs. 3.94 a kilogram to Rs. 4.46 a kilogram. The 1963 crop estimate is 290,000 kilograms at an outlay of Rs. 12.56 lakhs. The new season got off to a poor start due to the drought, but with substantial rainfall now having taken place, the crop condition has steadily improved.

The Birpara Tea Co. Ltd (a Dooars garden) has increased the taxable ordinary dividend from 12.5 percent to 17.5 percent, absorbing Rs. 1.58 lakhs. The yield works out to 10.9 percent at the present price of Rs. 160 a share of Rs. 100 each. The profit has improved from Rs. 3.52 lakhs to Rs. 5.75 lakhs, after providing Rs. 1.17 lakhs (against Rs. 83,379) for depreciation. Taxation absorbs Rs. 2.64 lakhs (against Rs. 1.90 lakhs), revenue reserve Rs. 2.50 lakhs (against Rs. 9.75 lakhs), investment reserve Rs. 10,000 (the same) and development rebate reserve Rs. 27,500. The carry-forward is Rs. 13,620, against Rs. 62,981 brought in. A sum of Rs. 25,000 has been transferred from development rebate reserve. The crop was 669,958 kilograms, against 666,763 kilograms, and the average sale price rose from Rs. 4.37 a kilogram to Rs. 5.01 a kilogram. A crop of 650,000 kilograms has been estimated for the current year at a cost of Rs. 27.39 lakhs. The start of the new season has been fairly satisfactory.

A shortfall in the East Pakistani tea crop has helped to contribute to the bigger profit of the Teliapara Tea Co. Ltd at Rs. 12.34 lakhs, against Rs. 5.28 lakhs. But the taxable ordinary dividend has been cut from 22.5 percent to 10 percent. The dividend now proposed and the dividends for the previous years will be declared and paid as soon as sufficient profits are remitted from Pakistan. Taxation is allocated Rs. 15.25 lakhs, of which super profits tax is Rs. 60,000. The tax provision was Rs. 3.40 lakhs in 1961. Development rebate reserve absorbs Rs. 33,500 (against Rs. 25,000), leaving a carry-forward of Rs. 29,229, against Rs. 36,277 brought in. A sum of Rs. 3.50 lakhs has been transferred from revenue reserve. The crop fell from 418,826 kilograms to 369,737 kilograms, but the average sale price increased sharply from Rs. 5.01 to Rs. 8.08 a kilogram. The 1963 crop estimate is 417,000 kilograms at a cost of Rs. 17.67 lakhs. The start of the new season has been unsatisfactory due to drought, but substantial rainfall has been experienced since. Hence the crop prospects have improved.

The Nagaisuree Tea Co. Ltd (a Dooars garden) has made a profit of Rs. 3.32 lakhs, against Rs. 3.93 lakhs, after transferring Rs. 75,289 (against Rs. 68,672) to depreciation. A taxable ordinary dividend of 15 percent has been repeated absorbing Rs. 1.44 lakhs. It offers a yield of 10.7 percent at the present price of Rs. 140 a share of Rs. 100 each. Taxation absorbs Rs. 97,925 (against Rs. 2.25 lakhs), revenue reserve Rs. 2.10 lakhs (against Rs. 9.35 lakhs) and development rebate reserve Rs. 23,000 (against Rs. 500). The carry-forward is Rs. 14,856, against Rs. 53,121 brought in. A sum of Rs. 30,000 has been transferred from development rebate reserve. The crop was 507,232 kilograms, against 603,619 kilograms, and the average sale price rose from Rs. 4.07 a kilogram to Rs. 4.76 a kilogram. A crop of 490,000 kilograms at a cost of Rs. 20.95 lakhs has been estimated. The new crop has had a poor start due to the drought, but with later rainfall, the prospects have improved.

Octavius Steel Tea Group Does Well

THE results of the Octavius Steel group of tea companies for the year ended December 1962 have now been published. The Methoni Tea Co. Ltd (an Assam garden) has made a profit of Rs. 6.22 lakhs for 1962, against Rs. 3.85 lakhs in 1961, after providing Rs. 60,807 (against Rs. 65,201) for depreciation. The taxable ordinary dividend has been increased from 14 percent to 20 percent absorbing Rs. 2 lakhs. The yield is 11.6 percent at the present price of Rs. 17.31 a share of Rs. 10 each. Taxation is allocated Rs. 3.76 lakhs, including a sum of Rs. 23,200 for super profits tax, compared with Rs. 1.65 lakhs in 1961. General reserve receives a sum of Rs. 1 lakh and development rebate reserve Rs. 3,000. The crop was 374,220 kilograms, against 382,580 kilograms, but the average sale price rose from Rs. 5.68 to Rs. 7.12 a kilogram. The crop estimate for 1963 is 381.045 kilograms at an outlay of Rs. 18.87 lakhs. It is proposed to amalgamate the Bokakhat Tea Co. Ltd in the same district with Methoni Tea in order to effect economies in production. The amalgamation will be brought about by an exchange of shares, if it is approved by the High Court and the shareholders.

The profit of the Grob Tea Co. Ltd (an Assam garden) has risen from Rs. 49,258 to Rs. 3.83 lakhs, after providing Rs. 3.27 lakhs (against Rs. 3.44 lakhs) for depreciation. A taxable ordinary dividend of 6 percent has been repeated, absorbing Rs. 1.40 lakhs. At the present price of Rs. 7.19 a share of Rs. 10 each, the yield is 4.2 percent. Taxation is allocated Rs. 2.10 lakhs (against Rs. 40,000), buildings and machinery reserve Rs. 60,000 and development rebate reserve Rs. 3,574 (against Rs. 3,275). The carry-forward is Rs. 12,112, against Rs. 26,674 brought in. The crop was 1.04 million kilograms, against 1.08 million kilograms, and the average sale price improved from Rs. 4.98 to Rs. 6.17 a kilogram. A crop of 1.13 million kilograms at a cost of Rs. 57.88 kilograms has been estimated for the current year.

The profit of the Bokakhat Tea Co. Ltd (an Assam garden) has been Rs. 2.63 lakhs, against Rs. 2.08 lakhs, after transferring Rs. 56,065 (against Rs. 40,913) to depreciation. The taxable ordinary dividend has been raised from 12 percent to 13 percent absorbing Rs. 78,000. It works out to a yield of 9.5 percent at the present price of Rs. 13.70 a share of Rs. 10 each. Taxation is allocated Rs. 1.45 lakhs (against Rs. 95,000) and general reserve Rs. 75,000. The carry-forward is Rs. 6,649, against Rs. 37,963 brought in. The crop declined from 223,909 kilograms to 209.073 kilograms, but the average sale price was higher at Rs. 7.12, against Rs. 5.90 a kilogram. The crop estimate for 1963 is 243,125 kilograms at a cost of Rs. 12.26 lakhs. The Company, it is proposed, will be amalgamated with the Methoni Tea Co. Ltd.

Kettlewell Bullen Tea Group Earns More

THE results of the Kettlewell Bullen group of tea companies for the year ended December 1962 have been published. Methola Co. Ltd (an Assam Garden) has made a profit of Rs. 1.23 lakhs, against Rs. 72,274 for 1961, after providing Rs. 55, against Rs. 69 for depreciation. The taxable ordinary dividend has been increased from 30 percent to 35 percent absorbing Rs. 52,500. The yield is 6.9 percent at the present price of Rs. 507 a share of Rs. 100 each.

Taxation is allocated Rs. 65,000, against Rs. 40,000, leaving a carry-forward of Rs. 45,423, against Rs. 40,192 brought in. Green leaves

produced amounted to 1,22,745 kilograms, against 83,921 kilograms. The Tea Board has permitted the Company to extend plantation over 60 acres of soil. So the new plantation amounts to 231 acres against which 160 acres have already been put under tea cultivation. Arrangements have been made to extend plantation further in the next cold weather.

The Joonktolee Tea Co. Ltd. (an Assam Garden) has repeated a taxable ordinary dividend of 15 percent, including an interim of 5 percent, to absorb Rs. 1.80 lakhs. It offers a yield of 8.7 percent at the present price of Rs. 17.31 a share of Rs. 10 each. The profit has risen from Rs. 4.13 lakhs in 1961 to Rs. 6.03 lakhs, after providing Rs. 1.22 lakhs, against Rs. 95,073 for depreciation. Taxation is allocated Rs. 3.10 lakhs of which super profits tax is Rs. 17,000. The tax provision was Rs. 2 lakhs for 1961. General reserve absorb Rs. 1 lakh, against Rs. 7,703, and development rebate reserve Rs. 8,727, against Rs. 49,541. The carry-forward is Rs. 81,941, against Rs. 1.06 lakhs brought in. The crop was 494,061 kilograms, against 485,538 kilograms and the average sale price increased from Rs. 4.84 to Rs. 5.31 a kilogram.

Naga Hills Tea Maintains

THE Naga Hills Tea Co. Ltd has made a profit of Rs. 1.25 lakhs for the year ended December 1962, against Rs. 2.07 lakhs in 1961, after transferring Rs. 1.02 lakhs, against Rs. 35,093 to depreciation. A taxable ordinary dividend of 10 percent has been maintained absorbing Rs. 40,000. The yield is 4.5 percent at the present price of Rs. 22.25 a share of Rs. 10 each. Taxation is allocated Rs. 9,000, against Rs. 1.20 lakhs, general reserve Rs. 50,000, against Rs. 90,000, capital reserve Rs. 15,201, against Rs. 37,843 and development rebate reserve Rs. 27.500, against Rs. 12,600. There is a carry-forward of Rs. 21,008, against Rs. 13,029 brought in. The crop was 326,748 kilograms, against 319,104 kilograms and the average sale price rose from Rs. 4.51 to Rs. 5.10 a kilogram.

The directors mention that the installation of the new factory has been completed. Hence there has been an improvement in the manufacture and quality of tea. The 1963 crop estimate is 340,000 kilograms at a cost of Rs. 4.28 a kilogram. The authorised capital of the Company has been increased from Rs. 4 lakhs to Rs. 10 lakhs.

Sone Valley Cement Output Up

IN his chairman's statement at the annual general meeting of the Sone Valley Portland Cement Co. Ltd held recently in Calcutta, Mr. A. K. Jain, referred to the growing shortage of cement (the full text was printed in last week's *Capital*). Since the demand has gone up further because of the emergency, the shortage is not likely to be relieved in the near future. Although the output target has been fixed at 15 million tons at the end of 1965, indications are that it will not be achieved. Existing capacity is about 9.5 million tons. The main factors restraining expansion and development are the unrealistic price policy of the Government and heavier taxation. The price, which has been fixed by the Government, does not cover the rising production costs. Although the industry has been assured by the Government that any increase in production costs arising out of governmental action would be compensated by corresponding increases in the price of cement, in practice it has not been done. The Government has been niggardly in sanctioning an increase in the price. The industry has also been denied the benefit of the escalation clause for fuel and power.

Heavy taxation has made it difficult for the industry to plough back funds into the business for expansion. In view of the shortage of cement, vigorous steps need to be taken to promote expansion by giving sufficient incentives to the industry. The present system of encouraging production by giving a cash bonus has been rather academic considering that only a few producers can qualify for the cash benefit since it has been linked to the excess production over the preceding three years.

Sone Valley Cement has produced and despatched more cement during the year ended December 1962 than during 1961. But the profit has been held down by rising production costs. The present formula for fixing packing charges has placed a heavy financial burden on producers. In computing the packing charges the Government assumes that the producer will use old bags to the extent of 50 percent, which is not practicable. Besides, the use of old bags for packing is not advisable because of heavy seepage. It is hoped that the Government will remedy the situation by adopting a more realistic attitude towards packing charges.

Better Results From National Tannery

THE National Tannery Co. Ltd has earned more profit, the rise being from Rs. 57,610 for 1961 to Rs. 1.24 lakhs for the year ended December 1962, after providing Rs. 79,868, against Rs. 52,724 for depreciation. A taxable ordinary dividend of 4.5 percent has been declared which absorbs Rs. 42.750. Taxation is allocated Rs. 38,000, against Rs. 28,669 and development rebate reserve Rs. 40,100, against Rs. 14,603. The carry-forward is Rs. 35,391, against Rs. 35,273 brought in. Sales were Rs. 45.25 lakhs, against Rs. 44.04 lakhs.

The directors have referred to the shortage of hides. The working of the Company depends greatly on sufficient imports of raw hides. Arrangements have been made to export goatskin to Czechoslovakia.

Tata Oil Mills Earns More

THE improvement in the Rs. 25-paid shares of the Tata Oil Mills Company Ltd from Rs. 56.50 to Rs. 60.50 within three days of the dividend announcement clearly suggests that the market is not the least bothered about the modest cut in the dividend from 23 percent to 22 percent, which, however, is scarcely surprising. Despite the dividend cut, the total distribution is higher because of the increased capital, even though the new shares are entitled only to the proportionate dividend of Rs. 1.73 a share, as against Rs. 5.50 on the old shares. Besides, the preliminary report on the Company's working results for the year ended March 1963, shows a marked improvement over the previous year's performance. The total turnover is up by about 15 percent from Rs. 11.19 crores to Rs. 12.89 crores, which is an all-time record.

The profit, after providing for managing agents' commission and depreciation, has recorded an increase of nearly 31 percent from Rs. 38.80 lakhs to Rs. 80.74 lakhs, which, however, is still below the 1959-60 level. The provision for taxation, including the estimated liability for super profits tax, has been raised from Rs. 15.77 lakhs to Rs. 23.03 lakhs, but the allocation to the development rebate reserve is a little lower at Rs. 3.15 lakhs, against Rs. 3.50 lakhs. A sum of Rs. 2.40 lakhs (against nil) has been set aside for general reserve, and the provision for plant modernisation and development reserve amounts to Rs. 2.75 lakhs, against Rs. 2.25 lakhs. The directors have transferred Rs. 19.50 lakhs (against Rs. 17.46 lakhs) to the dividend reserve, out of which the proposed dividends are to be paid. The total distribution to the equity shareholders amounts to Rs. 17.84 lakhs (against Rs. 16.12 lakhs) and the preference dividend absorbs Rs. 1.34 lakhs. After making all these appropriations, there remains a small surplus of Rs. 1,187 to be carried forward, against Rs. 10,154 brought in.

New Swadeshi Repeats Dividend

NEW Swadeshi Mills of Ahmedabad Ltd reports extremely disappointing results for the year ended March 1963, although the dividend has been maintained at 10 percent, subject to tax. In spite of an increase of 16.6 percent in the sales from Rs. 3.33 crores to Rs. 3.88 crores, the gross profit has come down by about 30 percent from Rs. 36.77 lakhs to Rs. 25.70 lakhs. The directors have provided Rs. 14.23 lakhs (against Rs. 11.37 lakhs) for depreciation, Rs. 3.50 lakhs (against Rs. 8.42 lakhs) for development rebate reserve, Rs. 3.57 lakhs (against Rs. 9.50 lakhs) for taxation and Rs. 2 lakhs (against Rs. 4.50 lakhs) for general reserve. The proposed dividend absorbs Rs. 2.61 lakhs (the same), leaving a sum of Rs. 58,000 to be carried forward, against Rs. 79,000 brought in. The Company is reported to have made further progress in its programme of modernisation and rehabilitation, and during the year 1962-63, it made net additions amounting to Rs. 22.40 lakhs to its fixed assets.

Dena Bank Maintains on Doubled Capital

THE Devkaran Nanjee Banking Co. Ltd (popularly known as the Dena Bank), which is usually the first to announce its results whether for the first half or the full year, has maintained the interim dividend at Rs. 2 a share of Rs. 50 for the half year ended June 1963, on the increased capital as raised by the once-for-one rights issue made at a premium of Rs. 2 a share during the latter half of 1962. According to the preliminary report, the bank's net profit for the half year amounts to Rs. 14.15 lakhs, against Rs. 17.11 lakhs in the corresponding period of 1962. This does not, however, provide any dependable clue to the bank's real performance as the profit for January-June 1963 has been arrived at after providing not only the corporation tax, but also the super profits tax for the half year ended June 1933 as well as that for the full year of 1962. The exact liability in this matter is not known. Including the sum of Rs. 3.19 lakhs brought forward from the preceding year, the disposable surplus amounts to Rs. 17.34 lakhs. The proposed interim dividend absorbs Rs. 4 lakhs (against Rs. 2 lakhs), leaving a balance of Rs. 13.34 lakhs to be carried forward to the next half year's accounts. The Rs. 50-paid share of the bank is currently quoted around Rs. 55.

A few observations about the banking industry's performance during the half year ended June 1963 are called for. Relevant statistics indicate that scheduled banks were under considering pressure during this period. Their deposits recorded an increase of only Rs. 99.59 crores, compared with Rs. 186.36 crores in the corresponding period last year. What is more, time deposits increased by a mere Rs. 14.12 crores, compared with Rs. 133.91 crores. This small increase is, however, due partly to the transfer of P.L. 480 funds from the State Bank to the Reserve Bank of India. In view of the smaller increase in total deposits and a much smaller rise in time deposits, scheduled banks experienced considerable difficulty in meeting the demand for funds and were unable to lend more than Rs. 108.56 crores. In the first half of 1962, scheduled banks' credit increased by Rs. 143.11 crores and there was also an increase of Rs. 27 crores in their investments in Government securities. But over the first six months of the current year, banks' holdings of Government securities remained almost unchanged around Rs. 653 crores. The banking system derived some benefit from the ½ percent increase in the minimum lending rates following the Bank rate rise and from the introduction of the new practice of compounding interest charged on advances every three months. Interest rates on deposits remained unchanged during the half year.

Share Offer by Madras Forgings

THE Madras Forgings and Allied Industries Ltd, which proposes to set up a factory in Coimbatore for the manufacture of heavy, medium and light steel forgings and heavy iron castings particularly useful for railway rolling stock and wagon parts, is offering for public subscription 11,000 equity shares of Rs. 100 each. The project is estimated to cost about Rs. 15 lakhs, which is being met by the issue of shares. The factory will have a capacity of 6,000 tons a year of steel forgings and iron castings. In view of the wide gap between the demand and availability of forgings and castings, marketing is not expected to present any difficulty for the new venture. About 75 percent of the machinery for the project will be obtained from indigenous sources. The rest will be purchased from the rupee payment areas. The Company has an authorised capital of Rs. 25 lakhs—all in equity shares of Rs. 100 each. The present issue is for Rs. 15 lakhs, out of which the promoters, directors and their friends are taking up shares worth Rs. 4 lakhs. The balance of Rs. 11 lakhs is being offered for public subscription.

New Capital Issues

THREE companies, two of which are public sector enterprises, have been authorised to issue fresh capital aggregating Rs. 4.5 crores. The following are the details :

Indian Drugs and Pharmaceuticals Ltd, Delhi, a Central Government undertaking, is to issue further capital of Rs. 4 crores, divided into 40,000 equity shares at Rs. 1,000 each for cash at par.

Andhra Pradesh Small-Scale Industrial Development Corporation Hyderabad, a State Government undertaking, is to issue capital of Rs. 30 lakhs in equity shares of Rs. 100 each, to be subscribed by the Government of Andhra Pradesh. The proceeds will be used for the development of small-scale industries.

Seshasayee Industries Ltd, is raising additional capital of Rs. 20 lakhs in equity shares of Rs. 10 each, to be issued for cash at par. The money will be used for the Company's expansion programme.

The Stock Markets

SENTIMENT IMPROVES IN LYONS RANGE

Wednesday Evening.

THE Calcutta stock market has improved during the past week under the lead of steel shares. Lyons Range has taken an optimistic view of the forthcoming dividend of the steel companies because their production during the year ended March 1963 has been bigger than in 1961-62. Operators have also been encouraged by rumours of a bonus issue by the Indian Iron and Steel Company. As a result of the rising support for Indian Iron, the prices of other selected shares have hardened ; the absence of selling pressure, combined with replacement buying, helped the process. Although Sino-Indian relations are far from settled, it is generally believed that any further Chinese aggression is not likely in the near future because of India's defence preparations, which are progressing with the co-operation of friendly foreign countries, such as the U.S.A. and the U.K.

It is vaguely believed that the Government may take steps to revitalise the capital market. It is possible that the margin against share advances by banks may be liberalised, although, it is doubtful whether this factor by itself will help improve the investment climate. Since the cost of credit has become almost prohibitive, investors will not take the risk of buying shares with borrowed funds. This apart, confidence has suffered because of the poor outlook for corporate profits and dividends. Although money conditions have temporarily eased on account of the slack season, banks are not expected to extend the supply of credit to the stock market because demands for credit from trade and industry are likely to increase in the near future. In view of the slow rate of deposit growth, banks themselves do not feel confident whether they will be able to satisfy the legitimate credit requirements of the economy when the next busy season starts.

A disturbing feature is that the support for new shares has declined considerably because of the loss of confidence. Several new issues have had to be taken up by the underwriters during recent weeks. To what extent the Life Insurance Corporation will support the equity market after the new Government loans are subscribed, it is difficult to assess now. A redeeming feature is that the prices of several good shares have fallen sufficiently to make them attractive. So a further decline is unlikely unless the political situation deteriorates There have been indications of fresh discriminating purchases.

The clearing passed off on Wednesday smoothly. The carry-forward charges have shown little variation from those in the past settlement. Among engineering shares, support has largely been confined to Burn, Indian Standard Wagon, Guest, Keen, Williams, Texmaco and Jessop. The prices of selected miscellaneous shares have hardened in rising turnover after a long interval. Indian Copper, Hindustan Motors, Dunlop Rubber and Jaipur Udyog have been active among clearing shares.

Replacement buying has helped to improve Indian Oxygen, British Paints, Union Carbide, Associated Battery and Alkali and Chemical. National Insulated Cable and Hindusthan Aluminium have gained. Among electric supply companies, Calcutta Electric have been sluggish. Managing agency shares have been generally neglected. Stray business has been done in Martin Burn, Balmer Lawrie and Jardine Henderson. Among new shares, India Carbon, Phillips Carbon and Asiatic Oxygen have recovered. In paper shares, Orient and Sirpur have hardened. Sugar shares have been difficult to deal in because the outlook is considered poor.

Jute shares have been hesitant because of sluggish enquiries for jute goods. Scattered business has been transacted in Birla, Barnagore, Champdany, Ganges, Lawrence and Union. Coal shares have been subdued on reports of heavier accumulation of pithead stocks. Stray business has been done in Burrakur, New Beerbhoom, Bengal and Central India. Cotton mill shares have lacked support because the profit outlook for mills during the current year is far from encouraging. Dunbar, Bharat Commerce and J. K. Rayon have been sold freely.

Tea shares have met with bigger support towards the close, although prices have shown little change. The support is due to the improved trend at the auctions held in Calcutta last Monday. Hasimara, Brooke Bond, Tezpore and Methoni have been transacted.

Government securities have been steady. Turnover has, nevertheless, been small since sellers have been few. Attention has been diverted to the forthcoming new Government loans. The 3 percent Conversion Loan 1986 has been steady around Rs. 64.15. The prices of selected State Government loans have hardened on institutional support.

Bombay

PRICES RISE ON BROAD FRONT

HECTIC BUYING IN STEEL SHARES

Wednesday Evening.

THE Bombay stock market has been cheerful during the past week. Share prices have hardened on a broad front because of fresh support, combined with nervous short-covering. Hectic buying in steel shares has helped improve the general tone of the market. Dalal Street has been encouraged by the prospect that the Tata Iron and Steel Company may improve on its previous dividend. Its dividend for the year ended March 1963 is likely to be declared soon. The optimism has been reinforced by the encouraging performance of the Company since the close of the last financial year ; higher production during June, compared with May, has been an additional stimulant.

Contrary to expectations, the new account started last Monday on a cheerful tone. The high margin requirements seem to have been taken in their stride. Because of easier money conditions, there has been no shortage of funds for *budla* transactions. The corporate news has, meanwhile, been good. The declaration of a maiden dividend by Zenith Steel has helped impart confidence. Operators have been cheered by the deliberations at the conference between the Central Finance Minister and the leading financial institutions held recently. It is expected that the margin against share advances may soon be liberalised by banks. The lull on India's northern borders has also been a helpful factor.

Tata Steel ordinary have soared to Rs. 143.25 and Indian Iron to Rs. 23.28. Among engineering shares, Tata Locomotive have recovered to Rs. 165.50 on replacement buying. Interest has been taken in Premier Construction, Mukand Iron and Alcock Ashdown. Motor-vehicle shares have improved. Hindustan Motors and Premier Automobiles have gained. Cotton mill shares have shown widespread gains. Prominent among them have been Century, Bombay Dyeing, Standard and India United ordinary, Gokak and Morarjee have recovered on replacement purchases.

Miscellaneous shares have moved up in sympathy with the general trend. Among cement shares, Associated Cement have gained on reports that the Company has arranged to sell its assets in Pakistan. Among steamship company shares, Scindia Steam have recovered on short-covering. Mining shares have been quiet, although Shivrajpur Syndicate have gained somewhat. In the sugar section, Belapur and Walchandnagar Industries have been steady.

Chemical shares have been steady and support has been extended to Tata Chemical. Bombay Burmah

have improved. National Rayon have gained substantially on short-covering. An encouraging factor has been that support has broadened in cash scrip. Permanent Magnets, Synthetics and Chemicals, and Indian Dyestuff have attracted attention.

Turnover in bank shares has been small, but prices have been maintained. Among insurance shares, New India Assurance have been steady. Prices of selected electric company shares have been higher on balance. Ahmedabad and Tata Power have been steady.

Madras

LARGER TURNOVER IN SHARES

SECURITIES REMAIN STEADY

Tuesday Evening.

THERE has been considerable improvement in the Madras stock market during the past week due to firmer advices from Calcutta and Bombay. Turnover in clearing and cash scrip has increased. The restoration of power cuts has been an important stimulating factor. Operators have also been encouraged by the prospect that banks may soon raise their advances against shares.

Government securities have been steady and prices of selected State Government loans have been higher. Business in bank shares has been restricted. Selected electric company shares have been bought on yield consideration. Support has been extended to selected sugar shares. Good planting shares have hardened on prospects of higher dividends. Cotton mill shares have been dealt in cautiously. In the miscellaneous section, interest has largely been confined to selected chemical and cement shares.

In the banking section, Canara have been done at Rs. 80.50 and Indian Overseas at Rs. 142. Among electric company shares, South Madras have been taken at Rs. 10.35 on declaring a final taxable ordinary dividend of 6 percent. In the sugar section, Deccan have hardened to Rs. 9.95 and E.I.D. to Rs. 38.75.

Among planting shares, Blue Mountain have recovered to Rs. 2.47 and Consolidated Coffee to Rs. 18.50. Periakaramalai have been bought up to Rs. 3.43 on declaring a golden jubilee interim dividend of 2.5 percent. Interest has been taken in Thamarapally at Rs. 14.50, in Thirumbadi at Rs. 1.96 and in Ouchterlony at Rs. 3.90. Coorg have been done at Rs 5 on paying a taxable ordinary dividend of 15 percent. Balanoor have been quoted at Rs. 12 on paying a taxable ordinary dividend of 10 percent. Devon have come to hand at Rs. 12.66 on paying a taxable ordinary dividend of 10 percent.

Among textile shares, South India Viscose have recovered to Rs. 129 and Travancore Rayon to Rs 23. Lakshmi have been transacted at Rs. 142.50 and Madura at Rs. 31.50. Janardana have been taken at Rs. 69.50 on declaring a taxable ordinary dividend of 6 percent. Ramnarayan have been quoted at Rs. 93 on paying a taxable ordinary dividend of 10 percent instead of 7.5 percent as decided earlier. Rajapalayam have been taken at Rs. 160 on paying a taxable ordinary dividend of 16 percent.

Among miscellaneous shares, India Cement have been steady at Rs. 5.63 and Dalmia Cement at Rs. 13.50. Aluminium Industries have been done at Rs. 16.75 and Ashok Leyland at Rs. 7.45. Tube Investment have been taken at Rs. 235 and Spencer at Rs. 21.08. Ruby Rubber have been dealt in at Rs. 4.65 on the news that the Company will sell its Bangalore branch factory to the Manimala Estates Ltd for a sum of Rs. 3.41 lakhs.

THE WEEK'S TRANSACTIONS

[In the following list of stocks and shares in which transactions have taken place during the past week, the figures indicate Opening Quotations. Highest for the week, Lowest for the week, Closing Quotations and Quotations for the corresponding Closing Date a Year Ago. SELECTIVE BUYING TONES UP SHARES

GOLD SCRIP IN DEMAND

London, 10th July.

IT was a satisfactory week on the stock market with prices responding to small but persistent selective buying. The event of the week, however, was the upheaval caused by the take-over bid for Burmah Oil by B.P. and Shell, the subsequent rejection by Burmah and then an immediate withdrawal of the bid. Dealings in the shares of Burmah were on a huge scale and price ranges were as wide as 10s for the "high" of 67s 6d after the bid, down to 55s on the withdrawal. However, there was a sharp recovery to 64s 10½d following an almost unanimous recommendation by the week-end Press of the shares, until Burmah disclosed its intentions regarding the Company's future. Equities made a satisfactory showing, but holidays were an influence on business while the fact that the stamp duty became operative at the end of the week caused some people to hold off, but many stocks were higher than a week ago. With Wall Street moving erractically, dollar stocks see-sawed, but with the dollar premiums moving up to 10½ percent the market became steadier after opening distinctly dull. Gold shares were wanted with some of the buying said to have been on U.S. account, but the demand was fairly general. Coppers were unsettled by the disappointing results of leading companies. Tins were quiet, rubbers showed little movement, but teas came into demand following better tea prices in London.

THE NEW INDIA ASSURANCE COMPANY LIMITED

CHAIRMAN'S SPEECH

Summary of the speech delivered by the Chairman, Mr. A. D. Shroff at the Annual General Meeting.

Addressing the shareholders of the New India Assurance Co. Ltd., at the 44th Annual General Meeting, on Wednesday, the 10th July, 1963, the Chairman, Mr. A. D. Shroff, expressed satisfaction at the better standards of conduct and understanding achieved in the General Insurance Industry in India due to the efforts of the Executive Committee of the General Insurance Council and increasing measure of co-operation amongst general insurers. He once again appealed to all Insurers, Indian and non-Indian, to pool their resources to make the Industry a strong and viable sector of the national economy.

Alluding to the crisis of confidence prevailing in Stock Exchanges in India, he referred to the heavy tax burden imposed by the Government, particularly the Super Profits Tax, and said that fears expressed by a number of experienced businessmen and industrialists at the time the proposal for the Super Profits Tax was made are unfortunately being completely confirmed by the behaviour of the new capital issue markets in India and reduction in Dividends declared by a number of Companies. He added that unless this ill-conceived new tax was aboiished, there would be a serious retardation in the industrial development of the country.

Gold Control Order

He further stated that Government's measures, including Gold Control Order and the Compulsory Deposit Scheme, have tended to create a sort of natural resistance and negative psychology as also to weaken the process of capital formation and to undermine the credit structure in the country. According to him, common sense understanding of human psychology suggested that the habits of thrift and saving cannot be fostered by measures of compulsion. Such measures of compulsion invariably invite resistance. He felt that the most effective mobilisation of people's savings could only be achieved through hard selling of the concept of savings. In this context he stated that the Life Insurance Corporation of India must adopt unorthodox measures to make a much larger contribution to national savings than it was doing at present. As regards the Unit Trusts, he opined that a Unit Trust, as a public sector monopoly, would not serve a real purpose.

(This does not purport to be a record of the proceedings of the Meeting.)

THE CALCUTTA MONEY MARKET

ADVANCES INCREASE AGAIN

Wednesday, 10th July.

SURPRISINGLY, the general level of advances has increased again in the Calcutta money market during the past week. Most of the increase is accounted for by the iron, steel and engineering industries. The requirements of the jute and sugar mills have declined a little. But the credit given to the cotton and woollen mills, and to the foodgrains and seeds trade, shows little change. In the interbank market, conditions were fairly easy for the greater part of the week, and the call rate was quoted around 1¾ percent. Towards the close, however, the supply of funds has become tighter and the call rate has moved up to 2½ percent.

The exchange market has been moderately active. More tea bills have been seen, and the supply of gunny bills has been fair too. There has been a moderate demand for remittances. Sterling is stronger in relation to most of the important currencies except the Norwegian krone.

SILVER WAS STEADY IN CALCUTTA during the past week. The price advanced from the previous week's level of Rs. 259.50 to Rs. 260.25, quoted today for ready delivery. There was no business in forward silver and gold. The London and New York silver prices were 111½d and 129 cents.

DURING THE WEEK ENDED 5TH JULY, Government of India Treasury bills for Rs. 65,27,00,000 were sold in favour of the Reserve Bank.

TENDERS FOR RS. 2 CRORES OF 91-DAY Government of India Treasury bills were opened on 9th July. The total amount offered was Rs. 4 crores. Tenders at Rs. 99.420 percent were allotted 50 percent. The total amount accepted was Rs. 2 crores, the average rate of acceptance being Rs. 2.320 percent a year. Tenders for Rs. 2 crores of 91-day Government of India Treasury bills will be received at all centres up to the close of business on 15th July.

IT IS STATED THAT 91-DAY INTERMEDIATE Treasury bills will be sold from 10th July to 13th July at Rs. 99.436 percent. Sales can be stopped at any time without notice if the Government thinks it necessary. These bills sold from 3rd July to 6th July amounted to Rs. 4.10 lakhs only.

THE STATEMENT OF THE RESERVE Bank of India for the week ended 5th July, 1963, shows a rise of Rs. 14.98 crores to Rs. 2,274.48 crores in active notes while the total note issue was Rs. 1.43 crores smaller at Rs. 2,298.18 crores. The currency contraction was covered by reducing rupee coin from Rs. 115.32 crores to Rs. 113.89 crores in the paper currency reserve. A decline of Rs. 3.94 crores to Rs. 95.89 crores in foreign securities was offset by an equivalent increase in rupee securities to Rs. 1,970.65 crores. These changes were made by contra transfers of securities to the Banking Department in which balances held abroad fell by Rs. 88 lakhs to Rs. 5.63 crores. Deposits of the Central Government were Rs. 8.30 crores larger at Rs. 73.37 crores, while those of State Governments declined by Rs. 5.49 crores to Rs. 9 crores. Balances of scheduled banks were Rs. 2.39 crores bigger at Rs. 96.77 crores while their loans from the Reserve Bank fell from Rs. 1.17 crores to Rs. 83 lakhs of which advances against usance bills were the same at Rs. 9 lakhs. A rise of Rs. 50.53 crores to Rs. 207.02 crores in other deposits arose out of the transfer of the profit of the Reserve Bank from the item of other liabilities. Investments were Rs. 11.78 crores smaller at Rs. 261.02 crores. Ways and means advances stood at Rs. 42.50 crores, against Rs. 30.94 crores.

THE RETURN OF THE STATE BANK OF India for the week ended 28th June, 1963, shows a rise of Rs. 8.23 crores to Rs. 573.77 crores in total deposits. Investments in Government securities are up by Rs. 7.84 crores to Rs. 257.70 crores, while other authorised investments remain unchanged at Rs. 9.34 crores. Advances, including loans, cash credits, overdrafts and bills discounted and purchased have increased by Rs. 81 lakhs to Rs. 280.13 crores. Cash and balances are, in consequence, shown at Rs. 30.12 crores or Rs. 6.82 crores higher.

THE STATEMENT OF THE POSITION OF scheduled banks for the week ended 28th June, 1963, shows Demand and Time liabilities at Rs. 1,053.39 crores (Rs. 30.86 crores on account of borrowings from banks) and Rs. 1,302.86 crores (Rs. 21.38 crores), compared with Rs. 1,036.22 crores (Rs. 29.07 crores) and Rs. 1,288.91 crores (Rs. 21.17 crores), respectively, in the previous week. Cash and balances with the Reserve Bank have increased by Rs. 9.17 crores and Rs. 6.90 crores to Rs. 62.74 crores and Rs. 91.90 crores, respectively. There is rise of Rs. 10.16 crores to Rs. 652.98 crores in investments. Advances and bills discounted at Rs. 1,536.43 crores show an increase of Rs. 5.05 crores. The ratios to total liabilities of cash and balances, and of advances and discounts are, in consequence, shown at 6.6 percent and 65.2 percent, against 6 percent and 65.9 percent.

THE CENTRAL BORROWING PROGRAMME

(BY A SPECIAL CORRESPONDENT)

AS expected, the Government of India announced the second phase of its borrowing programme on 1st July. In continuation of the conversion offer last May, two cash-*cum*-conversion loans of short and medium duration are to be floated on 22nd July for a sum of Rs. 225 crores. The loans are (1)a further tranche of the existing 4 percent 1969 loan at Rs. 99.50 for Rs. 100 (nominal) repayable on 8th May, 1969, and (ii) a 4 percent 1937 loan at par, repayable on 22nd July, 1973. The rates offered on the loans are slightly better than those offered last year, but the rise in the yield, in the context of further increases in interest rates in different sectors of the economy including Bank rate, appears far too insignificant.

For instance, the yield on the 4 percent loan issued at Rs. 99.50 works out to 4.10 percent, and this is slightly better than the return on last year's 3.75 percent 1968 loan at 3.90 percent. Likewise, the return on the 4½ percent 1973 loan comes to 4.25 percent and stands in contrast with the last year's 4 percent 1972 loan yielding a return of 4.10 percent. The rates are, however, comparable with the return on 4½ percent Defence Bonds 1972, which were closed on 30th April. Probably the Government has viewed the borrowing programme, although implemented in two stages, as a single phase as far as the interest rates are concerned.

An important feature of the borrowing programme is that it covers, unlike in the previous years, the borrowing requirements of the State Governments also. The consolidated loan flotation this year is prompted by the fact that of the State Governments, several are in the red, financially speaking, and their loans are now quoted at a substantial discount in the market compared with the Central loans. The redemption yields on State loans with seven to ten-year maturity are now ranging between 4.5 percent and 4.9 percent, compared with 4 percent and 4.2 percent on Central loans of comparable maturity. Administratively also, it must have been deemed convenient because the investors will be spared the embarrassment of being approached separately by each State Government.

The Reserve Bank has resumed, after the announcement of the borrowing programme, the sale of 4½ percent 1986 loan which had been suspended about a week before the announcement of the new loans. The absence of a long-term loan in the current series to suit the needs of institutional investors, *e.g.*, provident funds is probably responsible for the resumption of the suspended sale. It will be recalled that the Central Budget for 1963-64 made provision for a gross market borrowing of Rs. 393 crores. The conversion offer made by the Government of India early last May attracted an amount of Rs. 139 crores. A sum of Rs. 53 crores was collected by the 4½ percent 1986 loan, and another Rs. 86 crores by the 4 percent 1969 loan. The two loans, which are going to be floated on 22nd July will thus bring the total loan offer during the year to Rs. 364 crores, or short of the target fixed for 1963-64 by Rs. 29 crores.

This shortfall is expected to create no great difficulty. This is because the 4½ percent National Defence Bonds 1972 which remained open during April 1963, yielded a sum of Rs. 6 crores for 1963-64. Thus the actual shortage comes to Rs. 23 crores, and this is expected to be covered by the usual market operations. It is interesting to recall that the Reserve Bank has been able to dispose of Rs. 20 crores of the six-year and 23-year loans so far, notwithstanding the conversion of the big bloc of loans last May.

Share of States

The States' share has been fixed at Rs. 100 crores in the borrowing programme. The gross borrowings of the Centre, therefore, come to Rs. 293 crores. The States' re-payment obligations are around Rs. 39 crores, and the Central Government's liability on this account is Rs. 183 crores. The net borrowing by the State Governments, excluding the special overdraft liabilities (Rs. 61 crores) with the Reserve Bank, works out to Rs. 61 crores and that of the Central Government to Rs. 110 crores. Thus, the loan amount of the States will be just adequate to wipe out the special loan extended by the Centre to the States to clear the overdrafts with the Reserve Bank in 1963-64. It is obvious that the net contribution of the borrowing programme to State finances will be "nil" and correspondingly, the Central assistance has to be stepped up in other directions to prevent embarrassment to the States in the financial field. This will mean, in turn, more deficit financing by the Central Government over and above that provided in the Central Budget for 1963-64.

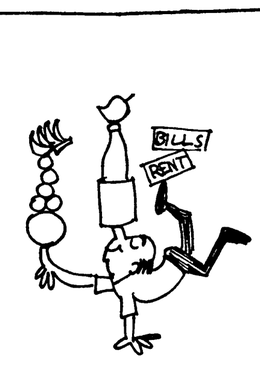
The gilt-edged market has been ruling firm with the return flow of funds into the banking system. The 4 percent loan 1969 which was issued on 8th May, is now quoted 5nP above the issue price of the second tranche of the loan. Similarly, the 4½ percent National Defence Bonds, 1972, are being done at a premium of 30nP in the market. With the intensification of the slack season, the return flow of funds is expected to gather further momentum before the close of the new loans. It may be noted here that the credit contraction in the slack month of June has been substantial and, in fact, more substantial than in the corresponding period of last year. Bank credit, which touched a peak of Rs. 1,601 crores on 12th April, 1963, came down to Rs. 1,593 crores on 3rd May, and since that date till 28th June showed a fall of Rs. 63 crores. The contraction of credit in the corresponding period of last year was much smaller at around Rs. 20 crores Aggregate deposits increased by Rs. 49 crores during the present slack season or slightly higher than in the like period last year and the tendency seems to be encouraging. The comfortable monetary conditions in the banking system found an echo in the call money market. The call money rate (Bombay) is currently quoted at ¾ percent. compared with 1¾ percent at this time last year with tenders all over.

The banks are, therefore, decidedly in a better position to subscribe to the new loans than they were last April. The banking system is statutorily required to adhere to a higher liquidity ratio (28 percent, compared with the present ratio of 20 percent) with effect from 16th September, 1964, and this might induce the banking system to extend wholehearted support.

Generally speaking, Indian banks maintain a liquidity ratio in excess of the legal minimum, but there are certain banks, especially the "big banks", which maintain just enough liquidity in terms of current requirements. These banks have to go in for more investment in Government securities. Cash subscriptions, according to market circles, from the banking system are placed around Rs. 50 crores, with the State Bank taking up about Rs. 20 crores of the estimated amount.

Support for L.I.C.

The L.I.C.—another major supporter of the Government borrowing programme—invests nearly 80 percent of its annual premium income in Government securities. Since the income of the Corporation has been swelling, it is anticipated that the support from that institution will be at least Rs. 30 crores. Other institutions, like general insurance companies and investment trusts, are expected to absorb a sizable sum. The new loans are likely to attract cash subscriptions of at least Rs. 100 crores.



The new issues might assist a further firming up tendency in the gilt-edged market. Since there are no separate borrowings by States, it is likely that the State Governments' loans, which are currently quoted at a discount in comparison with the identical Central issues, might look up. But the addition of the new loans to the Government's debt might further step up the burden of the medium and short-dated debt which is already heavy at 70 percent of the total public debt. It might increase the Government's difficulties of repayment later, especially in the context of inflationary conditions in the economy.

Have you tried balancing your budget?

I have—often!

It is no longer a case of balancing—it's just plain juggling!...Pay the milkman in full this month and the grocer on account so that the vegetable seller can be paid in part—the tailor will have to wait...and just when it seems to be working out—there are fees, doctor's bills and insurance premiums, not to mention taxes and compulsory deposits.

All of which remind me that I must somehow keep my insurance policy going—and take some more, if possible. I look at it like this: if I, with my regular income, can barely make both ends meet, how will my poor wife manage should the worst happen to me?

I must cut down on clothes? Perhaps. Less travelling, less entertainments, less parties, less festival expenses? Must talk to the wife.

E.C.M. DUTY ON TEA: DATE FOR CUT STILL TENTATIVE

By Malcolm Subhan

BRUSSELS.

WHEN discussing protracted negotiations between the Six and the U.K. for the suspension of their respective tariffs on tea, one willynilly falls back on *clichés*. "A storm in a teacup" would seem to describe rather accurately the objections raised by the French at the last meeting of the Council of Ministers; while the time-worn adage, "There's many a slip 'twixt the cup and the lip" no doubt makes a suitable moral to adorn this twice-told tale.

It is easy enough to joke about the cautious, pedantic manner in which the Community has managed the task of granting a tariff concession to which it had more or less committed itself a year ago. But the evidence of the various other agreements concluded by the Six—with Turkey, for instance—suggests that this in fact is how the Six negotiate. The number of conflicting interests which must be reconciled is so great that the progress of any negotiation is like that of a crab—sideways. As there is a lesson in this for those who want to conclude an agreement of any kind with the Community, a detailed account of the proceedings is perhaps not out of place.

To reverse the natural order and start at the end. The present position appears to be the following: the Common Market will suspend as from 1st January, 1964, and for a two-year period its tariff on loose tea and maté and reduce its tariff on tea in packets of less than 3 kilograms. The date is not definite, however: it seems to depend on whether the Convention of Association between the Six and their 18 African partners has meanwhile been ratified. "Seems to", because there is a certain amount of confusion in Community circles here as to whether the signature of the Convention or its ratification is the pre-condition to the suspension of the tariffs on tea and tropical hardwoods.

As matters stand, the Convention, which was initialled by the two sides last December, may be signed early in July. The only obstacle to its signature so far has been the absence of a Government in Italy; and while sceptics claim the present Italian Government will last only long enough to vote the provisional budget, it is nevertheless expected to sign the Convention as well. Ratification, on the other hand, will be a relatively long drawn-out affair, and certain Community officials feel it may be March before the Convention comes into force. The Council of Ministers apparently compromised on 1st January, 1964, as the date for the suspension of the two tariffs, largely because the Action Programme adopted in Geneva by the ministerial session of G.A.T.T. calls for the abolition of the tariffs on all tropical products by the end of this year.

When the question of suspending the tariff on tea was raised last year during the negotiations over Britain's entry into the Community, the Six agreed to it readily enough. With the break-down of the British negotiations the Indian reaction was to try to salvage as much as possible from the wreckage. It was suggested to the Dutch, who are the most addicted among the Six "to the cup that cheers but does not inebriate", that the Community could well afford to abolish the 18 percent tariff on tea even though Britain would not be joining the E.C.M.

The Dutch Proposal

Early in April, the Council of Ministers finally adopted a Dutch proposal that the Commission be authorised to negotiate with the U.K. a bilateral agreement for the suspension of their respective tariffs on tea and tropical hardwoods. It was agreed that the objective was to help the developing countries, not the U.K. or the Common Market. From the Indian point of view, the fact that tea and tropical woods had been linked together had certain disadvantages: if none of the 18 associated African States is particularly interested in tea, tropical hardwoods are another matter. (As it turned out, the Africans, invited by the Commission to give their point of view, refused to commit themselves in order not to compromise their position in the forthcoming tariff negotiations in Geneva. However, a large number of technical problems had to be solved before agreement on tropical woods could be reached between the Six and the U.K.)

The first official exchanges between the Six and the British took place in Geneva, towards the end of April. The latter wanted the suspensions to come into force as quickly as possible; the date first suggested was in fact 1st July. At the same time, the British proposed that the list be extended to include tea in packets, and essence of tea and maté, a South American beverage also prepared from the leaves of a shrub.

The common external tariff on tea in packets is even higher than the tariff on loose tea (24th percent as against 18 percent). The Six at once rejected the British proposal on the grounds that British packes would be the ones who would benefit primarily from it, although the Indians took the view that any measure which promotes the sale of tea is to be welcomed. (The Six eventually agreed to reduce their tariff from 24 percent to 5 percent. They also adopted the proposal to suspend the tariff on maté, but refused to extend the suspension to tea essence.)

Progress remained slow. The British delegation sought assurances which the Commission felt it could not give without first consulting the Council of Ministers. The British wanted the Community to affirm in writing that all six member States would suspend their tariffs from the date stipulated in the agreement. The point at dispute was a technical one. In principle, the Six had agreed to suspend the common external tariff on tea and tropical woods; but this Community tariff comes into force only at the end of the transitional period, five years hence, although the Six are committed to bringing their national tariffs into line with it in three stages. The British also sought a written undertaking from the Six that they would not increase their internal duties in order to compensate for the loss in revenue from the suspension of the tariff, nor introduce non-tariff measures, such as quota restrictions, thereby nullifyfying the effects of the suspensions.

Proposed Pact with U.K.

The Council of Ministers agreed to these various points when it met towards the end of May, and authorised the Commission to conclude a bilateral agreement with the U.K. along the lines set forth in its report. At the same time, the Council supported the Commission in its view that the assurances sought by the British did not concern tariff matters, strictly speaking, and could not, therefore, be the object of negotiations under the G.A.T.T. As these suspensions are to be consolidated in the G.A.T.T. after negotiations with the principal suppliers, the distinction is an important one from the Six's point of view. They offered, therefore, to give the necessary assurances in an exchange of confidential letters, which would be kept separate from the tariff agreement as such. As a result, the Commission was able to reach more or less complete agreement with the U.K. on a draft text. The Commission thereupon prepared a fresh report for the Council, in which it recommended 1st September, 1963, as the date on which the suspensions should come into effect.

It is at this point that the picture begins to blur. The Council of Ministers was originally scheduled to meet on 17th and 18th June. When it was discovered that all the foreign ministers would be in Rome for the funeral of Pope John XXIII, it was decided to limit the meeting to 18th June only, despite a relatively long agenda. When the question of the suspension of the Community tariffs was reached, the French representative raised two objections, both for the first time apparently.

The first was extremely technical, and was raised more to protect the French position in the future than anything else. The French representative argued that the suspensions should take place under Article 28 of the Treaty of Rome and not under Article 111. Article 28 stipulates that modifications or suspensions of the common external tariffs shall be decided upon by the Council "acting by means of a unanimous vote." Article 111, which relates to the adoption by the Community of a common commercial policy, states that a unanimous vote is only necessary during the first two stages of the transitional period—i.e., until the end of 1966. The French apparently were unwilling to create a precedent and, therefore, insisted that the Council suspend the tariffs in question under Article 28, even though the Commission had been authorised to negotiate with the U.K. under Article 111. The Council duly took this step, although it seems that with time running short, no reference was made to the draft agreement which the Commission had negotiated with the British.

French Stand on Duty Reduction

The French also linked the suspension of these tariffs to the ratification of the new Convention of Association, despite the vigorous protests of their partners. The Convention grants the African Associated States duty free entry for seven or eight tropical products, including tea, and provides at the same time for reductions to the common external tariff on these products of 25 percent to 40 percent. The French argued that the tariffs on tea and tropical woods should be suspended simultaneously with the tariffs on the other tropical products—once the new Convention comes into force. It was only as a compromise that they accepted the date of 1st January, 1964.

The British must now state whether they are prepared to accept this date. They may reject the enforced link between their bilateral agreement with the Six and the Convention of Association, as they are in fact entitled to do. According to officials at the Commission's headquarters here, all these problems should be settled during July, and the Council may even approve the draft agreement when it meets on 28th July. Meanwhile, the Six have agreed not to modify national tariffs on tea and tropical woods from 1st July.

ECONOMIC RESEARCH

- is an essential part of modern commerce. But it is
- not always easy to obtain. The ordinary business
- house does not usually possess the records, statistics
- and archives which are the raw material of research.
- CAPITAL'S RESEARCH & STATISTICAL DEPARTMENT
- has a long record of service to Chambers of Commerce,
- Industrial Associations and private business concerns.
- It does not undertake trade inquiries, but its facilities
- and advice are available for all kinds of research
- proper into the problems of Indian commerce
- and industry.

THE FOREIGN EXCHANGE LAW GOVERNING EXPORTS

By Walter Kraft

India's need to increase her exports, and to obtain for them a fair return, is universally accepted. This article examines the legal machinery designed to ensure the latter without stultifying the former.

SECTION 12 of the Foreign Exchange Regulations Act authorises the Government to impose an important restriction on the export of goods from India. Its primary purpose is "to ensure that the full foreign exchange proceeds from exports are made over promptly to the Control through the authorised dealers". (*Outline of Exchange Control in India*, published by the Reserve Bank, Bombay, 1961). The way in which this restriction has been imposed is somewhat indirect, and one needs to look at the substance in order to appreciate the form fully.

The Notifications

By notifications No. 12 (17) F-1/47 of 4th August, 1947, as amended, the Central Government was pleased (such are Governments!) to prohibit the export of goods otherwise than by post either directly or indirectly to any place outside India (except as mentioned) unless a declaration supported by evidence, as prescribed under Section 12, was furnished by the exporter to the appropriate authority. The prohibition does not apply to certain classes of goods, i.e., samples and personal effects of travellers, ship's stores, transhipment cargo and certain Government goods, as well as goods despatched by air and certified not to involve any transaction in foreign exchange.

Similar Prohibition

By notification No. 12 (18) F-1/47 of the same date, a similar prohibition was imposed on the export of goods by post, unless certified not to involve any transaction in foreign exchange.

The Foreign Exchange Regulation Rules, 1952, implement these provisions, and prescribe what declarations have to be signed. These declarations are not, however, an end in themselves, as some appear to believe. They are a means to an end, which can only be gathered from taking the sections, the notification, and the Rules as a whole.

1. The object of the export must be a sale of the goods outside India. The goods may have been sold prior to the export, and may be exported for delivery to the buyer; or the goods may be unsold at the time of export, and may be exported for being sold abroad. Either alternative is permitted. Export for any other purpose, *e.g.*, by way of gift, or by way of loan, or on hire, is prohibited, except with the express sanction of the Reserve Bank. This is implicit in the whole legislation.

2. Section 12(2) provides that if goods are unsold at the time of export, they must be sold promptly after export: "the sale must not be delayed to an extent which is unreasonable, having regard to the ordinary course of trade." Rule 6 goes further than this, in providing that the proceeds of sale must be received within six months from the date of shipment, unless the Reserve Bank grants an extension.

3. Rule 5(1) provides that evidence may be required to show "that the exporter is a person resident in India, or has a place of business in India", which means, by the sort of reasoning running throughout this piece of legislation, that only persons who are resident in India, or have a place of business in India, are allowed to export goods to which the Section applies. This is obvious, since non-residents will be under no enforceable duty to remit the proceeds.

4. Rule 6 provides that all goods must be paid for and payment received in India within six months from the date of shipment, and no sale is permitted (without the Reserve Bank's consent) which does not provide for payment of the full price within that period.

5. Rule 7 and the second schedule provide in what currencies the price may be paid. The sale may be in rupees, but the proceeds must be received in the approved currencies, and no sale is permitted which does not provide for payment as prescribed.

6. Rule 5(2)(i) requires the exporter to supply such evidence as may be in his possession or power to show that the declared destination of the goods is their final destination. This is relevant for determining under Rule 7, the correct currency to be received.

7. Rule 5(2) (iii) requires the exporter to supply evidence "that the amount representing the full export value of the goods has been or will be paid to the exporter." Where the goods are sold at the time of export, the required evidence will consist of the contract of sale, or of an accepted bill, or of a letter of credit, or similar documentary evidence proving the sale, and the seller's entitlement to receive payment within the prescribed time and in the prescribed manner. Where the goods are not sold at the time of export, the required evidence will consist of the agreement appointing the consignee of the goods to be the exporter's agent to sell the goods and remit the proceeds.

8. To give further effect to the Rules, Section 12(2)(b) forbids the exporter to do, or refrain from doing any act (except with the Reserve Bank's permission) with intent to secure, among other things, that payment is made otherwise than in the prescribed manner, or that payment is delayed.

Full Export Value

What has to be declared under Section 12(1), and what must be paid within the time limited by Rule 6 and in the manner prescribed by Rule 7, is "the amount representing the full export value of the goods". This is the amount which, under Rule 5 (2) (iii) the exporter has to prove, "has been or will be paid to him." Where goods are sold at the time of export, the declaration must state the invoice price of the goods. This invoice price must be the same as the full export value of the goods, and Rule 5(2) (ii) provides that the exporter has to supply evidence to prove that it is. Rule 5(2) (ii) cannot apply if the goods are unsold at the time of export.

It may be convenient to consider first what "full export value" means in the case of goods which are unsold at the time of export. The prescribed forms require the exporter to declare,

NGB/15C

for such goods, "that this is a fair valuation of the goods." What is required is evidently a fair estimate, as at the time of export, of what the goods are expected to fetch on a sale after export. It is, however, obvious that if the goods actually fetch more than the estimated figure, the exporter is under an obligation to procure remittance to India, not of the estimated and declared amount only, but of the full amount (subject to permitted deductions) for which the goods are actually sold. Section 12(2) (b) expressly forbids the exporter to do or refrain from doing any act with intent to secure that the full amount payable by the foreign buyer (subject to permitted deductions) is not received in the prescribed manner and within the prescribed time. Section 12 (6) provides that contracts with foreign buyers and other evidence may have to be produced to show that the full amount payable by the foreign buyer has been or will be paid as prescribed.

If an exporter, who has declared a fair valuation of goods exported unsold, must account for the full amount payable by the foreign buyer where this exceeds the declared value, he cannot be made to account for more than the full amount payable by the foreign buyer where this happens to be less than the declared value. There is no provision anywhere in the relevant legislation whereby the exporter is prohibited from selling below the declared fair valuation. The full export value of goods exported unsold must, therefore, be the price at which they are eventually sold. This price being unknown, and unknowable, at the time of export, a "fair valuation" is declared instead.

Just as there is no provision in the Foreign Exchange Regulations Act prescribing a price at which goods exported unsold may be sold abroad after export, so there is no provision in that Act prescribing the price at which goods may be sold for export. Therefore, the full export value of goods sold for export must also mean the full amount (less permitted deductions) actually payable by the foreign buyer. The legislator invented this expression, "full export value" evidently in order to have one expression cover two situations, namely, the value of goods exported sold, and the value of goods exported unsold. His effort resulted in nothing but confusion, but it is clear what was meant.

Powers of Reserve Bank

Section 12 (5) authorises the Reserve Bank, in cases where "the value as stated in the invoice is in its opinion less than the full export value," to detain the shipping documents until such time "as the exporter of the goods has made arrangements for the Reserve Bank to receive ... an amount which represents in the opinion of the Reserve Bank the full export value of the goods." What arrangements is the exporter meant to make? If the value as stated in the invoice is "the full amount payable by the buyer" and the exporter were nevertheless meant to make arrangements to obtain a higher price, possibly from some other party, the Section would give the Reserve Bank an arbitrary power to set aside international commercial contracts for the sake of expediency. This cannot possibly be the intention. If "the full export value" is equated with "the full amount payable by the buyer", the Section makes sense. It authorises the Bank to compel the exporter to have remitted to India the full amount which, in the opinion of the Bank, he is entitled to receive from his buyer under the contract of sale, without retaining any part of the price abroad and unaccounted for.

The term "the full export value" has been taken to imply that the price must represent the best one which was obtainable at the time of the sale in a *bona fide* transaction. This seems incorrect. The word "full" in the context means "the entire", and not "the highest", although taken by itself the expression is ambiguous and misleading. The invoice must state the *entire* sum payable by the buyer for the goods, without unauthorised deductions. The invoice price must represent the full consideration which the exporter receives from the buyer in exchange for the goods; otherwise, the transaction would not be a sale. Within these limits, it seems that exporters are free to market their goods in any *bona fide* manner, and at any *bona fide* price. They need not seek the highest priced markets, they need not vary their prices from day to day, and they need not eschew the middleman. The sales need not be in "customary wholesale lots" even if wholesale lots are "customary", nor are transactions between associated companies forbidden. Where the Indian exporter is a branch office of the foreign buyer, it can be argued that as a matter of law, there can be no sale and the export must be on a consignment basis. This will also be the position where the exporter and the foreign buyer are partners. If the exporter and the foreign buyer are two separate legal entities, not carrying on business in partnership, then the export may well be by way of sale, even though the foreign buyer is associated with the exporter through joint shareholding. This position may perhaps with advantage be modified by an appropriate amendment in the Rules.

Penalties for Contravention

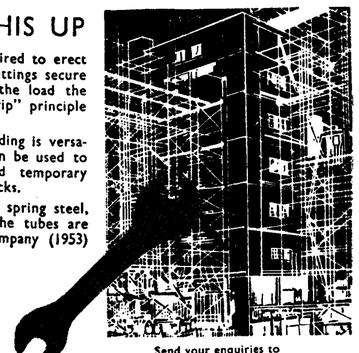
Section 23 (1A) of the Foreign Exchange Regulations Act provides that "whoever contravenes any of the provisions of this Act or of any rule, direction or order made thereunder" is liable to penalties. Section 12(1) of the Act itself contains no provision which is capable of being contravened. It contains nothing but an authority to the Government to issue a notification. The Government has issued notifications under the authority of Section 12(1) whereby exports are prohibited unless covered by declarations as prescribed. Is this notification a rule, direction or order made under the Foreign Exchange Regulations Act, so as to make an unauthorised export an offence under Section 23(1A)? It is believed that the correct answer is in the negative.

Section 22 of the Act provides, among other things, that no person shall, when making any declaration to any authority or person for any purpose under this Act, give any information or make any statement which he knows or has reasonable cause to believe to be false, or not true, in any material particular. A declaration made in terms of Section 12(1) and the supporting evidence given in terms of Section 12(b) are certainly made and given for a purpose under the Act. If these are known to be false, or not to be true, or if the person making or giving them has reasonable cause to believe them to be false, or not true, in any material particular, an offence has been committed which is punishable under Section 23(1A). The burden of proof is on the prosecutor to show not only that they were actually false or untrue in a material particular, but also that the person concerned knew or had reasonable cause to believe that they were false or not true.

The Customs Act

Section 23A of the Foreign Exchange Regulations Act provides, among other things, that the restrictions imposed by sub-section (1) of Section 12 shall be deemed to have been imposed under Section 19 of the Sea Customs Act, and all the provisions of that Act shall have effect accordingly. A prohibition issued under Section 12(1), therefore, amounts to a prohibition issued under Section 19 of the Sea Customs Act. While the Sea Customs Act stands repealed, the notifications have been saved and survive. The provisions which now have effect are those of the Customs Act, 1962, relating to prohibited exports.

When is an export prohibited, and when is the actual or attempted export punishable under the provisions of the Customs Act 1962? The correct answer, it is submitted, is this: Exports are prohibited, unless the required declaration can truthfully be made, and unless the required declaration is actually made, and supported by the prescribed evidence. The question arises: Is an offence committed if a declaration is filed which is in the required form, but which contains mis-statements; or if evidence is submitted which is false or untrue? One view is that once a declaration is filed in proper form, and this declaration and the supporting evidence have been accepted by the Customs authorities as true and correct, the export is not a prohibited export for the purpose of the Customs Act, 1962. The opposite view is that if a declaration can be shown to contain a single error, it is not a proper declaration; the export is prohibited and the goods liable to confiscation, although leniency may be shown in cases of inadvertence not due to carelessness. The correct view, it is submitted, must be based on the provisions of Section 22 of the Foreign Exchange Regulations Act which forbids the making of declarations which the maker knows or has reason to believe to be false. Any declaration which does not offend against that Section is a declaration which complies with the provisions of Section 12(1); and a declaration which offends against the provisions of Section 22, cannot be a declaration which complies with the provisions of the Foreign Exchange Regulations Act, even if it is on the correct printed form, and even if its falsity is not immediately discovered.



Genuine evidence to substantiate an offence of this kind is harder to come by than it is for almost any other kind of crime. *What has to be proved is that the exporter did not actually sell the goods at the price declared by him.* To prove that other exporters sold similar goods at higher prices is entirely irrelevant to the charge. The particular exporter may have had perfectly sound commercial reasons for selling at the particular price, or he may have misjudged the market completely, but nevertheless in good faith, or he may even have made a reckless gamble which failed. The sale may nevertheless have been a perfectly genuine sale at the declared price. The object of the offence is normally that the exporter accumulates undeclared funds abroad, free of Indian income tax, and the only circumstantial evidence of any value would be to show that this is what he is doing.

A ½" SPANNER PUT THIS UP

A half inch spanner is the only tool required to erect Mills Scaffolding. A few turns and the fittings secure the steel tubes firmly—the greater the load the stronger the grip due to the "shackle grip" principle on which they are designed.

Strong and safe, Mills tubular scaffolding is versatile; the same tubes and fittings can again be used to erect anything from Grandstands and temporary buildings to storage racks and road blocks.

All fittings are made from special quality spring steel, by Guest, Keen, Williams, Ltd., and the tubes are manufactured by The Indian Tube Company (1953) Limited.

THERE'S NO LIMIT TO THE SUPPORT YOU CAN GET FROM MILLS

New Delhi

IMPROVING THE PROCEDURE FOR INDUSTRIAL LICENSING

(FROM OUR NEW DELHI CORRESPONDENT)

THE Federation of Indian Chambers of Commerce and Industry, at its regional meeting in Hyderabad last month, expressed "grave concern over the sharp fall in joint ventures and declining trend in foreign collaborations". Although the emergency is likely to have affected the flow of external capital, the Federation felt that the special conditions imposed by the Government and the dilatory procedures followed had had a serious effect on foreign investment. The Federation supported its statement by some figures. A member of the Planning Commission has now written to the Central Ministry of Finance, suggesting single, unified control for industrial licensing. That there should be one contact point is not in dispute. What is being discussed is where this contact point should be located.

The Planning Commission's member has suggested, locating it in the Ministry of Finance itself. The other view is that it should be located in the Ministry dealing with industrial policy, which for the present is the Ministry of Commerce and Industry. It is, however, argued that such a solution would have been possible had the Ministry of Commerce and Industry been in overall charge of industries. It is also pointed out that the Ministry of Finance, which deals with foreign investment and taxation, is not fitted to deal with the problem.

It is generally agreed that Mr. L. K. Jha, with his wide knowledge, would have been an ideal person to handle this problem. Mr. Jha, however, is already overworked and it would be physically impossible for him to undertake additional responsibilities. The ideal solution, it is suggested, is to appoint a director-general for industrial licensing. He could provide the point of contact between Indian and foreign entrepreneurs.

Considering the administrative set-up and the number of agencies which deal with this problem, it is neither possible nor desirable to give one person the overall power to take final decisions. It should, however, be his main function to take such decisions as are within his delegated authority and to have final decisions taken by the appropriate persons. The Ministry of Commerce and Industry created a very similar post last year, and the experiment worked fairly satisfactorily. The emergency, following the Chinese aggression, disturbed this system, but it has been re-started since last month. A reform of procedure is urgently called for. Under the above scheme, a foreign collaborator would alone have a single point of contact. But the officer concerned would be helpless if the under-secretaries, say, in the Ministry of Finance, were to send for the parties to discuss issues on which they had no power to take any decision. What is needed is a manual of easily understood rules of procedure which are capable of speedy execution.

It will be recalled that by the end of the first year of the third plan, a number of licences in many industries were issued up to nearly the targeted capacity visualised under the plan. One result of this "leap forward" policy has been that many people, who had neither the experience nor the financial means, have addressed letters to foreign firms in capital exporting countries. This has created confusion among the foreigners, who have in some cases received a dozen letters from the same industry in India. Then again, in many cases, a foreigner finds that the particular industry in which he is interested, is either on the banned list or its capacity has already been taken up by outstanding licences. This may explain why the number of cases of foreign collaboration has fallen.

As already reported, the Government has been revoking licences. The number of licences revoked in the six months ended June 1963 is large. The case of the aluminium project in Mysore illustrates the point. For reasons already known, the project could not be implemented and the Government had to wait for two years, the statutory period, before revoking the licence. A fresh start is now being made. One way may be to find an Indian entrepreneur to collaborate with the U.S. firm of Reynolds. The alternative could be for an Indian firm to find another collaborator. In any case, this has had a dampening effect in the U.S.A. What is needed is some kind of preliminary screening concerning the suitability and capability of an Indian entrepreneur to start the industry when he applies for a licence.

As for a joint venture involving financial participation, the most important formality is getting Government approval for the terms of collaboration between the Indian entrepreneur and the foreign firm. It is found that this formality has in many cases taken a fairly long time with the result that, on the one hand, the foreign investor feels frustrated, and on the other, the project is delayed. It is, therefore, suggested that a broad framework of policy should be formulated, and the necessary authority for sanction should be delegated to the Ministries concerned. In exceptional cases which are not covered by such delegated authority or where there are special features requiring further consideration, a high-level inter-Ministry machinery may be created to take speedy decisions in cases involving foreign collaboration.

It is suggested that in the light of experience gained in the approval of collaboration agreements in over 1,000 cases, the Government may formulate broad principles concerning (a) financial participation, (b) rate of royalty for know-how, (c) consideration for know-how fees either in lumpsum or in the form of shares, (d) lumpsum consideration for research and development, (e) fees for design, engineering, etcetera, for important industries.

CEMENT

Bulk Movement Suggested

The technical group on rail transport has made its report on the movement of cement. It has suggested the bulk movement of cement in special rail wagons to be stored in silos and distributed in portable silos or drums. Such a scheme, it is claimed, will save packing and loss in transport, in particular through deterioration. The group has suggested that the scheme should be launched as an experiment in Delhi through the State Trading Corporation. The expenditure is placed at Rs. 80 lakhs.

TEXTILE INDUSTRY

Staple Fibre for Cotton

A proposal to make the use of staple fibre by the cotton textile industry compulsory is being considered here. The cost of staple fibre is 68nP a lb, compared with Rs. 2 a lb for cotton. A modest beginning can save £80 million a year, it is claimed.

BOKARO

Output Schedule

The following is the schedule of production for the Bokaro steel mill (in tons) as recommended by the U.S. team.

	First stage	Second stage	Third stage
Hot rolled sheets and strips ...	300,000	500,000	860,000
Cold rolled sheets and strips ...	250,000	600,000	1,000,000
Galvanised sheets ...	130,000	130,000	300,000
Plates ...	360,000	570,000	750,000
	1,040	1,800,000	2,910,000
Ingots ...	1,400,000	2,500,000	4,000,000

U.K. CREDIT

Negotiation on Use

Negotiations are going on concerning the utilisation of the £30 million credit the United Kingdom has offered to India towards financing the third year outlay of the current plan. Of this, £3.5 million is being used for importing steel from Britain. A portion of the loan will be earmarked to finance maintenance imports from the U.K.

Sir Norman Kipping of the Federation of British Industries, who came to India last cold weather, made some important observations on maintenance imports in his report on India. Sir Norman said: "The managements of Indian factories dependent on sterling maintenance supplies are, therefore, having to contend with a variety of difficulties, and from what we have seen are doing so in good heart and with ingenuity, for they understand the dilemma which has brought about this situation They are having to accept materials from unfamiliar sources and to varying specifications; they are having to press forward harder than ever to bring local supplies up to the quality standards they require; and they have a constant struggle to get licences for sterling supplies, ending up usually with 'too little and too late'.

"We, therefore, represented to the Government of India that a change of system would be desirable so that companies manufacturing products to which India gave priority and dependent on sterling supplies were given blanket licences of this kind. These representations were accepted in principle, subject to safeguards which, it was said, could be worked out in time for the procedure to be introduced in the April 1963, Red Book on import licensing policy.

"We have also requested that the cash allocations should be extended to companies having servicing organisations in India for the maintenance of, namely, machine tools, business machines, weighing machines, as this would be more economical than having each end-user carrying his own spares.

"Before coming to India we obtained particulars from a large sample of companies with factories or licence agreements in India, showing that they already found themselves restricted below their needs for efficient operation. In the course of our discussions with the Government of India, they agreed to measure the extent of this shortfall, concentrating on the metal-working and engineering factories in which dependence on sterling imports predominates. (In general, chemical works in India—with the possible exception of pharmaceuticals—can work satisfactorily from base materials of any origin).

"The estimates show that on the basis of the allocations made in 1962-63, the shortfall in the sum needed to finance the import of components, specialised raw materials and spare parts needed from Britain lies between £4 million and £10 million a year. The extent to which newly established capacity is taken into account, the range of industries covered and the degree of austerity assumed would determine the amount within this range. The average of £7 million should cover reasonable requirements.

"The possibility cannot be excluded that shortage of sterling may oblige the Indian Government to make still further cuts in the licence for maintenance imports in the coming licensing period. Any such event would be deplorable, but it would not, in our view, affect the rightness of the change in licensing procedure we have recommended. We are satisfied on the basis of a very large number of cross-checks that within the allotted level, whatever it may be, companies will be better off and will be able to turn a given amount of sterling to better use if given greater personal control of the use of their allotments.

"It was to be expected that dependence on sterling maintenance supplies would occur principally in British-based companies and those making products under British licence agreements. The study showed that in fact 75 percent of the total need arose from such companies, and the remainder from various other Indian companies."

It is likely that £1.75 million will be earmarked for maintenance imports by British-based industrial houses. A similar provision of 75 million deutschemarks has been made in the West German loan. The question of using the Dutch and Belgian credits is still presenting difficulties. The Dutch credit consists of 100 million guilders for three years, including 35 million guilders for export guarantee credits. So far, India has shown interest only in a dredger for Murmagao.

The Belgian credit was for one year. It has subsequently been ex-

tended to the end of 1963, to enable India to purchase coalmining machinery for which a mission went to Brussels.

PLANNING

Price Policy Failure

The Central Minister for Planning, Employment and Labour, Mr. Gulzarilal Nanda, usually admits mistakes. Speaking at a Press conference last week, he admitted that during the last 15 months, March 1962 to June 1963, there had been a rise in wholesale prices of more than 8 percent. Of this, he attributed 1 percent to new taxation and 7 percent to food articles such as rice, pulses, sugar and gur. He, however, added that in the final estimates, the impact of new taxes on prices might be even more. He was equally frank about controlling the price-line. According to him, the remedy lay in more and more consumers' co-operatives and fair price shops which were 959 and 51,000, respectively, in India at present. Here again, he admitted that it would take a long time to build up a network of co-operative consumer stores.

Referring to the recent publicity concerning the fourth five year plan, Mr. Nanda said that the Planning Commission, had neither determined any rate of growth for the five-year period ending March 1971, nor had it laid down any targets for development. Planning, however, was a continuing process. The Minister explained that arrangements for work on the long-term economic development plan and, more specifically, for preparation of the fourth plan, were considered by the Planning Commission last year. It was agreed that to begin with, planning groups should be set up for steel, coal, power, heavy engineering, basic chemicals fertilisers; transport and technical education for the preparation of the fourth plan. The question of setting up similar planning or working groups for other sectors was taken up recently with the Ministries concerned.

The broad terms of reference of these groups are: (i) to make a critical review of the progress of the programme and schemes in the third plan period; (ii) to assess, in the light of the current trends and other available data, the position likely to be reached at the end of the third plan period, and (iii) to formulate proposals for the fourth plan in the perspective broadly of a 15-year period, 1966-81, or more concretely of a 10-year period, 1966-76, as may be appropriate.

The present position concerning the setting up of working groups and the progress so far made on the work of preparation of the fourth plan is indicated below.

Industry: Planning groups have been set up for steel, machinery building industry, fertilisers and chemicals. For steel, a steering group has been set up. This group is assisted in its work by five subcommittees dealing with (i) economic and financial matters, (ii) raw materials and transport, (iii) technical studies, (iv) personnel and training and (v) indigenous equipment. To achieve a target of 18 to 19 million tons of steel at the end of the fourth plan, an additional initial capacity of 7.5 to 8 million tons has to be created. The various possibilities to bring about this extra capacity, including expansion of existing steel factories in the public and private sectors, are being examined. Techno-economic studies of two possible areas and an appraisal of steel demand are being undertaken.

On the machinery building industry, a planning group was constituted which has set up a sub-committee to ascertain machinery requirements in the fourth plan period. The planning group on the fertilizer industry considered the main studies which should be undertaken in connection with the planning of fertiliser production for the fourth plan, and also considered the immediate steps which need to be taken to meet the increased requirements of fertilisers in the first two years of the fourth plan. The estimates of requirements of fertilisers during the fourth plan period have been discussed by the planning group concerned, and the types and quantities of fertilisers for different zones are being worked out.

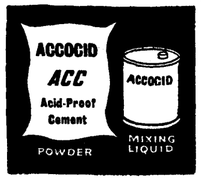
The planning group on basic chemicals has set up a number of technical sub-groups to examine the development programmes, and other related matters in specific sectors of the chemical industry. It is proposed to set up two other planning groups, one for light engineering industries, and the other, for non-ferrous metals.

As for other important industries, preliminary papers on the fourth plan programme will be drawn up by the officers concerned in the Ministries or the Technical Development Department, and these papers will then be placed before the development councils.

Minerals: The planning group on coal has discussed (a) the target for the fourth plan based on the requirement of various consuming industries, (b) a tentative fieldwise distribution for the additional production during the fourth plan and the pattern of production necessary for meeting the requirements of the steel plants, thermal power programme and the railways, and (c) broad features of the washeries' programme during the fourth plan. The production and preparation committee of the Coal Council is going into the details of fieldwise production, with particular reference to the steel programme, and work out the phased mine-wise production pattern both from the public and private sectors. The Ministry of Mines and Fuel has had discussions with the private sector of the coal industry with a view to assessing the latter's capacity to raise additional coal during the fourth plan period. After ascertaining the capacity of the private sector, the Ministry will take steps to solve any policy questions which may be involved in the private sector's programme.

Transport: With a view to enabling the Ministries concerned to collaborate effectively in studies pertaining to transport, a planning committee for transport has been set up. A joint technical group assists the Planning Committee with various studies and data.

Agriculture: In March 1962, the Ministry of Food and Agriculture set up four study groups on (i) cereals and pulses, (ii) commercial crops (including fruits and vegetables), (iii) fish, poultry, livestock and dairying, and (iv) forestry. A fact finding committee to study the method of collection of information and reporting on physical progress under different programmes and a crop planning committee were also set up. Some meetings of these study groups, the fact finding committee and the crop planning committee have been held. These study groups and committees will be co-ordinated with the working groups which are now being constituted.



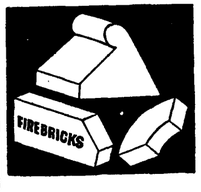
Working groups have been or are being set up also for (i) irrigation, flood control, drainage, anti-waterlogging, anti-soil-erosion and soil conservation schemes in river valley projects. (ii) power, (iii) communications, (iv) craftsman training, employment, etcetera. (v) health, town and country planning, medical and public health programmes and family planning, (vi) housing and urban and rural planning, (vii) construction service of voluntary organisations, (viii) social welfare and backward classes, (ix) general education, technical education, scientific research and cultural programmes, (x) khadi and village industries, small-scale industries and handloom, sericulture and handicrafts, (xi) financial resources, and (xii) international trade and development. All these planning groups are expected to submit their reports by March 1964.

ACC

QUALITY PRODUCTS TO HELP INDIA'S INDUSTRIES

ACCOCID

...a special acid-resisting cement, proof against both acids and chemicals. For setting acid-resistant bricks in acid towers, fume stacks, acid storage and pickling tanks...wherever protection from acids is needed.



ACCOSET-50

...air-setting refractory cement which can withstand temperatures up to 1710° C., and has firm bonding strength. For jointing, bonding, monolithic and rammed linings, for protective wash of furnace-walls and floors etc.

FIREBRICKS

...manufactured to your specifications of shapes, sizes and alumina content. ACC Firebricks resist abrasion and spalling. They possess all the properties required for long service under severe operating conditions in high temperature zones.

ATOMIC POWER

U.S. Aid for Tarapur Plant

The U.S. Ambassador to India, Professor John Kenneth Galbraith announced last week that the United States had offered a foreign exchange loan of $80 million (Rs. 38.1 crore) to finance India's first atomic power station in Tarapur, on the Arabian Sea, 62 miles north of Bombay.

The Tarapur atomic power station scheme, which is being launched by the Indian Atomic Energy Commission, will have a capacity of 380,000 kW. When it is completed, it will be one of the largest sources of power of any kind in Asia. The energy will be supplied to the electricity systems of Maharashtra and Gujarat, which are to be inter-connected. The major industrial loads to be served are in Bombay and Ahmedabad.

The Rs. 38.10 crore ($80 million) foreign exchange loan will come from the U.S. Agency for International Development, and will have a term of 40 years, with no payments of principal for the first ten years. The loan will carry a credit charge of three-quarters of 1 percent. In addition, the U.S. Government will provide the initial uranium fuel charge, estimated to cost about Rs. 7.14 crores ($15 million), on a long-term, deferred payment basis. The total amount of U.S. foreign exchange assistance for the project will be Rs. 45.24 crores ($95 million). The total cost of the plant —less the initial fuel supply—is estimated at Rs. 54.33 crores, of which local costs of about Rs. 16.23, crores will be met by the Government of India.

The Planning Commission sanctioned a nuclear power plant in August 1958, and the project was ultimately included in the third five year plan It was listed among the projects presented to the recent meetings of the Aid India consortium for financing in the current year of the plan. In mid-1960, the decision to locate the plant in Tarapur was announced in Parliament. Competitive quotations to build the station were accepted from a number of countries in August 1961, and a preliminary letter of intent was issued to the U.S. firm of International General Electric in September 1962. The General Electric Company has had substantial experience in building atomic power plants.

The U.S. was officially asked to finance the Tarapur project in 1961, and a loan application was submitted in November 1962. Talks were held between representatives of the U.S. Government and the Indian Atomic Energy Commission throughout the following winter and spring. In its consideration of the proposal the Agency for International Development was assisted by the U.S. Atomic Energy Commission and the U.S. consulting engineering firm of Burns and Roe. An agreement on safeguards for the Tarapur plant has also been announced.

Noting that a very large number of technical, scientific and economic questions had to be resolved in preparation for this plant, Ambassador Galbraith again stressed the importance of such careful planning. "By resisting the temptation to hasty decision", he observed, "we can now be reasonably certain that this plant will be built to high technical standards and that the economic performance will be a credit to all concerned."

The 380,000 kW plant will consist of two 190,000 kW boiling-water type nuclear reactors. These reactors will be charged with slightly enriched uranium oxide (UO_2). They will generate high-pressure steam to turn two 1500-r.p.m. tandem compound turbine-generators. The electricity produced by the turbine-generators will be stepped up through the main plant transformer to the distribution system transmission voltage of 230 kilo volts. The station will also have associated electrical equipment, condensing plant, and waste disposal and de-contamination facilities.

The boiling-water nuclear reactors to be used in Tarapur are similar to units used in a number of power stations around the world although the Tarapur plant will incorporate all the latest technological advances. A single boiling-water reactor of 313,000 kW is being installed at Bodega Bay in California. Similar units of 237,000 kW and 150,000 kW, are being constructed. The 208 kilowatt boiling water type station in Dresdon, Illinois, has been in commercial operation since 1960.

When it is completed in mid-1967, the Tarapur plant will be, with the Hinkley Point plant in England, one of the two largest atomic power stations in the world. These will eventually be superseded by two plants now in the planning stage, one for the Consolidated Edison Company in New York City, and one in Wylfa Head in Wales.

In announcing the loan at a Press conference during last week, Ambassador Galbraith stated: "Successful completion of the Tarapur nuclear power facility will be a further demonstration of the prestige and leadership of India in atomic development in Asia. Indeed, it has been India's record of nuclear research and development through your Atomic Energy Commission which has given the United States the confidence to provde so much assistance to this huge and exciting project."

Just as the late Sir Shanti Swarup Bhatnagar established a chain of national laboratories, Dr. Homi Bhabha is equally determined to establish a chain of atomic power stations. The second one in Rajasthan has already been planned, and is awaiting some foreign power to finance it. The Central Minister of State, Mr. O. V. Alagesan, who is looking after the portfolio of his senior colleague since the resignation of Hafiz Mohammed Ibrahim, has announced that the Government is considering a proposal to establish a 600 mW atomic power station in Kalapakkam, near Madras. Canada and Russia are among the countries likely to aid the other projects. Dr. Bhabha should be deputed to canvass financial and technical support from other countries, such as France, the U.K. and Japan.

It is said that the cost of producing electrical energy from the Tarapur station will not be higher than that from a conventional station. Whether the commercial rate of interest on the capital equipment and uranium has been calculated to reach this conclusion, is not yet disclosed.

POWER

Appraisal by Foreign Expert

The international team's appraisal of India's long-term requirements of power is now at the discussion stage. One view, which is finding greater favour, appears to be to locate giant power generation stations in the vicinity of coalfields or coal washeries. Such a plan would obviate the need for transporting coal to long distances to feed power houses. The recent development in power transmission has made it possible to transmit power to long distances, it is explained. The sub-stations under the plan will be equal if not bigger, than a power house of average size.

FOREIGN EXCHANGE

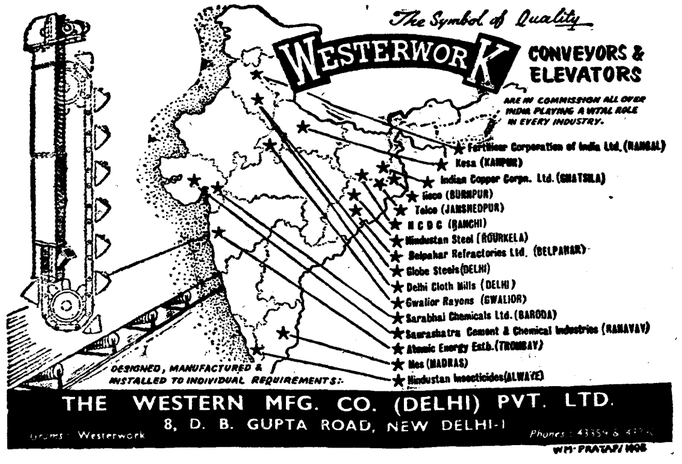
New I.M.F. Line of Credit

The International Monetary Fund has entered into a new standby arrangement with the Government of India which authorizes drawings from the Fund up to the equivalent of $100 million over the next 12 months. This succeeds a similar arrangement between the Fund and the Government of India, which was announced in July 1962. Under that arrangement, which also authorised drawings up to $100 million, the equivalent of $25 million was drawn and subsequently repaid to the Fund. Net drawings from the Fund by the Indian Government so far amount to $250 million. India's quota in the Fund is $600 million, of which $77.5 million has been paid in gold.

SMALL COINS

Withdrawal from Circulation

With effect from 1st January, 1964, the Central Government will call in the following denominations of the anna-pie series: (1) cupro-nickel one anna coin, (2) copper double pice coin, and (3) copper and bronze single pice coin.



From that date, these coins will cease to be legal tender. They will, however, be accepted from the public until 30th June, 1964, at all offices of the Reserve Bank of India, at all agency banks of the Reserve Bank of India, conducting Government business and at all Government treasuries and sub-treasuries in payment of dues as well as for exchange. During the same period, namely, from 1st January, 1964 to 30th June, 1964, they will also be accepted at all railway offices and post and telegraph offices, but only in payment of dues such as for railway tickets, booking of goods by railways, postage stamps and other postal stationery, radio licence fees, etcetera.

Moreover, until further notice, these coins will continue to be accepted even after 30th June, 1964 only at the offices of the Issue Department of the Reserve Bank of India in Bombay, Calcutta, Madras. Kanpur, New Delhi, Bangalore and Nagpur.

WM-PRATAP/1008

London

EXPANDING U.K. TRADE WITH COMMONWEALTH

(FROM OUR LONDON CORRESPONDENT)

IT is unrealistic to act as if change should not take place; it is anti-social to try to smother it; and it is criminal in the national interest to refuse to recognise that it is inevitable and to plan accordingly. Developing this argument in his presidential address to the Association of British Chambers of Commerce recently, Mr. T. H. Summerson referred to the cotton industry as providing a quotable example. In 1911, nearly one-quarter of the population of Lancashire was engaged in cotton manufacture. By 1951, under the impact of competition from India and Japan, the ratio of textile employment in that country had fallen to less than 14 percent. (During the same period, the numbers employed in metals and engineering had doubled, and, as a proportion of total employment, had risen from 9 percent to 15 percent.) Moreover, unsophisticated cotton piecegoods are the very antithesis of the type of export essential to maintain leadership. They have a high import and labour content, relative to their value; they face highly competitive conditions in export markets, and their profit levels are, therefore, low.

It was in recognition of this fact that legislation to assist the re-organisation of the cotton industry was introduced in 1959. Under its provisions, the Exchequer paid for two-thirds of the cost of removing surplus capacity and provided grants towards expenditure on approved re-equipment and modernisation. The argument leads remorselessly to one conclusion, which may be unpalatable to some. It is that if one wishes to be leader in the 1980s, one cannot afford to misapply the national effort by manufacturing goods which were profitable to the U.K. in the 1880s, but which are now only profitable when made in developing countries. That the Government should seek to shape industrial development is now generally accepted. The steps which it took towards rationalisation of cotton undoubtedly helped to solve a hitherto intractable problem.

However, Mr. Summerson felt that as business men, his audience should not wait for the Government, or anyone else, to solve their difficulties. It was up to them to look ahead and, where necessary, do their utmost to divert energies into those industries which will, once again, make the British people leaders. Since the war, with ever-rising tempo, invention and technological advance, as well as shifts in world demand, have produced profound changes in the structure of British industry, so that to-day, the electrical engineering, electronic, aircraft, motor and chemical industries contribute an increasingly large share of output and exports, and provide bigger opportunities for a highly skilled labour force. These are industries in which the U.K. has to strive to maintain its leadership; but in the heat of that struggle, she must still keep one eye on the future, because some of the products of these industries will inevitably become the cotton of the 1980s in their turn.

Planning for Future

It is as that "one eye on the future" that the National Economic Development Council, or Neddy, will play a big part. In its report—"Conditions Favourable to Faster Growth"—Neddy suggested that the Government and industry should work together to identify promising fields for research and development. One can only agree that it is not intelligent to pump money into research indiscriminately in the hope that some of it will be fruitful. Indeed, it is quite certain that a great deal of time and highly skilled energy have been wasted in the past by doing that. As for development, the country needs a more selective approach which rejects the assumption that almost any increase in investment is good, for it is essential to get it in the right fields and in amounts which bear a realistic relationship to the likely scale of effective demand. Neddy has, already, put in some useful work in this direction, but its recent report on export trends merely reviews the past and is not a particularly helpful guide to the future. One must hope the study by the National Institute for Economic and Social Research, to which the Neddy report refers, will give a better lead.

Looking through the Association's reports of 100 years ago, Mr. Summerson gets the impression of a dynamic and aggressive, almost belligerent, Association dragging a reluctant Government along behind it into ever-growing prosperity. He sometimes feels that to-day, the leaders of commerce and industry may appear too often as the champions of the *status quo*, interceding with the Government to protect certain sectors of the economy from "unfair" competition. After all, one industry can be subsidised only at the expense of another; and ultimately, leadership will go to the nation which has applied the right amount of effort in the right sector at the right time.

"There is no doubt whatsoever," he said, "that a long hard look must be taken both at industry as a whole and at our own businesses, in just the same way that Dr. Beeching has taken a long hard look at British Railways. The railways, being a service industry, have only an indirect influence on exports; but if such a re-appraisal is necessary for an industry which operates entirely within the United Kingdom, how much more necessary is it for productive industries, which must meet world competition, to make such a critical analysis. The Common Market is denied us, at least for the time being, and we now face the challenge of a global market with progressively falling tariffs and highly competitive imports. In such conditions it is more than ever imperative that we should make the maximum use of our resources."

Commonwealth Trade

Of many interesting contributions to the discussions of the conference, not the least important was a paper presented to the Overseas Group by the London Chamber. This opened: "The need for dynamic Commonwealth trade promotion is not new, it is not a consequence of the Brussels break-down, although that may have turned attention to it. It is not a question merely of Britain's interests or the booming of British exports. There is no need to argue the desirability of expanding Commonwealth trade."

The paper set out first to remind delegates of the existing position and secondly, to suggest what should be done both by individuals and by chambers of commerce to improve this. The paper recognised that the expansion of Commonwealth trade was basically dependent upon the expansion of world trade. However, even if the total volume of Commonwealth trade expanded, Commonwealth countries would not automatically benefit from the increasing opportunities in the markets of other Commonwealth countries. It is for this reason that dynamic trade promotion is necessary.

The rôle of the Federation of Commonwealth Chambers was referred to in the paper, which describes the main objectives of the Federation as being trade promotion, investment, education and research. The support of the A.B.C.C. for the Federation's work was sought, but it was also recognised that there was room for the Association to take its own initiative within the U.K. in order to stimulate the achievement of a dynamic Commonwealth trade promotion policy. It is the view of the Association that:

(1) For the past two years, led by the Government and aided by the Press, the United Kingdom has been conditioned towards accepting Europe both as a trading and economic partner in a very close and special sense. The impression has been gained, erroneously, in the Commonwealth that the emphasis on Europe has implied a diminishing interest in the Commonwealth countries as trading partners. It is the view of the Association that this is very far from the truth, and that positive steps must be taken to ensure that this is made clear both at home and abroad.

(2) The very real problems posed by the piecemeal industrialisation of under-developed countries are recognised. The disillusionment of some recently independent territories with the way in which their own industrialisation has been tackled is welcomed in the sense that, having learned that prestige industries did not necessarily contribute to the economic and, therefore, political advancement of their country, they might be able to advise and help other emergent territories in a way which the U.K. could not.

(3) The importance of stable markets and prices for primary products is paramount if a solution is to be found for the problem of uneconomic industrialisation. The Commonwealth sugar agreement is quoted as a desirable precedent in this context.

(4) The approach of France to her overseas territories is commended. Her maxim is trade not aid, and this has resulted in the development of healthy economies unhampered by exchange problems, and in a close and happy relationship between France and her territories.

(5) Whilst strict bilateralism in trade cannot be advocated, yet the Association feels that more attention should be paid by the Government, and in particular, the Board of Trade, to the need to strike the best possible bargain for the U.K. in trade negotiations. With too many Commonwealth countries Britain has an adverse trade balance, which arises in no small measure from the free access to the U.K. market for Commonwealth goods which is not reciprocated.

(6) There is a real need to ensure that the Commonwealth Relations Office and the Colonial Office take into account commercial and economic aspects in their political negotiations.

(7) Whatever action is taken by the Government, industry and commerce cannot be discharged from the responsibility of making the right goods and selling them, and the Association urges that attention should be given to the vital importance of salesmanship in the trade link.

(8) The United Kingdom has demonstrated in practical terms for many years her willingness to trade with the Commonwealth by opening her doors on preferential terms to Commonwealth goods. She must continue to demonstrate this willingness in practical terms, perhaps by championing the establishment of world commodity agreements. She is entitled to expect recognition of her desire to trade by the Commonwealth countries themselves being more realistic and affording U.K. exporters reasonable entry to their markets.

Jute

LULL IN GUNNY MARKET WORRIES INDUSTRY

THE lull in the raw jute and gunny markets during the past month has been worrying the industry and trade. Anxiety has been increased by reports that the jute acreage in India has risen by about 10 percent. The dullness in the gunny and fibre markets indicates that buyers are pausing. Reports from the U.S.A. say that bagmakers are drawing on their stocks and not replenishing their inventories by fresh purchases. Some of them want fresh orders so badly that they have had to accept U.S. Government business for sandbags without any manufacturing profit, merely to keep their workers engaged. Since the Indian mills are deriving a large part of their profits from hessian, any setback in U.S. consumption is likely to upset the industry. Other countries too are going slow with their purchases despite the low prices of sacking due to an abundance of supply in both India and Pakistan.

A comparison of the average prices of jute and gunnies in Calcutta at the end of June 1962 with those at the end of last week shows that the critical point has been reached and mills may have started losing. Against a price of Rs. 83.06 a quintal for Assam Bottoms in June 1962, 40in. 10oz. hessian was sold at Rs. 63.30 a 100 yards and B Twills at Rs. 132.90 a 100 bags. Now the corresponding prices are Rs. 71, Rs. 47.20 and Rs. 107.80. Thus, against a 14.6-percent fall in jute prices, hessian has declined by 25.5 percent and sacking by 19 percent. Against this background, it remains to be seen how long the industry can continue production at the maximum level.

Dullness in Fibre Market

In the fibre market sluggish conditions have persisted since the end of May. The mills had stocks amounting to more than 20 weeks' consumption in their warehouses, besides the J.B.S.A. stock of 750,000 bales. So they were not interested in the off-grade fibre offered by holders at a discount. The position was different a year ago. With an opening stock of 1.9 million bales in June 1962, mills purchased 441,000 bales during the month. The corresponding figures were 1.73 million bales and 332,000 bales for July and 1.51 million bales and 553,000 bales for August. The industry could extend active support to the fibre market because of the more remunerative price levels for gunny and the comfortable order-book position stretching far to the forward months.

Now the new crop has started coming to the upcountry markets at the rate of about 15,000 maunds a day. As a result, selling pressure has developed among operators and prices have sagged to new low levels, with Assam Bottoms quoted at Rs. 26.50 a maund for the old crop and at Rs. 28 for the new crop. Little business is being done. Cultivators are badly in need of money for going ahead with the sowing of *aman* paddy. So they are likely to emerge soon as keen sellers of fibre in the upcountry markets.

The I.J.M.A. has already asked its member-mills to extend maximum support to the market. But some in the trade wonder how far mills will be able to help considering that their jute stocks are large and the demand for jute goods is slack. Any insistence on compulsory purchases by mills is likely to create further complications unless the jute goods outlook improves. The State Trading Corporation's plans to purchase 2 million maunds through co-operatives are not likely to be of much help in halting the drift in prices.

Fourth Plan Target

The perspective planners have suggested a production target of 1.6 million tons of jute goods to be achieved by 1970-71, the last year of the fourth five year plan, it is learnt. This target is 300,000 tons higher than that for the third plan, and 578,000 tons more than the actual output of 1.02 million tons during 1960-61. The fourth plan target has been fixed after taking into account the possible rise in internal demand due to an increase in the production of agricultural commodities, cement, fertilisers and other goods, and in the overseas demand for jute manufactures.

During the second plan period, the industry could not achieve a modest target of 1.2 million tons, involving a small increase of 50,000 tons. In view of the progress made during the first two years of the third plan and the modernisation and diversification plans being implemented, the planners expect that the industry will be able to attain the fourth plan target. The output of jute goods now is about 1.2 million tons a year and the indications are that it may reach 1.3 million tons by 1965-66. Every effort is being made to install adequate balancing machinery of improved design. The broad loom capacity is being increased. With the installation of 227 such looms during the year, the total complement will rise to 2,250, with an output capacity of 135,000 tons of carpet-backing cloth a year on a three-shift basis.

As the achievement of the fourth plan target will depend on the availability of plentiful supplies of raw jute at reasonable prices, the fibre target has been set at 7.5 million bales, against 6.2 million bales for the third plan and 5.37 million bales produced in 1932-63. These figures exclude mesta, the production of which is estimated at 1.53 million bales in 1962-63. It is believed that the additional output of 1.3 million bales of raw jute can be achieved without increasing the acreage because the average output a hectare in India is only 6.33 bales; against 9.16 bales in East Pakistan. Improved farming practices have been introduced all over the jute-growing areas to step up the quality and yield of the fibre in India.

Promoting Exports

At its recent meeting in New Delhi, the Board of Trade expressed satisfaction with the progress of the jute industry's exports. The industry was advised to pay more attention to research on jute products and diversification programmes in order to expand the markets in non-traditional goods. It was complimented on having modernised more than 75 percent of its capacity. The Board pointed to the liberalisation of the foreign exchange allocations (amounting to Rs. 6 crores) in order to accelerate the industry's modernisation drive. It recommended that the industry and the Jute Commissioner should draw up a comprehensive programme for carrying out intensive research in jute goods and setting up a permanent exhibition of jute products in Calcutta.

The Board's recommendation that the Government should help the industry in promoting exports of jute sacking and bagging is construed as indicating a change in the official approach to the problem of fighting the competition from Pakistan. Trade and industrial circles are awaiting details of the nature and amount of such assistance with keen interest. They point out that a major hurdle for export promotion is that production costs are too high, with the floor price of fibre pegged at Rs. 30 a maund for Assam Bottoms and with labour charges increasing.

Jute Goods Stocks Rise

An I.J.M.A. statement shows a small increase of 100 tonnes in jute goods stocks, from 96,100 tonnes at the end of May to 96,200 tonnes at the end of June. Of this, sacking rose by 1,600 tonnes to 47,300 tonnes, while hessian fell by 100 tonnes to 32,300 tonnes and other goods by 1,400 tonnes to 16,600 tonnes. At the end of June 1962, the stocks were 80,200 tonnes, consisting of 24,800 tonnes of hessian, 39,100 tonnes of sacking and 16,400 tonnes of other goods.

The June stock figures indicate that practically the entire output during the month was absorbed. But June was a short month with 192 working hours, against 216 in May. There might, therefore, have been a small shrinkage in output. Market circles seem to have interpreted the rise in stocks bearishly. The pessimism is reinforced by the poor trend of overseas enquiries and business during the past month.

New Jute Mills in Burma

The Government of Burma proposes to set up a jute mill—the second in the country—in Rangoon to achieve increasing self-sufficiency in jute goods. Currently, Burma uses about 40 million jute bags for packing its farm produce. Of these, about 50 percent are produced within the country and the rest imported from India and Pakistan. A six-member Burmese team toured East Pakistan recently to study various aspects of the production of fibre and finished goods. Burma intends to grow more jute to meet the fibre demand of the two mills.

THE JUTE MARKETS

Manufactured Goods: Trading was devoid of interest in the jute goods market during the past week. Apart from stray covering in heavy goods and scattered business in hessian from the U.S.A. and Argentina, enquiries were rare. In sacking, a Government tender for Liverpools for the near position was reported towards the close. The I.J.M.A. gunny stocks figures for June had a bearish effect. But though the mills were keen on selling for all positions, they became reserved at the lower levels. The

futures market was depressed in line with the general trend and prices tended to drop on tired long liquidation. But bear-covering at the bulges stemmed the downward movement partially. At the close, prices showed widespread losses. Turnover was small in the spot market and moderate in the futures market. The closing undertone was hesitant in both.

Wednesday's quotations were as follows:

	July	Aug.	Sept.	Oct.-Dec.	Jan.-March
40in. 7½oz.	34.40	34.45	34.45	34.25	34.10
40in. 8oz.	37.15	—	—	—	—

Liverpools	122.50	122.50	122.50	122.50	122.50

Raw Jute: Conditions were subdued in the raw jute market during the past week. Mills showed little interest, while sellers were keen to dispose of their holdings of both old and new crop below the minimum levels. Sentiment was disturbed by reports of satisfactory crop conditions and an increase in the acreage under jute. Arrivals were about 20,000 maunds a day in the upcountry centres. Routine transactions were reported in small lots of selected grade fibre around Rs. 26.50 a maund, f.o.r. Calcutta, ready, for the old crop; and Rs. 28 a maund, f.o.r. Calcutta, July delivery, for the new crop. In the futures market, small business was transacted in Upper Assam White Bottoms for September at the floor level of Rs. 30 a maund. The undertone was hesitant.

Wednesday's quotations were as follows:

	Landed at Mills (Basis Bottoms) Current Prices		T.S.D. Minimum Prices

THE U.K. JUTE MARKETS

FIBRE QUIET

(FROM OUR DUNDEE CORRESPONDENT)

ALTHOUGH the loose jute market in Pakistan was firmer past week, this was not reflected in the position in Dundee. Sellers continued to offer at or under the current E.P.C. levels without attracting much buying interest from spinners. The business taking place in Dundee was still mainly confined to spot parcels at fairly low prices. However, there was some movement in new crop Mill Hearts at £94 15s, but the quantity of jute involved was small.

Spinners have been holding large stocks of raw material and these are being allowed to run down as the feeling is that prices are more likely to fall than to rise. Although the Pakistani mills are buying steadily, there is very little movement taking place in new crop jute.

The raw jute market here was featureless, with both buyers and sellers pausing. New crop offers were lowest at £109 for Mill Lightnings, at £93 15s for Mill Hearts and at £81 for Grade Hearts, c.i.f. U.K., for August-September shipment. Grade Tossa-2/3 was named at £119 10s and Grade Tossa-4 at £106. Outport Tossa-2/3 was available at £97 10s and Outport Tossa-4 at £87 10s, September-October. New crop cuttings were at £55 for S.N.C. and at £46 10s for N.C.

Offers of old crop were still being quite freely made at £109 10s for Mill Lightnings, at £94 for Mill Hearts and at £77 10s for Grade Hearts. Grade Tossa-2/3 was at £119 and Grade Tossa-4 at £106 10s. Outport Tossa-2/3 ranged from £93 15s and Outport Tossa-4 from £84 for July-August shipment.

THE PAKISTANI JUTE MARKETS

NEW CROP PROSPECTS BETTER

(FROM OUR DACCA CORRESPONDENT)

BRIGHT sunny weather with occasional showers has continued and the midland crop shows every indication of being of the best class. Earlier reports of poor germination have not been confirmed, so an excellent midland crop both in points of quality and quantity may be expected in White and Tossa. This gives a general picture, but in the hard district areas and also in the Jessore area, Tossa has suffered from excessive water during June. This will mean a poor Tossa crop in those areas both in quality and quantity.

A recent inspection of the crop in various parts of the country confirms earlier comments about the lowland crop which is not only short and croppy because of earlier harvesting, but in some places, it has suffered from lack of sufficient steeping water which means that it will be even more croppy. Certainly, no quality baler will be interested in the early lowland crop.

Buying of cuttings at slightly enhanced rates continues by the same big baler, so that not much cuttings are available at present for ready delivery. In long jute, very little business is reported in the local market. Overseas buyers continue to buy piecemeal, and Czechoslovakia is reported to have been in the market for grades ranging from Export Hearts to Mill Firsts.

Commodity Markets

OPEN COFFEE AUCTIONS MAY BE REVIVED

(FROM OUR SOUTH INDIAN CORRESPONDENT)

THE Coffee Board might again start open auctions for exportable coffee. There was a majority decision in a recent Board meeting to go back to this system which had been abruptly dropped a few months ago. Open auctions were introduced early last year, in response to a long-standing demand of the growers and a section of the trade. This was more useful and popular, and served to get better prices for the exportable surplus, in the opinion of those who favoured this system. But the Board dropped the experiment after a year's trial, and went back to the old system of closed bids, which is now in vogue.

There are complaints from growers that the payment from the Coffee Board for the coffee they surrender to the pool is delayed inordinately. For instance, Mr. J. W. Lawrence, chairman of the Nilgiri Planters Association, said in his address to the latest annual general meeting of this association: "Our members are undergoing considerable hardship financially due to the 18 months delay in realising sale proceeds of coffee delivered to the Board's pool. There is no doubt that our coffee planters, a number of whom are small growers, whose production is 3 to 4 cwts. an acre, would be given relief in running their properties if the Coffee Board arranged immediate payments for coffee delivered to the pool and they would no longer have to resort to borrowing money to pay their production costs".

The coffee yields in the Nilgiris being poor, Mr. Lawrence appealed to the Coffee Board to develop a replanting programme so that the existing plants could be replaced by those of better strains. Until these replanted areas began yielding, subsidies might be given at the rate of Rs. 2,000 to Rs. 3,000 an acre. Nilgiri coffee had a reputation for its quality in the world market and if only yields were raised, demand for it could be maintained and it would serve to earn more of the much-needed foreign exchange.

World Coffee Agreement

The new long-term International Coffee Agreement may not have to wait for long to become operative in view of the recent formal notification of the U.S. intention to ratify it. This agreement, reached under U.N. auspices, is aimed at strengthening the control over coffee exports from producing countries by regulating imports into consuming countries. It also limits coffee imports by member countries from those outside the Agreement. There were doubts in the United States whether the Government had adequate powers to implement the provisions of the Agreement, but these having been set at rest, it is said that the Agreement will come into force at an early date.

Ratification by 20 coffee-exporting countries having at least 80 percent of exports, and by ten importing countries having a similar amount of imports, is required to provide life and force for this Agreement. It may, however, come into force provisionally when adequate notifications of intention have been received. Until recently, 24 exporting countries representing 88.7 percent of exports and 10 importing countries representing 26.8 percent of imports had either ratified the Agreement or declared their intention to do so. As the U.S. imports 51.7 percent of the world's coffee, that country's intention to ratify the agreement raises the total of importing countries to 11, representing 78.5 percent of imports. A number of other coffee importing countries are also said to be ready to ratify the Agreement. It is, therefore, felt that the Agreement will come into force provisionally in the next few weeks.

The administrative council of the Agreement is meeting towards the end of this month to decide the quota for the coffee year beginning from 1st October, 1963.

The U.S. Department of Agriculture in one of its latest report says that the world coffee crop for 1963-64 will be slightly less than in the previous year. Brazil's crop will show the effects of the 1962 frost. "The reduction in the State of Parana, because of this, will more than offset a much improved crop in the State of Sao Paulo. Except for frost damage, reports indicate optimum weather conditions in Brazil and many trees are making a good recovery", the report adds. According to this report, very little change is expected in Columbia's new crop. On the other hand, Ecuador is expected to have a larger crop in spite of drought conditions in the province of Manabi. Production continues upward in Peru. The report says that production in Africa would show an increase of 0.4 percent. Angola's new crop is expected to be at the same level as last year's, but Ivory Coast's crop probably would not reach last year's level. Prospects are good in Tanganyika. The 1963-64 Asian crop is expected to show some increase as Indian production is expected to be slightly larger than the previous year's. The exportable surplus of the Philippines will be comparatively small.

S.T.C. Buying Lemongrass Oil

The State Trading Corporation is opening purchasing depots in Cochin, Alwaye and Calicut in order to enter the lemongrass oil market. This measure would enable the producer to get the prices fixed by the Government recently. The price of lemongrass oil came down as exports were not materialising, and there was a tendency on the part of the foreign buyers to hold off. The Government stepped in to help the producer and fixed the floor and ceiling prices. There were no buyers for the commodity at the minimum prices fixed by the Government, so there was a stalemate in the market. The State Trading Corporation was asked to step in and lift the accumulated stocks at the prices fixed by the Government. The Corporation's officials visited Kerala recently and finalised arrangements for lemongrass oil buying by the corporation. An S.T.C. spokesman told newsmen that it would be open to all producers of lemongrass oil to tender their oil at any of the depots where after the normal tests and analysis, the oil would be accepted, and paid for at the rates prescribed by the Government of India. He added that it had been brought to the notice of the State Trading Corporation that a certain quantity of lemongrass oil already purchased from producers by the dealers still remained unsold. The Corporation was thinking in terms of providing some relief to them also, under the procurement scheme.

According to the S.T.C. spokesman, India produces about 1,500 tons of lemongrass oil a year out of which 80 to 90 percent is exported. This essential oil is largely used in the manufacture of synthetic Vitamin A. It is used in the manufacture of cosmetics and anti-mosquito lotions, too. Kerala is the principal producing centre of lemongrass oil in India.

Financial Assistance to Tea Industry Promised

(BY A SPECIAL CORRESPONDENT)

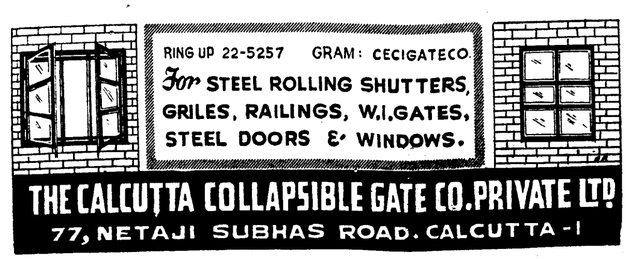
IT is heartening that the Governor of the Reserve Bank of India is reported to have advised the tea producers that the Government and the Reserve Bank are alive to the financial problems of the tea industry, and will render all possible assistance. The Governor is reported as saying that due to the emergence of a new situation last October, there was some flow of money into abnormal directions resulting in financial institutions receiving less in deposits, while the demand on scheduled banks increased. The present squeeze in money rates does not apply only to the tea industry, but to all industries.

From this month, the Agricultural Finance Corporation is in operation. This body will assist in meeting the cost of such items as extensions, replanting and replacements. These facilities will be made available to the tea industry through scheduled banks. The Governor also referred to the Refinance Corporation and stated that refinancing facilities would be available to any banking institution which advances money specifically for manufacturing and processing operations and not for agricultural operations. Although normally, this facility of refinancing is available on three to seven years' repayment terms, but, where so requested, the facility has been extended to ten years. He thought that the facility granted to scheduled banks to get the refinance against their commitments to the exporters of tea against purchase and shipping documents, should normally help the tea producers also to get their money quickly on the sale of tea. They should help tea estates who decide to export tea direct to any country.

The State Bank has agreed to share with the Tea Board the charge on the assets for advance to be made by the Board for plantation, replantation and replacement on a *pari passu* basis.

Rise in U.S. Imports

As the future prosperity of producing countries will depend on consumption, the north American countries received special attention on propaganda last year. It is interesting to note that as far as the U.S.A., is concerned, tea imports were a record at 128 million lbs; this shows a rise of 15½ percent, but consumption is not expected to show an equal rise. Tea drinking is going up, but not enough to account for the import figures, so 8 to 9 million lbs may be left in stock. The extra buying was apparently caused by the Chinese attack on India. In fact, the year's imports did not all go into consumption. Therefore, 1963 figures may show an easier trend.



On the vital question of increasing world consumption, it is possible that new inventions will add to the popularity of tea. Much has been heard from the U.S.A. about instant tea. India, Ceylon and a firm in Scotland have been working on the idea and now the beverage in this form, is reported to be in competition with instant coffee. Africa is also reported to be experimenting with some form of instant preparation.

Some of the latest vending machines are reported to serve tea from freshly infused leaf, and the time factor is said to vary from 10 seconds to 1½ minutes. Such short infusion time suggests that C.T.C. type of manufacture is being used with dusts or powder. It is further suggested that at some future date, tea powders will be produced on tea estates.

Tea Output and Price Trends

Production in North India to end of June, it is estimated, is down by 15 million lbs, compared with the same date last year. Auctions, consequently, show better results with average price realised at Rs. 5.15 a kilo, compared with Rs. 4.66 on the same date last year. At London auctions, the January-May average of 4s 1d a lb compares with 4s 5d a lb in the same period last year.

At the latest London auction, on 1st July, north India supplied 9,690 chests of the 30,187 packages offered. Apart from poor liquoring teas, there was an improved demand for all descriptions. At the Calcutta auction on the same day, offerings amounted to 22,536 packages. There was a strong demand with plain Orthodox well supported at firmer rates.

COMPANY AND PUBLIC NOTICES

THE INVESTMENT & FINANCE COMPANY LIMITED

NOTICE is hereby given to the members of the abovenamed Company that an Annual General Meeting of the Company will be held at the Registered Office, Chartered Bank Buildings, Calcutta, on Friday, the 2nd August, 1963, at 11 A.M. for the following purposes:—

THE CONTROVERSY ABOUT DECONTROLLING STEEL

THE proposal to decontrol steel remains, two months after it was mooted by the Ministry of Steel and Heavy Industry, in a nebulous stage. No one seems to know for sure quite what it is that the Minister, Mr. C. Subramaniam, wishes to achieve. A committee of the three major producers, which has now been asked to put forward comprehensive proposals for decontrol, has been left to decide on its own what aims to strive for. The directive given to it—not to upset price stability and plan priorities on the one hand, and to protect the interests of small and basic industries on the other—is too general to be of much help. Price stability and decontrol are in some ways contradictory concepts because the essence of relying upon the efficiency of allocation in a free market is to let prices reflect changes in demand and supply. That apart, producers can hardly settle on their own such issues as freight equalisation or the element of protection to be given to re-rollers. Nowadays, these are plainly matters subject to political decision.

The situation has made many wonder whether the Ministry has left the framework of policy undefined because Mr. Subramaniam is not yet ready to take a clear stand. In any case, his own judgment is hardly likely to suffice because several of his colleagues, and almost certainly the Planning Commission, will have a good deal to say before any major policy changes can be made. In the present political stalemate in New Delhi, it is perhaps futile to expect a firm lead. One can sympathise, therefore, with Mr. Subramaniam for having to stall for time until the political climate clears up and he can be sure of continuing his present association with steel. This may be one reason why the problem of decontrol has been dropped somewhat unexpectedly in the producers' lap, to rest there for a while until the Minister is ready to resume the initiative.

Before the details of decontrol can be usefully discussed, by the producers' committee or anyone else, it is necessary to outline the basic premises upon which the policy change is predicated. It has been suggested that supplies of some categories of steel—certain merchant mill products and light structurals—are now so plentiful that retail sales are at times made below the controlled prices. The continuation of either price or distribution controls is, therefore, unnecessary to protect the consumer, and it would be best to leave prices to adjust themselves to demand by putting these categories in the free market. While "distress sales" have undoubtedly taken place, this may well have been because of a sudden and purely temporary excess of supplies. In one instance, the Durgapur works—out to set a record—despatched very large quantities of a single section to the Calcutta market, which should normally have been distributed all over the country. Since destinational restrictions prevented upcountry despatches, the entire lot was pushed off to Calcutta, precipitating a crash in prices here. It would obviously be wrong to generalise about the demand-supply situation on the basis of such exceptional evidence. The disparity in prices between Calcutta and the more distant markets where steel arrivals continue to be erratic suggests that the surpluses arising from time to time reflect a malfunctioning of the transport system rather than an absence of demand.

Judging from the fact that consumers—both large and small—fear that prices will rise in the event of decontrol, the theory that demand and supply are now in balance cannot be accepted without close scrutiny. On this point, the Ministry has not so far offered enough information for reaching firm conclusions. Until evidence to the contrary is produced, one may assume from the fact that 850,000 tons of steel were imported in 1962 that supplies are still seriously short. Not all these imports consisted of the categories of flat products where a shortage is admitted, and which it is proposed to exclude from decontrol. Furthermore, in the coming months, the growth of public investment might well lead to an increase in construction activities and consequently in the demand for bars, rods and structurals. If so, the deficits may become bigger, which is the probable reason for the alarm expressed by consumers. Another reason for expecting a rise in the demand for these categories is that more non-project foreign aid is likely to be offered this year, which should make maintenance imports more freely available than in the recent past. The resulting growth in industrial production, and in economic activity, could be reflected in an increased offtake of steel. On this view of prospects, the assumption of plentiful supplies is to be seriously doubted.

This is not to suggest that controls should continue in their present form. Most people agree that the procedures need overhaul because they have clearly failed to allocate supplies according to rational priorities and also to maintain prices at the controlled levels. The Raj Committee's preliminary recommendations, well-received by both producers and consumers, suggest one way out which deserves to be given a fair trial. The basic concept underlying the Committee's suggestions is that production planning should be made the producers' collective responsibility, with the Iron and Steel Controller functioning only as an umpire to decide those few issues which the steelworks cannot settle on their own. Such self-regulation is greatly to be preferred because it would throw the responsibility for adjusting production to the pattern of demand upon the producers, where it rightly belongs. Implicit in the scheme is the adjustment of price differentials so that the real cost of productng a steel item is reflected in the price charged to the consumer. The present reluctance to roll certain uneconomic sections should then largely disappear, making it much easier to tailor production to actual demand. The Raj Committee's plea for allowing the price of steel to rise to its true economic level takes care of two major objections to the existing system of control. Mr. Khrushchev, at one extreme, and the World Bank, at the other, have declared that a lot of steel is wastefully used in India because its price is unrealistic in relation to the price of substitutes. If prices begin to reflect the real value that should attach to steel in the present conditions of scarcity, unnecessary consumption would automatically be

checked. Again, a rise in prices would restore to the steel industry a healthy level of profitability and enable it to finance its own future development to a far greater extent than is possible today.

Taking the Raj Committee's line of thought to its logical conclusion, one can argue that self-regulation by the industry should extend to the question of prices also. In other words, the responsibility for setting prices should be delegated to the producers instead of being borne by the Ministry. Formally, this would mean price decontrol, but in practice the Government would still retain an effective say, first through the agency of Hindustan Steel (which now accounts for 65 percent of the production); and, secondly, through the special powers which it would obviously wish to retain, in line with the practice in the U.K. Such delegation of authority has much to recommend it, not least because prices would become less of a political issue once the Minister is able to disclaim direct responsibility. Having disposed of the controversial price issue in this manner, the control over distribution remains to be considered. Here the answer for the present would be that controls should continue, so that essential users may enjoy the first call on available supplies. To argue that producers can be left to allocate supplies within the framework of a general directive regarding priorities is to miss the point that a choice often has to be made between two or more equally important end-uses. There is little justification, as has been shown, for the assumption that a surplus exists now or may develop in the future. That being so, the responsibility for maintaining priorities would remain with the Government.

MOBILISING BANK DEPOSITS

LEADING bankers have already started worrying about how they are going to supply the credit requirements of trade and industry during the next busy season (1963-64). The Indian Banks Association met *in camera* a few days ago to discuss the situation arising out of the slow growth of deposits since the onset of the emergency. It decided to discuss the trends with the Governor of the Reserve Bank, Mr. P. C. Bhattacharyya, and inform him of the banks' point of view. Later, a few prominent bankers, including Sir Homi Mody, Mr. Tulsidas Kilachand and Mr. A. D. Shroff, met the Governor. They are reported to have urged him to modify the two-tier system of interest rates; to abolish the "ceiling" on bank borrowings from the Reserve Bank in the coming busy season; to postpone the enforcement of the higher statutory liquidity requirement beyond 16th September, 1964; and to consider the difficulties of individual banks sympathetically. The Governor, it is understood, gave them a patient hearing and promised to look into the representation.

The bankers clearly feel that the slow growth of deposits requires attention immediately, that is, even in the trough of the slack season. But there are reasons to believe that the Reserve Bank does not share the anxiety fully. The latter seems to think that bank deposits will grow rapidly as the increased defence expenditure starts percolating back into the economy. This was made clear in its *Report on the Trend and Progress of Banking* (1962). The Reserve Bank is probably also worried that it cannot agree with the bankers without diluting the existing credit controls aimed at controlling inflationary pressure. The rise in prices, which has been causing anxiety since the presentation of the Central Budget for 1963-64, might be accentuated if the Reserve Bank relaxes its controls. The Reserve Bank perhaps also thinks that it is in a better position to judge the situation since it has access to fuller data. For instance, it knows more than the bankers do about the present trends in deficit financing, the size and pace of Government expenditure and the overall position in the banking system.

In assessing the situation, it is necessary first to take stock of developments during the past few months. In the 1962-63 busy season, in spite of numerous restrictions, the increase in bank credit turned out to be of the same order (Rs. 208 crores) as in the previous busy season (Rs. 213 crores). Expecting a sharp rise in bank credit, the Reserve Bank imposed on the eve of the 1962-63 busy season a ceiling on the accommodation banks could get from the Reserve Bank. The three-tier interest rate structure was changed into a two-tier one to make credit more costly. Banks were told to be cautious in lending against shares and gold, and in giving unsecured advances. Lastly, Bank rate was raised from 4 percent to 4½ percent with effect from 3rd January, 1963. The net effect of these changes was to make credit more costly and more difficult to obtain in the busy season.

But bank deposits lagged behind credit needs significantly because resources were diverted to the Exchequer to meet defence requirements. The aggregate deposits of scheduled banks, for instance, increased by only about Rs. 90 crores between November 1962 and April 1963, although they had gone up by Rs. 153 crores between November 1961 and April 1962. Notes in circulation during the 1962-63 busy season rose by Rs. 268 crores, whereas in the 1961-62 busy season the rise was Rs. 239 crores. The gap between resources and requirements during the 1962-63 busy season was bridged by securing accommodation from the Reserve Bank, which at one stage touched Rs. 83 crores. There was some liquidation of Government securities also. Certain big banks maintained the minimum liquidity cushion through borrowing in the call money market and lent every naya paisa in their tills, with the result that the credit-deposit ratio in some cases went up to 95 percent. On the whole, more credit was taken, and at higher rates of interest. It is to be noted here that the banks, taking advantage of the increase in Bank rate, raised the minimum rates of interest on advances to 6½ percent and the average rates of borrowing by 1 percent. The interest rates paid on deposits, on the other hand, were maintained almost at the 1958 levels in order to keep the increase in operating costs down to the minimum.

All this is broadly reflected in the bank results released over the past few days. The Bank of India and the Bank of Baroda have maintained their dividends on larger capital for the half-year after bearing the substantially higher costs of the branch expansion programme and higher taxation during the year. The Bank of Maharashtra has reported a sharp rise in deposits—an increase of 11 percent in the first half of 1963, against 5 percent in the corresponding period of the previous year. The Dena Bank has managed to maintain the dividend on larger capital, although the profit has fallen to Rs. 14 lakhs in the first half of 1963, against Rs. 17 lakhs in the corresponding period of 1962. According to some, the evidence suggests that the Reserve Bank has taken a sympathetic view of the credit needs of individual banks and permitted sizable relaxation in its controls. Various banks have been given special accommodation. The credit restrictions have also been relaxed for certain specified sectors like exports. On the whole, it is claimed, the Reserve Bank has operated its credit control policy in a flexible manner.

Since the current slack season commenced, the growth of deposits has gathered momentum. Since 26th April, deposits have increased by Rs. 55 crores (up to 5th July), or almost as much as in the corresponding period of 1962. Banks' borrowings from the Reserve Bank have touched a new low of Rs. 79 lakhs, against Rs. 83 crores at the peak of the 1962-63 busy season. The contraction in credit has been greater (Rs. 60 crores) in the current slack season than in the corresponding period of last year (Rs. 10 crores). The much larger credit contraction is responsible for the easy conditions in the money market. Inter-bank money rates touched ½ percent at one stage, against 6½ percent at the peak of the last busy season. Last year, at this time, the rate was around 1¾ percent.

The growth of deposits and the contraction of credit in the slack season has, therefore, been of the order of Rs. 115 crores. But bankers are afraid that the new borrowing programme and the compulsory deposit scheme will reduce their funds and stringency might return as soon as the new Government loans are subscribed. The Reserve Bank believes, however, that the tempo of defence and development expenditure has been gathering momentum, so the situation will ease before long. For instance, in the fiscal year 1962-63, deficit financing turned out to be Rs. 347 crores, instead of the Rs. 156 crores budgeted for. The larger dose of deficit financing did not, however, yield a commensurate increase in deposits. Mainly because of the diversion of resources for defence purposes, deposits in fact increased by only Rs. 192 crores, as compared with Rs. 225 crores in 1961-62, when deficit financing was Rs. 152 crores. But the higher level of expenditure envisaged in the 1963-64 Budget—nearly Rs. 800 crores more than last year—is bound to increase the pace of deposit growth in the next few months.

Taking the first half of 1963 as a whole, it is clear that the growth of deposits has not been commensurate with the scale of Budget expenditure. But apart from the temporary diversion of resources to the Exchequer (which resources might well come back to the banking system), the banks themselves are partly responsible for the slow growth of deposits. This is because bankers are reluctant to raise the interest rates on deposits to more realistic levels. In fact, some were thinking of increasing deposit rates, but the Reserve Bank's annual report on banking has made them change their mind and wait. At the same time, they have never had any hesitation in stepping up advances rates on the ground that interest rates generally have increased. The increase in the cost of credit has persuaded industrial houses increasingly to seek deposits from the public at rates of interest ranging from 6 percent to 7 percent. Such deposits were estimated by one source to total Rs. 25 crores in a few industrial houses alone. This trend is likely to continue unless bankers step up the interest rates on deposits, so the remedy for the situation really lies in their own hands. The Reserve Bank is unlikely to modify its dearer money policy before that is done.

OILSEEDS OUTPUT AND EXPORTS

IN spite of satisfactory weather conditions almost throughout the season, the production of the five major oilseeds in 1962-63—the second year of the third plan—is not expected to exceed 7.1 million tons, which is far short of even the second plan target of 7.6 million tons. Therefore, it is difficult to share the optimism expressed by the Central Minister for Agriculture, Dr. Ram Subhag Singh, in his inaugural speech at the recent annual meeting of the Central Organisation for the Oil Industry and Trade, that the third plan target of 9.8 million tons is not impossible to achieve. This will be difficult because more than 97 percent of the oilseeds crop is grown under uncertain rainfall conditions. Referring to the various measures for increasing oilseeds production, which the Government of India has taken in conjunction with the State Governments and the Indian Central Oilseeds Committee, Dr. Singh mentioned the integrated development schemes in 17 States at an estimated cost of about Rs. 2.66 crores. These schemes cover most of the feasible measures of extensive and intensive cultivation.

The Minister also referred to the package programme for increasing groundnut production. The programme aims at covering an area of 170,000 acres during the current plan period. In addition to the seven centres already sanctioned, it is proposed to set up another 24 package units for increasing the production of groundnuts. The package approach is also proposed to be extended to rapeseed, mustard and castor crops. Besides, there are other incentives which include subsidy for plant protection measures, subsidy for manures, additional allocation of fertilisers, extension of castor cultivation by free distribution of seeds exploitation of non-edible oilseeds, develop-

ment of red oil palm and tung plantations, etcetera. Yet, all said and done, a good crop of oilseeds, like most other crops, depends largely on timely and adequate rains, which makes all agricultural targets uncertain.

Considering the average oilseeds production over the past six or seven years, it is extremely doubtful whether the production will reach anywhere near the target of 9.8 million tons by 1965-66. It would be sheer wishful thinking to expect oilseeds production to rise by 2.8 million tons within the remaining three years of the plan. But looking to the increasing demand for oils and fats for a growing population in the country, the plan target does not seem ambitious. The problem of satisfying growing internal demand at reasonable prices is itself a very difficult one. It is complicated further by the pressing need for finding an exportable surplus in order to earn foreign exchange for the country.

The country's foreign exchange position calls for vigorous efforts to boost all exports. Oils and oilcakes have been leading items in the export schedule in the past. In 1955, India exported about 171,000 tons of groundnut oil, 71,000 tons of linseed oil and 43,000 tons of castor oil. Exports of castor oil reached an all-time record of 58,474 tons in 1960. In recent years, however, oil exports have suffered a severe setback because Indian oils were priced out. It was not that prices in India had risen more than in the other producing countries. But the rivals adopted new selling techniques and started offering their goods at prices which were lower than their internal prices. The Government of India has also taken certain measures in the recent past to stimulate vegetable oil exports; but if the results achieved have not been striking, it is because the Government's export policy has continued to lack imagination and boldness. Instead of boosting the export of castor oil and linseed oil, which are far less important than groundnut oil from the point of view of the domestic producer, the Government has been trying to stimulate the export of groundnut oil where the price disparity has been the widest. The continued disappointing export performance of castor oil in spite of rising world demand is a bad reflection on the country's export efforts. The Government has done little to exploit the export potential of castor oil, of which the country has a large surplus. It is also relatively easy to step up castorseed production.

The export performance of oilseeds, oils and oilcakes in 1962-63, however, shows a welcome improvement over the previous year's disappointing record when these items fetched no more than Rs. 25.11 crores, with groundnut extractions accounting for the bulk of the export earnings. The foreign exchange earned from oilseeds, oils and oilcakes in 1962-63 is much higher at Rs. 46.04 crores, of which as much as Rs. 31.79 crores are accounted for by groundnut extractions, Rs. 7.83 crores by groundnut oil, Rs. 4.29 crores by castor oil and Rs. 13 lakhs by linseed oil. The export of groundnut oil rose from 6.8 million kilograms to 57.7 million kilograms, that of castor oil from 24.9 million kilograms to 30.1 million kilograms and that of linseed oil from 400,000 kilograms to 700,000 kilograms. Spain was the biggest customer for Indian groundnut oil, followed by Hongkong, the U.K., Australia, West Germany, Burma, Morocco and the Netherlands. Russia occupied the first position concerning castor oil exports, followed by the U.K., Czechoslovakia and West Germany. Indian linseed oil went mainly to Czechoslovakia, West Germany and Pakistan. It is only oils which are posing a problem for the country. Oilcakes continue to do well, but measures need to be taken to assure the overseas buyers about the quality of the Indian products. The president of the Central Organisation for the Oil Industry and Trade, Mr. Ratilal M. Gandhi, has opposed the official move for quality control through preshipment inspection of export goods on the plea that this will cause unnecessary delays; the export trade in vegetable oils and oilcakes is being carried on on the basis of internationally recognised standards for several years. But it is no secret that the export market for Indian linseed cake has been lost mainly due to the uncertain quality of the stuff.

Current News and Comment

Credit for Exporters

The Ministry for International Trade has fixed an export target of Rs. 745 crores for 1963-64, against an actual export of Rs. 710 crores in 1962-63. Although the target is by no means ambitious, it is doubtful whether it can be reached considering that little has been done to remove the difficulties which have affected the export drive. The major handicap is that Indian products are too expensive, and so are being priced out of foreign markets. Since several items of production costs have been boosted by legislation or Government action, manufacturers find it difficult to quote competitive prices for their products. High prices apart, the export drive has been hampered by the lack of credit facilities for exports. Some half-hearted measures have been taken, but no attempt has been made so far to formulate a co-ordinated plan to provide export finance on a bigger scale. The provision of special export credit facilities by the Reserve Bank since March, and the supply of medium-term loans by the Refinance Corporation for Industry, have touched only the fringe of the problem. So the latest recommendations of the Study Group on Export Finance have evoked considerable interest. The eight-member group was headed by Mr. K. P. Mathrani, chairman of the Industrial Finance Corporation. While the recommendations look impressive on paper, it remains to be seen whether they will be implemented in time.

The Study Group has recommended to the Government that a scheme of credit guarantee should be evoked in consultation with the Reserve Bank to cover commercial banks against the losses they might incur in financing exports. It has suggested the establishment of an Export Credit and Guarantee Corporation to co-ordinate and strengthen the activities of the existing institutions in the field of export finance. The Study Group has also suggested that the Export Risks Insurance Corporation should be merged with the new Corporation which will undertake all the activities now carried on by the former. The E. R. I. C. at present takes on additional guarantee functions concerning exports and provides funds whenever the existing institutions are not in a position to provide them. The new Corporation would be owned wholly by the Government and modelled on the pattern of the Export-Import Bank of the U.S.A. The need for such a Corporation is clear because, with the increase in exports, Indian traders will soon require more long and medium-term credit facilities. An important handicap hitherto has been that Indian exporters have not been able to offer the same credit facilities to foreign buyers as their rivals do. A considerable proportion of international trade, especially in capital goods, is transacted on the basis of credit sales. Several countries have succeeded in increasing their sales because they have offered the facility of paying on instalment basis. Since efforts are being made to raise exports of Indian engineering products, it is essential that exporters should be able to offer competitive credit facilities to foreign buyers.

It is rightly recommended that export credit should be available cheaply. The Reserve Bank should provide funds for the purpose to commercial banks at a rate which is 1½ percent below Bank rate. The Refinance Corporation for Industry could also reduce its present interest rate of 5 percent in order to enable the ultimate borrower to obtain funds at 6 percent. If exporters are given cheaper credit, it will help them to offer better terms to foreign importers. Export credit is now provided on the basis of the f.o.b. value, which is often lower than the domestic price of a product. So the credit which an exporter gets is much less than what he can obtain by hypothecating the goods for sale in the domestic market. This inhibits export sales. If banks are to be encouraged to lend on the basis of domestic prices, it is necessary to give them two assurances. The first is that they will be adequately compensated in case the exporter defaults. The second is that they must be provided with sufficient credit facilities from the Reserve Bank.

The Study Group has endorsed the recommendation of the Mudaliar Committee that an import-export stabilisation fund should be set up to finance imports of essential commodities on a revolving basis. This fund could be used largely to finance imports of raw materials required by the export industries. The working of the latter has been greatly hampered by the shortage of imported raw materials. In fact, several export industries have suffered because growing idle capacity has raised unit costs.

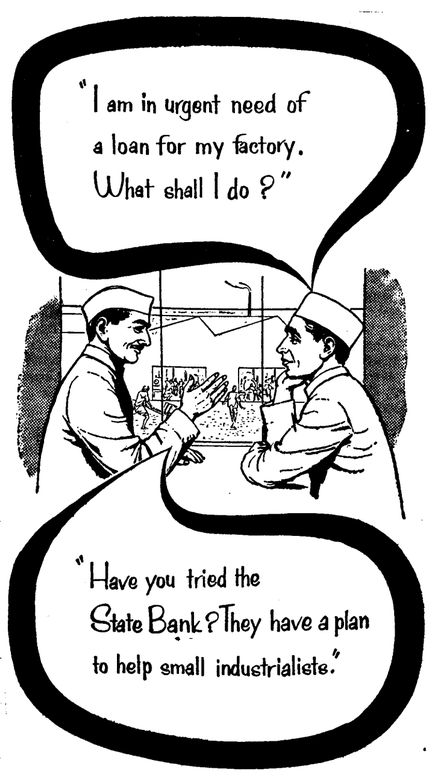
Plea for Higher Cloth Prices

The cotton mill industry has long been worried by the growing pressure on its profits as a result of the rising costs of production and voluntary control over cloth prices. In their annual speeches, the chairmen of almost all the textile mills have made gloomy forecasts about the future outlook if cloth prices are not suitably increased to compensate for the rise in manufacturing costs stemming from additional fiscal imposts, enhanced wages and higher raw cotton prices. The Committee of the Indian Cotton Mills Federation decided at its recent meeting to approach the Government for raising cloth prices.

It took many other important decisions relating to the submission of a memorandum to the Powerloom Enquiry Committee, collection of exicse duty and the export incentive scheme. Among other things, the Committee has suggested that the excise duty on cloth manufactured both by mills and powerlooms should be collected at the yarn stage and the processing stage, but not at the loom stage. The current practice is to collect the duty at all the three stages. The Committee, however, would like to make suitable provisions for ensuring that the handloom sector is not burdened with any additional yarn duty. To meet the growing demand for yarn from the handloom sector, it has been decided that the supply of yarn from mills direct to the weavers' organisations should be stepped up. The Federation's representatives will meet the Textile Commissioner to discuss the matter and arrive at some satisfactory arrangement for supplying yarn to weavers' organisations.

The Federation has also decided to take part in the tariff enquiry which has been ordered by the Australian Government with the object of giving protection to indigenous sheetings. It will put forward the case of the Indian textile industry for exporting Indian sheetings to that country. It is sending a delegation to Moscow for the opening of the Indian Industries' Exhibition, which is scheduled for 20th July. The Federation will share the cost of the fashion shows of Indian textiles at the exhibition. It has borne the cost of putting up the cotton textile section of the exhibition, amounting to about Rs. 6 lakhs.

Fall in Raw Cotton Rates



Cotton prices have fallen substantially over the past two-and-a-half months, and there is no indication yet that the downward trend is nearing its end. The August contract which touched a high

India's Resources
are Precious
WASTE NOT,
WANT NOT

of Rs. 748 (for three quintals) in April is now quoted around Rs. 689. In the ready section, where several varieties had been quoted at or above the ceiling, offers are now made at Rs. 40 to Rs. 50 a candy lower and the fall has been more pronounced in the inferior quality cottons. Several factors have contributed to the recent fall in prices. By far the most important of them is the upward revision of the 1962-63 crop estimate to around 5.60 million bales—an all-time high. Imports, although smaller than in the previous season, have been fairly satisfactory, and the figure for the current season is likely to exceed 850,000 bales. The recent barter agreement with the U.S.A. provides for the import of 300,000 bales (of 500 lbs each) of cotton in exchange for minerals. Mills are also being asked to lift staple fibre which the Government has imported at the instance of the Indian Cotton Mills Federation to augment the supplies of cotton.

While there has been a distinct improvement in the overall supply position, mill consumption of cotton has remained virtually static; in fact, it is slightly lower than in the preceding season. Total mill consumption during the first eight months of the season, September 1962 to April 1963, amounts to 3.8 million bales, comprising 3.1 million bales of Indian cotton and 668,000 bales of foreign cotton. The corresponding figures for the previous season were 3.1 million bales Indian and 700,100 bales foreign, making a total of 3.8 million bales. Stocks with the mills at the end of April were placed at 1.9 million bales, compared with 1.6 million bales at the end of April 1962, and on the basis of the current level of consumption, these stocks are sufficient to last for four months. Mills, therefore, are in no mood to make any further purchases, particularly when the weather news continues to be quite encouraging. Almost all the important cotton-producing areas seem well-satisfied with the progress of the monsoon. Of course, it is much too early to talk about cotton crop prospects.

The current fall in prices should not cause concern. In fact, it is welcome as it might help improve the industry's profit margin which has been badly squeezed by mounting costs. Besides, one cannot expect the entire crop to be marketed at the ceiling. If the new cotton crop turns out to be really good, cotton prices could be expected to keep below the ceiling prices. This should enable the authorities to restore freedom to the trade which has long been protesting against the supervisory scheme of marketing.

The State Bank of India, through its many branches, is ready to offer help and advice to small industrialists in need of a loan. Please call on the Agent of the branch in your town for full particulars.

Fresh Capacity in Sheet-rolling

In his address from the chair at the annual meeting of the Western India Sheet Rollers Association, in Bombay recently, Mr. P. R. Kamani severely criticised the Government of India's decision to permit the setting up of one more strip mill in the south. That individual applications for establishing strip mills should continue to be entertained in spite of the official policy of rejecting such applications without any reference to the Licensing Committee, seems rather surprising. There can be hardly any justification for establishing new units when the existing ones are being starved of raw material supplies. The Development Council for Non-ferrous Metals has estimated the demand for copper and brass sheets at 10,500 tons in 1965-66. The present demand, it is said, totals only 4,000 tons. Against this, the existing capacity of the sheet rolling industry is about 11,000 tons on a two-shift basis. With balancing equipment and diversification, the existing capacity is capable of manufacturing 22,000 tons a year.

The industry is fed to a considerable extent on imported raw materials. The foreign exchange shortage has naturally affected their supply. Imports of copper and zinc have recently improved, but the supply is still inadequate. Mr. Kamani says that if the Government had adopted a rational distribution of imported materials, it would not have been so very difficult to satisfy the demand of scheduled industries. In spite of the difficulties facing the industry, Mr. Kamani has great confidence in its future, especially for those units which have diversified their products. There has already been a considerable diversification of production and the industry is now producing strips up to 47 S.W.G. Mr. Kamani has suggested a phased programme for switching over from commercial to industrial rerolling by small units. He has also urged the members of the Association to step up their exports.

Export Plan for Motor-vehicles

An export promotion association for automotive products and internal combustion engines is likely to be set up shortly to promote the exports of motor-vehicles, tyres, tubes, batteries, diesel engines, internal combustion engines, air compressors, pumps and related products. A sub-committee appointed by the Government of India to prepare a scheme for promoting their exports has already submitted its report. The proposed association, it is said, will initially have a membership of 250. To operate the export guarantee scheme and to assist members who suffer losses in the course of the export business, the association will call for subscriptions from members. The rate will not exceed 1 percent of the turnover of each member in any one financial year. The basis and quantum of reimbursements to members will be determined by a committee. Contributions from members will take place only after actual exports have been effected.

The sub-committee has made several suggestions in its report. It has been suggested that manufacturers should be permitted to export in any financial year up to 10 percent of their sales within the country. The Government has been asked to specify how much could be exported without any reference to the authorities It has been suggested that the exporters should be allowed to pay commission on sales up to 5 percent to their foreign agents. Another suggestion relates to the setting up of a machinery to make available quick rebates on excise and Customs duties The sub-committee has recommended that a delegation of main manufacturers and ancillary producers should be sent abroad to study markets from the Middle East to the Far East.

The Indian motor-vehicle industry is still not fully developed. It is not merely that production is far short of domestic demand, which has risen considerably because of the defence build-up The industry is still dependent on imported materials. Considerable foreign exchange expenditure is necessary to enable it to go ahead with its expansion plans and for raising the indigenous content

of the vehicles. The country is unlikely to have anything like an exportable surplus in the near future. The value of exports of motor-vehicles and motor-vehicle products at present is negligible, being hardly Rs. 50 lakhs out of the industry's total turnover of about Rs. 140 crores. It will be too much to expect that the proposed export guarantee scheme will yield any significant result in the foreseeable future. Even when the country is able to develop an exportable surplus, exports will be difficult because of keen international competition.

Inspection of Insurance Accounts

Speaking from the chair at the annual general meeting of the New Great Insurance Co. of India Ltd, recently in Bombay, Mr. Tulsidas Kilachand voiced a widespread demand when he asked the Executive Committee of the General Insurance Council to relieve those companies who have voluntarily agreed to inspection, from this obligation, as certain companies have refused the administrative machinery permission to scrutinise their accounts. When the scheme was first mooted by the Executive Committee, it was understood, Mr. Kilachand pointed out, that all companies transacting insurance business in India would agree to inspection. It has now come to light that certain companies continue to withhold permission to scrutinise their accounts. Thus the country has two sets of insurers, namely, those whose books are subject to inspection by the administrative machinery and those whose books are not. This state of affairs was unsatisfactory, Mr. Kilachand stressed. It puts companies which are subject to inspection at a disadvantage as against the rest, and would lead to many complications in the actual working of the revised Code.

The solution to the problem lies in deleting some of the provisions of the existing Insurance Act, which complicate matters and which require artificial support in the form of the Code of Conduct, the administrative machinery, etcetera. Mr Kilachand felt that the entire Act should be reviewed, and a new one, simpler and solely connected with general insurance business based on the British law, should be enacted. If this is done, the companies would be able to reduce their expenses considerably, as there would be no longer any need for a Code of Conduct, administrative machinery, inspecting officers, etcetera, all of which add to the burden of insurers. The terms of commission fixed by the Insurance Act are artificial, in the sense that they have no relation to the market forces of supply and demand Since the Insurance Act pegs the payment of commission at fixed rates, supply and demand have to be artificially regulated to conform to the pegged price. It was suggested at one time that reduction in premium rates would reduce the surplus in the hands of insurers to such an extent that there would be no wherewithal to make payment in excess of the limits fixed under the Act After entering into a scheme of phased reduction in fire insurance rates, the insurers had to give this up as it was felt that there had been no appreciable impact on the buying and selling rates of insurance. A new system of inspection instead came into force, and it has so affected the working of the insurance companies that they feel that they are virtually required to relinquish management to an outside authority In fact, a system of dual control is slowly emerging now. This is proving detrimental to the development of the trade and a great anomaly in administration has arisen.

Developing Road Transport

There was a time when it used to be thought that road transport should serve mostly as a feeder to the railways in long-distance haulage of goods. The experience of the past few years has amply demonstrated that road transport has to play an important rôle in both short-distance and long-distance haulage of goods However, there has been no significant change in the Government's policy towards road transport The road operators have to bear an excessive tax burden experience shortage of lorries and face difficulties in obtaining licences and permits In view of this it is somewhat surprising that Mr. Raj Bahadur, Central Minister for Shipping, told the annual meeting of the Indian Roads and Transport Development Association in Bombay that the burden of taxation on the road transport industry could not be considered excessive. He said that "taxation is related to paying capacity" and if the transport industry pays heavily "it is obviously because it has higher profits and has so far been in a position to pay". One would like to know what other choice does the transport industry, or for that matter anyone else, have but to pay the taxes imposed by the Government. Representatives of the transport industry have been telling the Government in no uncertain terms that the burden of taxation on road transport is excessive and this is one of the reasons why it has not developed much. It is significant that, on average, a commercial vehicle in India pays a total tax, including on oil, of Rs. 3,200 a year, which is nearly 2½ times more than the corresponding levy in Britain and about seven times greater than that in the U.S.A. Another significant fact is that there has been a rise of more than 400 percent in Government revenues from motor-vehicles since the commencement of India's first plan; it is expected to increase by a considerable amount in the current financial year.

The need for developing road transport, not only for short distance haulage but also for long-distance, cannot be over-emphasised. At present, the railways are not able to handle more than three-fourths of the total long-distance traffic of about 200 million tonnes of goods a year. According to Dr. F. P. Antia, president, Indian Roads and Transport Development Association, the railways would not be able to carry 330 million tonnes of long-distance goods traffic by 1965-66, to which must be added another 75 million tonnes of goods traffic arising from the emergency. So it will be necessary to expand road transport in India many times its present capacity.

The road transport industry needs a greater supply of commercial vehicles than at present. It is encouraging that the production of motor-vehicles in India in 1962 increased by 6 percent to 56,967, and, according to Mr. R. G. Saraiya, president of the Indian Institute of Road Transport, the output of motor-vehicles by the end of the third plan may be 100,000 vehicles a year, consisting of 30,000 motor-cars, 60,000 commercial vehicles and 10,000 jeeps. This may fulfil the plan target. But even so, the road transport industry would not get an adequate supply of vehicles because of the greatly increased military demand. It is good that the foreign exchange allocation to the motor-vehicle industry has been increased and efforts are being made to step up production. But the production capacity for commercial vehicles will have to be considerably increased if a sufficient number of vehicles are to be made available to the road transport industry.

Rayon and Synthetic Fabric Exports

Exports of rayon and synthetic fabrics through the ports of Bombay, Calcutta and Madras in June are placed at 3.5 million metres, valued at Rs. 36.2 lakhs; they show a sharp fall of about 45 percent in terms of quantity and 42 percent in terms of value over the previous month's figures of 6.3 million metres valued at Rs. 62.7 lakhs. In June 1962, exports totalled 5.7 million metres, valued at Rs. 72.5 lakhs The June figure takes the total exports for the first half of the year to 31.2 million metres valued at Rs 3.02 crores, compared with 30.9 million metres, valued at Rs 3.22 crores in the corresponding period last year. Excepting Singapore and Ceylon exports to other destinations recorded sizeable falls. Singapore took 1.1 million metres valued at Rs. 8.92 lakhs against 352,000 metres valued at Rs. 2.08 lakhs In the case of Ceylon, exports were higher both in terms of quantity and value—446,000 metres, valued at Rs. 4.37 lakhs, compared with 373,000 metres worth Rs 3.12 lakhs in the previous month.

The value of shipments to other important destinations in June with the previous month's figures in brackets was: Canada Rs. 1.92 lakhs (Rs 3.11 lakhs), Kenya Rs 1.81 lakhs (Rs. 2.36 lakhs), Iraq Rs 1.66 lakhs (Rs. 6.91 lakhs), Northern and Southern Rhodesia Rs. 1.42 lakhs (Rs 4.19 lakhs), Nayasaland Rs. 1.38 lakhs (Rs. 2.77 lakhs), Aden Rs. 1.19 lakhs (Rs. 3.13 lakhs), Yugoslavia Rs. 1.16 lakhs (Rs. 78,000) and Iran Rs. 1.09 lakhs (Rs. 3.17 lakhs). Zonewise, exports for the January-May period show that out of the total worth Rs. 2.66 crores, the Asian zone accounted for Rs. 1.57 crores to be followed by Africa with Rs. 60.99 lakhs, America Rs. 21.15 lakhs, Europe Rs. 19.96 lakhs and Oceania Rs. 7.14 lakhs. The average price of exports realised in June works out to Rs. 1.04 a metre, against Re. 1 in May and 93nP in April. Southern Rhodesia, Sweden and Algeria did not figure among the buyers of Indian art silk fabrics in June. With the import ban on fabrics in Iran, only small quantities are going to that market against previous licences. After a lapse of several months, Morocco purchased small quantities of rayon fabrics from India.

Public Sector Management

There is something definitely wrong with the management of public enterprises in India as is shown by the delay in implementing the various schemes, slow increase in output, high production costs and poor quality of the products. It is, no doubt, true that some public enterprises are working quite satisfactorily, but many of them are inefficiently managed The Central Minister for Steel and Heavy Industry, Mr. C. Subramaniam, pertinently remarked in a recent speech in Ramachandrapuram near Hyderabad that in order to ensure the successful working of public enterprises they should be "emancipated from the stranglehold of Government administrative procedures". He pointed out that the "discipline of industry and business is different from politics and administration". It makes little difference whether such industrial and business units are in the private or the public sector. To secure freedom from official interference in the working of public enterprises, autonomous corporations were formed but they have not achieved this aim. The Appleby Committee, the Gorwala Committee and the Krishna Menon Committee all emphasised the importance of keeping public enterprises free from official interference, administrative procedures and red tape. From time to time the Prime Minister and other leaders too have emphasised this point.

The basic cause for the inefficient management of State enterprises is that the right type of men are not selected as managers. There was a time when it was believed that civil servants could manage any set-up. Although there has been some change in this line of thinking, civil servants continue to be appointed as managing directors and heads of public enterprises. Worse still is the appointment of politicians to such posts. The managers and heads of public enterprises often lack the necessary experience and knowledge of the work, and so are not able to take independent decisions. They are never sure whether their decision is right or wrong and are, therefore, willing to accept the 'advice" of ministers and departmental heads. Besides, those who owe their jobs to favouritism or nepotism cannot possibly remain free from interference. The remedy is to appoint independent persons with business and industrial experience as managers of public enterprises. There is undoubtedly a shortage of managerial talent in the country, but there is no reason why the public sector should not be able to get persons of calibre when private enterprises can get them.

Helping Small Industries

Some interesting points were raised at the *ad hoc* committee of the Conference of Small-Scale Industries in the western region which recently met in Bombay. A number of speakers pointed out that there was unconscionable delay and a lack of co-ordination in issuing licences to small units. It was pointed out that the latter were seriously handicapped by shortages of imported machinery, raw materials and other requirements. Foreign exchange allocations have been curtailed not only for the small-scale industries but also for other enterprises. However, the suggestion that the system of issuing block licences should be extended to the small units to enable them to make selective imports of raw materials deserves consideration. Unfortunately, small-scale industries account for about only 5 percent of India's

total exports. The Government has adopted the policy of linking the imports of raw materials and machinery to the export performance of industries. The small units which are unable to export more, thus stand to lose. The *ad hoc* committee did not consider measures to increase the exports of goods produced by the small sector.

A big problem faced by small industries is that in some cases, the idle capacity is as high as 50 percent. One of the reasons for this is that they are not able to produce goods of the right quality at competitive prices. It appears that the efforts so far made to improve the design and quality of goods produced by them have not yielded satisfactory results. Their production costs continue to be high. There is no doubt that small industries have a special significance for India's economy because the ratio of investment to output in their case is small and their employment potential is high. They also help in the exploitation of local resources. But some of them are not properly diversified while some others have grown haphazardly without correct planning. They have thus become a drag on the economy. It is necessary to remedy their defects if they are to become useful.

It was pointed out at the meeting that the decontrol of certain steel sections would affect the small engineering units by hampering the smooth flow of raw materials to them. The Raj Committee which went into this problem thoroughly, however, thought differently. There seems to be no reason why the small units should not get their steel requirements at reasonable prices after decontrol. The *ad hoc* committee's suggestion that 50 percent of all the relaxed categories of iron and steel should be allotted to the directors of industries in the States for distribution to the small industries is too big a demand.

Exporting Engineering Goods

A trade delegation sponsored by the Engineering Export Promotion Council recently toured the U.K. and west European countries to study the export prospects for Indian engineering goods. Mr. S. L. Kirloskar, chairman of the Engineering Export Promotion Council, led the team. In a report just published, the Council says that western Europe and the U.K. have the most dynamic markets in the world—"sophisticated, competitive, technically demanding and large in size whose potentialities are even greater." The scope for Indian engineering goods in these countries is at present limited, as this country is not in a position to supply a wide range of finished products, but given "specialised production, technical ability of a high order and first-class quality and salesmanship," the Indian exporters can expand their market there. The delegation is convinced that western Europe offers tremendous opportunities for both producer and consumer goods. Some of the products which European industries may require are steel castings for machine tools and machine-building industries and other components; tools dies, jigs and fixtures; free forgings; special purpose machines; producer goods of the second degree such as diesel engines, electric motors, switchgear, sewing machines, small tools, engineering as well as carpentry tools like cutters, twist drills, reamers, vices, and garage tools; and consumer goods such as steel folding furniture, specialised builders' hardware, coffers, ventilator fans, sanitary fittings, manhole covers and concrete reinforcing bars. The Council makes the remarkable suggestion that the image of India as a supplier of primary commodities needs to be changed by demonstrating the ability to produce quality prestige goods, such as the Rolls Royce car in the U.K.

The delegation makes a number of recommendations as to what the Indian manufacturers should do on their own, apart from the effort which is being made by the Central Government's Council for Trade with Western Europe or by other organised bodies. The industry must establish close personal contact with the buyers, and all communications with them should be in their languages. Individual firms must enter European markets on a permanent basis. The large firms who already have their organisations in Europe should strengthen them and keep them in good trim, and the smaller firms should take advantage of these to market their products. The Export Promotion Council must help the individual firms by organising joint market research and inspection arrangements for goods to be supplied to European markets. The Government, the delegation suggests, should help promote publicity for the trade by participating in fairs and exhibitions abroad, encourage joint ventures with European partics, and assist Indian firms wishing to undertake the manufacture of products which European countries require.

CORRESPONDENCE

A NEW COINAGE FOR BRITAIN

(To The Editor of "Capital")

Sir,

I was interested to read The Ditcher's comments on a new coinage for Britain. What is the harm in decimalising the present pound? A tenth of a pound then be one florin and a tenth of a florin would be a "new" penny. This penny would be nearly 2½ times the value of the current penny, but the farthing could be reintroduced. If inflation continues at the present rate, neither the "new" farthing nor the "new" half-penny will be required for very long.

Yours etcetera,

C. H. S. London

Quilon, South India, 10th July, 1963.

MAKING ALUMINIUM IN INDIA

THE rapidity with which this metal is being adapted to so many diversified uses ought to induce those seeking investment to exploit the several matrices furnishing it, known to abound in our mineral tracts. Here once more the eastern districts bid for notice. Aluminium is chiefly found in felspar, sandstone (in the transition stage between soft and indurated), clay, marl and the older slate. It occurs also in the overlay of the bright crystalline gray quartz in the southern low hills of Chota Nagpur and similar formations, being rather plentiful in what the uninitiated call clay slate, *id est* the coloured shale that forms a distinctive feature at the base of the hills in the N. Surma Valley, which crops out where the limestone formation takes an abrupt bend to the N.E. at the debouchure of the Lubah river, as also in the consolidated beds of whitish clay and even in the potters earth. In fact wherever these layers of clay-slate appear, aluminium may be found, though the cleaner these clays the less abundant the mineral, but as these shales generally rest on an underlay of sandstone it will be lighted on in a more concentrated form in the latter. In this condition it mostly appears as dull crystals and may be mistaken for iron or copper pyrites or even flint in a minute form. One aspect under which it presents itself frequently passes unnoticed where the shale denoting the presence of coal or petroleum shews up. In the gullies and ravines: in this it appears as lossely packed flakes very much resembling the layers in an old haystack and almost black in colour, a possible though not infallible indication of its presence is the salt-water holes which must not be confounded with the "licks," (the taste of the two being quite dissimilar) these are found in the neighbourhood of the railway bridge in Cachar near Katteegurrah and also among the scattered low hills through which the line runs in the South Sylhet district where shale is abundant.

A Ditcher's Diary

I ONCE FOUND MYSELF NEXT TO JOHN STRACHEY—about whose latest book I wrote only the other day—on a flight from Athens to London. It was not long before we started talking about an odd assortment of things; and it was fascinating to watch an active politician leave aside political platitudes and talk to a stranger like a human being. This was in 1958; he was working on *End of Empire*, a very far cry from *The Coming Struggle for Power*. The influence of the latter book on a whole generation can hardly be appreciated by the young of today who, as far as I can see, take little serious interest in politics. It was not so in the 'twenties and the 'thirties. Europe was full of unemployment; symptoms of fascism were already making themselves felt; and the forces of appeasement seemed entrenched. Came the Spanish civil war; and although today many are able to see that the communists used the mood of frustration for their own ends, I think it says something for the youth of the period that it reacted sharply to reaction. I do not need to be told of the mischief done by misplaced idealism; the Nazis were idealists too. Yet the cynical apathy, punctuated by enthusiasm over The Twist or something equally trivial, which I now see all around myself, has nothing at all to commend itself. This is where Strachey came in. He taught the young to think in impersonal terms, to think of social organisation rather than of individual careers. He saw the steady dissipation of the idealism of the Labour Party, culminating in the return of the Tories in 1951. He was distressed in the extreme and never lost his faith in the cause of socialism. How was affluence to affect idealism? Strachey turned to me rather sadly and said, "Isn't it funny? We demand full employment, get it and then lose the idealism that secured the prize for us. But the British affluence is artificial; and in old Dundee my meetings will be well attended again when unemployment returns." He hasn't been far wrong. One didn't have to share Strachey's socialistic ideas to see that the Labour Party was the richer for men like him. Eton, Oxford and then socialism—strange transformation it might seem to many; but Britain does seem to produce such apparent contradictions by the hundred. India has lost a friend in Strachey.

A HIGH MORAL TONE IS SUPPOSED BY SOME TO BE one of the things which distinguishes a good newspaper. So one would not have expected *The Times* to take any but the sternest of moral lines about recent events in Britain. Indeed, it has once again contrived to justify its old nickname of "The Thunderer", though I fear it has permitted its judgment to suffer in the process. It seems to be inclined to much the same theme as Lord Hailsham about the Profumo affair; that it is rather the moral concern of the whole British people than exclusively that of a particular political Party. There may be some truth in this, although I did consider Lord Hailsham's barefaced attempt to share the responsibility for Mr. Profumo's moral shortcomings and Mr. Macmillan's political ineptitude to be just about the finest example of insufferable impertinence I have ever known. What strikes me as wholly wrong is the way both these would-be arbiters of the British public's morals have tried to hoist off some of the blame on the "affluent society". Now this is just nonsense. In the first place, affluence is a matter of degree, and to equate it to any lack of public morality is to perpetrate a gross libel on all those countries who are more affluent than Britain, namely, the United States, Canada, Sweden, Switzerland, Australia and New Zealand. Not even, I should imagine, in their most indignant mood of moral magnificence would either *The Times* or Lord Hailsham wish to be guilty of that. And in the second place, to suggest that the morals of the British people are being corrupted by their first taste of the affluence which those sections of the community represented by Lord Hailsham, and catered for by *The Times*, have enjoyed for generations, is just about the ultimate in class prejudice and snobbery. Personally, even if lack of morality were a necessary concomitant of riches, I would still prefer to see a nation turn its back on poverty. But there is absolutely no evidence of any kind that it is. On the contrary, no greater spur to immorality exists than the desperation which comes from being irretrievably poor. It seems to me that "The Thunderer" is this time scourging its readers quite unnecessarily; it might do well to remember that a hair-shirt can as easily clothe hypocrisy as virtue.

SEVERAL FORMER U.S. AMBASSADORS TO INDIA HAVE remained good friends of this country after their return home; I am thinking of Sherman Cooper in particular and also of Ellsworth Bunker; and it is my hope that Professor John Kenneth Galbraith will be another such. Apart from his personal relations with President Kennedy, Professor Galbraith, when speaking for India, will no longer seem to be the appointed advocate of India. With his independent, academic status, he will seem the more convincing. How pro-Indian has he returned? I shall not attempt a clear answer, for Professor Galbraith is too intelligent and sophisticated a man to think in terms of black and white. It would be surprising, however, if he spent two years and more in New Delhi without finding a good deal to criticise in India's leaders and her administration. The need for diplomatic circumspection is no more; and I think he would do India much good by being occasionally frank. And I hope he will not be misunderstood in this country if he does criticise aspects of India. That remark of his, for instance, about India being open to persuasion only on things on which she has already made up her mind will be long remembered; and the point needed to be made. Mr. Galbraith's main contribution to diplomacy in New Delhi was, I think, a more intelligent articulation than hitherto. Whenever he spoke, he spoke well; his many lectures to academic bodies were on a higher intellectual plane than most diplomatists'. The Indian years must have been instructive for Professor Galbraith too; he must have seen at first hand that there is always a shadow to fall between the idea and the reality, the theory and the practice. As he returns to theory at Harvard, he will often reflect how the Indian economy itself has fallen between the two stools of theory and pragmatism. Did a closer view of Mr. Nehru lead to a certain disenchantment? We may never know. How is New Delhi awaiting Mr. Galbraith's successor, Mr. Chester Bowles? I am informed that the erstwhile silent sneer for the huckster is now less prevalent. Many indeed are the lessons the Chinese have taught this country, with more to come. With a little more realism earlier, the present abjectness would have been unnecessary.

NOT FOR A LONG TIME, PERHAPS, WILL CALCUTTA have pretensions to being a tourist centre of any importance; the filth of the city, the lack of amenities and the climate are against it. Yet it dismays one to think that even for the few visitors it manages to attract—mainly business men, or globe-trotters on their way to places like Kathmandu and Banaras—the shortage of hotel accommodation is desperate, and almost perennial. In the circumstances, the proposal that the Government should construct a "gigantic" new hotel in the heart of the city clearly has much to commend it, although I would say that the chief need is not so much for a large hotel as for a relatively cheap one. From this point of view, official ventures in hotel-building, confined so far mainly to New Delhi, have not been an unqualified success. They have done something to relieve the shortage of accommodation; but the Ashoka, for all its trappings of luxury, is expensive, and so is the Janpath. The result is that one of the main purposes they were intended to serve—to initiate a general reduction in hotel charges through State-sponsored competition—has never quite been fulfilled. In terms of the facilities and service provided, Calcutta's hotels are no whit superior to Delhi's; the general impression, on the contrary, is that they are a little worse. The threat from a new Government-owned hotel might well provide a spur

to improvement. But unless the new hotel, apart from being big, is also more competitive in its charges to customers, the gain would be minimal. India's conception of the average tourist is still unfortunately coloured by visions of superannuated American tycoons or rich and lonely widows roaming round the world armed with purses full of dollars that are readily dispensed. In few sectors of the tourist industry is this conception more firmly embedded than in the hotel-owning fraternity. Western Europe's experience should by now have been impressive enough to demonstrate that the best dividends in tourism these days come from catering to the millions rather than the millionaires: the main justification for a new Government venture in hotel-building would lie in ensuring that such elementary lessons begin to be learnt.

ONE'S AUDITOR, I HAVE ALWAYS CONSIDERED, SHOULD be treated like one's dentist. That is, he should be carefully chosen in the first place, and then never sacked because the advice given is unpleasant or the treatment prescribed painful. The main difference, I suppose, is that if I decide to disregard my dentist's opinion, he is not thereupon entitled to make a public issue of it. Nor, for that matter, is he justified in proclaiming his professional competence to the world at large if I should choose to change him for somebody else. Which is all because my dentist is answerable to me personally, whereas my auditor, although I may have appointed him myself, is in fact responsible to my shareholders. It is this principle, that the responsibility of an auditor is to the shareholders and not primarily to the management, which has just been established by the outcome of the much-publicised dispute between the City of London Real Property Company and the London accounting firm of Turquand Youngs. It seems that C.L.R.P. recently acquired a rival company through the exchange of a newly-issued block of its own shares, nominally valued at £170,600, for the other company's shares valued on the market at £580,000. The directors of C.L.R.P. had the support of counsel and of their "consulting accountants" for their claim that the book value of the purchased shares should be shown as £170,600, whereas their auditors, Turquand Youngs, maintained that they must be included in the accounts at a figure of £580,000. It is a highly technical point, and neither side is entirely wrong. But the subsequent action of the C.L.R.P. board in deciding to make this difference of opinion the excuse for blocking the re-election of Tarquand Youngs clearly was wrong, and this despite the fact that relations between the directors and their auditors had been strained for some time, as the existence of a "consulting" firm reveals. Now C.L.R.P. has wisely climbed down, though no doubt still planning to rid itself of Messrs Tarquand Youngs by other means, and, at least ostensibly, for other reasons. An honourable outcome, you might say. I agree. But how many auditors would, I wonder, dare to stand out on a purely technical point of accounting, on the plea that as they are the custodians of the shareholders' interests they cannot be dismissed by the board of directors. Not many in India, I imagine. And all too few in Britain also. Yet without this kind of firmness, how can a shareholder's interests be safeguarded in the way they should be?

SHE WAS YOUNG, BLONDE AND VERY LOVELY. HER admirers, and there were many, told her that such beauty should not go unrecorded. So she went along to a well known Italian artist and asked his fee for painting a portrait of her—full length and in oils. The artist quoted a figure of 3,000 guineas and somewhat to his surprise the girl immediately sat down and wrote out a cheque which she handed to him. The artist took the cheque, looked at it, paused, and looked at it again. "Madam," he said, "you've made a mistake: I asked for 3,000 guineas —this cheque is made out for 5,000."

"No mistake," she replied. "You see, I want you to paint me in the nude."

The artist hesitated—obviously something was bothering him. Finally he made his decision. "Very well, I agree. But please may I keep my socks on? That's where I keep my brushes."

THE DITCHER

Guide for Investors

T.I.S.C.O. EARNS MORE, STEPS UP DIVIDEND

(BY OUR BOMBAY CORRESPONDENT)

THE stock market's optimism about a higher dividend from the Tata Iron and Steel Company Ltd for the year ended March 1963 has not proved misplaced. The directors of the Company have recommended a gross distribution of Rs. 11 a share, against Rs. 10.36 in the preceding year. The net dividend works out to Rs. 7.70 a share, against Rs. 7.25 in 1961-62. Tata Steel shares, which had improved from Rs. 143 to Rs. 146 in last Thursday's kerb dealings after the announcement of the dividend, were sold down to Rs. 141.50 in Friday's regular session, but they rallied later to around Rs. 144. The post-dividend setback did not reflect the market's disappointment over the modest increase in the dividend or over the Company's working results during the year. It was caused mainly by heavy corrective profit-taking; the preceding rise had been too steep to be continued without necessary technical adjustments.

The preliminary report on the Company's working results for 1962-63, shows that the two-million-ton expansion programme undertaken at a cost of over Rs. 110 crores has now begun to bear fruit. The total turnover has gone up by about 15.4 percent from Rs. 86.25 crores to Rs. 99.53 crores and the gross profit is up by nearly 16 percent from Rs. 19.49 crores to Rs. 22.58 crores. The rise in the gross profit, in fact, is much higher if necessary adjustment is made for the increase in the retention price pertaining to the previous years, which has been credited in the 1961-62 accounts.

After providing Rs. 37.48 lakhs (against Rs. 25.30 lakhs) for managing agents' commission, Rs. 11.66 crores (against Rs. 13.15 crores) for depreciation, Rs. 8.70 crores (against Rs. 6.78 crores) for development rebate reserve and Rs. 80 lakhs (against nil) for taxation, the net profit amounts to Rs. 1.05 crores, against a loss of Rs. 69.13 lakhs in the preceding year. The disposable surplus falls far short of the amount required for paying the proposed dividend. The directors have, therefore, transferred Rs. 1.26 crores (against Rs. 69.13 lakhs) from general reserve No. 1 and Rs. 2.59 crores (against Rs. 4.65 crores) from general reserve No. 2 representing taxed profits of previous years. They have transferred Rs. 4.90 crores to the dividend reserve, out of which they propose to draw Rs. 84.39 lakhs (the same) for paying the preference dividends and Rs. 4.04 crores (against Rs. 3.81 crores) for the ordinary dividend.

After providing for the proposed dividends, there remains a surplus of Rs. 32,000 to be carried forward, against Rs. 34,000 brought in. It might be noted here that for the first time in four years, the Company became liable to pay income tax in 1962-63. It has no liability for super profits tax for 1962-63, and it may not have to pay any super profits tax for the current year as well, although the tax liability is likely to be considerably higher than in 1962-63.

Indian Iron Pays the Same

THERE has been a fall in the price of Indian Iron shares from Rs. 23.50 to Rs. 23.04 due to the disappointment of Lyons Range with the dividend declared by the Company for 1962-63. A taxable ordinary dividend of 16 percent has been repeated, but the stock market, inspired by the higher dividend of the Tata Iron and Steel Co. Ltd, had expected that Indian Iron too would raise the distribution. There is, however, little logic in this argument because the conditions of the two companies differ in several respects. Besides, Indian Iron has been paying a higher percentage of ordinary dividend than Tata Steel for some time now.

Its dividend is more than four times covered and works out to a yield of about 7 percent at the present price for a share of Rs. 10 each. The net profit has been Rs. 9.12 crores, against Rs. 9.18 crores for 1961-62, after transferring Rs. 3.40 crores (against Rs. 3.35 crores) to depreciation. Taxaton is allocated Rs. 3.56 crores (against Rs. 3.96 crores) and reserves Rs. 3.64 crores (against Rs. 2.98 crores). The usual preference dividends have been paid.

The stock market's dividend hope was pitched higher in view of the bigger output during 1962-63. The production of pig iron rose from 1.19 million tons in 1961-62 to 1.29 million tons and that of steel ingots from 934,498 tons to 1 million tons. The production of salable steel was higher at 795.119 tons, against 736,970 tons. Although it is difficult to take a comprehensive view in the absence of detailed results, it is possible that the latest increase in the retention price of steel has not covered fully the rise in production costs. The growth prospects of the shares are evident since the Company is likely to undertake further expansion. The financial position is very impressive. An ordinary share capital of Rs. 12.44 crores is backed by reserves of more than Rs. 27.50 crores. In view of the prospect of expansion and the debt repayment obligations of the Company, the repetition of the ordinary dividend should be welcomed.

Good Prospects for T.E.L.C.O.

THE preliminary report on the working of the Tata Engineering and Locomotive Company for the year ended March 1963, suggested that the Company had not perhaps fared well. In spite of a record turnover, the directors have had to draw on the reserves to provide for the payment of the dividend which has been maintained at the previous year's level—Rs. 14.50 a share. In his statement to shareholders released along with the directors' report, the chairman, Mr. J. R. D. Tata, says that the year was a somewhat disturbed one, marred by shortages of materials, power and foreign exchange as well as the aftermath of the declaration of emergency. (Full text of the chairman's speech appears on a later page in this week's *Capital*). In spite of a 5 percent rise in the sales from Rs. 41.65 crores to Rs. 43.64 crores, the gross profit is down by about 7 percent from Rs. 6.17 crores to Rs. 5.73 crores. The directors attribute the lower profit to (1) the delay of about five months on the part of the Government in sanctioning an increase in the selling prices of diesel vehicles to compensate for the increased Customs duties and the higher cost of components, (2) a special rebate required by the Government on vehicles supplied for the defence services and (3) the new levy of super profits tax which claimed Rs. 23.50 lakhs during the year.

Out of the year's profit, the directors have provided Rs. 23.12 lakhs (against Rs. 18.33 lakhs) for managing agents' commission, Rs. 2.23 crores (against Rs. 2.20 crores) for depreciation, Rs. 1.85 crores (against (Rs. 1.88 crores) for taxation, including super profits tax liability of Rs. 23.50 lakhs and Rs. 27.47 lakhs (against Rs. 40.18 lakhs) for development rebate reserve, leaving a net profit of Rs. 1.16 crores, against Rs. 1.51 crores in 1961-62. The Company has had to withdraw Rs. 6 lakhs from the general reserve to provide for the payment of the proposed dividends which absorb Rs. 1.25 crores.

The production of diesel vehicles was only slightly better at 12,200 units, against 12,100 units in the preceding year. The directors state that the output would have been substantially higher but for the shortage of foreign exchange and scarcity of raw materials. Since October, except for a few chassis delivered to dealers, the entire production of vehicles of the Company is booked against orders from the defence department. The output of locomotives was lower at 63 units, against 72 units, while production of excavators increased from five to 31 and that of industrial shunters from one to 11. The demand for industrial shunters continues to be good and the indigenous content is now as high as 80 percent. The indigenous content of excavators is now 69 percent, and this is likely to be stepped up to 80 percent as soon as the additional equipment still to be delivered is commissioned. The paper and pulp machinery project has not so far made the expected progress. Although the present order book is not unsatisfactory, the directors do not anticipate any large-scale orders in the near future as the short-term prospects for the paper industry do not appear to be good. The output of forge shops, however, recorded a substantial increase during the year. The extension of this division to meet the entire requirements for the production of 24,000 T.M.B. vehicles is stated to be making good progress. The Company has entered into a ten-year technical aid agreement with Garringtons Ltd and Scottish Stamping and Engineering Co. Ltd—two associated British firms.

T.E.L.C.O. shareholders can certainly derive great comfort from the chairman's statement that "notwithstanding the minor setback in profits in the past year and the difficulties and uncertainties which we may have to face in the current year, the fact remains that the Company's capacity and financial strength continue to grow." The chairman has, however, cautioned the shareholders against undue optimism concerning the dividend. He is hopeful that the profit will prove to be adequate for the maintenance of dividend, but has added that much will depend, among other factors, on the Finance Minister's attitude towards the super profits tax and also on the level of production in the current year, which in turn depends to a large extent on the availability of raw materials and foreign exchange.

The chairman says that the Government has sanctioned the implementation of the second stage of expansion to raise the output of Tata Mercedes Benz vehicles from 18,000 to 24,000 a year. The Company has accordingly submitted a second application to A.I.D. for a further loan to cover the foreign exchange requirements of this part of the expansion. The appropriate method of securing rupee finance for the expansion programme is under consideration of the directors. Mr. Tata takes an optimistic view of the performance of the alloy iron foundry, in as much as the installation of the new equipment ordered from the U.S.A. under the A.I.D. loan will greatly increase the capacity and further improve its efficiency.

As some of the latest techniques and processes of foundry practice are being introduced, Mr. Tata is confident that the performance and quality of the foundry products will compare favourably with those of motor-vehicle foundries in other parts of the world. The chairman says that the Company is not inclined at this stage to take up any new venture. It has, however, decided to make an exception concerning a plant for the manufacture of press tools, dies and production devices. This project will be undertaken in collaboration with a German firm. The necessary licence for this plant has been obtained and negotiations are in progress for securing suitable land in the Poona region.

Williamson Magor Tea Group Results

THE results of the Willimson Magor group of tea companies for the year ended December 1962 show that the Bishnauth Tea Co. Ltd (an Assam garden) has increased the taxable ordinary dividend from 13 percent to 20 percent, absorbing Rs. 6.60 lakhs. At the present price of Rs. 17.56 a share of Rs. 10 each the yield is 11.4 percent. The profit has risen from Rs. 7.52 lakhs in 1961 to Rs. 15.21 lakhs, after providing Rs. 2.22 lakhs (against Rs. 2.37 lakhs) for depreciation. Taxation is allocated Rs. 9.50 lakhs (of which super profits tax is Rs. 66,000), compared with Rs. 3.30 lakhs in 1961. Development rebate reserve is allocated Rs. 4,500, leaving a carry-forward of Rs. 2 lakhs, against Rs. 2.86 lakhs brought in. The crop was 1.5 million kilograms, against 1.6 million kilograms, and the average sale price rose from Rs. 5.80 to Rs. 6.71 a kilogram. The 1963 crop estimate is 1.6 million kilograms at a cost of Rs. 5.52 a kilogram.

The East India Tea Co. Ltd (an Assam estate) has returned to the dividend list after an interval of three years. A taxable ordinary dividend of 10 percent has been declared to absorb Rs. 1 lakh. It offers a yield of 7.4 percent at the present price of Rs. 13.44 a share of Rs. 10 each. There has been a profit of Rs. 2.48 lakhs, after transferring Rs. 88,186 (against Rs. 89,000) to depreciation. Taxation absorbs Rs. 50,000 and development rebate reserve, Rs. 8,500. A sum of Rs. 1.50 lakhs is transferred to general reserve, leaving a carry-forward of Rs. 70,423, against Rs. 96,325 brought in. The crop declined from 525,798 kilograms to 494,612 kilograms, but the average sale price was higher at Rs. 6.30, against Rs. 5.76 a kilogram. The 1963 crop estimate is 527,000 kilograms at a cost of Rs. 5.68 a kilogram.

The Borpukhuri Tea Co. Ltd (an Assam garden) has increased its profit from Rs. 78,259 to Rs. 1.15 lakhs, after providing Rs. 40,992

(against Rs. 38,470) for depreciation. A taxable ordinary dividend of 10 percent has been declared against nil. It absorbs Rs. 45,000 and works out to a yield of 8.6 percent at the present price of Rs. 11.69 a share of Rs. 10 each. Taxation is allocated Rs. 16,500 and development rebate reserve Rs. 4,000. The carry-forward is Rs. 74,286, against Rs. 53,420 brought in. The crop declined from 265,021 kilograms to 258,733 kilograms, while the average sale price rose from Rs. 5.25 to Rs. 6.32 a kilogram. A crop of 290,300 kilograms has been estimated for 1963 at a cost of Rs. 5.26 a kilogram.

The profit of the Seajuli Tea Co. Ltd (an Assam garden) has improved from Rs. 1.31 lakhs to Rs. 3.62 lakhs, after transferring Rs. 37,143 (against Rs. 35,688) to depreciation. The taxable ordinary dividend has been doubled to 30 percent to absorb Rs. 74,700. The yield is 14.5 percent at the present price of Rs. 20.75 a share of Rs. 10 each. Taxation including a sum of Rs. 8,000 for super profits tax, is Rs. 2.27 lakhs (against Rs. 50,000). General reserve is allocated Rs. 1.50 lakhs, leaving a carry-forward of Rs. 74,945, against Rs. 1.18 lakhs brought in.

The crop was 207,643 kilograms, against 242,697 kilograms, and the average sale price increased from Rs. 5.56 to Rs. 7.36 kilogram. A crop of 221,000 kilograms has been estimated for 1963 at a cost of Rs. 5.53 a kilogram.

The Dimakusi Tea Co. Ltd (an Assam garden) has earned a profit of Rs. 2.65 lakhs, against Rs. 2.20 lakhs, after providing Rs. 67,061 (against Rs. 62,292) for depreciation. The taxable ordinary dividend has been increased from 20 percent to 25 percent absorbing Rs. 1.18 lakhs. It offers a yield of 11.4 percent at the present price of Rs. 21.87 a share of Rs. 10 each. Taxation is allocated Rs. 1.40 lakhs (against Rs. 90,000), general reserve Rs. 1 lakh and development rebate reserve Rs. 9,500. The crop declined from 301,383 kilograms to 297,513 kilograms, but the average sale price rose from Rs. 5.81 to Rs. 6.44 a kilogram. An output of 308,000 kilograms has been estimated for 1963 at a cost of Rs. 5.13 a kilogram.

The Nagri Farm Tea Co. Ltd (a Darjeeling garden) has increased the taxable ordinary dividend from 25 percent to 35 percent, including an *interim* of 10 percent, to absorb Rs. 1.05 lakhs. The yield works out to 12 percent at the present price of Rs. 29.19 a share of Rs. 10 each. The profit has risen from Rs. 2.68 lakhs to Rs. 6.06 lakhs, after providing Rs. 26,790 (against Rs. 25,904) for depreciation. Taxation is allocated Rs. 5.65 lakhs (against Rs. 1.20 lakhs), buildings reserve Rs. 1.75 lakhs (against Rs. 25,000), general reserve Rs. 1 lakh, repairs and renewals reserve Rs. 4,50,000 (against Rs. 25,000) and dividend equalisation reserve Rs. 50,000. The carry-forward is Rs. 1.47 lakhs, against Rs. 1.68 lakhs brought in. The crop was 214,750 kilograms, against 220,390 kilograms, and the average sale price rose from Rs. 7.14 to Rs. 9.03 a kilogram. The crop has been estimated at 221,400 kilograms for the current year at a cost of *Rs. 5.77 a kilogram.*

A successful businessman knows that a bright office is the first step to winning the confidence of clients and customers.

So, get down to brass tacks and keep the brass articles and fittings in your office bright as new with a regular Brasso polish. Brasso, available in large tins, is easy to use and economical too.

Results of Duncan Tea Companies

THE results of the Duncan group of tea companies for the year ended December 1962 show that the Killicott Tea Company (a Dooars garden) has made a profit of Rs. 3.13 lakhs, against Rs. 3.32 lakhs for 1961, after providing Rs. 99,972, against Rs. 1.03 lakhs, for depreciation. A taxable ordinary dividend of 15 percent has been repeated to absorb Rs. 1.35 lakhs. The yield is 10.4 percent at the present price of Rs. 14.37 a share of Rs. 10 each. Taxation is allocated Rs. 1.28 lakhs (against Rs. 1.90 lakhs), revenue reserve Rs. 2 lakhs (against Rs. 9.25 *lakhs*) and development rebate reserve Rs. 2,500 (against Rs. 1,500). The carry-forward is Rs. 14,658 against Rs. 72,491 brought in. A sum of Rs. 50,000 has been transferred from development rebate reserve. The crop declined from 563,337 kilograms to 507,738 kilograms, but the average sale price rose from Rs. 4.23 to Rs. 4.50 a kilogram. The 1963 crop estimate is 520,000 kilograms at a cost of Rs. 21.70 lakhs.

The profit of the Ledo Tea Co. Ltd (an Assam garden) has declined from Rs. 1.49 lakhs to Rs. 14,202, after increasing depreciation from Rs. 70,205 to Rs. 77,532. The dividend has been passed. A sum of Rs. 1 lakh (against Rs. 1.29 lakhs) has been allocated to revenue reserve. The carry-forward is Rs. 8,744, against Rs. 54,264 brought in. The unsatisfactory results have been due to high production costs. The crop was 281,500 kilograms, against 279,777 kilograms and the average sale price increased from Rs. 5.15 to Rs. 5.30 a kilogram. A crop of 285,000 kilograms at a cost of Rs. 15.57 lakhs has been estimated for the current year.

The Dauracherra Tea Co. Ltd has produced satisfactory results because of the overall decline in the East Pakistani tea crop following drought. For the same reason the start of the current season too was unsatisfactory. Sufficient rainfall has been reported since and the crop prospects have improved considerably. The profit has been Rs. 8.01 lakhs, against Rs 4.03 lakhs, after providing Rs. 41,910 (against Rs. 30,819) for depreciation. A taxable ordinary dividend of 20 percent has been proposed to absorb Rs. 1.20 lakhs, but this dividend and those for previous years will be declared as soon as profits can be remitted from Pakistan. Taxation is allocated Rs. 8.35 lakhs (against Rs. 2.51 lakhs) and development rebate reserve Rs. 17,000 (against Rs. 1,500). There is a carry-forward of Rs. 30,452, against Rs. 58,039 brought in. The crop declined from 233,690 kilograms to 203,558 kilograms, but the average sale price rose from Rs. 4.97 to Rs. 8.17 a kilogram. The 1963 crop estimate is 218,000 kilograms at a cost of Rs. 9 lakhs.

The New Cinnatolliah Tea Co. Ltd (an Assam garden) has earned a profit of Rs. 5.91 lakhs, against Rs. 3.03 lakhs, after providing Rs. 62,414, against Rs. 51,722, for depreciation. A taxable ordinary dividend of 5 percent has been declared to absorb Rs. 25,000. At the present price of Rs. 455 a share of Rs. 100 each, the yield is 1.1 percent. There was no dividend for 1961. Revenue reserve absorbs Rs. 2.60 lakhs, against Rs. 1.25 lakhs, and development rebate reserve Rs. 12,500, against Rs. 10,500. The carry-forward is Rs. 11,827, against Rs. 52,034 brought in. The crop was 296,696 kilograms, against 290,978 kilograms and the average sale price was Rs. 7.64 a kilogram, against Rs. 5.98 a kilogram. An output of 290,000 kilograms has been estimated for 1963 at a cost of Rs. 15.59 lakhs.

The Kotamullai Tea Co. Ltd, which has estates in Assam, Travancore, and Cachar, has made a profit of Rs. 1.21 lakhs, against Rs. 2.06 lakhs, after providing Rs. 88,934, against Rs. 73,133, for depreciation. The dividend has again been passed. Development rebate reserve is allocated Rs. 12,500 and revenue reserve Rs. 1.20 lakhs. Taxation absorbs Rs. 24,000, against Rs. 45,000. A sum of Rs. 30,564 has been transferred from excess taxation provision in previous years. The carry-forward is 1,628, against Rs. 6,074 brought in. The crop was 488,346 kilograms, against 524,469 kilograms and the average sale price rose from Rs. 4.60 to R. 4.97 a kilogram. The 1963 crop estimate is 520,000 kilograms at a cost of Rs. 21.06 lakhs.

The Marybong and Kyel Tea Estates Ltd shows a profit of Rs. 1.56 lakhs, against a loss of Rs. 15,584 after providing Rs. 19,533, against Rs. 14,550, for depreciation. A taxable ordinary dividend of 2.5 percent a share of £1 each has been declared to absorb Rs. 5,009. Taxation is allocated Rs. 1.65 lakhs (against Rs. 60,000) and development rebate reserve Rs. 7,000 (against Rs. 3,500). A sum of Rs. 20,000 has been transferred from hail reserve. The carry-forward is Rs. 12,904, against Rs. 16,743 brought in. The crop was 120,353 kilograms, against 110,495 kilograms and the average sale price rose from Rs. 6.88 a kilogram to Rs. 8 a kilogram. A crop of 115,000 kilograms has been estimated for 1963 at a cost of Rs. 8.43 lakhs.

Thomas Duff Jute Group Does Well

THE Victoria Jute Co. Ltd, the Titaghur Jute Factory Co. Ltd and the Samnuggur Jute Factory Co. Ltd have decided to convert their paid-up shares of any kind into stocks transferable in units or multiples of such sum as the directors may from time to time determine. It is their intention to convert the £1 ordinary and preference shares into £1 stock unit. This conforms to the modern practice and the directors will complete the conversion as soon as possible. The results of the companies for the year ended December 1962 are published.

Samnuggur Jute has made a profit of £175,821, after providing £273,961 (against £11,817) for taxation, £34,680 (against £6,319) for development rebate reserve and £30,000 (against £10,000) for depreciation. There was a loss of £77,715 for 1961. A taxable ordinary dividend of 10 percent, including a final of 7 percent, has been declared which absorbs £36,750. General reserve and dividend equalisation reserve have been allocated £65,000 each. The carry-forward is £8,338, against £4,780 brought in.

Victoria Jute has made a profit of £173,749, after transferring £39,023 (against £5,797) to taxation, £7,920 (against £5,954) to development rebate reserve and £45,000 (against £10,000) to depreciation. The Company incurred a loss of £92,489 for 1961. A taxable ordinary dividend of 10 percent, including a final of 7 percent, has been declared to absorb £24,500. General reserve is allocated £85,000, modernisation of machinery reserve £20,000 and dividend equalisation reserve £35,000. The carry-forward is £8,551, against £4,814 brought in.

The profit of Titaghur Jute has been £211,646, after providing £43,698 (agains £10,446) for taxation, £19,148 (against £8,213) for development rebate reserve and £211,646 (against £10,000) for depreciation. A taxable ordinary dividend of 13 percent, including an interim of 3 percent has been declared which absorbs £47,775. General reserve receive £65,000, modernisation of machinery reserve £30,000 and dividend equalisation reserve £60,000. The carry-forward is £9,976, against £6,618 brought in.

Fair Prospects for New India

THE New India Assurance Co. Ltd did well in 1962, with the aggregate net premium income setting a new all-time record of Rs. 13.67 crores. From what the chairman, Mr. A. D. Shroff, said at the annual meeting, the Company is likely to do equally well, if not better, in the current year. (Extracts from Mr. Shroff's speech appeared in last week's issue of *Capital*). Mr. Shroff assured the shareholders that the Company would maintain the dividend on the increased capital following the *one-for-five* bonus issue. Referring to the "crisis of confidence" in the investment market, he said that the appreciation in the investments of New India Assurance which amounted to Rs. 1.12 crores at the end of 1961 had shrunk to Rs. 49 lakhs by the end of 1962, and the latest valuation shows that even this appreciation has also been almost wiped out. Not only have equity prices slumped heavily, but investments over a larger field have become practically frozen. Mr. Shroff urged the shareholders to realise that the factors contributing to the slump in the investment market were beyond the control of the management.

He blamed the "crisis of confidence" on the Government's fiscal policy, more particularly the super profits tax, and asserted that unless this ill-conceived tax was abolished, industrial development in the country would be seriously retarded. Mr. Shroff also criticised the compulsory deposit scheme on the ground that "habits of thrift and saving cannot be fostered by measures of compulsion." He felt that the most effective mobilisation of people's savings could only be achieved through hard selling of the concept of savings. In this context, he stated that the Life Insurance Corporation of India must adopt unorthodox measures to make a much larger contribution to national savings than it was doing at present. Unit trusts can be an effective agency, under Indian conditions, of mobilising substantial savings for the industrial development of the country. Mr. Shroff, however, added that the unit trust contemplated by the Government as a public sector monopoly would not serve the real purpose.

He stated that in spite of the present "crisis" of confidence, New India had continued to extend support to a large number of sound units through investment. This might result in some loss of income to the Company in the initial years, but it would have its compensation in the form of substantial capital appreciation later, said Mr. Shroff. Of course, much would depend on the Government's fiscal policy as well as on political developments.

Edward Textiles Cuts Dividend

EDWARD Textiles Ltd reports disappointing results for 1962. While sales including realisation from process work fell by only 9 percent from Rs. 2.86 crores to Rs. 2.61 crores, the gross profit fell from Rs. 16.07 lakhs to a mere Rs. 5.88 lakhs, and even this profit has been arrived at after taking credit for the profit of Rs. 14.83 lakhs realised on the sale of Hind Mills shares. After providing Rs. 9.09 lakhs (against Rs. 5.44 lakhs) for depreciation, Rs. 5.84 lakhs (against Rs. 4.47 lakhs) for development rebate, and providing for other prior charges, there is a loss of Rs. 9.41 lakhs, against a profit of Rs. 2.38 lakhs in the preceding year. The loss has been adjusted against the general reserve. The dividend has been reduced from Rs. 18 to 12 a share, subject to tax, and in order to provide for the payment of this dividend, the directors have transferred a sum of Rs. 2.04 lakhs from the general reserve.

The directors state in their report that the year was most difficult for the Company because of the implementation of the modernisation and rehabilitation programme. This programme is being financed partly by the Company's own resources and partly by a loan of Rs. 40 lakhs from the National Industrial Development Corporation, and by the proposed issue of preference shares worth Rs. 10 lakhs. The Company proposes to issue 5,000 9.3 percent taxable redeemable cumulative preference shares of Rs. 200 each at par. The Rs. 200-paid share of Edward Textiles is quoted nominally around Rs. 300.

Hindustan Dowidat Making Progress

THE directors of Hindustan Dowidat Tools Ltd state in their first annual report for the period 25th January, 1962, to 31st March, 1963, that the construction of the factory building is fast nearing completion under the supervision of a well-known firm of architects. There were some initial difficulties and delay in obtaining the initial power load needed for the construction of the factory. Besides, the absence of adequate pressure of power load on various occasions also caused minor delays in the fabrication work. In spite of all these hurdles, the factory buildings are expected to be ready by the end of July. Part of the machinery to be imported has already arrived at the site, and the remaining is expected to be received by the end of August. Orders for almost all the indigenous machinery have been placed and their delivery has started.

The cost of the project, it is expected, will exceed the original estimate due to the increases in the rates of Customs duty, sales tax and other taxes, increases in prices of materials and services because of the implementation of the new defence-oriented Budget. Trial production, it is expected, will start some time during the last quarter of the current year. The Company's accounts show that a sum of Rs. 1,58,897 has been spent on construction work. Amounts of Rs. 53,989 and Rs. 97,720 have been spent by way of preliminary and share issue expenses, respectively. The Rs. 7.50-paid share of Hindustan Dowidat is currently quoted around Rs. 7.

Same from New Standard Engineering

NEW Standard Engineering Co. Ltd has fared better in the year ended March 1963, although the increase in the gross profit is too small in relation to the rise in sales. While the sales are up by nearly 15 percent from Rs. 1.6 crores to Rs. 1.83 crores, the gross profit has risen by hardly 2.8 percent from Rs. 22.26 lakhs to Rs. 22.89 lakhs. The gross dividend has been maintained at 9 percent—Rs. 8 a share—but the net dividend works out to about Re. 1 higher because 8 percent of the gross dividend is being paid out of the special reserve created from tax-exempt profits and only 1 percent will be subject to tax deduction. The Company has made it clear that the recommendation concerning the dividend is provisional pending clarification of the income tax authorities. If the advice is not received in time, tax will be deducted at source at 30 percent. Further payment will be made to shareholders on the basis of the decision of the Central Board of Revenue.

The Company has also sought the advice of the Central Board of Revenue concerning the claim of the preference shareholders in tax exempt *profits under* Section 84 of the Income tax Act. Of the previous year's dividend, 4.5 percent was free of tax with the result that the net dividend worked out to Rs. 7.65 a share, compared with Rs. 8.70 for 1962-63.

From the year's gross profit, the directors have provided Rs. 8.48 lakhs (against Rs. 8 lakhs) for depreciation, Rs. 1.56 lakhs (against Rs. 1.73 lakhs) for development rebate, Rs. 5.10 lakhs (against Rs. 5.50 lakhs) for taxation and Rs. 75,000 (against Rs. 50,000) for general reserve. The proposed ordinary dividend absorbs Rs. 4.50 lakhs (the same) and preference dividend accounts for another Rs. 2.25 lakhs (the same), leaving a sum of Rs. 23,037 to be carried forward, against Rs. 11,838 brought in. The Company made additions to fixed assets totalling Rs 29.44 lakhs during the year, out of which Rs. 8.85 lakhs represented purchase of new machinery. The Rs. 100-paid share of New Standard Engineering is currently quoted around Rs. 165, offering a gross return of about 5.6 percent.

Bagalkot Cement Disappoints

BAGALKOT Cement Co. Ltd fared very badly in 1962, and the dividend had to be skipped for the third year in succession. Despite a small improvement in the sales from Rs. 1.51 crores to Rs. 1.57 crores, the gross profit dropped sharply from Rs. 40.91 lakhs to Rs. 22.81 lakhs. Although despatches of cement were slightly higher at Rs. 181,881 tonnes, against 178,738 tonnes, the production of both clinker and cement was down. The output of clinker declined from 176,225 tonnes to 154,256 tonnes and that of cement from 180,197 tonnes to 178,240 tonnes. The directors point out that the production was adversely affected during the period May to August on account of coal shortage and other reasons. The plant has, however, been working to its rated capacity since September 1962, and the performance during the current year so far holds out the promise of much better results. The increase in cement prices, effective from 1st June, 1963, will also be reflected in the working results for the current year. The directors have under consideration a proposal to announce an interim dividend for 1963.

From the year's profit, the directors have provided Rs. 20.95 lakhs (against Rs. 23.03 lakhs) for depreciation and made provision for other prior charges, leaving a modest surplus of Rs. 1.56 lakhs, against Rs. 16.29 lakhs in the preceding year. The provision for statutory development rebate reserve amounts to Rs. 1.50 lakhs, against Rs. 1,130. After making adjustments for the amounts recoverable from and refundable to the managing agents in pursuance of the resolution passed at the last annual general meeting, inclusive of the cost of drilling machines, the directors have carried forward Rs. 1 lakh. The directors point out that a complaint has been made against the managing agents by certain persons to the Mysore Government on the same matters as were dealt with in the shareholders' committee and the Government is investgating into the complaint. The Rs. 10-paid share of Bagalkot Cement is currently quoted around Rs. 7.32.

Testeels Skips Dividend

SHAREHOLDERS of Testeels Ltd who have gone without a dividend for three years can certainly derive consolation from the Company's improved performance during the year ended March 1963, which holds out the promise of their investments bearing fruit in the current year. In spite of a 10 percent fall in the sales from Rs. 52.75 lakhs to Rs. 47.44 lakhs, the Company's profit has shot up by as much as 155 percent from Rs. 3.17 lakhs to Rs. 8.08 lakhs. The directors, however, have decided to skip the dividend for the third year in succession and use the profits to wipe off the past losses amounting to over Rs. 5.51 lakhs and provide Rs. 70,000 towards depreciation up to March 1961. In addition, the directors have set aside for depreciation out of the year's profit a sum of Rs. 1.35 lakhs (against Rs. 1.32 lakhs). No provision has been made for statutory development rebate and development rebate for 1962-63, against Rs. 1.57 lakhs and Rs. 25,000, respectively, in the preceding year.

The volume of outstanding orders on the Company's books is reported to be satisfactory and sales during the current year, it is expected, will show an improvement over the previous year. All outstanding matters relating to the Kalyan establishment have been finally settled. The Dehgam plant has now become a compact unit covering all the activities relating to the chemical plant, fabrication, structural engineering and foundry engineering. During the year, a new structural shop was constructed and the plate shop was extended. The foundry installation has been completed and is expected to be commissioned shortly. The Company has on hand construction of a stress relieving furnace, and has on order a circular welding jig for the union melt welding machine.

The Japanese collaborators, Shin Mitsubishi Heavy Engineering Industries, have sent their experts for assisting further development of the plant and ensuring maximum utilisation of the existing capacity. The Company proposes to undertake the manufacture of electric hoists and light cranes for which a licence has been received. The Company is trying to secure the collaboration of a West German firm for manufacturing electric hoists and light cranes. It has been able to export a considerable number of components, valued at Rs. 1.92 lakhs. A rice bran oil extraction plant has been sold to East Germany and a further set of components for a second plant is expected to be exported during the current year. The Rs. 100-paid share of Testeels Ltd is currently quoted around Rs. 165.

Bank of India Pays the Same

THE Bank of India Ltd has declared an interim dividend of Rs. 4 a share, subject to tax, for the half year ended June 1963, which is the same as in the corresponding period of 1962. But the total amount to be distributed is higher at Rs. 32.40 lakhs, against Rs. 24 lakhs because of the increase in the paid-up capital

from Rs. 3 crores to Rs. 4.05 crores. The profit, subject to taxation, amounts to Rs. 47 lakhs, against Rs. 47.50 lakhs in January-June 1962. To this has been added Rs. 13.10 lakhs (against Rs. 29.16 lakhs) brought forward from the last account, making a total of Rs. 60.10 lakhs (against Rs. 76.66 lakhs). After providing for the proposed interim dividend, there remains a balance of Rs. 27.70 lakhs (against Rs. 52.66 lakhs) to be carried forward to the next account.

Calcutta Steel Cuts Dividend

IN their report for the year ended March 1963, the directors of the Calcutta Steel Co. Ltd point out that production has been hampered by the shortage of raw materials and power. Although the output of wire rods has been satisfactory, it has also suffered because of the shortage of billets. The Company has requested the Government of India for sanction to produce its own billets.

Its profit has been Rs. 14.47 lakhs, against Rs. 17.05 lakhs for 1961-62, after transferring Rs. 6.22 lakhs (against Rs. 5.27 lakhs) to depreciation, Rs. 35,768 (against Rs. 93,495) to development rebate reserve and Rs. 24 lakhs (against Rs. 19 lakhs) to taxation. The taxable ordinary dividend has been cut from 15 percent to 12.5 percent. It absorbs Rs. 12.50 lakhs and works out to a yield of 8.8 percent at the present price of Rs. 14.25 a share of Rs. 10 each. The dividend has had to be cut due to heavier taxation. General reserve is allocated Rs. 5 lakhs, leaving a carry-forward of Rs. 65.077, against Rs. 3.68 lakhs brought in.

Bank of Baroda Earns More

THE Bank of Baroda Ltd has maintained the interim dividend for the half-year ended June 1963 at Rs. 4 a share, subject to tax, (16 percent a year). But since the dividend is on the increased capital it involves a larger distribution, namely, Rs. 16 lakhs, compared with Rs. 12 lakhs for the corresponding period last year. The preliminary report on the bank's working results shows that it has done better than in the first half of 1962. After providing for taxation inclusive of super profits tax for 1962 and the first half of the current year, the bank's porfit amounts to Rs. 26.11 lakhs, against Rs. 25.41 lakhs in January-June 1962. Including the brought forward amount of Rs. 3.46 lakhs (against Rs. 3.02 lakhs), the total sum available for disposal comes to Rs. 29.57 lakhs (against Rs. 28.43 lakhs). The proposed dividend absorbs Rs. 16 lakhs (against Rs. 12 lakhs), leaving a balance of Rs. 13.57 lakhs (against Rs. 16.43 lakhs) to be carried forward to the next account.

Blundell Eomite to Expand

BLUNDELL Eomite Paints Ltd, Bombay, a subsidiary of Blundell-Permoglaze Ltd, London, has sought the permission of the Controller of Capital Issues to raise Rs. 28.60 lakhs from the public through the issue of 130,000 equity shares of Rs. 10 each at a premium of Rs. 12. The Company has also plans to raise Rs. 21 lakhs through a rights issue, and another Rs. 20 lakhs through debentures. Additional funds are required for financing the Company's expansion programme, which is estimated to involve a total outlay of Rs. 73.50 lakhs. The foreign exchange component, estimated around Rs. 14.65 lakhs, will be met from the subscription money of the parent Company.

The Company has acquired 27 acres of land in Kolshet village (Thana district). The present Mazgaon factory is to be shifted to the new site where arrangements for power and water have already been made After expansion, the Company will have an annual capacity of 4,000 metric tons of paints and enamels, 1,300 kilo litres of varnishes and 494 metric tons of resins. The present capital of the Company consists of 7,000 equity shares of Rs. 100 each, which, it is proposed, will be subdivided into shares of Rs. 10 each. The parent Company holds nearly 78 percent of the existing shares, and this holding will be reduced to 59 percent after the proposed public issue. The Company proposes to issue bonus shares in the proportion of two shares for each one held by capitalising Rs. 14 lakhs from the reserves which total Rs. 29.5 lakhs. The bonus issue will be followed by a one-for-one rights issue, raising the capital to Rs. 42 lakhs. The Company is doing well. Its turnover in the year ended June 1962 amounted to Rs. 1.70 crores on which it made a profit of about Rs. 25 lakhs, and declared a dividend of 80 percent.

Amrutanjan Results Impress

AMRUTANJAN Ltd reports excellent results for the year ended March 1963. As against an increase of 30 percent in the sales from Rs. 38.55 lakhs to Rs. 50.19 lakhs, the gross profits has shot up by as much as 167 percent from Rs. 4.72 lakhs to Rs. 12.62 lakhs. The dividend has been raised from 70 percent to 100 percent. The directors have provided Rs. 53,000 (against Rs. 45,000) for prior charges and Rs. 8.60 lakhs (against Rs. 2.18 lakhs) for taxation. The preference dividend absorbs Rs. 29,000 (the same) and ordinary dividend Rs. 2.50 lakhs (against Rs. 1.75 lakhs).

New Capital Issues

FIVE out of the seven companies which have been authorised to raise fresh capital will issue bonus shares. One of them is issuing a small part of its capital in equities as well. Out of the total of Rs. 99.05 lakhs for all the companies Rs. 32.36 lakhs will be in bonus shares. The following are the details:

Guest, Keen, Williams Ltd will issue 214,583 equity shares of Rs. 10 each at par. The shares will be issued to the Tata Iron and Steel Company Ltd in consideration of transfer by the latter of 15,606 fully paid-up equity shares of Rs. 100 each held in Sankey Electrical Stampings Ltd.

Sree Saraswaty Press Ltd, Calcutta, is issuing further capital of Rs. 5 lakhs, divided into equity shares of Rs. 10 each, on capitalisation of the Company's reserves to a like extent, to be issued as bonus shares to existing shareholders of the Company in the proportion of one such share for every equity share held.

Steam and Mining Equipment (India) Private Ltd, Calcutta, is to issue further capital of Rs. 5.50 lakhs, divided into 55,000 equity shares of Rs. 10 each, on capitalisation of reserves to a like extent, to be issued as fully paid-up bonus shares.

Cooper Engineering Ltd, Bombay, is raising further capital of Rs. 45.20 lakhs, divided in 45,200 equity shares of Rs. 100 each, for cash at par. The proceeds of the issue will be utilised for manufacturing turret lathes.

Kumergode Estates Ltd, Mangalore, is issuing further capital of Rs. 2 lakhs, divided into 100,000 ordinary shares of Rs. 2 each. On capitalisation of its general reserves to a like extent, it will be issued as bonus shares to existing shareholders in the ratio of one such share for every two shares held.

The New Shorrock Spinning And Manufacturing Co. Ltd, Ahmedabad, will issue capital for Rs. 14,10,625. Of this, Rs. 14,01,625 will be in bonus shares; Rs. 5,000 will be in 40 equity shares of Rs. 125 each to be sold in the market at the best price obtainable.

Rohit Mills Ltd, Ahmedabad, is to issue bonus capital of Rs. 5,85,000 on capitalisation of the Company's reserves to a like extent.

THEY ALSO FIGHT WHO WORK & SAVE

The future may be invisible to your eye, but you can shape your future to the extent that you plan and save for it.

The Stock Markets

LYONS RANGE DISAPPOINTED BY INDIAN IRON DIVIDEND

Wednesday Evening.

THE Calcutta stock market has shown mixed trends towards the close of the past week. The earlier buoyancy in steel shares has worn off following heavy profit-taking in Indian Iron. Lyons Range has reacted bearishly to the news that the Indian Iron and Steel Co. Ltd has maintained the taxable ordinary dividend at 16 percent for 1962-63. The expectation of a higher distribution was not based on sound premises. Considering the burden of heavier taxation and the debt repayment obligations of the Company, the maintenance of the dividend should be welcomed. Although it is not possible to make a correct assessment of the results in the absence of detailed figures from the profit and loss account, the disappointment has arisen from the fact that the net profit for 1962-63 shows little variation from that of 1961-62 despite a bigger output. It may be that the rise in production costs has not been adequately covered by the increase in the retention price of steel. After touching a high of Rs. 23.58, the price of Indian Iron has slipped back to Rs 23.06.

Sentiment has suffered somewhat in sympathy with the decline in steel shares, although turnover during the week has been fairly satisfactory. Business has been concentrated on selected clearing shares, indicating a lack of investment support. A redeeming feature has, however, been the absence of selling pressure. The improvement during the past few days has taken place largely because of professional support. It is encouraging that the market has taken the heavy margin requirements in its stride. The trend has again become sluggish because investors have been inclined to hold off. If the recent gains are consolidated, the trend should be steady for some time.

Contributing largely to the improvement has been the belief that the Government takes a serious view of the deterioration in investment confidence. It is difficult to say whether the Government will take any positive measures to revive the capital market. However, an indication is available from the sanction given to the issue of rights shares by Cooper Engineering at par. Only two years ago this Company was forced to issue rights shares at a substantial premium. So it looks as if the rules and regulations concerning capital issues will be liberalised.

In any case, the near-term trend is unlikely to be more bullish considering that a large volume of funds will be siphoned off by the Government loans the lists for which open on next Monday. Despite the temporary easiness in money supply because of the slack season, the stock market is not likely to get much support from banks. Due to the slow pace of deposit growth, banks are worried whether they will be able to satisfy the legitimate credit requirements of trade and industry during the next busy season. To what extent the Life Insurance Corporation will support the stock market after the new loans are subscribed, it is difficult to predict now.

There has been fair support for selected engineering shares, although the closing prices are somewhat lower than the highest levels touched earlier. Interest has been concentrated on Burn, Braithwaite, Guest, Keen, Williams, Texmaco and Jessop. Bhartia Electric Steel have met with scattered buying. Bank shares have been neglected. Cotton mill shares have been subdued since the prospect of an early increase in the prices of cloth is considered remote. Dunbar, J. K. Rayon and Bharat Commerce have been freely available. Little business has been done in coal shares and prices have shown no improvement; investors have been worried by the larger accumulation of stocks at pitheads. Burrakur, East Indian, Central India and New Beerbhoom have been transacted.

Turnover in miscellaneous shares has increased but profit-taking has reduced the prices towards the close. Hindustan Motors, Indian Aluminium, Indian Copper, Jaipur Udyog and Rohtas have been active among clearing shares. Interest has been taken in Alkali Chemical, Union Carbide, Associated Battery, Hindustan Aluminium, British Paints and National Insulated Cable. Electric company shares have been sluggish and scattered business has been transacted in Calcutta Electric. Among managing agency shares, Martin Burn and Jardine Henderson have been done. In the paper section, Orient and Sirpur have been active but Titaghur have been sluggish. Sugar shares continue to be freely offered without attracting buyers. Despite talk of a bigger output target for the 1963-64 season investors are worried about the profit outlook.

Jute shares have been hesitant because of the slow buying of jute goods by foreign countries. Barnagore, Fort Gloster, Birla and Ganges have been barely steady. Tea shares have met with bigger support on account of better auction prices. Interest has been taken in selected Assam and Dooars gardens.

Government securities have been steady but turnover has been small. Investors are waiting for the new Government loans. The prices of selected State Government loans have hardened following institutional support.

Bombay

WIDE FLUCTUATIONS IN PRICES

BIGGER DIVIDEND FROM TATA STEEL

Wednesday Evening.

THERE have been wide fluctuations in the Bombay stock market during the past week. At first, prices of selected shares were boosted on hectic speculative support on expectations of a higher dividend from the Tata Iron and Steel Company for 1962-63. When the dividend announcement came, there was heavy profit-taking although the Company fulfilled the market expectations by declaring a higher net ordinary dividend of Rs. 7.70, against Rs. 7.25 a share. The reaction was natural in that those who had bought earlier took the first opportunity to book their profits. The results of the Company are impressive. Turnover has risen from Rs. 86.25 crores in 1961-62 to Rs. 99.53 crores. The gross profit has shot up from Rs. 19.24 crores in 1961-62 to Rs. 22.21 crores.

Sentiment has been affected by the news that the Indian Iron and Steel Company has repeated a taxable ordinary dividend of 16 percent for the year ended March 1963. Towards the close, share prices have settled at the lower levels and selling pressure has abated. The possibility of the Government liberalising the rules governing capital issues has given rise to optimism. Cooper Engineering Ltd, for instance, has been permitted to issue rights ordinary shares in the proportion of one new share for every two held, at par. This Company had to issue rights shares in 1961 at a premium of Rs. 25 a share. Easier money conditions have also contributed to the steadiness.

Tata Steel ordinary have closed at Rs. 142.25 and Indian Iron at Rs. 22.96. Among engineering shares, Tata Locomotive have been steady on optimism concerning the working of the Company during the current year. Its expansion schemes, it is reported, have made satisfactory progress. Interest has also been taken in Mukand Iron, Alcock Ashdown and Premier Construction. Among motor-vehicle shares, Hindustan Motors and Premier Automobiles have reacted somewhat towards the close.

After a hectic rise earlier, cotton mill shares have softened towards the

MT/6/63

close following heavy profit-taking. Investors fear that there will be no increase in the price of cloth in the near future. The profit outlook for the current year is not considered encouraging in view of the rising production costs. Century, Bombay Dyeing, Tata Mills, Standard, Gokak and India United ordinary have closed below their best levels touched earlier.

Miscellaneous shares have moved up in sympathy with the general trend. In the cement group, Associated Cement have improved on reports that the Company has sold its assets in Pakistan, and that arrangements are being made to repatriate the funds to India. Mining shares have been fairly steady, and Shivrajpur Syndicate have recovered. Among sugar shares, Belapur have hardened on prospects that sugar mills may get a rebate in the excise duty as a production incentive.

Steamship company shares have improved on balance. Scindia Steam have gained on hopes of a rise in freights. Chemical shares have been steady, and support has been extended to Tata Chemical. National Rayon have recovered on replacement buying. Interest has been taken in Gwalior Rayon. Bombay Burmah have improved. Turnover in cash shares has shown an appreciable improvement. Permanent Magnets, Synthetics and Chemicals, and Voltas have gained. Colour-Chem have been steady in response to the encouraging speech made by the chairman of the Company.

Scattered business has been done in banks shares, but fluctuations have been narrow. Bank of India and Central Bank have been bought. Among insurance shares, New India Assurance have been steady. Prices of electric company shares have hardened somewhat. Ahmedabad Electric and Tata Power have been transacted.

Madras

EQUITIES IMPROVE ON OUTSIDE SUPPORT

SELECTED PLANTING SHARES FAVOURED

Tuesday Evening.

THE Madras stock market has been steadier during the past week. Turnover has improved in clearing and cash shares and their prices on the whole have been higher. There has been increased support from outside centres. The restoration of power cuts has been a stimulating factor. Operators and investors have been encouraged by the prospect that the Government may take measures to restore confidence in the capital market.

Government securities have been steadier, and support has been extended to selected State Government loans. Scattered business has been done in bank shares. Canara have been taken at Rs. 80.50 and Indian Overseas at Rs. 142. Selected electric company shares have met with interest. West Coast have been transacted at Rs. 18.75. Although the prices of selected sugar shares have improved somewhat, turnover has been small. Deccan have been transacted at Rs. 9.95 and E.I.D. at Rs. 38.90.

There has been greater support for selected planting shares on dividend news and good crop reports. Blue Mountain have hardened to Rs. 2.53 and Cochin Malabar to Rs. 6.40. Business has passed in Consolidated Coffee at Rs. 18.35 and in Ouchterlony at Rs. 4.25. Periakaramalai have been placed at Rs. 3.87 and Balanoor at Rs. 12.00 on paying a taxable ordinary dividend of 10 percent. Coorg have been absorbed at Rs. 5.15 on declaring a taxable ordinary dividend of 15 percent.

South India Viscose have recovered smartly to Rs. 132.50 in the textile section. Travancore Rayon have hardened to Rs. 24.31. Business has been done in Lakshmi at Rs. 142.50 and in Madura at Rs. 31.50. Cauvery Spinning has been transacted at Rs. 16.25 on paying a taxable ordinary dividend of 10 percent. Tirupati have been bought at Rs. 11.65 on declaring a final taxable ordinary dividend of 10 percent. Bangalore Woollen have been steady at Rs. 233 and Buckingham at Rs. 263.

Miscellaneous shares have shown mixed trends. Support has been extended to Aluminium Industries at Rs. 17.75 and to Dalmia Cement at Rs. 13.50. But Ashok Leyland have been neglected around Rs. 7.45. India Cement have been bought at Rs. 5.67 and Mettur Chemical at Rs. 12.65. Travancore Chemical Manufacturing have been taken at Rs. 18.87 on paying a final taxable ordinary dividend of 10 percent, making 20 percent for the year. Seeshasayee Paper have hardened to Rs. 7.60 and Tube Investment to Rs. 235. Forest Industries have been transacted at Rs. 2.19 on declaring a taxable ordinary dividend of 12 percent. Kirloskar Electric have been steady at Rs. 20.00 and Spencer at Rs. 21.08. Madras Rubber have been quoted at Rs. 14.50 and Tube Suppliers at Rs. 10.00.

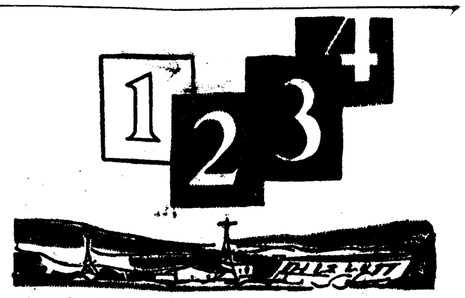
London

TRADING CONDITIONS QUIETER

SELECTIVE BUYING IN INDUSTRIALS

London, 17th July.

QUIETER conditions were the general experience over the past week in the stock market. There was little to induce buyers to open new commitments while talk of higher interest rate in the United States, the uncertain political outlook at home and holidays, were restraining influences. It was felt that many buyers were holding off in advance of the reduced stamp duty becoming operative, a view which was confirmed to some extent when on Monday many buyers were taking advantage of the cheaper dealing facility. There was some slackening later, but the firm undertone persisted. Although gilt-edged were at one time overshadowed by the threat of dearer money in the U.S.A., there was some investment demand and prices hardened. Dollar stocks moved in the wake of Wall Street where the trend was somewhat erratic, but generally towards lower levels. Industrial equities met with selective buying and among those receiving support were distillers whose dividend statement was due during the week, and Beechams, following the chairman's annual review. Tobaccos came into demand following Press comment to which investors responded well.



ANNOUNCEMENT
by
SKF

We hereby announce that with effect from 15th July, 1963 we have removed to the following new spacious office premises:

'BEHAR' the dependable name in

FIRECLAY & SILICA Refractories

For nearly half a century BIHAR REFRACTORIES are being used by leading Iron and Steel Works, Cement and Glass Factories, Tea Industries, Sugar and Cotton Mills and other Industries in the country.

Our manufacturing range includes

SILICA BRICKS • FIRE BRICKS • HIGH ALUMINA BRICKS • INSULATING BRICKS • FIRECLAY • FIRE CEMENT • STOPPERS • SLEEVES • NOZZLES • NOZZLE HOLDERS, ETC.

THE BEHAR FIREBRICKS & POTTERIES LTD.

THE CALCUTTA MONEY MARKET

FAIR DECREASE IN ADVANCES

Wednesday, 17th July.

THE general level of advances has shown a fair decrease in the Calcutta money market during the past week. The accommodation given to the iron, steel and engineering industries is noticeably smaller. There has also been a slight fall in the credit extended to the jute and sugar mills. Advances for cotton, and for the foodgrains and seeds trade, are unchanged. In the inter-bank market conditions have been very easy and the call rate is 1 percent.

The exchange market has been moderately active. The supply of tea bills has improved further, although the number of gunny bills remains about the same as before. There has been a fair demand for remittance. Sterling has eased in relation to most of the major currencies except the Danish kroner.

SILVER WAS STEADY IN CALCUTTA during the past week. The price advanced from the previous week's level of Rs. 260.25 to Rs. 262, quoted today for ready delivery. There was no business in forward. The London and New York prices were 111¾d and 129 cents. Gold was not transacted.

DURING THE WEEK ENDED 12TH JULY, Government of India Treasury bills for Rs. 221,43,50,000 were sold in favour of the Reserve Bank.

TENDERS FOR Rs. 2 CRORES OF 91-DAY Government of India Treasury bills were opened on 16th July. The total amount offered was Rs. 2,20,00,000. Tenders at Rs. 99.425 percent and above were accepted in full and those at Rs. 99.420 allotted 90 percent. The total amount accepted was Rs. 2 crores, the average rate of acceptance being Rs. 2.317 percent a year. Tenders for Rs. 2 crores of 91-day Government of India Treasury bills will be received at all centres up to the close business on 29th July.

IT IS STATED THAT 91-DAY Intermediate Treasury bills will be sold from 17th July to the 27th July at Rs. 99.436 percent subject to the conditions previously announced that sales can be stopped at any time without notice, if the Government thinks it necessary. These bills sold from 10th July to the 13th July amounted to Rs. 11 crores.

THERE WERE DECLINES of Rs. 14.06 crores to Rs. 2,284.12 crores in the total note issue and of Rs. 5.71 crores to Rs. 2,268.77 crores in active notes, according to the return of the Reserve Bank of India for the week ended 12th July, 1963. The currency contraction was adjusted by reducing rupee securities of the paper currency reserve by Rs. 14.98 crores to Rs. 1,955.67 crores. This was done by transferring securities to the Banking Department in which investments rose by Rs. 14.57 crores to Rs. 275.59 crores. Deposits of the Government of India were Rs. 17.57 crores bigger at Rs. 90.94 crores while those of other Governments fell by Rs. 3.31 crores to Rs. 5.69 crores. Balances of scheduled banks declined by Rs. 7.05 crores to Rs. 89.72 crores. Balances held abroad again fell by Rs. 34 lakhs to Rs. 5.29 crores. Loans to scheduled banks rose from Rs. 83 lakhs to Rs. 1.77 crores of which advances against usance bills were Rs. 94 lakhs (Rs. 9 lakhs). Ways and means advances stood at Rs. 54.87 crores, against Rs. 42.55 crores.

THE RETURN OF THE STATE BANK OF India for the week ended 5th July, 1963, shows a drop of Rs. 33 lakhs to Rs. 573.44 crores in total deposits. Investments in Government securities and other authorised investments are up by Rs. 5.04 crores and Rs. 1 lakh to Rs. 262.74 crores and Rs. 9.35 crores, respectively. Advances, including loans, cash credits, overdrafts and bills discounted and purchased have increased by Rs. 3.05 crores to Rs. 283.18 crores. Cash and balances are, in consequence, shown at Rs. 20.62 crores or Rs. 9.50 crores less.

THE STATEMENT OF THE POSITION of scheduled banks for the week ended 5th July, 1963, shows Demand and Time liabilities at Rs. 1,054.81 crores (Rs. 28.42 crores on account of borrowings from banks) and Rs. 1,307.69 crores (Rs. 22.98 crores), compared with Rs. 1,059.39 crores (Rs. 30.86 crores) and Rs. 1,302.86 crores (Rs. 21.38 crores), respectively, in the previous week. Cash has declined by Rs. 5.58 crores to Rs. 57.16 crores, while balances with the Reserve Bank have increased by Rs. 5.86 crores to Rs. 97.76 crores. There is a rise of Rs. 8.06 crores to Rs. 661.04 crores in investments. Advances and bills discounted at Rs. 1,536.28 crores show a drop of Rs. 15 lakhs. The ratios to total liabilities of cash and balances, and of advances and discounts are, in consequence, shown at 6.6 percent and 66.2 percent, against 6.6 percent and 65.2 percent.

TREASURY BILL MATURITIES

Details of 91-day bills outstanding with the public on 12-7-63.

Issue Date	Maturity Date	Amount (000's Rs.)	Average Acceptance Rate
19-7-62	22-10-62	2,00,00	Rs. 2.317%
12-7-62	15-10-62	2,00,00	Rs. 2.320%
5-4-63	8-10-63	2,00,00	Rs. 2.340%
28-6-63	1-10-63	2,00,00	Rs. 2.345%

TATA ENGINEERING & LOCOMOTIVE CO. LTD.

STATEMENT OF THE CHAIRMAN MR. J. R. D. TATA

The following is the statement of Mr. J. R. D. Tata, Chairman of the Tata Engineering & Locomotive Co. Ltd., for the year 1962-63.

The year under review was a somewhat disturbed one for your Company marred by shortages of materials and foreign exchange as well as the aftermath of the declaration of the National Emergency. But for the shortage of steel, particularly flat products and specials, the output would have been appreciably greater.

In spite of this shortage, your Company was able to increase its turnover by about 5% over that of the previous year. The establishment of production of excavators and Diesel shunters has helped to diversify the range of products manufactured. The successful execution of these two projects as well as the completion of the detailed planning for the expansion of the Automobile, Foundry and Forge Divisions is a matter of satisfaction to your Directors as I am sure it will be to you.

Profits and Appropriations

In spite of an increase of Rs. 2 crores in the year's turnover, the gross as well as the disposable profits are lower than those of the previous year. The reasons for this setback, which were beyond the Company's control, have been explained in the Directors' Report. I am sure the shareholders will approve of the action taken by the Directors in drawing a sum of Rs. 6 lakhs from General Reserve No. 1, in order to make it possible to maintain the dividend on ordinary shares at the same level as in the previous year. I trust, however, that shareholders will not interpret such action as any kind of commitment in regard to next year's profits or dividend. It would naturally be the wish of the Directors to maintain the present rate of dividend, and I hope that profits will in fact prove to be adequate for the purpose. At the same time, it must be borne in mind that we live and operate in difficult and uncertain times in which our own wishes and intentions are necessarily conditioned by circumstances and developments beyond our control. Much will depend, amongst other factors, on whether the Finance Minister will find it possible or be willing to repeal the super profits tax, and also on the level of production we are able to achieve in the current year. This itself will depend, to a large extent, on the availability of raw materials and foreign exchange. Notwithstanding the minor setback in profits in the past year and the difficulties and uncertainties which we may have to face in the current year, the fact remains that your Company's productive capacity and financial strength continue to grow and its prospects therefore continue to be bright.

Expansion Programme

The shareholders are aware of the Company's expansion programme, referred to as the "C" Programme, intended to double the output of Tata Mercedes-Benz vehicles from 12000 to 24000 per year. As I said in my statement last year, the Government of India desired, in view of the critical foreign exchange situation, that this programme should be spread over two stages and that only the first stage—limited to an increase in capacity to 18000 units per year—should be taken in hand for the present. Accordingly, during the year under review, the Company submitted, with Government's approval, an application to the Agency for International Development for a loan of $ 13.65 million (Rs. 6.5 crores) for implementing the first stage of expansion. This loan has been approved by A.I.D. and an Agreement has been executed. Government have also released to the Company, as agreed, a sum of Rs. 1 crore of foreign exchange from "free sources" for import of special items to be purchased from West Germany.

Since the advent of the National Emergency, and in view of the accelerated demand for our products for defence purposes, Government have now decided that the second stage of expansion should be implemented as soon as possible. We are accordingly submitting a second application to A.I.D. for a further loan to cover the foreign exchange requirements of the second stage.

The most appropriate method of securing the Rupee finance for the contemplated expansions is receiving the consideration of your Directors.

Automobile Division

It is only in times of emergency such as the one we are now experiencing that the vital importance of an efficient and self-supporting automobile industry can be properly evaluated and appreciated. This emergency has also revealed weaknesses in the structure of the Indian automobile industry, particularly for meeting the requirements of the special types of vehicles needed for our Defence Services. There are reasons to believe that Government is now directing its attention towards eliminating some of these.

Immediately after the declaration of the Emergency, with a view to raising to the maximum the output of Tata Mercedes-Benz vehicles for the Army, additional shifts and overtime working were resorted to and the output was stepped up by as much as 20%. Unfortunately, this high rate of output could not be sustained for more than a couple of months as Government could not provide the additional foreign exchange required for the import of raw materials and components.

The first stage of the expansion from 12,000 to 18,000 vehicles per year has been planned in such a manner that the additional output will be secured sometime towards the end of 1964. Deliveries of plant and equipment from the United States are reasonably short, varying from 9 to 12 months. As all the buildings and services will have been completed by then, the Company will be in a position to secure additional output no sooner this equipment is installed.

Commercial vehicles continue to be in short supply. The position has become particularly acute as a result of the diversion of a major portion of our output for Defence purposes. During the Company's financial year 1962-63, the production of commercial vehicles in the country totalled 25,385, of which 12,200 or 48% were Tata Mercedes-Benz. The commercial vehicle target for the Third Plan has been set at 60,000 vehicles by 1965-66. but this, of course, will not be attained because there is just not enough capacity either with the main manufacturers or with the components' industry.

The Commercial Vehicles (Distribution and Sale) Control Order, which came into force in May, 1963, is evidence of the deteriorating position regarding the availability of commercial vehicles. The directions issued by the Controller of Commercial Vehicles result in 80% of our output being reserved for priority allocation by Government. Whilst the preference of the Government authorities for Tata Mercedes-Benz vehicles is a matter of gratification, the reservation of these vehicles for non-Defence purposes not only operates unfairly on our dealer organisation, but is also likely to influence adversely our long-term market position. These facts have been brought to the attention of the authorities and we are hoping that suitable modifications to the Control Order will be issued before long.

Our dealers, whose reasonable expectations of continued supply of vehicles has been greatly and unexpectedly upset, have shown a great deal of patience and loyalty to the Company. During the past several years, a first class sales and service organisation has been set up, the successful functioning of which depends on a steady supply of vehicles and spare parts. Not only has the vehicle supply to our dealers dwindled to a mere trickle, but the spare parts position also is becoming critical due to a decision of Government not to grant import licences to manufacturers even for such items which are not currently being produced in the country by component manufacturers.

The growth of the road transport industry has always had to contend with high taxes and duties, multiplicity of regulations and inadequacy of good roads. At present the magnitude of the tax burden on road transport is so great that a recent estimate made by the Indian Road Transport Development Association reveals that taxes and duties on goods transport average 6 Naye Paise per ton-mile or approximately equal to the average freight per ton-mile charged by the Railways. This industry whose growth is vital for the development of our nation will now suffer additionally from the non-availability of vehicles. The inescapable conclusion is that the vital importance of encouraging the vigorous growth of the automobile and road transport industries has yet to be appreciated by our Planners and Government. If there is any appreciation, it has certainly not been translated into any effective action upto now.

General Engineering and Foundries Divisions

The release of production facilities as a result of the planned reduction in steam locomotive output has made possible a worthwhile increase in the turnover of the General Engineering Division, the performance of which would have been very much better if operations had not been plagued by several handicaps which appear to have become an inherent part of the Indian engineering industry. Though our excavators, shunters and paper & pulp making machinery contribute significantly to the country's development and save a great deal of foreign exchange, the actual position is that engineering companies such as ours are unable to obtain any assurance of supplies of steel in adequate quantities and of the required types; numerous orders for steel placed over the past couple of years remain outstanding without even an indication of when we may expect deliveries. It has to be appreciated by the controlling authorities that for the effective utilisation of high grade engineering capacity put up at considerable cost by companies such as ours, it is vital that the flow of materials through the shops be planned in detail and long in advance of actual operations. The uncertainties created by material shortages result in the processing of uneconomic batches, frequent setting, low labour productivity and lock up of funds in works-in-progress. Such inefficient operations inevitably raise our costs and lead to a wastage of production facilities, which is as undesirable as idle plant and equipment, even though this may not be equally evident.

Discussions are in progress with Government regarding the continuance of manufacture of steam locomotives after the current order for 325 units which will be completed during the latter half of 1966. We have brought to the notice of the Railway Board that the new projects which we have undertaken are very high up on the list of foreign exchange savers and the increase in their output and the rapid growth in their indigenous content is dependent on the availability of the skilled men and machines to be progressively released by the reduction in locomotive production. We have drawn their attention to the fact that further large scale investment by the Railways in obsolete motive power such as the steam locomotive, which in any case will have to be prematurely retired, is not calculated to solve the nation's transport problem. We are pursuing this matter with Government.

In Jamshedpur, as in most of India, industrial production has been hampered by power shortages. The Company's Foundries Division has been particularly affected; frequent furnace shut downs due to power cuts have limited the tonnage of both the foundries to about the same levels as during the previous year. It is to be hoped that the additional power to be generated by a number of Government projects in eastern India will become available according to schedule so that the crippling effects of such shortages on industrial production can be avoided.

The installation in the Alloy Iron Foundry of the new equipment ordered from the U.S.A. under the A.I.D. loan will greatly increase its capacity and further improve its efficiency. Some of the latest techniques and processes of foundry practice are being introduced and it is confidently expected that the performance and quality of the foundry products will compare favourably with those of automobile foundries in other parts of the world.

New Projects

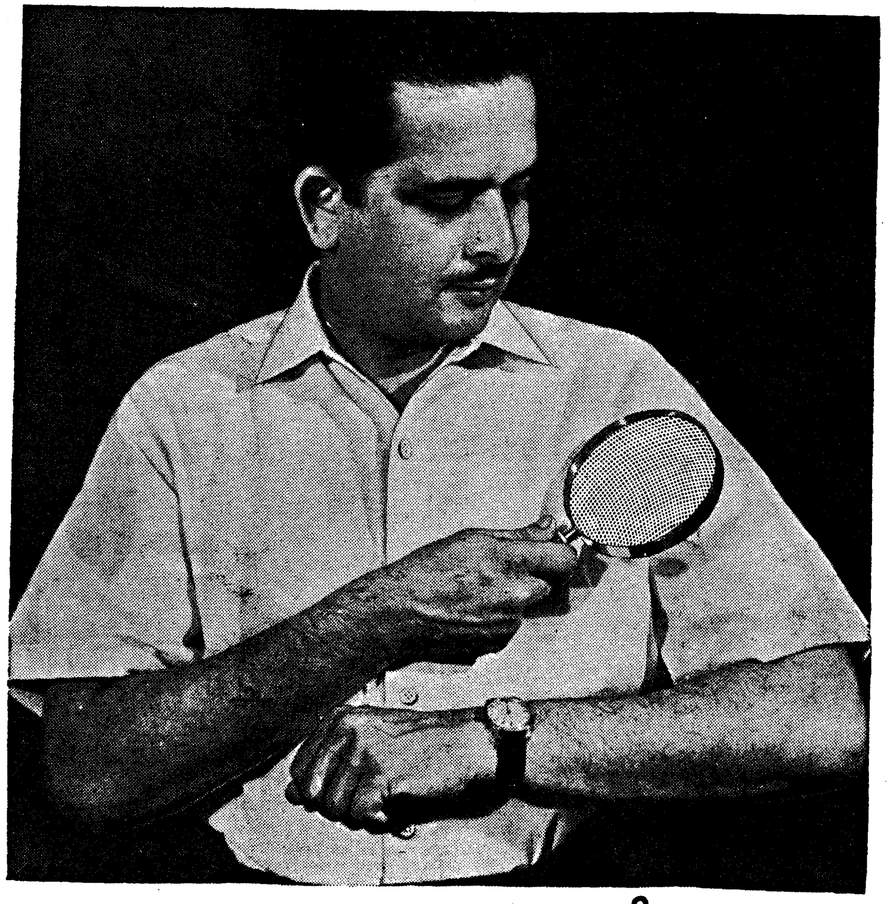
The execution of the projects undertaken recently and the implementation of our expansion programmes have fully extended our financial and managerial resources. Your Directors, therefore, consider as inadvisable at this stage any new venture which might detract from the major task to which we are fully committed. An exception has, however, been made in regard to a plant which we propose to set up with the technical collaboration of a German firm for the production of press tools, dies and production devices needed in increasing quantities by the repetitive engineering industry. Such an operation apart from saving and earning foreign exchange, will result in the development of those priceless assets—the skills and techniques required for designing and producing various types of production devices. This is a specialised field in which a beginning has scarcely been made in India, but one which forms an essential element in the country's engineering industry.

The Government of India have granted to the Company a licence to

establish such a plant. Though the location of the project has not yet been finalised, negotiations are in progress for securing suitable land in the Poona region.

Labour and Personnel

During the past years I have referred to one of our most important though intangible asset—our engineers, administrators and craftsmen. The attention that we have paid to the training and development of our personnel resources constitutes the principal assurance of our future vigorous growth. We have now over 700 persons on the Company's rolls who have obtained one or more University degrees in a wide range of technical, commercial and other subjects. The number of our engineering graduates exceeds 400, apart from over 1300 employees who hold engineering or technical diplomas and certificates. These constitute an asset that we must maintain and develop with as much care as we devote to our plant and equipment. It will continue to be the Company's policy to provide adequate compensation to its employees and to keep the avenues of promotion open for those who prove their ability to undertake greater responsibilities.



Our growth and expansion will continue to demand an increasing number of skilled and qualified personnel. The pool of trained and experienced men in the country is strictly limited and in view of our increased demand we shall need to establish in due course additional facilities for their training and development. Towards the end of the year under review there were under training at the Telco Works 473 trade apprentices and 125 graduate engineers and supervisors.

The labour situation at the Works continues to be satisfactory. There were no strikes and other disturbances to production during the year under review, although during May this year there was a stoppage of work in the Rear Axle Section of the Automobile Division resulting in a loss of 13,901 man-hours.

Your Company is taking active steps to build up a co-operative relationship with the recognised Union so that the productivity of our labour can increase and emoluments and conditions of work improve.

In conslusion, on behalf of the Directors and on your behalf, I would like to express my thanks to the Company's workers and staff for the results achieved during the year in the face of so many difficulties, only some of which I have mentioned.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

OIL INDIA LIMITED

(A 50 : 50 Cooperative Enterprise of the Government of India and The Burmah Oil Company for Prospecting, Drilling, Production Transport of Crude Oil from Upper Assam to Refineries in Gauhati, Assam and Barauni, Bihar)

STATEMENT OF THE CHAIRMAN SHRI KHANDUBHAI K. DESAI, M.P., TO THE SHAREHOLDERS ON THE OCCASION OF THE FOURTH ANNUAL GENERAL MEETING OF THE COMPANY HELD ON FRIDAY, 21ST JUNE, 1963. AT DULIAJAN, UPPER ASSAM.

GENTLEMEN: I have pleasure in presenting to you the Report of the Directors, and the Annual Accounts of the Company for the year 1962. Owing to certain restrictions imposed under the emergency, I regret that it has not been possible to circulate these Reports as usual.

GENERAL: 
The past year has been a most eventful one for our country due to the Chinese Aggression and their attacks on our NEFA border in October. This event has had its repercussions, both directly and indirectly on Oil India. Our oilfields are situated in the North-East corner of Assam. At the height of the emergency last year it became necessary to make arrangements for evacuation of the families of our personnel from the oilfields. I am glad to say that this was done smoothly and efficiently and within the shortest possible time. Subsequently, it has been possible to allow the families to return to their homes. Our staff, however, stuck to their posts through the period, and carried on with the motto "business as usual". I would like to pay here my tribute to the staff—labour, clerical and executve for the spirit of constancy they showed throughout.

Security precautions due to the emergency required, however, a certain diversion of our resources, and this has resulted in some slowing down of operations and of our construction works.

In a wider sphere the Chinese Aggression has highlighted the need to maximise our production of petroleum products both to save foreign exchange and as a vital necessity of our defence effort. As far as the Eastern area is concerned, steps are being taken by the Government of India to expand the capacity of Barauni and Gauhati Refineries by 1966 so that the total production of refined products in this area including also the Digboi Refinery could be increased to over 4½ million tons. Naturally Oil India would have to make every effort to increase the production potential of crude oil both in our existing oilfields as well as in the new areas for which we have been granted exploration licences in order to meet as much as possible of these increased requirements. The Oil and Natural Gas Commission will be making a similar effort in their own areas in Assam.

I would now like to refer particularly to some of the highlights which marked our activities during the past year.

ROYALTY & EXPLORATION: 
I am happy to say that the dispute regarding Royalty has been satisfactorily settled with the Prime Minister's award last November, which fixed this at a rate of Rs. 7.50 per ton and Oil India is now paying royalty on this basis. Soon after, we also obtained our prospecting licence for 1291 sq. miles in Area 'A'. Another application for exploration licence of 595 sq. miles is now pending before the authorities concerned. Arrangements for starting a seismic survey in the former area were taken in hand immediately, but this had to be postponed due to the Emergency. However, early in 1963, we decided to speed up the survey work and for this purpose, we were fortunate in obtaining the services of a seismic team from the Oil & Natural Gas Commission. The seismic survey started in March, 1963 and a considerable amount of work has already been done. Needless to say in the light of the latest requirements, these operations including drilling of test wells will have to be carried out on the most intensive scale possible and this question is now engaging the Management's attention. I would like here to express my thanks to the Oil & Natural Gas Commission and the Ministry of Mines & Fuel for their assistance in making this survey party available and also express our appreciation of the very good work done by the seismic team in this relatively short period.

OILFIELD OPERATIONS: 
Last year, 25 wells were drilled of which 19 were oil producers, 2 dry and 4 await further testing. Our progress in drilling was somewhat delayed, partly because of troubles in land acquisition during the middle of the year and later on with the slowing down of certain operations necessitated by the emergency. Owing largely to the assistance and cooperation given to us by the Assam Government and the local authorities, we were able to overcome the difficulties in regard to land acquisition and the work is now going on unhampered.

Oil India can claim credit for two "firsts" in our drilling programme. Recently we adopted the new technique of "Dual Completion" which would enable simultaneous production from two horizons in the same well. This is still more or less in an experimental stage though we have successfully drilled one dual well and the second one is in progress. Another new technique which OIL adopted is directional (deviated) drilling in order to tap oil resources under the bed of the Burhi Dihing river; and up to date we have successfully completed three wells through this method. This is the first time these techniques in oil drilling are being employed in India.

CRUDE CONDITIONING PLANT: Another major achievement of this year was the completion of the Crude Conditioning Plant in Nahorkatiya, the first one of its kind in any part of the world. The plant has been brought into commission from February, 1963, and conditioned crude is now being supplied to the Gauhati Refinery. A similar plant is under construction in Moran.

PIPELINES: 
The 16" sector of our pipeline was put into commission in March, 1962, and has been supplying crude continuously to the Gauhati Refinery. I am glad to say that the 14" sector is also now ready for commissioning with the completion of hydraulic testing in February, 1963. Actually this testing would have been completed even earlier, but was delayed due to a number of pipe failures which had to be rectified.

The 720 mile long pipeline connecting the oilfields in Nahorkatiya and Moran with the Government Refineries is now ready and supplies to the Barauni Refinery can start as soon as required. The final tele-communication facilities are expected to be completed by October, 1963, but sufficient facilities have been installed already to enable the pipeline to be commissioned and operated manually. The Burmah Oil Company (Pipe lines) Limited, which superintended the design and construction of the work and the contractors who participated in this effort deserve to be congratulated on a difficult job well done.

FINANCE: 
In the financial sphere the outstanding event was the flotation of our Rs. 30 crores debenture issue to finance the rupee cost of the pipeline. This is the largest single debenture stock so far put on the Indian Market and I would like to take this opportunity of placing on record our deep appreciation for the keen interest and invaluable guidance given by the Reserve Bank of India and the State Bank of India in making this debenture issue a success. In addition, I would also like to thank all the many other financial and banking institutions who also gave assistance in the issue.

A second major event related to the conversion of our Sterling overdraft of £10 million with the Bank of Scotland to a medium term loan. Arrangements have now been finalised for raising these funds partly by loan from banking institutions; and partly by debentures floated in London by The Burmah Oil Company Limited, and this amount will now be granted as a direct loan from the Bank of Scotland to Oil India repayable over a period of 15 years.

I should likely to refer briefly to our Profit and Loss Account for this year. Owing to certain recurrent troubles in the Refinery the offtake of crude by Gauhati was much less than anticipated. The commissioning of Barauni Refinery has also been delayed and it is now expected that the first stage will go on stream only in October-December, 1963. The result has been a corresponding curtailment in our sales of crude oil, the total being only 5,50,000 tons. Our unit costs of production excluding drilling and development costs have improved, the figures being Rs. 8/- per ton in 1962 as compared to Rs. 13/- per ton in 1961. On the other hand with the commissioning of the first stage of our pipeline and the creation of further assets in our oilfields, we have to make a much larger provision for depreciation than last year. After taking into account the price adjustment under the Second Supplemental Agreement, providing for full depreciation for assessed properties and transferring last year's surplus to the profit and loss account, we have recommended a final dividend of Rs. 90/- per share for the year 1962. An interim dividend of Rs. 40/- was declared and paid in December, 1962, and the remaining Rs. 50/- is now being paid. The net return on equity for 1962 will thus be 6¾% after deducting dividend tax.

GAS: 
A Special Sub-Committee set up for this purpose, with the representatives of the Assam Government has made a study of the problems connected with the production and supply of gas from our oilfields to potential consumers and has made certain recommendations which are now being considered by your Board. It is expected, however, that the actual demand for gas will only develop in about 2 years time when the State Electricity Supply Board, and the Fertilizer Factory at Namrup commence production, along with the development of other industries in this area. Meanwhile we have begun to supply gas requirements to some of the surrounding tea gardens in Assam and we are also continuing to sell our gas to meet the requirements of the Assam Oil Company.

STAFF: 
The year 1962 was the first year in which Oil India directly employed its own staff and became a distinct and separate organisation. As from January 1st, 1962, we had taken on our own pay rolls all the staff required who were hitherto employees of the Assam Oil Company Limited although the Assam Oil Company will continue to render certain residuary services under a new services agreement which we have concluded with them. As you would gather from what I have said, the year has been marked for Oil India by some notable achievements and I would like to record here my appreciation to all the staff for the loyal services rendered and the good work done by all the employees of the Company, during the year. I would also like to thank my colleagues in the Board for their active assistance and cooperation on all occasions. In particular, I would like to mention Mr. J. C. Finlay, Managing Director and Shri P. Govindan Nair, Financial Director, who have worked most closely together to make this year a successful year for Oil India Limited. I also take this opportunity of expressing my thanks to the Ministry of Mines & Fuel and the Government of Assam for their valuable assistance.

STATE WAREHOUSING OF FARM PRODUCE IN INDIA

By V. N. Hoon

ONE of the recommendations of the Rural Credit Survey Committee was the setting up of a chain of well-built, modern warehouses in the country, sponsored by the Government, for the storing of agricultural produce.* The main ideas were firstly, to provide scientific storage at reasonable rates for the benefit of producers and others, thereby eliminating the large amount of wastage in *kacha kothas* and unsuitable mandi godowns; secondly, to arrange against the goods stored, credit facilities at low rates of interest, thereby enabling the producers to avoid the heavy charges made on the advances given by the *mandi* middle men, moneylenders and *arhatias*, and at the same time, increasing their staying power to obtain the best price for their produce; and thirdly, to encourage the methods of standardisation and marking of goods, which would facilitate market transactions by samples or by quality markings and thus help in improving and stabilising the market prices.

As a result of these recommendations, Parliament passed in 1956 the Agricultural Produce (Development and Warehousing) Corporations Act, 1956, by which three kinds of corporate bodies were set up—the National Co-operative Development and Warehousing Board, the Central Warehousing Corporation and the State Warehousing Corporations—the former two with their head offices in New Delhi and one State warehousing corporation in each State.

Work-a-Day Difficulties

The Act which had set up these corporate bodies with a number of identical functions, was found to create difficulties in practical working as it related to warehousing and also the co-operative sector. The seeking of approval of the Board to the Central Corporation's programme of work and its Budget and estimates was cumbersome and rather superfluous as many members of the Board were the members of the board of directors of the Corporation also. As long as the Board and the Central Corporation were under the Central Ministry of Food and Agriculture, with the Secretary of the Ministry, (Department of Food) as the chairman, their mutual functioning somehow went on. But with the setting up of the Ministry of Community Development and Co-operation and the Board going under that Ministry, the differences of opinion came to a head not only in the plan and pace, but also in the areas of development. There was lack of co-ordination, for instance, in the allocation of centres at which the co-operative societies or the corporations could open their warehouses. The Central Government's share of 40 percent in the Central Corporation's capital was subscribed through the National Co-operative Board, which body had a predominant voice in the affairs of the Corporation. With the co-operative sector as its main concern, the Board naturally tended to view the affairs of the Corporation from its own standpoint. The Estimates Committee recognised the difficulty, but was not sure whether a separation of the Board from the corporations would achieve the necessary degree of integrated planning.

Eventually, however, there was a bifurcation, and as a result, the 1956 Act was replaced by two separate Acts in 1962—one relating to the Board as the National Co-operative Development Corporation, and the other, to the warehousing corporations. This was a definite improvement and some other alterations that had long been felt necessary in the old Act were also made. Mutual consultation between the Co-operative Board and the Central Corporation was, however, still necessary and for this, one member on the board of directors of the Corporation was provided to be nominated by the National Co-operative Development Corporation (as the Board was now called), and *vice versa* so as to ensure co-ordination in the expansion of warehousing activity, both in the co-operative and the corporate sectors. There will be no reason why this cannot now be achieved. The field for activity is country-wide, and there is ample scope for co-ordinated expansion in demarcated areas.

Development Plans

The Co-operative Board and the Central Warehousing Corporation had been formed in 1957, and by the end of 1959, practically all State warehousing corporations had also started functioning. They prepared their development plans for each five year plan period, having started practically in the middle of the second plan.

The Central Warehousing Corporation, in its existence of about three and a half years in the second plan period and two years in the third plan period, has done fairly well, considering the many difficulties it has had to encounter. In the second plan period, it advisedly went slow as it was a pioneering effort, and the producers, who are naturally conservative, and the others, had to be gradually weaned from the age-old practices of haphazard storage of produce in unsuitable godowns and shown the practical advantages of scientific storage and the other attendant facilities. It was a laborious and uphill task. The urge towards an ambitious programme of quickly constructing several large godowns was kept in check, and a modest start was made by opening about half a dozen warehouses in rented godowns at selected centres. The expansion in recent years has been rapid and the Corporation will very shortly reach the number of 90 warehouses of its own at different important centres, of which a small number is already located in its own well-constructed godowns. The constructions are designed to cater to the needs of the particular kind of commodities which are expected at particular centres. The State warehousing corporations, in their turn, likewise, started slowly on the same lines. They now have about 400 warehouses in their areas not covered by the Central Corporation.

Guarantees for Depositors

The Central Government guarantees the shareholders of the Central Corporation their capital and a minimum rate of dividend (at present 3½ percent), and the Central Corporation in turn guarantees the depositors or the lawful holders of the warehouse receipt any loss by fire, theft, etcetera, to their goods while in the custody of the warehouse. The persons who have taken advantage of the scheme so far are mostly the dealers who have readily recognised the advantages of scientific storage which keeps their produce safe, stacked properly in sound standard bags. They are also attracted by the advantage of drawing finances at cheap rates of interest against their stored goods from the banks. Greater publicity and effort are required for attracting the producers. The percentage of producer-depositors is so far low, but as the advantages of warehouse storage are being increasingly realised their number is slowly rising. The co-operative societies are also encouraged to bring their produce and a special rebate in the storage charge is allowed to them.

A warehouse receipt is issued to every depositor of goods in the warehouse, and it has been arranged with the State Bank and the other banks to give advances against the pledge of these receipts to their holders at very reasonable rates of interest. The Reserve Bank has allowed these advances outside the limits prescribed for foodgrains. The outstanding advances by the banks against the warehouse receipts at the end of March 1962 stood at over Rs. 9 crores, and have considerably gone up since then. The warehouse receipt is thus practically a negotiable instrument and is therefore, a very valuable document. It has now acquired considerable prestige in the market as a hallmark of correct produce (both as to quantity and quality) described in it, lying safely in scientific storage. The goods of each depositor are separately earmarked and further safeguarded by retaining marked and sealed samples for verification if the depositor or the holder of the receipt or the bank to whom the receipt has been hypothecated, so likes.

Targets and Achievements

The total combined targets, both of hired and constructed godowns, up to the end of the third plan period are for a capacity 1.3 million tons in 700 warehouses. As against these, the achievement up to date, both for the Central and the State corporations, is of over 550,000 tons in nearly 490 warehouses. Every effort is being made to increase the tonnage capacity by shifting the rented capacities into the Corporations' own constructed warehouses as these come up. The actual achievement cannot, therefore, be regarded as unsatisfactory; although, in the context of the country's total production of only foodgrains (which was about 79 million tons for 1961-62, and the surplus that could be stored for short and long periods), both the targets and the achievement are very inadequate indeed, even taking into account the Food Departments' godowns and the private godowns in the *mandies*. They but touch the fringe of the storage problem in India.

The Central Corporation has started making profits since the last two years, as also a few of the State corporations. But too much obsession with profit-making could rob the scheme of its benificence, and mar the enthusiasm required to carry out its objectives. It is not strictly a commercial venture, but is in the the nature of a public utility enterprise of a high order. However, when one talks of the so-called losses, one is apt to forget the invisible gains that these corporations give to the community. These are in the shape of servicing of the produce and saving of losses by deterioration from climatic conditions and bad storage and from rats, rodents and pests. So far, there has hardly been any complaint against deterioration of stocks in these warehouses.

Some of the difficulties which these Corporations had were those that a pioneering scheme of this type has inevitably to face, especially when interests of large numbers of wholesalers, dealers, middle men, commission agents and the *kacha kothawalas* are affected and seemingly jeopardised. Then there has been, and continues to be, a serious dearth of suitable and compact rented godown accommodation at reasonable rents, lack of suitable sites near the *mandis* for building godowns, and the proverbial government methods of red-tape and inertia in, for instance, expediting acquisition of sites. There has also been a serious short supply of building materials like steel and cement. Most of these difficulties, although real, are manmade and are capable of being overcome.

EQUIPMENT ORDERED FOR DURGAPUR EXPANSION

(FROM OUR NEW DELHI CORRESPONDENT)

SOME progress has been reported in placing firm orders for the expansion of the Durgapur steel works to 1.6 million tons a year capacity. The plant was originally designed and built to produce 1 million tons of steel a year by a British consortium, the Indian Steelworks Construction Company (I.S.C.O.N.). It was largely due to the co-ordinating work of this organisation that the Durgapur project has been spared the chaos which Hindustan Steel had to face at the Rourkela projects. Eventually, a co-ordinating agency had to be evolved for the expansion of the Rourkela steel plant. It has, therefore, been assumed that the Government will continue to use I.S.C.O.N. for co-ordinating the expansion work relating to the Durgapur steel mill, if at least 60 percent of the successful tenderers are members of the consortium. But it is not clear now whether the services of I.S.C.O.N. will be used, and if not, what other form of co-ordinating agency will be evolved for the expansion of the Durgapur steel works. The awarding of orders to non-members of I.S.C.O.N. has given rise to some apprehension. It may be added that the British Government, which has given credit for this expansion, has emphasised the need for a co-ordinating agency.

At least three orders have so far been placed with non-members of the consortium. These include the tender for the soaking pit won by Ofu-Lynx and that for the skelp mill won by another firm. Among member-firms, Head Wrightson will build the blast furnace and Wellman Smith Owen the steel-melting shop. The contract for the coke oven has gone to Coppee, a non-member, and not to Simon-Carves. Behind this decision lies an odd story of horse trading. Simon-Carves and Coppee, it is reported, were pitted against each other to reduce their quotations. Enquiries show that Hindustan Steel, which is responsible for the performance of the steel mill had originally recommended that Simon-Carves should build the coke oven as it had done earlier at Durgapur and elsewhere. The Ministry of Steel accepted this recommendation but, according to reports, it was vetoed by the Finance Minister himself. How the Finance Minister came into this purely technical matter, is not yet known. According to reports, the Finance Minister's main anxiety was to encourage a newcomer, namely Coppee, and thereby break the predominance of Simon-Carves.

Many ask whether it is fair to call tenders and then resort to horse-trading by telling one tenderer what the other has quoted. The practice, unless checked, will have far-reaching effects on the whole system of placing orders on the basis of global or regional tenders. The tenderers, knowing that they will have to reduce their quotations, will quote higher prices from the start. The practice is also detrimental to India's prestige. It is not a question of choosing one firm or another. It is a question of dealings as they are internationally understood. Such practices, if not given up, might have serious repercussions on the deal for the proposed Bokaro project.

There is yet another important matter. The orders for the expansion of the Durgapur plant have begun to be placed. It takes about 30 months from the date of placing an order to the commissioning of a new unit. On this basis, the expansion of the Durgapur Plant will not begin to bear fruit until 1965. By that time, the expanded Russian-built Bhilai steel mill may be in full production. And then, the Russians will be praised. In actual fact, the praise should go to the system under which there is only one supplier for the entire equipment. No tenders are invited and no haggling over prices is allowed.

FOREIGN INVESTMENT

Latin American Prospects

What is the attitude of U.S. companies towards investment in Latin America? Eighty companies responded last month to an exploratory *Vision* questionnaire sent to a representative group of major U.S. firms active in the Latin American field. The questions and answers are as follows:

What are the main stimulating factors today for your company's business in Latin America?

Economic growth 27; future potential 17; potential purchasing power eight; technological advance seven.

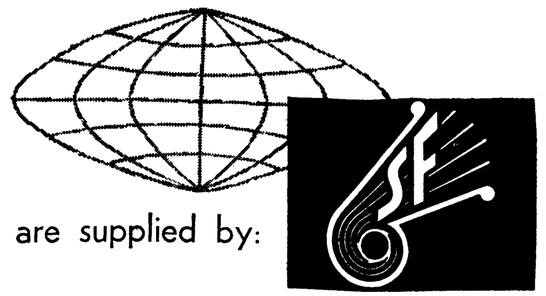
What are the main deterrents?

Political problems 39; economic problems 21; inflation 18; currency problems 14; import restrictions six.

Vision is a weekly magazine of New York, published in the Spanish and Portuguese languages.

INDIA

Climate for Foreign Capital



What is the climate for foreign investment in India? According to newspaper reports, the setback in capital issues noticed since the beginning of October 1962, continued during the quarter ended April-June 1963. As for the capital issues approved and actually floated in the market, two-thirds are quoted at or below par. Banks may not be able to meet industry's credit needs.

Newspapers have also reported a noticeable decline in the prices of stocks and shares. Side by side, labour costs and those of building materials have been increasing. Import restrictions continue to be as irksome as before. There are restrictions on remittances abroad. A monster petition for the nationalisation of banks, oil companies and the export trade is proposed to be presented to Parliament. There is political stability, but side by side, discontent in the ruling Party itself growing.

The reasons for the present state of affairs in the country are well known. They include high taxation, including the compulsory deposit scheme, the rising cost of living and the Government's gold policy, which have caused discontent. These partly explain why foreign collaboration cases have gone down, particularly since March this year. An entrepreneur may even tolerate procedural delays, however undesirable they may be. But a foreigner is hardly expected to invest his money in India if he is threatened with nationalisation, and if the return on

In Paper & Pulp Industry...

VAPOUR HOODS THAT SAVE THOUSANDS OF RUPEES...

are supplied by:

Heat recovered is money saved. The steam that escapes from the pulp which passes through rollers is faithfully collected in the specially designed SF Hoods. The moisture is channelled off from the hot vapour and most of the heat recovered and passed back into the chamber. This considerably reduces the consumption of fuel, resulting in a substantial saving of fuel cost. Production is also increased.

In the important pulp & paper producing countries of the world, SF Vapour Hoods have served for several decades. The engineering skill and over half a century of experience of Swedish technicians are today available in India.

his investment is less than, say, in Africa.

The responsibility for the present state of affairs devolve on the Planning Commission which has refused to cut down the size of the plan, and on the Finance Minister, who instead of telling the Planning Commission how much money it can have after meeting the defence Budget, has placed unbearable burdens on the tax-payer in general and industries in particular. The Indian tax-payer can be made to pay whatever taxes are levied on him, but a foreign entrepreneur will be attracted to India only if there is the prospect of a reasonable return on his investment. The Federation of Indian Chambers of Commerce and Industry is blaming the wrong persons when it says that due to procedural delays, the rate of foreign collaborations has gone down in recent months.

PATENTS LAW

Changes Explained

The Government of India in a Press note says: "There seems to be a certain amount of misunderstanding about the purpose and effect of certain changes which have been made to the provisions of the Defence of India Rules in so far as they affect the Patents Law of the country. The object of the powers taken under the Defence of India Rules is not to extinguish the existing patent rights or to make them usable without appropriate compensation, but merely to ensure that in an emergency, there are no occasions for delay in production or scarcity supplies leading to exorbitant prices for essential items like drugs and medicines. So far, no such action has been taken under the Defence of India Rules in question. Similar emergency powers have been taken by different countries in times of war. The long-term policy concerning patents is a matter which is still under consideration, and will be the subject-matter of fresh regular legislation. Pending the introduction of such legislation, it has also been considered advisable not to register under the existing law any fresh patents in the field of drugs and medicines. This is also secured by the amendments that have been promulgated to the Defence of India Rules."

EXPORTS

Board of Trade Sets Targets

The Board of Trade, meeting in New Delhi last week "approved the target of Rs. 745 crores of exports" set for the current year. It has not, however, been disclosed how this target will be achieved. For, exports of Indian merchandise do not depend on the will and determination either of the Indian Government or even of Indian exporters. It solely depends on the purchasing power and the will of foreign consumers. This again depends on competitive prices, quality and delivery of Indian exports. A target, say, of "X" million lbs of tea, is fixed on the assumption that tea would become duty free and the present taxes on coffee would remain intact. The target would not be reached, if tea did not become duty free, or along with tea, coffee also became duty free. In other words, the high-sounding declaration that the Board of Trade has approved the target of Rs. 745 crores for the current year has little practical significance beyond that it expects exporters to make further efforts.

Reviewing the exports countrywise, the Board has favoured more concentrated efforts towards expanding exports to the major trading countries, namely, the U.K., the U.S.A., western Europe, east European countries, Australia, Canada and Japan. Along with this individual attention should also be paid to the countries of south east Asia and Africa where India has the advantage of proximity.

The Board noted with satisfaction the Government's resolutions constituting a marketing development fund of Rs. 3.8 crores and the appointment of a three-man high-powered committee to administer this fund. The marketing development fund would also give preferential assistance to exporters and export houses dealing with south east Asian and African countries. In this connection, the Board welcomed the recent agreements the Government has entered into with Ceylon, Burma, Indonesia, Iraq, Iran, Jordan, U.A.R. and other countries of west Asia. The Board also recommended that the Government should arrange at an early date a conference in New Delhi of Indian Government commercial counsellors and trade representatives in African countries to hold discussions with Indian exporters who have specialised in trade with Africa, with a view to devising means for a rapid expansion of trade with that region.

IRON ORE

Exports at A Loss

The chairman of the State Trading Corporation, Mr. Govind Narain, told a news Conference last week that 1963-64 would be the first year in which iron ore exports were likely to be made at a loss although the volume of exports was expected to reach a new high. Mr. Narain said that since the State Trading Corporation came into being in 1956-57, both the volume and value of iron ore exports had steadily risen until the trade came up against the present difficulties.

India's largest buyer of iron ore was Japan, which accounted for more than 50 percent. This position was likely to continue, and India had to appreciate the position of Japan, he said.

Explaining the revised terms of the contract with Japan, Mr. Narain said that in the beginning of 1963, Japan experienced a recession in steel as production outpaced sales. Although that country was in the last year of a three-year contract with India, it had difficulties in buying any more iron ore. India could insist on the contractual payment of 81s a ton of basic grade only at the risk of damaging future export prospects. Under the terms of a fresh agreement, India accepted the price of 74s. This was not bad considering that the Japanese buyers had had sellers offering them a price of 60s a ton of basic grade iron ore.

Mr. Narain said that the chief among the State Trading Corporation's problems was inadequate loading capacity at the ports. No port in India could take more than 10,000-ton ore-carriers except Madras, which could handle 15,000-ton carriers. In Madras, the best area in India, the maximum loading rate was 2,000 tons a day.

INDUSTRIAL ADVISORY COUNCIL

Central Body Reconstituted

The Central Advisory Council of Industries has been reconstituted with the Central Minister of Commerce and Industry as chairman and 25 members representing industrial owners, employees, consumers and producers. The new Council will function for two years from the 5th July, 1963. The owners' interests are represented by Mr. Bharat Ram, president, Federation of the Indian Chambers of Commerce and Industry, Mr. A. R. Foster, president, Associated Chambers of Commerce of India; Mr. J. R. D. Tata, Bombay; Mr. K. K. Birla, Calcutta; Mr. K. Mahindra, Bombay, Mr. Arvind N. Mafatlal, Bombay; Mr. S. L. Kirloskar, Poona; Mr. T. S. Krishna, Madurai; Mr. B. V. D. Menon, Kalamasseri, Kerala; Mr. Neville N. Wadia, Bombay; Mr. Abhijit Sen, Calcutta; Mr. V. S. Kudva, Mangalore; Mr. K. C. Maitra, Bombay; Mr. N. M. Wagle, Bombay; J. V. Jardine Paterson, chairman, Indian Jute Mills Association, Calcutta; Mr. N. B. Prasad, Secunderabad.

Mr. S. R. Vasavada, general secretary, Indian National Trade Union Congress; Mr. Michael John, vice-president, I.N.T.U.C.; Mr. Manohar Kotwal, general secretary, Hind Mazdoor Sabha and Mr. K. G. Srivastava, secretary, All India Trade Union Congress, represent employees. Mr. M. P. Bhargava, M.P., Agra; Shrimati Raksha Saran, New Delhi and Mr. P. R. Ramakrishnan, M.P., Madras, are the representatives of consumers. Dr. A. Ramaswamy Mudaliar and Mr. N. Mahalingam, Pollachi, represent producers.

FOOD STORAGE

U.S. Loan for New Godowns

The U.S. Government has extended a grant of Rs. 1.8 crores to the Government of India from P.L. 480 rupee counterpart funds for the construction of 90 foodgrain storage godowns in different parts of the country. These godowns will have a total capacity of 1.8 million tons, and are being financed entirely by the United States. Last year, the U.S. Government granted Rs. 10.3 crores for this project. The third plan calls for doubling the existing foodgrain storage capacity to 5 million tons.

In addition to this rupee grant, the U.S. has already financed the import of two silo-*cum*-elevators, 50 prefabricated godowns and equipment for experimenting with new techniques of foodgrain storage. The silos are located in Hapur, Uttar Pradesh, and Calcutta. The Agency for International Development mission has also made available to the Government of India the services of a number of American technicians.

AGRICULTURE

Swiss Aid for Kerala Project

On the basis of a bilateral technical co-operation programme, the Federal Council of Switzerland has decided to grant a sum of 1,640,000 Swiss francs (Rs. 17.876 lakhs) covering the first phase of three years of an agricultural development project in Kerala. The present agreement covers only the first stage. The second stage can be taken into consideration if the first is successful. The first stage covers a pilot plant on Government land of about 500 acres in Munnar.

The commitments for the Munnar pilot plant will cover: (1) construction of a fodder station to explore the soil and to determine the most suitable kinds of grass seeds; (2) construction of a veterinary and sperm station for artificial insemination and the combat epidemics and parasites; and (3) construction of two cattle breeding farms, of 50 units each, to start cross-breeding experiments.

In addition, training courses will be held for agricultural advisers in Kerala in cattle breeding and fodder production. Preparatory experiments will be carried out at Peermade, about 1,000 meters above sea-level, for the second enlargement stage.

OVERSEAS BROADCASTING

U.S. Transmitter for A.I.R.

The Ministry of Information and Broadcasting last week announced the signing of an agreement under which the Government of India will purchase from the U.S. Government a powerful transmitter. All India Radio proposes to install the transmitter in the Calcutta region with a view to improving the signal and coverage of its external services to south east Asia. Payment for the transmitter and ancillary equipment with a total value of approximately Rs. 1 crore will be made in the form of airtime for relay of programmes by Voice of America to south east Asia. The actual time will be three hours during the optimum listening period.

E. C. A. F. E.

Economic Institute

Thirteen Asian countries and territories will jointly establish an Asian Institute of Economic Development and Planning in Bangkok. Its aim is to train Government officials who are responsible for the drafting and execution of national development plans. The Institute will be operated by the U.N. Economic Commission for Asia and the Far East (E.C.A.F.E.). The U.N. Special Fund will provide $2.4 million to finance the Institute, and the national Governments will contribute $1.1 million. Thailand, the host country, will pay the rent for the building where the Institute will be housed during the first five years. Thailand will also provide the land for the permanent building which is to be constructed later.

The first group of 30 students from all parts of Asia will arrive in Bangkok around the end of 1963. The number of students is to be increased to 40 in the second year and to 50 in the third year. Normally, the training courses will last nine months; however, it is also planned to hold short courses of not more than three months. The latter are to deal with specific development problems.

NAMES AND DATES

The fifth annual general meeting of the Calcutta Management Association was held on 12th July. The following office-holders were elected: President: Mr. H. K. S. Lindsay (managing director, Metal Box); treasurer: Mr. P. K. Sen (controller of branches, United Bank). The new members elected to the executive committee of the Association for 1963-64 were: companies: the State Bank and Guest, Keen, Williams; individuals: Mr. Prem Pandhi (Metal Box) Mr. Bhaskar Mitter (Andrew Yule), Mr. A. K. Sen (Indian Oxygen) and Dr. Ram S. Tarneja (Sahujain Services).

London

SYMBOLS TO REPLACE SIGNS ON ROADS IN BRITAIN

(FROM OUR LONDON CORRESPONDENT)

AFTER more than half a century of insularity in the signposting of her roads, continental-type traffic signs, using symbols, are to be introduced in Britain. This is one of the chief aims of the Traffic Signs Committee, which, under the chairmanship of Sir Walter Warboys, has been sitting for the past two years to review the whole incidence of road signs. The report has just been issued, and Mr. Marples, the Minister of Transport, has announced that its recommendations have been accepted in general by the Government. The Warboys Committee has recommended "radical and urgent modernisation" of the bulk of Britain's road signs and their replacement by the continental pattern, based on the protocol drawn up after the United Nations World Conference on Road Transport in 1949.

The main feature of the 1949 protocol signs is that, wherever possible, they use symbols instead of words. The Committee examined four other systems: American (which uses mostly words); African (largely based on the present British system); an international compromise between these and the European pattern, drawn up in 1953; and the present British system with enlarged signs. The system they have selected has been adopted by some 30 countries, including most of those in Europe. The Committee's main criticisms of present U.K. signs are:

(1) Roadside signs are too small to be readily recognisable and easily read by drivers travelling at normal speed.

(2) They do not have a simple, integrated appearance.

(3) The more important signs are not readily distinguishable from the less important at long range.

(4) They are often not effective at night.

(5) They are different from those used on the continent and only those who read English can fully understand them.

(6) They are often mounted too high, particularly in rural areas.

(7) They are often badly sited in relation to junction.

(8) There is insufficient continuity of place names on direction indicators.

The report states that madatory and prohibitory signs should be changed first, and that the aim should be to make the changeover uniform within two years. There would have to be an intensive publicity campaign.

The signs proposed, with some slight variations from the protocol list (for example, the list does not include a sign for a hump-backed bridge), have been designed by Mr. Jock Kinneir, who prepared the motorway sign system.

They include a "give way" sign to replace "slow, major road ahead"; the exclamation mark in a triangle, familiar to continental holiday-makers, which indicates an unspecified hazard", and minimum speed limit signs (white letters in a blue background) in case the powers given to the Ministry in the Road Traffic Act, 1962, should be used. The "halt" sign is replaced by the continental version, "stop", in an inverted red triangle. The new signs include many changes like arrows and crosses instead of such written instructions as "Kep Lft" and "No Right Turn."

Primary Routes

One of the Committee's main recommendations is the introduction of a system of primary routes. These would comprise main road routes between important centres, and would be clearly distinguished by the colour of their directional signs from other roads. Route indication signs will also be replaced. From primary routes—a new pattern of which is now being worked out by the Ministry—signs will be dark green, with white lettering for place names and yellow for road numbers.

Where minor roads join the new primary route system, "give way" signs and a new pattern of lines on the road will warn the driver on the minor road to take care. Thus, the primary routes will have priority over all traversing roads. The suggestions for road direction indicators include lower case lettering with initial capitals, because the Committee thinks its outline more familiar to the reading eye, and because it has advantages when site conditions restrict the width of sign.

The report suggests that road indication signs should, where possible, give a driver an idea of the shape of the junction ahead and the width of the roads. Since half the serious accidents on roads occur at or near junctions, the Committee recommends that minor and major roads should be clearly distinguished by new and emphatic carriageway markings at the mouths of minor roads, in addition to the "give way" or "stop" sign. The report regards the change as "a positive investment in road safety and better traffic flow," and would yield "appreciable economic dividends."

Roughly one and a half million signs will have to be replaced, and Sir Walter Warboys, the chairman of the Committee which drew up the report, said that he had allowed five years to complete the change-over because of the limited size of the sign-making industry. The cost, about £22 million, will be shared between the Ministry and local authorities in the proportion 60:40. The Secretary of State for Scotland is also in general agreement with the report.

A few days later, the Minister of Transport opened a demanstration of the new road signs produced by the Warboys Committee in Birmingham, and suggested that greater standardisation of signs throughout Europe might follow the Committee's report. Mr. Marples said he believed there were a good many new ideas and designs in the report in which other countries might be interested, and he was sending a copy of the report to all the Transport Ministers in Europe.

The Birmingham demonstration, which comprises 25 warning signs and 115 directional signs, along the A34 the main road into the city from Stratford-on-Avon and the Southeast, is the only one actually on the road at the moment. "The new directional signs are not only much better and clearer, but they introduce a new principle, which is to differentiate by coloured signs the best roads, other than motorways, from all others. The object is to help drivers, especially those on longer journeys. "When they use these primary routes, they will also be rely on being protected by 'stop' signs or by 'give way' signs from vehicles entering from side roads. Thus, our primary routes will have both continuity (going round city centres if they can, otherwise through them) and protection so that they become, in effect, priority routes."

The Noise Problem

Less welcoming has been the Government's reception of the report of the Committee under the chairmanship of Sir Alan Wilson, F.R.S., appointed by Lord Hailsham in April 1960, "to examine the nature, sources, and effects of the problem of noise and to advise what measures can be taken to mitigate it." The Government has accepted those recommendation on the need for more research, for spreading the results of research more widely, and for making the public aware of the need to avoid unnecessary noise, but has rejected the positive recommendation that grants be paid towards the cost of improving sound insulation of houses near London Airport "where aircraft noise is unreasonably high" and will take no decision on others requiring legislation if accepted, though meantime, it has undertaken to consult local authorities concerning them. Among the Committee's recommendations are:

Change in law: Local authorities should have power to serve an abatement notice where they are satisfied that a noise nuisance is likely to recur; they and the courts should be encouraged to deal with nuisance cases as quickly as possible; and there should be substantial increases in both maximum initial penalties and the maximum daily fines under the Noise Abatement Act. If noise caused by thoughtlessness and irresponsible behaviour is not reduced, consideration should be given to general legislation making it an offence for anyone in a public place to make unnecessary noise which might give reasonable cause for annoyance to other persons.

In towns: Deliveries of household stores and removal of garbage could be made quieter if containers were made of plastic rather than metal. Traffic should be canalised as far as possible into a number of main roads which, between them, would form a network through the town.

In buildings: 55dBA (decibels on the A scale) should be the upper limit to be tolerated in buildings in which communication by speech is of importance; with double-glazing on windows as a recommended method of noise reduction.

Motor-vehicles: Use of motor horns should be forbidden at all times in built-up areas except when necessary to avoid danger. Legislation should be introduced to provide that one year from the date of enactment, new vehicles should be so designed and constructed that their noise levels do not exceed 90dBA (motor-cycles) and 85dBA (other vehicles).

Railways: Recommended changes in the law would remove altogether the present exemption of railways authorities from proceedings of noise nuisance.

Hovercraft: Criteria for control of noise should be introduced as soon as possible.

Aircraft: It is recommended that the present day time noise limits for take-off should be progressively lowered proportionate to the increase in aircraft movement. Similar limits should be introduced for landings. Criteria should be established before any substantial increase in the use of helicopters or vertical take off aircraft over cities is permotted.

Industry: Planning authorities should consult the public health authority when considering applications for new factories. Noisy processes should be registered with a Minister whose inspectors would keep a check on sound levels.

Building sites: Contractors and local authorities should be encouraged to use enclosure for pneumatic drills, and all internal combustion engines used as prime movers should have efficient silencers. The noise from building sites between 7 a.m. and 7 p.m. should not exceed the level at which conversation in the nearest building would be too difficult with the windows shut.

Entertainment and advertising: More detailed restrictions on the use of icecream vendors' chimes should be introduced. Permission should required to hold motor-cycle scrambles, and pleasure fairs where annoyance may be caused.

Jute

SPECIAL FUND TO IMPROVE QUALITY AND YIELD

TO encourage growers to improve the quality and yield of jute, the Government of India has decided to set up a special development fund of about Rs. 4 crores. Dr. Ram Subhag Singh, Central Minister for Agriculture, said in Patna during the weekend that it was proposed to concentrate on intensive development work in the four major jute-growing States of Assam, West Bengal, Bihar and Orissa. The programme includes extension of acreage, distribution of fertilisers and better seeds, and the provision of retting facilities. Dr. Singh confirmed that the Government had sought the co-operation of the Central Marketing and Inspection Bureau, the Indian Standards Institution and the Indian Central Jute Committee to introduce a uniform gradation of jute on the basis of quality. Scientific classification and sorting should help the growers to get a better price for the fibre. The I.C.J.C. and the I.J.M.A. have already done valuable work in this sphere.

The I.J.M.A. Programme

The I.J.M.A.'s programme of intensive cultivation with the help of improved seeds, fertilisers and better equipment in compact blocks has yielded good results in U.P., Assam, Bihar, West Bengal and Orissa. There has been a perceptible increase in the average yield an acre from 2.6 maunds to 3 maunds. So it has been decided to extend the scheme to some compact areas in Andhra Pradesh. The Jute Development Wing of the I.J.M.A. has succeeded in growing improved seeds in dry areas in Bihar and U.P. It distributed 1,000 maunds of such seeds last year. The target has been increased to 5,000 maunds for 1964-65. As Purnea used to supply seeds of inferior quality to the growing areas in north-eastern India, better seeds have been distributed at a subsidised rate from centres in Bihar. It is proposed to distribute the improved strains more extensively in this area. Pakistan, it is reported, has also commenced seed-growing experiments in Hyderabad (Sind) and in certain areas in West Pakistan.

Fall in Jute Goods Output

Working at the maximum level for 194 hours in June, against 216 hours during the previous month the mills reporting to the I.J.M.A and two non-member mills together produced 100,300 tonnes of jute goods against 104,900 tonnes in May. The output of hessian declined by 2,200 tonnes to 41,500 tonnes and that of sacking by 2,400 tonnes to 40,000 tonnes; the production of miscellaneous goods remained unchanged at 18,800 tonnes. In June 1962, the mills worked for 200 hours, producing 97,800 tonnes. Of this 37,600 tonnes were hessian, 46,000 tonnes sacking and 14,200 tonnes other goods.

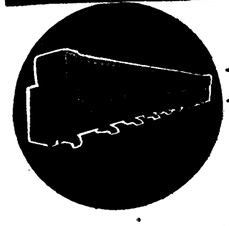
Setback in U.S Consumption

A further setback in U.S. burlap consumption has been reported, the fall being from 76.2 million yards in May to 68.8 million yards in June. The latter figure, however, compares favourably with the total of 61 million yards for June 1962. The fall has had a bearish effect. Enquiries and business from the U.S.A. have decreased recently. It seems that buyers in that country are waiting for a further decline in prices U.S. burlap consumption during January-June this year totals 463.7 million yards, compared with 443.7 million yards in the corresponding period of 1962. The monthly averages are 77.3 million yards and 73.95 million yards, respectively. U.S. burlap stocks at the end of June have fallen to 295.9 million yards from 296.5 million yards at the end of May. At the June level of consumption, they will last for 4.3 months. At this time last year, the stock duration was 4.27 months on the same basis.

Decline in Gunny Exports

An I.J.M.A. statement shows that gunny exports from Calcutta have declined from 89,161 tonnes in May to 79,591 tonnes in June 1963. Hessian offtake has risen from 49,257 tonnes to 52,697 tonnes. But sacking exports have fallen sharply from 23,574 tonnes to 19,111 tonnes and exports of miscellaneous goods from 16,330 tonnes to 7,801 tonnes. Exports during April 1963 were slightly lower than in June. The total was 79,068 tonnes, comprising 52,153 tonnes of hessian, 20,583 tonnes of sacking and 6,332 tonnes of other goods.

The I.J.M.A. statistics for the 11-month period ended May 1963 show a 15.7 percent increase to 800,400 tonnes, from 690,900 tonnes for the corresponding period of 1961-62. Of this, hessian rose by 24.9 percent from 340,800 tonnes to 426,000 tonnes, and miscellaneous goods by 30.3 percent from 85,700 tonnes to 111,700 tonnes. Sacking offtake showed a small decline by 1 percent from 264,400 tonnes to 262,700 tonnes.



Rise in U.S. Hessian Offtake

Detailed figures available for the ten-month period ended April 1963 show that hessian offtake by the U.S.A. rose to 235,110 tonnes from 175,134 tonnes for the comparable period of 1961-62. Exports to Canada increased from 32,334 tonnes to 40,698 tonnes, to Argentina from 23,868 tonnes to 43,554 tonnes and to the rest of America from 12,750 tonnes to 17,034 tonnes. In Europe, shipments to the U.K. rose from 25,398 tonnes to 28,560 tonnes and to the Continent from 50,490 tonnes to 70,686 tonnes.

Exports of sacking increased to 250,206 tonnes from 230,214 tonnes. Supplies of heavy goods to Africa rose marginally from 77,112 tonnes to 77,826 tonnes, to the Far East from 28,968 tonnes to 32,028 tonnes and to the Middle East from 1,530 tonnes to 8,160 tonnes. In Europe, sacking supplies to the U.K. shrank from 7,344 tonnes to 5,814 tonnes, but offtake by the Continent rose from 18,054 tonnes to 24,072 tonnes. Shipments to Australia increased from 27,336 tonnes to 28,662 tonnes, but New Zealand's imports were 7,650 tonnes, against 9,894 tonnes.

Australian Complaints

Another complaint about split seams in the fertiliser sacks supplied by India has been made by the Australian Jute Goods Association. A random examination of various consignments of sacks received during a fortnight by a fertiliser manufacturing company revealed that supplies by two Indian mills showed faulty edge-sewing defects in 10.6 percent and 2.9 percent of the lots. In the case of supplies from two Pakistani

mills, the proportions were 4.2 percent and 5.1 percent. Although the consignees have not claimed any damage for the defective lots, these complaints are harming the reputation of Indian goods in overseas markets. The consignors need to tighten up pre-shipment inspection.

THE JUTE MARKETS

Manufactured Goods: Opening on a subdued note, steady conditions gradually emerged in the gunny market towards the end of the past week. Lower levels and rumours of possible load-shedding on a large scale by the Calcutta Electric Supply Corporation put shorts on their guard. Scattered overseas enquiries came for small lots. Besides, there were rumours of some Government tenders. These revived the sagging market. The gunny stock figures for June issued by the I.J.M.A. removed fears about a possible sharp fall in offtake during the month. In fact, the entire output, although lower than in May, was despatched during June, which is generally considered to be a lean month. Better offtake during the week and more enquiries reinforced sentiment, which occasionally tended to sag due to the emergence of mills as keen sellers for all positions. Although the small decline in U.S. burlap consumption during June had a bearish effect on the trend, it seemed to have been offset by reports of fresh enquiries for hessian from the U.S.A. and a substantial Government tender. Business completed during the week included small hessian deals with the U.S.A. and Argentina, a woolpack order from Australia and an Indian Government tender for B Twills for ready and near-delivery positions. The futures market moved in sympathy with the spot goods market. Earlier during the week, prices nosedived on tired long liquidation and the hesitancy of bears to cover even at the low levels. But the trend was reversed towards the close when the spot market looked up and scattered covering helped prices close with small gains on balance. Turnover was moderate and the undertone steady at the close.

Wednesday's quotations were as follows:

	July	Aug.	Sept.	Oct.-Dec.	Jan.-March
40in. 7½oz.	34.60	34.80	34.60	34.60	34.45
40in. 8oz.	37.25	—	—	—	—
40in. 10oz.	47.75	47.60	47.35	46.90	46.50
B Twills	108.05	108.90	109.20	109.55	109.25
Cornsacks	110.80	111.75	112.00	112.25	111.75
Heavy Cees (Plain)	108.25	—	—	—	—
A Twills	132.50	132.50	132.50	133.00	132.50
Liverpools	122.75	122.75	122.75	123.00	122.75

Raw Jute: Dull conditions prevailed in the Calcutta raw jute market during the past week, although the Jute Commissioner's directive to the mills to lift a quota of 440,000 bales during July halted a further drift in the prices. Sentiment was affected by the low offtake by mills and reports of satisfactory crop conditions over a larger acreage. News of regular arrivals of the new crop in the upcountry markets induced selling pressure. From Saturday mills started buying against their quotas in the Calcutta and upcountry markets in selected grades for short and long delivery positions. Towards the close, sellers became hesitant to lower prices further. In the futures market, nominal transactions were reported in Upper Assam White Bottoms, September delivery, around the floor rate of Rs. 30 a maund. The turnover was moderate and the undertone steady at the close in the spot market.

Wednesday's quotations were as follows:

	Landed at Mills (Basis Bottoms) Current Prices		T.S.D. Minimum Prices	
	Rs. A Qtl.	Rs. A Md.	Rs. A Qtl.	Rs. A Md.

I.J.M.A. PRODUCTION FIGURES FOR JUNE

The Indian Jute Mills Association reports the production of jute goods in the month of June, as follows:

Description	Quantity
Gunny Bags	
(a) Hessian	
7,846 tonnes	(7,722 tons)
2,22,56 thousand metres	(2,42.4 lakh yds.)
1,77.1 lakh nos.	
(b) Sacking	
38,700 tonnes	(38,089 tons)
8,39.76 thousand metres	(9,18.4 lakh yds.)
3,92.5 lakh nos.	
Gunny Cloth	
(a) Hessian	
33,671 tonnes	(33,139 tons)
11,48,16 thousand metres	(12,55.6 lakh yds.)
(b) Sacking	
1,295 tonnes	(1,275 tons)
27,46 thousand metres	(30.0 lakh yds.)
Other Manufactures	
16,780 tonnes	(16,483 tons)
Total Production	
(All kinds)	
1,00,292 tonnes	(98,706 tons)

Summary

	June '63	May '63	June '62
	(000metres and 00,000 yds.)		
Hessian	13,70.79 (14,99)	14,39.11 (15,74)	12,45.94 (13,63)
Sacking	8,67.22 (9,48)	9,17.46 (10,03)	9,90.98 (10,84)
	(000 tonnes and tons)		
Hessian	41.5 (40.9)	43.7 (43.0)	37.6 (37.0)
Sacking	40.0 (39.3)	42.4 (41.7)	46.0 (45.3)
Others	18.8 (18.5)	18.8 (18.5)	14.2 (14.0)
Grand Total	1,00.3 (98.7)	1,04.9 (1,03.2)	97.8 (96.3)
Hours worked	194.0	216.0	200.0

N.B.—These statistics are based on replies received and represent all members of the Association and Gagalbhat with estimates for two non-member mills. The figures in brackets are in British units.

THE U.K. JUTE MARKETS

FIBRE EASIER

(FROM OUR DUNDEE CORRESPONDENT)

THE raw jute market was quiet in Pakistan, and offers made here tended easier. Shippers were very anxious for business, and although low prices were quoted in many instances, very little buying interest was shown by spinners. The fact that a considerable quantity of old crop jute is available both for shipment and ex-warehouse is not helping the position.

New crop offers were lowest at £124 10s for Mill Firsts, at £105 for Mill Lightnings, at £92 10s for Mill Hearts and at £78 10s for Grade Hearts, c.i.f. U.K. for August-September shipment. Grade Tossa-2/3 was available at £119 and Grade Tossa-4 at £106. Outport Tossa-2/3 ranged from £95 10s and Outport Tossa-4 from £85, September-October. There were sellers of new crop cuttings at £55 for S.N.C. and at £46 for N.C.

Named marks of old crop were available at £109 10s for Mill Lighnings, at £94 for Mill Hearts and at £77 10s for Grade Hearts. Grade Tossa-2/3 was at £119 10s and Grade Tossa-4 at 106 10s. Outport Tossa-2/3 was available at £93 10s and Outport Tossa-4 at £83 15s July-August.

The Siamese Jute market was quiet, and no alteration in prices took place. New crop grade A was offered at £1 10s and grade B at £66 10s, delivered mill Dundee for November-December shipment. The crop in Thailand was reported to be making satisfactory progress, and the possible yield in fibre should be in the region of 200,000 tons.

The Calcutta goods market was quiet and prices continued to fall. Quotations were at 71s for 40in. 10oz. and at 52s 3d for 7½oz. a 100 yards f.o.b. Calcutta for July shipment, at 71s 6d and 52s 6d August-September and at 70s 3d and 52s October-December. B Twills were at 165s, 166s 6d and 166s 9d for the respective shipment periods. A small business was taking place in imported goods here.

THE PAKISTANI JUTE MARKETS

FIBRE EXPORTS FALL

(FROM OUR DACCA CORRESPONDENT)

IT is interesting to note that finally, E.P.C. registrations for the season 1st July, 1962 to 30th June, 1963, total 3,843,447 bales, including 295,107 bales bought by India. During the previous season, the total was 4,886,548 bales, including 3,83,530 bales bought by India. If 900,000 and odd bales registered in June 1962, which should be deducted from the 1961-62 season and added to the 1962-63 figures, are taken into consideration, one finds that overseas buyers bought much more this season than in the previous one. Admittedly, much of this, possibly, as much as 150,000 bales, has still not yet been sold to the consumers. Nevertheless, the difference is large and reflects not so much an increased consumption as increased jute in store. That is to say, in 1961-62, overseas buyers bought hand to mouth, but this year, the large unsold position enabled them to replenish their stocks without raising the market, and also encouraged them to stock probably more than they have ever done before. This is not very encouraging for the baler, and is slightly offset by increased world consumption.

During the season which ended on 30th June, overseas buyers bought a total of 128,732 bales of mesta. This should not be added to the jute E.P.C. figures, because it is more than likely that it represents a shortfall of supplies from Siam.

The weather has continued to be favourable. Recent tours once again confirm that the quality prospect of the jat tossa crop is excellent. The quantity, in relation to white, will be even larger than expected. The northern and part of the district crop will also be fairly large, producing as usual little Dundee Tossa 2/3. There should, however, be a better proportion of Dundee Tossa 4 than last year. The hard district tossa crop, which produces better quality district tossa, has not prospered so well either in quantity or quality.

Commodity Markets

CEYLON GAINS GROUND IN U.K. TEA MARKET

(BY A SPECIAL CORRESPONDENT)

IT has long been known that Ceylon teas have been gaining ground in the U.K. market at the expense of the Indian commodity. Last week's "London Note Book" by Mr. James Cowley has some interesting information to give. Mr. Cowley says, "Some chance words dropped at a Press conference held at India House by Mr. A. S. Bam, Chairman of the Indian Tea Board, led me to wonder what exactly British housewives get when they buy a packet of Indian tea. As none of my acquaintance has ever expressed a special liking for Ceylon tea, I sought an explanation of the seeming riddle from a knowledgeable Mincing Lane source. He confirmed that Ceylon's share of the U.K. tea trade was going up. Last year Ceylon shipped 176 million lbs to Britain, 17 million lbs more than in 1961 and 24 million lbs more than in 1960. (India's shipments last year were 270 million lbs.)

"Who drinks Ceylon tea anyway? The answer, which might surprise many British addicts, is, all of us. At least, a third of the contents of every quarter-pound packet of Indian tea we buy from our grocer came from Ceylon—or maybe from any one or more of a dozen sources ranging from Indonesia to Africa and beyond."

It is well known that since the second World War, Ceylon has made great progress with output and export of tea, but recently, the *Journal of the Ceylon Planters' Society* has struck a note of warning that looking at market trends, Ceylon will not be able to sell much of her conventional black tea in the coming 15 to 20 years. For world competition in tea is likely to be tough as African countries are planning to double their production every seven years and "our closest competitor, India, is having an ambitious programme of tea market expansion", the Journal says.

It states the only course of survival for the Ceylon tea trade, is to cater to the demands of tea consuming countries like the U.S.A. The remedy, according to this article, could be found in instant tea. If this is produced on a commercial scale, a market could be found in North American countries which alone would absorb 400 million lbs of black tea.

This last sentence appears to be wishful thinking since North American and Canadian imports are together much less than 400 million lbs.

In the last week's issue in these columns, this correspondent noted that the prospects of increasing India total exports in the near future appeared to be improving. When in Calcutta recently, Mr. Manubhai Shah, Central Minister for International Trade, gave assurance to the tea trade that the Government would give financial assistance for all sound propositions. Now from New Delhi comes news for tea and jute, together with tobacco, sugar, minerals and textiles.

As far as tea is concerned, the Board of Trade asked the tea associations and the Tea Board to submit a broad-based intensive replantation scheme for the next three years. It assured them that it would recommend to the Government some "built-in promotional and incentive assistance schemes" to make larger investments possible in quicker and well-planned replantation programmes. The Board emphasised that quicker replantation with new and better varieties was most important and should be given special attention.

It was also emphasised that the packaging of tea by competent firms already in the line and new firms with considerable experience of the tea trade should be encouraged, as also the marketing of small tea packets in selected countries, wherever such teas found larger and expanding markets.

Mr. Manubhai Shah is reported to have made a statement, which strikes one as curious. He said, "to the tea traders and planters there is no real barrier to tea promotion excepting the lack of determination to produce more." This correspondent, however, tries to keep sights on practical matters and there is no commonsense in producing too much of anything that cannot be made and sold at a profit. The present shortage in output from north India has again shown the importance of heeding the law of supply and demand.

London Auction Trends

Some 73,000 packages of tea were put up for sale at the Mincing Lane auctions last week. About half of this quantity was Ceylon tea. Improved interest was in evidence for the north Indian and other miscellaneous teas offered and prices for all descriptions, although showing some irregularity, generally tended dearer. There was a good demand for shipping space, and with north India's tea crop now coming forward, bookings will increase.

U.K. tea stocks last week showed a small decline at 140.4 million lbs, against 142.5 million lbs the previous week. The total afloat was given as 28 million lbs, of which only 5.4 million lbs was shipped from Calcutta.

Average prices recorded in London last week were 43.60d a lb, against 46.46d a year ago.

The crop from north India to the end of June was 103.74 million lbs, compared with 118.66 million lbs on the same date last year.

Price Support for Ginger Likely

(BY A SOUTH INDIAN CORRESPONDENT)

PROPOSALS are under way to extend the Central Government's price support scheme to the growers of ginger and sea island cotton. These crops are now grown mostly in Kerala, and their prices have fallen to levels uneconomic to their growers. The Government of Kerala has already taken up the matter with the Centre. It is understood from the State Government circles that the Centre is now examining the question of giving price support to these crops too.

Two other cash crops of Kerala, namely, cardamom and lemongrass oil, were recently brought under the price support scheme. Although the initial reaction was not encouraging, these commodities are now getting better prices. The Cardamom Development and Marketing Advisory Committee which met in Bangalore recently has recommended the following (minimum) prices for the cardamom crop of the new season beginning next month: grade 1 Rs. 20 a kilogram; grade 2 Rs. 18 a kilogram; grade 3 Rs. 16.50 a kilogram; grade 4 Rs. 14.50 a kilogram; grade 5 Rs. 13.50 a kilogram and grade 6 Rs. 10 a kilogram. In case the trade is not willing to lift the stocks at these prices, the growers can tender their stocks to the Government at these rates, which are expected to be approved by the Government. The Kerala Government is making arrangements to buy such stocks through the State Warehousing Corporation.

The State Trading Corporation has started buying lemongrass oil by opening depots at three centres—Cochin, Alwaye and Calicut. This is under the price support scheme. The minimum price fixed by the Go-

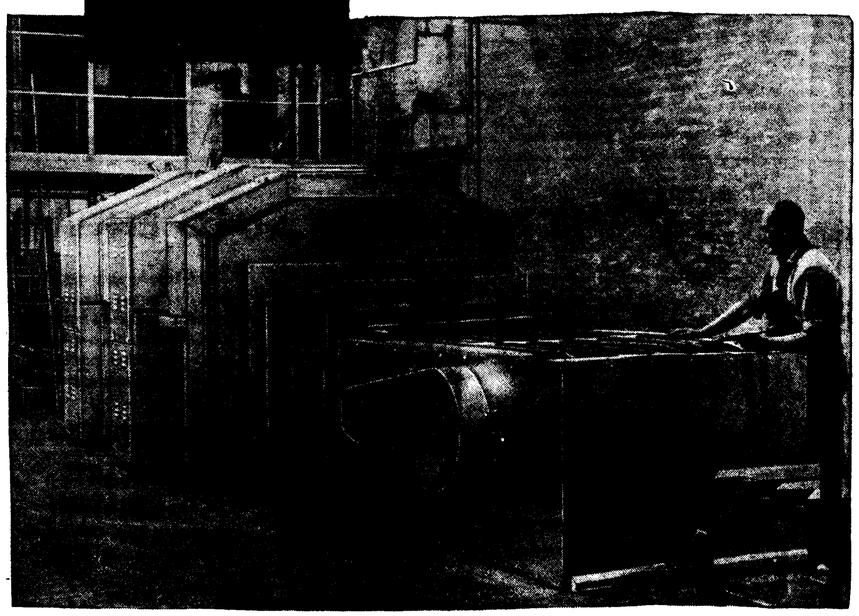
PROBL-11

vernment is Rs. 160 a 10 kilograms. With the entry of the S.T.C. into the market, lemongrass oil prices have started looking up. The private trade bought lemongrass oil last week-end at Rs. 137.50 a 10 kilograms, compared with Rs. 110 a 10 kilograms a week ago and Rs. 90 just before the Government intervened with its price support measure.

The regional manager of the S.T.C., Madras, has told the Press that the S.T.C. does not intend displacing the dealers and exporters of lemongrass oil who are already engaged in this trade. The S.T.C.'s rôle was limited to ensure that the producer, either through the traditional middle men or through the S.T.C., got the fair price even after allowing a marginal profit for the work of the middle man, wholesale dealer or exporter. The S.T.C. intends to function as an additional agency for procuring and exporting lemongrass oil rather than supplant the private trade in this field. It was officially stated that as on 2nd July, about 170 tons of lemongrass oil had been tendered at the S.T.C. depots by the dealers who could not sell them due to the slump in the market.

Rubber Replanting Scheme

The Kerala Government's ambitious rubber planting programme which was given pride of place in the third plan of the State will not reach anywhere near the target at the present rate of progress. The original scheme was to plant rubber in an area of 100,000 acres during the third plan period both in the public and private sectors, later revised to 650,000 acres. The target laid for the two Government-owned plantations was a total of 20,000 acres towards the end of the third plan. The most optimistic estimate at present is that it will be possible to plant 15,000 acres in the public sector. The Government has been encouraging rubber planting by making available Government lands to private individuals. This programme has been stifled by a dearth of land. It has not been possible to give more than 5,000 acres this way so far. A Government spokesman has said that unless and until the private forests in the Malabar area are taken over, the Government will not be able to do much in this field. In the Travancore-Cochin area, the availability of suitable lands with the Government is very limited. His estimate is that it may not be possible to distribute in all more than 15,000 acres to private individuals for rubber planting during the third plan period. Thus the total, both in the public and private sectors, will come to round about 30,000 acres.



Mr. George John Ancheril, chairman of the Mundakayam Planters

WELLMAN INCANDESCENT ELECTRIC FURNACES

A wide range of Electric Furnaces for industrial use are now being manufactured in India by Wellman Incandescent in collaboration with Metalectric Furnaces Ltd., of Smethwick, England.

Electric furnaces for heat treatment, enamelling, induction heating, dialectric heating, wire and strip annealing as well as furnaces for light alloys, non-ferrous metals and the ceramic industry can be supplied against order. Special furnaces can also be designed to meet the customers requirements.

Specialists in industrial heat engineering, Wellman Incandescent are also experts in the manufacture of mechanical handling equipment, much of which will shortly be made in India.

Association, told the annual general meeting of his association recently that the emergence of the synthetic rubber industry in India posed a "serious problem for the older, more conventional natural rubber industry of India". The rubber grower in the vast majority of cases was a small man and the rubber trees could not be hurried to mature and produce an economic yield with the same convenience or speed as a synthetic factory could be put up and its product brought to the market. The Barreily plant had just started production. Its capacity was originally fixed at 20,000 tons and has since been increased to 30,000 tons. The rubber growers did not know what facilities are being offered by the State and Central Governments for the supply of cheap power, power alcohol and such other concessions and what would be the eventual cost of production of synthetic rubber under these conditions, he said.

Continuing he said that the Government had repeatedly assured the planters of its policy of encouraging natural rubber development and exhorted the growers to take "full advantage" of the assistance offered or should ask for such assistance as they needed. The rubber products manufacturing industry is growing apace and its demand for raw rubber is now placed at over 300,000 tons within ten years. The rubber planting industry should be able to meet the major portion of the growing demand. Between 1950 and 1961, the area under rubber in India has gone up from 158,000 to 316,000 acres, a rate of growth unmatched by any other plantation crop. Much remains to be done, and producers are hoping that the past increase in acreage will begin to show results in heavier production during the coming years.

The chairman expressed the view that for a better future, planters have to cut down the existing poor-yielding rubber trees and to resort to replanting with high-yielding clones. The best procedure for achieving this objective, in his opinion, seems to be that the Government should assure the rubber growers that replanting subsidy will be open for a further period of at least 15 years. The small growers should be educated more on the benefits of replanting with high-yielding clones. Then alone would all the estates be able to do intensive tapping in the areas to be replanted and adopt a phased programme of replanting and expand with higher yielding varieties without visibily affecting normal progress in output, until the entire replanted areas begin to yield.

Aerial spraying of rubber trees against leaf diseases have become sufficiently popular, but the increasing cost might induce the estate owners to go back to the old system. It is said that when aerial spraying was introduced, the growers were given to understand that cost would go down as the acreage to be sprayed increased. But the experience this year has been that in spite of a substantial increase in acreage, the cost an acre has only increased. The cost has gone up from Rs. 50 an acre in 1961 to more than Rs. 65 an acre this year.

The Kerala Government has notified an amendment to the Agricultural Income Tax Rules to make an allowance for rehabilitation or replanting while computing agricultural income derived from rubber trees. The proposed allowance is Rs. 10 a 50 kilograms. The amendment would come into effect from 1st April retrospectively. This allowance is given by other States too.

Modern construction projects require scaffolding of far greater strength and safety than bamboo tied with coir.
Unaffected by rot, fungus and termites, MILLS tubular scaffolding has a versatile use: storage racks; temporary buildings; open-air auditoriums or bridges—apart from its normal use as a construction aid.

WHICH FOOT RESTS SURER ?

The special spring-steel fittings quickly secure the tubes-with only a ½" spanner as the tool. The greater the load the firmer the grip of the fittings, since they are designed on the 'shackle-grip' principle.

All fittings are made by Guest, Keen, Williams, Ltd. and the tubes by The Indian Tube Company (1953) Limited.

21st June, 1963.

Note 1: The dividend if approved will be payable on and after 24th August, 1963 to those members whose names are registered in the books of the Company on 14th August, 1963.

Note 2: The explanatory statement required to be annexed to the notice convening the meeting pursuant to the provisions of section 173 of the Companies Act, 1956, is being forwarded to the members.

INSIST ON

CALCUTTA ELECTRIC LAMP WORKS LTD., CALCUTTA-1.

ORISSA CEMENT LIMITED RAJGANGPUR

For information of Members:

THE Company had been advised by the Regional Director, Department of Company Law Administration, Calcutta, and also by its solicitors that a properly convened meeting of shareholders cannot be cancelled and that the announcement dated 19th June, 1963 regarding cancellation of the Thirteenth Annual General Meeting fixed for 28th June, 1963, published in newspapers, was ineffective. In this connection, the attention of the Company had been drawn to the decision reported in Volume II at pages 193-198 of the Law Report of the Chancery Division, 1906 [Smith v. Paringa Mines Ltd. (1906 S. 1102), Paringa Mines Ltd. v. Blair (1906 P. 744) and Paringa Mines Ltd. v. Boyle (1906 P. 748)]. In the circumstances, the Thirteenth Annual General Meeting was duly held on 28th June, 1963, as originally scheduled.

In view of the doubt, *inter alia*, regarding the adequacy of the notice of the meeting held on 28th June, 1963, Members decided at the said meeting to adjourn the meeting to a later date. The adjourned Thirteenth Annual General Meeting will be held at Rajgangpur, the Registered Office of the Company, on Monday, the 5th August, 1963 at 10 A.M. Notices of the adjourned meeting have been sent to all the Members by post.

For ORISSA CEMENT LIMITED.

For DALMIA AGENCIES PRIVATE LIMITED,
J. DALMIA,
Director
Managing Agents.

Dated: 5th July 1963.

CALCUTTA STEEL COMPANY LIMITED

NOTICE

NOTICE is hereby given that the Fourth Annual General Meeting of the Members of the Company will be held at the Registered Office of the Company at 4, Old Court House Street, Calcutta-1, on Monday, the 5th August, 1963 at 4-00 P.M. to transact the following business:—

1. To receive, consider and adopt the Directors' Report and the Audited Balance Sheet as on 31st March, 1963 and Profit and Loss Account for the year ended 31st March, 1963.
2. To declare a dividend.
3. To appoint a Director in place of Shri R. L. Bhartia who retires by rotation but being eligible offers himself for re-appointment.
4. To appoint a Director in place of Shri D. P. Goenka who retires by rotation but being eligible offers himself for re-appointment.
5. To appoint Shri S. N. Bhartia as director.

EXPLANATORY STATEMENT

Shri S. N. Bhartia holds office up to the Annual General Meeting under the provisions of Sec. 260 of the Indian Companies Act 1956, he having been appointed as an additional director by the Board of Directors under Article 92 of the Company's Articles of Association with effect from 24th October, 1962. The Company has received a notice in writing from a shareholder intending to propose Shri S. N. Bhartia's name as a director of the Company. Shri S. N Bhartia is agreeable to his reappointment as Director.

6. To appoint Auditors and fix their remuneration.

By Order of the Board,
R. N. BHOTIKA,
Secretary.

4, Old Court House Street,
Calcutta-1, the 24th day of June, 1963.

Note: (1) The Register of Members and Share Transfer Books of the Company will remain closed from 29th July to 5th August, 1963, both days inclusive.

(2) A member entitled to attend and vote is entitled to appoint a proxy to attend and vote instead of himself and a proxy need not be a member.

THE INDIAN IRON & STEEL COMPANY LIMITED

NOTICE

AT a meeting of the Board of Directors held today the Directors have recommended payment of a gross dividend for the year ended 31st March 1963, of 16%, or Rs. 1/60 per share, on the Ordinary Share Capital, subject to deduction of tax at the appropriate rates. This dividend awaits sanction by the shareholders at the Annual General Meeting to be held on Tuesday, the 3rd September, 1963.

The net profit after provision of Rs. 3,40,18,269 for depreciation, Rs. 3,56,00,000 for taxation and net transfer of Rs. 3,64,01,226 to Reserves is Rs. 1,91,87,975. For the previous year the net profit was Rs. 2,24,90,390 after provision of Rs. 3,35,24,699 for depreciation, Rs. 3,95,50,000 for taxation and net transfer of Rs. 2,98,38,026 to Reserves.

The Ordinary Share Register and Transfer Books of the Company, as already announced will be closed from the 27th July, 1963 to 17th August, 1963, both dates inclusive, and the dividend if sanctioned will be paid on or after the 4th September, 1963, to those shareholders whose names appear on the Register of Members on the 17th August, 1963.

By Order of the Board,
MARTIN BURN LIMITED,
F. G. LIVERSEDGE,
Managing Director,
Managing Agents.

THE COMPASS
THAT POINTS DOWN

By studying rocks exposed on the earth's surface, the geologist can uncover evidence of rock formations that lie hidden thousands of feet under the ground. The clues he seeks in his search for areas where oil may have been trapped occur in irregularities and upheavals of rock. A rapid geological reconnaissance over a likely area can be made with a special compass which measures the slope, or dip, of the rock layers, and also the direction, or strike, in which they extend. With this data, and with other information resulting from geological surveys, a map is made of formations deep inside the earth.

The application of scientific skills is a cardinal aid to all oil prospecting, but other factors that contribute to success in the hunting grounds are a bold and adventurous spirit on the part of the searchers, a willingness to bear costly risks, and good luck.

BRITAIN: ECONOMIC OUTLOOK AFTER PROFUMO

It is certainly too early yet to assess the full impact of the Profumo affair on the British economy. What can be said, though, is that so far it appears to have been remarkably small, bearing in mind that external confidence in the pound sterling and the strength of internal business sentiment are both to some extent dependent on a Conservative Government remaining in power. This is particularly true of the stability of the pound; as regards the internal economy, comparative stagnation reigned pre-Profumo, and has not yet seriously begun to disappear. Which may provide the clue as to why the affair has had so little apparent effect, despite its obvious threat to the Government's future and particularly to Mr. Macmillan's: the feeling about economic prospects in Britain was in such a state of cynical numbness that it has proved just as difficult to depress it any further as it has been for Mr. Maudling to revive it with his frequent doses of tax relief.

Eventually this may be seen to have been no bad thing. Nothing could have been more unfortunate than that the Profumo scandal should have come at a time when the British economy was on the move again, and then to have been the cause of a drastic setback. That might have killed the revival of business sentiment for many long months to come, and affected overseas confidence in sterling as well. As things are, the Conservative Government has a fair chance of riding out the storm on a modest wave of economic revival, provided nothing disastrous occurs during the next few months and provided Mr. Macmillan does not split his Party by clinging too tenaciously to office. Indeed, by underlining the need for new ideas, a new leadership and a new electoral image, the Profumo scandal may have helped rather than hindered the Conservatives' chances at the next general election. a fact which may or may not eventually prove a bull point for the British economy.

The London Stock Exchange did react sharply to the Profumo affair, although its recovery was fairly rapid. What seems to be holding it in check now is the persistence of political uncertainty, the volume of new issues, the slow rate of economic recovery and, of course, the approach of the holiday season. The prospects of a Labour Government appear to have been largely discounted; even the recent warning from Mr. Harold Wilson that restraint of wages would inevitably mean controls on profits, dividends, rents and capital gains as well, did not have the impact on the market which might have been expected. Nowhere is the weary phlegmatism in the face of the prospects of economic revival, which at present characterises the attitude in British industry and financial circles, shown more clearly than on the London Stock Exchange. It would be surprising if prices there were to show anything more than a slow and moderate advance until all electoral uncertainties are out of the way and the economic pattern for the future becomes clear for all to see.

The greatest economic disappointment for Britain this year, apart from the disaster at Brussels, has been the failure of the April Budget to achieve what was hoped of it. Why there should be this feeling is difficult to understand. The two chief aims of Mr. Maudling were to increase purchasing power so as to encourage consumption, and to concentrate that increase on the lower-paid members of the community so as to enlist the co-operation of the trade unions in a policy for wage restraint. With an election so close, the Chancellor could not possibly have been too serious about the latter objective. In the event the unions have thanked him kindly and reserved their co-operation for a Labour Government when that comes to power. On increasing the nation's spending, Mr. Maudling cannot have ignored the fact that the effect of his tax concessions would inevitably be delayed until the money actually arrived in the consumers' pockets. And that is only happening now, three months after the Budget. So as a major initiative in breaking Britain's economic log jam, Mr. Maudling's Budget has been a notable flop. Whether its long-term effects will be more decisive remains to be seen.

All this does not mean that there has been no economic progress whatever in Britain over the past year—the period during which positive measures have been taken to expand activity. It is true that April's index of industrial production was no higher than last November's, and that although retail sales increased during May, the level is still disappointingly low. But employment has been rising—a fact which suggest there may be something wrong with the picture as presented by the production index—and the mood of industry, as revealed in the latest survey by the Federation of British Industries, has decidedly improved during the past four months. Most important of all, perhaps, is that Britain's exports are rising and the balance of payments is still favourable. This is rather more than one could dare to hope for when the consequences of industrial expansion were being discussed a few months ago. Even now it is not being accepted as in any way permanent. Imports are expected to rise as the economy revives, even if, as has happened so far, most of the expansion is accounted for by the growth of exports. When this happens, there is no doubt that a change may be seen in the recent somewhat remarkable strength of the pound.

The most unfortunate aspect of the buoyancy of sterling is that it is due at least partly to the continued stagnation of the British economy, and that it is this which Government policy is chiefly aimed at ending There seems to be a contradiction in objectives here, but that is nothing unusual for an economy as finely balanced as Britain's is. The reconciliation of expansion at home with stability abroad will be the primary task of economic planning, but there is no sign that it is being tackled effectively yet. So the main reason why the pound has been strong recently is a bad one and, it is hoped, temporary as well. It is reassuring, therefore, that there are other reasons too. One of the most encouraging of these is the comparative cheapness of Britain's exports after two years of deflation at home and inflation among her competitors abroad, especially West Germany. Whether this advantage will survive economic recovery will

depend on the efficacy of the much-sought-after incomes policy, but it should serve Britain fairly well during the next few months.

There are two other important reasons why the pound has remained strong despite the shocks caused by the Profumo affair. The first of these is the improvement which has taken place in international borrowing techniques, thus making speculation that much more risky; and the lack of any satisfactory alternative. When an international holder of sterling finds that his chances of loss have been reduced by the credit backing which is now more readily available for the pound, and that no other currency offers any obvious opportunity for gain anyway, then he is likely to go on holding at least until the future becomes clearer. That is precisely what has been happening lately. The process has been helped to some extent by the British authorities' efforts to maintain the external discount rate while permitting the internal interest structure to move lower. But essentially the reason for the international popularity of the pound has been the unspectacular one that a profitable alternative has been lacking. There is no apparent reason why this should not continue for some time yet. The U.S. dollar is still under the cloud of an increasing balance-of-payments deficit, and the various west European currencies offer by no means the attractions they did a year or two ago. In this sense, at least, the prospects for the pound seem to be exceptionally favourable for a considerable period to come.

The picture of the post-Profumo economy in Britain, therefore, is not altogether a depressing one. With sterling still strong, the balance of payments favourable and the excess capacity in industry offering scope for considerable expansion without cost inflation, the stage would seem to be set for a modest recovery. Nothing that has happened as a result of the Profumo scandal has changed this. What it has done, of course, is to reduce the chances of a rapid revival in business confidence such as might have been expected to result in a wave of ambitious development and investment plans. This is certainly bad; if the long-awaited recovery is to prove anything more than yet another short-lived boom, it will have to be sustained by a massive increase in private investment. This would normally have been forthcoming as the natural sequence to improved output and demand, but with the uncertainties of the election ahead, it will probably not now be so. The Labour Party could help matters considerably at this stage, but it has two very good reasons for not doing. The first is that a rapid recovery now would reduce its own chances of winning at the polls, and the second is that any promises which might reassure investors would almost certainly lose it trade union support. This is not an easy dilemma for Mr. Wilson to resolve; and it is made all the more difficult by the fact that he himself well appreciates the need to take steps now if a more rapid economic growth rate is to be secured for the future.

Those who are looking for a sharp recovery in Britain when the dust of the Profumo affair has finally settled will probably be disappointed. The best that can reasonably be hoped for at the moment is a modest, though perhaps steady, improvement between now and the election. This might be accelerated by a number of events; the resignation of Mr. Macmillan and a fall in Labour's showing in the popularity polls are among the most obvious. But it is more likely to be susceptible to events acting in the opposite direction, and this just has to be accepted. So the main consequence of the Profumo scandal can be seen to be that it has caused the postponement of an election which might otherwise have been out of the way by this autumn. This could appear to be not too serious after all, but there is little doubt that such a judgment would be wrong. A period of difficulty and uncertainty probably still lies ahead for the British economy; it is considerable consolation that, with luck, the pound should remain reasonably strong throughout it.

TRADE WITH RUSSIA

SINCE *bonhomie* is an essential part of the international image Mr. Khrushchev has been carefully cultivating, his bubbling good humour at the opening of the Indian trade exhibition in Moscow was entirely in character. It would nevertheless be a mistake to overlook the fact that a Chinese delegation had left Moscow only a few hours earlier in high dudgeon. Without a doubt, the wily Mr. Khrushchev was rubbing in the points that the Russians had made to the Maoists during the talks by his many expressions of friendship for India. These political sidelights might have been less important if in the highly integrated Soviet society economic relations were not always subordinate to political aims. Mr. Khrushchev having decided to hold aloft the banner of peaceful co-existence as a contrast to Chinese belligerency, the world might well expect a major Russian effort to enlarge and strengthen trade relations. A period of sweet reasonableness could lie ahead in which the Russians with their usual thoroughness would set out to make themselves model trading partners not only of the non-aligned nations but also possibly of the West. The conciliatory Russian moves in the sphere of oil may be a pointer to this new mood in economic diplomacy.

For developing nations like India, struggling with serious balance of payments difficulties, opportunities for expanding trade are especially welcome. The structure of the Russian economy, with its emphasis on capital goods industries, leaves wide scope for the absorption of manufactured consumer goods that developing nations have been seeking markets for. In return, Russian industry can readily supply the plant and equipment for development programmes, providing thus a pattern of complementarity which it is not easy to duplicate elsewhere. In some instances, the equipment may not be as efficient or as economic as what the West can offer. But that is of little consequence in the present stage of growth in the underdeveloped countries where very different concepts of technical obsolescence must apply. Again, a price mark-up—assuming, of course, that fair comparisons can be made in the highly artificial conditions in which international trading often takes place today—need not be a deterrent since a machine tool 15 percent dearer is better than none at all. With imports from West fully up to the ceiling of what trade plus aid allows, the choice is often as simple as buying from rupee payment sources or going without. Differing technical ideas and specifications create difficulties. But import curbs are obliging industry to find ways of overcoming such snags as quickly and deftly as possible.

About 75 percent of India's imports from Russia have consisted of machinery and base metals needed for priority programmes of industrial development. Another 10 percent consist of chemicals, railway stores and transport equipment to meet equally essential needs. Although imports have gone up from Rs. 6 crores in 1955-56 to Rs. 55.5 crores in 1962-63, it does not seem to have taken away any trade from others but only supplemented what was obtained from traditional suppliers, including both ordinary commercial transactions and imports made under special credit arrangements. In fact, an analysis of India's trade with Russia shows that imports were smaller than the total possible if current earnings were pooled with available credits—the direct opposite of the position in the case of Indo-West German trade.

In the coming years, the total value of Indian imports from Russia is bound to rise as a result of the new trade pact and the credits which are being negotiated for fourth plan projects. Opportunities for expanding the flow of trade and investment need to be energetically explored. The political importance which the Russians attach to joint enterprises often brings a bonus which commercial arrangements made with western collaborators cannot normally be expected to match. Mr. Khrushchev's remarks at the Moscow exhibition last week, where he proudly compared Bhilai's performance with that of Durgapur and Rourkela, would seem to bear this out. The size of India's needs leaves her no choice but to make the most she can of Russia's interest while it lasts. There is much to be said for not putting all eggs in one basket but the situation need never arise. For one thing, Russian capability—although rising from year to year—can meet only a small part of India's total requirements. For another, collective western interest and participation in Indian development can be safely assumed to leave the Russians a long distance behind.

India's exports to Russia have increased steadily from Rs. 3 crores in 1955-56 to Rs. 38 crores last year—but not fast enough to cover the full value of the rising import bill. In 1962-63, the shortfall was as large as Rs. 17 crores; exports rose by 20 percent over the previous year but imports went up by 40 percent, with the result that the current trade deficit was doubled. The provision in the new trade agreement for larger exports of manufactured goods from India may help to reduce this unbalance. That must remain the hope because it would be wrong to depend only on traditional exports to bridge the gap. Even if Russia's demand for jute goods or tea were to shoot up, the short-term effect would be to raise export prices. However welcome the immediate impact on the terms of trade, high prices would be harmful to India's long-term interests in maintaining and widening markets. In the case of such items as jute goods, mica and tea, the threat from substitutes can be fought only by long-term price stability which makes a precipitate rise in demand almost as unwelcome as a sudden decline.

It would ill serve India's aims if this were allowed to happen because of poor programming of the exchanges with Russia. There is also the danger that traditional exports sent nominally to Russia may find their way into third countries at cut prices, despite the assurances that Mr. Manubhai Shah claims to have obtained from his counterpart in Moscow. Such dangers apart, the benefits of India's growing trade with Russia and her East European associates is well brought out by the export statistics of last year. The increase of Rs. 23 crores in exports to these countries more than offset the losses suffered in the Common Market countries and Japan. Without this increase, total earnings last year may well have shown a decline. The experience justifies the hope that the communist economies are expanding in a direction which raises their absorptive capacity for India's exports. This gives them special importance in the context of the current export drive.

TOO MANY POWERLOOMS

THE memorandum submitted by the Indian Cotton Mills Federation to the Powerloom Enquiry Committee could well be described as the revised and abridged edition of its booklet entitled *Third Plan Targets for Handlooms, Powerlooms and Mills* published in February 1961. The memorandum contains little that is really new. But this is hardly surprising because the mills have long been complaining bitterly about the unrestricted and clandestine growth of powerlooms in the decentralised sector. Not far inferior to some mills in technical efficiency, the powerlooms are virtually free from the burden of taxation and other financial obligations such as rising wage costs that weigh so heavy on the organised sector. They score over the handlooms by achieving eight to ten times their output, which gives them a big cost advantage. In addition, powerlooms make serious inroads into both the sectors by freely producing varieties which are reserved for the handlooms and are limited—in certain cases banned—for production by the mills.

The Federation contends that the powerlooms do not provide a larger employment potential than the mills. Nor are the wages and working conditions they ofter as favourable as in the organised sector. The Government loses heavily because the average duty borne by powerloom cloth is hardly 0.5nP a yard, against 30.6nP a yard on mill-made cloth. According to calculations made by the Federation, for every 100 million yards of cloth produced by powerlooms, labour loses about Rs. 40 lakhs by way of lower wages and the Central exchequer about Rs. 3 crores. The memorandum argues that, whether from the point of view of supplying better goods to the consumer at reasonable prices or making larger contribution to Government revenues or paying higher wages to labour, the performance of the powerlooms is poor. While conceding that powerlooms have their place in the economy, the Federation says that the size and structure of the industry are almost entirely governed by the advantages accruing to it from the manner in which the excise duty operates from time to time. The Federation makes the point that if the production of the handloom sector, for protecting which the mill industry has been subjected to many disabilities, has actually dwindled over the years, and if the Government cannot do anything to stop the invasion of powerlooms in the field reserved for handlooms, there can be no ground for continuing the disabilities of the mills.

The task before the Powerloom Enquiry Committee is far from easy. The difficulties are varied and complex. The chairman of the Committee, Mr. Asoka Mehta, has already hinted in some of his recent statements that the recommendations might not satisfy all the interests concerned, as they can at best be only of a tentative nature. As it is, no precise data are available about the number of powerlooms operating in the country and the quality and volume of their production. The Committee's findings will be awaited with keen interest since they will provide a basis for discussing problems in their proper perspective.

The Federation's memorandum, however, raises some controversial issues. It is certainly essential, as it points out, to lay down in clear terms the aims of the Government's textile policy while deciding the relative rôle which mills, handlooms and powerlooms should play. These aims, according to the Federation, are (1) offering the consumer better cloth at lower prices and (2) strengthening the export potential. Although the aims sound simple, the mills cannot take much credit for making a serious effort to realise them. Their concern for the consumer is in odd contrast to their persistent demand for an increase in cloth prices and their failure to raise output despite the comfortable supply of cotton this season.

The industry's record in the export trade too is disappointing. The memorandum says that "to the extent the mill-sector is allowed to produce more, the country's export potential will be increased". But, surely, exports are not suffering because an exportable surplus is lacking. Nor is there any official obstacle in the way of stepping up the output of cloth which is at present running far below the past ten years' average. It is true that the additional spindleage visualised under the third plan is not covered by a corresponding increase in the loomage, but the mill industry cannot explain away the complete stagnation in its cloth output due to lack of weaving capacity. It might be of interest to recall that the Indian Cotton Mills Federation, in its booklet *Third Plan Targets for Handlooms, Powerlooms and Mills*, had hinted at a possible shortage of cloth due to the failure of other sectors or through the defective assignment of targets. But in spite of mill production remaining virtually static, a glut developed during the last quarter of 1962 which could not be completely explained away in terms of the political uncertainties following the Chinese aggression.

Current News and Comment

Continuing Protection for Bicycles

The bicycle industry has been enjoying protection for over 16 years during which it has made appreciable progress. From a meagre 4,000 in 1947, the production of bicycles has kept rising steadily, and it reached the level of 1.175 million pieces in 1962. The industry has now attained self-sufficiency in components. Apart from meeting the entire requirements of the country, the industry has also been exporting its products. Bicycle exports were valued at Rs. 4.46 lakhs (3,664 units) in 1960, Rs. 11.89 lakhs (12,677 units) in 1961, and Rs. 3.17 lakhs (3,564 units) in 1962. Exports of components were valued at Rs. 2.70 lakhs in 1960, Rs. 5.14 lakhs in 1961 and Rs. 6.17 lakhs in 1962.

There are at present 18 factories in the large-scale sector with an installed capacity of 1.36 million bicycles a year. Of these, five are in the Punjab, three each in West Bengal, Uttar Pradesh and Delhi and one each in Maharashtra, Madras, Bihar and Assam. Besides, there are 145 units in the small-scale sector with an aggregate capacity of 832,000 bicycles a year. They are largely concentrated in the Punjab, Uttar Pradesh, West Bengal and Delhi. Production of bicycles in the large-scale sector was 1.053 million in 1960, 1.049 million in 1961 and 1.116 million in 1962, while the small-scale sector produced 228,000 in 1960, 148,000 in 1961 and 59,000 in 1962. There are some 24 units manufacturing only components, and licences for 13 more new units have been issued. All the bicycles are now available from indigenous sources.

The apparent consumption of bicycles, made up of indigenous sales plus imports (negligible) minus exports, amounted to 1.23 million in 1960, 1.18 million in 1961 and 1.15 million in 1962, thus showing a slackening of demand over the past three years. The current demand is estimated around 1.25 million, and it is expected to rise to around 1.50 million by 1965-66. Imports of bicycles have been banned since July 1957, and imports of components are restricted. Imports of components, which amounted to Rs. 1.15 crores in 1961, fell to Rs. 27.18 lakhs in 1962.

In spite of the fact that the industry has substantially increased its production over the years and has achieved efficiency in technical and managerial spheres, it has pleaded for continuing protection beyond 31st December, 1963. The existing rate of protective duty on bicycles is 65 percent *ad valorem* (preferential) or Rs. 80 a bicycle whichever is higher, the standard rate of duty being 10 percent more than the preferential rate. The rate of duty on components is 65 percent *ad valorem* (preferential) and 75 percent *ad valorem* (standard). For items on which excise duty has been levied, a countervailing import duty has also been added. Further, a surcharge of 10 percent has been levied on all import duties under the Finance Act, 1963.

Opening the public enquiry into the question of continuing protection to the industry beyond the current year, the chairman of the Tariff Commission, Mr. K. R. P. Aiyangar, recently outlined the progress made during the past 16 years of protection and urged the manufacturers to keep an effective check on the domestic prices of bicycles, which seems to have become all the more necessary in view of the declining trend in consumer demand over the past few years. Check over prices is also necessary to step up exports. Bicycles, said Mr. Aiyangar, had good export possibilities and the Government was already giving incentives to stimulate exports. But he added that if a stable export market had to be built, the industry must strive its utmost to improve the quality of its products and make all possible economies in production. Fuller use of capacity is necessary for effecting such economies, and this is possible only if the industry is assured of regular and abundant supplies of raw materials. The industry is still dependent on imports for its requirements of trips, free cutting bars and wires and chromium anodes. Most of the consumable stores including chemicals for polishing, brazing, electro-plating and heat treatment required by the bicycle industry have to be imported. The industry has been also complaining about inadequate and irregular supply of a number of imported raw materials.

Mr. Aiyangar stated that the bicycle industry which requires about 200 different components, appeared to offer enough scope for the small-scale sector. It was considered desirable to earmark a portion of these components for the small units. But the latter are said to be facing difficulties in obtaining essential components and raw materials, and they also lack the requisite testing and other facilities for improving quality. Mr. Aiyangar advocated the bringing together of the large-scale and small-scale sectors and aiming at a common production programme in order to ensure a healthy and organised development of the industry.

The spokesmen of the industry stated that efforts to reduce costs were being neutralised by the increase in taxes, rise in the prices of raw materials and power charges. These factors have undermined the industry's competitive position in foriegn markets. The industry has pointed out that, if protection were to be discontinued, it should be allowed to import components freely. Imported components are cheaper than those available from indigenous sources. Mention needs to be made of T. I. Cycles of Madras which has opposed the industry's plea for continuing protection. T. I. Cycles thinks that the industry is now sufficiently strong to stand on its own feet—a view shared by many outside the industry. Outside competition is completely shut out because of the ban on bicycle imports.

Cotton Textile Exports

Shipments of cotton piecegoods from Bombay port, which accounts for nearly 90 percent of these exports from India, are provisionally estimated at 35.74 million yards, valued at Rs. 2.8 crores. The June figures raise the total shipment during the first six months of the current year to 231.90 million yards valued at Rs. 17.3 crores. The corresponding figures for 1962 are 224.69 million yards valued at Rs. 18.1 crores. Thus, while the quantity of cloth exported is higher, the value realised is lower; this appears to be very largely due to the compulsory scheme of exports. The average price realised during the first half of the current year works out to 74.6nP a yard, compared with 80.6nP a yard in the corresponding period last year. There has, however, been a welcome improvement in the average price realised since the turn of the year, from around 70nP a yard in January to 74.8nP in May, and further to 78nP in June.

Shipments of mill-made cotton piecegoods effected from Bombay during January-May 1963 comprised 114.98 million yards of grey cloth valued at Rs. 7.9 crores, 33.33 million yards of white valued at Rs. 2.5 crores and 49.85 million yards of coloured goods valued at Rs. 4.4 crores.

Cloth Output Running Low

The production of cloth by Indian mills in May is provisionally placed at 412 million yards, compared with 400 million yards in the preceding month and 423 million yards in May 1962. The May figure—the highest since January—raises the total for the first five months of the current year to 1,994 million yards, compared with 2,085 million yards in the corresponding period of last year. The monthly average for the current year works out to 399 million yards, which compares with the 1962 average of 416 million yards and is well below the past ten years' average of 419.7 million yards. The production has to be stepped up to around 492 million yards a month if the organised sector is to achieve its third plan target of 5,800 million yards. The industry's current performance is in odd contrast to its earlier demand for a higher share in the total plan target of 9,300 million yards. The poor cotton harvest in 1961-62 had been blamed

India's Resources
are Precious
WASTE NOT,
WANT NOT

for the setback in cloth production last year, even though domestic supplies were supplemented by fairly large imports from abroad. But the industry cannot offer any convincing explanation for the continued low level of cloth output this year as the supply position of cotton has continued to be fairly comfortable because of the record crop of 5.6 million bales in 1962-63 and reasonably large imports.

Can it be that the industry does not find it worthwhile to step up production because of the declining profit margin resulting from the voluntary control over cloth prices and mounting production costs? Or is it that the organised mill sector is finding it difficult to compete with the powerlooms in the decentralised sector? Judging from the civil deliveries of cotton yarn produced by the mills, there are strong indications of a much bigger increase in the production of cloth, especially of finer varieties, in the decentralised sector than what the official figures indicate. The unregulated growth of powerlooms has been a source of constant irritation to the cotton mill industry. An enquiry into the various aspects of the powerloom industry is already in progress and its findings are awaited with keen interest.

While cloth output during January-May 1963 is considerably lower than during the same period in the previous year, yarn production is slightly better. The May figure of 165 million lbs—the highest since January—raises the total for the first five months of the year to 794 million lbs, compared with 790 million lbs in the same period last year. Stocks of cloth with the mills at the end of May totalled 303,800 bales (of 1,500 yards each), compared with 312,600 bales at the end of April. Unsold stocks fell from 165,800 bales to 153,800 bales, but there was an increase of 3,200 bales from 146,800 bales to 150,000 bales under "sold but delivery not taken".

Motor-car Insurance Premiums Up

Indian comprehensive insurance rates for private motor-cars are scheduled to go up, rather steeply, from 1st August, 1963. Loss experience in this business during the past few years has been given as the reason for changing the existing rates. The Tariff Committee of the Insurance Association of India, which is responsible for administering the premium rates, has put its seal of approval on the recommendations of the local regional councils. With a view to offsetting in some measure the increased premiums, the new rates will be subject to a higher no-claim discount which may go up to 50 percent for five consecutive no-claim insurance years instead of the present maximum of 33⅓ percent for three consecutive no-claim years.

The no-claim bonus will also be effective from 1st August. No waiting period is required, that is, if an insured has not made any claim for five consecutive insurance years and if his policy is due for renewal on 1st August, 1963, he will be entitled to the 50 percent discount from that date, and it will not be necessary for him to have two more claim-free years to earn the proposed maximum discount. It has been suggested that the proposed revised rates are more commensurate with past experience, and having regard to the fact that the increased premium will be partly offset by higher no-claim discounts, the new basis of rating is more realistic.

It will be recalled that Indian comprehensive rates for public carriers went up steeply in 1960. The last increase in private motor-car comprehensive rates took place in 1958. Several reasons have contributed to the unsatisfactory loss experience. For one thing, enhanced repairing charges, increased prices of parts on account of heavy duties and higher manufacturing costs, have contributed in no small measure to claims outstripping premiums. For another, India's antiquated roadways, which had not been designed to withstand the present volume of traffic, have been responsible for many collisions and accidents. For the insurers too, the cost of running the business has gone up in every item during the past few years. All these have led to the enhancement of the premium rates. The only consolation for the insuring public perhaps is that they will have a no-claim discount of 50 percent, which, it is stated, is the highest in the world.

India is not the only country which is increasing the motor-car comprehensive insurance rates. The U.K. rates too will be raised from October 1963, the proposed increase in basic premium rates ranging from 10 percent to 30 percent for private motor-cars. The U.K. no-claim discount for a period of five years will go up to only 40 percent, and not 50 percent as in India. In both countries the claim-free policyholders will, it is claimed, be paying less than what they are currently paying to insurance companies. The new rates, therefore, are likely to ensure better care in the handling of motor-cars and should benefit, by and large, owner-drivers.

Indian fire rates, however, have been cut to the extent of at least 35 percent by a phased premium reduction. The last reduction in the series took place in 1962. In the U.K., where the loss ratio continues to be heavy, fire premium rates have been put up. Fire losses in 1962 reached an all-time high of £55.6 million, that is, £16.5 million more than in the previous year, and double the loss suffered five years ago. The trend during the first five months of the current year shows no improvement. In fact, the fire losses for the five-month period are estimated at over £30 million, representing a 25-percent increase over the figure for the corresponding period in 1962.

British insurers, anxious to reverse the trend of claims outstripping premiums, have raised the fire premium rates by 15 percent. It shows that even a highly industrialised country like the U.K., with one of the best fire protection systems, has not been able to avoid mounting losses; industrial complexes, with all the improvements in the fire protection system, are still vulnerable to accidental fire hazards. The present premium rate structure in India may show sizable profits for insurers, but it must not be taken as good for all time. With the progress of industrialisation and the consequent need for intricate handling of machinery, large fire losses are possible. It would have been better for Indian insurers to take these future possibilities into account rather than base their calculations on the present dispersal of risks where the bulk of the premium comes from scattered shops and godowns. But this may not be so in the future.

Textile Exports to Eastern Europe

A six-member team headed by the Director-General of Cotton Textiles Export Promotion Council, Mr. H. A. Sujan, is now on a study tour of east European countries to find out how best to stimulate the offtake of Indian cotton textiles by these countries. Although exports of cotton fabrics to eastern Europe have been showing an upward trend of late, they remain far short of the targets set by the Government under the trade agreements with these countries. The performance looks very disappointing in the context of the impressive increase in India's total exports to eastern Europe. India's total sales to these countries increased from Rs. 63.8 crores in 1961 to Rs. 93.2 crores in 1962 but of this cotton piecegoods accounted for no more than Rs. 4.87 million. In terms of quantity, cotton textile exports to east European countries increased from 840,000 yards in 1961 to 3.03 million yards in 1962, but the target for 1962 had been fixed very much higher around 30 million yards.

Out of the 3.03 million yards exported last year, Russia took 980,000 yards, Yugoslavia 790,000 yards, Hungary 620,000 yards, East Germany 560,000 yards and Czechoslavakia 80,000 yards. Exports to Rumania were negligible, and Poland did not figure among the buyers of India textiles. The target for 1963 has been set at 40.5 million yards, but it seems doubtful whether cloth exports to eastern Europe will show any spectacular improvement over last year's performance. Exports during the first quarter of the current year are placed at only 1.29 million yards (valued Rs. 2.03 million), and the provisional figure for shipments from Bombay port, which accounts for the bulk of the business, for the second quarter is estimated around 690,000 yards. Shipments to Russia in the first quarter are placed at 230,000 yards, valued at a little over Rs. 10 lakhs. Exports to east European countries consists mainly of printed cloth for shirting, grey and printed drills, bleached sheetings, chintz, domestics and negligible quantities of voiles and mulls.

Using Better Farm Implements

The Central Minister for Agriculture, Dr. Ram Subhag Singh, told the Conference on Manufacture and Popularisation of Improved Agricultural Implements in New Delhi last week that the achievement of a 30 percent rise in foodgrain production during the Third Plan period would depend, among other things, on the use of superior agricultural implements by farmers. At present the demand for tractors is about 10,000 a year, but internal production in 1963 may be only 3,600 and in 1964 6,000. It is only after two or three years that production might increase to 7,500. The country has, therefore, to depend on imported tractors which cost a good deal of foreign exchange.

There is a shortage of small tractors in India. Dr. Singh said that if they could be produced in the country and priced at Rs. 2,000 to Rs. 2,500, many cultivators would make use of them and agricultural production could be increased. Although three firms have been licensed for manufacturing small tractors of up to 10 horse-power none of them has yet started working. As for bigger tractors, only three out of the five firms licensed have come into existence. The situation can be remedied, not by cancelling the licence of the firms which could not progress, as was suggested by Mr. Shriman Narayan, member of the Planning Commission, but by removing their difficulties. The main difficulties are the shortages of iron and steel and of imported machinery and equipment. Unless their supplies improve, it will not be possible to increase the production of tractors or, for that matter, of harvesting machines, threshers and other agricultural implements.

The high cost of agricultural machinery makes it impossible for the average cultivator to use them. Besides, repairing facilities are not easily available in most parts of the country. A large number of tractors unfortunately lie idle for long periods because of the lack of repairing facilities. It has also been found that imported tractors and ploughs are not suitable for Indian conditions, since deep ploughing removes the moisture from the soil. It is, therefore, necessary to devise implements which are suitable for Indian conditions in order to make them popular. It is to be hoped that the proposed Agricultural Implements Board, which will include representatives of the Government, the Planning Commission, the State Trading Corporation, manufacturers of agricultural machinery, co-operative societies and farmers, will devise methods not only for increasing the production of agricultural machinery but also for popularising them with the cultivators. It has been suggested that this Board should arrange to supply tractors and other machinery to farmers on hire-purchase and ensure that at least one workshop is opened in each district for their repair and maintenance. As Mr. S. K. Dey, Minister for Community Development stated at the Conference, it is also necessary to train the extension workers and *gram sevaks* in the use of agricultural machinery so that they could help the cultivator in using them. It is especially necessary to promote research to evolve the type and design of implements, which will be suitable for various parts of the country, since differences in soil conditions and manpower utilisation do not make it possible to use standardised machinery efficiently. The Board will also have to ensure that the village artisan is encouraged to produce improved varieties of ploughs, sickles and other implements and he is supplied with adequate quantities of iron and steel. Only a few cultivators can use tractors, threshers and other modern machinery, while the majority will have to depend on improved varieties of old implements.

Consolidation of Holdings

The small size of agricultural holdings caused by fragmentation is one of the main causes of low productivity in India. Some interesting points have been brought out in a review of the progress of consolidation of holdings in the June 1963 issue of the *Reserve Bank of India Bulletin*. Although nearly 7 million acres of land were consolidated during 1961-62, the first year of the third plan, against the total plan target of 30 million acres, the total area of land consolidated since the inception of the movement up to the end of March 1962 is only 36½ million acres. Some idea of the slow progress of the movement is obtained from the fact that the area so far consolidated in U.P., Madhya Pradesh, Rajasthan and Mysore is only 17¾ percent, 10½ percent, 8¼ percent and 4¾ percent of the net sown area, respectively. In Andhra Pradesh, Bihar, Maharashtra and Gujarat very little progress has been made. While in the other States there has been no progress whatsoever.

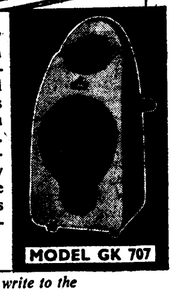
Madras and Kerala have no legislation for consolidating holdings and preventing fragmentation; Assam, Jammu and Kashmir, Orissa and West Bengal have such laws, but they have not yet been implemented. It is not that the problem of fragmentation is less serious in these States. In Assam, for example, holdings of less than 10 bighas (3.2 acres), occupying 1,527 acres or 12 percent of the total area, are divided into 7,246 fragments. This gives an average of 0.2 acre a fragment. Progress has been made only in Punjab and U.P. In fact, of the 7 million acres consolidated in the first year of the third plan, nearly 5 million acres are in the two States. In Punjab as much as 94.7 percent of the net sown area has been consolidated. It is to be hoped that the other State Governments will expedite the process. The experience of Punjab and U.P. shows that if the initiative is left to the farmer the progress of consolidation will be very slow. It is, therefore, necessary that the Government officials in charge of this work should take the initiative.

The laws in Madhya Pradesh, Assam and West Bengal are defective in so far as they do not provide for consolidation at the Government's initiative. The cultivators, either because of ignorance or for sentimental reasons, are usually opposed to consolidating their holdings and cause too much delay if they cannot altogether prevent it. It is, therefore, necessary to provide against too much delay. In most of the States, the Governments have not placed experienced and efficient officials in charge of this work. As the U.P. Government did in the beginning, it would be worthwhile for the other State Governments to send their consolidation officials to study the work done in Punjab. An important reason for the success in Punjab and U.P. is that there consolidation operations are regarded as part of "an integrated programme of village development", whereas in the other States like Maharashtra, Gujarat, Bihar, Madhya Pradesh, Orissa, West Bengal and Assam consolidation operations are confined to "mere regrouping of fragmented holdings to form compact holdings". It is not suggested that the work of consolidation is easy. There are difficulties such as in valuation of land, payment of compensation, distribution of the consolidated land and prevention of re-fragmentation. But these difficulties can be overcome, as have been done in Punjab and U.P.

Finances of Local Bodies

The two-day conference of U.P. municipal corporations in Lucknow last week discussed problems which are of interest to local bodies all over the country. The conference highlighted the fact that the financial position of municipal corporations has deteriorated because, although their responsibilities have increased, their revenue has not increased in the same proportion. Taking into account all the local authorities in the country—city corporations, port trusts and municipalities—the total outlay on revenue and capital account in 1961-62 was budgeted at Rs. 242 crores, against total receipts of Rs. 203 crores. This left a gap of Rs. 39 crores, against Rs. 24½ crores in 1960-61 and only Rs. 1¼ crores in 1959-60. It is worthy of note that in 1961-62 most of the gap of Rs. 39 crores was accounted for by city corporations. Their receipts from rates and taxes now account for only two-fifths of total receipts, against more than half in 1958-59. The local bodies have been trying hard to raise additional revenues, but the scope for this is strictly limited.

The Lucknow conference recommended that the State Government should give the municipal corporations of Kanpur, Agra, Varanasi, Allahabad and Lucknow the revenues it realises from the cities in the form of electricity duty, entertainment tax and motor-vehicle tax and also a share in the sales tax. The Local Taxation Enquiry Committee also emphasised the need for giving local bodies a share in the taxes which the State Governments realise by way of entertainment tax and motor-vehicles tax. However, nothing has been done by the States on the plea that their requirements are high and they cannot afford to share the tax revenues with the local bodies. But since many of the welfare activities are financed by local bodies, it is only fair that they should get a share in the revenues raised from these taxes. Otherwise the local bodies will continue to depend on loans and other assistance from the State Governments.



Sales Tax Assessment

The order passed by Mr. Justice Manchanda of the Allahabad High Court in a writ petition by a firm of Moradabad, Jagdish Saran and Sons, against a sales tax assessment order brings out an interesting point. The writ application was made against the assessment order of the sales tax officer, Moradabad, and the judge (appeals) sales tax, passed in 1960. The petitioners had sold their business to another firm named Nand Kishore Ajai Prasad for about Rs. 24,800; the sales tax officer included this sum in the gross turnover of the petitioner for levying the tax. The judge (revisions) sales tax also came to the conclusion that the sum received as a result of the transfer of business by a firm could not be excluded from its gross turnover. However, in an earlier case—Sri Ram *versus* Commissioner of Sales Tax 14 S.T.C.

HERE IS
TELEDEK
the amazing new Transistorised Telephone Amplifier

Teledek increases business efficiency and is a boon to busy persons in any business or profession, to executives, secretaries, receptionists and telephone operators. Teledek leaves your hands free for work while you talk and saves your valuable time. Both incoming and outgoing telephone calls can be attended to by merely placing the telephone receiver on the Teledek. It amplifies the sound and facilitates trunk-telephone conversations.

275—a division bench of the Allahabad High Court had laid down that the sale proceeds of a business were not to be included in the turnover of the firm on which sales tax was payable under Section 3 of the Act and it did not matter whether the sales tax was a single point tax or a multi-point one. In view of the earlier decision of the Allahabad High Court Mr. Justice Manchanda reversed the order of the judge (appeals) which confirmed the assessment order of the sales tax officer.

It has been often pointed that in order to prevent tax evasion, it is necessary that the assessing officers should be impartial and sympathetic. In the present instance the assessee firm won the case, but there was no decision about costs and it took such a long time for the matter to be settled. The U.P. Government should look into the matter and find out the circumstances under which the mistake in interpreting the law was made, in spite of the High Court ruling in a similar case. Apart from the High Court ruling the meaning of "sale" should not have been so difficult to decide. This is not the first case in which the meaning of "dealer" and "sale" has been misinterpreted by sales tax officers. If there is some defect in the wording of the Act, it should be removed.

Rehabilitating U.K. Cotton Mills

The Lancashire cotton industry is by no means happy with the situation which is facing it at the moment. This was brought out at a recent meeting with the president of the U.K. Board of Trade, when Mr. Frank Rostron, chairman of the Cotton Board, spoke frankly of the urgent need for new and better Government policies to meet the serious situation with which the industry was now confronted. He said that the upturn in trade which the U.K. cotton industry had been anticipating for well over a year had not so far materialised. The normal cyclical pattern has become distorted and it is clear that this has arisen from the perpetual threat on the imports side. The measures so far taken by the U.K. Government do not add up to a solution of Lancashire's difficulties. There is no doubt that the ceiling on imports from the Commonwealth countries and the quotas in the case of other countries have been pitched far too high. Thus, at the present crucial stage in the industry's attempts to modernise itself, to reorganise its structure and to re-equip, any increase in demand is reflected in increased imports from abroad. Even if the ceilings are reasonable—and no one in the industry will agree that they are—it will be impossible to have stability unless certain other measures are taken.

Mr. Rostron suggested the following measures to improve the prospects for the industry : (a) The limitation of import by categorisation. As matters stand at present, huge volumes of imports relate to particular classes of goods, causing acute disruption and wide price variations in the affected sections of the U.K cotton industry. Other countries have not hesitated to limit imports by categories. The U.S.A., for instance, has already taken over 70 effective actions under the "G.A.T.T. long-term arrangement, against 17 different countries on a categorised basis. Imports into the U.K. represent over 30 percent of domestic requirements, against about 5 percent in the U.S.A.

(b) A revision of the Commonwealth-content qualification for entry is also necessary. No other country is in the same position as the U.K. in that foreign and Commonwealth cloth can enter in the form of made-up goods from such a country as the Republic of Ireland without paying any duty, merely because 25 percent additional value has been attached to it. The Commonwealth-content qualification should be raised to 50 percent and the added value should all be attached in one country and not, as at present, on a composite basis.

(c) There should be a greater willingness on the part of the Government to make use of the provisions of the "G.A.T.T. long-term arrangement." The latter held out a great hope of securing stability against imports from countries other than the Commonwealth, but the U.K. Government has shown itself extremely reluctant to invoke it against western countries. Britain has argued that it is inapplicable against the E.F.T.A. countries . This means presumably, that Portugal, for example, may become the Hongkong of the European Free Trade Area.

(d) Steps should be taken to make the U.K. anti-dumping legislation more effective. Britain's anti-dumping legislation has proved in the past to be remarkably slow in operation and ineffective, so it should be drastically overhauled.

(e) A thorough revision of the Ottawa Agreements of 1932 should be made. If Britain had entered the European Common Market, it would have meant that the duty-free principle, which had existed intact since Ottawa, would have been breached for the first time. The industry cannot understand why this principle should now apparently revert to its previous sacrosanct status. No industry is more conscious than the cotton industry of the arguments in favour of helping the developing countries—indeed, no industry had made a larger contribution—but it has a legitimate grievance when the same treatment is accorded to such countries as Canada, which has at least as high a standard of living as in the U.K.

LORD CURZON

THE London *Times* is responsible for the rumour that Lord Curzon has been offered a two years extension of his present office after the expiry of the customary five years. Probably His Excellency is waiting and watching to see how the political cat is to jump at home before he finally makes up his mind on the question. If that be so, it may be a few months yet before he tells us his present secret. There is not the least hurry or curiosity on the part of the public to know. But the unexpected may happen any day after Parliament is prorogued next month. It is an unfailing sign that a dissolution is not far off, when Cabinet Ministers send messages to their own party managers (as Mr. Balfour has lately been doing) in the constituencies that they need not be in any hurry to select candidates for the General Election. "No, No, please don't put him under the pump." A nod is as good as a wink at any time. If the present Cabinet intend to fix the Viceroyalty of India by keeping on Lord Curzon or by sending out the Earl of Pembroke, there is not much time to lose in coming to a decision. There is a good story going round at home which ought to provoke a good deal of mirth in the high places of India. Here it is: An American globe-trotter, dining with a gentleman in Calcutta, was asked if Americans were interested in India. The American assured him that such was the case, and said : "One day I met a lady I knew in the cars, and I handed her a newspaper in which was a paragraph headed 'India and Lord Curzon'. She settled down to read it with close attention. I remarked to her, 'You seem interested in that item about India. 'Yes', she said, 'I am. When that young man came out here and married Mary Leiter I always said she would make something of him—and she has."

A Ditcher's Diary

LAST WEEK'S ANNOUNCEMENT ON SOME MINIMAL nominal changes in the Central Cabinet could hardly have been less thrilling. Mr. K. C. Reddy had been a "gonner" a long time ; and the other alterations may or may not mean the beginning of a precise portfolio for Mr. T. T. Krishnamachari. In case, however, Dr. K. L. Rao has been brought in less for his Andhra origin than for his engineering experience, the benefit may accrue not only to the crucial Ministry of Irrigation and Power but also to the country's political thinking as a whole. In all the years since independence the assumption has been that a Minister is chosen for the "popular touch" he is supposed to have, for having been elected while the actual work is done by bureaucrats and experts. I was surprised, agreeably, to read somewhere the other day that a large proportion of Mr. Khrushchev's Cabinet consists of men and women with recognised technical qualifications. It was possible, for instance, for Mr. Malenkov to take over a large power project after his political death : here political rejects can only become Governors. Dr. K. L. Rao is said to be a distinguished engineer ; and I do hope he will set a different sort of example for his colleagues. Let him, I suggest, refuse to lay foundation stones or open school buildings ; let him spend more time on work sites than in the secretariat ; let his notes consist more of diagrams and things than of verbiage. Be that as it may, let us remember the essential insignificance of the recent changes. Even on Friday morning Mr. A. K. Sen was said to be distraught that he had not been given something besides or other than Law ; Mr. S. K. Patil still seemed unconvinced that it was time for him to leave Food to someone else ; Mr. Manubhai Shah still seemed inconsolable that he had not been elevated to Cabinet rank, whatever that may mean. Mr. Nehru seems to enjoy such uncertainties all round him ; he seems almost to thrive on his colleagues' unconcealed discontent. I suppose this kind of ministerial disarray makes for the Prime Minister's own political security ; on the administration the effect has been just about disastrous. All around, one senses the prevalence of that dangerous malaise which the French call *immobilisme*. Moving up are only prices.

QUITE APART FROM THE FACT THAT I HAVE NO reason to be happy over a united international communist front, I rather admire the way the Russians and the Chinese recently stuck to their respective, irreconcilable points of view. The inner contradictions of communism have long been clear to all but the faithful ; but the Russo-Chinese differences need not be looked at in ideological terms at all. The very bourgeois criterion—clash of national interests—will explain most of the row, although the jargon of Marxism-Leninism has been used by both. The Soviet Union has in the last 46 years built quite a society which it does not want to see destroyed in a nuclear war. China has nothing comparable to lose and can, therefore, afford to gamble with the future of mankind of which such a sizable part is Chinese. Why then is Chinese dogmatism, so obviously suicidal, gaining the adherence of more and more national communist parties, as reported from Tokyo the other day? Again, it is easily explained. The Soviet Union is and looks relaxed, while China is burning with ideological fervour ; and this enthusiasm always appeals to people who have not yet attained power. Even as India after her independence concentrated on development and appeared indifferent to the fate of the Asians and Africans still in bondage, the Soviet Union is now a "have" country and seems insufficiently sympathetic to communist aspirations in the world outside. The Russians look selfish, while the Chinese are crying their hearts out for the poor Congolese and the poor Cubans and the poor Yemenis. Since the Chinese are not expected to do much with their unbounded sympathies, while everyone wants a steel plant or something from the Russians, you will see how easy it is for the Chinese to collect admiration here, there and everywhere. The impertinence with which the Chinese apparently demanded the removal of Mr. Khrushchev was in the event matched by the Russian leader's superb nonchalance ; but the confrontation remains. The danger is that there are men in the Kremlin who share the Chinese view ; and Mr. Khrushchev has to be wary of them. You see, the communist world is no more stable than the non-communist ; but then tension is the very breath of life. Tenacity with the Chinese postulates a Russian willingness for a *détente* with the West ; but the West would be foolish to crow and get tough.

THE NUCLEAR TEST BAN TALKS IN MOSCOW WERE rather appropriately timed, I thought. They opened the day before the eighteenth anniversary of the first explosion of an atomic bomb ever : that was at Almogordo, New Mexico. Since then there have been over 400 detonations, and I am enough of a cynic to believe that there are going to be many more yet. I cannot see France, for example, feeling herself bound by anything agreed in her absence in Moscow, and certainly China seems unlikely to halt her drive for membership of the nuclear club. So have these Moscow talks really been important? Personally, I am beginning to wonder whether a ban on testing will have any significance at all in reducing the risks of nuclear war, and I am sure this suspicion is behind much of Russia's new-found enthusiasm for accommodation with the West. The point we have to face is that nuclear weapons are already so well developed by Russia and the United States, if not by Britain as well, that there is little need for further testing. Even now it is possible for these Powers to destroy their enemies a dozen times over ; and there is simply no point in striving for the means of doing it more often than that. Now the competition between them is centred on the means of delivery, and that is something which no mere test ban is going to curb. So, apart perhaps from permitting a gradual fall in the level of radioactivity in the atmosphere, I cannot myself see that there is much to be gained if the three major nuclear Powers stop their testing. Not that I wish to discount this single important advantage ; although I would have felt considerably safer if the need to stop the testing of rockets and other missiles had also been conceded. But I suppose one cannot expect too much all at once. In fact, there is much to be thankful for that the Russians have been prepared to go as far as they have. And why should they be? Well, let us just say that if the Chinese have been responsible, as we all suspect, then it is no more than they have already achieved in changing other entrenched attitudes among their neighbours.

A COLLEAGUE IN LONDON WRITES : THE STATE VISITS to Britain of Dr. Radhakrishnan and the King and Queen of Greece were separated by only a week or two. But what an extraordinary contrast there appears to have been in the degree of success each achieved. The President of India was publicly welcomed, féted and personally extolled, despite his distinctly un-monarchical image ; whereas the only admiration which seems to have been expressed outside the usual formal addresses about a real live pair of crowned heads was for their nerve at insisting on the visit in the first place. When we add the fact that for the first time in more than 150 years, members of the British Royal Family have been booed in the streets of London, it is no wonder that some of Britain's most responsible newspapers have been asking, in all seriousness, whether or not the people are becoming tired of royalty as an institution. That is something I very much doubt, although it does seem that there may be a growing feeling that the Queen's advisers are becoming too far out of touch with public opinion. They could have foreseen the resentment which would inevitably be aroused by

a controversial visit which appeared to have no other justification than as a family call by one royal personage on another. Certainly there seems to have been no enthusiasm for it in political circles either in Britain or in Greece. The demonstrations in London were communist-inspired, that I am prepared to believe. And the lengths to which some of the young hooligans went were probably responsible for any small public sympathy the Greek visitors received But it was surely not seriously to be expected that the British people would cheer enthusiastically for a woman who was once a member of the Hitler youth, and only a few years ago was supporting her husband in denouncing British soldiers as murderers in Cyprus and in honouring the leader of the terrorist organisation there—a man who was eventually so extreme that he was disowned by the very people in whose name he had been fighting. Memories are not as short as all that. So the general reaction that the whole occasion was a tiresome waste of good public money, and an unnecessary burden on the energies of the police, is not altogether surprising. Yet none of these criticisms were heard about Dr. Radhakrishnan's visit; then, the general opinion seemed to be that the money was well spent and the inconvenience worth while. This is a tribute to the esteem in which India and the personality of her President are held in Britain. But it would also appear to indicate that the British no longer have quite the affection they used to have for royalty as such, or the same appetite for royal occasions.

I ONCE WENT TO A BENGALI WEDDING; AND BIG IT was. (The bride, I remember, was a rare combination of grace and glamour, two qualities that are usually mutually exclusive.) For the majority of the guests, however, the marriage was far less important than the feast; and that's where confusion reigned. Everybody seemed in charge of everything and nobody in command. A kept screaming for *hilsa*—delicious in mustard—and B instantly wanted mutton curry while C would be content with nothing but *dahi* for his section of the feasters. The noise was beyond measure; none of the items so urgently indented arrived until minutes later. The confusion rather than the noise came back to mind when I read of who had done what about All India Radio's agreement with the Voice of America. The Prime Minister had apparently approved of the deal in principle at some point; he seemed like the father of the bride at the wedding who knew of the marriage arranged but did not know what the dowry agreed upon was. The External Affairs Ministry seemed to scream that, since there was a law on the subject, no dowry was permissible; the A.I.R.-V.O.A. marriage must be a case of strings without aid. The Ministry of Information and Broadcasting did not seem to know whether it was the bride or the bridegroom; it behaved, alternately, coyly and impetuously; it kept arguing that the marriage must take place and that the marriage was nothing more than a commercial transaction. In any event, it is being argued now, the marriage will not be consummated until two years later, for the transmitter cannot be installed earlier than that. So Trans Mitter, a common enough Bengali surname, is now making more noise than it is likely to when it is on the air. What it is saying is that nobody in Delhi knows who is doing what and he himself has only the faintest of clues. The enthusiasm of the two or three people who put the deal through in such unseemly haste is no easier of explanation than the outraged modesty of others who, having received a good deal of military aid from the U.S.A., are now aghast at the prospect of identification with the V.O.A. Again the whole situation is Bengali, as you will agree if you remember that woman in a novel by Sarat Chandra Chatterji in which she, a *brahmin*, brags that although she had been living for 18 years with a man of inferior caste she had never allowed him into her kitchen!,

THE ATTRACTIVE BLONDE WALKED INTO THE DENTIST'S surgery almost shaking with fright. The dentist did his best to soothe her, but without much success. As she sat down she ventured, "You know, I think I would rather have a baby than have a tooth drilled."

"Madam," said the dentist, "I suggest you make up your mind before I adjust this chair."

THE DITCHER

IMPRESSIVE RESULTS FROM BRITANNIA BISCUIT

THE Britannia Biscuit Company Ltd has made record sales amounting to Rs. 5.08 crores during the year ended March 1963, against Rs. 4.28 crores in 1961-62 So the profit has jumped from Rs 72.75 lakhs to Rs. 86.52 lakhs, after providing Rs. 9.99 lakhs, against Rs 8.61 lakhs, for depreciation. Taxation has, however, absorbed a bigger sum of Rs. 59 lakhs, of which the super profits tax accounts for Rs. 15.20 lakhs. The tax provision was only Rs. 38.26 lakhs for 1961-62. In view of the reduced net profit and the need to set aside funds for replacement and expansion, the directors have cut the taxable ordinary dividend from 25 percent to 21 percent, including an interim of 6 percent. It is covered more than six times and works out to a yield of 4.9 percent at the present price of Rs. 42.50 a share of Rs. 10 each. Development rebate reserve is allocated Rs. 1.49 lakhs (against Rs. 1.98 lakhs), debenture redemption reserve Rs. 1.50 lakhs (the same) and general reserve Rs. 12.80 lakhs (against Rs. 13.76 lakhs). The carry-forward is Rs. 6,999, against Rs. 2.84 lakhs brought in.

The directors point out that heavy taxation has reduced the capacity of the Company to finance capital projects and long-term expansion schemes. They have, nevertheless, made strenuous efforts to extend its activities. Innovations and improved manufacturing techniques have helped to improve the results. Ancillary equipment costing Rs. 8 lakhs have been installed. They say that the project for establishing a biscuit factory in the south could not be proceeded with because the Government would not give the necessary industrial licence. Since it has become urgent to increase the output in order to reduce unit costs, it is to be hoped that the Company will be allowed to expand

Steps have been taken to develop the bread trade of the Company. Efforts are being made to increase the export of its products, but there is keen competition in overseas markets. If the Company is to compete effectively in foreign markets, it should be permitted to import the necessary equipment.

Jardine Jute Companies Do Well

THE results of the Jardine Henderson group of jute mills for the year ended March 1963 are much better than in 1961-62. The Howrah Mills Company Ltd has increased its profit sharply from Rs. 10.94 lakhs to Rs. 57.39 lakhs, after providing Rs. 7.84 lakhs for depreciation, although the working was hampered by a lock-out. The directors say that the industry has been working at the maximum level of production, but the output has been affected by the absence of sufficient spinning capacity and the shortage of power.

As for current prospects, the margin of profit has shrunk, following the recession in the price of jute goods. Competition from the Pakistani mill industry has been keen in sacking because the former enjoys the advantages of cheaper fibre and export subsidy. Although the Indian mills have diverted as many looms as possible from sacking to hessian, the continued erosion of the overseas sacking market should cause a good deal of concern. As for raw jute, it is to be regretted that the Government has not discouraged the production of low-quality fibre by reducing the minimum prices for the lower grades. The demand for high-quality jute, especially for carpet-backing cloth, will continue and remunerative prices will be paid for this fibre.

A taxable ordinary dividend of 10 percent has been declared, which is covered more than nine times; the yield is 5.3 percent at the present price of Rs. 19 a share of Rs. 10 each. There was no dividend for 1961-62. General reserve is allocated Rs. 84,335, debentures stock sinking fund reserve Rs. 2 lakhs, taxation Rs. 30 lakhs (of which super profits tax is Rs. 5.87 lakhs) and development rebate reserve Rs. 54,953. Sales were Rs. 3.51 crores, against Rs. 4.11 crores. A battery of four circular looms, two cone winders and a pre-beaming machine has been installed and experimental production has begun. Sacking production on two of the looms has reached a satisfactory level, but difficulty has been experienced on the two looms used for trial production of hessian bags. A new second drawing frame has been installed. This should increase the supply of sliver to the third drawing frames and improve operational efficiency.

The Reliance Jute Mills Company Ltd has made a profit of Rs. 17.65 lakhs, against Rs. 7.32 lakhs, after providing Rs. 92,798 for depreciation. A sum of Rs. 13.86 lakhs has been transferred from provision for contingencies. Taxation absorbs Rs. 1.55 lakhs (against Rs. 1.64 lakhs) and general reserve Rs. 4.85 lakhs. The credit balance of Rs. 25.41 lakhs has been used to wipe off the outstanding debit balance. The dividend has again been passed.

The Company's income continues to arise from the leasing of its godowns to the Government and the sale of its loom-hour entitlement. The directors reopened the mills in September 1962 and began reconditioning the machinery. From March 1963 the manufacturing operations have begun to show small monthly profits On 26th April, 1963, the managing agents gave notice of their resignation from office The resignation will become effective on 31st October, 1963 The managing agents have already disposed of their entire shareholding in the Company.

Results of McLeod Tea Group

THE results of the McLeod group of tea companies for the year ended December 1962, show that the Dibrugarh Tea Co. Ltd (an Assam garden) has earned a profit of Rs. 5.70 lakhs, against Rs. 5.16 lakhs in 1961, after providing Rs. 89,684 (against Rs. 94,818) for depreciation. The taxable ordinary dividend has been reduced from 40 percent to 30 percent to absorb Rs. 1.35 lakhs. The yield is 9.6 percent at the present price of Rs. 31.25 a share of Rs. 10 each. Taxation, including a sum of Rs. 11,712 for super profits tax, is Rs. 3.27 lakhs (against Rs. 2.26 lakhs). Buildings and machinery reserve is allocated Rs. 1.25 lakhs (against Rs. 1.50 lakhs) leaving a carry-forward of Rs. 22,945, against Rs. 24,232 brought in. The crop was 301,917 kilograms, against 305,738 kilograms and the average sale price rose from Rs. 6.23 to Rs. 6.68 a kilogram. The 1963 crop estimate is for 330,200 kilograms at a cost of Rs. 12.66 lakhs The Tea Board has agreed to grant a long-term loan of Rs. 5.99 lakhs for expanding the plantation.

The Teloijan Tea Co. Ltd (an Assam estate) has maintained a taxable ordinary dividend of 25 percent, absorbing Rs. 1.50 lakhs. The yield works out to 11.8 percent at the present price of Rs. 21.12 a share of Rs. 10 each. The profit has improved from Rs. 2.51 lakhs to Rs. 5.19 lakhs, after providing Rs. 1.15 lakhs (against Rs. 1.10 lakhs) for depreciation. Taxation, of which super profits tax is Rs. 6,172, amounts to Rs. 2.70 lakhs (against Rs. 1.12 lakhs). Buildings and machinery reserve absorbs Rs. 75,000, leaving a carry-forward of Rs. 6,325, against Rs. 524 brought in. The crop was 390,802 kilograms, against 373,286 kilograms and the average sale price rose from Rs. 4.99 to Rs. 5.61 a kilogram. A crop of 381,000 kilograms has been estimated for 1963 at a cost of Rs. 14.64 lakhs. The Company has been sanctioned a loan of Rs. 4.49 lakhs by the Tea Board for carrying out extensions to the plantation.

THE profit of the Amluckie Tea Co. Ltd (an Assam garden) has been Rs. 3.08 lakhs, against Rs. 3.41 lakhs, after transferring Rs. 89,302, (against Rs. 86,033), to depreciation. The taxable ordinary dividend has been reduced from 10 percent to 7.5 percent to absorb Rs. 33,428. The yield is 3.8 percent at the present price of Rs. 20 a share of Rs. 10 each. Taxation is allocated Rs. 1.53 lakhs (against Rs. 1.44 lakhs) and buildings and machinery reserve Rs. 86,454 (against Rs. 1.40 lakhs). The crop declined from 424,104 kilograms to 413,012 kilograms, but the average sale price increased from Rs. 4.81 to Rs. 5.67 a kilogram. The crop for 1963 has been estimated at 471,700 kilograms at a cost of Rs. 17.62 lakhs. The Tea Board has agreed to give a loan of Rs. 4.93 lakhs to the Company for expanding the plantation.

The Sungma Tea Co. Ltd (a Darjeeling garden) has made a profit of Rs. 4.82 lakhs, against Rs. 2.78 lakhs, after providing Rs. 66,396, (against Rs. 62,007) for depreciation. The taxable ordinary dividend has been increased from 15 percent to 20 percent to absorb Rs. 1.25 lakhs. It works out to a yield of 13.1 percent at the present price of Rs. 15.31 a share of Rs. 10 each. Taxation, including a sum of Rs. 7,250 for super profits tax, is Rs. 2.14 lakhs, against Rs. 1.36 lakhs. Development rebate reserve is allocated Rs. 5,555 (against Rs. 240) and general reserve Rs. 1.65 lakhs (against Rs. 50,000). There is a carry-forward of Rs. 16,503, against Rs. 49,166 brought in. The crop fell from 195,487 kilograms to 189,392 kilograms, while the average sale price rose from Rs. 7.32 to Rs. 9.58 a kilogram. The 1963 crop estimate is 206,800 kilograms at a cost of Rs. 11.37 lakhs.

Tezpore Tea Earns More

THE Tezpore Tea Co. Ltd (an Assam garden) has maintained a taxable ordinary dividend of 12.5 percent for the year ended December 1962, which absorbs Rs. 2.48 lakhs. The yield works out to 8.5 percent at the present price of Rs. 14.75 a share of Rs. 10 each. The profit has risen sharply from Rs. 4.76 lakhs to Rs. 8.36 lakhs, after providing Rs. 1.81 lakhs, against Rs. 1.63 lakhs, for depreciation. Taxation absorbs Rs. 4.81 lakhs, of which super profits tax is Rs. 15,914. The tax provision for 1931 was Rs. 2.22 lakhs. General reserve is allocated Rs. 50.000. development rebate reserve Rs. 72,318 and capital reserve Rs. 5.70 lakhs. The carry-forward is Rs. 20.902, against Rs. 25,600 brought in.

It is proposed to extend the area under tea to 2,290 acres by 1966-67. The Company has introduced C.T.C. manufacture. Capital expenditure was Rs. 8.79 lakhs, of which a sum of Rs. 4.63 lakhs was incurred for conversion to C.T.C. manufacture. The crop declined from 37,161 maunds to 28,763 maunds. The 1963 crop estimate is 28,500 maunds at a cost of Rs. 48,44 lakhs. A capital expenditure of Rs. 6.02 lakhs is likely to be incurred in 1963,

Dhunseri Tea Cuts Dividend

THE Dhunseri Tea Co. Ltd (an Assam garden) has earned a profit of Rs. 2.14 lakhs for the year ended December 1962, compared with Rs. 2.13 lakhs in 1961, after transferring Rs. 1.08 lakhs, (against Rs. 1.02 lakhs), to depreciation. The taxable ordinary dividend has been cut from 15 percent to 10 percent to absorb Rs. 70,000. The yield is 8.3 percent at the present price of Rs. 12.06 a share of Rs. 10 each. Taxation is allocated Rs. 75,000 (against Rs. 1 lakh), general reserve Rs. 60,000 (against Rs. 2.40 lakhs) and development rebate reserve Rs. 10,000 (against Rs. 8,000). The carry-forward is Rs. 20,499, against Rs. 4,308 brought in. The crop of Dhunseri estates declined from 388,269 kilograms to 368,591 kilograms. The average sale price increased from Rs. 4.44 to Rs. 5.13 a kilogram. The production of the Dhendai Estates was 186,100 kilograms, against 244,530 kilograms, and the average sale price rose from Rs. 4.72 to Rs. 5.06 a kilogram. A crop of 370,000 kilograms at a cost of Rs. 3.48 a kilogram has been estimated for Dhunseri estate for 1963. The crop estimate of Dhendai is 250.000 kilograms at a cost of Rs. 3.92 a kilogram.

Expansion Plan of National Rubber

THE National Rubber Manufacturers Ltd has outlined its programme for further expansion, which has been approved by the Government. The output capacity for bicycle tyres will be raised from 2.4 million to 4 million a year. The capacity for producing industrial V-belts and fan-belts will be increased from 840,000 to 1.4 million a year. These products are being manufactured by the Company largely for Goodyear India Ltd, according to the technical assistance agreement with the latter.

It is proposed to manufacture 1,200 tons of reclaimed rubber. The move will save for the Company the high

costs of importing reclaimed rubber. It will also enable it to use its own rejections and waste rubber, and thus effect substantial savings. The manufacture of PVC fire-resistant conveyor belting will also be undertaken. When the expansion schemes are completed, the Company's turnover should rise sizably. A large part of the new products is expected to be exported.

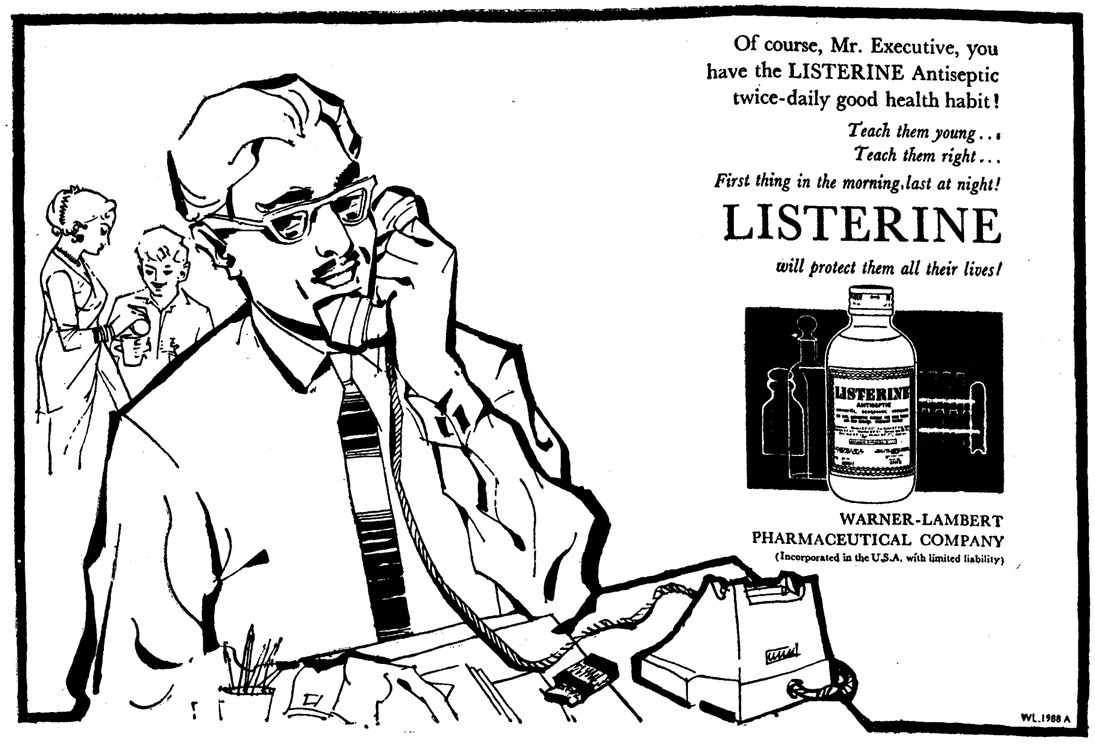
Good Prospects for Colour-Chem

THE shareholders of Colour-Chem are very happy with the management of the Company, as it started paying dividend from the very second year of its existence—a rare performance indeed. The Company's past record has been excellent and notwithstanding the uncertainties concerning the supply of raw materials and their rising costs, the shareholders have little reason to fear that the Company will not be able to maintain its progress in the future. The chairman, Mr. Ramniwas R. Ruia, has assured shareholders that the Company's working in the current year so far has been satisfactory, with monthly sales running around Rs. 25 lakhs.

The demand for the Company's products continues to be good and the customers appear well satisfied with the quality of the products. Of course, the Company has its difficulties arising mostly out of restricted imports because of the foreign exchange shortage. It has so far been able to absorb higher costs of raw materials by increased production and maintain prices at the 1959 level according to an understanding with the Government. But the chairman has warned that this may not be possible in future with the cost of raw materials showing a steep rise following the cut in the Company's own actual users' licences and the consequent necessity to depend on textile industry's import entitlements which had to be purchased at a premium of 60 percent. The present situation has, however, one advantage, in that the Company will be able to effect larger imports and the shortage of raw materials will ease to that extent.

The chairman indicated that the Company's German collaborators were working on plans to diversify the production and for widening the scope of the activities. But since these plans have yet to take a final shape, Mr. Ruia was unable to satisfy the shareholders' curiosity concerning the details of the diversification plans visualising the manufacture of phthalocyanine green and intermediates for pigment powder and emulsion. The chairman counselled patience to shareholders who pleaded for a higher dividend and/or bonus issue. Mr. Ruia was unwilling to make any commitment concerning a possible rights issue for raising funds for financing the Company's expansion schemes, but he assured the shareholders that whatever is decided will be in the best interests of the Company. He informed them that last year's entire dividend of Rs. 12 a share would be exempt from tax and that the same position might hold good for the current year as well. The Company's taxation liability last year had increased by Rs. 23 lakhs to Rs. 64.29 lakhs, out of which Rs. 14.78 lakhs were for super profits tax. In spite of that, the net profit had increased. The company's income tax assessments is complete up to 1961-62. The Rs. 100-paid share of Colour-Chem is currently quoted around Rs. 365.

Citric India to Raise More Funds



THE reconstituted board of directors of Citric India Ltd is engaged in raising additional finance by the issue of further equity shares to existing shareholders and redeemable preference shares to the public. Negotiations are also in progress for raising further medium-term finance from banks. This was disclosed by Mr. G. D. Somani, who presided over the extraordinary meeting of the Company on 20th July, in the absence of the chairman, Mr. M. R. Ruia. Additional finance has become necessary because the capital cost of the Company's project has gone up far beyond the original estimate of Rs. 90 lakhs. The chairman has attributed the increase in the cost of the project to the nature of the process of manufacturing citric acid, increase in import duty from 10 percent to 22½ percent and increases in the prices of steel, cement and other construction materials. But all these factors cannot fully explain the steep rise in the capital cost of the project from Rs. 90 lakhs to Rs. 1.5 crores. One is inclined to believe that the original estimate was a gross underestimate.

The Company recently issued and offered to shareholders 10,000 equity shares of Rs. 100 each at par. Mr. G. D. Somani and Maharajkumar Prithviraj, directors of the Company, have jointly and severally agreed to take up at par the whole or part of this rights issue remaining unsubscribed by the shareholders. Considering that the Company's Rs. 100-paid share is currently quoted around Rs. 75, the shareholders could hardly be expected to show much interest in the rights issue. However, with the reconstitution of the board which now includes Mr. G. D. Somani and Maharajkumar Prithviraj, the Company is unlikely to experience any big difficulty in raising the requisite funds necessary for the successful implementation of the project

In his speech, the chairman has assured the shareholders that the Company will start trial production in the first quarter of 1964 and the plant will attain its rated capacity within six months thereafter. Mr. Ruia has stated that the work on the fermentation and production buildings was interrupted by lack of adequate funds while the other sections of the buildings are complete. The erection of the main plant and machinery will be taken up very shortly and in the meantime, the laboratory and pilot plant have started functioning. As the Company could not get electricity from the Maharashtra Electricity Board, it had to make its own arrangements for generating power.

Ahmedabad Jupiter Mills Maintains

LIKE several other cotton textile mills, the Ahmedabad Jupiter Spinning, Weaving and Manufacturing Co. Ltd has fared badly in 1962 although the dividend has been maintained at Rs. 33 a share of Rs. 125. Sales of cloth, yarn and waste are up by about 65 percent from Rs. 2.37 crores to Rs. 3.91 crores, and closing stocks are higher at Rs. 1.14 crores, against Rs. 21.7 lakhs, but the gross profit is down by nearly 11 percent from Rs. 55.52 lakhs to Rs. 49.07 lakhs.

It must be noted here that the results for 1961 and 1962 are not strictly comparable because of the amalgamation of the Hind Mills Ltd, Bombay, with Ahmedabad Jupiter from 1st July, 1962. The figures relating to 1961 represent those of Ahmedabad Jupiter Mills only, while the figures for 1962 also include the working of the Hind Mills from 1st July.

Allocations of the year's profit include depreciation Rs. 21.14 lakhs (against Rs. 12.40 lakhs), development rebate reserve Rs. 3.37 lakhs (against Rs. 3.46 lakhs), taxation Rs. 11.25 lakhs (against Rs. 17 lakhs) and reserve for doubtful debts Rs. 30,000 (against Rs. 1,221). No provision has been made for development reserve and general reserve which received Rs. 1.15 lakhs and Rs. 8.50 lakhs, respectively, in 1961. After providing for the proposed dividends which absorb Rs. 10.23 lakhs (against Rs. 9.30 lakhs), there remains a balance of Rs. 52,498 to be carried forward, against Rs. 26,843 brought in.

The directors state that the programme of renovation and modernisation of the mills is in progress. The Company spent last year Rs. 6.35 lakhs towards the construction of buildings and Rs. 24.3 lakhs on machinery and equipment for purposes of expansion and replacement. The Company had a financial liability of Rs. 46.47 lakhs concerning orders for machinery at the end of 1962. The Company has received a licence for 7,200 spindles under the expansion scheme and order for these spindles has already been placed. It has also received permission to install 192 automatic looms under the replacement scheme.

Tata Oil Earns More

THE impressive rise in the shares of Tata Oil Mills from Rs. 56.50 to Rs. 66.50 within about a fortnight of the release of the preliminary report on the Company's working during the year ended March 1963, reflects the market's full satisfaction with the past year's performance and its optimistic reckoning of the Company's future prospects. Indeed Tata Oil fared very well in 1962-63, with its sales and other income rising by about 15 percent from Rs. 11.19 crores to Rs. 12.89 crores and the gross profit increasing by nearly 27 percent from Rs. 55.78 lakhs to Rs. 70.81 lakhs. Although the dividend is lower at 22 percent, against 23 percent, the distribution among the equity shareholders is higher at Rs. 17.84 lakhs, against Rs. 16.12 lakhs because of the increased capital.

The directors' report and the attached chairman's statement to shareholders hold out the promise of better results in future because of the expansion and diversification of the Company's activities and modernisation of its plants and equipment. The directors state in their report that the Company's combined sales of laundry and toilet soaps improved by 8 percent and reached 29,500 tonnes. The laundry soap units at all the three factories worked very nearly to capacity. The Company has set aside a certain percentage of its soap production to meet the defence needs since last December. Sales of refined glycerine fell by 6 percent due to the non-availability of crude glycerine from other producers and the Company's output of crude glycerine is still insufficient to keep its refineries in full operation. The crushing operations of the oil mills slightly exceeded the previous year's tonnage, in spite of reduced imports of copra.

The solvent extraction plant in Bombay worked to full capacity throughout the year on mowra and groundnuts. The deoiled meals found a steady sale internally as well as in export markets. The sale of "Pakav" registered only a small increase of 3 percent, but the hydrogenation plants in both Tatapuram and Sewri worked to full capacity to meet the need for hard fat for the soap plants. The rate of growth in the sales of toilet products was somewhat lower than in the previous years. The Company had to increase the prices of some of its products following the steep rise in the prices of raw coconut oil. The aggregate value of the Company's exports amounted to Rs. 1.16 crores, against Rs. 71 lakhs in the preceding year.

The chairman, Mr. J. R. D. Tata, has stated that the Company is taking full advantage of the facility to import machinery and spare parts under the export incentive scheme to modernise the plants. The laundry soap plant in Bombay has been completely modernised, and the Calcutta plant partially. The Ghaziabad factory will have a modern laundry soap plant from the start. The modernisation of the plant in Tatapuram will be taken in hand after the Company has gathered some experience of the operation of the fatty acid plant which is expected to go into production there shortly and where soap will be made from fatty acids. Steps are also being taken to modernise the oil refinery and the deodorisation units of the *vanaspati* plant in Tatapuram, which are more than 30 years old.

Kirloskar Oil Engines Cuts Dividend

KIRLOSKAR Oil Engines Ltd reports encouraging results for the year ended March 1963, with both sales and profits recording substantial improvement over the previous year's figures. Sales are up by about 20 percent from Rs. 3.95 crores to Rs. 4.72 crores and the gross profit has increased by nearly 14 percent from Rs. 1.03 crores to Rs. 1.18 crores. But in view of the steep rise in the tax liability from Rs. 37 lakhs to Rs. 61 lakhs, the directors have thought it advisable to recommend lower dividends, which, however, do not mean any hardship to the shareholders as the total distribution is still higher because of the increased capital—preference as well as ordinary. The equity capital was raised by the one-for-two bonus issue in May 1962, and the additional preference shares issued in 1961 are eligible to the full dividend for 1962-63. The ordinary dividend has been reduced from 16 percent to 12 percent, and the preference dividend from 10 percent to 8 percent.

Kirloskar Pneumatic Earns More, Pays Less

THE directors of Kirloskar Pneumatic Co. Ltd have recommended a dividend of 10 percent for the year ended March 1963, against 12½ percent paid in the preceding year. The dividend for 1962-63 is, however, on the increased capital as raised by the conversion of the convertible preference shares and by the increase in the paid-up value of new shares issued in 1961-62. The new shares were Rs. 50 paid-up last year, and at the end of March 1963, they were Rs. 75 paid-up. Since then, they have become fully paid-up.

The working results of the Company for 1962-63 show a considerable improvement over the previous year's performance. Sales are up by about 18 percent from Rs. 1.43 crores to Rs. 1.68 crores, and the gross profit has risen by nearly 19 percent from Rs. 23.48 lakhs to Rs. 27.91 lakhs. Allocations include depreciation Rs. 4.60 lakhs (against Rs. 5.38 lakhs), development rebate Rs. 1.86 lakhs (against Rs. 1.64 lakhs), taxation Rs. 10.23 lakhs (against Rs. 8.14 lakhs), development reserve Rs. 1.50 lakhs (the same), general reserve Rs. 1 lakh (the same), machinery replacement reserve Rs. 1 lakh (the same) and taxation reserve Rs. 1 lakh (the same). The Rs. 100-paid share of Kirloskar Pneumatic is quoted around Rs. 267.50.

Lakshmiratan Sales Up, Profit Down

IN spite of the 10.5 percent rise in the sales from Rs. 80.45 lakhs to Rs. 93.15 lakhs, the gross profit of Lakshmiratan Engineering Works Ltd for the year ended September 1962, shows a fall of 9 percent from Rs. 11.83 lakhs to Rs. 10.77 lakhs. The setback in the profit is attributed mainly to the poor performance of the Bombay factory, where, apart from the rise in production costs as a result of higher prices of raw materials, production was hampered by the shortage of essential raw materials. There was also a curtailment of production of diesel engines at the Faridabad factory due to a fall in demand.

The directors, however, state in their report that demand for diesel engines has been showing signs of increase during the current year and the factory in Faridabad has reached the production of 300 engines a month. The Bombay factory has also increased the production of high draft conversion material for ring frames, the demand for which has continued to grow and over-reached the production capacity. Efforts are being made to increase production of these ring frames. The Kanpur factory has been doing well. There was a general increase in the production of ring frames and the Company supplied 36 ring frames in 1961-62. During the current year, it has already supplied so far 38 ring frames. The Company has started the production of automatic looms at the Kanpur factory in collaboration with Toyoda Automatic Looms Works Ltd of Japan. It has so far supplied 12 looms. In view of the demand for pirn change looms, the Company proposes to take up the production of these looms with the permission of the Japanese collaborators.

Out of the 1961-62 gross profit of Rs. 10.77 lakhs, the directors have provided Rs. 9.56 lakhs (against Rs. 7.56 lakhs) for depreciation and Rs. 49,673 (against Rs. 2.08 lakhs) for development rebate reserve. After adjusting the small loss of Rs. 10,196 brought forward, the directors have carried forward Rs. 71,276. The preference dividend has been skipped, and arrears of preference dividend up to the end of the year amount to Rs. 3.60 lakhs. It might be mentioned here that at an extraordinary meeting held in October 1962, the preference shareholders had agreed to accept Rs. 40 a share, subject to tax, in lieu of the arrears of dividend amounting to Rs. 70 a share, free of tax. The Rs. 10-paid of Lakshmiratan Engineering is quoted nominally around Rs. 5.24.

Central Bank Repeats

THE Central Bank of India Ltd has maintained the *ad interim* gross dividend of Rs. 2.40 (net Rs. 168) a share for the half year ended June 1963. The net profit of the bank before taxation for January-June 1963 is slightly higher at Rs. 89.79 lakhs, compared with Rs. 88.43 lakhs in the same period last year. With a sum of Rs. 93,249 brought forward from the previous year, the disposable surplus amounts to Rs. 90.72 lakhs. The proposed interim dividend will absorb Rs. 30.28 lakhs, leaving Rs. 60.44 lakhs to be carried forward to the next half-year's account subject to taxation.

Star Textile Engineering Earns More

THE directors of State Textile Engineering Works Ltd have recommended a gross dividend of Rs. 8 a share for the year 1962. The new shares issued to the public in 1962 will get proportionate dividend on the amount paid-up. The Company had declared a dividend of Rs. 25 a share for 1961 when it was a private limited concern. The preliminary report on the Company's working results in 1962 shows a marked improvement over the previous year. Sales are up from Rs. 46.60 lakhs to Rs. 81.59 lakhs, and gross profit has increased from Rs. 5.23 lakhs to Rs. 7.75 lakhs.

Aryoday Mills Disappoints

THE Aryoday group of mills—Aryoday Spinning and Weaving and Aryoday Ginning and Manufacturing—reports disappointing results for the year ended March 1963. The gross profit of Aryoday Spinning and Weaving Co. Ltd has declined sharply from Rs. 34.05 lakhs to Rs. 16.71 lakhs. The directors have recommended a gross dividend of Rs. 25 a share on the increased capital (11,973 equity shares), against Rs. 35 a share paid in 1961-62 on 7,000 equity shares.

The gross profit of Aryoday Ginning and Manufacturing Co. Ltd has declined from Rs. 24.92 lakhs to Rs. 11.27 lakhs. The directors have recommended a gross dividend of Rs. 20 a share, against Rs. 30 a share, including bonus of Rs. 5, paid in the previous year. The proposed dividend absorbs Rs. 3.46 lakhs, against Rs. 5.40 lakhs. The preference dividend absorbs another Rs. 86,000.

Outlook for Oriental Insurance

PRESIDING over the annual general meeting of the Oriental Fire and General Insurance Company Ltd held last week, Mr. B. K. Kaul, chairman, mentioned that 1962 was virtually the first full year's working of the integrated Company. (A fuller version is printed on a later page in this issue of *Capital*.) The National Fire and General Insurance Company Ltd and the Asiatic Government Security Fire and General Assurance Company Ltd were amalgamated with Oriental Fire and General Insurance Company in 1962. He hints at the possibility of expansion in the Company's overseas business. It has been conducting the emergency risks insurance scheme on a no-profit basis as the sole agent appointed by the Government.

The working of the Company during 1962 has been satisfactory. The distributable balance has risen sharply from Rs. 20.50 lakhs in 1961 to Rs. 44.69 lakhs in 1962. A taxable dividend of 6 percent has been declared. The Company's financial position has been strengthened. Against a paid-up capital of Rs. 1.10 crores, reserves amount to Rs. 46.68 lakhs. There are also other additional reserves. The net total premium income rose from Rs. 4.34 crores to Rs. 4.92 crores. The investments of the Company amount to nearly Rs. 3.99

crores; the total depreciation on these investments has been fully covered by an investment reserve.

Hindustan Wires Sales and Profit Up

THE Hindustan Wires Ltd has done well for the year ended March 1963. Sales rose from Rs. 44.45 lakhs for 1961-62 to Rs. 87.16 lakhs, although its working has suffered from power shortage. There has been a profit of Rs. 10.16 lakhs, against Rs. 3.04 lakhs, after providing Rs. 1.45 lakhs, against Rs. 81,235, for depreciation. An ordinary dividend of 6 percent, free of income tax and super tax, has been declared absorbing Rs. 3 lakhs. The share is being quoted at par. Development rebate reserve is allocated Rs. 3.93 lakhs (against Rs. 1 lakh) and general reserve Rs. 4 lakhs. The carry-forward is Rs. 32,525, against Rs. 9,166 brought in.

The Company has been executing several important defence orders. Equipment worth Rs. 13.41 lakhs have been received and are being installed. This will help increase the production of high tensile wires. The Company's application for manufacturing 5,000 tons of prestressed concrete has been sanctioned by the Government. This is in addition to the licence for producing 4,200 tons of tyre bead wire. Technical collaboration for manufacturing tyre bead wire has been arranged with Kobe Steel Works Ltd of Japan. Machinery worth Rs. 35 lakhs will be imported under a yen credit for the purpose. An agreement to import the equipment has been signed subject to the approval of the Governments of India and Japan. The tyre bead wire project will cost about Rs. 1.27 crores. The Industrial Finance Corporation has agreed to give a loan of Rs. 54 lakhs to the Company for the scheme.

Premier Mills Pays Less

A MARKED fall in the net profit by about Rs. 8 lakhs, compared with that of the previous year, and a decline in sales, feature the trading results of the Premier Mills Ltd for the year ended March 1963. The net profit for the year amounts to Rs. 23,43,243, after providing Rs. 9,88,168 for depreciation, against the previous year's profit of Rs. 31,48,603 after providing Rs. 9,05,953 for depreciation. With the amount of Rs. 24,186 brought forward, the total surplus available for appropriation comes to Rs. 23,67,429.

The provision for taxation amounts to Rs. 13,25,000 (against Rs. 15,25,000). A sum of Rs. 200,000 is transferred to development rebate reserve (against Rs. 100,000). A sum of Rs. 200,000 is transferred to general reserve (against Rs. 400,000). Gratuity reserve gets Rs. 50,000 (against Rs. 100,000) and donations amounted to Rs. 75,000 (against Rs. 50,000). Sales tax for prior years amounted to Rs. 10,045.

The directors have recommended a lower dividend of 20 percent (against 25 percent), and this dividend accounts for Rs. 500,000 (against 625,000). The balance of Rs. 7,384 is carried forward.

Interim Dividend from Indian Bank

THE net profit of the Indian Bank Ltd for the half-year ended June, 1963 is Rs. 8,96,000 after providing for income tax and super profits tax. The profit for the corresponding period last year was Rs. 8,29,000. Deposits have risen to Rs. 49 crores from Rs. 44.87 crores. The Directors have proposed to pay an interim dividend and bonus of 7 percent on the paid-up capital. After transferring Rs. 1,80,000 to the reserve fund, the carry-forward will be Rs. 2,37,700.

The Indian Bank is the only south Indian Bank, which has been authorised to receive deposits under the Compulsory Deposit Scheme.

Titaghur Jute

THE Titaghur Jute Factory Co. Ltd has provided a sum of £30,000 as depreciation for 1962 instead of £211,646 as was printed in the previous issue of *Capital*.

New Capital Issues

THE Controller of Capital Issues has authorised six companies to issue capital totalling Rs. 3.55 crores. One of them is issuing part of its shares to Indians abroad and one is a new company. Two companies are having foreign collaboration. One is issuing bonus shares while another is raising debentures. The details are as follows:

Bharat Auto Parts Manufacturers (Private) Ltd, Gujarat, is to issue Rs. 50 lakhs capital. It is divided into 4,000 equity and 1,000 preference shares, each of Rs. 1,000 each. The shares will be issued for cash at par and the proceeds utilised in the establishment of a factory in Karamsad (Gujarat) for the manufacture of automobile spare parts. Shares of the value of Rs. 45 lakhs will be issued to Indian nationals resident in Africa.

East India Pharmaceutical Works Ltd, Calcutta, is raising fresh capital of Rs. 11 lakhs divided into 110,000 equity (bonus) shares of Rs. 10 each on capitalisation of the general reserves.

International Tractor Company of India Ltd, is raising Rs. 1.50 crores equity capital in shares of Rs. 10 each. This is in supersession of the previous consent dated 20th November, 1962, for Rs. 1 crore capital. Shares of the value of Rs. 25.50 lakhs will be issued to International Harvester Co. Chicago (U.S.A.), against capital goods. The money will be used for the manufacture of tractors, implements, etcetera.

Assam Coke Oven and Briquette Co. Ltd, a Company proposed to be incorporated in Assam, has been given consent to issue capital of Rs. 20 lakhs, divided into 200,000 equity shares of Rs. 10 each for cash at par. The capital will be utilised in installing soft coke and Bee-hive coke manufacturing units near Cherrapunji (Assam).

Industrial Plants Ltd, Calcutta, will issue capital of Rs. 75 lakhs for cash at par. The capital is divided into Rs. 55 lakhs in equity and Rs. 20 lakhs in 9.3 percent preference shares. The capital is required for the manufacture of machine tools in collaboration with Hitachi Machinery Co. of Tokyo.

Modi Sugar Mills Ltd, Modinagar, is to issue capital of Rs. 50 lakhs divided into 5,000 debenture units of Rs. 1000 each carrying interest at 7 percent a year for cash at par. The proceeds of the issue will be used for financing the manufacture of steel castings and M. S. special alloy wire.

The Stock Markets

BUSINESS CONCENTRATED ON CLEARING SHARES

Wednesday Evening.

THE tone of the Calcutta stock market has been steady towards the close of the past week, although share prices fluctuated widely earlier on alternate bouts of buying and selling. The clearing on Wednesday passed off smoothly and carry-forward charges have been moderate. Business has been concentrated on clearing shares since support has largely been professional in character. Lyons Range has been cheered by several favourable factors. Firstly, the minor reshuffle in the Central Cabinet has removed a good deal of uncertainty. Secondly, the political situation has taken a turn for the better in that there has been a lull in the Sino-Indian conflict. It is generally thought that China will not take any aggressive action for the time being. Meantime, India's defence preparations have been reinforced by assistance from friendly foreign countries, especially the U.S.A. and the U.K. On Tuesday sentiment was aided by rumours that China might accept the Colombo proposals *in toto*. The news has since been contradicted by the Government of India. Thirdly, various corporate rumours have been backed by interested buying.

In any case, the improvement has largely been due to a healthier technical position. There has been evidence of shortages of scrip following the closure of books by several companies. In view of the improvement since the resumption of forward trading nearly two months ago, the stock exchange authorities have decided to ask the Government for relaxing the margins on trading. It has been argued that the carry-forward and interim margins, in particular, have hindered activity. Unless the margins are sufficiently relaxed, business will not expand. Since they have been imposed in order to restrain speculation, the Government will have to consider carefully whether it would be appropriate to relax the restrictions under present circumstances. There is no doubt that support hitherto has been largely professional. Investment support has been conspicuous by its absence. This is why share prices have not moved further up.

Judging by current indications, it looks as if the trend is not likely to improve quickly. The new Government loans, the lists for which opened last Monday, will siphon off a considerable volume of funds. In view of bigger demands for credit from trade and industry, banks are not expected to supply much credit to the stock market. This apart, a Press report that the Government of India may soon take steps to restrict the use of blank transfers is significant. If the system of blank transfers were to be discouraged, the marketability of shares would suffer. Despite these unfavourable developments, the prices of several shares have fallen sufficiently low to become attractive investment propositions. Hence there is scope for discriminating purchases.

Indian Iron have improved further after an earlier fall because of hopes that the Government is likely to take a more realistic attitude towards regulating the prices of commodities. Among engineering shares, attention has centered on Guest, Keen, Williams, Burn, Braithwaite, Jessop and Texmaco. Interest has been lacking in coal shares since the Government has not yet moved to increase the price of the fuel. Scattered business has been done in Burrakur, Pench Valley, Amalgamated and Central India. Cotton mill shares have been subdued because investors are not hopeful of any increase in the prices of cloth and yarn. J. K. Rayon have recovered somewhat on short-covering.

The prices of selected miscellaneous shares have improved in the absence of pressure. Hindustan Motors, Indian Copper, Indian Cable, Indian Aluminium and Dunlop Rubber have been prominent. The disappointment over the cut in the dividend of Hindustan Motors seems to have been overcome. Alkali Chemical, Union Carbide, British Paints, Associated Battery and Indian Oxygen have been steady. National Insulated Cable and Hindustan Aluminium have recovered on replacement buying. Among managing agency shares, Martin Burn and Balmer Lawrie have been steady. Bank shares have genrally been neglected. Electric company shares have met with stray buying. Calcutta Electric have been transacted. Among new shares, Isaac Holden, Phillips Carbon, India Carbon and Asiatic Oxygen have recovered. Sugar shares have improved somewhat on prospects of bigger production during the 1963-64 season. Cawnpore have gained. In the paper section, Orient have been firm on influential support. Interest has been taken in Sirpur.

Birla have been prominent in the jute section because of interested buying. Barnagore, Champdany, Ganges, Union and Anglo-India have been supported. Tea shares have met with stray buying. Interest has been concentrated on good Assam and Dooars garden. Government securities have been steady, although turnover has been small. Attention has been diverted to the new loans. The prices of selected State Government loans have hardened on account of institutional buying.

Bombay

PRICES STEADY AFTER INITIAL EASINESS

TECHNICAL POSITION IMPROVES

Wednesday Evening.

THE Bombay stock market has been steady towards the close of the past week after an easier spell earlier. Prices of selected clearing shares have recovered appreciably on hectic support, combined with short-covering. Operators have been inclined to interpret bullishly the recent political developments. It is believed that India's defence preparations have progressed much because of the assistance given by the U.S.A. and the U.K. The possibility of any further Chinese aggression in the near future is considered unlikely. The minor changes in the Central Cabinet have removed the earlier uncertainties.

Meanwhile, the technical position of the market has improved and bears have been forced to cover their open positions because of the shortage of several selected scrip. The fact that the stock market authorities have decided to approach the Government to relax the restrictions on margins, has been an additional stimulant. It is argued that the existing margin requirements have restricted business; now that the stock market has become more stable, there is no need for continuing the margins in their present form. Corporate news has also been somewhat favourable in that the Government is likely to relax the rules governing capital issues.

Tata Steel ordinary have recovered to Rs. 145 on optimism concerning

the possibility of decontrol of steel. Indian Iron have gained at Rs. 23.48 on short-covering. Among engineering shares, Tata Locomotive have been prominent on replacement buying induced by the prospect of expansion and diversification of activities. Larsen and Toubro, Mukand Iron, Premier Construction and Alcock Ashdown have met with support. Among motor-vehicle shares, Hindustan Motors have recovered in spite of a cut in the dividend. Premier Automobiles have been steady.

Prices of selected cotton mill shares have improved after an earlier fall. Kohinoor have been fancied on rumours of a bonus issue. Bombay Dyeing have also gained on hopes of a bonus issue. Century have recovered on short-covering. Support has been extended to Tata Mills and Svadeshi on corporate rumours. India United ordinary, Gokak and Morarjee have been steady.

Prices of miscellaneous shares have moved up in sympathy with the general trend. Among cement shares, Associated Cement have been bought on reports that the Company has sold its assets in Pakistan. In steamship company shares, Scindia have gained on hopes of an increase in freight. Among mining shares, Shivrajpur Syndicate have recovered on replacement buying. The prospect of an increase in production during the next season has induced support for selected sugar shares such as Belapur, Phalton and Walchandnagar Industries.

Chemical shares have been steady. Tata Chemical have improved on expectations of good results. Indian Dyestuff and Polychem have been steady. Among rayon shares, National Rayon have gained; so have Gwalior Rayon. Business in cash shares has been small and the trend has been mixed. Voltas have been steady, but Synthetics and Chemicals have lost on profit-taking. Routine business has been transacted in bank shares. Bank of India and Central Bank have been dealt in. New India have been prominent in the insurance section. Prices of selected electric company shares have improved on balance. Ahmedabad and Tata Power have been done.

Madras

EQUITIES SOFTEN TOWARDS CLOSE

SECURITIES REMAIN STEADY

Tuesday Evening.

THE trend in the Madras stock market has turned softer towards the close of the past week after initial steadiness. There has been some profit-taking, and support from outside sources has lessened somewhat towards the close. Government securities have been steady and prices of selected State Government loans have improved because of institutional support. Business in sugar shares has been small and fluctuations have been narrow.

Selected planting shares have met with broadening support in view of dividend prospects and good crop reports. Good tea and coffee shares, in particular, have attracted attention. Cotton mill shares have met with scattered support. Turnover in miscellaneous shares has been small and buying has been confined largely to selected cement and engineering shares.

Among banks, Indian have been done at Rs. 161.50 and Canara at Rs. 81.75. In electric supply companies, Kumbakonam have been transacted at Rs. 11.10 on paying a taxable ordinary dividend of 10 percent. Negapatam have come to hand at Rs. 11.40 on declaring a taxable ordinary dividend of 10 percent. Among sugar shares, E.I.D. have been steady at Rs 38.19 and Deccan at Rs. 9.95.

In the planting section, Blue Mountain have declined to Rs. 2.45 on uncertainties about the working of the Company's fertiliser department, Cochin Malabar have changed hands at Rs. 6.40 on paying a taxable ordinary dividend of 20 percent. Consolidated Coffee have been done at Rs. 18.20 and Ouchterlony at Rs. 4.64. Business has passed in Periakaramalai at Rs. 3.77 and in Nilambur at Rs. 13.45 on payment of a taxable ordinary dividend of 10 percent. Devon have changed hands at Rs. 12.66 and Kil Kotagiri have been transacted at Rs. 5.88. Peermade have been steady at Rs. 20.77 and Nonsuch at Rs. 24.50.

Among cotton textile shares, South India Viscose have reacted to Rs. 131.50. Travancore Rayon have been transacted at Rs. 24.50. Business has passed in Lakshmi at Rs. 141 and in Madura at Rs. 31.50. Cauvery Spinning have come to hand at Rs. 16.25 on repeating a taxable ordinary dividend of 15 percent. Business has been done in Kamala at Rs. 81.70 on maintaining a taxable ordinary dividend of 6 percent. Interest has been taken in Ramakrishna at Rs. 233.90 and in Bangalore Woollen at Rs. 233.

In the miscellaneous section, Dalmia Cement have been steady at Rs. 13.50 and India Cement at Rs. 5.65. Aluminium Industries have improved to Rs. 18, but Ashok Leyland have been quiet around Rs. 7.35. Mettur Chemical have been done at Rs. 12.65. India Steel Rolling have been bought up to Rs. 11 on declaring a taxable ordinary dividend of 10 percent. R.E.M. Company have been firm at Rs. 19.25 on repeating a taxable ordinary dividend of 18 percent.

London

SHARES QUIETER ON U.S. MOVES

TEA SCRIP IN DEMAND

London, 24th July.

THE outstanding event of the past week was undoubtedly President Kennedy's move to bring about an improvement in the U.S. balance of payments position. Otherwise, there was little to influence the market apart from company statements and the latest, and not unexpected action, by the directors of Burmah Oil to justify their rebuffing of the B.P. Shell bid. The rise in American discount rate had been largely discounted so that its actual announcement had little influence on gilt-edged stocks, although prices eased a trifle, but the President's foreign securities tax proposal brought a sharp fall in those leading equities usually favoured by American investors and although the measure—even in a modified form—was expected to meet with considerable opposition in Congress, there was no recovery in prices. The behaviour of Wall Street where prices tend to move lower each day, caused demand for dollar stocks to contract. Teas met with renewed demand on consideration of the good prices at the London auctions, but rubbers showed little movement.

STUDY GROUP REPORT ON EXPORT FINANCE

THE second study group on export finance was set up by the Government of India on 31st May, 1962. It was in March 1961 that the first study group (known as the Kapur Committee) submitted its report suggesting several measures for liberalising and improving facilities relating to export credit. But even before the ink was dry on the recommendations of the first study group, the second group with Mr. K. P. Mathrani of the Industrial Finance Corporation, New Delhi, as its chairman was constituted.

Curiously enough, the second study group included several members of the first study group. The former examined once again the same witnesses such as bank representatives, trade bodies and Government officials as the first group and has produced a report recommending far-reaching changes in the institutional mechanism which were not suggested by the first group. It is difficult to believe that there were such far-reaching changes in the pattern of India's exports within the short span of one year. What reasons precisely prevented the first group to view the problem from every possible angle before making its recommendations is known only to those members who were common to both the bodies.

There are no two opinions on the urgency of improving the export earnings. This country's external earnings are at the rock bottom level. At the same time, the superimposition of the needs of defence over those of development, following the declaration of the emergency, has made a larger flow of imports imperative. That the calculation of import requirements for the third plan (Rs. 3,650 crores for maintenance imports) erred on the wrong side is evident. For instance, the domestic output of steel did not expand sufficiently to permit a drastic cut in steel imports with the result that the actual outlay on them in the first two years of the third plan amounted to Rs. 194 crores, compared with Rs. 230 crores provided in the original calculations.

The same kind of unwarranted optimism was witnessed in fertilisers, chemicals and other goods. In order to finance maintenance imports only, India's export effort during the third plan would have to be around Rs. 740 crores a year or Rs. 3,700 crores. As against these targets, this country's export earnings averaged about Rs. 612 crores in the second plan period; in the first two years of the third plan, 1961-62 and 1962-63, they were Rs. 661 crores and Rs. 695 crores, respectively. A sum of Rs. 16 crores was added to the country's export earnings by the annexation of Goa in 1962-63. The actuals for the first two years, excluding the contribution from Goa, which was not taken into account in fixing the original third plan export target, came to Rs. 1,370 crores leaving a balance of Rs. 2,330 crores to be covered in the next three years. The Board of Trade has fixed a target of Rs. 745 crores, including the exports from Goa, for 1963-64, and it is evident that the figure falls short of what the circumstances demand. Compared with the disappointing performance, the Planning Commission has fixed an export rate of Rs. 1,300 crores to Rs. 1,400 crores, or twice the present level by the end of the fourth plan. The study group naively assumes that it is possible to lift the exports to the desired level by sustained efforts of the business community and the Government.

Reserve Bank Credit

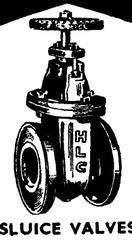
Broadly speaking, the Reserve Bank now gives credit up to 180 days, as compared with 90 days before, against usance bills on the security of promissory notes of scheduled banks; the Bank has exempted packing credits and usance bills from the purview of its credit controls; such credit is provided at the Bank rate of 4½ percent; importers in foreign countries are enabled to obtain credit for medium periods, that is, up to a period of five years through the Refinance Corporation for Industry; the Exports Risks Insurance Corporation has been permitted to cover preshipment risks of advances made by private organisations other than banks. This was done at the instance of the Kapur Committee and it is only recently that the Reserve Bank and State Bank Acts and the provisions governing the Refinance Corporation were amended. It is, therefore, surprising that the Mathrani Committee was asked to examine the adequacy of institutional arrangements providing export finance; the policy of concessional rates of interest by various lending institutions; and whether it is necessary to set up an export finance corporation.

It must be remembered here that there might be other bottlenecks in improving India's exports, but finance is not certainly one of them. The traditional exports, which account for the bulk of the trade, are financed by commercial banks through short-term devices like the letter of credit and existing channels are more than adequate. The question of providing medium and long-term finance arises in the case of exports of engineering goods and capital equipment. The financing of engineering goods, which are yet insignificant, is taken care of by the provision of medium-term facilities made available by the Refinance Corporation for Industry. The export of capital equipment requiring long-term finance does not arise in the foreseeable future because with vast industrialisation programmes inside the country whatever is produced will be required for domestic needs. It is again not prudent to imagine, as the second study group had assumed, that India would be able to compete with advanced western countries with whose assistance it is setting up its own industries. The question of exporting capital equipment to developing countries on a big enough scale does not arise during the next few plans.

It is likewise difficult to support the assumption of the second study group that it will be possible to find new markets in Africa, south east Asia and Latin America. These countries are closely aligned either to west European powers or Japan or China (mainland) in trade relations. It is the powerful competition from the advanced countries in price, quality and delivery which lies behind the poor export performance. In the years to come, if at all, these tendencies would gather further momentum. When a sheltered market is expanding at home, it is difficult to induce the Indian industrialists and business men to sell abroad whatever might be the inducements. It is plain that no major increase in exports will be achieved without a substantial readjustment in the domestic economy. This will in turn involve an increase in agricultural and industrial output at a rate fast enough to satisfy the growing domestic market and yet leave sufficient surplus to export abroad to touch the targets visualised. The several ideological hurdles which hamper production have to be removed if production is to be expanded at a fast rate.

Engineering Goods Exports

It is against this background that the Mathrani committee's approach requires to be seen. It approached the question on the assumption that there will be quick diversification of export trade, that is, India will export before long adequate quantities of engineering goods and capital equipment to new markets in Africa, south east Asia, and Latin America. The group assumed, therefore, that the creation of an institutional framework obtaining in foreign countries like the Export-Import Bank, Washington, in the field of export financing is a vital necessity in the next few years so that Indian exporters do not stand unfavourably with their counterparts in western countries. The study group recommended the setting up of a new institution to be known as the Export Credit and Guarantee Corporation. The institution will co-ordinate and supplement the activities of existing institutions. To provide some basis for such a corporation, to start with, the E.R.I.C. will be amalgamated with the new body. It will have an authorised capital of Rs. 10 crores, of which Rs. 5 crores is to be issued and paid-up. The Corporation will be wholly owned by the Government.



While considering the existing credit facilities as adequate and the cost reasonable, the second study group felt that it would be desirable to give preshipment and postshipment credit to banks at 1½ percent below Bank rate—now it is provided at Bank rate—so that Indian exporters will be able to offer better competition abroad. It has also been suggested that banks should be enabled to extend to exporters the difference between the internal and external prices of credit documents through the provision of risk guarantee. Now the difference is given by banks as a personal advance to the exporter on his own guarantee. The suggested guarantee might cover up to 25 percent of the f.o.b. value of goods exported. Such a guarantee will be continuously in operation. It will be somewhat on the lines of the guarantee scheme evolved for small industries by the Reserve Bank.

Stabilisation Fund

The second study group suggested that the new institution set up would give suitable performance guarantees in connection with the problem of medium and long-term credit. The group is in favour of the import-export stabilisation fund suggested by the Mudaliar Committee. Probably, the object is that the fund will be administered by the new body. It is relevant to note that the State Bank has already moved in the field. It is now providing bank guarantee for a loan in foreign currency to a company for importing raw materials on the understanding that repayment will be made out of the exports of finished goods. The other banks have shown anxiety to conclude their own arrangements with the correspondents abroad.

The broad pattern of credit facilities, as it is being evolved, is quite satisfactory and there seems to be no need to disturb the institutional arrangements evolved over a period of time. It seems advisable to watch the pattern of export trade before devising institutional arrangements without such diversification. It is relevant to remember once again, in spite of the risk of repetition, that export performance is stagnating not for want of credit but because of other factors like uneconomic production, poor quality, an even-widening and sheltered domestic market and the inability of production—agricultural and industrial—to expand at a faster rate than domestic needs. It is these factors which require attention and the provision of finance can await the developments in export field.

THE CALCUTTA MONEY MARKET

MODERATE FALL IN ADVANCES

Wednesday, 24th July.

THERE has been a moderate decrease in the general level of advances in the Calcutta money market during the past week. This has arisen from the slight decrease in the accommodation given to jute and sugar mills, and to the foodgrains and seeds trade. There has been a slight increase in the advances to the iron, steel and engineering industries. In the interbank market, conditions have hardened and the call rate quotes 3½ percent.

The exchange market has been active. The supply of tea bills is good and that of gunny bills moderate. The demand for remittance has been moderate. Sterling, after fluctuating within narrow limits, shows nominal gains against the Canadian dollar, deutschemark and the Dutch guilder.

SILVER WAS STEADY IN CALCUTTA during the past week. The price closed at Rs. 274.50 for ready delivery. There was no business in forward. The price was quoted at 111½d in London and at 129 cents in New York. Gold was not transacted.

DURING THE WEEK ENDED 19TH JULY, Government of India Treasury bills for Rs. 172,82,75,000 were sold in favour of the Reserve Bank.

IT IS STATED THAT 91-DAY Intermediate Treasury bills sold from 17th July to 20th July, amounted to Rs. 4.01 crores.

DECLINES OF RS. 31.19 CRORES TO Rs. 2,237.58 crores in active notes and of Rs. 27.31 crores to Rs. 2,256.51 crores in the total note issue were notable features of the return of the Reserve Bank of India for the week ended 19th July, 1963. The currency contraction was covered by reducing rupee securities of the paper currency reserve by Rs. 29.36 crores to Rs. 1,926.31 crores. This was done by transferring securities to the Banking Department in which investments rose by Rs. 42.50 crores to Rs. 318.17 crores. Deposits of the Government of India fell by Rs. 35.99 crores to Rs 54.95 crores, while those of State Governments rose by Rs. 10.13 crores to Rs. 15.82 crores. Balances of scheduled banks increased by Rs. 19.79 crores to Rs. 109.51 crores. Their loans from the Reserve Bank declined from Rs. 1.77 crores to Rs. 47.10 lakhs of which advances against usance bills were Rs. 9 lakhs (Rs. 94 lakhs). Ways and means advances stood at Rs. 23.67 crores. against Rs. 54.87 crores.

THE RETURN OF THE STATE BANK OF India for the week ended 12th July, 1963, shows a rise of Rs. 1.12 crores to Rs. 574.56 crores in total deposit. Investments in Government securities are up by Rs. 19.17 crores to Rs. 281.91 crores, while other authorised investments remain unchanged at Rs. 9.35 crores. Advances, including loans, cash credits, overdrafts and bills discounted and purchased have fallen by Rs. 9.75 crores to Rs. 273.43 crores. Cash and balances are, in consequence, shown at Rs. 20.32 crores or Rs. 30 lakhs less.

THE STATEMENT OF THE POSITION OF scheduled banks for the week ended 12th July, 1963, shows Demand and Time liabilities at Rs. 1,051.52 crores (Rs 27.51 crores on account of borrowings from banks) and Rs. 1,314.97 crores (Rs. 21.35 crores), compared with Rs. 1,054.81 crores (Rs. 28.42 crores) and Rs 1,307.69 crores (Rs. 22.98 crores), respectively, in the previous week. Cash and balances with the Reserve Bank have decreased by Rs 3.70 crores and Rs. 10.50 crores to Rs 53.46 crores and Rs. 87.20 crores, respectively. There is a rise of Rs. 29 99 crores to Rs. 691.03 crores in investments. Advances and bills discounted at Rs. 1,522.74 crores show a drop of Rs. 13.54 crores. The ratios to total liabilities of cash and balances, and of advances and discounts are, in consequence, shown at 5.9 percent and 64.3 percent, against 6.6 percent and 66.2 percent.

THE FOLLOWING IS A STATEMENT OF the cash balances of the Central Government on the last day of March 1963:

	Rs.
(1) At the Reserve Bank of India (A)	1,09,95,61,000
(2) At Treasuries in India	(–)1,11,12,000
(3) In England (sterling converted at 18d the rupee)	52,88,000
Total	1,09,37,37,000

(A) Represents net of cash in treasuries and remittances in transit.

STATE WAREHOUSING OF FARM PRODUCE IN INDIA

By V. N. Hoon

IT is true that, even with several storage agencies functioning, there is still a shortage of good storage accommodation in the country*. There are the Government of India godowns—bins, silos and huge warehouses—for storing Government-procured and Government-imported foodgrains. There are the State Governments' godowns for storing their locally procured foodgrains or those allotted by the Central Government. Then there are the warehouses of the Central and the State Warehousing Corporations and the godowns of the co-operative societies. In the private sector, there are the godowns of the local dealers, who have been playing a vital, although not very healthy part in the country's rural and *mandi* economy. With so many agencies at work, there is bound to be wasteful overlapping if sufficient care is not taken clearly to define the functions and the geographical and economic areas of working of each agency and their dovetailing into one another.

The Central and the State Governments' godowns are meant to store only the Governments' foodgrains and no other agricultural produce. At one time it was envisaged that the warehousing corporations will take over this function and run the Government godowns on a strictly commercial basis. But the Government was unwilling to agree for a number of reasons; and in view of the huge quantities of foodgrains imported in recent years under P.L. 480 and the heavy programme of construction of large silos, bins, etcetera, that the Government has already undertaken, the likelihood of the Government agreeing to making over this tremendous responsibility to the corporations has receded into the background.

Responsibility of Government

The Government has not only to undertake heavy storage, which involves a large-scale turnover, but also a large-scale programme of movement of foodgrains from one part of the country to another. However, the Government has been making over, where possible, a part —although a very small part—of its foodgrains storage to the Central and the State warehousing corporations. But this is more in the way of a gesture of goodwill and of helping the corporations to tide over their teething troubles, rather than as a matter of sustained and expanding policy. As far as the co-operative sector is concerned, its godowns, which are necessarily small-sized, cater to the members of the co-operative societies, who are mostly producers. There need be no difficulty in demarcating the co-operatives' area of storage work. Their godowns would spread in the villages, with perhaps apex godowns at the bigger villages or the *tehsil* level, where there is no godown of the warehousing corporation, which could be advantageously used.

The remaining area in the country, which would still be vast, could be taken up by the warehousing corporations. Unfortunately, there has been a tendency to wrangle over the centres not only between the warehousing corporations and the co-operatives, but also between the Central and the State Warehousing Corporations. That leads to confusion, unhealthy competition and carping criticism. There is no reason why there could not be an integrated development.

The Central Corporation has an all-India basis. The idea was that it would set up or construct large warehouses with capacity of 10,000 tons or over each in the main distributing centres and the biggest *mandis*. The capacity of the State corporations' godowns was visualised at 5,000 to 10,000 tons each, and their field would be other fair-sized *mandis* in semi-urban areas and the district headquarters in their respective States. The Central Corporation, however, got into serious difficulties. It could not get suitable godowns of the requisite size nor could it quickly construct its own godowns.

The novelty of the scheme launched on almost uncharted seas itself excercised a check on too extravagant a start. Its capacity target was brought down to 5,000 tons a godown to start with; but in actual practice, even this was not found possible (except at half a dozen places) and it had to go down to 1,500 tons and even below. Similar was the fate with the 5,000 to 10,000 tons target of the State Corporations. That went down to an average of below 500 tons. The result was that, for reasons beyond the Corporation's control, the scheme made a slow headway and the very lowering of godown capacity gave rise to a spirit of competition for sites, centres and *mandies*; and where a State Corporation grabbed a centre (which the Central Corporation thought was suitable for itself), the Central Corporation could hardly do anything and check the State Corporation.

Management of State Bodies

The State Corporations, with their own boards of directors, are separate corporate bodies; and even though half of the directors are nominated by the Central Corporation (and half by the State Government), the general superintendence and management of the State Corporations are their own affair. They take their own decisions, which sometimes do not integrate with the policy of the Central Corporation.

For example, in the selection of centres, in the fixation of storage rates, etcetera. One cannot help thinking that, instead of making them independent units like this, with a rather remote and indirect control by the Central Corporation, if the State corporations had been established as branches of the former, with a centralised control, matters would probably have worked out more smoothly. Administrative, financial and technical control from the Centre would have been more economical and the incidence of overheads would have been very much less. The economics of running the warehouses would have been worked out on a uniform basis and development of warehousing in the country would have been completely integrated. Although very desirable, perhaps it is too late to make this change now, as happens in all such cases where vested interests get entrenched.

It would obviously mean another change in the warehousing corporations' law. If such a change cannot be made, surely it cannot be beyond human ingenuity to devise rational methods of avoiding mutual bickering and overlapping by demarcation of the fields of activity. However severely limited by the slow processes of setting up the godowns and of acquisition of sites, there is more than enough scope for the Central and the State Corporations and the co-operatives for creating suitable storage capacity in the country.

Demarcating Functions

The rational future trend would seem to be that with the existing set-up, the Central Corporation may devote itself more and more to specialised storage, leaving it to the State Corporations to undertake all other storage that is not highly specialised. That would also avoid any unhealthy trends of competition. Specialised storage for the Central Corporation would include cold storage, dehumidification in godowns, heating arrangements where necessary, etcetera, and the commodities for specialised storage would be like potatoes, turmeric, groundnuts, oilseeds, oils, cotton and cottonseeds, ginger, *gur*, jaggery and sugar, mustard, fish, fruits, eggs, fowl and fresh vegetables, milk products, coffee, tea and tobacco. Ordinary storage for the State corporations could be of all foodgrains, pulses, grams, chillies, coriander, linseed, pepper and cardamom and also fertilisers, agricultural implements, etcetera.

Cold storage and other specialised storage require highly technical knowledge, training and experience not only in the handling of commodities but also in the constructional designs of the warehouses. They would also require very much larger financial outlay, and could, therefore, be more appropriately undertaken by the Central Corporation with its greater resources. It would be uneconomic for a co-operative society or a State Corporation, with their limited resources, to build even small units for specialised storage. Along with specialised storage, the Central Corporation would continue to act as the mentor to the State corporations in the technical and financial sides of storage and in constructional designing. The Central Corporation has rightly in the recent past made over, after investigation, those centres to the State Corporations which did not have very large business potential, but were suitable for the State Corporations' economy. It would be for the State corporations to reciprocate both concerning centres for specialised storage and large business potential, and make these over to the Central Corporation.

A rational functional division between the storage agencies could, therefore, be as follows: (1) Government godowns for procured and imported foodgrains; (2) Central warehouses for specialised storage at the main producing, distributing and exporting centres; (3) State warehouses for storage of foodgrains and other commodities not requiring specialised treatment at the bigger *mandis* and (4) co-operative societies for storage in the villages and the rural areas.

Nature of Storage

After all, there is hardly a real, overall surplus of foodgrains in the country. So whatever comes into the warehouses, may be termed as either surplus for a relatively short period or as transit storage. In the surplus producing areas, these short periods would be lengthened and may extend from three to six months in the case of foodgrains, and for longer peiods in the case of cash crops. Therefore, the economy of a warehouse has to be built on a relatively short-term storage.

Also, there is the Government's policy of procurement of foodgrains and price fixing, which would appear to militate against their storage in the warehouses. If there is large-scale procurement, the procured grain would go into the Government's godowns, and there would hardly be any surplus left for warehousing by the producers and others. There would be no incentive left to wait for an interplay of market conditions of demand and supply for a better price when prices are fixed.

There is also the fact that with the imposition of ceilings on the holdings of agricultural land, large-scale cultivation is for the present dying out and large surpluses are not produced. The small area holder could hardly produce that quantum of surplus. Co-operative farming may be the answer; but so long as servicing co-operatives or servicing by Government for co-operative farming does not take place, the disadvantage of small-scale cultivation will continue to affect the economy of warehousing.

Limited Activity

Warehousing of agricultural produce by these corporations is an innovation that must have a far-reaching effect on the rural economy of the country. But its expansion and usefulness will be in proportion to the insistence on scientific methods of storage in properly-built, modern godowns and to the ready help rendered to the producer or the cultivator to induce him to bring his produce to the warehouse against which he may get a ready advance, so that he may bide his time for a favourable market and get the best price for his labours. Meanwhile, his commodity would be in safe and experienced hands, secure from theft, pilfering and deterioration.

So far, except storage, no other functions described under the Act have been undertaken by the corporations; for instance, facilities for transport of produce to and from the warehouse. Bullock-cart economy may seem to be cheap, but it is cumbersome, wasteful of time and energy and not conducive to bringing large custom to the warehouses. If these other functions are taken up, the benefits of warehousing will grow rapidly.

(*Concluded*)

THE ORIENTAL FIRE & GENERAL INSURANCE CO., LTD.

THE CHAIRMAN, MR. B. K. KAUL'S ANNUAL REVIEW

Speech delivered by the Chairman, Mr. B. K. Kaul, I.C.S., at the Fifteenth Annual General Meeting of the Shareholders on Wednesday, the 17th July, 1963.

The Report, Accounts and Balance Sheet for the year ended 31st December 1962 are already in your hands and, with your approval, I propose to take them as read. Before we proceed to consider these for adoption, I would like to review some of the points which had a bearing on your Company's working during the year.

The year 1962 witnessed an unprovoked and treacherous attack on India's northern borders by the forces of the Chinese People's Republic. The Government of India declared a state of emergency in the country and initiated steps to prepare the nation for the defence of the country and for the shift in the country's economy to cater to the defence needs on a priority basis. On the insurance front, the emergency resulted in the Parliament passing the Emergency Risks (Goods) Insurance Act, 1962, and the Emergency Risks (Factories) Insurance Act, 1962.. On 26th December 1962, your Company was appointed by Government as its sole Agent in connection with the Schemes which were framed under these Acts and which came into force from 1st January 1963. As a result, the Company had to make arrangements throughout India at an extremely short notice for accepting applications and dealing with queries from the public in connection with the Emergency Risks Insurance Schemes. A very considerable amount of detailed work had to be done within a few days in setting up procedures and making arrangements at as many as 163 centres all over India and in preparing material for the purpose of explaining the Schemes to the public and answering their queries. I am glad to report that with the unstinted efforts put in by the officers and the staff of the Company, we were able to complete the necessary arrangements in time. During the first two quarters of 1963, the Company received over 2,50,000 applications under these Schemes and dealt with innumerable inquiries from the public and with voluminous correspondence relating to the Schemes.

I may mention here that this work is being done by the Company entirely on a non-profit basis. I am sure that Members will derive a feeling of satisfaction from our having been able to contribute in this manner to the defence effort and the requirements of the Emergency.

On the international scene, the recent years have witnessed the granting of independence to some of the territories in which your Company operates. Tanganyika and Uganda became independent on 6th December 1961 and 9th October 1962 respectively. As you will be aware, Kenya will be attaining independence in December next. We join in welcoming these countries to the comity of free nations.

I am also glad to note that the agreement to launch the Federation of Malaysia covering Singapore, Malaya, North Borneo and Sarawak has been reached very recently. I have every hope that the Federation will bring increased strength and prosperity to the people of these territories and in turn will provide further scope for insurance.

Working after Amalgamation

Coming now more particularly to ourselves, the year 1962 may be termed our real first full year of working as an integrated entity after the passing of the Bombay High Court Orders in December 1961 regarding amalgamation of the National Fire & General Insurance Co. Ltd., and the Asiatic Government Security Fire & General Assurance Co. Ltd., with your Company.

The process of amalgamation was completed very smoothly both in India and abroad. We are functioning in India through a set up of five Regional Offices at Bombay, Calcutta, Delhi, Kanpur and Madras which control, in turn, Divisional, Branch, Sub-branch and Inspectorate offices at a total of 85 centres in the country. The working of the Regional Offices is co-ordinated by the Central Office functioning at Bombay.

The foreign operations of the "Oriental Fire" before amalgamation were of a limited character and these have widened considerably with the accession to the now combined organisation, of the foreign operational centres of the "National Fire" and the "Asiatic". Our activity abroad is not yet very large and we are exploring the possibilities of expansion in this field. As, however, there are considerable changes taking place in the political as well as economic character of many of the foreign territories where such possibilities exist, we are progressing in the matter of expansion with caution. The present can therefore be considered only a formative stage for our foreign organisation.

Turning now to the results of the year's working, you will be gratified to note the increase in the balance for appropriation from Rs. 20.50 lacs for 1961 to Rs. 44.69 lacs for 1962.

The net total premium of all departments increased from Rs. 434.30 lacs in 1961 to Rs. 492.29 lacs in 1962, showing a rise of about Rs. 58 lacs, i.e., 13.35% over the previous year's figure. This increase was made up of Rs. 46.5 lacs from business effected in India and Rs. 11.5 lacs from business outside India. Considering the market conditions in India and abroad, this rise may be considered satisfactory.

Claims-Premiums Ratio

The ratio of net claims to net premiums in 1962 was 34.83% for the Fire Department as compared to 28.97% for the year 1961. The increase in the Fire claims ratio was mainly due to the adverse experience abroad arising out of some large fires. On the Miscellaneous side, the trend of rise in Motor accidents and their costs contributed to the increase in claims ratio from 48.56% in 1961 to 57.79% in 1962. Despite these increases, the claims ratios for both these departments can be considered satisfactory. On the Marine side, the general market experience continued to be unsatisfactory particularly in the Cargo section. The claims ratio in our case, however, has shown a small decrease from 96.45% in 1961 to 93.26% in 1962.

The overall ratio of commission and expenses of management to net premiums has been maintained around 32.5%, which is very satisfactory.

The Company is liable to payment of Super Profits Tax in respect of this year's profit and the estimated tax liability has been provided in the Accounts.

Our investments as at 31st December 1962 aggregated to about Rs. 399 lacs and the total depreciation in these investments was of the order of Rs. 6.65 lacs and is fully covered by the Investment Reserve. Considering that the total investments of the "Oriental Fire", "National Fire" and "Asiatic" as on 31st December 1960 were only about Rs. 175 lacs and that we invested Rs. 224 lacs in the course of 1961 and 1962, it will be seen that the depreciation of Rs. 6.65 lacs is very nominal in the light of the great fall which took place in prices of shares and securities during the last few months of 1962. The policy of the Company of exercising the utmost care and prudence in making investments during the period when the prices of most Ordinary Shares continued to be unrealistically high, has now paid us dividends in keeping down the depreciation to a very nominal value even under the present difficult circumstances. Whilst as a result of our policy, we did not make large book appreciations in our investments, we have neither been required to provide for large amounts by way of depreciation.

Better Financial Strength

As in the past year, your Directors have recommended a dividend of 6% (subject to deduction of tax at prescribed rates) on the paid-up value of the shares. In doing so, they have kept in mind the desirability of strengthening the reserves of the Company. Against the paid-up capital of Rs. 110 lacs, we now have reserves totalling Rs. 46.68 lacs (excluding investment reserve and dividend reserve). We have also additional reserves for unexpired risks of Rs. 3 lacs each in the Fire and Miscellaneous departments in excess of the reserves maintained on the required basis of 50% of the premium income for the year. The financial strength of the Company has, I am happy to say, increased considerably after amalgamation.

Coming to staff matters, your Company signed a new agreement on 1st June 1963 with the Staff Union. The agreement provides, amongst other benefits, for merger of Dearness allowance by an amount ranging Rs. 47 to Rs. 55 per month in the basic salary of the employee, and of the linking of the Dearness Allowance scale with the All India Working Class Consumers' Price Index (Base 1949=100). This agreement is the first of its kind in the General Insurance Industry and marks a departure from the old practice of having an arbitrary system of Dearness Allowance. The agreement applies retrospectively from 1st July 1962 and the relevant increase in the Management Expenses for the year 1962 has been fully provided for in the accounts.

In conclusion, I take this opportunity to express my thanks to our clients and well-wishers both in India and abroad who have continued to extend us their support. I also thank the officers, staff and development officials of the Company for their loyalty and good work.

FOREIGN EXCHANGE AND PARRYS

FOREIGN EXCHANGE*—the most important factor in the country's economy today—is also the most important factor in the E.I.D.—Parry Group's plans for brighter and better tomorrows.

The production of fertilisers provides a good example of the E.I.D.—Parry Group's contribution towards increased food production and towards conserving foreign exchange by reducing the volume of fertiliser imports. In 1962/63 the Government have set aside no less than Rs. 40 crores for the import of fertilisers to meet the deficiency between indigenous production and total demand. During the same period the E.I.D.—Parry Group will produce and distribute about 200,000 tons of fertilisers, which figure will be further increased by expansion programmes during the Third Plan Period.

Other manufactures of this Group of nine companies of substance include sugar, confectionery, sanitaryware, light railway equipment, acids, chemicals, carbonic acid gas, industrial and potable alcohol.

THE E.I.D.—PARRY GROUP, MADRAS

New Delhi

WIDENING SCOPE FOR FOREIGN CONSULTANCY FIRMS

(FROM OUR NEW DELHI CORRESPONDENT)

A MEETING under the chairmanship of Professor M. S. Thacker, will shortly be convened in New Delhi to review the principles which have been adopted for allowing the establishment in India of consultancy, design and related services by foreign firms in the light of experience gained, and with reference, in particular, to the following:

(1) What are the fields in which scope exists for setting up a technical consultancy organisation?

(2) What should be the scope of activities of the organisation, namely, whether it should be limited to technical consultancy and design only, or whether it should extend to undertaking turn-key jobs also?

(3) What are the safeguards to be observed to see to it that foreign exchange is not spent abroad on jobs which can be undertaken in India by Indian organisations?

In 1961 a number of applications were received from reputed foreign firms for setting up technical consultancy organisations in India in various engineering fields. In a series of discussions, in which the representatives of the Economic Ministries participated, the basic principles to be taken into account while considering the grant of approval to such firms were evolved. These principles were also given wide publicity by the Indian Investment Centre.

On this basis, nine cases have so far been approved. It is learnt that with the exception of Simon-Carves and Hydrotherm, in all the cases, the approval is limited to the firm undertaking consultancy and design services only. Some of the firms which have already been licensed, as well as others whose applications are pending, have represented that unless they are permitted to undertake turn-key jobs, their ventures, besides being uneconomic, will not permit them to offer the best service to their customers. The proposed review has, therefore, become necessary.

CENTRAL CABINET

Some Readjustments

Readjustments in the Central Council of Ministers, following the resignations of three Cabinet Ministers, were announced last week. Mr. K. D. Malaviya and Hafiz Mohammed Ibrahim, had already resigned. The Minister of Commerce and Industry, Mr. K. C. Reddy, resigned last week on "grounds of health."

The Prime Minister has taken no replacements for these vacancies in the Cabinet. For the present at least, the co-ordinating portfolio of Commerce and Industry has been abolished, and the Ministry has been bifurcated into the Ministries of International Trade and Industries which continue to remain the charge of Messrs Manubhai Shah and Nityanand Kanungo, respectively, both of whom hold the status of Ministers of State. Mr. Kanungo, in addition to Industries, will hold charge of the Department of Company Law Administration.

The Ministry of Irrigation and Power was entrusted to a newcomer, Dr. K. L. Rao, who has been appointed a Minister of State. Mr. O. V. Alagesan, who has been a Minister of State in the Ministry of Irrigation and Power, has been transferred in the same capacity to the Ministry of Mines and Fuel.

Vital Ministries dealing with subjects for which constitutionally the Centre is responsible, such as those of Commerce and Industry and Mines and Fuel, will no longer be represented in the Central Cabinet, while those dealing with subjects which have been transferred to the States will continue to enjoy membership. The continuous chopping and changing of the Ministry of Industry should be viewed with some concern. The Presidential order allocating the subjects to the various Ministries has entrusted the jute and textile industries to the Ministry of International Trade on the plea that they are export-orientated. Under the plan to diversify exports, light industries have also become export-orientated industries, so by the same logic they should have been allocated to the same Ministry. The sugar industry too should have gone to the Ministry of International Trade, the commodity having entered the export market already. It will thus be seen that no attempt has been made to streamline and rationalise the administration.

The Central agricultural teams, which recently completed a round of visits to the States, have, it is understood, reported on the lack of co-ordination among the various agencies dealing with farm production. The teams, it is learnt, have suggested the appointment of a co-ordinating committee representing the Ministries of Agriculture, Community Development and Irrigation, etcetera. As against this a co-ordinating Ministry like Commerce and Industry which was created because the old system of having separate Ministries for Commerce and Industry had failed, has been abolished.

The chaos this rearrangement will create can be visualised by the fact that heavy industries including fertilisers are under one Minister, industrial policy and licensing under another, the Development Wing under a third, import policy under a fourth and capital issues control under a fifth. An entrepreneur applying for a licence to set up, say, a seamless pipes factory will apply to the Ministry of Heavy Industries. This application will be forwarded to the Development Wing, which is under the Ministry of Defence and Economic Co-ordination. In due course, it will be forwarded to the Ministry of Industries for the grant of an industrial licence. Thereafter, it will be dealt with by the Ministry of Finance for the grant of foreign exchange to import capital goods. The Company Law Department in between may have to be consulted. Thereafter, it will be left to the tender mercies of the Ministry of Commerce now called the Ministry of International Trade for the grant of import licences not only of capital goods, but also for raw material not available in India.

The Planning Commission and the Federation of Indian Chambers of Commerce and Industry have been urging that the administration should be streamlined in order to evolve a single contact point machinery. But what has been done is to enlarge the scope of procedural delays. It is, however, learnt that some Cabinet Ministers and, in particular, the Minister of Heavy Industries, Mr. C. Subramaniam, are not satisfied with these arrangements. Two suggestions have been made. Firstly, industrial policy and licensing should be placed under the Ministry of Defence and Economic Co-ordination, and secondly, in determining the requirements of maintenance imports, the Ministries of Heavy Industries, Industries and Steel should have a final say, and legitimate complaints of any unit would be referred to the Ministry of Economic Co-ordination for decision. The question of final allocation of subjects to be dealt with by three Ministries, namely, Heavy Industries, Industries and Commerce, or International Trade, may need revision.

RAILWAYS

More Goods Carried

Some idea of the non-stop rise in the goods traffic carried by the Indian railways could be had from the fact that in the first five year plan period, the total originating tons of goods traffic carried by the railways rose from 91 million tons in 1950-51 to 114 million tons in 1955-56. The latter figure of traffic in 1955-56 was thus greater than the maximum peak traffic of 97 million tons of overall un-partitioned railways during the second World War. By 1960-61, the end of the second five year plan, the goods traffic had risen to 154 million tons.

The target originally planned for the third five year plan was 245 million tons, revised subsequently to 250 million tons. Present anticipations are that this may go up to 260 millions tons. In 1961-62, the first year of the third five year plan, the volume of traffic handled by the railways rose to 158 million tons. In 1962-63, the second year of the third five year plan, the volume of traffic increased to 175 million tons.

The table below summarises the figures:

Originating tons of goods traffic (in million tons)

Year		
Peak goods traffic carried by the railways in undivided India	97	
1950-51	91	
1955-56	114	Average rate of growth during the first five year plan, 4.6 million tons a year.
1960-61	154	Average rate of growth during second five year plan, 8.0 million tons a year.
1961-62	158	Increase in the first year of the third five year plan, 4 million tons.
1962-63	175	Increase in the second year of third five year plan, 17 million tons.

BOKARO

Raw Materials Survey

Two representatives of the U.S. Agency for International Development have arrived in New Delhi to undertake a survey of the raw material potential required for the proposed Bokaro steel mill. This is in modification of an earlier plan to send out a whole team for this appraisal.

BRAND NAMES

Adopting Foreign Labels

The question of foreign brand names is being reappraised. It is felt that the policy so far followed has been too rigid, and needs revision. A foreign brand name may not be permitted if it is considered detrimental to an old and established Indian industry. It should, however, be allowed if it ensures larger consumer acceptance.

The Government is committed to discourage monopolies. Competition improves the efficiency of an undertaking and the quality of its goods. The case of the lamp industry illustrates the point. What are called G.L.S. lamps have been in short supply, and even the essential requirements have not been adequately met. To introduce competition and increase the capacity, the Government recently approved the scheme of the Mysore Lamp Company to increase its output by installing additional equipment in collaboration with International General Electric. The foreign collaborator, however, wanted to manufacture lamps under its own brand name. To this also, the Government has agreed.

RAILWAYS

More Goods Carried

Some idea of the non-stop rise in the goods traffic carried by the Indian railways could be had from the fact that in the first five year plan period, the total originating tons of goods traffic carried by the railways rose from 91 million tons in 1950-51 to 114 million tons in 1955-56. The latter figure of traffic in 1955-56 was thus greater than the maximum peak traffic of 97 million tons of overall un-partitioned railways during the second World War. By 1960-61, the end of the second five year plan, the goods traffic had risen to 154 million tons.

The target originally planned for the third five year plan was 245 million tons, revised subsequently to 250 million tons. Present anticipations are that this may go up to 260 millions tons. In 1961-62, the first year of the third five year plan, the volume of traffic handled by the railways rose to 158 million tons. In 1962-63, the second year of the third five year plan, the volume of traffic increased to 175 million tons.

The table below summarises the figures:

Originating tons of goods traffic (in million tons)

Year		
Peak goods traffic carried by the railways in undivided India	97	
1950-51	91	
1955-56	114	Average rate of growth during the first five year plan, 4.6 million tons a year.
1960-61	154	Average rate of growth during second five year plan, 8.0 million tons a year.
1961-62	158	Increase in the first year of the third five year plan, 4 million tons.
1962-63	175	Increase in the second year of third five year plan, 17 million tons.

By lifting 17 million tons of traffic more than in the previous year, the railways have greatly surpassed the previous record of the 10 million-ton increase in any one year attained at any time during the first two plan periods or at any other time.

A feature of special importance in the overall improvement in railway operation is that coal movement has contributed 46 percent and the general goods traffic 35 percent to the increased tonnage lifted in 1962-63. This achievement in the transport of goods during the year is additional to the emergency movements of defence material and personnel, which the railways effected, at a very short notice, with practically no interruption to, or curtailment of the normal passenger service or the flow of civil supplies. During the peak months of the emergency, the Northeast Frontier Railway transported 65 percent more traffic than in normal times, and the wagon ferry across the Ganga at Khejuriaghat serving the B.G. route to Siliguri trebled its throughput.

The daily average of originating loading excluding repacking, transhipment, etcetera, in terms of four-wheeler wagons on broad gauge as well as metre gauge during the first two years of the third five year plan is given below:

Average daily loading	1961-62	1962-63	Percentage increase
Broad gauge (all commodities including coal)	15,454	17,143	10.9
Coal	9,957	6,624	11.2
Metre gauge	6,547	6,740	2.9

Although the average loading of coal during 1962-63 amounted to 6,624 wagons a day, the actual load-

ing during March 1963 had come up to 7,254 wagons a day. In this connection, the following extract from the Planning Commission's half-yearly review of the third five year plan from October 1962 to March 1963, may be of interest: "There has been a significant improvement in the rail transport position generally, and coal movements particularly, during the period under review The average daily loading on the railways has shown a marked increase. The average daily loading of coal increased from 6,723 wagons in October 1962 to 7,254 wagons in March 1963. The railways are currently meeting fully the demands for coal loadings from the various coalfields."

To handle effectively and economically the fast increasing freight and passenger traffic, it became necessary to modernise the type of traction and rolling stock. This involved a switchover in certain selected sections with heavy density, from steam to diesel and electric traction. Programmes relating to electrification have made good progress in the first two years of the third plan. Electrification has been completed on 524 route miles, bringing the total route mileage electrified on the railways to 758. The fleet of diesel locomotives has grown from 100 in 1959 to 352 at present. In 1962-63, over 23 percent of the total net ton miles of rail traffic carried was hauled by diesel and electric locomotives.

Effective utilisation of its assets in track and rolling stock has been the keynote of railway planning and progress in the successive five year plans. That the large investments channelled into expansion of the railway system have been put to use efficiently is borne out by the fact that while the net ton miles of traffic carried by the railways more than doubled itself in the last ten years or so, this has been achieved with an increase in the number of wagons and locomotives of barely 55 percent and 47 percent, respectively, and with an addition of only 11 percent in the total mileage of tracks. Taking all investments together, equated at 1938-39 prices, the increase in the total capital has been under 40 percent in the same period.

Before the beginning of the first five year plan, the railways were largely dependent on imports for all their rolling stock and practically all their other equipment. Since then, considerable progress has been made in both establishing and promoting the indigenous manufacture of railway stores, plant and equipment. For quite some time now, the railways have either themselves manufactured or obtained their entire requirement of steam locomotives, wagons, passenger coaches, mechanical signalling and train lighting equipment within the country. In certain categories of components and equipment such as steel castings, medium and heavy forgings, wagon couplers, roller bearings and electrical signalling gear, the indigenous capacity generated tends to fall short of the requirements and the railways' constant endeavour is to reduce, if not eliminate, the gap by the end of the third five year plan.

Wagon production has risen from 3,700 units a year in 1950-51 to 12,000 units in 1960-61. During 1961-62, the first year of the third five year plan, the total number of wagons manufactured was a little over 19,000. During 1962-63, the actual production amounted to 25,869 wagons in terms of four-wheelers.

Within five years of its construction in 1950, the Chittaranjan Locomotive Works realised its output target of steam locomotives, which has now been stabilised at 168 a year. The manufacture of electric locomotives commenced at these works last year. Twenty direct current locomotives have already been built, and work is at present in hand on three alternate current locomotives. By 1965-66, it is hoped that 138 alternate current locomotives will be turned out from Chittaranjan locomotive works. A steel foundry with a capacity of 10,000 tons of steel castings a year is also being established at Chittaranjan, and production is scheduled to start next year.

At the integral coach factory in Perambur, which was established in 1955, the target of production of 350 units a year was reached in 1959. By the introduction of double-shift working, production has since been raised to 600 coaches a year from 1962. This factory has since taken up the manufacture of, besides the conventional coaches, electrical multiple unit stock for use in the suburban services on broad gauge and metre gauge.

In addition to the integral coach factory, the Hindustan Aircraft Ltd, Bangalore, and a firm in the private sector in Calcutta (Jessop) are between them producing 300 to 350 passenger coaches a year. For intercity passenger services in non-electrified areas, where urbanisation is becoming increasingly manifest, diesel rail cars are being designed for manufacture at Hindustan Aircraft Ltd.

A new factory is being set up in Varanasi for manufacturing diesel locomotives. The work is making good progress and the factory, it is expected, will go into production in 1964 and reach its desired level of 150 units a year in 1967-68.

ACCOPROOF

CEMENT WATERPROOFING ADDITIVE

—a top-quality **ACC** product

Protect your walls with a rendering of cement mortar admixed with a small quantity of **ACCOPROOF.** This will safeguard your walls from damp and will also preclude the development of efflorescence on their surface.

ACCOPROOF also stops leaks and seepage. It is excellent for water storage-tanks, reservoirs, conduits, sewers, roofs, basements—in fact it is essential wherever waterproofing is desired.

The ACC's expert engineers will be happy to give free technical advice on all waterproofing problems, big or small.

ACCOPROOF is manufactured by the **ACC** and is available from

MACHINE TOOLS

Productivity in Russia

One of the latest reports of the National Productivity Council on on the machine building industry in Russia and Czechoslovakia is a useful document. Some of the recommendations made by the team are not endorsed by the workers' representatives. The recommendations relate to the linking of wages to production and productivity, suggest that the workers should not get automatic annual increments and that trade unions should not be allowed to fall into the hands of irresponsible leadership.

As for linking wages to productivity, the workers' representatives in a minute of dissent state as follows: "In the conditions obtaining in India this recommendation is unacceptable to the trade union movement. In Russia and Czechoslovakia, the socialist system of production ensures that the product will be utilised for the common good of all, and wages are only one part of return which workers get. Constant reduction in prices, elaborate and cheap housing facilities, medical aid, educational facilities, recreational and holiday arrangements, provisions for cultural activities, etcetera, all contribute to the well-being of the workers and ensure a real wage which increases much more rapidly than nominal wages. In India, at present, all these facilities are either totally or practically non-existent. Available data show that in the past years, productivity has outstripped real wages by as much as double.

"Apart from this in the prevalent conditions in industry in which there is no standardisation of jobs, or wages, where patterns, tools, machines and materials are also not standardised and where piece-rates are often changed arbitrarily by the employer, the real meaning of linking wages to productivity will be only to increase the exploitation of the workers. There is no minimum fall-back wage in India, no unemployment insurance, no old age pension, and retrenchment benefits are meagre. This contrasts sharply with conditions in Russia and Czechoslovakia.

"In view of this we feel that this recommendation is not warranted by the prevailing conditions in India. All trade union organisations are opposed to it, and, in fact, if an attempt is made to enforce it, the workers will be forced to resist it."

As against this, the majority have cited the observations of the Russian team, which visited India in 1961. The team had suggested that wages should be linked to productivity. The Indian productivity team says: "This is in the interest of the workers themselves in as much as they can earn money according to their skill and output. This principle has been established all over the world, specially in Russia and Czechoslovakia where workers earn more money by producing more norms which are periodically revised with the change of techniques. It is also in the national interest that wages are linked with productivity in order to curb inflation. In India it is found that wage increase without linking it with production, gives rise to increase in costs resulting in inflation of prices. With the increase in wages the cost of living also increases with the result that no benefit accrues to the working class."

Mr. Khrushchev in a speech to tractor workers had also stated that if wages were not linked with production, the Russian workers would not have anything to buy from the increased roubles they would get. The majority have added that the so-called exploitation of workers by employers is not a fact now due to the various measures taken to safeguard the interests of the working class, and a few small employers who may disregard these laws, cannot be taken as representing the whole industry. The unanimous recommendations are as follows:

(1) A central agency should be set up to translate into English the technical literature already available and published from time to time in other languages.

(2) Russian language study courses should be introduced in schools and colleges.

(3) For effective maintenance of machines, each industrial unit should have a maintenance section adequately staffed and equipped to foster maintenance-consciousness.

(4) Similarly, each unit should have a design office adequately staffed and equipped for the preparation of designs. For this purpose, a machine building section, either as part of tool room or as a separate unit, should be set up in each plant for making its own special purpose machines.

(5) The development and installation of special purpose machines in factories should be encouraged.

(6) A continuous supply of skilled operatives and technicians is essential and properly organised apprenticeship training schemes and educational and training facilities for adult workers should be provided throughout the country.

(7) Safety-consciousness must be inculcated among workers at every stage. All levels of management should observe the principle of "safety first", and top management must associate itself closely with the prevention of accidents.

POWER

Supply Lagging Behind

The view that in India, the energy sector is being developed less rapidly than the economy as a whole was expressed last week by Professor E. Austin Robinson of the Royal Economic Society, Cambridge, at the first meeting of the Energy Survey Committee.

Professor Robinson observed that the energy sector was lagging behind the economy as a whole, and he believed that there was some advantage when the energy sector was ahead of the economy. He, however, pointed out that the energy sector was one of those in which investment to be made was very high, and, therefore, the danger was that if the energy sector was expanded faster in the economy, the country might have to use very scarce resources. He thought that it would be extraordinary to keep the energy investment rightly in balance with the growth of the economy.

According to preliminary figures made available to him, Professor Robinson stated that while the demand in 1950-51 of commercial energy was 37.8 million tons of coal equivalent, it rose to 66.1 million tons of coal equivalent in 1960-61. The demand for non-commercial energy in 1950-51 was 7,486 million tons of coal equivalent and rose to 98.1 million tons of coal equivalent in 1960-61.

According to Professor Robinson's paper, the estimates of energy consumption suggested that during the decade 1950-51 to 1960-61, the demand for total energy rose by about 39 percent. "If on the crudest of bases, that rate of growth were continued the demand for energy in 1965-66 would be 184.3 million tons of coal equivalent, in 1970-71 271.1 million tons of coal equivalent and by 1975-76 it would rise to 256.2 million tons of coal equivalent."

PORTS

Development Plans

The port of Bombay is being expanded by four additional deep-water berths in the Alexandra docks, and a new landing-place for ferry-boats near the Prince's dock to make room for three deepwater berths. The Ballard pier will be extended by 750 feet to allow the construction of another berth. The main channel will be deepened to 32 feet.

The port of Madras will receive new ore handling equipment with a handling capacity of 3 million tons a year and at a cost of Rs. 2.5 crores.

The Indian Government plans to expand and modernise the port of Marmugao in Goa at a cost of Rs. 24.71 crores.

GOVERNMENT CARGO

Seeking Freight Concessions

A three-man delegation, led by the Chief Controller of Chartering, has left for the U.S.A. to negotiate concessions in freight rates for Government cargoes. Under an agreement with the U.K.-Continent-India-Pakistan Conference of September 1962 the quantum of rebate accruing on Government cargoes imported from the U.K. and north Continent was enhanced from 10 percent to 15 percent, resulting in a foreign exchange saving of about Rs. 50 lakhs a year.

The tonnage of Government cargoes allocated to Indian shipping has increased from 158,974 tons (13.3 percent) in 1960 to 329,260 tons (38.2 percent) in 1962, against the corresponding tonnage of cargoes lifted by foreign shipping totalling 1,034,337 tons and 532,775 tons, respectively.

FOREIGN TRADE

Agreement with Jordan

An agreement to develop and strengthen trade and economic relations between Jordan and India was signed last week. The main items of export to Jordan are tea, engineering goods, electrical goods, textiles and jute goods. Rock phosphate is the major item of import from Jordan.

The volume of trade (both ways) between India and Jordan has increased from Rs. 22.38 lakhs in 1959 to Rs. 1.47 crores in 1962. The export of tea from India increased from Rs. 10.45 lakhs in 1960 to Rs. 41.12 lakhs in 1962.

PRINTING MACHINERY

Survey of Demand

The panel, which was appointed by the Government of India in June 1962 to investigate and report on the printing machinery industry in the country, has submitted its report. It has assessed the demand for printing machinery at Rs. 7.5 crores by the end of the third plan and Rs. 12 crores a year by the end of the fourth plan. Output in the country in 1961 was worth only Rs. 10 lakhs. The panel has recommended that the sizes of printing machines to be developed in the country should be such as to conform to the international sizes of paper, with adequate margin. Other considerations in determining the types of machines to be developed are the raw materials used in the manufacture of paper, the increase in the demand for more colours in printing, the wide variations in the circulation demands of newspapers arising out of the use of a large number of regional languages and the lack of power in rural areas. The panel has specifically recommended that the manufacture of the following types of printing machinery should be encouraged: (1) Platen presses (other than cylindrical inking type); (2) cylinder machines; (3) rotary machines; and (4) proof presses.

The panel has also stated that production could be made economical if certain components and sub-assemblies such as feeders, guillotines and machines for wire stitching, board shearing, composing, folding, perforating, book sewing and numbering, are developed by ancillary units to cater to the needs of the industry as a whole.

The Government of India has generally accepted the recommendations of the panel, and is taking steps to implement them.

TRACTORS

Ban on Imports

Due to foreign exchange shortage, no import of tractors is allowed at present except from Russia and east European countries. Arrangements have been made for the import of 1,800 tractors from Russia during 1963, and the possibilities of arranging imports from some east European countries are being explored. Five firms in India have been given licences for the manufacture of larger types of tractors in 12-45 D.B.H.P., the demand for which is expected to rise to about 10,000 a year by 1965-66. Three firms have been licensed to manufacture smaller tractors of 10 D.B.H.P. Three other firms have already started production of wheel tractors. The number of wheel tractors likely to be produced in the country by the end of 1963 is placed at 2,461 and at 3,600. By 1966, indigenous production, it is hoped, will meet the demand for agricultural tractors in full.

The Defence Department has already taken up production of the "Komatsu" type high horse-power crawlers with the collaboration of a Japanese firm. Power threshers are being manufactured in Ludhiana, Punjab, and Ahmednagar, Maharashtra. The possibility of manufacturing power tillers, chaff cutters and tractors was also discussed by a conference in New Delhi last week.

It is explained that there has been a phenomenal increase in the demand for improved agricultural implements in the last ten years. The demand is still rising.

WAREHOUSING

More Goods for Storage

Warehouses established by the Central and State warehousing corporations have been empowered to accept for storage agricultural produce, namely, foodstuffs including edible oilseeds, cattle fodder including oilcakes and other concentrates, raw cotton whether ginned or unginned and cottonseed, raw jute and vegetable oils, seeds, manures, fertilisers and agricultural implements. There have been persistent demands for inclusion of certain other commodities also. The Government of India has examined the desirability of extending the scope of warehousing so as to enable the depositors to offer for storage a wider range of articles of interest to agriculturists. The Government has now issued orders by which depositors can offer for storage iron and steel (metal), iron and steel structurals, insecticides, fungicides and weedicides, rubber, portland cement, coir fibre and coir products, textiles, paper and pulp including paper products and leather, leather goods and pickers in the warehouses of Central and State warehousing corporations, in addition to the articles offered so far.

London

CAUTIOUS OPTIMISM ON U.K. ECONOMIC OUTLOOK

(FROM OUR LONDON CORRESPONDENT)

THE economic indicators continue to make a good showing. Output and exports both show encouraging buoyancy, giving rise to "cautious optimism" in business circles, and to some extent, these movements have been bolstered rather than suppressed by the surprising moves in the matter of capital spending, even though this has been declining overall. A further rise in exports during June has raised U.K. shipments in the first half of 1963 to 6 percent above the level of a year ago. After allowing for seasonal factors, exports in the second quarter of this year were 3 percent up on the first quarter.

These figures were described by Mr. Frederick Erroll, the President of the Board of Trade, as "very pleasing." He pointed out that exports in the second quarter alone have risen to over £1,000 million. This was, he said, "a most important contribution to the present strength of the balance of payments. Seasonally adjusted, exports in June were £345 million, re-exports £14 million, and imports £401 million. This left a "trade gap" of £42 million, against £41 million in May. Exports were a new record except for last March, when the figure was inflated by arrears caused by the freeze-up in January and February.

Imports in June were the highest since November 1960. This is partly a statistical illusion. Sugar imports are booked at the high world price while the U.K. pays for most of its sugar exports at a much lower Commonwealth price. In addition, imports of fuel have been rising. Bearing in mind the sugar price distortion, imports in the first six months of this year were nearly 4½ percent higher than in the first half-year of 1962. Mr. Erroll said that "we must expect further rises in imports as we bring in the materials needed to support the growing economy." But it appears from the figures that the current balance of payments in the second quarter has probably been in surplus at least as much as in the first quarter.

Higher Industrial Output

Industrial output expanded in May faster than usual for the time of year. The index of production covering all industries, adjusted to remove the effects of seasonal influences, was 118, compared with 117 in April (1958=100). The seasonally adjusted figure, which went up because of an expansion in a wide range of industries, is the highest ever recorded. The previous peak was 117 in September. The figures suggest that the Chancellor's hope for a steady but not spectacular growth has begun to be realised. Treasury officials at any rate believe that a movement other than just a recovery from the severe winter is taking place. They find support in the fact that the average output for the three months from March to May is slightly higher than any three months last year. On the other hand, production is still running less than 2 percent above the corresponding month of 1962. This is in spite of the target of 4 percent set by the National Economic Development Council.

The figures now published contain another hopeful feature. This is because Treasury statisticians have recalculated figures since January 1962, so as to make the adjustment for seasonal factors accurate. The effect has been to increase many of them so that in retrospect the decline last winter does not appear too pronounced as originally thought. The exceptionally severe winter seems to have thrown the normal formula for making seasonal adjustments out of step.

ALL INDUSTRIES INDEX OF PRODUCTION

Month	Unadjusted 1957-1963		Seasonally Adjusted 1962-1963	
January	111	108	113	109
February	118	116	114	113
March	121	122	115	116
April	114	116	114	117
May	120	122	116	118
June	117		116	
July	109		115	
August	100		116	
September	120		117	
October	121		116	
November	121		116	
December	111		113	

1958=100.

The "All Industries" index includes mining, building and public utilities as well as manufacturing. The seasonally adjusted index for manufacturing alone was 118 in May, also a record, compared with 117 in April.

Fall in Capital Spending

On the other hand, final figures for the first quarter of this year confirm preliminary indications of a further fall in capital spending by British industry. Compared with the fourth quarter of 1962, there has been a decline in volume of about 5 percent thus continuing the downtrend which has persisted since capital expenditure reached a peak in the third quarter of 1961. Undoubtedly, the latest downturn was influenced to some extent by the severe weather, especially as regards new building work, but the figures suggest that even ignoring this factor, there would have been a falling off.

Capital spending by manufacturing industry, seasonally adjusted, shows a drop of about 8 percent, compared with the fourth quarter of 1962, although within this group, there was a notable exception in the "engineering, shipbuilding and metal goods" categories. Here, the first quarter figures show a rise, after seasonal adjustment, for the first time since the middle of 1961, which may well mark a turning point in this sector. Final estimates of the volume of the fixed capital expenditure of the distributive and service industries show that there was no significant change in the first quarter of this year.

For all industries, the 5 percent decline in capital expenditure in the first quarter of 1963 reflects a reduction of about 8 percent in spending on plant and machinery, and of about 4 percent in outlays on new building work, only slightly offset by increased spending on vehicles. Further evidence that there has been some rise in industrial activity comes in the latest survey of the National Association of British Manufacturers. The results of this survey, the Association says, confirm the forecast made three months ago that there would be a general improvement in production in the second quarter of the year.

It qualifies this statement, however, by saying that "there is no suggestion of a boom in the economy." A number of firms attributed the improvement to a recovery from the bad conditions of the winter months and to other seasonal influences. The Association also believes that political uncertainties have had a depressing influence on trade. All in all, it sees the mood of industry as "one of cautious optimism only."

The detailed results of the N.A.B.M. survey show that 43 percent of the 502 firm reported increases in production, 46 percent showed no change and 11 percent recorded a fall. The number reporting a drop in output is the lowest since these surveys were started. But the Association draws attention to the large percentage of firms showing no change. Substantially more firms reported increases in home orders than in export orders. On home orders, 45 percent of returns showed a rise, 38 percent no change and 17 percent a fall. On export orders, only 30 percent showed a rise, 54 percent recorded no change and 1½ percent a fail. This is not necessarily at variance with the buoyancy that exports as a whole have displayed in recent months; many small firms which do not export directly supply others which do.

Unchanged Costs

Among industries, engineering, building and vehicles showed most marked improvements; paper and textiles were the least satisfactory. Firms in the Midlands and London are, surprisingly, said to have done relatively less well than those in the Manchester and Liverpool areas and in South Wales. Yorkshire came out worst, while for Scotland and the north east "a substantial improvement" is recorded. Practically no firms reported a drop in costs, while 54 percent recorded increase. Complaints of higher costs were most frequent in textiles, chemicals and the miscellaneous industries; firms in engineering and vehicles showed least concern about costs. Most firms, on the other hand, said there had been no change in selling prices —only 10 percent reported increases while 11 percent said prices had fallen. Firms which reported that they had taken no more labour slightly outnumbered those which had reduced their labour force, but 70 percent said there had been no change. There were a few complaints of shortage of skilled labour —mainly in London, the Midlands and Yorkshire.

Forecasts of production for the coming months were mainly that the rising trend would continue. Rising production was expected by 28 percent of the firms, 53 percent thought there would be no change. Only 9 percent forecast a fall. Unofficial surveys should always be treated with caution, if only because their coverage is relatively narrow and may be unrepresentative. Even so, this one includes firms of all sizes and in a wide range of industries, so is worthy of more serious acceptance as a guide to what may be expected.

Jute

NEED TO EXPAND MARKET FOR GUNNY

THE year 1962-63 is important in the history of the jute industry for various reasons. It was during this year that the industry could, for the first time since partition, work at the maximum level, being assured of adequate supplies of fibre at an economic price. There was a big increase in the installed capacity and diversification of production, following the progress in rationalisation, renovation and modernisation. Low fibre prices helped the industry to work at a profit, despite the increases in the costs of power, fuel, replacements and accessories and wages. Furthermore, the industry could also offer its products at competitive prices.

According to the I.J.M.A.'s monthly statements, the production of jute goods rose from 1.07 million tonnes in 1961-62 to a record figure of 1.22 million tonnes in 1962-63. Hessian rose from 414,300 tonnes to 514,900 tonnes, sacking from 508,500 tonnes to 532,800 tonnes and miscellaneous goods from 146,200 tonnes to 170,500 tonnes. Total despatches showed an increase of 12.8 percent, from 1.06 million tonnes to 1.19 million tonnes.

The export offtake reached an all-time peak of 875,700 tonnes from 772,400 tonnes in the previous year. Of this, hessian increased by 22.9 percent—from 378,300 tonnes to 465,100 tonnes. Exports of other goods went up by 28.6 percent—from 99,800 tonnes to 128,400 tonnes. However sacking registered a small decline of 4.2 percent from 294,300 tonnes to 282,200 tonnes. Internal consumption rose from 287,000 tonnes to 319,500 tonnes. Hessian intake increased from 41,500 tonnes to 46,400 tonnes, sacking from 211,600 tonnes to 237,000 tonnes and other goods from 33,900 tonnes to 36,100 tonnes.

Completion of the industry's modernisation and broad loom installation schemes will pose the problem of finding outlets for a much larger tonnage of jute goods. As there is little prospect of any appreciable increase in internal consumption, the industry will have to concentrate on stepping up exports substantially. It must not only retain its existing markets and capture the lost ones but also develop new markets. Unless this is done, it will be left with larger stocks of fibre and jute goods, which will adversely affect both the mills and the farmers.

Export Promotion Efforts

In order to ensure that trading opportunities are not lost by default, the I.J.M.A. has been taking steps to attend to all overseas enquiries. It has set up a standing committee to deal with matters relating to export promotion. All enquiries for odd constructions and even small quantities of gunny are being circulated to members. The Calcutta Jute Fabrics Shippers Association is also likely to set up a committee on the same lines.

The I.J.M.A. committee has been formed following the concern expressed by the Government over the poor offtake by the west European countries, particularly France. In some cases, the import quotas issued by them to India could not be fully used. The Government felt that unless India could fulfil the quotas neither the Government nor the industry could press the E.E.C. countries for larger quotas in future.

Arrangements are also being made to send trade delegations to the east and west European countries to explore the possibilities of stepping up exports. Mr. Manubhai Shah, Central Minister for International Trade, is of the view that there are bright prospects for stimulating the export of jute goods to those countries.

The Government of India has asked the industry to increase its foreign exchange earnings at least by Rs. 15 crores this year. The industry has been urged to draw up an intensive research programme to develop new uses for jute and jute products. The Government has a plan to set up a market development fund shortly.

Falling Gunny Prices

The industry is worried over the steady fall in the prices of jute goods. Prices of ready goods ruled around Rs. 112.50 for B Twills and Rs. 50.50 for 40in. 10oz. hessian during April and early May, and rose to Rs. 117.75 and Rs. 53.75 on fears of protracted power shortage on 11th May. They fell to Rs. 107.40 and Rs. 47 two months later on 11th July, and closed around Rs. 108.80 and Rs. 47.30 on 20th July. Despite the lower prices, the offtake has not registered any improvement.

U.S. burlap consumption has declined in May and June. However, the fall is not so bad in view of the fact that consumption during January-June 1963 was higher than in the comparable period of 1962. U.S. bagmakers are using their stocks to meet current requirements without replenishing their inventories. It is reported that ready stocks are plentiful in the market and about 4,300 bales of jute goods are being offered at well below July replacement prices in all North American and Gulf ports following "distress" sales by a prominent speculator. Larger manufacturers are anxious to reduce their stocks because of fewer orders in their books.

It is stated that unless the market in the forward positions drops to very attractive levels, the U.S.A. is not likely to enter the market in a big way. In the circumstances, the U.K. Board of Trade's move to cut the 20 percent mark-up on at least some jute goods imported into Britain to 5 percent has not produced any reaction in the market. The concession has been allowed following a suggestion by the U.K. Jute Goods Association and the Indian Jute Mills Association.

An I.J.M.A. deputation is likely to wait on Mr. D. S. Joshi, Special Secretary to the Central Ministry of International Trade, to discuss the falling price trend and explore possibilities of stabilising it at an economic level. In order to revive confidence in the market, it has been suggested that minimum prices should be fixed for heavy goods transacted in the futures market. Another suggestion is that the industry should revert to the normal working of 48 hours a week from the present 49 hours. An agreement among mills has been proposed to discourage the sale of jute goods at the present levels.

Raw Jute Arrivals

Arrivals of raw jute into Calcutta and mill stations during June were lower at 281,210 bales, against 358,770 bales for the corresponding month of 1962, according to the Bengal Chamber of Commerce and Industry. Arrivals of Indian jute fell from 347,450 bales to 271,750 bales during the month under report. Imports of Pakistani fibre were lower at 9,460 bales, against 11,320 bales. During the entire 1962-63 jute season raw jute arrivals declined to 7,007,250 bales from 7,139,310 bales in 1961-62. Of this, 6,736,730 bales (against 6,738,380 bales) came from India and 270,520 bales (against 400,930 bales) from Pakistan.

Ceylon to Set Up Jute Mill

Ceylon has decided to set up a jute mill for using kenaf, which grows in abundance on the island. The Ceylon Institute of Scientific and Industrial Research investigated the technical aspects of extracting and processing the fibre. It has been claimed that bags made of kenaf are durable for packaging purposes. Besides, they have a better look and finish.

THE JUTE MARKETS

Manufactured Goods: Divergent trends prevailed in the manufactured goods market in Calcutta during the past week. Sacking opened on a subdued note but gathered momentum on reports of an Indian Government tender for about 7,000 bales of B Twills for July-August delivery. September and far forward positions recorded small gains in sympathy and on scattered covering. Hessians lost pace due to lack of interest. Towards the close, a part of the loss was recouped on due date covering. Fair freight bookings from the Argentine produced a mild stimulus to the sentiment. Among the transactions during the past fortnight may be mentioned scattered sacking deals for 2,000 bales to 3,000 bales for July-August with Argentina, about 4,000 bales for July shipment with Chile, and 6,000 bales to 8,000 bales of Heavy Cees for immediate shipment with Indonesia and about 10,000 bales of Cornsacks for August-November shipment with the Sudan. Barring small transactions in ready and near positions in hessian, the U.S.A., the U.K. and European countries were virtually absent from the market. The futures market continued to be influenced by the trend in the spot market. Sacking prices rose following frantic bear covering and large purchases by a couple of leading shippers. But the gains were partially trimmed later. Hessian continued to be neglected though there was little evidence of selling pressure. Stray transactions were reported in November futures. Towards the close, sacking finished firm

with a gain on balance, while hessian turned softer and was marked a shade lower. Fluctuations were wide in the former and narrow in the latter. Turnover was fair in sacking and small in hessian.

Wednesday's quotations were as follows:

	July	Aug.	Sept.	Oct.-Dec	Jan.-March
40in. 7½oz.	34.55	34.70	34.70	34.70	34.25
40in. 8oz.	37.00	—	—	—	—
40in. 10oz.	47.20	47.20	47.00	46.60	46.15
B Twills	108.45	109.25	109.45	109.60	109.40
Cornsacks	111.20	112.00	112.25	112.40	112.60
Heavy Cees					
(Plain)	108.50	—	—	—	—
A Twills	132.25	132.75	132.75	132.75	132.50
Liverpools	122.75	122.75	122.75	122.75	122.50

Raw Jute: The raw jute market remained steady during the week following scattered mill purchases against the July quota. Selling pressure was held in check and holders were not inclined to discount prices further. Business was reported in selected grades of the old and new crops at slightly higher prices. Turnover was moderate and the undertone firm at the close. In the upcountry markets, daily arrivals of new crop came down to around 20,000 maunds following heavy rains which affected the movement of goods from the growing areas to the agency stations. Harvesting and retting operations were in full swing and the quality of the fibre satisfactory. It is estimated that the 1963-64 crop will be well over 7.5 million bales.

Wednesday's quotations were as follows:

	Landed at Mills (Basis Bottoms) Current Prices		T.S.D. Minimum Prices	
	Rs A Qtl.	Rs. A Md.	Rs. A Qtl.	Rs. A Md.

U.S. BURLAP CONSUMPTION AND STOCKS

U.S. burlap consumption during June was 7,400,000 yards less than during May 1963, but was 7,500,000 yards more than June a year ago. Average monthly consumption during the first six months is 3 million yards monthly more than the comparable period of 1962. Last month's bag cut-up was 47.8 million yards and piecegoods deliveries 21.0 million yards, compared with 46.8 million yards and 14.5 million yards, respectively, in 1962. U.S. spot stocks and afloats increased slightly by 200,000 yards. At 295.9 million yards, 175.5 million yards were spots and 120.4 million yards were afloats. Spot stocks continued to increase, while afloats stocks decreased. Appearing below are two tables which include the June figures, (1) based on member reports to the Textile Bag Manufacturers Association and the Burlap and Jute Association and (2) projected to represent the estimated consumption and stocks for the entire industry (all figures in million yards).

THE U.K. JUTE MARKETS

FIBRE REMAINS DULL

(FROM OUR DUNDEE CORRESPONDENT)

THE Pakistani E.P.C. values of the higher grades of white jute were reduced by £3 to £5 a ton last week, but this made no difference to the position in Dundee as sellers were already discounting the official rates. The E.P.C. values of all grades of white jute except Mill Reds and Mill Firsts are now at minimum export price levels. Spinners in Dundee showed no interest as they were looking for still lower prices. Occasional transactions took place in spot fibre, but the prices which had to be accepted were very low. In fact, there was a seller of passed quality Grade Tossa-4 at £100. Spinners are still holding large stocks of raw jute, and this applies to the Continent as well as to the U.K.

Offers were being made at £124 for Mill Firsts, at £105 for Mill Lightnings, at £91 10s for Mill Hearts and at £78 for Grade Hearts, c.i.f. U.K. for August-September shipment. Grade Tossa-2/3 was at £119 and Grade Tossa-4 at £105 10s. Outport Tossa-2/3 was now available at £93 10s and Outport Tossa-4 at £83 10s, September-October. Many sellers were asking more than the above rates, and the market here was very irregular. Offers of old crop were being freely made, and prices were in line with the above rates for new crop.

The Siam jute market was firm, but no change in prices took place. Grade A was offered at £71 10s and Grade B at £66 10s, delivered mill Dundee for November-December. Although the crop was expected to yield in the region of 200,000 tons this season, shippers were refusing to reduce their rates.

The Calcutta goods market was firmer possibly due to the Indian Government showing interest in sackings. Demand from the U.K. was small. Quotations were at 72s 6d for 40in. 10oz. and at 53s 3d for 7½oz. a 100 yards f.o.b. Calcutta for July shipment, at 72s 3d and 53s 6d August-September and at 71s 3d and 52s 9d October-December. B Twills were at 165s 9d, 167s 6d and 168s 3d for the respective shipment periods.

Demand for yarns and cloth in Dundee was of small size. Further meetings have taken place between the industry and the Board of Trade concerning the future of the mark-up on imported jute goods. The industry is taking a very serious view of the situation and every endeavour will be made to get the Government to alter the latter's ideas about reducing protection to the home industry.

Buying interest was still shown in the wide cloths for the tufted carpet trade and further movement took place in tarpaulins. Although there was an easier trend in raw jute values, prices of yarns and cloth remained firm and the quoted rates were to be paid in all instances.

DUNDEE JUTE WORKERS SEEK PROTECTION

A demand that the British Government reaffirm the decision of previous Governments to ensure adequate protection for Britain's jute industry was made at a recent emergency meeting of Dundee jute workers. A resolution viewing with the gravest alarm Board of Trade proposals to reduce still more the level of protection to the industry was passed unanimously. The resolution, which will be sent to the President of the Board of Trade and the Scottish Secretary, said the proposals would bring tragedy to thousands of jute workers and have catastrophic effects on the whole economy of Dundee. The jute workers would not stand by idly while Scotland's second industrial city became a ghost town strangled by red tape. Mr. G. M. Thomson, Labour M.P. for Dundee, East, said the Board of Trade had a secret plan to mutilate the Dundee jute industry and destroy upwards of 6,000 jobs. The President of the Board of Trade would have been in a much stronger position if he had first produced a new motor-car industry or something of that scale for Dundee.

THE PAKISTANI JUTE MARKETS

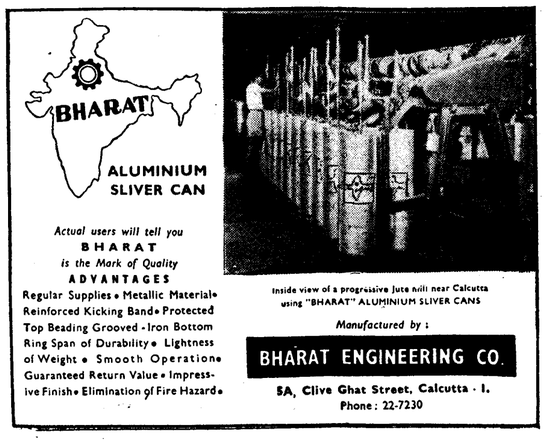
GOVERNMENT POLICY ANNOUNCED

(FROM OUR DACCA CORRESPONDENT)

HEAVY rains throughout the country have slowed down operations in the ports and have encouraged exaggerated newspaper reports, but have had a good effect on jute. In the loose jute market, arrivals last week were still fairly small, and although the condition was good, quality for this time of year should be better. There were not many buyers, but one group was buying heavily to the full extent of the small arrivals. Despite this, the market was weak and for the time being showed no signs of improvement.

In the pucca bale market, there was absolutely nothing to report, and the big cuttings operator was no longer interested except in T.C. for ready delivery at discount prices. From overseas, very little business was reported.

Pakistan's new jute policy for 1963-64 follows the pattern of last year's policy in all essentials except that first, for small shippers other than those mentioned in a Press note and the Jute Marketing Corporation, the minimum export prices will be £2 less than those fixed for large exporters. Secondly, the Government has decided to fix maximum export quotas for the big shippers whose exports exceed a certain quantity "to be determined by the Ministry of Commerce on the recommendations of the Jute Board." The main features of the new policy are as follows:



Statutory minimum prices at growers' level and the buffer stock scheme will continue as in the previous year. The Jute Marketing Corporation will remain under the control of the East Pakistani Government and will continue as the agent of the Jute Board for the buffer stock operations.

The existing practice of purchasing buffer stock at prices 10 percent below the minimum will continue. If at the end of the season, the accounts of buffer stock operations show a profit, an undetermined portion thereof after deducting a reasonable amount for reserves to meet future contingencies, will be made over to the Provincial Government for disbursement to the growers by way of relief. The Jute Board-guaranteed repurchase scheme will continue "with such modifications as the Board may consider necessary."

The minimum export prices and the export price check system will continue. Six Pakistani small shippers and the Jute Marketing Corporation will be given a price advantage of £2 a ton both in the minimum export prices, and in the export price check, but the advantage will not be available to Pakistani small firms in which any partner or director of a big shipper has a sizable financial interest.

With a view to preventing the concentration of the jute trade in the hands of a few individuals or firms, the Central Government will fix minimum export quotas for the big shippers—those whose exports exceed a certain quantity to be determined by the Ministry of Commerce on the recommendations of the Jute Board. These quotas will be based generally on the shippers' past performance. Export of mesta will be allowed on the same basis as during last year.

The export duty on raw jute and cuttings and cut ropes will continue as at present. The possibility of bringing all anti-smuggling agencies in East Pakistan under one control will be carefully examined by the Central and Provincial authorities.

LOWER SOUTH INDIAN TEA CROP

(BY A SPECIAL CORRESPONDENT)

IF the official view as to future consumption proves to be correct, tea is in for a good year. The south Indian crop for the half-year ended 30th June, shows a small fall from last year, which is somewhat unusual. Rain and floods continue to interfere with plucking and despatches from north Indian gardens. Nevertheless, a week ago there were signs of irregularity in the prices for common teas and again at Sale No. 7, held on 15th July, the demand for leaf teas was less general than in recent auctions. With less tea from south India, increasing domestic consumption, and U.K. stocks normal, why are "commons" still difficult to sell?

After many statements and counter-statements relating to the entry of tea into the Common Market, it has now been reported that the Council of Ministers of the Six have decided to suspend the tariff on tea as from 1st January, 1964 for a two-year period. This will provide the Tea Board with an opportunity to advertise and promote tea exports to that region.

The chairman of the Indian Tea Board can be counted on to initiate suitable propaganda if allowed sufficient funds. It is understood that two or three tea centres will be opened within the Common Market. But what is the good of that among 220 million people?

The U.K. is a tea drinking country and special tea houses in London, Edinburgh or elsewhere may help to increase consumption, but one house each in Paris, Dusseldorf and Milan, hardly sounds enterprising. In France tea in the afternoon used to be fashionable, but the aim is surely to popularise the beverage among the millions of industrial workers. The E.C.M. is a vast potential market. Can it be tapped in two years of grace with India's cost of production constantly mounting? It is a fairly safe bet that labour wages will soon receive another boost. Then there remains the surplus labour problem which in due course will be aggravated by a higher birth rate.

Progress of Replanting

In recent annual market reports one of Calcutta's leading tea brokers mentioned that gardens were likely to find fertilisers in short supply this year, but there has been so much reference to the 900 million lbs target being attained by replanting and new planting with special seedlings and clones and scientific application of irrigation, that it comes as rather a shock to accept the fact that results depend on the vagaries of the weather and the three-year period 1961, 1962 and 1963 will probably show no progress in output.

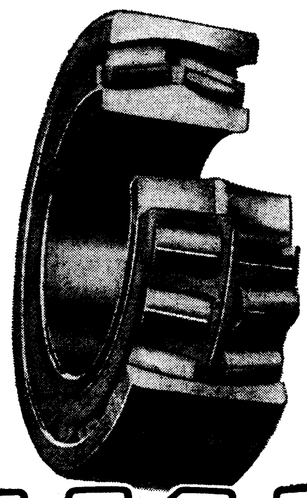
To secure crops in 1963, large areas should have been laid under seedlings five to six years ago. Here is the record of land under tea.

1955	320.5 hectares
1957	325.3 hectares
1959	330.8 hectares
1961	333.3 hectares

This shows an increase of 12,740 hectares over seven years, say, about 31,000 acres (1 hectare = 2.471 acres). If modern science and research achieved results, this land should yield at least 12 maunds of made tea an acre, or, say, about 30 million lbs, but, of course, only about half of this new tea will be in bearing this year. So a practical man remains puzzled by the constant exhortation to planters to produce. If they could do so they would, for if more tea is wanted in the world it would pay the planter to make it, but once again the law of supply and demand must be watched. Although the Calcutta auctions are only offering comparatively small quantities, prices have already started to ease. This correspondent learns that to-date Russian buying has provided a useful support, while some of the big export buyers are waiting for larger offerings. Auctions have been running with about 25,000 packages, but next month, supplies may rise to 70,000 packages every Monday.

U.K. tea stocks continue to fall, and for the week ended 12th July were reported at 137.87 million lbs, compared with 140.42 million lbs a week earlier. Deliveries were 9.25 million lbs, and landings were 6.70 million lbs. Auction prices during the week were 44.69d last week compared with 43.62 in the previous week and 44.42d in the same period last year.

The fall in stocks is mainly due to small arrivals from north India. The drop usually tapers off during August, and September.



Cotton Textile Production and Trade Depressed

COTTON textile production in the non-communist world as a whole remained relatively depressed in the first quarter of 1963, according to the latest issue of the U.K. Cotton Board's *Quarterly Statistical Review*. Following the drop of 1 percent in 1962 below the 1961 level, cotton yarn output in those countries for which regular statistics are available was about 4 percent smaller in the first quarter than in the same period of last year. Once again, the decrease compared with a year earlier, was geographically widespread, covering the U.K., much of continental Western Europe, the U.S.A., Japan and India. However, there are reports from a number of countries of possible recovery from the recession.

So far, there have been no signs of any recovery in world trade in cotton fabrics. Exports from the main non-communist exporting countries in 1962 were about 5 percent less than in 1961 and in the first quarter of 1963, they were not only seasonally smaller than in the preceding quarter, but about 8 percent less than in the corresponding period of 1962. The only major exporting countries whose exports in the first quarter are known to have been greater than a year earlier are India and Pakistan.

Exports of man-made fibre fabrics from the principal non-communist exporting countries, after their 5 percent expansion in 1962, fell seasonally in the first quarter of 1963, but were probably slightly greater in total than in the corresponding period of last year. There were increases in exports, compared with a year earlier from the European exporting countries, including the U.K.; in contrast, Japanese exports were smaller than in the first quarter of 1962.

There was an unwelcome increase in U.K. imports of cotton goods in the first quarter of the year. Imports of cotton yarn totalled 9.8 million lbs, compared with 7.6 million lbs in the preceding quarter and 9.7 million lbs in the first quarter of last year; arrivals in April and May, totalling 7 million lbs, were running at an even higher rate than in the first quarter. Main features of the first quarter's figures were the big increases in imports from Spain and India. Imports from Pakistan also increased, but it is understood that these have not exhausted the

MIDDLE CLASS COST OF LIVING INDEX NUMBER FOR CALCUTTA

(Base : August 1939)

THE Middle Class Cost of Living Indices, by groups, have now been brought up to June 1963. As compared with May, the June index for Food reveals a rise of 6 points, while those for Fuel & Lighting, Clothing and Miscellaneous remain unchanged at 308, 602 and 317 points, respectively.

Combining all the factors, the Middle Class Cost of Living Index for Calcutta shows that the cost of living increased by 4 points during June 1963.

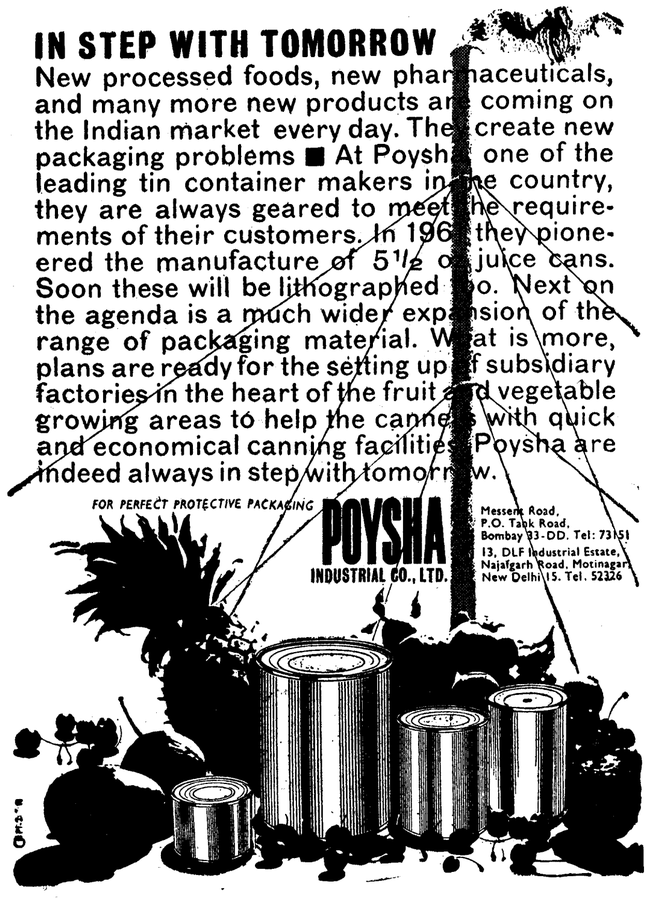
Compiled and constructed by the Statistical Department of "Capital"

Food quota for 1962 and 1963. Imports of cotton piecegoods increased to a level of 175 million square yards in the first quarter, compared with 148 million in the preceding quarter, and 147 milion in the corresponding quarter of last year; the total of 108 million square yards entering in April and May indicates a decline in the rate of import, however. The biggest increases in the first quarter were in supplies from India, Pakistan China (almost entirely for re-export) and Portugal. There was also a substantial increase in the volume of made-up goods imported from Hongkong and India. Imports from Pakistan and Hongkong in the first quarter were at an annual rate well in excess of the permitted ceilings, which from one point of view is slightly reassuring. It has been suggested that much of the first quarter increase in imports was speculative, the importers hoping for an improvement in the price level.



Output of cotton yarn and cloth in Japan remained at a very depressed level in the first quarter of this year and was less than that in the corresponding period of 1962. In contrast, with the exception of filament viscose fabrics, the production of man-made fibre textiles in the first quarter was either equal to or greater than production in the first quarter of last year, the biggest advances again being in the synthetics. The stringent curtailment of activity in the cotton sector of the textile industry continued in the second quarter, but it is understood that stocks have been much reduced and that the bottom of the current recession may now have been reached. However, the basic problems of the industry remain; excess capacity, competition from man-made fibres and the need for stabilisation of export prices.

Industry in India

Activity in the Indian cotton industry continued to be relatively depressed in the first quarter of this year as accumulated stocks in the mills were run down. Cotton yarn production was about 2 percent less than in the same quarter of 1962, while mill production of cotton cloth showed a drop of about 6 percent over the same period. Although output fell by a comparatively small margin in 1962, the financial results of many mills were severely affected as profits were squeezed between rising costs and controlled prices.

The measures taken to make the export of cotton textiles compulsory seem to have had some effect as far as volume is concerned. Thus exports or cotton piecegoods expand from 116 million yards in the second quarter of 1962 to 129 million in the third quarter and 152 million in the fourth quarter. Even so, it is reported that shipments fell short of what they theoretically should have been if all mills had fulfilled their commitments. The cost has been heavy, too. Thus it is reported that while exorts in the first quarter of this year were greater in volume than a year earlier, they were considerably smaller in value. It appears that price-cutting by mills anxious to fulfil their export obligations has completely nullified the intended expansion in earnings of foreign exchange. The increase in shipments in the final quarter of 1962, compared with a year earlier, was directed largely to the U.K., the U.S.A. and the Sudan.

The output of the Hongkong industry appears to have fallen somewhat in the course of last year, presumably because of difficulties in export markets. More recently it has been reported that dyeing and bleaching activity has been cut by as much as half because of drought.

HIDES AND SKINS

The market in hides was steady. Stocks in skins were higher, but those of hides were less than in the previous week.

Bazaar Sales

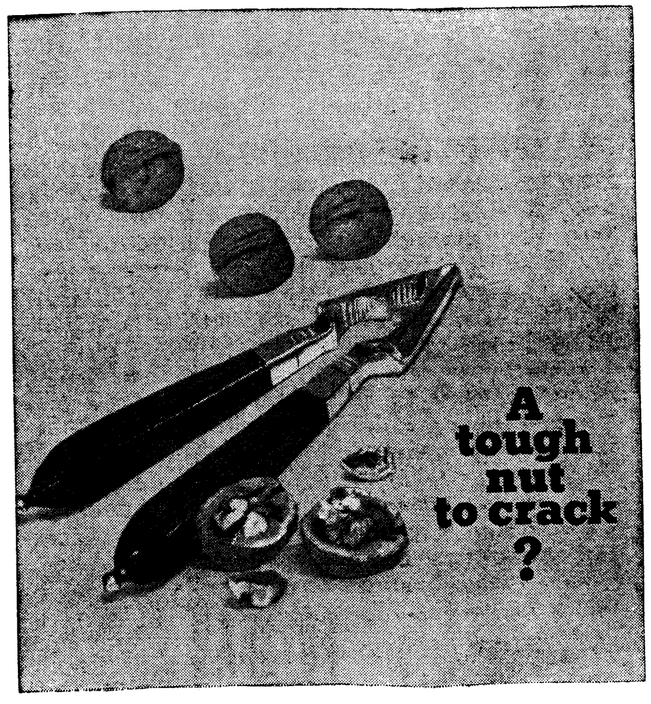
(Between 16th July and 22nd July, 1963)

Cowhides :—Wet salted (Ord.) 7,000 pcs. on the basis of Rs. 9 to Rs. 12.62, Wet salted (Slaughtered) 45,000 pcs. on the basis of Rs. 10.50 to Rs. 16.50 and Rs. 19.50 to Rs. 28; Wet salted (Ord.) 2,000 pcs. on the basis of 90nP. a lb.

Bazaar Stocks

(22nd July, 1963)

Cowhides :—Wet salted 78,800 pcs.



Goatskins :—Wet salted (Patna, Daissee, Kustia, Killed) 21,000 pcs.; Assam Dinajpur 80,000 pcs.; Muzafferpore-Patna-Pakur-Purneah-Kissenganj 2,22,000 pcs.

SHELLAC STEADY

During the week ended 23rd July, the market was steady.

	Rupees a package
Pure Buttonlac	92 to 98 value
Lemon One Shellac	94 to 100 buyers
	98 to 104 sellers
Lemon Two Shellac	84 to 90 buyers
	88 to 92 sellers
Standard One Shellac	72 to 76 buyers
	76 to 80 sellers
Pure T. N. Shellac	62 to 68 buyers
	66 to 70 sellers
Golden Kusmi Seedlac	90, 92 value
Kusmi One Seedlac	80, 82 value
Golden Bysacky Seedlac	72 to 78 buyers
	76 to 82 sellers
Manbhum Fine Bysacky Seedlac	60 to 68 buyers
	64 to 70 sellers
Fine Bysacky Seedlac	50 value
Genuine Bysacky Seedlac 5%	36, 38 buyers
	40 sellers
Grade One Class B Seedlac	56 value
	56 to 60 buyers
	58 to 62 sellers
Grade Two Class B	40 to 44 buyers
	44, 46 sellers

Shipments during July until 10th were 5,305 packages.

Company executives can obtain a free copy of this booklet by writing on their official letterhead to their nearest Caltex Office.

...if you are trying to dent high costs, here is something to get your teeth into! By making use of the Caltex "Stop-Loss" Programme you cut costs by proper lubrication. Programmed maintenance practices will help you to keep your equipment and your machinery in top condition and will also boost profits.

It is not a mere question of more oil or more grease. The Caltex "Stop-Loss" Programme will help you to select the proper lubrication practices, to train your personnel to proper maintenance procedures. Help your operation to greater profit with the Caltex "Stop-Loss" Programme.

(W) After giving six months' notice.

(X) Rs. 5,00.000 will be redeemed each year from and after 1964.

* These Debentures are registered and are transferable by transfer Deeds.

JOINT STOCK COMPANIES PREFERENCE SHARES

Dividends are cumulative and shares carry a Preferential claim on the property for the payment of capital and on the profits for dividend except in case of companies marked otherwise. Months against names of companies indicate approximately times of payment of dividends. T means that dividend tax is deducted at source.

TEA COMPANIES—Contd.

O., Po., C. and Dd indicate Ordinary, Preferred Ordinary, Contributory and Deferred Shares respectively. P next to the name of the company indicates that the company also has Preference Shares. Figures in "accounts closed" column indicate the months of the calendar year in which accounts are closed. For Managing Agents refer to the Key (last page) under the numbers indicated.

BORDER NEWS DISTURBS THE STOCK MARKETS

THE moderate recovery in the stock markets which began about three weeks ago, and which was facilitated by the earlier decision to resume forward trading in shares, has been suddenly interrupted during the past few days. Operators are shaken by reports that there is an unusually heavy concentration of Chinese troops along the northern border, and that the Chief of India's Army Staff has had to cut short his visit to North America in order to return home and cope with a potentially dangerous situation. The markets have been extremely sensitive to such developments ever since the Chinese launched their attack in October last year. The border conflict is likely to be the main influence on investment sentiment for a long time to come, especially since no solution is in sight. But, assuming that fighting does not start again, it is unlikely that heavy selling pressure will develop. This is, firstly, because the technical position of the markets has become healthier as the load of floating stocks has been reduced. Secondly, investors are reassured by the news that India's air defences will be strengthened by the supply of radar and other equipment from the U.S.A. and the U.K.

The situation nevertheless remains delicate, and that is why the decision of the stock exchanges to ask the Government to relax the existing margin restrictions is premature. When forward trading in shares was permitted about a couple of months ago, the Government stipulated extensive margin requirements in order to check overtrading and speculation. The experience since then has been satisfactory, in that trading has been disciplined and sharp fluctuations in prices have been prevented. If the margins have restrained the expansion of business, that is a good reason for continuing rather than scrapping them. The recovery which has taken place so far has not yet been consolidated. The markets continue to be vulnerable, so it is important to enforce measures which will check excessive trading.

A major weakness revealed by the recent trends is that business has been concentrated largely on clearing shares, which indicates that speculators have been predominant. It is true that in a recovery movement professionals usually take the lead. But in the present case their buying has unfortunately not been followed by support from genuine investors. The latter are hesitant—and for good reasons. The outlook for company profits and dividends is discouraging. The latest reports of several companies show that although turnover and gross profits have increased, after-tax profits have declined quite sharply due to heavier taxation, especially the super profits tax. A number of companies have, therefore, found it difficult even to maintain their dividends. The growth prospects of the shares have suffered too, since economic progress during the first two years of the third plan has been extremely disappointing. Achievements have fallen far short of targets and the record of agricultural production has been particularly dismal. The growth of industrial output has slowed down. Since the money supply has meanwhile been increased substantially by the heavy outlay on development and defence, the economy is suffering from inflation.

Against this already bearish background, the results of the recent meeting of the Advisory Committee on Capital Issues Control in Bombay have disappointed operators. The Advisory Committee is in favour of maintaining the controls over capital issues as before. Operators had thought that the controls would be liberalised in order to revive the capital market. The optimism arose after a meeting between the Central Finance Minister and representatives of the leading financial institutions, where it was generally agreed that steps should be taken to promote a recovery in shares. The hope was reinforced when Cooper Engineering, of Bombay, was allowed to issue rights shares at par. (The same Company had to issue rights shares at a substantial premium two years ago.) The Advisory Committee has apparently taken the view that the present policy of the Government on rights issues is flexible enough to deserve support. No attention has been paid to the objection that the policy of forcing a company to issue rights shares at a premium is wrong in principle because it should really be the company's own business to decide whether rights shares should be issued at par or at a premium. Any benefit that shareholders get by subscribing for rights shares on terms of their choice is merely a reward for the risk of investing their funds. The control over the premium for rights shares might have had some justification at a time when it was necessary to restrain speculation. But now that the capital market has become sluggish, the restrictions deserve to be removed.

The Advisory Committee's recommendation that companies should be allowed to get their rights issues underwritten is also difficult to support for a number of reasons. Firstly, the cost of underwriting will not be small. Secondly, if a rights issue has to be underwritten, it reflects poorly on the confidence shareholders have in their company. Thirdly, the underwriting of rights issues is not likely to serve the long-term interests of investors, since rights shares might pass into the hands of an underwriter for no better reason than that existing shareholders are short of cash at the time of the issue. Finally, the root of the trouble is that subscription to rights shares is discouraged when they are issued at a premium. An important recommendation made by the Advisory Committee on Capital Issues Control is that the ceiling for interest rates on debentures should be raised from 7 percent to 7.5 percent. Considering that interest rates generally have risen and that companies have found it difficult to sell ordinary and preference shares, an increase in the interest rates on debentures would be justified. But such a move would have bearish implications for equity shares since the ordinary dividend yields in many industries are less than the ceiling proposed for debenture interest rates.

The near-term trend in the stock market in any case is unlikely to be upward. If the gains of the past few weeks can be consolidated, the

undertone should remain steady. But no great burst of activity is likely. As the prices of several good shares have declined, there is scope for discriminating purchases. Support from the Life Insurance Corporation will probably not be substantial for some time yet since it has just invested large sums of money in the new Government loans. The tendency to look upon the Corporation as a saviour whenever the stock market is seized with panic is unfortunately reviving. It seems that the lessons of the Mundhra scandal have not yet been learnt. The fact is that the Corporation is the custodian of the policyholders' money; its investment policy must be framed to serve their interests faithfully. Unless security, yield and growth prospects are assured, there is no reason why it should buy particular stocks and shares. In no circumstances does the Corporation have any political obligation to compensate for the Government's fiscal blunders. Its purchases by themselves cannot relieve the prevailing gloom in the stock markets at a time when investment confidence has been shaken by such fundamental factors as heavy taxation, rising production costs, credit restrictions and the irrational price control policies adopted by the Government.

THE COAL SURPLUS

THE surplus that has unmistakably emerged in coal, as shown by the rising pithead stocks, raises several important issues of policy. Coal output, now running at the rate of 68 million tons a year, is well below the phased year-by-year goals formulated by the Planning Commission in the context of the target of 97 million tons set for 1965-66. The emergence of a surplus, despite this shortfall in production, must mean that demand estimates were greatly exaggerated by consumers —by no means unusual in a situation of shortage. Secondly, the slowing down of economic growth since the beginning of the third plan has also had its effect in aggravating the unbalance. In the absence of fuller information, it is difficult to say which of the two factors is the more important, but one may assume that both have contributed equally to the present impasse.

While the slow-down in economic growth is the result of a number of complex factors which it may not have been possible to foresee, there is little justification for the failure to make more realistic estimates of demand. Each industry's requirements can presumably be ascertained by reference to past consumption, for which fairly complete records should exist in the case of a controlled commodity like coal. Allowing for the effect of technological changes on demand patterns, it should be possible to determine accurately the consumption norms, and consequently the total volume of demand related to the likely levels of production in the consuming industries. The fact that serious errors have been made in carrying out this exercise throws doubt on the whole system of planning, and must inevitably lead to scepticism about the flood of forecasts emanating from Yojana Bhawan. It will not do to argue that the mining industry's knowledge of markets should have supplied a corrective, since the relationship that should normally exist between producers and consumers has been totally distorted by years of control.

Admittedly, the surplus reflected in mounting stocks is only in the aggregate. The better qualities of coal—both coking and non-coking—are still in short supply. The tremendous expansion in production over the past decade has left the better grades untouched, which indicates that most mines have already attained the optimum rate of output in these categories from existing workings. It also shows that the incentive to raise better grades has not been sufficient because price differentials, despite recent changes, do not compensate fully for the extra effort and outlay needed to improve quality. The additional production that may be expected under a more rational price system will remain a matter for speculation, but there is no denying that the pattern of coal production has suffered a great deal from New Delhi's inability to appreciate the need for a new approach to the industry's problems.

Coal is, and will remain, India's principal industrial fuel in spite of any marginal shift to oil. While this is the starting point for the formulation of a coherent fuel policy, the fact that only a small proportion of the total reserves are of the better grades has also to be taken into account. This implies making an intelligent use of the technological possibilities to limit the supply of the better grades to the industries where it is needed, and where it will do the maximum good. Administrative prescriptions alone cannot achieve the objective because of the political pressures that allocation by official decree invariably generates. The same end may be attained more quickly and with far less fuss by allowing prices to reflect the true scarcity value. Once this is done, the consumer will have a strong incentive to use coal more efficiently, and take only the grade that he really must have.

A study of fuel efficiency carried out by a two-man team of experts, brought from Britain by the Government of India, has shown the possibilities in this direction. The team's findings confirm the impression that a lot of good coal is wastefully used because it is available under the present system of prices at a rate only slightly above the *middle grades*. The conclusion lends weight to the industry's plea for widening the range of prices by widening the differentials, both to encourage the quest for quality at the producing end and to rationalise consumption. The World Bank, which has now acquired a stake in the private coal industry's viability, has taken much the same view in urging an increase of up to 20 percent in the price of the top grades.

Since coal production has now reached a level where shortages have been eliminated, it may seem to New Delhi that there is no longer any urgency attaching to the industry's claims for price incentives. This would be a serious misreading of the situation on several counts. One is that demand will, even at the present slower rate of growth, rise to something like 80 million tons by the end of the third plan, which calls for a production of at least 12 million tons above the current level. While the National Coal Development Corporation's new collieries will undoubtedly be making some contribution in another two years, output in the private sector will have to rise to 61 million tons as planned if a shortage is not to recur. More than its aggregate contribution, it is the private sector which will have to meet the demand for the better grades. It is the qualitative aspect which New Delhi has to keep in mind if it is seriously concerned about coal supplies to essential consumers. As things stand today, private sector producers may be asking themselves whether the expansion to which they are committed is really necessary. The sluggishness of demand has introduced an element of uncertainty which may seem to make investment in coal even more unattractive than it is under the present price system. If the rate of growth suffers in these circumstances, shortages will develop again once demand starts to pick up. One present indications, a spurt in demand is likely from the end of 1966, when the current expansion of the steel plants and the installation of new power plants is completed. Since supplies cannot be increased overnight, this implies that current expansion programmes have to be pursued to create, in good time, the output potential needed three or four years hence. The policy implication is clear—that the country may have to pay dearly once again for any complacency engendered by the current coal surplus.

A CHECK ON PROFITS

A PROPOSAL by Britain's National Incomes Commission, in its second report, that profits shall be treated as an essential element in a national incomes policy has been resisted by the Federation of British Industries, and the ensuing controversy has raised some doubts about the principle of an incomes policy itself. Why not allow incomes to find their "natural" level within the framework of a general economic policy? The N.I.C. does not propose simple restraint of profits. It intends that profits shall be related to productivity: that if a company's productivity increases more than 3 percent or 3½ percent a year, the increase above that level shall be used not to raise profits but to lower prices. The F.B.I. replies that a profits policy will do more harm than good if it does not "take account of the nature of profits or of their functions in a progressive economy".

Debates of this kind will become more lively in Britain as the opposing political factions line up for the general election (which will probably take place next year, though the economic trend may persuade the Government that this year, about October, would be favourable). Both the major parties, it appears, will try to demonstrate the virtues of economic regulation. The Socialists will insist, and the Conservatives will probably concede, that profits and dividends must not be left free if wages are restrained. But restraint will probably be accepted as a general policy, not as a subject of specific legislation; and experience shows that general policies that are not formally enforced are not always effective. However, the emphasis on specific restraints is not wholly approved by economists. They prefer to emphasise the virtues of flexibility. And they believe that a financial policy that prevents inflation will avoid the need for specific restraints. The N.I.C. has been commended for recognising the importance of prices. But in economic conditions where competition is keen, the natural tendency to reduce prices will automatically restrain the rising trend of profits, in general.

Around the London Stock Exchange the idea of restraining profits specifically, and indiscriminately, is anathema. The most prosperous companies, the companies whose shares are most consistently favoured, are not those that charge high prices but those that become more and more efficient and are therefore able periodically to reduce their prices If beyond a certain point all the benefits of efficiency are to be passed on through prices, not retained as profits, the incentive to promote efficiency will be weakened, and the efficiency that could further reduce prices in the future will be lacking. The Stock Exchange regards restraint of dividends as only slightly less objectionable. It is, of course, different in principle, in that undistributed profits—unlike the notional profits that might have been earned but were not—actually exist, are the property of the shareholders, and, if properly employed, will increase profits in the future. But indiscriminate retention of profits distorts the flow of capital and thus distorts production. Britain had years of experience of dividend limitation after the last war, and economists believe that some of her subsequent troubles are attributable to the underdevelopment of some companies and the overdevelopment of others that it caused.

The essence of the argument against dividend limitation is that each company has its own requirement of self-financing capital and that if it is compelled to retain profits in excess of that requirement, its shareholders are deprived not only of income that they can spend but also of income that they can invest, so the capital market is deprived of resources that expanding companies could advantageously employ. (The same objection is applicable to unnecessary retention of profits by companies with overcautious directors; but that is a problem that the companies' shareholders can solve—if they make enough fuss.) Politicians argue that such objections are unrealistic because restraints on profits and/or dividends are intended not for any direct advantage but as a demonstration of equity. The workers' unions cannot be persuaded to limit their wage demands unless they can be convinced that equivalent sacrifices are accepted by, or imposed upon, the shareholders.

Some economists believe that the advantages of wage restraint have been exaggerated. Last year wages rose less in Britain than in continental Europe, but Britain did not noticeably improve her competitive position in world markets. This year there is evidence that she is improving her competitive position, not by relatively reducing her

wage costs but by improving her efficiency. It is arguable that future policy should positively emphasise efficiency, not negatively emphasise restraint. Efficiency is the surest means to reduce prices; and if also it increases incomes—employees' and shareholders' alike—so much the better. Efficiency will not solve the problem of relative wages in the era of modern technology: the problem of widening differentials between skilled and unskilled workers. Nor will restraints solve that problem. It is a social problem, and it must be treated as such.

CREDIT POLICY DEFENDED

A STRONG defence of the Reserve Bank's credit policy was offered by the Governor, Mr. P. C. Bhattacharyya, in his address at the tenth anniversary dinner meeting of the Bombay Bankers last Thursday. The address seemed to reflect official concern over the increasing criticism of the Bank's policy. The credit policy, said Mr. Bhattacharyya, was guided by two main aims. One was to create enough credit for genuinely productive activity, and the other was to help check inflationary pressures. It was also important, he added, to eliminate the wasteful use of finance and to promote the soundness of the economy. While nobody disagrees with these objectives, the question is how far the central banking authorities have succeeded in achieving them. Many banks are known to be opposed to the tiered system of lending rates but, according to Mr. Bhattacharyya, it represents a worthy compromise between the obligations of the Reserve Bank as lender of last resort and its duties as controller of credit. The Governor contended that the restrictions on the availability of Reserve Bank credit and the raising of the cost of credit had been operated in such a manner as to enable banks substantially to meet the credit requirements of the country during the 1962-63 busy season with due regard to the needs of defence and development.

Few financial observers are inclined to share Mr. Bhattacharyya's view that the credit requirements of the economy have been satisfactorily met and that the credit restraints have helped to curb less essential demands. Mr. Bhattacharyya claimed that were it not for the vigilance and safeguards against excessive borrowings, the total expansion of credit would have been greater with inevitable repercussions on prices and, on a longer view, on the progress of the development effort. But this claim is easily countered by pointing to the steady rise in prices since the beginning of 1963. The fact is that a large part of the economy is still non-monetised, and organised banking finances only 45 percent or 55 percent of the country's internal trade. In such circumstances, as the central bankers ought to know, monetary restraints can do little to restore the economic balance when there is a shortage of real resources.

That the credit-deposit ratio of scheduled banks should have reached the high level of 82 percent during the last busy season (1962-63) is an indication of the severe strain on the resources of the banking system. According to the Reserve Bank Governor, the liquidity problem has stemmed not from an excessive expansion of bank credit in the busy season but from an inadequate contraction of the bank credit during the 1962 slack season and the slow growth of deposits. However, that does not make the situation less disturbing. With the development of the economy, the credit requirements of industry and trade will increase. The new statutory requirements for liquidity will also exert some pressure on the resources of the banking system. As Mr. Bhattacharyya pointed out, the bankers' problem now is not so much one of seeking new borrowers as of securing the resources to meet the credit requirements of the private and public sectors.

The banking system has to face the challenge of how best to meet all demands for productive credit and yet to avoid any excess in credit expansion which might tend to push prices up. The pressure on banks will increase if deposits continue to grow at the present rate even though that rate, according to Mr. Bhattacharyya, is by no means abnormally low. The need for maximum mobilisation of the community's savings in the form of bank deposits can scarcely be over-emphasised. On its success in attracting deposits will depend the banking system's ability to meet the growing credit requirements of the economy. It would, however, be too optimistic to expect the increase in deposits to keep pace with the demand for funds because the compulsory deposits scheme and heavy taxation have seriously undermined the community's ability to save. The situation is likely to be further complicated by the deteriorating political situation because of the possible increase in the preference for liquidity. Reports about the heavy concentration of Chinese troops along the northern borders have already caused panic in the stock markets and an atmosphere of political uncertainty is not conducive to the growth of bank deposits.

Mr. Bhattacharyya's suggestion that banks should co-operate in lending both working and long-term capital for big individual projects deserves careful consideration. Such co-operation will not only relieve an over-extended liquidity position in some banks, but also help a particular bank to limit its commitment for any one party. Happily, there are precedents in this field and some experience has been built up. An extension of such co-operative operations would be of considerable help in meeting the problem of large individual demands for bank credit for genuinely productive purposes. No less welcome is the Reserve Bank Governor's advice to banks to be more flexible in adopting new practices and techniques of lending in the industrial sphere.

Current News and Comment

Cloth Output and Stocks

The output of cloth by Indian mills in June is provisionally placed at 393 million yards, compared with 411 million yards in May and 418 million yards in June last year. The June figure raises the total for the first half of the current year to 2,386 million yards, against 2,503 million yards in the same period last year. The production of yarn in June is placed at 158 million lbs, compared with 165 million lbs in the preceding month and 155 million lbs in June 1962. Yarn output in the first half of the current year amounts to 952 million lbs, which shows a small improvement over the January-June 1962 figure of 945 million lbs. The production performance of the mills is disappointing because unlike in the preceding season, the supply position of cotton this season has been distinctly comfortable. Stocks of raw cotton with the mills are reported to be fairly large—sufficient to last for nearly three-and-a-half months. Mills cannot complain about experiencing any difficulty in securing their supplies of raw materials since the turn of the year. Can it be that mills are restricting their output of cloth because they are hopeful of an upward revision of cloth prices? The Indian Cotton Mills Federation is known to have made a strong plea to the Government for an increase in cloth prices to compensate for the all-round increase in manufacturing costs.

Stocks of cloth with the mills at the end of June totalled 311,200 bales (of 1,500 yards each), against 303,800 bales at the end of May. While there has been an increase of 10,400 bales in the stocks under "sold but delivery not taken", unsold stocks are down by 3,000 bales from 153,800 bales to 150,800 bales. Stocks of cloth have increased during June, but yarn stocks with the mills have declined from 79,500 bales (of 400 lbs each) to 73,200 bales. Unsold stocks are down from 38,300 bales to 35,100 bales, and "sold but not lifted" stocks are lower at 38,100 bales, against 41,200 bales at the end of May. Stocks of both cloth and yarn are considered to be quite normal.

Job Opportunities in Community Blocks

Although, out of the 5,223 community development blocks into which rural India has been divided, about 5,150 blocks have so far been allotted covering nearly 99 percent of the population, the employment opportunities provided by the community development programme have not increased as much as was expected. According to a survey by the Planning Commission, by the end of March 1963, the rural works programme has provided jobs only to 78,000 persons at a cost of Rs. 1.6 crores. At this rate it is expected that not more than 750,000 additional jobs would be provided by the end of the third plan in the rural areas, against a target of 2.5 million additional jobs. The poor result so far achieved is surprising in view of the fact that the community development programme covers a large field, including animal husbandry, fisheries, minor irrigation and land improvement, rural arts, crafts and industries, health and rural sanitation, education, communications and housing. All of them are labour-intensive and should have provided new employment opportunities to landless and casual labour. Although the number of wage-earners in the community development areas is smaller than in other places, the survey has revealed that the scope for self-employment of agricultural labourers has increased somewhat because of the development activities. But it appears that the advantage derived by landless labourers has been rather limited.

An important point which emerges from the survey is that, whereas there has been an improvement in production and employment in some blocks, there has been either no significant improvement or a deterioration in others. It is quite possible that these differences have been due not so much to the operation of the community development programme as to "other forces of economic transformation" in the rural areas. A more detailed enquiry may help to find out the causes for such differences and to devise methods to remove them so that the backward blocks may be levelled up.

The working of community projects is hampered by administrative bottlenecks. It is necessary to ensure that official and non-official agencies work in harmony in order to maximise production. An important reason for the failure of agricultural production progammes at the block level has been the multiplicity of workers—the village level worker, the co-operative supervisor, the assistant agricultural inspector, the stockman, etcetera—who are not able to work in harmony and with a common purpose. For quite some time the State Governments have realised the harm which the multiplicity of workers has caused, but nothing has so far been done to set things right. The Government departments dealing with the various problems of agricultural production seem to be working without any co-ordination. Another shortcoming, which has reduced the effectiveness of community development programmes, is that use has not always been made of improved techniques of production and superior tools.

WANT NOT

Toning Up the Capital Market

In spite of some revival in recent weeks, the Indian capital market continues to be dull and

depressed. In a speech in Bombay, Mr. Dhirajlal Maganlal, vice-president of the Indian Merchants Chamber, recently stated that there has been a fall of nearly Rs. 400 crores in the market value of shares and securities quoted at the various stock exchanges as a result of the Chinese aggression and the taxation policy adopted by the Government to meet the emergency. Another indicator of the dullness in the capital market is that business in the seven stock exchanges in the country has been only 10 percent to 25 percent of what it was a year ago. The adverse investment climate has affected the rate of economic growth. In the past few months the rise in prices and the consequent increase in the cost of living, the compulsory savings deposit scheme and the unprecedented increase in both individual and corporate taxation have together reduced the people's capacity to save. It is quite likely that there might be an increase in institutional savings but, since they constitute only about 5 percent of the total savings, a decline in individual savings is bound to retard capital formation in the country.

The importance of Mr. Maganlal's speech lies in his suggestions to accelerate the rate of capital formation and to tone up the stock market. Savings are important, but still more important is the channelling of the savings into industrial investments. For this purpose it is necessary to start unit investment trusts in the country. There are at present about 600 financing bodies and holding companies in India which call themselves investment trusts, but they are not "unit" trusts and do not perform that function for the small investor. For some time now there has been a proposal to start a unit trust in the public sector. But since the management of such an institution calls for special qualities of initiative, understanding of the working of corporate enterprises and extensive contacts with business executives in the country, it will be advisable to start a number of unit trusts in the private sector. Under the existing income tax law, the shareholders of such investment trusts will be subject to double taxation. This anomaly will have to be removed. The super profits tax has done much harm to the process of capital formation and has been partly responsible for scaring investors away from the stock markets. Many companies have been compelled to reduce their dividend rates because of the incidence of this tax. It should either be scrapped altogether or toned down. Mr. Maganlal also suggested that, to the extent of holdings of shares in new companies, the wealth tax on companies should be removed.

Mr. Maganlal further pointed out that in 1961 the Indian capital market was at its best, but then the Government imposed a system of interim margins on stock exchanges along with some other restrictions and the Reserve Bank issued directives to banks to impose a minimum margin of 40 percent on advances against shares and bonds. Many investors pledge their shares in existing companies with banks to obtain funds in order to invest in the shares of new companies. The high minimum margin of 40 percent imposed by banks on advances against shares has made this method of investment difficult. In order to encourage the capital market, Mr. Maganlal has rightly suggested that the Reserve Bank should relax the minimum margins; it would be more in conformity with the prevailing conditions to lay down a minimum margin of 25 percent or so on advances against shares.

Ferrous Scrap Exports

Exports of ferrous scrap from India in June amounted to 25,023 tonnes, compared with 26,051 tonnes in the preceding month and 4,721 tonnes in June 1962. The June figure raises the total quantity of scrap shipped from the country during the first half of this year to 122,603 tonnes, compared with 77,350 tonnes in the corresponding period of 1962. Shipments during January-June 1961 and 1960 were 198,155 tonnes and 174,072 tonnes, respectively. Export performance during July is reported to be fairly satisfactory. Although there has been a modest setback in overseas prices over the past few weeks, demand, it is said, has been maintained at a satisfactory level. The easier trend in prices is attributed to increased competition following the entry of Russia into the scrap export trade, the offer of superior grade scrap by all exporting countries and the reduction in scrap prices in the principal Japanese market. While the export trade does not anticipate any noteworthy recovery in foreign prices in the immediate future, exporters seem fairly optimistic about the level of overseas demand. To take advantage of the demand, the trade wants encouragement for upcountry collection by introducing concessional railway freight and compensation for the export loss on inferior grades of scrap, which amounts to about Rs. 30 a ton at the current level of export prices.

Sugar Control

The new control measures introduced under the Sugar Control Order 1963 have so far made no perceptible impression on sugar prices. In the past wholesalers were licensed and the market received its supplies through them. Under the present measures, stringent restrictions have been imposed on the licensed wholesale dealers whereby they cannot sell sugar to those who are not registered as retailers with them. Wholesalers will have to display prominently the prices of all varieties of sugar stocked by them and keep a record of the supplies made to each retailer, the prices charged and the date of sale. The permissible margin for wholesalers is 1½ percent in the case of cash sales and 2 percent in the case of credit transactions. The retail distribution has been left within the purview of the State Governments, which may introduce a system of identity cards to enable consumers to draw a fixed quantity of sugar and foodgrains from fair price and other shops.

By merely controlling the wholesale prices, the sugar problem cannot be tackled. Due partly to defective distribution of the available supplies and partly to the nervousness of the consumers, who are keeping reserves of sugar, an artificial scarcity has been created in the market. So prices have gone up. In view of this, the tightening of control measures and the use of the Defence of India Rules to curb profiteering and blackmarketing are not likely to succeed. The Central Government has clearly stated that, although the enforcement of the control measures is the responsibility of the State Governments, its inspectors would be used to detect irregularities and malpractices in the trade. The weakness of the control measures arises from the fact that they depend for their success on the integrity, efficiency and alertness of the officials. It has been the experience all over the world that the Government machinery should be efficient in order to make price and distribution controls effective, otherwise the situation only turns worse. An increase in supplies either through larger production or through imports, as in the case of foodgrains, is the only effective method of stabilising the prices of essential commodities like sugar, wheat and rice. Controls are at best palliatives.

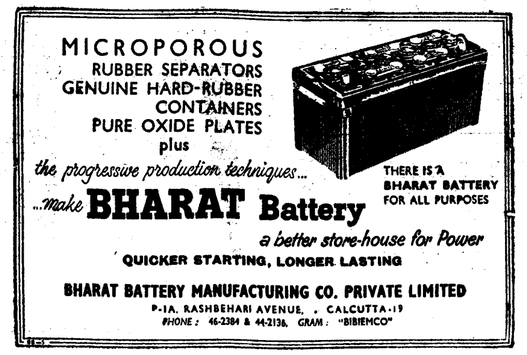
CORRESPONDENCE

STATE WAREHOUSING OF FARM PRODUCE

(To The Editor of "Capital")

Sir,

Mr. Hoon, while reviewing "State Warehousing of Farm Produce in India" in *Capital* of 18th July, writes: "The Reserve Bank has allowed these advances outside the limits prescribed for foodgrains." This is so only concerning new warehouses established on or after 1st April, 1962. In terms of the Reserve Bank's directive of 23rd January, 1963, as amended by the directives of 11th March and 16th May, while keeping advances against all foodgrains (excluding wheat) including advances against warehouse receipts within the overall ceiling limits, average aggregate levels of advances other than those against warehouse receipts shall not exceed the levels in the corresponding two-month period of the previous year. This permits a little additional level of credit against warehouse receipts.



Yours etcetera,
R. K. Sinha

Muzaffarpur, 22nd July, 1963.

INDIA AND FREE TRADE

THE people of India are indebted to Lord Northbrook for raising the interesting debate in the House of Lords on the 10th ultimo, which we print in another column, upon the question of India's position with reference to the proposed new fiscal departure in England. It, of course, transpired that India had not been considered and, needless to say, had not been consulted. India is one of the most striking and consistent apostles of free trade. Her industries not only receive no protection but her cotton manufactures are handicapped by an excise duty equivalent to the Customs import duty on foreign manufactured goods. Such a case is without parallel in the world. Of course it could only have been adopted because Indian interests are always subordinated to the philanthropic desires of Manchester. It is unfortunate that Mr. Robertson should have issued his Review of the Trade of India so early, because a chapter on the incidence of India's foreign trade would have been of considerable interest at this juncture. We gather from his review that the United Kingdom supplies 66 percent of the value of imports, the Continent of Europe 15 percent and the United States 1½ percent. Of the 15 percent contributed by the Continent, Russia supplies 3 percent and this is represented by petroleum. Similarly the great bulk of the imports from the United States is petroleum also. It thus appears that only 12 percent of the value of the import trade of India is contributed by the Continent of Europe, and it would be interesting to know how much of that 12 percent could be supplied by Great Britain. It is perfectly clear that she has the great bulk of the import trade.

FROM

A Ditcher's Diary

SOME COMMENTATORS, I FIND, HAVE BEEN DEMANDING that New Delhi give the people its assessment of the magnitude of the Chinese threat and spell out its methods of dealing with it. It is true enough that few countries are less informed of the state of their defences than India. Yet it seems too much to expect that the Government of India will oblige. Surely it cannot say what its precise information is on the Chinese build-up along the Himalayas without giving away to the enemy data useful to him. I have never tried to be a political or military astrologer; so I do not know what the Chinese may be up to. But the time may have come to divide the problem into two parts, military and political. On the first, preparedness must continue to grow; this much is obvious. But it should be clearly understood, and this is where politics comes in, that the Chinese are unlikely to stand by and watch India acquire greater and greater military strength and do nothing about it. (India did not view U.S. military aid to Pakistan with indifference.) Where do we go from here? While political inhibitions within the country and its Government may or may not hinder greater military aid from the West, the external limitations do not appear to have been sufficiently widely recognised. It is necessary to mention another limitation, this from the West. Having for years played down the threat from China, New Delhi now affects to be disappointed that its current military assessments are not accepted without examination in Washington and London. Also, India's internal limitations may not proceed solely from political inhibitions but also from physical factors. To mention these limitations is not to advocate a policy of weakness and appeasement. Far from it. But it is dangerous to go round saying, as an air force officer is reported to have said to Rawle Knox of the *Daily Telegraph*, that the Indian Air Force should bash up the Chinese before they complete their build-up. Such talk from the Prime Minister not so long ago provided the Chinese with at least a pretext for doing what they did. Nobody can want a repetition of that. Talking can be as effective a weapon as some others lately imported; not the kind of talking the officer indulged in, though.

THE ONE MAN WITH ALL THE REASONS IN THE WORLD to disapprove of detailed reporting of the Ward trial—yes, Mr. "Jack" Profumo—has not yet done so. But see how many simple-minded people he has from Charing Cross to Chowringhee to do it for him! Maybe I haven't got a particularly clean mind, said to be a handicap in journalism; maybe my stomach is strong enough to take in worse stuff than the juicy details of the lives of Miss Christine Keeler and Miss Mandy Rice-Davies. I still believe that most newspaper readers have in the last few days turned first to the Ward story and then to Mr. Nehru on the third plan. And it is among such readers that you may find a majority of the people who have been writing angrily about purveying pornography. It seems as yet unestablished that Dr. Stephen Ward's flat contained a two-way mirror. What the public hates is to be held before it any kind of mirror. Yes, even in affluent societies pretty girls go awhoring. Yes, even in Britain's still in many ways Victorian society "top people" tolerate low friends with interesting acquaintances. Yes, in the underworld of espionage morality does not enjoy priority number one. Such is the truth; and why not know it? Remains the ancient Athenian question of corrupting the youth, leading to Socrates's cup of hemlock. Fortunately, this journal does not have to report court cases. Even more fortunately, this journal is not read by adolescents. But what is a daily paper to do? Think of that small fraction of their readership which consists of children whose minds have not been trained by their parents to have a healthy attitude to sex and other facts of life? I find the demand preposterous. That some politicians have objected to detailed coverage of the Ward trial does not surprise me one bit; most people in that profession —second oldest?—would rather have things suppressed than published. But the public should know that by inciting editors to suppress news it deprives itself of its best source of information, the sort of information without which it is ill equipped to judge its rulers. There's nothing, absolutely nothing, like—exposure.

IT HAS LONG BEEN A CONVICTION OF MINE THAT THE true frontier of India—that is, the line which must be watched for intrusions from outside—stretches from south of Sydney at one end, up through Singapore, then along China's border with Burma and the watersheds of the Himalayas and the Sulaimans, across the coasts of Persia and Arabia and then down the east coast of Africa at least as far as Durban. This may sound rather startling, but it is no longer merely a piece of fanciful *realpolitik*, not since the Chinese forcefully underlined the fact that such old-fashioned concepts as "spheres of influence" still have tremendous significance in ensuring this country's defence. It has always seemed to me that India's sphere of influence must include the whole of the Indian Ocean, a strategic concept which, so far, only the Indian Navy seems to have grasped. I do not think President Soekarno has, considering his decree that the Indian Ocean be renamed the Indonesian Ocean. Now I agree that it would be a mistake to take this piece of weird geo-nationalism too seriously; Dr. Soekarno is, after all, only one among a horde of picturesque and flamboyant despots who have been thrown up by modern nationalist movements. Generally speaking, their significance can be judged from the fact that their antics are usually in inverse proportion to the size and importance of the countries they lead. But certainly Dr. Soekarno is one of the most dangerous from India's point of view. He is in tenuous control of a country whose population is almost half ours. He has flirted with communism in his time for reasons which have exceeded the usual one of its being understood as necessary to gain economic aid and political support from the United States. And although his policy on Malaysia appears to have been at least temporarily frustrated, he has been spectacularly successful in gaining his ends over West New Guinea, even though it has involved breaking faith with the United Nations. Altogether a character to be watched, one might say—particularly if his implied ambitions in the Indian Ocean and his antagonism towards Malaya cause him to draw too close to China.

AT A TIME WHEN AMATEUR GROUPS IN CALCUTTA are moving increasingly towards the serious theatre, there is some merit, I suppose, in the Dramatic Club of Calcutta maintaining the balance by concentrating on the light-hearted and the inconsequential. John Chapman's *Dry Rot*, staged by the D.C.C. at the New Empire last week in aid of Dr. Graham's Homes, is not exactly the best possible choice from the latter category. But for busy amateurs occasionally able to spare a little time for acting, it has the advantage of being relatively undemanding in terms of talent and rehearsals; and, in its own way, it can be entertaining too. The story of *Dry Rot*, qualitatively, is dry rot, which perhaps is the main justification for what otherwise appears to be a rather irrelevant title. To the extent that there is a story at all, it centres on the antics of three goons conspiring to make a fortune by switching horses before a race. The conspiracy is hatched in a small country hotel in England newly taken over by a retired colonel and his wife (ex-India); predictable jokes abound, and so do improbable situations, in a comedy in which the humour is anchored firmly to the level of low slapstick. Condemned to cope with drama of this calibre, Terence Rochford gave a competent performance as Alfred Tubbe, the bluff and hearty bookmaker who leads the trio of goons. Colonel Wagstaff and his family were stiff—in parts stiff enough to suggest that they might have walked all the way back from

BANK OF NEW SOUTH WALES*

India. But Mike Griffiths and Doreen Lack gave an amusing display of dimwits coo-ing themselves into romance; and Basil Gill was brilliant in his Anglo-Saxon caricature of gallic eccentricity. On the whole, Margaret Anderson's production was a fair effort, which might have been improved with a little more pace in the earlier scenes. If she had some difficulty, as I did, in coping with John Chapman's humour, it may not have been entirely her fault; buffoonery, after all, is a poor substitute for wit even in the most unambitious of light comedies.

WHILE NOT A NAYA PAISA OF GOVERNMENTAL expenditure should go unscrutinised, I do not quite see why the West Bengal Assembly should have got so worked up this week over the few rupees the Government of West Bengal may have spent on its extension of hospitality to Acharya Vinoba Bhave. Perhaps it was not necessary to make the Acharya a guest of State; perhaps the Opposition was within its rights to consider the Acharya an undesirable guest. Yet the debate lacked decorum. Similar questions have in the past been asked in the Lok Sabha, always leading to some embarrassment and no great saving of public funds. The fact is that when I present a friend with a gift I first take the price tag out; and now Acharya Vinoba Bhave will be made to feel, as the late Lady Mountbatten and some others were earlier made to feel, that perhaps his acceptance of Mr. P. C. Sen's invitation cost the people too much, or so their elected representatives think. This takes the grace out of hospitality. The point has been made elsewhere that in the current emergency the Acharya performs a very useful public function by being able to say a thing or two which need saying but cannot be said by others. I am inclined to agree. The channels of criticism are not exactly multiplying in this country; and the lack is only partially justified by the conflict with China. I hear from Delhi that the A.I.R.-V.O.A. deal has rendered Mr. Gopala Reddi's position somewhat vulnerable; I also hear that some of Mr. Reddi's "unfriends" do not mind the deal so much as his unmilitant Hindi policy. Nothing in Indian politics is what it seems; there are wheels within wheels within wheels. I have a horrible feeling that the objections to Acharya Vinoba Bhave's visit stemmed from factors and motives which may have nothing to do with possible disapproval of the Acharya as a public figure.

THE PROBLEM OF KEEPING ONE'S SCIENTISTS FROM migrating abroad to wherever their talents are accorded the greatest scope, the best remuneration and the highest social esteem seems to be becoming increasingly serious in Britain, as it is in India. The loss there is to the United States, and since the multi-occupational Lord Hailsham made such a fool of himself by suggesting the cause was the inadequacy of the U.S. educational system, it has been obvious that something would have to be done about it. So in Britain the drive to stop the "brain drain" is on, although the remedies proposed up to now promise to be no more effective than those seen in this country. More money for research is an obvious one; so is the provision of better university appointments and training awards. The Labour Party has even announced plans for a stronger and more independent Ministry of Science, although not, significantly, for putting it in the charge of a scientist rather than merely the socialist equivalent of an amateurish layman like Lord Hailsham. In fact, almost everything has been promised except higher salaries, a form of inducement to which somehow insufficient importance is always attached. All very heartening for the scientists, perhaps; but I doubt if it is going to be enough. Personally, I think such ideas miss the real point, which is that scientists will always tend to move from a society in which their status is low to one where it is higher. Unless they are able to assume the position to which their importance entitles them, and are not prevented from doing so either by social tradition and prejudice, as in Britain, or by complete indifference, as in India, they are bound to be frustrated and inclined to move elsewhere.

THE DITCHER

Guide for Investors

BIRLA JUTE EARNS MORE, PAYS SAME

THE Birla Jute Manufacturing Co. Ltd has done well during the year ended March 1963. The gross profit has substantially risen, but the impact of taxation including the super profits tax, has been so heavy that the distributable amount for shareholders has been cut. The jute mills have worked satisfactorily because of an abundant supply of fibre, and its low price in relation to the prices of goods. During the current year, the overseas demand for jute goods has declined so far, but the directors hope that the demand from developing and communist countries will rise in due course. So the mill industry is expected to work at the maximum level of production throughout 1963-64. Pointing out that Pakistani competition has been growing, they hope that suitable incentives will be given to the Indian industry to face up to the danger.

The Company has increased the number of broad looms to 64. As for the cement plant in Satna, it has worked satisfactorily and produced 221,477 tons. The entire equipment for expansion of the factory is being erected and production may begin towards the end of 1963. The output should rise to 1,750 tons a day, when the expansion is completed. The Company has obtained a licence to build a new cement factory in Chittorgarh with a daily capacity of 600 tons. Provisional orders for the plant have been placed, and output may begin in the middle of 1965. The project may cost Rs. 2.75 crores. The staple fibre spinning mill with 30,000 spindles has done well. It has been decided to build a factory for producing oxygen and acetylene gas and orders for machinery are being placed. Production may begin in April 1964.

Sales rose from Rs. 9.30 crores in 1961-62 to Rs. 10.45 crores. The gross profit has improved from Rs. 1.60 crores to Rs. 2.07 crores. Taxation absorbs a higher sum of Rs. 60 lakhs including super profits tax, compared with Rs. 42 lakhs. A taxable ordinary dividend of 15 percent has been maintained to absorb Rs. 23.93 lakhs. The yield amounts to 5.1 percent at the present price of Rs. 29.50 a share of Rs. 10 each. Depreciation is allocated Rs. 67.43 lakhs, against Rs. 63.62 lakhs, development rebate reserve Rs. 14.11 lakhs, against Rs. 4.33 lakhs, general reserve Rs. 30 lakhs, against Rs. 17.82 lakhs, and development and rehabilitation reserve Rs. 3.10 lakhs.

McLeod Pays More

MCLEOD and Co. Ltd has increased its profit from Rs. 14.09 lakhs in 1961 to Rs. 25.29 lakhs for the year ended December 1962, after providing Rs. 1.24 lakhs (against Rs. 1.19 lakhs) for depreciation. The improved results are due to a better dividend income because considerably higher incomes have been received from the managed jute, tea and engineering companies. The insurance and miscellaneous departments have done well, but the shipping department has produced disappointing results.

The taxable ordinary dividend has been increased from 15 percent to 18 percent absorbing Rs. 8.48 lakhs, so the yield amounts to 8.7 percent at the present price of Rs. 206 a share of Rs. 100 each. Taxation is allocated Rs. 7.75 lakhs (against Rs. 2.68 lakhs), convertible notes redemption reserve Rs. 2 lakhs (the same), investment reserve Rs. 1.25 lakhs, general reserve Rs. 3 lakhs and development rebate reserve Rs. 5,554. The carry-forward is Rs. 2.35 lakhs, against Rs. 2.01 lakhs brought in.

India Cements Cuts Dividend

THE directors of India Cements Ltd have recommended a dividend of 9 percent, less tax, for the year ended March 1963, compared with 12 percent paid in the preceding year. Although the rate of dividend has been reduced considerably, the total amount distributed among the equity shareholders is almost about the same because of the increased capital. The preliminary report on the working of the Company during 1962-63 shows a small setback in the gross profit from Rs. 91.62 lakhs to Rs. 85.84 lakhs. After providing Rs. 37 lakhs (against Rs. 40.33 lakhs) for depreciation and Rs. 24 lakhs (against Rs. 23.50 lakhs) for taxation, the net profit amounts to Rs. 24.84 lakhs, against Rs. 27.79 lakhs in 1961-62. After taking into account the previous year's balance of Rs. 1.39 lakhs (against Rs. 1.19 lakhs), refund of taxes and coal subsidy relating to earlier years amounting to Rs. 1.22 lakhs (against Rs. 68,000) and transferring Rs. 11.31 lakhs (against Rs. 5 lakhs) for rehabilitation and development reserve and general reserve, the disposable surplus amounts to Rs. 38.76 lakhs, against Rs. 34.66 lakhs.

Appropriations include donations Rs. 3.47 lakhs (against Rs. 1.17 lakhs), rehabilitation, research, modernisation and development reserve Rs. 4.49 lakhs (against Rs. 2.07 lakhs) and reserve for development rebate Rs. 35,000 (against Rs. 87,400). The proposed ordinary dividend absorbs Rs. 26.75 lakhs (against Rs. 26.93 lakhs) and preference dividend accounts for Rs. 2.22 lakhs (the same). After making all these appropriations, there remains a surplus of Rs. 1.47 lakhs to be carried forward, against Rs. 1.119 lakhs brought in. The Rs. 5-paid share of India Cements is currently quoted around Rs. 5.60.

Polychem Maintains Dividend

IN spite of a 20 percent increase in the sales from Rs. 1.64 crores to Rs. 1.97 crores, the gross profit of Polychem Ltd for the year ended March 1963, is slightly down from Rs. 39.52 lakhs to Rs. 38.42 lakhs. The profit has been arrived at after providing Rs. 5.93 lakhs (against Rs. 4.95 lakhs) for sole selling agents' commission. The directors point out that sales would have been still higher but for the large stocks of materials allowed to be imported. From the year's profit, the directors have provided Rs. 6.30 lakhs (against Rs. 7.06 lakhs) for depreciation, Rs. 17 lakhs (against Rs. 15.50 lakhs) for taxation, Rs. 2.44 lakhs (against Rs. 22,939) for development rebate and written off Rs. 5,739 (against Rs. 34,445) towards expenses on the issue of new equity shares. The net profit amounts to Rs. 12.69 lakhs, against Rs. 16.74 lakhs in 1961-62. No provision has been made for the general reserve which had received Rs. 6 lakhs in the preceding year and allocation to the dividend equalisation reserve has been reduced from Rs. 3 lakhs to Rs. 2 lakhs. The directors have created a dividend reserve with an allocation of Rs. 12 lakhs out of which will be paid the ordinary dividend at the rate of 15 percent (the same) absorbing Rs. 8.40 lakhs (against Rs. 6.94 lakhs) and preference dividend amounting to Rs. 3.33 lakhs (the same), leaving a sum of Rs. 9,000 to be carried forward, against Rs. 1.19 lakhs brought in.

The directors state that the Company's polystyrene plant operated satisfactorily during the year and plans have been implemented for simultaneous production of both the general purpose as well as high impact materials at the plant. Facilities have also been augmented to meet the growing demand for the coloured materials. The erection of the styrene monomer and alcohol plant has been completed and both the plants are expected to be commissioned shortly. The directors add that the progress of work on these two projects would have been achieved as planned but for the delays caused in receiving the foreign and indigenous equipment and the required approvals of various Governments and local authorities concerned. The capital expenditure incurred during the year was Rs. 32.35 lakhs including that on building under construction and machinery under erection. Since 31st March, 1963, further amounts totalling Rs. 11 lakhs have been borrowed from the I.F.C., making a total borrowing of Rs. 93.37 lakhs. A sum of Rs. 15 lakhs has since been borrowed from the Bank of Baroda. The Rs. 50-paid share of Polychem is quoted around Rs. 140.

Universal Cables Skips

UNIVERSAL Cables Ltd has passed the dividend for the year ended March 1963, because the directors want to conserve resources for expansion. The equipment for making paper-insulated lead-covered power cables has been received, and will soon be installed. The production may begin towards the close of 1963. The Company has obtained a licence for manufacturing thermo-plastic power cables with an output of 240 miles a year. A licence for producing aluminium redraw rods with an annual capacity of 3,000 tons has been obtained. Industrial licences have been received for producing paper capacitors and industrial condensors. The directors are negotiating for foreign collaboration for the capacitor-making project. There is a profit of Rs. 4.68 lakhs. Bringing in Rs. 5,609, there is an available balance of Rs. 4.74 lakhs. Depreciation absorbs Rs. 40,976, development rebate reserve Rs. 42,000, general reserve Rs. 2 lakhs and taxation Rs. 1.65 lakhs. The carry-forward is Rs. 25,594.

Bally Jute Pays the Same

THE Bally Jute Company Ltd has raised its gross profit from Rs. 20.64 lakhs in 1961-62 to Rs. 38.19 lakhs for the year ended March 1963. A taxable ordinary dividend of 2[illegible] percent has been repeated to absorb Rs. 5 lakhs. It offers a yield of 9.2 percent at the present price of Rs 272 a share of Rs. 100 each. Depreciation is allocated Rs. 6.39 lakhs against Rs. 6.90 lakhs, development rebate reserve Rs. 80,000, against Rs 18,000, general reserve Rs. 4.50 lakhs and taxation, including super profits tax, Rs. 19.70 lakhs, against Rs. 6.90 lakhs. The Company has obtained a licence to install 80 broad looms and the necessary equipment has started arriving. Production may start towards the close of 1963, and the project will cost about Rs. 70 lakhs.

Bararee Coke Maintains

IN their report for the year ended March 1963, the directors of the Bararee Coke Co. Ltd mention that they are considering schemes to expand the output of coke and by-products. They have also plans to diversify their by-products output. The production of hard coke rose from 59,540 tons in 1961-62 to 62,483 tons. The sulphate of ammonia and the sulphuric acid plants worked fairly well. Although efforts are being made to reduce production costs, only marginal success is likely to be achieved in view of the old age of the equipment.

The profit has risen from Rs. 8.62 lakhs to Rs. 10.12 lakhs, after providing Rs. 69,757 for depreciation. A taxable ordinary dividend of 15 percent has been maintained which is more than five times covered and offers a yield of 7.1 percent at the present price of Rs. 21.06 a share of Rs. 10 each. Taxation including a sum of Rs. 1.55 lakhs for super profits tax, absorbs Rs. 7 lakhs (against Rs. 3.17 lakhs). Development rebate reserve is allocated Rs. 120 (against Rs. 3,457), deferred repairs reserve Rs. 1.50 lakhs (against Rs. 1 lakh) and general reserve Rs. 80,889 (against Rs. 50,110).

North-Western Cachar Tea Halves Dividend

THE North-Western Cachar Tea Co. Ltd has earned a profit of Rs. 6.13 lakhs for the year ended December 1962, compared with Rs. 2.61 lakhs for 1961, after providing Rs. 1.29 lakhs (against Rs. 1.59 lakhs) for depreciation. The taxable ordinary dividend has, nevertheless, been halved to 10 percent, although the ordinary share capital has, meanwhile, been raised from Rs. 7 lakhs to Rs. 12.60 lakhs by the issue of bonus shares. The dividend absorbs Rs. 1.26 lakhs and works out to a yield of 6.3 percent at the present price of Rs. 160 a share of Rs. 100 each. Taxation is allocated Rs. 3.27 lakhs (against Rs. 1.53 lakhs), development rebate reserve Rs. 7,500 and revenue reserve Rs. 1.50 lakhs. The carry-forward is Rs. 5,355, against Rs. 2,358 brought in. The crop amounted to 5,783 quintals against 5,708 quintals and the average sale prices of all estates were higher than in 1961. For 1963, the crop has been estimated at 5,800 quintals at a cost of Rs. 8.50 lakhs.

Rameshwara Jute Pays Nil

THE Rameshwara Jute Mills Ltd shows a trading profit of Rs. 20.68 lakhs for the year ended March 1963, compared with Rs. 8.36 lakhs for 1960-61. Depreciation, including a sum of Rs. 5 lakhs for previous years, absorbs Rs. 10.64 lakhs, but there is still unabsorbed depreciation for Rs.

7.37 lakhs. Development rebate reserve is allocated Rs. 2.28 lakhs (against Rs. 2.25 lakhs) and taxation Rs. 3.90 lakhs (against Rs. 200). The outstanding debit balance of Rs. 3.61 lakhs has been wiped off leaving a credit balance of Rs. 25,500 to be carried forward. The dividend has again been passed. The Company has a contingent liability of Rs. 4.20 lakhs for arrears of preference dividends up to March 1963.

The directors expect bumper crops in India and Pakistan during 1963-64. Considering that Indian mills have stocks of raw fibre equivalent to nearly five months' consumption, the disposal of the new crop will present a serious problem. Since the Government has fixed the minimum price of raw jute at a higher level than in Pakistan, fibre smuggled from that country is likely to press on the Indian supplies.

Britannia Engineering Sales, Profit Up

THE directors of the Britannia Engineering Co. Ltd take an optimistic view of the Company's expansion prospects in their report for 1962. The wagon division in Mokameh has done well and produced 675 wagons for the railways. The production of cone-winders in collaboration with foreign parties has begun. Machines are being produced and supplied to the jute industry. The factory for producing road rollers has been completed, and the output rose from 95 in 1961 to 150 in 1962. It is hoped to increase the output further with a 100-percent indigenous content when more equipment is installed. The steel foundry is expected to start producing by the middle of next year. It is estimated that about 4,005 tons of steel castings will be produced a year.

Sales rose from Rs. 2.72 crores to Rs. 3.52 crores and the profit has increased from Rs. 11.48 lakhs to Rs. 24.17 lakhs, after providing Rs. 12.19 lakhs (against Rs. 9.05 lakhs) for depreciation. A taxable ordinary dividend of 10 percent has been maintained on the capital which was doubled by a rights share. The dividend absorbs Rs. 10 lakhs and works out to a yield of 9.6 percent at the present price of Rs. 10.44 a share of Rs. 10 each. Taxation absorbs Rs. 9.10 lakhs (against Rs. 4 lakhs). Development rebate reserve gets Rs. 3.70 lakhs (against Rs. 2.62 lakhs). The carry-forward is Rs. 5,115, against Rs. 1.11 lakhs brought in.

Hilla Tea To Diversify Output

THE Hilla Tea Estates and Industries Ltd (a Dooars garden) has again passed the dividend for the year ended December 1962. The Company has made only a small profit of Rs. 3,547, after providing Rs. 53,603 (against Rs. 37,735) for depreciation. There was a loss of Rs. 10,416 for 1961. A sum of Rs. 6,800 has been set apart for development rebate reserve. The directors point out that a sum of Rs. 18,208 representing the loss on the sale of the previous year's crop has had to be set off against the earnings for 1962. The crop was 3,334 quintals and the average sale price amounted to Rs. 4.38 a kilogram, against Rs. 3.86 a kilogram. A crop of 3,629 quintals has been estimated for 1963. Replanting has been undertaken and the directors are considering the adoption of C.T.C. manufacture. The present name of the Company has been adopted in place of the former name in view of the decision of the directors to diversify its activities to include production of instant tea, chemicals, wastewood products and engineering equipment, especially for manufacturing tea.

Central Cachar Tea Profit Down

THE Central Cachar Tea Co. Ltd has reduced the taxable ordinary dividend from 7.5 percent to 5 percent for the year ended December 1962 to absorb Rs. 55,000. The yield amounts to 6.7 percent at the present price of Rs. 74.50 a share of Rs. 100 each. The profit has declined from Rs. 2.39 lakhs for 1961 to Rs. 1.74 lakhs for 1962, after providing Rs. 84,685 (against Rs. 82,223) for depreciation. Taxation absorbs Rs. 1.35 lakhs (against Rs. 1.32 lakhs), development rebate reserve Rs. 4,583 (against Rs. 1,840) and general reserve Rs. 1.56 lakhs (against Rs. 50,000). The crop declined from 545,645 quintals to 454,449 quintals. A crop of 353,060 quintals has been estimated for 1963 at a cost of Rs. 3.75 a kilogram. The disappointing results have been due to drought. It has been decided to dispose of the Burnie Brass estate.

Roopacherra Tea Suffers Loss

THE Roopachetra Tea Co. Ltd (a Cachar garden) has incurred a loss of Rs. 1.72 lakhs for the year ended December 1962, after providing Rs. 61,384 (against Rs. 65,674) for depreciation. For 1961 there was a profit of Rs. 92,257. The dividend has been passed. Bringing in Rs. 6,331 and setting aside a sum of Rs. 1.486 for development rebate reserve, a debit balance of Rs. 1.69 lakhs has been carried forward.

The crop declined from 326,670 kilograms to 195,018 kilograms. Although the average selling price has gone up from Rs. 4.40 to Rs. 4.62 a kilogram, the directors point out that 150 acres of tea were badly affected by floods and must be considered a total loss. Out of this 35 acres have already been sown with high-quality jute seed and this will be followed by paddy crop. It is proposed to plant Ramie on spare lands and they hope that it will be a profitable side-line crop. The 1963 tea crop has been estimated at 250,400 kilograms at a cost of Rs. 9.50 lakhs.

Punjab National Bank Repeats Interim

THE directors of the Punjab National Bank Ltd propose to maintain the interim dividend for the half year ended June 1963 at 10 percent, that is, Re. 1 a share of Rs. 10. The net profit of the bank for January-June 1963, amounts to Rs. 50.19 lakhs, compared with Rs. 49.55 lakhs in the corresponding period of 1962. But the profit has been arrived at after providing for corporation tax and super profits tax for the whole of 1962 and for the first half of the current year. After bringing in Rs. 15.21 lakhs (against Rs. 10.38 lakhs) the directors propose to utilise Rs. 20 lakhs for the payment of the dividend, leaving a sum of Rs. 45.40 lakhs to be carried forward to the next half year's account.

More from Dejoo Valley

THE Dejoo Valley Co. Ltd (an Assam garden) has made a profit of Rs. 2.85 lakhs for the year ended December 1962, compared with Rs. 1.16 lakhs for 1961, after providing Rs. 49,430 (against Rs. 47,606) for depreciation. The taxable ordinary dividend has been increased from 20 percent to 30 percent absorbing Rs. 36,000. The yield works out to 5.7 percent at the present price of Rs. 52.50 a share of Rs. 10 each. Taxation absorbs Rs. 1.48 lakhs (against Rs. 25,100), development rebate reserve Rs. 1,665 (against Rs. 766) and buildings and machinery reserve Rs. 1.20 lakhs. There is a carry-forward of Rs. 3,613, against Rs. 23,610 brought in.

The crop was 200,496 kilograms, against 173,277 kilograms, but the average sale price rose from Rs. 5.19 to Rs. 5.90 a kilogram. The 1963 crop estimate is 199,600 kilograms at a cost of Rs. 7.97 lakhs. The Tea Board has agreed to give a long-term loan of Rs. 3.77 lakhs for expansion in planting.

Radio and Electricals Does Well

THE working results of Radio and Electricals Manufacturing Co. Ltd for the year ended March 1963, show a considerable improvement over the previous year's performance. The profit, after poviding for all expenses of management, depreciation and bonus, has increased by nearly 21 percent from Rs. 31.24 lakhs to Rs. 37.84 lakhs. With the amount of Rs. 41,536 brought forward and with a sum of Rs. 3 lakhs transferred from dividend equalisation reserve and including Rs. 3.31 lakhs being excess provision made in previous years for income tax together with other excess provisions amounting to Rs. 62,270, the disposable surplus amounts to Rs. 45.19 lakhs, compared with Rs. 31.77 lakhs in 1961-62.

Allocations include donations Rs. 1.01 lakhs (against Rs. 2,600), reserve for bad and doubtful debts Rs. 36,696 (against nil), development rebate reserve Rs. 3.58 lakhs (against Rs. 23,600), taxation, including super profits tax. Rs. 5.43 lakhs, Rs. 17.53 lakhs (against Rs. 16 lakhs), dividend reserve (including amount transferred from dividend equalisation reserve) Rs. 10.50 lakhs (against Rs. 6.57 lakhs) and general reserve Rs. 6.75 lakhs (against Rs. 8.50 lakhs). The proposed 18 percent dividend, subject to tax, absorbs Rs. 7.43,469. After making all these appropriations and some minor adjustments, there remains a balance of Rs. 2,987 to be carried forward, against Rs. 41,536 brought in. The Rs. 5-paid share of the Company is quoted around Rs. 3.25.

Bharat Fertiliser Share Offer

BHARAT Fertiliser Industries Ltd which is setting up a modern fertiliser granulating plant in Thana (Bombay) with an annual capacity of 11,000 tons on a single shift basis, is offering 12,500 equity shares of Rs. 100 each for public subscription. The list will open on 5th August, and will close on 12th August or earlier, but not before 7th August. The entire public issue has been underwritten. The Company's project is nearing completion and it is expected to go into production by the end of this year. The project is estimated to cost Rs. 33 lakhs and it is proposed to be financed by the equity capital of Rs. 25 lakhs and a loan of Rs. 8 lakhs from the I.C.I.C.I. The Company has been marketing manually prepared mixed fertilisers in the States of Maharashtra and Gujarat for many years, and has, therefore, a ready organisation for selling compound granulated fertilisers which it intends to put on the market from the coming year.

Talking to newsmen, the chairman, Mr. Ratilal M. Gandhi, stated that the Company's products would have an assured market in agriculturally advanced States like Maharashtra which had decided to give, from April 1963, a subsidy of Rs. 50 a ton to the farmers using mixed fertilisers manufactured according to the agreed formulae. Barring some unforeseen circumstances, the Company hopes to be able to pay a reasonable dividend from the very first year of the commissioning of the plant to full capacity. The Company which had been converted from a private into a public limited company in November last, has an authorised capital of Rs. 50 lakhs and its paid-up capital amounts to Rs. 10 lakhs. It is now proposed to raise further capital of Rs. 15 lakhs—all in equity shares of Rs. 100 each. Of this, shares worth Rs. 2.50 lakhs are being taken up by the directors and their friends. The remaining 12,500 shares are now being offered for public subscription. The entire foreign equipment worth Rs. 5.85 lakhs required for the project has already been received at the site. The Company's board of directors includes Mr. Ratilal M. Gandhi (chairman), Mr. Khushal K. Shah, Mr. M. L. Apte, Mr. Chandrakant T. Sanghvi, Mr. N. G. Thakkar, Mr. D. V. Sanghvi, Mr. Jashbhai V. Patel, Mr. Dayabhai M. Patel and Mr. Chinubhai B. Patel (managing director).

Dhrangadhra Chemical Results Impress

THE Dhrangadhra Chemical Works Ltd reports excellent results for the year ended March 1963, which have encouraged the directors to step up the dividend from Rs. 6 to Rs. 8 a share (Rs. 100-paid) and that, too, on the increased capital as raised by the rights issue of Rs. 43 lakhs in 1961. The increased dividend is thus on an equity capital of Rs. 1.08 crores, compared with Rs. 64.50 lakhs in the previous year. The preference dividend, too, is on a large capital. Of the 60,000 preference shares, 13,000 shares which had been entitled to the dividend in 1961-62 only for part of the year are entitled to the full year's dividend in 1962-63. The total distribution by way of dividends amounts to Rs. 13.28 lakhs, against Rs. 8.16 lakhs in the preceding year.

The increase in the dividend seems fully justified by the Company's impressive performance during the year. As against a 10 percent rise in the sales from Rs. 3.91 crores to Rs. 4.30 crores, the gross profit has shot up by as much as 75 percent from Rs. 52.60 lakhs to Rs. 92.29 lakhs. Improvement is due both to higher production and increased efficiency of the soda ash as well as caustic soda units. The production of soda ash recorded an increase of 30 percent and that of caustic soda of 11.5 percent over the previous year. The output, it is stated, would have been still higher but for the four major shut-downs as a result of which the Tuticorin plant could not be operated fully.

Allocations include depreciation Rs. 34.70 lakhs (against Rs. 31.61 lakhs), development rebate Rs. 1.06 lakhs (against nil) and general reserve Rs. 46 lakhs (against Rs. 2.30 lakhs). After providing for the proposed dividends and making certain minor adjustments, there remains a surplus of Rs. 1.75 lakhs to be carried forward, against Rs. 5.73 lakhs brought in. In view of the arrears of depreciation, the Company has no liability for taxation.

The directors expect the Company to show still better results in the current year and they take an optimistic view of the future in view of the various expansion schemes which

ne Company has on hand. As part f the expansion of the caustic soda nit, the Company installed ten ells towards the end of 1962 and the alance of 20 cells in April 1963. This ill raise the capacity of the caustic oda plant from 80 tonnes to 140 tonnes a day. The expanded plant ould not be started before July 1963 ecause of the power restriction imposed by the Madras State Electricity Board.

This restriction has since been removed and the plant is currently roducing about 110 tonnes a day and t is expected to reach its full capacity within a month. The Company as signed an agreement with a well-nown Japanese firm for the import f plant and machinery under the econd yen credit for setting up a liquid chlorine plant with an installed capacity of 60 tonnes a day. The final approval of the agreement y the Government is now awaited. The Company proposes to finance his project out of its own resources nd by borrowings from banks. As or the manufacture of poly vinyle hloride and calcium carbide, the ew undertaking, Plastic Resins and hemicals Ltd, sponsored by Dhrngadhara Chemical has signed a collaboration agreement for technical now-how and supply of plant and achinery with reputed Japanese irms. This agreement also is awaiting the Government's approval. The s. 100-paid share of Dhrangadhra hemical is currently quoted around s. 104.

Hindustan Wired Glass Project Cost Rises

THE directors of the Hindustan Wired Glass Manufacturing Co. Ltd state in their report for the year nded March 1963, that the project will now cost Rs. 1.08 crores—Rs. 30 lakhs more than the original estimate due to the rise in the cost in civil works, addition of some more units, ncrease in import duty, excise and ction, etcetera. This additional cost will be met by borrowing from banks. The Company has arranged for a term-loan of Rs. 24 lakhs from the I.C.I.C.I., out of which a sum of Rs. 14 lakhs had been drawn up to the end of March 1963. The balance of Rs. 10 lakhs has also been drawn since then. The civil works of the Company's main units of the factory are almost complete and erection of machinery is in progress. The diesel sets will be commissioned shortly. There has been some delay in procuring materials required for civil construction and other various indigenous items. The strike at the New York port also delayed the shipment of machinery. The directors are, however, hopeful that the Company will go into production in the last quarter of 1963.

The Company's foreign collaborator, Mississippi Glass Company, is taking keen interest in the early establishment of the plant and is rendering all possible help. The U.S. firm has subscribed to the shares of Hindustan Wired Glass to the extent of Rs. 10.80 lakhs in cash and these shares have been allotted to it in terms of the collaboration agreement. It has supplied to the Company plans and specifications for construction of special machinery and equipment. It has also made available training to the Company's technicians at its works in the U.S.A. and has agreed to send a representative to supervise the erection and running of the plant, ensure production of a minimum 75 percent of the licensed capacity, etcetera. In consideration of fulfilling these conditions of the agreement the Company proposes to issue further shares of the value of Rs. 1.20 lakhs to the foreign collaborator. The Company's working results for 1962-63 show a loss of Rs. 95,565 (against Rs. 1.21 lakhs) after providing Rs. 23,762 (against Rs. 6,550) for depreciation, Rs. 21,300 (against Rs. 72,000) for taxation and transferring a sum of Rs. 2.97 lakhs to works under construction accounts. The works under construction is estimated at Rs. 33.86 lakhs, while fixed assets are valued at Rs. 28.78 lakhs as on 31st March, 1963. The Rs. 100-paid share of Hindustan Wired Glass is currently quoted around Rs. 133.

Aluminium Industries Cuts Dividend

THE directors of Aluminium Industries Ltd have recommended a final dividend of 60nP a share, which makes a total dividend of 15 percent for the year ended March 1963 (against 18 percent). Although the profit for the year is much higher than that for the previous year, the dividend has been reduced to 15 percent because of the sharp increase in the provision for taxation. According to preliminary figures, the profit for the year amounts to Rs. 55,39,720 after providing for depreciation, but before taxation, compared with the previous year's profit of Rs. 41,36,766. Including Rs. 3,27,446 brought forward from the previous year, the total amount available for appropriation comes to Rs. 58,67,166. Of this, the provision for taxation amounts to Rs. 39,50,000, which includes the S.P.T. liability of Rs. 11 lakhs (against Rs. 18,20,000). A sum of Rs. 69,250 has been transferred to development rebate reserve (against Rs. 4,91,000) and Rs. 1,00,000 to general reserve (against nil). Dividend equalisation reserve gets Rs. 2,00,000 (against nil). The total dividend of 15 percent for the year absorbs Rs. 15,00,000 (against Rs. 18,00,000). The balance of Rs. 47,916 has been carried forward.

Indian Overseas Bank Profit Up

THE net profit of the Indian Overseas Bank Ltd for the half year ended June 1963, subject to audit, amounts to Rs. 22,79,064 after including a sum of Rs. 2,03,043.60 brought forward from the previous year's account. The net profit for the corresponding period of last year was Rs. 22,06,467.

Ruby General Insurance Results

THE Ruby General Insurance Co. Ltd has declared a taxable ordinary dividend of Rs. 1.25 a share of Rs. 25 each (of which Rs. 8 has been paid-up), absorbing Rs. 5 lakhs. The yield amounts to 11.9 percent at the present price of Rs. 10.50 a share. The profit is Rs. 30.36 lakhs. Bringing in Rs. 4.95 lakhs, there is an available balance of Rs. 35.31 lakhs for distribution. General reserve is allocated Rs. 3.50 lakhs, dividend equalisation reserve Rs. 5 lakhs, investment reserve Rs. 4.70 lakhs and taxation reserve Rs. 17 lakhs. The net profit of the fire department has been Rs. 16.43 lakhs, while that of the miscellaneous department Rs. 4.17 lakhs. The marine department has earned a profit of Rs. 1.31 lakhs.

Progress of Ashok Paper Mills

IN their report for the year ended December 1962 the directors of Ashok Paper Mills Ltd point out that the Company has derived an income of Rs. 2.05 lakhs largely from the deposit of funds which were not required immediately. After providing Rs. 44,245 for depreciation and Rs. 1.02 lakhs for taxation, there is a balance of Rs. 58,142 which has been used to reduce the outstanding debit balance of Rs. 1.58 lakhs. The total expenditure of Rs. 10.33 lakhs on the project has been transferred to capital account. The construction of the paper mill has advanced satisfactorily. They, nevertheless, mention that the Darbhanga Sugar Co. Ltd will not be able to supply 18,000 tons of bagasse because it has not been permitted to import the necessary equipment to do so. Hence Ashok Paper has decided to use bamboo as the main raw material. Messrs Empacel, the foreign collaborator, will supply the equipment to produce 60 tons of paper a day instead of 50 tons as previously arranged, but the cost of the machinery will be the same.

Shamsher Cable Share Offer

SHAMSHER Sterling Cable Corporation Ltd proposes to raise additional capital of Rs. 35 lakhs in order to finance its expansion plan for manufacturing plastic-coated and rubber-coated wires. Of this, shares worth Rs. 10 lakhs will be taken up by Showa Electric Wire and Cable Co. Ltd and Mitsui and Co. Ltd, both of Japan. The proposed investment by the Japanese firms will be made out of the rupee funds which Mitsui and Company, the predecessor of the present Mitsui and Co. Ltd, has held in India as frozen assets. Showa Electric, one of the foremost cable manufacturers in Japan, is already providing the necessary technical assistance to Shamsher Sterling Cable Corporation. The proposed issue will raise the Company's capital from Rs. 30 lakhs to Rs. 65 lakhs. Shares of the value of Rs. 25 lakhs are to be offered for public subscription in the near future.

Atlas Cycle Repeats Again

THE Atlas Cycle Industries Ltd reports encouraging results for 1962. Despite a small setback in sales from Rs. 3.07 crores to Rs. 3.01 crores, the Company's gross profit shows a rise of about 14 percent from Rs. 18.99 lakhs to Rs. 21.65 lakhs. The setback in the sales was not due to lack of demand for the Company's product, but due to its inability to execute all the orders because of frequent restrictions on railway bookings. The production of bicycles was up from 206,139 to 214,147, and the output could have been still better but for the difficulty in obtaining essential raw materials in sufficient quantities. The ordinary dividend has been maintained at 15 percent for the fourth year in succession. Allocations include depreciation Rs. 4.98 lakhs (against Rs. 5.01 lakhs), taxation Rs. 10.80 lakhs (against Rs. 8.25 lakhs) reserves Rs. 2.19 lakhs (against Rs. 2.01 lakhs) and dividends —preference and ordinary—Rs. 3.74 lakhs (against Rs. 3.72 lakhs). The directors expect the current year's results to show an improvement over the previous year's performance.

Ceramic Magnets from Permanent Magnets

PERMANENT Magnets Ltd has received a licence for manufacturing a new product—Hard Ferrite (Ceramic) Magnets, with an annual capacity of 180 tons. The market for this product has been expanding because of the increasing consumption by manufacturers of house service meters, dynamos, toys and gift articles, besides by industrial users. Marketing of the product, therefore, is unlikely to present any problem to the Company. The raw materials required will be primarily indigenous and ferric oxide has already been sent to the foreign collaborators for test. The Company expects to receive the import licence for machinery shortly. The new project will be taken up as soon as the preliminary formalities are over. The Company's plant in Borivli for the manufacture of cast alloy magnets has been in commercial production since January last. The Rs. 100-paid share of Permanent Magnets is currently quoted around Rs. 160.

Lakshmi Mills Cuts Dividend

A MARKED fall in the net profit and sales and a cut in the dividend by 5 percent when compared with the previous year's, feature the working results of Lakshmi Mills Co. Ltd for the year ended March 1963. The net profit for the year amounts to Rs. 49,43,285, after providing Rs. 23,52,574 for depreciation and deducting other prior charges. This net profit compares with the previous year's Rs. 57,94,800 after providing Rs. 22,52,212 for depreciation and other charges. Adding to the year's net profit a sum of Rs. 14,269 brought forward from the previous year the total available for appropriation comes to Rs. 49,57,554. Out of this, the directors have provided a sum of Rs. 21 lakhs for taxation (against Rs. 25 lakhs), and donations Rs. 75,467 (against Rs. 44,922). The provision for development rebate reserve amounts to Rs. 5,65,000 (against Rs. 5,17,500). Gratuity reserve gets Rs. 70,000 (against nil). The proposed dividend at 20 percent (against 25 percent) will absorb Rs. 21,30,000 (against Rs. 26,62,500). The balance of Rs. 17,087 is carried forward.

New Capital Issues

THE Controller of Capital issues has authorised 11 companies to raise capital aggregating over Rs. 5.31 crores. A twelfth company, whose capital is in sterling, has been authorised to issue units of stock as bonus shares. Two companies need money for acquiring ships. One is a new company and another is a State enterprise. One concern is offering part of its issue to its foreign collaborator on rights basis. Another is to raise part of its capital through public subscription. Four companies are issuing bonus shares. One is issuing equity plus cumulative preference shares, three equity plus preference shares and three equity shares. The consents of the Controller of Capital Issues is valid for 12 months in all cases. The following are the details:

Indian Copper Corporation Ltd, Calcutta, is to issue 6,856,500 units of stock of 2 shillings each as fully paid-up bonus shares on capitalisation of reserves to the extent of £685,650 in the ratio of one bonus share or two units held.

Ashok Leyland Ltd, Madras, is raising further capital of Rs. 55,25,000 divided into 11,05,000 equity shares of Rs. 5 each, for cash at par. Of this, shares of the value of Rs. 33,15,000 will be offered to the U.K. collaborators on rights basis, against imported plant and machinery at par. The capital will be used in the phased progressive manufacture of Leyland heavy duty commercial vehicles and diesel engines.

Chettinad Cement Corporation Ltd, a new company incorporated in Madras, has been given consent to issue capital of Rs. 280 lakhs. The capital is divided into 230,000 equity

shares of Rs. 10 each and 50,000 (9 percent free of company's tax but subject to deduction of all taxes at source at the prescribed rates) cumulative preference shares of Rs. 100 each, to be issued for cash at par. The capital will be for setting up a new industrial undertaking near Kapur in Madras State, for the manufacture of portland cement.

Thakur Shipping Company Ltd, Bihar, is to issue capital of Rs. 1 crore divided into Rs. 20 lakhs in 9.3 percent preference shares and Rs. 80 lakhs in equity shares. The capital is required for buying ships from abroad for which a sum of Rs. 5.25 crores is necessary.

Chowgule Steamship Private Ltd, Maharashtra, has been given consent for the issue of further capital of Rs. 40 lakhs, divided into 40,000 equity shares of Rs. 100 each, to be issued privately for cash at par. The money will be used for the construction of three passenger-*cum*-cargo steamers under construction in Yugoslavia.

The Orissa Forest Corporation Ltd, a State Government undertaking, is to raise further capital of Rs. 10,00,000 divided into 10,000 equity shares of Rs. 100 each for cash at par to be subscribed privately. The money is needed for scientific exploitation of the forest resources of the State.

Max-Designs And Process Works Private Ltd, Bombay, is to issue capital of Rs. 1,72,500 divided into 1,725 equity shares as bonus shares by capitalisation of the Company's reserves to a like extent.

Electro Metallurgical Works Private Ltd, Bombay, is issuing further capital of Rs. 1,00,000 divided into 1,000 equity shares of Rs. 100 each. On capitalisation of the Company's general reserves of a like extent, the capital will be issued as fully paid-up bonus shares to the existing shareholders of the Company.

Sarvaraya Textiles Ltd, Kakinada (A. P.), is to issue further capital of Rs. 12 lakhs, divided into 120,000 equity shares of Rs. 10 each, to be issued for cash at par. The money will be spent on new spinning unit to be set up at Visakhapatnam, having a capacity of 12,000 spindles.

South Punjab Electricity Corporation Ltd, Rohtak, is to issue further capital of Rs. 6,29,920. This is divided into 62,992 equity shares of Rs. 10 each to be issued as bonus shares in the ratio of 1:1, on capitalisation of the Company's undistributed profits and reserves to a like extent.

The Indo-Ceylon Dental and Surgical Company Ltd, Madras, is to issue further capital of Rs. 35,440 divided into 3,544 equity shares of Rs. 10 each. On capitalisation of the Company's general reserves to a like extent, it will be issued as fully paid-up bonus shares to the existing shareholders of the Company.

Madanapalle Spinning Mills Ltd, Andhra Pradesh, is raising Rs. 25 lakhs, divided into 40,000 equity shares of Rs. 50 each, and 5,000 preference shares of Rs. 100 each, to be issued for cash at par. Of this, shares of the value of Rs. 18 lakhs (Rs. 13 lakhs in equity shares and Rs. 5 lakhs in preference shares) will be offered for public subscription by prospectus. The money will be spent in financing a new spinning mill having a capacity of 12,000 spindles in Madanapalle. (A.P.).

10 YEARS OF NEW HEADINGS

New compass settings for new routes. New schedules signifying quicker journeys. New aircraft flying you at new heights of comfort. 10 years of heading towards broader horizons since 1953 when eight different airlines were merged to form IAC. 10 years of steady growth, of careful planning which have led to better air travel—symbolised above all, by the Caravelle, with its rear mounted jet engines, shortly to fly in Indian skies.

The Stock Markets

BORDER DEVELOPMENTS CAUSE SHAKE-OUT

Wednesday Evening.

THERE has been a major shake-out in the Calcutta stock market during the past week. Share prices have toppled down on nervous selling, following reports about the concentration of Chinese troops along the northern border. Bulls have been frightened by the sharp decline and they are keen on lightening their commitments. Bears have meanwhile been aggressive and sold heavily.

Even at the present low levels there is no support. Business has been concentrated on clearing shares. The investors have held back since the economic outlook is far from encouraging. The earlier improvement due to favourable corporate news proved short-lived. The decision of Indian Aluminium to issue bonus shares by capitalising reserves in the proportion of one bonus share for every three held had created a temporary flutter last week.

Judging by indications it does not appear that the trend will take a turn for the better until the political situation improves. There has been growing concern about the shortage of funds. A large number of new issues floated recently have met with a poor response. In the case of many companies the shares have had to be taken up by the underwriters. So it is asked whether the Government should not take active measures to restore confidence in the capital market. As for support from the Life Insurance Corporation, it cannot but be marginal, at least for the time being, since a large part of its resources have already been invested in new Government loans. It has been suggested that financial institutions like the Industrial Finance Corporation, the Industrial Credit and Investment Corporation and the L.I.C. should take vigorous steps to provide more capital to industry.

Indian Iron have nose-dived because of heavy selling pressure. Even the prospect of an increase in the retention price of steel has not inspired confidence. The earlier support for selected engineering shares has fizzled out. Guest, Keen, Williams, Burn, Jessop, Indian Standard Wagon and Texmaco have declined.

Jute shares have been easier due to the absence of overseas demand for jute goods. Investors have turned cautious because the profits of mills have shrunk; there has been an appreciable decline in the prices of gunnies while fibre prices have been artificially maintained at a high level. Birla, Champdany, New India, Howrah and Ganges have been offered at lower prices. Cotton mill shares have lacked support because of the discouraging outlook for mill profits. Production costs have risen sharply, while the prices of cloth and yarn have been moving downward due to the slow offtake of piecegoods. J. K. Rayon, Bharat Commerce and Dunbar have been sold freely.

Miscellaneous shares have weakened all-round because of heavy selling pressure. Among clearing shares, Indian Copper, Hindustan Motors, Dunlop Rubber and Kesoram have lost. Indian Aluminium have closed below the best level touched earlier. Indian Cable are sluggish, although bigger profits have been earned. Interest has declined in Alkali Chemical, Union Carbide, British Paints and Associated Battery. The prices of new shares have fallen on a predominance of sellers. Hindustan Aluminium, Phillips Carbon, Isaac Holdens and Asiatic Oxygen have been quoted lower. Electric supply companies have been subdued. Stray business has been transacted in Calcutta Electric. There has virtually been no interest in bank shares. Managing agency shares are weaker on balance. Martin Burn, Balmer Lawrie and Jardine Henderson have lost. Among paper shares, Orient have reacted on pressure. Sirpur have fallen. Sugar shares have been difficult to deal in because the investors have not been impressed by the prospect of higher output during the 1963-64 season.

Coal shares have been neglected and prices have declined. Reports about bigger accumulation of pithead stocks have frightened the investors. Burrakur, Central India and Amalgamated have been quoted lower. There have been a few transactions in tea shares. It is difficult to attract investors even by discounting the current prices because of the border news.

Government securities have been steady, although subscriptions for the new loans have amounted to Rs. 226.17 crores. Cash subscriptions have totalled Rs. 207.03 crores and conversions Rs. 19.14 crores. The total amount due for repayment was Rs. 48 crores, of which Rs. 9 crores was on account of the Central Government and Rs. 39 crores on account of the State Governments. Two loans were offered for subscription last week—a further tranche of 4 percent loan 1969 at Rs. 99.50 percent and 4½ percent loan 1973 at par. The loans opened on 22nd July and closed on 26th July, 1963.

Bombay

PANICKY SELLING IN DALAL STREET

SHARE PRICES FALL ON BROAD FRONT

Wednesday Evening.

NEAR-PANIC conditions have prevailed in the Bombay stock market during the past week. Nervous long liquidation, combined with short-selling, has depressed share prices on a broad front. Operators are panicky on reports of a heavy concentration of Chinese troops along the northern border. Towards the close, almost everybody has turned out to be a seller. Bulls have been nervous and they have tried to lighten their commitments at every stage. Reports of the slow offtake of cotton piecegoods have weakened sentiment earlier.

Earlier during the past week, support emanated largely from optimism concerning the relaxation of restrictions on margins But margins have already been imposed on sellers in the case of some scrip since their prices have fallen by more than 10 percent below the past clearing rate. Operators had also expected that the Government might soon take steps to revive confidence in the stock market.

Tata Steel ordinary have fallen sharply to Rs. 136.25 and Indian Iron to Rs. 22.48. Among engineering shares, Tata Locomotive, Mukand Iron and Alcock Ashdown have lost considerably. Motor-vehicle shares have been quiet. Hindustan Motors and Premier Automobiles have been quoted lower. Cotton mill shares have shown widespread losses. Century, Bombay Dyeing, Simplex, Kohinoor and India United ordinary have touched new lows. Standard and Svadeshi have been somewhat steady on knowledgeable support.

Miscellaneous shares have moved down in sympathy with the general trend. Among cement shares, Associated Cement have lost on profit-taking. In the sugar section, Belapur have been somewhat steady on hopes of bigger production during the next season. Phalton and Walchandnagar Industries have been quiet. Among shipping shares, Scindia Steam have reacted on pressure. Mining shares have been quiet, and Shivrajpur Syndicate have been offered freely. Bombay Burmah have declined on a predominance of sellers.

Chemical shares have lost, and Tata Chemical have been quoted lower. Indian Dyestuff and Polychem have lost on balance. Scattered support has been forthcoming for Tata Oil and Voltas. Turnover in cash shares has been negligible. Synthetics and Chemicals, and Per-

manent Magnets have been sold at lower prices.

Nominal business has been done in bank shares. Bank of India, Central Bank and Bank of Baroda have been dealt in. In the insurance section, New India Assurance have been somewhat steady. Electric supply company shares have been softer on balance. Ahmedabad, Bombay Suburban and Tata Hydro have been quoted lower.

Madras

BIG DECLINE IN TURNOVER

OPERATORS WORRIED BY BORDER NEWS

Tuesday Evening.

THE Madras stock market has turned quiet towards the close of the past week because of lower advices from the Calcutta and Bombay stock markets. Turnover has shrunk considerably in the absence of support from outside interests. Business in clearing shares has been nominal since operators have been worried about the developments along the northern border.

The earlier support for selected tea and rubber shares has vanished towards the close. The sharp reduction from 20 percent to 12 percent in the ordinary dividend of Cochin Malabar has made the investors cautious. The scrip has declined to Rs. 6.40. Blue Mountain have reacted to Rs. 2.47 and Consolidated Coffee to Rs. 18.20. Kailas have been quoted at Rs. 5.65 on declaring a final taxable ordinary dividend of 15 percent. Business has been done in Periakaramalai at Rs. 3.53 and in Peermade at Rs. 20.77. Ouchterlony have been offered down to Rs. 4.40, but Thamarapally have met with support up to Rs. 16.00.
