THE THIRD EYE

The magic eye that can make the difference between life and death.

By detecting defects in critical fabrications before they are allowed to be put to use. Fabrications like railway wagons, pipe lines, pressure vessels, cranes, girders and hundreds of others that are subjected to pressure or dynamic loads. Defects such as gas pockets, slag inclusions, unfused roots or cracks can lie underneath a smooth weld surface, absolutely invisible to the naked human eye. These are danger points that initiate failure in service and are a hazard to life and limb and property. The gamma ray eye can detect them immediately. ADVANI-OERLIKON'S expert radiologists with portable gamma ray equipment can reach your job any time, anywhere in India. ADVANI-OERLIKON'S welding specialists can advise you on the right procedures to avoid them. Need more details? Telephone 581366 or write to Non-Destructive Testing Division, J. B. Advani-Oerlikon Electrodes Pvt. Ltd., Bhandup, Bombay-78.

ADVANI-OERLIKON

Reflections on a Newspaper Anniversary: Between the Wars and After

As Editor of "Capital" from 1932 to 1952, and subsequently as Joint Adviser and Secretary to the India, Pakistan and Burma Association in London, Mr. Tyson's connection with this subcontinent has been an old, deep and practical one. Few men have chronicled the changes of the long and eventful years with as great insight and understanding as he has done. The article below, written specially for "Capital's" seventy-fifth anniversary number, is a record of personal reflections and reminiscences starting from a time when financial journalism was almost an esoteric pursuit, and when the business milieu was far different from that of today.

By

GEOFFREY TYSON

WHEN I joined *Capital* in 1930 it was housed on the top floor of Number One Commercial Buildings. This gave the staff a splendid view of what we then called Clive Street —a name which I suspect a good many people continue to use without meaning the slightest disrespect to Netaji Subhas Road. As the representative in India of a famous international news agency I had had some earlier acquaintance with Clive Street; but *Capital* and Commercial Buildings brought me into the very midst of this unusual highway of commerce and adventure. Even thirty-odd years ago Commercial Buildings offered few amenities, and had no claim whatever to architectural distinction. In the dim past Number One had been a private residence and, according to uncorroborated report, it had once been the scene of a violent fight between two Hooghly pilots, one of whom died in combat.

But the place had a certain character, and housed quite a few of the small broking firms which abounded in Calcutta at that period. The gateway was invariably jammed with horse-driven office jaunts, bundles of jute lay on the staircases on their way to or from the arbitrator, young European brokers and their marwari under-brokers and dealers rushed around the place buying and selling or settling (or perhaps not) and somewhere in the dim background was that dark concept known as "the bazaar" which governed and decreed all speculative movements. Though attached to Clive Street by a sort of unbreakable umbilical cord, the bazaar also enjoyed a colourful existence of its own. By day its captains paid court to the merchant princes of Clive Street; by night they played a chequers game of which they alone knew the rules and often for very high stakes. And when I say by night, I mean that until long past midnight the *gadis* of Harrison Road, Cross Street and Burra Bazaar were almost always doing big business in jute and gunnies, gold and silver and any other commodity that offered a reasonable prospect of a variation in price. This was the sort of world which a young and inexperienced financial journalist was expected to comprehend.

Good Card of Entry

But *Capital* was a good card of entry to almost any place of business, and though the circulation did not run into the scores of thousands the paper was widely read and its views were respected. The founder of the paper, Shirley Tremearne, had begun his own journalistic career by doing a weekly finance letter for the *Pioneer* in Allahabad and the *Times of India* in Bombay whilst he was Assistant-Registrar of the Calcutta High Court. (I have told the story of how Tremearne came to start the paper in the golden jubilee issue of 3rd November, 1938, and will not repeat it here.) The amazing thing is that even by 1930 none of the leading daily newspapers, British or otherwise, had accepted the simple fact that money, share prices, company results, imports, exports and all the rest of the chit-chat of the market place were news, and quite often the raw material from which good and readable comment could be made.

There was no such thing as a city page to be seen in any of the dailies. *Capital* had had this field almost entirely to itself for half-a-century during which it had built up a tradition of fair and reasonable treatment of the affairs of the day; some famous names had been associated with its earlier years (at one time Lord Layton was a regular contributor from London); and shrewd management had given it a good financial foundation. Then, as now, it was a well favoured newspaper property with influential connections. Government and big business alike were only just beginning to understand the importance of the newspaper Press and as an institution the Press conference was quite unknown; the Indian nationalist politician had much the better idea of public relations and it was not difficult for an English journalist, if he knew his job, to get on terms with the Congress Party. On the whole, *Capital* was an easy paper to represent and project.

But, of course, the publication's main concern was with the problems and prospects of British and Indian business. Certain events stood out in red in the newspaper calendar: the Budget at the end of each February; the annual forecast of the jute crop, on which punters of all kinds and conditions backed their judgment; the cold weather visitation to Calcutta of the Government of India and the sifting of its pronouncements for economic signs and portents; the Honours Lists, the weekly Treasury Bill tender, especially during the early 1930's when London money was flowing into India where 90-day bills offered a gross return of 7 percent which was quite adequate to cover arbitrage and transmission charges and still leave a very reasonable net return to the purchaser.

The Agency Houses

In 1930 the great agency houses were still, for the most part, private partnerships which in many cases were drawn from family dynasties. The partnership was regarded as vastly superior to the private limited company because, so it was argued, partners put their individual reputations and personal fortunes behind their business, whereas the limited company drew a discreet veil of anonymity over ownership and responsibility. There was something in the contention. But the ever-increasing burden and complexity of taxation (there were two Indian Budgets in 1931 when the United Kingdom went off the gold standard) hastened the end of the simple ideas on which generations of *box-wallahs* had been nourished.

In due course the private company was to point the way for the public company, a marking on the stock exchange and subsequently a public shareholding. But that was still quite a few years ahead. Meantime, a great deal of what we now call "development" in the private sector, had been achieved through the managing agency system, whose primacy in India's commerce and industry then seemed destined to last for ever. It is easy to be wise after the event, but looking back on those years of change I think the score or so leading managing agencies did too little to explain themselves and their place in the scheme of things. The men at their head would have been genuinely shocked and surprised to know that a body of public opinion was building up which did not accept their system at its face value.

Last Generation

By 1930 the Lords Inchcape and Cable and Sir David Yule had disappeared from the Calcutta scene, but they had left an indelible impression upon it. Perhaps they were the last of the last generation of real pioneers; certainly after their departure managing agency seems to have reached a sort of plateau in which the opportunities for an extension of the principle of group management (which substantially is what managing agency is) were not so obvious. But they had implanted a system which was to have a dominant influence on the character of all British business in India and the terms and standards of employment of the whole expatriate community. They set a pattern which others have followed—or tried to do so. The period 1929 to 1931—beginning with the Wall Street crash and culminating in the abandonment of the gold standard first by Britain and then by others—were lean years for business everywhere, and this was fully reflected in the affairs of Clive Street.

When Britain went off gold, banks in India were closed for three days until new exchange rates and fresh formulae had been established. The trade depression was even sharper in its impact than the devaluation; credit was severely contracted and widespread retrenchment was the order of the day. Many Europeans lost their jobs, and Indians sold some of their gold savings for export. I recall that on one fateful Monday morning no less than eleven young expatriate assistants in one agency house found, on arrival at their office desks, notices abruptly terminating their employment. At the height of the U.S. slump an American of my acquaintance, representative in India of a concern which in the ordinary way was most lavish towards its employees, received a curt cable instructing him to make his way home by the cheapest possible method. I

saw him go off as a deck-hand on a tramp steamer of great age and decrepitude, but twenty years afterwards I had the pleasure of meeting him again in the rôle of distinguished international civil servant. The point of recalling this rather trite story is to show that for an earlier generation boom and slump were vivid personal experience from which the individual was not protected, even in what was thought to be a privileged community.

Close Relationship

But, in reality, how privileged were these people? It is true that in one sense they enjoyed a close relationship with the Government of the day; but in many respects there was a yawning gulf between business and the administration some of whose members were highly distrustful of the business community. They were also envious of the financial rewards that were supposed to accrue automatically to the wealthy merchant class and took no account of the inevitable losses and failures. One of the results of the Government of India Acts of 1919 and 1935, which provided for legislatures of limited powers, was to bring the Government and both the British and Indian sectors of business closer together and so to a better understanding of one another. For the British element of organised commerce it was the first close encounter with the Indian nationalist movement and, if nothing else, each side realised that the other was not the monster that it had been led to believe. The British were genuinely reluctant to go into Indian politics, but once in they did their best to make an effective contribution to the establishment of a parliamentary tradition, which may be news to a generation of Ditchers whose experience has been acquired in a sovereign and fully self-governing India.

But, of course, in terms of *realpolitik* British non-official representation in the legislatures was entirely adventitious and could never be of more than marginal significance. It was part of the dyarchical process by which Britain was withdrawn, *via* representative government, from the position of ruler in many parts of Asia and Africa. But during the period of nearly thirty years which this process lasted after the 1919 Act, the finding of qualified men to fill over-generous (as it now seems to the present writer) British representation in the Central and Provincial legislatures represented a continuous drain on Clive Street's exiguous supplies of manpower and presented a similar problem to the British business communities in Bombay and Madras. The average Englishman abroad is not a political animal, and has little appetite for public debate and the hustings. His main object is usually to get on in business and advance in his firm or company. These were certainly the chief considerations during the period of which I am writing. Nor was there a British leisured class in India, from whom to recruit budding legislators. But with such a paucity of candidates "honourable members" were invariably returned unopposed and this greatly simplified the problem. The appointment of three or four whole-time stipendiary political representatives also helped; round them was built a regular corps of representation which came to be known in the respective Assemblies in various parts of the country as "the European Group".

Strong Exception

Capital always took strong exception to the designation "European" when what was really meant was British. A minor point perhaps, but of some significance in the light of later events. The paper used to argue that whilst it was true the British were European, so too were for example the Bulgarians, who never in all the history of mankind had had anything to do with India. But the stupid misuse of the word continued until the postwar constitutional changes forced a change and the European Association became the United Kingdom Citizens Association. The European Association dated from 1883 (the year of the ill-starred Ilbert Bill) and had a somewhat chequered career. In the 1920's and 1930's it was the venue of not a few stormy meetings.

I have said above that the Briton abroad is not a political animal, and by and large this is true. But in the period about which I am writing there would occur, every now and again, a most unexpected explosion of feeling, usually of very short duration and directed against the community's leadership, who were accused in some undefined way of selling the rank and file "down the river". I recall, one such at the beginning of the war at a meeting held in the New Empire Theatre, at which an orator of obscure origin demanded the impeachment of the then Viceroy and a few other more or less drastic reforms. It was a passing aberration of the kind of which Clive Street had had plenty of experience; by long usage it knew how to deal with the activities of its lunatic fringe. Notwithstanding my oft-proclaimed devotion to the city within the Ditch, I am bound to say that during these fateful years the younger members of the British business community in Bombay with their Progressive Group, to whose meetings prominent Indians came for discussion, seemed to me to be making the more useful contribution to Indo-British understanding.

The 1930's saw only a very tentative beginning to internal air-travel in India. Whereas nowadays a short air journey quickly takes you from one city to another, thirty odd years ago Bombay and Calcutta lived in extreme isolation from one another. The Indian communities of the two cities knew even less of each other than did the British communities. As a journalist editing a newspaper seeking after an all-India synthesis, I used to try to spend at least a week, and possibly two, in Bombay each year. This involved a train journey of a day and two nights, and looking back I do not regard the time so spent as wasted. One was able to savour and feel the whole country, notwithstanding that by today's standards my company's time was being consumed to no apparent purpose. Despite all its advertised advantages quick air-travel seems to have induced in a later generation a curious indifference to the simple facts of life of the Indian masses. I used to regard an Indian railway station as a very fair sample of a slice of pullulating life in movement —and that is a feeling which one never gets at an airport in India or elsewhere.

But one would be foolish to deny that in many respects air-travel is ideal for a country of vast distances such as India, where it has certainly brought the classes (as distinct from the masses) closer together. I do not know how far railway travel for the masses has been made more tolerable in the last few years, but in my experience first-class air-conditioned rail travel in India is quite as good as continental European railway travel and has now reached a very high standard of comfort and service. I well remember the first air-conditioned coaches on what was then the East Indian Railway and the lively Press party which, did the journey from Howrah to Burdwan and back to introduce the new service to the public. Air-conditioning is one of the great boons which modern technology has brought to India and other tropical countries; and for those who can afford it is an immensely worthwhile investment. As yet its benefits are restricted to the relatively privileged, but a time must come when schools, factories, hospitals, law courts and public offices and business premises of all kinds are air-conditioned to the immense advantage of the quality and quantity of the work turned out. Too little account has been taken of the effect of climate on all kinds of economic pursuits in India, and when I read learned disquisitions adversely comparing Indian output with say Japanese output, remembrance of the harsh facts of an Indian hot weather (which slows down all economic processes) pulls me back to realities.

Medical Discoveries

Another of the revolutionary but wholly beneficial changes which has

Will be published on Tuesday, 6th November 1888.

CAPITAL

The Speculators' Guide and Investors Vade Macum,

A Weekly Commercial Paper.

THE absence of any Newspaper dealing authoritatively with questions of commerce and finance renders any apology for the appearance of "CAPITAL" unnecessary. There is absolutely no journal which attempts in this country to supply the place that in England is filled by the *Economist*, *Bullionist*, *Statist* and other kindred papers.

Considering the growing importance of India and the large sums invested in Banks, Railways, Mills, Tea Gardens and other industrial enterprises, it is somewhat surprising that no Journal has yet made its appearance to devote itself to those interests which are represented by invested capital.

"CAPITAL" will particularly deal with joint stock companies—their life history, present position and future prospects. It will also review the different markets for products and manufactures, report judicial decisions affecting trade and commerce, and afford information useful to the merchant, the investor, and the speculator. It will not be a mere recapitulation of market transactions,—the interest in which begins and ends with the day, but a solid record and work of reference which every business man should possess.

An index and title-page will be issued every half-year to enable it to be bound.

RATES OF SUBSCRIPTION:

Yearly ... Rs 30: with postage Rs 34

taken place in my working lifetime are the new medical discoveries which have taken the sharp edge off some of the earlier terrors of tropical illness. Today international travel regulations require that the traveller shall produce proof of inoculation against certain kinds of illness and the wise employer encourages his staff to take other precautions which have no statutory compulsion behind them. It was not always so, and there were many casualties from such misfortunes as enteric fever and cholera which might have been avoided (or at least minimised) if there had been a better understanding of the rôle of prophylaxis in combating tropical disease. Thirty or forty years ago enteric, malaria and both kinds of dysentery were the major health hazards for the Briton in India. Since then there have been tremendous advances in both preventive and curative medicine, in the achievement of which both British and Indian doctors have shared.

The post-first-World-War generation of Britons in Calcutta and Bombay (and probably Madras as well, though I cannot speak for this) made an absolute fetish of daily exercise. East of Suez the liver was regarded, probably correctly, by the expatriate business community as the most important organ in the human frame. The idea was that it required constant "shaking up", for which purpose exercise of a more or less violent kind was the favoured prescription. In Bombay young men used to rise in order to play two or three sets of tennis at the Gymkhana Club between six and eight in the morning, rush back to their quarters to bathe, change and breakfast to present themselves jaded and rather weary at their office desks at around nine-thirty. Allowing for minor variations the same routine used to take place in Calcutta where generally speaking the British live rather further away from their work than their brethren in Bombay. Personally, I loathe early morning exercise and, like the late Robert Benchley, if I find myself in danger of doing any I just get back into bed again for another ten minutes. Seriously, however, my opinion, which is based on experience and observation, is that the young European of any nationality requires time to adjust himself to a tropical climate and that he needs more deep and solid sleep than is commonly conceded. He certainly cannot do a good day's work if he arrives at office with half his stamina already used up in tennis, racquets or riding which was once thought to be a necessary accompaniment to a successful business career.

Gamesmanship

This kind of gamesmanship—if I may borrow and misuse Stephen Potter's word—was especially associated with the institution known as the "chummery" which I believe still survives in a few rare instances, but no longer thrives as it did in days gone by. By definition, the chummery was (and is) the nursery in which the next generation of business leaders are being trained to take their place in "the establishment". In its heyday the chummery could be regarded as an extension of the British educational system: if you had been to Eton and Kings, and later done a short spell as a trainee in the London office of your new employer, on arrival in Calcutta you gravitated towards a chummery where sons of Eton and Kings College, Cambridge, were to be found and where those venerable institutions were accorded proper respect. On the other hand, if you had merely been to Stretford Secondary and Redbrick you were drawn towards the like minded and similarly placed. There were famous and infamous chummeries, and there were many quite insignificant ones as well. But to start in the right kind of chummery meant that the young business cadet had laid firm foundations to his business career: henceforth he would have the right friends and know the people best able to advance his prospects in life. The social historian of the future will doubtless accord the chummery a place of some importance in the ranking list of British institutions in India.

But just as it changed much else besides, the war ended the primacy of the privately organised chummery. For one thing most young men disappeared into the armed forces; for another, there developed an acute housing shortage and rents soared in both Calcutta and Bombay. It was no longer practicable for an enterprising young assistant to take on the responsibility of renting a house or flat and running it as a chummery; banks or insurance companies might do so, but the old privately financed chummery, which belonged to its inmates and often had lasted for years, had fallen victim of postwar economic pressures. Henceforth, communal living was to be practised mostly in residences provided by the employer. To those who had known both the old and the new environment it seemed that a desirable form of private initiative had been put out of the reach of the younger members of the business community which was, in any case, beginning to change its character in other and more fundamental ways.

No New Recruitment

No new recruitment had been possible for British business during the war, and at least some of the men who had been drafted into the Services did not, for one reason or another, return to their business appointments in India. With the coming of peace there was a tremendous exodus of the elderly and ageing executives on which British business had been mainly dependent throughout the war years. Accompanying the political changes at the end of the war, there had been a certain amount of disinvestment by which Indian shareholders had acquired some of the equity of old established businesses. More important perhaps was Government's proclaimed desire for a progressive plan for Indianisation. Finally, it had become increasingly difficult to recruit from abroad for India; there was a world shortage of administrative and technical personnel and India (mostly by reason of her high rates of personal tax) was not regarded as a first choice for overseas employment by forward-looking young men.

All these factors pointed to a rate of Indianisation which would have seemed improbable a few years earlier. A further influence for change was the fact that the growth industries were now mainly in the engineering field, which meant that an increasing proportion of imported personnel tended to be engineers and technical men whose attachment to India might be thought to be not so strong as that of an earlier generation. But perhaps the most noticeable of all changes was the disappearance of the British element in the Civil Service. They had the scholarship and (in easier days) the leisure for those cultural activities which gave Indian and British intellectuals a respectful and friendly appreciation of one another. The business community would not pretend to be able to fill this gap.

The pull towards conformity is strong in every expatriate community, but there is usually a handful of deviationists and eccentrics to leaven the hard lump of convention. Clive Street was no exception. There were others too and their purpose was not to be different so much as to help their fellow men. Of this now forgotten minority I remember two quite vividly: Father Douglas of the Oxford Mission and Sir Daniel Hamilton, the creator of the co-operative settlement at Gosaba in the Sunderbans. Though well known to the business community Father Douglas had not been a member of it. For many years he was a familiar figure cycling about Calcutta and his establishment at Behala gave many a Bengali orphan a home and a start in life.

Hamilton retired from the senior partnership in Mackinnon Mackenzies during the first world war. He wanted to repay some of the debt he felt he owed to India, and so he launched and developed the famous co-operative settlement on land he had acquired at Gosaba and on which he eventually settled some 10,000 debt-free peasants. For many years he used to return to spend part of each cold weather with the prosperous little community he had brought into being. His authority was entirely paternalistic, and I do not know what happened to the settlement after Sir Daniel's death; but when I knew and visited it, Gosaba represented precisely that type of rural extension work which the Indian Government is trying to apply more widely as part of its five year plans. Despite the reputation of big business for money-grubbing and hard-facedness I have the impression that the spontaneous, individual gifts of those days exhibited more of the spirit of true charity than the nation-wide appeals and well-publicised subscription lists of today. Any impartial assessment of the period covered by *Capital's* seventy-fifth anniversary (on which I most sincerely felicitate my old paper) would, I think, confirm that both the public image and the private conscience of business has been sharpened to a greater awareness of its importance in the fuller life of the community.

PRO/MIC-3

THE FACTORS HAMPERING INDIAN ECONOMIC GROWTH

Mr. Colin Clark, who is the leading agricultural economist in the world, highlights the more important of the factors which are hampering India's economic growth. His analysis of the difficulties in accelerating the expansion of agricultural production, which he describes as "the most urgent of all India's tasks", is of particular interest at a time when the stagnation on the farms is threatening the progress of the third five year plan. The policies for foreign trade, transport, and energy and fuel are also discussed in relation to the past experience of nations with similar problems.

By

COLIN CLARK

Director, Agricultural Economics Research Institute, Oxford

THE factor in Indian economic growth which is obviously the most important, when one comes to think of it, although it tends to receive rather formal and stereotyped treatment in the writings of planners and others, is the progress of agriculture. It is possible, though difficult, for a sparsely populated country, with rich natural resources in minerals and forestry products, to progress without developing its agriculture. It can import food for its urban centres, and pay for it from its export proceeds—some African and Latin American countries are doing precisely this. But India is in just the opposite position. She has to feed a large and growing population, and her mineral and forestry resources are few. Moreover, Indian agriculture has to earn a large part of the required export income, and will have to continue to do so for many years to come, because it will be a long time before Indian manufactures can earn any substantial export revenue.

Indian agriculture also has the duty of providing labour for the development of industry. Some economists may treat this proposition as all too simple, or indeed the subject for bitter laughter. Do not all informed surveys, and indeed official estimates, they ask, show that Indian agriculture has a vast surplus of labour and that, on an average throughout the year, one-third of all available manpower is unemployed?

Great Fluctuations

This is quite true. But the figures do not mean quite what they seem to mean. In the first place, we must allow for the great fluctuations in labour needs in the course of the year. The monsoonal climate which prevails over the larger part of India necessarily requires a great concentration of agricultural effort in a short season of the year, and periods of actual labour shortage may alternate with long periods of unemployment. This has definitely been found to be the case in some parts of Punjab and Madhya Pradesh. It is not true in the south, where rainfall and cultivating seasons are more widely distributed over the year, and where there appears to be a surplus of labour at all seasons.

But consider the case of a landless labourer, or the owner of a completely inadequate plot of land, for whom we should all feel the deepest sympathy. For a large part of the year he and his family and dependents are subsisting on their reserves, or on gifts from family or friends, at less perhaps than a rupee a day. It is a grave mistake which many economists have made to suppose that, without any increase in agricultural production, such men can be made available for industrial labour, even in the south and other areas which do not have the peak demand for labour in the monsoon or harvest seasons, when every man in the village is required for agricultural work.

In the first place, he would not be willing to work in industry without an increase in income. For a man to be willing to leave his family and his village, to face all the unfamiliarities of living in an industrial town, to purchase his food, to pay rent and so on, a much higer wage, of Rs. 2 a day or more, may have to be offered. And, even if such men were willing to go to industrial employment without any increase in their present consumption, they would not on their present diets be physically able to do so. If a substantial number of men, at present unemployed or partially unemployed, are to be made able and willing to do industrial work, agriculture must produce enough to feed them properly, while at the same time dispensing with a certain amount of its present labour requirements.

Non-agricultural Employment

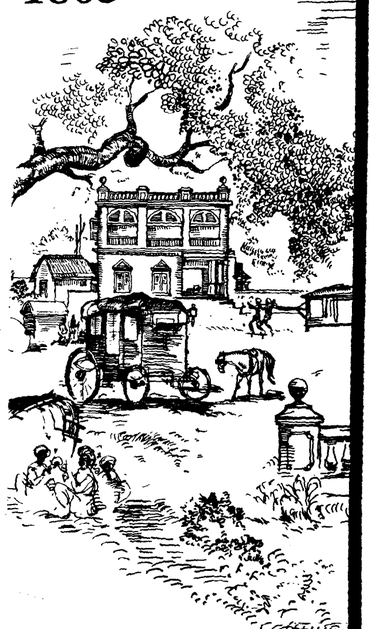
The population—workers, part-time workers and fully dependent persons—obtaining its livelihood from industry, and from all other forms of non-agricultural activity, handicrafts, building, transport, etcetera, is very hard to estimate precisely, because of the large number of families who have some agricultural and some non-agricultural activities. Apportioning these approximately, the full-time equivalent of all non-agricultural workers, and their dependents, represented a population of the order of magnitude of not much more than 100 million in 1960. The rate at which these numbers in non-agricultural employment can grow is controlled fairly firmly by the rate of improvement of agricultural productivity.

An Observed Fact

This is not merely a theoretical proposition, as stated above. It is a fairly precise observed fact, from comparison of different countries, or of a single country at different stages in its history, which can be stated in the form of a mathematical equation, that the proportion of the labour force engaged in non-agricultural activities is a linear function of the logarithm of agricultural productivity (measured a head of the agricultural population, and including mining and forestry with agriculture)[1]. Applying this formula to India, with population growing at 2 percent a year, and total agricultural product growing on the average (subject to very considerable annual variations) at 3 percent a year, then it is found that non-agricultural employment can only grow at a rate slightly less than 3 percent a year. It will grow faster than total population, and the proportion of non-agricultural employment will increase; but only slowly.

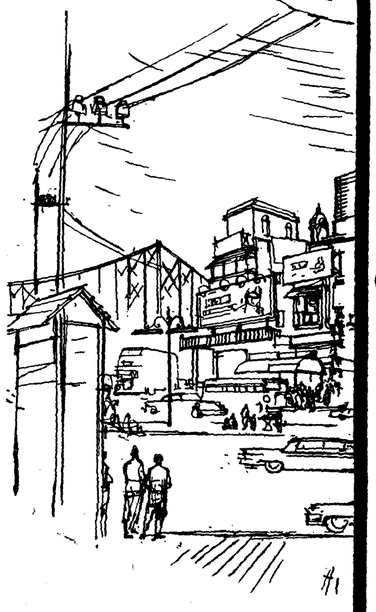
We have to conclude, on the present evidence, that the rate of growth of total product of Indian agriculture is just about 3 percent a year. The figures for individual years fluctuate so much that we should study the trend by grouping at least three years at a time. The trend of 3 percent is computed by comparing the average of the three years centred on 1950-51 with that of the three years centred on 1960-61, and using the U.N. Food and Agriculture Organisation's index for India's production. The Indian Ministry of Agriculture index[2] indicates a rate of 3.3 percent a year. This latter index covers crops only, excluding animal products (which, however, are only a small fraction of the total output). It may have been vitiated by a certain amount of understatement in the earlier years. These were years of rationing, price control and Government purchase. Cultivators had strong incentives to conceal part of their output; and one Government department does not publish figures which imply that the purchases by another department were less than they legally should have been. It is interesting to see that the real product of agriculture (*i.e.*, contribution to national product measured at 1948-49 prices), as estimated by the Government's National Income Unit, rises at the same rate as the F.A.O. index.

Food from U.S.A.



The most urgent of all India's tasks, therefore, is to get a higher rate of growth of agricultural production. Indian political leaders are entirely right when they point out that, welcome and indeed indispensable as are food gifts from the United States in years of shortage at the present time, permanent dependence upon such gifts or imports is not to be countenanced, because it distracts attention from the main task, which is to increase India's own agricultural productivity. Relative prices within India have been moving in agriculture's favour in recent years, and it may be necessary to let them move further. Any permanent programme for importing large quantities of food is bound, directly or indirectly, to hinder the attainment of this objective.

It is worth recording that Japan some 60 years ago, in a situation somewhat comparable to that of present-day India, was able to increase agricultural production at the rate of 3½ percent a year, at a time when the technical means for improving agricultural productivity were much less abundant than they are now, and Japan was receiving no financial help from abroad whatever. At the present day, Brazil and Mexico, which have large land area, are shown by F.A.O. index numbers as increasing their agricultural production at the rates of 5 percent and 6 percent a year, respectively. These figures may have to be modified a little if we allow for faulty methods in the compilation of the statistics, but even so, it is clear that high rates are prevailing there. Agricultural production in those countries can be enlarged by



[1] This formula, and the evidence on which it is based, which is very voluminous, is being published in *The Economics of Subsistence Agriculture* by the present writer and Miss Margaret Haswell, which is now in process of publication by Macmillan and Company.

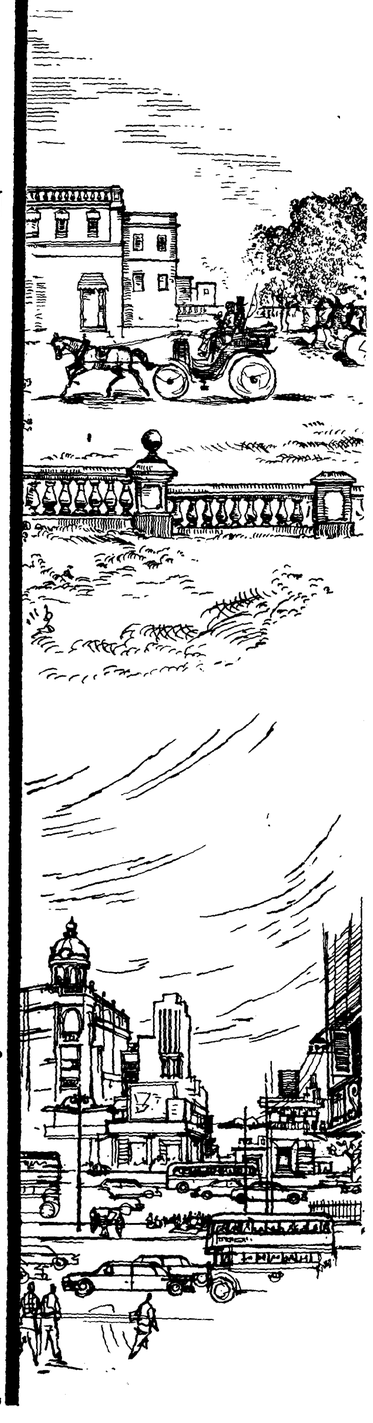
100

YEARS OF INDO-BRITISH CO-OPERATION



Speaking at the fourth session of the Indian National Congress held at Allahabad in 1888, its President, George Yule, made a forceful plea for the adoption of measures by the Government of the day which "would unite England and India not by hard and brittle bonds which may snap at any *moment*, but by the flexible and more enduring ligaments of common interests promoted, and common duties discharged."

The Firm which George Yule and his brother Andrew established in 1863 celebrates its Centenary this year—a hundred years in which it has played a significant part in the development of many of India's vital industries.

A general view of a steel plant

extending cultivation to uncultivated land. India, it is true, has less opportunities of doing this than the Latin American countries; but more opportunities than Japan.

Indians must be tired of hearing, but it is nevertheless still worth repeating, that the average yield of rice a hectare in Japan is nearly four times what it is in India. The possibilities of improving yields are still very great, mainly through the use of fertiliser—though new strains of rice plants will have to be bred for India before they are able to take fertiliser inputs at the Japanese level. The construction of fertiliser plants is a most praiseworthy investment for India. But, in addition, it would be wise for India to import all the fertiliser she can. Substantial quantities are now available at very low prices —Pakistan has been buying Japanese ammonium sulphate at $40 a ton, f.o.b. As a ton of ammonium sulphate, carefully applied on the soils which most need it, may yield 2 tons of additional cereal harvest within a few months, this clearly is one of the best investments in the world.

Irrigation Water

Agricultural output can be improved by better supplies of irrigation water. But the situation varies greatly between regions. For almost the whole of the Ganges plain, and for some of eastern India, water can be obtained by sinking comparatively shallow wells. This is certainly not true, however, over a large area of the Deccan, where the water table is very far down, and the rock in any case is very hard to bore. But to sink a well, and then to require the water to be lifted from it by bullock labour, is not a good investment. The maintenance and reproduction of the bullocks use up a large part of the product obtained from the water. Power pumps are a clear need. Diesel engines require skilled maintenance; electric motors require little maintenance, but the provision of the power lines demands much more capital. Even so, a widely diffused system of electric pumps (which could be worked largely at night, so as not to put an additional strain on the electrical system during peak periods) would be far less costly than some of the large dams now under consideration.

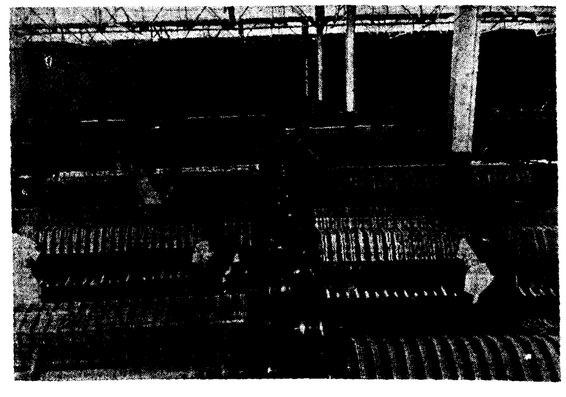
These more modest projects for local wells do not get a chance in face of large and spectacular dam projects, when so many politicians—and engineers too—suffer from megalomania. "We had to do something to make a show", as one politician once rather sadly remarked to me. But "show" can be extremely costly, especially in a country which is comparatively short of capital. It is true that the Damodar Valley project has been remunerative—the electric generating capacity alone would have justified it. The Bhakra-Nangal project might have been remunerative had it not been for the decision taken, on purely political grounds, to spread the distribution network over an uneconomically large area. Moreover, in all these large schemes, even though economic benefit may accrue to the country as a whole, it is surprisingly difficult to get a reasonable amount of the proceeds back into the Treasury. Political agitation against paying a reasonable rent (in other countries as well as in India) seems unduly easy to organise in these large schemes; whereas in a small village scheme nobody objects to paying his fair share of the cost of the water.

Most Remunerative

There is also a simple geographical fact which we tend to forget. India, like every other country, has a limited number of potential dam sites, and the possible economic returns, per unit of capital outlay on them, can be computed and ranged in order. It is only natural that the most remunerative will be selected first. Such projects, therefore, must inevitably be expected to become less remunerative as we proceed down the list (this consideration being mitigated only by the possibilities of technical improvements in methods of dam-building as time goes on).

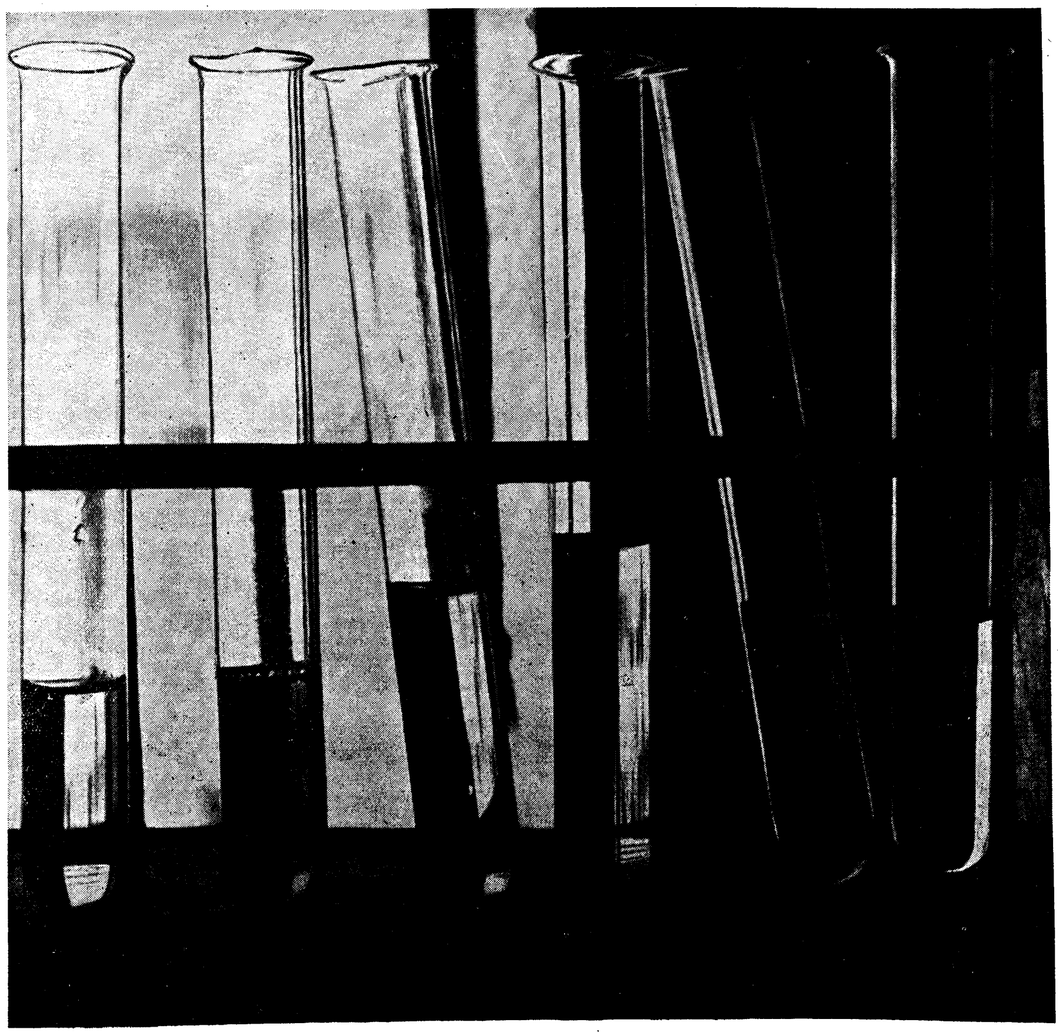
We now come to the subject of foreign trade, to which Indian agriculture must perforce make the largest export contribution. Indian imports (a large part of which is not at present paid for by exports) are only 7½ percent of net national product. In few countries in the world is the ratio so low, apart from the United States and the Soviet Union. It is significant that they also are large countries, with large populations. The amount of foreign trade which a country requires does in fact depend very largely upon its size and population. It is a mistake to suppose, as many economists do, that import requirements are a function of income a head. Consider two countries, one of which has twice the income a head of the other; but the poorer country has twice the population of the richer, so that their aggregate real incomes are the same. It will be found that, subject to a few qualifications, the import requirements of the two countries are about the same. Imports depend upon aggregate income, not on per head income.

For low-income countries, the relationship is about a three-fourths power relationship, that is to say, for every 4 percent rise in real national product, the quantity of import requirements rises about 3 percent. This means that, as the country grows, whether through rise in income a head, or through rise in population, imports fall as a *proportion* of national product, though the absolute amount of imports needed goes on rising. It is in this way that the Indian ratio has been brought down to 7½ percent. Indian imports, however, are already below those computed for a country of India's size, and it is a great mistake to believe that they can be reduced further, or indeed prevented from rising. It may be easy for politicians and industrialists to pick out specific commodities, and to decide that imports can be replaced by home production; they tend to forget the new demands for imported goods which are springing up all the time in many unexpected directions, not least in providing equipment to operate some of the import-replacing industries. If India is aiming at a 4 percent per annum growth of real national product in total, or 2 percent a head per annum, it is necessary to plan for the volume of imports to rise 3 percent per annum.



Trend in Imports

The relationship between the ratio of imports to national product, and the size of the country, is not surprising, when one comes to think of it; a country with a large and diversified population, and also with a large area, is more likely to be able to find any given product, manufactured or natural, within its borders than is a small country. The United States and the Soviet Union have both allowed imports to fall to some 3 percent of national product. While for a country of the size and wealth of the United States, this is about the figure which is to be expected, the proportion is considerably lower than could reasonably be expected for the Soviet Union. Soviet planners seem to be aware of this; since 1955, Soviet imports have been rising at the unprecedented rate of 15 percent a year; and exports have been rising to match. Soviet Russia is now taking very concrete steps to rejoin the international economic community.



With trade necessarily goes transport. We tend to underrate the importance of transport in the life of an advanced community. Even in a compact country like Britain, gross expenditure on transport is of the order of magnitude of over 20 percent of the entire national product. Countries doing a large international trade, such as Britain and the Netherlands, besides their internal transport, also require a great deal of transport performed for them, by their own ships or by others, in carrying their import and export trade to and from the rest of the world. Indians must realise that while the size and population of their country frees them (and most Indian planners are pleased to be so freed) from the close dependence on international trade which is inevitable in smaller countries, at the same time it imposes upon them the necessity of performing much more internal transport.

Transport Neglected

The comparative neglect of transport has been one of the gravest faults of Indian planning. The fault has lain not only with official planners, but with industrialists too. In the Bombay Plan of 1945, perhaps the only example in the world of a plan drawn up entirely by business men, without any participation by governments, it was recognised that India would find shortage of capital a limiting factor in economic growth, and that (on the face of it this is quite reasonable) manufacture offered the best return, in terms of national product, on capital invested. Practically all available capital, therefore, was to be channelled into manufacture, virtually none into transport. The railways as they stood were deemed to be capable of carrying much additional traffic, without further investment. This latter idea persisted far too long. During Mr. T. T. Krishnamachari's earlier term as Finance Minister, I was present at a conversation between him and a

CIBA where research is the tradition

The substance in these test tubes may be gold tomorrow, or it may be cast away. From research to riches is an unpredictable course with the only certainty being that progress in the chemical industry depends upon and demands the daring, the initiative, imagination and hard work that are associated with research investment.

The development of new products from research to reality, from the laboratory to the plant, and finally to the market, involves skills and co-operative endeavours that come only from long experience. A constant flow of original and valuable dyes, pharmaceuticals, plastics, and chemical specialities provide the character of the CIBA concern. These are the treasures that CIBA offers to the world.

In keeping with the CIBA tradition of research, a multi-million rupee centre has been established at Goregaon, Bombay, for fundamental chemical and biological research in answer to India's present Five-Year Plan. The CIBA Research Centre is the first of its kind sponsored by private industry in South Asia—an ambitious project devoted to the betterment of man.

CIBA of India Limited.

JWT-C. 1620

distinguished foreign economic adviser, who continued to assert this belief. The Minister made it clear that he was aware of the great strain on the railway system, and named the junctions which were in danger of breaking down through congestion.

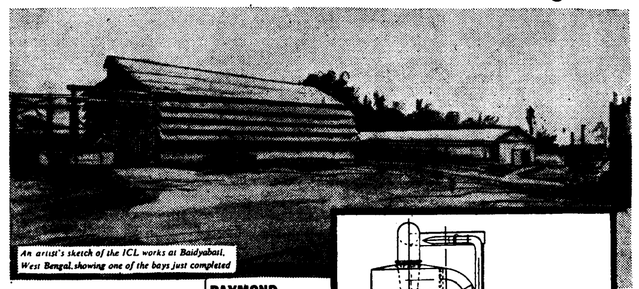
Much credit for foresight is due also to Mr. Badhwar, former chairman of the Railway Board. Writing in the *Financial Times* of London (13th August, 1956), he pointed out that the demand for goods transport had risen from 26,000 million to 34,000 million ton-miles between 1954 and 1956. The second plan provided for 48,000 million ton-miles to be carried by rail in 1961; Mr. Badhwar's estimate was for 60,000 million ton-miles of requirements by rail in 1961, or 68,000 million ton-miles by all forms of transport. What in fact happened was that railway ton-mileage rose to 54,000 million by 1960, and then was unable to rise any further; delays and congestion, very costly to industry, were occurring. Recently, railway capacity has been belatedly improved, by the electrification of some junctions, and in other ways, and the most recent figures indicate traffic flowing at an annual rate of 63,000 million ton-miles. Road transport has also grown to occupy a much larger part of the market than was expected. But it would have been wiser to have made the investments in railway transport earlier.

Nor is this the end of transport requirements, by any means. Most Indians no doubt still think in terms of ton-miles; but we should do what we can to support the Indian Government's admirable initiative, and begin thinking in terms of the metric system. (To convert a British ton-mile to a metric ton-kilometre, multiply by 1.635.) For each rupee of net national product, India now requires about 0.97 ton-kilometres of goods transport. This figure has risen with great rapidity from 0.67 in 1956 and 0.85 in 1960. In the early stages of Indian industrialisation, it is interesting to recollect, between 1900 and 1913, demand for rail goods transport was increasing at more than 6 percent a year. But then followed a long period of much slower growth, of only about 2 percent a year, which left railway planners unprepared for the sustained high rate of rise in demand since 1947.

International Comparisons

Preparing comparable figures for other countries (converting upon the real purchasing power and not solely on the exchange rate of the rupee), we find that the Indian figure of 0.97 ton-kilometres of goods transport requirement per rupee of net national product already exceeds that for most west European countries, except Germany. In Germany, the combination of fairly long distances, and relative concentration upon heavy industry, has raised the figure to 1.44. In Japan, a country which also has a considerable concentration on heavy industry, the figure stands at about the same level, and has not changed much since 1955; the large rise in demand for transport in Japan, which is now causing some congestion on the Japanese railways, has been at very much the same rate as the rise in national product as a whole.

In the United States, however, the about 1920, it stood at 2.5. Since that figure is about 1.6. If we go back to an earlier stage of development, date, the relative importance of heavy industry in the United States has decreased, and of light industries and services has increased; and also the increasing wealth of the market has made it worth while to establish more branch plants for production, rather than attempting to serve the whole market from a single plant, which is often necessary in the early stages of industrialisation. This, unfortunately, is often now the case in India; and the demand for transport therefore becomes correspondingly greater. This principle is indeed illustrated by the figures for Soviet Russia. Even in 1913, the figure stood at 1.5. By 1932, it had risen to 2.85. Stalin then found himself, in addition to his worries about the collapse of productivity under collectivised farming, with a transport crisis on his hands; the Russian railway system was on the point of breaking down. After a pause for recuperation, the advance continued, and the figure rose to 3.7 in 1937 and to 5.4 in 1956. Soviet Russia now seems to require the highest amount of transport, per unit of national product, of any country of the world. This seems to suggest that planners often pay insufficient attention to transport costs.



We must finally pay some attention to India's requirements for energy and fuel. "Commercial fuels", in international statistics, are generally now all expressed in terms of their equivalents of good quality coal, and we will again use the metric unit of kilograms (2.205 pounds) a rupee of net national product. The non-commercial fuels include wood, cowdung, etcetera, on which it is impossible to get quantitative information, except that we know that most Indian families have to be very economical, even with these commodities. The consumption of such fuels (not included in the statistics below) can be assumed at one-sixth of a ton of coal-equivalent a person a year, or about ½ kilogram a rupee of net national product. Such supplies will quickly diminish, and will have to be replaced by coal, as India becomes more urbanised and industrialised.

Consumption of Commercial Fuels

Indian consumption of commercial fuels increased with industrialisation, and by 1950 it stood at 0.37 kilograms a rupee of net national product (at the present purchasing power of the rupee). In no other leading country, however, was the figure so low except in Brazil (where wood is abundant). In the early 1950's India suffered a fuel shortage, which hindered industrial growth. Recently this has been remedied, and India's energy consumption has risen to 0.47 units a rupee.

But this falls far short of the two units of consumption per unit of net national product in the United States, Britain and Soviet Russia. These countries, however, have a number of "energy-intensive" industries; and possibly also use some of their fuel wastefully. Countries short of fuel have shown that they can develop very successfully industrially with a more economical use of fuel per unit of net product. Thus the most recent figure for Japan is only 0.92, having been reduced from the level of 1.25 which it held in the 1930's. In France, it is 1.12, also on a downward trend. Being comparatively short of fuel, India should model her technology and choice of industries on these countries, rather than on the more wasteful use which prevails in the fuel-rich countries. Even so, it is clear that India's supply of fuel and energy will have to be increased much more rapidly than the rate of increase of national product, for many years to come.

Retrospect and Prospect: Reflections on Men and Affairs

Mr. Brock, who was Editor of "Capital" from 1928 to 1932, offers random reflections on the problems and personalities of that time, as well as of today.

By

ROBERT W. BROCK

AS the Editor of *Capital* who initiated its Annual Supplements I appreciate the invitation to contribute to this Seventy-fifth Anniversary Number a few personal reminiscences and reflections, subject only to the self-imposed reservation that personal commentaries in this category can be considered to be of public interest only in the context of public affairs.

As an English journalist privileged to work for over 20 years in India, my one small claim to distinction is that, during that period, I was alone among my contemporaries in having enjoyed the opportunity to edit one daily paper, the *Madras Times;* to have founded, and become Managing Director of, another—the Madras *Daily Express;* and, finally, to have edited *Capital.* When I joined *Capital* in 1913 the proprietor, Shirley Tremearne, was the financial patriarch, Pat Lovett, the originator of A Ditcher's Diary, was Editor; and I was the drab economist, supplying the knowledge of finance which Lovett (who could never grasp the difference between a lakh and a crore) entirely lacked. In 1932, when "Tim" Tremearne, Shirley's son, decided to retire, and invited me to become the new proprietor, it was my misfortune that family reasons prevented acceptance of his offer. As an alternative, I suggested the formation of a Fleet Street syndicate which, under Sir Edward Benthall's leadership, later materialised.

After serving for a time as London correspondent of *Capital,* I became Managing Director of the London weekly *Great Britain and The East,* supporting the campaign for the Halifax-Hoare Reforms, and thereafter Managing Editor of *The Annual of The East,* of which my second issue was published (ominous date) in September 1939. After service in the Ministry of Information during the war years I moved to the India Office "on special duty" to assist in the creation of Information Departments for the new U.K. High Commissioners in India and Pakistan, supplemented by facilities for the operations of the British Council in both countries.

Commonwealth versus Communism

My political faith is that the Commonwealth—not merely despite but because of its disparities—represents, within its own wide boundaries, the only genuine league of nations in a harassed world. At least we all speak the same language, not only linguistically, and are pursuing the same political ideals, however imperfectly. Whereas the members of the Commonwealth are volunteers, equally free to leave or remain, the communist *bloc* are regimented conscripts—with Hungary's sanguinary experience as a constant reminder of the price of freedom from Kremlin control.

The task of empire-building was not completed by planting autonomous Parliaments in economic slums. The ex-Prime Minister pointed to the African de-colonialisation programme as one of his proudest achievements. Was it? As the Attlee Government had carried the creation of an autonomous Commonwealth to the point of no return, his successors had no option but to finish the job. Nor did the senseless slaughter in Cyprus warrant any more flattering judgment. If it was noble to initiate the military resistance to Cyprus's autonomy it was ignoble to abandon that programme. Tory leaders cannot have it both ways. The ex-Premier was also proud to have initiated the Common Market discussion and been saddened by General de Gaulle's abrupt termination of them. In reality, was the Common Market campaign anything more than a highly sophisticated Party manœuvre? From start to finish it conformed closely to the Thorneycroft prescription as defined in that Minister's 1947 publication *Design for Europe,* in which he wrote: "No Government dependent upon a democratic vote could possibly agree in advance to the sacrifices which any adequate plan must involve. The people must be led slowly and unconsciously into the abandonment of their traditional economic defences".

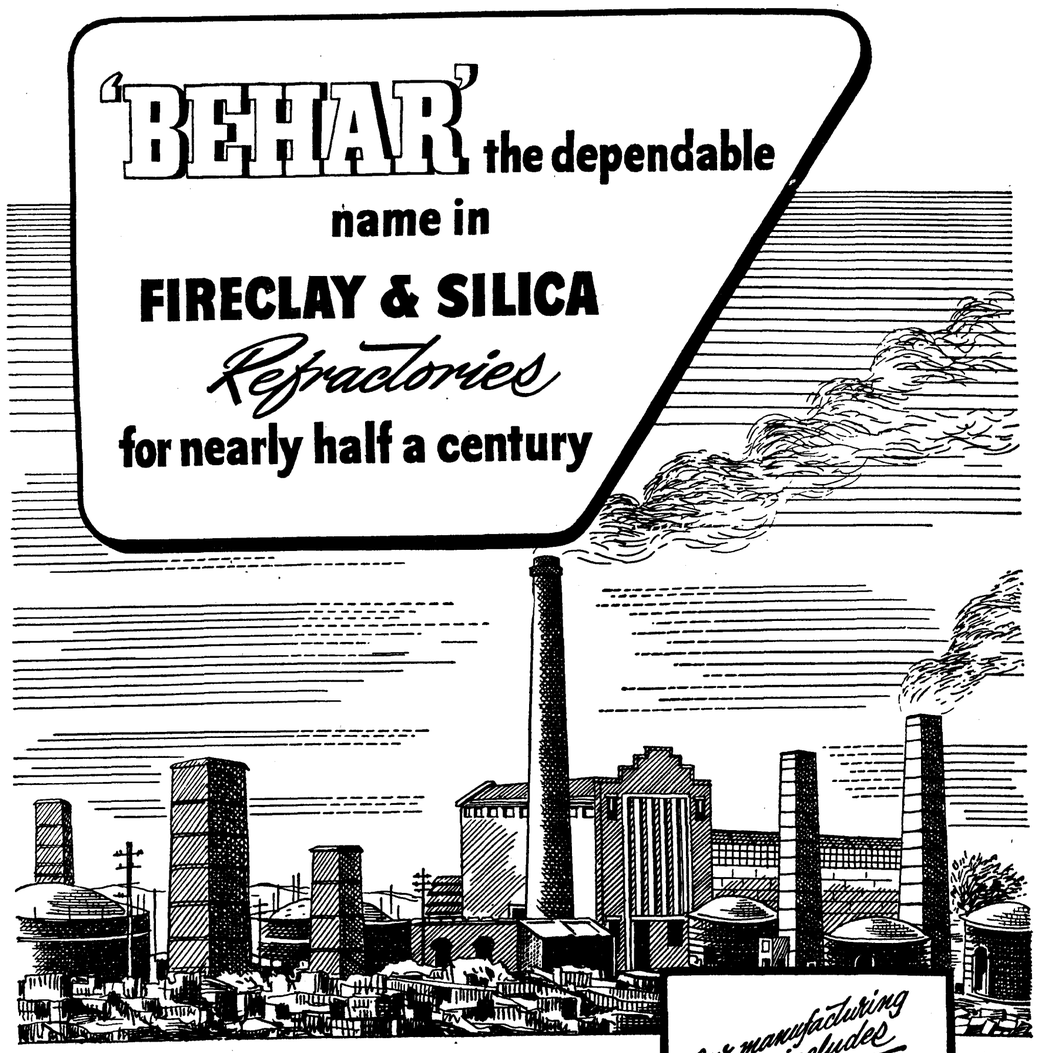
Baldwin, with devastating candour, confessed in Parliament, in the Hitler era, that he had concealed the inadequacy of the country's defence arrangements solely to win a Tory election victory. Mr. Macmillan, who is less candid, tried to repeat the Baldwin tactic by endeavouring (fortunately unsuccessfully) to win a Party victory at the price of abandoning the country's "traditional economic defences". It was a fortunate failure. British exports to Europe are larger today than before the Brussels negotiations collapsed, and will rise further if tariff reductions mature. Concurrently, with automation approaching, development of undeveloped Commonwealth resources presents the U.K. with the greatest economic opportunity in its history.

School-tie Economists

Tory leaders did not realise that. Oxford and Cambridge, whence they are all recruited, produce only "school-tie" economists, lacking practical experience. Conversely, Washington Administrations recruit business "tycoons" to control the key economic departments, as typified by Defence Secretary McNamara, formerly super-salesman of Ford cars, now super-salesman of American "conventional" armaments, especially to countries acquiring political independence.

As Financial Editor of *Capital,* I suppose my most fruitful commentary was made during the First World War when I hazarded the suggestion that perhaps the Lancashire-imposed link between the cotton excise and import duties could be broken by undertaking to allocate the revenue from a higher import duty on textiles (leaving the excise duty unchanged) as a contribution to war finance. The immediate sequel was a personal message from Sir William Meyer through his confidant, Pat (Sir Norcot) Warren, that probably I had devised the only feasible "solution" of this age-old political and industrial grievance. The sequel, some months later, was the incorporation of this overdue fiscal bifurcation in the Budget, subject to India accepting financial responsibility of £100 million War Debt. Lancashire representatives in Parliament were forced to bow to what amounted to a political *fait accompli,* and the way was opened for the progressive advance towards "discriminating" protective duties, and for the acquisition by India of fiscal autonomy, within certain limits, long before political independence was in sight.

As the product of a series of industrial and political accidents the gargantuan Lancashire piecegoods export trade never rested on a stable economic foundation, and today the U.K. imports more cotton goods than it exports. Nor has the migration of mass-production of consumer goods to mass-consumption markets yet reached its limits. On the contrary, it will persist until the leading western industrial countries move over almost entirely to the production and shipment, on long-term credit terms, of the capital equipment the "developing" nations will require for decades ahead.



As already noted, after editing the *Madras Times* for a couple of years after the First World War, and trebling its circulation before it was acquired by J. O. Robinson, of Spencer and Co., and absorbed by the *Madras Mail,* I established the Madras *Daily Express,* partly to re-equip Madras with a morning paper, and partly, in step with the advent of "Dyarchy", to experiment with Indo-British ownership. Perhaps not inappropriately, the new paper passed wholly into Indian ownership within a short period. It was during my editorship of the *Express* that, with the aid of an Indian reporter, I secured from Mahatma Gandhi an interview, occupying a full page, to which he attached so much importance that he insisted on "passing the proof" before his replies to my wide-ranging list of questions were printed.

Non-violence and World Peace

I recall a conversation on one occasion with Lord Willingdon, then Viceroy, when he expressed his personal estimate that Gandhiji was pre-eminently, if not exclusively, an astute politician. That was certainly not the impression I formed during my lengthy discussion with the Mahatma in Madras in 1921 or 1922. Nevertheless, at that period I expressed to him complete scepticism concerning his doctrine of non-violence, alike in its domestic and international aspects. Today, it is hardly necessary to insist, the nuclear bomb has made acceptance of the principle of non-violence the world's only conceivable alternative to Nuclear Doomsday.

Among major nations, however, let it be fully understood, non-violence will survive only as long as the nuclear bomb survives. The supreme merit of the H-Bomb is that its utilisation would mean instant suicide for any aggressor ready to employ it: and it is wholly certain that no

'BEHAR' the dependable name in FIRECLAY & SILICA *Refractories* for nearly half a century

"BEHAR" REFRACTORIES are being used by leading Iron & Steel Works, Cement & Glass Factories, Tea Industry, Sugar & Cotton Mills and other industries in the country.

Our manufacturing range includes

SILICA BRICKS • FIRE-BRICKS • HIGH ALUMINA BRICKS • INSULATING BRICKS • FIRECLAY • FIRE CEMENT • STOPPERS • SLEEVES • NOZZLES • TUYERS, ETC.

aggressor from Hannibal to Hitler would have faced that risk. If the H-Bomb had emerged before 1939 the Second World War would not have occurred. Then why destroy the deterrent?

If nuclear disarmament occurred, leaving only conventional arms available, wars would recur as often, but with greater loss of life and property, as they have recurred from time immemorial. Conversely, if conventional arms are eliminated, and only nuclear bombs survive, world peace will achieve recognition, by all Governments and peoples, as the sole alternative to world annihilation. Incidentally, if only conventional arms are retained, China, with a population likely to climb ultimately to 1,000 million, will become the dominant world Power.

Economic Development

A competent statistician has estimated that the present world outlay of £40,000 million a year is roughly equal to the total incomes of the entire populations of Asia, Africa and South America. The tragic aspect is that capitalist-communist rivalry has resulted concurrently in (1) the building up of military forces by nearly every country which has acquired political independence during the postwar period; and (2) the multiplication of frontier conflicts between countries thus armed—between India and China, Algeria and Morocco, Indonesia and Malaysia, Korea, Vietnam, and many others. Whether independent African countries will combine to attack South Africa remains conjectural. Somalia is now acquiring Russian arms to threaten Kenya.

In Asia I regard American policy as the main incentive to conflict. If China is displaying every symptom of political and economic claustrophobia, the American translation of McCarthyism in terms of foreign policy is primarily accountable; and American military equipment represents poor compensation for the overriding disruption of Asian relations thus provoked. In simplified terms, a caged dragon becomes, inevitably, an enraged dragon, spouting fire on all and sundry. The progressive withdrawal of Russian aid since 1960 can only accentuate that aggressive reaction. Where do we go from here?

The Alternative to Military Aid

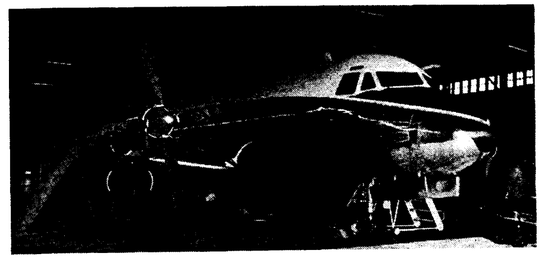
If the N.A.T.O. and Warsaw Powers are genuinely anxious to stabilise international peace by progressive disarmament they could take a valuable joint initiative by agreeing to abandon the almost unceasing distribution of conventional armaments in Asia and Africa whose defence budgets would then decline automatically to the great advantage of their own efforts towards capital formation and the financing of their economic development from their own resources. There are recurring discussions concerning the creation of "neutral zones" in Europe. It would be more profitable to make Asia and Africa "neutral zones" with the minimum possible delay.

Concerted action in that direction would be promoted by most of the present expensive "military aid" by America and other countries being diverted to the rapid formation of a U.N. international army, of not less than 100,000 men, equipped with conventional arms, and available to cope with frontier conflicts in both continents. As a current test, would China have initiated or prolonged her infringement of India's frontiers if the immediate sequel would have been the intervention of a U.N. force whose political prestige, allied with a high level of military efficiency, would have ranked as one of its most formidable weapons? It is highly improbable.

If there is a feasible and fruitful alternative to this diplomatic-*cum*-military *detente* the rival Power blocs have not yet disclosed it. If *apartheid* is indefensible on a national basis, it is still more so on an international basis. British political and industrial interests favour termination of the American "economic blockade" of communist countries, including China. And America's readiness to sell surplus wheat to Russia shows that, in the ultimate analysis, American policy rests wholly, not on political principle, but on economic expediency. Military disarmament is desirable. But economic disarmament is the essential prerequisite.

Indian Economic Dilemma

The accelerating approach of automation, rapidly becoming the major issue in British politics, is of additional significance to India in as much as it signals the arrival of the second Industrial Revolution prior to the full implementation of the first. One example will illustrate my point. In order to make their farms larger and more fully productive, the European Six are engaged in the considerable operation of displacing 8 million small farmers—absorbing them in industry and the professions. A corresponding transfer from field to factory in India would involve the displacement of 50 million peasants —without the industrial and other avenues of employment needed to absorb them.



Hence my advocacy of the creation of a large-scale tractor industry, to facilitate maximum productivity even on small farms by co-operative use of mini-tractors, and associated mechanical aids, in all categories. Britain's agricultural machinery industry, mainly a postwar growth, last year (in addition to meeting domestic demands) achieved exports totalling £145 million. India is the only Asian country capable of rivalling and excelling that notable industrial achievement. To that extent, India's agricultural and industrial productivity would become interdependent and expand together. The smaller the number of workers needed to produce a given output of industrial products, the more essential it becomes to maximise rural purchasing power by increasing rural productivity to its attainable limits.

Meanwhile, in order to promote technological correlation, India's planners may find it advisable to establish an Institute of Automation, linking American, British and Indian personnel in a co-operative analysis and assessment of the economic consequences for India of the new technologies now beginning to shape western economies—with impacts which will not be confined to countries west of Suez.

Survival of the Commonwealth

If the Tory Party, under its new leadership, wins its fourth successive general election in 1964, the new Government will undoubtedly re-open negotiations to join the Six, and Commonwealth statesmen and traders meanwhile would be incautious to base their calculations on any alternative assumption. Every Tory paper, excluding only the Beaverbrook trio, continues to advocate this policy, disastrous though it would be, in my judgment, to U.K. and Commonwealth interests alike. The over-riding Tory *motif* is political rather than economic. If he had become the first postwar Premier, Sir Winston Churchill would not have established the autonomous Commonwealth; Sir Anthony Eden almost wrecked it by his Suez misadventure. Mr. Macmillan, believing in the "wind of change", was ready to risk its disintegration by abandoning Commonwealth leadership and accepting the lesser rôle of "offshore islands" of Europe.

Under a Labour Government, (which every successive by-election foreshadows) all the indications are that Commonwealth economic collaboration will command top priority—deferring negotiations with Europe pending not only the completion of the G.A.T.T. tariff and associated negotiations but also until the Commonwealth, as an economic group, has become sufficiently cohesive to negotiate as a team. On that broader basis, but only on that basis, negotiations might well prove mutually profitable.

PSIHAC-16/63.

THAT WAS THE YEAR THAT WAS

Come to think of it, we are on the threshold of 1964—two decades to George Orwell's "1984". From the vantage point of 1st December, 1963, Mr. Majumder, an old "Capital" hand and now an Assistant Editor of the "Statesman", takes a quick and soft look at the year before it passes into history. He has tried hard to keep his account of the year wholly factual and free from his personal views which are always unorthodox and usually unpalatable.

By

NIRANJAN MAJUMDER

FOR some months in 1963 there was a printers' strike in New York City, N.Y., where in consequence there were no daily newspapers. Oddly enough, the world did not stand still but rumbled on in total disregard of the importance of the place where "the conscience of the world", the United Nations, is located. The U.N. itself, "broke" enough to give its Secretary-General a substantial rise in pay, wondered throughout the year whether it would not be better for all concerned if the world moved a little less fast. Doctors, dentists and teachers in Britain also had pay rises; it was debated still whether the world body was in good health, whether it needed "teeth" and whether it had learnt its lessons.

In spite of the newspaper strike China called the nuclear-armed U.S.A. a "paper tiger"; Mr. Khrushchev retorted that it was a paper tiger with nuclear teeth. The white tigers of Rewa were sent to various zoological gardens to win friends. Influencing people was beer of which Britons drank 155 pints apiece in 1963. The Planning Commission in India appointed a study team on Prohibition which had great fun going round illicit stills and distilleries all over "dry" India. In Britain Prince Charles was punished at school for drinking a cherry brandy. Princess Margaret's trip to Paris was called off because Britain got the dusty answer at Brussels. But Valentina Tereshkova, the world's first woman cosmonaut, came to India all right. Later in the year there was an enquiry whether some members of the U.N. staff were working as "call girls"; it was not disclosed that many were not working at all, like most tubewells in India.

Fourteen Suitcases

Early on in the year there was trouble again in the Congo; at some point, however, Mr. Moise Tshombe left Elisabethville with fourteen suitcases and some ocular ailment. Less responsive to treatment was the Kashmir malaise which, among so many other sores, the U.N. had failed to cure. Messrs Duncan Sandys and Averell Harriman came to New Delhi from Britain and the U.S.A. to tell India how to resist the Chinese but soon forgot all about the Chinese. Kashmir, they decided, was a more urgent case and Mr. Z. A. Bhutto and Mr. Swaran Singh were the best of healers. The former suggested surgery, for which the latter, Railway Minister at the time, did not let the signal down.

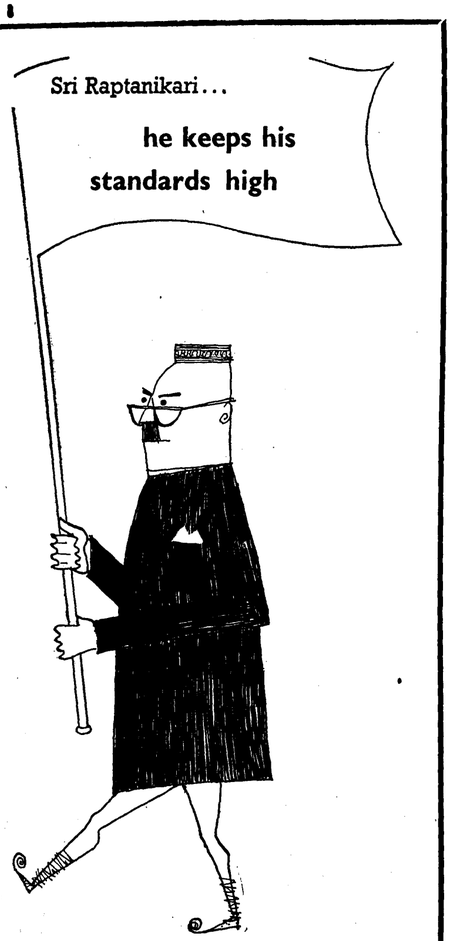
The negotiations rolled on and on like a slow train in no hurry to get anywhere. *Pace* Mr. Sandys, the talks did not shake the world. Badgam, Kashmir, experienced an earthquake with several fatalities. Pahalgam, Kashmir, had earlier in the year known a cloudburst. There were severer earthquakes in Libya (not entirely because women there got the vote); also in Skopje, Yugoslavia. None of these was attributed to the Kashmir talks. If in Kashmir Bakshi Ghulam Mohammed later ceased to be India's only other Prime Minister, besides Mr. Nehru, that was for reasons which only Congressmen pretended to understand. Some, like Mr. S. K. Patil, didn't even pretend and so got into trouble, having got out of office. The public was not sure that the Bakshi had in fact ceased to be Prime Minister of Kashmir. Somebody called Mr. Patil Sri P. L. 480; Mr. Nehru prescribed "gradual erosion" for Article 370.

In January Mr. Nehru opened the Rihand Dam; later a penultimate part of Bhakra-Nangal. Also opened was a Hilton hotel in London. While in Italy in October a whole mountain fell into a dam, killing thousands, the dams in India produced plenty of power of which there were frequent shortages in Calcutta, Kanpur and Delhi. They also irrigated thousands of acres of land, as a result of which there were famine conditions in Rajasthan (where, in Jaipur, there was later a session of the All-India Congress Committee at which much good food was eaten and there was a bar for the Press; some newspapermen, however, were still sober and churlish enough to report it.)

Gentlemen Hard to Find

In West Bengal rice, fish, sugar and most other essential commodities disappeared from the market at one time or another. The State Government arrived at various "gentlemen's agreements". The commodities were as hard to find as the gentlemen, whereupon Dum Dum, West Bengal, devised its own new bullet in the shape of what was politely called "consumer resistance". Mr. P. C. Sen, Chief Minister, welcomed it and the price of sweets came down from Rs. 10 to Rs. 5 a kilogram. Soon came down, too, the shutters of groceries and other shops in Calcutta; and the police had to swoop down. Prices went up again, as the Americans scaled Everest and Mr. G. L. Nanda went on speaking of the need to hold the Price Line. Only the Communist Party of India found it difficult to draw a Party Line as Afghanistan dismissed the Durand Line as "so-called". The Durand Cup was still being played as we went to press. West Indies won the Test series against England. When Sonny Liston knocked out Patterson, he said it wasn't cricket; it wasn't; only boxing. The winner of the Derby, some said, had been doped. In India Mr. Asoka Mehta joined the Planning Commission, without winning all P.S.P. hearts.

Frost Before Thaw



Mr. Hugh Gaitskell died on 19th January, leaving the Labour Party to find a new leader, Mr. Harold Wilson. General de Gaulle did not think France needed one and toured the countryside time and again saying so. Mr. Mohammed Ali of Bogra, once Prime Minister of Pakistan, died on 24th January, leaving no problem of leadership behind because President Ayub Khan remained the only leader Pakistan, according to him, needed. In the same month died the American poet, Robert Frost, who had earlier witnessed from Moscow the thaw in the cold war.

Dr. Rajendra Prasad, India's first President, died on Budget day; but it was Mr. Morarji Desai's cruel budget that depressed all. Pope John died in June, after which the cardinals took their time electing Pope Paul. Even those who thought the election of John F. Kennedy as the U.S.A.'s first Roman Catholic President would mean establishment of a direct telephone line between the White House and the Vatican (the number, presumably, was to be VAT 69) were shocked when President Kennedy was assassinated in Dallas, Texas, on a Friday in November. A great President had died. That the alleged assassin was himself killed 48 hours later took nothing away from the tragedy. As for telephone lines, there was one between the White House and the Kremlin, called the "hot line" which was considered a great improvement on decade-old cold war manoeuvres. Into cold storage went Calcutta's circular railway plan. Up went India's first sounding rocket from Kerala, where Mr. Sankar, Chief Minister, was found innocent of corruption. More serious allegations against Mr. Kairon were referred to a retired Chief Justice. Chief Justice Earl Warren headed a commission to report on President Kennedy's assassination.

Some Marry Others

Dr. Adenauer at long last ceased to be Federal Germany's Chancellor, handing over to Professor Erhard, but not before he had striven hard for an abiding marriage between Germany and France. In Sikkim Miss Hope Cooke, U.S. citizen, was married to the Maharajkumar of Sikkim; and in Britain Princess Alexandra was married to Mr. Angus Ogilvy. Both made excellent television shows, as did M. Bidault on the B.B.C. A rather different kind of television entertainment was the screening of the murder of President Kassem of Iraq, where there was a *coup* followed by another which was supposed to give more power to President Aref. In Syria the Ba'ath Socialists broke away from President Nasser's divided Arab Republic, failed to form a stable Government while trying to take over affairs in Iraq.

The change in Government in Canada, whereby Mr. Diefenbaker went out and Mr. Lester Pearson came in, could claim none of these dramatic features of West Asian changes, although the termination of President Sylvanus Olympio's life, and hence of his *régime* in Togo, before the U.S. Embassy did not lack in drama. Through many hotel and hosiptal episodes, Miss Elizabeth Taylor reached the climax of her film, *Cleopatra*, which now must make $62

He's a stickler for quality. Ever striving for perfection. Takes meticulous care in selecting raw materials. Keeps well equipped test room and laboratory. Exercises strict quality control. Products are checked at each stage of manufacture. Double checked before despatch.

Sri Raptanikari realises the importance of it all. He is conscious of the fact that to compete in an international market his goods should be second to none in quality. Repeat orders, he realises, depend on the quality of his product and Sri Raptanikari scores every time. The reputation his goods have earned in other countries is a credit for India and a help for other exporters to get easy acceptance of their goods.

In order to earn a good name for Indian goods and get repeat orders that bring foreign exchange for the country it is important that the standard of quality is kept high.

million before it shows any profit. The profit motive was the least important when, in February, General Ne Win's Government nationalised all banks in Burma. National and Grindlays Bank celebrated its centenary, as did Andrew Yule and Co. More highminded folk celebrated the birth centenary of Swami Vivekananda.

Christine and Mandy

During the year flirting was permitted in Gulhane Park, Istanbul. Imperial Chemical Industries, however, courted Courtaulds with less than success. Britain's wooing of the European Common Market came abruptly to an end when General de Gaulle declared that Britain was insufficiently European. He did not soften even after Britain's War Minister with a continental name, John Profumo, first denied and then admitted his relations with Miss Christine Keeler who, incidentally, had been holidaying in Spain, Europe, when she was required as a witness in a case against one of her many ex-lovers, a West Indian, who was first found guilty and then innocent. Mr. Profumo resigned. Many thought Mr. Macmillan would too; but Lord Hailsham said tartly that a great Party was not to be brought down by a couple of tarts.

Instead of resigning, Mr. Macmillan appointed Lord Denning to look into the security aspects of the affair. Meanwhile Miss Keeler and her mate, Miss Mandy Rice-Davies, continued to come to the Old Bailey in flashing Rolls-Royce limousines. It appeared that Rolls-Royce might not, after all, have to close down their motor division, a prospect that gained further strength when Mr. Jomo Kenyatta, Prime Minister of Kenya which was to be free on 12th December, bought himself a Rolls-Royce. At Ford's at Dagenham, however, there were frequent strikes on some issue or another. In spite of Dr. Beeching's very drastic report on British Railways, railwaymen abandoned their idea of a national general strike. Britain's independent nuclear strike rested on the monstrously expensive *TSR2*, which Australia decided not to buy. Australia, as well as New Zealand, decided on a no-change in government. In Canada 118 died in an air crash; the jet plane was completely burnt out. In Madras the Dravida Munnetra Kazhagam wanted to burn only copies of the Constitution and, in New Delhi, it demanded that Mr. T. T. Krishnamachari answer questions in Tamil; this after Mrs. Lakshmi Menon had been heckled for answering in English instead of Hindi.

Tenants Tenuous

Almost simultaneously with the Profumo affair in Britain came disclosures of Rachman's rent racket. Although every country behaved as though there could be no Christine Keelers in its society, problems of housing and tenancy existed in India too. The most nervous of tenants seemed Congress Ministers after the Kamaraj Plan. While the nation continued to prepare against the Chinese with borrowed arms and home-made slogans, it seemed that Mr. Gopala Reddi, Information Minister, had nothing to lose but his slogans.

As it happened, he lost office; so did Mr. Morarji Desai, Finance Minister, Mr. S. K. Patil, Food Minister, and four others. Also to go were six Chief Ministers of as many States. In West Bengal Mr. P. C. Sen said he needed all his colleagues and then sacked two Ministers and all Deputy Ministers. The resigning Ministers then all devoted themselves to work for the Congress Party. Consequential unity was most pronounced in Gujarat, where Dr. Jivaraj Mehta had to go and Mr. Balwantrai Mehta to come, and in Uttar Pradesh where India's first woman Chief Minister, Mrs. Sucheta Kripalani, fought an open war with Mr. Kamlapati Tripathi. Punjab was full of "dissidents". Kerala's Congress chief agreed not at all with its Chief Minister.

Kamaraj Plan for Mr. Macmillan

As if in conformity with the Kamaraj Plan, Mr. Macmillan resigned too. Mr. R. A. Butler was once again bypassed and became Foreign Secretary in the Government of Sir Alec Douglas-Home, formerly the fourteenth Earl of Home. The bell did not toll for Lord Hailsham either, now Mr. Quintin Hogg again. Britain's new Prime Minister was promptly greeted by the *Tailor and Cutter:* "At last we have a Prime Minister who looks like one". Mr. Butler did not repeat his suicidal witticism, "He's the best Prime Minister we've got". The former Prime Minister's son got a job in the new Government. As British defence was being moulded on the lines of the Pentagon, British politics too followed, in part, the U.S. pattern. As the year was closing, people on both sides of the Atlantic wondered about the prospects of the Tories under Sir Alec Douglas-Home and those of the Democrats under Mr. Lyndon Johnson, thirty-sixth President of the United States of America. India's only Prime Minister, Mr. Jawaharlal Nehru, could not help being 74 in November, as he had been born in 1889, although some newspapers unfairly made him 75. In a commemorative stamp Mrs. Annie Besant was made ten years older than she was. Ten years after Avadi, the Congress was still looking for a definition of socialism.

In spite of his election victory at Amroha, Acharya Kripalani looked older. The other non-Congress victor, Dr. Ram Manohar Lohia, started a great debate with his discovery—"invention" according to Mr. Nanda—that the majority of Indians lived on 3 annas a day. (One household in three in Britain, it was announced, has a motor-car.) Mr. Nehru said the figure should be 15 annas a day; Mr. Nanda thought 6 annas would be a reasonable compromise. Professor Mahalanobis maintained his dignified silence. Golden, more than 14 carat at any rate, could not be ornaments in India, under Mr. Morarji Desai's dispensation. When Mr. T. T. Krishnamachari became Finance Minister he changed the furniture of his office; down came most of the props too of Mr. Desai's financial policy. The entire Diem-*cum*-Nhu *régime* collapsed in South Vietnam, with the two leaders shot dead but not "barbecued" as, according to Madame Nhu, monks in Saigon had been. America's Mariner II found Venus too hot for human life. Too hot for the Dutch, became New Guinea, now West Irian and Indonesian.

While the nearest the world saw of war were a chicken war between the U.S.A. and the Common Market and a citrus war between two other countries, there was a limited test ban treaty signed by most countries except France and China. (The Twist was unlimitedly banned in Indonesia.) China throughout the year retained its warlike posture and forbade even a peace march by some Indians to Peking. The Negroes' march in Washington, demanding civil rights here and now, was most impressive; but it continued to cost the U.S. Government thousands of dollars a day to keep James Meredith, a Negro student, in Mississippi University. Universities in India kept thousands of students, brown and other, out because classrooms were overflowing. In Burma the Army moved into the university campus. In Britain, Princess Anne went willingly to school.

Chief Enahoro went, unwillingly, back to Nigeria, there to be sentenced for treasonable felony. Billie Sol Estes of Texas got 15 years for fraud. Mr. Satyajit Ray got many more awards for his brilliant films. Mr. K. D. Malaviya got the sack for taking a paltry sum for a friend's election expenses. (In Britain there was a train hold-up and robbers walked off, or drove off, with the tidy sum of £2½ million.) Mr. Biju Patnaik of Orissa got his man as Chief Minister after him; so did Mr. Kamaraj, who also got the presidentship of the Congress which, said Messrs Lal Bahadur Shastri and Atulya Ghosh, had gone to the best man.

Airy Exercises

As part of India's preparedness against the Chinese, there were joint air exercises with the Indian Air Force, the U.S. Air Force and the Royal Air Force participating. Joint air exercises between All India Radio and the Voice of America proved more difficult. The agreement, signed in a fit of sustained absent-mindedness over a period of months, hung in the air instead; and there was no 1,000 kilowatt transmitter in Calcutta. The B.B.C. suspended its popular satirical programme, That Was The Week That Was. (B.O.A.C. made a huge loss, showing that it takes better care of you than of itself. Air-India made a tidy profit.) Indonesia withdrew diplomatic missions from Malaya as Malaysia was born. Russia withdrew its missiles from Cuba. India altogether withdrew her request for U.S. aid for a steel plant at Bokaro; aid or no aid, Mr. C. Subramaniam declared, India would go ahead with the project. China went on attacking, first, President Tito of Yugoslavia and, then, Mr. Khrushchev of Russia for deviationism and other crimes.

Mr. Khrushchev kept up his attack on abstract and impressionist art, a venture in which he was joined by our own Sir Biren Mookerjee, chairman of Indian Iron and Steel, who told shareholders that the picture he had presented of prospects for steel was photographic, not impressionistic. Mr. Khrushchev also beat U.S. Secretary of State Dean Rusk at badminton. Stirling Moss retired from motor racing, but not because an Indonesian mob had burnt a British embassy car and then the embassy itself at Djakarta. In Britain, however, No. 10 Downing Street was thoroughly renovated; in Algeria Ben Bella became President while in Cuba Fidel Castro remained President. The hurricane Flora hit Cuba; only an unnamed cyclone swept Cooch Behar in West Bengal. Nagaland swept into existence; but Phizo stayed in London, observed mainly by the *Observer*. The *Spectator* got a new editor, Mr. Iain Macleod, who refused to serve Sir Alec who was soon dubbed "Smart Alec".

Literary Lapses

In Britain facetious writers started interpreting B.C. as Before Christine and A.D. as After Denning, whose 50,000-word report became a best-seller. The man who coined A.F., After Ford, Aldous Huxley, died of cancer; Jean Cocteau died too, at 73, without ever growing old. Miss Keeler's story in the *News of the World* sold well. The *Daily Mirror* discontinued "Daughter of Jane". More modestly, *Capital* completed its seventy-fifth year; the *Statesman* got a new board of directors from its new owners. For *Time*, life began at forty. A second wage board was formed for working journalists in India's Fourth Estate. Her third plan was found to have set many targets too high. Afghanistan got its first Government without a single Minister from the royal family. To that country had gone Professor Humayun Kabir on a cultural mission; although the India Office Library remained out of India, as did Mr. Kabir for longish stretches, he became Petroleum and Chemicals Minister. Education and Cultural Affairs went to Mr. M. C. Chagla, who came from London; to the High Commission went Dr. Jivaraj Mehta of Gujarat. Eton got a new headmaster, a non-Etonian. Oxford beat Cambridge in the boat race. In Punjab an Opposition M.L.A. was beaten up.

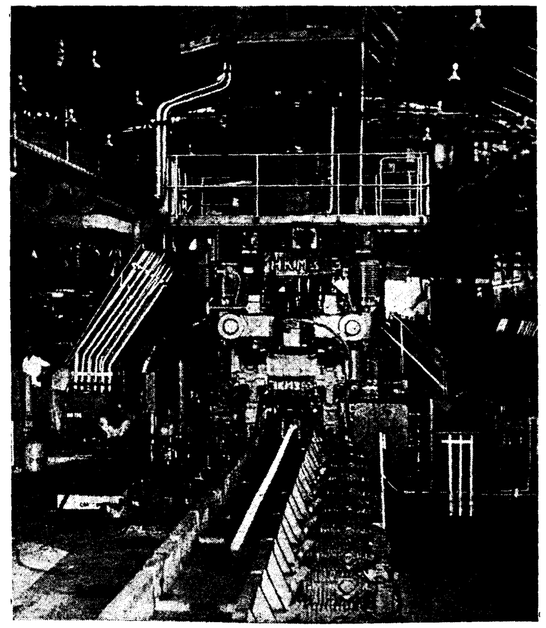
For the first time in many years, Mr. Krishna Menon did not lead the Indian delegation to the General Assembly of the United Nations; he was busy writing for *Century* without being called a working journalist. Journalism's gain was India's loss, or *vice versa*; and Mrs. Vijay Lakshmi Pandit went to New York in his place. She also later represented India at the solemn funeral of President Kennedy, at which another unexpected presence was General de Gaulle's. The latter event brought about no change in France's attitude to U.S. offers of Polaris equipped submarines.

China disclosed that the Soviet Union had refused it nuclear secrets; off and on there were rumours that China might test its first atom bomb some time, this year, next year or in ten years. India will not make one at all. The "Great Leap" had, by common consent, failed. When, however, there was a harvest failure in Russia the Chinese attributed it to Mr. Khrushchev's departures from the ways of Lenin which were correctly understood only by Mr. Mao Tse-tung and Mr. Liu Shao-chi. The Chinese kept sending long notes to India and writing longer editorials in the *People's Daily*. *Pravda* retaliated with an even longer editorial. In India shorter editorials were favoured; and they did not have to be against or about China. The Corporation of Calcutta never got a favourable notice; and a succession of Mayors wondered why. The citizens knew.

Early in the year a U.S. submarine mysteriously went down in the Atlantic with 129 aboard. Late in the year a helicopter crashed near Poonch in Kashmir with five very senior officers of the Indian Army and the Air Force; all were killed. A cholera epidemic in Orissa carried away about 1,000 lives. The 1961 census figures, still under examination, showed that the population of the country had increased enormously; not a few Muslims had infiltrated from East Pakistan, while there was a surprising increase in the number of Buddhists in the country.

More Babies, Fewer Lions

Since the census was taken some time before the Chinese attack last year, it seemed unlikely that there was a patriotic attempt to match the Chinese in numbers. America's "baby boom" continued; there was one in Britain too. The number of lions in the Gir forests was said to be on the decline; there was talk of imports from Africa. The African Lion, Dr. Banda, got ready to leave the Central African Federation; Northern Rhodesia followed Nyasaland; and there was little left of either Sir Roy Welensky or his beloved Federation. The Federal Premier went to South Africa's Dr. Verwoerd for advice; advice was all he got. The Africans in South Africa got more repression and Transkei.



In Laos the International Control Commission controlled few of its Princes. Cambodia was annoyed with the Americans and refused U.S. aid. Most other countries asked for more aid; and more than once Congress cut appropriations recommended by the President. In India a heavy machine building plant was opened at Ranchi; but waste continued in *khadi*, cottage industries and such other unproductive ventures. When Mr. U. N. Dhebar, associated at a salary with one of those projects, was criticised for his part in the Rajkot by-election campaign, which the Congress lost to Mr. Minoo Masani anyway, Mr. Dhebar said he could not help advising his former electors.

Mr. Atulya Ghosh was elected President of the Indian Football Association and also applied for membership of the Calcutta Club. Many admired the range of his interests without necessarily seeing the connection among them. Pakistan's proposal for an air connection with Tokyo, *via* Peking, was turned down by Japan, which Rawalpindi, Peking's new friend, considered unfriendly. The Indian Airlines Corporation lost a *Viscount* in a crash near Agra but was waiting for *Caravelles* in December. It was announced that the Life Insurance Corporation of India would go into non-life, general insurance. Only the Government appeared reassured.

Age of Longing

Whatever the age of the earth, 1963 made it—and us all—one year older. If the year be proud of this achievement, let it remember that the earth survives while 1963 is all but dead; there is the hearse waiting to pick up its carcass. Those who can hardly wait to usher in 1964, a pre-ordained leap year (not another "big leap" in China, we hope) might do well to remember that 1964 will be two decades to Orwell's age of perfected inhumanism. Must it? The answer has to come not only from Mr. Khrushchev, Mr. Mao Tse-tung, Mr. Lyndon Johnson, Sir Alec Douglas-Home and such men, mere men, in authority but from each one of us in every walk or station of life. What distinguishes our earth from Dante's Inferno is the presence of charity in the former and its total absence in the latter. The concept of a welfare State is in no way in conflict with personal charity which can be in word and in deed. There is time yet to send a cheque to the *Capital* Christmas Toy Fund; it will not save the world from nuclear extinction but it will make a few children happy—a happiness that transcends all terror.

1st December, 1963.

The Commonwealth Today: Some Results of Recent Thinking

Mr. Barrell, who was Editor of "Capital" from 1955 to 1962, makes a critical analysis of the future of the Commonwealth.

By GEORGE BARRELL

HISTORIANS are almost sure to identify the failure to join the European Common Market as one of the major traumatic experiences in Britain's long history. What will puzzle them, however, is that during the first year of exclusion the true extent of the opportunities lost seems to have troubled the British public scarcely at all. In fact, there is probably less support in Britain now for joining the European Economic Community than there was a year ago. This can be explained by the simple economic paradox that the Common Market has been faced with its first cyclical difficulties at precisely the time the British economy has been reluctantly pushed into one of its limited upswings. Such a coincidence of circumstances can hardly be expected to last. But while it does, Britain's predicament as a major exporter excluded from what is potentially its largest single market, and as a small island power situated on the doorstep of a powerful continental neighbour, is likely to remain insufficiently appreciated. Instead, one of the main questions which will continue to be asked is why Britain's main international connection, the Commonwealth, is proving unable to substitute either politically or economically for the failure in Europe.

It can be said right away that Mr. Macmillan's Government was under no illusions last January about the Commonwealth as an alternative to the European Economic Community. It was the British people, encouraged rather rashly by the Labour Opposition and by a few die-hard empire enthusiasts, who were inclined to turn to the Commonwealth for possible consolation. The fact that disappointment has not been greater is again due to more favourable circumstances than could reasonably have been hoped for. But these have not discouraged considerable debate in Britain about the true nature of the Commonwealth and its exact significance in the world of today. The points of view expressed have, of course, differed widely. But it is true to say that a consensus is emerging which is far more critical and much less sentimental about the Commonwealth connection than was the case a few years ago. This is all to the good. It is no aid to rational thinking that the Commonwealth should remain forever a precarious prop to Britain's self-esteem, as a recent official publication described it. It is much more useful for all concerned that the true balance be struck without emotion or prejudice distorting the issue one way or another. Considerable progress has been made in this direction since last January, and now the picture is clearer than it has been since the war. As part of the Commonwealth herself, and potentially the most powerful member of it, India has a direct interest in what exactly this is turning out to be.

Defence Ties

First militarily: Any idea of the Commonwealth as a viable defence system is a thing of the past. It never has been regarded as such by the newer members, nor, this century, by Canada. But the defection of South Africa, and the growing tendency for Australia and New Zealand to turn to the United States for military support, have for all practical purposes dissolved the last remnants of what was once the old British imperial defence system. It is a demise which goes unmourned in hard-headed official circles in the U.K., where the need to conserve Britain's limited military resources for N.A.T.O. is accepted as of first priority. But there remains considerable sentimental regret concerning its disappearance among some individuals both in London and elsewhere, and even now this continues to obscure current British thinking about the Commonwealth. Of course, one important vestige of imperial defence still remains, as India has recently discovered. Any Commonwealth member finding itself in conflict with a power which is outside the Commonwealth can, generally speaking, rely on moral and material support from the others, and especially Britain. This link has strict limitations, as the dispute between India and Pakistan has proved. But the fact that India has found her membership of the Commonwealth useful in her dispute with China is evidence that material benefits are still to be derived from it.

Commonwealth defence, as a single entity, is complicated by the loose nature of the ties which unite member nations, by the relative weakness of Britain herself, and, of course, by the realities of the cold war. Any sober assessment of the future must conclude that the opportunities for strengthening defence ties are practically non-existent. This is no doubt as most members, including Britain, would prefer it. The informal nature of the Commonwealth system does not make for close co-operation in military matters even if the necessary power were available to back it. And at the moment there is no indication that anything more formal would be acceptable to all members.

Political Co-operation

When any possibility of closer military ties is ruled out, it becomes clear that the field for further political co-operation is also limited. With each member-nation anxious to follow its own foreign policy, joint action in the political field must obviously be reserved to the least formal of contacts. This is in fact a fair assessment of the present state of affairs. The periodic conference of Commonwealth Prime Ministers has long been accepted as valuable mainly because of the opportunity it provides for exchanging ideas, not for co-ordinating policy. This is not to say such conferences are, therefore, of no value whatever. But their present size, the diversity of their composition, the varying stages of political and economic development of the countries represented, and the determined preservation of every aspect of national sovereignty and independence, all militate against any move to concert foreign policies. In other words, the Commonwealth Prime Ministers conference is, at least politically speaking, more of an old-boys' reunion than a concert of powers. Again, this conforms with the general wishes of the members.

The opportunities which arise from a meeting between relatively like-minded statesmen who uphold roughly similar ideals about peace, freedom, progress and racial equality—no matter how much these may become modified in practice—must not be underestimated. Nor must the advantages which small and newly-independent countries can derive from being associated, however loosely, with a larger grouping, be dismissed out of hand. Voices are amplified when in unison, and the Commonwealth has provided not only a window on to world affairs for a surprising number of small, ex-colonial States, but has also helped ensure that what they have to say for themselves is heard with reasonable deference.

The availability of a common language has helped in this, and indeed the existence of a large and growing community of English-speaking States has proved a significant factor in world councils since the war. But here the political significance of the Commonwealth ends. Its members do not march in step on all occasions and Britain, unlike France with her former African empire, has neither the ability nor the desire to act as either spokesman or pace-setter. Under such circumstances, the very possibility of common discussion between so many varied nations ensures that the outcome will be innocuous rather than spectacular.

Economic Advantages

And finally economic: It is in this field, perhaps, that the Commonwealth retains its chief significance for its members. The maintenance of the old imperial preference system more or less intact, despite the dissolution of empire, has been of considerable importance and benefit to all member-countries. So has the sterling area system, of which most Commonwealth countries are still a part. Both have provided markets and the means to serve them, and the advantages gained have been both mutual and lasting. Nevertheless, they have been limited, as recent discussion has revealed. Again, it has been the insistence of members on their sovereign rights which has been the main source of weakness.

Member-nations have exercised their right to buy in the cheapest markets and to protect those of their industries which it has been decided to develop, or merely to preserve. In this respect Britain, with her massive agricultural protection, her "voluntary" agreements governing the import of cotton textiles, and her various schemes of official buying, has been among the worst offenders against the spirit of the Commonwealth. It is not necessary to be a Commonwealth enthusiast to realise that there is considerable scope for improving the usefulness of the system as an aid to mutual trade, and it is this point which has done so much to justify the feeling that with a little determination and some attention to detail the system could be developed so as to compensate Britain for the failure to join the Common Market and provide corresponding benefits to other members.

One of the main possibilities lies in the sphere of development aid. So far the existing Commonwealth system has found perhaps its main scope for further development in this field, and in that of technical assistance. The scope for both is limited only by sufficient resources of capital and expertise. These have been growing in recent years, but still not fast enough to meet the need. There is an increasing awareness of aid requirements in Britain and a few

simple measures, such as the organisation of an official corps of technical consultants for service in under-developed countries, would rapidly transform the situation. But the main limiting factor is money, and all rational assessments of the British economic situation during the next few years suggest that on neither private nor public account, whether as investment or as payment for services, is its supply likely to expand in line with requirements. This is unfortunate, because, as was agreed in a recent pamphlet entitled *The Future of the Commonwealth: A British View*, and published by H. M. Stationery Office, the present Commonwealth organisation is perhaps uniquely suited to the provision of technical assistance.

Basic Reality

So that is the picture of the Commonwealth today. A loose association of many differing and diverse States having little in common except their former imperial ties, their mastery of the English language, the lip-service they pay to the principles of freedom and parliamentary democracy, their participation in a mutual and inadequate system of trade preferences together with the choice of sterling as the common trading currency (excepting Canada) and an unshakable dedication to the principle of unrestricted national sovereignty. Clearly, this is not the stuff on which grandiose concepts can be based. Nor does it lend itself readily to rapid conversion into something which can substitute for the snug political and economic cohesion of the old British Empire. The ready acceptance of its better features, such as the scope provided for technical and educational aid, cannot obscure the fact that any development of the Commonwealth beyond its present limits is going to be a very difficult task indeed. Which, of course, does not mean that it is impossible.

Indeed, the recent heart-searching which has been taking place in Britain about the Commonwealth, apart from establishing a firm and desirable basis of reality, may have cleared the way for fresh constructive thinking, and is almost certainly the harbinger of new initiative. Whichever of the two British political Parties is in power after the next general election, it is going to be under considerable pressure to suggest radical development of the existing Commonwealth structure. There is little chance of sweeping reforms being proposed; Britain's interest in maintaining the present loose relationship, the main source of existing weakness in the Commonwealth, is as great as that of any other member. But even accepting such limitations, there are numerous ways in which the Commonwealth connections can be developed to the benefit of all concerned. Some of these have already been suggested in British political circles. Others have yet to see the light of day. No doubt they will during the next couple of years, because this promises to be a period of particular significance for the Commonwealth: a time for formulating new approaches and investigating new opportunities.

One of the most welcome developments for all concerned would be in the direction of increasing mutual trade, but it is here that the prospects are probably least promising. At present three-quarters of all Commonwealth trade involves exchange with the U.K. The main problem of expanding it, therefore, boils down to opening the British market for Commonwealh products and persuading other member-countries to take more goods from the U.K. The difficulties are numerous enough. But the main ones are, briefly, Britain's own determination to protect her agriculture and certain of her older manufactures; the need for other Commonwealth members to protect their own infant industries; the shortage of foreign exchange among the less developed members; and, by no means least important, the determination of all member-countries to preserve the sovereign right to buy in the cheapest market. There is also the added problem that the trade of under-developed countries nowadays tends to follow aid, and this, in India's case, is causing a considerable diversion of import trade from Britain.

The impact of these many difficulties could no doubt be mitigated if the Commonwealth were able to form itself into a tighter trading *bloc* on the lines of the European Economic Community. But partly because the stages of development of member-countries are so widely different, and partly because there is no urge to emulate the political initiative which, as much as economic expediency, is behind the European experiment, anything of the kind can be ruled out. In the absence of any practicable possibility of radical reorganisation, therefore, the expected initiatives will no doubt be reserved to peripheral matters.

Liberal Attitude

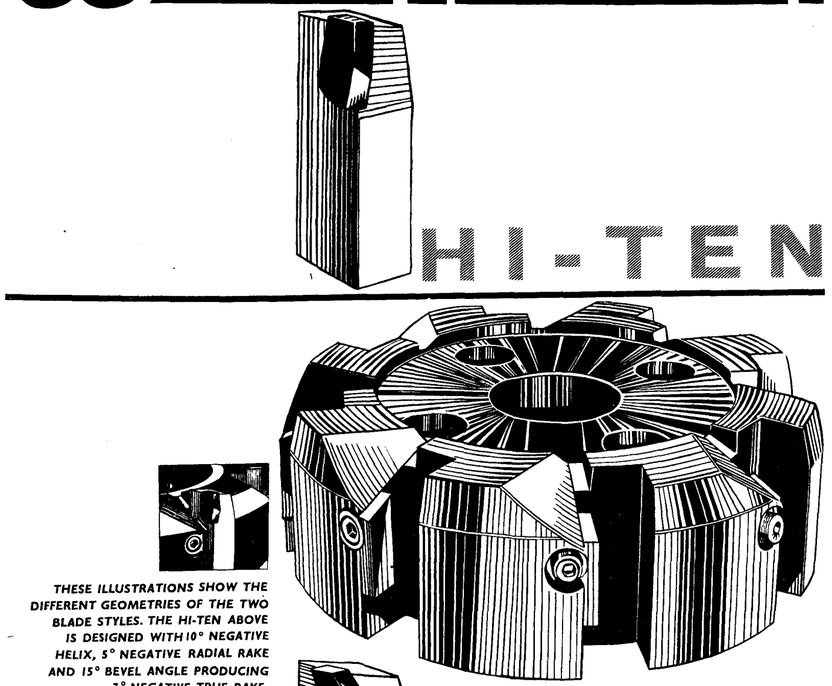
Apart from a more liberal attitude on the part of the British Government towards Commonwealth imports, possibly based on reciprocal agreements with individual countries, probably the most promising opportunities in the economic field would be the negotiation of long-term commodity agreements. Taking the Commonwealth Sugar Agreement as a possible model, there is obviously scope for arrangements of this kind, and the official attitude towards them in Britain has been softening in recent months. They would not, however, benefit all member-countries equally, and they might prove particularly ineffective in helping the under-developed. These would derive greater assistance from the proposal to establish a Commonwealth Bank and a Commonwealth Development Association.

The first of these would seem to be a practical enough proposition, although in what way it would be able to enter fields which are not already adequately covered by the World Bank, the I.F.C. and the I.D.A., or could be if the functions of these established organisations were extended in line with recent proposals, is not easy to see. The second, a Commonwealth Development Association, would presumably concern itself chiefly with initiating economic and industrial surveys, with co-ordinating technical and financial policies and with the training and selection of management, and would, therefore, enjoy considerable scope for its activities. Linked with the existing facilities for technical assistance for under-developed Commonwealth countries, and perhaps linked to the mutual assistance device of the Colombo Plan, the concept of a C.D.A. could be the most useful of the many suggestions put forward so far.

Commonwealth Planning

The most ambitious proposal yet made, at least among those which can be regarded as in any way practicable, is the one put forward by Mr. Selwyn Lloyd some months ago for a Commonwealth "Neddy". Neddy is the affectionate title for Britain's National Economic Development Council, a planning organisation for the British economy inaugurated by Mr. Lloyd when he was Chancellor of the Exchequer. Extending its principle to the Commonwealth would involve, presumably, the co-ordination of national plans, where these exist, into a single overall plan for Commonwealth development. Without taking up the space which would be required to list the objections to such a project, it is sufficient to point out that these would be numerous and weighty. It would be wrong to dismiss Mr. Lloyd's dream out of hand, but it would certainly be safer to press forward for the time being with the proposed Commonwealth Economic Survey, perhaps later leading to the establishment of the more modest C.D.A., rather than think immediately in terms of a supra-national planning authority for so loose and heterogeneous an organisation as the Commonwealth. The economic survey project mentioned above was recently announced as the first practical initiative in the Commonwealth field after the failure at Brussels last January. So far, it is wholly lacking in detail and only partly justified in outline. However, it does seem likely more will be heard of it under the new Government of Sir Alec Douglas-Home, which has already declared its intention of making a fresh approach to the subject of the Commonwealth.

Other suggestions for developing Commonwealth connections which stand some reasonable chance of success are confined chiefly to the educational and cultural fields. At the moment about 65,000 Commonwealth students are studying at British universities. The number could be increased. How many British students are studying at Commonwealth universities is not known, but the total is probably negligible. To expand it, possibly on a reciprocal basis, would not only help Commonwealth relations, but would go some way towards relieving the gradual descent into insularity which is afflicting the youth of post-imperial Britain. A project for a Commonwealth University has been suggested, and there seems no reason why this could not eventually be realised in view of the fact that there are no serious difficulties of language standing in the way. No doubt the initiative now lies with Britain, from whose pocket the resources would have to come. Finally, in the field of teaching generally, progress is at present being made, but continues to be impeded by the unenlightened attitude of British employers towards anybody whose experience has been largely gained overseas. The British Government is making half-hearted efforts to change this, particularly among local authorities, but so far the progress has been indiscernible.



There are two more recent suggestions which deserve examination before being decisively rejected. Both are in the political field and both appear to encroach upon the inviolable and cherished principle among Commonwealth members of unencumbered national sovereignty. Their practicability, therefore, can be dismissed without more ado. Briefly, they propose the establishment of a Commonwealth Consultative Assembly, which would presumably be a permanent extension of the periodic Prime Ministers conference, and of a Permanent Secretariat to handle the business flowing from it. It is difficult to see what either body could accomplish under present circumstances, and so not much good would result from a detailed analysis of the proposals, even if this were possible with the information available. Perhaps the only thing that can be said about these ambitious ideas is that they refer to possibilities which are too far in the future to warrant serious attention at the moment.

The Commonwealth Ideal

The object of listing these various proposals is to indicate the fact that although recent critical thinking has stripped the Commonwealth concept of much of its sentimentality and revealed its innumerable limitations, it has not justified its being abandoned altogether. Britain's failure in Europe and the arrival of the final stage in the dissolution of empire, may, indeed, mark exactly the right time for a comprehensive review of the whole Commonwealth ideal. And without attempting to force it into something it is not and can never be, there is obviously considerable scope in an entity so vast for the kind of progress and development which would be a help to all member-nations. The next few years may see a modest revival of the Commonwealth idea both in Britain and elsewhere on the lines of a more equal partnership and with economic, educational and cultural co-operation as its main aims. There are many factors which will impede that type of development—such as race relations—but on the face of it, the possibility seems practicable enough. Much will depend on whether the Government which takes power after the next election in Britain is primarily Commonwealth-orientated, or is still mainly concerned with Europe. Whether the co-operation will be forthcoming from member-countries will depend to some extent no doubt on whether the remarkable solicitude for the Commonwealth connection which was shown when Britain announced her intention to seek membership of the E.E.C., was genuine, or merely cupboard-love.

The one thing which can now be accepted without question is that whatever steps are taken by Britain will not be towards any form of neo-imperialist revival, as to some extent has happened in France. The prevailing mood about the Commonwealth among the British public generally is one of disillusionment, and only vaguely of hope for the future. This is extremely healthy under the circumstances. It means that all efforts towards improving the Commonwealth connection will be made with the greatest care and tact. But that way, and that way only, lies the possibility of success.

Reducing the Economic Disparities between Rich and Poor Nations

The developing countries cannot accelerate their economic progress without generous aid. The advanced nations should see to it that greater capital resources flow to the under-developed countries and trade possibilities are steadily increased.

By
TARLOK SINGH
Member, Planning Commission

IN common with many other countries, for more than a decade, India has been engaged in the effort to develop her resources, raise the level of skills and reorganise the social and economic structure. At intervals, this effort involves searching inwards for the causes of backwardness and slow growth. At other times, the scarcity of capital resources, difficulties encountered in expanding exports, shortage of foreign exchange and the burden of payment obligations compel the country to turn from national issues to external economic relations. One begins to see that there is a close interdependence between national planning and international economic policies and that, in the critical period of development, this interdependence has far-reaching implications for national policies and objectives. The very compulsions of national development, therefore, lead to a consideration of the trends and prospects of the world economy and the international framework within which India pursues her chosen paths.

In recent years, besides combinations based on the tensions of the cold war, countries have been grouped in different ways, for instance, as nations which are rich and those which are poor, or as countries in the northern and the southern hemisphere, or as countries in different stages of economic growth varying from the traditional to the mature economy. They have also been grouped on a statistical basis in terms of gross product *per capita* and income *per capita*. The distinction now commonly adopted is that between developing countries and developed countries, the latter, again, being arranged into two groups, private enterprise and mixed economies and centrally planned economies. In all these different ways of looking at countries, there is a common focus, namely, that among nations there are large disparities in levels of development and that, if an integrated world economy is to be achieved, these disparities have to be reduced and a more widespread sharing of the fruits of prosperity and of science and technology achieved.*

Take-off Stage

The present disparities between nations have their roots in the economic and political history of the past century and more. Each of the developed countries has had a long period of growth, sometimes interrupted for years together, yet—on a broad view—sufficiently sustained. Thus, the "take-off stage" for Britain has been placed by one writer in the closing period of the eighteenth century, for France, Belgium and the United States in the two or three decades preceding the American Civil War, for Germany, Sweden and Japan in the second half of the nineteenth century, and for Russia and Canada in the period of 20 or 25 years preceding the first World War. In these and other developed countries, for periods varying from 50 to 100 years, the available statistical data indicate an average increase in total product varying from 2 percent to 4 percent a year and in product *per capita* from 1 percent to 2.5 percent a year. In other words, in spite of wars and booms and depressions, in a number of these countries the national product was doubled every 20 years or so and the *per capita* income doubled every 30 or 40 years. Development at these rates, along with rising productivity and growth of knowledge, contains the seeds of cumulative growth, so that the balance of history has remained largely in favour of those who had more or less come into the arena of developed nations before the first World War.

For the period since the end of the second World War, and more specially after the initial phase of economic reconstruction, fuller and more easily comparable data are now available, at any rate, for developed countries of the West and to an extent for underdeveloped countries. Thus, according to a study prepared in the United Nations, outside the centrally planned economies, the gross domestic product of the world may have increased between 1950 and 1960 (at 1950 prices) from $583,000 million to $862,000 million, an increase of about 4 percent a year. For the developed regions, the increase in gross domestic product during this period is reckoned at 3.9 percent a year and for underdeveloped regions at 4.3 percent a year. Among the developed countries some are going ahead much faster; for instance, in this period, in western Europe the average annual rate of growth was 4.7 percent and in Japan 8.5 percent. During the decade 1950-60, the *per capita* gross domestic product rose in the developed regions from $839 to $1,089, an increase of 30 percent while, in the under-developed regions, the corresponding increase was from $102 to $126, marking a change of 23 percent.

There are, of course, enormous variations between countries, both in the levels of domestic product *per capita* at the beginning of the decade and in the rates of growth. What is significant is that during the decade 1950-60, the population of developed regions increased by 13 percent from 565 million to 639 million while, in the under-developed regions, it increased by over 23 percent from 1,063 million to 1,312 million. Among the centrally planned economies which are left out of this reckoning is China with an estimated population of some 700 million. Even apart from the enormous difference in total and the *per capita* product between developed and under-developed regions at the start of the decade, on account of relative increase in population, the annual rate of growth in the *per capita* product has been around 2 percent in the under-developed regions, compared with 4 percent in western Europe and nearly twice as much in a country like Japan.

The evidence of the past decade thus sets the scales against the under-developed world. But the trend it brings out has, in fact, existed over a much longer period. In his book, *Shaping the World Economy,* Tinoergen cites data on *per capita* national income in major areas, which show that in terms of the dollar values for 1952 to 1954, during the period 1913-57, while the *per capita* income roughly doubled in North America, north-west Europe and Oceania and appreciable increases even occurred in south-east Europe and Latin America, much of Asia continued to be a vast area of poverty with no significant increases in *per capita* income.

The Continuing Trends

These continuing trends, with roots deep in the social, economic and technological developments of the past, have some important implications for the future. On current assumptions as to the increase in population and growth rates, it has been estimated that, outside the centrally planned economies, by 1975, 72 percent of the world's population may be found to be sharing 21 percent of the total domestic product, against 65 percent sharing about 19 percent of the world's domestic product in 1950. The *per capita* domestic product in the developed regions has been about eight times as high as in the under-developed regions; this gap may increase by 1975 to about ten times. Between western Europe and Asia, the gap may increase even more. Between 1960 and 1975, according to the same study, in the developed regions, the total *per capita* product may increase (at U.S. 1950 dollar values) from $1,089 to $1,599. But in the under-developed regions, the increase may be only from $126 to $170 and in Asia from $89 to $113.

Such figures are not merely illustrative. They are both a warning and a signal for action, equally for the under-developed and the developed countries; for, behind the present disparities and levels of development lie differences in the rates of economic growth. This would be true whatever the nature of the disparities, whether these are between nations, between regions, between rural and urban areas or between different income groups within a national community. So one has to consider, however briefly, the essential conditions in the international context which may assist developing countries in attaining higher rates of growth, in modernising their economies, in transforming their economic and industrial structures, in raising levels of productivity, in a word, in catching up somehow with countries which have been ahead of them and are even now moving faster.

There are two areas in which the existing and prospective gaps in levels of development are likely to prove specially decisive. These are the expansion of international trade and an increase in the flow of capital resources between the developed and developing nations. Obviously, there is an intimate connection between the two. Many thoughtful men realise that only a sharp break from the past can begin to make a real impression on the total problem. Of course, responsibility for action lies both with the developed and the developing countries, for the latter too are under obligation to create the conditions in which such possibilities of expanding trade as are opened up can be effectively used and to increase their own absorptive capacity for external financial resources in a marked degree.

Useful Data

As in the case of growth in the national and *per capita* product, the trends in world trade during the decade 1950-60 have been somewhat adverse from the point of view of developing countries. Some useful data on this subject have been brought together in the *World Economic Survey, 1962.* There are at least four important facts to which attention should be drawn. Firstly, as was to be expected, wherever efforts are be-

ing made to develop purposefully, industrialisation and economic development have increased the dependence of developing countries on imports of machinery, equipment and components and raw materials. More than 80 percent of their imports now consist of machinery, metals, manufactures and fuels. Over the decade, imports in these items rose (at 1957 prices) from about $12 million to about $18 million and would have risen still more but for the lack of foreign exchange with which to buy from abroad. Secondly, while world exports have increased at an annual compound rate of about 6.4 percent, exports of developing countries have risen at only 3.6 percent a year and, in fact in many individual countries, there has been near-stagnation in exports. Thirdly, over the decade, the terms of trade have moved against developing countries. Whereas, for the developed countries, the ratio between the unit value of exports and imports, reckoned against 1959 as base, has increased from 91 in 1950 to 101 in 1960, in the case of developing countries, there have been wide fluctuations, and the ratio diminished from 109 in 1950 and 116 in 1951 to 100, the general trend being downward. Fourthly, trade between developing countries and developed countries—including centrally planned economies—has increased during the decade 1950-60 from 71.5 percent to 80 percent, and that between the developing countries themselves has diminished from 27.3 percent to 19 percent. In other words, almost as a natural sequence to the process of development, there are real difficulties in enlarging co-operation and trade between countries at the regional level.

In the less developed countries, there are numerous impediments to development, and many of these are essentially of an internal character. Yet, it would be fair to say that once a country is prepared to undertake the necessary effort and attack its own deep-rooted problems, the shortage of capital and specially of foreign exchange resources soon comes to constitute perhaps the most important single limitation on the pace at which development is, in fact, achieved. From this aspect, external financial resources have a crucial rôle, both in themselves and in stimulating domestic savings. The total annual flow of long-term capital and official donations from capital-exporting countries rose from an average of $3,300 million during 1951-55 to $4,900 million during 1956-59. In 1959, it amounted to $7,600 million. In 1960, out of a total net international flow of long-term capital and official donations to under-developed countries amounting to about $5,000 million, about a quarter was accounted for by private capital, the proportion in south-east Asia being only half as much.

Three Broad Propositions

Three broad propositions may be advanced. Firstly, the total foreign exchange requirements of developing countries are considerably larger than the degree in which they are, in fact, being met at present. The contribution of external assistance as a proportion of the foreign exchange requirements which are being actually financed is still small although, in view of differences in absorptive capacity, it varies considerably between country and country. Secondly, to an increasing extent, inflows of external resources are being counterbalanced by heavy repayment obligations. Thirdly, while private capital has a contribution to make in the planned development of many countries, it is unlikely to have more than a modest share and it is best to see its rôle in correct proportions.

In considering measures for expanding the inflow of long-term capital into developing countries, much greater attention should, therefore, be given to multilateral and bilateral assistance. Another aspect to which attention should be drawn is the comparatively small increases now taking place from year to year in the total volume of financial resources flowing from developed countries to developing countries, both directly and through multilateral agencies. The available data from the O.E.C.D. member-nations and other developed countries suggest that the volume of external assistance from advanced countries has more or less reached a plateau. Consequently, a number of countries engaged in development and undertaking expansion of their economies are already confronted with difficult decisions as to the scale and pattern of development for which they should plan during the next few years.

Against the background of trends and prospects at the international level which have been described above, there is no assurance that in the foreseeable period disparities between developed and developing countries will lessen materially. Perhaps one could outline some of the directions in which action might be taken, both by individual countries and by the international community, such as could create favourable conditions for reducing the gap between rich nations on the one hand and some at least of the poorer nations.

In some ways, the greater part of the action lies with individual countries themselves. In the absence of political and social stability and continuity in economic planning and policy, no amount of external support will avail. Equally, without relaxation of tensions and some advance towards disarmament, the prospect of conflicts between nations will not permit a greatly expanded flow of capital resources or freer world trade. It can hardly be overlooked that, as was recently pointed out in the study of economic and social consequences of disarmament, the world is at present spending roughly $120,000 million a year on military account, that is, the equivalent of about 8 percent to 9 percent of the world's annual output of goods and services and at least two-thirds and possibly more of the entire national income of all the under-developed countries. Thus, both within individual countries and between nations, there are so many imponderable and uncertain factors to be reckoned with that one could not at present ask for much more than a steady advance towards conditions under which at least these countries, which put their own house in order and are prepared to meet the challenge and burden of development with all its implications, might move forward with a degree of assurance by way of capital resources, know-how and expanded opportunities for trade.

Common Strategy

Conflicts of interests and outlook between groups of developed countries as well as their individual political and economic circumstances come in the way of a common idiom and strategy being evolved for enabling the less developed countries to achieve more rapid economic growth. On the facts of the case, under certain conditions, it should not be too difficult for countries under different social systems to agree on terms and conditions of aid to developing countries. It is increasingly realised that wherever there are large disparities, the process of development involves large-scale and sustained transfer of resources from the higher income to the lower income groups. Considerations of a purely commercial nature have a limited place but in the main, both in national and international terms, the major decisions have to be taken on the basis of broad policy and judgment for the future. In a situation in which there is both political struggle and economic competition between developed countries, not only are the possibilities of growth in developing countries thereby limited, but also, beyond a point, the expansion of their own economies is likely to be impeded. In the last resort, important as it is for the economies of under-developed countries to grow much faster than those of developed countries, slow economic growth, for instance, in the United States or Canada or Australia runs counter to the essential interest of developing countries. Indeed, several of the restrictive foreign economic policies of a number of advanced countries may be traced to the very limited expansion which has occurred in their own economies.

In recent years, a growing number of observers have tried to mark out the paths leading to a "world without want". They know that in the long run, like peace, prosperity too is indivisible. While this goal is pursued, without waiting for perfect instruments and policies, one should see to it that capital resources flow from the more advanced to the less advanced countries and trade possibilities are steadily increased. To a large extent, assistance should be made to flow through international and multilateral channels. Such assistance could also serve as a basis for channelling bilateral assistance and private investments on terms which are internationally approved and take account of the inherent problems of receiving countries. Similarly, there could be a large measure of agreement on a plan for the development of world trade with reference specially to the industrial and agricultural commodities produced in developing countries. Also, more effective means for maintaining reasonable terms of trade could be established. On their side too, developing countries seeking to take advantage of more favourable policies on the part of developed countries, would need urgently to strengthen their economies and work with a sense of purpose to eliminate their own social, economic and political weaknesses to the greatest extent possible.

INDIAN NATIONAL INCOME GROWTH AMONG SLOWEST IN THE WORLD

India's per capita income is among the lowest in the world and the growth of her national income has also been about the slowest. Unless the national income rises much faster than in recent years, there is little hope of catching up with the industrially advanced countries. The returns from agriculture are much higher than from industry. Professor Shenoy says that for quickening the tempo of development, agriculture should get more attention.

By

B. R. SHENOY

Director, School of Social Sciences, Gujarat University, and now Visiting Professor, London School of Economics

INDIAN national income statistics as a continuing series begin with the fiscal year 1948-49. Compiled by the Central Statistical Organisation (C.S.O.) attached to the Cabinet Secretariat, they are based on the principles outlined by the first report, issued in 1951, and the final report, issued in 1954, of the committee appointed by the Government of India in 1949 under the chairmanship of Professor P. C. Mahalanobis "to make recommendations on the compilation of the estimates of national income, the improvement of the statistical data on which the estimates were based and the promotion of research in the field of national income". Issued annually as a White Paper entitled "Estimates of National Income", the latest number, the tenth in the series, is dated January 1963 and relates to the period 1948-49 to 1961-62. The figures for 1961-62 are "preliminary"; the figures for the earlier years are "final".

The time lag in the statistics has progressively diminished, that in the tenth issue being ten months. As a corrective to the time lag, the C.S.O. has been issuing, more generally in August, "quick" estimates for the latest year not covered by the published statistics; for the year 1961-62, the "quick" estimates were published in October 1962 and for 1962-63 in November 1963.

Apart from stray estimates or conjectures for certain past years, no other statistics of Indian national income are available. The attempt of the *Economic Times*, Bombay, to estimate the national income for 1962-63 in its issue of 23rd June, 1963, represents expert processing of the available basic data to fill the void of the time lag in the C.S.O. statistics.

The White Paper comprises 19 tables which relate, among other things, to national income at current and constant prices and by industrial origin; the share of the Government in the domestic product and expenditure; and the relationship of national income to the balance of international transactions on current account.

Definition of Income

National income is defined as net national product (output) at factor cost. This familiar technical jargon refers to the concept of national income as being equivalent to the output of the domestic factors—of which their earnings are a reflex—of production, namely, land, labour, capital and enterprise (organisation). Accordingly, the term national product at factor cost, first, excludes the share of the national product accruing, on balance, to foreigners on account of foreign capital and enterprise operating in India, which, incidentally, has been on the ascendant in recent years; or, more rarely, as in 1956-57, adds to the domestic product the net earnings from abroad by the people resident in India. During the three years, 1953-54 to 1955-56, the incomes earned by Indian nationals from abroad and the incomes earned by foreigners from India were exactly equal to one another; they, therefore, mutually cancelled and the "net domestic product" and the "national income" of these years were identical.

Secondly, the concept of Indian national income at factor cost—the output of the factors of production—differs from the market prices of this output. The prices of the latter in the market would deviate from their money values by the impact on market prices of indirect taxes and subsidies. Indirect taxes, it is assumed, would lift up the market prices of the output above their money value by the amount of the taxes; and subsidies are assumed to depress the market prices of the output below their money values by the amount of the subsidies. Indian national income at factor cost would be, therefore, equal to Indian national income at market prices plus the amount of the subsidies and less the amount of the indirect taxes such as excise and purchase taxes. This is well brought out in Table 5, Page 8, of the White Paper of January 1963, which gives figures of Indian national income at market prices and establishes its relationship, conceptually and statistically, with Indian national income at factor cost.

The White Paper does not give statistics of the gross national product, another familiar technical jargon often referred to in its abbreviated form, G.N.P. The G.N.P. of India would be "the value of all goods and services produced for final use by consumers or government, for investment or for export"; the contribution to the national product represented by the production of raw materials and semi-finished goods are not reckoned separately; to do so would be double counting, as the value of the final goods in which they eventuate include their value too. Since G.N.P. includes all goods, it would differ from Indian national income at factor cost in that, while the latter would exclude, G.N.P. will include, depreciation and obsolescence of existing capital.(1) Although in most countries, G.N.P. is expressed at market prices, it may be expressed at factor cost as well, that is, as the value of the output of the factors of production less depreciation and obsolescence. Expressed at market prices, it would be the total market value of the national product without any allowance being made for depreciation or obsolescence. That is to say, the G.N.P. of India at market prices would be equal to Indian national income at factor cost plus indirect taxes minus subsidies plus depreciation and obsolescence.

Real National Income

As in times of inflation, the money value of output would rise without a corresponding rise in the national product expressed in goods and services, and as changes in the latter are a more correct measure of the changes in the economic condition of the people, the White Paper gives figures of Indian national income at "current" prices, that is, at the average market prices of the year to which the national income relates, and also at "constant" prices, that is, in terms of the prices ruling in 1948-49, the first year from which the current series of the national income begins. Indian national income at constant prices may be also described as the real national product as, being the net national product corrected for price changes, it expresses national income in real terms.

It will be noted that, apart from net earnings from abroad, the values of imports and exports do not figure in the national income. It is not as if net exports, *i.e.*, exports less imports—which may be positive or negative—using the terms imports and exports to cover invisible items of trade as well, are included in the national income. For, it is not as if the net sales of a trader—whose purchases and sales may be said to correspond to the imports and exports of a country—get incorporated in his net income. What becomes part of his net income is the difference between his payments and receipts, against his purchases and sales, respectively, during the year—his gross profits less his costs on account of personnel, interest, rent and depreciation. His income, thus defined, corresponds to the net earnings from abroad in the case of national income; these earnings get embodied in the net national product. This explains the exclusion of imports and exports from the computation of national income; it explains, too, the disregard of import and export duties from indirect taxes in the mutual conversion of national income at factor cost and at market prices.

Money Value

As in times of inflation, real national income is more meaningful than the money value of income, in what follows, except when otherwise stated, by national income is meant national income at constant prices, national income being defined as the net national product at factor cost.

Indian national income in 1948-49 amounted to Rs. 8,650 crores. It rose to Rs. 13,020 crores in 1961-62, an increase of 50.5 percent in 13 years, an annual rate of 3.8 percent. The income in 1961-62 represents an increase of 47 percent, an annual rate of 4.7 percent, over 1950-51, the year immediately preceding the commencement of planning. The White Paper also gives national income on a *per capita* basis, although this may be easily derived from the aggregate national income and population

figures. *Per capita* income rose from Rs. 249.60 in 1948-49 to Rs. 293.40 in 1961-62 or by 17.7 percent, an annual rate of 1.3 percent. The rise in *per capita* income over 1950-51 was 18.5 percent, an annual rate of 1.7 percent. It may seem queer that *per capita* income in 1961-62 should show a larger increase over 1950-51 than over 1948-49. The explanation is that in 1950-51 *per capita* income had dropped to below the 1948-49 level.

Except for a drop in 1957-58, Indian national income has been in the ascendant since 1948-49. *Per capita* income, on the other hand, dropped during the same period in four years, 1950-51, 1957-58, 1959-60 and 1961-62; this reflects the fact that the rate of increase in the national income during these years lagged behind the rate of increase in population. Every decline in the *per capita* income has been followed by a substantial rise in the immediately following year. It would seem that this sequence of expectation failed to materialise in 1962-63. The *Economic Times* estimate of national income for this year—this is identical with the "quick" estimates of the C.S.O. for the year issued on 2nd November, 1963—shows a fall of 0.3 percent in the *per capita* income, which follows a fall of 0.1 percent in the C.S.O. estimate for 1961-62. For the first time since independence, *per capita* income has declined in two successive years.

International Comparisons

International comparisons of national income statistics may not be strictly valid or safe in all cases, not only because of differences in the techniques and principles of computation, but also because the command over goods and services of a given unit of income might vary, especially between the industrially advanced and the economically under-developed parts of the world. In the latter, the poverty of the vast masses permits the better-to-do groups of people the benefits of various personal services, which individuals in the same income categories would not be able to command in the richer countries; precisely because of the material poverty of the people, the personal services are costlier in the richer countries—such services generally tend to rise with the scale of riches—and most people have to forgo them. Thus, in western Europe and North America and in the highly industrialised parts of the world, people generally polish their own shoes, mostly wash their own clothes, work in the gardens and do much of the housekeeping themselves, carry their own baggages in the airports and railway stations, and so on. In the economically under-developed countries, people of quality may not like to be seen doing these things, apart from hobbies such as light gardening now and again.

On the other hand, manufactured goods, except in cases of organised dumping, are generally cheaper and of better quality in the industrially advanced countries. The price and quality factor is particularly striking in relation to countries such as India where import restrictions, exchange control, exchange rate over-valuation and persisting inflation have combined to produce fantastic disparities over virtually the whole range of import goods between the internal (rupee) prices and the prices abroad expressed in foreign currencies. Much of household equipment and furnishings, most groceries, especially tinned goods, present phenomenal price contrasts. To cite a stray example, refrigerators, which may cost in India about Rs. 2,500 a unit, may be had in the U.K. from about Rs. 525 upwards.

This explains the strange experience that, for people who run a household of their own, the total cost of living, with better comforts under healthier weather conditions, may be even less than is the case presently in Bombay, Calcutta, New Delhi or Ahmedabad; rents, which account for a fair part of the living costs, of three bed-room furnished houses or flats—the availability of accommodation is much greater in London than in the larger Indian cities—are distinctly lower in London. Milk and milk products, the main support of vegetarians, which are available only in unadulterated condition, are also less costly.

This is, however, an economic oddity, the results of statist economic policies, which as has been indicated elsewhere [2], have produced a whole series of preverse phenomena vitiating the Indian economic scene. Unless these policies continued indefinitely, which we hope not, considering the untold economic and social damage they have caused, the economic oddity of the cost of living in London appearing to be even less than in the larger Indian cities must be deemed to be an artificially created optical illusion. It would cease to be with the abandonment of import restrictions, exchange control, exchange rate over-valuation and inflation.

Price Disparities

More normally, as price disparities in manufactured goods in several parts of the globe may correspond to the costs of transport and incidental expenses, and as the cost of "services" may diverge as between the richer and the poorer economies, the same money income may yield perhaps more comfortable living in the under-developed countries than in the high-income industrialised countries; this may be particularly true for people in the upper-income groups. A family with an income of Rs. 500 a month in India, Burma, Ceylon and Pakistan —this is 20.4 times the Indian *per capita* income in 1961-62—may have a part-time servant doing the more irksome household jobs; in the rural areas, it may own a house, although the house may not have much of furniture. In the U.S.A., an income of Rs. 500 a month is far less than the monthly *per capita* income of the country in 1961 (about Rs. 910) and the living wage of a family. This may not be far different in most of the other high-income economies. By the same reasoning, a millionaire in the under-developed countries may probably live like a multi-millionaire in the highly industrialised parts of the world. It would seem, therefore, that the contents in real terms of the same income slabs being possibly different, in the two categories of countries in particular, unqualified international comparisons of national income statistics may be misleading.

These limitations do not take away from the broad observation that Indian national income is both among the lowest in the world and has been rising at among the slowest rates in the world. Indian *per capita* income in 1960-61 (Rs. 293.70) was about 1/37th the income in the same year of the U.S.A.; about one-seventh the income of Japan; about 1/29th the income of Sweden; and about one-tenth the income of Israel. It was lower even than the *per capita* incomes of Thailand, Burma, Ceylon and most other under-developed countries of Asia, Africa and Latin America. Of the 26 countries in the table below, India, with an annual rate of increase of 1.3 percent, ranks twenty-second in the order of the rate of increase in *per capita* income, the U.S.A., Canada, Ceylon and Pakistan coming after India.

INCREASES IN REAL NATIONAL INCOMES
1951-59

Country	Percent growth in income per year	
	Total	Per capita
Japan	8.3	7.2
Jamaica	8.9	6.9
West Germany	7.3	6.1
Trinidad and Tobago	9.1	5.9
Algeria	8.0	5.7
Austria	5.8	5.6
Puerto Rico	6.1	5.5
Greece	6.2	5.2
Italy	5.7	5.2
Israel	9.0	5.0
Rhodesia and Nysaland	6.8	4.1
The Netherlands	4.6	3.4
France	4.2	3.2
Turkey	5.9	2.9
Switzerland	4.1	2.8
Sweden	3.4	2.8
The Philippines	5.8	2.5
Indonesia	4.2	2.2
The United Kingdom	2.6	2.1
Ireland	0.9	1.6
Thailand	4.8	1.3
India	3.3	1.3
United States	2.8	1.1
Canada	3.7	0.9
Ceylon	3.0	0.4
Pakistan	2.3	0.4

Indian Per Capita Income

This picture may not change if we brought under comparison most or all of the members of the United Nations. Indian *per capita* income and its rate of increase may both be still about the lowest in the world. Simple statistical calculations will demonstrate the staggering length of time that would be required for the Indian income to reach the present U.S. level. Unless Indian national income rose several times faster than in recent years and kept on doing so for decades, there is little hope of the Indian income reaching the level of western Europe or of North America, as otherwise, short of a catastrophe and setback, the incomes of the countries in these parts of the world would continue moving up and the prevailing gap between India's income and theirs would widen.

In formulating measures for the economic betterment of a family, the income of which is meagre, it may be perilous to ignore its principal occupation, the training of its members in the occupation and their talent and abilities. If the head of the family is a carpenter and the demand for his output remains good, the best means of lifting up its income may be, Santa Claus economics apart, to provide it with better facilities to pursue its trade more effectively than hitherto. Because of poverty and hence the shortage of savings, it is possible that the implements and materials it may be using is of poor quality and it may be unable to hold the produce, the result of its labours, to await a good price. Provision of adequate credit, both short and long term, might enable it to overcome these handicaps; it may be helpful, too, to provide the adult workers in the family a technical refresher course in carpentry, which may be necessary for the more efficient use of the new tools. This may make the individual a better carpenter and may add materially to the income of the family almost at once, i.e., as the output of the better implements and raw materials begin to flow into the market.

To make the head of the family a better carpenter to begin with may serve best the longer term interests of the family as well. This may enable it to save more and to invest more on the education and training of the children and to give them, in addition, a better financial start in life. The family may soon begin moving up the ladder of economic well-being and may keep doing so. This may provide it with the necessary financial wherewithal for training its more talented children for lucrative and socially more valued occupations than carpentry. Thus, it may not be as if the family would remain carpenters indefinitely if priority attention was paid to making its workers better carpenters, with no hopes of moving up the economic and social escalator.

Prudent Use of Resources

If, on the other hand, leaving carpentry to stagnate, the family resources and the betterment credits allotted to it under the development projects were used to force on the children an expensive technical education to which by aptitude and otherwise they were not well fitted, the family may not be on the right road to progress. The resources and the betterment credits, while they lasted, might indeed engender a false feeling in the family that it was forging ahead and that once the gestation period of the investment of capital in man had been completed, it may well enter the realm of lower middle class prosperity. It is more likely, however, that the family might eventually discover that a great deal of precious funds had been misdirected; that it is unable to meet the demands of its creditors; that its expenses are out of balance with income; and that it might have been on the whole much more expedient if the family resources and the betterment credits had been devoted to improve and streamline the family occupation of carpentry as the experience of more than one family in the neighbourhood and elsewhere had convincingly demonstrated.

What is true of this family of carpenters, essentially holds true of the general principles of the economic betterment of the Indian people, a collection of 88 million families. The extension of these principles from the family to the country as a whole is not any the less valid because in the case of the economic development of the latter, investment in the economic and the social overheads has to progress commensurately with the increase in the aggregate investments of the families in the country. If so, it is a fatal error to assume,

Contributing to Nation's Progress....

After achieving Independence India is marching ahead with national development projects. The Five Year Plans are further step forward towards building up newer and better India. Private sector should also contribute towards the fulfilment of the ambitious plan.

We, on our little part, are always striving to serve our country by maufacturing the following :—

- **PHARMACEUTICALS**—Drugs and Galenicals, Medicinal Specialities, Injectables.
- **CHEMICALS**—Heavy, Fine and Technical.
- **LABORATORY RE-AGENTS**
- **SOAPS & COSMETICS**—viz. Margo Soap, Neem Tooth Paste, etc.
- **ESSENTIAL OILS & AROMATIC CHEMICALS**
- **DISINFECTANTS & ANTISEPTICS**

THE CALCUTTA CHEMICAL CO., LTD.

Head Office :
35, PANDITIA ROAD, CALCUTTA-29

Sales Offices & Depots :
DELHI, MADRAS, BOMBAY, VIZAG, RANCHI, PATNA, KANPUR, JAMSHEDPUR, NAGPUR, BILASPUR, SILIGURI, BANGALORE, ERNAKULAM, ASANSOL, MADHUPUR, HYDERABAD & BHAGALPUR.

as the Indian policy-makers seem to do, that the national schemes of economic development rest on principles which are independent of the basic principles of the economic development of its component units, the individual families.

Indian Production Pattern

Schemes of Indian economic development cannot ignore with impunity the prevailing production pattern of the Indian economy. In 1950-51, the immediate pre-plan year, 51.3 percent of the national income came from agriculture. The next highest head of production, namely, mining, manufacturing and small enterprises, accounted for but 16.1 percent of the national product. In 1961, despite an increase of 165 percent in the output of factory establishments during the interval, agriculture accounted for 46.8 percent of the national product. In 1951, 69.8 percent of the population drew its living from agriculture; the phenomenal expansion of factory output since then made no difference to this percentage; it was still around 70 in 1961. Of an increase of 78.1 million people between the censuses of 1951 and 1961, the rural area took 74 percent (58 million) or somewhat more than the percentage of the population living on agriculture. The numbers of the agricultural labour households in 1956-57 were 16.3 million and the people living on agricultural wages 72 million. By contrast, the total labour force in the manufacturing industries, transport and communications, is about 3 million.

This production pattern cannot change overnight. Over a decade of pressurised expansion of industries has not materially reduced the predominant place of agriculture in the Indian economy; the output of factory establishments still account for but 10 percent of the national product and the percentage of the population dependent on agriculture has not diminished. At the same time, plantation crops such as tea, rubber and pepper apart, the output an acre in the case of most crops is about the lowest in the world. Investment in agriculture would add to the national product much more than investments in the other sectors of the national economy. It has been estimated that Rs. 1 crore of investments in agriculture would add Rs. 57 lakhs to Rs. 69 lakhs to output, as against Rs. 33 lakhs in the lighter manufacturing industries and Rs. 19 lakhs in iron and steel.

These two considerations—the predominance of agriculture in the national economy and the high potentiality of its growth—suggest that for accelerating Indian economic development, agriculture merits priority attention. But this has not been the case hitherto, although for political reasons, the policymakers have not been slow in paying lip sympathy to agriculture. From 1950-51 to 1961-62, agricultural output rose at the slowest pace, by 39 percent or 3.5 percent a year, while the output of factory establishments rose during the same interval at an annual rate of 15 percent; commerce, transport and communications at 4.2 percent; and "other services" at 7.1 percent.

This would seem to be the result of the comparative neglect of agriculture. The State appropriated over 50 percent of the national savings in the first plan, about 60 percent in the second, will absorb 67 percent in the third, although public sector enterprises contributed but 4.2 percent of the national product in 1961-62. For agriculture to get its due share of savings, the appropriations by the State must bear some reasonable relationship to the ratio of the contribution of public sector enterprises to the national product.

Summary

The main points made in this article may be summarised to bring together the principal conclusions emerging from this discussion :

(1) The White Paper on the "Estimates of National Income", which gives Indian national income statistics as a continuing series from 1948-49, defines Indian national income as net national product at factor cost, i.e., as the net output of the domestic factors of production, namely, land, labour, capital and enterprise. It excludes, therefore, the net earnings of the factors of production in India owned by residents abroad, but includes the net earnings of the factors of production abroad owned by residents in India. This definition differs from the concept of Indian national income at market prices as the market prices of this output would deviate from their money values: the market prices would be more than the latter by the amount of indirect taxes—excise duties and purchase tax, but not import and export duties—and less than the latter by the amount of the subsidies. The White Paper does not give statistics of G.N.P. The national income statistics are given at "current" and "constant" prices.

(2) Imports and exports do not expressly figure in the national income statistics; the earnings from them (including invisibles) are embodied in the net earnings from abroad.

(3) Indian national income as at 1961-62 has risen by 50.5 percent since 1948-49, an annual rate of 3.8 percent. *Per capita* income rose during the same interval by 17.7 percent, an annual rate of 1.3 percent. While Indian national income has been in the ascendant, except for a drop in 1957-58, *per capita* income dropped during the same period in four years, 1950-51, 1957-58, 1959-60 and 1961-62. In the latter years, the rate of increase in national income lagged behind the rate of increase in population. A private estimate suggests that *per capita* income has declined in 1962-63 as well—this makes a decline, for the first time since independence, for two successive years.

(4) International comparisons of national income statistics may not be strictly valid in all cases, as, firstly, the techniques and principles of the computation, and, secondly, the goods and services content of a given unit of income may be different in different countries.

(5) The appearance of the costs of living today in London being about the same or even somewhat lower than in Bombay or Calcutta is a deceptive one; it is a delusion caused by the unrealistic exchange value of the rupee. More normally, the same money income may yield perhaps more comfortable living in the underdeveloped countries than in the high-income countries.

(6) Nevertheless for the limitations of the international comparisons of national income statistics, it would seem safe to say that Indian national income is both among the lowest, and has been rising at among the slowest rates, in the world. Unless Indian national income rose several times faster than in recent years and kept rising for decades, there is little hope of the vast gap between the Indian income and the income of the industrialised countries being reduced.

(7) The broad principles of the economic betterment of a family may be extended to the economic betterment of a country, as the latter is but an aggregation of families. Schemes of Indian economic development cannot ignore with impunity the predominance of agriculture in the production set-up of the Indian economy. Nearly one-half of Indian national income is drawn from, and about 70 percent of the population live on, agriculture. This predominance of agriculture has not changed in spite of an increase of 165 percent in the output of factory establishments in the decade ended 1961.

(8) Agriculture has remained neglected hitherto, although, for political reasons, lip sympathies are being paid to it. From 1950-51 to 1961-62, agricultural production rose at the slowest pace, by 3.5 percent annually, while factory output rose by 15 percent, commerce and transport by 4.2 percent and "other service" by 7.1 percent.

(9) The neglect of agriculture may be seen in the poor allocations of resources to agriculture and the growing proportions of domestic savings and foreign aid appropriated by the public sector and by the heavy industries in the private sector.

Impact of U.S. Aid on the Indian Economy: An Evaluation of Results

American economic aid has not only helped India's economic growth, but has had healthy effects in the political and cultural spheres as well. Dr. Chandrasekhar, a well-known demographic expert, pleads that the United States should now give help for India's population control programmes since the rapid increase in numbers poses the major economic problem of the day. India also needs assistance for promoting modern sanitation and environmental hygiene in order to raise the working capacity of her people.

By
S. CHANDRASEKHAR
Director, Indian Institute of Population Studies

WHAT is the total impact of American aid on India's progress? What are the effects of U.S. assistance on India's political stability, economic development, and cultural and social progress? There are, of course, short and long range, as well as visible and invisible effects. And certain effects in terms of human and international relations cannot be measured in any quantitative or statistical terms. In certain other sectors, effects may not be visible for a considerable period, since projects take time to start a chain reaction of beneficent results.

This entire field of evaluating the impact of foreign aid on India's overall development represents an area of relative ignorance, as no objective evaluation studies on the basis of each project or on the basis of the amount of aid provided by individual countries have been undertaken. In economic phenomena, the relation between cause and effect, aid and result are not so clear and direct as in scientific phenomena. There are several elusive and intangible factors, factors unmeasurable but nevertheless quite important in any worthwhile long-range study. What is, therefore, needed in this area is more research and an annual or project-wise and countrywise evaluation.

In such a study, the character and amount of aid, its form and purpose, its range and rôle, have to be taken into consideration. The fact that American aid has taken many forms —grants, loans, commodity help, technical assistance—makes evaluation of the impact less easy. What is more, American aid is a continuing phenomenon and has had no time to "simmer" down into the economy as it were, and this makes evaluation even more difficult. However, an effort is made here to outline certain obvious and indisputable effects of U.S. aid on overall Indian progress.

To begin with, a preliminary and pertinent question relating to aid must be raised and dismissed as far as India is concerned. An underdeveloped country may receive all the foreign economic aid she needs and yet there may be no perceptible economic progress in the country. The country may have a poor administrative machinery, no concerted plan, programme or policy and what is worse, may be burdened with corrupt, inefficient, self-seeking leaders whose tenure of office is temporary and shaky and who, therefore, have to make their quick piles. In such countries, thanks to widespread graft and greasy palms, external assistance more often than not tends to end up in the private bank accounts of unscrupulous politicians rather than in the nation's economic development.

In such countries gift milk powder, instead of being given free to needy children and nursing mothers, may find its way into black market. Costly machinery may lie rusty in the harbours and godowns of such recipient countries due to general administrative inefficiency and transport bottlenecks and want of competent technicians. Even foodgrains and other relatively perishable commodities may rot in railway yards for want of wagons and efficient transport facilities. In other words, external aid may be too large, in more than one sense of the term, for the assimilation capacity of the recipient country. Instances of such countries where foreign aid is a relative if not a total waste are unfortunately not wanting.

Fortunately, these problems, by and large, do not exist in India. There may be an occasional instance of petty corruption or the incompetence of a lower official, but, on the whole, American and other foreign aid has found its way to its appointed and destined places and no doubtful diversions have taken place, thanks to the relative integrity of the leaders and the administrative service, the vigilance of Parliament and the existence of an articulate and free Press.

Before one examines the overall impact of American aid on India under (a) political, (b) economic and (c) cultural and social heads, a few general observations on the total and general effect may be made. American aid has covered a wide variety of projects embracing practically every sector of the Indian economy. Any objective attempt to assess and evaluate the impact of these projects on the Indian economy will pose many questions. What has this aid accomplished for India, for her total economic development and the standard of living of her people? What should the United States do in the future? Does the past and current experience on Indo-American aid relations yield any suggestions for the future?

The major objective of the Government of India and the Planning Commission, indeed all the efforts of the public and private sectors in India during the last 15 years, since the advent of political freedom, have been to transform the present near-static and stagnant economy into a dynamic and vital one where the picture of artificial and real scarcity could be changed into one of adequate self-sufficiency, if not eventual affluence and abundance.

General Observations

To begin with, in assessing the total impact of foreign aid on India's overall economic and other development, it is not easy to demarcate particular results as the products of a particular country's assistance. As India receives aid from some 15 major countries, it is difficult to be precise and definitive on what country's particular aid has led to certain specific results. Of the total aid given by all the foreign countries during the last 15 years, the aid of the United States alone constitutes more than 50 percent. India has received from the West excluding the Russian Bloc, in overseas grants and loans, nearly $7,500 million of which the United States has contributed nearly $5,000 million. As such foreign aid means largely American aid.

That American aid (as well as aid from other foreign countries and the United Nations and its specialised agencies) has contributed to the overall productive capacity of the economy—plants and people—is undeniable though attempts at quantification may not be successful. The obvious difficulty here is that foreign aid resources cannot be separated from non-aid, internal, national resources as they are substitutable.

Secondly, for any evaluation of the total impact of U.S. aid on the Indian economy one must take only the utilised aid and not the committed aid. And then all the authorised aid may not be used because of the limited absorptive capacity of the recipient country and other reasons. In the transfer of aid several stages are involved. Aid is promised, then authorised and then utilised.

It must be conceded that the overall records of modest progress of the Indian economy over the two plan periods (1951-61) has been largely due to the amount of foreign aid received by India, the largest share of which was provided by the United States. There is no doubt that the continuation and acceleration of this progress will continue to depend on substantial contributions of aid in various forms from the more advanced countries, the Aid-India Club in particular. This will be particularly true of the financial needs of the third plan (the Aid-India Club has committed itself to raising $1,000 million for the third plan) and the fourth plan to come. That is, Indian economic development, as it has been planned by India's Planning Commission, could not have been accomplished without the ample external resources made available by the United States of America.

Impact on Economic Stability

That American aid during the period of the first two plans and the two years of the current plan has contributed significantly to Indian economic stability, no matter how broadly the term "stability" is defined, is conceded by all schools of economic thought with perhaps the single possible exception of the communists. The validity of this statement can be realised if one can picture the economic position of India today had she not received nearly $7,500 million from the West in overseas loans and grants during

HARVEYS OF MADURAI

the last decade and a half. The popularity and stability of the Government of India can well be imagined if it had had to extract this huge amount, badly needed and quickly spent on development, from the poor Indian taxpayer!

It can even be argued that the United States, by providing India with this unfettered, large-scale aid, has given the country sufficient economic independence to pursue an independent foreign policy—that of non-alignment. And in view of this policy of non-alignment, it has been easy for India to accept aid from all political camps including the communist countries which can aid only the public sector. If America has thus indirectly supported non-alignment in politics, it has obviously supported its economic counterpart, a mixed economy. American assistance has been extended both to the public and private sectors, perhaps more to the former than to the latter in India.

This need not be considered paradoxical, for America's stake in India's free political and social institutions must be taken for granted for its own sake. If it is then granted that American aid has contributed to India's economic stability and growth and if a nation's political cohesion and stability are a product of its economic development, it can be maintained that American aid has been a contributing factor to India's —that is the Indian Government's— political stability, a stability which is a near-rare phenomenon in Asia. The relationship between external aid from the U.S.A. and the recipient country's internal economic development on the one hand, and its political stability on the other, seems to be simple and obvious in the case of India.

Productive Capacity

That American aid during the last 12 years, and particularly during the last five years, has contributed considerably to the productive capacity of the country is undeniable, although it is difficult, if not impossible, to gauge or measure the magnitude of this capacity. There is a need here to distinguish between capacity and output. Once the capacity is increased, output will take care of itself.

Contrary to popular belief, there are countless ways in which India's productive capacity can be raised without any proportionate increase of several scarce factors. Apart from mobilising the substantial surplus of labour, particularly in rural areas, several capital cheap labour improvements can be effected leading to workers working more and harder. As John P. Lewis rightly points out, "To accept the view that, in many consumer goods lines that do not depend heavily on imports or other unmistakably scarce factors, productive capacity is quickly and highly stretchable does not require a retreat from the judgment that Indians by and large are neither afraid of work nor lacking in healthy appetites for material self-improvement. The point rather is that lack of knowledge, fear of change, lack of vigorous, effectively functioning markets and of certain supporting administrative structures—especially in the traditional rural economy—all continue to impede an optional translation of these healthy appetities into productive capacity. Catalysts are needed to speed the stretching of latent capacities, and one of the most conventional and promising of such catalysts, rather obviously, is additional demand".[1]

American and other foreign aid has been applied at various levels and to various factors to increase the nation's capacity. While a particular amount of aid whether in goods or service may be applied to a particular project, the productive capacity created often goes beyond the project in question in a few years, for no project works in a vacuum. The generation of such productive capacity varies from project to project and in different sectors of the economy depending upon the level of development of the sector involved.

As long as foreign aid and indigenous, non-aid resources are mutually exchangeable or substitutable, aid resources used for development purposes imply non-aid resources being available for current consumption. Similarly, if aid resources contribute to current consumption, internal resources can be used for capital formation. India was importing about 2 to 3 million tons of cereals annually before P.L. 480 imports were made available. Now the imports from the United States average 4 million tons annually. These imports have released domestic resources which in turn have gone towards capital formation. However, the net contribution of foreign aid to the productive capacity of a country depends not only on the economic policies pursued by the recipient country, but also on the overall total disposable resources at its command.

Disinflationary Effect

In general, it is accepted that foreign economic aid contributes to combating inflation in the receiving country. American aid, particularly the massive P.L. 480 imports of foodgrains, has had a striking disinflationary effect on the Indian economy. Inflation, to use its simplest definition, is nothing more than "too much money chasing too few goods". The remedy is obvious. The supply of goods and commodities should be increased without pumping in a proportionate increase of money. Aid can sometimes mean more money without any increase in the availability of goods produced within the country or through increased imports. The liberal payment—salaries and other emoluments—to American and other foreign resident personnel such as A.I.D. missions or military or technical assistance groups can increase the money in circulation. But on the contrary, if aid means the import of foodgrains or cotton or other consumer goods under P.L. 480 or some similar arrangement, it can to a considerable extent fight inflationary trends. However, the total picture is not too simple, for it depends on a variety of such factors as the recipient country's fiscal and monetary policies, the demand for and the volume of imports and the wages and prices policy and general level of living in the country.

On the whole, the P.L. 480 imports and the funds they give rise to contribute considerably towards a disinflationary trend. India imports American surplus agricultural commodities such as wheat. The Government of India sells this wheat to the people at current or lower prices in internal rupee currency. This means, to begin with, "free" goods are available: and secondly, local purchasing power is siphoned off from the public into government coffers. These rupees are not given back to America, but are deposited in the Reserve Bank of India to the credit of the United States treasury. And now, in so far as these rupees are not spent it has been disinflationary. But America grants India's loans from these rupees of up to 50 percent of the accumulated rupees. And some 5 percent of these rupees are given for "Cooley Amendment" projects, that is, projects involving collaboration between American and Indian joint industrial ventures.

The rupee loans received by the Government of India from this source are, of course, used for development purposes. These "loans" might eventually become outright grants to India, for these rupees are not convertible into dollars and cannot be paid back unless the United States as the donor country is willing to accept more imports from India. According to one American observer, "one might speculate whether in procedures laid down for commodity disposal under Public Law 480, the United States is not getting the worst of the two worlds. Although much of the sales proceeds is reloaned for development on the 'never-never' as the British aptly call their instalment plans, we insist on calling the transactions 'sales'. As a result, some recipient countries feel they are doing the United States a good turn by taking the surpluses off our hands but in reality these transactions are apt to become permanent investments, or perhaps even grants, unless the United States eventually becomes willing to accept more imports and in this way use inconvertible currencies".[2]

An opposite view, that foreign aid is inflationary, although a little overdrawn in the following analogy, is not wanting. Elgin Groseclose writes, "According to theory, foreign aid funds should be deflationary in effect in the recipient countries since they increase the supply of goods available within the economy without increase of the money supply (since the goods are provided as U.S. gifts). This theoretical result does not follow in practice. The reasons are simple. The effect is somewhat like that upon a high school boy's allowance from the gift of an automobile . . . . . Even though the automobile may save him car fare he becomes involved in the expense of gasoline, tires and repairs, not to say a whole scale of expenditure which the status of an owner of an automobile seems to impose.[3] It is, of course, possible that foreign aid can lead to inflation if the amount, kind and timing are such that it increases corruption or reduces saving and consequent investment.

However, as far as American aid and the Indian economy are concerned, there is no doubt that on the whole P.L. 480 imports and even the expenditure of counterpart fund rupees have contributed to a disinflationary effect for two obvious reasons. One is the supply effect. The imported foodgrains and cotton have increased the total internal supply. This has led to a reduction in the price of foodgrains and cotton as the demand is always there for a certain amount of supply at certain prices. The other is the demand effect. As observed already, the Government sells the foodgrains to the Indian consumer and thus withdraws a certain amount of purchasing power from the people; this is tantamount to the collection of extra taxes.

Expansion of Exports

American aid has proved to be a stimulant to the expansion of India's exports. American and other foreign aid have proved a vital factor in international trade. While it is true that since the beginning of 1958 (the year of India's foreign exchange crisis) a growing share of India's exports has been financed by American and foreign aid, India's exports have also increased. Indo-American trade has been to India's advantage and has contributed to her economic development. Between 1951 and 1955, India had a surplus in her merchandise trade with the United States (1952 was an exception for during that year wheat worth $490 million arrived in India). For this five-year period as a whole, India's exports to the United States exceeded the imports from the United States by $118 million.

As a United States Deparement of Commerce report points out, "India's dollar receipts from exports to the United States were augmented by dollar exchange made available under U.S. development loans. Until October 1959, proceeds of these loans could be used by India for purchases from sources of its choice. The extent is not known, but it is apparent that a substantial portion of the proceeds of these global procurement loans was used for purchases from non-U.S. sources. Thus the real spread between India's dolar earnings and its expenditure for U.S. goods was wider than if measured by the trade balance alone. Net payments by India for invisibles, particularly shipping, reduced this spread, but India still earned considerably more dollars than it spent for U.S. goods".[4]

While this particular rôle of American aid has been a relief, India has to further expand her exports considerably, for otherwise she will be faced with serious difficulties for the implementation of her third five year plan. If India cannot increase her export earnings, she will have to depend on foreign aid even more than she is now. In fact, India's current budget and other economic policies are directed towards the goal of stepping up India's exports. The Government is giving preferential aid to such industries as have export potential. The import licensing policy also has a definite export bias, for imports will have to be used to enable the country to export more. Perhaps export earnings may need a certain income tax relief. In a word, while

American aid has aided India's exports both directly and indirectly, the Government of India itself is leaving no stone unturned consistently to expand India's exports to finance her third five year plan as much as possible.

Indian Industrialisation

In the realm of Indian industrialisation, American aid has been helpful in at least three major areas. The most significant has been in developing the country's infrastructure. Both the importance and the expensiveness of the infrastructure are sometimes overlooked while planning the rapid development of an underdeveloped country. The infrastructure or what may be called the basic capital of an industrial society represents overhead in the shape of roads, railways, docks, harbours, basic technical schools and polytechnics, power installation and industrial housing—all these involve heavy investment with no promise of quick returns.

An important aspect of this contribution is that it does not contribute directly and immediately to an increase in the national income, but rather paves the way for an explosive increase in the national income at the time when productive enterprises—both in the public and private sectors—begin to build on and draw from the infrastructure. This factor indicates to some extent the soundness of Indian planning in making provision, especially during the third plan period, for the infrastructural development rather than for industries to supply consumer needs when Indian resources at present are not adequate to meet both. That is, there has to be a choice between development facilities for the production of consumers' goods on the one hand, and the creation of the infrastructure on the other. Since the total resources available to India are not adequate to meet both these needs at once, a choice has to be made and the current Indian choice in favour of the infrastructure supported by American aid appears to be a wise one.

The second significant factor in the general area of Indian industrial development is the help rendered by the United States through the National Productivity Council. The major objective of these Productivity Councils is to make Indian management more efficient in mobilising and applying the available limited Indian resources to more effective and productive use in both public and private sectors. The simple rationale behind this is that the management of any enterprise controls the bringing together of such resources as raw materials, machinery, capital funds, labour and land for the production of goods and services in such a manner as to ensure the greatest award in monetary or other returns. It is the way in which any management controls the combination of these resources which determines managerial ability and efficiency. Thus the better and more efficient the management, the more productive will be the particular combination of resources it selects, and the greater the contribution that these resources will make to the total of goods and services made available in India.

The third area is the American contribution to enlarging the sources of funds for investment and for operating capital for private sector enterprises through loans of foreign exchange and rupee capital made available through such institutions as the Industrial Finance Corporation (I.F.C.), the Industrial Credit and Investment Corporation of India (I.C.I.C.I.) and the Refinance Corporation for Industry (R.F.C.). The United States has not only provided these institutions with funds to lend to private enterprise, but has also to some extent contributed to the organisation and policies of these institutions to enable them to serve better the needs of productive enterprises for investment and working capital, which are essentially different in a developing economy as distinguished from an advanced and industrialised one. In addition to these three major areas of help, the last factor in the American contribution to Indian industrialisation is the supply of raw materials, machinery and equipment besides the various components of infrastructure referred to earlier.

It is interesting to note that during the first half of the Indo-American aid period, only 10 percent of the total U.S. aid was provided ; the remaining 90 percent of the total aid was provided during the second half. Apart from certain political and other reasons, American aid in large quantity really dates from 1958 when India was faced with her foreign exchange difficulties during the second five year plan. The provision of foreign exchange is perhaps the most important component of American aid to Indian development. The amount of the provision, particularly to set up power plants, is quite large. Here it is both possible to separate sector and purposewise, and calculate the magnitude of foreign exchange made available to India. The foreign exchange provided by the United States has contributed to the total volume of capital formation, particularly in the public sector to the tune of some Rs. 2,000 crores including the P.L. 480 imports.

Food, Clothing and Prices

Perhaps the most significant immediate contribution which America has made to India is her supply of food and clothing (cotton). America's wheat and cotton have given support to a perennially weak and vulnerable spot in the Indian economy. The common man needs these two commodities—food and clothing—more than any other. In fact, by providing substantial help to meet these two basic requisites, America has assured the stability of the Indian Government. Secondly, U.S. supplies of wheat have greatly relieved the shortage of foodgrains in India. The P.L. 480 imports, which began only in 1956-57, have had a welcome repercussion on India's cost of living index, especially since food is by far the largest item in the average Indian family budget.

American food aid has made a certain manœuvrability possible for the Ministry of Food in the matter of food prices. These food imports have enabled India to maintain not only stability of prices, but also a reserve stock and an even food supply without either glut or scarcity. The American food supplies have, in a word, provided an intelligent framework in which India's food problem can be viewed and a workable and predictable attack mounted.

In spite of the major contribution made by American food supplies to Indian economic development, criticism of these imports has not been wanting. Some have complained that the American grant of so much agricultural commodities has robbed the Indian farmer of the incentive to produce more foodgrains. It is also contended that the fact that P.L. 480 wheat has not only prevented the rise in the price of foodgrains, but has even lowered it in view of the increased supply against the existing demand has been unfair to the Indian wheat grower. But an examination of the present total acreage under cultivation in wheat and other foodgrains, agricultural investments, farm inputs and the overall conditions under which Indian farmers live today shows that P.L. 480 foodgrains have not only not adversely affected Indian agricultural production, but have contributed to its stabilisation.

Cultural and Educational Effects

Perhaps the most abiding contribution which the United States has made to India, other underdeveloped countries and the world at large is in the realm of technical assistance. Any rich country can give grants and loans, can supply goods and commodities, but only a few countries can impart their technical knowledge and share their special skills. America, which is so full of inventive genius, has been responsible for many a modern marvel. Lesser nations might jealously guard their science and skills, knowledge and technology, but not America. A few other nations might equal the United States in their scientific advancement, but unlike America, they are not always eager to share their knowledge with the less developed world.

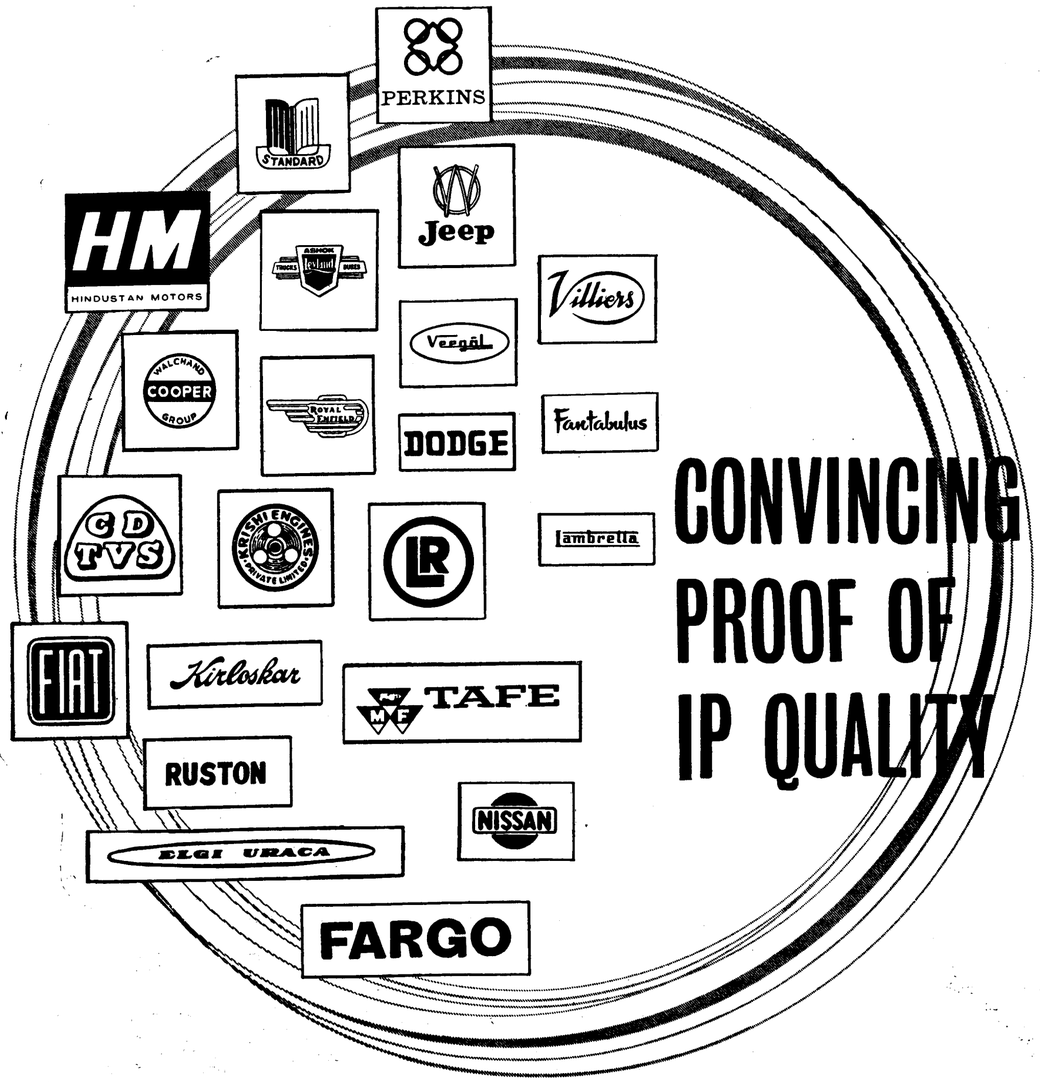
American technical assistance to India has been terribly important because it introduces new ideas, novel and improved work techniques, a new and daring spirit of doing things—a spirit that persists till success is achieved—and these cannot be evaluated in any quantitative sense. American technical assistance to India has been provided through :

(1) The provision of experts' services

(2) The training of Indians in India, in the United States and in the third countries

(3) The establishment of new or development of existing educational, scientific, research and training institutions in the country.

As for the experts' services, America has sent so far numerous experts to teach and train Indians participating in American-aided projects and to help build plants and institutions. These experts have been drawn from virtually every discipline—all the way from home science to nuclear physics. No matter how simple or complicated the task, these American technicians have brought to bear a dedicated attitude upon India's reconstruction—an attitude that cannot be bought. Whether it is teaching hot lines maintenance or building a huge dam, setting up an agricultural university or an institute of technology, eradicating malaria or organising traffic in a congested city, demonstrating the latest methods in surgery or devising procedures, techniques and systems to promote efficiency and increase productivity, these Americans have given themselves unstintingly despite difficult odds in an alien cultural milieu.



As for the provision of training for Indians in India and the United States, Indians working on the Indo-American projects receive instruction and training on the spot from U.S. experts. Besides this, nearly 5,000 Indian participants on aid projects have been sent to the United States for further training, and some have been sent to other countries such as the U.K., Canada, Japan or West Germany where the training facilities are more appropriate for India's immediate needs. The impact of the returned American-trained students on the Indian economy and even culture is referred to elsewhere in the discussion of American assistance in the field of education.

As for the establishment of new or the development of existing educational and scientific institutions, the U.S.A. began with a general exploratory assistance programme to various institutions in different fields of higher learning. This assistance has been in the form of the supply of text-book and laboratory equipment, the provision of adviser-consultant services, services of visiting professors for short periods and grants for building and general equipment. But of late, American help has been narrowed down to concentrate on a few strategic and vitally important pace-setting educational centres like the Indian Institute of Technology in Kanpur and the Agricultural University in Rudrapur.

India's greatest need has been and continues to be technical education, a field which has been relatively neglected during the last century. This lack has been one of the factors responsible for India's backwardness and consequent low standards of living. A frontal attack on India's poverty implies a scientific and technological bias in her education which alone can transform her traditional agrarian economy into an industrialised one. And it is in this badly needed but much neglected sphere that the U.S.A.'s contribution has been of paramount importance in the reconstruction of the Indian economy. Technical assistance is only one phase of the overall development of what may be called human capital.

Development of Human Capital

India's population numbers today constitute a problem both quantitatively and qualitatively. The qualitative level of the people is low because of the unmanageable quantity against the limited resources. But if the quality of the people is raised, the population of a country becomes its greatest asset. A country's population is its human capital and its development must be of paramount importance, particularly in a developing country. The promotion of health and the imparting of education are the twin major factors contributing to the development of human capital. The various health programmes covering malaria eradication, health education, support to medical and nursing colleges and their contribution to the lessening of the nation's morbidity is too well known to need discussion. The variety of educational programmes, also referred to elsewhere in this study, includes not only the training of Indians associated with the aid

Our production so far has exceeded 2.5 million pistons, 31 million piston rings and 0.8 million cylinder liners—majority of this volume for Original Equipment. Here are some of the leading names with which India Pistons is proudly associated in the successful development of ancillaries manufacture.

This kind of Original Equipment leadership means that you can specify IP quality products with confidence.

INDIA PISTONS LIMITED, SEMBIAM, MADRAS-11.

projects in India and the United States, but also such pioneering and unique institutions as the All-India Institute of Medical Sciences in Delhi, the Indian Institute of Technology in Kanpur and the Agricultural University in Rudrapur. Apart from the training imparted to Indians working on air projects in India by American technical experts, some 5,000 Indian participants have been sent to the United States during the period under the auspices of the T.C.M. for some kind of training in the United States. A pervasive cultural effect of American aid on India has been due to this training outside India, particularly in the United States.

What about the effect of these American-trained Indians on India and America? The changed attitudes and new ideas as well as new and improved work techniques brought back by them are bound to have leavening effects on the communities in which they live and work. The T.C.M. (A.I.D.) has carefully selected these young men and women, officials and managers with ability and leadership potentialities. It is true that the total impact of some 5,000 young trainees is too small to chage basically Indian cultural attitudes. But nevertheless, these American trained people do contribute a new and vital element to that segment of enlightened Indian opinion which will undoubtedly increase in importance as time goes by.

What about the effect of Indian students, scholars and trainees on the United States of America? Indo-American educational, scientific and cultural exchanges are a real two way traffic. Indian students, trainees and other exchange personnel bring Indian values to the United States. These young men and women have had some impact on the United States in the sense that they have helped change the image of India in that country and this change has to some extent made it easier to maintain and enlarge the American programme of assistance to India.

On the other hand, American Fulbright students and professors in India bring with them their cultural values. They not only take back some Indian values, but they also leave behind certain American values among those with whom they lived and worked. That there is benefit in getting acquainted with each other's attitudes and views is undeniable. What has been the general effect of American educational aid activities in India? In the broad field of education, American efforts have been closely allied with those of the Government of India to make education more pragmatic and to contribute more directly to desirable changes in cultural, economic and political life. As people become more educated, they are bound to take a great interest in the country's political problems, and the creation of an enlightened public opinion becomes possible. The result will be less emotionalism in political life, and national issues are apt to be considered with more light and less heat.

A broadbased educational system in India must accomplish much more than imparting formal instruction to the students. The first aim of such an educational system in India must be to increase the ability of the individual who has gone through the system so that he is productive and is able to contribute his share to the nation's increased productivity. The second aim must be to inculcate and increase a sense of civic responsibility and participation—a sense that is sorely lacking today.

At the same time, an educational curriculum and system can be dangerous if it arouses an individual's premature awareness of a higher standard of living and of ways of demanding them through political channels. Until the country is able to create a productive economic system which permits a rather high level of employment, if not full employment, and some equality of opportunities, the revolution of rising expectations is apt to misfire. While the promise of a socialist pattern of society, made so frequently by political leaders to the vast illiterate electorate before and even after elections is tantalising, the slogan should not be taken either literally or too seriously by the people. Otherwise the disappointment will be all the greater because not only is there no socialism, but what is worse, the cost of living along with the tax burden is going up. In the name of the socialist pattern of society of the future, the citizen is treated with scant respect in the present.

Thus, an educational system which contributes to a lowering of the general standards and permeates confusion in the system's ideals and objectives can hardly contribute to the nation's welfare. In other words, a country' educational system can be looked at in two ways, from the point of view of the individual and that of society. From the individual citizen's point of view, education should make him more productive and a better citizen. It should give him access to a higher standards of living and develop his individual potentialities to the **maximum limit.** As for society, it has a right to expect from the educational system a stable, prosperous and progressive community made up of integrated individuals who are anxious to promote social welfare as a whole.

The impact of American activities on education, in a country as large and diverse as India, has to be selective rather than general in its approach. American aid authorities have experimented during the last 12 years with several approaches and have come to the conclusion that American assistance effort in this area has been scattered in different directions and not concentrated in one particular and limited area to show any rewarding results.

In view of the decision in favour of "concentration" as against the "scatter" policy, American aid has, of late, as observed already, been concentrated on certain specific key, standard-setting institutions like the All-India Institute of Medical Sciences in New Delhi, the Indian Institute of Technology in Kanpur, the Agricultural University in Rudrapur and the National Institute of Education in New Delhi. The idea here is that the available limited resources should be concentrated on a few strategic institutions whose value to the country can be tested and can be copied in other parts of the country with suitable modifications in the light of this experience.

International Demonstration Effect

To some critics, the presence of a large number of affluent Americans and their comfortable, if not luxurious, ways of living in terms of Indian conditions (they are paid large salaries in India, but not unrelated to what they draw at home in the United States) lead to frustration among Indians who come in contact with them and, what is more, this (as a kind of "international demonstration effect") acts as a barrier to capital formation in India and other underdeveloped countries. The argument usually runs as follows: the contact with developed economies directly or indirectly through their representatives' ways of living in underdeveloped countries in damaging to underdeveloped countries by raising the propensity to consume among the indigenous population, thus discouraging saving and preventing investment.

This has come to be known as "international demonstration effect". In the words of Professor Ragnar Nurkse "knowledge of or contact with new consumption patterns opens one's eyes to previously unrecognised possibilities . . . . . In the poorer countries such goods are often imported goods, and not produced at home; but that is not the only trouble. The basic trouble is that the presence or the mere knowledge of new goods and new methods of consumption tends to raise the general propensity to consume".[4] While the adverse influence of the "international demonstration effect" on capital formation in an underdeveloped country is not denied, it has certain desirable results. In India, the relatively opulent ways of the rich foreigners, particularly the Americans, create new wants, new desires, encourage new methods and perhaps better ways of living. When certain sectors of the Indian population come into contact with the American way of living and decide to emulate the richer way of life in, for example, food and furniture, the probable result is an acceleration in economic growth. The desire for better things in life is sometimes matched by an increased effort (hard and more work and more savings) to obtain the envied good things of life.

In a sense "International Demonstration Effect" is not new in India since the British lived in India for a couple of centuries, but there is something else which may be called inter-group demonstration effect. Indians have always been exposed to the luxurious ways of living of a small section of quite wealthy Indians. But their ways of living have usually been marked more by mere conspicuous consumption than by a healthy pattern of living. Their diet, because of ignorance, is often almost as unbalanced as the poor man's diet and their tastes in other matters not necessarily refined. Numerous examples can be cited from various Indian communities in support of this contention. On the other hand, the ways of living of wealthy Americans may have pointers for Indians who would like to emulate some of the desirable aspects of the American way of life. Unfortunately, all the customs, habits and manners of the foreigners are not necessarily commendable.

What of the future? It is not easy to forecast the future pattern of Indo-American aid relations. Judging from the various factors governing the current Indo-American relations it is possible to hope for closer, more cordial relationship leading to much greater aid to India from the United States. Of course, the end of all foreign aid is to have no aid at all. That is, from the Indian point of view, the real and ultimate end of all foreign aid is that it should cease; that is, the economy of the country should become creative, productive, and self-generating at such a desirable high level that foreign assistance becomes by and large unnecessary. In a word, the economy has taken off and is high up in the clouds, flying smoothly at a high speed with everything under control.

Future Pattern of Aid Relations

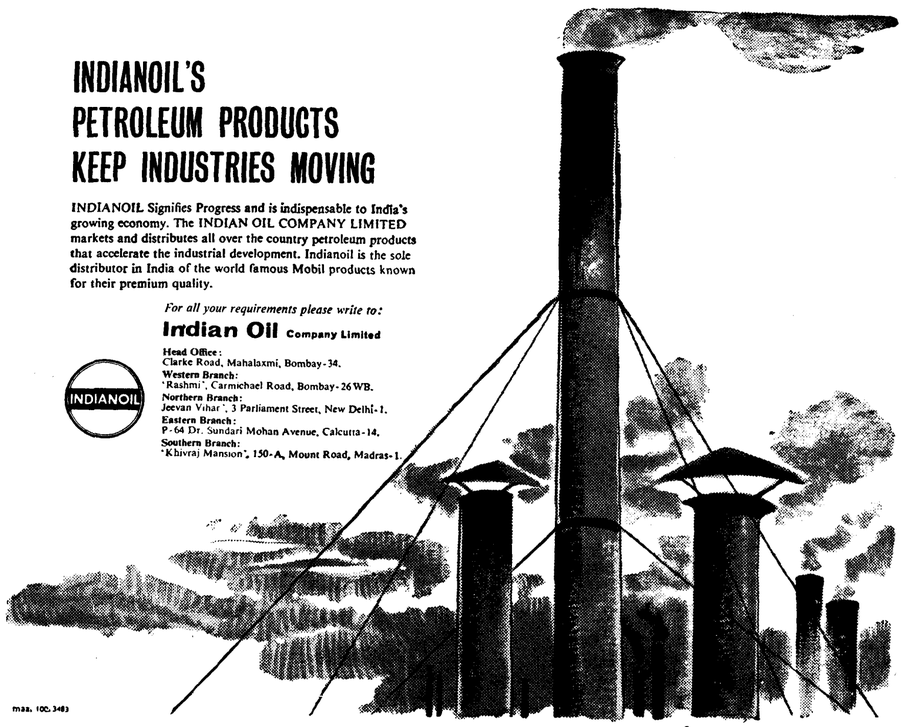
The *modus operandi* of American aid to India is simple and well known. U.S. aid for any specific project is predicated on the request for such aid by the Government of India. The initiative is taken by the Government of India since it is known that the United States Government is ready and willing to entertain such requests for aid. The magnitude as well as the conditions of aid for the proposed project are a matter of diplomatic and other negotiations between the two Governments or their designated agencies (such as the Foreign Aid Division of the Ministry of Finance and the United States A.I.D. Mission in New Delhi). Once the request for aid for a particular project is submitted, the U.S. aid authorities from Washington D.C. or New Delhi may examine the proposed project from various points of view, call for a lot of details and if they are satisfied that it is a worthwhile and rewarding project within the financial and technical competence of the United States, approve it.

Normally, the United States does not suggest the kind of project the recipient country should have. Once the aid is granted, the implementation of the project rests solely with the Government of India. It is true that American technical experts, that is from the aid-giving countries, are associated with the projects, but the administration of the execution of the project is left with the recipient Government. This does not mean of course that differences between the American technical experts and the Government of India personnel on the execution of the project do not arise. And when they do arise, they are settled through negotiations to mutual satisfaction, for after all both the parties are interested in the quick and efficient implementation of the project on hand.

Thus the United States gives money or equipment or technical personnel or all three for a particular project approved by them, and then the American aid and direct interest on the project ceases. Since Americans or other foreigners are not employed in the Indian administration, save for a few special cases, the task of seeing a particular project carried out is left to the Indians. There is no specific machinery at present to watch

[4] R. Nurkse, *Problems of Capital Formation in Underdeveloped Countries* (London, Oxford University Press, 1953) pp. 61-62. Professor Bauer writes: "The usual formulation of international demonstration effect omits to note that the new types of consumer goods can be bought only if incomes are first earned to purchase them; consumption can stimulate saving and investment as a means to such consumption." *Economic Analysis and Policy in Underdeveloped Countries, op cit* p. 65.

INDIANOIL'S PETROLEUM PRODUCTS KEEP INDUSTRIES MOVING



INDIANOIL Signifies Progress and is indispensable to India's growing economy. The INDIAN OIL COMPANY LIMITED markets and distributes all over the country petroleum products that accelerate the industrial development. Indianoil is the sole distributor in India of the world famous Mobil products known for their premium quality.

over the project till it is completed and evaluate its impact on the economy. To some extent, of course, this is done here and there, particularly when things are not going well.

In the light of experience of current administration of American aid to India through the existing machinery—in giving as well as in receiving aid—a few problems have cropped up. These are not really difficult problems, nor are they unique to India or America. With a little goodwill and some effort on both sides, they can be solved to the satisfaction of both countries. And once certain changes are effected in the terms and machinery of aid. Indo-foreign aid administration in India can be smoothened to render the entire operation more efficient and smooth. Besides certain suggestions for reforms there are a few problems, hitherto ignored, which need to be tackled with some vigour. These suggestions and problems must, of course, be looked at from both the Indian and American points of view. A few of these are: new priorities, tied loans, scatter *versus* concentration, new patterns of loans, reform of administrative machinery, the population problem and family planning, the problem of public health and sanitation and general problems involved in Indo-American understanding.

New Priorities

As the Indian economy is one of shortages, the question of priorities assumes paramount importance. To some priorities are a matter of opinion, but to others, certain priorities are basic and obvious. To the latter, the first task before the Indian Government should be to mobilise the countryside. That is, India should get an agricultural revolution going in the villages, and until this revolution has gathered momentum, no serious attention should be paid to heavy industrialisation.

The second major task is one of administration and organisation. That is, the need here is to establish effective institutions to implement these plans. An administrative machinery designed by the British during the nineteenth century to collect taxes (the head of the district is still called a Collector) and maintain law and order can hardly cope with economic, sociological, and anthropological problems inherent in implementing aid programmes on a vast scale. This needs an entirely different mental equipment, knowledge and training. What is needed here are many reforms—major and minor, but none too difficult to implement.

A primary need here perhaps is informed decentralisation with authority. The trouble is that Indian bureaucracy's training has been so tragic that it not only does not trust the citizens of the country it administers but also its lower echelons. (How else can one explain the enormous number of petty, tiresome and meaningless rules? The British framed these rules because, as ruling foreigners, they could not trust the Indians, but the Government of free India have made more rules! The decision-making apparatus has to be overhauled and radically changed.

Mere decentralisation may not be enough. But at the same time, decentralisation with authority becomes at once a serious educational problem. Authority without knowledge will be disastrous. The people at the lower levels must, therefore, be trained. And once they are adequately trained, they must be given responsibility so that they are able and willing to act. The problem here is perhaps one of social organisation. We shall revert to the need for administrative reforms a little later.

The third major task before the country is that of rapid and large-scale industrialisation. Here much is being done and even the worst sceptic must concede that India has made more advancement in this area in the last decade and a half than in the last half a century. There is no need to discuss again the question of the merits of the public sector as against those of the private sector. However, one suggestion may be made. It would perhaps be wiser to let more outsiders come in, start industries, set up plants, train Indians and raise the total wealth of the country by leaps and bounds, even if this means, as it must, that the foreigner makes and takes some profits. Today, the Government appears to take almost sadistic pleasure in devising obstacles in the path of foreign investors and collaborators in India. No country has pulled itself up by its own bootstraps. Therefore, it would be profitable in the long run, for the Indian Government not to put too many obstacles and objections in the path of the American industrialist who is willing to share his capital and know-how with Indian for mutual benefit. It must be remembered that in the present day, the foreigner, no matter who he is, can neither exploit the local people nor can he carry away his plant and industry from India. The days of nineteenth century imperialism and exploitation are definitely over.

To give just one random example. India wants to attract foreign tourists, particularly Americans, not only because India has many ancient and beautiful things to show off, but also because India needs precious foreign exchange, particularly American dollars. And yet, the Government of India does unwittingly just about everything possible to discourage foreign tourists because of the endless red tape of the Government's blight-breeding bureaucracy from the granting of the visa, through the hotel accommodation and the giving of the exit permit. There are no hotels adequate for the needs of foreign tourists or for Indians for that matter. The country can boast of frayed, dirty, old hotels both under Government and private management which have never seen cleanliness nor efficiency in their lives, or new mausoleums like the Ashoka where there are more protocol-conscious servants than paying patrons. Why not let the Americans come in and build a network of clean, efficient and modern hotels on the lines of the Hiltons? This American hotel organisation has built first-class hotels in many foreign countries which have apparently not lost their sovereignty on this account. An Indo-American joint venture in hotel-building might be a welcome idea. Private enterprise in India is not up to this as yet because it is used to such shoddy, second-rate accommodation that it cannot think in first-class terms. Once there is a chain of really comfortable and functional modern, and not gaudily ornate, hotels at every sightseeing centre, no matter how small it is, and some effort is directed to improve sanitation and environmental hygiene and control the congregation of beggars at these centres, word will get around and foreign tourists will flock to India. Such a network of neat hotels will be a sound and rewarding investment in the long run.

Tied Aid

Secondly, the question of tied aid is important. Tied aid is, of course, the American insistence of the recipient country buying with American aid funds of food and services of United States origin only. This applies to all American development loans now. This began in October 1959 and officially came into being in early 1960.

From the American point of view, the motive behind tied aid is to prevent her from suffering from an adverse balance of payments. It happens this way. India buys various commodities and services with U.S. dollars from Germany because German goods are cheaper than those of American origin. While this leads to an expansion of German exports, the United States suffers an adverse balance of payments. This situation could be prevented if all the advanced countries participated in programmes of foreign aid to less developed countries in proportion to their resources and national income. But since this is not so America has to bear an unduly large burden of giving aid to foreign countries. Therefore, she has to insist on tied loans to safeguard her economic position. It is true that the United States prefers untied aid just as much as India desires it and it is hoped that such untied loans will become the rule once the burden of assisting underdeveloped countries is shared by all the rich countries.

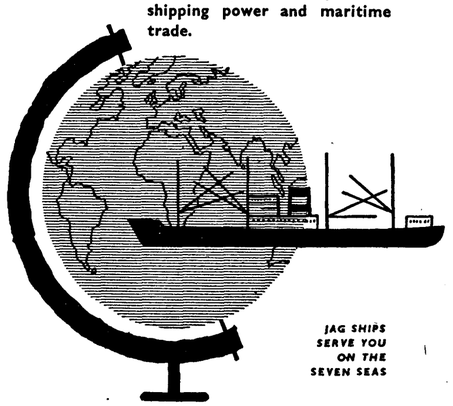
Thirdly, American aid has been scattered over various spheres of Indian economic development. While the total U.S. aid, as already pointed out, is more than half of all the aid received by India from nearly a score of countries, American aid appears to be spread rather thinly. Thus, Russian aid, for instance, is tangible and produces tangible goods visible to the naked eye (*e.g.*, the Bhilai steel plant and its products). American aid has been diffuse and rather intangible, as in communication, community development and the general infrastructure. While the importance of these in the nation's total economic development is unquestionable, years have to elapse before their beneficient effects can be felt. It is but natural that a foreign country willing to help India would like to impress the recipient country with some kind of dazzling gift. While such a desire may appear juvenile and superficial something must be said in its favour. It is desirable, on the whole, for a donor country to concentrate its aid resources on a particularly important sector of the recipient country where it can demonstrate the possibilities of impressive development within a reasonable period of time. Once what can be achieved under certain circumstances can be shown, the recipient country may do likewise in other areas capable of development.

The reason why the United States scattered her aid in diverse areas of development in earlier years is because they did not know what exactly was needed (and every sector appears to be crying for help) and what the core of the Indian economic problem was. India herself was experimenting (and still is, to some extent) and no one knew for certain where one ought to concentrate. Now America has realised that she must concentrate her aid in particularly criticical areas of the Indian economy and in fields where she has special and unrivalled competence. Through such concentration of assistance as distinguished from scattered aid, India and the United States are likely to obtain larger results for a given unit of effort for India's economic development. In a sense, Americans have struck recently the golden mean in their approach to problems of Indian development. While, on the one hand, they have concentrated certain portions of their aid on more and more specifically defined projects, on the other hand, they have increased and broadened the general goods and services supplied to support development effort on the whole.

Pattern of New Loans

As is well known there are two kinds of American loans—project loans and non-project loans. The former are for development imports while the latter are for maintenance imports used by the Government of India to import industrial raw materials (like non-ferrous metals, iron and steel, sulphur, synthetic rubber, lubricants, chemicals, accessories, etcetera), to help her in the balance of payments. In discussing the evolution of American aid, two things must be remembered: The mode and agency through which a grant or loan is distributed and whether the loan is to be repaid in dollars or rupees.

The pattern of American aid to India through the various development aid agencies is constantly under review as to both criterion and policy. One change is from loans repayable in local currency—rupees—with a fairly high interest rate and shorter terms *into* loans for longer terms with only a nominal service charge but repayable in dollars.



The conditions under which American loans are granted to India have been changed recently for the better. She now charges low rates of interest —¾ percent. The amount is repayable in 40 years. But this also means that India has to repay in dollars and not in rupees. However, it is hoped that India will have developed in 40 years (about 2000 A.D.) and be able to repay the loans in dollars without any strain. In the meanwhile, there is a minimum of strain on India's current balance of payments position. There is a ten-year grace period before repayment need start. As for loans to the private sector, America charges 5¾ percent interest. The basic real question in matters of aid is the recipient country's capacity to repay. This long period can be taken as a sufficient guarantee that India will be developed enough by then to repay the loan and the nominal interest with ease.

Reform of Administrative Machinery

In the art of public administration, India has a great deal to learn from the United States of America if only to increase the overall efficiency of her administration. It is true that India has inherited from the British raj a relatively efficient civil service. But this Indian (half of it was Bri-

tish) civil service, with its particular pro-British (if not anti-Indian) bias and training, which unfortunately knew nothing beyond British ways, has almost disappeared within 15 years of India's freedom. The number of I.C.S. men left today in the Indian administration is very small.

The Indian Administrative Service has succeeded the Indian Civil Service. The chief defect of the I.A.S. is that it reflects the general fall in standards that the country has witnessed during the last decade. (This is not the place to explore the reasons behind the decline in standards). And secondly, unlike the I.C.S., the I.A.S. young men and women have neither seen nor experienced anything better organised and more efficient than their own slow, delaying, bureaucracy neatly tied and shelved with red tape with the aid of an army of *chaprasis* (servants). They are being trained by senior and retired I.C.S. people, besides a few visiting scholars, in Mussoorie in the traditional chores of the 19th century British administration of a backward country interested in law and order. They have unfortunately not yet learnt that they are being trained in rules and regulations that are the very antithesis of the needs of a rapidly developing economy of a free nation. The days when a man with a chemistry degree who passed a competitive examination was put in charge of the finances of a State at the age of 23 or 24 after a year's training are gone, one hopes, for ever.

What is needed today is a different kind of a civil servant to do development work. The country needs the type who is extremely well informed (this means that the present Indian university education must be overhauled and the English language must be retained for contact with the external world and all-India communication) and who is trained to examine issues competently and quickly and take serious, responsible decisions. Today, the Indian administration is top heavy with a platoon of all kinds of secretaries accompanied by an army of parasitic *chaprasis* who seem to grow in numbers with the increase of the country's total population; and they are all lost in a maze of countless strangulating rules and procedures.

It is not so much that these men are at fault, but that they are victims of an invidious system of rules. Many of these basic rules were framed about three quarters of a century ago by an alien Government which did not believe in the integrity of the average colonial citizen. It is amazing that the administration of free India has increased these pettifogging rules by a hundredfold. This can only be explained on the assumption that the Government considers the average citizen of free India is a criminal till proved otherwise. Try and obtain Rs. 10 sanctioned by the Government through what is called a contingent bill at a Government pay and accounts office. If a man can obtain this paltry sum after ten visits and signing countless receipts and vouchers, he is a lucky man indeed!

In the rapid industrialisation of an underdeveloped country (to take just one phase of the development problem), the efficiency of the administrative procedures plays a vital rôle. The authority to take decisions has been denied at almost all levels till one reaches the top. Even at the top, it is not always one man's decision, but a group decision. It is a committee or a board. On the other hand, even when individuals have power, they often refuse to exercise it for fear of going wrong. One must be able to make a mistake and one's boss must be able to back him up if the *bona fides* are not in doubt. The concept of the collective responsibility of the cabinet (whether this is followed in the Government of India or not) is certainly not in evidence at the lower levels.

It is a pity that the United States has not offered any help in streamlining the Indian administration beyond Appleby's reports (which were not really part of U.S. aid to India) which have been conveniently shelved. But U.S. aid is given only on India's request. And India has not asked for any aid in this direction. How can the civil servants who constitute the administration ask for aid which will reform them!

The Population Problem

Thus it will be seen that American aid has at least touched, if not completely covered, just about every major sector of the Indian economy. In the earlier and experimental years, American aid was extended to all kinds of projects because no one, including the Indian authorities, knew for certain where the vulnerable spots in the economy badly needing aid lay. But soon the American authorities realised that their aid must be concentrated on a few strategic areas and not be scattered all over. After all, the resources of even the United States are limited.

U.S. aid's contribution to the stability and even vitality of the Indian economy has already been commented upon. However, it cannot be denied that this aid could have been even more effective and could have had a more lasting impact had she given some solid support to India in two difficult and vulnerable areas that have been crying for help for some time. One is her population problem and another the problem of public health, hygiene and sanitation.

That India unfortunately suffers from these really nineteenth century problems, is undeniable. India's population problem which arises from a relatively high fertility and declining mortality, is simply the net annual addition of some 8 million people to the existing large base of about 440 million by and large nullifies much of the national effort towards a higher level of living. The second problem is one of India's filth. Indian communities, whether they are large cities, small towns or villages, do not as yet have modern sanitation and environmental hygiene. They are yet to have a modern potable water supply, sanitary conservancy systems, underground sewage collection and disposal, and even proper garbage disposal systems. This filthy situation, apart from its disgusting, physical ugliness, leads to a catalogue of diseases which have been controlled and conquered in the advanced countries of the West. This deplorable lack of sanitary and health consciousness leads to a high incidence of morbidity of a primitive kind. It is shocking to record that during the year 1963, thousands of Indians have died of smallpox and cholera in India's major cities! To say the least, all this profoundly affects Indian economic and social development through high infant, maternal and general mortality rates and through the loss of millions of man-hours every year in the field, factory and office due to avoidable sickness, not to speak of unnecessary suffering.

Yet due to some cussedness, in India and other underdeveloped countries, health problems receive low priority and the Health Minister is often only a junior member of the Cabinet. The only possible explanation for this is that these emergent countries are irrationally aping the advanced western countries on this matter. The advanced countries have no problems of public health comparable to those of the underdeveloped countries and hence they can afford to give health a low priority. But certainly the less developed countries cannot.

American aid could make a splendid contribution in this area. American communication and educational techniques could be pressed into service to bring home the importance of family planning for economic, health and social reasons. The Government of India, unlike some underdeveloped countries, has taken a progressive attitude on the question of the country's population growth. The various attitude surveys conducted in different parts of the country have revealed that Indian parents are in favour of family limitation. And family planning has been given an important place in all the three five year plans. American aid could easily give a push and a fillip to the existing Indian family planning programmes.

Secondly, America could set up with this latest technical know-how large plants to manufacture such contraceptives as sheaths and diaphragms and jellies. These contraceptive factories could operate under the public sector with little or no profit and with a tremendous turnover they could sell contraceptives at extremely cheap prices. Today the imported contraceptives, incredible as it may sound, are too costly for the average Indian villager. American supply of raw material (rubber) and technical assistance in the manufacture of contraceptives could make a tremendous contribution in lowering the Indian birth rate. Once the Indian birth rate is lowered and the net annual addition to the existing population numbers becomes manageable, American aid in other sectors would then be able to witness a real rise in the Indian level of living.

But unfortunately, population problems are often viewed with more heat than light. They are bedevilled with politics and theology. Contrary to what the American Catholics—a small minority—are likely to say, there is a large body of public opinion in America—Protestant, Jewish and even Catholic—which believes that America should give birth control aid to the underdeveloped countries should the latter specifically request such aid. It is to be hoped that India will ask for such aid, and America will provide it without any squeamishness in the future. There would be no room for any misunderstanding on either side, once America gives such aid on India's request.

As for public hygiene and environmental sanitation, all the problems involved in these can be solved easily. They are merely matters of education and expense. The average Indian's "sanitary" habits are far from desirable. He needs to be educated. If his behaviour as far as the rules of health are concerned even at home is atrocious, it is often because there is no healthy alternative. But it must be granted that even the lowly do not love dirt, filth and poverty. So it should not be too difficult to educate at least the younger generation on certain basic healthy habits. On the question of expense, it is true that most municipalities and even large corporations like those of Calcutta and Delhi just cannot afford modern hygiene and sanitation. This expenditure must be considered an important part of the infrastructure that will yield rewarding gains in the long run. If in the next decade, India could be rescued from her dirt and filth and converted into a clean and healthy country, the effect of such a transformation on her economic and social development would be beyond any calculation.

Intangible Effects

And last, there are some intangible benefits flowing from American aid to India. There is, for instance, a considerable improvement in the understanding between the two countries because of an enlarged exchange of people and information through articles, books and films about each other in both the countries. Before the second World War, the average American's knowledge of India from a serious point of view was practically nil. Apart from a handful of Indian specialists, the man in the street equated India with fabulous Maharajas, tiger hunting, *sadhus* on beds and nails, sacred cows and snake charmers, the caste system and untouchables, and last, but not least, Gandhi in his loin cloth who sometimes refused to eat! Today, within about 20 years, the picture has almost completely changed for the better, thanks to India-returned Americans, America-returned Indians, Indian students on almost every American campus, visiting Indian scholars and professors, the publication of an increasing number of books on India by both Indians and Americans, and to a limited extent, the rôle of the diplomatic establishments and information services in both the countries. In fact, today there is more serious and scholarly interest about India in the United States, than about the U.S.A. in India.

There is a deep, abiding and invisible psychological effect arising from a greater knowledge and consequent better appreciation of mutual merits, difficulties and problems. The fact that a powerful and affluent nation is sympathetic and helpful to India and will stand behind her in case of serious difficulties is very reassuring to India. The psychological effect on the nation that things are really moving and the country is gradually but definitely becoming developed and industrialised is bound to be tremendous. The next two years, 1964 and 1965, will show a considerable impact on India's industrial output when all the machinery that has been ordered from the United States does fully arrive and go into action. In a word, nothing succeeds like success.

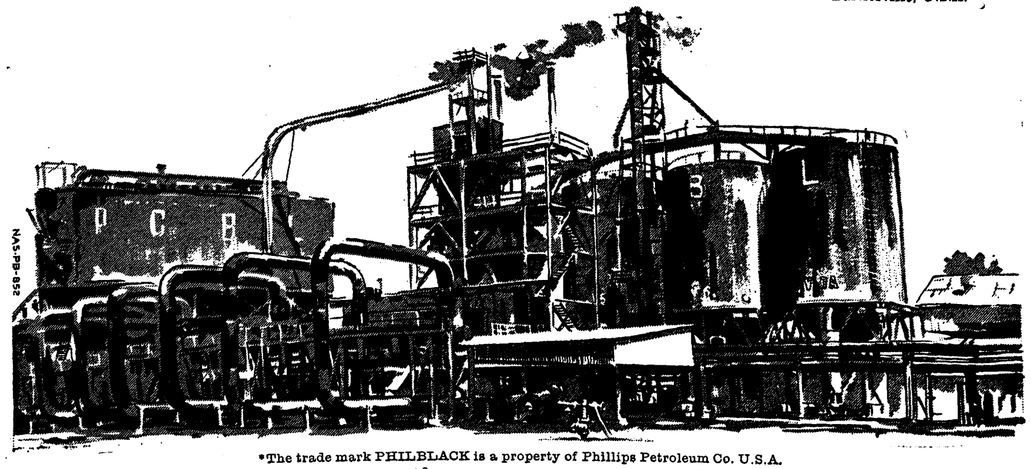
From India's first Carbon Black Plant at Durgapur

PHILBLACK*

another step towards national self-sufficiency

PHILBLACK*, famous all over the world for its outstanding performance in many different applications and especially for the unique quality it imparts to rubber compounds, is now for the first time made in India by Phillips Carbon Black Ltd. at their Durgapur Plant. With an annual production capacity of 30,000,000 lbs., the plant will ensure a saving in vital foreign exchange to the value of more than two crores of rupees per annum.

All four types of PHILBLACK are available to you from Durgapur. Write for complete information and find out which PHILBLACK will be the best and most economical for your operation.



Let any or all the types of PHILBLACK work for you.

Raising Exports: Major Changes Required In Government Policies

India desperately needs some foreign exchange to finance her imports under the third plan. Apart from securing foreign aid and loans, this can only be done by promoting exports. The recent improvement in exports is attributable to transitory factors. The measures which the Government has taken so far have proved inadequate. Mr. Patel questions many of the assumptions on which the export policies are based.

By

H. M. PATEL

AT the time of the formulation of the third five year plan, among the problems which were agitating the minds of the planners most, were the problem of increasing agricultural productivity and the problem of raising the country's exports. In spite of the various measures that were taken to secure significant increases in both these directions during the first two plan periods, little success has so far been achieved.

It was realised that marked improvement in both agricultural production and exports was of vital importance if the third plan was to succeed. And, accordingly, it was decided from the outset to give high priority to steps designed to increase agricultural production and exports. "Export or perish" was adopted as the watchword of the Ministry concerned. Today, however, a little over two and a half years after the third five year plan period began, it is unfortunately no exaggeration to say that neither agricultural productivity nor exports have shown a marked upward trend. Increases have taken place, but these have usually lasted only for short periods, and occurred only because of special reasons. Why should this be the case? While it is not easy to give a short answer, it is probably correct to say that the failure is due as much to unsound policies as to their inefficient and unimaginative execution.

Bumper Crops

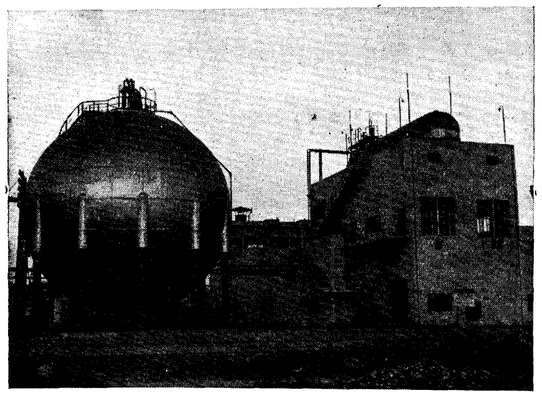
The first year of the third five year plan period, 1961-62, fortunately for all concerned, turned out to be a year of bumper crops. But this piece of good fortune only served to lull everybody into an unwise state of complacency instead of goading them on to greater and more determined effort. And the problem of raising agricultural productivity continues as a consequence still to be India's major problem, which has defied all efforts to solve it. Exports have, likewise, continued to show no buoyancy, and such increases, as have been achieved, have fallen far short of the objective.

Surprising though it may seem, it was not until India's unfavourable balance of payments became large, and virtually all her gold and sterling reserves were wiped out, that both the Government and the people started doing some hard thinking on the matter. A high-powered committee was appointed under the chairmanship of Mr. Ramaswamy Mudaliar to examine the whole policy of foreign trade and in particular to recommend measures to be adopted for the promotion of exports. The committee worked with speed and made a number of useful recommendations, most of which were accepted by the Government. Export incentives were to be increased, quality control was to be introduced but on a voluntary basis, a special revolving fund was to be created for maintenance imports, etcetera. A new Ministry was created and a vigorous Minister was placed in charge of it. It was hoped that now at last international trade will really receive the sustained attention and deep study it called for. But although the approach towards export promotion became "dynamic", it did not become as realistic as was essential, with the inevitable result that India's export trade continues to be in the doldrums, showing no signs of a real upward swing.

The latest available figures up to June 1963, compared with those for the corresponding period of 1962, point to only one conclusion, and that is that no striking improvement has taken place in India's balance of trade position. Whatever little improvement has come about is largely attributable to transitory causes, such as the merging of Goa's exports with those of the rest of the country. The measures so far taken by the Government have proved to be inadequate.

Unsuccessful Methods

India continues to pin her faith on old and well-tried but unsuccessful methods: trade agreements, direct export incentives, freight reductions, drawbacks and such like financial concessions, import licences, etcetera. All these are of value and have undoubtedly helped, but they have not helped in building up export markets of a lasting character. If one analyses commodities and articles which account for the great part of India's export trade, it will be found that they still are in the main what they have been in the past many years. There is demand in the foreign markets for these commodities, and if India had more of them, she could perhaps secure a larger volume of export trade in them. There is demand for India's oilseeds or oil or oilcake, short-staple cotton, hides and skins, tea, etcetera. But largely because of the growing internal demand, the country has less and less of these to spare each year. Ought India not to have then devoted some considerable efforts to ensure that these commodities were available in ever increasing quantities? Should she not have pressed for greater attention being paid to the increased production of such cash crops as part of her export promotion drive, quite apart from the desirability generally of increasing her agricultural productivity?



The third plan has, no doubt, set up higher targets of production for these crops also as for food crops, but the increases aimed at are very modest. And even these modest targets remain unrealised. Thus, for instance, for the five major oilseeds the target was 9.8 million tons. In 1962-63, the second year of the third plan, the total production of these oilseeds amounted to 6.8 million tons, less even than the second plan target of 7.6 million tons! There is nothing to suggest that the total production of oilseeds during the current year will show any significant improvement. The demand for oilseeds within the country, meantime, is steadily rising, and consequently unless production is stepped up faster and at a greater rate than the rise in domestic demand, it would be impossible to expect any worthwhile results from any export promotion campaign for oilseeds and their associated products.

It is also important to note that the total quantity available affects the prices in the internal market. Since the export market in oilseeds and oilseeds' products is highly competitive, the country can only hope to secure larger markets and hold on to them if its domestic prices are kept down to a reasonable level. And this can only become possible if the total production of oilseeds is sufficiently large to cover the domestic requirements comfortably and leave over an adequate margin for exports. Considering that this group of commodities can be marketed abroad profitably and in large quantities, what India ought to have been doing is fairly obvious. Every effort ought to have been made for increasing the production of oilseeds by both increasing the productivity an acre and also by increasing the acreage under them.

Self-sufficiency in Foodgrains

But there one comes up immediately against the policy which the Government has adopted for achieving self-sufficiency in foodgrains! There can be no particular merit in aiming at self-sufficiency in foodgrains when one knows that in the event of a shortage, foodgrains are available in the world in abundant quantities for import. It would be only during wartime when the supply lines may perhaps be interrupted that any serious problem would arise in relation to the feeding of the population. During normal times, the right policy clearly ought to be to achieve maximum agricultural productivity, that is to say, achieve maximum yields in whatever crops are grown, and the crops which a country will select for cultivation will be determined with reference to the maximum economic advantage that can be derived from them. If this argument is valid, it follows that *today* the maximum contribution to the country's economy can be made only by ensuring the maximum production of cash crops which have both industrial value within the country and an export market without. If maximising India's exports is of that high degree of importance that everyone claims, the sooner her policy of self-sufficiency in foodgrains in all its rigour is suspended and is replaced by the adoption of one of ensuring maximum agricultural productivity, the better will it be from every point of view.

In so far as manufactured and industrial products are concerned, export promotion efforts have leaned heavily on what are generally described as export incentive measures. The keyword is "incentive". Now an "incentive", by definition, should be such as would enable the producer concerned to export the product in question on a competitive basis. It is implied, therefore, that there would be increased exports not merely in the immediate future, but—and this is more important—in a continuing manner, through the establishment of a permanent market for the product. The "incentive" should be clearly large enough to overcome the forces that would otherwise weigh heavily in the mind of the producer or manufacturer in favour of finding a

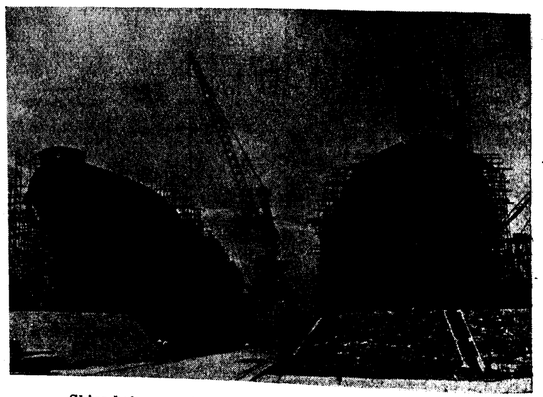
Horton spheres and cooling towers at a fertiliser factory

market for his goods inside the country rather than outside. Clearly, it should be large enough to ensure that no loss is incurred by the exporter.

At the same time, the country can only afford to carry the burden of a subsidy of this nature, only if there is a reasonable possibility of (a) India acquiring a permanent foothold in the international market for the quality and kind of goods proposed to be exported and (b) of their cost of production being brought down within a relatively short period of time so as to make it possible for the producer to export them without any assistance. It follows that the commodities to which assistance should be given through incentives need to be carefully selected: incentives should not be made available generally to everyone who exports any commodity grown or produced within the country, but only those who can have a reasonable prospect of securing a lasting foothold in the international markets.

Export Promotion Efforts

India's present export promotion efforts do not, I fear, comply with these rather self-evident rules of guidance, and to the extent that they fail to do so, they must be regarded as unsound and wasteful. This wastage is particularly heavy and harmful where the incentive takes the form of import licences to exporters for items which have nothing whatever to do with the products exported, for example, maintenance spare parts of the exporter's equipment. The incentives, in short, have not resulted either in increasing the production of exportable commodities or in the steady lowering of the cost of production of those commodities. It is indeed difficult to understand why the Government has not yet woken up to this fact. Not merely have the incentives failed to increase India's exports in any significant manner—and indeed such increase as has taken place is largely attributable to increased trade with Russia and the east European countries, where a totally different system of foreign trade is slowly being evolved, of which the net result is difficult at present to estimate—but also has in fact resulted in commodities imported by exporters being marketed at high prices, thus adding to the inflationary forces already operating within the country. "Exporters of chemicals, bicycles and engineering goods are being offered import licences for dry fruits and dates. Exporters of manganese ores are being given import licences for dyes. These imports in turn fetch bumper profits in internal sale."



The usual justification for such a policy would be that, if the exporter has to be enabled to make good his losses, let it be done through profits that he can make by being allowed to import commodities for which a market exists within the country at prices which are uncontrolled so that no burden falls upon the public exchequer! A little thought, however, would show that, indirectly, the burden upon the public that the adoption of this method involves is high, for the high prices of imports inevitably affect the internal price level, and by increasing the cost of production, yet further reduce the country's competitive power.

Another variant of this policy that has been adopted is no less unwise and self-defeating. Expansion or establishment of new units in some industries are given, subject to the condition that a proportion of the output will be exported. Sometimes licences for the import of even "raw materials" required are allowed to be imported on this condition. In most cases, undertakings of this kind can be implemented honestly only at a heavy cost to the internal consumer. If exports are to be made compulsory—and there is no doubt a case for this exists—compulsion must be enforced very differently, and indeed in such a manner that the burden cannot be passed on to the consumer.

The Incentive Method

An objective appraisal would leave no one in any doubt that the incentive method as at present conceived and implemented has failed to achieve its purpose. And since it is most important that India must maximise her foreign exchange earnings, it is imperative that she loses no time in accepting this failure and proceeding to make a fresh approach to the problem. It should be possible for India to decide on the basis of such data as are already available to her, which of the industries are in a position to produce commodities for which there is a demand in the international market, and having made this selection, to proceed to make an assessment of measures that would be necessary in order to enable those industries to secure a firm and lasting foothold in foreign markets. India may then find that for each different commodity, different type and amount of assistance would be necessary in order to enable her to compete effectively and ensure for herself a firm foothold in the foreign markets. There would then have to follow an assessment of whether the price that would have to be paid in each case would be worth her while.

In other words, the Government ought to devise a policy of incentives or assistance for each different commodity with reference to its own peculiar conditions, internally and externally. Its final decision must favour offering assistance to only those industries (a) for the products of which there is a demand in the foreign markets today and (b) which would be capable progressively of reducing their cost of production in such a manner that over a period of years they would be able to compete in international markets without any assistance. This method would not only enable the country to prevent abuse of the incentives that are made available to the exporters, but would also compel the industries selected for assistance, themselves to make their own respective plans for developing their export markets in a businesslike and effective manner. In addition to these selected industries, the Government should further be prepared to examine any request for assistance from manufacturers of other commodities who wish to develop an export market for their particular lines of production and accept their request if they fulfil the criteria laid down for such assistance.

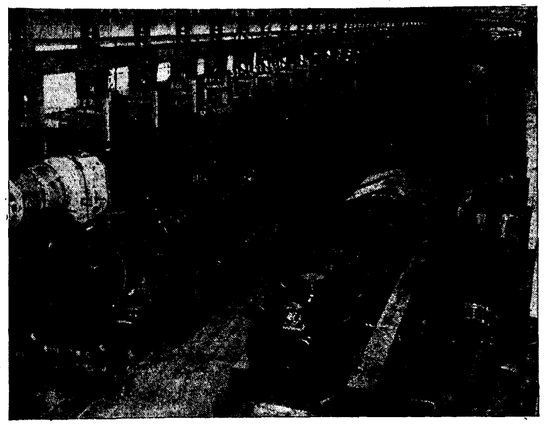
Ships being constructed at a Government shipyard

One valuable form that the assistance may take would be the grant of import licences for "maintenance" items or for "raw materials" on an actual-user basis. Care would no doubt have still to be taken to see that the licences are not given for excessive quantities. The value to the exporter would consist essentially in the fact that he would be able to run his industrial unit efficiently and at full capacity.

Targets for Industries

Finally, wherever possible, the entire industry rather than each industrial unit should be made responsible for ensuring a certain minimum level of exports. The industry would then evolve the method most suited for achieving the required target at a minimum cost to each of its units. Knowing that the exports would have to be made year after year, its aim would be to see that the goods exported are of the right quality and are produced in the most efficient units, that is, at the lowest cost possible. Even the industry may sometimes be tempted to take short-cuts, but they must be firmly advised to eschew them. They are as dangerous as slogans and catch-words.

If the country proceeds along these lines, it should be possible for it over a period of years to ensure an expansion of exports in a lasting manner. This may well be a slow process, but it will be a sure process for achieving increased exports in the most productive and sound manner possible.



Trade with communist countries has necessarily to be governed by different procedures. The basic criterion, however, for judging the value to India of her trade with them remains the same, namely, is she securing long-term markets for her products? The method of bilateral agreements apparently gives a fillip to her exports, but only a careful and detailed analysis in each case could give the country a real picture of the advantages it secures from its trade with each of the east European countries. It is by no means yet established that the larger sales of certain of the products India has made in recent years to these countries are likely to be of a continuing nature.

Finally, reference needs to be made to the desirability of seeking out with greater determination and purposiveness new products for export and new ways of earning foreign exchange. Fishery, thus, gives promise of providing substantial export earnings. A relatively small co-operative society in Gujarat has already found it possible to export some crores of rupees worth of fish. A flourishing export trade has been developed in certain types of fish from the south-western coast. Much greater possibilities exist than have been realised so far.

Invisible Exports

"Invisible exports" provide another promising method of earning foreign exchange. Tourism, thus, offers far wider possibilities than has yet been accepted by the authorities. A more imaginative approach is called for and greater readiness shown to cater to the needs of the tourists. India need not seek to reform her visitors.

None of these, of course, is an original suggestion. It will be claimed, and rightly, that much is already being done to promote exports of fish and fish products, and to make conditions more attractive to the visitors from abroad. It cannot, however, be claimed, and ought to have been possible to claim that India has done everything in her power to maximum her fisheries' exports and her earnings from tourism. It is in the implementation that the country appears usually to falter, and that is, fortunately, something which it can, and should, easily remedy. India's export policy must be rooted not in illusion but in reality. Dreams are of value, but only if they are capable of being converted into achievement, and achievement is in front of the country's dream.

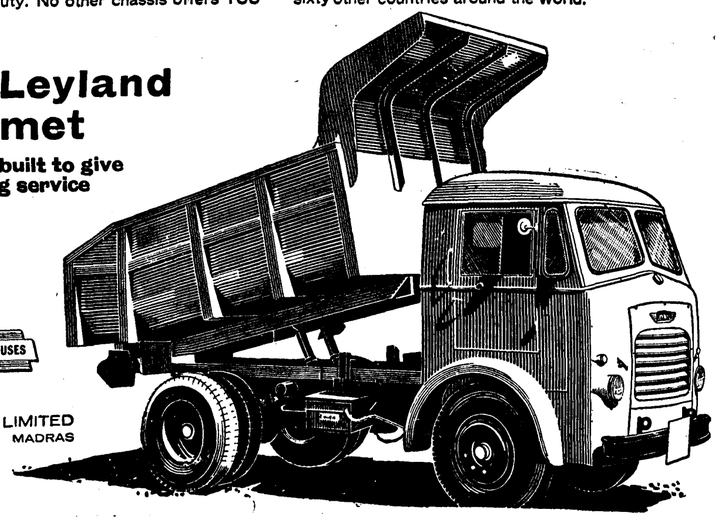
Bearing this brunt efficiently is the heavy-duty rear axle which is yet another outstanding feature of Ashok Leyland Comet chassis

The Ashok Leyland Comet rear axle presents a picture of solidity and great strength. It is built that way to take the pressure of an 8-ton load. The final spiral bevel drive transmits power smoothly and efficiently even under the most arduous conditions of operation.

Heavy-duty chassis



The Ashok Leyland Comet is a heavy-duty chassis built for rugged performance. Every part is specifically designed for heavy duty. No other chassis offers 100 B.H.P. 255 lbs./ft Torque Engine, Nitrided Crankshaft, Slip Fit Liners, 13" Diameter Clutch, 5-speed Constant Mesh Gearbox, 9"-deep Frame, 8-ton Rear Axle and 24-volt Electrical System.

Fleet owners prefer Ashok Leyland Comets

Remarkably low fuel consumption and economy in maintenance and overhead costs make the Leyland Comet the choice chassis in India just as it is in over sixty other countries around the world.

Importance of Management Education: Training Programmes Need to be Broad-based

The growth and diversification of Indian industry is creating a new need for trained, professional management. Dr. Lokanathan argues that heredity must give way to science in the choice and training of managers.

By

P. S. LOKANATHAN

Director-General, National Council of Applied Economic Research

TO what is known as the "revolution of rising expectations," there is, for all who know, a powerful under-current—irrespective of the sector of the economy, whether private or public—that *men in charge of affairs deliver the goods.* It is time an appraisal was made of the revolutionary potential of this mass feeling, for it immediately concerns the vital interests and ideologies of persons on both sides of the established line : to what has now become fashionable to call the Left and the Right in the Indian political economy. The challenge is really common to both sectors, for political consciousness has clearly passed the stage of accountability to Parliament only of the public sector. One now clearly sees the beginnings of a strong feeling that everybody—irrespective of the level of authority, position or possession—is in a final sense accountable to the people. Here, as in many other spheres of economic and political life, one finds Mahatma Gandhi's theory of trusteeship vindicated, although the level of sophistication now reached is much higher, as reflected in the present mass consciousness concerning cost and quality of public services. As a writing on the wall, this general phenomenon has relevance to the survival and prosperity of individual enterprise in the management of economic affairs.

Difficult Business

In this context, management—particularly of industrial enterprises—has become a particularly difficult business. *Externally,* a number of Government functionaries, labour leaders, consumers, sellers of raw materials and intermediate products, press various types of demands on management. Internally, not only its own employees press insistently their demand for a decent income, but there is almost equal pressure on management from the whole complex structure of line and staff—foremen, works managers, researchers, quality control personnel, finance and accounts, sales organisers and promoters : to mention only a few of the many functionaries who now combine to run the complex machinery of industrial business. Where do we identify management in all this complexity ?

It is usual to define the function of management as decision-making, but this approach is deceptive for it "fails to tie the functions of management with the people of management."* Unions through collective bargaining participate in decision-making: does this mean that they participate in the management function ? Managers, on the whole, are prepared to concede that unions can legitimately seek a voice in the matter of wages because their interests are deeply involved. But it may equally well be argued that their interests are deeply involved in technological change. Does this mean that the unions are entitled to a voice in these matters also? If so, then decision-making cannot be held to be the exclusive function of management.

Management has also tried to justify its authority and position in terms of the law, as the agent for the owners or shareholders of a business, but as people in industry know that law in this matter is but a broken reed, particularly where it concerns people. People are not slow to point out that property rights confer control over things, and not over people.

Making of Decisions

The whole concept has, in fact, now to be worked out again, not in terms of the law of contract but the idea of community. Workers have tried to interpret it all in terms of their notion of industrial democracy, arguing that the making of decisions should be shared by all whom they affect. This line of thinking has found its justification in the recent researches in industrial psychology. It is legitimately argued that the speed of an assembly line, for example, is decided upon not only by management but also by the foremen and the workers. Even willing acceptance, so it is argued, is an integral part of the decision-making process. What then is the exclusive sphere of management ? It consists really of balancing the internal and external pressures on business.

Because there are so many individuals and groups involved within the company itself, and because the ultimate decision on any one issue must be consistent and compatible with decisions on all other issues, there must be not only "bargaining" with all the individuals and groups, but also a co-ordination of all this bargaining. In this task—the co-ordination of the bargains of all those who compose the business—lies the real function of management. The co-ordinating authority is management:

> "The decision-making process is seen as a kind of multilateral bargaining process involving those whose aspirations are somehow involved in any of the numerous decisions which are constantly being made or remade. But this decision-making process is not the same thing as management, any more than collective bargaining is the same thing as management. Beyond the terms which are demanded, the bargains which are struck, the decisions which are made, is the inevitable necessity of a co-ordinating authority who must see to it that the numerous bargains or decisions are somehow made consistent with each other. It is that co-ordinating authority which is here identified as management."

Co-ordinating Function

In exercising its co-ordinating function, management has to observe two conditions if the business is to survive. Firstly, "the cost of agreeing on the complex of internally consistent bargains must be less than the cost of disagreeing", and secondly, "the total outflows of the firm must be matched by its inflows."

In this context, the whole idea of management as a powerful co-ordinator of multilateral bargaining, one has now to think afresh of the position of the taxgatherer, the labourer, the investor, all pressing upon management for an increasing share in the product of industry. They can all make the task of management difficult, if not impossible, but they cannot usurp its function as the head of the vast bargaining complex of industry.

In this participating process lies the real art and challenge of management : "The real fun in managing a business, it would seem, must lie in projecting one's own creative imagination into realms which none of the participating parties dream of... The managers to whom one tends to give the accolade are those who can accomplish their functions while still retaining to themselves some room for building into their work a private and purely personal expression, which is the mark of their uniqueness and vision.

This type of management has new attitudes. It regards the co-operation of *all* the personnel engaged in the business as of greater importance than the best of new machinery. Labour demands, in fact, become a spur to productivity, for additional costs must be offset through improved methods. If additional costs cannot be passed on to the consumer, they have to be met by greater efficiency through materials control, quality control, product simplification, etcetera. A postwar team of British trade union leaders, who visited the U.S.A. to investigate the rôle of American unions in increasing productivity reported that "the American trade unions' major contribution to increasing productivity, takes the form of spurring the less efficient companies to increase their efficiency."

New Awareness

People in India are yet far from these western attitudes and the understanding of their co-relation to productivity. During the last few years, however, significant developments have taken place whose far-reaching importance cannot be overrated. The National Productivity movement has got into stride and has in a few years succeeded in creating a new awareness in the country of the rôle of productivity in accelerating economic development. Simultaneously, almost synchronising with the period when the National Productivity Council was established and began to function, management development also came into recognition, as singly the most important contributing factor to efficient production and success in industry. The two movements have drawn from each other, and the productivity movement has learnt the fact that unless it embraces within the concept of productivity the supreme rôle of management, there would be little change of productivity spreading over the entire sector of industry. Similarly, management associations seeking to promote management development have come to recognise that without some understanding and knowledge of productivity techniques and methods improvement, it is not likely to get the success which it seeks. This convergence of the two leading movements has all been to the good, and there is a possibility that given the right direction to both the movements, success will be achieved.

One must, however, be clear as to this business of productivity, for productivity even today is not free from ambiguity. Increased production can take place by raising the input of various factors and thereby increasing output. That is precisely what India is seeking to do in the field of agricultural production: she is trying to increase the output of cultivable land through increased facilities for water, supply of ferti-

lisers, seeds and other things, and hopefully expect to get considerable expansion of agricultural production. In that context, it is a matter for serious concern that there has not been proportionate increase in output as a result of the enormous increase in input, as evidenced by the massive investments in agriculture, irrigation, community development, co-operation, rural banking and the like, since 1951.

The fact is that while increased production is certainly dependent upon increased input, there is one other crucial factor which determines output. That is "productivity" which means the fuller and more effective use of the various factors or inputs which go into production. It means, in other words, that besides the so-called physical and material factors of production, there is another factor—call it the human factor or the organisational factor or a factor which is a compound of many things including knowledge, research and so on—which enables the organisers or entrepreneurs to secure better and more valuable results as a result of effective utilisation. In this sense, productivity holds the key to increased output and thereby to increased surpluses for investment, exports and higher standard of living.

Rôle of Productivity

If this primary rôle of productivity is understood and its techniques are properly applied, the Indian economy is bound to show significant results. And it must be emphasised here that both knowledge of productivity and the application of productivity techniques to industry are obviously the responsibility of management. While labour must be appropriately motivated and rewarded, productivity is certainly not its primary responsibility. Labour can undoubtedly be educated to assist the management in the application of productivity techniques but by itself it cannot be expected to initiate the necessary changes required for efficiency.

In this context, if one examines the real causes of poor development, it is not so much the lack of material and physical resources, as a serious deficiency in the supply of the critical and strategic management resources. Modern development theory has proved that it is not investment in mere material resources that would bring about a rapid growth in the economy, as *a balanced investment equally in man.*

Fundamentally, there are only two factors explaining the rapid growth of a country's economy. They are its material and natural resources and the quality and quantity of human resources. The more a country desires to industrialise or even to develop its economy, the more rapidly it must invest in education and training. Even industrialised countries of the West have now acknowledged that they cannot maintain the desirable developmental goals unless there is greater investment in education, research and training. If this recognition has taken so long in the developed countries, it is not surprising that relatively poor countries like India have been slow to understand the significance of investment in the human factor, largely because India's total available resources are inadequate to meet the investments required in capital and materials and at the same time invest in education and research, but it is fortunate that slowly and gradually this popular awareness of the human factor is slowly dawning in India. It may be hoped that before long the efforts that are now being made to increase the supply, among other things, of managerial ability will be crowned with success.

Training Managers

There are many who believe and it has been the fashion not only in India but also in other countries to say that managers cannot be trained; managers are born and the only kind of training that they should be given is what may be called in-service training in the process of management. While this theory is good as far as it goes, it is very obviously inadequate for any country that has a programme of rapid economic development for which the number of managers required is far too many to be left to nature's accidents and the normal process of growth. In Italy, for example—taking physically a small country—an estimate made by a scientific organisation as to the number of managers required between 1960 and 1970 was of the order of 1½ million persons. The National Council of Applied Economic Research made a forecast of the demands on managerial power between 1960 and 1980. It estimated that the number required would be more than 500,000, but this estimate was challenged by several of the more knowledgeable persons belonging to industry and they thought that 700,000 might be nearer the mark.

Be that as it may, no country can leave it to accident the supply of such a large number of persons; obviously they cannot all be born; they have to be trained in any case. Secondly, the qualities required for management are again not such as can be left to development without some kind of training. It is true that whatever be the training, there will be difference between one manager and another on account of indefinable qualities. But it will increasingly be found that management education pays good dividends provided it is carefully prepared like every other kind of education.

In India, the concept and scope of management education and training are only recently being explored. It is, therefore, necessary to emphasise here certain basic elements in management education that must be regarded as common. These similarities flow from the very nature of the tasks pertaining to management.

Wrong Impression

There has been a feeling, especially in India, that there is something different in the elements of management of enterprises in the public sector and those belonging to the private sector. This is an entirely wrong impression. Similarities in management problems and characteristics are much more obvious and in fact deeper than any differences that may exist. The managers in private and public-sector enterprises have the same task. They have the same challenges; they have to work at the same levels—physical, economic and social. The private enterprise manager—equally with the public-sector enterprise manager—must be conversant with the various management techniques, work study, method study, quality control, operational research and things of that kind. They will equally be dealing with the problems at the finance level, requiring acquaintance with the principles of management accounting, financial control and so on. Thirdly, what is most important, they have to function within the same social framework and as such both types of managers must have some grasp of the social, political and other factors at work in the country and a broad affinity to its cultural and ethical values.

Even in relation to the Government, the differences between the two are really not so significant as the similarities. It is a great mistake to think that public-sector enterprises alone have the obligation to develop a sense of public accountability. While they are certainly accountable to Parliament, the private sector enterprises are equally accountable to what may be broadly described as the general public, and therefore to the Government as the custodian of public interest. The principles governing labour policy, price policy, profits policy, investment policy, etcetera, are to be governed broadly, both by the changing demands as a result of the changing incomes of the people but also as a result of the social and political values which prevail from time to time.

The usual distinction which is sought to be made between free-enterprise economies and public-enterprise economies is really no longer valid because in the so-called free enterprise economies, it is now fully recognised that the *Government plays a determining rôle in enunciating the rules of the game.* Even in the United States, the rôle of the Government has increased over the years to such an extent that except for the fact that the Government of the United States does not own and manage proportionately the same number of companies as the Government of India does, but for all practical purposes their rôle is as significant and potent as ours. The commitment of the Government of the United States to the growth of the economy, to full employment, to economic stability, to bring about a balanced development and in many other matters, is similar to India's commitments.

When the U.S. steel industry desired to increase its price, its action was checked by orders of the President. So today it is no longer right to think that the distinctions usually sought to be made between the two are really sharp and watertight. In the real world today, there is nothing that corresponds to an unplanned economy, that is, an economy in which the sovereign authority has not the final say in the broad pattern of development, in the priorities of investment and again the broad pattern of distribution.

Science of Management

Reverting to training, while the science of management is not fully developed and much of the training has, therefore, to be on a pragmatic basis, there is no doubt that a manager—if he is to succeed in his task—must not only have a perspective sense of the inter-relationships involved, but must be able to have a view of the changing situation in the next ten or 15 years because what he is to do in his own industry is very much conditioned by what would happen in the rest of the economy in the coming years. In other words, he should not only keep himself abreast with time and analyse the factors which affect his own individual case, but he must be able to have sufficient far-sightedness and intuition and judgment as to what is going to happen in the next ten or 15 years.

The enormous changes that have taken place in science and technology during the last ten years, thereby bringing about a new relationship between various industries and classes, should obviously create in the manager's mind the possibility that there would be changes of at least equal magnitude in the coming years. As a matter of fact, many of the items that are now common products in the 'sixties were unknown in the 'thirties. Most of the electronic products were not known 25 years ago and science is making such rapid strides that no industry stays put and the manager should always be prepared to understand the implications of these changes. These difficulties, however, only add to the necessity for trying to get all the facts as much as one can, analysing them and on that basis building up for the future.

In India, the sudden demand for managers both in the private and public-sector enterprises has created a real problem of increasing the supply in all possible ways. India has adopted all possible techniques with varying degrees of success. She has sent her young men abroad, especially employed in such industries as steel and has given them training in addition to the basic training they have had in engineering within the country. Her new industries have imported a large number of technicians and managers who have been in this country for some time and who have trained their Indian counterparts.

Training Programmes

India is pursuing several training programmes in the field of management—both through the National Productivity Council and through Management Associations. One of the most interesting experiments is the training by way of refresher courses for managers and executives, adopted in the Administrative Staff College (Hyderabad). It cannot be said that all these have been quite satisfactory, and partly because of the awareness of the limitations of the above and partly because of the knowledge that there should be permanent institutions for training within the country, the Government has now established Management Institutes, one in Calcutta and the other in Ahmedabad. The National Industrial Training Institute for Engineers has also been established in Powai, Bombay.

These are very important and welcome developments, but India's needs are so great that she may have to expand these facilities over the years. In addition, however, to increasing the number of such opportunities for training, she should pay closer attention to improvement in quality. Most of the *ad hoc* training programmes suffer from lack of depth. The participants are not always carefully chosen, and after they have been

given training, their training is hardly utilised by the factories or firms who have deputed them.

It is also astonishing to see how in India so few industries have really training programmes of any kind. Not only do they lack training programmes, but there are several industries which have not even understood the importance and value of training their various grades of managers. Even in the jute industry, which is one of the relatively old industries, it came to the present writer as a shock that several units have not had any arrangements for training their workers and they have left the training to be entirely on the job without giving them any formal help. In fact, the management was not even aware of modern techniques and the part they can play in increasing productivity. If Indian management is to be regarded as reasonably efficient, it should develop a greater sense of awareness of the imperative need of management education and management training, and this management education and management training are not a one-shot process. It has to be continuous and permanent.

Value of Experience

Not only should this training be given to various levels of management, but they should be constantly exposed to management programmes so that what may be regarded as a system of permanent education may be built up. Unfortunately, in India managers think, they know everything because they have experience. Experience is undoubtedly an important asset, but it should always be pitted against the new knowledge that is coming into the world from time to time. It should be the aim of a carefully prepared management education and training programme to ensure that every person has the benefit from time to time of pitting his knowledge and experience against the results of more recent research in technology and the social sciences.

The establishment of facilities for education, however, will not by itself be the answer to the challenges which modern society poses because the basic question is whether the opportunities are open to all and whether there is free entry to the doors of management. In India, this has been one of the greatest weaknesses. Most of the businesses managed under the managing agency system —whether they are run relatively efficiently or inefficiently—have not given free access to talent from outside. It is, in fact, the relatively successful and efficient firms who have restricted the choice to their own family or at best to their caste and it is true of even the best.

The family or caste type of management is not something unique in or special to India. Family managements have prevailed in various countries at various stages of their development. While other countries have changed their systems, in India today the family and caste systems act as a deterrent to the free flow of talent. There is, of course, no reason to think that talent is possessed by or confined to the family or caste members of the managing agency firm or of the top management.

Selection on Merit

In this matter, at least the public-sector enterprises offer better opportunities. Although political pressures and other influences are at work, the top managers of public-sector enterprises, by and large, are recruited not on account of their family or caste connections, but mainly on account of merit, in whatever way it is assessed. This cannot be said of the private-sector enterprises. India needs for both private and public-sector enterprises a better system of recruitment, a better system of training and fuller opportunities for development.

As for recruitment, the question has to be seriously considered by private industry whether it cannot organise itself to establish a recruitment procedure by which industry can—as in the case of the public sector—mobilise a pool of industrial managers on whom they can draw as and when vacancies arise. The principle of dynastic succession which is now increasingly subject to adverse criticism must go; and opportunities should be provided not only for free entry to all the deserving people but under a so-called socialist pattern of society it should be possible for a person to rise to the top by merit. There should be arrangements for evaluation of the work of persons from time to time so that nobody stays put in the job which he has entered in the beginning.

It is true that motivation in the private-sector enterprises is much stronger, but there is no reason why in public-sector enterprises, the necessary motivation cannot be supplied. This is a field where much more research has to be done, but there is no reason to think that the differences should persist; on the contrary, the fact that a person working in a public-sector enterprise has a feeling that he is not enriching his boss or is lining the pockets of a few already wealthy people, but is working for the community as a whole should be a more favourably motivating factor than in private business.

During the last few years, the writer himself has come across a number of instances where there is a great deal of dissatisfaction in the private sector, among the senior and almost top executives who have been denied access to the door of top management. They feel a great urge to come out and work in public and semi-public organisations. So even from the point of view of motivation, there is no reason to think of public-sector enterprises as inherently unsatisfactory in this matter. After a certain level of financial and technical competence is reached, the desire for social good does in most normal individuals become in itself a strong motivating factor. This has a potential in a mixed economy which can be exploited for the promotion of the public sector. The most important challenge to management comes really from the question whether management today is facing up to the tasks which India has set for herself, that is, to bring about a much more rapid development of the economy and to increase the levels of living of most of the population. This is a definite objective and every manager has got to accept the goal and to strive towards contributing to that goal.

The first question, therefore, that every management has to ask itself is whether it demands too high or too heavy a price for its own services. The managing agency system of remuneration, which has been the subject of regulation under the Companies Act of 1956, can still rightly be regarded as excessive. The fact is that against the background of extremely low levels of income for the overwhelming mass of the people and what is much more important, the near-impossibility of any significant increase in these low incomes in the near future, no decent man can accept the theory which asks for management a remuneration which, on an individual basis, works out to Rs. 2 to Rs. 3 lakhs a year.

Making allowance for all the elements of risk involved for which separate remuneration is actually paid, there is no justification for a scale of remuneration which could be more than, say, Rs. 10,000 per month. From this point of view, there is need for a further review of the scale of remuneration to be paid to managing agents. The fact that in its historical background managing agents performed several functions for which separate remuneration could be added up, is no justification for its continuance when the functions of management are really limited to management as such. There is no real element of risk when the price of the product which he is manufacturing is guaranteed and when the capital of the company is being increasingly added to by the finances provided by public-sector financing corporation and by the Government.

The justification which used to be advanced for excessive managing agency remuneration was that they were financiers of the companies, a claim which is no longer valid. The price that has got to be paid is, therefore, only the reward for management as such and here I think the standard of remuneration payable to an individual for all the services which he can render may be equated at the limit with that of the President of India and anything above that should be regarded as impermissible. It is in the interest of private business to establish some such ceiling, above all a code of morals according to which it should be considered somewhat sacrilegious to draw remuneration beyond the President's salary level.

Demand for Accountability

The most important challenge is, however, the demand for accountability to the people. There is an impression among a very large number of people, many of whom are fairly well-educated, well-informed and well-intentioned that there is something seriously wrong somewhere in private business. This feeling can be disregarded only at a grave peril to the whole economic system as at present organised. It can only be dispelled by a frank and honest acceptance of public accountability and, in fact, establishing in an organised way the standards and criteria of that accountability. The other alternative is the periodic facing of public enquiries, whenever something serious is revealed in any section of the private enterprise economy, by which the whole of it gets unnecessarily condemned.

Probably, it would be better to think out this question of public accountability of private concerns as an integral part of the socialist pattern of society. Private industry has to function—willingly and productively—within this framework of society upon which the sovereign Parliament has resolved. And one has to accept the rules of the game as framed by the Government of the day in pursuance of the basic policies decided upon by Parliament.

The question is whether managements of private enterprises are psychologically ready for an acceptance of these established policies and working them out in good faith for the common good, which includes for private entrepreneurs a reasonable measure of prosperity; reasonable in the context of the privations and sacrifices which the mass of the people have to undergo for quite some time.

The sooner private managements recognise that their activities have to be conducted within the accepted social and ethical framework and that they should adjust themselves to the requirements of the socialistic pattern of society, the better will be the prospects of a continuance of the mixed economy.

This does not mean that all that the Government does is right. There is increasing recognition even by the Government that its administrative procedures, controls and regulations need to be thoroughly overhauled, that there is too much of detailed control which retards progress. It is equally well recognised by the people in authority that the duty of the Government should be broadly to lay down the terms within which private industry should function without their subordinates trying to regulate every little detail. For example, whether foreign participation should be limited to 10 percent or 15 percent or 20 percent; whether preference shares should be issued at 9 percent or 9½ percent: these are not matters which should be decided by the Government. There are quite a number of such frustrating and irritating details of control which should be thrown overboard.

While appreciating all this, it should be equally recognised that private management should understand quite frankly that they are as much responsible to the public, as public-sector enterprises in terms of efficiency, profit making, and of allocating surpluses between various claimants, etcetera.

Furthermore, in a social democracy, one has necessarily to meet the challenge posed by the intense desire on the part of the workers not only to have better wages, higher wages but to have some choice in the determination of the rules of the game as it were. No management can now adopt the old dictatorial and one-sided attitude towards regulations that determine the working life of workers. While there may be argument as to the extent to which workers should participte in management as such, it should be the duty of management to ensure that it shares with the workers the responsibility for management, subject only to the capacity of workers which will gradually increase over a period of years, provided they are also trained adequately, which in

turn is the responsibility of management.

Wider Dispersion

In this context, one has to be conscious of the growing dissociation between ownership and management. It is indeed fortunate in one sense because in itself, it is an outcome of the increasingly wider dispersion of shareholding rights. While in a sense this may be regarded as reducing the motivation of owner-managers because they would not be interested very much in their dividends, such a development is most welcome from the social standpoint. Furthermore, the divergence of ownership and management will lead to what may be called a professional type of management by which management will be judged by the efficiency of its performance as management, rather than get messed up in a complex of personal loyalties. Their right to continue or to be re-elected from time to time should depend entirely upon their performance. India has had far too long what may be called the paternalistic or family system of managers. What is now needed is gradually to change this into a more professional type of management by which the management will be composed of persons who are specially qualified by virtue of their knowledge and competence as managers.

From this point of view, the change from the managing agency system of management to a board of management or to the managing director system of management is to be welcomed. There is undoubtedly place for a few status men or a few persons who can bring their long experience of business into the management, but their number has necessarily to be small. The management should broadly consist of persons who are actually engaged in the business. In the U.S.A., management is more or less in the hands of those who actually run the business. India also should gradually seek to evolve that type of management. In public-sector enterprises, it is really unfortunate that civil servants dominate in management.

Too many civil servants are being still employed in top positions and their methods of personnel selection leave such to be desired. It has to be recognised that industrial management is a professional job requiring special experience and expertise and that work in any industry like steel and heavy engineering or oil should be generally regarded as a life career. In this context, one notices with regret the number of changes in top management positions in public industrial enterprises which has been a source of great inefficiency.

Rapid Economic Growth

Finally, to conclude, whether India can look forward to a period of rapid growth of her economy and whether she will succeed in raising the levels of living depends upon a number of factors some of which are not predictable. But as far as industry is concerned, things will depend very much upon whether Indian management can quickly adjust itself to the challenges posed by the changing situation and by a number of social and economic as well as political forces. To the extent to which management in India can meet these challenges, to that extent alone can India go forward. The shift away from the managing agency system of management is a reflection of its inadequacy to meet these challenges, but whether other forms of organisation and management will better face these challenges time alone can say.

One thing, however, appears certain; and that is a matter of attitude and philosophy. Private business has flourished in India during the last 20 years of war and inflation against a moral background, which has fostered certain very illusory ideas about the rights and privileges of private money. These really nowhere obtain; and even historically *laissez faire* capitalism had its offset in Protestant ethics, which has been an integral part of western capitalism.

In fact, the most significant lesson of American capitalism is not its *hire and fire*, but the leadership and inspiration of men like Henry Ford, Edison and the like. The philosophy for which these pioneers of American capitalism stood is shockingly illustrated from a public statement (made not from a platform but in a court of law) by Henry Ford that *the profits he was making were awful profits:*

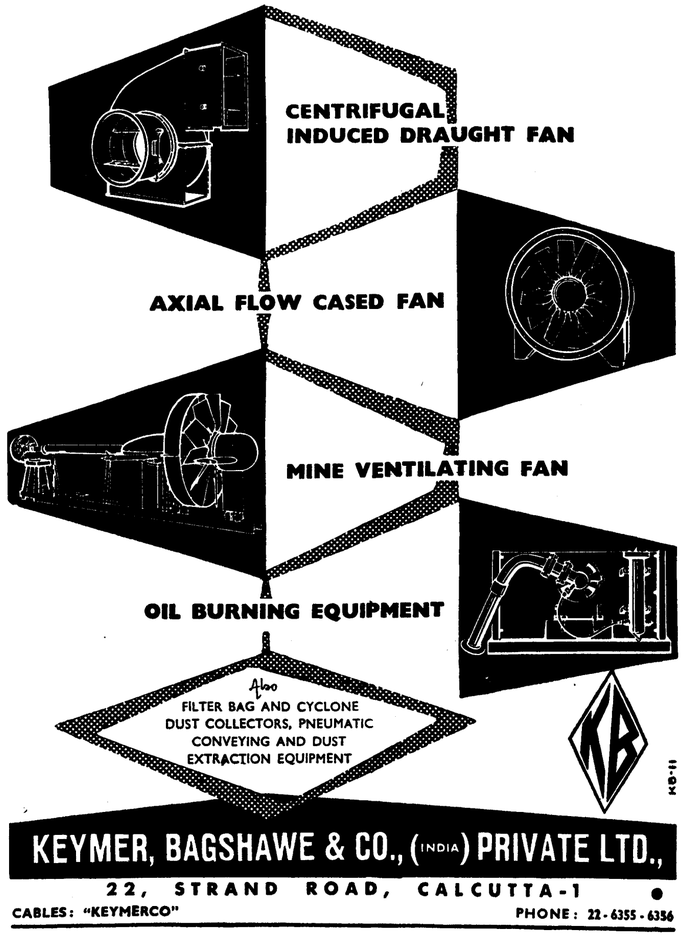
STEVENSON (Judge): "Now I will ask you again, do you still think that those profits were awful profits?"

FORD: "Well, I guess, I do, yes."

STEVENSON: "And for that reason you were not satisfied to continue making such awful profits?"

FORD: "We don't seem to be able to keep the profits down."

STEVENSON: "Are you trying to keep them down? What is the Ford Motor Company organised for except profits, will you tell me, Mr. Ford?'



FORD: *"Organised to do as much good as we can,* everywhere, *for* everybody concerned. To do as much as possible for everybody concerned. To make money and use it, give employment and send out the car where people can use it. And *incidentally to make money."*

STEVENSON: "Incidentally make money?"

FORD: "Yes sir."

STEVENSON: "But your controlling feature is to employ a great army of men at high wages, to reduce the selling price of your car, so that a lot of people can buy it at a cheap price and give everybody a car that wants one."

FORD: "If you give all that, then money will fall into your hands. You can't get out of it."

Ending the Stagnation in Cotton Production: Some Experiments to Produce Superior Grades

THE statistical trends of cotton development in India in the past 25 years reveal a tale of ups and downs, of success and failure, which provides useful lessons in planning for agricultural crops. Undivided India was surplus in cotton except for long staples, and during the second World War, cotton production was actually discouraged; but the partition of the country soon after the War and virtual stoppage of supplies from Pakistan by 1949 resulted in a great shortage of supplies for the consuming mills were largely

By

M. S. SIVARAMAN, I.C.S.

Adviser, Programme Administration, Planning Commission, New Delhi

situated in the Indian Union while a major part of the irrigated cotton area was transferred to Pakistan. Local production of cotton was thereupon actively encouraged both in quantity and quality, and there was a spurt in the production of long staple cotton; but a stage of relative stagnation in the total area and output was soon reached in 1956 at the beginning of the second plan and since then, very small progress has been made.

The Planning Commission originally fixed a target of 5.5 million bales for the second plan with a view to meeting the expanding requirements of the textile industry. Later this was considered to be inadequate and the target was raised to 5.86 million bales at a conference of State Ministers of Agriculture. The Indian Central Cotton Committee, Bombay, however, suggested a more ambitious target of 6.5 million bales, and this was accepted by the Planning Commission after consulting the States. The actual production at the end of the second plan was 5.39 million bales.

The target for the third plan has been fixed at 7.07 million bales in accordance with a development programme summarised below:

Table I

THIRD PLAN DEVELOPMENT PROGRAMME FOR THE TEXTILE INDUSTRY

	Unit	1960	1965
Rated capacity of mill industry (end of period)	Unit	1960	1965
Active spindles	million	12.7	16.5
Looms	'000		225
Production			
(i) Yarn	million lbs	1,737	2,250
(ii) Mill cloth	million yards	5,048	5,800
(iii) Handloom, powerloom, *ambar* and *khadi* cloth	million yards	2,269	3.500
Cloth exports	million yards	695	850
Per capita consumption ...	yards	15.6	17.4
Raw cotton requirements of mills	million bales	5.1	6.6
Export of raw cotton and extra mill consumption	million bales		0.465

Shortfall in Production

The actual production of cotton in 1962-63 was 5.312 million bales which is 1.75 million bales short of the target for the third plan and 1.2 million bales below even the second plan target.

Before the War, the undivided country produced from 5.8 million bales to 6.2 million bales of cotton, nearly double the requirements of the cotton mills in those days. A large part of Indian cotton was exported to other countries, particularly Japan, but with the entry of Japan into the War and precipitate dwindling of the market for short-staples, cotton became a drag upon local markets. At the same time, the food situation deteriorated when outside supplies of rice stopped. Various steps were, therefore, taken to limit the area and production of cotton.

The pre-war area under cotton in the undivided country ranged from 24 million to 25 million acres, and this included about 3 million to 4 million acres in the area now comprised in Pakistan. As a result of restrictions placed on the growing of cotton, the reported area came down to 14.86 million acres in 1946-47 and production to 4.2 million bales. Of this, the cotton area in the Indian Union was 1.07 million acres and production was 2.6 million bales, including 850,000 bales of short staple cotton.

Mill Consumption before Partition

In the year before the partition, the mills within the Indian Union consumed 3.86 million bales—1.64 million bales of quality cotton of staple 11/16 in. and above produced within the country, 540,000 bales of short staple cotton of below 11/16 in., 980,000 bales of cotton from Pakistan and 700,000 bales of cotton from outside India. Thus, domestic supplies in 1946-47 amounted to 2.18 million bales or about 60 percent of the mill requirements at that time. Several measures were adopted to meet the gap in the supplies, special incentives were provided and all restrictions on the cultivation of cotton were removed. The basic ceiling prices on all varieties of cotton were also increased by Rs. 150 a candy of 784 lbs. The area, staplewise production of cotton in the Indian Union, consumption of cotton in the mills and export of cotton since 1947-48 are shown in Table II on this page.

Broadly speaking, the production of domestic cotton over a number of years should be fully accounted for by the consumption of such cotton in the mills, the exports of raw cotton and the extra mill consumption of about 250,000 to 300,000 bales a year, of short staples. It will be noticed that while the reported official estimates of production fall considerably short of the utilisation, the trade estimates approximate more closely to actuals.

The excess of consumption over official estimates of production is particularly noticeable in the medium staples and ranges from 600,000 to 700,000 bales a year from 1947 to 1956: but this difference gets reduced to 250,000 bales in the second plan period and practically disappears in the last year of the second plan. The year after partition started with a carryover of 3.8 million bales—780,000 bales of long staple cotton; 2.1 million bales of medium staple and 920,000 bales of short staple cotton.

The carryover stock with the trade and the mills in 1961 was 1.737 million bales of which short staples accounted for 61,000 bales. Even after allowing for the carryover stocks, it is obvious that the officially reported figures of production were underestimates of varying degrees. It is possible that a larger area was actually under cotton than was reported in the late 'forties or early 'fifties by about 3 million to 4 million acres. The estimates of production then in vogue were clearly defective, but since 1955-56 estimation of yield by the random crop-cutting method

has been adopted in some of the major cotton growing areas. In 1962-63, this has been extended to cover 69 percent of the cotton area and it is likely to be extended to nearly all areas next year when there will be closer correlation between the official figures of production and consumption.

The output of cotton in the base year of planning (1949-50) has been taken at 2.628 million bales, but considering the persistent and large excess of mill consumption of medium staple cotton over the reported figure of production—it was 380,000 bales in that year—it will be more correct to take the base production at a higher figure for purposes of projections of production trends in the plan periods. The trade estimate of 2.97 million bales in 1949-50 was possibly nearer the mark.

There can be no doubt that commendable results have been achieved in the textile industry and in cotton development in the last 15 years. The number of spindles in the Indian cotton mills has increased from 10.35 million in 1947 to 11.24 million in 1951, 12.38 million in 1956 and 13.98 million in 1961. There has been a striking increase in the production of long staple cotton and the annual consumption of Indian long staple cotton has gone up from 526,000 bales from 1947 to 1951 to 1.249 million bales in the first plan and 2.06 million bales in the second plan period. At the same time, the annual imports of foreign cotton has been reduced from 1.19 million bales between 1947 and 1951 to 778,000 bales in the first plan period and 680,000 bales in the second plan. The irrigated area under cotton has increased from 990,000 acres in 1949-50 to 1.81 million acres in 1955-56 and 2.43 million acres in 1960-61.

Rise in Yield

There has been an increase in the average acre yield of cotton from 82 lbs of lint an acre in the first plan to 93 lbs in the second plan. The yield in the base year (1949-50) was 85 lbs an acre; but if the production in the base year was an underestimate by about 12½ percent, the acre yield should have been about 95 lbs assuming that the area was correctly reported. It is likely that there was an underestimate of the area also, and, therefore, no special significance can be attached to the reported figures of acre yields in the earlier years. Possibly there has been a small increase in the yield an acre due to an increase in the area under irrigation: but it is also possible that this increase has been offset by other factors. All these considerations are no doubt speculative, but emphasise the need to ascertain clearer particulars of the average acre yields of cotton obtained by the actual cultivators under dryland and irrigated conditions for the major cotton tracts as a necessary aid in realistic planning.

The increase in the output of long staple cottons has been achieved (i) by replacement of some of the short and medium staple varieties, (ii) substitution of the susceptible by disease-resistant types, and (iii) extension of the area grown under irrigation. Some of the more significant varietal changes which have helped to improve cotton production in general are given in Table III.

† Irrigated. *† Partially irrigated. ** Partially resistant to wilt. *** Wilt resistant.

Although the results have been satisfactory so far, a word of caution is necessary about introducing high yielding or disease-resistant varieties under rainfed conditions without taking adequate measures to maintain optimum levels of moisture and plant nutrients in the soil. The higher genetic potential of the improved strains requires sufficient reserve of plant nutrients in the soil for full exploitation and if this is not available, there will be rapid depletion of soil fertility and the yield will go down.

A little over half the irrigated area under cotton is now in Punjab where the extension of irrigation in general has resulted in a steady annual rise in the ground water table ranging from 0.27 feet under the Western Jamuna Canal to 1.13 feet under the Bist Doab Canal. In the first three years of the first plan, the water table was within 5 feet of the surface in about 800,000 acres: but in recent years, the rise has been more rapid and it is now estimated that about 3.2 million acres are in this condition. There has also been a rise in salinity in the cultivated areas as a result of spread of irrigation without adequate surface or sub-surface drainage.

Water logging and increase in salinity have adversely affected the cultivation of long staple cotton in the State: both the area and production of American cotton have declined steadily and at the same time, there is a progressive increase under the Bengal Deshi. The short staple deshi cotton is able to withstand water logging to a large extent and is relatively immune to pests and diseases. The cultivators in the problem areas, therefore, get a better return by growing the deshi cotton. A larger price margin to make the cultivation of the long staple cotton worth while can be no solution to this problem when the basic cause is a rise in the water table.

The following particulars indicate the trend in the area and production of cotton in Punjab since 1956:

Table IV

STATEMENT SHOWING AREA UNDER BENGAL DESHI AND AMERICAN COTTON IN THE PUNJAB

Variety	Condition	1956-57	1957-58	1958-59	1959-60	1960-61

	Total	791	566	690	555	

*Note: In general, the trade estimates are higher than the official estimates: but the position is different in the Punjab.

Improving Surface Drainage

A great deal of attention has been paid in the last two years to improve surface drainage in the cultivated regions of the Punjab to relieve water logging. No doubt such measures will help to drain surface accumulations of rain water and prevent further deterioration, but cannot reduce the level of the water table that is already high. The surface drains will draw off soil moisture from only a few feet away: for the top crust extending down to about 10 feet in a large part of the irrigated area in the Punjab consists of fairly heavy soils which contain an excess of soluble sodium salts and such soils will not easily part with water. A practical approach will be to dewater the topmost aquefer which is 10 feet to 12 feet below the surface and this cannot be a difficult problem as the surface topography would allow of draining of the aquefer even with the aid of the surface drains if the ground water is tapped from the aquefers with the help of shallow wells from which the water can rise naturally and flow into the drains.

The declining trend of production of American cottons in the Punjab and the possibility in the near future of a decline in the output of the high yielding cottons raised elsewhere under rainfed conditions are matters of great concern. Added to this, there is a disquieting decline in the total area under cotton in the country from about 20 million acres in 1957-58 to 18.7 million acres in 1961-62: but more cotton has to be produced if the targets of increase in the *per capita* consumption of cloth are to be reached. How then are the production targets for cotton in the third plan are to be fulfilled and still larger requirements in the future

plans to be met? It seems to be necessary to review some of the approaches adopted so far so that one can look to the future with confident optimism.

The Package Approach to Production

For some time past, great expectations have been held out on the package approaches to cotton production in irrigated areas and in areas of "assured rainfall". The main components of this approach are the use of improved seeds, fertilisers and pesticides. About 2.4 million acres or one-eighth of the cotton area receives the benefit of irrigation and it is made out that over 11 million acres under cotton in the whole of Gujarat, Maharashtra and Malwa receive assured rainfall and, therefore, fertilisers could be applied without risk. The normal distribution of rainfall in Gujarat, Maharashtra, Vidarbha and West Madhya Pradesh is shown below:

In 1957, the rainfall in Gujarat in September was only 16.3 millimetres against a normal of 142.5 millimetres and the rainfall in October was 7.4 millimetres, against 25.4 millimetres. The September rains are of crucial importance in maintaining the moisture level in the fields during the peak flowering stage and the subsequent stage of boll formation. If a cultivator in Gujarat had applied nitrogenous fertilisers to his cotton crop in July or August 1957 (the rainfall in 1957 was adequate—July rainfall 288 millimetres, against normal of 353.6 millimetres, August rainfall 180.9 millimetres, against 219.7 millimetres) there should have been abundant vegetative growth and the larger leaf surface would have led to more transpiration of moisture by the plants. In September when the rainfall was far below normal, more drought would have been induced in the soil and the cotton plants would have suffered more severely than in the fields where no fertilisers had been applied.

Table V

Normal Monthly Rainfall

Millimetres

Sub-division or division	Jan.	Feb.	March	April	May	June	July
West Madhya Pradesh	9.4	7.4	6.9	4.8	9.9	136.1	331.5

Vidarbha	246.6	177.5	51.8	19.1	8.1	1,068.6

The early and the closing stages of the monsoon are critical for agriculture in general and cotton in particular. Both these can be very erratic; it will, therefore, be a misnomer to call an area which normally receives good rainfall as having "assured rainfall." In fact, there is no tract in India where the rainfall is assured. If heavy annual rainfall is to be equated to assured rainfall there should be no justification for projects like the Kosi or the Gandhak in a tract of 50in. rainfall. The clamour for other types of irrigation works including wells and tubewells in Bihar and east Uttar Pradesh is also a pointer. It will not be agronomically correct to recommend the use of fertilisers under uncertain conditions of moisture in the field. Even in America where there is a fair amount of rain every month in most of the States, the farmers were not eager to use fertilisers under rainfed conditions until the moisture level in the fields was improved on a big scale in the late 'thirties of this century by soil conservation measures.

In general, irrigated cotton is adequately manured in the southern States. In many parts of Coimbatore district cotton is cultivated as a garden crop and experiments done in the Cotton Breeding Station in Coimbatore have shown that the garden lands, rendered rich by frequent application of fairly heavy dose of farmyard manure, were not benefited by the application of ammonium sulphate. In the Punjab, farmyard manure is applied to sugarcane, maize, fodder and garden crops and the cotton which follows benefits from the residual effects of the manures applied to the other crops. No doubt there is scope for obtaining higher yields by the use of fertilisers in the areas where irrigation will be extended under some of the major projects like the Nagarjunasagar or Rajasthan Canal in the fourth or fifth plan, but there is no ground to expect any large additional production from the existing irrigated areas in the third plan period. Improved seeds are commonly used and the possibility of increase of production by this method is very limited. Some attention is paid to eradication of pests on irrigated cotton and on the whole, a package of sound agronomic practices is already observed for cotton raised under irrigation. It is, therefore, doubtful whether there can be any substantial improvement in production by the adoption of the package programme as conceived so far. But if the package also contains extension of sound principles of agronomy applicable to dry land conditions there can be a considerable increase in the cotton yield within three or four years, for at present, cotton raised under rainfed conditions is not manured and in large tracts, the crop suffers from excess or deficiency of moisture in different periods of its growth.

A correct agronomic approach will be a programme which will also improve the level of plant nutrients particularly nitrogen on dry lands and ensure better tilth and water-holding capacity in the soil so that excess moisture is rapidly drained in the heavy rains and more moisture is made available to the plants in the drier periods. The great importance of organic composts which will ensure all these necessary conditions cannot, therefore, be exaggerated. In the heavy clay soils where cotton is often grown, the use of adequate organic matter is necessary to maintain optimum sub-soil drainage even under rainfed conditions. In the lighter soils it makes moisture available to the plants for a longer time.

Organic Manure Supply

The beneficial effects of the application of organic matter to the soil are well known to the cultivator, but as sufficient organic manure is not available, the cultivators prefer to use whatever local manure can be secured, on the food crops like millets and some of the cash crops of which the yield is more certain. Cattle dung is largely burnt for want of fuel and no serious attempt has been made to produce the plant wastes in sufficient quantity for composting. As a result of experiments initiated by the writer in the composite Madras State from 1947 to 1951, it has been definitely established that the required plant wastes can be produced from the existing cultivated area by planting perennial shrubs on the borders of dry fields. If these shrubs are frequently lopped, the spread of roots into the field can be greatly reduced, and on the whole, it has been found that the crops are not adversely affected by the border plantings.

In the Koilpatti Agricultural Research Station where cotton is grown on about 100 acres, perennial shrubs of *Ipomea carnea* and *Glyricidia* were planted in 1951 around each five-acre block and along the sides of the roads. A headload of *Ipomea* cuttings was developed in one season for planting ten miles of hedges in this farm. From the third year these shrubs provided every year about four tons of organic matter an acre by way of loppings which were composted in pits dug in the fields. Two small pits of 10 feet × 5 feet × 3 feet will be sufficient to produce all the manure required for an acre. *Ipomea carnea* is found all over India and it can be multiplied very rapidly: it is highly drought-resistant and it withstands water logged conditions. Above all it is not ordinarily eaten by goats or cattle. A mass planting of *Ipomea* and other suitable shrubs can be completed around all dry lands within one or two seasons if the *panchayat* organisations are made to take a live interest.

Application of Fertilisers

According to the monograph on cotton in India published by the Indian Central Cotton Committee in 1960, "under rainfed conditions the application of ammonium sulphate to cotton is risky. In the absence of rain at the proper time, the fertiliser has been found to be actually harmful to the cotton crop. The slow acting farmyard manure has been found more useful for rainfed cotton. Besides providing plant food it improves tilth, mechanical condition and water-holding capacity of the soil." Though farmyard manure is now available in limited quantity, a way has been found by which rural composts of equal manurial value can be produced on a mass scale from perennial plantings on the sides of fields without affecting the crops and what is lacking is the implementation of this simple programme which has got tremendous potentialities of transforming the agricultural conditions on rainfed lands. Unless organic manure is produced in this manner and used in the fields there is no other way of improving the soil fertility or maintaining optimum moisture, under all conditions of unirrigated cultivation in tropical countries.

Alongside with this, other soil and moisture conservation practices like checking the run-off and impounding rain water will have to be adopted in the areas of low rainfall. The improvement of the manurial level on cotton fields under rainfed conditions has become all the more pressing in view of the large-scale use of high yielding and disease-resistant varieties of cotton. A successful programme of this type will have other far reaching consequences, for cotton is grown very largely in rotation with crops like millets, oilseeds and pulses.

The area under millets is about 100 million acres, oilseeds 34 million acres and *kharif* pulses about 35 million acres. Millets are not important in the cereal consumption of urban areas like rice or wheat and the overall improvement of agronomic conditions designed for cotton is bound to improve the acre yields of millets: as more millets are not likely to be produced than are necessary for local consumption there will be reduction of the area under millets and diversion of the area to other crops like cotton and oilseeds. In the recent past, more than any other factor the area under cotton was the decisive element which determined the output: if the country needs more cotton, the area under cotton will have to be increased and this can be done: for any improvement in the yield of millets by 25 percent to 50 percent will help to divert 25 million to 50 million acres for other crops. The improvement of the conditions in dry lands for increasing millet production will be of special importance when hybrid seeds are developed, for the hybrid millets cannot result in any spectacular increase in the yield unless attention is paid to soil fertility and moisture—the twin limiting factors in dry land cultivation.

Apart from this, there is great scope for extension of cotton cultivation on the paddy fields during the summer months when there is no cultivation in large areas of the deltas of the southern States. A practical approach to this was demonstrated by work done at the writer's instance at the Aduthurai Agricultural Research Station in Tanjore district from 1947 to 1952, when it was shown that a variety of cotton like the Punjab 216F could be successfully grown in the Tanjore delta from January to June provided water is available for irrigation and the possibility of successfully tapping ground water for irrigation was also demonstrated for the first time in the history of this delta by large-scale installation of filter point tubewells which cost about Rs. 250 each.

These tubewells tap water from the first super-saturated aquefer of coarse sand at a depth of 30 feet to 40 feet, but the water rises in the tubewells to within 10 feet of the surface and can be continuously pumped by 5 to 10 horse-power engines. In the Aduthurai farm, the discharge from these tubewells ranged from 12,000 to 20,000 gallons an hour, but no great advance has been made in this direction in view of the uncertainties about division of produce of cash crops between the landlord and tenant and the reluctance of the landowners to invest capital for installing pumpsets costing about Rs. 2,000 in the prevailing conditions.

Superior Long Staples

While great expansion has taken place in the production of long staple cotton sufficient attention has not been paid to the development of superior long staples which are obtained from outside India. In Madras, programmes were initiated in 1947-48 to improve upon the staples of the Uganda-Cambodian types and one of the results of this was the evolution of the summer Uganda MU, (staple 1-3/32 in.) and more recently the winter Uganda MU, (staple 1 1/32 in.). Although the departmental officers were not at first enthusiastic, this writer insisted upon the cultivation of the Sea Island cottons, the Montserrat and St. Vincent varieties in the Agricultural Research Stations in Malabar and South Canara in 1947 following the successful backyard cultivation of these varieties by the late Mr. Subba Rao, a pleader of Udipi.

Mr. Subba Rao was a great enthusiast and he succeeded while several attempts made previously during the East India Company days and later on by the Departments of Agriculture to grow the Sea Island types were failures. A scheme was placed before the Indian Central Cotton Committee in 1948 to study the economics of cultivation of Sea Island cotton. By 1952-53 the mill tests by the Matunga Technological Laboratory and Bombay Dyeing indicated that the Montserrat and St. Vincent varieties with staple length of 1 1/8 in. to 1 3/8 in. were not so useful for Indian mills and that the mills would prefer a cotton of a lower staple of 1 1/4 in. Thereupon, the writer decided on the introduction of the "Andrews" from the varietal collections of Sea Island types as this had desired staple length and it was found that this cotton was more resistant to diseases and the yields were higher.

A scheme was submitted to the Indian Central Cotton Committee in 1955 to take up large-scale cultivation of "Andrews" and it was finally approved in spite of some initial opposition from cotton breeders and others at that time. But so far, no great progress in the large-scale cultivation of the Sea Island types has been made. Proper extension techniques have to be followed when a crop is introduced in entirely new surroundings. All over India there are enthusiastic cultivators who will venture in a small way with new things and if their co-operation is enlisted, there is bound to be a great spurt in the development of "Andrews" in suitable areas.

Given a basically sound approach and lead, there can be no doubt at all that the production of cotton can be greatly increased both in quantity and quality without in any way encroaching upon the output of other crops. The import of the superior long staple cottons can be curtailed if not eliminated in a few years' time, and above all, the present stagnation of cotton production need not continue if the necessary effort is seriously made in all cotton-growing tracts along lines consistent with tropical agronomy. No financial investment is involved and an assured cotton crop is a better stimulus to cultivators than price incentives. At present, cotton production is one of the soft spots of Indian agriculture, highly vulnerable and dependent upon the time of incidence, distribution and duration of the monsoon rains. Even when irrigation is extended in the country, very large cotton areas will continue to be rainfed and the limiting factors of production under dry land conditions will have to be surmounted through practical approaches if cotton and more cotton is to be produced.

Accelerating the Economic Growth of South-East Asian Countries

Professor Vakil analyses the main economic trends in the newly independent countries of South-East Asia, and suggests ways to accelerate their growth.

By

C. N. VAKIL

THE International Institute of Differing Civilisations, which has its headquarters in Brussels, is a non-official organisation devoted to the study of problems of different countries, particularly developing countries. Among other things, it convenes international conferences each year to discuss specific problems relating to such countries. The thirty-third conference of the organisation was held in Palermo, Sicily, from 23rd to 27th September, 1963. It was a large gathering; experts on different subjects from different countries were invited to discuss the problems of emergent countries. The problems were grouped under four headings: (a) legal; (b) constitutional; (c) economic and (d) social. Papers were invited on each of the countries concerned, that is, the newly independent countries of south-east Asia and Africa. These served as background papers. Special reports were invited from four *General Rapporteurs*, each dealing with one of the main aspects referred to above.[1] The plenary session was divided into two commissions, one dealing with legal and constitutional aspects and the other dealing with economic and social aspects. The reports of the *General Rapporteurs* were the basis of discussion. The conclusions of the commissions on each aspect formed the report, which was later approved by the plenary session with some modifications in some cases. Three languages were used in the proceedings—English, French and Italian—with facilities for simultaneous translation.

Economic Trends

The object of this article is to give an idea of the conclusions of the conference on the economic trends in the newly independent countries of south-east Asia.[2] This is based on the report of the *General Rapporteur* on Economic Aspects and the discussions at the conference on the same. The method adopted is to state in brief some of the leading economic trends (printed in italics in this article) supported by a brief explanatory note in each case. It is hoped that in this manner it would be possible to focus attention on the leading points. There are certain obvious limitations in any effort at generalisation for large areas such as those involved in the present effort. It is hoped, however, that subject to this, it will draw attention to certain broad tendencies and stimulate interest in a subject which deserves to be studied in greater detail.

I. The emergent countries of south-east Asia have economic communities where for many centuries income has remained on the subsistence level. For the study of economic growth, several important varieties are found among them. Most of these countries raised their levels of total output during the last decade, although the rise was not the same for all. This was spread over larger populations. It was not possible, therefore, to meet the challenge of extremely low levels of living.

GROWTH RATES OF REAL OUTPUT AND TRANSPORTATION, 1950-59[3]
(Percent a year)

Country	Real national product	Agriculture	Mining	Manufacturing	Rail freight (tons-kms.)	Number of commercial motor-vehicles
Burma	5.1	1.6	—	—	16.7	6.1
Federation of Malaya and Singapore	—	1.1	—	—	3.8	6.5
India	3.1	3.5	4.7	6.1	6.8	7.6
Indonesia	3.6	2.3	8.3	—	3.0	6.8
South Korea	5.0	1.8	26.0	15.1	0.4	11.5
Pakistan	2.6	1.2	8.8	19.7	5.9	5.3
Philippines	6.0	3.3	9.0	11.1	0.6	2.2
Thailand	5.0	3.2	—	—	9.1	13.6

[3] Source: *Economic Survey of Asia and the Far East 1961*, E.C.A.F.E.

The large variety of economic conditions which prevail in these countries is well known. The uneven growth in different countries is seen from the table above which compares the growth rates of real output in the principal sectors.

Growth of Population

II. The latest censuses of population show that the annual average rate of population growth for the region is nearer to 2.5 percent, against 2 percent which was assumed before. This fact affects all calculations of economic requirements for an improvement in the levels of living. Without going into details, it is easy to see that the higher output had to be distributed among rapidly increasing numbers. The impact of growth could not, therefore, be felt by the people, whose levels of living remained low.

In most of these countries, the existing populations are large in relation to land and other resources. This condition is aggravated by uneven distribution of the population. One finds dense concentrations in cities and also in old agricultural areas. The rates of growth of population in some countries are tending to be as high as 3.5 percent a year. In consequence, problems of unemployment and under-employment have become pressing. Furthermore, with the spread of education, consciousness has grown about the inequality in the distribution of incomes, and the wide gaps between the few rich and the masses of the poor. The only way to solve the problem of inequality as well as that of poverty is to work for a rapid rate of economic growth.

There is scope, however, for improvement in social as well as material requirements for growth, so that the consciousness and desire for economic advancement may grow in some countries. Their institutional structure lacks flexibility. Education and the development of human resources are not given due attention. Besides the low level of technical skills, one finds that social attitudes are not consistent with the attainment of economic goals. The demands on the work of the administrative machinery go on increasing. In some countries, the acceptance of socialistic goals leads to greater demands on Government machinery for development, with the result that human resources outside the Government do not function properly.

III. Several causes led to this unsatisfactory performance. The low income of these countries presents the greatest difficulty. This leads to a low level of investment. Besides, even this low level of investment has not been used in such a manner as to obtain maximum benefits.

The distribution of public investment in some of the countries is given below:

DISTRIBUTION OF PUBLIC INVESTMENT 1950-1959[4]
(Percent of total investment)

Country	Transport and communications	Construction	Agriculture	Industry	Energy	Health and education	Others
Burma	30	16	15	16	15	5	3
Ceylon	22	13	35	3	8	11	8
Mainland China	15	3	9	.....51.....		6	16
India	32	—	29	13	8	16	2
Philippines	40	3	22	8	—	15	14
Thailand	43	9	19	4	8	12	5

[4] Source: *Economic Survey for Asia and the Far East, 1960*, E.C.A.F.E.

It is not possible to have an accurate idea of the priorities and performance of investment from this table. Although attention has been given mainly to economic and social overheads, there is evidence, however, of unused capacity; this results not only from the low level of economic activity but also from the lack of a fully developed network. Besides, there are cases of over-generous provision for transport, communications and power (77 percent of public investment) in an economy which has not yet reached the prewar level of production in agriculture, and which needs more attention to direct production.

Capital-output Ratios

It has been argued on the basis of the limited definition of "capital" that capital-output ratios (varying between 1 and 2) are more favourable in agriculture than in industry (where they range upwards from 3), so countries should direct their fixed investment to agriculture in order to accelerate growth rates. This recommendation goes beyond the inferences that can properly be drawn from present empirical work on capital-output ratios. "Capital projects, such as bringing new lands into cultivation by resettlement or by extending irrigation, for example, the Gal Oya project in Ceylon, have proved unduly expensive (even reckoning in terms of social rather than financial costs) in relation to results obtained. Current outlays on such inputs as fertilisers have, on the other hand, where technical conditions permitted, yielded significant results within a short time at negligible cost. It has been generally recognised that the resource allocation problem, that of ascertaining the productivity of inputs of all scarce, tangible and intangible, resources—not only just 'investment'—is crucially important to E.C.A.F.E. countries. But much more research is required before any judgment can be made about productivity and gestation periods for inputs in different projects within a given industry sector, or for that matter, for different industry sectors in a national programme of resource allocation".

IV. Instances of mis-allocations of investment can be found in several directions. One notices too much in-

vestment in infrastructure on the one hand or too little in direct production on the other. Even in such fields as agriculture or industry, preference has been given to capital-intensive projects. This has resulted in the neglect of high-yielding projects which would have been more economical in relation to capital and foreign exchange. A serious deficiency in agricultural progress is also a cause for arresting the growth of the rest of the economy.

Most of these countries have agriculture as the principal industry. Economic development, based on agricultural prosperity, would be the natural evolution for them. Lopsided development involving greater investment in heavy industry before a country is ready with the prerequisites of such industry may raise new problems. Among these, the chief is that of foreign exchange resources. If agriculture is not developed in the meanwhile, it may be necessary to import food, as the growing population may not find adequate supplies from local production. This will aggravate the foreign exchange shortage.

V. The traditional concepts of investment have also proved inadequate. Besides capital formation in durable assets, development expenditure will also be required for current outlays to promote growth. In some countries, there has been an overemphasis on the infrastructure and heavy industry, which has led to the relative neglect of agriculture or export promotion in both of which current inputs are usually more important than capital inputs.

In some countries, this has led to an effort to import both capital goods and food with the help of foreign aid. At the same time export promotion has not been given due importance. For emergent countries trying to accelerate economic development, export promotion must be planned in order to obtain the much-needed foreign exchange. Even if foreign aid is received in an adequate quantity, the problem of repaying capital and interest has to be faced. Besides, the demand for foreign supplies increases with greater industrialisation and the growth of income, and this also requires more foreign exchange. This has brought home to some countries the need for planning in the light of their actual situation, so that unnecessary strain on the economy may be avoided. The tendency to imitate the growth models of some other countries without realising their applicability to one's own case, may lead to serious difficulties.

Institutional Factors

VI. There has also been neglect of institutional factors. For example, the economic growth in some countries has been hampered by the failure to achieve full co-ordination between the public and private sectors.

The planning effort has for obvious reasons been the responsibility of Governments. They have naturally thought of undertaking State enterprises for the development of certain schemes, such as river valley projects or steel plants. There has also been a desire to nationalise existing industries or some of the new ones, particularly public utilities. This tendency has created a sharp distinction between the public and private sectors in some of the countries. The Government tries to assume more and more responsibility by expanding the public sector, so the private sector feels its sphere suddenly restricted. Besides, planning involves some controls according to the ideology of the country. The private sector shrinks under such new regulations which curb its freedom.

On an examination of the spheres of public and private sectors, it will be found that they are, in effect, complementary. Neither can function effectively without the help of the other. In fact, in some cases, they are so interdependent that the progress of one depends on that of the other. In view of this, any controversy between the two sectors which leads to antagonism instead of co-operation and bitterness instead of goodwill, is likely to hinder the progress of the country. For example, they may scramble for the available skilled manpower or limited managerial personnel, and so on. Although the need for co-operation between the two sectors is being realised, the attitude of mutual suspicion and, therefore, of criticism and hostility has not completely gone. It will be in the interest of progress if both the sectors could work in complete harmony. At a time when the urgent need is to make rapid economic progress, it is not wise to raise ideological considerations in the effort, as these may divert attention to issues which are not urgent and may impede the process of growth.

VII. In the case of development of human resources, imbalances have also taken place. For example, housing and education have not been adequately related to economic needs. In some cases. demands for consumption have been strengthened before the material basis for satisfying them has been prepared. The resources have been used for social amenities and redistribution of incomes without considering the requirements of growth. In some countries, suitable political and social institutions have still to be created before economic growth can be properly planned and implemented.

The human resources of the countries of the region constitute an even bigger bottleneck than material resources. The mere possession of a large population is not in itself a resource, and may even be a drag on growth. The technical competence of Asian labour remains poor. Even a country like the Philippines, which introduced a mass-education system early in the century, still has an illiteracy rate as high as 25 percent; elsewhere illiteracy may be even more widespread. Health conditions are also poor. The shortage of skilled workers co-exist with massive unemployment of unskilled workers. In India. the 1951 census gave the number of professional, technical, administrative, clerical and related workers as only 2 percent of the economically active population whereas the corresponding percentages were 15 in Japan (1950), 19 in the United Kingdom (1959) and 29 in the United States (1950). The productivity of south-east Asian labour remains poor; even with the paltry wages often paid, labour costs a unit of output are not low. This makes it difficult for them to export.

Few countries of the region are favourably endowed with entrepreneurship. The Philippines is now beginning to reap a harvest from an educational effort which began decades ago. India inherited a sound machinery of public administration from the British; the Civil Service has been used for running public enterprises. The private sector has also been vigorous, perhaps even more so than the public sector judging from the fact that it has done better than the public sector in reaching investment goals. In other parts of the region, the supply of entrepreneurship remains deficient in relation to requirements.

Availability of Foreign Aid

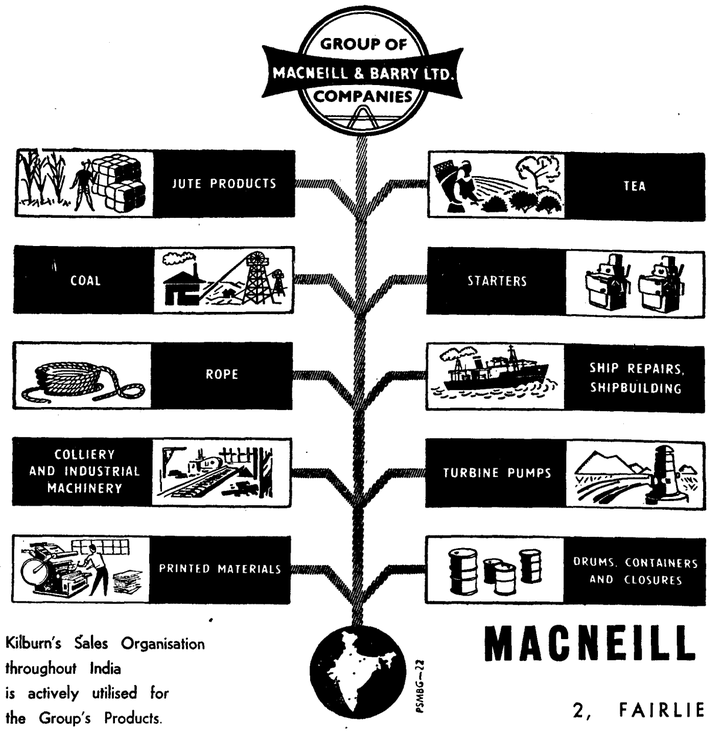
"The availability of foreign aid has helped not only in supplementing the domestic supply of consumer and capital goods, but also in building up human resources for growth. Russia's most significant contribution to mainland China was in technical assistance. United Nations and inter-Governmental programmes have imparted not only the techniques of the advanced countries to the underdeveloped countries, but have promoted co-operation among the underdeveloped countries to exchange ideas and experience. Even foreign private enterprise has come in with a contribution of techniques and market connections in addition to capital. A new wind is blowing; joint-ventures, marrying foreign and indigenous resources, are becoming prominent even in countries that have hitherto been notable for economic nationalism".

E.C.A.F.E. COUNTRIES : HOUSEHOLD DISPOSABLE INCOME AND SAVING, 1950-59

Country	Percent of gross national product		Household saving percent of disposable income
	Disposable income of households	Gross savings of households	
Burma ..	76.6	9.2	12.0
Ceylon ..	83.7	4.0	4.8
China : Taiwan ..	76.3	4.0	5.3
India ..	—	—	5.8
Japan ..	70.0	10.5	15.0
South Korea ..	87.1	3.1	3.5
Philippines ..	83:7	−1.3	−1.6

VIII. The performance in increasing the domestic savings is rather inadequate. It should be possible for Governments to increase their revenues by imposing additional taxes more effectively. At the same time, they should exercise more restraint in non-developmental spending whether on current or capital items. It is possible to encourage savings by suitable measures.

In several countries, tax policy has been positively orientated towards encouraging private saving. "Apart from tax policy, there are several measures which range from allowing high rates of interest, providing other facilities under official small saving schemes, operating State lotteries (as in Thailand) or prize bonds (as in India), to deficit financing by creating more money, so as to force additional saving on the private sector through higher domestic prices. The resultant rise in domestic prices causes a redistribution of income in favour of profits and, therefore, makes for higher saving by the private sector, in addition to the free gift of saving made to the Government in the process of money creation".



Corporate Saving

As stated above the level of private saving is influenced by fiscal and other Government measures, but depends mainly on the desire for saving within the private sector itself. This desire varies from country to country according to a number of factors. The level of *per capita* income, the level of personal disposable income, and the distribution of income, are among the few important and identifiable factors which are likely to influence household saving. Corporate saving tends to be more important than household saving in advanced industrial economies, but the opposite holds good in underdeveloped countries because corporate income there is usually so small a fraction of national income that, however high the corporate propensity to save may be, it can contribute little to aggregate saving. In India, corporate income after tax comprised less than 1 percent of national income, and corporate saving accounted for 5.8 percent of total private saving during the decade under review; whereas in Japan, where the corporate gross income, after tax, accounted for 13 percent of the gross national product, corporate saving contributed 53 percent to private saving. In Ceylon, corporate saving contributed a little over 70 percent of private saving, because the share of corporate income in national income is higher in Ceylon than in India due to the latter's relatively large plantation and export sectors.

The level of total private saving in Ceylon was, however, much lower than in Japan; and this discrepancy is explained by a very different propensity to save by households (15 percent in Japan and only 5 percent in Ceylon). Considering the low level of consumption in Japan relatively to other advanced countries of the world, it is indeed remarkable that Japan has so high a household propensity to save. One explanation is that in Japan, the ratio of self-employed in the total work force is higher than in other advanced countries, and as self-employed worker-owners must finance not only household investment but also business investment, their saving ratio has to be higher than for those who are employees. In the Philippines, on the other hand, households appear to have dissaved, and corporate saving exceeded household dissaving by a sizable margin.

Household Income and Savings

Saving by households also depends upon a complex of factors, no single one of which can explain the wide disparities in rates of private saving among countries of the E.C.A.F.E. region. It is difficult, for example, to account for these disparities only in terms of differences in the level of *per capita* income. In spite of the great disparities of household income, both Burma and Japan saved more than 10 percent of it; whereas in Taiwan, where personal disposable income is higher than in Burma, the rate of household saving was only one-half as high. It is difficult—on the basis of information which is available for only a few

Macneills have been associated with India's commercial and industrial development for almost a century, and with the growth of the country's economy, Macneills' services to commerce and industry have grown. Macneills today are owners and managers of an important group of companies engaged in the manufacture or sale of Mining and Industrial Machinery, Turbine Pumps, Starters and Switchgear, Ropes, Jute Products, Drums, Containers and Closures and other Light Industrial Products for the home market and for export. They are important producers of Coal and Tea and also operate the largest system of inland water transport in Asia which maintains its own Shipbuilding and Repair Yard on the river Hooghly.

Kilburn's Sales Organisation throughout India is actively utilised for the Group's Products.

MACNEILL & BARRY LTD.

2, FAIRLIE PLACE, CALCUTTA-1

RIPPLE

The LIC is at the centre of a ripple whose widening impact is felt throughout the land.
On the one hand, LIC's operations are far-reaching. They cover about 729 centres, a number which is steadily increasing. So is the number of new individuals in India being covered with Life Insurance.

On the other hand, the LIC invests over 2 millon rupees a day in industry, agriculture, railways, transport, electricity and many other projects. The radiating effect of these investments creates more jobs, more incomes, more food—in fact, a higher standard of living—for everybody.

LIC—YOUR COMPANION IN PROGRESS

ASP/LIC-E-96

countries—to say how far private saving is related to the share of personal disposable income in national product. The range of variation in the saving propensity of households is indeed wide and does not seem related to either the absolute level or the share of household income in national product.

Economic growth naturally becomes slow with such a low level of saving in so many countries of the region. The dependence on foreign aid cannot be the main source for uplifting these economies; they should make their own efforts to raise internal resources, so that the advanced countries may feel encouraged in supplementing the same.

IX. Even if domestic savings are increased by suitable measures, it is beyond the power of most countries of the region to do without foreign aid to attain a satisfactory rate of growth, at least in the immediate future.

While contribution of foreign assistance has risen for most countries of the region, they have to give thought to the balance of payments aspect of foreign assistance. It is to be remembered that for serving and repayment of foreign loans, what is required is export service and not economic growth. It is possible that with economic growth, the present import surplus may increase rather than diminish.

So there is a general desire for independence from imports in planning for economic growth. This has taken the form of a policy of national self-sufficiency in food at a high cost. In industry, this results in a policy of import substitution and efforts to develop capital goods industries. Technological progress may make such industries obsolete and, in the meanwhile, opportunities to build export industries may be lost.

"The basic value of the inflow of foreign saving is that it provides underdeveloped countries with additional resources for stepping up their investment. But if dependence on foreign saving is not to become permanent, they must, at some stage, be able to sustain economic growth by means of their own resources. Foreign saving placed at the disposal of these countries should, therefore, be used in a manner which furthers this objective. No uniform pattern of utilisation could be prescribed for all underdeveloped countries, because, the pattern is bound to differ according to the stage of economic development and various other factors. This difference in use may, in turn, reflect the manner in which foreign saving flows into these countries, and whether it should take the form of loans or grants. If the receiving countries are building up their export capacity, or their capacity to produce substitutes for imports, foreign loans need not be much of a burden. If no such capacity is, however, being created, it would be preferable to receive foreign saving in the form of grants. Economic development does not necessarily give a country a larger export capacity, but may merely expand its demand for imports. If foreign capital has to be repaid at a later stage, the repayment can become a constraint on further growth. From the economic standpoint of receiving countries, therefore, grants are always to be preferred to loans".

Official Assistance

Although the broad pattern of the inflow of official assistance to the underdeveloped countries of the region shows some uniformity, there have been marked disparities between countries. The extent of *per capita* official assistance has varied considerably, and it is difficult to explain such disparity in terms of the *per capita* income levels or of economic absorptive capacity of the receiving countries. Undoubtedly, immediate political and strategic rather than long-term economic considerations have dominated the distribution, not only of military, but also of economic assistance from abroad.

E.C.A.F.E. COUNTRIES : ECONOMIC ASSISTANCE RECEIVED IN 1950-59
(Annual average in dollars)

Country	Per capita assistance received		
	Official	Private	Total
Laos	23.30	—	23.30
South Viet-Nam	19.19	—	19.19
South Korea	9.78	0.26	10.04
China : Taiwan	8.29	0.27	8.56
Cambodia	7.68	—	7.68
Philippines	2.22	0.43	2.65
Thailand	1.46	−0.20	1.26
Pakistan	1.03	−0.03	1.00
India	0.41	0.19	0.60
Indonesia	0.36	−0.05	0.31
Nepal	0.30	—	0.30
Burma	0.45	−0.39	0.06
Ceylon	1.55	−1.63	−0.08

"In most countries of the region, foreign aid has provided the crucial margin required to tide over the balance of payments difficulties. It has taken the burden of military commitments substantially off the shoulders of Formosa, South Korea, Laos and South Viet-Nam. It has staved off food crises in India and alleviated in Pakistan the situation arising from a secular fall in the terms of trade, thus freeing foreign exchange in both countries for spending on developmental imports. It has made possible productive investments in broad fields of public and private endeavour in Thailand and the Philippines, and has assisted specific projects such as steel mills in India, dams in Formosa and Thailand, or more general services such as agricultural extension or the building of roads. As a result, almost all countries have been able to maintain or raise their levels of living and, in some cases, the momentum of growth without having to demand a fully proportionate reduction of consumption".

What is still more important, they have no favourable prospects for the balance of payments. The following table indicates the increase in foreign indebtedness of these countries and also the share of current account receipts taken by debt service. As more and more foreign assistance is received in the form of loans, debt service payments will increase further. Unless exports also increase or imports decline correspondingly, the strain on borrowing economies will grow progressively. No doubt, as long as new assistance from abroad is forthcoming and as long as it progressively increases, the impact will not be felt because part of the new assistance, among other things, can release resources for servicing debt. But this implies a still sharper increase in foreign indebtedness and so in future commitments for debt servicing and repayment, there are grounds to believe that saturation point is already being reached for borrowing; in granting and seeking foreign aid, the assisting and benefiting countries may well consider reviving donations, or, if loans are to be arranged, making counterpart provision for service and repayment in the domestic currencies of the borrowing countries.

E.C.A.F.E. COUNTRIES : EXTERNAL PUBLIC INDEBTEDNESS AND PUBLIC SERVICE RATIO, 1955 AND 1958

Country	External public indebtedness at the end of the period stated			Public debt service charges Percent of current account receipts	
	In million dollars		1958 percent of 1955	1955	1958

Indonesia	569	415	73	3.8	3.5

Promoting Exports

X. In the case of countries where domestic markets are too small, the question of full exploitation of economies of scale arises. One way to overcome this is by promoting exports. In order to do so, however, it is desirable for the countries of the region to co-ordinate their industrial development plans. The possibilities of inflation exist when there is slow progress of the national product because stagnation results in instability. A high rate of growth, on the other hand, would solve many economic problems. Savings, for example, would be possible under certain conditions. It is easier to maintain social harmony along with economic stability.

The problem of exports is common to most countries of the region. One way in which this can be solved is by having some understanding of the industrial development plans of these countries. Instead of each of these countries trying to develop the same or similar type of industry, *e.g.*, the textile industry, if there is an agreed division of labour between them by which each country undertakes to build certain industries which may cater to the needs of the entire region, it will be possible to have economies of scale. This will also lead to more trade between these countries. Any effort to have a Common Market arrangement between these countries should be preceded by a conscious co-ordination of their plans so that the economies of these countries can be made complementary.

XI. It would be desirable if the advanced countries give opportunities for increasing their exports to less developed countries as this would be consistent with the generous programme of aid to them. This would be of more lasting significance. There has been the tendency towards a substitution of domestic manufactures for imports in most of these countries.

The tariff policy of the advanced countries makes it difficult for the less developed countries to export their goods to them. There is a growing demand on behalf of the less developed countries that aid should be accompanied by trade. The long-term development of these countries depends on increasing their capacity to trade. Instead of allowing the tendency towards self-sufficiency to grow as a result of prevailing conditions, it would be in the mutual interest of all countries to see that a new trade pattern is developed by which a greater exchange of goods between both types of countries is encouraged.

Scope for Co-ordination

XII. The main problem in most of the countries in the region is still one of further growth. This is not merely a matter of investment on agricultural and industrial development because a good deal depends on the efficient allocation of resources and outputs. There is also the problem of co-ordinated growth between the countries of the region. This may imply that the present plans and policies of economic development may require modification so as to serve the long-term interests of all the countries of the region.

Further growth among the countries of the region depends on their willingness and capacity to co-ordinate their development plans. As the resources of each are limited, it would help them to develop large-scale industries by such co-ordination. More investment in the development of agriculture and industry should be in accordance with such agreed regional arrangements, which are likely to help in bringing about rapid growth. Such co-ordination presupposes stable political conditions, willingness to share in the joint effort and an understanding of the long range benefits of the same. It is to be hoped that this awareness will grow.

The example of countries of western Europe, who joined together to form the European Common Market, is useful. Countries which for centuries have been in opposite camps like France and Germany, have come together to develop and strengthen their economies. These are some of the more advanced countries of the world, which have found it necessary to work together for their mutual advantage. The need for the south-east Asian countries, with their backward economies, to come together to work out joint development plans which are mutually complementary is greater and likely to be of lasting benefit to them.

India and the Common Market: Uncertainty in Trade Relations

By
MALCOLM SUBHAN

N retrospect it cannot be said that India progressed very far during 963 towards the goal of a more alanced and harmonious trade elationship with the E.E.C. Ironi-ally enough, she was perhaps nearer o it while the negotiations for ritain's entry into the Common larket were taking place than after-ards. If in August 1962, the Six ere ready in principle to conclude comprehensive trade agreement ith India, a year later they were eluctant even to speak of it. The oncessions which they finally grant-d this November had been negotiated he year before by Mr. Heath and were, in any case, so minor that they ffect a mere 3 percent of India's otal exports to the Community.

The change in the Six's attitude is ot difficult to understand. During he British negotiations, the Indian roblem was one of many which had o be solved, and the Six were glad n the whole to accept the solution f a comprehensive trade agreement o be negotiated once the more erious business of Britain's entry ad been settled. Such an agreement as thus not only an element in a ackage deal, but also the logical nd inevitable consequence of Bri-ain's accession to the Community. But with the breakdown of the egotiations, the Six no longer felt hemselves under an obligation to elp the members of the Common-ealth; indeed, they took the view hat the situation which the provi-ional agreement on India had been designed to meet having failed to materialise, the agreement had lost its *raison d'être*.

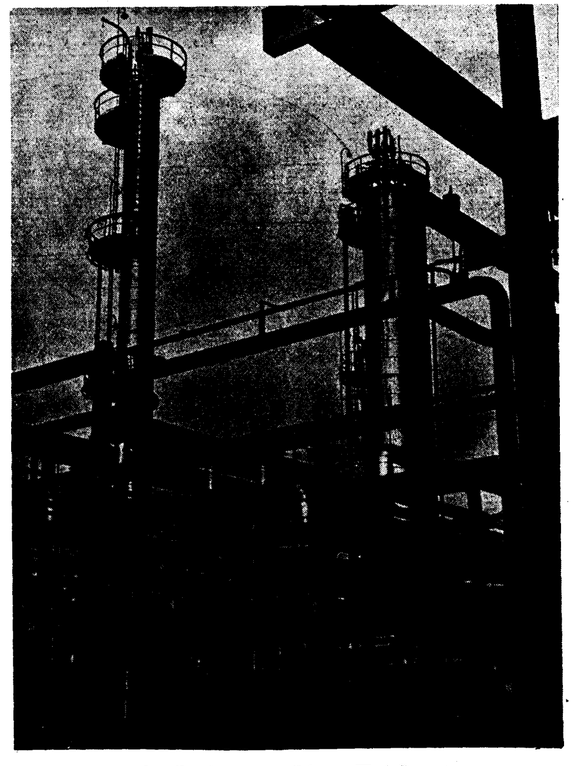
This unwillingness to retain any-thing from the British negotiations as strongly reinforced by the mood of frustration and indecision to which their breakdown gave rise. The crisis which followed the French decision to blackball the U.K. virtu-ally paralysed the Community. The bitter recriminations between the French on the one hand, and the Belgians and Dutch on the other, created an atmosphere of hostility in which any fresh initiative was out of the question.

Internal Crisis

It has been India's misfortune that her first direct and sustained contacts with the Six have taken place at a time when the Community is passing through a severe internal crisis. In one sense, India has had no choice in the matter, of course. A trade agreement with the E.E.C. was en-visaged even before the start of the British negotiations; and the fact that the outlines for such an agree-ment were traced with Mr. Heath (along lines largely suggested by Mr. K. B. Lall, India's Ambassador to the European Economic Community) favoured a formal approach to the Six, in spite of the prevailing un-certainty within the Community.

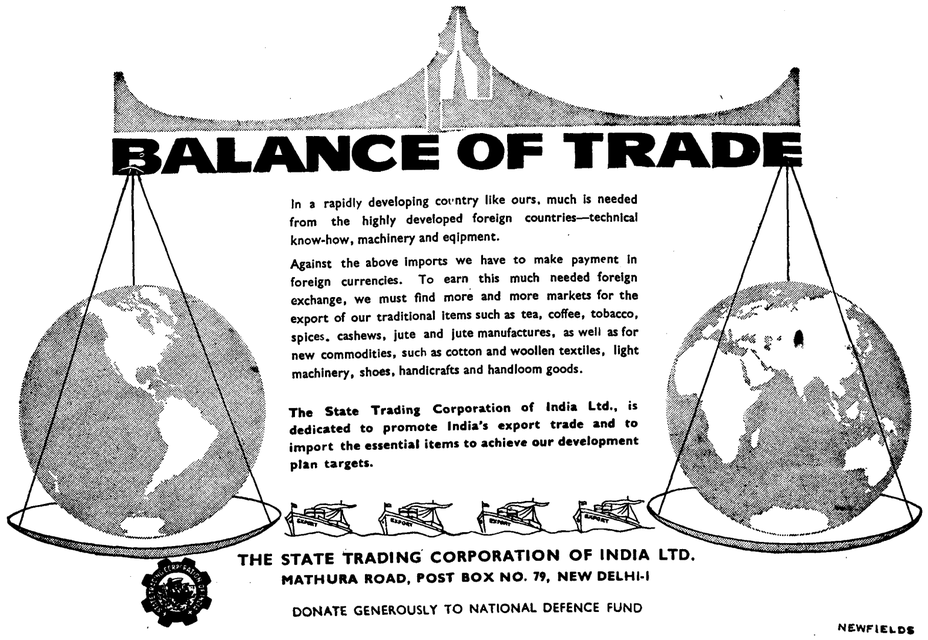
There were, in fact, one or two encouraging factors. One was the desire of the Commission to salvage something from the wreckage of the negotiations. Professor Hallstein, the Commission's President, told the European Parliament that the solu-tion which had been proposed in the case of the three countries of the Indian sub-contnent was sufficiently original to merit survival. The second factor which favoured a direct approach by India was the determination of some of the Com-mon Market countries, including Holland, to counterbalance the Com-munity's preoccupation with the associated African States with a more positive policy towards other deve-loping countries—notably, the English-speaking African States and India.

The manner in which the E.E.C. was approached in April reveals something of the preoccupations of India's representatives at the time. Instead of a straightforward request for the opening of talks, if not nego-tiations, India submitted an *aide-mémoire*. (This was not the first Indian *aide-mémoire* to the Commu-nity; the first was submitted in July 1962.) This brief document—it was a mere four pages in length—grew out of the numerous informal discus-sions between the Indian Mission in Brussels and the Commission and permanent representatives of the six member-States. These discussions had shown that while there was a good deal of sympathy both within the Commission and among the Six for India's efforts at putting her trade relations with the E.E.C. on a more normal basis, the nature of the Com-munity machinery is such that little could be accomplished unless the Council of Ministers were directly involved.



Meeting Objections

The *aide-mémoire* was skilfully drawn up to meet the various objec-tions which the Six had already raised informally. It made it clear at once that the problems which India faced were in no way related to Britain's application for membership, but arose from the extremely one-sided nature of the Indo-E.E.C. trade. India had a substantial and growing trade deficit with the Community; the consequences of the Chinese in-cursions along her northern frontiers had only aggravated her balance of payments position. Although she was making determined efforts to increase her exports to the Commu-nity, help was necessary if these efforts were to prove successful. The *aide-mémoire* suggested that as a first step the E.E.C. grant India the various tariff concessions visualised during the negotiations with Mr. Heath. More comprehensive arrange-ments for fostering increased eco-nomic relations between India and the Community could be reached through bilateral negotiations in Brussels and also through multilateral talks under G.A.T.T.



This formula was chosen no doubt in the belief that if the Six could make a certain number of conces-sions—including a zero duty on tea—without difficulty, the climate was unpropitious for negotiations on the more detailed proposals which India had in mind. The *aide-mémoire*, therefore, proposed no timetable; it did not even request the formal open-ing of talks between the Six and India. (Professor Hallstein was to praise the *aide-mémoire* for its air of sweet reasonableness. However, the very fact that it left the initiative to the Community was evidence in the eyes of some of the Six that India's problems were not really urgent ones.)

The Six in their view took the first step towards meeting Indian wishes when they agreed to a Dutch proposal that the tariff on tea and tropical woods be suspended. The suspension was made conditional, however, on Britain's willingness to do likewise. The agreement was, therefore, nego-tiated between the Six and the U.K., although its principal beneficiaries will be India and Ceylon, of course, as far as tea is concerned. Although such an agreement involved the loss of Commonwealth preference, it was clear that duty-free entry into the Common Market largely outweighed this loss.

While it is unnecessary to enter into the details of the protracted negotiations between the Six and the U.K., reference must be made to two points. The first concerns the Com-munity's machinery for concluding an agreement with third countries. The Six have been the first to describe it as slow and cumbersome. In the present instance, all six member States had agreed to the suspensions; yet when a draft agreement was on the point of being approved by the Council of Ministers, the French protested that the procedure being followed was inconsistent with the sovereignty of the six member States. In order to avoid setting an unwel-come precedent, it was, therefore, necessary that the E.E.C. first sus-pend unilaterally the common exter-nal tariff on tea and tropical woods,

and only then enter into a bilateral agreement with the British.

E.E.C. Tea Imports

The second point was of greater consequence to India. During the British negotiations the Six had argued that the offer to allow tea to enter the enlarged Community duty-free represented a substantial concession in view of the fact that tea is the principal Indian export. (They appear to have overlooked the fact that the concession was not as important as they imagined, given the relatively small amount of tea consumed in the Common Market as a whole.) The same argument was repeated this year when it was suggested by India that urgent action was necessary to help her improve her trade balance with the Community.

The result was that the *aide-mémoire* aroused little comment among the Six, who felt that with the suspension of the tariff on tea (the suspension was originally expected to come into force on 1st September) the most important single concession visualised in 1962 had been granted. Indian efforts to persuade the Council of Ministers to react officially to the *aide-mémoire* were largely fruitless; there seemed to be no possible way of having it included on the Ministerial agenda as long as the negotiations with the U.K. over tea and tropical woods had not been formally concluded.

The Indian Mission's informal talks with the Commission proved more fruitful, however. Under the Community machinery, the Commission had the task of recommending to the Council the reply to be given to the Indians. Although the Commission as a whole was preoccupied with the internal crisis facing the Community, Professor Hallstein continued to advocate the re-examination by the Six of their original offer to conclude a trade agreement with India. His visit to India (to deliver the Azad Memorial lectures) gave him an opportunity to discuss the matter with Ministers and senior civil servants in New Delhi.

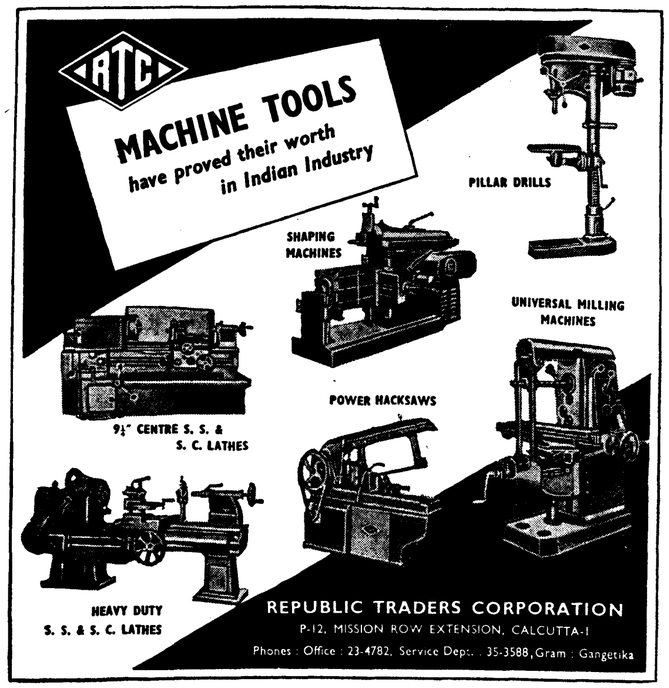
Finally, in July the Commission prepared not only a detailed report on the *aide-mémoire*, but also a draft resolution under which the Council of Ministers was to authorise it to hold exploratory talks with Indian representatives with a view to the conclusion of a commercial agreement. The proposed agreement would provide for a limited number of tariff reductions (to be eventually consolidated in the Kennedy round) as well as certain other measures, primarily commercial in nature, susceptible of promoting Indo-E.E.C. trade. The Commission, which was at that time putting the finishing touches to a commercial agreement with Iran, also wanted the agreement to provide, as in the case of Iran, for a joint standing committee on trade promotion.

It was soon clear that if the draft resolution proposed by the Commission did little more than offer India the opportunity to hold exploratory talks, it was nevertheless far too ambitious for several of the member States. The Council of Ministers refused to vote on it in July on the grounds that it needed further information on trade between India and not only the E.E.C., but also other industrialised countries.

When the permanent representatives—that is to say, the heads of the Six Common Market delegations in Brussels—began seriously to study the *aide-mémoire* in September, they found it extremely difficult to agree on the recommendations to be made to the Council. Although the Commission stood by its earlier proposal for exploratory talks, it was opposed by the majority of the permanent representatives, who favoured the immediate, autonomous grant by the Community of a number of the tariff concessions which it had negotiated in 1962 with Mr. Heath. It was argued that such a step would meet India's wishes for immediate relief, as suspensions would be quicker to arrange if they were unilateral than if they were to be negotiated first with India. (Negotiations were regarded as unnecessary in any case as the Six were not seeking reciprocity.)

Risks of Unilateral Solution

The predilection of the permanent representatives for a unilateral solution alarmed Indian representative in Brussels, for it was feared that a unilateral suspension of tariffs (even though on a limited range of relatively unimportant products) would be followed by a long, if not complete, silence on the other, more crucial, matters raised in the *aide-mémoire*. A second *aide-mémoire* was, therefore, delivered to the Six in early October, even while the permanent representatives were trying vainly to agree among themselves. As skilfully worded as the first, it was quick to seize the conflicting viewpoints which had been expressed and to suggest a compromise.



The *aide-mémoire* welcomed the projected unilateral suspensions, but pointed out that neither traditional Indian exports, such as heavy jute goods, carpets, coir matting, nor the products of her newer industries—sewing machines, machine tools, oil engines—had been discussed. In view of the growing reluctance of the Six to embark on any further "negotiations" (especially after the impasse reached by the well-prepared negotiations with Israel) the *aide-mémoire* suggested a much vaguer formula—informal, high-level talks between the representatives of the six member Governments and the Indian mission, the result of the talks to be embodied in a report to the Council of Ministers.

As a number of representatives had expressed the view that unilateral action by the Community had the great merit of promptness to recommend it, the *aide-mémoire* suggested that a survey be made of the problems for which unilateral action was not possible. To those who had argued that there was little the E.E.C. could do for India once the various tariff suspensions under discussion had been granted, the *aide-mémoire* proposed an exercise to separate the problems for which solutions on a Community basis were necessary (those involving tariffs, for instance) from those which could be dealt with on a national basis (such as those involving quota restrictions). At the same time, to those who claimed that Six could not negotiate bilaterally with India on the eve of major trade and tariff negotiations, the *aide-mémoire* pointed out that even informal talks would help both sides formulate their policies for the forthcoming multilateral conferences.

Despite the arguments invoked by India, the majority continued to favour unilateral tariff suspensions—and no more. The Commission suggested a compromise—the immediate autonomous grant of tariff concessions to be followed by talks on the other aspects of the Indian problem. Those who opposed any further reference to the problem until the Geneva negotiations were well under way, claimed there was no obstacle to informal talks between the Commission and India. They pointed out that such talks went on all the time between the Community and the large number of diplomatic missions accredited to the E.E.C. As they were in a majority, the solution finally adopted by the Council of Ministers provided simply for the unilateral suspension of tariffs on a score or so of products.

Balance of Trade

The solution obviously will have a negligible effect only on India's growing balance of trade difficulties. Even if the various suspensions come into force by the beginning of 1964, it is clear that India cannot substantially increase her export earnings by promoting sales of spices such as coriander and ginger, nor of mango chutney and tobaccoseed oil (or even polo and cricket equipment). The long debate on the question of whether or not to suspend the tariff on handloom products, and the refusal to discuss products such as jute goods and carpets, demonstrated better than anything else the Six's reluctance to grant concessions on products around which a reasonably important export trade can be built up. (During the negotiations with the British, the Six agreed to suspend the tariff on all handloom products also; but it seems the decision

was taken somewhat hastily and largely in order to help Mr. Heath.)

Even taking the decision to suspend the tariff on tea into consideration, one cannot say that the Six have been animated by a sentiment of generosity. Indeed several of the concessions offered border on the ridiculous; one can only assume that the decision to throw in cricket bats and polo sticks, for instance, was made tongue in cheek. To what can one attribute the meagre fashion in which the Six have responded so far to India's repeated requests for help in reducing her growing trade deficit with them? Given the important role which the Community will undoubtedly play in next year's multilateral trade negotiations, the question is of more than passing interest.

Addressing a German audience earlier this year, Professor Hallstein took as his theme "1963—year of trial." The fact is that ever since General de Gaulle torpedoed the negotiations with the U.K., the Common Market has been in the grip of an internal crisis which has virtually paralysed it. The General's action, taken without any reference to France's five partners, was interpreted by several of them as being directed not against the British alone, but against the Community itself, for which the French President has never shown much enthusiasm. France thus not only divided the Community, but also strengthened national rivalries and jealousies at the same time that it virtually destroyed the much-vaunted "Community spirit."

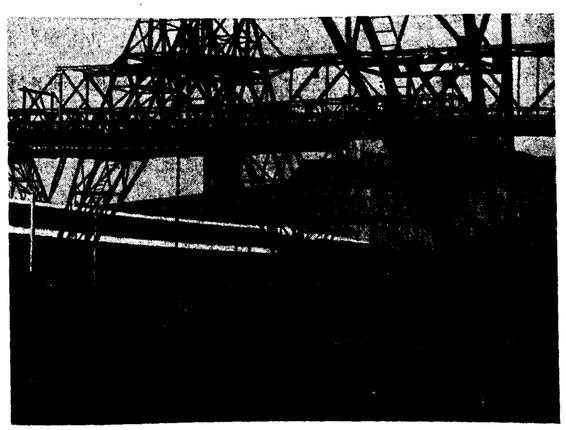
Faced with a crisis which threatened the very fabric of the E.E.C., the Commission felt that it was necessary to strengthen the Community by pushing ahead with the formulation of Community policies wherever possible. To this end, it favoured the conclusion of trade agreements with third countries. Such a step would both allow the Six to develop a common commercial policy and force them to co-operate in relatively calm fields. The German also favoured such a policy, for it turned attention away from the very delicate agricultural sector. But on the whole, the Six have been far too preoccupied with their internal problems to have either the energy or determination to negotiate with third countries. In fact, most of the negotiations between the Community and third countries have simply dragged on.

United Front

If the circumstances did not favour the adoption of Community policies, whether in agriculture, foreign relations or anything else, the E.E.C.'s international obligations nevertheless forced the Six to present a united front on various occasions. The most important such occasion was the Ministerial session of G.A.T.T. last May, although as a result of the Six's inability to agree among themselves, undue emphasis was placed on the differences between the E.E.C. and the United States on the question of tariff disparities. The Action Programme presented by 18 developing countries, including India, hardly received the attention it deserved.

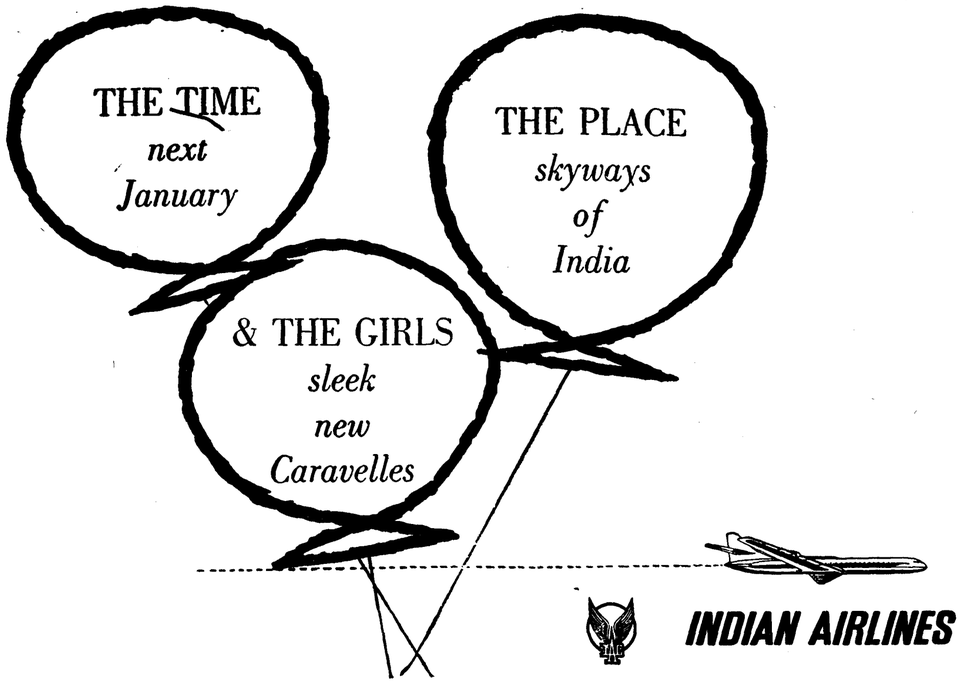
However, the determination of the developing countries to force the industrialised nations to adopt a more positive attitude towards their problems seems to have impressed the Six. Although the preparations for the Kennedy round have been overshadowed so far by the dispute between the E.E.C. and the U.S.A. over frozen poultry, a number of proposals for aiding the less developed countries are being drafted either by the Commission itself or the member States. One such proposal was made public in May, during the G.A.T.T. ministerial session itself. It is the Belgian plan for preferential tariffs for exports of manufactured goods from the developing countries. The idea, which has been strongly advocated by India during the last 12 months, was discussed by the Six some three years ago, but was shelved as premature. The Belgians have revived it, and hope to present it in Geneva next year, either as a Benelux proposal or on behalf of the E.E.C. (While Holland and Luxembourg have approved the Belgian proposals, they are still under examination by the other three member states. They will be discussed by the O.E.C.D. also, although the U.S.A. is known to be opposed to all preferential arrangements.

In the view of the developing countries such as India and Pakistan, the Belgian proposals are far too timid; the former are in fact seeking preferential treatment for all their manufactured products. The Belgian plan is much less ambitious. Under it, a developing country intending to build up or develop, say, its bicycle industry could ask the industrialised countries for preferential tariffs for this item. The request would be examined by a special committee on which all interested countries would be represented. All concessions would be on a degressive basis; that is to say, they would be gradually withdrawn. However, during this period, the developing country would have the right to protect its new industry with a tariff which could be as high as 100 percent.



A more objectionable feature of the Belgian plan from the viewpoint of the developing countries is the distinction it makes between industries in which the developing countries have an advantage over the industrialised (because of cheap and abundant labour reserves, for instance) and those in which they are at a disadvantage (as in the case of of the more sophisticated products in the industrial field). Whereas the Belgians are prepared to grant preferential tariffs in the one case, in the other, they favour the imposition of a levy on imports from the developing countries in order to raise prices to the levels prevailing in the importing country. (The amount of the levies would be determined by special mixed committees representing both importing and exporting countries.)

Compensatory Levies



The only redeeming feature of the compensatory levies is that the funds would not be retained by the industrialised countries collecting them, but would be paid into a pool from which they would be returned to the exporting countries in the form of development aid. The Belgian, in fact, also have a project for an international development fund which would also guarantee export credits granted by industrialised countries to the developing and by the latter to other developing countries.

Clearly, a plan such as the Belgian, even though unacceptable to the developing countries as it stands, can serve as the basis for discussion. The Indian request to the Six for talks on industrial preferences has been refused on the grounds that the problems will be discussed on a multilateral basis in Geneva (India has already raised them in a preparatory committee). Although progress will be slow, there is no doubt that the notion of preferences for the developing countries has gained wider acceptance in the course of the last few years. (Just over a year ago, it was dismissed by Professor Hallstein as of no practical value.)

The Six are also actively preparing price stabilisation schemes covering the raw materials and agricultural products exported by the less developed countries. The French still operate a price stabilisation and support programme for their former

colonies, and they would like to see it adopted on a wider scales. The Six, who earlier this year signed a new Convention of Association with their African partners, believe this agreement could well serve as the basis for future collaboration between the developing and industrialised nations.

Meanwhile, it must be recognised that their ties with the 18 associated States have considerably hampered the Six in their relations with other developing countries. (The Dutch and Germans, whose interests lie in the English-speaking rather than French-speaking parts of Africa, would even prefer to minimise as much as possible the importance of the new Convention, which creates a preferential relationship between the E.E.C. and the Africans.) At the same time, it must be pointed out that the Six are aware of this problem. Earlier this year they agreed to let all the members of the O.E.C.D. participate in tenders announced by the associated States for projects financed by the European Development Fund (set up by the E.E.C.). Similarly, African holders of Community scholarships will hereafter be able to study in countries other than those belonging to the E.E.C.

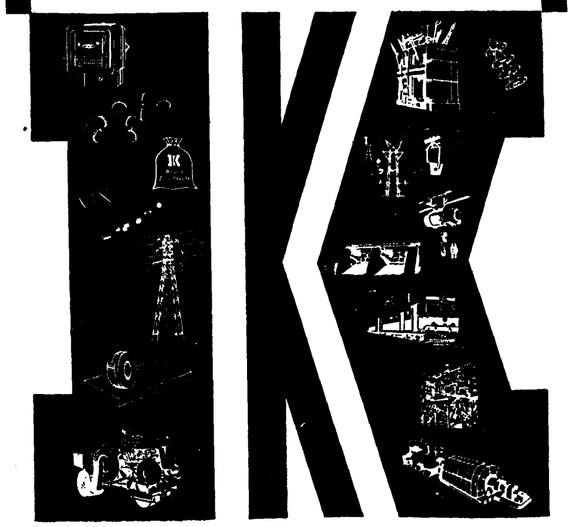
Although the Six are determined to make a contribution to the forthcoming Kennedy round and U.N. World Trade Conference in keeping with their economic importance, the evidence to-date has been somewhat discouraging. Far too much time and energy have been wasted on the relatively unimportant question of American poultry exports; the problem of tariff disparities, which primarily concerns the Six and the Americans, has also diverted attention from other more important problems. (This preoccupation with secondary issues can be traced to the crisis within the Community: in the prevailing atmosphere of indecision and confusion the Six seem at times to lose all sense of proportion.) Should it finally prove necessary to delay the opening of the Kennedy round, the E.E.C. will have to assume much of the blame.

U.N. Trade Conference

Although the Six have insisted on seeking solutions to the problems facing India and the other developing countries in the multilateral framework of next year's tariff and trade negotiations, it must be remembered that the solution that are finally reached in Geneva will owe something to the Six, but perhaps even more to the other industrialised countries. The Six hope that the industrialised countries will therefore be able to work together during the coming negotiations to present a united front against the demands of the developing countries. While such a front is not altogether in the inerests of the developing countries themselves, it remains to be seen whether it will be achieved.

All the evidence suggests that in next year's Geneva negotiations—and in the Kennedy round to a greater degree than the World Trade Conference—a great deal will inevitably depend on the extent to which the industrialised nations are able to settle their own problems. The Americans have insisted that the Kennedy round must cover agricultural products as well as industrial. However, given the growing agricultural surpluses throughout the West, and the determination of the French to make the E.E.C. self-sufficient in farm products, there is every likelihood of angry exchanges taking place between the Community and other producers of temperate zone foodstuffs. (The less developed countries may be the ultimate beneficiaries of the dispute over agriculture. The French have already proposed that agricultural surpluses be given as aid or sold at nominal prices to the developing countries, and the Commission is studying a project somewhat along the lines of the American P.L. 480.)

Crucial Questions



It is evident that the policies advocated by the Six in Geneva next year will be determined to a certain extent by their relations among themselves. Although the crisis caused by the break-down of the British negotiations is nearly over, a number of problems crucial to the future development of the Community remained to be solved, of which the most important concerns the Community's agricultural policy. There is no doubt that an acceptance of the policies espoused by the French would lead to an exceptionally high degree of agricultural protectionism. For domestic as well as other reasons the Germans would prefer a more liberal policy. While the Six have so far refused to face this problem squarely, it will have to be settled quickly if the E.E.C. is to negotiate effectively in Geneva on agricultural products.

The most that can be said at present is that the Six are unlikely to show themselves generous to the developing countries unless they find the other industrialised countries prepared to do likewise. They have their hands tied to a considerable extent as regards tropical products for which the African associated States are important suppliers, and, therefore, may offer limited tariff concessions or, at the other extreme, comprehensive price stabilisation schemes. The relatively encouraging response to the Belgian proposals for preferential tariffs suggests that the Six may be prepared to accept far-reaching changes to the very structure of G.A.T.T., including a revision of the most-favoured-nation clause.

It is in the broad range of manufactured and semi-manufactured goods which interest India that the Six are likely to prove most reluctant. Thus for items such as jute goods, carpets, partly tanned leather and leather goods, and ready-made clothing, few concessions can be expected from the Community. This is even more true of textiles, of course. With the textile industries of France, Belgium and Italy haunted by the fear of being overtaken by the fate of Lancashire, there is no possibility of concessions at all—unless countries such as India and Pakistan are prepared to offer reciprocity.

KAMANIS IN THE MARCH TOWARDS INDUSTRIAL SELF-SUFFICIENCY

Rapid industrialisation is the need of the day. Kamanis are proud to be active partners in the efforts to make India industrially self-sufficient.

THE CHALLENGE TO INDIAN INDUSTRY

Mr. da Costa offers a provocative analysis of the ways to achieve an industrial breakthrough.

By
E. P. W. da COSTA

Managing Director,
Indian Institute of Public Opinion and Marketing Research Corporation of India

THE mid-term appraisal by the Planning Commission of performance in the first two years of the third five year plan has cast a shadow of gloom over the country. In the general despondency that has ensued, the distant take-off of the Indian economy has receded further and is now almost lost to sight. Serious doubts have been expressed in Delhi about India's capacity in agriculture and, as a consequence, seeing that agriculture is so basic to the economy, doubts have overflowed almost everywhere. There is obviously a psychological block to be cleared before one assesses the precise problems which face the nation in the new year and the many years which stand before the symbolic "take-off" still the goal of economic theorists, although on closer examination Mr. W. W. Rostow's "Stages of Economic Growth" has visibly crumbled before the facts.

It is vital in the first place that the country should not be unduly discouraged, any more than it should be unduly pessimistic, whether by facts or by fiction parading under statistical masks. The swings of the psychological pendulum are as dangerous to economic effort as are the swings of agricultural good and bad fortune to economic stability. One should at least be able to see through two major errors which have currently been the instruments of depression. And after one has dismissed the dismal prophets in the Planning Commission no less than anywhere else, one should address oneself to the basic problems of production which are curiously absent in current literature on the "take-off" in Indian industry. This is basically the problem of imaginative management dedicated to full plant utilisation.

This article attempts, having dismissed current pessimism as overdrawn, to set a sight for doubling of the rate of industrial growth based on the utilisation of capacity still lying idle in Indian industry. The conclusion is that a revolution in Indian industry can be brought about by a great application of existing knowledge, much more perhaps than can be generated by additional capital in new machines, although large capital development in power and transport is still necessary.

Growth Statistics

Much of the current trouble is due to a foolish overprecision in growth statistics based on gross national product or income figures. The Central Statistical Organisation's figures for the last two years present a rate of growth in the first two years of the plan at 2.7 percent and 2 percent, which are stated to be just equal to the rate of population growth. The possibility that these figures of the national income estimates might err seriously on the low side—according to the National Income Committee, the error is plus or minus 10 percent—has been ignored.

The view has been presented in a recent publication* to suggest that the national income figures for 1962-63 are considerable under-estimates. In any case, the view that India has stood stationary for the first two years in *per capita* income cannot be established from national income figures based on two years. To elevate national income figures to a deciding element in India's economic thinking is the crowning absurdity of the statistical worship which has been inculcated in the country over the last decade.

Quite apart from errors of statistical estimates, there is the problem of shortfall in agricultural production in a really bad year, which is an element in restraining development fortuitously just as a very good year can raise it fortuitously the other way. Studies based on figures of the last 20 years suggest that between a good and a bad year in the Indian Union there might be a difference of 12 percent in agricultural income and about 6 percent in national income.

Assuming 1962-63 to be the worst year of a cycle of five, and the current year one of the best, this would imply that with practically no planned effort a rise in national income by 6 percent might take place. Thus, even a stationary performance in a bad year cannot be totally bad; for it suggests that planned development has placed a floor under agricultural fluctuations which is written into Indian monsoon fluctuations. Seen in proportion both the national income figures and the course of agriculture in 1962-63 do not warrant the dark pessimism that has lain heavily on the country since the last two months.

Routine Analysis

It is becoming clear that the routine analysis which is proceeding on the basis of statistics of India's economic problems is far from adequate. The basic flaw is in the absence of knowledge on the directions where an assessment is most likely to assist a future breakthrough. It is far more important to measure shortfalls in the areas where a breakthrough can be expected than to measure general figures from which no very helpful conclusions can be drawn. Indian organised industry lends itself much more readily to such an analysis than does agriculture or transport. A single instance will probably suffice to show that the problems in Indian industries are not nearly as acute as they might appear at first sight.

In 1960, a remarkable paper on the pattern of plant utilisation in the Calcutta area which was produced by Mr. Morris J. Solomon, a consultant for the U.S. Technical Co-operation Mission, indicated that some of India's best plants there were operating at between 30 percent and 40 percent of scheduled efficiency on a single shift. He did not seek to measure then the difference from optimum efficiency attainable by changing techniques, particularly jigs, fixtures and tools, but there is evidence from productivity studies that in many cases between 25 percent and 50 percent can be attained in engineering workshops by additional utilisation from improved design and lay-outs.

It is roughly true that productivity for machines in engineering workshops is about a third of what it would be in other countries under similar conditions on similar machines. The official figures, both for 1961 and 1962, tend to show this element of non-utilisation. The non-utilisation exists and one of the elements in which the breakthrough needs to take place is not so much in the higher rungs of the management (although this is also necessary) but in middle management, to extract from existing layouts the scheduled productivity. Mr. Solomon's 1960 study on a group of machines gives the following figures:

TABLE I

UTILISATION AND REASONS FOR NON-UTILISATION OF MACHINES

State	Percentage of total time
Machine used	45.3
Machine under repair	19.6
Machine under setting	4.3
Raw material being awaited	7.5
Quota complete/No man deputed/No job	5.0
Personal work of the operator	14.8
Miscellaneous	4.5
Total	100.0

TABLE II

UTILISATION AND CAUSES OF NON-UTILISATION OF AN INDIAN MACHINE-SHOP

(Expressed in percentage of Total Time of Shift)

No.	Status	Percentage of time
1	Machine working	39.5
2	Setting	11.9
3	Breakdown repair	0.8
4	Gauging the product	2.5
5	Planned to be idle	0.4
6(a)	Waiting for instructions	0.7
6(b)	Taking instructions	0.9
7(a)	Worker gone for tool grinding	0.8
7(b)	Worker gone to bring material	0.6
7(c)	Worker gone to bring tools	0.5
7(d)	Changing the job	0.3
8(a)	Lunch	5.9
8(b)	Operator absent	0.5
8(c)	Worker not engaged	3.8
8(d)	Worker gone to canteen	1.8
8(e)	Worker gone to toilet	0.4
8(f)	Worker out—cause unknown	18.6
8(g)	Work not started or stopped before schedule time	5.5
8(h)	Work completed but new work not started	4.2
9	Miscellaneous	0.4
		100.0

Mr. Solomon comments: "In any complex process involving machines, materials and men, one cannot hope to balance each factor perfectly. In actual practice, the manager must choose between men waiting for machines and machines waiting for men. The overstaffing that is suggested in Indian enterprises is very different from truly redundant labour of which we have some of the world's worst cases. It is possible—as has been calculated in the Calcutta area—by 'readjusting' and increasing staff by 40 percent to obtain 2-1/2 times the usual output a machine and double the output a man. A 50-percent increase in production of many plants in India by means of a 50-percent increase in staff would also result in financial gains in enterprise as well as to participating personnel. This is on the basis of existing patterns of operation."

Speed of Machines

When to this is added speeding-up of machines, which often run at half the speed of machines in the United States, one might argue that there is, in fact, immediate potential capacity in many machine-shops of between 75 percent and 100 percent for new production. "Overstaffing" is particularly important in the areas of setters, and particular administrative skills such as the quick issue of stores and ordering "progress" in factories. The broad solution remains that the fuller use of machines can take place

* *Monthly Statistical Commentary on Indian Economic Conditions*, November 1963.

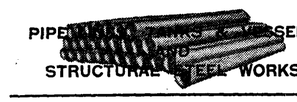
at costs so low in comparison to those in any other country of the world that greatly increased productivity can flow without substantial capital expenditure. In this sense, the challenge here is precisely the reverse of that of the United States, where high-cost labour has made productivity almost entirely a function of capital-in-use per man employed. Increased productivity in Indian conditions can, and should, be obtained by a substitution of labour to overcome periods lost and, thus, result in a reduction of capital cost per man-hour.

Foreign Exchange Situation

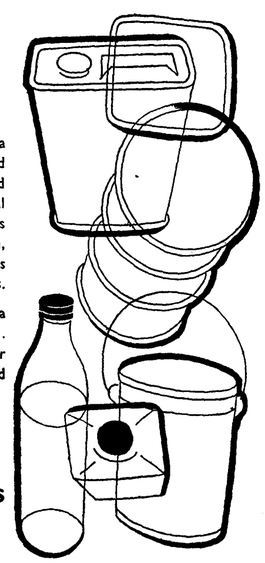
This is a challenge to Indian industry as, indeed, it is a challenge to the country as a whole at a time when the foreign exchange situation is likely to become worse because of the deterioration in the climate for foreign aid in the United States. There remains still in India's plans a vast amount of duplication of machinery in cases where existing machinery is inadequately utilised. There is also—as in every country in the world—the problem of placing at all levels in management a new dimension in the application of knowledge as the largest of the instruments of economic growth.



In allocating the growth rate of real national income a person, among the sources of growth, Professor Edward F. Denison has shown that between 1929 and 1957 "advance of knowledge" in the United States contributed 36 percent, as against a contribution by "capital" of only 9 percent. He calculates that in the 20 years from 1960 to 1980, the corresponding figures might be 46 percent, with capital contributing only 9 percent. It is obvious that we have now struck one of the most tremendous elements in economic growth which was outside the classical economic explanations, which taught that quantitative additions in capital and labour narrowly conceived were the only answers to economic stagnation.

The Third Culture

It is vital, if Indian industry is to think in these terms, to be equipped with the "advance of knowledge" to which Professor Denison has referred. Curiously this is very seldom one discipline, and belongs much more to that realm of general information which is often referred to as the "third culture". Sir C. P. Snow, it will be remembered, in his controversial Ride lecture at Cambridge four years ago talked about the "two cultures" by which he described the gulf between the humanities and the sciences kept wide apart in advanced university education. He has recently said that "it is probably too early to speak of a third culture already in existence but I am now convinced this is coming."



The "third culture" is precisely the synthesising of humanities and the sciences to apply modern scientific programming as, for example, in computer use with imaginative incentive approaches suited to special conditions of labour in each country, so that the harnessing of advanced knowledge to capital and labour can take place under the most fruitful conditions. Indian middle managers are not possessed of the third culture and too often are not possessed of either of the first two. This application of the third culture for management is in fact what the new science of management is most concerned about.

In India's case, more than in any other country's, the dividends from the application of scientific analysis of factory output under varying conditions and of industrial productivity, can achieve more fruitful results than in any other country in the world. Here, and not only in the solution of the problem of foreign exchange (which in any case will be extremely difficult) or in the problem of changes of human nature or of political environments (which will be slow), lie possibilities of an industrial breakthrough which could be decisive within a decade. Will Indian management acquire within a short period the "third culture" which Sir C. P. Snow believes is coming abroad? One cannot be too hopeful. But this, and no other, is the means of our deliverance.

THIRD PLAN EMPLOYMENT TARGET NOT LIKELY TO BE ACHIEVED

ADDRESSING the third meeting of the Central Committee on Employment in New Delhi on 31st August, 1963, Mr. Gulzarilal Nanda, the then Central Minister for Planning, Labour and Employment, frankly admitted that the employment situation was worse than what it was at the time of the formulation of the third plan. The two most distressing features, according to him, were, firstly, the number of persons to be provided with jobs was much more than what was estimated at the beginning of the third plan. Secondly, the scheduled rate of creation of employment opportunities had not been achieved. Quoting certain estimates prepared by the Planning Commission, Mr. Nanda said, that in the first two years of the third plan, the creation of employment in the non-agricultural sector had been only 30 percent of the target. At this rate, only 75 percent of the target (which again was quite inadequate in the context of the larger addition to the

By
N. DAS
Director-General, Employers Federation of India

working population) would be reached by the end of the third plan period.

Two Basic Factors

There are thus two basic factors in the situation today: (i) population is increasing more rapidly than was expected earlier and (ii) employment creation under the plan is shrinking. Added to these two factors is also the fact that the output of the educational institutions is rising every year, thus aggravating the problem of unemployment among the educated classes.

It is necessary to consider first the factor of increased population. Quite some time before the third plan employment targets were fixed, the planners had calculated that the new entrants in the employment market would number 17 million during the third plan period (1961-66), in addition to the 9 million backlog spilling over from the second plan. In other words, on the eve of the third plan, the planners were faced with the problem of finding jobs for 26 million people. Now, the earlier estimate of the rate of population increase has been totally upset by the 1961 census report. During 1951-61, population increased by 21.69 percent to 438 million, against 431 million estimated by the Central Statistical Organisation in 1959. As a result, the backlog at the end of the second plan period is now found to be higher than 9 million, while the net addition to the working force during 1961-66 will definitely be much more than 17 million.

It may be argued that the increase in total population need not necessarily mean an increase in the population in the working age group (*i.e.*, those between 15 and 60 years), at least not in the immediate future. This would have been true if the rise were due solely to a higher birth rate. But, as the census authorities have pointed out, over the past decade, while the birth rate has remained constant, the death rate has gone down steeply in the younger age groups. This has increased the dependency load. One should, therefore, accept the position that, at the end of 1966, pressure on employment from the demand side will be much greater than what the planners had envisaged in 1961.

The 1961 census also revealed that, over the last decade, there was little change in the distribution of the working force in various occupations. Agriculture still continues to cover about 70 percent of the total working force, and there has been only a slight rise in manufacturing (including household industry). Another revelation was that although there were more workers in every category in 1961, compared with their number in 1951 (this, of course, was inevitable on account of the increase in population), relatively more of them went into sectors like "agriculture" and "service" where there was already considerable underemployment and low productivity. In other words, the state of underemployment and unemployment in these sectors has become even worse.

Third Plan Target

It is necessary to examine more closely at the pace of employment creation. It was stated in the third plan that the programme included therein would provide additional employment opportunities to about 14 million people (3.5 million in agriculture and 10.5 million outside agriculture). Although at first this figure was arrived at on the basis of a predetermined investment, the Planning Commission, in its note on population and employment, published as an appendix to the *Third Five Year Plan*, made the calculations in some detail, sector by sector and phase by phase (*i.e.*, construction phase, continuing phase and the indirect employment phase).

At the meeting of the Central Committee on Employment held on 31st August, 1963, however, it was frankly stated by the Government spokesmen that, in many sectors, the anticipated additional employment had not been generated because the production targets of certain important and basic (basic to accelerated economic development and hence to the creation of employment) industries such as fertilisers, iron and steel, steel castings and forgings, paper, newsprint and cement had not been, and were not likely to be, reached. The production of coal and iron ore also has had to be adjusted to a lower level of demand, bringing in its train adverse repercussions on employment. Although a view was expressed that "the possible shortfalls in the employment targets on the civilian side might be made good by the increasing defence activity," the review of the actual employment trends over the past two years or so did not hold out any such promise. The appraisal made by Mr. Nanda that not more than 75 percent of the additional employment targets was likely to be reached by 1966 was not also seriously challenged.

This means that only about 11 million additional jobs would be created during the third plan, against 14 million originally estimated. Taken in conjunction with the additional backlog from the second plan and the larger number of new entrants into the employment market during 1961-66, the creation of less employment opportunities is likely to inflate the backlog of the unemployed at the end of the third plan to something like 17 million, against 12 million originally estimated: a very grim prospect indeed.

A clarification would be desirable at this stage. When one speaks of 12 million or 17 million unemployed, it should not be concluded that all of them would be completely without work. More than 50 percent of them are "underemployed" rather than "unemployed", but that makes the problem no easier of solution. In the rural areas, both unemployment and underemployment exist side by side; the distinction between them is never very sharp. In the urban areas, however, unemployment in the sense of being completely without work is the more common pattern.

Population Explosion

What exactly has gone wrong in the third plan period? Apart from the adverse consequences of the population explosion of 1951-61, which had not been foreseen by the planners in India in 1960-61, both the slowing down of the rate of economic development and the tardy implementation of certain employment generating programmes have been responsible for the present state of affairs.

The slowing down of the rate of development is revealed by the total national output figures. The third plan had envisaged that, at the end of 1966, as a result of development in all the sectors, the national output (at 1960-61 prices) would go up by 34 percent. In actual practice, however, the increase is taking place at a much slower pace. The year 1961-62, for example, registered only a modest 2.1-percent rise over the total national output in 1960-61. According to tentative reports, the rate of rise will be only slightly higher in 1962-63. This is having its inevitable repercussion on the volume of total additional employment. If national output continues to increase at the present sluggish rate during the remaining three years of the plan, the additional employment created would correspondingly go down.

What then is to be done? A hint was dropped by Mr. Nanda himself in his address before the Central Committee on Employment. "Our economic policies and plans must become much more employment-oriented than they have been so far," he said. What exactly did he imply? If he had implied that all policies and plans of the Government, whether they are investment policy, price policy, wage policy or taxation policy, should have one main guiding principle, namely, whether they can create the conditions necessary for an increase in employment, then it was a most significant statement indeed. On the other hand, he might have just meant that—in the plan as a whole—greater stress should henceforward be laid on the objective of employment promotion. Whatever it was, coming as it did from the lips of a Minister holding charge of both Planning and Employment, it was most welcome. Although the chapter on "Employment and Manpower" in the *Third Five Year Plan* opens with the sentence "Employment has been a major objective of planning in India" and goes on to say that "the goal of planning must be to absorb in gainful employment in each five-year period at least the equivalent of new entrants to the labour force," it is well known that these objectives or goals have hardly been kept in view in the actual formulation or execution of policies. Hence the importance of Mr. Nanda's statement.

I.L.O. Report on Employment

What should be the strategy of employment policy in a country like India? The recent I.L.O. report on *Employment Objectives in Economic Development* says that the basic policy requirements in a less developed country are, firstly, to raise the level of investment and, secondly, to explore all opportunities for raising the level of employment associated with a given level of investment *by changing its pattern and the composition and techniques of production.* It is necessary to examine these two strategies a little more closely.

It is almost an elementary fact that the larger the investment, the greater is the economic growth accompanied by increased employment. Raising the level of investment is, however, not an easy task. Even with a programme for raising the rate of investment up to 15 percent of the national income by 1965-66, there would have been a spill-over of 3 million unemployed from the new entrants alone (the spill-over will, of course, be much larger now—thanks to the rate of population increase since 1951). In actual fact, for reasons which need not be elaborated here, even the modest target of 15-percent investment of

DUNCANS

THE SYMBOL OF A PROGRESSIVE ORGANISATION

For over a century DUNCANS' DIAMOND has been renowned in the Tea Industry at home and abroad. Today, when Duncans, in keeping with the requirements of national development, are prominent in new and wider fields, DUNCANS' DIAMOND truly reflects the many facets of our name.

TEA : Annual production over 55 million pounds.

JUTE : Anglo-India Jute Mills Co. Ltd., the nation's largest.

the national income is not likely to be reached.

One should, therefore, have to think in terms of changing the pattern of investment and the composition and techniques of production. This does not mean that the country should give up *all* capital-intensive projects. It does mean, however, that it should have a second look at its projects and programmes, and consider to what extent the claims of more rapid economic growth leading to a fuller and better life in, say, *two or three decades hence* should have priority over the claims of more immediate employment *today and tomorrow*, may be with a slightly slower rate of development. It is not denied that a substitution of capital-intensive pattern of investment by labour-intensive patterns would bring in some conflicts between employment, output and growth objectives. It is also true that such other factors as export prospects, natural resource endowment, the size of the national market, the pattern of domestic demand and considerations of development strategy do, in practice, considerably reduce the manoeuvrability of the investment strategy. Some people would, therefore, prefer not to think of employment objectives at all.

I beg to differ. On the scale on which it exists in India, unemployment is such a scourge that steps must be taken to reduce its volume in the *immediate* future. I quote from the I.L.O. report again : "An increase in employment is an urgent need in itself. It gives more people at least a minimum income, it satisfies the human need for useful and creative activity and it provides more people with the opportunity for acquiring skills and the habit of work". The far-reaching economic and social consequences of being employed (as against being without work) are so great, for both the individual and the society, that the country should be prepared for some losses in other directions. The losses will not, however, be very heavy. Greater employment will increase the total output and, given appropriate measures to raise the level and improve the pattern of investment, more employment could lead to a higher rate of economic growth. This, in its turn, could facilitate the absorption of more labour at higher levels of productivity.

Change of Outlook

All that Mr. Nanda has asked for is a change of outlook. *Employment should be regarded as a primary objective and not as a mere by-product of development.* And I agree wholeheartedly with him, because I have been pleading for this approach over the past 15 years, if not longer.[1] Let the employment potential (both direct and indirect) be worked out in relation to all projects and let at least some of them be selected on account of their higher employment potential instead of other considerations of development. While some production will have to be capital-intensive, let labour-intensive techniques be used in at least some industries and projects. The argument that labour-intensive techniques yield smaller non-labour incomes and, therefore, a smaller investible surplus is not wholly valid; if capital-intensive techniques are used, the investible surplus may be greater, but as against this one has to offset the consumption of unemployed workers eating into the surplus.

As for under-employed labour, particularly in the rural areas, rural works programmes must be pushed on with greater vigour. Whether this should be done through community development programmes or otherwise is a matter of organisational detail. The important point is that there is considerable scope for labour-intensive activities in the rural areas and in small towns, and their possibilities have not been fully explored yet.

I now come to the problem of unemployment among the educated classes. As a result of continuous increase in the number of young men and women coming out of educational institutions (the output rose from 662,000 in 1955-56 to 865,000 in 1959-60), the problem has assumed new dimensions. According to estimates made by the Directorate-General of Employment and Training of the Central Ministry of Labour and Employment, the number of educated employed at the end of the second plan was of the order of about 1 million and that about 3 million new entrants who have studied up to the school-leaving standard or above, would join the employment market during the third plan period. While jobs would be available for some of them, the Directorate-General has estimated, from both actual figures of such persons registered at employment exchanges and the survey reports conducted by the National Sample Survey, that the number of educated unemployed towards the middle of 1963 would be of the order of 1.2 million. This is likely to increase to at least 1.5 million at the end of 1966.

A number of surveys have been made in recent years about the pattern of employment of educated persons. The reports show that, in the absence of any specialised skill, the bulk of them have to fall back on white-collar jobs like clerical occupations, which are already overcrowded. Yet many of them would have liked to go into professional and technical jobs even as learners or apprentices. Unfortunately, industry and commerce require trained men and have little use for persons who do not have at least some basic specialised skill. As a matter of fact, according to the Directorate-General of Employment and Training, side by side with the very large number of educated unemployed on the live registers of employment exchanges, there is an acute shortage of persons in many of the technical trades and skilled occupations. This "scarcity in the midst of plenty" indicates a lack of balance which demands the immediate attention of the Government, employers as well as employment-seekers.

TRENDS IN FOREIGN INVESTMENT IN INDIA: RISE IN EARNINGS RATIO

The inflow of foreign capital, including direct private investment in India, has increased over the years with the growing opportunities provided by a developing economy. The flow could be substantially increased if the economy could regain its momentum through the short-term measures proposed by the Government.

By
R. S. BHATT
Executive Director, Indian Investment Centre

THE inflow of foreign private capital into a country is basically governed by the difference between the rate of profits in the receiving country and the exporting country. Foreign investors have their own expectations about the differential rate of profit based on their evaluation of the degree of risk and uncertainty inherent in investment in a country other than their own. This risk and uncertainty are mainly influenced by the political and financial conditions, the balance of payments position, stability of exchange rate and the policies of the Government of the receiving country.

Whether or not a country desirous of attracting foreign private capital is able to offer the expected rate of profit to the prospective foreign investors depends largely on the cost and demand conditions prevailing in the receiving country. The cost of production is determined by the factor prices, facilities of transport and power and the efficiency of management of an industrial enterprise. The demand conditions are determined by the size of market which, in turn, depends on the rate of growth of the economy of the borrowing country, degree of foreign competition in domestic market and the scope of exporting the product to foreign countries. A discussion of the trends in the inflow of foreign private capital to India within this basic framework of analysis would be useful.

I shall first deal with the broad characteristics of the flow of foreign capital into India in the pre-independence period. This will point up the comparison and contrast concerning the problems of international capital movement affecting India before and after the achievement of independence. This is followed by an analysis of the recent trends in the foreign private capital inflow to India. Thereafter, the question of its prospects is examined.

Data on foreign business investments in India during the pre-independence period are scanty and sometimes not comparable. However, the figures that are available do indicate certain characteristics concerning the foreign investments which took place during this period. One of these features is that India received most of its foreign capital from one country, namely, Britain. According to an estimate by Sir George Paish, about £ 370 million of British capital was invested in India in 1914. It is estimated to have increased to £ 1,000 million in 1930. It is necessary to recall that substantial amount of British private capital was attracted in the form of sterling loans floated by the Government of India in the London market.

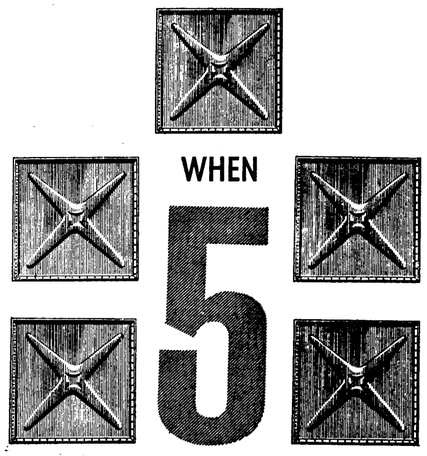
Inflow of British Capital

The inflow of British capital to India since 1860 was motivated by both political and economic considerations. Therefore, the British capital flow into India had followed what is called the "colonial pattern". It was invested mainly in the extractive industries such as mining, plantations and also railways which helped Britain to penetrate the Indian market as well as to export the raw materials which the British industries required. For instance, in 1911 about 75 percent of the British capital (excluding Government and railway securities) in India and Ceylon was sunk in the extractive industries and plantations. Thereafter, British capital had gone into jute manufactures, cotton textile mils, engineering, construction, sugar and paper mills and other miscellaneous industries.

Although India was a large country in terms of both its size and population, the share of India in the total British capital outflow was not very large. When the total British foreign investments had reached the highest level in 1914, India accounted for only 10 percent of this total. Nearly 65 percent of the British capital was invested in what are called regions of recent settlement such as the U.S.A., Canada, Australia, South Africa, Argentina and Uruguay.

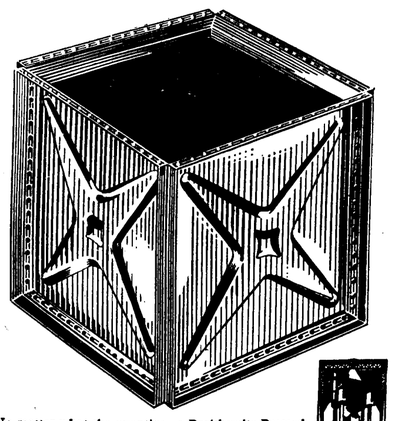
These countries in the nineteenth century were empty and fertile lands. The British investors in these countries concentrated their investments in public utilities, notably, the railways. It is also worth noting that the inflow of foreign capital to these countries was accompanied by an inflow of labour. From the pont of view of the present problem of attracting foreign private capital to India, what is important to know is the reasons why such a large proportion of the capital from Britain—the dominant creditor country in the nineteenth century—flowed to the regions of recent settlement.

Economic Stagnation



One of the reasons was that most of these countries did not have a subsistence economy when they started receiving foreign capital. In fact, these countries which were then underdeveloped had already had "splendid markets" for the foreign capital. India, on the other hand, experienced an economic stagnation for about 150 years—from 1800 to 1947. Even during the period from 1900 to 1947, India's *per capita* real income, according to one estimate, hardly increased by about 12 percent. Consequently, the Indian economy did not offer "splendid markets" to the foreign investor. Nor were the investment opportunities of such magnitude as to attract foreign capital.

Another important factor was that in most of the regions of recent settlement, the Government played an active part not only in promoting economic development, but also in attracting foreign capital. Moreover, whatever British investment which took place in India before 1947 was of the nature of an "outpost investment". It did not transmit its growth impulse to the backward sectors of the economy mainly because of the lack of a positive Government economic policy. However, as will be evident later, India in the post-second World War period, can be compared in these two matters with some of the regions of recent settlement.



There was also a third important factor which accounted for the diversion of a large proportion of the outflow of British capital to these regions. These countries having comparative advantage produced and exported foodstuffs and raw materials to the creditor country—Britain which was in great need of these commodities. British capital went into the regions of recent settlement with a view to encouraging the production and facilitating the export of industrial raw materials and foodstuffs. In this matter, however, India as an investment outlet for foreign capital at the present time, differs from the nineteenth century capital importing countries like the U.S.A., Canada, Argentina, etcetera. This is particularly so when one realises that the U.S.A. which is now the largest creditor nation in the world is not in need of importing on a large scale the primary products which the developing countries are able to export. The U.S.A. is inerested in the imports of minerals with the result that its private capital is attracted to those countries which possess large mineral resources.

Post-independence Picture

Since 1948, one gets a much better picture concerning the volume, composition and origin of foreign private investment in India. In this period, the orientation as well as motivations of the flow of foreign private capital into India are entirely different from what they were in the pre-independence era. There has been a distinct upward trend in the foreign business investment in India during the post-independence period. According to the estimates of the Reserve Bank of India, the outstanding book value of non-banking foreign private investment registered a steep rise from Rs. 255.8 crores in June 1948 to Rs. 690.5 crores in 1960—the latest year for which data are available. This is an impressive increase of about 175 percent during a short period of 12 years. It is estimated that in 1961, the inflow is likely to be in the neighbourhood of Rs. 70 crores. This has been made possibly by a positive net inflow of foreign private capital into the country in the form of fresh inflow of

cash, ploughed back profits of the foreign enterprises and import of equipment by these concerns. The net inflow of foreign business investment also shows a somewhat upward trend. It increased from an average amount Rs. 26.6 crores for the period 1948 to 1955 to Rs. 78.4 crores in 1960.

As for the industrywise composition of the foreign business investment, one finds that a substantial proportion is invested in the petroleum and manufacturing industries. Their combined share has gone up from 36.3 percent in 1948 to 64 percent in 1960. Again in the broad category of the manufacturing industries, industries like chemicals, machinery, metal and metal products have increased their relative shares (See Table 1). In the case of metals and metal products, it went up from 11.3 percent in 1948 to 32.4 percent in 1960. Similarly, the relative shares of chemicals and allied products and machinery and machine tools increased from 11.3 percent and 1.7 percent, respectively, in 1948 to 13.2 percent and 4 percent, respectively, in 1960. Thus the pattern of foreign private investment has been consistent with the industrial priorities laid down in the five year plans.

TABLE I

INDUSTRYWISE BREAK-UP OF FOREIGN BUSINESS INVESTMENTS 1948 AND 1960
(Rs. million)

Name of the industry	At the end of June 1963	Percentage share of each industry to total foreign business investment in June 1948	At the end of 1960	Percentage share of each industry to total foreign business investment in 1960
* Manufacturing	707	27.6	2,894	42
a. Transport equipment	10	1.4	218	7.5
b. Machinery and machine tools	12	1.7	110	4

* Percentages in the sub-groups in the manufacturing sector are worked out in relation to the total foreign business investments in that field.

Turning to the countrywise origin (See Table 2) of private business investment, one finds that the U.K. continued to be the largest source for importing private capital. The British capital amounting to Rs. 206 crores in 1948, accounted for 80 percent of the total foreign private investment in India. In 1960, however, its relative share declined to 64.6 percent, although in absolute terms, the highest amount of foreign investment in the country belonged to British investors. It is encouraging to note that a steep rise in the American private investment in India from Rs. 11.2 crores in 1948 to Rs. 112.7 crores in 1960 was largely responsible for the relative fall in the share of British private capital. The relative share of the U.S. private capital in India increased rapidly from 4.4 percent in 1948 to 16.3 percent in 1960. The outstanding book value of the Swiss and West German private capital was of the order of Rs. 8.9 crores and Rs. 6.8 crores, respectively, in 1960 as against Rs. 5.4 crores and Rs. 1.0 lakhs in 1948.

Countrywise Origin of Capital

It may be pointed out that these trends of the composition and countrywise origin of foreign private capital in India have been consistent with the general trends in the international capital movement. After the first World War, the U.S.A. emerged as the largest creditor nation. It continues to be so also in post-second World War period. It is, therefore, significant to note that the share of the U.S. private capital in India has increased since 1948. Moreover, the U.S. private capital has so far gone to Latin America in the form of direct investment partly for manufacturing for the domestic market and partly for developing extractive industries for export purposes. In the capital-importing advanced countries of western Europe and Canada, about two-thirds of the total U.S. private capital is invested in the manufacturing industries to serve the domestic markets of the capital-importing developed countries. That shows that the U.S. private capital is not so much concerned about the potential competition that the foreign manufacturing industries in which the U.S. capital is invested may offer to the domestic U.S. industries provided the capital importing countries offer sufficiently large domestic markets to the manufacturing industries. In future, the manufacturing industries in India would provide a large and growing scope for foreign private investment since the Indian economy with its rapidly rising level of national income would create an expanding domestic market for the products of the manufacturing industries.

The upward trend in the outstanding amount of foreign private capital tn the post-independence period was influenced by certain positive factors. The Indian economy after independence offered new and growing investment opportunities to the private sector and the foreign investors. The new investment opportunities were created by the prospects of rapid economic growth in turn generated optimistic expectations on the part of the entrepreneurs concerning the rate of return on their investments. The size and natural resources of India, the actual and planned rate of economic growth, the strategy of economic development and the Government economic policies—all were responsible for creating the favourable prospects of an expanding economy.

Industrial Resources

Although the size of a nation may not be a decisive factor affecting the rate of economic development, it does exert some influence on the pace and pattern of economic growth. The economic structure of a large nation would be more diversified just as the U.S.A. with its large size has already developed a broadbased and diversified industrial structure. This happens because there is a wide variety of natural resources in a large country. Moreover, a big country has the potentiality of supporting plants not merely of a minimum scale determined by technical forces, but of an optimum size. India which possesses the largest high-grade iron ore resources in the world and also the third largest combination of iron and coal resources next only to the U.S.A. and Russia, holds out a very promising future for a diversified and broad-based industrial growth of its economy.

The actual rate of growth achieved during the last decade of planning has already laid the foundation for a rapid industrialisation of India in the years to come. The Indian economy has registered a rise of 42 percent in the real net national income during the period 1950-51 to 1960-61. The *per capita* real income in 1960-61 was also higher than in 1950-51 by about 18 percent. The post-independence economic growth was made possible, among other factors, by a considerable increase in the rate of investment. As against a 5 percent rate of investment in the pre-plan period, it went up to 8.5 percent at the end of the first plan in 1955-56 and to about 11 percent at the end of the second plan in 1960-61. The investment was financed partly by domestic savings and partly by foreign capital in the form of aid and private investment. The average rate of domestic savings during the first plan was 6-6½ percent. It increased to 8 percent during the second plan. The relatively large gap between the rate of investment and the rate of domestic savings during the second plan was bridged by the inflow of foreign aid and foreign capital. About 24 percent of the total net investment during the second plan was financed by external resources.

Besides the rising rate of growth, the strategy of economic planning, namely, to attain the stage of self-sustained growth for the Indian economy by the end of 1975-76 also tends to accelerate the process of creating new avenues of investment. This strategy, among other things, implies a rapid development of either import-substitutes or export industries. Thus Indian planning has assigned a high priority to the development of basic and heavy industries such as metals, machinery, chemicals, machine tools, electrical goods, transport equipment, cement, paper, etcetera. As pointed out earlier, Table 1 indicates the uptrend in the flow of foreign business investment in these industries. Furthermore, these are also the industries included in the illustrative list of 26 industries in which foreign capital participation is ordinarily welcome by the Government of India.

Rôle of the Public Sector

Another important aspect of economic planning in India is the rôle of the public sector in stimulating economic growth of the country and its bearing on private investment both domestic and foreign. This writer believes that the pattern of public ivnestment itself has created new and profitable opportunities of investment for the private sector in India. This is so because a substantial proportion of public investment is devoted to the building up of overhead facilities such as transport, power, irrigation, education, etcetera, and basic industries, especially iron and steel. Rostow and Millikan, prominent American economists, have observed that "public and private investment (in India) are not alternatives, but can support each other in the early take-off stage of development . . . The purchasing power created by public investment and the improved transport, communication, power and other services resulting from the activities of the public sector have created an environment (by generating consumer demand and by lowering cost of production due to the external economies) in which private investment opportunities have multiplied." The availability of infrastructure facilities in particular has a very favourable impact on the inflow of foreign private capital to India because it raises the "absorptive" capacity which is much higher in India than in most of the emerging nations of Asia and Africa.

Within the framework of the growing investment opportunities for the private sector, the Government's policy has played an important rôle in attracting foreign private capital. Realising the importance of foreign private investment from the points of view of augmenting the domestic resources for capital formation, increasing the industrial efficiency by obtaining the foreign technical know-how and easing the pressure on balance of payments, the Government of India since 1949 has followed a "constructive, helpful and pragmatic" policy towards foreign business

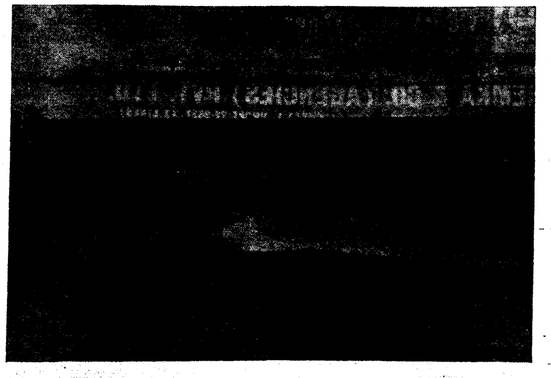
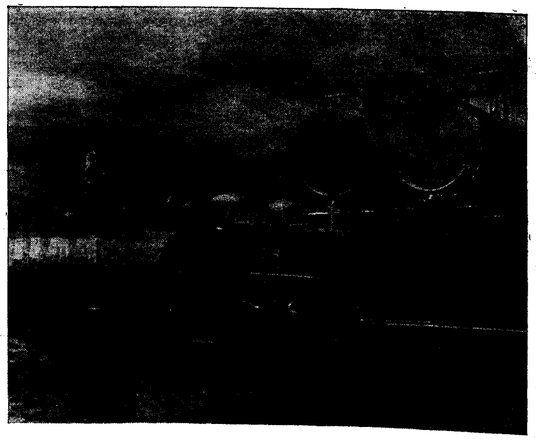
investment. In fact, the measures aimed at attracting foreign investors have made the growing investment opportunities in India really "commercial propositions". The degree of risk and uncertainty inherent in investment has been made much lower in India than in most other developing countries and, not much higher than what it is in the capital exporting countries.

This is so because of various factors such as (a) the government assurances concerning the payment of fair and adequate compensation to foreign investors; (b) its non-discriminatory treatment accorded to foreign capital (c) freedom of remittance of profits and dividends and repatriation of capital; (d) a *régime* of stable exchange rate; (e) a clean record of honouring foreign obligations; and (f) stable political conditions in India. As a result of these forces, the risk premium on foreign private capital is reduced. Thus, the foreign investor is willing to come to India at a differential rate of return lower than what he would expect in most other developing countries.



The Government has also offered a number of tax incentives and exemptions with a view to increasing the profitability of industrial investment in India. Two important incentives are the tax holiday, that is the tax exemption of profits of new industrial undertakings up to 6 percent of capital employed for the first five years and a deduction from taxable income equal to 20 percent of the plant and machinery given as a development rebate in the year of installation. These tax benefits are available to both the Indian and foreign corporations. Besides, certain special incentives are also created which apply only to foreign capital.

Profitability in India



A few recent figures support the writer's statement on profitability in India. The earnings ratio on total U.S. business investment in India, according to the U.S. Department of Commerce, increased from 8.8 in 1960 to 13.3 in 1962, compared with 12.6 and 14.3 in the Philippines. These earnings ratio in India compare well with those in the developed western Europe. It was 11.5 in western Europe in 1960 and declined slightly to 10.9 in 1962. Again if one takes the earnings ratio on U.S. private investment in manufacturing industries only, one is convinced about the bright prospects of a high rate of return on foreign investment in India. For example, the earnings ratios on U.S. investment in manufacturing were 19.2 and 20.6 in India in 1961 and 1962, compared with 15.7 and 18 in the Philippines and 10.2 and 12.6 in western Europe. Again, according to the study of 1,333 companies having a paid-up capital of over Rs. 50 lakhs conducted by the Reserve Bank of India, profits after tax were quite high in certain industries in which foreign investors are usually interested. For example, profits after tax as percentage of net worth was 16.4 in medicines and pharmaceuticals, 13.4 in electrical machinery appliances, 13.1 in basic industrial chemicals, 12.6 in machinery other than transport equipment, 12.3 in other chemicals, 12.0 in mineral oils and 11.2 in iron and steel.

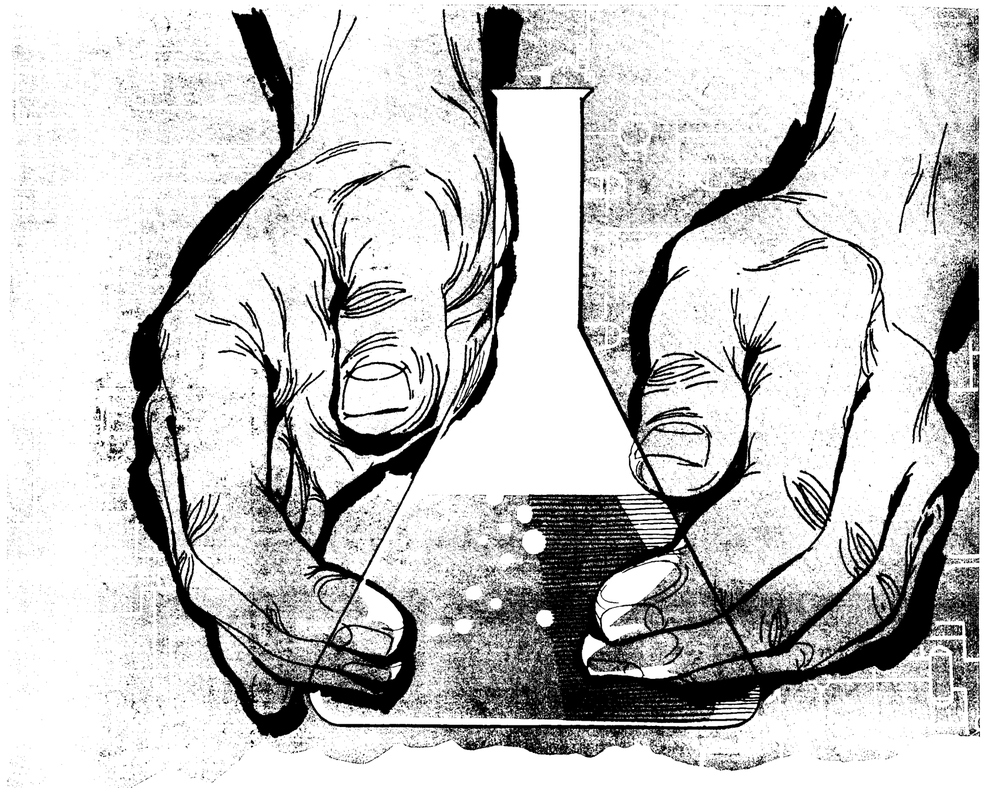
It would appear from the analysis of the salient features of the economic progress during the last decade, that the factor which largely influenced the investment climate in the country was the sustained growth of a fairly appreciable level in the various sections of the Indian economy. Against this background of the long-term trends, the recent developments which have affected the climate adversely require special mention. First, the slow rate of growth in the first two and a half years of the third plan has indicated that the basic factors of productivity in agriculture and industry have been slow in generating the flows of income at all levels which again determine the level of investment. Secondly, the Chinese aggression, which was sudden and totally unexpected, created, temporarily, conditions of panic in all markets. At the same time, the external aggression gave the country a rude awakening to the immediate needs of building up adequate defence. These required financial resources on an immense scale. Since the major plans of development under implementation were themselves essential for strengthening defence, the Government decided, and rightly, that the requirements of development and the special needs of defence should be simultaneously met.

It was, therefore, inevitable that fresh resources had to be raised to meet the increased outlay, especially

Oil well in Ankleshwar

An oil-filling station

on defence. The heavy taxation imposed through the 1963-64 Budget of the Government of India further depressed the markets. The impact of various fiscal measures, especially the super profits tax, on the forward-looking expectations of entrepreneurs and investors was adverse. In combination with other factors, this psychological attitude tended to slow down the economic activity further. The effects of the slack in the economy are bound to persist for some time. However, the recent measures taken by the Government are likely to restore market confidence to some extent. The broadcast of Mr. T. T. Krishnamachari, Central Finance Minister, had a very good effect on the markets. He has underlined the Government's positive attitude to economic growth. He observed, "It is my intention to review the present fiscal and related policies with reference both to the immediate needs of the economy as well as the requirements of growth and social justice in the years to come". All these recent developments will certainly improve the short-term expectations of the entrepreneurs and investors, who, in turn, will for the immediate future, revive the investment activities in the country

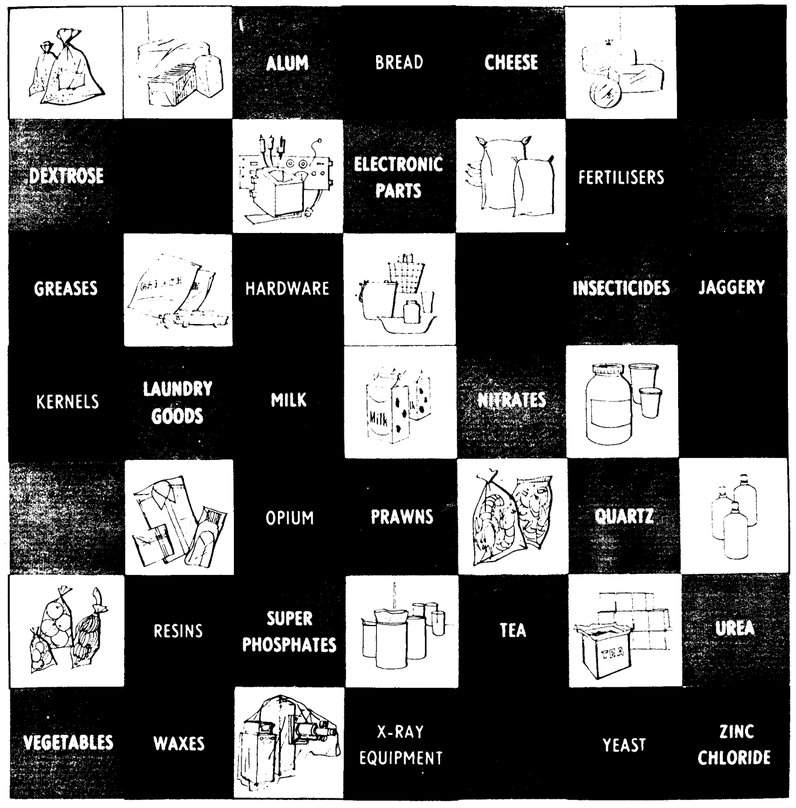


Need for Fresh Momentum

However, the basic question is the imperative need to sustain the optimistic expectations of the investment decision-making units. This calls for all the measures necessary to impart a momentum to the Indian economy which it experienced during the last decade. It is not merely the target of the planned rate of growth, but the capacity to attain the planned rate of growth which sustains the confidence and optimistic outlook of the investors.

In this connection, it is heartening to note that both the Central and State Governments have decided to proceed as a matter of urgency to implement the suggestions made by the Planning Commission in its third plan mid-term appraisal. Accordingly, field project studies would be undertaken with the help of technical experts in order to facilitate advance action on them and to ensure greater continuity in planning. Special efforts would be made to reduce the cost of construction of the important projects. Specific detailed programmes of import substitution would be carried out for various industries in order to increase the availability of foreign exchange for the essential imports. Moreover, one may reasonably hope that the cumulative effects of the agricultural measures adopted during the first two and a half years of the third plan, would considerably raise the agricultural output in the coming years. The improvements in the transport as well as power facilities and the increased availability of foreign exchange resources due to the speedier utilisation of aid received, larger inflow of aid and rising exports, would brighten the long-term prospects of industrial growth.

Given the favourable conditions for a rapid economic growth of India, the inflow of foreign private capital would certainly increase. This is because of two primary reasons. Firstly, the decisions of the foreign investors are very much influenced by the state of the economy of the capital importing country. Secondly, the optimistic expectations of the entrepreneurs of the country desirous of receiving foreign capital are crucial for setting up industrial ventures in collaboration with the foreign investors. The capital exporting countries, especially the U.S.A., have large surplus savings which they would like to invest profitably in the developing countries. The foreign investors have been appreciative of the growth potentialities of India and the Government economic policies. Hence with her immense natural resources, especially iron ore and coal, with her potentially large domestic market and the prospects of penetrating the third country markets, with her current level of high profitability in important industries, having growth prospects and with her stable political conditions, India can confidently hope to induce on a larger scale than hitherto foreign private capital to flow into the country, once the Indian economy regains its momentum. Such a larger inflow, in turn, would accelerate the process of economic growth by exploiting the investment opportunities created by the growing Indian economy.



...emphasis on quality

As a country develops, as its technology improves, as competition grows, product quality becomes a yardstick of progress, a symbol of endeavour. In the laboratory, in the deep recesses of scientific minds, in the hands of competent technologists, quality is the end-product of skill, a paean to individual and collective effort. ■ By ceaselessly striving to improve product quality, UNION CARBIDE INDIA LIMITED participates in the growth of a great scheme of industrialisation.

Development Banks Contribute More Finance For Industry

Development banks have done much to mobilise savings for industrial development. Mr. Parekh reviews their progress and answers some criticisms.

SAVINGS whether they accrue out of personal income, corporate profits or public revenues, are the ultimate source of industrial capital. Since increasing availability of savings is indispensable to sustained economic growth, their mobilisation is as vital as their generation in the modern world. The rôle of financial institutions as mobilising agencies for capital has, therefore, become more and more important. Banks, insurance companies, investment trusts, hire-purchase financing companies, building societies and development banks have assumed a steadily growing rôle, even though these credit institutions are intermediaries only which do not themselves create much savings.

Each of these various agencies plays its own distinct rôle in capital formation. Industrial entrepreneurs find

By
H. T. PAREKH
General Manager, Industrial Credit and Investment Corporation of India

that the resources they are themselves able to generate fall short of their needs and they have necessarily to draw in one form or another on the liquid resources available with these financing bodies.

Although these agencies are all in some way concerned with the supply of industrial capital, the long-term requirements of industry are being provided increasingly by the specially created industrial finance corporations better known as development banks. In underdeveloped countries particularly, they have become the chosen instrument through which industrial finance is made available in the appropriate manner to different sectors of private industry, small-scale, medium-scale and large-scale, especially that portion of finance which the existing channels are not able to provide. The development banks are meant to supplement the available sources of capital. What is more, since the objective is to broadbase the economy by attracting a new class of entrepreneurs and new types of industry, they are specifically meant to foster this kind of growth. These institutions thus become the focal points for much useful development.

Project Approach

Not only do they provide capital, but by processing industrial projects from all relevant angles, they assist in a more orderly development of those industrial projects which are viable. The "project approach" involves scrutiny of capital cost, cost of production, market, management, and financial structure without which the viability of a scheme cannot be assessed. To new entrepreneurs, the process of applying for and obtaining the loan itself becomes an education of much value. Successful starting of industry requires many long-term considerations which are often overlooked by them. The function of development banks is to make the entrepreneurs realise that they must first examine the different aspects of their project fully before they can expect to get the finance they need. The banks thus enforce certain financial discipline on their borrowers, discipline which is needed to inculcate a scientific spirit in the newly growing industrial community.

Apart from helping the project itself through their scrutiny, development banks assist the process of planning itself. Any form of national planning, to be practical and useful, needs the support of planning at lower levels, which the operations of development banks promote through the "project approach". Without this kind of screening, there would be the risk of greater wastage of capital and other resources which are in short supply. These financing institutions thus perform a rôle which is much more than that of a pure banker. They aid the process of development, which has more aspects than the mere provision of capital.

Financing Institutions

If this is the *raison d'être* of development banking, what is its contribution in financial and physical terms? Facilities for industrial finance are provided in India through the Industrial Finance Corporation of India, the Industrial Credit and Investment Corporation of India and the 15 State Financial Corporations. In addition, commercial banks grant medium-term loans, for which they can draw on the Refinance Corporation for Industry run by the Reserve Bank of India. The latter also operates a guarantee scheme in order to encourage the lending institutions to grant loans to small-scale industry. Moreover, the National Small Industries Corporation (N.S.I.C.) procures industrial equipment for small entrepreneurs under a hire-purchase arrangement. The National Industrial Development Corporation (N.I.D.C.), also a government agency, has given large loans to cotton textile and jute industries for rehabilitation. The Film Finance Corporation seeks to meet the special needs of the film industry which is not able to obtain finance through the normal channels. Many State Governments have recently started industrial development corporations in their States for helping industrial development within their territories.

This broad pattern of financing agencies is going a long way in meeting the diverse requirements for capital of different sectors of industry in the country. Some of the agencies, such as the industrial development corporations in the States, are hardly likely to go far because they do not have the resources to be effective. The biggest contribution, however, has been made by the I.F.C., I.C.I.C.I. and the S.F.C.s, as Table I shows.

The total assistance sanctioned by these agencies is broken down further geographically to show the extent of development in each State. As the total of these figures indicates, these development banks during the period of their existence have approved industrial assistance of nearly Rs. 300 crores to about 3,800 entrepreneurs, a large number of which are new units. It needs to be mentioned that these agencies are not intended to provide the entire finance needed by enterprises, but only such part as cannot be otherwise raised by entrepreneurs. The institutions act as catalysts which draw out much more finance than they are themselves able to provide. For instance, in the case of the I.C.I.C.I., for every rupee which is provided by that Corporation, on average, Rs. 3 to Rs. 4 are provided from other sources.

In terms of employment, the above aid has helped to create about 300,000 new jobs, half of which can be attributed to the assistance provided by the State Finance Corporations. In physical terms, to give a few instances, these financing agencies have helped in producing over 100,000 tons of paper, 500,000 tons of sugar, 1.5 million tons of cement, 185,000 tons of steel tubes, 16,000 tons of steel wire ropes, 178 million yards of P.V.C. and V.I.R. wires and cables, 3,700 miles of power cables, 300,000 tons of superphosphate, in each case a significant proportion of the total output in the country.

The third five year plan has laid down the targets of financial outlay

for industry in the private sector at Rs. 250 crores a year. Read in this context, the financial assistance sanctioned by development banks last year exceeded Rs. 75 crores, which can be regarded as a not unimpressive record.

Criticism of Working

It may be useful at this stage to examine the validity of different kinds of criticism which are heard in certain quarters. It has been said that the time taken by development banks to process the applications is needlessly long and therefore frustrating to the borrower, who ought to get the loan on his credit-rating, as is the case with commercial banks. This view is based on the misconception that there is no major difference between the long-term industrial loan and the short-term commercial accommodation. The critics fail to appreciate that an industrial loan is made for acquiring fixed assets whose profitable utilisation would generate funds from which the loan would be repaid. This can be determined only by a careful scrutiny of the project. Moreover, if creditworthiness were to be the only criterion, only the wealthy and established parties would be eligible and the new class of entrepreneurs whose creditworthiness is not yet established would *ipso facto* be excluded. That would defeat the very purpose for which development banks are set up.

Another criticism relates to the long time taken to make the loans effective and to disburse the amount. In the nature of things, a certain amount of time-lag is inherent in making the loans effective because the borrower, after a loan is sanctioned, proceeds to negotiate for the purchase of machinery, for construction of factory, for raising the total capital and to obtain the various licences all of which are time-consuming. Moreover, payment for the machinery and plant is required to be made in instalments as the equipment gets ready, and, therefore, the time-lag in disbursement does not necessarily mean any delay in the setting up of the project.

A more serious criticism is that the development banks' lending has not helped the less-developed areas to the extent necessary while they have helped more the States which are already industrially advanced. The State-wise break-down of assistance given above may indicate this trend, but what requires to be recognised is that the industrial policy is determined by the Government; development banks do not initiate that policy, but as financing agencies, can only implement it. Tables II and III show the distribution of licences of the Government during 1962 and the present State-wise distribution of joint-stock companies at work.

TABLE II

STATE-WISE DISTRIBUTION OF INDUSTRIAL LICENCES ISSUED IN 1962

State-wise Distribution of Loans

The issue of industrial licences by the Government itself shows that Maharashtra, West Bengal and Gujarat, which are all advanced States, continue to lead, these three States having obtained 50 percent of new licences. The table showing State-wise distribution of companies at work and of new registrations also show that West Bengal and Maharashtra are industrially in the forefront and continue to remain so, but in the race for development, Madras has been showing a somewhat greater rate of progress.

The financing institutions come in only after the industrial licences have been granted. It would be difficult for them to direct the location of enterprises. Nonetheless, the figures show a gradual widening of the locational base of industry. While Maharashtra and West Bengal remain prominent in attracting industry, their relative share is smaller today than it was a decade ago; the marginal rate of growth in other States is greater than in these two advanced States. Once the less advanced States have established a certain industrial base, then industrial progress would gather momentum.

The contribution which the specialised financial institutions have been able to make to industrial development of the country has now begun to be felt. In the field of industrial finance they have not only established themselves, but have also been able to make a significant impact. The base of the capital market of the country has steadily broadened as a result of the operations of the development banks. Between them and the commercial banks, the problem of providing industrial loans has been very largely met.

Industrial finance in the form of permanent capital by way of share capital, which was hitherto found to a considerable extent through insurance companies' investments, is now met to some extent also through the underwriting and investment activity of development banks. They are acting as intermediaries who are willing to hold industrial securities till such time as the industry is established and the private investor is ready to invest his savings in such securities. The field of stock market activity is thus widened and the special financial institutions serve to feed the stock market with industrial securities as the demand for them from private investors appears. The new development banks act as one more pillar of the investment market and assist the other established financing agencies in supporing the country's fast growing industrial structure.

Office space seems to grow when cumbersome partitions are replaced with glass. Rooms look lighter, brighter and so much more elegant. It's not surprising glass is finding its way into more and more homes, stores, schools and restaurants —wherever light and space are important considerations.

Glass is so practical too. It keeps out noise and dust and lets in natural light. And keeping glass clean is the easiest thing in the world.

Available in a wide variety of sizes and thicknesses, and quality tested at every stage of manufacture, there's an HPG sheet glass to suit every purpose.

For the finest, most durable glass you can depend on HPG

MARTIN BURN LOOK BACK TO OVER *180 YEARS OF SERVICE TO INDIA*

...to be able to compute this service by decades, not by years alone... to recall that our creed has consistently been the development of our country's resources through engineering and allied enterprises... to take pride in planning that makes the many units in our organization fall into a rational and complementary group and each one a leader in its particular field, a position which some of them, early pioneers in India, held even in the last century. For us looking back is a worthwhile proposition —an incentive to *move forward.*

AMONG THE COMPANIES IN THE MARTIN BURN GROUP ARE:

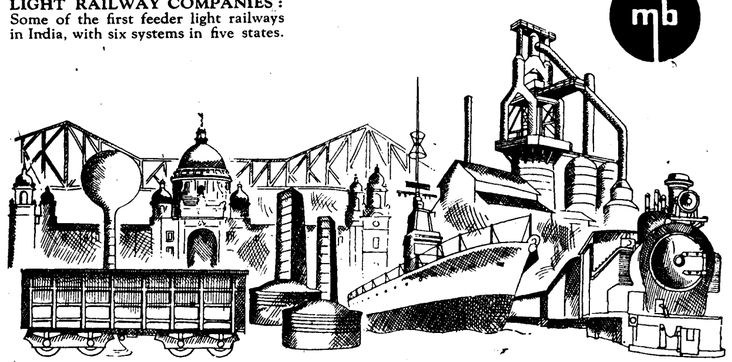
THE INDIAN IRON & STEEL CO. LTD.: With a million ton integrated steel plant at Burnpur, the largest foundry in the Commonwealth at Kulti and its own collieries and iron ore mines, IISCO has an enviable record in production efficiency.

BURN & CO. LTD., HOWRAH WORKS: Pioneers in foundry practice in India, in structural steelwork fabrication and the manufacture of rolling stock—the origins of the Company go back to the year 1781.

BURN & CO. LTD., REFRACTORY & CERAMIC GROUP: Apart from stoneware pipes and chemical stoneware, the works of this group—eight in number and located in four states—manufacture nearly all types of refractories to meet the requirements of India's steel industry, power undertakings, railways, ordnance factories—in fact, any industry requiring refractory material for the maintenance of furnaces.

THE INDIAN STANDARD WAGON CO. LTD., SANTA: The oldest Indian unit started for the specific purpose of manufacturing railway rolling stock—has been mainly responsible for building up the wagon building industry. Also manufactures springs, forgings, pressings and stampings for heavy industry as well as automotive components.

THE HOOGHLY DOCKING & ENGINEERING CO. LTD.: Established in 1819, the Company has a shipbuilding yard, a dry dock and extensive workshops at Salkia.



ROBERT HUDSON (INDIA) LTD.: A premier concern in its own field, the Company devotes itself to all types of light railway engineering—has important connections with the mining industries.

LIGHT RAILWAY COMPANIES: Some of the first feeder light railways in India, with six systems in five states.

ELECTRIC SUPPLY COMPANIES: Pioneers again in the generation and distribution of domestic power in India—serve 45 towns in Uttar Pradesh and Madhya Pradesh.

THE VAUGHAN BURN CRANE COMPANY LTD.: A collaboration with The Vaughan Crane Company Ltd. of Manchester — manufactures hand operated and electric overhead travelling cranes and chain pulley blocks.

The Law on Company Contributions to Political Parties: Some Basic Changes

By

A SPECIAL CORRESPONDENT

FOLLOWING the Bombay and Calcutta High Courts' judgments on the modification of the objects clause of the memoranda of association of the Tata Iron and Steel Company and the Indian Iron and Steel Co. Ltd, with a view to allowing these Companies to contribute to the funds of political parties, considerable discussion on the question of permitting such practices have taken place in Parliament as well as outside. Political and moral issues apart, the discussions showed that there existed a good deal of confusion about the provisions of the Companies Act which have a bearing on such donations. There was a widespread impression, although quite erroneous, among people that the provisions of the Companies Act were lax in the matter. It was believed in some quarters that whatever limits to the making of such donations existed in law, they facilitated donations to political parties.

Consequently, the extremist opinion in the country demanded that there should be an outright ban on the making of contributions to political parties by companies under the Companies Act. A slightly less extreme view was that the permissible limits under the law should be further lowered. A number of private members' Bills had also been introduced in both Houses of Parliament, and some of them were discussed too. Although none of these went past the discussion stage, the discussions did lead to the amendment of the provisions of Section 293 of the Companies Act in 1960. Notwithstanding this, the pressure for further drastic changes continues.

Going back to the history of the question of permitting contributions to political parties by companies, the controversy did not exist until the submission of the report of the Bhabha Committee on company law. For the first time, a passing allegation about making sizable donations by certain companies in Uttar Pradesh was made in Parliament soon after the 1952 General Elections. It was only after this that the question came to be mentioned more and more prominently and debated hotly against the background of the happenings of the two successive general elections in 1957 and 1962.

Before the submission of the report by the Bhabha Committee and during the period the 1913 Act remained in force, separate Acts of Central Legislature or Parliament existed for facilitating companies to make donations to funds not connected with the actual working of the companies concerned. In the post-independence period, the first Act of this type to be passed was the Gandhi National Memorial Donations Companies Act, 1948, which was subsequently repealed and substituted by the Companies (Donations to National Funds) Act, 1951. Section 3 of this Act stated, "Any company may, notwithstanding anything contained in the Companies Act or in any other law for the time being in force regulating the affairs thereof and notwithstanding that the memorandum or articles of association of the company do not entitle it to do so by an extraordinary resolution passed in accordance with the provisions contained in Section 81 of the Companies Act authorise the making of donations to the Gandhi National Memorial Fund or the Sardar Vallabhbhai National Memorial Fund or to any other fund established for a charitable purpose which by reason of its national importance has been approved by the Central Government for the purpose of this section."

Permissive Legislation

This permissive legislation apart, the position under the Indian Companies Act, 1913, on companies' contributions to charitable and other funds not directly relating to the business of the company or the welfare of its employees, was that the directors enjoyed powers to make these contributions provided the "objects clause" in the memorandum of association of the respective company permitted it. That is to say, if the memorandum of association in its "objects clause" included a clause to that effect, the directors had the absolute discretion to contribute any amount, irrespective of whether the company made adequate profits or not, to any fund or funds whether political, educational, charitable or for social purposes. This was quite in keeping with the spirit underlying the old Act which placed the minimum possible restrictions on the powers of the company management including managing agents who enjoyed a place of pivotal importance in the corporate sector.

Later, because of irregularities alleged against company managements during the period ending with the second World War and the emphasis which came to be placed on the new rôle that the corporate sector was expected to play in pursuance of the Directive Principles of State Policy enunciated in the Constitution and the other objects emphasised in the Industrial Policy Resolution of 1948 as also in the first plan report, the Bhabha Committee made a number or recommendations restricting the powers of the company managements including managing agents and boards of directors. The only restrictions on the powers of directors in the provisions of Section 86H which was inducted in the substantive Companies Act of 1913 by the Amendment Act of 1936, were that the directors of a public company or a subsidiary thereof could not, except with the consent of the company obtained in general meeting, sell or dispose of the undertaking of the company and remit any debt due by a director.

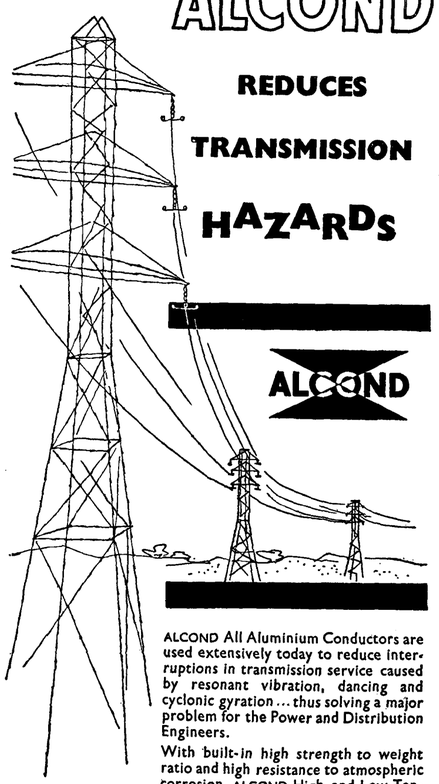
Suggested Restrictions

The Bhabha Committee, however, felt that some more effective restrictions should be placed on the activities of directors and company managements: It, therefore, suggested a number of restrictions to be added to those already existing in Section 86H of the 1913 Act and among these, the Committee suggested that the directors of a public company or a subsidiary should not contribute more than Rs. 5,000 a year to any fund without the consent of shareholders. This recommendation of the Committee was accepted for inclusion in the proposed Companies Bill by the Government. Accordingly, clause 272(3) of the Companies Bill, 1953, provided that the directors of a public company or its subsidiary should not except with the consent of such public company or its subsidiary in general meeting, "contribute or agree to contribute, after the commencement of this Act to charitable and other funds, any amount the aggregate of which exceeds or will, when taken with contributions made or agreed to be made before the commencement of this Act, exceed in any financial year, Rs. 5,000 or 2 percent of its average net profits during the three financial years immediately preceding, whichever is greater."

Later, as a result of the discussions in the Joint Stock Committee on the Companies Bill, the limit of the contribution to charitable and other funds which did not directly relate to the business of the company or the welfare of its employees was changed to Rs. 10,000 or 3 percent of the annual profits. Subsequently, the position underwent further change and according to the Bill as finally passed by both Houses of Paliament, Section 293(1)(e), among others, provided that the board of directors of a public company or a subsidiary thereof shall not, except with the consent of the company in general meeting, contribute to parties and other funds not directly related to the business of the company or the welfare of its employees any amount exceeding in any financial year Rs. 25,000 or 5 percent of the average net profits during the three financial years immediately preceding, whichever is greater.

Thus, the provisions of the 1956 Act for the first time placed a specific restriction on the powers of the board of directors of a public company or a subsidiary, to make contributions to the various funds. But in case the board of directors intended to make any contributions exceeding the limits prescribed in the aforesaid section, it was necessary for them to place the matter before the general meeting of the company, that is, before the shareholders. In other words, while the board of directors could contribute up to a certain limit, namely, to the tune of Rs. 25,000 even if the company were to show a net loss in any financial year, the company in general meeting was absolutely free to make any contribution it liked. But like the Act of 1913, it was even now necessary that the memorandum of association should expressly authorise within the framework of its objects clause the making of such contributions to the various funds.

Two High Court Cases



It was actually this requirement of law which actuated two of the biggest companies in the country on the basis of the high net profits earned by them to make, if they so liked, the maximum contribution of even above Rs. 32 lakhs in one case and Rs. 91 lakhs in another, that is, 5 percent of the average net profits for the three preceding years 1953-55 and to go to the High Courts for the necessary permission for altering the memorandum of association under the provisions of Section 17 of the Companies Act, 1956. These companies approached the respective High Courts for confirmation of the special resolutions passed at the general meeting of their shareholders and carried by the requisite majority. According to the provisions of law, due notices were given to the shareholders, creditors and debenture holders of the Companies as also to the Registrars of Joint Stock Companies of the State in which the two Companies were registered. Also according to provisions of law, notices concerning the proposed alterations in the memorandum of association of the two companies were published in the newspapers so that any one from the general public desiring to oppose the application could come forward to press his views before the court. The provisions of law thus provided that any change that was proposed to be made in the memorandum of association of a company, should be done in the full knowledge of the Government, of the parties directly concerned with the affairs of the company as also of the general public and with the approval of a court of law of the stature of High Court which would approve the proposal only after a judicious examination of the same in the limited as well as in the wider context of the interests involved.

In the Indian Iron and Steel case, the Company's original clause in the memorandum of association ran in the following terms:

> "To establish and support or aid, in the establishment and support of associations, institutions, funds, trusts and conventions calculated to benefit employees or ex-employees of the company or its predecessors-in-business or dependents or connections of such persons and to grant pensions or allowances and to make payments towards insurance and to subscribe or guarantee money for charitable or benevolent objects or for any exhibition or for any public, general or useful object."

The Company got the following special resolution passed proposing the alteration of the aforesaid clause and brought it before the Bombay High Court for confirmation. The special resolution read:

> "Sub-clause 3(16) of the memorandum of association of the Company be deleted and substituted by the following two sub-clauses.
>
> "16 (a): to subscribe, contribute or guarantee money for any national, charitable, benevolent, political, pub-

lic, general or useful object or fund or for any exhibition ;

16 (b) to establish and support or aid in the establishment and support of associations, institutions, funds, trusts and conventions calculated to benefit persons who are or have been employed by or who are serving or have served the company or its predecessors-in-business or the dependents and connections of such persons and to grant pensions and allowances and to make payments towards insurance."

The reason put forward by the Company in its application in support of its proposed change was that the "prosperity of the Company's business is very much dependent upon the industrial policy of the Central Government of the day. Further, the Company's principal business being the manufacture of iron and steel, the sale and distribution of the Company's products, the prices to be received by the Company for the sale and the manufacturing and other policies to be followed by the Company are all subject and closely related to the requirements of the Central Government with which the Company has intimate dealings, transactions and connection.

In order to enable the Company to carry on its business more efficiently, it is necessary that it should be enabled to contribute to the funds of political parties which will advance policies conducive to the interests of the industries in general and of the Company in particular and also the Company should be able to contribute to other funds and objects of national importance."†

In the case of the other Company, the Tata Iron and Steel Co. Ltd, permission was sought by the Company to the change of sub-clause (r) of clause (3) of its memorandum of association, namely, the clause outlining the objects of the Company, before the Bombay High Court. Sub-clause (r) ran as follows:

"to support and subscribe to any charitable or any public object and any institution, society or club which may be for the benefit of the company or its employees or may be connected with any town or place where the company carries on its business ; to give donations, gratuities or charitable aid to any person or persons who have served the company or to the wives, children or other relatives of such persons ; and to form and contribute to provident and benefit funds for the benefit of any persons employed by the company."*

The Company proposed alteration of the aforesaid sub-clause into two parts, namely, (r) (i) and (r) (ii) ; the first one dealt with the power of the Company to incur expenditure, broadly stated, for the welfare and benefit of its employees and the second sub-clause which was sought to be included, was as follows:

"(r) (ii) To subscribe or contribute or otherwise, to assist or to guarantee money to charitable, benevolent, religious, scientific, national, public, political or any other institutions, objects or purposes or for any exhibition."*

The two Companies submitted to the courts that their proposals were covered by the provisions (a) and (b) of sub-clause (1) of Section 17 of the Companies Act which permitted such alteration of the memorandum of association if the Company believed that it would help running the business more economically and efficiently and by new or improved means. Although the original sub-clause in the objects clauses of the memoranda of association of the two Companies in a broad sense could have been interpreted to cover political contributions, these Companies, as a measure of abundant caution, approached the courts for approving a specific change to the effect in the memoranda of association so that any contribution made by them to political parties at the time of the general elections could not later be held as illegal within the provisions of the Companies Act.

Indian Iron and Steel Case

In the Indian Iron and Steel Company case, the learned judge, Mr. Justice P. B. Mukherjee, after discussing the desirability of making political contributions by companies in the wider context of society and the body-politic of the country passed the following order on the application of the Company:

(a) Clause 16(b) as amended by the special resolution is confirmed without any condition.

(b) Clause 16)a) of the memorandum as altered by the special resolution is confirmed subject to the following conditions:

(1) It shall remain effective and operative for a period of six years from the date of the passing of the order, that is, up to 7th March, 1963, and that sanction by the Court would elapse and stand revoked upon the expiry of the period of six years unless further extension is hereinafter ordered ;

(2) During the period of six years, the Company shall show in their profit and loss account every year every single contribution directly or indirectly made to any particular political party by name, the amount and date of contribution and shall show the same under the head "miscellaneous expenditure" in part I of Schedule VI of the Companies Act, 1956 read with clause 3(x)(i) of Part 2 of Schedule VI ;

(3) Upon the Company satisfying this Court on a verified petition at the end of the period of six years that it has faithfully carried out the above directions of the Court showing its contribution to the political funds as aforesaid and upon its desiring to continue to do so, the Company will be free to apply for and obtain continuance of this Court's sanction to the alteration in the Memorandum contained in clause 16(a) as amended by the special resolution of 7th December, 1956, passed at the Company's general meeting for such further period and upon such terms and conditions as the Court thinks fit under Section 17(5) of the Companies Act, 1956.

(c) No condition limiting the amount of contribution was imposed and the question of amount was left to the wisdom and discretion of the shareholders in accordance with the Companies Act, 1956.†

The Case of Tata Steel

In the Tata Iron and Steel Company case, in the first judgment of the Bombay High Court delivered by Mr. Justice Tendolkar, the judge, while confirming sub-clause (r)(ii) as passed by the special resolution of the Company, suggested that since the words as used *prima facie* and without involving the rule of *ejusdem generes* construction may lead to the view that contribution to any cause whatever was within the objects he proposed to add the word, "useful" after the words "any other" as a condition of his confirming the said clause. The sub-clause (r)(ii) as amended and confirmed by the judge read as:

"(r) (ii) : To subscribe or contribute or otherwise to assist or to guarantee money to charitable, benevolent, scientific, national, public, political or any other useful institutions, objects or purposes or for any exhibition."

It may be mentioned here that the trial judge, like Mr. Justice P. B. Mukherjee in the Indian Iron and Steel Company case, favoured the widest possible publicity being given to any contributions made by the Company through the disclosure of the details in the annual accounts, but in view of a voluntary undertaking given by the Counsel for the Tata Iron and Steel Company to do so, the trial judge did not expressly make any order to that effect. In this context, he said: "In a democratic State such as India is today, ... requirement of publicity for funds contributed to a political party appears to me to be such a revolution and Mr. Seervai who appeared for the Company not only states that it will be wholesome to have such publicity but the petitioners have undertaken that they shall separately show in their profit and loss account every year every single contribution directly or indirectly made to a political party in the event of the alteration of the memorandum being confirmed. If this obligation of publicity had not been voluntarily undertaken by the Company, I would have felt myself compelled to impose it as a condition of confirmation, if I ultimately found that there was no other valid ground for not confirming the alteration.*

Later, in his judgment delivered on an appeal preferred by the appellants, the judge upheld the original judgment and dismissed the appeal. On the point of law, Mr. Justice Chagla held : "The new power or activity or object sought to be introduced by the Company in its memorandum is not unlawful, but is indeed one which is countenanced by the law in England and the law in the United States. It cannot be said that it is an unlawful object which the court will not permit the Company to carry out by the amendment or alteration of its memorandum. We should also like to point out here that even our legislature in the new Companies Act has taken cognizance of the practice or the possibility of companies contributing to political parties, because in Section 293 a restriction is put upon the power of the board of directors to make contributions to charitable or other funds. Therefore, the very restriction assumes that the legislature was aware that the board of directors had the power in some companies and exercised that power to make contributions not only to charitable but other funds. If that be so, the only question that we have to consider for the purpose of Section 17(1)(a) is whether it can be said that where the company contributes funds to a political party it is carrying on business more efficiently. Before construing this expression, it is necessary to point out that a large volume of authority in England has clearly established that a liberal though not a strained construction, should be placed upon this section, and in order to realise how liberal a construction the English judges have put upon this section it may be pointed out that although in the English Companies Act this section practically corresponds to ours, in the earlier Companies Act, clauses (f) and (g) did not find a place and when a company wanted to alter its memorandum in order to enable it to sell or dispose of the whole or any part of its undertaking or to amalgamate with another company, clauses (f) and (g) not finding a place in the section, the courts were driven to confirm the alteration by holding that the case fell under clause (a) and it could be construed that selling the whole or part of the undertaking or amalgamation with another company was for the purpose of carrying on business more efficiently.

"Therefore, we must give to the expression 'efficiently' a very wide import ..... We must construe 'carry on business more efficiently' to mean carrying on business in a manner which will produce the desired results or effects. In other words, if a particular method or mode or means in connection with the business is conducive to the business producing more profits or improving the security or stability, then that mode or means or methods is a mode, means or method which is more efficient and what the Company tells us is that if you permit us to spend this money by helping a political party we expect results from that contribution which results will be beneficial to the company".‡

Definition of Efficiency

Disagreeing with the contention put forward on behalf of the appellants Mr. Justice Chagla stated: "It is difficult to accept Mr. Gokhale's suggestion that 'efficiently' in this context must be confined and limited to 'efficiently in regard to the actual production of iron and steel' and that only that alteration should be permitted which would enable the Company to produce iron and steel efficiently. There is nothing in the expression 'efficiently' which carries with it the connotation suggested by Mr. Gokhale nor is there anything in the plain natural meaning of that expression which would compel us to limit that word to a cost of production and to no other cost."*

On the question of publicity being given to the political contributions made by the Company, Mr. Justice Chagla's observations were more specific. He said: "We will add to the condition already imposed by the learned trial judge and we will impose the condition on the order passed by the learned judge confirming the alteration that the Company at the end of every financial year will publish in two leading papers in India one of which must be published in Bombay a complete statement of all the contributions and donations made by it to any political party or any political institution or any political cause."†

Besides the above observations and specific orders passed by the judges deciding the two cases which came up before them, there were certain other observations of a general nature which drew the attention of Parlia-

BANGLES FOR EXPORT...

Special solvent-resistant, mirror-finished, Al Foil makes bangles for my fair lady, in India and abroad. Purely decorative business? On the contrary, it's an exchange earner. The bangle industry exports nearly ten lakhs rupees worth of bangles annually. Prospects are bright for increasing this figure too. The contribution of India Foils Limited towards this export promotion is substantial, as they are the sole manufacturers of bangle foil in this country. Besides, it helps keep a cottage industry flourishing here—bangle making being the source of livelihood for tens of thousands of men and women.

ment and the people in the country and very frequently those observations were referred to in all the subsequent discussions on the subject.

In the Indian Iron and Steel Company case, Mr. Justice Mukherjee had made the following observations:

> "To induce the Government of the day by contributing money to the political parties or political funds is to adopt the most sinister principle fraught with great dangers to commercial as well as public standards of administration.... Persuasion by contribution of money lowers the standards of administration even in a welfare state of democracy. To convert convictions and conscience by money is to pervert both democracy and administration.††
>
> "Its (political contributions) dangers are manifold. Joint Stock Companies are not intended to be adjunct to political parties and possible sources of revenue for these parties. They are statutory bodies working under statutory conditions for different purposes. Secondly, it will induce the most unwholesome competition between business companies by introducing the race which could pay more to the political funds or political parties. In what competition, business interest is bound to suffer in the long run. In the bid for political favouritism by the bait of money the company who will be the highest bidder may secure unfair advantage over its rival traders and companies. Thirdly, it will mark the advent and entry of the voice of big business in politics and in the political life of the country."††

Mr. Justice Chagla in his judgment made the following general observations:

> "Democracy in this country is a nascent democracy and it is necessary that it should be looked after, tended and nurtured so that it should rise to its full and proper stature. Therefore, any proposal or suggestion which is likely to strangle that democracy almost in its cradle must be looked at not only with considerable hesitation but with a great deal of suspicion. Now democracy is a political system which ensures decisions by discussion and debate. But the discussion and debate must be conducted honestly and objectively and the decisions must be arrived at on merits without being influenced or actuated by any extraneous considerations. On first impression it would appear that any attempt on the part of anyone to finance a political party is likely to contaminate the very springs of democracy. Democracy would be vitiated if results were to be arrived at not only on their merits, but because money played a part in the bringing about of those decisions."†

He further said :

> "Before parting with this case, we think it is our duty to draw the attention of Parliament to the great danger inherent in permitting companies to make contributions to the funds of political parties. It is a danger which may grow apace and which may ultimately overwhelm and even throttle democracy in this country. Therefore, it is desirable for Parliament to consider under what circumstances and under what limitations companies should be permitted to make these conributions ..... In our opinion, Section 293 is not a sufficient check on this evil. Wide power is conferred upon the directors to make these contributions and with the consent of the company unlimited power is conferred on them. As we know from experience in a large number of cases the so-called sanction of the company is merely a camouflage. Either the directors control the company or some powerful group holds some large block of shares so as to control the voting. The least Parliament could do is at least to require the sanction of the court before any large amount is paid by the company to the funds of a political party but it has no voice to legislate nor has it voice to lay down the policy. But having had the case before us and our attention being drawn to the possible evils attending upon the powers exercised by the companies, we think it our duty to draw the attention of Parliament to the necessity of remedial measures being immediately undertaken to curb and control this evil."*

Sastri Committee Report

The Sastri Committee in its report on the amendment of the Companies Act gave the fullest consideration to the observations and specific points made in the judgments delivered by the three judges on the foregoing cases. They also considered the provisions of the relevant legislation in the United States dealing with the lobbying and financing of political parties or candidates for elections and came to the conclusion that the question of political contribution was a wider issue and "the case of the companies could not be considered in isolation and contributions from other sources such as the bodies corporate, partnerships, societies, trusts, trade unions and even from individuals might have to be regulated or prohibited by a comprehensive enactment.

"This evil is a matter which falls outside the scope of the Companies Act," the Committee reported, and disagreeing with the observations made by the Appellate Bench of the Bombay High Court, it said "We consider that it is not desirable that companies should be called upon to seek the prior approval of the Courts to any contributions that they might like to make to the funds of any political party. Such applications would be a source of embarrassment to the judges and it is also not desirable that courts should get involved in political or quasi-political controversies.'"

On the question of publicity being given to the political contributions made by companies in the newspapers, the Committee said : "In support of the suggestion that such contributions should be promptly published in the newspapers immediately after they are made, the reason put forward was that if the information concerning such contributions was given to the shareholders long after the event, it would be too late for them to take any effective action..... Even if the publication in the newspapers were made immediately after the making of such contributions, the shareholders would hardly be in a position to recall the contributions already made.

"In view of the strongly expressed views of the High Courts, we recommend that full information relating to such contributions with particulars as regards the parties or organisations to which such contributions are made and the amounts of such contributions should be incorporated in the accounts and circulated to the members before the next annual general meeting. If the shareholders so decide at that meeting they may give proper directions to the board of directors on such contributions in the future.

"A further provision may be added as sub-section (6) to Section 293 in these terms: "Every company shall disclose in its profit and loss account every donation made by it during the year of account to any political party, giving particulars of the amounts given and the name of the person or persons, association or party to whom or to which such donation is made." Later, the Committee suggested a minor drafting change also to be made in Section 293(1)(e) by insertion of the word "annual" after the word "average" occurring in that clause.

* ibid p. 633.

The Sastri Committee's recommendations were accepted by the Government and Clause 103(b) of the Companies (Amendment) Bill 1959 as introduced in the Lok Sabha on 1st May, 1959, gave effect to these in the following words:

"103. In Section 293 of the principal Act—

(b) after sub-section (5), the following sub-sections shall be inserted, namely:

"(6) Every company shall disclose in its profit and loss account any amount contributed by it under clause (e) of sub-section (1) to any political party or for any political purpose to any individual or body during the financial year to which that account relates giving particulars of the total amount contributed and the name of the party, individual or body to which or to whom such amount has been contributed.

(1) The provisions of this section in so far as they relate to contributions made by a company to any political party or for any political purpose to any individual or body shall also apply to a private company which is not a subsidiary of a public company:"

Important Amendment to Act

The Joint Select Committee accepted the foregoing proposed amendment, but later on, as a result of the discussions in the two Houses of Parliament, this clause was withdrawn and in its place, a new section —Section 293A—was introduced by the Government and passed by both the House (*vide* Section 100 of the Companies (Amendment) Act, 1960) which became law with effect from 28th December, 1960. This new Section 293A reads:

(1) Notwithstanding anything contained in Section 293, neither a company in general meeting nor its board of directors shall, after the commencement of the Companies (Amendment) Act, 1960, contribute—

(a) to any political party, or

(b) for any political purpose to any individual or body,

any amount or amounts which or the aggregate of which will, in any financial year, exceed twenty-five thousand rupees or five percent of its average net profits as determined in accordance with the provisions of Sections 349 and 350 during the three financial years immediately preceding whichever is greater.

Explanation : Where a portion of financial year of the company falls before the commencement of the Companies (Amendment) Act, 1960, and a portion falls after such commencement, the latter portion shall be deemed to be a financial year within the meaning, and for the purposes, of this sub-section.

(2) Every company shall disclose in its profit and loss account any amount or amounts contributed by it under sub-section (1) to any political party or for any political purpose to any individual or body during the financial year to which that account relates, giving particulars of the total amount contributed and the name of the party, individual or body to which or to whom such amount has been contributed.

(3) If a company makes default in complying with the provisions of sub-section (2), the company and every officer of the company who is in default, shall be punishable with fine which may extend to five thousand rupees.

The introduction of the above Section 293A in the Companies Act thus marked an important change in the situation. It curtailed the power of every company whether public or private, or a private subsidiary of a public company, in this behalf to a contribution in any financial year, of Rs. 25,000 or 5 percent of the net profits during the three preceding financial years whichever is greater. In other words, neither the company in general meeting nor its board of directors can now exceed the limit which before this amendment came into force, could be exceeded by the company in general meeting.

Compulsory Disclosure

The new Section also requires disclosure in the annual accounts of the companies of all political contributions made by them in the relevant financial year showing the total amount contributed and the name of the party individual or body to which or to whom such amounts have been contributed. Such a disclosure was not previously compulsory. It is clear from this that Parliament has been more receptive to the idea of regulation of the powers of companies to make contributions by law than is the case in some other countries like the U.K. and many other Commonwealth countries—the countries with whose Company Law, the Indian Companies Act bears very close resemblance—who make no attempt to regulate the payment of contributions by companies to political purposes or parties. The companies in these countries can make contributions as a matter of commercial expediency and up to any extent provided it is empowered by its memorandum of association to do so. That is to say, in these countries, the position continues to be what it once used to be under the repealed Indian Companies Act of 1913.

Apart from the above specific Section dealing with political contributions, it may be mentioned that by virtue of an amendment to Section 192 of the Companies Act relating to filing of copies of special resolutions with the Registrars of Companies, companies have now been required to file a copy of every resolution—special or ordinary—passed by them in general meeting authorising their board of directors to contribute to charitable and other funds not directly related to the business of the company or the welfare of its employees any amount exceeding Rs. 25,000 or 5 percent of its average net profits during the three immediately preceding financial years whichever is greater in any financial year. This means that apart from the disclosure being made in the annual accounts filed with some time lag, companies are required also to inform the concerned authorities of any decisions on the subject by filing the relevant special resolutions with them.

Compliance with Law

Because of the close scrutiny to which the documents filed with the Registrars of Companies are now subjected and also as a result of the deterrent clause (3) of Section 293A which imposes a fine of up to Rs. 5,000 for lapses committed. Through the disclosure of information as required in clause (2) of the said Section, all companies have now been made to comply scrupuluosly with the law.

The collection of data in any consolidated form about the exact impact of this Section would, however, not

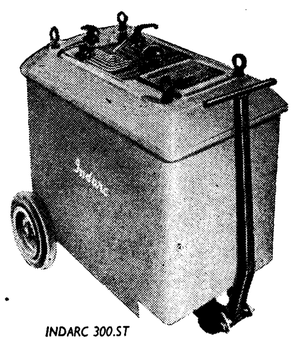
Indarc FOR MEDIUM AND HEAVY DUTY ARC WELDING



INDARC 300.ST, 450.ST and 2/300.ST transformer welding sets of the Standard Tapped Choke type are a major development in the fields of medium & heavy duty arc welding. Designed for faster production, these sets have the advantage of giving a wide range of selected currents. Made in India according to British Standard Specifications, the sets are portable, oil cooled and can be supplied with a complete set or sets of arc welding accessories.

be possible considering the stupendous job of scrutiny and processing involved in going through the annual accounts pertaining to 25,000 public and private companies at work. Still, an idea about the extent of compliance with the provisions of law can be had from a sample check of the annual accounts filed with the Registrars of Companies after the third general elections held in 1962. It is found from a random study of the annual accounts of companies that even such amounts as Rs. 10, Rs. 20 and Rs. 50 have been disclosed in the annual accounts of companies, let alone the big amounts contributed by corporate giants. This would seem to prove conclusively that in the corporate sector, there is both respect for the provisions of law and fear of administrative action for non-disclosure of facts and the provisions of the Act in this behalf have been adequate to ensure the fulfilment of the object underlying them.

Government Companies

It may be mentioned here that during the debates in Parliament, the attention of the Government was also drawn to the desirability of companies in which the Government had a substantial financial stake or interest, contributing to the funds of political parties. On the restrictions on the making of such contributions by Government companies, the Central Minister for Commerce and Industry said in the course of the debate in Parliament : "It was not the intention or policy of the Government that Government companies of which the Central Government was a member should directly or indirectly make any contribution to the funds of any political party or political purpose and that Government would bring this to the notice of all Government companies, that the policy in this respect in regard to statutory corporations under the control of the Central Government was the same as stated above and in regard to Government companies within the meaning of the Companies Act of which one or more State Governments were members and the statutory corporations under the administrative control of the State Governments, the Government of India would address the State Governments concerned requesting them to follow the same policy as the Central Government proposes to follow."

In accordance with the statement made by the Minister, all the concerned Ministries and Departments of the Central Government and State Governments were asked to issue suitable directives to the Government companies and statutory corporations under their administrative control so as to ensure that they would not make any contribution to the funds for any political purpose or of any political party.

To sum up, the position concerning political contributions and their disclosure by companies as it obtains today is very radically different from the one that existed before 1st April, 1956, under the provisions of a law passed four decades ago, that is, as early as in 1913. The change in law has broadly been in step with the change in the country's political conditions.

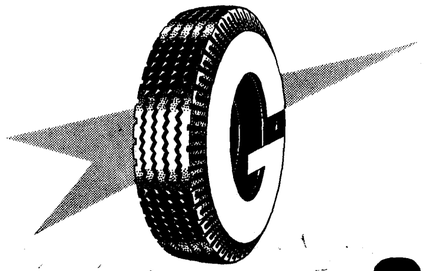
MORE ROADS... MORE VEHICLES—AND THE NEW TYRE

ROAD DEVELOPMENT

Under the Third Plan—broadly based on a 20-year road development plan (1961-1981) it is proposed to complete 2,52,000 miles surfaced roads and 4,05,000 miles unsurfaced roads by 1981.



MOTOR VEHICLES

By the end of 1965/66 it is estimated that the number of COMMERCIAL VEHICLES would be about 3,65,000 and of GOODS VEHICLES about 2,85,000. Further, the increase of freight traffic by road is expected to be about 23,350 million ton miles by 1965/66.

THE TYRE INDUSTRY

The target for the production of automobile tyres to be achieved by 1965/66 has been fixed at 3 million nos. constituting a rise of more than 120% over the production in 1960/61. A further upward revision of this target is under consideration.

HENCE...

Gentire

THE COMPANY

A multi-crore project, GENERAL TYRES LIMITED is the first tyre company which is completely Indian financed. Technical know-how is provided by M/s. TECHNOEXPORT FOREIGN TRADE CORPORATION of Czechoslovakia—who have set up Tyre and Rubber plants in 25 countries. The Company is licenced to produce 3,00,000 sets of car, truck and bus tyres and tubes per year.

In addition to the Company's own team of expert technical personnel, it has the unique advantage of having at its disposal the experience of its Managing Agents—M/s. NATIONAL RUBBER MANUFACTURERS LIMITED, who are the largest manufacturers of Industrial Rubber products in India.

THE FACTORY

A giant new factory has been built at Kankinara, West Bengal, on 35 acres of land.

No compromises on equipment. The foreign collaborators have supplied and erected new machines of the latest type. The most modern production techniques are employed. A team of expert foreign and Indian technicians supervises production.

THE PRODUCT

GENTIRE has been planned on the basis of an extensive study of the requirements of tyres in India. A new component material gives it built-in reserves of ruggedness. GENTIRE is specially made for India.

General Tyres Limited

Heavy Taxation and Restrictive Official Policy Hamper Progress of Road Transport

IN the modern world, economic underdevelopment stands as a challenge to human genius and the progress of mankind. With the achievement of India's political independence, among the first things to which this country has been awakened is a greater realisation of the barriers of economic backwardness, and a greater understanding of the need for diminishing the wide international disparities in economic prosperity. Economic development today is concerned with its much emphasised aspects of capital formation and a better exploitation of natural resources. With the forces of dynamism and changing trends in the progress of technology galvanising the economy towards more rapid development, a constant readjustment of the existing and potential forces of transport, commensurate with the needs of the time, becomes imperative.

By
F. P. ANTIA

President, Indian Roads and Transport Development Association Ltd

The search for a right policy for the development of transport as a strategic component of the infrastructure of a developing economy, is basically a search for a balanced growth of the different modes of transport in the country, as the provision of adequate, efficient and cheap transport facilities ranks among the essential prerequisites of a developing economy. In this context, the impact of a good road system on the rate of economic growth, is undeniable. Apart from opening up the country and linking up all areas with each other, an efficient road network can be instrumental in meeting the growing movements of goods and services necessitated by rapid industrialisation fostering balanced regional development and helping to raise the overall levels of consumption and distribution in the country.

The Internal Combustion Engine

The invention of the internal combustion engine, and its application to the transport industry has been by far the biggest contribution of the century towards human progress. Moreover, in the march towards higher living standards, road transport has proved to be the greatest single combination of economic activities in the history of mankind. In the U.S.A., for example, it provides direct employment to 10½ million persons, about two-thirds of whom are in the trucking industry alone. As for the indirect employment afforded by the motor-vehicle manufacturing industry, the magnitude is colossal. Further, the industry consumes 7 percent of all steel produced in the country, 48 percent of all malleable iron, 60 percent of all rubber, and is the largest single contributor to the U.S. *per capita* income of Rs. 10,900, which is the highest in the world. With the tremendous advance of technology during the last half century, and above all because of its flexibility, convenience, cheapness and speed, roads have provided a full-fledged alternative means of transport to rail and inland water, in the U.S. economy, and indeed an infinitely more efficient one.

Rural Sector

A good roads system assumes key importance in the entire process of economic growth. Its penetration into the remoter regions of the country can make all the difference between a stagnant countryside, and a nation springing to economic life. India's is essentially an agrarian economy, with rural India slumbering in her villages—550,000 of them, housing over 70 percent of the country's population. Although far from being homogeneous in geography, population density and culture, one fact common to them all is the backwardness of a good roads-communications system which severely restricts the size of their markets and hence their overall social and economic intercourse. With the third plan geared towards maximising the rate of investment in the country, and securing an increase in national income of over 5 percent a year, the problem today remains no longer solely one of shaking the nation out of a centuries old inertia; it is becoming as important to see that the fruits of the new enterprise and activity are spread efficiently among the teeming millions of this country.

Further, as an inevitable feature of a self-generating economy, with economic development characteristically moving in the direction of industrialisation, the overriding need of the country is to attract manufacturing industries to rural areas. However, as Adam Smith said: "The division of labour is limited by the extent of the market". And with the size of the market severely limited in the rural sector the establishment of the optimum form does not become justifiable, as the necessary stimulus for enhancing productive capacity is conspicuously lacking. As long as the rural areas remain depressed because of faulty transport facilities, one of the basic needs of the economy remains grossly neglected.

An adequate road network with its two-dimensional effect in space and time can provide an effective solution to the problem. In economic analysis, "space" is conceived in a negative sense, that is, as the distance which must be overcome. This is the so-called "friction of space" and the cost of overcoming it, the "distance inputs". If commodities can be carried cheaply from where they are produced to where they are consumed, the effect in terms of the dimension of space is to widen the market, and in consequence, increase the scale of production. In terms of "time", if output can be produced at the optimum level by reducing the capital cost a unit, the demand for working capital is minimised, thanks to the rapid turnover, and this can be a contribution of vital importance especially in an underdeveloped economy, where capital is notably scarce.

Although the scarcity of capital may be a chronic complaint in the country, there certainly is not any dearth of manpower resources. It, therefore, becomes one of the primary objectives of planning to ensure fuller opportunities of work and better living of all sections of the community. With available work opportunities spread too thinly even to produce a tolerable means of livelihood, mass exodus towards metropolitan areas constantly takes place, intensifying the congestion in already overcrowded cities. The road transport industry, apart from itself being highly labour-intensive, rural road construction programmes can do much to absorb the backlog in unemployment, which by its very enormity constitutes a challenge to this country.

Using All Resources

For maximising the benefits resulting from industrialisation, it is desirable that industries should be spread out to as many different regions as possible. In this connection, dispersion, decentralisation and industrial diversification have become the key words of regional planning. As a correct policy of location can form the framework of industrial orientation, the spatial structure of a developing economy needs to be carefully aligned by an industrial policy, so as to promote the optimum utilisation of its resource potential. The construction of a highway can exert a highly agglomerative influence on locational decisions, and thereby change the entire character and intensity of land use. With intensity of activity climbing steeply in and around the primary focus, a powerful gravitational field is formed, which helps to catalyse rapid economic development of the area, while simultaneously improving the accessibility of adjacent ones. No doubt, the resource endowments of a region give it an inherent growth potential, but the developmental topography can influence the locational policy of even resource-based industries, which do not normally seek centralised cities.

The difficulty, in readjusting this original unbalance and creating a successful competitive environment by accelerating the development of the remoter regions of the country, is only too obvious, in the absence of a well-laid transport network. The contribution of roads, therefore, to economic growth needs to be appreciated in a far wider context—particularly in an economy like India's, where the indirect benefits derived from their construction are much too great to be ignored.

Transport Shortages

Planning for transport requires perspective planning on the basis of the projected estimates of traffic generated during successive plan periods, so as to avoid any unbalance between different sectors in the economy. Together with the defence requirements, imposing an unprecedented strain on the transport network on account of exceptionally long hauls along the border areas, production visualised in the current plan period is expected to generate long-distance traffic of 375 million tons. With the railways being geared to handle 260 million tons, and assuming that roads and inland waterways can take care of even 40 million tons, there still remains the considerable gap of 75 million tons to be catered for. What with all sectors leaning heavily on the availability of transport, the situation is likely to be much worse during subsequent plan periods. As experience in all countries shows, the rate of increase in freight traffic far outpaces the rate of increase in national income. During the first decade of planning, while national income increased by 42 percent, freight traffic rose by 100 percent on the railways and 200 percent on roads. With the national income estimated to increase by 135 percent by March 1976, that is, to Rs. 33,000 crores, the ton-mile increase in traffic is likely to jump by over another 300 percent eclipsing the other indices in economic progress.

A frequent recurrence of shortages in transport has been common to the Indian economy, but the magnitude of the current shortage is particularly distressing in view of the severity of its impact on the production units in the economy, especially in the case of strategic commodities. No doubt there is the fundamental reality that bulky freight traffic over long distances will continue to be carried by the railways, at least for some time to come. Nevertheless, the observation needs to be qualified by the fact that the potentiality of road transport for traffic movements over long hauls has not even been remotely appreciated in this country. This system of potential growth and ever-increasing capacity, if allowed to step into the gap, as a full-fledged alternative agency of transport, can provide the much-needed balance in the transport structure of the economy.

The arrival of the age of roads, however, has received a lukewarm reception in India. Suffering from a historical hangover, the attitude of authorities has been that transport development is synonymous with railway development. Whatever justification such a policy may have had 100 years ago, in this age of spectacular advances in world communications, it is positively antediluvian and has lost all meaning. As Lord Keynes remarked: "The

difficulty lies not in new ideas, but in escaping from the old"—and this unfortunately is very true of this country.

The ideological implication apart, at a stage when the railways, having reached the maximum point of capacity within allocable resources, have proved physically incapable of handling all traffic that is offered—they have to be assigned a lower priority in the sphere of further expansion of overall transport. Such a situation makes it imperative to afford sufficient latitude to the other components of transport, to help them rise to their legitimate stature.

Logic dictates that an over-strained railway system needs to be assisted by diverting the surplus traffic to other modes of transport in the country, the real and effective alternative being road transport. As the British Ministry of Transport remarked: "Whatever unit of measure is used, ultimately road transport is the major means of inland carriage of goods".

Inadequate Roads

India, with her vast land mass, is a country eminently suited for road transport; in spite of this natural advantage the gross inadequacy of the road network is widely known. On the basis of road mileage for each square mile, India not only stands below the all-European average, but also below that of many Asian countries. For every 100 square miles of territory, the U.K. and France have over 300 miles of road, West Germany has 229 miles, the U.S.A. has 97 miles, and even Ceylon has 46.8 miles, while India has less than 30 miles, of which just 11.9 miles are surfaced. Many of the surfaced ones have a crust thickness of 9 in. to 10 in., which according to informed quarters is thoroughly inadequate even for the present volume and intensity of traffic. Further, of the 15,000 miles of national highways, only 2,300 miles are equipped with two-lane carriageways, all the rest having a single lane!

The paucity of the road mileage in the country is also reflected by the fact that thousands of the villages still lie isolated. The findings of a National Sample Survey show that about 36 percent of villages in this country lie six miles away from metalled roads, and about 25 percent of them, three to five miles away. Further 85 percent of the roads linking the villages to the nearest metalled road, are unmetalled or often mere foot-tracks. Isolation on so vast a scale precludes the infiltration of the fruits of progress into the remoter sectors of the economy—a thoroughly deplorable feature, which needs to be rectified as soon as possible. The Chief Engineers' Plan for road development proposes to raise the road mileage for over 100 square miles, from 26 in 1961 to 52 in 1981. Even this target represents a modest estimate of the minimum requirements of the country, and will still leave India far behind even the semi-industrialised nations of the world.

Another regrettable feature is the inadequacy of the existing road network in the country. The maximum economic usefulness of roads is considerably reduced due to the weakness of bridges and culverts, poor surfacing, narrow-width on high traffic density routes, tortuous alignments, traffic concentration on arterial routes, etcetera. Not only do these factors render the roads critically unsafe, but they also make road transport operation expensive. The operator, being forced to use small, uneconomic lorries, his operation costs are augmented by about 50 percent. Further, as tests conducted by the Indian Roads Congress have shown, modernising road surfaces can help lengthen the life of motor-vehicle parts, tyres, and also raise the fuel average. The annual loss to the industry on this score is estimated at Rs. 60 crores.

The public pays too high a price for these deficiencies, and it is in the public interest to remove, wherever possible, the excessive penalties imposed by deplorable road conditions. As a U.S. Commissioner of Public Roads once states: "We pay for good roads whether we have them or not, and we pay 'less' if we have them, than if we do not."

Insufficiency of Vehicles

The backwardness of road transport is further reflected in the insufficiency of vehicles, a factor which leads to the underutilisation of even the present sub-standard road network. As against 2,000 motor-vehicles for every 100 square miles of area in the U.S.A., 7,000 in the U.K., 6,000 in West Germany, 114 in Japan, 109 in the Philippines and 94 in Vietnam, India has just 45.

The second five-year plan laid down an annual target capacity for 40,000 commercial vehicles. Against this, the actual production by 1960-61 was less than 30,000 vehicles. To quote the third plan: "the insufficient supply of new vehicles, particularly during the last few years which is attributable to the shortage of foreign exchange, is the principal factor which has stood in the way of more rapid expansion of road transport during the period". It is difficult to understand why in an expanding economy, the number of vehicles produced should be limited at all. Even conceding that commercial vehicles have to be given priority in the allocation of scarce foreign exchange over passenger cars, the manufacture of even the former vehicles did not exceed 64 percent of the second plan target! This under-use of roads is a definite loss to the country.

Because of the continued hesitant approach towards roads, a legacy of British days, the overall allotment to the industry (including the I.D.A. loan) during the third plan period has been barely Rs. 450 crores, as against the Chief Engineers' modest recommendation of Rs. 590 crores. In a recent report, the World Bank estimated the transport needs of India at nothing less than Rs. 800 crores, that is, about 4 percent of the projected increase in national income during 1961-66. In view of the fact that the road transport industry will yield the exchequer a revenue of Rs. 1,000 crores during the period, there should have been no difficulty in allotting it the minimum of Rs. 590 crores, as recommended by the Chief Engineers. This gap in outlay is eloquent, and its warning cannot be missed, save to the detriment of all other sectors in the economy.

Increasing Traffic Demands

One can, therefore, hardly be complacent over the present road programme which is fast losing ground in relation to the nation's expanding traffic demands. In view of the backlog of Rs. 140 crores in the allocation under the third plan, coupled with the over-riding needs of defence, and very likely a bolder fourth plan, the pressures on the already inadequate road transport system will be intensified beyond question. It thus becomes imperative that substantially increased allotments be made to the industry in the fourth plan period, beyond the minimum Rs. 1,065 crores recommended by the chief engineers.

In a special survey undertaken by the World Bank relating to the problem of highway development in Bombay and Calcutta, considerable emphasis is placed on the cost benefit ratio, of Government's investment programmes. In this connection, Professor Leontieff's input-output techniques have proved a powerful tool of economic planning—particularly in areas where the interdependence of industries is less complex. The assessment, therefore, of the cumulative effects of various factors on the cost of highway construction requires carefully conducted road tests, and a scientific appraisal of relevant economic and engineering data. If sufficient investment is not forthcoming for the above purposes, there is likely to be further economic dislocation, through misdirection in the allocation of scarce resources.

Restrictive Licensing

As far back as in 1933, the International Chamber of Commerce laid down that it should be the principal objective of every nation to co-ordinate all the agencies of transport. Moreover, it was not the function of the State to favour one means of transport at the expense of another, but rather to create conditions for securing the maximum efficiency of all means of transport and furthering the evolution of each for the general welfare of the community. The Taxation Enquiry commission appointed by the Government of India more than ten years ago actually urged that India should adopt these principles through legislative enactment. As the Mašani Committee points out the principle of co-ordination "has not been fairly applied and has been working in a one-sided way so as to restrict road transport, ... as is evidenced by persistent attempts to impose a limit on the distance over which motor-vehicles can ply". Referring to the elaborate and dilatory

MODERNIZING
THE BANKING BUSINESS FOR YOU

Old in experience but young and progressive in outlook - that is the essential character of the Punjab National Bank.

Established 69 years ago, the PNB has grown over the years in strength and stature and is one of the most progressive banks in the country today.

Modernization for increasingly better service has been a consistent feature in the history of the PNB, and it can proudly claim to be the first bank in India to introduce modern and up-to-date banking methods. For example, the installation of IBM machines and the Teller System. Both these innovations, introduced by the PNB as far back as 1954 have greatly increased the working efficiency of the Bank, and a boon to depositors enable instant payments to be made on presentation of cheques.

The same desire to improve service and step up efficiency was responsible for the establishment of the Bank's own Staff Training College. This has been in existence since 1958 and all Bank personnel are trained and re-trained to give efficient, friendly and personalized service.

procedures of the Motor Vehicles Act, the Committee states that the Act "exists more to restrict than to regulate, much less to develop motor transport". Although the 1956 amendment of the Motor Vehicles Act has relaxed some of the procedural hurdles, the relief accorded to the industry has hardly kept pace with the needs of the times.

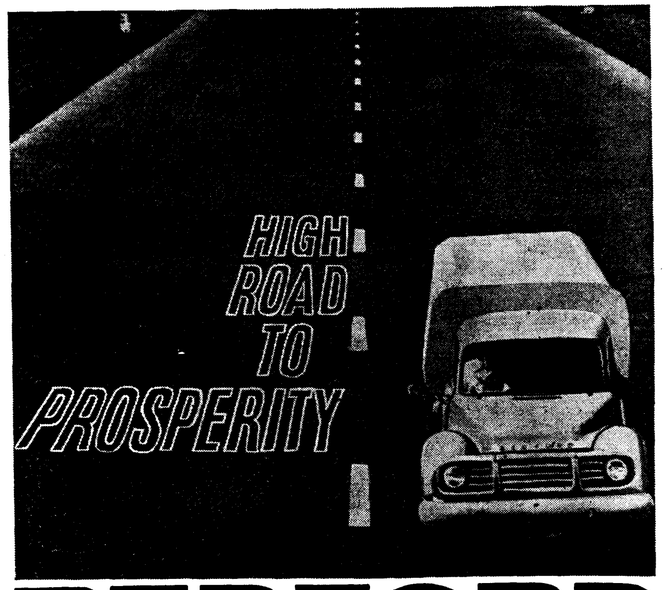
The limit of distance—normally 300 miles—which is often placed on road hauls at the instance of the railways, is certainly an anachronism in the present-day situation. Although all States want to encourage long-distance services, the effectiveness of the railway lobby in opposing such services is retarding the growth of road transport, much to the chagrin of the public who clamour for these. Actually the obtaining of the permit is a vexatious process, with the process of counter-signatures entailing further delays. All this puts a brake on the expansion of the vehicle fleet in the country. The Inter-State Transport Commission has sanctioned the issue of a few hundreds of permits for routes traversing more than two States. Although a welcome measure, it is still inadequate. It has been suggested that for any appreciable effect to take place, a beginning with at least 6,000 permits ought to be made.

Tax Burden

Mobilisation of resources for securing an adequate rate of growth is no doubt the crux of the problem of planning. In an economy like India's with an adverse balance of payments position, rising price spiral and inflation, with its consequent limits to deficit financing, a substantial tax effort becomes an indispensable precondition to see the plans through. The effects of taxation, however, being complex, the techniques of resource mobilisation should consider what the optimum feasibility is, and determine the limits of each form of taxation pragmatically. This alone can ensure that the economic fabric is not stretched too far, or in the wrong places. Such pragmatic approach is denied to the road transport industry, on which the tax burden is pitched at so prohibitive a level, that it sharply impinges on its expansion.

There can be no doubt that the tax load apportioned to the motor-vehicle industry has been unusually harsh, the incidence being 200 percent to 300 percent greater than in most developed countries. With successive multi-pronged attacks in the anual Central budgets, the magnitude of the burden is so great that incredible though it sounds, taxation alone on the carriage of goods by petrol vehicles exceeds the actual freight rate charged by the railways. While the average rate charged by the latter is 6½nP a ton-mile, according to the Masani Committee, the tax incidence alone on petrol lorries works out at 7nP a ton-mile. With the recent Finance Bill geared to yield the exchequer an additional revenue of Rs. 54 crores from motor transport, the incidence is bound to be still greater.

The case against indirect taxation in general, and excise duties in particular, has long formed part of the corpus of economic theory. It is a case against a tax system which discriminates against particular goods, causing loss to the society viewed as consumer, as it makes prices diverge from marginal costs. It causes loss to the society viewed as producer, as the returns of the factors of production are made to diverge from the marginal product. Although this is strictly true only under purely competitive assumptions of economic theory, the implication of a rise in prices is none the less valid. Almost the entire incidence of the enhanced duties on motor-vehicles and fuel is passed on to the consumer in the form of increased prices, thereby aggravating the inflationary trends in the country.



Tax Principles

It has been rightly argued that the price increases because of these duties are less inflationary in their effect than the haphazard and cumulative trends of deficit financing. But it has not simultaneously been appreciated that the need of the country today is not for a stabilising, neutralising policy, but for a revenue-yielding, investment-generating diversionary one, wherein the appropriate tax principles of productivity and expediency are accorded due consideration.

There can be no doubt that the road transport industry is sufficiently revenue-yielding, considering that it is estimated to contribute as much as Rs. 260 crores between the Central and State revenues. But there is every doubt about the expediency of such a policy, which through crippling taxation restricts the expansion of this much-needed industry. As for the investment-generating aspect, as has been calculated by the author, given a 25 percent reduction of the tax burden, the industry will be provided with sufficient impetus to expand vehicle production, a fact which in itself ought to fetch 50 percent additional revenue to the Central and State Governments.

The whole question of road transport needs more sympathetic and imaginative handling, to satisfy not only the needs of development, but also the supreme needs of defence and allied industries. As long as the railways continue to buckle under the increasingly heavy demands thrown on them, production targets will continue to lag behind. The only way to escape the *débâcle* and lower the cost of communications to more economic levels, is to deliver road transport from the hindrances of inheritence and alow it to develop to its full potential.

As President Eisenhower said: "Next to the manufacture of most modern implements of war as a guarantee of peace through strength, a network of modern roads is as necessary to defence as it is to our national and personal safety". The apathy of the Indian Government towards this vital problem can do much harm to the larger interests of the country. The road problem is a nationwide problem, requiring co-ordination, aid and guidance at all levels. In this context, the State has a decisive rôle to play, in order to ensure improvement of roads to adequate standards essential for the broad national objectives of military security in times of war, and total economic well-being in times of peace.

BEDFORD

Penetrating far-flung, hitherto neglected areas, the Bedford truck shuttles all over the land, carrying raw materials and men to factories and plants, chemicals and finished goods to fields and villages, agricultural, forest and industrial products to rail-heads and waterways, thus knitting the pattern of India's economic fabric.

Its sustained trouble-free performance means on-the-schedule operation, quick turn-arounds and longer duty on the road—which add up to more profit for the transport operator.

Railway Capacity Improving but Still Great Scope for Alternative Transport

THE quality of railway performance used to be judged in the past from the point of view of the year's working, and the extent to which the transport demands of the year were met by the railways. The transport requirements did not vary much from year to year, the volume of traffic fluctuating with the vagaries of agriculture and the rise and fall in exports and imports. Over the years, it is true, a rising trend might be discerned. The financial success of the railways thus depended mostly on the external factors of agricultural and industrial production, domestic and foreign commerce, and these depended on the monsoons on the one hand, and the world conditions on the other. On these a careful watch was kept to ascertain the character of railway working and the financial results.

These factors are still important, but the basis of assessment of transport performance has altered somewhat. With the introduction of a planned economy, the five year plans have striven to raise steadily the total output of production in the country with the twin objectives of meeting the requirements of a growing economy and ensuring the benefits of better standards of life for a growing population. This means that a programmed increase is anticipated under both agricultural and industrial production from year to year. Thus the production of foodgrains rose from 51 million tonnes to 67 million tonnes during 1950-51 to 1955-56 and to 81 million tonnes by 1960-61. The third plan target for 1965-66 is 102 million tonnes. The industrial production index, taking 1950-51 as 100, advanced to 134 in 1955-56 and to 194 in 1960-61. The third plan assumes a target for 1965-66 of 320. These are striking, indeed unprecedented, increases.

By L. A. NATESAN

The overall figures do not distinguish between heavy and light industries, the impact of the expansion of which in terms of tonnage moved is bound to be different. From the point of view of sheer quantity, coal, iron ore and manganese ore constitute by far the largest. The comparative figures for select years are as follows:

	(In million tonnes)			
	1950	1955	1960	1961
Coal	32.82	38.84	52.63	56.10
Iron ore	9.92	4.75	10.68	12.19
Manganese ore	0.90	1.61	1.18	1.18
	37.64	45.20	64.49	69.47

Increasing Traffic Volume

These statistics disclose the essential problems of transport under the stimulus of planned development. Between 1950 and 1955, the additional tonnage for transport by rail was 7.56 million (metric). In the next quinquennium, it rose to 64.49 million tonnes, or by 19.29 million tonnes. When it is borne in mind that in 1950-51, the total freight carried by the railways was only 93 million tonnes, it will be appreciated that the figures of increase are indeed considerable.

The progress achieved and anticipated in industry, particularly in those making capital and consumer goods, is no less remarkable. The expansion in output may be illustrated by the statistics of output of certain select industries.

STATISTICS OF PRODUCTION OF CERTAIN SELECT INDUSTRIES

	1950	1960	1965-66
I. Capital Goods			
Commercial vehicles ('000)	9.5 (1955)	27.1	60.0
Diesel engines ('000)	4.6	41.7	66.0
Elec. motors ('000 h.p.)	82.0	681.0	2,500.0*
Power-driven pumps ('000)	30.0	102.0	150.0
II. Intermediate goods			
Aluminium ('000 tonnes)	3.7	18.5	81.3
Ammonium sulphate ('000 tonnes)	48.0	388.0	n.a.
Ball-bearings ('000)	41.0	2,699.0	15,000.0
Caustic soda ('000 tonnes)	11.0	99.0	345.0
Cement (million tonnes)	2.7	7.8	13.2
III. Consumer goods			
Bicycles ('000)	103.0	1,051.0	2,000.0
Cotton piecegoods ('000,000 metres)	3,351.0	4,616.0	5,304.0

Sugar ('000,000 tonnes)	1.1	2.5	3.6
Vanaspati ('000 tonnes)	174.0	338.0	508.0

* For 300 H. P. and below.

The pronounced character of the increases—prodigious in some cases considering the short period in which it has occurred—indicates the great strain these have caused to transport. The capacity of rail and other forms of transport has had to be augmented in order to cope with the implications of these increases in traffic.

In order to render the detailed plans realistic and effective, a careful assessment needs to be attempted of the raw materials, output and their flow in all sectors of the economy, public and private. These calculations afford a rough basis to measure the volume of transport required for economic activity. Consequently, the difficulties experienced in transport are generally of a predictable kind and of the character which lends itself to be calculated and provided for.

Against this background, planning of transport has to be not merely one of doing the best within existing capacity. In view of the expansion of output attempted by the plans, that capacity is soon exhausted and has to be expanded in step with the growing demands. In other words, concurrently with planning for production, has to come planning for transport as well. In the years prior to the plans, the general attitude has been one of providing from time to time for a certain amount of excess capacity, so that this will take care of the additional needs of the future. When the facilities prove inadequate consequent on the growth of traffic, the capacity is then sought to be increased to a level which, as at present anticipated, would be sufficient to meet the future anticipated additional traffic over a period.

Built-in Excess Capacity

It is this type of built-in excess capacity which has encouraged the belief in the past that the railways could with appropriate pressure or compulsion be coaxed to carry more and more through greater efficiency and that demands for capital expenditure are suspect for the reason that the railways had in the past carried increased quantities of traffic without any call for fresh capital expenditure. It is only in recent years that it has been appreciated that during a period of rapid economic growth and a steeply ascending curve of production, this does not hold good and that augmentation of transport capacity has to be planned and provided for.

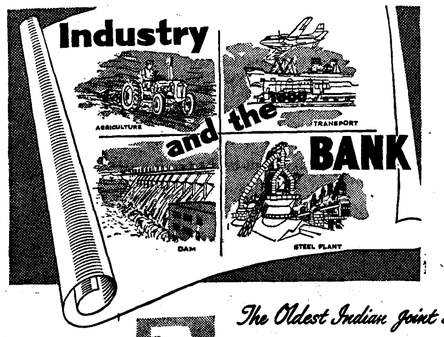
It is this consideration which renders the requirements of current and future transport policy quite different from those in the past. The implications when translated into practice are that, (a) it will be necessary to provide systematically for annual increases in traffic; and (b) each year transport planning should include, apart from that connected with the current demands, implementation of schemes calculated to bring about increased facilities of transport required in the future. The annual verdict on the efficiency of transport performance thus amounts to an appraisal of the adequacy of the facilities provided to cope with the current demands and the effort to augment capacity by the time it is likely to be required.

Transport Policy

From this point of view, it is of interest to examine the character of transport policy and planning during recent years. It is necessary to bear in mind that in current discussions rail transport has come in for greater attention, because, as compared with others, of its relatively advanced development, and the ease of centralised control and direction. Other forms of transport are essentially local in character, except in the case of inter-State road transport and coastal shipping. These are as yet limited in scope and operations.

The recent review of the third plan affords a convenient starting point. The very first year of the third plan faced heavy weather because of transport difficulties particularly in connection with the movement of coal from the Bengal-Bihar coalfields. The skimpiness of the Planning Commission's calculations of the financial provision for transport was felt in the very first year and an additional sum of Rs. 120 crores was added towards providing more facilities, for coal transport and for electrification programmes, doubling of track (250 miles), some more locomotives (350) and wagons (50,000), in addition to what had already been provided under the third plan. The shortfalls under certain heads, namely, steel plants and coal, afforded some relief to the traffic burden which might otherwise have proved too much for the railways to handle. The transport situation looked better in 1962-63 both for coal and general goods. The actual and anticipated tonnage since 1960-61 is as follows:

	(Million tons)
1960-61	153.8
1961-62	158.0
1962-63	173.0
1963-64*	190.0



*Estimate

In order to attain the third plan target of 245 million tons, the annual increases during the next two years have to be of a very much higher order. The expectations, according to the Planning Commission's recent review, are that the traffic might indeed touch 260 million tons by 1965-66, even higher than that assumed in the third plan.

Augmenting Capacity

Confidence in these anticipations depends on the success of the current railway programmes for augmenting capacity. The production of wagons (in terms of four-wheelers) is reported to have increased from about 12,000 in 1960-61 to 19,100 in 1961-62 and to 23,000 in 1962-63. During the current year it is expected to go up to 30,000. During the first two years of the plan, electrification has been completed on 540 route miles bringing the total electrified track to 758 miles. About 900 miles of track have been doubled in particular sections. The operational changes to achieve more intensive utilisation of available capacity such as by resort to trainload movement of selected commodities, have also contributed to increased transport output.

How about the actual railway performance itself? For, unless railway working is conducted with progressive efficiency, the railways may find

Blueprints of expansion of a nation's industrial activity require adequate financial resources for implementation.

Allahabad Bank plays its part in providing funds for projects. The investor's money thus plays a vital role in the country's rapid development, the Bank guaranteeing its security and interest to the investor.

THE COLCRETE PROCESS

A versatile system for obtaining a stable and fluid colloidal mixture of cement/sand/water, capable of being pumped over considerable distances to points of placement and permeating uniformly the voids of preplaced aggregate.

A speedy and economical method for use on mass structural works like

GRAVITY DAMS • BARRAGES • WEIRS • FOUNDATIONS • PIERS • QUAYS
SEA WALLS • PILES • CAISSONS • CANAL LININGS • ROADS RUNWAYS

DOUBLE DRUM COLCRETE MIXER

which combines SPEED with QUALITY and ECONOMY

Special features include:

DOUBLE DRUM, which gives an output of 60 mixes an hour, each mix using one cwt. of cement ;

EFFICIENT MIXING TECHNIQUE, which ensures an intimate mixing of cement, sand and water ;

ADAPTABILITY, to be powered by either a diesel engine or electric motor.

Now made in India : Available ex-stock and also on hire

GAMMON INDIA LIMITED

hemselves unable to handle the teadily increasing volume of traffic. Capital assets may help to increase he railways' ability to provide adeiuate transport. If the additional ssets reflect technological improvenents, they are likely to prove even nore effective. Necessity as well as growing appreciation has happily ed to a greater emphasis on improvd technology than used to be the ase a few years ago. The effect of his is seen reflected in the indices of reight transport as shown below:

SELECT INDICES OF FREIGHT TRANSPORT

	1950-51	1955-56	1960-61	1961-62
Broad gauge				
Net ton kilometres a goods engine day on line	29,438	35,162	44,275	43,862
Net tonne kilometres a goods engine in use	45,000	50,952	65,011	63,614
Net tonne kilometres a goods train hour	8,590	8,570	10,808	10,533
Net load a train (tonnes)	489	539	656	657
Wagon kilometres a wagon day	62.3	74.5	76.9	76.1
Net tonne kilometres a wagon day	709	884	998	973
Metre gauge				
Net tonne kilometres a goods engine a day on line	10,813	14,849	16,977	18,307
Net tonne kilometres a goods engine in use	17,504	22,948	27,782	29,615
Net tonne kilometres a goods train hour	2,884	3,437	4,232	4,366
Net load a train (tonnes)	185	246	298	311
Wagon kilometres a wagon day	50.2	45.9	51.6	54.8
Net ton kilometres a wagon day	304	332	405	445

The increases indicated by these igures have been of an unprecedentd character. The essence of transport in its dynamic sense is *speed* and, here, there has been hardly any improvement. In fact, there has been a deterioration. The average speed of goods trains has declined on both broad and metre gauges as shown by the comparative figures. Obviously, the intractability of the speeds of goods trains is itself likely to make for congestion and reduced output. Dieselisation and electrification of the track in the areas of heavy traffic density should have contributed to increased average speeds.

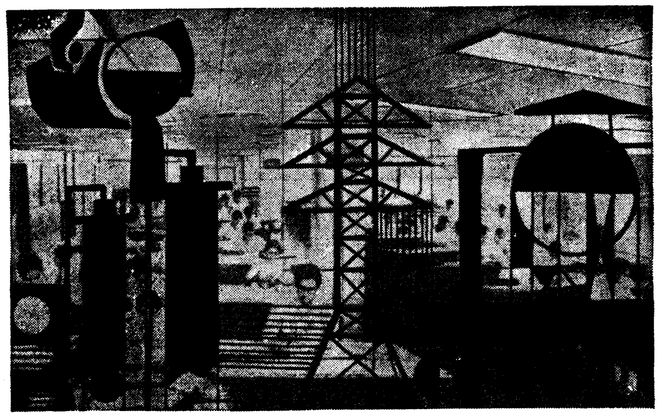
AVERAGE SPEEDS OF GOODS TRAINS

	Broad	Metre
1950-51	17.4	15.0
1955-56	15.9	13.6
1960-61	16.1	13.7
1962-63*	14.6	13.5
1963 April	14.0	13.5
May	13.6	13.2
June	13.5	13.3

*Monthly average

Present Methods of Working

The present methods of working may need to be scrutinised in order to ascertain whether they stand in the way of optimum performance, and deriving the full benefit of the improved equipment and techniques. It is possible that the expeditious removal of elements of obsolescence which may retard the exploitation of the full potential of the improved assets, may by itself lead to an immediate augmentation of transport capacity. In a railway system more than a hundred years old, as with the Indian railways, this is an aspect deserving most careful consideration. For the time being, however, the delay in the maturing of certain projects in the steel and coal sectors has afforded substantial relief. But this is only incidental.



Railway planning and performance in recent months has been such as to inspire confidence in the ability of the railways to accomplish the tasks allotted to them in the plans. There are, however, certain aspects to which current transport policy does not appear to pay sufficient attention. Firstly, the railways should gradually cease to handle transport which can be better and more economically done by other means. In the absence of adequate alternative facilities, the railways are obliged to take over this task. The only effective means of relieving the railways here is by the development of alternative transport —by road and by water (inland and coastal). Unfortunately, the attention now devoted to the development of these additional transport facilities seems far less than what is required to ensure quick and satisfactory results. The Planning Commission has recently started some regional transport studies which are expected to indicate the appropriate spheres of activity of the different forms of transport, and thereby help to evolve a sounder policy of transport planning for the country. This may lead to some worthwhile findings, more to the purpose than the speculations of the Neogy Committee on the co-ordination of transport.

Secondly, the lack of a clearly visualised and well-defined policy on the cost of transport is producing a rather disturbing situation. It is not often realised that freight charges enter at several stages into the costs of production and distribution, and that if these are not properly kept in check, they would insidiously affect the cost of production and build up the pressure to inflate prices. It is to be feared that the dam has been breached by what the Finance Minister has done with his levies and what the railways have done about freight charges, all with the approval of Parliament. Other forms of transport have followed this lead with even less restraint. This raises a complex of problems of costs and prices, which need to be gone into most carefully and comprehensively. Hesitation to go into them now or any delay in examining these will only mean taking them up later when they might prove less tractable than now.

Urban Passenger Transport

The strain on passenger transport, specially in urban areas, has also begun to pose problems which would brook no postponement. Regional dispersal of industry, taken up at a sufficiently early stage, may help to avoid undue concentrations in and around big cities and thus keep down the consequential mass passenger transport in urban areas.

In an expanding economy, problems continue to emerge from all directions with an increasing sense of urgency, and these have to be dealt with in terms of a current as well as a long-term solution, fitted into an overall transport policy. The agency to go into these matters should be clearly the Ministers concerned—the Ministry of Transport and the Ministry of Railways—at the Central level with the help of their counterparts in the States. The essence of a successful transport policy is a constant awareness of the present and future demands for transport and of the steps to be taken to meet them.

FROM BLUE PRINT TO INITIAL OPERATION

Kuljian's wide-range services in the field of consulting engineering range from preliminary surveys, site selection, feasibility reports, engineering studies, preliminary design through detailed plans and specifications, estimating and purchasing, management of construction and initial operation. ■ The Kuljian system of integrated engineering provides efficient and economical solution to all problems of an entrepreneur. Under one corporate roof Kuljian maintains not only an able team of project engineers—civil, mechanical and electrical—but also architects, designers, technicians, economists and administrators who, individually or collectively, are equal to any exacting assignment anywhere in India. ■ Whatever be your project—a steel plant or an apartment house, a fertilizer plant or a thermal station, subway systems or transmission lines, let Kuljian do the job for you. It has the experience and the resources.

Defects in Indian Planning: Realistic Assessment Needed

A basic weakness of Indian planning is the lack of authentic statistics. The adoption of the Communist model with its emphasis on heavy industries to the neglect of agriculture and consumer industries is another weakness. Mr. Shroff suggests that India should adopt "indicative" rather than "imperative" planning, as has been done by the French.

By

A. D. SHROFF

A LITTLE over 40 years ago, as a student at the Elphinstone College in Bombay, I used to spend considerable time in the library reading what I consider to be some of the classics on Indian economics, such as the Budget speeches of the late Gopal Krishna Gokhale and papers of the late Dr. Dadabhai Naoroji. For instance, the following passages from *Poverty and Un-British Rule in India* by the Grand Old Man of Indian politics give one even today an insight into one of the important problems of the Indian economy, namely, deficiency of authentic statistics.

"Parliament requires a yearly report of the moral and material progress of India; and a Statistical Committee is formed at Calcutta to supply the necessary information. This Committee has prescribed certain tables to be filled up by the different Governments in their administration reports.

"The Central Provinces and Burmah reports are the only two complete in their agricultural tables as far as practicable. Four others (Madras, North-West Provinces, Punjab and Oudh) give them imperfectly. Bengal and Bombay gave the least, or none, up to 1869-70. For what I could not get from the reports, I applied to the India Office, which naturally replied they could not give what they did not get from India. It will be seen, therefore, that I have been obliged to work out the production under much the quality even of such as is given is defective. For instance, in the tables of prices of produce in the different districts of the Central Provinces, in order to get an average the prices are added up together, and the total is divided by the number of the districts. This principle is generally adopted by the returns made by all the Governments on average produce or prices. The principle, however, is altogether fallacious. In taking the average of prices, the quantities of produce sold at the different prices are altogether lost sight of. In the same way, in taking the average produce of an acre, the extent of land yielding different quantities is overlooked.

"The result, therefore, is wrong, and all arguments and conclusions based upon such averages, are worthless. Taking the instance of the Central Provinces in the administration report of 1867-68, the average price of rice is made out to be Rs. 2.12.7 per maund, when in reality the correct average will be only Rs. 1-8 per maund. Again, the table for the produce of rice per acre gives the average as 579 lbs, when in reality it is 759 lbs. Now, what can be the worth of conclusions drawn from these wrong averages? These averages are not only worthless but mischievous. It is a pity that, with large Government establishments, more accurate and complete information should not be given. I sincerely trust that future reports will not only work averages upon correct principles, but also work out the total production of their respective provinces. *Then* only we shall know the actual condition of the mass of the people. All 'I thinks' and 'my opinions' are of no use on important subjects. The whole foundation of all administration, financial and general, and of the actual condition of people, rests upon this one fact—the produce of the country, the ultimate result of all capital, labour and land. With imperfect materials at the command, and not possessed of the means to employ a staff to work out all the details as they ought to be, I can only give approximate results."

Deficiency of Statistics

One of the basic weaknesses of Indian planning even today is deficiency of statistics of an authentic character. The *Census Report of 1961* has brought this out vividly. It says:

"One also notes that what is impressive is not so much the rate of increase, which up till now has never been inordinately high, and for past decades even quite low, but the large absolute increments. The Census Commissioner for 1961 aptly called 1921 the Great Divide, while the last decade may be viewed as a great leap forward. For the actual count in 1961 surpassed even the most generous of expectations, having exceeded by more than 8 million the highest estimate ever made before the census. The Registrar-General in 1951 had forecast an upper limit of 407 million, Kingsley Davis 402 million, Coale and Hoover and T. Chellaswami 424 million, and the Planning Commission expert committee 431 million. These estimates appear to have failed to project the cumulative effects of the elimination of recurrent famines and epidemics on the one hand and pandemic malaria on the other, the former after the first World War, the latter after the second World War which had carved up the country, as it were between themselves in two distinct regions."

I would like to congratulate the Indian Government on republishing at moderate prices classics of Indian economics such as Dr. Naoroji's writings. Every student of Indian economics should read them.

As a life-long student of economics, I feel similarly rewarded by a study of some of the latest literature on economics from communist countries. I recommend to students of Indian economics study of speeches by Mr. Khrushchev and the statements of Communist Parties of Russia, Yugoslavia and Poland, justifying the changes being effected in the economies of those countries. For instance, citing reasons for large grain imports from Canada, the U.S.A. and Australia, Mr. Khrushchev recently said the following, thus stressing the importance of developing agriculture, a lesson which the Indian planners are slowly learning now:

"The Central Committee of the Party is presently planning to carry out such measures which will make it possible to lay a stable foundation for our country to obtain big guaranteed harvests, especially of grain. As already mentioned, we shall not proceed from the size of sown area, but from harvests, from produce.

"The more important thing is to make people interested in the realisation of this task, to create material incentive for them and to think over and introduce a more rational organisation and remuneration of labour. The question of labour remuneration is a very important one. I would even say it is a cardinal problem in managing agriculture."

Importance of Incentives

The importance he places on "incentives" needs to be appreciated by developing countries. Or, once again, the resolution of the Communist Party of Russia, in March 1962, justifying higher prices for essential foodstuff laid stress on "material incentives". It said:

"It is necessary to raise the purchasing prices of meat and milk in order to make production of these products economically profitable for the collective farms, to give the latter the necessary accumulations, and to interest them materially in swiftly raising output of animal husbandry products. This, however, calls for vast sums of money. Where should they be taken from?"

The outstanding impression one gains from the classics on Indian economics and material like the above quotations is that economics is a matter of common sense. Laws of economics are inexorable. Political or ideological considerations or legislative enactments cannot defeat or overcome those laws. Countries which have before them an adventure of raising the standards of living of the masses would, therefore, do well to understand and implement those laws which even totalitarian communism has not succeeded in defying.

The foremost problem before India today is to eliminate poverty by rapid and large-scale economic development, and, to accomplish this within the framework of a democratic society. It is a great consolation to learn that even socialists like the Prime Minister have categorically emphasised (his speech in Jaipur on 2nd November) the need to maintain the democratic character of society, and there is a growing recognition that socialism may not fit in with a democratic society. There is no dispute about the method also for democratic planning. I cannot do better than state this economic process in the inimitable words of Dr. Ludwig Erhard, father of the West German economic miracle. I am quoting him extensively because

these passages have a special significance for us today.

"The real contradistinction is not between free and planned economic systems, nor between capitalist and socialist economic systems, but between a market economy with free price-level adjustment on the one hand and an authoritarian economy with State controls extending into the sphere of distribution on the other. In the last analysis, it is simply a question of whether the market as the voice of the economic society as a whole or, alternatively, the State or some other collective entity is better able to decide what is conducive to the common good or the well-being of all. It is still a widely held fallacy that the outcome of free competition is to arrest movement and change within the social structure or at least to set up economic strains and stresses. In actual fact, all liberal-minded experts with a sound knowledge of the social organisms are agreed that it is precisely the other way round, that it is the limiting of freedom of movement that throws the economy out of balance and produces crisis after crisis, each more unmanageable than the last.

"Provided in future the State sees to it that neither social privileges nor artificial monopolies impede the natural process by which economic forces reach and maintain a state of equilibrium, and that the operation of supply and demand is allowed free play, the market will adjust the total input of economic forces so as to create optimum running conditions and to compensate any mistakes made at the controls. Anyone who wishes is welcome to believe that a planning and regulating economic authority might be a better judge of the economic intentions and wishes of society; but just let him try to prove it. What can be said is that in a free market economy mistakes of judgment in the management of affairs automatically produce price changes with all their attendant repercussions, whereas in a State-directed economy, there is always the danger that equally serious mistakes can be covered up and left to fester until they ultimately erupt with elemental force. We have had experience in recent years of how easily a State-directed economy can deteriorate, by imperceptible stages, into a travesty of what an economy should be.

"Our criticism is thus not directed against the planned economy *per se*, whose manifold forms can be variously interpreted, but most definitely against the State-controlled authoritarian economy which, if carried to its logical conclusion, wipes out the market and robs the consumer of all freedom of choice. On the other hand, a collectively managed economy responsive to market reactions is a contradiction in terms and, therefore, unthinkable; disregard for the wishes of the consumer as reflected in market reactions is bound to destroy freedom of action and stems from the fallacy that human happiness can be secured by maximum satisfaction of statistically measurable needs. So, even assuming that the authority wielding economic control had no other motive than to serve the good of the community—and this not even the socialist State guarantees—it is still open to doubt whether the people as a whole would prefer any form of collective economy to the free market economy."

Scathing Criticism

There is considerable disillusionment in India today about the planned economic progress achieved so far. Criticism of Indian planning and the Planning Commission is no longer confined to non-officials and the general pubic. Some of the scathing criticism emanates from the ranks of the authorities themseves like the Prime Minister and the Finance Minister. While the present position, composition and mode of functioning of the Planning Commission itself has to bear considerable responsibility for the frustrating state of affairs, the fault lies essentially with the model of planning chosen for the country.

The first plan was merely an accumulation of projects, some of which were started before the plan was initiated officially in 1951, and some even before the country became independent. The plan, nevertheless, was a success, thanks to its realism and the bounty of nature. The trouble started with the second plan. It was based on the communist model of planning. Unfortunately, the error has been repeated in the third plan. So one sees the sad spectacle of appraisals and reappraisals, frequent upward revision of targets, talk of "core" and "hard core", lack of balance in the economy, serious deficiencies in basic sectors like steel, coal, cement and power, and above all the hardship of rising prices suffered mostly by the fixed income groups.

In other places, I have enumerated the characteristics of the communist model of planning and illustrated its failure not only in India's democratic set-up, but also in communist countries. For instance, neglect of agriculture has led Russia today to import huge quantities of foodgrains from Canada, Australia and the U.S.A. At one time, before this communist experiment started, Russia was an exporter of foodgrains. Only 11 years ago, addressing the nineteenth Communist Party Congress, Mr. Georgi Malenkov, the then Central Committee Secretary, made the statement: "The grain problem, formerly considered the most acute and serious problem, has been solved, solved definitely and finally in the Soviet Union." The statement looks pathetic today, and the present position confirms the basic law of economics, namely, agriculture should receive priority.

The demand for consumer goods—in acute short supply—is also a characteristic feature of the communist model of planning. It is interesting, above all, to note the return to basic economic laws such as the "profit motive" (Dr. Liebermann's thesis is well known by now to every student of Soviet economics), linking remuneration to productivity, providing "incentives" for larger production, and an attempt to measure real costs of production. If planning had not been based on ideology, but on realism, all these distortions could have been avoided.

What is currently happening in India is something similar, although

the people here are still enjoying a democratic form of Government. Having applied the communist model of planning, the economy is undergoing unnecessary strains and stresses. The attempt at such *centralised, comprehensive* planning, with its inverted sense of priorities, and multitude of frustrating controls is impeding rapid economic progress and producing distortions in the economy. The situation can best be illustrated by the following news item in a Bombay financial daily of 10th October, 1963:

"A curious situation has developed in the Madras region in the matter of cement supplies.

"Many public-sector undertakings hold more stocks than they need. To some of them, it has become a problem to find godown space.

"At least one of them has wired to the authorities to stop sending any more stocks for some time.

"Also, it is reported that large quantities of cement are lying idle with an Andhra producer for want of transport facilities.

"Meanwhile, there is a decline in building operations because of the Government's extra care to stop the flow of cement into the black market. This is reflected in the fall in the price of bricks from Rs. 85 to Rs. 15 to Rs. 25 a thousand, below the controlled rate.

"The supply position of iron and steel materials has also eased."

Distortions and Maladjustments

Such distortions and maladjustments in a free economy are automatically eliminated by the market mechanism. But under centralised, comprehensive planning, such distortions are the order of the day. They cannot be dismissed as harmless. Particularly in this stage of India's economic development, they impede production which is the need of the hour.

The attempt at unnatural forcing of the pace—under centralised comprehensive planning—is also resulting in the wasting of scarce resources, thus defeating the purpose of planning. Russia tried such a policy, only to backtrack with the New Economic Policy; and, recently, Mr. Khrushchev's realism, aimed at increasing production and productivity and giving the Russian people consumer goods which they desire is slowly dissolving the centralised, comprehensive planning. While implementing the communist model of planning, China has run into difficulties. It is amusing to read the observations of Russian commentators on China's experiments which have been described as "foolhardy". The following report appearing in the Indian Press in October 1963, makes interesting reading:

"A Russian economist, Mr. A. Belayaev, said the Chinese leaders had ignored Soviet advice against defying 'all laws of economic development'. Taking cover behind 'loud revolutionary phrases', the Chinese leaders had replaced 'planning and cost accounting' by 'volitional decisions'," he said.

"Mr. Belayaev said: 'The Chinese leaders in essence declared war both on machinery and technical experts, maintaining that scientific norms of exploitation of equipment and utilisation of labour power were not meant for them. The result was that industry, having chalked up rates of growth beyond its powers, fell through and suffered a big setback.

"The output of the primitive steel and iron furnaces proved worthless. The labour and tremendous material resources spent on their construction were completely wasted. Major enterprises, a large part of which was built with the help of Russia, were worked till they were worn out, with no attention paid to repairs.

"The setting up of agricultural communes brought down considerably the production of foodstuffs and raw materials for industry.

"He said that the Russian advice against this ruinous policy was rebuffed as 'conservative' and 'everything was done to make the sojourn of Soviet experts in China unbearable'.

"The Soviet economist added that all this led in the end to an 'abrupt drop in the living standard' of the Chinese people."

The example of Russia and communist China is before India. The latter's own experience confirms the futility of comprehensive, centralised planning. So it is time that a shift in India's planning techniques was effected.

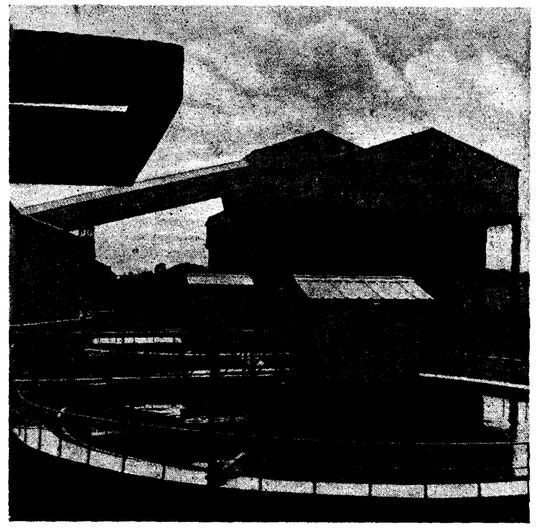
Indicative Planning

The planning India can usefully implement is "indicative" planning as distinct from the "imperative" planning of the communist model. France has successfully applied such planning. It means first, the setting up of national goals of economic development, then consultation with all interested parties like industrialists, trade union leaders, officials, and finally, the devising of suitable fiscal, monetary and administrative policies to help all people engaged in production to achieve those goals.

If such planning were adopted in India, it would highlight the enormous tasks before the Government of India to help economic growth. Every ounce of administrative energy and every naya paisa of the scarce resources in the country need to be conserved and used in the best possible manner for fulfilling those basic tasks. I cannot do better than quote Professor Milton Friedman as to the proper sphere of action of the Government to contribute towards economic growth where such "indicative" planning is adopted:

"There is a right way and wrong way to do most things. Planning is the appropriate use of means for the achievement of objectives. In this country (i.e., India), planning is taken to mean the attempt by a centralised agency to establish a pattern for the economy as a whole and to enforce it by a host of specialised and detailed controls, including Government engaging in certain enterprises and so on. This whole paraphernalia, which in this country goes by the name of planning, is in fact bad planning, because it is almost guaranteed to defeat rather than to promote your objective.

"On the other hand, a Central Government which maintained law and order, provided for the national defence, secured people in the enforcement of private contracts freely entered into, provided a stable monetary framework, fostered the spread of elementary schooling and the improvement of road communication and, for the rest, fostered a free market to enable millions of individuals in this country to use their own resources in accordance with their own objectives—such a Government would be engaging in good planning, in planning which was suited to the promotion of economic development in the sense of the improvement of the lot of the ordinary man."



Candid Admission

The leeway India has to make up in this direction is considerable. It is the everyday experience of citizens as to the shortfalls in elementary services which it is the duty of the State to provide. Only two recent newspaper items are cited to point this out. One of them is an admission by a State Minister as to the way the administration is moving; the other is a pathetic letter from a reader to the editor, which highlights how the deficiencies in the vital postal and telegraphic services are harming the common people:

"Ahmedabad—The Minister for Panchayats, Gujarat State, said here yesterday that the quick redressal of public grievances depended to a great extent on the quality of Government officials. Pointing out an instance where a petition to the Development Officer lay unattended for 17 days, he said that such delay was inexcusable in view of the fact that Government officials are not loaded with much work. All petitions henceforth will have to be attended to in three days by the respective officials, failing which strict action will be taken against them. The Government, he said, is devising suitable measures."

"Sir, On 31st August, 1963, I sent Rs. 100 by telegraphic money order from the Goregaon Post Office to my home on an urgent request, needed to repay a certain Government loan. They received the amount on 6th September, 1963. The delay caused much hardship and they had to sell their cattle in order to repay the loan. What is the use of sending money by T.M.O. if it cannot reach destination in time? Who is responsible for this delay? The postal authorities should look into the matter urgently."

I hope that at least now realistic considerations will displace ideology in our economic policies. Human welfare can be achieved only on the basis of practical considerations by respecting basic economic laws and taking into account human nature as it is.

Bank Deposits and Advances Rise with the Growth of National Income

By

D. BRIGHT SINGH

AS general purveyors of credit, commercial banks play an important rôle in financing economic development. In a developed free enterprise economy, a large part of national savings is routed through the agency of commercial banks into channels of profitable investment. Even in low income countries in which financial institutions have not been well developed, business enterprises depend to a large extent on banks for their capital requirements. As industries are started and trade and commerce expand, the demand for banking services increases in proportion, while the growth of banks and other financial intermediaries in turn promotes further economic expansion. Thus the standard of economic development of a country is reflected in the structure and organisation of its credit institutions.

A review of banking developments in India in recent years brings out clearly the close interdependence between economic expansion and the growth of commercial banking. In the last 12 years of planned development in India, national income has increased by about 43 percent and, at the same time, the proportion of savings canalised into investment through the agency of commercial banks shows a substantial increase. Between 1951 and 1961, the number of offices of scheduled and non-scheduled banks in India increased from 4,119 to 5,111. This was made up of a progressive decline in the number of non-scheduled banks from 1,473 to 723 and a progressive rise in the number of scheduled banks from 2,646 to 4,388. The offices of foreign banks increased in number slightly from 64 to 71 while that of the State Bank of India rose from 391 to 946.

The personnel employed in the banks in India increased from about 70,000 in 1951 to over 100,000 in 1962. The aggregate deposits and advances of commercial banks and their paid-up capital and reserves during this period went up from Rs. 834 crores, Rs. 544 crores and Rs. 69 crores to Rs. 1,955 crores, Rs. 1,302 crores and Rs. 81 crores, respectively. This growth is quite commendable, but considering the vastness of the country, the size of its population and the large needs that will arise as economic development gains momentum, it should be deemed inadequate. As late as 1962, it was reported that "there are still as many as 1,018 towns out of a total number of 2,690 in the country which are not served by any office of commercial banks."

Economic Expansion

The trends in bank credit in India in the past 12 years reflect the important changes that have come over the country's economy. The different phases of the expansion of scheduled bank credit on the whole synchronise with the phases of growth of national income and the trends in investment and deficit financing. This is illustrated by the figures in the following table:

TABLE I

TRENDS IN BANK CREDIT AND ECONOMIC CHANGE

(In Rs. crores)

Base 1952-53=100.

Scheduled bank credit reached a high of Rs. 532 crores in 1951 raising the ratio of credit to liabilities to 59.6 percent. Over the first three years of the first plan, both liabilities and credit declined slightly, the annual average being Rs. 868 crores and Rs. 514 crores, respectively. It may be noted that the level of investment in the economy decreased from Rs. 693 crores in 1951-52 to Rs. 550 crores in the next year, but improved to Rs. 583 crores in 1952-54. In the next two years, as investment rose sharply to Rs. 714 crores and Rs. 951 crores, bank credit also registered a sharp increase. It reached Rs. 744 crores in 1956-57 and rose to Rs. 874 crores and Rs. 893 crores in the next two years. There is also an appreciable rise in the level of investment since 1956-57. Between 1956-57 and 1959-60, scheduled bank liabilities increased faster than credit, so the credit liabilities ratio receded from the high of 68.9 percent in 1956-57 to 54.4 percent in 1959-60. Since then the trend has been reversed, the rate of expansion of bank credit being higher than that of liabilities.

Rôle of Government

The expansion of bank credit becomes possible when the supply of resources of commercial banks is increased and along with it there is a rise in the demand for bank credit. In a planned economy like that of India, where the Government plays an important rôle in economic development, public expenditure affects both the supply and demand sides of bank credit. Since planning started in the country, the public sector has been responsible for making large annual investments which have directly affected the level of activity in the private sector as well. It may, in fact, be said that Government investment has set the pace for general economic activity in the country. When the Government raises its investment and the current resources are found inadequate to meet the rising need for them, large borrowings are made from the central bank. When the central bank lends to the Government and the latter makes use of the credit by issuing cheques to its employees, creditors, contractors, etcetera, and when the money is deposited with commercial banks, the reserves of these banks are augmented. Also, if there is pressure on commercial banks for funds because of increased needs of the business sectors, the central bank's action to relieve this pressure by lending to the banks through rediscounts or purchase of securities or through advances would strengthen the free reserves of commercial banks. The increase in money supply and in deposits of commercial banks resulting from a rise in public investment and deficit financing is reinforced if there is a surplus in a country's external accounts.

On the demand side, the influence of public investment is less direct. The demand for bank credit comes largely from the private business sector. Even as the central bank's holding of Government securities measures the extent to which deficit financing is resorted to by the public sector, a net increase in the volume of commercial bank credit reflects deficit financing by private business. The demand for more bank credit arises from the fact that the investment activity by the State and large spendings by the Government exert a general stimulating influence on business. In a period of economic expansion when the demand for bank accommodation is high, it would be difficult for the banking system to resist the temptation to expand credit with a view to making profits for themselves. The lending activity of commercial banks directly leads to an increase in money supply and thus helps to raise the level of effective demand. There is, however, the likelihood of a lag between public investment activity and the demand for commercial bank credit. Initial investment in the public sector brings about a rise in money incomes. To the extent private investment activity does not follow close on the heels of public investment, there is an excess supply of money with the public, a part of which gets deposited with commercial banks. And as private investment gains momentum, there is increased demand for bank advances. Recent trends in deposit liabilities and advances of scheduled banks in India illustrate the influence of these factors.

Trends in Bank Deposits

Scheduled banks' deposit expansion commenced from 1953, marking a distinct break with the preceding years and continued at a steady rate up to 1955. The major factors responsible for this uptrend were budgetary deficits and surpluses in the balance of payments which in the three years 1953-54 to 1955-56 totalled Rs. 321 crores and Rs. 73.3 crores, respectively. The rate of expansion of deposits slowed down in 1956. This was the combined result of the opposite influences exerted by a rise in investment expenditure and deficit financing on the one hand and a large balance of payments deficit on the other. A phase of steady and rapid growth in deposits started in 1957 and the trend continued up to 1960. Over these four years, the deposit liabilities of scheduled banks increased by Rs. 872 crores or at an annual rate of Rs. 218 crores. Many factors contributed to this uptrend. Severe restrictions on the import of raw materials as well as capital goods limited the opportunities for fresh investments and induced private business concerns to accumulate their deposits with banks. The hardening of interest rates on fixed and savings deposits would have been an additional incentive for such shifting of resources and might have led to a switch over from current to time deposit accounts and possibly also from non-banking to banking accounts. The setback in the rate of growth of deposits in 1961 is to be explained partly as the effect of the change in procedure for the banking of the P.L. 480 funds. Up to May 1960, these funds had been kept with the State Bank of India, mostly in the form of time deposits and the greater part of

them was invested by the bank in Government securities.

Since May 1960, fresh funds of P.L. 480 have been maintained with the Reserve Bank which invests them in special securities. Besides, the funds under this head remaining with the State Bank at the time the earlier arrangement was terminated, have since then been transferred to the Reserve Bank in instalments of Rs. 12 crores a month. But apart from this, the smaller order of deficit financing, the widening of the balance of payments gap which necessitated the net sales of sterling and the decline in public confidence in banks caused by the closure of two banks would also have adversely affected the growth of bank deposits. In addition, there are evidences to show that in view of the stringent monetary conditions, and the offer of high rates of interest by a few industrial companies, depositors with idle balances were induced to resort to direct financing, on a cash basis, of some transactions on the market. Subsequent to 1961, however, deposit growth has revived. Among the factors which helped this improvement must be mentioned the measures taken by the Central Bank towards toning up the banking system. The compulsory mergers of small and inefficient banks and the setting up of the Deposit Insurance Corporation, which started functioning on 1st January, 1962, would have restored the confidence of the public, while the withdrawal of the 2-percent ceiling on the call deposit rate and the offer of slightly higher deposit rates by commercial banks would have operated as incentives for the building up of bank deposits. Higher deposit rates offered by the banks helped in averting the diversion of deposits to the non-banking sector and in attracting them back to the banks.

Deposits Rise

During the 11 years from 1951 to 1961, deposits of scheduled banks increased from Rs. 893 crores to Rs. 1,956 crores or by 119 percent. This substantial growth of deposits is the result of two major factors, namely, the increasing money incomes of the community generated by the large investment expenditures in the two five year plan periods and the spread of the banking habit geographically over a wider area and among various classes of income earners. The number of bank accounts increased by 13 percent in the first plan and 55 percent in the second. That the spread of the banking habit contributed substantially to the growth of deposits is evidenced by the fact that since 1955 the rate of deposit expansion has been the highest in centres with a population of 50,000 and less, against a smaller rise in the larger centres. Much of this increase was in the savings and fixed deposit accounts of smaller income earners. The increase in the ratio of deposit resources of all commercial banks to currency in circulation from 72 percent in 1950 to 86 percent in 1960 and the rise in the proportion of all deposits to the total monetary resources (i.e. currency and bank deposits—both current and fixed) lend further support to this view.

Impressive as this expansion has been, it is important that there is further substantial growth in the next few years. With the rapid industrialisation of the country and the growth of the private sector and the implementation of the public investment programmes in the third plan, the pressure of demand for bank funds would increase and this can be adequately met only by intensive mobilisation of resources by commercial banks. So far, progress in the establishment of banks in rural areas has been satisfactory only as far as the State Bank is concerned. Larger mobilisation of deposit resources is possible only through the extension of banking facilities to rural areas and the newly developing regions, more efficient banking service and the establishment of closer contact between the agents and officials of banks and the investing public.

Trends in Bank Credit

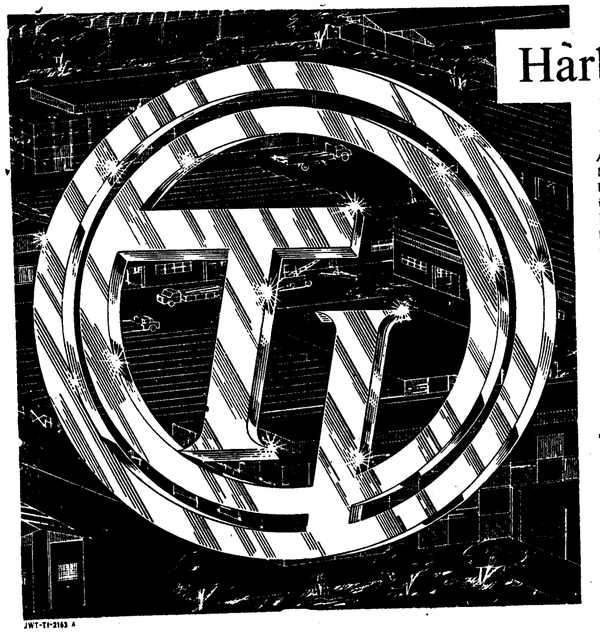
The trend in bank advances is determined by the investment activity in the public and private sectors, industrial and agricultural production, price level, conditions of foreign trade, level of employment and the Government's trade and commercial policy. When demand and prices are high, and the prospects for profits are bright, business men are prompted to increase their investments in order to expand their businesses or start new ones and to add to the stock of industrial materials. Dealers in agricultural commodities also require bank accommodation under similar conditions. An increase in the deposits adds to the resources of banks and facilitates their lending. Apart from this, they draw on their excess reserves or add to their liquid resources by unloading their investments especially in Government securities and by borrowing from the central bank. As a result of credit expansion, the expending power of the community is increased, but in so far as the creation of credit by banks is preceded by a rise in the level of economic activity which in turn may be influenced by the Government's investment policy and the central bank's preparedness to meet the Government requirements, it would be incorrect to hold the commercial banks primarily responsible for any inflationary trend in the general price level. However, to the extent commercial banks take a hand in providing finance for unproductive purposes such as Stock Exchange speculation, they contribute directly and actively to inflationary price rises.

The trends in scheduled bank credit in India since 1951 fall into four rather well-marked phases—a decline in the first three years of the first plan, a rapid rise from 1954 to 1957, a slow rise between 1957 and 1959 and a sharp increase since then. The decline up to 1953 reflects the impact of the restrictive monetary policy adopted by the Reserve Bank in 1951. As a result of the raising of Bank rate and the Reserve Bank's abandonment of the policy of supporting Government securities, credit became costlier, and banks came to exercise greater caution in their lending policy. The decline in commodity prices which started in the first quarter of 1952 and uncertainties about business prospects discouraged inventory building and contributed to the downtrend in bank advances. The generally restrained nature of bank credit continued in 1953 because of difficulties facing certain export industries.

It was, therefore, possible for the banking system to meet the credit demands without much difficulty mostly out of their own resources. The revival of bank credit in 1954 was due to improvement in production, the rise in the level of business activity and the consequent increased scope for trade and finance. The rise in the volume of foreign trade and the resumption of private trading in foodgrains were also contributory factors. The increased credit demand was met partly out of own resources and substantially through borrowing from the Reserve Bank which was facilitated by the liberal policy under the bill market scheme. The uptrend in bank credit was maintained in the next two years by large Governmental capital outlays, high levels of private investment, increase in industrial production and a sharp rise in prices. The advances deposit ratio was stretched, rising from 57.7 percent in 1953 to 68.9 percent in 1957. The strain on the liquidity position of banks compelled them to reduce their investment holdings in Government securities in order to expand their advances in response to the rapidly growing credit demands of trade and industry. The scarcity of funds in the money market also induced commercial banks to attract fresh deposits by offering higher rates of interest.

Pace of Growth

In the years 1957-59, the pace of growth of bank credit slowed down, the increase in these years averaging only Rs. 72.6 crores a year. A recession in industrial production, decline in new issue activity and some slackening in private investment activity accounted for this trend. The adoption of a restrictive credit policy by the Reserve Bank, the implementation of selective credit control measures and the steps taken to control the speculative use of bank finance must also have had their effect. The slackening of credit expansion against a rapid rise in deposits enabled the banks to make large additions to their investments. Banks absorbed Treasury bills and also subscribed to State and Central Government loans. Of the record rise in investments amounting to Rs. 206 crores in 1958, Government securities accounted for over Rs. 202 crores. At the same time, commercial banks reduced their reliance on the Reserve Bank for funds, and their borrowings under Sections 17(4) (a) and 17(4) (c) declined sharply. Thus in the first three years of the second plan, while total scheduled bank advances rose by about 40 percent, bank deposits increased by as much as 55 percent. However the high degree of liquidity attained by the banks did not necessitate any action on the part of the Reserve Bank to freeze the excess liquidity in so far as a large proportion of the liquid resources at the disposal of the banks was in any case diverted to investment in Government securities.



Since 1959, there has again been a rapid rise in the advances of commercial banks. Scheduled bank credit increased from Rs. 893 crores in 1958 to Rs. 1,253 crores in 1961 and touched a peak level of Rs. 1,437 crores in the first week of May 1962. The credit deposits ratio moved up from about 55 percent in 1959 to about 70 percent in the second quarter of 1962. Credit against manufacturers and minerals and against stocks of raw materials went up sharply in 1959. There was besides a substantial rise in advances secured against iron and steel and engineering products. However, the expansion in advances for commerce was greater than that for industry. With an increase in industrial and agricultural output and a rise in overall investment in the economy in 1960, the pressure of demand for bank funds became more intense. In that year, bank credit to the private sector rose by Rs. 246 crores or more than one-third of the total increase during the second plan period.

The high level of investment in the public as well as the private sectors, accumulation of large stocks with industry and trade, and the rise in the prices of industrial raw materials and manufactures, combined with some speculative activity on the stock and commodity markets, necessitated a rise in commercial bank credit to a level higher than it had reached before. Since the demand for advances increased faster than the growth of deposits, bank investments in Government securities had to be reduced, and commercial banks had to resort to larger borrowings from the central bank. These amounted to about Rs. 50 crores, against less than Rs. 1 crore in 1959. Industrial credit in the aggregate went up by Rs. 144 crores in this year, and the expansion was shared by most of the major industries, such as cotton textiles, sugar mills, jute mills, iron and steel and engineering. As for the last mentioned two industries, considerable increase in bank credit was necessitated by the expansion of the iron and steel industry in the private sector and the growing financial requirements of the trade in marketing the iron and steel produced by the public-sector steel plants. The expansion of credit to trade and industry in 1961 was moderate, compared with the rise in the previous year due largely to a slight recession in industrial output. On the other hand, growth of deposits was much greater in 1961. The rise in bank credit gained further momentum in 1962 and 1963. At the close of March 1963, total scheduled bank credit reached the high level of Rs. 1,588 crores and the ratio of credit to deposits moved up to 77.8 percent.

Shifts in Composition

The important changes that have come over the economy in the last few years are reflected not only in the steady uptrend in bank credit and money supply, but also in the significant shifts that are noticeable in the direction of bank credit as well in the composition of deposits. One striking feature of the trends in commercial bank credit in recent years is the more or less steady rise in the proportion of advances to industry as against commerce. Table II on the following page showing the distribution of advances according to purpose, illustrates this trend.

In the decade 1951-61, the share of industry in total scheduled bank advances increased from 33.5 percent to 54.2 percent while that of commerce and trade declined from 52.8 percent of the total in 1951 to 28.6 percent in 1961. The attraction of a greater volume of bank funds by industry and the relative decline of trade and commerce in this matter is an index of the industrial growth of the economy. The concentration of investment in trade and commerce in which capital turnover is quicker and the risk element is less is characteristic of the investment pattern in underdeveloped economies. Hence the fact that industry has been able to attract

Harbinger of a new Industrial era

AMBATTUR, a tiny village twelve miles away from Madras, lay sleepily, neglected by history, by-passed by the industrial revolution. Then, on a cool morning in November 1949, the village woke suddenly to life. Bulldozers and excavators arrived on the scene to be followed by a mass of steel and weird-looking machines. The T.I. Cycles factory had come into being. T.I. Cycles was only the first venture of Tube Investments of India, a joint enterprise of Murugappa & Sons of Madras, and Tube Investments of England. The scope of the T. I. group had been widening year by year and today it embraces steel strip rolling; tube making, the manufacture of cycles and cycle accessories and industrial chains. T.I. Cycles was the harbinger of a new industrial era for Ambattur, and its environs are today among the busiest industrial townships in our country.

TUBE INVESTMENTS OF INDIA LIMITED

52/53, Jehangir Street, Madras-1

Source: *Trend and Progress of Banking in India.*

to itself an increasing proportion of total bank advances may be taken as indicative of a healthy development of the country's economy. It is worth noting that among the industries listed in the above table, the share of the traditional ones and those which have existed in the country for a relatively long period of time, such as cotton and jute textiles, sugar, vegetable oil crushing and refining, has fluctuated within a limited range or gone down. On the other hand, new industries like engineering and chemicals whose potentialities for further expansion are great and which would contribute substantially to the overall growth of the economy, show a rapid improvement—the share of the first going up between 1951 and 1961 from 2.7 percent of total advances to 10.4 percent and that of the latter from 1.5 percent to 3 percent during the same period. There is a marked increase in the proportion going to the iron and steel industry—from less than 1 percent to about 3 percent.

Industrial Progress

The effect of industrial progress is also seen in the modification of the seasonal trends in bank credit. In most parts of the country, the busiest part of the year is the last and first quarter; and the slack season is covered by the six months from April to September. Usually, the lowest level of the slack season is reached in August and September and the maximum height of the busy period is attained somewhere in the first or second month of the year. In relation to agricultural produce, bank advances show marked seasonal variations but advances against manufactured products are non-seasonal. Hence as the non-agricultural or industrial sector develops and expands and bank advances against these commodities increase, they considerably moderate the seasonal variations in bank credit for agricultural commodities. This compensatory effect is illustrated by the seasonal and non-seasonal advances offered in 1961 and 1962.

TABLE III

SEASONAL TRENDS IN BANK CREDIT (SECURITYWISE CLASSIFICATION)
(In Rs. crores)

	Busy season		Slack season	
	1960-61	1961-62	1961	1962
Seasonal advances (against the security of food and non-food crops)	+168.0	+126.9	−117.4	−121.3
Non-seasonal advances (against the security of manufactured and engineering goods, shares and debentures, gold and silver bullion)	+30.8	+53.0	+35.6	+61.7
Total secured advances	+198.7	+179.9	−81.9	−59.6
Unsecured advances	−0.1	+12.9	+7.3	+16.8

Source: *Trend and Progress of Banking in India, 1962.* p. 5.

The attenuation of the overall seasonal variations indicates that a large part of the increase in advances is being absorbed by the new industries with a non-agricultural basis, such as iron and steel, engineering and chemicals. The speculative use of bank credit for maintaining stocks of some commodities would also have tended to submerge seasonal trends. Over the years 1951-62, the expansion in bank credit was brought about by a steady rise in the expansion in successive busy seasons and by less pronounced contraction in the slack seasons. The fall in the decline of bank credit in the slack seasons has been due to the fact that the decrease in bank credit against seasonal commodities is largely offset by an increase in credit against non-seasonal commodities, reflecting the higher rate of industrial output and the fast expansion of the secondary sector of the economy. As may be seen from Table IV, credit expansion in the busy seasons has been on the whole upward; while in relation to the slack season contraction—with the exception of three years—the trend has been generally downward. The large contraction in the slack season of 1958-59 was due to the relative slackness in industrial activity, lower imports and the continuation of the overall policy of credit restraint pursued by the Reserve Bank. In 1959-60 and 1961-62 also, the decline in scheduled bank credit was quite marked, exceeding Rs. 70 crores in each year. The appeal of the Governor of the Reserve Bank to banks in 1959, calling for a reduction of Rs. 100 crores in credit during the slack season of 1959, might have been responsible to some extent for the large contraction in 1959-60. The similar sharp decline in credit in the slack season of 1961 was due to the appreciably small expansion in credit against non-seasonal commodities and a large contraction in credit against seasonal commodities. This close approximation to the seasonal trend, which was normal in the earlier years, appears, however, to be exceptional.

TABLE IV

SEASONAL VARIATIONS IN BANK CREDIT, 1951-62
(In Rs. crores)

Year	May-October Slack season	Busy season November-April
1950-51	− 62.0	+172.6
1951-52	− 85.9	+ 95.7
1952-53	−119.6	+ 78.1
1953-54	− 90.0	+112.0
1954-55	− 62.0	+109.0
1955-56	− 31.6	+164.5
1956-57	3.7	+148.5

1962-63	− 41.1	+203.9

Source: *Reports on Currency and Finance.*

On the side of deposits, a notable feature is the larger increase in time deposits compared with demand deposits. The figures in the following table show the relative trends in the growth of these two type of deposits:

TABLE V

RELATIVE SHARE OF TIME AND DEMAND DEPOSITS (AS PERCENTAGE OF TOTAL DEPOSITS)

Year-end	Time deposits	Demand deposits
1951	37.2	62.8
1952	40.1	59.9
1953	43.0	57.0
1954	40.8	59.2
1955	42.1	56.0
1956	44.8	55.2
1957	51.5	48.5
1958	58.3	41.7
1959	63.3	36.7
1960	60.4	39.6
1961	59.3	40.6

Source: *Trend and Progress of Banking in India.*

Between 1951 and 1961, demand deposits increased by 40 percent but as a proportion of total deposits declined from about 63 percent to 41 percent. Time deposits rose by about three and a half times and their proportion from 37 percent to about 60 percent. Savings deposits doubled, but their share remained constant at about one-sixth of the total deposits. The much larger growth of time deposits in relation to demand deposits should be attributed to the steady rise in national income as a result of planned economic development and the spread of the banking habit. It is fair to assume that the higher rates of interest offered on time deposits would have provided an attraction to the small savers and the expansion of banking facilities would also have contributed to some extent to the mobilisation of savings of those classes of people who benefited by a rise in money incomes. The spread of the banking habit among larger sections of the people is indicated by the increase in the number of new deposit accounts. In the ten years 1950-60, it went up by about 2.5 million or 75 percent. Of these, savings deposits accounted for about 1.6 million. The proportion of these to the total number of accounts increased from 59 percent to 62 percent. The number of time deposit accounts rose by about 650,000 while that of demand deposits increased by only 200,000. The relative share of the latter to the total number of accounts declined from 32 percent to 22 percent.

As for the trends in the ownership pattern of deposits, one finds that the largest absolute rise was in personal deposits which increased by Rs. 380 crores or nearly doubled in the years 1951-61. Of the total increase in personal deposits, savings deposits accounted for one-third and time deposits for two-thirds. Business deposits (excluding those of business concerns owned or managed by the Government) went up by Rs. 168 crores or by 54 percent. The increase in business demand deposits was negligible, but business time deposits expanded by nearly two-and-a-half times. As a proportion of total deposits, business deposits declined from 37 percent to 30 percent while personal deposits remained unchanged at about 48 percent. In addition to personal and business deposits, Government and quasi-Government deposits also showed a substantial increase.

Agriculture and Small Industry

Apart from the general expansion of bank credit and the shifts in the direction of advances, an important recent development is the adoption of certain measures by the Government for the purpose of directing the flow of bank credit into particular sectors of the economy which have so far failed to receive such facilities. Commercial banking in India has, for long, been criticised for its failure to provide financial assistance to agriculture and small-scale industries and its reluctance to advance medium-term credit to bigger industries. This attitude of commercial banks cannot, however, be attributed exclusively to their conservatism or adherence to traditional principles of banking. In reality, the development of banking and economic advancement of a country are interdependent. One helps the other. In India, small-scale industries and agriculture have failed to attract the attention of commercial banks, because of the general backwardness of the economy, the low standard of literacy of the people in the villages, the absence of the practice of keeping accounts, inadequacy of marketing and warehouse facilities, the lack of security and the existence of a considerable element of risk in industries. But in a scheme of planned economic development, the progress of agriculture and small industries is given as much importance as the development of bigger industries. In the absence of financial facilities forthcoming in the normal voluntary manner from commercial banks, the Government has taken up the responsibility of canalising savings through agencies managed or controlled by it. The

PUBLIC PROJECT: The lighting of the Atomic Energy Establishment, Trombay is an outstanding example of an entirely new and complicated lighting problem solved by Philips.

PHILIPS LIGHTING SERVICE BUREAU
For maximum illumination at lowest running cost ... in projects, factories, offices or shops—consult the Philips Lighting Service Bureau. Highly trained and experienced lighting engineers will assess your particular requirements, and recommend the best, most economical lighting—*free and without obligation!*

All over India

IT'S PHILIPS FOR PLANNED LIGHTING

Lighting for optimum efficiency whether in factories, public projects, offices or shops, has today come to mean planned lighting by Philips. For Philips have the resources and worldwide experience of their international associates to draw upon. And Philips lighting equipment, made in India to higher than international specifications, function at peak efficiency under the severest working conditions. *That's why, all over India, Philips quality lamps, fittings and accessories are specified for ultimate economy*

OFFICE: Only the most modern lighting can complement modern decor. At the new office of Japan Air Lines, Calcutta, Philips have effectively used concealed lighting and decorative lighting fittings to create illumination which is both functional and elegant.

INDUSTRY: The fast-expanding Usha Spinning & Weaving Mills at Badarpur (Punjab) have Philips high efficiency industrial fittings with vitreous enamel reflectors. The lighting planned by Philips provides excellent illumination and helps to raise worker morale and efficiency.

CONCERT HALL: The lighting in the Music Academy, Madras, embodies the latest concepts in concert hall lighting. Planned entirely by Philips right from the beginning, a wide range of Philips lamps and fluorescent, mercury vapour and floodlight fittings has been utilised to create various lighting effects.

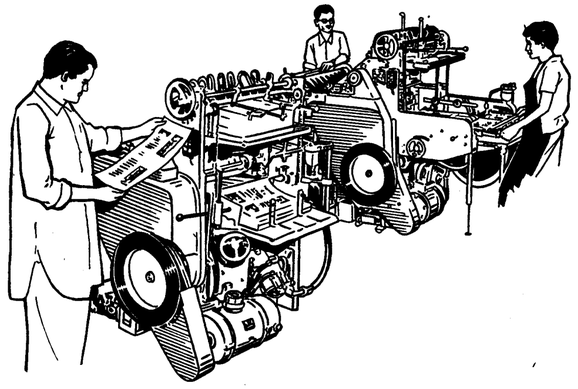
measures adopted in this direction are three-fold: (a) provision of rural credit (b) provision of financial assistance to small and medium-sized industrial units and (c) extension of medium-term credit to industries.

(a) State Bank and rural credit: Since its establishment in 1955, the State Bank of India has been taking an increasing interest in rural credit. However, financial assistance that the State Bank is rendering is indirect, being routed through co-operative societies and is confined mostly to the marketing and processing of agricultural produce. It has taken the form of advances to co-operative banks against Government securities and against the repledge of produce at a concessional rate of interest. Also, indirect assistance in relation to long-term finance for agriculture is provided through the agency of land mortgage banks by the State Bank subscribing to the debentures of land mortgage banks and by ensuring their marketability by granting advances to co-operative institutions against the security of such debentures. According to the recommendations made by an *ad hoc* committee constituted by the Reserve Bank in 1957, the State Bank undertook measures to finance co-operative sugar factories. These measures have taken the form of advances of clear loans, advances against pledge of stocks, loans for working capital against both fixed and floating assets of factories and the provision of deferred payment guarantees for the import of machinery and capital goods. It may be expected that such facilities would be extended in course of time to an increasing number of agro-industries.



(b) Financial facilities to small industries: The assistance given by commercial banks to small industries is insignificant. About the close of 1960, outstanding scheduled bank advances to small-scale units amounted to Rs. 35.02 crores or barely 6 percent of the total industrial advances. In 1956, the State Bank took up the question of evolving a co-ordinated scheme of extending credit to small-scale industries. A beginning was made by introducing a pilot scheme in certain selected centres for the purpose of ascertaining the proper means by which the needs of small industrial establishments could be met. Subsequently, the lending procedures and practices were liberalised, and provision was made for extending medium-term advances for periods not exceeding seven years to the bank's constituents for the modernisation of capital equipment, replacement, etcetera. In order to enlist the co-operation of commercial banks in this venture, a guarantee scheme for loans to small industries was formulated and brought into force on 1st July, 1960. The administration of the scheme has been entrusted to the Reserve Bank which functions as the agent of the Government of India.

The primary objective of the scheme is to encourage the lending of funds to small-scale industries (i.e., establishments with capital equipment not exceeding Rs. 5 lakhs) by commercial banks by granting the lending institutions a certain degree of protection. Under this scheme, losses are to be shared between the lending institutions and the guarantee organisation, subject to the condition that the maximum amount of any one advance does not exceed Rs. 1 lakh. The guarantee is applicable to all demand loans and term loans of not more than seven years. The guarantee scheme was placed on a permanent basis on 1st January, 1963, and its scope and area of operation were extended. Since its inception and up to the end of 1962, the Guarantee Organisation had received 4,266 applications for guarantee for sums aggregating Rs. 16.26 crores, against which guarantees were issued for 3,887 applications for a total amount of Rs. 13.95 crores.

Another Incentive

Another step taken by the Reserve Bank to encourage banks to increase their lending to small industries and co-operative institutions was the decision to permit scheduled banks to borrow from the Bank and excess amount over and above that normally permitted, i.e., half the average of statutory balances required to be kept under sub-section (1) of Section 42 of the Reserve Bank of India Act. excess amount was fixed with reference to the average increase in the individual bank loans to small industries and co-operative institutions as between the first half of 1960 and the corresponding period of 1961. This incentive scheme came into operation on 1st January, 1962, and soon showed encouraging results. In the first six months of 1962, scheduled banks' advances to small-scale industries increased from Rs. 32.08 crores to Rs. 43.59 crores. Of the total advances, the State Bank of India accounted for more than a half. The number of accounts of small-scale industrial units with scheduled banks increased from about 11,900 in June 1961 to over 13,000 a year later. Scheduled banks' advances to co-operative institutions also registered a similar increase. This incentive scheme has been continued with some modifications.

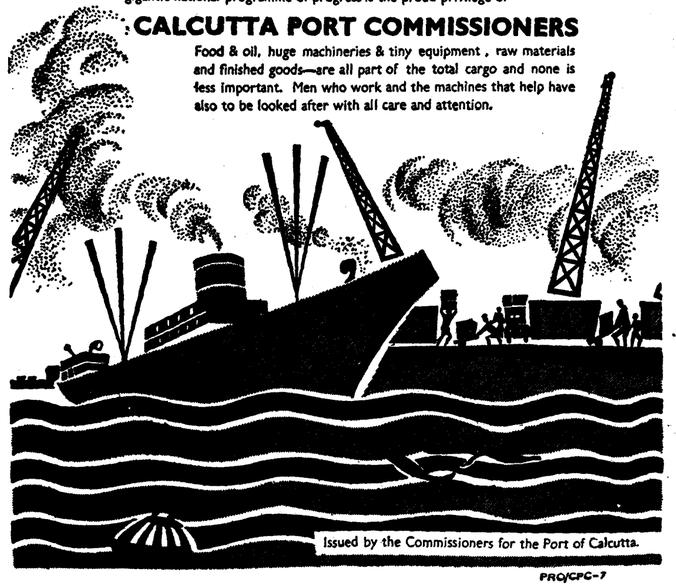
(c) Extension of medium-term credit facilities to industries: The growth of industries and the expansion of the private sector along with the public sector resulted in a great pressure of demand for bank accommodation. The nature of the investments and the change in the industrial structure of the economy call for a more favourable attitude on the part of commercial banks towards industry in the matter of supply of medium-term and long-term credit. But here again it has been found necessary to give some stimulus to the private banks to enter this new field of lending activity by reducing their risks in the early stages. It was for this purpose that the Refinance Corporation was started in June 1958. The main object of this institution is to help augment the resources available with the banking system for the use of medium-sized industrial units (i.e., units having resources up to Rs. 2½ crores) in the private sector. The share capital of the Corporation is made up of contributions from the Reserve Bank, the State Bank of India, the Life Insurance Corporation and some selected scheduled banks in the country. The banks are grouped into different categories, and quotas are assigned to them on the basis of the size of their deposits; and they are enabled to obtain refinance from the Corporation by the offer of certain types of loans which they would have advanced to industry. Lending banks assume the full credit risk on loans submitted to the Corporation. The advantage of this scheme to the selected banks consists in the fact that they are provided an opportunity to extend term-lending facilities to industries; besides, the arrangement imparts a measure of liquidity to the eligible paper offered by banks to the Corporation.

Up to the close of 1962, the Refinance Corporation received 202 applications for Rs. 33.85 crores and the amount sanctioned was Rs. 27.12 crores, of which Rs. 14.92 crores were disbursed. In March 1961, the Corporation was made a public limited company and its scope was widened in the next year by increasing the number of banks eligible for refinancing facilities and by extending the provision to a larger number of industries in the private sector, including certain categories of small-scale industries. It is, however, felt that commercial banks have been rather slow in taking advantage of the facilities provided by the Corporation. This may partly be due to certain rigidities in the procedure and operational techniques of the institution.

Aid from State Bank

In addition to this arrangement made by the Government and the Reserve Bank, the State Bank of India has also (since 1958) attempted to extend medium-term advances to small-scale industries. In 1960, a scheme was prepared for granting reasonable amounts of advances for a period up to seven years to small industrial units which were obtaining their working capital needs from the State Bank, to meet the cost of modernisation, expansion, the replacement of equipment, etcetera. These facilities were later extended to more industrial units and an instalment credit scheme was introduced in 1962 in order to help finance the purchase of equipment or machinery by small and medium-sized businesses engaged in approved manufacturing operations. It may be hoped that these measures taken by the Government, the Reserve Bank and the State Bank would open the way for commercial banks in the country to new fields of lending activity as well as help in the overall growth of the economy.

Recent banking developments in India and the trends in bank credit reveal clearly the impact of planned economic development in the country. On the one hand, the increase in the number of banking institutions, the substantial expansion of bank deposists and advances and the changes that have come over the pattern of distribution of bank credit and the composition of deposits, are the natural concomitants of industrialisation and economic advancement. On the other hand, the part played by the State and the Central Bank—in regulating the development of banking in the country and in encouraging the flow of savings through banking institutions into desired lines of investment, and the efforts made to provide greater financial facilities to industries in the private sector by organising special credit agencies as well as by showing the way to commercial banks in the matter of provision of short and medium-term credit to industries—are in tune with the policy and programmes of planned economic development. The increasing interest taken by the Government in the development of banking is necessary and justifiable in the context of economic planning, for planned development of financial institutions is the counterpart of planned development of industries and agriculture.



in tune with the progress of trade and industry

Serving a hinterland of 5,00,000 square miles with 180 million people, The Calcutta Port has to live up to the increasing demands of our national plans and progress. With the aid of over 42,000 workers and the best possible equipment, the Port helps the country to earn 50% of the foreign exchange from export. The task and target of the vital cause that this Port serves are as complex as they are extensive. By 1971, the traffic capacity has to be geared up to about 14 million tons from nearly 10 million tons in 1960. To be an active participant in the gigantic national programme of progress is the proud privilege of

India and the Commonwealth: Need for Closer Economic Co-operation

India has always taken the Commonwealth for granted and has not been able to do as well in Commonwealth trade as other members. Among the Commonwealth countries, Britain occupies a special place. Mr. Natarajan says that India was not prepared to buy from Britain when it entailed some sacrifice, but she expects Britain to commit herself to buying more from this country. The future of the Commonwealth depends on closer economic co-operation among its members.

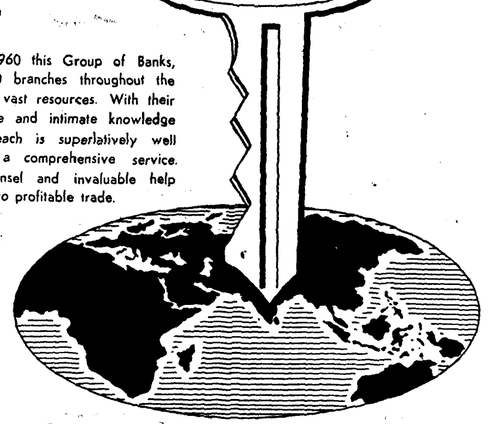
By

S. NATARAJAN

NOT all in Britain were happy at the earnestness with which the British Government was pursuing the European Common Market idea. There was a strong and nagging section of opinion which favoured building on Commonwealth foundations; nor was this the result of frustration at the failure of the integration. A perfectly rational case exists for contending that, if Britain has to meet other nations on a footing of equality, she cannot begin better than with those nations who have taken over her political ideals and institutions, and who might be expected to share with her common traditions and common purposes. After all, the political ideas obtaining in the west European countries do differ from those which have influenced Britain, while the new nations of Asia and Africa have drawn their inspiration from Britain.

It has always seemed a mistake to me that the handing over of political power by Britain to an indigenous elite should be represented defensively as the ending of colonialism. Had the positive aspect been stressed, many of the difficulties experienced in these nations would have been avoided. That positive aspect is achievement, not abdication. It is no small achievement that the ideas of freedom and democratic institutions should have been transplanted among other peoples—not only among colonials of British stock but among the non-British as well.

Parliamentary Democracy



Unfortunately, this point of view has been left to reactionaries who insist that such transplantation is not possible. The consequence has been distortions of the ideal, adaptations of the institutions and perversions of practices. People in India may take credit for retaining the externals of parliamentary democracy. After all, though the Prime Minister might draw incorrect analogies from British practice, he does respect the British tradition. Again, though India has a written constitution, the men who played an active part in drafting it left several vital questions to be decided by convention with the hope that the British example would be useful. But the most significant manifestation of regard for Britain's politics was the decision of India to remain in the Commonwealth, although the emphasis of political agitation in the preceding years had been on severance of the British connection. A Canadian student of Indian affairs has observed that the decision was a personal triumph for Lord Mountbatten, and a gain to Britain, whatever its consequences to India. Most Indians appear to have regarded the terms of the settlement as a

personal triumph for Mr. Nehru and, since both independence and interdependence were accepted, a gain to India. It might be correctly argued that personal charm worked on both sides, that in both countries the implications of the decision received little attention, and that, as often happens where personal relations are decisive, the follow-up work was neglected.

In the case of Lord Mountbatten, his was natural because his Indian experience was a diversion. The development of policy was the responsibility of the British Government and the British people are politically mature. In other words, he was the instrument accepted by all sections of opinion in Britain to effect a particular purpose. With Mr. Nehru, the position was very different. As the Prime Minister of India, it was on him that the responsibility lay to pursue a policy consistent with the decision to remain within the Commonwealth system. The fact that he had the powerful backing of Mahatma Gandhi, made this responsibility all the greater. It is not irrelevant in this context to point out that India's most distinguished Commonwealth statesman, Mr. V. S. Srinivas Sastri, retained to the end the faith that Mahatma Gandhi would, in the ultimate analysis, veer round to the recognition of the significance of the Commonwealth and to the contribution that India had to make to its growth and development.

Indian Foreign Policy

Among the failures of Indian foreign policy—and they have been many—the greatest has been the habit of taking the Comonwealth for granted, of trying to secure as much as could be got out of it and of not appreciating that India had a contribution to make to its stability and strength. This has been manifested in India's attitude towards the High Commissionership in London. It was demonstrated during the discussions on European integration when India's official spokesmen indicated that Britain's stand was Britain's business but hoped that India's interests would be duly considered and led the opposition to "associate membership" which would have secured those interests because of its apprehended inferior status. As usual, official India felt impressed by its own generosity in this stand.

Politically, the Commonwealth, as the largest multi-racial group of nations at different levels of economic development, has a definite place in the present world. Apart from that, however, if for India the Commonwealth is a worthwhile association to belong to, it is an association which deserves India's best support. Since it is an association of free nations, the area of non-alignment is insignificant and certainly does not permit the raising of non-alignment to the level of a first principle. There has been a great deal in the past 16 years to show that these basic facts have been ignored. Moreover, the establishment of new relations between Britain and India meant much more than national independence for India and Pakistan. Since Britain had established herself in territories in Africa and elsewhere to guard the route to India, it naturally implied altered relations with those territories. To form a policy based on a proper appreciation of these considerations would have meant the exercise of thought. The easier and more tempting course was to continue in the rôle of "freedom-fighters". It is spectacular to mount a crusade, and anti-colonialism provided a flaming banner. India's Commonwealth policy has followed the line of least effort and least resistance.

British Investments

In industry and trade, the Commonwealth countries—and the United Kingdom in particular—occupy a special place in the Indian economy. For the 12 years, 1948 to 1960, Britain's share of foreign direct investments has been well over 80 percent: in portfolio investments Britain has held the major share. Unique in the present-day world, the British business community in India enjoys a position and prestige which can be measured by the importance given them in official and non-official pronouncements. Whatever problems this unusual set-up has presented and faced, they have been solved or smoothed over. In the field of exports, the sterling area's share in India's exports has been 54 percent in the first plan period, 50 percent in the second and 44 percent in the first year of the third plan. As for Indian imports, the figures are 46 percent, 38 percent and 35 percent, respectively. In contrast, reduced Indian exports and increased imports into India from the European countries have created one set of problems, while the increase in both exports to, and imports from, the communist countries raise another set of problems. The resort to barter and payments agreements in the latter instance has evoked considerable speculation over the nature of communist international trade.

In the first place, the predominance of traditional commodities in Indian exports to these countries suggests trade diversion rather than trade expansion since the domestic demand is on the increase and little change is noticeable in the exportable surplus. In the second place, the rise in imports—in the context of the foreign exchange shortage—involves a measure of compulsion, with the equally undesirable alternatives of higher prices and dumping. Thirdly, the political factor is always present in communist economics, which a "non-aligned" country might do well to be wary of. Moreover, barter and payments agreements are double-edged weapons—both edges operating against the nation which resorts to it. Where the purchasing nation buys commodities for which it has no use itself, the transaction secures the much-needed foreign exchange for the buyer who can also use the goods to disrupt the seller's traditional markets.

The primary problem in increasing exports is less exploring new markets than increasing the exportable surplus, maintaining quality and holding established markets. The trade figures of the past 12 years suggest that both India and Britain have neglected the last point—to the detriment of the Commonwealth. One can speak for India and here the difficulty has been that slogans and exhortations have displaced considered policy, that the Commonwealth has been taken for granted, and that even within the range of preferences India has not been able to do as well in Commonwealth trade as other members. India has not been prepared to buy British goods when it entailed some sacrifice; but she fully expects Britain to commit herself to buying Indian goods, even on occasion to cede markets.

I began by saying that, since Britain had to operate on a basis of equality, she ought to find it more natural and congenial to do so with nations whom she has politically guided to independence. There is a corollary to this which has not been adequately appreciated. As an association of free nations, the Commonwealth has many focal points, not just one centre. Dwarfed by the rise after the second World War of the two giants and numbed by the political adjustments within the Commonwealth, the British harped on the advisability of settling down to "Little England". This was a grave error of judgment and a failure of leadership. But that in no way minimises the failure of Indian leadership to make a much-needed contribution to the Commonwealth. Here was not a loss of faith in the Commonwealth, but a total lack of understanding of grave decisions lightly taken.

This association of multi-racial units, containing within it the potential of economic development and technical assistance and shared knowledge between the different members, offering the best chance of political stability in a shifting world, has a vital part to play if its members could rise to the opportunity. What seems to bother many who accept the view that it cannot be discarded as an empty shell, is whether it is not too late now. The question is superfluous. If it is worth doing, it cannot be too late. Not to make the exertion would be a gross betrayal of political ideals to which so much lip service is paid.

Cost Consciousness in Planning: More Control over Spending Necessary

The slow growth of national income indicates that India has been unable to reap the benefits from large investments undertaken for economic planning. This has inevitably led to large-scale wastage of resources. Nowhere is it more obvious than in river valley projects on which huge sums have been spent so far but the benefits accruing to the State Governments in terms of irrigation and other facilities have not been great.

By

V. K. NARASIMHAN

THE "quick estimates" of national income for 1962-63 by the Central Statistical Organisation, which showed that for the second year in succession India's national income has grown at the rate of only 2 percent, should cause concern among the planners as well as others interested in the progress of the economy. If the central idea of planning is to achieve a certain rate of growth by planning the pattern as well as the magnitude of investment, every failure to achieve that rate of growth should be closely examined. It is not enough that excuses and alibis are offered for the failure of national income to grow at the projected rate in any particular year. Something more concrete has to be done if the mistakes in planning are to be avoided. In this context, it is interesting to examine the manner in which national income has been rising from the time India has launched economic planning.

NET NATIONAL OUTPUT AND PER CAPITA OUTPUT AT CONSTANT (1948-49) PRICES (IN ABJAS=Rs. 100 CRORES)

	1950-51	1951-52	1952-53	1953-54	1954-55	1955-56	1956-57	1957-58	1958-59	1959-60	1960-61	1961-62	1962-63
Net national output (in Abjas)	88.5	91.0	94.6	100.3	102.8	104.8	110.0	108.9	116.5	118.6	127.5	130.9 (Revised)	133.5 (Provisional)
Per Capita net output in rupees	247.5	250.3	255.7	266.2	267.8	267.8	275.6	267.3	280.1	279.2	293.7	295.0	294.2

The figures, in spite of their limitations, suggest the existence of a deep-seated malady. The first notable fact about the rate of growth of national income is its unevenness from year to year. It is obvious that in an economy, which is still predominantly sustained by agriculture and is very much subject to the vagaries of the season, some fluctuations in the share of national income attributable to agriculture are inevitable. But the purpose of economic planning in India is partly to bring under some sort of control the influence of the vagaries of nature by ensuring irrigation facilities through multi-purpose river valley projects and other measures. Secondly, the purpose is to develop other sectors of the economy such as mining, power, transport and major and small-scale industries at a rate which will more than compensate for the failures of the agricultural sector. A close examination of the performance of the different sectors for the past 12 years will show that the failure to achieve a fairly stable and high rate of growth has largely been due to India's inability to realise these two objectives.

Uneven Rate of Growth

Among many explanations that may be offered for the unevenness in the rate of growth and the failure—particularly during the last two years—to achieve anything like the increase that ought to result from the planned outlays during 1961-63, it appears that a high place should be accorded to what I regard as the absence of "cost consciousness" in our planning. (By "cost consciousness", I mean the deliberate and continuing awareness of the need for keeping the economics of every project or undertaking in view and seeking to achieve the projected returns, physical and financial, for the outlays incurred on the project.) In one sense, this defect has been obvious almost from the time planning in India was started. During the first plan period, the Planning Commission was more preoccupied with ensuring that the rate of expenditure proposed in the plan was kept up rather than in ensuring that the money was being properly spent and that it was producing the physical and financial results expected from it. In some of the reports of the Commission during this period, one notices that it considered the failure of the Central or State Ministries to spend the monies provided for various projects as a grave lapse on their part without caring to find out why the monies were not spent. This necessarily produced an impression among the project authorities that what was expected of them was not so much the achievement of specific results through the outlays they were expected to undertake, as the maintenance of a certain rate of spending. That in spite of this attitude fair results were achieved during the first plan period was due largely to the fact that the schemes included in it were limited in scope and had been based on fairly elaborate preparations in the earlier years.

During the second plan, however, the rate of investment was raised considerably. There was clear evidence that many projects were included in a hurry because of what was regarded as the growing "plan consciousness" in the States and among the general public. There was a widespread demand for public projects and amenities of every kind under the impression that there was a "good fairy" at Delhi who had such endless resources that anybody could ask for anything and get it. Of course, at some stage or other there had to be a return to realities, so the overambitious projects submitted by the States had to be pruned down to the available resources. But even so, the general mood was one of planning for public expenditure without much regard for either the availability of real resources or the cost that would be involved in raising them or for the return expected from the projects.

It was at this stage that the Planning Commission felt that something was going wrong with Indian planning and that it must take steps to ensure that the outlays were producing the expected returns. This consciousness dawned on them when the national income in 1956-57 and 1957-58 remained almost constant (in current prices) and actually declined in 1957-58 (in constant prices) over the previous year. Then the Commission started setting up the various evaluation agencies to find out what exactly was happening in such sectors as Community Development, agricultural improvement, and the use of irrigation resources.

Evaluation Reports

Although the evaluation organisation has been throwing some light on what is happening to plan expenditure in specific sectors and has shown a gap between the targeted objectives and actual achievements, neither the Planning Commission nor the Governments concerned have so far been able to infuse intense cost consciousness in planning. But this alone will imbue the different bodies engaged in the implementation of the plans with the determination to achieve results which ought to flow from the outlays on the projects.

The reasons for the lack of cost-consciousness among the many agencies which are engaged in the implementation of plans are many. One of the principal reasons is the existence of a dichotomy between those who raise the resources and those who spend the money. This dichotomy is obvious in the multi-purpose river valley projects where the resources have been provided mostly by the Centre while either the spending of money or the use of the resulting benefits is by the State Governments. The discovery by the Planning Commission that irrigation facilities which could benefit as much as 3 million acres of land have remained unused in the States is a sad commentary on the failure of the State Governments concerned to make proper use of the highly expensive multi-purpose projects which have been carried out in recent years. The reason for this is partly attributable to the failure to envisage the use of irrigation resources as an essential part of the multi-purpose projects and to provide for the construction of canals and the evolution of proper crop patterns well in advance of the completion of the projects. But another reason is that the State Governments are more keen on

What price value?

Burmah-Shell are People in the Service of the People

having big projects constructed in their respective areas rather than to see to it that they are used for the purposes for which they are intended. The fact that hardly has any irrigation benefit been derived from a big project like the D.V.C. is only one example of the many instances in which there is a vast gap between the completion of a project and the use of the resources created by it.

Another reason for the lack of cost-consciousness—especially in quite a number of public-sector industrial projects—is the frequent change in the top executives in charge of these enterprises with the result that no one has a continuing interest in seeing that the enterprises are executed efficiently and economically and become productive as quickly as possible. The fact that the cost of many public-sector projects has gone up, compared with their original estimates and that the cost of their products has increased much above the original calculations are again a serious reflection on the absence of cost-consciousness at every stage in the planning and implementation of these projects. Again, the fact that during the period of the second plan, the general price level rose by 30 percent cannot be ascribed entirely to the scale of deficit financing launched during the period. It has also to be attributed to the failure to make a considerable part of the investments during the second plan sufficiently productive. It is true that the large outlay on the steel projects could not become remunerative during the second plan itself. But these should have been compensated for by quick-yielding investments in consumer goods industries and by making the investments in agriculture more productive.

Actually, however, one notices that there was hardly any increase in income from agriculture and allied sectors between 1956 and 1957 and 1957 and 1958 and again between 1958-59 and 1959-60. The growth of national income from other sectors like mining, factory establishments and small enterprises was also poor and sluggish.

Steady Rise in Prices

Another aspect of the absence of "cost-consciousness", which has affected the growth of the economy, is the continual rise in the prices of almost every article produced in the country. There seems to be hardly any incentive anywhere for bringing down prices. Planning, which ostensibly is designed to improve the standard of living of the people and which aims at raising the general productivity of the economy by adopting improved methods of production and technology, has so far hardly brought any benefits to the consumer in terms of lower prices. For this, there may be many explanations. Fiscal policies have certainly had a great part to play in raising the retail prices of many consumer goods.

The phenomenal increase in the range and burden of excise duties as well as the upward revision of sales taxes in many States largely account for a rise in the prices of consumer goods. The fact that periodically manufacturers of many products like steel, sugar, cement, motor-cars and the like have urged the Government to raise the prices of their products because of increased production costs shows that inflation is gaining momentum in the economy and that there is little or no conscious attempt at bringing down prices by adopting appropriate policies. Unless the consumer is brought more definitely into the picture and economic planning is constantly conceived in terms of how to improve the supply of goods and services to the consumer at lower prices, it will not be possible to rescue the economy from the inflationary rut into which it has fallen.

It must be confessed that in lacking a continuing sense of cost-consciousness, private industry in India appears to be nearly as much a sinner as the public sector. Under conditions of a closed economy—thanks to comprehensive import and export controls and the severe shortage of foreign exchange—there is such a large pressure on the limited supplies of goods and services that there is nothing like competition among producers. The result is that most producers have hardly any incentive to improve the quality of their goods or to lower their production costs and the prices of their products. A scarcity economy has been prevailing almost over the entire range of consumer goods, so the consumer has had a raw deal. It is significant that only in those sections of industry in which there is something like an excess of production over demand—for instance, radio receiving sets, sewing machines or electric fans—that one finds some attempt on the part of the producers to reduce prices.

Removing Bottlenecks

The need to remove the bottlenecks in increasing production in as wide a range of consumer goods industries as possible—whether the bottlenecks are due to the shortages of raw materials or power or transport or imported components—is greater than ever before to bring down production costs and the prices of consumer goods. The belief that for commodities essential to the life of the community, price controls and distribution through fair-price shops and co-operatives can ensure fairness to the consumer is largely misplaced as the experience of the past few years has shown. Where the shortages are sizable, controls over prices and distribution, unless they are followed up by rationing, hardly meet the needs of the situation and lead only to an extensive black market and other evils associated with controls. The emphasis in a country where the population is rising at the rate of more than 2 percent a year must clearly be on increased production, especially of goods of mass consumption.

As for the performance of the public sector, there is one vital consideration that has to be borne in mind. In view of the highly accelerated rate of investment in the public sector from the first plan to the third plan, it has become more than ever necessary that every care is taken to see that this investment is made with due consideration to economy and that it is made to yield results as quickly as possible. A number of instances may be cited from recent experience in which delays in the implementation of public sector projects have greatly increased the outlays on them and have also postponed the returns from them, thereby adding to the losses during the gestation period. With the growth in the size of the public sector in relation to the total annual investment, it is important that its contribution to the increase in national income is up to the mark. The failure of national income to grow in the first two years of the third plan during which more than one-half of the investment was in the public sector clearly means that the latter is not contributing to the growth of national income at the rate expected of it.

There is obviously no simple solution to all the economic problems of India. But having embarked on a planned economy, it is the duty of the planners as well as of everyone engaged in the implementation of the plans, whether in the public or the private sector, to see to it that the enormous resources that are raised at considerable sacrifice from within the country and at no small cost from foreign countries, are used as effectively as possible and as remuneratively as possible. This calls for a lively cost-consciousness and continuous concern for economy on the part of everyone engaged in planning. There has hitherto been little evidence that efforts towards this end are being made. The national income figures of the past two years are a grim reminder that unless the planners make the investments in agriculture and industry fully productive, and ensure the most efficient use of the available manpower and other resources, the third plan may end up in a grievous debâcle.

At its recent meeting, the National Development Council showed only a partial awareness of the real task facing the country in the third year of the third plan. The decision to set up an Agricultural Production Board to infuse more vigour and dynamism into India's agricultural planning, although necessary and important, is only a part of the answer to the problem. The country equally needs a high-power Industrial Production Board consisting of the principal Economic Ministers in the Central Cabinet, who will have under constant review the progress of the various industries in the country and take prompt, co-ordinated measures to see that all the industries in the public and private sectors operate to full capacity. Unless a very high tempo of activity is maintained in the industrial sector, the rate of growth in the third plan cannot be accelerated to what has been envisaged in the plan estimates.

Progress through Planning: Wrong Approaches to the Right Aims

India's declared objective is to evolve a pattern of socialistic co-operation. But what the country has achieved so far is a new form of State paternalism. In the industrial sector, the Government has enforced discipline through licensing and controls, but has failed to enforce similar discipline in the wider non-industrial sector. Progress could have been accelerated if the planners cared more for real democracy than for dogmas.

By

K. KRISHNA MOORTHY

A FORMER British Ambassador in a south Asian capital, who had spent his formative career years in military and administrative service in India, once recounted to me a fable to explain the frustrations and ambitions of Asian countries seeking economic development. The fable related to a princess who went for a swim in a swift mountain stream and was being carried away by the current. A peasant who was sitting on the river bank jumped in and saved her from drowning. The king, naturally, was grateful and wanted to reward the peasant. He offered the peasant two pedigree horses but the peasant, according to the fable, was ripe with rustic wisdom and declined the gift of horses and opted for a couple of cows. The king obliged and came to admire the discretion of the peasant who prospered.

The moral of the fable was that, after all, the horses were instruments for the warriors and would prove a "white elephant" for the peasant. The latter was shrewd enough to realise his proper place in society. The fable, coined with an open caste orientation, allotted prescribed and predetermined rôles to the peasant, the warrior and the king. Woe befall the man trying to transgress the limitations.

Framing Rules

Carry this over to the international scene. It would mean the framing of rules for the working patterns in various countries which reached their national caste status in the imperial heydays. Until recently, the higher caste countries decreed it would be better for the countries classified backward to continue with their allotted tasks of tending to the cows (raw materials) rather than aspire to ride the horses. Fortunately, there are few, if any, of the high caste countries which continue to believe in the perpetuation of a rigid international caste system. The lower caste nations' desire to tend the cows as well as ride the horses is being systematically encouraged in varying degrees.

There are, of course, differences over the pace at which the cowherds can be trained to be proficient horsemen. The trainers too are at loggerheads. Some are addicted to the theory that the peasants should first learn to ride the quieter ponies before mounting the bigger beasts. These trainers are the proponents of gradualism in economic development. The others would prefer some peasants to mount on to the race horses in one jump. These trainers can be classified as the advocates of the forced pace of development.

The classic patterns of mounting and riding the horse developed by the conflicting systems (capitalist and communist) have not been found wholly applicable to the developing countries in Asia. The Chinese may have evolved their own crude ways of mounting and moving forward, taking many a tumble in their strides. In India, the attempt has been to mix both the classic patterns, leading to confusion in style and performance. In Indonesia, the choice so far has been to ride a few expensive white stallions (symbolised in the mammoth Asian Games complex). The white stallions are costly to train and maintain, but provide the initial image of achievement.

The western countries did not have the Asian concern over the time perspective in development. A western writer describes the Asian problem "as that of the position of a man trying to catch a train that always pulls out of the station just as he arrives; by the time a five year plan to find places for 10,000 extra children has been realised, 20,000 tots are at the door." (The quotation is from the article "The Crowded Hour," by Elspeth Huxley in *Punch*.)

Agonising Problems

When faced with the agonising problems of development, both the proven roads were found brutal—industrial barons wielding power and developing at a fast pace or the State taking over and accelerating the pace at the cost of a generation or two. In rejecting both these extreme proven methods and favouring a mixed process, a "quiet revolution" to evolve a new society as Mr. Nehru describes it, Indian leaders no doubt made a theoretically desirable *Ram Rajya* approach. Under emperors and kings and chieftains Indian society had been governed by paternalism. The British had merely superimposed the final paternalistic authority, and the declared objective now is to evolve a pattern of socialistic co-operation. But the achievements so far have perhaps added up to a new form of State paternalism. This has largely tended to encourage long established patterns—some progressive industrial institutions, a retrograde civil service and some slothful rural systems. (The Prime Minister's "quiet revolution" thesis itself is self-contradictory—either there can be quiet development or revolutionary forces in action!)

In the industrial sector, the Government has been able to enforce a certain amount of discipline in development through complicated controls and licensing. Central planning has, however, failed to enforce a similar system of discipline in the wider non-industrial sector where the rewards may have been more worth while. If the controls on industrial development were coupled with a departure from the *laissez faire* attitude in non-industrial matters, progress in the last decade could have been faster.

State Intervention

Since State intervention has been accepted as necessary for development in this country—Swatantric objections apart—it would be worth while to extend this intervention forcefully to the weak agricultural sector. M. Rene Dumont, the French development expert (and author of *L' Afrique Noire est Mal Partie*—"Black Africa Got a Wrong Start") suggests State intervention on the following lines: "Donations, subsidies in capital or foodstuffs should no longer be a gift so much as a contribution towards development. In return, a village receiving such aid would undertake a sort of contract to carry out all those fundamental improvements on its territory which would enable it to become adequately productive and to finance subsequent development itself. Let me give an example. A village in India has had a bad harvest. It receives the few tons of grain it needs but in exchange it must improve the irrigation reservoirs. It is no longer a question of charity or begging, cf subsidised idleness but of a fraternal helping hand given to people whom we help to emerge from their wretchedness on condition that they likewise help themselves.

This policy would be followed by greater priority on the improvement of techniques rather than on capital investment. These improvements would need expansion in education at a much faster rate than hitherto envisaged. The *mantra* for this already exists in one of the more rhetorical passages in the third plan document which says, "Ultimately, it is development of the human being and personality that counts. Although planning involves material investment, even more important is the investment in man."

There is more than one myth standing in the way of expanding education or standards of living in the villages. The first myth is the supposed superiority of the men who are now more than 50 years old or were educated in the days of the great depression or earlier and who are hoarse from shouting about falling educational standards. If some of the cream of this generation is taken to have been absorbed, say, in the Indian Civil Service, one has only to make a round of India's various embassies to see what stuff the superior men of the decaying generation are made of. According to the pundits of this generation, they had to work harder than my generation to pass their examinations! Perhaps their harder efforts stemmed from the fact that the absence of electric light or modern forms of transport caused them greater extra-curricular strain! A random comparison of syllabus in the science courses of the 'twenties and the 'forties is enough to show the higher standards expected from my generation which was in college during the later years of the second World War. And today, two decades later, the Physics course in Delhi

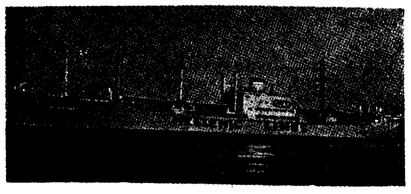
University, for example, is much more exhaustive than what I had to study. The multiplier effect may have led to the emergence of a larger proportion of average students, since higher education is today less of a privilege than even two decades ago. Certainly, the teachers in the universities today are by and large better equipped than most of my teachers of two decades ago.



Rural Housing

Another type of myth which exaggerates the problems involved, for example, concerns rural housing. During discussions among experts under the auspices of the E.C.A.F.E. in New Delhi some time ago, it was pointed out mournfully that 50 million out of 54 million housing units in the rural areas of India were "sub-standard or needing replacement." This exaggeration of the housing problem stems from the urban-polarised expertise which would by and large consider cement, concrete and tiles as among standard housing materials. Perhaps the comfortable and stably built cowdung plastered house with a thatched roof, popular in my home State of Kerala, will come under the definition of sub-standard. If these types of houses need periodic rebuilding or repair, that is part of the natural flow of economic activity of the farmer in his off-crop periods. The supposedly sub-standard housing also makes good use of by-products from agriculture.

A conversation between an urbanised architect and a village capitalist in an area in the neighbourhood of Delhi illustrates the danger in imposing artificial standards. A flour mill in the village had made liberal use of heavy wooden beams in construction. The urban architect pointed out that for perhaps a little higher outlay, he could have had a more stable concrete beam structure. The village flour mill owner pointed out that, if some cracks developed on the wooden beam, he and his fellow villagers would be able to say from experience at what stage it would need replacement. In the case of a concrete beam, they would have to send for a city slicker to pass judgment. The village's economy could not sustain a residential R.C.C. chap. The school in the village had used R.C.C. construction. There were cracks on the roof and the parents were always scared, in spite of the expert's assurances.

Vociferous foreign and Indian critics of planning have been exhausting themselves in exercises devoted to proving how fewer controls may have led to a faster pace of progress. For a change, it might be worth while examining whether a greater degree of State intervention would not have provided a higher octane fuel for speedier propulsion. An undemocratic thought? Elections once in five years are not all that there is to a democracy. The undemocratic division of the national cake is perpetuating and increasing the gulf and creating a new caste system. The democratic simplicity of a Gandhian concept or a tribal society is no longer tenable. Nor is the self-reliant democratic tenor of a Sarawak Dyak longhouse possible any more.

Progress of Non-agricultural Co-operative Societies

By
V. G. RAMAKRISHNA AIYER

A STUDY group has been appointed by the Central Ministry of Community Development and Co-operation to examine the working of co-operatives in the non-agricultural sector and to suggest measures to ensure their sound and speedy growth. It will examine the present pattern of organisation and working of non-agricultural societies, including urban co-operative banks and employees' credit societies. It is therefore, worth while to examine the present position of various types of non-agricultural co-operatives and indicate the lines on which they should be developed.

The non-agricultural credit societies comprising urban banks, employees' credit societies and other types of credit societies which cater to the banking and credit requirements of artisans, traders, Government servants, salaried employees and other urban and semi-urban residents numbered 11,995 at the end of June 1961. Punjab and Maharashtra together accounted for about 32 percent of the total number of societies. Their membership was 4,573,000. Their paid-up share capital, resources and deposits were, respectively, Rs. 32.97 crores, Rs. 13.06 crores and Rs. 95.05 crores in 1960-61. Their working capital exceeded Rs. 150 crores. Of these societies, 9,442 societies advanced loans amounting to Rs. 130.37 crores during 1960-61. The loans outstanding to them at the end of 1960-61 were of the order of Rs. 115.55 crores, of which Rs. 7.87 crores were overdue. About 20 percent of the non-agricultural credit societies were dormant. About 93 percent of them had capital and reserves of less than Rs. 1 lakh. These institutions are not linked to the co-operative credit structure in the same manner as the central banks at the district level or primary credit societies in the rural areas.

There has been a steady increase in membership, owned funds, working capital and loan operations of these societies. Unlike agricultural credit societies, these societies do not depend mainly on borrowings from the central banks but rely more on deposits from members and non-members. Since these societies are situated mostly in urban and semi-urban areas and provide various types of banking facilities to constituents, they are in a favourable position to attract sizable deposits. The deposits held by these societies formed 63 percent of the working capital.

Urban Banks

Among the different types of non-agricultural credit societies, co-operative urban banks play a very important rôle in catering to the credit needs of individuals residing in the urban and semi-urban areas. Their clientele largely consists of persons of small means such as artisans, traders, merchants, and hawkers who cannot ordinarily get loans from joint-stock banks; and urban banks accept all kinds of deposits. Some of the urban banks are undertaking the collection of bills and cheques, remittance of funds and even the discounting of bills in a few cases under proper safeguards. The number of urban banks has increased from 826 as on 30th June, 1958, to 1,242 as at the end of June 1960. They had a membership of 1.8 million, and their total deposits amounted to Rs. 60.70 crores, of which those from non-members were Rs. 27.07 crores. These banks advanced loans amounting to Rs. 64.72 crores during 1959-60 and at the end of the year, the outstandings amounted to Rs. 57.89 crores. Of the total urban banks, West Bengal accounted for the largest number, namely, 622, while Madras and Maharashtra had 148 and 141 banks, respectively. Gujarat had 79, Kerala 71 and Punjab 47. The average working capital of the bank at the end of the period was the highest in Maharashtra at Rs. 18 lakhs followed by Gujarat at Rs. 12 lakhs, Madras at Rs. 6.6 lakhs and West Bengal at Rs. 4.7 lakhs.

The general picture of co-operative urban banking which emerged from a sample survey undertaken by the Reserve Bank of India during 1960-61 was one of a fairly widespread, financially sound, expanding and useful framework of banking institutions. However, on the basis of the data collected for 1957-58, the report of the survey revealed that the growth of urban banks in several States was not uniform. In former Bombay, Madras, Andhra Pradesh and Mysore urban banks had developed well and were able to meet most of their requirements of funds from the resources raised by way of owned funds or deposits. The resources of urban banks were mostly used in the form of loans and advances to their members predominantly in the form of fixed short-term loans which were given against personal surety, gold and silver mortgage of real estate and life insurance policies. Urban co-operative banks, the report further said, have immense potentialities for development, the most important being in the direction of mobilisation of savings and the drawing of urban resources into apex and central co-operative banks which are very much in need of funds. The report recommended the promotion and development of urban banks and indicated, among other things, the following as possible lines on which this may be brought about :

(1) establishment of urban banks in new centres wherever there is scope either by organising new ones or by converting the existing non-agricultural societies in the area ;

(2) expansion of membership ;

(3) offering additional banking facilities to members such as the cheque system in savings bank accounts, safe deposit facilities, etcetera ;

(4) liberalisation of the loan policy to suit the needs of different categories of members, particularly small industrialists ;

(5) elimination of trading activities ; and

(6) improvement in the accounting and operational arrangements, especially recovery of dues.

Salary Earners Societies

Salary earners' societies primarily function as thrift institutions and also operate as credit agencies for providing cheap credit, as thrift is the ultimate foundation of credit. They are based on limited liability as there is a lack of mutual knowledge and mutual supervision over the dealings among members unless the institution is a very small one. These societies consist of various types. The following two categories may be recognised :

(i) societies formed exclusively for Government servants and servants of municipalities, railways, district local boards, commercial and industrial firms and the like ;

(2) societies formed for wage earners in factories, mills and other industrial concerns. There were 3,377 salary earners' societies of the first category in 1955-56 with a membership of 1 million. Their deposits amounted to Rs. 15.56 crores. Loans to the tune of Rs. 27.83 crores were made in 1955-56. The loan outstanding was Rs. 25.72 crores in the same year, of which Rs. 1.45 crores were overdue. Under the second category, there were 355 mill hands' societies in 1955-56 with a membership of 326,000. Their deposits amounted to Rs. 2.01 crores. Loans advanced by them during 1955-56 were Rs. 6.08 crores. The loan outstanding at the close of the year amounted to Rs. 4.94 crores, of which Rs. 9 lakhs were overdue.

Among other types of non-agricultural credit societies are the thrift societies in Bombay, societies for Harijans in Madras, societies for criminal tribes in Madras, societies for hill tribes and credit societies for displaced persons Up-to-date data are not available for these societies.

Consumers Stores

There were 7,058 primary consumers' stores and 75 wholesale stores in the country during 1960-61. There was a general improvement in the working of primary stores during 1960-61. Their owned funds increased from Rs. 5.70 crores in 1959-60 to Rs. 5.88 crores in 1960-61 and their sales from Rs. 39 crores to Rs. 44.2 crores. Among the States, Maharashtra with 1,140 primary stores had the highest number of them, Madras following with 864 and Assam a close third with 680. However, judged from membership and sales, Madras occupied first place where total sales rose from Rs. 11.23 crores in 1959-60 to Rs. 12.59 crores in 1960-61. The progress in Maharashtra was also marked, and total sales amounted to Rs. 9.30 crores in 1960-61. The primary stores in Madras accounted for about 28 percent of total sales effected by all the co-operative primary stores in the country, closely followed by those in Maharashtra. The progress of the societies in Madras is attributable to several concessions made available by the State Government such as (1) special staff for supervision and exemption from payment of supervision fees (2) exemption from sales tax (3) preferential treatment in the matter of supply of dietary articles to religious institutions, jails and hospitals (4) grant of import licence by the Central Government for certain items of consumer goods and (5) allotment by the Indian Coffee Board of a percentage quota of coffeeseeds for distribution to the public through consumers' stores.

Consumers' stores generally thrived more in urban and industrial areas and also among railway staff. Wholesale stores numbered 75 during 1960-61 with a membership of 26,390 and a working capital of Rs. 2.62 crores. They sold goods of the value of Rs. 15.82 crores in 1960-61, against Rs. 8.99 crores in the previous year.

A seminar on consumers' co-operation was held in Bombay under the auspices of the All India (now National) Co-operative Union in September 1960. Among the recommendations made by the seminar was a drive to increase the membership and share capital of co-operative stores, exemption from income tax, liberalisation in the issue of import licences, arrangements for adequate assistance from the State Bank of India and other agencies and State participation in the share capital of both primary and wholesale stores. The committee on consumers' co-operatives set up by the National Co-operative Development and Warehousing Board, which submitted its report in May 1961, emphasised, among other things, the importance of the rôle of consumers' co-operatives and made recommendations for their development in the third plan period. The committee stressed the importance of economic viability and, for this purpose, suggested definite standards in terms of membership, share capital, working capital and business turnover for a co-operative store and wholesale store. In its view, while the work of distribution in villages may be taken up by service co-operatives, independent societies should be established in small towns and large-sized societies with a number of branches in big cities. Among other

measures, the committee recommended State participation in share capital, provision of working capital from the State co-operative banks, and central financing agencies, financial assistance for the construction of godowns-*cum*-offices, subsidy for rent, long-term loans for the purchase of lorries and managerial subsidy for a period of three to five years. It also recommended the establishment of an organisation at the national level to advise the Government in planning and conducting research on problems relating to consumers' stores.

Strong district organisations having consumers' societies as members are considered vital to the development of consumers' co-operatives as they can supply standard quality goods to the primaries at low prices. They also undertake processing, etcetera.

Housing Societies

Good progress has been made by central and primary housing societies during 1960-61. There were seven central housing societies. Of the seven, two were in Gujarat and one each in Andhra Pradesh, Maharashtra, Mysore, Orissa and Delhi. Their membership stood at 1,693 in 1960-61. The loans advanced by these societies which were mainly to primary housing societies declined from Rs. 2.13 crores in 1959-60 to Rs. 1.54 crores in 1960-61. The loans outstanding on 30th June, 1961, amounted to Rs. 3.47 crores, of which Rs. 4.51 lakhs were overdue.

The number of primary housing societies stood at 6,451 recording an average annual growth of about 16 percent. The number of members of these societies increased from 320,000 in 1959-60 to 379,000 in 1960-61. Their working capital, paid up share capital and reserves amounted to Rs. 53.57 crores, Rs. 10 crores and Rs. 2.2 crores, respectively. Maharashtra and Gujarat, which had 1,495 and 1,718 primary societies together accounted for about 50 percent of the total number of societies in the country. The progress in the construction of houses and tenements was significant in Maharashtra, Gujarat and Andhra Pradesh. The number of societies which worked at a profit increased from 1,710 in 1959-60 to 2,322 in 1960-61. A large number of the societies were situated in urban areas. But a few societies also function in the rural areas of some States.

Poor Progress

It may be noted that except in Maharashtra, Gujarat, Madras, Andhra Pradesh, Mysore and Uttar Pradesh, progress achieved in other States in the matter of housing on co-operative lines was negligible. Although there has been an increase in the number of societies, their working capital and share capital in the building activity in some of the States were not sufficiently accelerated. Building activity has, however, been greatly hampered due to an abnormal rise in the cost of building materials and labour and the scarcity of proper housing sites at reasonable prices. The co-operative movement can play a more dynamic rôle when the two Central Government schemes—the low income group housing scheme and the subsidised industrial housing scheme—are implemented in a much larger measure by the State Governments than has been the case at present. As between Maharashtra and Madras, the latter has made a more practical approach to the solution of the problem by making finance available to rural areas and by granting various facilities including the reservation of appropriate areas for house sites, supply of timber at concessional rates and free supervision of construction work.

Paddy cultivation under the Japanese method

Even here the needs of middle and higher classes are catered for as in Maharashtra. The co-operative housing movement has so far confined its activities to financing the middle and upper middle classes only. The poorer classes of people have received no benefits from it. If the subsidised housing scheme made applicable at present to industrial workers were extended to other low income groups and if a more rational approach were made, it would be possible for the movement to gain strength and popularity before long. In rural areas, the real difficulty is that buildings are not a commercial proposition as they cannot be readily sold in the event of forced sales. As for rural housing, a more realistic approach is needed.

Raising Agricultural Productivity in India

A MID-TERM appraisal of agricultural achievements during the third five year plan affords no satisfaction to the planners themselves, but provides a valuable insight into the administration. What has been done so far is inadequate, while what has been neglected is appreciable and what has to be done is considerable. The rise in national income during the first two years of the third plan (1961-62 to 1962-63) has been of the order of only 4.7 percent, or less than the average increase assumed by the plan for one year. In 1961-62, the rise was only 2.1 percent, as against the average of 4 percent during the second plan period and the extraordinary rise of 7.1 percent in 1960-61. In 1962-63, the increase was just 2 percent, reflecting the failure of agricultural production to maintain the expected rate of growth.

The production of foodgrains, especially rice, shows a downward trend.

By
Dr. A. N. RAJAMANI
Department of Economics, Sri Venkateswara University

Other agricultural commodities too do not show any significant change. For an overall investment of Rs. 2,000 crores during the decade ended in 1961, the annual average increase in productivity was only 1.5 percent, or less than the growth of population. The shortage of food has played havoc in parts of West Bengal and Assam. As if this were not enough, the floods in the sourthern region have caused serious damage to standing crops over large areas.

Against this background, the National Development Council has called for vigorous efforts by State Governments to step up agricultural production by implementing the recommendations of the Central teams on agriculture. These teams, which have visited various States, have highlighted several factors impeding production, such as the low priority given to agriculture, the inadequacy of the plan provision and the diversion of funds to other programmes. Twelve months ago, the matter became so serious that the Planning Commission organised a series of high-level meetings and from the deliberations emerged a three-pronged approach for agricultural development. It was decided to intensify pilot projects, complete land reforms and organise the exchange of progressive farmers. But there was nothing new in the approach; the proposals had been repeated often with no results.

The intensified pilot project (package plan) aims at concentrating attempts in all surplus areas to maximise production for immediate needs. But while looking after these areas, inadequate attention is given to backward areas. In package plan areas, it has been observed that the increase in production is not commensurate with the additional investment. Besides, the suitability of intensifying the existing techniques has not been critically examined.

Land Reforms

As for land reforms, the idea itself has not been found effective in pushing up production. Apart from legislative loopholes, vagueness and ineffectual implementation, land reforms have introduced a sense of uncertainty and hesitation about investment. Not content with disorganising big *ryotwari* holdings by disintegration, which could have been fruitfully employed as scientific farming and demonstration areas, measures like rent reduction and award of higher wages, with no stipulation about efficiency in both cases, have tended to leave tenants and cultivators without any obligation to exert more.

Lastly, as for the exchange of progressive farmers, the proposal looks novel but contains an implied admission that 13 years of official direction have only been wasted. It is true that agriculturists are backward and require guidance. But the guidance needs to be given by people who know the farmers well and understand them. The officials' approach more often than not assumes a bureaucratic form, with the result they fail to carry conviction. The Balwantrai Mehta Committee's report substantiates this.

Other causes are hampering agricultural production too. If the psychology of the agriculturist is not properly understood, the main reason is not his conservatism. Often village institutions are not built on a sound base. Popular representation in *panchayats* and co-operatives is a long-felt need, but factions tend to dissipate the institutional vitality. Community development projects and co-operative societies still form the protective coat for the undiminished influence of the rich in the villages. In other words, these institutions not only fail to discharge their assigned functions, but create the contrary conditions.

Co-operation is held to be of particular importance for the regeneration of the rural economy. The slogan is, "co-operation has failed and it must succeed". But the problem as to why it has failed calls for a searching enquiry by the Government. Large sums have been invested in establishing a chain of consumer co-operatives but they have achieved little. One important reason is that most members are poor and ignorant, and so they rely on official guidance and direction in running the co-operatives. The Prime Minister declared recently that the dependence on officials was undesirable—an admonition which hits the nail on the head.

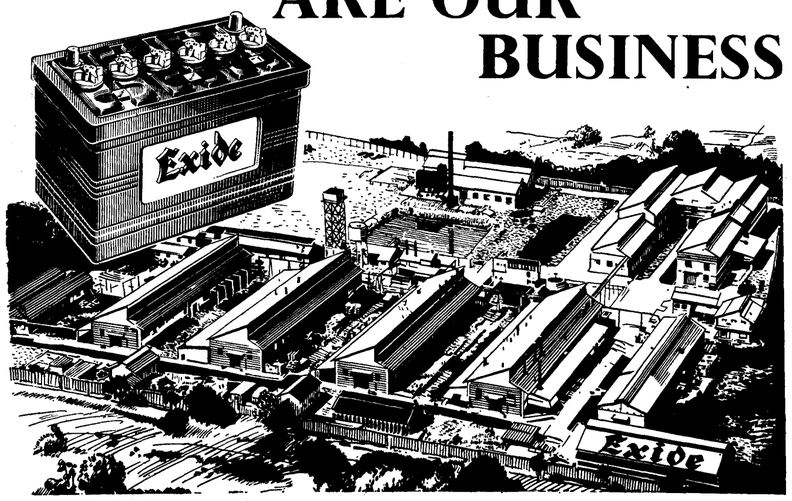
Another defect is the system of dispensing loans and ensuring their recovery. Loans are not always invested in productive enterprise. Neither are they given nor collected back in instalments suited to different categories of borrowers. Studies show that wherever the principal amounts have had to be collected by auctioning the collateral assets, the co-operatives have tended to outrage the feelings of village folk. In the last analysis, many co-operatives have had to sell the assets in the open market or take consumption goods to satisfy the clients. The people in charge of the consumer co-operatives seem unable to bargain.

Drag on Agricultural Development

Ultimately, the failure of the movement has constituted a drag on agricultural development. The failure has led to the success of professional money lending classes and middlemen in some garb or other. This is certainly an unwholesome phenomenon. To remedy these defects, efforts must be made to eliminate village funds and facilities, to educate the peasants for taking a more intelligent part in the *panchayat* activities, to reduce official controls to the minimum and finally, to fix prices in relation to market rates and to provide adequate help in time.

It is only by proper organisation of the different economic parameters that an effective equilibrium of forces will prevail among various groups of the population and institutions for a relatively long period. But if the statistics on agriculture's performance is analysed in all their import, one finds that one has to traverse through a period of organisational crisis. The uppermost evidence in this matter is the stagnant agricultural economy. Another piece of evidence is the disproportionate accrual of growth dividends among various classes of agriculturists according to their toils. But what is all this due to? One would be prompted to take the lesson from the past.

In spite of huge investments and over 40,000 village level workers, agriculture has fallen into the doldrums because the administration has been preoccupied with the macro-economic set-up and not paying proper attention to particular sectors however important they may be. Two instances can be cited in this matter. First, between the allied ministers at the Centre and the States there is either no co-ordination or there is overlapping of functions, both of which are a waste. There is also no co-ordination or collaboration in the execution of schemes between the Centre and the States. The striking example is the absence of a systematic organisation or the programmes of reconstruction of headworks, canals, distributaries and field channels so as to ensure that the irrigation waters flow into farmers' fields, in much the same time as they are availble at the headworks.



The second organisational defect is that the whole scheme of agricultural development is conceived by the Government and is taken by all as a matter exclusive for the Government to handle. It gives scope not only for aloofness for other political parties, but also creates no responsive feelings in them. The Government and the Opposition must realise that these confuse the farmers. This is why some economists have been suggesting that real efforts are needed for planning from the bottom upwards so as to inculcate in the village leadership a loyalty to values of development and ideas of accelerated progress in social and cultural fields *via* agricultural improvement. It is, therefore, high time that developmental policy in agriculture took note of the above organisational limitations and devised suitable remedies.

Public Co-operation

Indeed, the problem of successful organisation of the developmental measures is a two-way process. On the one hand, initiative, technical competence and guidance must come from the Government, on the other, the agriculturists must co-operate as a body of ultimate beneficiaries in following the Government's lead. From this point of view, public co-operation assumes great significance. Although the third plan report shows evidence in support of growing public co-operation in the shape of voluntary donations of labour, money and goods, it does not give a correct interpretation of public co-operation in the agricultural field since the acid test of public co-operation must lie in the attainment of higher productivity rates. But their present rates of productivity are not at all showing any agricultural progress. The average productivity level is only one-third of comparable countries like Egypt and Indonesia. The productivity rate in sugarcane is reported to be only 20 percent of what it is in Hawai, rice 29 percent of that of Japan, wheat 19 percent of Belgium, maize 17 percent of Belgium, cotton 22 percent of Amreica and milk 5 percent of the Dutch. Within the country itself, for example, the productivity of rice in southern States is computed to be twice the level in Uttar Pradesh and of cotton in Punjab over six times of what it is in Madhya Pradesh. Therefore, there is conclusive evidence that public co-operation is not forthcoming sufficiently and what is available is not only thin in the aggregate, but also unevenly spread over the country.

Consequently, one is led to believe that the agricultural ills are essentially a problem in culture. It should not be ignored. The decline and fall in cultural standards is directly related to the absence of rural facilities for educational progress. Economists have nowadays come to assert that a unit of investment in human beings brings forth greater dividends in national income than what it yields when made in rail-

BATTERIES ARE OUR BUSINESS

ways, dams, machine tools and the like. Therefore, if there is capital scarcity in the rural areas, it is only a "derived phenomenon." In other words, investments in human beings in the rural sector must be given all possible consideration for the fulfilment of the preconditions for rapid agricultural growth.

Akin to culture is the problem of carrying the benefits of industrialisation to the agricultural sector. Regeneration of the latter is dependent upon production as well as on increased-standard-of-living - incentive provided by the former. For, the policy of industrialisation in the past has been one of building heavy industries with a long-term end in view. The pattern of industrial production suffers in that process. Consumer goods run short, and with the result, the higher price levels compel agriculturists to incur increased expenditure.

It occurs on two counts: The first is the shortage of agricultural raw materials from agro industries like fertilisers. The second is the shortage of items like kerosene, power engines, etcetera. Meanwhile, labour costs have increased and agricultural prices do not cope up with rising costs. The need to change the pattern of industrial production is obvious. In fact, therein lies the main incentive for the farmers improved living standards because the low industrial product prices not only increase their ability to go in for more of such things, but also they make them work more for additional earnings. But unfortunately, this aspect of the matter has never received adequate attention in the past. The fact remains, however, that there is interaction between industrial and agricultural policies and the planning for the two must be suitably re-oriented.

Economic Balance

Particular attention is needed to remove the lack of regional and sectoral balance occurring in the process of economic growth. Government policy should not allow the juxtaposition of well-developed industries and urban areas with stagnant or slow moving rural economic segments. If agriculture must provide a surplus for the economy as a whole, and if industrialisation must gain its momentum and continued sustenance from a progressive and widening domestic market, it is desirable to manufacture for the rural areas cheaper and easily operable agricultural implements and machinery. Only then, can industry and agriculture coexist to mutual advantage, and backward agriculture can emerge as a sector supporting accelerated industrialisation.

Another important but very often neglected aspect of Indian agricultural policy is that the whole basis of development programmes is suited more to the needs of consumers of agricultural products than appropriate to production conditions. It is consumer-oriented, rather than farmer-oriented. All the time, efforts are made to curtail agricultural price levels instead of stabilising prices to the mutual advantage of consumers and producers. The principal reasons listed are that prices of basic necessities should never be high, that upward price changes in the past were not accompanied by increased revenue receipts to the State exchequers and that expenditure elasticity on food being very high, any further increase will jeopardise consumers' interests and worsen inflationary conditions in the country. These reasonings have certain validity, but it is still deplorable, that no effort has been made to safeguard the interests of the farmers.

As for the impact of prices on production or *vice versa*, available statistics do not say anything definite. However, it is more or less correct to assume that a reasonably high price is itself a good incentive to the farmers either to produce more or sell more. In either case, the marketed surplus of agricultural products will increase. But price controls by the Government, however good-intentioned they may be, have killed production incentive. They give rise to structural difficulties for the farmers. Invariably, the procurement price, for instance, fixed by the Government is extremely below the market rates. It involves the two defects: neither the market price comes down due to the inadequate Government machinery for enforcing fair prices, nor does it enthuse farmers to produce more. Therefore, the fixing of prices must take note of the cost of production and also the ruling rates in the market.

Zonal Movement of Foodgrains

One other defect in the policy relating to agricultural products is the restriction on the movement of foodgrains between one State and another. The origin of the idea of the zonal control is in the report of the Asoka Mehta Committee. The Committee recommended it as a short-term device to regulate price levels. But the zonal control seems to be staying for good. This measure would produce various difficulties if continued any further. It is well known that the grouping of the surplus areas with the deficit ones gives rise to the problem of pricing for purchase and sale within the zone. If the idea is that the deficit State must not be made to pay more than the fair price, price reduction in the process affects the potential expansion of marketable surplus in the surplus State. Secondly, permanent control measures restricts the market for efficient producers, but also for those middle men who are still left in the field in spite of the Government's entry through open market operations in foodgrains. It tends to boost up the traders' tendency to sell the products outside the open market.

To eliminate this unhappy situation, it requires a vigorous implementation of the Essential Commodities Act of 1955, which among others, empowers the Government to requisition the stocks of all traders, among whom exist even now a variety of nondescript agents, at a price average of three months preceding the date of the Government's move. Thirdly, the zonal control hinders the diversification of agriculture. Incidentally, it arrests commercialisation of the crop also. Fourthly, when a permanent arrangement is made for covering a deficit from an adjacent area, the State Government concerned does not feel responsible for increasing the production level in the deficit area because the pooled surplus wipes out the deficit. In fact, there is reason to believe that this is the case with a number of deficit areas.

What is needed is a bold move in making shortages in an area to adjust themselves to demand by a temporary spurt in prices. In the meanwhile, the Government should release the needed quantity of grains at the right time in the deficit areas. The recent events in West Bengal and Assam have compelled the Central Ministers to own that insufficient, inefficient attention and redistribution of stocks and an army of middle men exploiting the situation, have added to the misery of the people. The zonal arrangement in that part of India, in other words, has failed.

Fiscal Policy

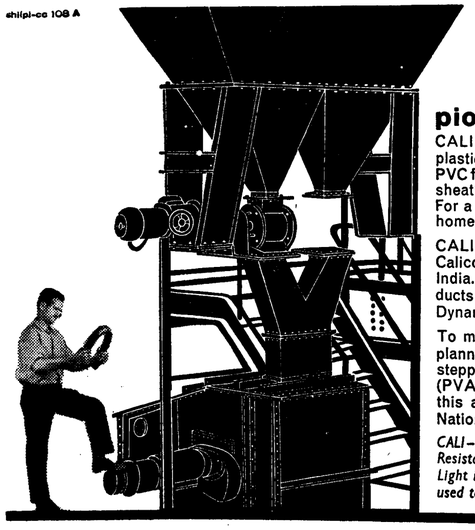
A serious hindrance to agricultural development, the full significance and impact of which has not been realised, is the cumulative burden of taxation in the agricultural sectors. Economists like I. M. D. Little, N. Kaldor, K. N. Raj and A. M. Khusro favour increases in farm taxation. But have they taken into account the total direct and indirect taxes paid by the agricultural sector as a whole and paid through different agencies? Calculations made by the author show that the agricultural tax burden in relation to the non-agricultural sector is prohibitively high.

Whereas the total direct and indirect tax on agriculture was Rs. 2,545 crores during the second plan and Rs. 2,076 crores during the first three years of the third plan, the tax on the non-agricultural sector amounted to Rs. 3,653 crores and Rs. 3,776 crores for the same periods. The importance of taxation arises in relation to the total revenues which it provides, not to mention loans and other non-tax sources, for economic development. The problem is whether the agricultural or the non-agricultural sectors can self-finance their projects. Looking at it that way, taxation in the agricultural sector is far heavier.

The aggregate private and public investment in agriculture during the second plan was of the order of Rs. 1.520 crores and Rs. 1,521 crores during 1961-62 to 1963-64. The relevant figures for the non-agricultural sector for the respective periods were Rs. 5,230 crores and Rs. 5,319 crores. For agricultural sector the proportion of taxes collected to the amount invested was 164.4 percent and 132.5 percent and for the non-agricultural sector, it was 69.8 percent and 70.9 percent, respectively, in the second and third plan periods. In other words, the proportions of agricultural and non-agricultural taxation in their respective plan investments form 37.1 percent and 17.6 percent a year, respectively.

This raises important policy issues: from agriculture, the Central and State exchequers in India drew back more than twice they did from the non-agricultural sector in terms of investment. It primarily shows that self-financing is done proportionately to a larger extent in agriculture. But it cannot be equated with greater tax potential in that sector, because of vast rural-urban differences in *per capita* income and wealth, measure of ceiling on wealth and holding applied in the agricultural sector. Secondly, there is room for more taxation in the non-agricultural sector because for more absolute investments, a lower proportion is ploughed back in addition to the prevalence of tax evasion in that sector. Thirdly, a measure of non-agricultural investment is financed from agricultural taxes because agriculture's list of obligations includes financial contribution to industrialisation.

Increase in Taxation



Further, it is a fact that while taxation in agriculture increased throughout the planning periods, relative importance accorded to agricultural development in the total framework of planning was not consistently maintained. Fourthly, if all the time funds were taken away from the agriculturists while proportionately less is spent on rural development, it will worsen the regressive impact of fiscal policy besides aggravating income inequality.

Although certain changes in the present structure of agricultural taxation are not ruled out, any further increase in direct farm taxation will reduce private capital investment on land which is already reported very low and diminishing because of land reform measures and the consequent uncertainty and tension arising from them. This development problem assumes gravity when it is remembered that industrial needs of capital are given top priority by the planners in comparison with the needs of agriculture. When the prospects of increased agricultural growth in the near future are still a matter of speculation, and when, therefore, an increasing number of peasant families must be content with obtaining an equal share in the available cake whose size appears to be almost constant viewed against the third plan performance so far, it is obvious that the taxable capacity in this sector is certainly limited.

The Government's policy is to make Indian agriculture stable. That should not mean that it should be rigid. Hitherto, guaranteed prices have been applied through a loosely-knit official marketing system. One can understand that Government intervention on a scale and degree necessary for the purpose will be difficult to overcome soon, but it should never repress the urge for expansion and freeze the spirit of risk-taking and imaginative enterprise.

The basic aim of agricultural policy being swifter rates of economic growth, it can be secured only by allowing the natural economic forces to work to reward enterprise in producers and allowing the consumers to use their income to express their tastes without undue curbs. Of course, the price methods adopted in securing them must differ from one commodity to another. An all-India peasant institution must be established for consultation in this matter, for establishing a beneficent market such that it ensures reasonable returns to the producer as well as providing needed time margin to them to adjust production without prejudicing long-term farm stability on which soil conservation subsists. What the Government can do is to create preconditions essential for utmost production, and leave full freedom of action to the farmer which would ensure greater response.

pioneers progress thro' pvc

CALI-PLAST PVC—Polyvinyl Chloride—the modern plastic material for today's industrial age. CALI-PLAST PVC for rigid pipes and flexible tubes. For insulated and sheathed cables. For handrails. Coated fabrics. Films. For a variety of uses in a variety of industries. And the home, too.

CALI-PLAST, the Chemicals and Plastics Division of Calico Mills, are the pioneer manufacturers of PVC in India. Manufacture of raw materials and finished products started in August 1961 —in collaboration with Dynamit Nobel AG, West Germany.

To meet the needs of tomorrow, CALI-PLAST are planning today. Production of PVC has already been stepped up. A new plant to produce Polyvinyl Acetate (PVA) and copolymers is now under construction. In this and other ways, CALI-PLAST are helping the Nation's progress.

CALI-PLAST PVC is made to international quality standards. Resistant to chemicals. Corrosion-resistant. Fire-retardant. Light in weight. And in attractive colours. It can profitably be used to replace metals as well as soft flexible materials.

For information or technical service, write to: **calico chemicals and plastics division**

THE BRIDGE OVER THE BRAHMAPUTRA

By day and by night, with deafening roar and rattle, goods and passenger trains hurtle across the new Brahmaputra Bridge, connecting Amingaon and Pandu. When on 7th June 1963, Prime Minister Nehru formally opened the Saraighat Bridge, wholly Indian in design and execution, it marked the culmination of a plan first thought of in 1910.

Work commenced in November 1958, and it took Rs. 10.6 crores and nearly four years of round-the-clock effort to throw the bridge across the mighty and turbulent Brahmaputra.

When the first goods train travelled over the bridge on 31st October 1962, it heralded a new era in the fast-developing economy of north-eastern India. For the first time, an all-rail-cum-road link was established between the tea gardens and the oilfields of Assam and the rest of the country.

No less than 4.2 million cubic feet of concrete, 40,000 tons of cement and 14,000 tons of steel were used to build the 10-span, two-tier bridge with a roadway on top and rail tracks below. Of about 11,000 tons of vital mild and high tensile steel required to build the girders of the bridge, about 60 per cent came from the steel works at Jamshedpur. This is yet another example of Tata Steel in the service of the nation.

Investing Bank Funds in New Capital Issues

By

K. M. UPADHYAY

COMMERCIAL banks, being mainly dealers in short-term funds and also being guided by the orthodox banking practice, have not been greatly interested in long-term industrial financing. But an awareness of the need for a change in the conventional investment policy has also been noticed in recent years. It has been increasingly accepted by all concerned that commercial banks cannot be altogether kept away from long-term financing of industries, although the extent to which they can safely do so is still a matter of controversy.

Banks can help in the long-term financing of industries in two ways; (a) long-term lending, (b) helping in raising long-term funds through the capital market both by investing in industrial securities and facilitating the flotation of securities through underwriting or sub-underwriting and granting loans to brokers. Long-term lending may not be very practicable for banks, due to non-availability of suitable securities, risks of default, difficulties in the realisation of loans, inadequacy of funds available for long-term investments, etcetera. The second method, if managed carefully, after a proper investigation of the security business may serve the purpose in view. The latter will also have some advantages over the former, such as greater profits from investment in variable dividend securities. Banks' participation in the investment market as investors, underwriters or sub-underwriters will increase investors' confidence. A new issue will be easily subscribed by investors if a good bank underwrites it. At the same time, the amount of risks to be shouldered by bankers will be heavier. So these risks should be minimised as far as possible by careful handling and by diversifying investments.

For financing industries banks have certain advantages. These consist in the wide organisation which assists them in the management of the effective spreading of probable risks. If they invest in capital issues or by any other method, facilitate the flotation of securities, most probably losses incurred on some new issues will be cancelled out by profits earned on others. Banks, moreover, may know the true financial condition of persons concerned with new enterprises making capital issues, by demanding statements of their accounts maintained in their branches and in case their accounts are maintained in other banks, by inter-bank correspondence.

Bank Investment Policy

A banking company is required to exercise utmost care in formulating its investment policy. The law requires that a banking company will have to maintain in cash, gold and unencumbered approved securities an amount which will not be less than 20 percent of the total of its time and demand deposits. If a banking company wishes to invest more than this legal minimum, it may do so either by purchasing Government securities or shares and debentures of public limited companies or any other forms of investments in accordance with the provisions of Section 19 (14) of the Banking Companies Act.

During the past decade, scheduled banks' investments in securities have shown a considerable increase. The index of investments (1951=100) in gilt-edged stood at 256.4 and 189.8 at the end of 1959 and 1961, respectively. On the other hand, the index of investments (1951=100) for the same period in industrial securities was 187 and 147.9, respectively. The investments in Government securities during the period accounted for more than 90 percent of the total investments except in 1961, whereas the share of industrial securities was, on an average, only 2.8 percent of the total investments. Moreover, the investments in industrial securities showed a fall at an average rate of 0.32 percent (based on mean deviation) up to 1958. After that, there was an increase in the banks' investments in industrial securities. But this increase was not significant compared with the relative increase in the investments in Government securities. Further, on an average, only 1.2 percent of the total deposits have been invested in industrial securities which were very small, compared with the investments in Government securities. It is clear from the above that banks have invested small funds in industrial securities as such.

On the other hand, the industrial advances by scheduled and non-scheduled banks rose from 32.5 percent in 1951 to 53.5 percent in 1961 of their total advances; an increase of 65 percent. This rise shows that banks are increasingly financing the short-term needs of industry.

Short-term Lending

The present investment policy of banks is mainly to provide short-term finance. But as the short-term advances to industries usually help to economise the volume of long-term capital needed in any enterprise, and they are, generally, carried over from one short period to another, remaining outstanding for a fairly long period, the repercussions of such advances are similar to those of granting medium and long-term loans. In actual practice, banks do what they deny or do not want to do as a matter of policy. Hence, there is the need for a suitable change in the banks' investment policy, to keep pace with the socio-economic changes in India today. The Shroff Committee in its report also expressed the view that banks should provide medium-term and long-term finance. Banks in other countries like Italy, Sweden, the U.S.A. and West Germany manage medium-term and long-term finance by providing loans to brokers and dealers in securities so as to enable them to underwrite more new issues and to make outright purchases of industrial securities.

In recent years, banks have been taking an active part in underwriting new issues. But their participation in underwriting is not adequately diversified since only a few banks seem to have taken up underwriting work. Nor is the amount underwritten by them is sizable, in view of their increased importance and their capacity and vast resources available in the form of deposits. According to a study made by Dr. G. Balkrishnan of Company Law Administration, 32.1 percent, 19.2 percent and 16.2 percent of the total amount were underwritten by banks in 1959-60, 1960-61 and 1961-62, respectively. In 1959-60, the Central Bank of India alone underwrote to the extent of Rs. 1,967 crores, although it confined itself only to three new issues. Only eight banks in 1959-60, six banks in 1960-61, and ten banks in 1961-62 were engaged in underwriting. Of these, the main underwriters were the Devakaran Nanjee Banking Company, the Central Bank of India, the United Commercial Bank and the Bank of India. According to another study made by the *Economic Times*, during the first half of 1963, only 7.9 percent of the total amount underwritten has been taken up by banks.

New Capital Issues

The success of a new capital issue depends upon underwriters, brokers, bankers, management, financial position as shown in the prospectus and so on. With their wide organisation, sound financial health, experiences gathered over a long period, banks may be regarded as first-class underwriters and prudent investors. The need for their active participation in new issues was also felt as far back as in 1938. Professor D. S. Savkar in the book joint-stock banking in India wrote as follows, "as banks can render great assistance to these industries if their debentures are purchased by these banks from their capital resources with a view to passing them on to the public within a reasonable time".

Against taking up underwriting or making outright purchases of securities, banks argue that they lack the necessary funds. Also if they have

to be interested in investments in new issues, they will have to take a direct interest in industries which is not consistent with banking business. As far as the availability of funds is concerned, the ratio of time deposits to total deposits is showing an increasing trend. In 1951, time deposits accounted for just 35.8 percent of the total deposits, whereas in 1959, 1960 and 1961, they were over 60 percent. Further, while time and demand deposits have both increased, the rise in time deposits is phenomenal.

The index of time deposits (1950=100) stood at 385.9 in 1961, compared with 142.9 for demand deposits. Banks may also, of course, to a limited extent, change the nature of savings. As all persons will not come at a time to draw their money, banks may invest a certain proportion of short-term savings in long-term investments as if they were long-term savings. As for the second argument, it may be reasoned that whenever loans granted by banks to industry are frozen, which is of course not very frequent, bankers have to take a direct interest in the industry. Even otherwise as lenders, they do take a direct interest in the enterprises financed by them. The purchase and underwriting, etcetera, of debentures and shares will not necessitate this to a much larger degree.

Liberal Lending Policy

There are certain lines of action for the successful execution of a liberal investment policy. Some of these are underwriting, sub-underwriting, financing the early stages of a capital development programme, grant of loans to brokers and dealers in securities, formation of some special institutions by commercial banks to invest in new issues whose capital will be jointly held by banks only and by some other methods, facilitating the marketing of capital issues. An opinion survey was conducted by the author of this subject in April-June this year to find out the suitability of these methods. Three questionnaires were issued to bankers, brokers and promoters. This opinion survey was a limited one. But as they were placed before men and institutions important in their respective fields, the ideas and opinions may be regarded, to a reasonable extent, as representative.

Most of the brokers preferred underwriting while bankers have preferred sub-underwriting. In order to assist the marketing of new issues, banks may be advised (where they do not wish to invest for a long period) to take up any slack at the time of issue, carry it for a period and sell it later at an appropriate moment. The brokers have suggested that banks can do so to a "limited extent". This "limited extent" may be determined by a careful study of the capital market.

Most of the brokers are of the opinion that loans should be frequently provided to brokers and dealers, and banks should keep a watch on their (brokers, etcetera) behaviour as far as the utilisation of these loans is concerned. Unit trusts may well be undertaken by banks if necessary incentives in the form of tax concessions will be forthcoming from the Government. (In the U.S.A., investment trusts are exempted from the income tax in order to avoid double taxation).

Underwriting of Issues

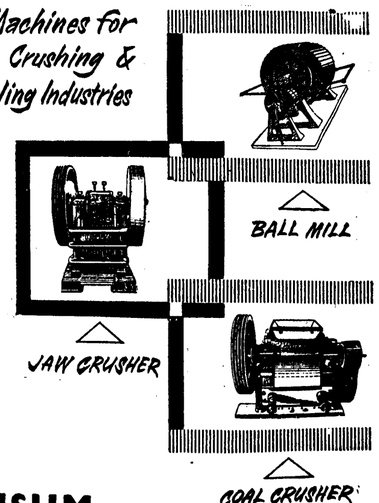
An analysis of the opinions and views expressed by bankers, brokers and promoters leads to certain conclusions. In the present context of the new issue market, bankers' entrance will itself be a great incentive to other investors. The statutory provisions should be suitably modified to permit larger bank investments in industrial securities and the Government should provide some incentives in the form of tax concession to banks undertaking the establishment of unit trusts. All applications for the admission of new issues to stock exchanges should be submitted through banks which in small proportions, say, 2 percent to 5 percent of the issues in order to ensure normal trading conditions.

The Reserve Bank of India should help bankers by accepting sound equities as the security for advances, and by imparting knowledge gained by surveys of the capital market in general and security business in particular. As far as the problem of getting more funds for investment is concerned, banks should popularise deposit certificates for medium and long-term periods. The Shroff Committee's suggestion to form a syndicate of bankers for investment purposes, should now be implemented. The all-important point is that the country's industrial progress demands more investments for medium and long terms and banks can and should play an important rôle in the investment market in general, and in the new issue market in particular.

THE TEST OF QUALITY

At any time, in any place, since the emergence of competitive enterprise, the quality of a product—tested continuously by that most critical of critics, the consumer—has made or marred the manufacturer's reputation. And a product, once firmly established by virtue of its Quality, is difficult to dislodge even in the intense price market of India, if that Quality is steadily maintained.

For more than a decade, Sen-Raleigh has been increasing its production of the well-known Raleigh, Rudge, Humber and Robin Hood bicycles. Yet their demand seems to be insatiable.



Sen-Raleigh manufactures, in addition to these bicycles, quality Union components and Wittkop saddles.

Credit Demand Rising Faster than Banking Resources

By R. M. MITRA

THE story of banking in 1962 is the now familiar one of growth. Deposits rose by Rs. 233 crores, or 13.7 percent, compared with the rise of Rs. 168 crores or 11 percent in 1961. The number of banking offices opened by commercial banks reached 211, compared with 200 in 1961. The number of offices closed fell from 116 in 1961 to 51 in 1962, resulting in a net increase of 160 in the total number of banking offices during the past year. The increase in 1961 was 84.

But this picture of expansion has its blemishes. The "balance of profit" of the 32 larger Indian scheduled banks fell by 4.5 percent—from Rs. 11.2 crores in 1961 to Rs. 10.7 crores in 1962. The increase in total earnings of Rs. 14.9 crores in 1962, was more than neutralised by an increase of Rs. 15.5 crores in operating expenses. The extra earnings accruing from higher levels of advances and investments were offset by interest payments, establishment costs and provision for taxation.

The rise in resources does not seem to have kept pace with the increasing demands of the developing economy. The total resources of the scheduled banks, consisting of paid-up capital, reserves and deposits, rose by Rs. 239.3 crores in 1962, compared with Rs. 169.1 crores in 1961. But the demand generated by Government borrowings and private credit needs increased by Rs. 260.8 crores, against Rs. 155.9 crores. The lag in the rise of resources (combined with other factors) led to a reduction of Rs. 23.1 crores in scheduled banks' cash and balances with the Reserve Bank. It appears, therefore, that a more intensive use of the banks' resources has further aggravated the question of liquidity, which has been a source of constant anxiety to the monetary authorities for some time.

The ratio of Indian scheduled banks' cash in hand and balances with the Reserve Bank to deposits fell from 9.59 percent on the last Friday of March 1952 to 6.56 percent on the same day of December 1962. Similarly, the ratio of investment in Government securities receded from 38.07 percent in March 1952 to 33.93 percent in December 1962. On the other hand, the ratio of loans and advances (including bills purchased and discounted) rose from 64 percent to 64.44 percent during the same period.*

Aspects of Liquidity

The problem of liquidity, rendered in simple terms, involves the question of availability of an acceptable medium of exchange. Obligations arising from economic and financial activities in modern society are expressed in terms of money, and require to be discharged by payment in legal tender money. It is consequently necessary not only for business concerns, but also for individuals to have access to, or control over, legal money in adequate quantities and at the appropriate time. The question of liquidity, however, assumes particular importance for bankers who receive deposits of money subject to withdrawal on demand or at short notice. The question, as it concerns public policy, is aggravated by the fact that bank deposits operate as vicarious money.

When the banking system is sufficiently developed and monetary transactions are largely channelled through this system, the question of settlement by payment in money takes a new form. A banker is under the obligation to repay deposits in legal tender money; mutual claims as between the account-holders are normally discharged by transferring a deposit from one account to another whether at the same or at a separate bank. Again, deposits may grow by converting rights to physical and financial assets into monetary claims through the process of credit creation. This process of multiple expansion of credit and deposits in an economy with a well-organised banking system can conceivably proceed indefinitely, unless it is deliberately subjected to restrictions, or until it is checked by a reverse process of credit contraction.

Risks of Excessive Credit

Experience has shown that, as long as the process of multiple expansion operates unrestricted, material assets like commodities and property and financial assets like shares and securities, change hands at progressively rising prices until the spiral breaks at some point when prices start tumbling and a reverse process of contraction begins. A business recession coming in the train of falling prices brings about failures and bankruptcies and loss of assets supporting bank deposits. It is, therefore, commonly considered necessary to moderate the process of multiple expansion. This necessity has led to the formulation of principles governing the credit deposits relationship which may be regarded as one aspect of the liquidity problem.

The other aspect relates to the withdrawal of deposits. When more than one bank functions in a banking system, the growth of deposits may not run parallel to the creation of credit in the case of each bank. Again, there may arise a transfer of deposit from one bank to another whether in consequence of loss of confidence in one bank or higher competitive ability of the other bank, or otherwise. Moreover, there does not yet exist any banking system through which all monetary transactions pass; and so there are a number of occasions when a part of the deposits leaks out of the banking system in the form of legal money. Each individual bank requires, therefore, to be in possession of legal money or to be able readily to acquire legal money in such measure as will ensure its capacity to meet demands for payment arising from (i) excessive creation of credit (*i.e.*, when expansion of credit is not followed by corresponding growth of deposit); and (ii) withdrawal of deposits, whether by way of transfer to another bank or in the form of legal money. This requirement accounts for the development of the concept of relationship between deposit and liquid assets.

Statutory Control

It is, however, worth noticing that the two different questions of the relationship between deposits and liquid assets, and of the relationship between deposits and credit, are often treated as one and the same problem from the point of view of the requirements of legal and executive control of banking. It is also significant that while statutory and executive control of advances is provided for in the Banking Companies Act, 1949, with a view to preventing speculative and undesirable loans and that though the instrument of selective credit control is frequently used to deal with the problem of unhealthy credit, there is no direct quantitative restriction of overall credit to control the inflationary effects of excessive credit. Convention is allowed generally to regulate the "norm" of the credit-deposit ratio, while such regulation is indirectly strengthened partly by statutory and partly by traditional ratios between deposits and different kinds of liquid assets.

But it is worth noticing that although neither the Banking Companies Act nor the Reserve Bank of India Act contains specific provisions for the imposition of a credit-deposit ratio, the provisions of the Banking Companies Act confer sufficiently wide and discretionary powers on the Reserve Bank to enable it to direct a particular banking company, or banking companies in general, not to exceed such credit-deposit ratio as it may from time to time or at any time consider proper (*vide* Sections 21 (35A and 36). It is evident from information furnished in statements appended to the Reserve Bank's annual reports on *The Trend and Progress of Banking in India* that the power is being actively used for individual banks, to control ratios between advances and total resources. Yet, by and large, the question of liquidity is regarded in terms of the relationship between deposits and liquid assets.

It is, perhaps, obvious that if the inflationary threat of over-extended credit is disregarded, operational requirements relating to liquidity will vary from bank to bank and from region to region. It has been noticed that these requirements arise from the disproportionate growth of deposits and advances and from withdrawal of deposits. Even if public relations and organisational arrangements may help in checking an inspired or panicky withdrawal of deposits, a certain amount of withdrawal will take place daily at every bank in the ordinary course of business. The requirement of liquidity arising from the incidence of such normal withdrawals is not subject to the direct control of a bank. Nevertheless, the extent of the requirement needs to be anticipated shrewdly so that the bank may not be involved in a *débâcle*.

In this connection, the special characteristic of the bankers' liability to meet a demand for payment has to be carefully noted. An individual or a non-banking business concern is not only in a position to make a reasonably accurate assessment of anticipated outlays, but may, if the occasion demands, arrange to postpone a payment without much loss of grace. The slightest indication of a bank's necessity to gain time in making a payment will, on the other hand, spell its doom. As for the requirement arising from the disbursement of loans, although it should normally be amenable to control, factors relating to the growth of deposits and credit needs often prove unpredictable.

Content of Liquidity

It is evident that no bank can hold legal tender money to the full extent of its deposit liability. This is, first, because a system of banking which does not seek profitable employment of deposit money but depends for its earnings wholly on service charges will prove prohibitively expensive; and, secondly, because a system of banking in which bank deposits consist wholly of primary deposits of cash and in which "derivative" deposits arising from creation of credit play no part, will fail to serve the productive and distributive needs of the economy.

It is, therefore, the task of sound banking to arrange such distribution of assets as will ensure the availability of cash to meet demands for payment as they arise and yet will yield adequate earning. Here emerges the theory of "liquid assets". Cash which does not yield any income belongs to the first order of liquid assets. Earning assets, which are readily convertible into cash without loss of capital, belong to the second order. Such earning assets as are redeemable in cash in a short time, but may involve loss of capital if sought to be disposed of before maturity, belong to the next order.

Any scheme of well-balanced distribution is based on the assumption that the withdrawal of a deposit on one account will, except where it escapes the banking system, be reflected in a fresh deposit in another account whether at the same bank or at a separate bank: transfers and

* The disproportion between a fall of about 7.2 percentage points in cash, bank balances and investment in Government securities, and an increase of only 0.44 percentage point in bank credit, reflects dissimilar growth of other assets and total resources, which include capital, reserves, deposits and other liabilities such as drafts and pay orders.

cross-transfers of deposit will thus tend to keep the deposits of a bank at a level consistent with its normal proportion to the general level of aggregate deposits of the banking system, unless the particular bank has suffered loss of confidence or unless there are special factors affecting the business of the bank's customers or the economy of its area of operation. It might, then, appear that cash held on the basis of an average of daily turnover of deposits should meet the needs of withdrawals which result in a flow out of the banking system. In this connection, it may be recalled that a committee on bank reserves appointed by the U.S. Federal Reserve System, recommended as far back as 1932 that the distinction between "time" and "demand" deposits should be abolished and that cash reserves should be equal to 5 percent of the total net deposits plus 50 percent of average daily withdrawals of deposits, subject to a maximum of 15 percent of total gross deposits.

Withdrawals which cause the transfer of deposits may perhaps be covered by holding the second order of liquid assets. Withdrawals and other payments which might be occasioned by loss of confidence, excess lending or other special factors, would require to be provided for by assets which rank third in order of liquidity.

Banking Reserves

Working principles have evolved different ratios relating to the primary reserves, secondary reserves and tertiary reserves. A primary reserve of between 5 percent and 10 percent of deposits, a secondary reserve of between 10 percent and 20 percent of deposits and a tertiary reserve of about 30 percent of deposits are generally regarded as adequate. Secondary and tertiary reserves are intended to be capable of conversion into more liquid form when the necessity arises.

As long as a banking system is sufficiently alert and is prepared to adjust the different ratios in accordance with changing factors relating to monetary habits and needs, the question of sound ratios should not constitute a difficult problem from the bankers' point of view. But the question becomes complicated when the term "liquid assets" comes to be given its denotation, and it assumes a new dimension when it is subsumed in the scheme of credit control of the monetary authorities. A brief survey of the position obtaining in the U.K., the U.S.A. and India will serve to bring out the nature of the complications.

The cash reserve requirements of member banks in the U.S.A., effective from 1st September, 1962, are 16½ percent of the net demand deposits for the reserve city banks and 12 percent of net demand deposits for the country banks plus 5 percent of time deposits for the banks in either category (as from 24th November, 1960, all vault cash is regarded as part of statutory cash reserve). The actual position in July 1962 shows that cash reserves (vault cash plus balances with the Federal Reserve Banks) represent about 11 percent of the total deposits (excluding demand deposits from domestic banks and cash items in the process of collection). Although there is no prescribed minimum, investments in U.S. Government securities amounted to about 28 percent of the total deposits of the member banks in December 1961. It is, however, customary for U.S. banks to regard U.S. securities having a maturity of three years or less, commercial paper, bankers' acceptances and loans to stock exchange firms, as constituting a secondary reserve which varies for individual banks between 12 percent and 25 percent of demand deposits and between 8 percent and 12 percent of time deposits. As for the U.K., there are no statutory requirements for cash reserves or other liquid assets; but convention (strengthened by the Bank of England's guidance) requires banks in England to hold cash and balances with the Bank of England to the extent of 8 percent of total deposits and liquid assets (comprising cash, balances with the Bank of England, money at call, Treasury bills and commercial bills) of not less than 30 percent of total deposits. Published figures show that cash reserves, sometimes tend to fall marginally below 8 percent, but the overall ratio of liquid assets invariably keeps above 30 percent.

It was noticed in the last Annual Review of *Capital* that until the recent amendments, Section 42 of the Reserve Bank of India Act required the scheduled banks in India to maintain cash reserve in the form of balances with the Reserve Bank to the extent of 5 percent of demand liabilities and 2 percent of time liabilities. Section 24 of the Banking Companies Act required every banking company to hold in cash (including vault cash and balances with the Reserve Bank, the State Bank or any notified bank, whether as part of cash reserve or not), gold or unencumbered approved securities, totalling at least 20 percent of its total liabilities. Non-scheduled banks were required in terms of Section 18 of the Banking Companies Act, to hold in cash with themselves and/or balances with the Reserve Bank, the State Bank or any notified bank, to the total extent of 5 percent of demand liabilities and 2 percent of time liabilities.

The relevant sections of the two Acts were amended in September 1962. It is now provided that the statutory cash reserve will be equal to 3 percent of total deposits with effect from 15th September, 1962, in the case of scheduled banks, and with effect from 16th September, 1962, in the case of non-scheduled banks. The reserve required under Section 24 of the Banking Companies Act, will with effect from 16th September, 1964, be equal to 25 percent of total deposits and will not include the cash reserve prescribed under Section 42 of the Reserve Bank of India Act or Section 18 of the Banking Companies Act. (The deposit held by a foreign banking company with the Reserve Bank under Section 11 of the Banking Companies Act will, however, continue to be treated as part of the reserve under Section 24).

Varying Cash Reserve Ratios

Section 42 of the Reserve Bank of India Act also contains provisions for varying the cash reserve ratios of scheduled banks subject to a maximum. The maximum in 1956 was 20 percent of demand liabilities and 8 percent of time liabilities, but the amendment of September 1962 sets the maximum at 15 percent of total liabilities. The prescribed range of variations has been changed from time to time in the U.S.A. also, where the device of variable reserve ratios was first introduced; the present range is between 10 percent and 22 percent of demand deposits for reserve city banks and between 7 percent and 14 percent of demand deposits for country banks, while the range for time deposits is between 3 percent and 6 percent for all member banks.

Not only the ratios of reserves but their composition too vary from country to country. Such variations are partly explained by different traditions and experiences and partly by the state and availability of markets for the disposal of and the shifting of banking assets. There is a discount market in England which performs a useful function in maintaining the "liquidity" of the assets treated as liquid by the commercial banks. It is true that doubts have been expressed about the value of the discount market's functions which depend largely on finance made available by the commercial banks and, in the last resort, by the Bank of England. Yet the competent view is that the market represents "the force of a tradition of great convenience"; and that the close relations between the members of the discount market and the Bank of England serves to ensure the liquidity of the assets dealt in by the market.

As for the U.S.A., the brokers' loan market, the commercial paper market, the bankers' acceptance market, the U.S. Government security market, instalment credit market, mortgage loan market and arrangements for insurance of various credit risks, etcetera, represent a complex of devices designed to secure the liquidity of various financial assets. These devices give a meaningful rôle to the bankers' secondary and even their tertiary reserves.

The conception of secondary or tertiary reserves, as reflected in Section 24 of the Banking Companies Act, covers mainly Government securities ("approved securities" have been defined to include Government or Government-guaranteed securities). Although Government securities of any maturity rank as approved securities under Section 24 of the Banking Companies Act, both convention and the Reserve Bank's power of direction treat investment in securities having a maturity of not more than ten years as part of the secondary reserves and the longer-dated securities as perhaps part of the tertiary reserves.

Proper Bill Market Needed

It seems, however, that Government securities cease to be readily salable when the stock exchanges become slack, and often fail to serve as a dependable reserve. If a proper bill market could be organised, facilities for rediscounting as contained in Section 17 of the Reserve Bank of India Act, could conceivably help in building a tradition for secondary reserves. But there is no such market operating in India; the "bill market" set up by the Reserve Bank seems neither to have created a "market" nor to be concerned with "bills" which may shift from hand to hand. Both statute and convention seem, therefore, to have proved ineffective in providing operative secondary, or for that matter tertiary, reserves for commercial banks in India.

The position relating to tertiary reserves seems particularly confusing. It may, of course, be argued that long-dated Government securities and loans and advances created in the form of transferable securities form part of these reserves. But statistics showing the proportions of negotiable loans and advances are not easily available. Government securities having a maturity of more than 10 years are reported to account for about 14 percent of the total investments of the scheduled banks in Government securities. Subject to the qualification, already noted, about the operational availability of liquidity, the "liquid" assets of Indian scheduled banks, therefore, appear to be distributed to the extent of about 6.5 percent in the primary reserve of cash and balances with the Reserve Bank, about 29 percent in such Government securities as are conventionally regarded as constituting secondary reserve and about 5 percent in other Government securities which may be treated as a tertiary reserve.

It needs to be repeated, however, that although, quantitatively, the secondary reserve may seem to be adequate, in the absence of proper markets its composition lacks in diversity and dependability. As for the tertiary reserve, it is conspicuous by its insignificance, both because of the smallness of the holding of long-dated securities and of the practical absence of any scope for the utilisation of negotiable loans.

Influence of Money Supply

The question of liquidity may now be considered from the point of view of credit control. It is conventional to relate money supply to prices in a study of inflationary forces.

According to the traditional concept, money supply in India consists of currency with the public and demand deposits with banks (excluding Government deposits and some special deposits with the Reserve Bank). It appears that currency with the public represents about 16 percent of the national income as in March 1963, against about 12 percent as in March 1952. Similar ratios for demand deposits are about 5 percent and 6 percent in the respective years. It may be observed, however, that as all bank deposits are in fact repayable on demand or at short notice, irrespective of the conditions of deposit, and as bank deposits are treated by the depositors as potential cash, the total deposits of banks should be taken into consideration in order to arrive at a correct assessment of the inflationary action of money.

The authoritative opinion is that inflation arises when the flow of money exceeds the flow of goods and services. But it has not yet been found possible to evolve a basis for a rational estimate of the stock of money which would not lead to inflation. The factors involved in the formulation of an appropriate basis are many and varied. For example, there are transactions which do not call for the use of money; turnover of money multiplies quantitative performance; a quantity of money may be secreted from use; another quantity of money may be used for transactions relating to financial assets;

and yet another for speculative dealings in goods or securities. The stock of money as measured in terms of gross national product (which includes all economic transactions which may require the use of money) may, however, serve as a workable basis for a study of the comparative position in different periods provided that monetary habits and the proportion of non-monetised transactions do not show material changes.

Bank Deposits and National Income

Total bank deposits and legal money amounted to about 8 percent and 12 percent, respectively, of national income in 1951-52, and about 14 percent and 16 percent, respectively, in 1962-63. It may be noted that the turnover of bank money (including current, cash credit and overdraft accounts) increased from 16.2 in 1952 to 17.5 in 1960.

It is noted that in the U.S.A., the ratios of legal money to national income fell from about 11 percent in 1951 to 8 percent in 1961, and bank deposits represented about 54 percent of national income both in 1951 and 1961, while the turnover of demand deposits in leading cities (other than New York) rose from about 21.7 to 36.8. Yet the index number of consumer prices in the U.S.A. showed a rise of about 15 percent, and the index number of wholesale prices rose by approximately 4 percent during the period from 1951 to 1961. As for the index number of common stock prices, although comparable figures are not available because of changes in weightage and in the years of base, the rise in prices is more than is warranted by the conditions of money supply.

It thus appears from the figures relating to the ratios of bank deposits and legal money to national income and other relevant statistics that they do not support any theory of proportion between money supply and prices. While the aggregate ratios of bank deposits and legal money show a relative rise of more than 40 percent in India, the comparative rise in prices (other than securities) is much less; on the other hand, the ratios of bank deposits and legal money show a slight fall in the U.S.A.; but the rise in prices is proportionately high. The discrepancy may, for aught one knows, be attributable to the difference in changes in the rate of turnover of money.

In this connection, it may be interesting to attempt an analysis of the factors contributing to the rise in commodity prices. Such rises are generally attributed to (i) monetary inflation, (ii) rising costs and profits, (iii) population growth, (iv) unequal distribution of income, (v) indirect taxation and (vi) transport bottlenecks.

Monetary Inflation

The all-India index number of wholesale prices of "all commodities" rose by 25.3 percent during the period of about ten years between 1952-53 and the year ended 31st December, 1962. The table of the all-India index is constructed on the basis of weighted calculation of prices under selected groups of goods and services, namely, (1) "food articles", (2) "liquor and tobacco", (3) "fuel, power, light and lubricants" (4) "industrial raw materials" and (5) "manufactures". The component groups show rises of 21.9 percent, 24.3 percent, 33.8 percent and 28.7 percent, respectively, for groups 1, 3, 4 and 5, while group 2 shows a fall of 0.9 percent.

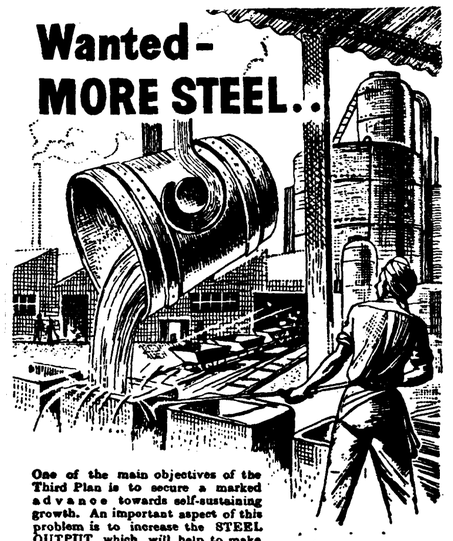
Both the comprehensive index number and group index numbers have registered noticeable fluctuations during this ten-year period. These fluctuations do not appear to have followed any law of proportion, whether as between the groups *inter se* or for external factors like money supply in general and credit money in particular.

It is noted that the index number of wholesale prices for "food articles" and that comprehensive index for "all commodities" rose to 131.5 and 131.1, respectively, in August 1962, while the former fell more markedly to 121.9 in December 1962, than the latter which recorded 125.3 for that month. Again, money supply has increased by 77 percent from Rs. 1,764.71 crores in March 1953 to Rs. 3,118.73 crores in December 1962, and bank credit rose sharply by 169 percent from Rs. 528.62 crores to Rs. 1,422.38 crores during this ten-year period. The percentage rise in prices is, therefore, relatively small, compared with those either in bank credit or money supply.

A study of the effects of selective credit control measures brought into force by the Reserve Bank from time to time, as from May 1956, also does not reveal any direct relation between prices and bank credit.

Credit control measures concerning foodgrains were revised in December 1958. The scheduled banks' advances against foodgrains fell from Rs. 23 crores in April 1958 to Rs. 20 crores in April 1959. Yet the index number of wholesale prices for foodgrains showed a comparatively large rise from 105.2 in April 1958 to 113.1 in April 1959, against a rise in the index number for all commodities from 107.4 to 112. Again, directives issued on 28th February, 1962, relaxed the control of credit against paddy, rice and groundnuts and removed the control on sugar, wheat, raw jute and jute goods.

It appears, however, that the scheduled banks' advances against paddy and rice fell from Rs. 10.19 crores on 29th December, 1961, to Rs. 10.14 crores on 28th December, 1962, and that advances against sugar and *gur* registered a sharp fall from Rs. 65.26 crores to Rs. 56.26 crores, but that corresponding figures relating to the other commodities (as mentioned above) showed rises of varying degrees. The changes in index numbers for the respective commodities fail to show any relation with the corresponding changes in the volume of bank advances. It is significant that the index number for sugar and *gur* rose markedly from 113 in December 1961 to 139 in December 1962, whereas the index number for cereals showed a small rise from 101 to 103 and that for oilseeds fell from 152 to 147. The trends suggest that any conclusion that the rise in prices in the last decade is essentially a monetary phenomenon, is vitiated by the fallacy of the "fourth term".



It is sometimes argued that rises in direct costs like raw materials and wages, and in indirect costs like profit, account for the rise in prices. But the fact that the index number of wholesale prices for finished goods shows a rise of 27.2 percent, compared with 33.8 percent for industrial raw materials and 37.7 percent for intermediate products, is positive proof of the absence of a preponderant influence of the profit motive on price rises in the last ten-year period.

It is, again, frequently urged that the "population explosion" has led to the rise in prices in India. But it is worth noticing that while population has increased by 21 percent during the period from March 1951 to March 1961, agricultural production has increased by 41 percent and industrial production by 94 percent during the same period. It is also noted that larger savings have not introduced any new element in the scarcity of supply. As against the savings rate of 8.5 percent, *per capita* income increased by 16 percent during the second five year plan.

Income Distribution

The widening disparity in the distribution of income is reflected in a study of the subject appearing in the September 1962 issue of the *Reserve Bank of India Bulletin*. The disposable income of the income group Rs. 0-3,000, accounting for 95.3 percent of households, fell from 81.9 percent to 80.5 percent during the period 1953-54 to 1956-57, while the share of income-groups Rs. 3,001-25,000 and Rs. 25,001 and above, accounting for 4.5 percent and 0.2 percent of households, rose from 14.1 percent to 15.2 percent and from 4 percent to 4.3 percent, respectively. It seems, therefore, worth enquiring whether the pressure of unsatisfied demand in a low-standard economy has not been expressing itself in rising prices brought about by intensified demand originating from the higher-income groups.

It is true that statistics may be used to prove that personal income is more evenly distributed in India than in many other countries. But the fact remains that the feature of concentration in the distribution of personal income in the urban sector is more pronounced in India and that disposable income (income after tax) is less evenly distributed in India than in a number of other countries. Again, the low level of income in India does not permit a constructive

One of the main objectives of the Third Plan is to secure a marked advance towards self-sustaining growth. An important aspect of this problem is to increase the STEEL OUTPUT which will help to make the economy self-sustaining. And hence, under the Third Plan the Bhilai, Durgapur and Rourkella Steel Plants are proposed to be expanded, contributing jointly 5.5 million tons of steel ingots. The plan also provides for a fourth Steel Plant in the Public Sector to be started at Bokaro.

As in the previous plan, so in the next one, paper would prove to be an essential pre-requisite to the implementations of all schemes for expansion and starting of new steel plants.

STAR PAPER is ready to prove its worth in carrying out the responsibility of the country's economic development. It has recently added M.G. Kraft and Posters to its line of production.

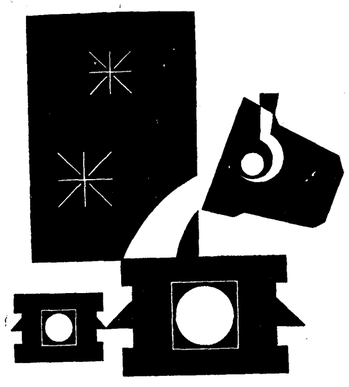
comparison with the ratios of concentration of income in other countries.

As for the impact of indirect taxation, it may be noted that the Government of India's share of Central taxes on commodities and services (in the form of Customs and excise duties and taxes on railway fares and freight) rose by more than 133 percent from Rs. 257.05 crores in 1952-53 to Rs. 600.46 crores in 1961-62. A process of elimination would, therefore, appear to indicate that an accentuation of the disparity in distribution of national income and the stepping up of indirect taxation, may have been the main contributory factors in the rise in prices, while difficulties of transport by causing local shortfalls in the availability of supply of goods, account for short-term price fluctuations.

It has been stated by many distinguished economists that a gradual rise in prices is an unavoidable feature of a developing economy. It is also possible to argue that such a rise does not produce any deleterious effect, but, on the other hand, stimulates economic activity. It may, however, prove dangerously complacent to dismiss the phenomenon of rising prices in India as a mere "secular' development. Rising prices, unaccompanied by an economically (and perhaps socially) sound distribution of income will not only bring distress to lower income groups, but also tend to unsettle the economy.

It is true that various devices, like buffer stocks, ceiling prices, fair-price shops, co-operative stores, and even rationing, may serve to control short-term fluctuations and that prices fixed by tariff commissions or by agreement among producers (and properly publicised) may promote fair trade practices. But these steps root of the problem. The questions of more equal distribution of income and of a graduated shift from indirect to direct taxes may call for more serious and systematic attention than they have received so far.



Rise in Prices and Income

Dichotomy is the dominant feature of the Indian economy. Official control and interference is justified in the name of co-operative endeavour and collectivisation of resources, while individual suffering following such interference is explained away as the inevitable and corrective result of competitive enterprise. Estimates of national income published by the Central Statistical Organisation of the Government of India show that national income has risen at an average annual rate of 4.3 percent from Rs. 8,850 crores in 1950-51 to Rs. 130.20 crores in 1961-62 (at 1948-49 prices).

According to the office of the Economic Adviser to the Government of India, the average index number of wholesale prices has registered an increase of 12 percent from 111.8 in 1950-51 to 125.1 in 1961-62 (1952-53 equals 100). The rise in income is acclaimed as an outcome of high-powered planning, while the rise in prices is attributed to the market forces of profiteering and hoarding helped and accentuated by the explosive growth of population. But the decline in prices from 111.8 in 1950-51 to 92.5 in 1955-56 seems to show that the malign forces of profiteering and hoarding are not intractable and may in fact be subdued whether under the compulsion of nature or the influence of man.

It may, therefore, be interesting and instructive to know that although there are bulges in the U.S. economy and occasional misadjustment between production and sale and between foreign receipts and payments (mostly due to special aid programmes), the U.S. economy is functioning with strength and purpose. The reason is that there is a balanced distribution of disposable income and business failures in any one year do not involve more than 0.2 percent of national income.

The conclusion which emerges, therefore, is that it is not so much the quantity of money or the relative rise in prices that affects economic health. It is the presence of a scheme for properly distributing income, the availability of adequate arrangements for the shifting of assets and the existence of a thoughtfully devised mechanism for the absorption and distribution of losses, which determine the soundness and vigour of an economy.

KUMARDHUBI ENGINEERING WORKS-LEADING MANUFACTURER OF

CASTINGS AND STRUCTURALS

KEW's technical skill and resources in the manufacture of Castings and Structurals have been harnessed on many a project of national importance like bridge-building and penstocks for Assam. KEW today plays an active part in the industrial life of the country.

CASTINGS Carbon and Manganese Steel Castings, Wagon and Loco components, machinery parts for paper, sugar, coal and cement industries, tyre moulds, etc.

STRUCTURALS Fabrication of steel work for projects, plants, bridges and buildings, penstocks, water storage tanks, chimneys, bunkers, ropeways, coal washing, crushing and screening plants.

KEW is but one of the many progressive divisions of the Bird-Heilgers Group. The Group, with its varied industrial activities, plays a significant role in the country's economy.

L.I.C. Writes More Rural Business: Need to Introduce U.K. Type of Industrial Assurance

By

A. C. GUHA RAY

OF particular interest in the Life Insurance Corporation's activities during the year 1962 and thereafter is its continued emphasis on venturing into sectors hitherto unexplored by traditional writing of business, particularly by the former life insurers operating in India. The chairman, Mr. B. K. Kaul, in one of his speeches endeavoured to focuss attention on this matter. He pointed out that the potentiality for life insurance in this country is immense and has steadily expanded over the years because of the various development activities. The potentiality, he added, is comparatively large in rural areas which were not tapped earlier because of the financial and other limitations of the former private companies.

Since the L.I.C. has been set up, development of rural insurance has been one of the main planks of its activities. Mr. Kaul was, however, careful to point out that development of the business in the rural areas did not mean issuing life insurance policies on the lives of those living in the countryside, but it meant much more than mere procuration. It involved a process of education and awakening of insurance-consciousness among those who have not been acquainted with this form of security. It was also a question of preparing the Corporation's field organisation to take advantage of the desire thus created in the minds of the village people.

Fundamentally, the problem is one of approach. By and large, as the economists have noted from a study of the national income, there has been over the years, particularly from the time the first five year plan was launched, a slow and steady shift in income from the middle classes to skilled and semi-skilled labour, artisans, agriculturists, village craftsmen, blacksmiths, tinsmiths and so on. These latter classes, who have been growing in number have not the advantage of education so necessary to understand the fundamentals of protection afforded by life insurance. These classes also were fatalistically inclined. Even today, their psychological approach to life insurance is different from those who have traditionally gone in for life insurance.

Stupendous Task

To create the necessary awareness and the consciousness among these new classes of the protective utility of life insurance is by itself a stupendous task. How far the Corporation will succeed to educate this class is hard to prophesy, for the L.I.C. will require an army of trained insurance personnel to probe deeply into the means of the rural population, and the benefit will inevitably be slow. It is also important that in the rural areas the approach to the problem of selling life insurance must be conditioned by certain fundamental principles, and there must not be any large deviation from the actuarial principles of guiding life insurance. An indiscriminate sale of life insurance may result in loss to policyholders themselves if policies lapse prematurely. It will also be a loss to the Life Insurance Corporation in the sense that it will not be able to tap a source of savings which it must in order to succeed in its mission.

At one stage, knowledgeable circles suggested to the Life Insurance Corporation the formation of a subsidiary unit entirely given to rural insurance. The ambit of the said subsidiary corporation would be different from that of the Life Insurance Corporation of India as a whole, the guiding factor being rural insurance which would also cover the small wage earners working in factories, whether in the city or in villages or in small-scale industries. Apart from creating the requisite consciousness by propaganda or otherwise, it is of paramount importance that the premium to be paid is duly and regularly collected. In the U.K., industrial life assurance has made tremendous progress. Some companies specialise in this type of business. India is fast approaching a stage where industrial life assurance can have a prominent place. It will be worth while for the L.I.C. to emulate the ways of U.K. industrial life assurance companies and to study their system of having paid officers engaged exclusively in the collection of the usual deductions from the weekly pay roll. A study team in the U.K. to investigate these factors can be of considerable value and the expenditure would be insignificant compared with the results likely to be achieved. The L.I.C. should have the proper mental make-up to launch in the country schemes similar to industrial life assurance in the U.K.

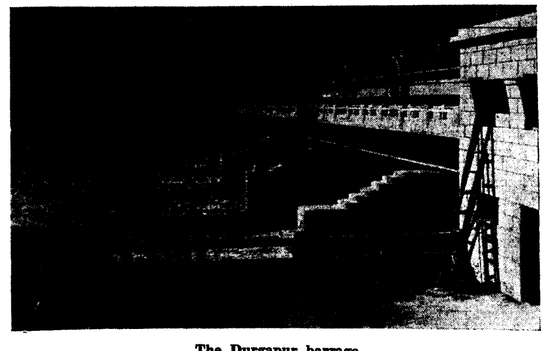
Expansion of Offices

The chairman, Mr. Kaul, claims that the Corporation has achieved the objective of familiarising the masses with life insurance by countrywide efforts including the utilisation of all known media or media developed specially for the purpose. By a planned and judicious use of a variety of methods, the chairman further claims, the Corporation has been able to meet the needs of the different areas. The chairman claimed that the Corporation had also planted its offices in different areas to ensure further development and proper servicing. Thus while the Corporation started in 1957 with 240 branches and sub-offices, by the end of 1962, it had set up 339 branches and 354 sub-offices and development centres in the country.

In the 15-month period 1962-63 which constitutes the last working year of the Corporation, new business amounted to Rs. 746 crores. The chairman pointed out that the number of policies issued to persons in areas where life insurance was never known before was 38.5 percent covering 31.9 percent of the sum assured. Thus out of the total business done in India during the last financial year, the rural business alone accounted for Rs. 234 crores. This is no doubt creditable having regard to the fact that there was hardly any business done in most of these areas, and if this business remains in the books of the Corporation, it is likely to pay good dividends.

As for the Corporation's endeavour to draw the right type of men for sale of life policies, against 89,000 active agents in 1957, the Corporation had by the end of 1962, over 174,000 individuals. But since India is developing fast and since rural development is the special assignment of the Corporation, it is quite obvious that many more men are needed, specially in the rural areas.

L.I.C. as Investor



On the rôle of the Corporation as an investor, there has been of late considerable discussion, particularly as to the rôle the Corporation should play as an institutional investor. Time and again the importance of the Corporation to the national economy and to the corporate sector has been emphasised not only by the Government but also by the Corporation itself. The policyholder hardly figures in these statements and calculations. An insurance company is above all a trustee of the policyholders' funds. The savings of the people are entrusted to it out of trust and with the view that the savings will ensure a return eventually. Therefore, it is of paramount importance that the life funds are invested in a manner which would yield the maximum return consistent with safety. The insurance company's subsidiary rôle or indeed the rôle of the Life Insurance Corporation as a monopoly organisation, is the promotion of ventures and industries. In other words, its function is to combine the return for the policyholders with the promotion of industries and ventures in the country, so that with this dual rôle carefully handled and carefully planned, an insurance company can ultimately promote the national dividend and well-being.

The argument that the Life Insurance Corporation of India is solely a Government organisation and that its liability to policyholders is guaranteed by the Government does not entitle the Corporation to invest its funds in a manner which may constitute a risk to the fund itself or the returns expected may not be commensurate with what the L.I.C. would have earned had it followed the traditional ways of the insurance companies operating all over the world. The Corporation, it should be remembered, is not an instrument for the achievement of a socialistic pattern of society, nor is it an organisation to promote what the high-ups in the Government of India think socially desirable. It is by and large, as the chairman himself has claimed, a commercial organisation and is to be viewed as such. Its funds, therefore, have to be carefully nursed, scrutinised and handled so that the L.I.C. as an investor may not be guilty of widely deviating from the traditional rôle of an institutional investor functioning always in the interests of the policyholders.

Increase in the Sum Assured

Trends in new Indian business as given in the *Insurance Year-Book, 1962*, show that the increase in the sums assured (22.7 percent) and in the number of policies (16.9 percent) in 1961 over those in 1960 was greater than the corresponding increase of 16.6 percent and 9.5 percent, respectively in 1960 over those in 1959, but these increases are still less than the corresponding increases in 1959 over those in 1958 (namely, 24.8 percent and 19.6 percent, respectively). The average sum assured a policy during 1961 was Rs. 4,097, compared with Rs. 3,903 a policy during 1960, which shows an increase of 5 percent, but this increase was smaller than the corresponding rise of 6.5 percent in 1960 over that of 1959.

The increase in the sums assured and bonuses (20.5 percent) and in the number of policies (11.8 percent) between 31st December, 1960, and 31st December, 1961, was greater than the corresponding increase between 31st December, 1959 and 31st December, 1960 (namely 17.3 percent and 11.7 percent, respectively). The average

sum assured and bonuses a policy in force as at 31st December, 1961, was Rs. 3,146, compared with Rs. 2.918 as at 31st December, 1960, which shows an increase of 7.8 percent. The net rate of interest realised on mean life insurance fund in the year 1961 was 4.67 percent when income tax refund is taken into account. When it is excluded, the rate works out to 3.69 percent. The corresponding rates in the year 1960 were 3.55 percent and 3.53 percent, respectively.

Overall Expense Ratios

The ratios of total expenses of management to the net premium income for the years 1959, 1960 and 1961 were 28.68 percent, 28.44 percent and 27.97 percent, respectively. The ratio of lapses loss revivals to the mean gross direct business in force (sum assured) during 1961 as far as the Indian business was concerned was 7.5 percent, compared with 7 percent in 1960, 6.3 percent in 1959 and 5.3 percent in 1958. These figures show that the lapse ratio is increasing and steadily nearing the ratio of 8.2 percent for 1955, the year immediately preceding nationalisation.

The lapse ratio rose to 8.1 percent during the period 1st January, 1962, to 31 March, 1963. The chairman deplored the tendency of the net lapse ratio to rise in spite of the efforts to improve the quality of business. There is hardly anything, he said, an insurer can do to prevent lapses attributable to factors beyond his control. At the same time, efforts to improve the quality of business so as to minimise lapses attributable to new business of doubtful quality must continue; if anything, they need to be pursued more vigorously. With this end in view, the L.I.C. has recently decided that a fresh proposal, from any person whose existing policy has lapsed during the preceding three years, would be entertained only if such policy is first revived by him for which purpose special facilities are now given.

In order to have an indication of the rate of settlement of claims by the Life Insurance Corporation of India, a ratio of the amount of mean outstanding claims at the end of a year to the amount of claims paid by it in that year, has been worked out. In the last issue of the *Year-Book*, old claims outstanding and unclaimed written back were taken as claims paid for the purposes of this ratio. If these are not taken as claims paid, the ratio works out to 38.1 percent in 1961 compared with 41 percent in 1960, 45 percent in 1959 and 47.7 percent in 1958. These ratios indicate some improvement in the speed of settlement of the claims by the Life Insurance Corporation.

The third biennial valuation of the Corporation's business as at 31st December, 1961, had been completed. As a result, Rs. 32.73 crores were allocated to the participating policies. The rates of reversionary bonus allotted to policies issued by the Corporation as well as policies issued by the former insurers were the same as those declared for the first two valuations. The amount allocated to the Central Government was Rs. 1.72 crores. Consequent on the change in the accounting year of the Corporation, it has been decided to make the fourth valuation of the Corporation's business as at 31st March, 1963, and the same is in progress. It is expected that the results of this valuation would be available early in 1964.

The Corporation has taken on hand a detailed investigation into the mortality of assured lives during 1961-64. It is proposed to construct a life table, on the basis of the experience during the years 1961-64 of medically examined male lives accepted at ordinary rates under whole life and endowment assurance plans. It is also proposed to investigate separately the experience of male lives assured under the non-medical scheme, and of the female lives assured with the Corporation.

A preliminary investigation into the mortality of assured male lives has been made. A life table based upon the experience during 1961 of nine major integrated head office units, accounting for about three-quarters of the entire business in force of all the insurers prior to nationalisation, has been prepared and incorporated in the report. The results of this investigation confirm that there has been considerable improvement in the mortality of assured lives in India since the publication of Oriental's 1925-35 experience. The investigation into the mortality experience of lives assured with the divisional offices of the Corporation also confirms the same.

Reducing Premium Rates

It has often been suggested that in view of the favourable experience of the Corporation, particularly concerning mortality, the premium rates should be reduced. The chairman said in this connection that when most of the insurers effected substantial reductions in the rates of premium in 1954, a considerable part of the current favourable experience concerning mortality and interest was anticipated and taken into account. He further said that in adopting in 1956 the premium rates of the "Oriental", after further reducing them by Re. 1 a Rs. 1,000 sum assured or 5 percent of the premium, whichever was less, the Corporation anticipated economy in expenses. However, in view of the increasing pressures of inflationary forces, it would be too much to expect any significant reduction in the expenses in the near future.

As for the mortality basis underlying the premium rates, the same can be reviewed only when the low rates of mortality now being experienced are stabilised. This would be known only in 1966 when the results of the detailed investigation into the mortality experience for 1961-64 undertaken by the Corporation are expected to become available.

Apart from this, the chairman said, it is the general practice among insurers even in foreign countries not to revise frequently the premium rates for with-profit policies. The general view of the insurers is that changes in experience concerning mortality, interest and expenses can more equitably be handled under the profit policies by changes in the bonus rates than by changes in the general level of premiums. This is particularly significant when 90 percent to 95 percent of the new business is generally under with-profit plans as is the case in this country. Moreover, passing on the benefits of favourable experience in the form of reversionary bonuses to the policyholders rather than reductions in premiums is desirable as an anti-inflationary measure.

Progress of General Insurance Hampered by Official Interference

By
A SPECIAL CORRESPONDENT

IN order to "aid and advise" and to set up what is called a "standard of conduct and sound practice" with Mr. E. Kolet at its head, the Executive Committee of the General Insurance Council had set the stage by the end of 1962 for "posting its representatives wherever and whenever possible in the accounts offices of insurance companies". The representatives were authorised to check all transactions, whether of receipts or payments made on and after 1st July, 1962, with a view to ensuring that transactions repugnant to the Act and the Code of Conduct, whether directly or indirectly, are not taking place. Armed with authority from the acquiescing company managements, Mr. Kolet started inspecting offices from the beginning of 1963. The round of inspections is continuing although Mr. Kolet has met with little success in most of the companies in south India and also a few in other regions.

These companies did not approve of such inspection, so the Executive Committee and its administrative machinery were unable to look into their affairs. This led to a strange anomaly. The unsullied behaviour of some of the companies to divert field personnel and to carry on administration unhindered by the vexatious interference of the inspecting officers of the administrative machinery, put them in an advantageous position compared with those who approved of inspection. Time and again, this has been brought to the notice of the chairman of the Executive Committee. But the latter, for one reason or another, has failed to carry conviction with the companies who are reluctant to co-operate.

Voluminous Reports

In some companies, however, inspection has been carried out twice or thrice primarily by persons who are inexperienced and ignorant of the nature and character of trading in general insurance. Voluminous reports have, meanwhile, accumulated in the archives of the Executive Committee. The latter's secretariat has laboriously gone through the reports and has prepared summaries which, according to the authors, reveal a general trend. The Executive Committee wants to curb what it calls rebates and illicit inducements, and the trend, it is reported, has revealed the main sources of outgo. The committee has not, however, been able to carry conviction, with all insurers, for its findings are primarily based on inference and guesswork. Since the committee or the administrative machinery has limited powers, it has to rely on letters of authority granted to it to advise insurers to take certain actions. Primarily, advice is limited to reducing salaries, cancellation of appointments and reducing, in some measure, the overall expenses. Since by virtue of these directives it often encroaches on the privilege and prerogatives of company managements, it is difficult to decide whose suggestions the trade should implement. The companies are bound by the terms of their incorporation and articles of association and by the authority of the boards. So interference from outside often causes embarrassment to both the administrative machinery and the managements of companies.

In one case, an important industrialist said in his annual address that the state of affairs was unsatisfactory and put those companies subject to inspection at a disadvantage when compared with the rest. He, therefore, urged the Executive Committee to correct the anomaly and to relieve those who voluntarily agreed to inspection from their obligations. In this, he generally expressed the opinion of the trade. Many companies would like to be relieved of their obligations, since they find to their dismay that by entering into the obligations, they have virtually had to surrender the administration to an outside authority. That was clearly not intended, for the terms only provided for checking. The Executive Committee has, however, reserve powers and can, if the chairman so wishes, authorise disbursements by the administrative machinery with the concurrence of the chairman or the principal officers of the companies. Most of the companies are jealous of their powers, and if the Executive Committee is ever to invoke them—which, it is understood, many companies have been asked to—there will be considerable commotion in the trade which might lead to the breaking of the administrative machinery itself.

Periodical Reports

It is reported that the chairman of the Executive Committee, who is an official of the Government of India, submits reports periodically to the Central Finance Minister. The chairman will now make a report to the new Central Finance Minister, Mr. T. T. Krishnamachari. What attitude the latter will take to this interference in the working of general insurance companies is not known. But if his recent pronouncements provide any guide, Mr. Krishnamachari is immune from the theoretical bias of nationalisation and prefers companies to function within the ambit of the law with as much freedom as possible.

That the ways of the Executive Committee are getting curiouser and curiouser is evident from its latest directives. Companies are being requested to reduce expenses in the field by about 5 percent before the end of December 1963, and the members of the Executive Committee are reported to have agreed to this proposition. This seems strange, for the Indian insurance companies in both Bombay and Calcutta have repeatedly urged the Controller of Insurance to relax the expense regulations as embodied in Section 40C, mainly on the ground that wages and prices in 1963 are much higher than what they were in 1950 when the rules were framed. Cautious and wary insurers, meanwhile, think that representations made off and on to the Controller of Insurance lose force if the companies can voluntarily reduce their expenses, whether in the field or otherwise. But it is obvious that the committee makes many far-reaching moves without consulting the members.

The time has come when the constitutional position of the members of the Executive Committee should be re-examined thoroughly. If expenses are reduced voluntarily, the Controller of Insurance might easily withdraw all relaxations by pointing out that if insurers can voluntarily agree to reduce their field expenses or otherwise by about 5 percent, all representations so far have been made on false pretences.

The report that the Life Insurance Corporation will operate as a general insurer and that too in a big way has created a stir. This news which came in the wake of the meeting of the Executive Committee of the General Insurance Council in Madras has caused worries to the Executive Committee, administrative machinery, general insurers and the various insurance associations in India. The correct shape that the idea will take has not yet been authoritatively stated, but it is clear from Press reports that the purpose of the L.I.C. entering the field of general insurance is to set up the standard of conduct and sound practices in the business—a function entrusted by law to the Executive Committee of the General Insurance Council. It follows, therefore, that if the L.I.C., as is now anticipated, enters the market as a moral preceptor for setting up the standard of conduct and sound practices in the trade, the Insurance Act will have to be amended to abolish the Executive Committee altogether. For obvious reasons, there cannot be two sets of authorities for discharging the same functions.

The *modus operandi* of the L.I.C. has not been clarified, but it is gathered that the L.I.C. will reduce premium rates, consistent with safety, to such an extent that the competing insurers will have no other alternative but to offer similar rates to their own clientele with a view to retaining their own business. That will necessarily reduce the premium income of the companies. Considering that the companies will have to show profits, declare dividends and at the same time compete with the L.I.C., they will have to cut their overheads as well as those expenses which reportedly go for rebates and illicit inducements. From this point of view, the L.I.C.'s entry into the business does not presage well for the Executive Committee and the administrative machinery who are now prying into the books of the companies, maintained and supported at the expense of insurers. Moreover, insurers, on their own, will not like to incur expenses for the maintenance of the machinery, since they must, in any case, cut down their expenses and cannot afford to have the administrative machinery. They also do not need the machinery because its work will be automatically undertaken by the companies themselves due to the competition with the powerful L.I.C.

Some contend that this rôle of the L.I.C. is top dressing and that it is indeed nothing more than a facade. But, in fact, the L.I.C.'s entry into the business will virtually amount to back-door nationalisation. Having its hand on all major investments in the country, the L.I.C.—if it likes—can manoeuvre its investments to channel business in its books. It will also have the monopoly of all Government and semi-Government business and business emanating from autonomous corporations, public undertakings, etcetera. The private general insurance companies will have a hard time indeed. It is quite possible that many of them will be squeezed out of existence unless, in self-defence, some of them combine together to form an economic unit to face competition from the L.I.C. The nature of the L.I.C.'s operations in general insurance will be known if, as is reported, a Bill is introduced in Parliament to amend the Insurance Act, 1938. The Life Insurance Corporation Act, 1956, does not, however, require much modification. This is because the articles of association of the L.I.C. permit it to transact general insurance business.

Creditable Performance

After all these difficulties, it is creditable for insurers operating in India to have written a gross premium direct in India in 1961 (the latest year for which figures are available) amounting to a little over Rs. 43 crores. This may increase to Rs. 55 crores in 1962. The record on the whole is creditable, considering that insurers operating in India have not had scope to expand in the way they could because of the restrictions on their operations. Premiums written direct outside India by Indian insurers amounted to Rs. 9.55 crores. The gross direct premium written in India and outside India by Indian insurers was higher in 1961 than in 1960 in all classes. Non-Indian insurers also wrote a higher gross direct premium in India in all classes of business in 1961, compared with 1960.

The net premium income in India for all classes of general insurance business of Indian insurers increased to Rs. 23.50 crores in 1961 from Rs. 18.59 crores in 1960. Similarly, in the case of non-Indian insurers, the net premium income in India for all classes of general insurance business increased to Rs. 8.44 crores in 1961 from Rs. 7.90 crores in 1960. The total net premium income in India of Indian and non-Indian insurers,

therefore, amounted to about Rs. 32 crores. The net premium income outside India of Indian insurers, which was higher in 1961 than in 1960, amounted to Rs. 15.97 crores in 1961.

Total Income

The total income of all Indian insurers amounted to Rs. 40.18 crores. This was made up of a net premium income in India of Rs. 23.50 crores, the net premium income outside India of Rs. 15.97 crores, interest, dividends and rents of Rs. 67 lakhs and the balance of Rs. 4 lakhs from miscellaneous sources. The total outgo was Rs. 34.76 crores, of which Rs. 19.34 crores related to claims, Rs. 5.53 crores to net commission, Rs. 9.10 crores to expenses and Rs. 79 lakhs to miscellaneous outgo. Of the balance of Rs. 5.42 crores, Rs. 3.57 crores were absorbed by the increases in reserves for unexpired risks and additional reserves, while Rs. 1.85 crores were transferred to the profit and loss account. The profit of Rs. 1.85 crores, together with a deficit of Rs. 4 lakhs brought forward from last year (after the payment of Rs. 98 lakhs as dividends for the previous year), and amounts of Rs. 1.21 crores and Rs. 44 lakhs earned by way of interest, dividends and rents (not relating to any particular class of insurance business), and miscellaneous income, respectively, amounting in all to Rs. 3.46 crores, was appropriated in the profit and loss accounts and in the profit and loss appropriation accounts as follows: Expenses of management took Rs. 12 lakhs, taxes paid and provided for Rs. 1.42 crores, transfers to particular funds or accounts Rs. 59 lakhs, dividends for 1961 paid or provided for Rs. 30 lakhs, miscellaneous outgo Rs. 20 lakhs and the balance carried over was Rs. 83 lakhs.

Fire Insurance

As for fire insurance business in 1961, Indian insurers spent 29 percent of their total gross premium income in India on expenses, taxes and miscellaneous outgo, 14 percent on commission, while 35 percent was absorbed by claims payable, leaving a balance of 22 percent. The corresponding figures for non-Indian insurers in relation to their Indian business were 30 percent, 14 percent and 21 percent, leaving a balance of 35 percent.

In marine insurance in 1961, Indian insurers spent 17 percent of their total gross premium income in India on expenses, taxes and miscellaneous outgo, 7 percent on commission while 68 percent was absorbed by claims payable, leaving a balance of 8 percent. The corresponding figures for non-Indian insurers in relation to their Indian business were 23 percent, 9 percent and 57 percent, leaving a balance of 11 percent.

In relation to miscellaneous insurance business in 1961, Indian insurers spent 21 percent of their total gross premium income in India on expenses, taxes and miscellaneous outgo, 12 percent on commission while 43 percent was absorbed by claims payable, leaving a balance of 24 percent. The corresponding figures for non-Indian insurers in relation to their Indian business were 29 percent, 13 percent and 42 percent, leaving a balance of 16 percent.

The number of groups (parent and subsidiary companies taken together) of Indian as well as non-Indian insurers, who contravened the provisions of Section 40C of the Insurance Act during 1961, was less than in the previous year. About one-third of the groups of insurance companies who contravened the provisions in 1960, were administered a warning. Of a total of 116 groups of both Indian and non-Indian insurers who transacted business in 1961, 32 groups contravened the provisions four or more times during the years from 1956 to 1961 and 28 of these groups were warned once or more during the period 1956-60.

The groups of insurers who spent less than the basic limits in terms of Rule 17E of the Insurance Rule, 1939, wrote a greater proportion of the total gross direct premium income in India in 1961, compared with 1960. The aggregate experience of all the groups shows that there is a sharp rise in the saving during 1961, compared with 1960.

Marine Insurance

One of the most important landmarks in general insurance trading in India during the year was the passing of the Marine Insurance Act by Parliament after many years of effort. The legislation came into force from 1st August, 1963. Surprise has often been expressed that although marine insurance was practised in the country for many years, there was no marine insurance legislation in India. This is not strictly correct. In the United Kingdom—the traditional home of marine insurance—no effort was made to introduce a legal system to govern contracts of insurance, although insurance was practised in that country for many decades. Statutory provisions were connned normally to the prescription of particular practices. Merchants, shipowners and their insurers were for long content to accept what was customary.

The historical process of evolution of the law is, however, a fascinating study. It was Mr. Chalmers who for many years had given his attention to marine cases in the courts and had interpreted the law as it then was. He took the view that the law had to be codified. When the Bill was drafted, it was referred to a committee of underwriters, average adjusters, shipowners and lawyers presided over by Lord Herschell. The Bill was later brought before the House of Lords by Lord Halbury as Lord Chancellor. He hoped that codification of the law in England might be followed by other countries later. Eventually, an Act to codify the law relating to marine insurance was placed on the Statute Book. The Act was not designed to remodel the law relating to marine insurance but merely to codify previous decisions and customary practices.

The Indian Marine Insurance Act, 1963, also intends to codify the law relating to marine insurance. The realisation of the objective will not be easy, since India does not have age-long practices or legal decisions sanctified over the years calling for codification. Indian courts have been guided by the decisions of English courts and the provisions of the English Marine Insurance Act, 1906. Although the claim of the preamble that the Act aims to codify the law relating to marine insurance may seem somewhat pretentious, the need for enactment cannot be under-estimated.

International Character

A marine insurance policy has an international character. A claimant in a country other than where the policy was originally issued cannot be sure of the protection he intended to have unless the words convey the meaning in his court of law identical to the interpretation given in the country of origin. The form of policy is laid down in the schedule. Section 24 of the Indian Act lays down that a contract of marine insurance shall not be admitted in evidence unless it is embodied in a marine policy in accordance wth the Act. The policy, in all particulars, is a word for word reproduction of the internationally accepted Lloyds S. G. form of policy which, together with the rules of construction, has legal interpretations hanging almost to every word and almost certainly to every sentence.

The Law Commission urged the introduction of legislation of this character, by pointing out that while legislation on the above lines (meaning the law relating to the assignment of marine policy) would clarify the law of assignment and subrogation of marine insurance policies, the whole law of marine insurance would not be put on a satisfactory basis unless comprehensive legislation on the lines of the Marine Insurance Act, 1906, was enacted for India. That the statute should generally follow the English Marine Insurance Act, 1906, has long been recognised. The English law, as is well known, is based on usage and the codification of established principles. Over the years, they have been accepted and ratified by commercial communities the world over. The Indian law can codify those principles and usages.

The Indian Act does not materially differ from the English Act. The differences are only differences in codification. The principles were well accepted in the United Kingdom, even though they may not have been specifically mentioned in the English law. The Indian law, for instance, has clarified that an inland transit policy is as much a marine policy as a policy of insurance on overseas shipment. This is well understood in the United Kingdom and accepted as such. The clarification was needed in India because of varying decisions of Indian courts, some raising the plea that the Insurance Act has only defined marine insurance business, there being no definition of a marine insurance policy.

Workmen's Compensation

Another important development during the past year was the enforcement of the amended Workmen's Compensation Act, which received the assent of the President on 19th December, 1962. The provisions of the Act have been enforced with effect from 1st February, 1963. As a result, the liability for the payment of compensation for accidents arising out of and in the course of employment and occurring on and after 1st February, 1963, has been substantially increased. Particular mention may be made of death and permanent disability benefits which have been doubled. Temporary disablement benefits to workers in the Rs. 100 to Rs. 200 a month wage bracket have been increased by about 50 percent on average, and the wage limit for under the Act has been increased from Rs. 400 to Rs. 500

The existing insurance premiums were considered inadequate for the additional liability imposed by the amended Act. The Tariff Committee of the Insurance Association of India has, therefore, increased the existing premium rates by 60 percent in relation to new policies and renewals issued on and from 1st February, 1963, that is to say, the date from which the provisions of the amended Act became operative.

Motor Premium Rates

Another development of considerable importance was the revision of the rate of comprehensive cover for private motor-cars and the enhancement of the scale of no-claim discounts. Unsatisfactory loss experience in private car insurance business during the past few years necessitated considerable changes in the existing rates and conditions. The matter was considered in detail by the local Councils and later by the Tariff Committee. Thereafter, on and from 1st August, 1963, the rates for private car comprehensive insurance were enhanced, but with a view to allowing the careful insureds the necessary relaxation, no claim discounts for private cars were raised to 50 percent for a no-claim period of five consecutive years. The increase in the discount for freedom from claims during four and five consecutive years of insurance in relation to private car comprehensive risks became operative simultaneously with the adoption of revised premium rates, without any waiting period, that is to say, if an insured had made no claim during five consecutive years of insurance and if his policy was due for renewal on 1st August, 1963, he was entitled to 50 percent no claim discount from that date. It will not be necessary for him any longer to have two more claim free years to earn the proposed maximum discount.

Prior to these reductions, the maximum no claim discount that could be earned was 33⅓ percent. Since the motor claims ratios have shown an upward trend in other parts of the world, motor insurance rates in the U.K. have also been enhanced from October 1963, but in the case of British insureds, the maximum no claim discount was limited to 40 percent and not 50 percent. The Tariff Committee considers the revised rates to be commensurate with experience. Since, the increased premiums in the case of better risks would be partly offset by higher no claim discounts, it is hoped that the new enhanced rates will not unfavourably affect the careful insureds with a good driving record.

Share Prices Recover but New Issue Market Stagnates

THERE has been a spectacular rise in share prices since the return of Mr. T. T. Krishnamachari as the Central Finance Minister. Whatever one may say about the Kamaraj plan, the stock market has been greatly benefited since the Cabinet reorganisation following the implementation of the plan has installed Mr. Krishnamachari as the Central Finance Minister. Judging from the brisk activity, it appears that operators have shed the nervousness which overwhelmed them since the Chinese attack on India towards the close of 1962. At first, the return of Mr. Krishnamachari acted as a psychological tonic. Operators thought that he would thoroughly overhaul the fiscal system which his predecessor, Mr. Morarji Desai, built up. The latter scrapped the Kaldorian tax edifice which Mr. Krishnamachari installed. Later events proved that operators were right since Mr. Krishnamachari has so modified the Compulsory Deposits Scheme and the Gold Control Order that they have become merely a shadow of their former selves. These measures have strengthened the optimism that the Central Finance Minister will soon modify the fiscal system.

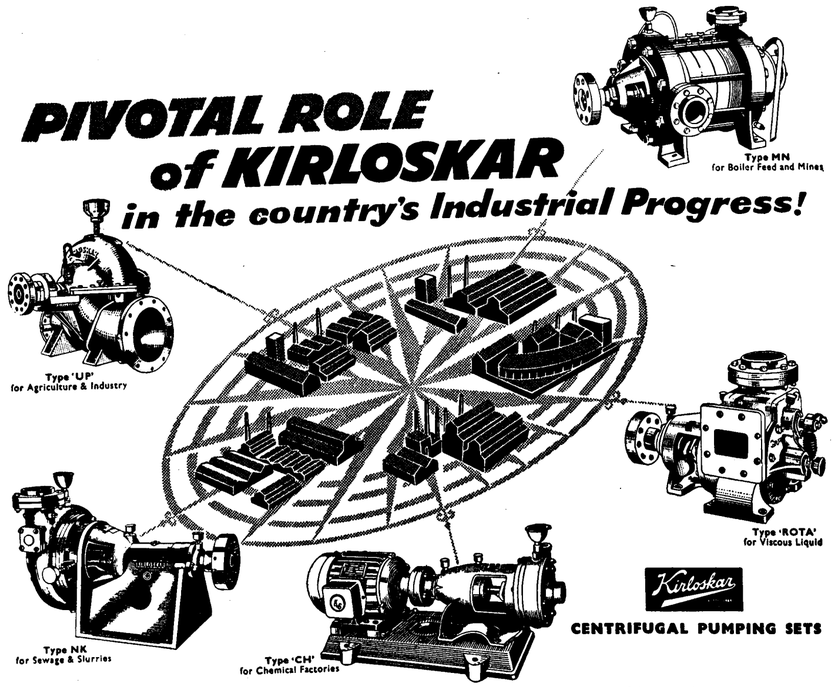
By
A SPECIAL CORRESPONDENT

The cheerfulness has been brought about by the Reserve Bank's announcement of a more liberal credit supply for the 1963-64 busy season. Although the supply of credit to trade and industry is expected to be somewhat easier in the coming months, it is unlikely that the stock market will benefit from the move. The importance of scrapping the minimum margin requirement against share advances by banks has been exaggerated. Although banks have been empowered to advance money against shares freely, it is doubtful whether they will relax the margin against share advances or divert more funds into stocks and shares. Banks generally keep a sufficient margin which is not less than the hitherto stipulated compulsory margin of 40 percent of the share value in relation to advances against shares. Considering the sharp rise in share values during recent months and the various uncertainties ahead, the margin against share advances is unlikely to be liberalised by commercial banks. The latter do not also look upon share investments with favour because the corporate prospects are considered poor.

Liberal Credit Policy

There is, nevertheless, no doubt that a more liberal credit supply from the Reserve Bank has been a step in the right direction. Although the need for Reserve Bank finance during the present busy season might not be as urgent as was thought before, the new credit policy contains at least two commendable features. Firstly, a cut, although marginal, has been made in the Reserve Bank lending rate. The high cost of credit has done more harm than good to the economy. It has sharply raised the production costs of industries without helping to curb inflation. Secondly, it has been realised that monetary regulation by itself will not rectify the evils of growing inflation. The legitimate credit requirements of the economy have not been adequately met due to the imposition of undue restrictions on the supply of funds. Since a large volume of "unaccounted money" has been floating on the fringe of the organised money market, it has been almost impossible to regulate the supply of funds.

So undesirable distortions in the economy have developed as a result of the restrictive monetary policy. The fact that several commercial houses have taken large deposits from the public during recent months suggests that various industries have been compelled to procure funds from outside the banking system since the latter has been unable to satisfy their full requirements. This apart, the current inflation has been accentuated by the physical shortages of commodities. The battle against it cannot be won unless active measures are taken to increase production all-round. But the expansion of the economy cannot proceed satisfactorily unless sufficient finance is provided. It is encouraging that the resources of banks have been sufficiently reinforced so that they may be able to cope with the rising credit requirements during the busy season. The substantial improvement in banking resources has been partly due to the sharp decline in advances and partly because of the steep rise in deposits during the past slack season.



Prices Rise Sharply

The recent rise in share prices, which have scaled new peaks during the year, has been all the more striking since it has taken place in spite of many uncertainties. Adverse political developments have also been overlooked. The reason is that the improvement has largely been brought about by speculative support. Business has largely centred on clearing shares. The predominance of professional buying after a long period of depression extending over a year is not surprising since the beginning of a bull movement has generally been ushered in by speculative support. If operators' assessment of the future outlook proves correct, there will be more investment buying. The stock market has been cheered by the pep broadcast of Mr. Krishnamachari in October since he reiterated his resolve to end the economic stagnation by adopting appropriate measures. Judging from the promptness with which he has watered down the Compulsory Deposit Scheme and the Gold Control Order and has helped the Reserve Bank to adopt a more liberal credit policy, the belief has grown that he might soon back his other statements by action. Operators have merrily pushed share prices forward in anticipation of good tidings from the Lok Sabha during the current winter session.

Hopes have been raised by the prospect that Mr. Krishnamachari will modify the fiscal system. There is no doubt that investment confidence has been shaken by the super profits tax. Unless it is scrapped or at least substantially modified, it will prove extremely difficult to revive or maintain investor confidence. Investors are unlikely to be impressed unless concrete measures are taken to prove that the outlook for the corporate sector has improved. There has been a great deal of speculation on whether the fiscal system will be modified now or at the time of presenting the Central Budget in February next year. In view of the urgency to revive confidence, there is no reason why tax changes should be delayed. There is nothing unusual about introducing changes in the fiscal system by means of a supplementary Budget. The present time looks extremely appropriate for granting tax relief. Not only have revenue receipts been buoyant, but expenditures under various heads have fallen below estimates. So there is no reason why the Government should be reluctant to lighten the tax burden without further delay.

As for for the Government's pricing policy, there have been indications of a drift towards greater realism. Industrial growth has been hindered due to the fixing of prices at unrealistically low levels for such commodities as steel, paper, cement and coal. Not only has the profitability of various industries been affected, but they have been denied the necessary wherewithal to finance modernisation, expansion and diversification. So the production of steel, paper, cement, coal and sugar has fallen far below the third plan production targets, and there are shortages of these commodities. Meanwhile, the move of the Central Steel Ministry to decontrol the commodity by stages has been welcomed. If the expansion of industries is to be promoted, it is necessary that the prices of various commodities are regulated in such a way that an adequate return on the

capital employed is ensured. The profit should also be sufficient to allow a reasonable plough-back for expansion, modernisation and diversification.

Growing Apprehension

It is not difficult to understand the growing apprehension that the rise in share values, which has already taken place, might prove temporary unless active measures are taken by the stock market authorities to consolidate the gains already achieved. Although stray efforts have been made to restrain over-trading by imposing margins, it is doubtful whether they have been sufficiently effective under the present circumstances. The widespread option business has been a potential danger which might upset the apple cart. It is distressing that bigger business has taken place in the kerb market than on the floor of the stock market. The growing volume of kerb trading suggests a link between kerb operators and some inside brokers. Unless the authorities take vigorous measures to mitigate the evils of kerb dealing, the business under the clearing system itself might come under heavy fire. Although business in clearing shares involves futures contracts which are speculative, it has been allowed under the present circumstances to promote activity in the stock market. Except for scattered buying in selected scrip, investors generally are sitting on the fence. The corporate news has been good and several leading companies have issued bonus shares by capitalising reserves. The move to issue such shares has been encouraged because the bonus share tax will be deducted in computing the super profits tax.

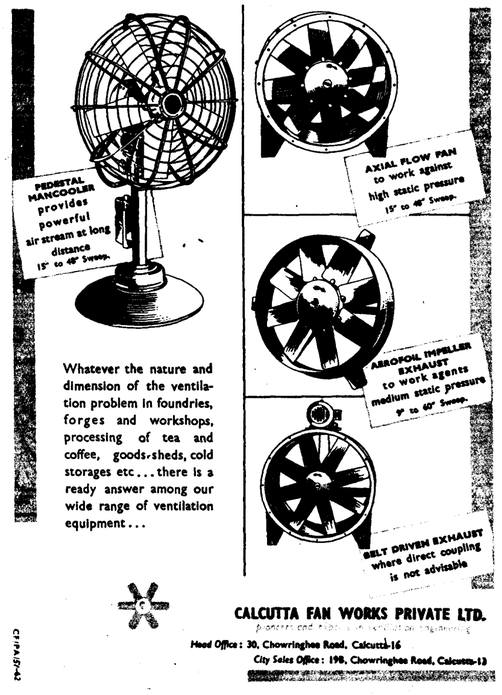
Meanwhile, the caution of investors has been justified. An industrial equity is generally bought on dividend and growth considerations, but both these factors have been far from encouraging under the present circumstances. Investors have been disappointed by the slow rate of growth of dividends during recent years. As a result, the prices of most good scrip have been sufficiently high in relation to their dividends. The average dividend yield on equity at current prices does not amount to more than 5 percent to 6 percent, which is considered unattractive by present market standards. There has, meanwhile, been a sharp rise in interest rates all-round. Good debentures giving a yield of more than 6 percent have been freely available. The preference shares of good companies have offered fixed dividends of more than 9 percent. The growth value of equities has also suffered greatly during recent years. Although turnover of industries has expanded, the profitability has not improved in proportion due to the incidence of heavy taxes, combined with rising production costs. The expansion and diversification of activity have been hindered by the shortages of foreign exchange, raw materials, power, transport and spare parts.

Effect of Political Developments

Economic incentives apart, the wide fluctuations in shares over the past year have shown that the stock market has been very sensitive to political developments. Hence the near-term trend will depend greatly on the political situation. Although the Kamaraj plan is unlikely to fulfil the objective of streamlining the Congress Party, there is little doubt that the latter will continue to control and regulate the destiny of this country for a long while yet. An important factor from the investor's point of view is whether the Party will accelerate its socialistic measures to the detriment of economic growth. Deliberations at the recent A.I.C.C. meeting in Jaipur have stressed the need for hastening the pace towards a socialistic pattern of society. So the investors will be well advised to wait until the Congress plan takes a clearer shape at its plenary session in Bhubaneswar early next year. As for Indo-Pakistani and Sino-Indian relations, the situation has been far from encouraging. The tension has been growing between India and Pakistan over Kashmir and Assam borders. Since Pakistan has been determined not to settle the outstanding differences with India, troubles from that country might continue to disturb the investment climate. Although there has been a lull on the border between India and China, the attitude of the latter gives no ground for taking a complacent view. Since India will have to make preparations to meet aggression from any country, substantial resources will be diverted to defence.

The most disappointing feature is that the improvement achieved so far has not had its impact on the new issue market which continues to stagnate. Several new shares have quoted below par. Although the prolonged gestation period, combined with mismanagement, has shaken confidence in several companies, investors have generally been shy in diverting funds to new companies due to the poor corporate prospects. Apart from the cumbersome procedures relating to licensing, red tape of Government departments has impeded their growth. In addition to the shortage of transport, power, raw materials and spare parts which they have had to face like other industries, they have had peculiar difficulties of their own. Project costs have more often than not exceeded the original estimates due to the high price of foreign equipment. The cost of plant and machinery has risen due to the increased import duty. Furthermore, the price of domestic equipment has also risen. Meanwhile, investors have been discouraged by the arbitrary way in which the Controller of Capital Issues has sanctioned the issue of rights shares in new companies. Whenever these shares have quoted above par, the Government has generally been inclined to sanction rights shares at a premium. These disincentives have been sufficient to counteract the advantage of tax exemption which they enjoy in initial years.

Heavier Taxation



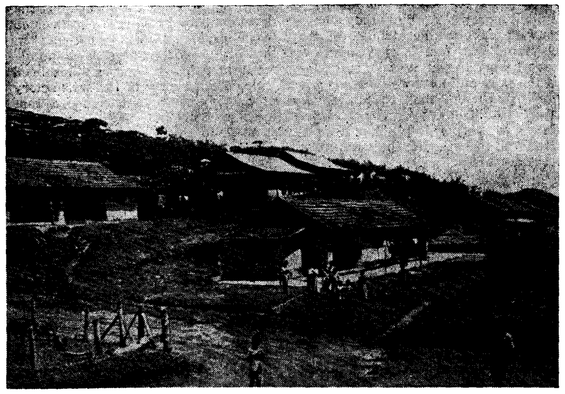
This apart, heavier taxation has greatly destroyed the attraction of industrial investments. As a result of the poor outlook, foreign investors have been shaken. So new enterpreneurs have found it difficult to attract foreign collaboration. True, the Government has moved to improve the investment climate by increasing financial facilities through the Life Insurance Corporation, the Industrial Finance Corporation, the Industrial Credit and Investment Corporation and the State Financial Corporations. The Central Finance Ministry has taken measures to set up a unit trust particularly to attract small savings for industrial investment. These measures have no doubt served their limited purposes, but they have touched merely the fringe of the problem. The fact is that investors have been reluctant to take risks due to the poor outlook for dividends and growth. Under the circumstances, it will be difficult to revive confidence unless the corporate profit outlook is improved by relieving the tax burden on companies.

Although there are several imponderables in the investment situation, it does not imply that there is no scope for discriminating purchases. The investors may pick up those industries which are likely to benefit from future developments. Although defence efforts have not gained the momentum expected earlier, it is likely that several industries will receive increasing orders from the defence departments. If new industries are developed under the stimulus of defence orders, the economy as a whole will be benefited. The most favourable development, by and large, has been that a large part of foreign aid sanctioned has been earmarked for maintenance imports. Industrial growth will be promoted if imports of raw materials, equipment and spare parts are liberalised. Not only will a considerable portion of the idle industrial capacity be used, but the progress of several new industries will also be promoted. Since the Government has been keen on ending the economic stagnation by adopting appropriate measures, the development of industries is expected to be promoted more vigorously in the future. Meanwhile, the improvement in railway transport has been welcomed. In view of the satisfactory production of coal, it is hoped that industry will not suffer from the shortage of the commodity. The steps which have been taken to increase the supply of electric power should also be welcomed. If agricultural production turns out to be better in the current year as expected, there should be an improvement in the overall economic situation. It is encouraging that the demand for products of almost all industries has risen steadily. The growing domestic demand, combined with the virtual ban on imports, has made it easy to sell all industrial products. The latest reports of companies show a rising turnover. The profitability of industries will improve if the tax burden on the corporate sector is lightened.

Steel Share Prospects

Steel shares have been supported on hopes of an increase in the retention price of the commodity. A move has been made by the Government to introduce gradual decontrol of the commodity. Although this is being bullishly interpreted, it will be rash to form a dogmatic opinion until fuller details are available. The benefit to producers will depend on how de-

THE RANGE OF CALCUTTA FAN FOR INDUSTRIAL VENTILATION



Whatever the nature and dimension of the ventilation problem in foundries, forges and workshops, processing of tea and coffee, goods-sheds, cold storages etc... there is a ready answer among our wide range of ventilation equipment...

Labour quarters in a tea estate

control is implemented. Anyway, the prospects for the private steel companies look fairly encouraging since they are likely to be asked to undertake further expansion. The steel companies will have to issue fresh shares in order to raise finance for expansion. Considering that the working capital employed by these industries has been excessive in relation to the share capital, the prospect of bonus shares cannot be ruled out. The attraction of these shares has largely been hampered by the unrealistic way in which the retention price of steel has been fixed. If the Government decides to decontrol the commodity and allow prices to be regulated by economic considerations, the health of the industry should improve a great deal. As for engineering shares, the prospects are certainly good. Most of the engineering units have full order-books. The fact that the delivery date for engineering goods has been lengthening shows that the demand has exceeded the supply. Meanwhile, a large part of the industry's installed capacity has been rendered idle due to the shortage of raw materials and balancing equipment. Since the demand for engineering products will improve steadily and defence orders will rise in the coming months, it is hoped that the authorities will take vigorous steps to reduce the idle capacity. Inventors will do well to take note of the diversification of activity undertaken by the various engineering firms. Meanwhile, it is encouraging that exports of various engineering products are being promoted.

Miscellaneous shares have been in the limelight since it has been rightly believed that these industries should do well due to the growing demand for their products. Since the demand has lagged far behind the supply, these industries will have to be developed more vigorously. Such industries as aluminium, cable, copper and chemical industries should be promoted rapidly if the growing shortage of these commodities is to be removed. Since oxygen is essential for various industries, it should also be expanded quickly. The expansion of the paper industry has become urgent due to the growing shortage of the commodity. Paper shares have started moving up after a long spell of depression on hopes that the Government will increase the price of the commodity to promote expansion, modernisation and diversification.

L.I.C. as General Insurer

The outlook for general insurance companies has been far from certain since the Life Insurance Corporation has decided to enter this field of activity. When life insurance business was nationalised in 1956, the Corporation inherited two subsidiary companies transacting general insurance. Since 1961, all general insurance companies have been forced to reinsure a substantial part of their business with the Indian Guarantee and India Reinsurance Corporation. Since the private companies have been transacting this business satisfactorily, the latest move of the Corporation has given rise to the doubt whether it is not trying to nationalise general insurance in a roundabout way. The apprehension has been the greater because the Corporation might reduce the premium rates to beat the rival private companies. With huge resources and several offices throughout the country, the Corporation should have no difficulty in cutting the premium rates.

As for bank shares, the investors should be discriminating. The sharp fall in advances during the 1963 slack season might reduce the profitability of banks for the current year. Their profits will be further squeezed since they have been asked to increase their liquidity. In any case, the Banking Companies Amendment Bill should be studied carefully. As far as managing agency shares are concerned, their prospects have suffered since they are hamstrung by the Companies Act. Their earnings have been severely regulated, but some of them have tried to compensate themselves by diversifying their activities. Except composite companies producing alcohol, sugar shares have been freely offered without attracting support. Sugar companies situated in northern India have suffered heavily during recent years. Their equipment is obsolete; and the cane supply, too, has been short and poor in quality. In spite of the prospect of a bigger output during the current season, there is little possibility that the profitability of sugar mills will improve. Unless vigorous measures are taken to modernise the equipment and rationalise production, the outlook will not improve.

Selective Support for Jute Shares

Jute shares have met with selective support, although investors have generally been restrained. There has been a steady decline in the price of jute goods while that of fibre has been held at a minimum level. Under the circumstances, jute mills are unlikely to make the same big profit as in 1962. This apart, the sluggish overseas enquiries for jute goods has caused a great deal of concern. In view of the growing competition from the Pakistani mills, combined with the prospect that the Indian industry may work at the maximum level of production in the coming months due to an abundant supply of raw jute, the foreign countries are expected to buy jute goods slowly. Meanwhile, mills which have diversified their activities have generally been favoured. If the industry succeeds in diversifying the production of jute goods and rationalising its processes of manufacture, the outlook should improve.

The apathy of investors towards coal shares is understandable considering that the price of the commodity has been fixed at an uneconomic level. The collieries have been discouraged since the Government has net yet made any move in raising the price to make investment in the industry attractive. The price should be such as to give sufficient funds to producers for plough-back to expand and mechanise production. The outlook has also suffered due to the decline in the demand for the commodity. So pithead stocks at collieries have accumulated causing financial strain on producers. Although the demand for good coal has been satisfactory, the collieries have not been encouraged to increase its production due to the uneconomic price. Since deep mining has to be done to raise good coal, production costs have become high. This apart, the collieries have not been fully compensated for the costs they incurred in stowing.

It has been difficult to ascertain the outlook for cotton mills due to conflicting circumstances. Mills were encouraged on reports that there would be an abundant supply of raw cotton during the current year. The move to allow the mill industry to expand by increasing its spindles and looms has also been a step in the right direction. But the industry has been disturbed since the Government is unlikely to consider increasing the price of cloth for the time being. The competition in export markets has meanwhile been growing. Indian piecegoods are being priced out of overseas markets. So it has become urgent to encourage the industry to modernise equipment and diversify production. The big question mark is whether the industry will obtain the finance required for this purpose.

Outlook for the Shares

Although selected Assam and Dooars tea gardens have met with support, the outlook has been far from certain. Investors have been disturbed by border developments since the north Indian tea estates are situated near the Sino-Indian border. Confidence is unlikely to return unless the relation between India and China becomes more cordial. Occasional raids on the Assam border by Pakistan has also caused a great deal of concern. The economics of the industry has not been good in the meantime. The north Indian crop will fall short of the 1962 production. The 1962 crop itself was smaller than that of the 1961 one. Although the average price of the commodity was initially higher than that for 1962 at the beginning of the current season, the recent trend has shown a softer tendency. The reason is that the decline in the north Indian crop has been more than offset by the increase in production of south India and other producing countries. Hence the world supply should be sufficient to meet consumption.

In any case, there is little doubt that the supply of common teas will be sufficient. India has, in fact, been finding it difficult to sell teas in foreign markets due to rising competition from other producing countries which enjoy the advantage of cheaper production costs. It is true that the outlook for good teas has been considered satisfactory due to the shortage of these grades. Hence it is generally believed that gardens producing quality teas may do as well as they did in 1962. Nevertheless, it is not certain whether the shortfall in output will be compensated for by the higher prices for good teas. Except selected Assam and Dooars gardens, the prospects for Darjeeling and Cachar gardens cannot be considered good. Not only has the output in Darjeeling been smaller, but the average price of the commodity has also declined in comparison with that for 1962 due to deterioration in quality. The Cachar tea estates have suffered partly due to rising production costs and partly because of poor teas produced in that district. In any case, investors should not expect better dividends for the current year than in 1962, considering that taxes have been heavier and production costs higher.

Gilt-edged Recover

Government securities have recovered and prices have been well maintained throughout the year. The index for Government securities at 99.7 is nevertheless lower than 100.1 (1952-53 equals 100), compared with the corresponding period a year ago. The Central Government's borrowing programme for 1963 was completed in two instalments. In the first instalment, two loans—4 percent 1969 and 4½ percent 1986—were offered for conversion, and the total amount of conversion amounted to Rs. 138.79 crores. The second instalment also offered two loans—4 percent 1969 and 4½ percent 1973—for subscription in cash. Holders of State Government loans which matured for repayment were also given the option of converting their securities into these new loans. Although the Central Government budgeted for borrowing Rs. 393 crores for 1963-64, of which Rs. 100 crores was earmarked for State Governments, the Government has so far borrowed Rs. 363 crores. Contributions to National Defence Bonds have amounted to Rs. 6 crores for 1963-64. The remaining shortfall in the borrowing programme should be made good before the close of the current financial year. Whether it will be raised later by borrowing from the open market or by selling securities on tap through the Reserve Bank remains to be seen.

Combined borrowing has been the outstanding feature of the 1963-64 borrowing programme. The Central Government has raised funds on behalf of State Governments which did not resort to borrowing on their own account. The composite borrowing scheme has been welcomed since it has imparted greater steadiness to securities. Unlike in previous years, there has been no pressure to sell new State Government loans this year. When State Governments borrowed directly, a large part of the subscriptions was forced due to their pressure. As a result, subscribers hurried to sell the new loans immediately after subscription. It is true the combined borrowing programme has slackened the efforts of State Governments to make a success of the Central loans. There is no reason why the Central Government should not succeed in persuading State Governments to take greater interest in loans floated by it. Their interest should be the greater since they also share the funds raised by the Central Government.

The Government securities have mainly been supported by banks, insurance companies, including the Life Insurance Corporation, and provident funds. There has been a considerable addition to the banks' investment portfolio. Although banks have invested more in securities due to an improvement in their deposits, they were largely obliged to do so in order to increase their liquidity according to the directive of the Rsserve Bank. As a result, the prices of short and medium-dated securities have appreciably hardened over the past year. The Life Insurance Corporation, other insurance companies and provident funds have taken greater interest in long-dated loans in order to earn bigger returns. The steady trend should continue since these various institutions have been compelled to invest a substantial part of their funds in securities under the law. The apprehension of a decline in the value of securities following the hardening of interest rates has abated since the Reserve Bank has slightly reduced the interest rate on loans to commercial banks for the 1963-64 busy season.

Jute Industry at the Crossroads: Some Ways to Ensure a Better Future

India's jute industry has for the past two years been enjoying fairly stable working conditions, thanks to an adequate supply of fibre and improved foreign demand. But the threat from Pakistan has become serious and she has already cut into this country's sacking markets. The need has arisen for a vigorous programme to produce better quality fibre, and for the diversification of products to cater to new and growing lines of overseas demand.

By
A SPECIAL CORRESPONDENT

VIEWED within the narrow compass of the year now ending, the jute industry's performance has undoubtedly been satisfactory. Full production has been maintained for the second year in succession without, so far, any definite sign that output is running ahead of demand. (There has, admittedly, been some anxiety expressed about the phenomenal expansion in the capacity for jute carpet-backing manufacture, giving rise to a possible unbalance, but this should counsel restraint and thereby help to correct the situation.)

The industry's total stocks of finished goods at the end of October represented only about one month's production, and there are prospects of good business with east European countries, particularly Russia, to offset the extra production expected in the normally high-output period November-January. All being well, the industry should in the current financial year exceed the third plan (final year) production and export targets of 1.3 million tons and 900,000 tons, respectively, which will be a notable achievement. Foreign exchange earnings from the exports of jute manufactures, which in the year 1962-63 amounted to Rs. 156 crores or about 23 percent of India's total export earnings, should be as good again, if not better, when the final reckoning is made for the present financial year. This will enable the jute industry to retain the position it now holds as India's foremost export industry.

The circumstances which have made this possible are, briefly, the uninterrupted flow of raw jute to the mills, which has helped considerably to promote stable conditions; the remarkably steady demand both at home and abroad for the industry's standard products; and, finally, the rapid growth in the production and export of jute carpet-backing, the bulk of which is consumed by the tufted carpet industry in the U.S.A. This comparatively new outlet is already yielding well over Rs. 25 crores worth of foreign exchange annually and now accounts for some 8 percent of the jute industry's total production; in so doing, it is cushioning the effects of the loss of sacking trade to Pakistan.

Competition from the Pakistani jute industry is unquestionably the major problem still facing the Indian mills. This has been recognised for some years, and has been much talked about for as long a period, but action to counter it has still to be initiated. The problem has not lost its urgency merely because the Indian mills have been able to operate at full capacity for the last two years. The Pakistani industry is expanding at an unnatural pace, far in excess of what is justified by the rate of growth in the world demand for jute products. Before very long, this policy is bound to impinge even more forcibly than at present on India's export trade, and diversification of production cannot possibly provide an answer to this in the short term.

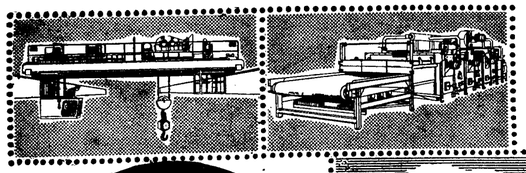
Fall in Sacking Exports

India's exports of sacking have fallen from 438,000 tons in 1955 to 287,600 tons in 1962. In the corresponding period, Pakistan's exports have risen from 36,000 tons (estimated) to 162,000 tons, an increase of nearly 450 percent. The combined exports of sacking from the two countries in the same period have actually decreased by about 5 percent. The current indications are that India's shipments of sacking in 1963 will be down to an annual rate of not much more than 250,000 tons. This is not all. It is expedient to attribute at least the same amount of business acumen to one's competitors as to oneself, and on this principle, it would be wrong to suppose that Pakistan is only concerned with capturing India's sacking markets. There is ample scope for the exploitation of other markets, including not only the hessian trade, but also speciality lines. Pakistan has recently announced plans for setting up 12 broad-loom units for the manufacture of carpet-backing and indeed the first shipments of this fabric from Pakistan to the U.S.A. have already taken place.

It is no doubt arguable that Pakistan's ability to expand her jute manufacturing capacity further is limited by the availability of raw jute, which she both exports and uses in her own manufacturing industry. There is, however, no reason why the acreage yield in Pakistan—already much higher than India's—should not be raised still further by more intensive cultivation; and other potential suppliers of fibre to the world market, such as Burma and Thailand, for example, cannot be overlooked. In the meantime, it is presumably not the Government of India's intention that no attempt should be made at least to contain the growth of the Pakistani industry within more reasonable limits.

Committee on Exports

A committee under the chairmanship of Mr. N. C. Srivastava was set up by the Government in 1962 to explore ways and means for increasing India's exports of jute manufactures. It was generally expected that this Committee would devote a great deal of thought to the aggressive and superior competition offered by Pakistan. This it apparently has done, in the form of a confidential report. The public version of the Committee's report, issued belatedly at the beginning of August this year, all but ignores the Pakistan question. This attitude of secrecy on such a vital issue is understandable; but informed people in this country are entitled to hope that the Srivastava Committee's circumspection is matched by its perspicacity and that an effective policy will emerge from the recommendations it has presumably made.



The Committee's terms of reference were sufficiently wide to permit expression of opinion on practically every aspect of the jute economy. The coverage of the Committee's report is accordingly sweeping, and as the treatment is also concise there is plenty of room for reader comment on many of the generalised statements made. Nevertheless, there are obvious merits in a number of the Committee's recommendations. The longest section in the report is the one dealing with raw jute cultivation. This is correctly emphasised as there can be no two opinions on the clamant need for a substantially improved jute agriculture. By and large, India has now achieved self-sufficiency in jute. It is a great pity that this did not come by way of improved farming methods, instead of by a progressive increase in acreage, but it must be accepted that circumstances did not permit of much choice.

Need to Raise Fibre Quality

Now that the problem of sheer physical shortage of jute appears to have been successfully overcome, there is all the more reason for an intensive and sustained drive to promote the per acre yield and raise the standards of quality all round, so that a better crop can be produced on a smaller acreage. This is manifestly in the best interests of the growers, the millowners and the national economy generally. The growers because they need to move away, however gradually, from subsistence farming; the manufacturers because they cannot afford to pay uneconomic prices for their raw material and because their requirement of superior quality

The world over people of taste prefer
INDIAN COFFEE
for its distinctive aroma

From the world's finest Coffee Plantations in India, where ideal conditions for growing superior Coffee exist, INDIAN COFFEE goes to cheer up millions of Coffee lovers in France, Italy or Germany, in U. K., U. S. A. or U. S. S. R. - in fact all over the World !

The expansion of Indian Coffee industry has been rapid in the last decade as can be seen from these figures:-

PRODUCTION HAS NEARLY TREBLED in the last eight years: from 23,943 tonnes in 1952-'53 to 67,925 tonnes in 1960-'61. The target of production by the end of the Third Five-Year Plan is 80,000 tonnes.

CONSUMPTION IN INDIA HAS INCREASED from 26,000 tonnes in 1955-'56 to over 35,523 tonnes in 1960-'61.

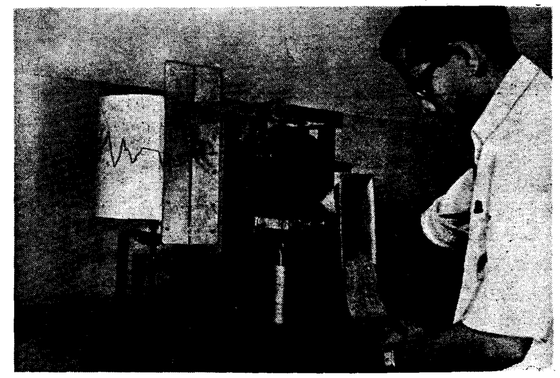
EXPORT HAS GONE UP FIFTEEN TIMES since 1952: from only 2,200 tonnes in 1951-'52 to 32,271 tonnes in 1960-'61.

INDIAN COFFEE— THE CUP THAT XL'S

COFFEE BOARD, BANGALORE.

jute is increasing steadily with the shift towards more refined products; and the Government of India because it not only shares these particular needs in the national interest but also has to look to the counter-claims on land for food production.

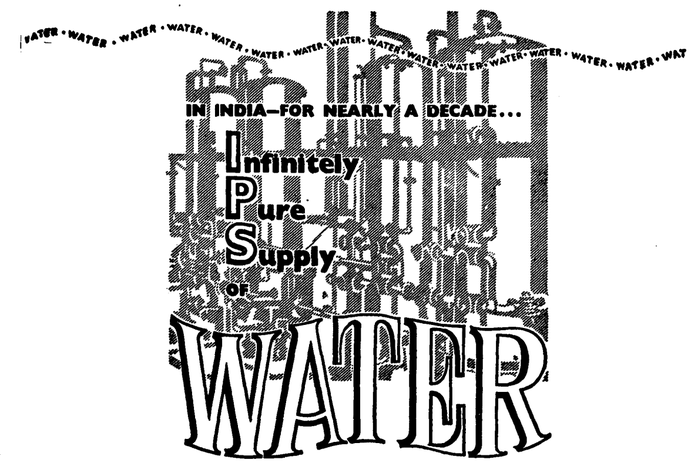
The Srivastava Committee's recommendation for the setting up of a jute development board to pursue these aims should, therefore, find universal support. It is satisfactory to record that the Government of India has recently allocated funds amounting to Rs. 3 crores for jute development work during the remainder of the third plan period.



Some of the other proposals of this Committee deserve favourable consideration, particularly those relating to export incentives and the need for greater attention to market intelligence and product development. Export incentives require consideration in the context of any scheme for meeting Pakistani competition, and it is assumed that this is under study at present. Concerning market intelligence and diversification of production, the Govenment of India has already taken a welcome step in establishing a marketing development fund, with an initial capital of Rs. 3.8 crores, available to all export industries in the country for such purposes. The jute industry will, it is hoped, take full advantage of this financial provision for the development of its market research activities on a wider scale.

The I.J.M.A. has already given notice of its intention to do just this by commissioning, for a start, a two-year market research project in the United States from a firm of industrial consultants in that country. Nearer home, the Association's Research Institute is understood to be putting the finishing touches to a scheme for a broader-based programme of work which will require additions to the existing premises of the Institute and the installation of new plant and equipment. Product development at the plant level is also being undertaken, and on a larger scale than is perhaps realised, as progressive companies are not prone to divulge their research operations.

The theories propounded by the Srivastava Committee on certain matters have given rise to a considerable amount of controversy. One of its recommendations, for example, was that the working time agreement of the Indian Jute Mills Association should be abolished because it is "basically restrictionist" in outlook—a view with which the Association strongly disagrees. The Committee's alternative scheme of a jute goods buffer stock to promote stability of export prices has also been attacked from more than one quarter as being misconceived and potentially harmful. It is not proposed here to engage in a detailed examination of the merits and demerits of these arguments. Enough has already been said on both sides, and it is now for the Government and the Indian Jute Mills Association together, with all their accumulated wisdom, to decide on the steps most likely to further the jute industry's interests and particularly its export trade.



Adequate Raw Jute Supplies

The balanced jute supply situation during the past two seasons has been a very influential factor in creating the stable conditions which have been seen. This is partly the result of planning and partly luck—the latter because nature has been generally kind to the crops. The efficacy of the jute policy which has been pursued should not, however, be underestimated and credit is due to both the Government and the manufacturing industry. Planned purchasing, with special emphasis on lifting supplies at the height of the season (October-February) to match upcountry arrivals, has on the whole ensured orderly marketing and prevented any serious slump in prices. The Jute Buffer Stock Association has played its part, too, in the jute prices support scheme, and will very shortly be adding another 150,000 bales to its existing stock of 625,000 bales. At the annual general meeting of that Association held in September, the acting president, Mr. R. H. Morrison, confirmed that it was the intention to build up additional stocks to give extra security for the future.

Irregularity of jute sliver being tested

While these various measures, with some marginal assistance from the operations of the State Trading Corporation, have succeeded in holding jute prices at or near about the "operational minimum prices" fixed by the Central Government, it is pertinent to consider what the ultimate objective of this price policy is. If the aim is merely to maintain the *status quo* concerning jute supplies, overlooking the fact that jute is being grown in a number of marginal areas where the land and the agronomy are not really suitable for it, then it is time for some serious rethinking on the subject. It is not that the mills just need jute: they

WITH EQUIPMENT MANUFACTURED BY BIRDS

BIRDS have nearly a decade's experience in building Package Water Treatment Equipment in India. BIRDS' Ion Exchange Plants offer thoroughly dependable service...daily produce 1·5 million gallons of infinitely pure water approaching the triple distilled range.

THE COMPLETE RANGE OF BIRDS' WATER TREATMENT EQUIPMENT INCLUDES :

- BASE EXCHANGE SOFTENERS
- DE-AERATORS
- DEALKALISERS
- DEMINERALISATION AND FILTRATION PLANTS
- CHEMICAL DOSING EQUIPMENT
- IRON REMOVAL FILTERS
- LIME SODA PLANTS

need jute of particular qualities, in particular proportions, and they are also sorely in need of a much higher average quality fibre.

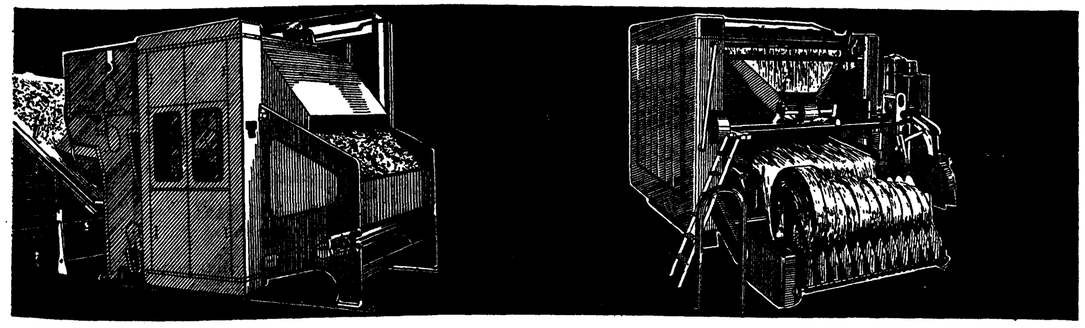
At present, the mills in Pakistan not only have a cost advantage of about Rs. 170 a ton on their raw material supplies, but they also get better value for their money. Any credit earned by the Central Government for its jute policy must, therefore, be subject to reservations. Something should be done, price-wise, to discourage excessive production of poor quality jute (although not to the extent that the total supply of fibre available is endangered); and this must be accompanied by an all-out drive to increase yields in the most suitable areas.

Changing Foreign Offtake Pattern

On the export front, the changing pattern of the offtake has already been briefly referred to. The decline in sacking exports resulting from Pakistan's inroads has been counterbalanced by increased shipments of hessian and of "other" goods, particularly jute carpet-backing and (to a lesser extent) cotton bagging. The stabilisation of prices at reasonable levels has given overseas buyers greater confidence, and this has been reflected for example in the increased burlap consumption in the U.S.A., averaging about 76 million yards a month in the current year, compared with 73 million yards in 1962. Canada's purchases of hessian have also been rising, but those of Argentina have fluctuated widely in recent years because of unsettled political and economic conditions.

The U.K's offtake of Indian hessians has tended to decline, but it should be noted that Pakistan has become quite an important supplier of this market. The import policy of the U.K. Jute Control is, however, being gradually relaxed—recently, the mark-up on common hessians was reduced further from 20 percent to 10 percent, while heavy bags and common sackings have now been returned to private trade—and a jute working group has since been set up by the U.K. Board of Trade to examine the protective machinery that remains. Whatever the outcome, there should be better opportunities for Indian jute manufactures in this market.

Negotiations have also been proceeding with the European Economic Commission for liberalisation of India's trade with the E.C.M. countries, although it is still too early to say how the jute goods trade will fare. India has strong support from the Continental importing and merchanting interests, and Governmental sympathy in the case of Belgium and West Germany at least. On the other hand, there is stern resistance from France at both Government and industry levels, and also from the jute manufacturing industry in West Germany. A study team from India, led by the Jute Commissioner, has recently left for an extensive tour of western Europe, including the United Kingdom, to investigate the market potential with special reference to new outlets for Indian jute products. The ultimate success of this mission will largely depend on how far the European Economic Community can be persuaded to agree to larger imports of manufactured jute goods from Asia.



Jute fibre being stripped and washed

A striking feature of India's export trade in jute goods in the last year or two has been the emergence of eastern Europe, and especially Russia, as an increasingly important consumer area. So far, this has been mainly to the advantage of India's hessian trade, but there appear to be good prospects of establishing a big market for sacking goods for the bagging of agricultural produce, fertilisers, etcetera. This was the conclusion reached by the Indian jute delegation which toured eastern Europe this year under the leadership of Mr. M. P. Birla. Two preconditions, however, are consumer education in the uses to which India's various sacking products can be put, and, secondly, a balanced trade between these countries and India. The second of these conditions does not

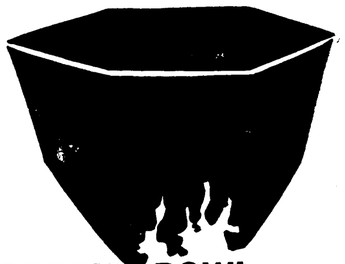
a giant in India's economy

In the many-sided development of India's economy, jute plays a vital part.



One of the oldest and most progressive of India's industries, it provides employment to millions of farmers, traders and mill workers.
In the financial year 1962-63 the jute industry was India's leading foreign exchange earner, exporting 877,500 tons of goods worth 156 crores of rupees or 22.7 per cent of the country's total foreign exchange earnings.
In the current year the jute industry is expected to improve on this performance and should exceed the Third Five Year Plan export target of 900,000 tons of jute manufactures.

Jute serves the nation in many ways, strengthens its economy.

"A WOODEN BOWL CANNOT BE USED TWICE ON A COOKING STOVE"

The first order is only half as important as the second order.

Therefore exporters must maintain a very high standard of business in order to make long term profits and uphold the country's prestige—particularly as new competitors with highly industrialised countries.

The export market can be a source of continuous earning power—if quality goods, prompt service, competitive prices and service facilities are provided.

Export is a Sacred Trust

fall within the purview of the jute industry, but should receive the close attention of the Government of India in the negotiation or renewal of trade agreements.

Internal Consumption

Internal consumption of jute goods continues to rise, without which the jute industry's sacking production would be but a shadow of its former self. Well over half of the mills' present output of sacking now finds its way to the domestic market where it is used for bagging foodgrains, cement, fertilisers, sugar and other commodities. This trend will almost certainly be maintained, and for obvious reasons will be welcome; but it can never be a substitute for the export trade, which is the industry's *raison d'être*, and on which India has traditionally relied for a substantial contribution to her foreign exchange earnings. The excise duty which was imposed last year on jute goods sold for internal consumption was intended as a measure to stimulate exports. This it has not done, and it is for serious consideration whether this imposition should not be replaced by a levy whose proceeds could be used to build up an export incentive fund instead of merely supplementing public revenues.

An important step towards export promotion has now been taken by the Indian Jute Mills Association with the introduction of a voluntary scheme of quality control and pre-shipment inspection. The immediate inspiration of this scheme was the publication by the Government of India of the Export (Quality Control and Inspection) Bill, which has since passed into law and is designed to encourage activity in a field which has, to India's cost, been largely neglected so far. The jute industry is to be commended on the promptness with which it has responded to this call. The I.J.M.A.'s scheme has, as its first aim, the introduction of a system of inspection against prescribed standards or specifications; a longer term objective is the development of scientific methods of quality control in each mill backed by a quality control service to be rendered by the Central Bureau (which will be located at the I.J.M.A.'s Research Institute).

The Central Wage Board for the Jute Industry, after three years' deliberations, submitted its unanimous report to the Government of India at the beginning of September this year. The Board's recommendations were accepted *in toto* by the Government in terms of a resolution published on 27th September. Among the more important of the Board's recommendations, which are now being implemented by the industry and which are intended to remain effective up to the end of 1967, are the following:

(i) integration of existing wage groups so as to reduce their number;

(ii) a wage increment of Rs. 8.33 (inclusive of the interim relief previously granted) for all workers;

(iii) a variable dearness allowance, to be adjusted twice yearly on the basis of 20nP a point rise or fall in the average cost of living index for Calcutta. At the cost of living index 425 (base year 1939=100) the total minimum wages in West Bengal mills should work out to Rs. 81;

(iv) a minimum fall-back wage for piece-rated workers in all genuine cases of shortage of production for reasons over which the worker has no control;

(v) an annual bonus of two weeks' wages to the weekly paid workers and half a month's wages to the monthly paid workers subject to qualifying conditions (this is the first occasion of an industry-wide bonus in the jute industry's history); and

(vi) the age of retirement of men workers should be 58 years and of female workers 55 years. It will, however, be open to the employers in their discretion to retain workers in service beyond this age.

It is estimated that these changes will add at least another Rs. 3½ crores to the industry's annual wage bill.

The heading of this article puts the jute industry at the cross-roads. This indicates that a decision has now to be made as to the direction the industry should take in the future. If production is to be maintained and expanded to fulfil the targets set out in the fourth plan, some bold thinking, as well as the translation of this thought into action, will be necessary. The basic requirements appear to be a policy to curb the proliferation of the Pakistani jute mills industry; an intensive development programme for jute agriculture; and greatly increased activity in market research and product diversification.

Heavy Taxes Hamper Tea Expansion and Exports

By

A SPECIAL CORRESPONDENT

WITH the gradual decline in India's foreign exchange reserves and with the fear of aggression on her northern frontiers, popular and official interest has begun to look beyond the more spectacular expansion of heavy industry and turn for help in times of difficulty also to such older and more established industries as tea. The industry has long been regarded by the Government simply as a milch cow for tax revenue. A sum of Rs. 16 crores—more than its total gross profits—is taken from it annually in the shape of Central excise, and a further Rs. 4 crores by State Governments in similar taxes. On top of that is, of course, the 50 percent to 68 percent of profits, depending on the nature of the company, taken in the form of income tax by the Centre and agricultural income tax by the States.

More recently emphasis has been placed on tea as an earner of foreign exchange, and ways are being examined to increase that capacity. India is still the greatest producer and exporter of tea in the world. Together with Ceylon, she accounts for 75 percent of the world's trade in the commodity. Her area under tea is not only wider and her total production greater than that of Ceylon—as is natural in view of her comparative size—but, contrary to popular belief, her yield an acre is also larger and her average prices a lb fetched in the world's markets are greater. It is a mistake to imagine, therefore, that Indian tea is getting in any way a back number in the export trade, or that her place is elsewhere than at the top. Tea and jute goods stand about equal as India's largest earners of foreign exchange. Other industries are not only a long way behind, but require proportionately a much greater import of foreign goods and machinery to keep them alive than does tea.

Perpetual Struggle

Nevertheless, it is a perpetual struggle for India to keep her share of the world market. Although in the last 12 years or so, production has increased by 25 percent, exports have fluctuated but on a rolling average increased little, and India's share of world trade has declined by about 5 percent. In the third plan, tea has been set a production target of 410 million kilograms a year by 1965 and an export target of 280 million kilograms. The figures at the bottom of columns 1 and 2 indicate the progress so far.

It is too soon to pronounce whether either production or export targets will be reached by 1965-66, but progress is admittedly slow. The main reason has been that although 1961 was a good crop year in Assam and West Bengal, there was lack of rain early in the season both in 1962 and 1963, and the "flush" of crop was delayed. There was also delay in 1963 in applying fertilisers, as military requirements in the cold weather of 1962 caused a severe transport shortage, and fertilisers had to yield priority to food and coal as well as military supplies. Unless fertiliser is applied early in the season, it cannot be usefully applied at all.

Long-term Problems

These, however, are short-term obstacles, and the industry is concerned more with long-term problems standing in the way of increased output. There are limits to the increase in crop which can be achieved by the application of fertiliser to the same bushes; and the increase has to a large extent already been achieved in the past. Moreover, the problem is one of quality even more than of quantity. The earning of foreign exchange depends not only on the volume of exports but also on price, since it is the total return that one seeks to increase. The quality teas are now maintaining their position in the export market, but the plainer types find it difficult to obtain an outlet abroad due to the cheaper cost of production and transport in Ceylon and east Africa. It should, therefore, be the primary aim of the industry and the Government to produce more and more quality teas, which still enjoy a premium in the world market, and which buyers look to India to produce.

To achieve this object, it is essential to encourage the producer to expand and to replant, and to replant not on recently uprooted ground but on virgin soil, and with the best modern methods from tried and tested stock of high quality, and at the same time to maintain and rehabilitate his factory with the best machinery and equipment. What has been delaying this objective for many years past has been the high cost of laying out new plantation and the absence of relief from the heavy weight of taxation. A tea company is neither allowed depreciation on its bushes nor permitted to treat the replacement of them on virgin soil as a revenue expenditure. The simplest and best encouragement to replace worn-out tea would be to treat such expenditure as a revenue charge for tax purposes. The next best would be to allow depreciation on all young tea, spread over, say, five or six years so that it would be allowed 100 percent by the time the tea matures to its full yield. At least, a 40 percent development rebate might be granted, a percentage warranted by the fact that tea is an agricultural industry from which the return does not accrue until several years after planting.

Unless the Government provides some such encouragement, it is unlikely that expansion will take place on the scale required, as only the most prosperous companies can afford it. The industry has been told to take loans from the Government through the Tea Board. But the terms of such loans have never been as satisfactory as reputable companies can secure from their own banks, and they are hedged in with stringent provisions for security. It may be said that banks should provide the finances, but there are limits beyond which a prudently managed company should not go when involving itself in debt. Expansion in former days—and it is still the case today—was financed almost entirely by the ploughing back of profits earned by the tea company itself. This brings one back to the point at which the article started, that the industry is so heavily taxed that the accumulations which in the past produced the funds for expansion are no longer created.

Excise Duty Raised

The export duty has now been happily abolished, and the result as far as can be judged under the auction system has been an appreciable gain in exports and export earnings. But the revenue loss was forthwith made up by the Government by a 20 percent increase in the excise duty leviable at the estate, and no rebate in excise duty is now allowed on tea exported, although every other export industry is allowed such a concession.

Although the tea industry benefits much from the auction system and the prices that may be gained by it for high quality teas, it is an unfortunate consequence that it precludes the burden of excise being passed on to the buyer. This is because if the latter is prudent, he will adjust his bids according to his own requirements and the competition with which he meets, and has no reason to worry whether or not the payment he makes goes in part to the Government. The industry in north-east India, whose teas take two to three months at the height of the season to be transported by road, rail and river down from north Bengal and Assam to Calcutta where it is sold, has for long requested the Government to relieve it at least of the burden of financing the excise until the teas are sold, by allowing payment in arrears during the early part of the season, the period of grace being gradually shortened until at the end of the season teas, as at present, could not leave the factory till the duty was paid. Although it would be perfectly easy to make such a system evasion-proof at no cost to the Government, this sensible suggestion has been brushed aside as "unprecedented", and instead proposals have been made for a bonded warehouse system in Calcutta with a second set of excise staff and many additional complications. If such a system were combined with relief from excise duty when teas were removed from the warehouse for export, the industry might welcome it. Otherwise, it is doubtful whether any financial relief would accrue. These, however, are mere palliatives, and what the industry needs is a mitigation in the gross weight of excise, particularly in those areas which produce good export teas.

A further burden is the entry of State Governments into what was intended to be the Central field of excise on tea. This may take the form of a carriage tax, as in Assam, or an octroi, as in Calcutta; but as long as it is paid by the producer, it is in incidence and effect an excise, and a discriminatory tax in so far as it is only applied to certain articles. The story of the tax in Assam makes interesting reading from the legal point of view. It was imposed in 1954, upheld as valid by the Assam High Court, declared *ultra vires* by the Supreme Court since it was an interference with inter-State commerce without the President's consent and was re-enacted with retrospective effect but with limited validity up to 31st March, 1962, with the consent of the President. The Assam Government, meanwhile, enacted an orthodox carriage of goods Act of wider application and levied a tax on the carrier. The temporary Act was again declared ultra vires, this time by the Assam High Court on various grounds, and it is now pending appeal in the Supreme Court. The result at present is that the Assam Government owes the industry several crores of rupees in illegally collected taxes, which it is unable to repay.

One wonders whether it would not be to the advantage of all parties if the industry's members waived their claims to refund while the Assam Government dropped the appeal (with its threat, if successful, of claims for an interim period), and contented itself with the revenue from the current and accepted Act. The West Bengal octroi has had a similar clouded history, but has been protected by a subsequent Act with the President's consent permitting its indefinite continuance. It

Chairman.

DA 63/352

will surely be preferable if the Central Government assesses the producer's capacity to pay such taxes on the amount of production, and the State Governments drop their taxes on condition that the Centre makes a special grant to those States in which the tea is grown. It is hard to believe that the Central Government's tax gatherers relish such encroachments in their field, nor does the industry appreciate a competition between Governments to see who can tax them most.

Agricultural Income Tax

The same applies to agricultural income tax. By convention now enshrined in legislation, 40 percent of tea profits are subject to Central income tax and 60 percent to State agricultural income tax if the Centre and the States choose to levy it. State rates are now in some cases higher than Central rates. A convention should be established that the Centre should fix the rate and the State concerned should get a 60-percent share.

Furthermore, the industry—particularly in north-east India—should get a fairer treatment over its food, fuel, and fertiliser supplies. The southern States have always recognised their responsibilities in this matter, and so generally does West Bengal. But the industry in Assam is forbidden to buy food for its labour because it might upset local markets. The Government doles out allocations, which often only exist on paper, inadequate for a firm supply. The result is that the tea companies often have to live on a hand-to-mouth basis, with all the wastage of transport and threat of labour trouble that it may bring in its train. As a deliberate addition to their troubles, the Assam Government has instructed the industry to give up its long-standing practice of "*khet* assessment", under which labourers who till paddy land on nominal licence fees from the garden are "laid off the godown" while they have rice of their own, and force the management to issue rations at concession rates to those workers who themselves have ample supplies and can resell their produce outside the garden at a profit. They are even forbidden to sell their own produce to the management. The cost of this policy last season was in the nature of 10,000 tonnes of rice to the industry.

The industry sells foodgrains at fixed concession prices to labour: there is no question of black-marketing. In these days of control, it is, in fact, doing the Government's job in bringing supplies of food to its workers. Under the circumstances, it is surely the Government's duty to see that the foodstuffs are supplied in good time and at controlled prices.

The same applies to fertilisers and coal. When plans are made in good time and transport arranged by the most economical route to the gardens, all is well. Where there is procrastination and delay, uneconomic arrangements have to be made at the last moment, so all suffer in consequence. These articles are all subject to Government monopolistic control as far as the tea industry is concerned.

Propaganda and Research

For the improvement of India's tea market abroad, there is an ever-growing need for propaganda and research,

Tea pickers on an estate near Coonor

and these are primarily the responsibility of the Tea Board. A great opportunity now exists with the abolition of all import duties by the European Common Market countries with effect from 1st January, 1964. All credit is due to the Ministers and officials, both Indian and British, who achieved this success. The Tea Board has set up a centre of propaganda in Brussels, under the ægis of India's Ambassador to Belgium and Commissioner for Trade in Europe. This large market for tea will not be brought within the reach of the ordinary citizen of Europe unless the E.C.M. countries can also be persuaded to abolish their high internal excise duties. It is to this objective that India's diplomats should direct their energies.

As for labour, it is not the purpose of this article to discuss wages or even amenities when a wage board is investigating the issue, but it may be said that a little calm reflection should persuade any labour leader to conclude that in all the matters mentioned above, the general interests of labour are at one with employers, and that the level of their wages, and particularly their "real" wages, bears a none-too-distant though inverse relation to the weight of taxation and other burdens with which the industry is saddled. Looked at from another point of view, the Government is the biggest shareholder (let us not say "exploiter") of the industry, so it should make it prosperous.

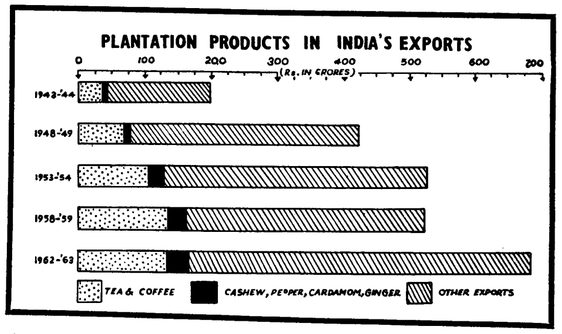
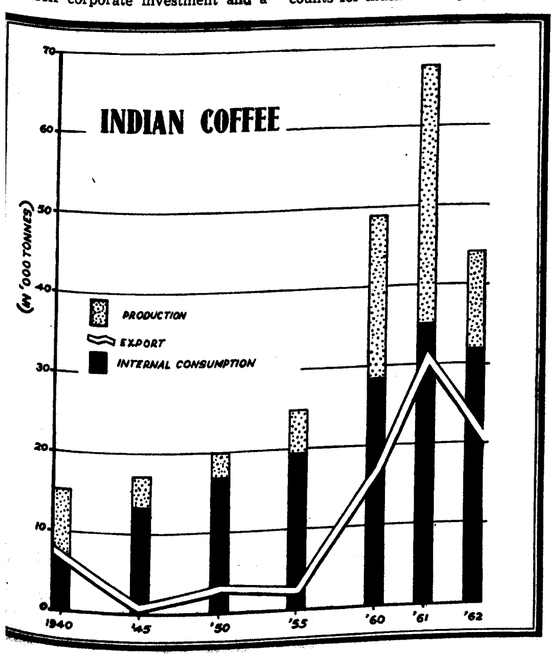
More Foreign Exchange Being Earned from Plantation Exports



The plantation industries are major earners of foreign exchange. But high production targets and exhortations to raise exports have little meaning if the Government is not realistic in its approach to the industries' problems.



By

K. K. KURIAN

THE plantation crops, which have contributed Rs. 2,095 crores to India's foreign exchange earnings since independence, will continue to figure prominently in her export trade for at least some time to come. This accounts for the importance attached by the Central Minister for International Trade, Mr. Manubhai Shah, to raising the production and exports of these crops. India has several plantation crops, the most important among them being tea, coffee and rubber. They are all "introduced crops" on Indian soil. Tea came to India from China, although the indigenous growth of tea plants was subsequently discovered in upper Assam in the first quarter of the last century. Coffee was introduced into India from Arabia some 300 years ago. Rubber is of recent origin having been commercially grown in India from 1902.

The tea industry which attracted to itself corporate investment and a devoted and enthusiastic band of pioneering British planters could achieve the most remarkable progress among the plantation crops in this country. By 1923, over 711,000 acres were brought under tea plantation and production reached 375 million lbs. Unlike tea, coffee and rubber cultivations were confined to the hill tracts of south India. Coffee planting spread to an area of about 300,000 acres by 1896. Thereafter, it fell to 116,411 acres by 1920 at its lowest, and it has reached again the 1896 level today. Coffee growing was largely an individual enterprise in which the planting proprietor was the key figure with corporate ownership being rather an exception. Rubber began as a large grower's crop, and the initial interest in rubber growing was confined to corporate enterprise. But soon it became a backyard crop wherever rubber would grow. Today, 60 percent of the 361,000 acres of rubber cultivation in India is on small holdings. In both coffee and rubber that section which sets up standards in cultivation and management sticks together for organised action and shares ideas on the common problems of cultivation and marketing. It is this section that accounts for much of the progress that both these industries could make over the years.

Small Acreage

The area under plantation crops in India is very small. It comes to only 0.3 percent of the total land under the plough in this country. However, their contribution to the national wealth—particularly to the country's export trade—is significant. Tea, coffee, cardamom, pepper, and cashewnuts figure prominently in India's export trade. They earn for the country substantial foreign exchange. Plantation crops accounted for Rs. 16.4 crores, out of the Rs. 241.3 crores India earned from her foreign trade in 1912-13. Their share rose sharply to Rs. 166.6 crores by 1962-63, representing 24.3 percent of the total export trade. Tea alone earned Rs. 120 crores in foreign exchange last year.

The importance of the industry's contribution to export trade is likely to increase in the context of the country's need to earn more foreign exchange to finance its development plans. But an elementary fact is overlooked when exhortations are made to increase exports. Before any significant increase in production is achieved, forced increase in exports is an exercise in arbitrary physical controls. Export promotion as an effective and continuous process must be backed by increased production. The volume of such increase must be sufficient to cover the expanding demand at home and that of the created market abroad.

It must be said in this context that the achievements of the past were within a framework which was at least neutral, if not favourable, to the increase in the size of the units and enterprise which ensured returns proportionate to the planters' efforts, skill and initiative. For an established industry, essentially conservative in make-up and only capable of slow change because the pace is set by the plants, there are a number of problems. Increased production targets every five years and passionate appeals for export promotion lose all meaning unless the Government's approach to the industry is realistic. This is a point where there has been much confusion of thought in the framing of official policies.

Third Plan Targets

The industry is sometimes blamed for its anticipated failure to fulfil the third plan targets laid down for different crops. The authors of the plan fixed a production target of 408 million kilograms for the tea industry. The targets for coffee and rubber were 80,000 tonnes and 45,720 tonnes, respectively. The performance of these industries during the first three years of the plan gives room for serious doubts whether they will be able to fulfil these targets by 1965. India could produce only 344 million kilograms of tea, 55,175 tonnes of coffee and 31,350 tonnes of natural rubber in 1962. During the year, the tea output showed a decline of 10 million kilograms, compared with the previous year. The present estimates for 1963 are; tea 340 million kilograms, coffee 60,000 tonnes and rubber 40,000 tonnes. It is to be seen whether the remaining wide gap between the actuals and targets will be covered in the next two years. There is not much justification for blaming the growers for the shortfalls in the targets because the fixing of the production targets was unrealistic. Even if new planting or replanting were attempted from the commencement of the third plan, no crop could be obtained till some years after the plan period. Any planning for increasing a plantation crop must necessarily be a long-term affair, taking ten or 15 years as the period of planned development. Tea takes six to eight years to reach the stage of yielding a crop and a

few more years to reach full maturity. Coffee takes at least five years and rubber seven years to give the first crop.

Export promotion is now viewed as a crash programme. It is now even suggested that the home market should be starved for raising exports. An increase in the volume of exports without a corresponding rise in demand will force prices down and thus defeat the purpose of gaining more foreign exchange through exports. A denial of sufficient supply to the internal market is likely to force prices up, and that will amount to penalising the consumer here. This will ultimately retard the growth of the internal market, which will be bad for the future stability of the industry.

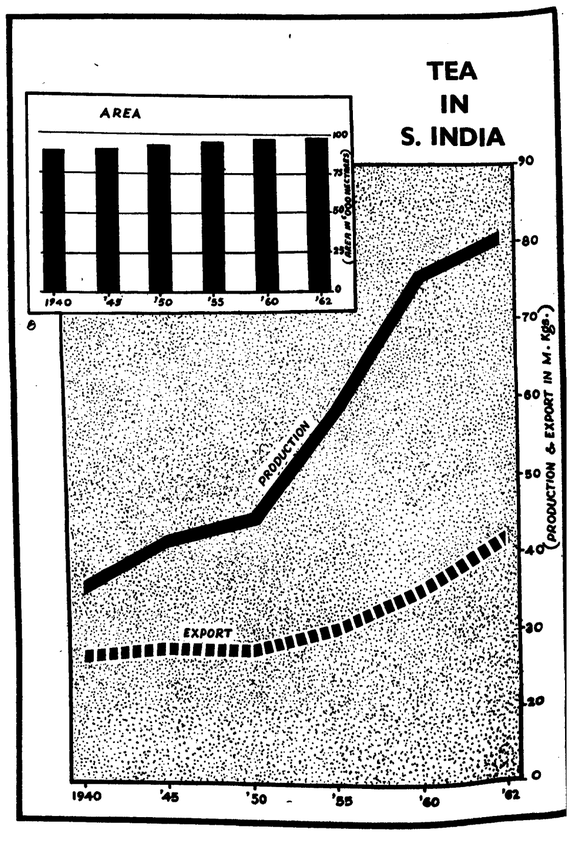
Another thing which one has to remember in this context is that export promotion is a meaningless exercise unless the increase is gainful to the exporter. It is, therefore, essential that increased exports must follow the creation of additional demand. But if additional demand is created without the supply to meet it, the beneficiaries will be India's rivals. It is obvious, therefore, that export promotion should be thought out and operated as a package programme involving production, internal consumption and export.

Better field management, improved manuring, pest control, increase in plant population and, to a relatively small extent, the introduction of high-yielding planting material have greatly helped to achieve the high yields from the existing acreage. While these may continue to improve, any sizable rise in production must come from the replacement of worn-out and low-yielding stands of plants whether in tea, coffee or rubber. As a result of land reform and forest preservation legislation, there is only very limited scope for further expansion of the planted acreage. The most suitable alternative is, therefore, the rehabilitation of the existing acreage. According to one estimate, 95,000 acres of tea, 120,000 acres of coffee and over 200,000 acres of rubber stands in south India are due for replanting. It is said that a meaningful programme for putting the plantation industry on a sound footing and for enabling it to fulfil the rôle assigned to it for the next quarter of a century would involve renovation and rehabilitation of 80 percent of tea and 60 percent of the coffee and rubber acreage in south India. In addition to this, the handling, processing and manufacturing facilities available on estates have to be modernised and expanded to cope with the increased output of crops expected during this period. All these require heavy investment and also a sufficient allocation of foreign exchange for necessary imports. The spokesmen of the industry say that the plantation industry is left with very little after taxation and it is also forced by law to hasten the implementation of labour welfare measures with no consideration for the availability of resources.

Labour Legislation

The plantation industry in India employs about 1.4 million workers. They are protected under 11 statutes. The Plantation Labour Act, 1951, is the most comprehensive labour welfare legislation for any section of workers in south-east Asia. Housing and medical welfare—the two major responsibilities imposed on plantation employers by this Act—call for a substantial diversion of available resources. The housing programme which began in 1954 lays down a construction rate of 8 percent each year and, when completed, will absorb an estimated Rs. 92 crores. Together with the estimated outlay on hospitals and schools and equipment, the total sum required for welfare measures stipulated under these statutes will almost be equal to the amount required for the total replanting programme of tea, coffee and rubber and the renovation and modernisation of processing facilities. It is, therefore, obviously a question of priorities and to determine such priorities, there must be some co-ordination between the different Ministries of the Central Government and the State Governments concerned. It is also important that the Government should consult planters before taking decisions on all these questions affecting the future of the industry. If the latter is to play the rôle assigned to it, many aspects of official policy relating to it must be changed; and the sooner it is done, the better.

With these general observations, an attempt is being made here to make a brief review of the performance of the three major plantation crops of south India—tea, coffee and rubber—during 1963. South India produced 81.2 million kilograms of tea in 1962 and exported 42.4 million kilograms. The export constituted only 51 percent of the crop, against north India's 66 percent. Both production and exports show a marginal increase this year. The latest available production figures cover only the first nine months of 1963, and they put the south Indian crop at 62.6 million kilograms, against 61.8 million kilograms of the previous corresponding period. Export figures cover the period from 1st April to 15th August and they show an increase of 260,000 kilograms over the previous corresponding period's exports. The Cochin sale average for leaf grade tea from January to the middle of October was Rs. 4.66 a kilogram, against Rs. 4.50 for the same period in 1962. The dust grade got a more attractive price, the sale average having reached Rs. 4.20 a kilogram, compared with Rs. 3.65 a kilogram during the same period last year. This can be taken as an indication of the growing demand for south Indian tea in the internal market. This need not be grudged in view of the loss being suffered in the world market. South Indian tea is losing its traditional grip on the London market due to growing competition from Ceylon and east Africa. The latter are in a position to offer teas with the same characteristics at competitive rates. The fall in quality that is happening as a natural corollary of the larger crop being harvested in south India is said to be the primary reason for this new disturbing experience in the foreign market. Meanwhile, there is a feeling in planting circles that it is not worth while to send more tea from south India to the London market.



Coffee Output Up

Coffee production during 1962-63 amounted to 53,000 tonnes, against 46,000 tonnes during 1961-62. The new crop which will start coming in to the Coffee Board's pool, when this review appears in print, is presently estimated at 60,000 tonnes. The internal consumption might amount to 32,000 tonnes—slightly less than the quantity absorbed last year. This is the result of a new shift in the Coffee Board's policy in favour of exports. India became a member of the new long-term International Coffee Agreement and got under it an export quota of 21,600 tonnes. She could fill this quota during the year under review. There is a feeling in official circles that the quota this country got is on the low side and that it should get a more liberal export quota. India has already moved the International Coffee Council for an export quota of 50,000 tonnes a year. This might be considered with some latitude in view of the anticipated fall in world production. Brazil, Costa Rica, Cuba and some other major producers of the South and Central Americas were hit by natural calamities like drought, frost, fire and hurricane. So their contribution to the world supply this season might be smaller. On the other hand, the worldwide campaign for higher coffee consumption has started showing results.

The export marketing procedure adopted by the Coffee Board has been under fire with producers generally supporting an open auction system. After experimenting with the open auction system for some time last year, the Board had reverted to the closed bid system. Under the present world market conditions, the conversion of the sealed tender system into open auctions may not be of much significance. The producers' contention is, however, that open auction is more suited to the nature of the commodity.

Raising Rubber Production

The weather was unusually favourable for rubber this year. Past efforts for raising production have also started showing results. The production figures available so far point to a 20-percent increase in this year's crop. The present estimate is that the 1963 crop will be something between 38,000 tonnes to 40,000 tonnes. Last year's output was 31,357 tonnes. In view of the possible increase in local production, the Rubber Board has recommended the import of only 20,000 tonnes of natural rubber this year, against 24,000 tonnes in 1962. Consumption this year is estimated at 80,000 tonnes, including synthetic rubber. The Bareilly synthetic plant has started production and, according to present indications, it will reach its full capacity of 30.000 tonnes in less than a year from now. There have been many assurances this year that the plant is not going to be a serious rival to the natural rubber growing industry in south India. At present, it looks so because synthetic rubber is costlier even after the recent reduction in its price.

Mill Cloth Production Stagnates: Increasing Competition from Powerlooms

Mr. Podar, Chairman of the Indian Cotton Mills Federation, discusses the need for curbing the unrestrained growth of the powerloom sector. He pleads for the expansion of the existing units and for the modernisation of their productive equipment in order that the industry may acquire greater competitive strength to fulfil the export target laid down for cotton textiles under the current plan. He gives a brief account of the contribution made by the Indian delegation, of which he was the leader, to the proceedings of the International Federation of the Cotton and Allied Textile Industries at its annual session held in Athens last September.

By
RAMNATH A. PODAR

FRANKLY, the cotton mill industry of India is not moving forward. Despite the fact that the third five year plan is half way through, there has been no increase in the *per capita* consumption of cloth. On the contrary, it is barely 16 yards today, compared with 17.94 yards in 1938-39. Not only should the industry be assisted to produce more, but it also needs to be helped to reduce costs, so that its goods can be offered at more attractive prices to domestic as well as foreign buyers.

A major problem of the industry for many years has been its inability to secure adequate and assured supplies of cotton at reasonable prices. It was not possible under the second plan to reach even the drastically reduced domestic production target of 5.4 million bales. While mill consumption has increased steadily, the rise in the home production of raw cotton has not been commensurate, as the following figures show:

Year	(In '00,000 bales of 392 lbs each) Production	Consumption Indian	Foreign	Total
1956-57	47.4	46.6	5.7	52.3
1957-58	47.4	44.3	5.7	50.0
1958-59	47.1	46.2	4.5	50.7
1959-60	38.3	44.2	6.8	51.0
1960-61	53.8	42.0	11.1	53.1
1961-62	45.0	47.1	9.8	56.9
1962-63	56.0 (Estimated)	48.0	9.0	57.0 (Estimated)

The continued shortage in the supply of home-grown cotton has forced the mills to depend on imported varieties, the average annual receipts over a period of years being 700,000 to 800,000 bales. Notwithstanding the somewhat depressing picture presented by the agricultural sector, the planners have confidently provided for an annual production of 7 million bales of cotton by the end of the current plan.

Cotton production at an estimated 5.6 million bales in 1962-63 promises to be a record. It may well help to ease the supply position. But the question of building up buffer stocks will arise only when the country becomes self-sufficient in this raw material. Such a day has yet to dawn in India. Perhaps the issue will demand consideration in the event of surplus cotton becoming available during the current cotton year through sizable imports. Meanwhile, the Indian Cotton Mills Federation has appointed a committee to study the problems connected with the purchase, storage and disposal of buffer stocks and to prepare a suitable scheme to be put into operation if and when the country has a raw cotton surplus.

Cloth Production Trend

Besides the cotton supply problem, the industry is deeply concerned about the trend in cloth production. The output target assigned to it under the current plan, namely, 5,800 million yards a year, is by no means ambitious, but if the present is a true reflection of the future, it is doubtful whether the goal will be reached at all. Production of yarn has been quite satisfactory, but with some 5,000 looms remaining unused, cloth output during the current year will be less than that of 1962. The table below shows the current monthly production trend of cloth and yarn with comparable figures for last year.

Month	Cloth (Million yards)		Yarn (Million lbs)	
	1963	1962	1963	1962
January	410	436	162	166
February	369	396	149	151
March	403	417	159	160
April	400	413	159	154
May	411	423	164	159
June	396	418	150	155
July	417	432	166	158
August	396	431	161	162

There are two reasons for the threatened stagnation in mill cloth production. First, the phenomenal growth of the powerlooms, authorised and unauthorised, poses a grave threat both to the mills and the handlooms. A good deal still needs to be known about this relatively new sector. Estimates of the number of powerlooms vary between 150,000 and 200,000. Enjoying a decisive advantage over the mills in the matter of excise duty and wages, they score heavily over the organised sector, especially in the production of finer fabrics.

Growth of Powerlooms

An unregulated growth of the powerloom sector is obviously undesirable. Apart from hurting the interests of the other branches of the industry, its proliferation nullifies the very rationale of assigning production targets to the different sectors. If production cannot be properly accounted for, statistics relating to it pass from the realm of accuracy to one of guess-work, while the Government loses the revenue by allowing the powerlooms to grow unchecked.

The second deterrent to a fuller utilisation of the industry's weaving capacity should be traced to the present system of voluntary price control. The system was introduced in September 1960, as a contribution by the industry to arrest the rise in prices. Since 1st January, 1961, cloth prices have remained stationary, while there has been a general increase in the cost of production. Many mills today find it unremunerative to offer their cloth at prices that obtained more than two years ago.

The way out is clear. Production targets are laid down to ensure an orderly growth of the economy. This principle should be enforced in the case of powerlooms whose growth and productive activity should be strictly confined to authorised limits. In that event, the mill sector will be able to regain its resilience and fulfil the production targets assigned to it under the current plan.

With the restoration of normal conditions, there will be a clear need for more spindles and looms, which in turn would call for suitable steps to help the industry to acquire them in good time. There is no advantage in attempting to establish new spinning units independently of the existing mills. Experience has shown that, although licences have been freely granted for increasing the spindleage, very few new spinning units have come into existence. In these circumstances, expansion of the present mills should be encouraged not only because it means a considerable saving in the capital cost, but also because it greatly minimises the time required for increasing textile production. Experience, technical knowledge and superior resources are advantages which the new entrants cannot readily secure and which are of great value in running an enterprise efficiently.

The organised sector bears the major responsibility for meeting the domestic needs for cloth and for fulfilling the export target. Its plea for expansion is, therefore, justified. In addition, it should be allowed to equip itself with modern machinery so that Indian products abroad may hold their own both in price and quality. While all the textile machinery produced inside the country should be bought and installed, the additional equipment required by the industry should be allowed to be imported freely.

Export Target

The export target for textiles under the current plan is 850 million yards a year, while the industry has set before itself the task of earning foreign exchange worth Rs. 60 to 65 crores annually. The following figures show the export performance of the cotton textile industry over a period of years:

Year	Yarn exports (in million lbs)	Cloth exports (in million yards)	Value (in crores of rupees)
1957	17	839	62.1
1958	31	581	47.0
1959	21	810	58.8
1960	14	690	57.7
1961	16	575	49.9
1962	23	508	45.3
1963 (Jan.-June)	12	369	22.9

A long way has still to be covered before the country can reach the prescribed target.

While the industry is making strenuous efforts to expand the overseas trade in cloth and yarn through its export schemes, it is necessary that friendly countries should give it a helping hand in realising the goal. It is, however, readily recognised that trade and not mere aid, is the best solution to a nation's economic problem. India's economic prospects, therefore, depend on how well and quickly her overseas trade can be expanded. The fact that progress in that direction is not satisfactory is disturbing. For instance, the surplus of $ (U.S.) 10 million which this country enjoyed in 1950 in relation to the E.C.M. countries, was converted into a deficit of $(U.S.)380 million in 1960-61 and into one of $(U.S.) 342 million in 1961-62. No country can hope to become prosperous if it has such serious adverse trade balances. "Export or perish" is not a mere slogan with India, but is a pressing necessity.

World Cotton Textile Meet

A good opportunity was presented to the spokesmen of the Indian

cotton textile industry to urge their case when the International Federation of Cotton and Allied Textile Industries held its annual session in Athens last September. The Indian cotton textile industry was represented at the conference for the first time. Presenting the case of the textile industry of the developing countries, the Indian delegation urged that the long-term Geneva Agreement should be worked in a proper spirit so that the contemplated changes in the pattern of world trade in cotton textiles might be effected on the basis of international co-operation and goodwill.

The Indian spokesmen called attention to the strength and prosperity of the European textile industries. For instance, the annual textile exports from the E.C.M. countries totalled well over 1,000 million yards, while their receipts were only 600 million yards. With their highly developed economies, it should not be difficult for those countries to admit a sizable volume of textiles from the developing countries, especially when the bulk of such imports consisted of grey cloth which needed processing before it could be put into use.

The delegation, therefore, pleaded that the "disruption clause" should not be lightly invoked by the importing countries with a view to frustrating the provision in the Agreement recommending preferential treatment to countries like India. Attention was drawn to the fact that the Agreement had not helped to advance the interests of the Indian textile industry in the United States, for example, where the "disruption clause" was being invoked to hold down Indian exports to an extremely low figure. It was pointed out that neither the U.S. textile industry nor the prosperous economy of that country, whose textile imports amounted to 1,100 million yards a year, would suffer a setback if its takings of Indian cloth were raised from the present 30 million yards to a more respectable figure.

Some concrete suggestions were put forward by the Indian spokesmen before the Conference as a means of saving the Agreement from becoming a dead letter. These were, first, that there should be a steady lowering of the import barriers to enable a freer flow of textiles from the developing countries to the industrialised countries. If the import duties could not be scaled down for the entire range of textiles, the concession should at least be extended to yarn and grey cloth, since the latter could be used as raw material and subjected to sophisticated finishing by the importing countries. Secondly, it would be advisable to have an impartial agency to pronounce whether any disruption had in fact taken place in the market of an importing country as a result of its receiving textiles from the developing countries.

Thirdly, if there was a real threat of disruption or if disruption had actually taken place, the prohibition of imports should be limited only to the country or countries which had been the cause of such dislocation and should not be enforced against all the exporting countries. Attention was drawn to the reasonable stand taken by the representative of the Lancashire industry on the issue of textile imports from the developing countries. He had suggested that 10 percent to 20 percent of textile consumption by the developed countries should comprise cloth imported from the developing nations.

Indo-British Trade Relations

Britain's accommodating attitude towards India is perfectly understandable. A special commercial relationship exists between the two and dates back to many centuries. Not only the pattern of the trade between them, but also the structure of production in India is to some extent determined by this long-established relationship. The question of Britain's admission to the European Common Market is, therefore, of great importance to this country. Indian textiles enter the U.K. market duty-free, the volume of imports by that country being regulated by an inter-industry agreement. According to this agreement, Britain currently receives from India 195 million yards of cloth a year for retention. Cloth meant for re-export is not included in this figure.

India is, however, under no special obligation to Britain on this account because the trade relations between the two are entirely based on reciprocity. In fact, this country runs a heavy deficit in its trade with Britain, as the following figures will show :

Year	Imports into India	Exports to Britain	Balance
1959-60	194.30	178.85	−15.45
1960-61	217.15	172.48	−44.67
*1961-62	200.15	160.94	−39.21
@1962-63	1783.1	163.73	−14.58

* Revised. @ Provisional.

The talks held in London last September between the British and Indian textile interests were concerned, not with the quota of cloth and yarn which that country should receive from India, because there already exists an agreement on this account, but with the categorisation of goods sent from this country. It was agreed that the export of folded yarn from India should be subjected to a ceiling of 7.3 million lbs out of a total quota of 11.5 million lbs. Any shortfall in the export of folded yarn could be made good by the exports of single yarn so that the total quota remained unchanged at 11.5 million lbs. It was also agreed that statistical information should be collected relating to the import of Indian grey goods into the U.K. There was a clear understanding between the two sides that India should not suffer any loss of her existing market in the event of categorisation being agreed to.

These are some of the important developments which have taken place in the Indian cotton mill industry during the current year. Following the Chinese threat to India's national security, this country is confronted with the two-fold problem of defence and development. Both are as important as they are interdependent. It is of the utmost importance that the foundations of the cotton mill industry, which caters to a basic need of the armed services and the civilian population, should be suitably strengthened. The stagnation which threatens cloth production in the organised sector should be removed by taking prompt remedial measures. This is necessary if the industry is to reach the planned target of production.

India's vital Coal Industry had its beginnings here in Bengal with the opening of the first mine at Raniganj in 1814, and in this era of transition and promise, coal is in demand more than ever before to meet the requirements of Industry, Trade and Commerce.

The Bengal Coal Company Ltd., were the first of existing Coal Companies to be formed and on its formation in 1843, took over among others, this famous Raniganj Colliery.

BENGAL COAL COMPANY LIMITED

8, CLIVE ROW, CALCUTTA.

Coal Industry Needs More Help for Raising Production

India wants more coal, especially of the higher grades. Bigger output calls for fiscal and price incentives, and more trained personnel for the industry.

By

A SPECIAL CORRESPONDENT

THE third five year plan having run half its course, a suitable opportunity has arisen for examining the working of the coal industry and the various factors which either have impeded or are likely to impede the production of coal during the remainder of the plan period. It will be recalled that when the Chinese invaded India in October 1962 coal stocks were extremely low, and urgent action was necessary to step up production. The industry rose to the occasion and was among the first to start seven-day working. Although seven-day working could not be maintained because of the strain on workers and the adverse effects on the maintenance of machinery, production was speeded up considerably. Thus monthly production rose from 3.96 million tonnes in October 1962 to 4.69 million tonnes in November 1962.

The industry as a whole was able to exceed the tentative target of 63.49 million tonnes for 1962-63 by 230,000 tonnes, representing an increase of 0.36 percent over the target.

Production in Both Sectors

The private sector produced 52.07 million tonnes, against a target of 48.55 million tonnes, or 7.25 percent more. The public sector, with a production of 11.65 million tonnes, against a target of 14.95 million tonnes, fell short of its target by 22.02 percent. While credit is to be given to the private sector for its achievement, the performance of the public sector is not to be judged by the sole criterion of a production target. Although the scales are weighted heavily in its favour, the public sector is comparatively a newcomer to the field and allowance must be made for the various teething troubles and other difficulties which have been experienced. They are only to be expected during the first few years of an organisation of the size of the National Coal Development Corporation. It is also to be appreciated that imports of mining equipment and machinery against World Bank assistance did not begin to materialise until early 1963, and even then in only insignificant quantities. Additional credit must be given to the private sector for having increased its production from 46.34 million tonnes in 1961-62 to 52.07 million tonnes in 1962-63, with its existing machinery.

However, to give a correct picture since from the consumer's point of view the grade-wise production of coal is more important than the overall production—it is to be stressed that the industry's achievement related mostly to the medium grades of coal. Production of the higher grades, especially of coking coals, did not show any appreciable increase. The output of coking coal in 1962-63 was only 17.39 million tonnes, against the previous year's production of 17.04 million tonnes.

Accumulation at Pitheads

In March-April 1963, there were reports of a fall in demand and the consequent accumulation of coal stocks at pitheads. The reports were eventually confirmed by the statistics which showed that while in May 1962 stocks at pitheads had been about 3.59 million tonnes, by May 1963 some 4.07 million tonnes had accumulated. While this was below the March 1961 figure of 4.8 million tonnes—which was, incidentally, the highest figure for the last ten years—the position naturally caused concern to producers, especially since stocks had been as low as 2.6 million tonnes in October 1962. There was no question of shortage of railway wagons; there was in fact an improvement in the movement of coal by the railways. So it was apparent that the cause of the accumulation of stocks was a fall in consumer demand.

This decline in demand was allegedly due to the three main factors. First, since October 1962 industries had built up considerable stocks so that only coal sufficient to replenish the stocks was necessary. Secondly, because of inadequate supplies in the past due to transport difficulties, consumers tended to inflate their demands grossly in the hope that at least some of their requirements might be met. Thirdly, the tempo of industrial production had slowed down considerably, so the demand for coal was less than had been originally visualised. Other factors which probably have some bearing on the situation are : (1) there has been less demand for coal from the railways due to their programmes of electrification and dieselisation; (2) the expansion of the steel plants during the third plan period has been delayed; (3) the construction of the thermal power projects in the first two years of the third plan has been slow; and (4) certain industries, particularly those located far away from the coalfields and nearer the main ports, have switched over to furnace oil for fuel, in accordance with the policy of the Government of India.

Restriction of Output

The inevitable result of the accumulation of stocks and the decline in demand has been that several coal companies have been compelled to restrict their production, and many have been obliged to review their expansion programmes. This fall in demand has naturally raised the question whether it is purely temporary, or whether production has in fact been in excess of demand, in which event the production target of 97 million tonnes for the end of the third plan would have to be revised downwards. This is of particular interest as it is not long since the Planning Commission was thinking of raising the 97-million-tonne target to 104 million tonnes.

The approximate total consumption of coal by all industries was 3.6 million tonnes in October 1962, against 3.4 million tonnes in October 1961. By May 1963, it had risen to just over 4 million tonnes. The figures suggest that the decline was perhaps only temporary, especially since industrial production had slowed down between October 1961 and October 1962 as a result of transport bottlenecks and shortages of power and raw materials. It would, therefore, be unwise to proceed on the basis of a misleading temporary slowdown in coal consumption especially as it may be assumed that industrial production will increase once additional power projects begin to function in the remaining years of the plan. In that event, the demand for coal will rise at a rapid pace. Be that as it may, in assessing the position, consideration has also to be given to the fact that although the private sector has so far fulfilled its share of increasing production, the future is not so certain unless numerous inhibiting factors which prevent expansion are removed. Additionally, the performance of the public sector has not been satisfactory and as its share in production progressively increases, there is very little chance of the original plan target of 97 million tonnes being achieved.

The Central Minister of State for Planning and Finance recently stated in the Lok Sabha, during the debate on the increased development rebate for the coal industry provided by the Income Tax (Amendment) Bill, 1963, that, on revised estimates, the requirements of coal would amount to 88 million tonnes. However, the target of 97 million tonnes has not yet been revised and this figure is still being used as the basis for the industry's production plans. Hitherto, the official view had been that 90 million to 92 million tonnes at the end of the plan would be sufficient to meet the demand, while the industry's view has been that a lower figure might suffice. The conclusion to be drawn from these differing assessments is that the existing means of assessing the effective demand for coal are inadequate and that, in future, such data must be more reliable.

Shortage of Quality Coals

It will thus be apparent that while there is currently a surplus of coals quantitatively, there is a shortage of quality coals. The shortage is serious in the case of those grades which are most needed, namely, the better grade coking coals. While reserves of such coals are limited, large quantities of coking coal now exist mainly in the form of pillars in existing deposits. Increased production could, therefore, be obtained by extraction of these pillars, but this would involve stowing, *i.e.*, filling in with sand or some other incombustible material of the spaces left underground by the extraction of coal, so as to permit extraction of the maximum quantities and to avoid the danger of roof collapses and consequent risks of subsidence and fire. This, however, is a very costly operation since comparatively only a small proportion of coal can be obtained against substantial stowing. In other areas, increased production of coking and blendable coals can be obtained from existing workings but only with the installation of expensive machinery since such coals are in deep-shaft mines which are not only expensive to operate but, in many cases, are being operated at a loss. This deficit of coking and blendable coals is serious and vigorous steps will have to be taken to raise their output.

While the producers of higher grades are finding it difficult, if not impossible, to expand production at the current statutory prices fixed for coal, the producers of the medium and lower grade coals, which are now surplus, are also experiencing difficulties. The latter are losing some of their important markets, firstly, because of the use of "middlings" (produced by coal washeries) by thermal power stations and other consumers. Secondly, certain industries—particularly the cement produces—are now using furnace oil in place of coal.

Difficulties of Small Producers

It must be borne in mind that the lower grades of coal are mostly mined by the smaller collieries whose financial resources are slender. Consequently, if they are unable to dispose of their coal, they may have to go out of production. Since many of them exist on a hand-to-mouth basis with very small financial reserves, considerable difficulty has been experienced by them in meeting their wage bills and other statutory commitments relating to labour.

While this was the position faced by the industry from March to October 1963, the Government of India announced on 13th November, 1963,

that, as a result of the increased production of coal and the comparatively easy transport position, all consumers will be given additional supplies, according to their requirements, over and above their present quotas, the entire demand to be met from ready stocks.

Mention has been made of the disposal of washery "middlings", the output of which is estimated to be some 25 million tonnes by the end of the fourth plan. It has been confirmed that the boilers of all large central thermal power stations to be installed in the fourth plan will be designed for the use of coal and washery middlings with ash content of up to 45 percent. This means that this market will not be available to low-grade producers.

Use of Furnace Oil

The Government of India announced in July 1962, that it would encourage the use of furnace oil in place of coal by those industries which enjoyed a high priority for the allotment of coal and which experienced great difficulty in obtaining it because of their being distant from the coalfields and on account of transport bottlenecks. To begin with, cement factories in southern and western India were asked to change over to furnace oil. While there is no reason to believe that furnace oil has found extensive application in industry as a substitute for coal, and there is no doubt that solid fuel in the form of coal will remain the premier source of commercial energy, the Government's policy has undoubtedly had an effect on demand estimates. The coal industry is naturally apprehensive about the future of solid fuel consumption in these industries. Since furnace oil has to be imported and its source of supply is, therefore, subject to political uncertainties elsewhere in the world, it is very imprudent to encourage major industries to change over to furnace oil at the cost of the indigenous industry. The strategic implications of relying on imports for a major fuel are also obvious. While the switch-over to oil was encouraged at a time when the outlook for coal supplies was admittedly bleak, it is felt that the situation has changed considerably since then and a re-examination of this important question has now become urgent.

Doubts have been raised whether future production could be increased to the extent required, in view of certain factors which are inhibiting the industry's working. The most important of these inhibiting factors is the uneconomic level of coal prices which has resulted in the inability of the industry not only to accumulate sufficient internal resources for further development but also to cover production costs. The price formula evolved by the Coal Prices Revision Committee in 1959 made allowance for depreciation, rehabilitation of plant and machinery and a profit margin, which the Committee considered fair and reasonable to attract the additional finance necessary for development and expansion in order to produce 45 million tonnes. The existing price structure, apart from falling short of this price formula, neither provides for the servicing of the additional capital required for a production of 62 million tonnes by the private sector nor does it fully neutralise the enhanced production costs, despite the specific recommendation made to this effect by the Committee. The *ad hoc* price increase granted in 1962—which did not apply to the lower grades—fell far short of the requirements of the price formula and certainly did not provide the incentive necessary to attract the additional finance necessary for the achievement of the third plan target. The industry has recently again taken up with the Government of India the necessity of increasing coal prices to neutralise increases in production costs and this matter is still under consideration.

Need for Fiscal Incentives

However, neutralisation of production costs alone will not encourage coal production, especially of those grades which are essential for the economy and are still in short supply. Further incentives will be necessary in the form of a direct price increase plus income tax concessions in the shape of an increased development rebate, provision of a depletion allowance and increased depreciation by way of a multiple shift allowance. There should also be increases in the subsidies for adverse mining conditions and for stowing. While the existing level of controlled prices is inadequate and in many cases does not cover current production costs the majority of producers of all grades maintain that the spectrum of controlled prices should be opened out in order to widen grade differentials. The higher prices for the higher grades, it is pointed out, would provide the incentive for the extra effort and resources required to increase the production of those higher grades of coal which are immediately and vitally needed. This would also prompt consumers to make more economic use of solid fuel which, in turn, would help the country to conserve its limited resources of better grade coals.

Despite the demand for high grade coals the production of such coals has suffered a setback over the last three years due to the unremunerative price differential between the various grades. The price structure does not justify the working of more difficult mines and seams in order to produce better grades. On the other hand, the view has been expressed that, since the statutory obligations are the same for all collieries, irrespective of the grades they produce, there should be a uniform increase in the prices of all grades of coal; furthermore, since coking coal forms only a small percentage of the total reserves, measures should be devised for the conservation of coking and high grade coals and for the better utilisation of inferior grades which are weakly coking and which, after washing, should be used for blending with the high grade coking coals. While the final decision lies with the Government of India, it is patently illogical that any price increase by way of incentive is necessary for coals which are already in abundance, and particularly when there is every indication that a very substantial increase in the present production of coking coal will have to be achieved by the end of the fourth plan period. The World Bank mission, in its recent report on the Indian economy, stated that there was a strong case for raising substantially the prices of the better qualities of coal, if not for removing controls over coal prices altogether.

Higher Development Rebate

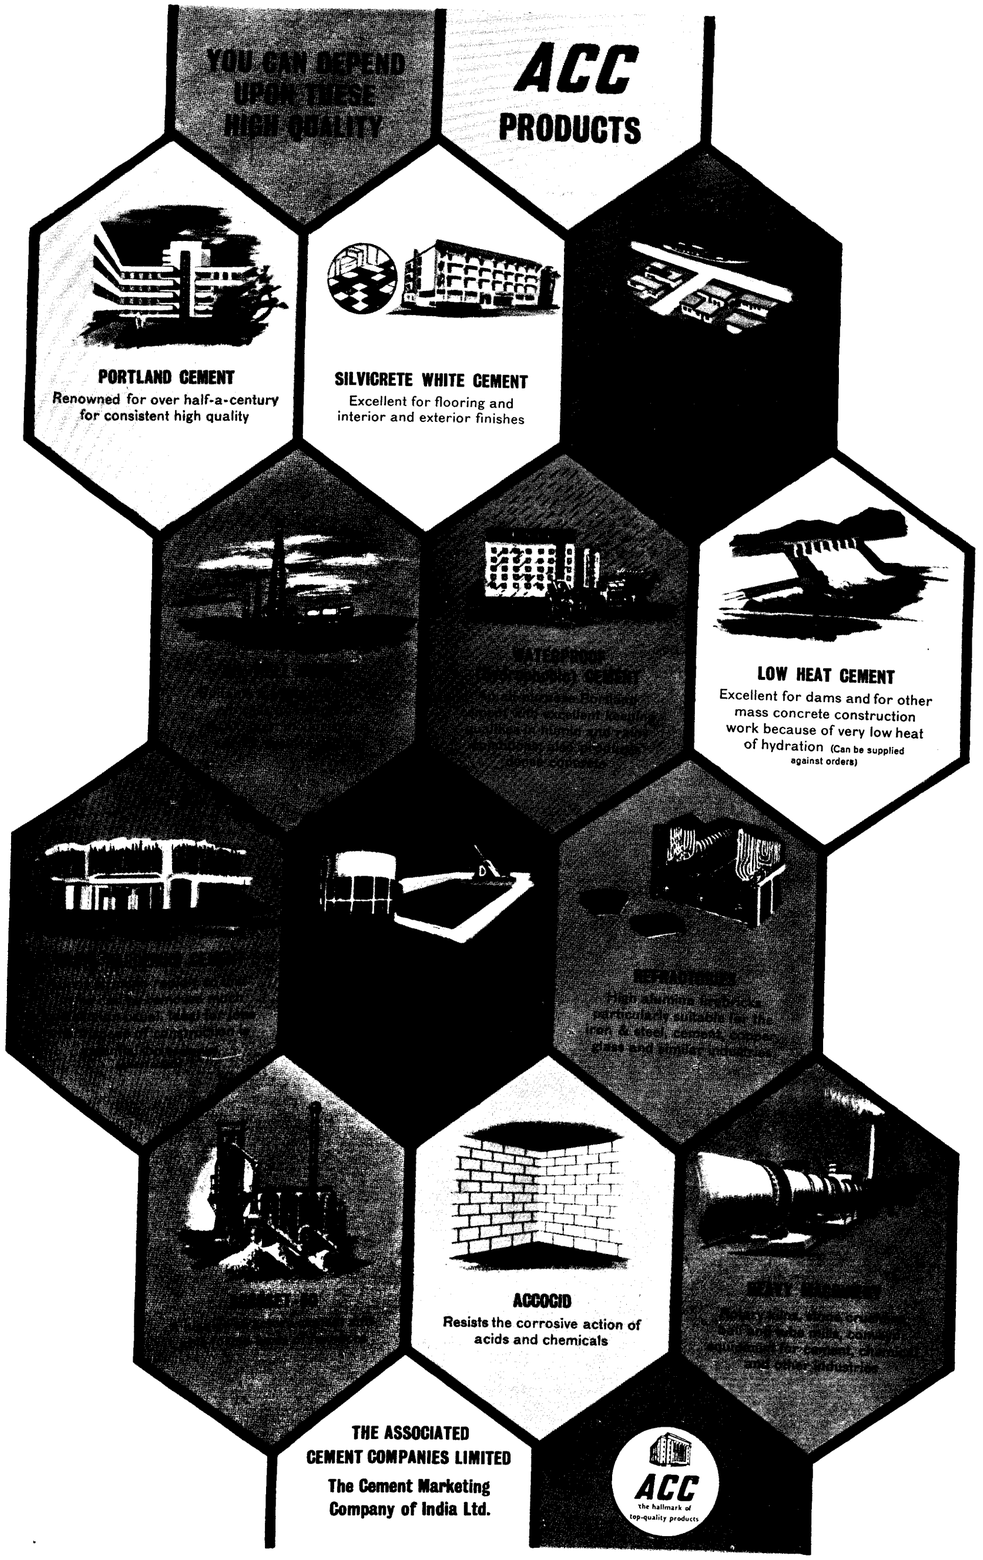
The former Finance Minister, Mr. Morarji Desai, announced last April that he proposed to increase the development rebate for the coal industry from 20 percent to 35 percent, and that this concession would be available from the assessment year 1963-64 and would remain in force till 1965-66, which is the last year of the third plan. The Income Tax (Amendment) Bill, 1963, which was subsequently introduced to give effect to this concession, is presently receiving the attention of Parliament. However, in view of recent developments and the necessity to prepare the groundwork for the much greater expansion of production in the fourth and subsequent five year plans, the industry is now of the view that this rebate should be increased from 35 percent to 50 percent.

Since coal is a wasting asset, the industry has pressed for provision to be made in the cost structure for a depletion allowance. This is a recognised practice in all other developed countries. It is pertinent to note that, in the case of the oil industry in India, provision has been made for a substantial depletion allowance in the price structure of the fuel. There is, therefore, no reason why a similar provision should not be made for the mining industry as a whole, and particularly for coal.

In view of the greater wear and tear on machinery used for extracting coal and the fact that other industries are entitled to extra rates of depreciation allowance for double and triple shift working, the coal industry has pressed for similar additional rates of depreciation. The majority of collieries work double and triple shifts, which fact seems to have been lost sight of when the rates of depreciation were first fixed.

Under the Coal Mines (Safety and Conservation) Act, provision is made for the levy of an excise duty on all despatches of coal and coke, the amounts collected being credited to the Coal Mines Safety and Conservation Fund administered by the Coal Board. From this Fund are paid the amounts granted by the Board by way of assistance for voluntary stowing and for the special assistance paid by way of subsidy to collieries specially handicapped by any or all of the following adverse factors, *viz.*, gassiness, depth of shafts, inclination of seams, high pumping costs, thinness of seams and high cost of transporting coal from pit-head to rail-head.

Stowing Assistance



As for the scheme for the grant of stowing assistance to collieries, the industry maintains that the present scales of maxima are totally insufficient if the production of the higher grades of coal—particularly coking coal—is to be increased substantially. The industry has also urged that the regulations about the provision of assistance for stowing are unnecessarily and inequitably restrictive and, in support of this, it is pointed out that the quantity of coking coal produced through stowing in the last three years has fallen from 5.1 million tonnes in 1960-61 to 4.5 million tonnes in 1962.63. Support for the industry's request will also be found in the Report of the Coal Prices Revision Committee, which categorically states that, after due consideration, the Committee felt that while it was not appropriate to include an element for stowing in the general price of coal, it was at the same time not only necessary to provide for the stowing cost to be met, but to do this in such a way that there would be no disinclination to adopt stowing.

The Committee accordingly recommended that stowing costs should be met in full, subject, of course, to the maximum limits to be prescribed so as to ensure economy of expenditure on stowing. The scales of subsidies under the scheme of assistance for adverse mining conditions are also totally inadequate, and it is understood that this fact is appreciated by the Government of India. Various increases based on the experience of managements working under such adverse conditions have been suggested by the industry, as also the extension of the scheme to Grade II and HH coals in the West Bengal and Bihar coalfields and to Grade III in the outlying coalfields, since these will be increasingly relied on in future. The scheme is at present limited to grade I coals and above in the West Bengal and Bihar coalfields, and to Grade II and upwards in outlying coalfields.

Import Duty Cut

The former Finance Minister, while announcing the increase in development rebate referred to earlier, also stated that, in order to encourage investment in the coal industry, he proposed to reduce the import duty on certain items of machinery and equipment needed by the industry. The rates of duty on certain specified items were accordingly reduced but, unfortunately, this concession has been of little benefit. Apart from the fact that the reduced rates are still higher than the current rate of 10 percent *ad valorem* for mining machinery, the number of items covered by the concession is extremely limited, the bulk of mining machinery and equipment still being subject to varying rates of import duty up to 95 percent. Furthermore, the purpose of the concession, as also of the existing 10 percent *ad valorem* duty on mining machinery, has been largely defeated by the administration's restrictive interpretations of the Customs tariff, and in particular its insistence that the classification of any item should be determined on the basis of its construction and design and not its end-use.

The natural reaction of the consumer to any suggestion that the price of coal should be increased is one of resistance. This principle was discussed by the Coal Price Revision Committee in paragraph 52 of its Report. While commenting that the increase in price resulting from its recommendations would have only a negligible effect on the users, it observed that, except for consumers in the vicinity of the collieries, the transport cost of coal was an element nearly as important as the price of coal itself, and that the assurance of supplies and the right conditions for the expansion of coal production were even more important to the consumer than the price of coal itself. However, according to the industry, even

aking into account the cost of coal delivered to an undertaking, that is, after including railway freight, cesses and other charges paid on coal, the verage cost of coal as a percentage the value of ex-factory products d by-products in the case of 29 ma- coal-consuming industries is only 1 percent. So even a substantial in the cost price of coal cannot ve any serious impact on the pro- ction costs of other industries. The in opposition to any increase in the ices of coal comes from the rail- ays and thermal power stations. ere again the industry is satisfied at even a substantial increase in oal prices would not have adverse epercussions on either the railways r on power generation costs.

Basing Prices on Calorific Value

The question of a price increase is lso tied up with the report of the Expert Committee, which was set up n 1961 to look into the possibility of hanging the present system of samp- ing adopted by the Coal Board, and tudy the existing system of classi- ication of coals on the basis of ash nd ash plus moisture contents. The Committee, in its report submitted in 962, urged that the classification of ll coals should be on the basis of heir calorific value. Since grada- ion determines the prices which oals would fetch, price fixation is vital aspect of any system of grad- ng. The industry has indicated that is agreeable to the use of gross alorific value as the basic criterion f a new grading system, provided lue weightage is given in price fixa- ion to certain principles set out by he industry. Particularly it wants ognisance to be taken of factors such the "usefulness" of the coal for e purposes for which it is most ited. As the changes recommended ould have serious effects on the isting pricing system, it was agreed at a study group should examine e implications of the Experts Com- ittee's recommendations and devise price structure based on the calori- value of coals. The report of the udy group is now awaited.

The view has been expressed that oal prices are low because little ttention is paid to economy in its se, and that the only way of reducing uel costs is not by keeping prices t an unreasonably low level, but by he proper and efficient use of coal. This view is supported by the Colombo Plan team which was asked o report on the standards of fuel fficiency obtaining in Indian indus- ry. It found that fuel wastage may e as high as an average of 25 per- ent. The team recorded that indus- rial management tends to value coal y what it pays for it and not by ts intrinsic worth and suggested that he price of coal should be related o its real value to discourage industry rom being wasteful. It also suggest- d that, in view of the marked ten- ency to burn more coal to offset fficient use, the grade differentials ould be broadened.

Delay in Using World Bank Loan

Related to the question of a price crease is the delay in the use of the an facilities granted by the World nk for the import of mining machi- and equipment. Under the ms of the loan agreement, the aid as granted to the Government of ndia and not to individual coal com- panies. It was specified that after the approval of individual projects the Government of India should release from its own resources the foreign exchange sanctioned, and that after importing the machinery and equip- ment, the Government could claim reimbursement from the loan account on producing the necessary docu- ments. There was considerable initial delay in finalising the guarantee bond, which the Government required from mining enterprises and their bankers, and consequently the issue of import licences was held up for nearly a year. There has also been long de- lays in using the assistance provided by the World Bank due to the fact that most coal companies had diffi- culties in raising the necessary coun- terpart rupee funds, which were required to pay for the machinery imported.

Difficulty in Raising Funds

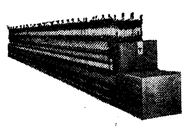
Most coal companies estimated that they would be able to finance their expansion by plough-backs from in- creased production, but for various reasons this has not been possible. The Chinese aggression caused a set- back in the stock markets which made it impossible for coal companies to float debentures or shares to raise funds for expansion. The plough- back originally hoped for did not materialise for reasons such as in- creased taxation, bigger costs of labour, stores, import duty and new impositions like the Emergency Risks Insurance. In those cases where super profits tax is payable, the available plough-back has been re- duced further.

As far back as 1961, following the signing of the World Bank loan agreement, the industry drew atten- tion to the difficulties faced by coal companies in raising rupee funds from banks and other financial insti- tutions. But it was not until early 1963 that really serious attempts were made to formulate concrete proposals for enabling coal companies to ob- tain matching rupee finance. Finally, in April 1963, the Coal Controller circulated details of a scheme pro- posed by the Refinance Corporation of India for guaranteeing advances granted to coal companies by ap- proved credit institutions. Thus rupee funds were arranged one year and eight months after the loan agreement was signed in Washington for a credit that was to last, origin- ally, for only two years. Despite the credit guarantee scheme further de- lays occurred in obtaining funds because, under Rule 52 of the Defence of India Rules, coal companies have been prohibited from submitting statements of accounts, reports and other documents covered by the Rules, to banks and financial insti- tutions. In the absence of balance sheets and other data, banks have naturally refused to consider appli- cations for loans.

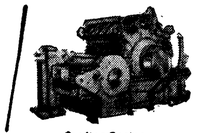
It was not until July 1963 that coal companies were permitted to furnish information relating to their opera- tions and accounts to banks or other financial bodies 'incorporated or established in India". By a sub- sequent notification, they were also permitted to submit such information to the World Bank in accordance with the requirement of the loan agreement that coal companies seek- ing loans for working new mines are to supply certain information and produce their annual balance sheets to the Bank. Even now, because of royalty disputes with the State Gov- ernments due to faulty legislation, many coal companies are unable to use the credit facilities. Under the Minerals Concession Rules, the crea- tion of mortgages or charges in the corporate structure of a mining enterprise must receive the prior approval of the State Government concerned. Such permission has been withheld pending the payment of disputed royalties to State Govern- ments, despite a rule issued by the Calcutta High Court. It will thus be apparent that coal companies were not really in a position to place orders against import licences issued until June 1963 despite the fact that the machinery and equipment spares re- quired for existing mines were ori- ginally to be imported by 31st March, 1963 (since extended to 30th June, 1964). Meantime, certain coal com- panies revised their expansion pro- grammes in the light of the fall in demand. As a result, a number of expansion schemes were either can- celled or modified and the relevant import licences had to be surrendered. The World Bank has agreed to con- sider fresh applications for import licences against the amounts either surrendered or not taken up and 30th September, 1963, was fixed as the last date for the rest of such appli- cations. Orders against such licences have to be placed by the end of March 1964, and the machinery has to be imported by 30th October, 1964.

The industry has requested that the last date for utilisation of the World Bank loan for all categories should be extended up to 30th Sep- tember, 1965, as for new mines. No decision has yet been taken. The present position is that against licen- ces issued for Rs. 16.30 crores, orders have been placed for Rs. 12.13 crores. The value of machinery imported is understood to be about a third of the value of orders placed, but the amounts which have been claimed by the Government of India from the World Bank in reimbursement are considerably less. This is a matter of concern to the Government since commitment charges are being paid on the principal amount not with- drawn, to cover servicing costs.

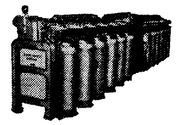
Transport Facilities



Assuming that there is a demand for coal, the industry's productive capacity is mainly governed by the availability of transport. Credit is, therefore, due to the railways for their increasing part in moving coal. The improvement in coal transport will be evident from the fact that the average daily rate of coal wagons loaded in West Bengal and Bihar was 4,768 for 1961, 5,090 for 1962 and 5,622 for the first ten months of 1963, with a highest-ever loading figure of 5,760 wagons for March 1963. By the end of the third plan about 90 million tonnes of coal will have to be moved. So the railways are concentrating on their programme for switching over the transportation of bulk commo- dities such as coal and iron ore from four-wheeled wagons in trains of 1,600 tonnes to 1,800 tonnes to block rakes of 55-tonne "box" wagons in trains of 3,400 to 3,600 tonnes hauled by diesel or electric locomotives. This changeover is essential from the railways' point of view, but causes problems to users since it requires a change of loading and unloading facilities. While the larger industrial consumers, which use coal in large quantities, have the facilities to re- ceive such block rakes, the smaller ones that have been receiving their supplies in a few four-wheeled wagons at a time, will experience consider- able difficulty in adapting themselves to the new pattern of movement. The collieries are also experiencing difficulties since, except for the larger ones, many are not equipped with sidings that could receive full rakes of "box" wagons. Moreover, even where such sidings do exist these will have to be strengthened and remo- delled so as to be able to take longer and heavier "box" wagons instead of four-wheelers. Here again, there have been delays in the remodelling and strengthening of collieries' as- sisted sidings to accommodate "box" wagons, since there is a controversy as to who will bear the cost of such alterations.



The industry contends that since "box" wagons have been designed for the convenience of the railways alone, they should bear the entire cost. The railways, however, main- tain that it is only by using "box" wagons that they can cope with the heavy traffic that already exists and the bigger traffic that may be expect- ed; it is, therefore, only reasonable that the beneficiaries of this expan- sion should bear the cost. The indus- try has suggested a compromise, namely, that collieries will bear 50 percent of the cost of the sub-grade work. This has been rejected by the railways as also the industry's sug- gestion that the question should be referred to arbitration. Related to this question is the railway's insis- tence that collieries producing more than 10,000 tonnes a month should install a 100-tonne weighbridge. This has been opposed by the industry in view of the heavy capital costs it will involve at a time when all its re- sources are fully committed for in- creasing coal production. Besides, the weighbridges may remain idle for most of the time. The industry has, therefore, suggested that the rail- ways should install weighbridges for box wagons at suitable points at their own cost. This would be logical since "box" wagons are run in rakes and weighbridges should, therefore, be installed at marshalling yards or base depôts rather than at individual collieries. It has also been pointed out that the rebate of 6nP a tonne, which is allowed in cases where weighbridges have been installed, should be increased to at least 19nP a tonne since the existing rebate was calculated on the costs obtaining in 1936 and the costs of installation and operation have increased consider- ably since then.



Box Wagons Create Difficulties

The introduction of "box" wagons has created a host of small and petty problems for the collieries such as restrictions on loading time, the fixa- tion of the loading heights in "box" wagons irrespective of the grade and size of coal to be loaded, reduction of overloading/underloading margins in such wagons, and the increased overloading and demurrage charges. The railways insist that even if only one "box" wagon remains unloaded, demurrage has to be paid on the entire rake of "box" wagons. A more reasonable attitude and a greater understanding of the difficulties of both collieries and consumers by the

railways would eliminate most of the petty bickerings that go on daily, and would encourage consumers to use coal instead of discouraging them as at present.

World Bank Study Team

Of importance to coal producers and consumers alike, was the setting up of a study team by the World Bank to examine the country's coal transport problems and to recommend measures which would put coal transport on a sound footing in the light of (i) the coal programme for the third plan and projections for the fourth plan; and (ii) other bulk transport requirements and the overall limitations on the resources, particularly foreign exchange, likely to be available. The study team was asked to submit an interim report within six months recommending measures which could be implemented readily in order to provide quick relief for the present shortage of coal transport, particularly in the West Bengal-Bihar area. While the interim report has not been made available to the public, Press reports indicate that the study team, while criticising the railways for failing to create reserve capacity, has commented favourably or the performance of the railways in the conditions under which they operate. It has stressed that the real solution to the transport problems of collieries lies in greater supply of the right type of wagons. So it has recommended that, in the remaining years of the third plan, a start should be made in closing the gap between transport demand and rolling stock available and that, in addition to the purchase of all the rolling stock called for in the latest revision of the third plan, 4,000 "box" wagons and 100 diesel locomotives should be ordered promptly.

Labour Relations

Labour relations in the coal industry have continued to be good, on the whole. There have, nevertheless, been a few instances of strikes and lock-outs as a result of the accumulation of stocks at the smaller collieries. They have found it difficult to continue production and, in some cases, to find the resources from which to pay wages and other statutory dues to their workmen. Since early in the year employers and unions have been busily engaged in preparing and presenting their respective cases before the Central Wage Board for the Coal Industry. Replies have been submitted to the very lengthy questionnaire issued by the Wage Board, public hearings have been held at which representatives of employers and unions have made depositions before the Wage Board, and the stage of inspecting collieries has now been reached.

Looking further ahead into the future, it is pertinent to note that the International Coal Conference, held in Tokyo in October this year, has come to the conclusion that a world shortage of commercial energy is likely to arise by the 1980s. In spite of the vast resources available in this country (a good proportion of them will have been tapped by then to meet the country's growing economic expansion), the planners should not ignore the possibility of India also facing a shortage of commercial energy. The production of coal at economical prices is a complicated process calling for long-term planning on scientific lines. Heavy capital investment on mechanisation, possibly even on automation, will be inevitable. This, in turn, will raise numerous problems such as the training of personnel at all levels in order to ensure that production keeps pace with demand and that the sources of commercial energy are so used as to avoid wastage.

Need to Raise Productivity

This article has so far been mainly concerned with the problem of achieving increased production. It will, however, be appreciated that increased production, however desirable, is only a means to an end, namely, to produce the maximum amount of coal efficiently or, more particularly, to produce the maximum amount of coal at the lowest cost. Since the increasing of production alone will not ensure that coal is produced at the lowest cost, serious consideration must be given to productivity. It is evident that with the necessity to undertake deep-mining, ever increasing mechanisation will be necessary. As this will involve heavy capital expenditure, it is essential that consideration should be given to increasing substantially the industry's current low productivity. At present, the overall output per manshift (O.M.S.) in India is one of the lowest in the world and, despite the mechanisation that is taking place, has remained almost static over the last decade. This is apparent from the fact that the overall O.M.S. (in metric tonnes) for 1953 was 0.36 as against 0.51 for the first four months of 1963. Comparisons with other coal-producing countries are as follows:

	O.M.S. in Tonnes		
Country	1950	1957	1958
U.K.	1.21	1.25	1.28
Germany	1.08	1.25	1.30
France	0.76	1.12	1.13
Poland	—	1.23	1.31
U.S.A.	6.14	9.61	10.27
India	0.35	0.40	0.42

Increased productivity implies not only more mechanisation, but also that the machinery and equipment will be used to the maximum capacity. While new mining techniques will also be necessary, these by themselves will not be sufficient to increase productivity. What is more important is new management techniques so that, by proper planning and control, the maximum use can be made of machinery and resources.

Poor Maintenance Standards

One of the most marked features of Indian industry is the lack, or low standards, of maintenance of machinery. It is necessary to ensure that the maintenance of machinery and equipment used in coal mines is of the highest standard. It is also to be stressed that, because of the difficult and special conditions under which mining machinery and equipment are required to operate, the standard of maintenance required in coal mines has to be much higher than in other industries. Since coal mining machinery is expensive to install and run, the fullest use will have to be made of it. It, therefore, follows that in addition to a high standard of maintenance, it is also essential that machine operators should be capable of carrying out the running repairs, as distinct from normal maintenance and workshop repairs. So machine operators will have to be fully trained in the use of the machines. It is probable that, in due course, the majority of mine workers will be skilled or highly skilled workers and there will be little scope for unskilled workers. This in itself will be a major revolution in the industry.

It is thus clear that much thought will have to be given to this dual problem of increasing production and raising productivity. Unless adequate preparations are made in advance, it is apparent that the coal industry, whether in the public or private sectors, will not be able to cope with the tremendous tasks that lie ahead. This calls for courageous and far-seeing managements who will be able to pay attention to the management problems involved in raising coal production. It is reassuring to learn that the larger managements are aware of this problem and are already preparing themselves for the massive tasks ahead.

EASTERN ECONOMIST

ANNUAL NUMBER — 1964.

The Eastern Economist Annual Number 1964 discusses the progress, problems and prospects of all the important industries of this country. It seeks to study how each industry has grown, visualise the rate at which and the lines along which it is likely to develop and assess critically the limitations on its progress as well as solutions for its problems. A study of our industries in these terms should be useful at the present time when there is a justified and widespread disappointment over the failure of many of them to achieve third Plan targets. In the belief that the best service that an economic journal can render to the country now would be to study and state objectively the obstacles to development in individual industries, the Annual Number attempts to present a comprehensive picture of India's industrial progress and discuss measures necessary to promote further growth of individual industries and ensure the steady industrialization of the nation.

A section devoted to stimulating discussions on contemporary economic history, national and international, is a special feature of this number.

Special Numbers of "Eastern Economist" have always enjoyed a wide readership both at home and abroad, and we are confident that the tradition will be maintained. This year's issue is a substantial one and includes colour graphs, charts and statistical tables. Priced at Rs. 10 per copy, it is available for sale at our office or with our Agents.

Sugar Industry can Produce More if Diversion of Cane is Prevented

By

J. S. MEHTA

THE susceptibility of the sugar industry to the vagaries of nature was fully exposed in the 1962-63 season, when production recorded a precipitous fall. Afater a period of surpluses, the industry was ironically faced with the problem of shortages.

In the 1960-61 season, production reached the all-time record of 3,026,000 tonnes, against an offtake of 2.38 million tonnes both for internal consumption and exports. The inevitable result was the accumulation of stocks amounting to 1.26 million tonnes, which caused unprecedented financial and storage problems for the industry. With a view to bringing about a balance between supply and demand and to help the industry out of the difficult position, the Government imposed a 10-percent cut on production in the 1961-62 season and alongside took steps to stimulate internal consumption by doing away with the irksome controls on movement and price of released sugar. However, it retained the power of regulating sugar supplies, the monthly quota for free sale being determined by it.

If the end justifies the means, the Government's policy was successful because, while production was pegged down to 2.73 million tonnes, the offtake for internal consumption rose appreciably to 2.56 million tonnes. Exports also increased to 373,000 tonnes. The cumulative effect was that the carry-forward stocks declined marginally to 1.01 million tonnes. To all intents and purposes, the carry-forward stocks were also excessive. But a new vista had been opened for the industry and it could safely look forward to a total offtake of about 3.1 million tonnes—2.6 million tonnes for internal consumption and 500,000 tonnes for exports. In the background of this increased offtake, the industry was looking forward to higher production. But belying all expectations production has registered a precipitous fall and is finally estimated around 2.16 million tonnes. This was notwithstanding the fact that the Government had lifted the statutory cut on production and factories were once again free to have unrestricted crushing. The number of factories working in the 1962-63 season was also higher being 185, against 179 in the preceding season.

Decline in Acreage

Against this, the cane acreage had declined slightly by about 8 percent, i.e., from 5.94 million to 5.49 million. Besides, there were the vagaries of nature such as big floods in some areas and droughts in others, which took a heavy toll of the cane crop. The crop failure brought in its wake increased diversion of the limited cane supplies to *gur* and *khandsari* producers. Consequently, sugar factories were starved of cane supplies, with obvious results.

The problem of the industry in getting sufficient cane was more acute in the two principal sugar-producing States, U.P. and Bihar. In fact, the overall decline in sugar production was principally confined to these two States only as would be seen from the following figures:

STATE-WISE PRODUCTION OF SUGAR DURING 1961-62 AND 1962-63.

Sl. No.	States	Sugar Production 1961-62 (Tonnes)	Sugar Production 1962-63 (Tonnes)	Percentage increase (+) or decrease (−) over 1961-62
1.	Uttar Pradesh	1,203,531	849,433	− 29.43
2.	Bihar	358,971	169,926	− 52.62
3.	Maharashtra	507,419	529,629	+ 4.38
4.	Gujarat	33,861	36,983	+ 8.95
5.	Madras	116,261*	107,569	− 7.48
6.	Andhra Pradesh	187,663	172,192	− 8.25
7.	Punjab	90,592	62,445	− 31.07
8.	West Bengal	16,081	10,773	− 33.01
9.	Orissa	4,242	3,533	− 16.73
10.	Madhya Pradesh	30,948	34,250	+ 10.67
11.	Rajasthan	15,551	13,714	− 11.86
12.	Kerala	10,769	12,011	+ 11.53
13.	Mysore	137,753*	134,127	− 2.64
14.	Assam	5,428	4,272	− 22.24
15.	Pondicherry	10,269	9,744	− 5.12
	All India	2,730,419	2,160,511	− 21.24

* Estimates.

In U.P. production declined by about 354,000 tonnes, compared with 1961-62, while in Bihar the fall was of 189,000 tonnes. These two States alone, therefore, accounted for 543,000 tonnes or about 93 percent of the net decline in production. Factories in U.P. and Bihar worked only for a limited period. In U.P. the duration of the 1962-63 season was 99 days, against 151 days in 1961-62 and the average duratoin of 148 days during the second plan period. In Bihar, the season was unusually short. Factories worked for 73 days only, compared with 148 days during the previous season and the average duration of 131 days during the second plan period. Production in some other States, instead of registering a fall, has in fact gone up. For instance, in Maharashtra production increased by about 4.38 percent, while in Madhya Pradesh and Kerala the increase was 10.67 percent and 11.53 percent, respectively.

Sugar is principally an agro-based industry and variations in output are not an uncommon feature of only the sugarcane economy. In other sugar-producing countries of the world too, variations in sugar output are witnessed, although rarely of the magnitude experienced in our country.

Voluntary Measures

It goes to the industry's credit that it was able to foresee if not forestall sugar shortages. As early as March 1963, the trends revealed the shape of things to come. By the end of March as many as 124 mills out of a total of 185 had closed down and it became clear that production would be much lower. The Chinese aggression further created a stir in the economy and sugar prices tended to rise somewhat. Fully conscious of its responsibility the industry came forward with voluntary measures to ensure equitable distribution of sugar to consumers at reasonable prices. A scheme of voluntary regulation was devised by the Indian Sugar Mills Association in close collaboration with trade associations. This scheme provided for a voluntary ceiling on ex-factory prices as also on retail prices at important consuming centres. Besides, other measures such as distribution through fair price shops were finalised and the release of the sugar quota for the month of April 1963 was eagerly awaited to put the entire scheme into operation. In Delhi and Calcutta such shops had even started functioning. The Association also undertook to arrange for the maintenance of buffer stocks at selected centres in Assam and West Bengal in view of the peculiar situations obtaining therein. But, meanwhile, by promulgating the Sugar Control Order, 1963 on 17th April, the Government imposed control extending to the whole of the country.

Inhibiting Controls

Sugar has been controlled notwithstanding the fact that controls, whenever imposed in the past, have tended to curtail production. In contrast, decontrol has invariably stimulated production. During 1942-47 when controls were in force production declined from 1.17 million tonnes to 927,000 tonnes. Sugar was decontrolled in December 1947 and there was a sudden spurt in output to 1.10 million tonnes. In September 1949 controls were once again imposed and production declined to 978,000 tonnes. After the policy was modified and incentives were given, production once again increased to about 1.48 million tonnes in 1951-52. The decontrol of sugar in 1952-53 stimulated both production and consumption, which continued to rise till 1957 when production was 2.10 million tonnes. When controls were reimposed in 1958, production dropped to 1.98 million tonnes. As is common knowledge, in October 1959 incentives were offered to sugar factories and cane growers to increase production, and in 1960-61 production reached the all-time high of 3.03 million tonnes.

The decline in production to 2.16 million tonnes in 1962-63 meant that a total supply of 3.18 million tonnes was available in the country, against an offtake of about 3.10 million tonnes both for internal consumption and exports. Under the circumstances, some sort of regulation of sugar supplies became necessary. But it is doubtful whether such elaborate control measures as were initiated by the Government were actually necessary, especially when the industry itself was working for a scheme of voluntary regulation of prices. India is a vast country geographically and it would be difficult to provide for an efficient machinery to enforce controls. Mere introduction of controls cannot help to keep prices in check if there is the real shortage. This has been the experience in the past when consumers had had to pay much higher prices than those warranted by the ex-mill prices fixed by the Government. This holds true for the 1962-63 season also when consumers generally found it difficult to procure their normal requirements at reasonable prices, despite the extensive measures undertaken by the State Governments.

Uneconomic Control Rates

Yet another unsatisfactory aspect of controls is the fixation of uneconomic prices. The ex-factory controlled prices notified by them after the imposition of control on sugar did not provide fully even for the actual costs, specially for the northern region and the various sub-regions therein. It is an accepted and time honoured principle of price fixation that the prices fixed should be such as to take into account the costs and provide for a reasonable profit margin. But the price of Rs. 40.50 a maund ex-factory notified by the Government for the mills in the northern region was much below the fair prices calculated according to the Tariff Commission's cost schedules. The factories in these regions, especially in eastern U.P. and Bihar, were already facing a precarious position due to very low crushing.

Further, the costs have gone up in the sugar industry since the last Tariff Commission enquiry in 1957-58. The Emergency Risks Insurance alone entails an additional burden of about Rs. 1 crore, and the incidence of the wage boards' recommendations would be around Rs. 4.5 crores. Further, costs of materials such as coal, firewood, lime, filter cloth and chemicals

have gone up by 17 percent, 47 percent, 30 percent, 13 percent and 17 percent, respectively. The interest rates payable to banks by the sugar factories for advances taken by them and the railway freight have gone up by 25 percent and 10 percent, respectively. Due to the steep decline in production the incidence of overheads has also increased. The overheads in the north in 1960-61 related to a production of about 1.9 million tons, while in 1962-63 the overheads had to be spread on an output of only 1.05 million tons. All these have added to the cost of production of sugar. No doubt, the manufacturing expenses too have increased, but they are much less in relation to the increase in cane costs and taxes. The fixation of unremunerative prices for the mills in northern India, specially for eastern U.P. and Bihar, has resulted in these mills suffering considerable losses year after year. Consequently they have not been able to rehabilitate thier worn-out plants and carry out modernisation or to expand their capacity as has been done by factories in other regions.

Exports Rise

The most welcome feature of the developments in the 1962-63 season was the increase in sugar exports. Sugar exports are no more undertaken merely to balance supply and demand. They are today an essential part of the Government's export drive to earn foreign exchange for the country. The industry's maiden attempt to produce raw sugar was marked with great success. Forty sugar factories undertook production of raw sugar, either wholly or partially, and produced among themselves as much as 269,000 metric tons. This sugar has been favourably received by foreign buyers including Japan, one of the world's leading importers of raw sugar and India's customer for the first time.

Production of raw sugar on a commercial basis opens up a vast scope to step up exports. Besides, bullish tendencies prevail in the international sugar markets. In May 1963 sugar prices shot up to £101 a tonne. Subsequently, the bottom fell out of the boom and prices declined to £50 a tonne. Prices have, however, shot up once again and while writing have reached the record level of £103 a tonne. Besides the above quantity of sugar, India has also exported about 230,000 tonnes of white sugar to different destinations. The total quantity thus exported this year is of the order of 500,000 tonnes and the foreign exchange likely to be earned is over Rs. 30 crores. The prospects for exports are bright because international prices are likely to rule firm. In fact, the Government has already finalised export contracts for 300,000 tons of sugar for 1964. Depending on production prospects, this may be stepped up further.

Need to Increase Output

In the context of the rising offtake, both for internal consumption and exports, the steep decline in sugar output in the 1962-63 season has caused considerable anxiety. The Government has fixed a target of 3.3 million tonnes for the 1963-64 season. This is the bare minimum needed to be in a position to cater to the rising internal demand and provide for larger exports. But the achievement of the targeted output is not going to be an easy task. The situation calls for a concerted effort on the part of all concerned.

It is heartening to see that the various difficulties being faced by the sugar industry are receiving better attention from the Government. Appreciating the difficult position of the industry in U.P., which arises from poor cane yields, the State Government appointed a high powered committee to consider the various problems and suggest suitable remedies. The committee has since considered the problems in all their aspects and submitted its report. Acting on its recommendations an intensive cane development scheme has been evolved to cover 4,000 acres of the reserved area of all factories in U.P., Bihar and Punjab. The expenses are to be met by the Central Government, the State Government, the factories and the cane growers their share of the total expenditure being one-third, one-third, one-sixth and one-sixth respectively. This is a welcome move.

Uneconomic Units

Simultaneously, to solve the problem of uneconomic units the Government appointed a special committee under the chairmanship of Mr. S. N. Gundu Rao to make on-the-spot enquiries. This committee has already visited U.P., Bihar and other States and is expected to submit its findings to the Government shortly. It is unfortunate that a large number of factories, especially in eastern U.P. and Bihar, are uneconomic mainly due to the lack of cane development work. Prolonged uneconomic working has crippled the industry in these regions financially, and factories do not have sufficient funds to carry out rehabilitation and modernisation of their plants at the prevailing high costs.

It is hoped that the Gundu Rao Committee will pay special attention to these regions where a large number of units are concentrated. It is no exaggeration that the economy of these regions is dependent on their future development and growth. Rehabilitation of these units is of particular significance because of the need for increased production.

The Government has also decided to resume licensing of further capacity. It is proposed to license an additional capacity of 500,000 tons during the next two or three years. A committee has been appointed to screen the various applications received for additional capacity and advise the Government about the suitability of the proposals in the light of the availability of cane supplies, etcetera. For proper and systematic development of the sugar industry it is necessary that additional capacity should be created by allowing the existing units to expand rather than by licensing new units. In the process not only would the foreign exchange required be less, but the additional capacity would also become effective in a much shorter period. Among the existing units, priority should be given to the uneconomic units to expand to economic sizes. This would be in larger national interests. Earlier, the Government had set a capacity target for the third plan of 3.5 million tons and had licensed new capacity accordingly. Out of this, licences for 200,000 tons had to be revoked due to non-implementation. With the proposed addition of 500,000 tons, the capacity now visualised for the third plan is 3.8 million tons. Against this, the effective capacity last season was about 2.7 million tons, and in the current season it is expected to be 2.8 million tons.

New Sugar Policy

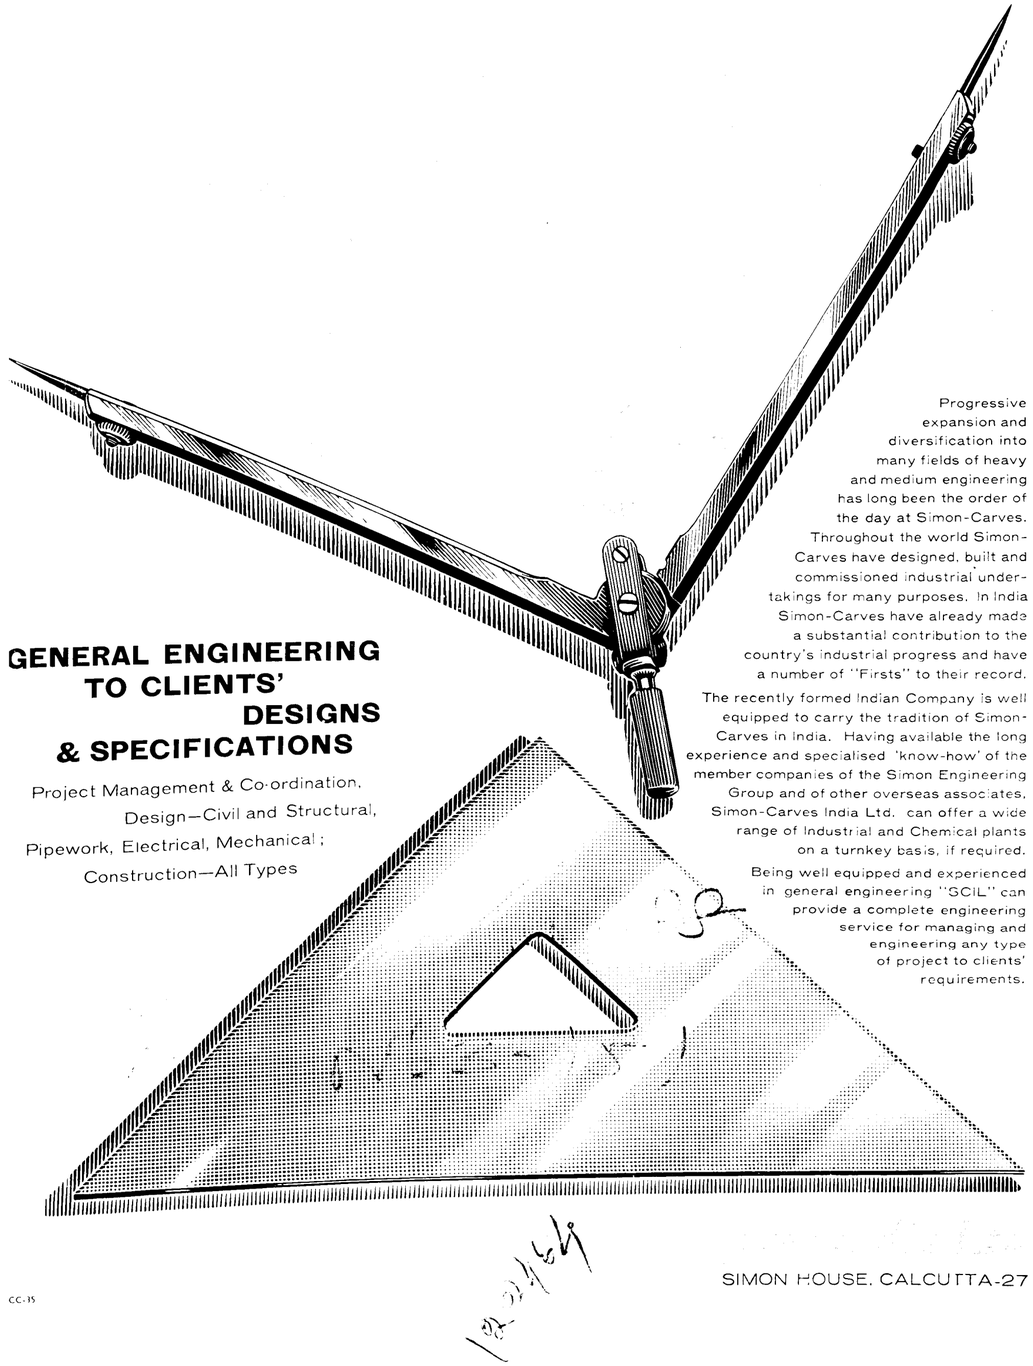
The steps undertaken for cane development, solution of the problem of uneconomic units and licensing of additional capacity are essentially long-term measures and are not likely to be of much help during 1963-64. If the target output of 3.3 million tons has to be achieved, steps have to be taken to make available sufficient cane to the factories from the existing crop.

The need for ensuring equitable distribution of the available cane supplies between the competing users, namely, sugar factories, *gur* and *khandsari* producers, is the basic postulate underlying the Government's new sugar policy. Realising the need to provide price incentives to cane growers, the Government has decided to allow an increase of 18nP a maund related to recovery at all points from 9 percent or below and upwards over 1962-63 cane price. The basic price at 9 percent or below would thus be Rs. 1.68 a maund instead of Rs. 1.56 and corresponding increases are to be allowed at all higher levels of recovery. The schedule of minimum cane prices on this basis has been worked out and the prices payable by individual factories have been notified.

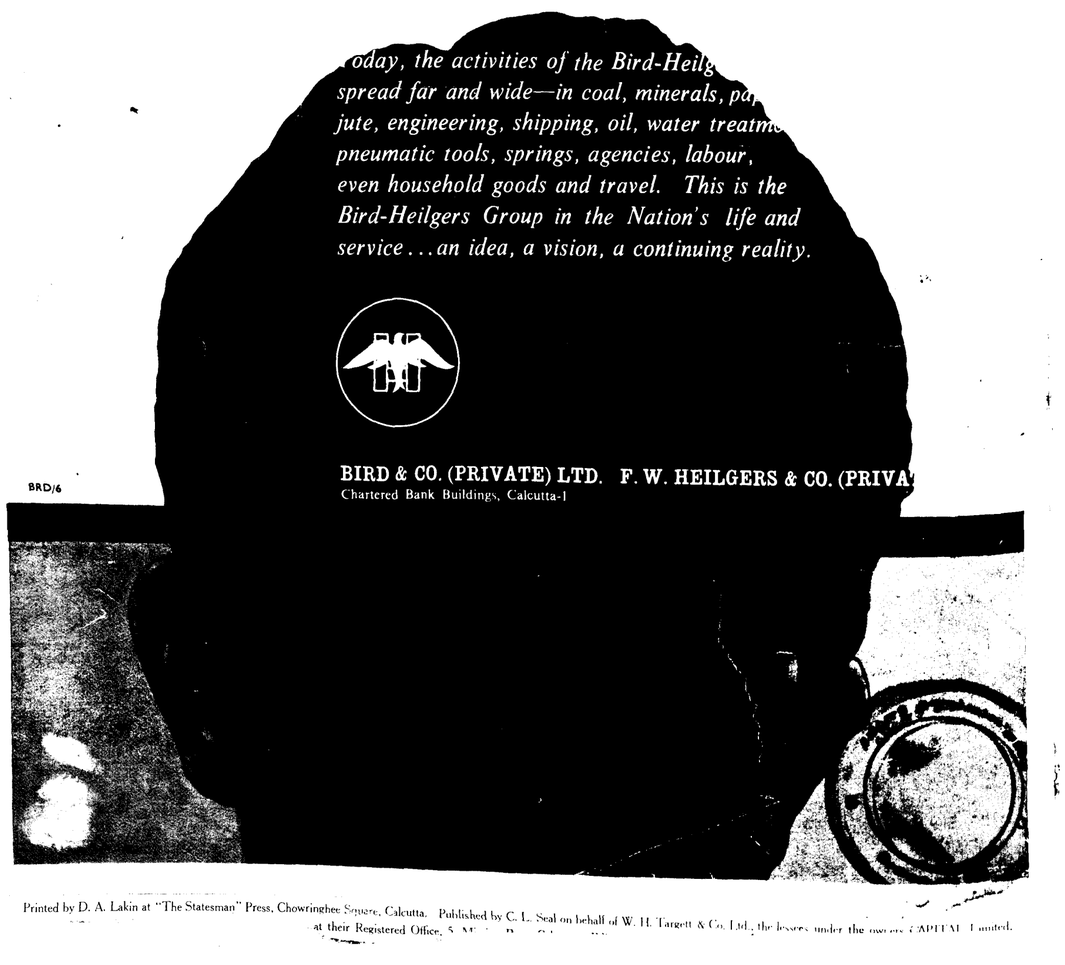
Further, the Government has announced that in areas where competition from *gur* and *khandsari* is intense, factories would be authorised to pay up to Rs. 2 a maund. It is understood that 77 factories have been authorised to increase cane price thus. The policy of permitting selected factories in certain regions to pay more is causing considerable difficulty to the neighbouring units, as the growers who are deprived of this are agitating for a higher price, specially in the eastern U.P. and northern Bihar. It is hoped that the Government will reconsider the matter and agree to raise the price for all the factories in the area to Rs. 2 a maund.

The maximum permissible deduction on transport of cane by road has been fixed at 12nP a maund as allowed in the case of transport by rail, which would in effect mean that growers transporting their cane from a radius of 8 miles to 24 miles will receive an additional 24nP a maund of cane.

This upward revision in cane price was called for to check diversion of cane supplies to *gur* and *khandsari* producers. The producers of *gur* and *khandsari*, by virtue of the fiscal advantage enjoyed by them *vis-à-vis* suagar as also due to the higher returns realised by them, are able to attract substantial quantities of cane.



Realising that price incentives to growers alone would not be sufficient to bring about equitable distribution of cane between competing users, the Government has added a new rule 125B to the Defence of India Rules whereby it has assumed powers to regulate cane supplies principally to sugar factories. These powers have been delegated to the State Governments. In exercise of the powers thus conferred, the various State Governments have initiated measures to ensure adequate cane supplies to sugar factories. For example, the U.P. Government has made it obligatory for growers in a factory reserved area to supply two-thirds of the cane to factories. In order to bring down the prices of *gur* and *khandsari*, which are ruling at a very high level, a Gur (Control) Order has been promulgated. All these measures are boldly conceived and have helped to bring down *gur* and *khandsari* prices. Although the need to ensure adequate cane supplies sugar factories has been realise from time to time, this is perhaps the first instance that such bold measure have been initiated for the purpo



Integrated Approach

It will be realised that with thr users competing among themselv for cane, any policy to achieve the d sired results must necessarily conce itself with all the three users. I therefore, follows that either all th three users should be brought unde regulation or they should all enjoy a equal degree of freedom. Hitherto,u fortunately, while sugar was subje ed to numerous regulatory measur which controlled the working of t factories, no such measures were a plied to *gur* and *khandsari*. The ne sugar policy for the first time reco nises the fact that mere regulation sugar without corresponding control on *gur* and *khandsari* would not yield the desired results and that what i needed is an integrated approach to the problem. The Government therefore, deserves to be congrat lated on its bold and realistic policy It is hoped that it would help formu late a suitable long-term policy fo sugar.

As far as incentives to the suga industry are concerned, the Goverr ment proposes, to give rebate in basi excise duty at varying rates during different periods on additional pro duction achieved over and above th output during the correspondin period in 1961-62. The rebate wou be 50 percent on additional prod tion between 1st July, 1963, and October, 1963, as compared with corresponding period of 1962, for tories that commence production ing this period. These are mostl the south. As regards other facto which commence production November, a similar rebate would available on additional product in November 1963, as compared w the production of November 19 For additional production during t normal season between 1st Novemb 1963, or 1st December, 1963 and 3 March, 1964, or thereabouts the fa tories would be entitled to a rebat of 20 percent in basic excise duty On additional production during th remaining period up to 30th June 1964, as compared to the correspon ing period of 1962, the factories woul be entitled to a rebate of 50 percen On the above basis the total rebat of excise duty has been estimated t be Rs. 4.5 crores, against Rs. 9 crore given in 1960-61 when a simila scheme of excise duty rebates was in operation.

It is clear that the Government i making an all-out effort to achiev a production of 3.3 million tons an has, in the circumstances, adopted realistic and bold policy. The indu try, on its part, has also extended its wholehearted co-operation. As many as 130 factories have started crushing up to the end of November 1963, and the total sugar production by that date may be about 100,000 tons higher than last year.
