Back from Pahalgam

THE EXIT of Hafiz Mohammad Ibrahim and Mr. K. D. Malaviya from the Central Cabinet has let loose a flood of speculation on what Mr. Nehru should do or might do in the direction of reconstituting the Government. Much of this discussion has been proceeding on the assumption that the country stands to benefit if the Prime Minister would send out a number of people from the Cabinet and replace them by others. It is not immediately obvious that this assumption is right. Now that Hafiz Mohammad Ibrahim has gone the only other senior Minister whose continuance in office can be automatically questioned is Mr. K. C. Reddy. Mr. Reddy has been a Cabinet Minister for much longer than is justified by the quality of his contribution as a member of the Government. Where a Minister is being kept on, say, for more than two terms or longer than ten years, this must be justified by his special competence. It cannot be said that Mr. Reddy satisfies this test. That apart, it is no secret that he has been a semi-invalid for some time now and has not been physically able to discharge his obligations on important parliamentary occasions.

It may certainly be argued that Mr. Reddy is not the only unremarkable man in the Cabinet. Dr. K. L. Shrimali and Mr. Humayun Kabir, to mention two, do not have any particularly distinguished record as Ministers of Cabinet status. That of course is true and the Prime Minister certainly erred when he took the decision to promote them from the junior ministerial positions they were holding earlier. For the rest it can hardly be contended that there are many Congressmen now outside the Government who, in terms of political stature, ability, experience or judgment, are clearly superior to the members of the present Cabinet and, therefore, are entitled to be allowed to replace them. On the contrary, on any objective assessment, the present Central Cabinet as a whole certainly represents as competent and worthy a team as Mr. Nehru is ever likely to piece together, shuffle or reshuffle as he may.

Those who plead for the reconstitution of the personnel of the Cabinet are apt to talk in terms of 'young blood' or 'new blood'. They forget that it is only the permanency of Mr. Nehru's Prime Ministership which gives the Central Cabinet its appearance of agelessness. The hard fact, however, is that, apart from Mr. Nehru, there are only three others in the present Cabinet — Mr. Jagjivan Ram, Mr. G. L. Nanda and Mr. K. C. Reddy — who have been continuously Cabinet Ministers for over ten years. On Mr. K. C. Reddy we have already expressed our views. As for Mr. Jagjivan Ram, although his ministerial tenure too has been quite long, he is still very much on the right side of 60. That his administrative and parliamentary talents are more than average will be generally admitted, while the fact that he has a certain position in our public life can hardly be denied. Mr. G. L. Nanda again is a very senior Congressman who has made a special and distinct contribution to Congress philosophy. It may be said that he has been too long in the Planning Commission; and, that would be true. The Planning Commission certainly needs new leadership which means that it calls for new ideas, whereas Mr. Nanda's role lately has been to apologise endlessly for the failure of old ones. It follows that, while it may be doubted that Mr. Nanda has any further useful contribution to make through holding special ministerial responsibility for Planning, the propriety of his continuance in the Cabinet as a Minister need not be questioned. The argument about new blood again does not seem to take into account the fact that there has been a certain amount of transfusion. The induction of Mr. C. Subramaniam, and more recently, Mr. Y. B. Chavan, cannot be ignored. Incidentally,

the presence of Dr. Sarimali and Mr. Kabir as Cabinet Ministers suggests that the argument about new blood is not always conclusive. New blood could be weak blood.

The case for letting in young blood, again, is not as conclusive as it may appear. It is an interesting fact that out of the 16 Cabinet Ministers, as many as nine are below 60, while five are 55 or less. It is true that the White House in Washington is biased in favour of men in their early forties, but then the President of the United States himself is 45. It is reasonable to suppose that our Prime Minister who is 74 may not feel as easy in the company of so much youthful zest as Mr. Kennedy might; and the first principle on which any Cabinet is composed is that the leader chooses the team he thinks he can feel easy with.

To our thinking what is important about Cabinet reform, therefore, is not whether Mr. Nehru is going to throw anybody out or even whom he is likely to bring in. The more significant issue is the better ordering of the business of the Government and the conduct of the Administration by the rationalisation of portfolios and ministerial responsibilities. If the Government has proved less efficient than the people are entitled to expect and its performance is poor in important areas of its responsibility, it is not so much because Mr. Nehru has failed to employ in his Cabinet men abler than his present colleagues, as because, through a series of errors of commission and omission, he has managed to construct a crazy quilt of criss-crossing ministerial jurisdictions, the final product of which must inevitably be frustration.

There has always been sufficient evidence that implementation of the various development programmes has been seriously obstructed by the confusion and overlapping of ministerial responsibilities. It is now becoming also clear that defence preparedness is suffering equally for the same reason. If the Prime Minister desires to improve the efficiency of his administration he would do well to give some attention to this problem. In the first place, the Ministry of Economic and Defence Co-ordination, as constituted at present, has created more problems than it has helped to solve. The Prime Minister will do well to abolish it and set up in its place, as a simple and straight alternative, a Ministry of Supply under which both defence and civil industries may be placed. It should be the responsibility of this Ministry to attend to both production and procurement. While in normal times defence production establishments such as the Ordnance factories are under the Defence Ministry, there is sound precedence for shifting them to civilian ministerial jurisdiction during a war or an emergency. In the present context there should be no objection to this procedure being followed. As regards civil industry, the existing division between heavy industries and consumer goods industries has proved unsatisfactory in actual working. No tears will be shed if this bifurcation is now ended.

It may be argued in some quarters that steel is a special case and that there should be a separate Ministry to look after it. The logic is not easy to follow. It is true that there is an important development programme in the steel industry, but a separate Ministry or a separate Cabinet Minister is not necessarily a condition for the proper accomplishment of this programme. After all, Mr. K. C. Reddy at one time and Mr. Swaran Singh at another did function as Minister for Steel without the steel expansion programme conspicuously benefiting thereby. Broadly speaking, there is undoubtedly much to be said for all industries, defence and civil, heavy and consumer goods industries, steel and others, being placed under a single Cabinet Minister at least for the emergency.

The lack of progress in agriculture has justifiably been a matter of national concern. It is now seriously to be considered whether the implementation of development programmes in this area cannot be energised or improved by the proper consolidation of ministerial functions and responsibility in the Central Cabinet. Now that the phase of large-scale development of hydro-electric power through multi-purpose river projects seems to be virtually over, it should be possible to contemplate the bifurcation of the Ministry of Irrigation and Power, absorbing Irrigation in the Ministry of Food and Agriculture. Additionally, the Ministry of Community Development may be wound up, but its worthwhile parts, such as Co-operation and an Agricultural Extension Service, may be united with the portfolio of Food and Agriculture.

Finally, the place of the Planning Commission in the machinery of Government needs to be examined anew. We are convinced that the Planning Commission should without further delay be reconstituted and reorganized so as to serve as a purely research and advisory body with no policy-making or executive authority whatsoever. This should be brought about by abolishing the post of the Minister for Planning and making the Planning Commission a part of the Prime Minister's Secretariat. In the new dispensation there will not be many occasions for Parliament to discuss directly the Planning Commission or its activities. But to the extent to which such necessity arises, the Prime Minister or a junior minister working under him could very well discharge the necessary parliamentary functions. The Planning Commission itself would only be a specialised body of persons, with a chairman, who will have no ministerial status and it would be expected to devote itself to broad issues of preparing the five-year Plans and generally advising on their implementation when a reference is made to it by a Cabinet Minister or by the Cabinet as a whole. That way, while the Government gets the benefit of a brains trust, its normal working and executive decisions will be freed from the delays and debates which are now constantly being caused by the Planning Commission being permitted

July 5, 1963

to concern itself with the day-to-day functions of the Government. Having said all this we are constrained to conclude on a somewhat cynical note — Mr. Nehru may find it easier to reshuffle personnel rather than portfolios, for while he could always take a few more

Banking in 1962

IT IS a picture of impressive strides made by banks in their diverse operations and of rapid expansion in their funds which "Trends and Progress of Banking in India" unfolds for the year 1962. The growth in the sources from which funds are drawn and the consequent ability of the banking system to direct their use to the supply of credit on a marked scale as well as to augment their investment portfolios are features of last year's development on which the Reserve Bank's statutory report focuses attention to the detriment of due recognition of the stresses and strains which their financial structure is undergoing and seems threatened to suffer more acutely in the near future. These are certain trends in the working of banks which utter a warning against complacency with the present expansion in their resources. Reduced profitability which is bound to react on the build-up of reserves and dividend distribution as well as the rigidity which is being imparted to their pattern of expenses are the chief among the strains. At the same time, Government's fiscal policy holds out the disconcerting prospect of deposit resources assuming inflexibility in their expansion. These warnings appear to pass practically unheeded.

Expansion of deposits (excluding P.L. 480 funds) attained yet another peak in 1962. As against the increase in total deposits of the order of Rs. 168 crores in 1961, the increase in 1962 was Rs. 233 crores, which was made up of Rs. 84 crores in demand deposits and Rs. 149 crores in time deposits. The major factors for this record expansion are two — the higher rate of deficit financing in 1962-63 and the higher rates of interest offered by banks on time deposits. The upward revision of the maximum rates on deposits in pursuance of the Inter-Bank Agreement and the differential allowed to the smaller banks served to provide a stimulus to the flow of funds in the banking system. The deposits insurance scheme, which became operative at the beginning of the year, undoubtedly produced a marked psychological effect in revitalising confidence and is rightly regarded as an important factor in reversing the incipient trend of diversion of funds from the medium and small banks in certain areas. The effect of the measures of rationalisation undertaken to strengthen the liquidity and capital funds of banks on the mobilisation of deposits is likely to be exaggerated, since they operate as intangible forces apt to escape the attention of the average depositor. Other noticeable features in the changes in the sources of bank funds may be recounted briefly. Cash and balances with the Reserve Bank were drawn

people into his Cabinet it must certainly be more difficult to persuade Ministerial empire-builders to disgorge territory or satisfactorily settle fine points of prestige, precedence and prejudice arising from every one wanting some one else's job.

upon at a faster rate—Rs. 23.1 crores in 1962 as against Rs. 13.6 crores in the previous year. Investments were not reduced as in the year before, while the increase in borrowings from the Reserve Bank was of the nominal margin of Rs. 3 crores. The paid-up capital and reserves recorded a sizable increase of Rs. 6.5 crores which is to be compared with the increase of merely Rs. 1.3 crores in 1961. It reflects the effect of the obligation to strengthen the capital funds by compulsory transfer of 20 per cent of the profits to the reserve fund.

While the resources position of bank is undoubtedly of basic importance to the expansion of their activity, "Trends and Progress of Banking" invariably places accent year after year on the developments in the supply of credit with the specific object of demonstrating the effectiveness of the credit control policy enforced by

Eastern Economist 20 Years Ago

JULY 2, 1943

We have the largest amount of iron ore in the world, next only to the United States and France, and what is more, they are of the richest variety and of excellent quality. About 3,600 million tons of superior ore are said to be available. Our coal resources are also vast, although some are of inferior grade. They are estimated at about 50 to 60,000 million tons. And yet India's production of steel is the lowest of all comparable countries. The fact is that under modern economic conditions, it is an anachronism to have a Government in a country that is not established by its own people. From the narrow point of view of economic efficiency, the thing cannot work. A Government must be completely identified with the people and should also enjoy the power to act independently to further the country's interests. The Government of India cannot claim that they satisfy either test. Their ear is more keyed to listen to British and even foreign interests. When the late Sir Jamshedji Tata put up his scheme for the iron and steel factory, vested interests in Britain shook their heads and said that it could not be done. Time has proved that those Jeremiahs were false prophets. Today to every suggestion of increased steel output, production of motor engines, cars, electrical equipment, machine tools, etc., the invariable response is that they are not possible in war-time, and this in the face of glaring instances of rapid advance in several countries. India can and should plan for the production of at least 5 to 6 million tons of steel within the next ten years. Even that is only a slow rate of growth.

the Reserve Bank of India. In so far as selective credit controls are concerned, the application of such controls generally produces the result of putting curbs on credit against specified securities. The follow-up procedure is not difficult for the Reserve Bank to pursue and violations of its directives cannot normally escape detection. But the claim of success for its overall credit policy has become something of a dogma for the past few years and it is in the light of this claim that trends in credit expansion need to be examined.

Over the year as a whole, in 1962, expansion of credit amounted to Rs. 146 crores in contrast with the much lower rise of Rs. 106 crores in 1961. In percentage terms the increases were 11.5 and 9.0 respectively. But this flat figure for the busy season and slack season combined gives no idea of the sharp behaviour of credit supply in response to the pressure of demand in the busy season or of the size of its contraction during the slack season. Some of the figures quoted in the report bear emphasis. The busy season of 1961-62 entered its phase of a high tempo at the start of the calendar year 1962. During the busy season as a whole, credit expansion reached the high water-mark of Rs. 204 crores which is to be compared with the figure of Rs. 199 crores for the previous season. There was yet another significant trend. The 1961-62 busy season extended to the first week of May, when the peak in the volume of credit was reached at Rs. 1,437 crores as against Rs. 1,320 crores in March 1961. At its height, the credit-deposits ratio in May last year was 73.2 per cent, while the previous year's corresponding figure was 72.5 per cent. The level of bank credit in the slack season is to be gauged by the volume of contraction. In the 1962 slack season the volume of credit contracted by Rs. 34 crores only in sharp contrast with the contraction of Rs. 78 crores in the preceding season and showed narrower disparities in seasonal fluctuations.

It is now pertinent to examine certain claims advanced by "Trends and Progress of Banking" in its appraisal of the credit policy. Stressing the role of the slab system of rates for lending to scheduled banks as the major instrument for restraining excessive expansion of credit, the report records its central finding that scheduled banks reduced their recourse to the Reserve Bank in 1962 as a result of two weighty factors — the satisfactory growth of deposits and the effective operation of the slab system of rates. Borrowings from the Reserve Bank stood at the maximum of Rs. 66 crores in 1962 as against Rs. 95 crores in 1961. Mention ought to be made in this context of another factor which contributed to the comfortable resources position of scheduled banks in 1962 — their ability to draw upon the cash and balances with the Reserve Bank to the extent of Rs. 23.1 crores as against Rs. 13.6 crores in 1961. But advertent to the first two causes, the report does not care to indicate how much of the decline in Reserve Bank borrowings could be attributed to the record de-

posit expansion and how much to the tier-system of rates.

There are, however, relevant trends on record about the latter. To constrain banks to rely more on their own resources, the three-tier system of rates was firmed up into a four-tier system from July 2, 1962. The rates were fixed at the Bank Rate of 4 per cent for the first slab of 25 per cent of the banks' average statutory reserves for the previous year and 6.5 per cent for the last slab in excess of 100 per cent of their reserves. Despite this change, in the slack season of 1962 (when the stricter system was introduced) borrowings from the Reserve Bank declined by a nominal figure of Rs. 3 crores as against Rs. 32 crores in the 1961 slack season. On the eve of the 1962-63 busy season, the slab system was tightened from October 31, 1962. Freedom to borrow in excess of 100 per cent of the statutory reserves at the penal rate of 6.5 per cent was taken away, and applications for borrowings above this line were subjected to special scrutiny and sanction in approved cases alone. But in the immediate context, the declaration of emergency upset the tenor of the different sectors of the economy. The efficiency of the stricter curb could not, therefore, be tested in the last two months of 1962.

The impressive expansion of the banking system, as indicated by the growth of deposits and credit supply, was accompanied in 1962 by a reverse trend in profits. The brief summaries of the working of banks disclosed in the statements at the annual general meetings have underscored this paradox. Actual figures, however, are available for 32 large banks with deposits of Rs. 5 crores or more. Their combined total earnings rose to Rs. 103.9 crores in 1962 as against Rs. 89.0 crores in 1961, but total expenses took a higher jump from Rs. 77.7 crores to Rs. 93.2 crores. Their profits were reduced in consequence from Rs. 11.2 crores in 1961 to Rs. 10.7 crores in 1962. The causes responsible for pushing up expenses and pruning the profits are now matters of common knowledge. Chief among them are the steep increase in establishment expenses mainly due to an increase of 10 to 12 per cent resulting from the Desai Award, the payment of premia for deposit insurance, expansion of branch offices which need to be subsidised by the older ones and the increase in the corporation tax from 45 per cent to 50 per cent imposed by the 1962-63 budget. Fiscal burdens continue to be added and the super profits tax, even in spite of its modifications in its application to banks, is the latest addition. The Compulsory Deposits Scheme is likely to show its adverse repercussions on the expansion of bank deposits in a community where modest savings are made more difficult by inflationary pressures on the cost of living. But if expenses are being made more rigid, larger resources must be raised to augment earnings even at a relatively higher cost. It is difficult to see how the drive for deposits can be pushed without the offer of competitive interest rates casting their shadow on the cost of bank credit.

Highlights of the Week

DEFENCE PRODUCTION

IF PUBLICITY is a weak spot in the Government's effort to boost the morale of the public for the defence effort, it is typically represented by a recent official handout which passes under the caption, "Gearing Up Defence Production". In an informative and business-like publicity document, a historical preface, even if brief, on the Government's policy for defence since independence, looks out of place. The harsh truth is that China's sudden and treacherous attack gave a rude shock to our complacency in the matter of modernization of arms and defence equipment. The handout in question lacks in clarity since it confuses procurement of defence equipment with indigenous production. This conclusion mars the utility of the effort to take the public into confidence to explain how domestic production of modern arms and equipment — undoubtedly of the medium and small range — is being stepped up.

Only precious little has been disclosed in this handout, although more information could have been imparted to the public without defeating the ends of security. The important facts on which fresh information is made available are that technical schools have been opened to train technicians and skilled workers in the six new ordnance factories which it is contemplated to establish in the course of the next three years in addition to the existing 20 odd units. The existing ordnance factories are working multiple shifts—which is quite obvious and their production has been increased four-fold. Top priority is being given to the manufacture of automatic weapons. It is, of course, absurd to expect a disclosure of the types and ranges of the automatic weapons whose production is taken in hand. But the point of emphasis is that for our immediate requirements overseas procurement and not production is of material value.

Concern for secrecy has been carried to an excessive degree and the public has been told what it either knows or can easily guess. Manufacture of arms and ammunition is exclusively reserved for the State sector in terms of the Industrial Policy Resolution, but the handout points out with an air of breaking confidential information, that there is a wide range of defence stores which can be produced by the private sector. This source is being tapped for expanding the supply of the stores badly needed by the army. What these stores are is a matter of public knowledge in other countries and nothing would have been lost by revealing how private industrial capacity has been geared to the production of specific defence stores. In that case the private sector would have been in a position to make positive proposals about entrusting to it items not delegated to it so far. One is constrained to observe that this document running into four sheets will come as a disappointment as throwing no mentionable light on the progress of defence production.

INDO-U.S. BARTER DEAL

LAST WEEK the largest ever barter deal negotiated in the history of the United States was concluded when India and the United States signed an agreement at Washington according to which this country agreed to export strategic materials, such as manganese ore in exchange for cotton and other farm surpluses from the United States. The terms of the deal made known so far indicate that India will receive approximately 300,000 bales of cotton and some farm surplus products from the United States, while the United States will get nearly 336,000 short tons of manganese ore, beryl ore and mica. The total value of the goods which will be bartered comes to nearly \$40 million. The deal will be transacted by the United States through the United States Agriculture Department's Commodity Credit Corporation which will be responsible for

supplying cotton and other farm products. The strategic materials, particularly manganese ore, which will be exported from India to the United States will be processed by the US industry into manganese metal and high carbon ferro-manganese for stockpile of strategic materials.

The importance of the barter deal lies in the fact that, hitherto, cotton and other food surpluses have been imported under PL 480 for which payments were made in rupees. According to the new deal, the problem of payment in rupees does not arise. At the ceremony organized in Washington for the signing of the agreement, Mr. B. K. Nehru is reported to have said that he was "not sure who got the better of who". In fact, it should not be a difficult exercise to determine as to what price India has received for its exports. The international prices of both the farm surpluses and the ores being known, it should be only a problem in arithmetic to know if the Indian Union had received a favourable price for its exports or not. Possibly, Mr. Nehru did not intend his observation to be taken in a serious vein. The fact, however, remains that the barter deal has obviated many of the difficulties which the sale and purchase of goods on such a scale usually entail. Mr. S. K. Patil, on his return from the US recently, had promised that agricultural shortages in this country would not be allowed to take a serious turn because arrangements were being made for the import of wheat, cotton and other farm surpluses from the US. The present deal is one in the same category to supply the much needed agricultural products to this country. The agreement is not only an example of the "intimate co-operation" that exists between the two countries but also an earnest and generous effort on the part of the US to make the Indian experiment in democratic planning a success.

TRENDS IN CAPITAL ISSUES COSTS

THE DEPARTMENT of Company Law Administration has conducted an interesting analysis into the various trends and changes that are undergoing in the recent past in the costs incurred for raising capital for new floatations or expansion of existing enterprises. Fifty-five cases of capital issues in the market for 1962-63 were selected for this analysis. These issues represent a cross-section of ventures so that the trends may be regarded as comprehensive in character.

The pattern of costs reveals one dominant feature. Excessive reliance on underwriters, brokers and sub-brokers is being reduced at a marked rate. This dominant trend is noteworthy since it reveals that company promoters are developing increasing confidence in direct approach to the capital market and leaning less on intermediaries, that support from institutional investors as well as the keen interest which the investing public is taking in subscribing to new issues have begun to emerge as important factors. This is an encouraging sign of the progress of the capital market towards modernization.

Out of the fifty-five cases of capital issues and the prospectuses of the companies concerned, which were investigated for the analysis, about one-half disclosed that they had no arrangements for underwriting. Considering the conventional role and influence of underwriting, this is surely a noticeable change. The number of issues in which there were no broking arrangements at all were, of course, not expected to be of a high order, but the Department of Company Law Administration's analysis has recorded its finding that five companies did not resort to brokers at all. Even so, this is over 9 per cent of the issues selected for study. There was yet another class of cases in which recourse to local underwriters was unnecessary because of the special arrangements of foreign collaboration or support from large-scale investing institutions — the ICICI being the one under reference. This class of

cases has been becoming a permanent feature of new company formations, but its share in the total number of floatations is bound to remain small.

Some of the statistical comparisons in this analysis should prove instructive. The outlay on raising share capital is progressively decreasing. As against a ratio of 4.5 per cent of the issued capital as the cost incurred in raising capital in 1961-62, the ratio dropped to 4 per cent in 1962-63. Taking the total cost of the project, the ratio of expenditure on raising capital to the aggregate project cost declined from 2.4 per cent in 1961-62 to 1.9 per cent in 1962-63. In individual cases, however, the analysis shows wider variations showing higher costs as well as lower costs. A follow-up study of this particular aspect of company floatations in the coming years should prove useful now that the capital market is emerging into a more mature and modernized avenue for funds.

LAND ACQUISITION FOR COMPANIES

THE GOVERNMENT of India has issued the rules governing the acquisition of land for private companies engaged in any industry or business which is for a public purpose pursuant to the amendment to the Sections 40 and 41 of the Land Acquisition Act. Under the amended Act, the rule making power has been removed from the State Governments in view of the disregard shown by them to their normal responsibilities to agriculturists who would be dispossessed and it is vested in the Central Government. These rules will have to be placed before both the Houses of Parliament which may exercise their right to suggest modifications, if necessary.

The rules now issued aim at ensuring that compulsory acquisition of land for private companies is made only where it is indispensable and that too after private negotiations for its sales have failed, that high-grade agricultural land would not be acquired to the extent it is possible and that the additional delays in the payment of compensation would be cut short. The last object is of course important inasmuch as compulsory acquisition would result in many cases in the displacement of the land owner from agriculture and require his resettlement in another avocation.

The District Collector, who will be directly responsible for carrying out the acquisition proceedings, will have to satisfy himself of the failure of private negotiations on payment of a reasonable price. He will also have to take into consideration the fact whether the land is suitable for the purpose of the company, whether its area is not excessive, whether it comes under the category of high-grade agricultural land without any alternative land for the site or construction work and whether the company in question is in a position to put the land to use expeditiously.

The State Governments will not be entitled to undertake the acquisition proceedings ordinarily under the special powers conferred on them for acquisition in cases of urgency, unless, of course, an exceptionally strong case is made out in this behalf. A novel feature introduced in the acquisition proceedings is the setting up of Consultative Land Acquisition Committees in the States whose advice must be sought before the declaration for compulsory acquisition is made by the State Governments.

Strict obligations are being laid on the private companies for whose benefit the land is being compulsorily acquired. A company has to deposit with the Collector a specified amount not exceeding two-thirds of the amount of compensation before the land is delivered to its possession. This is to be paid without undue delay to the owner of the land acquired. Proper utilisation of the acquired land is to be enforced by special agreements which the companies have to execute with

the State Government. These agreements would contain stipulations requiring that land would not be used for any purpose other than the one for which it is acquired, that the building or any other work should be completed within three years of the delivery of the land to the company (unless, of course, there is some exceptional justification for extension of time) and that if any of the stipulations is violated, the entire land or the unused portion of the land would revert to the State Government and the company in question would forfeit an amount not exceeding one-fourth of the total amount paid by it as compensation. It is not clear from the notified rules whether the dispossessed owner of the land has a right of pre-emption to buy the entire land or the unused portion of the land which would revert to the Government. The company in question is debarred from transferring the acquired land or any portion of it, by sale, mortgage, gift, lease or in any other manner, except with the previous sanction of the State Government. Rules have also been framed laying down the conditions under which the State Governments may sanction such transfers.

RAJASTHAN: TRAINING THE SERVICES

THE REPORT of the State Committee on Training, Government of Rajasthan, released to the Press recently lays stress on the centralisation of training institutions. It means that training institutions of all general services should be located at one place preferably in the University town. The advantages claimed are economy in expenditure and co-ordination in training programmes. In view of the fact that there remain regional demands to be satisfied within the State itself, it is difficult to understand how a beginning can be made in this direction. As regards interchange of field and college staff, it is also difficult to comprehend how teaching staff would be able to undertake the field duties particularly when they do not possess the requisite background for such work.

So far as the administrative services are concerned, it is, of course, a good idea that the officers of the RAS and IAS be attached for one month to an agricultural college as they have to deal with agricultural programmes in the discharge of their duties. During this period they would get acquainted with the different types of crops, soil, water and climate conditions under which they grow, operational details connected with cultivation, soil conservation practices etc. To cope with the changing administrative requirements, some modifications are suggested in the administrative training course conducted at Jodhpur for the administrative services.

For the technical services, the State Committee on Training has suggested that the officers of these services be encouraged to write articles and papers on various aspects of the problems they are dealing with. Writing articles will encourage the personnel to take an active interest in their subjects and keep them posted up-to-date with the recent developments. These papers may be examined by the departmental committees and mention may be made in the annual confidential reports of all articles and papers which are considered to be meritorious. Stress is also laid on the publication of journals from technical institutions. It is a pity that from most of these institutions, such as medical, veterinary, agricultural, engineering etc., no technical journal is being published. A quarterly, if not a monthly, journal could be easily published by most of these institutions in which articles could be subscribed by members of the staff, students and experts in their respective spheres.

To improve the level of education in the State, it is considered desirable to arrange special courses for lecturers under the auspices of the University of Rajasthan in which instruction in such subjects as techniques of teaching educational psychology, maintenance of class discipline and similar subjects may be given.

A POLICY FOR RAILWAYS—IV

The Cost of Carrying Coal

By T. M. RAO

THE PRODUCTION of coal in India is estimated at 97 million tons by 1966, representing an increase of 37 million tons over the target set for the end of the second Plan (1956-61). This is going to tax the rail capacity on the eastern railroads to the utmost. For bulk movement of coal, the railways have programmed to build 8 wheeled BOX type freight cars with centre-buffer coupling and a pay load of 55 tons. These BOX cars would go to form 3,600-ton trains hauled by twin diesel units. Trials have also been made to run 7,000-ton trains. The idea was to run these trains from the coal fields to distribution centres located at different points in the country, where coal dumps would be created. It was felt that this was the only way to meet the extraordinary demands of coal movement.

In the United States for bulk movement of coal, similar ideas have been put forward. One of the most publicised is a semi-permanently coupled "integral" train. The integral train concept devised by the Consulting Engineering firm of Theodore J. Kauffeld of New York is simply that of applying to railroads the same basic idea of the ocean bulk carrier. The vessel arrives in port to find its cargo waiting, loads it quickly, proceeds to the port of destination where it unloads quickly and is ready for another cargo. The integral train is expected to perform a similar operation. The new type of train could arrive at a loading point when a shipment of coal is ready, load quickly, operate speedily over the railroad, stopping only to change crews, arrive directly at the destination, unload, refuel and be serviced and then be ready in a matter of hours to return to the same mine or proceed for another load of coal.

Saving in Costs

This is a departure from the present practice of loading each day's output into hopper cars at the mine, and then moving the cars to classification yards, to be made up into trains for operation over the railroad. At destination terminals the cars are again classified according to delivery points. A considerable amount of time and money could be saved if the intermediate handling of cars could be avoided.

It would appear that approximately a 25,000 ton pay load per train would be a minimum. As presently conceived, the integral train will consist of four-axle cars with a maximum total weight of 251,000 pounds each and will be designed for a particular service. For coal service the cars will be permanently connected in blocks of four to seven by drawbars, without the use of couplers within blocks. By assembling the train from such permanently connected units, there will be a reduction in the number of draft gear couplers, etc., leading to a reduction in both tare weight and cost.

The power for the train consisting of 250 or more cars will be distributed throughout its length. It would be accomplished by the use of 2,500 h.p. units in four groups of two units each, located at the midpoint of each group of 60 cars. The controls of the locomotive units could be activated in unison by means of electrical cables stretching the length of the train, from a control cab at one end to an identical cab at the other. Thus the train would operate in either direction without having to be turned.

It is estimated that the cost of running an integral train of 270 cars over a 500-mile stretch could be as low as 84 cents

THIS DISCUSSION of the different modes of coal transportation is of topical interest to transport planning in this country where it has become as necessary that coal should be transported economically as that it should be transported adequately. When so much of our new investment in the Railways is directed towards expanding facilities for the transportation of coal, Mr. Rao's warning that it might be uneconomic to sink large amounts of scarce capital funds in amplifying rail capacity in this manner until alternative modes of transportation have been thoroughly investigated clearly needs to be listened to.

per ton of coal carried. The costs include a return on investment of 8 per cent. The charge for hauling coal on a similar run at present rates averages about \$3.50 per ton.

The integral train is expected to contribute toward railroad fixed costs, thus reducing the burden on other traffic. It is probable that it will contribute more than the conventional train it will replace. The integral train concept will strengthen the trend toward maximising the inherent advantages of each mode of transportation.

Another idea in the making to help bulk transport of coal is a network of coal slurry pipeline. Coal slurry is a mixture of coal and water in varying proportion—up to 70 per cent coal and 30 per cent water. It is ordinary coal that is mined and pulverized into a fine grain, mixed with water and poured into the pipelines, where it is pumped directly to the furnaces to be burned.

It is reported that Babcock and Wilcox Company who pioneered this idea, have held satisfactory demonstrations of slurry in a sixty-five — thirty-five mixture burned directly in boilers. The problem of what to do with the thousands of gallons of water seems to have been successfully solved.

Economic Need for Pipeline

George H. Love, Chairman of the Consolidation Coal Company in the United States, told the United States Senate Commerce Committee that "the economic need (for slurry pipelines) is great, the technological means and the raw resources are available and capital and labour are ready to perform. Only the right to acquire the right of way is needed."

In its April 30 issue, "Electrical World" said that a fully operating slurry line could deliver coal to Boston for 30 cents a million B.T.U. This may be contrasted with the rail-delivered price of about 37 cents a million.

"Gasund Wasserfach" a German publication, reported in its March 30 issue:

A hydraulic pipeline was designed by the Polish Central Mining Institute. Coal at a size up to 50 millimeters was transported over a distance of 200 kilometers (126 miles). Transporting costs for coal were 50 to 65 per cent less by pipeline than by railroad and capital costs were 80 per cent less.

The threat of a network of coal slurry pipelines has naturally caused concern to the railroads in the United States. The railroad people admit that coal pipelines offer transport-

ation at least 15 per cent cheaper than present railway rates. They, however, point to the integral train as a weapon in meeting the threat of competitive rates posed by slurry pipelines.

The conversion of coal energy into electricity near the mine and transmission of high-voltage power to distant points is another alternative which dispenses with the physical transport of coal over long distances. Until recently the limiting factor to the construction of large power plants in mining regions has been the availability of water. This difficulty has been largely overcome by new developments such as the hyperbolic cooling tower.

Mine-Mouth Generation

In the United States the trend toward mine-mouth generation seems to be growing. As an illustration two large power plants will be built shortly for the two new intertie systems recently created, viz., the Pennsylvania-New Jersey-Maryland Interconnection which will have a 1,600 mw power plant near Johnstown, Pennsylvania, and the Allegheny Power System which will be supplied from a 500 mw plant on the Monongehela River near Morgantown, West Virginia. These two systems combine the distribution network of 17 existing companies.

In Europe the mine-mouth power plants seem to be popular. The Emile Huchet Power Station in the mines of Lorraine in France has an installed generating capacity of 450,000 kw. Large size coal is brought to the station by rail, while fine coal, in the form of water slurry is carried to the station by pipelines. The slurry constitutes 80 per cent of the fuel consumed in the twelve Babcock and Wilcox pulverised coal

boilers. The coal slurry, upon its arrival at the station is first decanted and filtered, then dried from 24 per cent moisture to 8 per cent in four turbo-driers and the pulverized coal is then fired. At the Emile Huchet Station, cooling water is regenerated in hyperbolic cooling towers.

In the United States the railroads seem to fear that the mine-mouth power station would pose a more serious threat to their competitive position than the slurry pipeline.

In an interview with "Power" magazine, Frank Soen, Assistant Vice-President of the New York Central System, made the following comments on the emergence of the mine-mouth power station.

"Railroads today can carry coal at the same cost per B.T.U. as these transmission lines can carry energy. With the consent of I.C.C., the C & O Railroad recently offered coal rates equivalent to Virginia Electric Power Company's estimated cost of transmitting electricity over its planned 500 kv line. Yet the utility company went ahead and is now building its line. This will be an interesting test case." 2

In India a beginning has been made in mine-mouth generation of power with the inauguration of the 250 mw Neyveli Power Station in August 1962. It is built in the very midst of the lignite belt in South India and is the first power station in the country to use lignite as fuel.

In the United States, up to 90 million tons of coal is delivered to steel mills and power plants by water carriers. This roughly accounts for 36 per cent of all coal consumed by both the steel and power plants.

The barge lines have begun to emulate the railroads im-

Our Prime Motive Is Not To Sell But To Serve Your Purposes Through Our COMPANY FORMATION AND CAPITAL ISSUE ENCYCLOPAEDIA

Pages: About 1000

Price Rs. 75/-

What purposes of yours may be served

If you are an entrepreneur or a director, or a secretary of an executive and you are thinking to start a new undertaking or turning over your mind a scheme of expansion, your immediate problems would be — how to tap the capital market and how and where to get the loans, what form of organisation would be most suitable, what are the tax burdens that you may have to bear, how to apply for industrial licences, how to get the necessary foreign exchange for foreign collaboration or imports of plant and machinery etc. Now if you choose the company form of organisation you would next like to know all about its floatation, issue and allotment of shares, procedure to take consent from the Controller of Capital Issues or procedure relating to Stock Exchange enlisting and so on.

All these and many other items related directly or indirectly with a capital issue have been fully discussed in a simple language in both of their legal and procedural aspects to guide your steps in finalising and materialising your scheme, however ambitious they may be. Relevant lists of important brokers, underwriters, financiers, foreign collaborators, bankers, etc., have been incorporated to make the contents richer than ever. You would find the publication unique for your purposes.

their efforts to reduce rates by using larger and more efficient-ly operated equipment. They are building larger barges of 1,000 to 1,500 ton sizes, capable of discharging the load within an hour where proper equipment is available at the terminal.

A spokesman for Dravo Corporation told "Power" magazine recently, "It's the size of the locks on our rivers in coal-producing areas that limits the size of our barges. But locks built today are 110 feet wide, to accommodate three 35 foot wide barges. Thus 16, 195 foot long barges, and a tow boat can be contained in one lock. This matches the size of the shuttle train load, and it's easier to unload. Now barges are also built much more sturdily: they have a stronger longitudinal frame rather than a heavy transversal frame, it withstand shocks better than older barges." 3

The purpose of the above discussion is to indicate the alternatives that are available in the field of bulk coal transportation. Given the location of the coal fields and the demand for coal at different points in the country, the opportunity costs involved in developing the different alternatives must be worked out. In any such calculation, the possibility of mine-mouth generation of power on a large scale in the future and the consequent reduction in the demand for long-distance transportation of coal must be included. When such a picture of the range of alternatives and economic costs involved in each of them is available, it will be possible to choose one alternative rather than another based purely on rational considerations. To my knowledge, such a cost analysis of different forms of transportation has not yet been made by the Indian Planning Commission.

In the United States comparative costs of the different energy-transport systems have been developed and are reproduced in the following table. In their very nature, they are rough estimates but they do present a useful guide to the alternatives available and the magnitude of investment involved in each of them.

Take for instance the slurry pipelines. It may offer a solution to the coal transport problem in India and paradoxical as it may seem, relieve the railroads of its major head-

ache. There are two reasons for making such a suggestion.

First is the fact that all the major steel plants are located within hundred miles of the Bengal-Bihar coal fields. Coal transport by rail over those short distances is not only uneconomical but has created problems for the railroads in this highly congested area which threaten to interfere with the efficient transport of coal over long distances. At the existing level of freight rates transport of coal seems non-compensatory. Most of the coal cars return empty and not only do not earn revenue but adversely affect line capacity slowing down the movement of other freight. It is also fairly certain that the rapid increase in the demand for coal transport would call for very heavy capital investments in railroad track and equipment which may fail to yield an adequate rate of return.

Capital Costs Favourable

Secondly, owing to their close proximity to the coal fields, the capital costs of building a network of slurry pipelines to feed the steel plants and power stations would seem to be far less than a network of railroads.

There is, however, some question whether it is technically feasible to transport metallurgical coal for steel mills in a slurry pipeline. It was learned from discussions with men experienced in furnace technology that there was nothing in the coal slurry that would preclude its use in steel production and if there was a limit to moisture content in the coal, it could be achieved by drying the slurry on arrival at the steel mills.

Until the alternatives outlined above are thoroughly investigated and a rational decision made on the most economic mode of coal transportation, it would seem a folly to sink enormous capital funds in increasing rail capacity merely to transport coal.

From Our Special Correspondent

PARIS:

EYEBROWS were raised here last week on reading a statement by the US Joint Secretary of Commerce, speaking to the annual conference in Washington of the American Marketing Association. Said Mr. Richard Holton, "If Europe is reasonable in the tariff negotiations on the Trade Expansion Act, the United States will be able to restore their balance of payments". The enormity of this claim is not immediately apparent and indeed will not become so to many Americans who will find in it further support for the belief that their country's monetary difficulties are due, basically, to the cussedness of a protectionist Common Market. Let the Six throw off the sinister domination of Gaullism and accept the modest proposals contained in President Kennedy's trade schemes, and the USA will be able to pay its way in the world. There is, fortunately, reason to think that some of Mr. Holton's colleagues do not accept this simple view. For example, when the Secretary of State, Mr. Dean Rusk, was urged by some Senators who are angry that Europe will not consent to be flooded with hygienically dubious American poultry, he pointed out that the USA had no interest in practising reprisals because it runs a surplus in its commerce with the Common Market.

Still, the full meaning of Mr. Holton's statement is worth elucidating because it reveals what is behind American anxiety to see Mr. Kennedy's trade plans adopted and explains the determination of European opposition to that proposal. In taking Mr. Holton quite literally, we risk exaggerating his meaning but scarcely betraying it altogether. The US payments deficit in the first quarter of this year was \$672 million or, seasonally adjusted, \$820 million. This means that the annual rate is \$3.3 billion (our billions are American billions from here on, since we are talking of dollars), compared with an actual deficit of \$2.2 billion last year, \$2.4 billion in 1961, \$3.9 billion in 1960, \$3.7 billion in 1959 and \$3.5 billion in 1958. Thus, to balance her international payments on aggregate account, the USA has to earn or save an extra \$3 billion a year.

Trade Surplus

Mr. Holton evidently thinks that this tidy sum can be found in a trade surplus. But the country's external trade is already leaving a very respectable surplus. That surplus this year so far is running at an annual rate of \$4.1 billion, somewhat reduced from last year's actual \$4.4 billion compared with \$5.4 billion in 1961. So what the Joint Secretary of Commerce envisages is a favourable trade balance of around \$7.5 billion a year, i.e. the present surplus plus the extra to be earned in order to wipe out the payments deficit. What's more, Mr. Holton thinks that most of these additional trade earnings can be scored in Europe, since the matter depends, he says, on Europe's reasonable attitude in the tariff negotiations next year on the Kennedy plan. And of course he is correct to the extent that the only place where the USA can make significant trade gains is West Europe, more specifically the Common Market, for there alone does one see the required combination of rapid industrial growth, rising incomes and a certain Americanisation of life. That the citizens of the Six countries are receptive to American wares may be seen in the fact that their imports from the USA have jumped from \$2.8

billion in 1958 to \$4.45 billion last year, and by now, at mid-1963, we must be able to say that they have doubled in five years. If they were to double again in the coming five years, or sooner, Mr. Holton's recipe for balanced payments would be well on the way to being realised.

The difficulty is that this trade between the USA and the Common Market is leaving a substantial surplus in American favour. That surplus was \$1.144 billion back in 1958, because against the above-mentioned imports from the USA of \$2.8 billion, exports to the USA were \$1.664 billion. By last year, the US surplus in commerce with the Six had grown to \$2 billion, because while imports from the USA mounted, as noted, to \$4.45 billion, exports to the USA had increased to only \$2.446 billion. Taking Mr. Holton at his word, he envisages that much of the extra \$3 billion that the USA has to earn in foreign trade to balance its aggregate accounts can be added to this surplus of \$2 billion in trade with the Common Market. That is, the Six's deficit in trade across the Atlantic should grow from \$2 billion to \$4 or may be \$5 billion. For memory, one should recall that the Common Market now runs a deficit in its trade with all the outside world, of the order of \$1.69 billion last year (up from a mere \$245 million in 1958 before the "closed, inward-looking and protectionist" European Community came into existence.)

American Design

Without attaching too much importance to these particular figures, one is now in a position to appreciate what the Americans mean by equal and mutual trade and tariff concessions between themselves and the Common Market. They mean an arrangement that will cost the Six several billion dollars a year, to add to their current deficit in this bilateral trade. By making carefully balanced concessions, on the lines suggested at Geneva by Mr. Herter, West Germany's deficit of \$405 million in trade with the USA last year, and France's similar deficit of \$349 million, could be expected to double. In practice, equality would mean a vast inflow of American goods into Europe and perhaps a moderate increase in European exports to the USA, in sum to unilateral advantage for the bigger partner.

In reality, matters would not have to go so far for the US payments deficit to disappear. Seeing that it was easy to flood West Europe with goods, American corporations would stop exporting capital to found businesses in the Common Market and would prefer to manufacture at home. American unemployment would thus diminish, and the moderation of the capital outflow (which is all that enables European countries to balance their payments with the USA at present, given their trade deficit) would cease to burden the US payments account. The solution is thus in every way ideal for the Americans and Mr. Kennedy is to be congratulated on his patriotism for having thought of it. The trouble is that it would entail the annihilation of much West European enterprise, and the ruination of most of the Continent's farming communities. The reply that the Europeans could, in this freer trade climate, make important gains in the US market is not taken seriously by Mr. Holton and his colleagues, because they see it as assured that the USA will make large unilateral trade advances, to the tune of some \$3 billion a year. If the Kennedy proposal were to lead to an expansion of trade in approximate balance, or without worsening the

present Common Market deficit, it would be of no interest to Washington.

It could be of course that in all this the Americans are being too optimistic. A comparison of current prices in the Common Market (where wages are still far lower than American) and in the USA does not indicate that the US corporations would have it so much their own way. But would current prices be relevant if the Kennedy plan were adopted? Firstly, it is clear that the Americans require the Six to reduce their low tariffs as fast as they themselves reduce their high tariffs, so that the ultimate duty burden to be added to current domestic prices would be higher in the one case than the other. That is, the Common Market would be virtually disarmed as to duties, while American enterprise would retain a solid protective barrier.

Secondly, Common Market industries are today working at very near full capacity and could not increase their output without considerable investment. US industry, on the contrary, is by and large working at well below capacity, and could thus increase output for exports at very low marginal cost. The circumstance is particularly important as regards steel and chemicals. European steelmakers, after years of working at the limit of installed capacity, are complaining because they can at present use only 80 or 90 per cent of their potential, but the US mills have been used for years to

working at half the pace they are capable of.

Thirdly, there is the indelicate question of dumping, that is, selling abroad for less than one sells at home. One would not raise it, except that the French Finance Minister told the students of Harvard this month that he would suggest, during the negotiations on the Kennedy plan, the creation of a world anti-dumping court which would monopolise the power now in the hands of national governments of decreeing the protective measures to be taken by a country exposed to dumping from abroad. Since he brought it up in connection with the trade negotiations between the USA and the Common Market, the Minister must have thought it relevant to the question we are now discussing. He probably had in mind not only clear instances of dumping in West Europe by American chemical producers who are hard put to use their capacity, but also the readiness with which Europeans (and Japanese) are accused of dumping in the USA whenever they make notable trade gains there.

So to a comparison of current prices must be added consideration of these three possibilities — unequal duties, the marginal cost of extra output, and dumping (or protection by "anti-dumping" measures). Then the large trade gains envisaged by Mr. Holton do not seem improbable. What does seem improbable, however, is that Common Market will consent to a trade deal having such unequal consequences.

Anglo-American Monetary Alliance

By PAUL BAREAU

LONDON:

A GREAT deal of nonsense is often uttered about the "special relationship" which is said to bind the two English speaking nations, the United States and the United Kingdom. The "speciality" of these links has on occasion been overstressed in recent years by Britain in the hope that these small islands might remain the economic and political stepping stone between the United States and Europe. There may be less and less substance in the claim, but the gospel has been propagated with such zeal as to provide General de Gaulle with his major reason and excuse for keeping Great Britain out of the Common Market. To allow Great Britain to enter Europe would be to trundle the American Trojan Horse into the Continent — that is the plea on which the veto against Britain's membership was entered.

Reserve Currencies

There is, of course, some substance in the special relation: a common language (more or less), a common basis of law, for the early settlers a common racial stock. In moving to more recent times there is also the common link provided by the fact that their two currencies, the dollar and sterling, perform the function of international reserve currencies, and share the relevant heavy responsibilities.

The main juxtaposition of forces in international balances of payments and in the foreign exchange markets, is no longer the US dollar versus the rest, but that of the reserve currencies versus the rest, and in particular versus the strong currencies of Central Europe. For some time past London and Washington, or rather London and New York, have felt that they are in the same monetary boat; that the pound and the dollar will sink or swim together.

The best expression and symbol of that conviction is the recent arrangement made between the two countries for

mutual credits of \$500 million and its equivalent in sterling. This arrangement will allow the Federal Reserve Bank of New York to draw up to £178 million from the Bank of England whenever it needs sterling to support the dollar in the foreign exchange market. Conversely the Bank of England operating for the Exchange Equalisation Account will have the right to draw up to \$500 million from the Federal Reserve of New York if it needs to supplement its dollar resources in order to meet pressure on sterling.

This is the latest and also the largest of a series of bilateral arrangements made between the American monetary authorities and those of other countries in order to provide a secondary line of defence for the US dollar. These arrangements are paralleled by corresponding but somewhat less formal understandings between the Bank of England and other central banks. These were first called into being in the spring of 1961 at the Basle meeting of the Bank for International Settlements and at the height of the sterling crisis in that year they had mobilised the equivalent of about \$900 million in support of sterling. All of this was repaid. In February and March of this year a further \$250 million was borrowed under these arrangements and at the time of writing is still outstanding.

The US mutual credit arrangements with other countries now total \$1,550 million. All but one of these are on a standby basis, i.e. they are not drawn upon until they are needed. The exception is a \$50 million credit with Belgium which was fully used from the moment it was arranged. The National Bank of Belgium was allowed to add \$50 million to its reserve. Conversely the Federal Reserve Bank of New York had the equivalent amount of Belgian francs credited to its account and this was added to the foreign exchange reserve of the United States. By this means the equivalent of \$100 million of international reserves was created out of nothing. The rabbits were pulled out of the hat straightway. In the case

of the other mutual credit arrangements the rabbits only emerge when they are needed.

These credits have added considerably to the mass of manoeuvre available to the monetary authorities of the world to counter speculative attacks or sudden movements of short-term funds from one market to another. They have undoubtedly added to the measure of confidence with which the endurance of the present pattern of exchange rates is envisaged. It is probable that the announcement of the \$500 million mutual credit between the United States and Britain was partly responsible for the calm and detachment with which sterling stood up to the early days of the political crisis that blew up after the resignation of Mr. Profumo.

Major Limitation

It would, however, be wise to appreciate the limitations of this Anglo-American monetary alliance. Its main limitation has already been indicated by the contention that these two currencies are now in the same boat. That implies that they cannot in all circumstances help one another. The analogy is with that of two men given to occasional fits of instability. If they can so arrange their gyrations that they compensate one another, then all may be well. If, however, the timing goes astray and they sway together, their mutual support will merely accentuate their imbalance. If the pound and the dollar are under pressure at the same time the \$500 million "swap" will be valueless.

This, therefore, is by no means the full answer to the problem of the reserve currencies. The Anglo-American mutual credit must be seen as a part of the devices that are being erected on a much wider front to protect the existing pattern of exchange rates, including the present monetary price of gold. These other means include the bilateral credit arrangements between the two reserve currency countries on the one hand and the European countries on the other. They also include the reinforcement of the International Monetary Fund—though here one would like to stress and deplore the seeming reluctance which the United States shows in using its large facilities at the IMF. It does so under the impression that to draw on the IMF would be an admission of weakness and thereby ensures that when it does draw on its facilities with the Fund this will be regarded by the world as a sign that the dollar is 'in extremis'.

Finally, there is a new interesting and intriguing technique for defending the dollar which the United States is now adopting with a number of countries: it is to induce monetary authorities and central banks which hold dollar reserves they deem excessive, to sell those dollars to the US Treasury and take in exchange two-year obligations of the US Treasury expressed in terms of the currency of the creditor country. In this way the US Treasury has already become obligated to Germany, Italy, Switzerland, Belgium and Austria. Things have indeed come to a pretty pass when the US Treasury finds it desirable and profitable to borrow dollars from little Austria.

Subscriptions to the above loans will be received simultaneously and will be limited to a total of Rs. 225 crores (approximately). Subscriptions may be in the form of (i) cash/cheque or (ii) securities of 2½ per cent, Hyderabad Loan 1953-63, 4 per cent State Development Loans 1963, of Hyderabad, Bihar, Bombay, Madhya Bharat, Madhya Pradesh, Mysore, Saurashtra, Travancore-Cochin and Uttar Pradesh, 4 per cent Loan 1963 of Madras and West Bengal or Mysore Government, 4 per cent Conversion Loan 1953-63. All loans other than 2½ per cent Hyderabad Loan 1953-63 will be accepted for conversion at par. 2½ per cent Hyderabad Loan 1953-63 will, however, be accepted for conversion at Rs. 85.00 per Rs. 85.71 (O.S. Rs. 100).

Interest on the 2½ per cent Hyderabad Loan 1953-63, 4 per cent Hyderabad State Development Loan 1963 and Mysore Government 4 per cent Conversion Loan 1953-63 tendered for conversion will be paid at the respective rates upto 21st July, 1963. On the other loans offered for conversion, interest will be paid at the rate of 4 per cent per annum upto 14th July, 1963 and for the period 15th to 21st July, 1963, at the rate applicable to the new loans as applied for.

Interest on the new loans, which will be subject to tax under the Income-tax Act, 1961, will accrue from 22nd July, 1963. Interest on 4 per cent Loan 1969 will be paid on 8th November, 1963, for the period 22nd July to 7th November, 1963 and thereafter at half-yearly intervals. Interest on 4½ per cent Loan 1973 will be paid half-yearly on 22nd January and 22nd July.

Subscription lists will open on 22nd July, 1963 and close on 27th July, 1963, or earlier without notice.

Applications for the loans will be received at:-

- (a) Offices of the Reserve Bank of India at Bangalore, Bombay, Calcutta, Madras, Nagpur and New Delhi;
- (b) Branches of the subsidiary banks of the State Bank of India conducting Government treasury work; and
- (c) Branches of the State Bank of India at other places in India.

For full particulars apply to any of these offices or branches.

Tarapur Atomic Power Plant

By Our Correspondent

NEW DELHI:

ON JULY 1, Professor J. K. Galbraith, the US Ambassador, announced that the United States had offered a foreign exchange loan of \$80 million (Rs. 38.1 crore) to finance India's first atomic power station at Tarapur, on the Arabian Sea, 62 miles north of Bombay.

The Tarapur plant, which is being undertaken by the Indian Atomic Energy Commission, will have a capacity of 380,000 kilowatts. When it is completed it will be one of the two largest atomic power stations in the world. It will also be one of the largest sources of power of any kind in Asia. The energy will be supplied to the Electricity Systems of Maharashtra and Gujarat which are to be interconnected. The major industrial loads to be served are in Bombay and Ahmedabad.

The Rs. 38,10,00,000 (\$80 million) foreign exchange loan will come from the Agency for International Development and will have a term of 40 years with no payments of principal for the first 10 years. The loan will carry a credit charge of three-quarters of one per cent. In addition, the US Government will provide the initial uranium fuel charge, estimated to cost about Rs. 7.14 crore (\$15 million), on a long term, deferred-payment basis. The total amount of US foreign exchange assistance for the project will be Rs. 45.24 crore (\$95 million).

The total cost of the plant — less the initial fuel supply — is estimated at Rs. 54,33,46,000, of which local costs of about Rs. 16,23,46,000 will be met by the Government of India.

U.S. Finance

Competitive quotations to build the station were accepted from a number of countries in August 1961, and a preliminary letter of intent was issued to the American firm, International General Electric, in September 1962. The General Electric Company has had substantial experience in building atomic power plants. The US was officially asked to finance the Tarapur Project in 1961, and a loan application was submitted in November 1962. Talks were held between representatives of the US Government and the Indian Atomic Energy Commission throughout the winter and spring. A.I.D. was assisted in its consideration of the proposal by the US Atomic Energy Commission and the US consulting engineering firm of Burns and Roe. An agreement on safeguards for the Tarapur plant was announced two days ago.

The 380,000 kilowatt plant will consist of two 190,000 kilowatt boiling-water type nuclear reactor. These reactors will be charged with slightly enriched uranium oxide (UO₂). They will generate high-pressure steam to turn two 1500-rpm tandem compound turbine-generators. The electricity produced by the turbine-generators will be stepped up through the main plant transformers to the distribution system transmission voltage of 230 kilovolts. The station will also have associated electrical equipment, condensing plant, and waste disposal and decontamination facilities.

The boiling-water nuclear reactors to be used at Tarapur are similar to units used in a number of power stations around the world, though the Tarapur plant will incorporate all the latest technological advances. A single boiling-water reactor of 318,000 kilowatts is being installed at Bodega Bay in California. Similar units of 237,000 kilowatts and 150,000 kilowatts, known respectively as the KRB reactor in Germany

and the SENN reactor in Italy are under construction. The 238 kilowatt boiling water type station at Dresden, Illinois, has been in commercial operation since 1960.

When it is completed in mid-1967, the Tarapur plant will be, with the Hinkley Point plant in England, one of the two largest atomic power stations in the world. These will eventually be superseded by two plants now in the planning stage, one for the Consolidated Edison Company in New York City and one at Wylfa Head in Wales.

In announcing the loan at a press conference on July 1, Ambassador Galbraith stated:

"Successful completion of the Tarapur nuclear power facility will be a further demonstration of the prestige and leadership of India in atomic development in Asia. Indeed, it has been India's record of nuclear research and development through your Atomic Energy Commission which has given the United States the confidence to provide so much assistance to this huge and exciting project."

**

The Cabinet Secretary, Mr. S. S. Khera has been given an extension of his term for another six months. This, it is believed was done at his own request, because Mr. Khera did not want a longer extension.

By practice and convention, the Senior-most Serviceman is appointed to the post of the Cabinet Secretaryship. In the batch following Mr. Khera are the Secretary, Company Law Department, Mr. D. L. Muzamdar and Secretary, Mines and Fuel, Mr. K. R. Damle. In the third batch are the Labour Secretary, Mr. Madhava Menon, the Secretary for Kashmir Affairs, Mr. Shanker Pershad and the Transport Secretary, Mr. G. Venkateshwar Ayyar.

That, this system lacks comparative continuity is its drawback. As was recently reported, if Mr. Damle were to succeed Mr. Khera, he would be due to retire from service in October 1964 and might have to be given extension. The administrative view has been that the Indian Civil Service being a covenanted service, none of its members should be given extension of service. They could, however, be eligible for re-appointment on mutually agreed terms. It may be added that not a single member of the Indian Civil Service was given extension by the British even during the War. It may also be added that it was largely on this ground that Mr. M. R. Sachadeva was not given extension of his service, although Hafiz Mohammad Ibrahim had recommended him for two years' extension. Another administrative view is that the tenure of the Cabinet Secretary should be, like those of others, for five years.

**

The Board of Trade is meeting here during this week for another session of tonnage exercise. The trends in trade do indicate an increase by Rs. 33.4 crores in 1962-63 as compared to the previous 12 months. This was notwithstanding a decline registered by cotton fabrics, manganese ore, ferro-manganese, raw cotton, cotton waste, raw wool, leather, tanned and dressed, iron and steel scrap and iron and steel. There was a decline in exports to Western Germany, Belgium, Austria, Norway and Portugal. Exports to Asian countries, excluding Japan also recorded a decline. The issue is of simple arithmetic namely that so long as the internal prices are higher than the world prices, the export drive will continue

'Jeep' vehicles are doing
the Nation's work

The Jeep Universal is at its best when the going is the toughest. That is why the Jeep Universal is relied upon in exploration. When personnel and equipment have to be carried through mud, sand, swamp or other impassable parts of the country, the Jeep Universal moves about easily with the extra traction of its 4-wheel drive and special low gear range. On normal roads it shifts easily to conventional 2-wheel drive.

'Jeep' Universal — the world's biggest little vehicle

This is the sign of your Jeep Dealer who is specially trained to solve your transport and maintenance problems. He is equipped to supply you with factory-approved genuine spare parts throughout the life of your Jeep.

to be an uphill task. The recent tendency of rise in the cost of production will have serious repercussions on export trade.

A non-stop procession of delegations and missions has been visiting Japan via Hongkong and yet no attempt, apparently has been made to reorient India's industries for export trade on the model of these two countries. Japan and Hongkong have hardly any raw materials and yet Japan is giving battle to Germans in Germany on Germany's own terms.

A change in industrial pattern and import outlook is needed to stimulate exports. India shall have to give all encouragement to new units of industry tied to exports, provided they do not increase the import bill. Token imports to step up standards of Indian production by introducing competition is also called for. In other words, what is needed is not tonsil exercise but constructive planning on inter-ministerial level.

★★

Shell International and British Petroleum have offered to acquire the total share holding of Burmah Oil Company. They have offered their holdings of Burmah Oil Company plus some money in lieu of its assets to the shareholders of Burmah Oil Company on pro-rata basis. Their plan is to retain the individuality of Burmah Oil Company of which, they will become equal partners.

Burmah Oil Company holds 24.5 per cent shares of British Petroleum and about 3 per cent shares of Shell International. In addition it is the cent per cent owner of the Assam Oil Company and through it, it is fifty-fifty partner with the Government of India in Oil India Limited, which owns and operates Assam Oilfields and has prospecting rights in Assam. It owns 50 per cent shares and assets of Burmah Shell Refinery Limited at Bombay and Burmah Shell marketing and Distribution Company. It has also acquired a small oil company, LOBOITS and has certain interests in Canada and Australia.

It will be thus seen that the Burmah Oil Company is both a holding and operating company. If the proposal made by Shell and British Petroleum were accepted, it will cease to be a holding company and its operating functions will be shared equally by Shell and British Petroleum. In Oil India Limited, for example, British Petroleum and Shell will hold twentyfive per cent shares each. Similar changes will take place in the pattern of ownership of Burmah Shell, Marketing and Distributing Company and Refining Company. Government of India is not likely to raise any objection to this change. It may even welcome it because both Shell and British Petroleum would be partners with Indian Government and in that capacity will provide India with two international companies prospecting oil in Assam and if permitted elsewhere, with latest equipment and most experienced personnel. This will also afford an opportunity to the personnel of Oil India Limited to get training in Europe and America.

★★

It has been possible to accelerate considerably the pace of electrification during the third Plan. In the period 1961-63, sections Gomoh - Moghalsarai and Nimpura - Tatanagar were commissioned, bringing the total AC electrified length to 1075 route kilometres (2518 track kms). By 1966, the entire main route section from Howrah to Kanpur on the one side, and line section from Howrah via Khargpur and Asansol is expected to be completed. In addition, sections Igatpuri-Bhusaval in the Western region and Madras-Villupuram in the Southern regions are also being electrified.

One hundred and ten AC broad gauge mixed traffic type electric locomotives are now operating in the eastern zone. Altogether about 330 locomotives are required for dealing with goods services in this area. Chittaranjan is expected to

manufacture 138 locomotives during the current Plan and the remaining are being imported.

In order to cater to the needs of the increasing traffic in and around Calcutta, particular care has been taken in electrification of the existing lines in this metropolis area. The suburban sections proposed to be brought under AC electrification aggregate to 440 route kilometres (905 track kms) and the following table indicates the targets planned at present:

Sealdah-Ranaghat;	)
Dum Dum-Bongaon;	)
Ranaghat-Krishnagar City	) August/December, 1963.
Kalinarayanpur-Shantipur;	)
Bandel-Naihati	)
Saktigarh-Dankuni;	)
Dankuni-Dum Dum and C.C. Link;	) December, 1964.
Dum Dum-Chitpur	)
Dankuni-Belur	)
Sealdah South-Baruipur Jn.	)
Ballygunge Jn.-Budge Budge	)
Sonarpur-Canning	) March, 1965.
Baruipur Jn.-Lakshmikanthapur	)
Baruipur Jn.-Diamond Harbour	)

Howrah-Khargpur is expected to be electrified by the end of 1966. In addition, the existing electrified sections Howrah-Bandel-Burdwan including Tarakeswar Branch are proposed to be progressively converted to the AC system by the end of this Plan, thus making unified working of the railway lines around Calcutta possible. Fast electric multiple unit services are proposed to be introduced in this area by employing nearly 640 electrical multiple unit coaches. In the early stages locomotive hauled trains are being introduced in the Sealdah area.

Traction Equipment

Simultaneously, considerable progress in developing indigenous manufacture of electric traction equipments has been planned and achieved, with a view to saving foreign exchange. For equipping railway tracks with 25 kv overhead wires and other ancillary items (excluding copper) the foreign exchange required has already been brought down from Rs. 25,000 per track km in 1958 to about Rs. 8,000. In order to attain self-sufficiency in the manufacture of AC rolling stock, the Integral Coach Factory in Madras has commenced turning out Broad Gauge EMU trailercoaches. Prototype motor coaches are now under construction and after necessary trials it is expected that the Integral Coach Factory will be in a position to commence production of AC motor coaches from early 1965.

For building electric locomotives in the country, capacity has already been created at the Chittaranjan Locomotive Works, which is currently handling an order for 21 broad gauge DC electric locomotives. These are expected to be completed very shortly, after which the delivery of AC locomotives will commence. During the third Plan, Chittaranjan is expected to build 138 AC freight type electric locomotives and reach an output of six locomotives per month by 1965. The mechanical parts for these locomotives are being manufactured in Chittaranjan while majority of the AC electrical equipments are expected to be manufactured by Heavy Electricals (India) Ltd., Bhopal. As a result of these measures it is hoped that the foreign exchange content in rolling stock as well as other equipments required for electrification will progressively come down in the next few years.

★★

A school of Paper Technology is to be set up at Saharanpur (Uttar Pradesh) with Swedish technical assistance. The Royal Swedish Government will contribute the foreign exchange cost of the project including the seconding of experts and the supply of equipment required for the School. The

machinery, laboratory equipment and spare parts to be supplied are estimated to cost 1,650,000 Swedish Kroners (Rs. 15 lakhs). The rupee expenditure on the project will be met by the Government of India and the Uttar Pradesh Government.

The School, the first of its kind in India, will have a training capacity of between 180 and 200 persons when in full operation. With the help of Swedish experts, the School will impart training in pulp and paper manufacture, instruments engineering for the paper industry, operation and maintenance of plant and equipment for the paper industry and paper and pulp laboratory techniques. In addition the School will, as far as possible, render consultative and advisory service to existing enterprises. It is expected that, in five years, which is the duration of this agreement, the technical and operational functions of this School will be taken over from the Swedish personnel.

Self-sufficiency Unlikely

India is unlikely to achieve self-sufficiency in heavy electrical equipment before the end of the fifth Plan because of the shortage of trained technical personnel and industrial raw materials. Mr. K. B. Mathur, Chairman, Heavy Electricals Ltd., said at a press conference here.

Effective steps had already been taken to remove these handicaps, he said.

Reviewing the progress at the four public sector projects, being set up with foreign collaboration, Mr. Mathur said that while the boiler plant at Tiruchi and the power equipment unit at Hyderabad were expected to go into production by the end of third Plan, the Hardwar unit of the Heavy Electricals would commence production in the first or second year of the fourth Plan.

The detailed project report for the Rs. 50-crore unit at Hardwar had just been received and the Russian experts were expected here within a fortnight to finalise details of the scheme.

The negotiations with the Soviet experts would be completed within a month or so and that work on the project might begin in August.

The Hardwar project will manufacture hydraulic turbines and generators of the sizes of 100,000 kw. capacity, steam turbines and turbo-generators of 50,000 kw. 100,000 kw. and

200,000 kw. capacity and heavy and medium-sized AC and DC machines.

The Hyderabad project had been somewhat delayed because of the Government's belated decision to undertake the manufacture of 100 mw. turbines instead of the 60 mw. turbines as initially decided. The revised project report had been received from Czechoslovakia and the project was expected to go into production in about two years.

★★

Birla Brothers Limited have indicated their interest in setting up a naphtha cracker in India in connection with the proposed unit for the manufacture of poly-propylene. The fuller details of their scheme are being awaited.

★★

The Punjab Government plans to set up a factory to manufacture seamless steel pipes, it is learned. It is a Rs. 5 crores project, including Rs. 2 crores in foreign exchange. The installed capacity proposed for the plant is 36,000 tons a year. The capacity, already licensed for seamless steel pipes is as under :

Madras	..	..	..	..	24,000 tons
West Bengal	..	..	..	..	60,000 tons
Punjab	..	..	..	..	9,600 tons
Gujarat	..	..	..	..	72,000 tons

★★

Triveni Engineering Works, Limited are already licensed to manufacture sugar machinery. Due to a fall, so far registered, in the offtake of sugar mill machinery and, in order to diversify their production, they now propose to undertake the manufacture of paper and pulp machinery in collaboration with a South American firm, BELOIT International. They plan to manufacture three sections of the equipment, namely stock refining and preparation, paper machine and paper finishing machines. With the assistance of their South American collaborators, they also propose to supply integrated paper and pulp mills.

★★

Fertilizer Corporation of India plans to establish a new undertaking at Bombay for the manufacture of refined methanol.

Woollen Industry's Reassuring Record

From Our Correspondent

BOMBAY:

THE INDIAN Woollen Industry has good reasons to feel proud for two reasons. First, it has had a very good chit from the Textile Commissioner, Mr. R. Doraiswamy, for its contribution to the defence effort, and, secondly, it has closed its ranks by bringing about a merger of the two associations that represented the industry until May 27 last. Mr. Doraiswamy, who, in a way, contributed to the latter consummation also complimented the industry on it. It is in the interest of the industry itself, as he said, to have one organisation; in that case, its grievances are bound to be effectively attended to by the Government.

Playing a magnificent role in the work for the country's defence is one thing and facing the problems of a growing industry is another. While, as Mr. R. K. Birla, Chairman of the Federation of Woollen Manufacturers in India, observed, the industry may be prepared to continue to do its best, it should, in turn, be enabled to play its role by the provision of such facilities and incentives as are necessary for the purpose. For instance, if the industry is asked to improve its produc-

tion, both quantitatively and qualitatively and also bring down its cost of production, it follows that, as far as possible, no hurdles must be placed in the way of the industry getting all its requirements of suitable raw material and modernising itself. In fact, Mr. Birla addressed himself primarily to these two needs of the industry.

As regards raw material supply, Mr. Birla said that, for making quality fabrics, whether for the domestic market or for the export market, India had to import fine wool, be it against barter or in the normal course. He had to make some plain speaking. Indian wool is good only for making carpets, for which, of course, there is a good foreign market, and not for making fine fabrics. But the industry has a target for export of woollen and worsted fabrics to the tune of Rs. 2½ crores, besides Rs. one crore worth of raw wool and carpets, and blankets, yarn, etc. worth Rs. 50 lakhs, not to speak of Rs. 5 crores worth of hosiery, for which Mr. Manubhai Shah, Union Minister for International Trade, maintains, on the basis of his recent study survey, there is a ready market abroad. It is a moot point whether, with its present outmoded machinery, the industry can reach anywhere near this ambitious

target. One notices among officials a facile feeling of optimism about fulfilling the export target. Even the present realistic Textile Commissioner told the meeting that, with about Rs. 3 crores to be made available to the industry for import of raw materials, it should be possible for the industry more or less to meet its requirements. Anyway, if the anticipated exports materialise — what with hopes of substantial orders from Russia expected in the wake of the coming Indian Exhibition in Moscow! — “the problem of import of raw material will be automatically solved”. But it is a big “if” all right.

The F.O.W.M.I. Chairman had genuine grounds to grouse about Government's prodding the industry time and again to produce more without itself doing anything much to provide it with the requisite facility. Here is his bitter complaint: “Day in and day out, we are advised to produce and provide cheaper and finer finished goods to meet the requirements of Indian consumers and also be able to export to foreign markets. I personally, and my colleagues in the Federation, have explained, times out of number, that the woollen industry very badly needs modernisation and rationalisation. The machinery in most of the existing units is obsolete and outdated. We fortunately have the capacity and the know-how to be able to produce fine and competitive goods and can possibly compete with the best in the world, but this will not be feasible unless we are given facilities to modernise our machinery. On this point we do not have to convince Government as, through a number of independent surveys, they themselves have come to realise the absolute necessity for modernisation. I am obliged to lay stress on this point again as Government's decision to come to our rescue in this respect is still awaited”.

Holding the Price Line

In the matter of prices, Mr. Birla seemed to hint that, although most of the woollen mills had kept the prices of their finished products at last year's levels, and this in spite of the substantial increases in tax levies, including super profits tax, it might not be possible for the industry to hold the price line when the price spiral all round was rising higher and higher. He even complained that the Government had failed to keep the price line of essential commodities in check or even at a reasonable level, but Mr. Doraiswamy contended that prices of both Indian and imported wool tops had been well under control. Perhaps there are yet other requirements of the industry where the price line has been barely held.

★★

Mr. Raj Bahadur, the Union Minister for Shipping, paid a hurried visit to Bombay City to intervene in the harbour strike. He successfully persuading the (striking) workers to call off the strike. The Minister took the opportunity to review the progress made by Indian Shipping at a gathering under the auspices of the All-India Manufacturers' Organisation. In the post-Independence period, the shipping industry had received its due share of attention. It is not true that ‘all had not been done’ for shipping because it had to be viewed against the background of the entire economy of the country. Besides Plan allocations, which during the third Plan try. Besides Plan allocations, there had been tax concessions, amounted to Rs. 51 crores, there had been tax concessions, exemption from wealth tax and the allotment of a big bulk of Government cargo to shipping companies. As a result, of Government cargo had risen rapidly, so that, at the end of shipping tonnage had risen to 1.5 million tons. Coastal the third Plan, it might as well reach 1.5 million tons. Coastal shipping had expanded simultaneously and it now stands at 4.1 lakh tons.

The solution to the country's shipping problems lay in securing ‘a bigger share of the bulk carrier trade’ in overseas shipping. The Indian shipping companies were earning Rs. 29 crores annually mostly through liner trade. The bulk carrier trade amounted to only 4 per cent. Fortunately, the Indian bulk carrier trade was developing very rapidly because ‘both

the situation and the men had conspired to assist it.’ The country's attempt to build a bulk carrier fleet had coincided with a period when the shipping yards of the world were literally ‘thirsting for building.’ In this connection, the Minister praised the efforts made by the Jayanti Steam Shipping Company in securing bulk carriers on a nominal (10 per cent) initial instalment and paying the major portion as the ships earned. As a result of the efforts made by the Indian shipping interests, Indian shipping companies now had a larger share of overseas shipping. This had risen from 29 per cent to 40 per cent and it would soon rise to 48 per cent in the near future.

★★

The Government of India has announced a series of changes in the Gold Control Order to minimise the chances of evasion of rules and to standardise the supplies of primary gold. The new rules direct the refineries and dealers to convert within a week their stocks of gold into gold of 14-carat purity. Production of higher purity in any primary form after July 1 will be illegal. Simultaneously, the Government also expressed determination to unearth illicit gold held by individuals. Modern electronic devices are being employed by excise and customs authorities, who are now armed with additional powers, to detect hidden gold. The Gold Board announced during the week-end that the rules published were clear and there was no scope for confusion.

★★

It is reliably learnt that the Government will shortly introduce a proposal to start an investment trust in the public sector. The Reserve Bank has finalised the outlines of the scheme. The Finance Minister had hinted on such a possibility in the course of the budget debate. The idea behind the investment trust is to enable the small investor to participate in the various developmental projects and thus enable him to share the national prosperity. The funds of the Trust might as well be used to support the capital market. An important point which should not be lost sight of in this connection is that the Trust must be managed efficiently and with imagination and skill. Otherwise, the poor middle classes will be backing a losing proposition. There is yet another consideration. With the various schemes like the introduction of compulsory deposit, the increase in taxation and cost of living, it is doubtful whether the middle class investors would be left with any savings to patronise the investment trust. While the idea is good, there is reason to doubt whether the present time is at all opportune to launch on yet another experiment in the public sector.

★★

The first year of the third Plan showed progress in the co-operative movement. The total working capital at the end of 1962 stood at Rs. 256 crores and this represented an increase of nearly a third over that of the previous year. The loans disbursed came to Rs. 256 crores, whereas the outstandings due went down from 10.6 per cent in 1955-56 to 4.1 per cent in 1961-62. The health of the co-operative movement seems to be improving. This is a welcome development, inasmuch as the co-operative credit institutions are expected to finance nearly 50 per cent of total agricultural credit (Rs. 1,300 - 1,400 crores) by 1965-66. It is obvious that there is a long leeway to be made up. There is, again, a lot of unevenness in the development of co-operative credit societies in different States and in different regions even within a State. An encouraging feature of the situation, however, is that the Reserve Bank authorities are fully aware of the drawbacks of the co-operative structure and accent is being placed upon toning up the structure from down below side by side with expansion.

★★

There was a sizable return flow of funds into the banking system. During the week ended June 21, deposits swelled by Rs. 10.8 crores to Rs. 2,123 crores and credit contracted

by Rs. 16.4 crores to Rs. 1,524 crores. The borrowings from the Reserve Bank showed a reduction of Rs. 6.5 crores and they amounted to just Rs. 1.3 crores. Bank credit contracted since May 3 — the peak of the 1962-63 busy season — by Rs. 69 crores, whereas, in the corresponding period of last year it went down by Rs. 22 crores. The seasonal contraction in credit has been sharper than in the previous year. The evidence of the comfortable conditions in the banking system is reflected in the inter-call money market. The call money rate is now ruling around 1½ per cent. The Reserve Bank suspended its open market operations last week, it seems, for preparing the market for the floatation of cash loans — the second instalment of Government borrowing programme. The announcement of the loans has now been made.

Dalal Street beat a hasty retreat. It was anticipated

Spotlight on Tea

From Our Correspondent

CALCUTTA :

WHILE FORMALLY inaugurating the new tea auction centre of the Calcutta Tea Traders' Association in Calcutta last week, Mr. Manubhai Shah, Union Minister for International Trade, struck an optimistic note of the prospects for tea exports from India. The fact that two-thirds of the world's population are yet to take to tea should dispel all fears about over-production in the near future. Another factor in favour of tea among other beverages is its comparative cheapness and its popularity both among the common man and the higher strata of society. But it would be idle to imagine that these advantages alone will bring expanded markets for it. As Mr. Shah has emphasised, there is need for intense propaganda.

It is gratifying that Mr. Shah has placed the emphasis on increasing output in India, for the results so far in the current plan period are not very encouraging. If the third Plan target of 900 million lbs. is to be hit in time, vigorous work has to be put in by all concerned during the remaining period. Production last year was 150 million lbs. short of the target and there is not much time left to complete the task. It is true that it is within the competence of the Indian tea industry to step up production to the required extent. And the industry also knows quite well enough what needs to be done. A sizable part of the increase in output can be attained without extending the acreage under tea since average yield in our country is still well below that attained in some other tea producing countries. But for producing 900 million lbs. quite a large number of existing tea gardens have to be rehabilitated while more suitable land is to be brought under tea.

All this requires money and time. As Mr. Shah has himself admitted a new garden to be brought under tea takes something like five years. It is on the score of finance that the industry is in hard straits. There is no reason to think that tea producers lack the determination to attain the target set for them but the real impediment is the paucity of funds, as they are themselves unable to plough back any appreciable amount, as the taxes and other levies and obligations to labour eat up almost all the earnings. The difficulties of the industry have been ventilated too often in recent months from a number of platforms to need recapitulation. In short it may be said that without adequate help from Government the industry is apprehensive of hitting the third Plan target of production. Mr. Shah's assurance in Calcutta last week that any worthwhile scheme from the industry for the expansion of pro-

duction will receive the sympathetic attention of Government is therefore timely and welcome. Remedial action to remove the avoidable difficulties brought about by the multiplicity of levies imposed by the various State Governments alone will go a long way towards freeing the industry from work that profits neither the industry nor the Government. Financial help too is necessary.

Since 1960 tea exports have been well maintained. In 1962-63 the value of tea exports was Rs. 7 crores more than in the previous year. The improved result is mainly due to the growing realisation on the part of the Government of India that higher exports have to be consciously promoted especially since the overseas buyer has many sellers to choose from. The reduction in the export duty in the 1962-63 budget had gone some way towards making Indian tea attractive. Among the various factors governing exports, perhaps the three most important are price, quality and propaganda. It is a truism that the buyer will, given that quality is comparable, go in for the tea that has a price advantage too. A country's tea may have both these requirements but it may not still sell well on the overseas markets if adequate propaganda is not there to tell the consumers about its qualities. Referring to the need for vigorous propaganda for tea, Mr. Shah has pointed out that the tea industry and trade should not rest content with the work done by the Tea Board. Perhaps the tea industry is quite anxious to supplement the Tea Board's propaganda with its own efforts. But if it is not doing it, it is not because it has no interest in the matter, but most probably because it has no resources to spare for undertaking such a costly task. For the fact remains that for all its excellent performance on the export front, its own finances are in no good shape. Hedged in by high taxation, multiplicity of levies imposed by the Central and the State Governments and ever rising cost of wages, amenities etc., it is finding it hard to mobilise adequate funds even for necessary developmental works such as replanting etc.

★★

Lyons Range has been showing improvement in sentiment since the resumption of forward trading at this centre last week. But the apprehension persists that in common with other Exchanges where conditions deteriorated after a brief spell of recovery following the resumption of forward trading, Calcutta's present recovery may not be sustained. While the long awaited resumption of forward trading will afford greater freedom to operators than had been enjoyed by them since the imposition of the ban, there is

from the fact that forward trading is no longer what it used to be. It is now hemmed in by a number of restrictions, a gist of which has been provided by the Calcutta Stock Exchange authorities for the guidance of its members. The other centres where forward trading was resumed earlier than in Calcutta have already had a fair experience of the working of the new regulations and such experience has not been very happy. It is unlikely that Lyons Range will be able to like them better. Whatever others may think of the outlook, the investors who should after all provide the momentum to the onward march of the stock market do not seem to be in any great hurry to extend their commitments. The dividend and growth prospects being what they are, buyers will be extremely choosy.

Lately there has been a slight improvement in the undertone in the jute goods market following reports that the industry may decide to curtail production. It is evident however that the market is beginning to worry about the continued absence of sizable foreign enquiries, though now and then a few enquiries are received. Despite the fact that US burlap consumption has been well maintained so far this year, operators seem to be less hopeful than some time back that there will be an even flow of orders from that country. It is however the declining trend in sacking exports that is causing concern. The expectation that the Government would

initiate remedial measures so that sacking comes into its own again on world markets has not materialised and with report of the Pakistani industry taking active steps to expand its production, it is feared that continued inaction on the part of the Government of India will further jeopardise the outlook of sacking and consequently the Indian jute industry as a whole.

Problem of Bumper Crop

It is now generally expected that raw jute production in the new season will be quite large, at least as large as in the 1962-63 season. The problem of dealing with another bumper crop may perhaps not prove difficult if vigilant measures are taken in good time. For adequate steps to handle the crop, ensuring at the same time an equitable return to the grower, seem to have been taken. Further measures have been suggested by the ad hoc committee of the National Agricultural Co-operative Marketing Federation for making the price support scheme successful. These include the provision of adequate revolving finance to the co-operatives participating in the price support scheme, priority in the allotment of wagons to co-operatives and arrangements regarding weighing, inspection and storage of jute stocks. Nearly 600 co-operative marketing societies are now functioning in the various jute growing States and under the price support scheme the co-operatives are likely to procure some 17.50 lakh maunds of jute during the 1963-64 jute season.

Power Cut Extended

From Our Correspondent

MADRAS :

THE MADRAS State Electricity Board is going through a testing period as even with the large additions to hydel generating capacity in the past few years and the commissioning of the three thermal units in Neyveli, the heavy dependence on hydro power has been forcefully brought out. It had been expected that the drastic cut in power utilisation by high tension consumers would be for a short period and that heavy rains would prevent the situation from taking a turn for the worse. The expectations in this regard have not, however, materialised and Mr. R. Venkataraman, the State's Minister for Industries and Electricity, was painfully compelled to announce last week that the cut had been extended by another week and that even if the rains set in, the cut would remain in force for the specified period.

Economic Use of Power

The Government had to take a definite decision because the industrial units would have difficulty otherwise in laying off workers or arranging for the statutory holiday or undertaking overhaul of plant and machinery. The Industries Minister addressed the people of the State in a radio broadcast and appealed for their co-operation in the economic use of and available power in the present critical period. The existence of a large unsatisfied demand and the inability of the Electricity Board to meet even basic needs has been clearly emphasised by the present crisis even though the thermal capacity of the Neyveli station and the two units of the Electricity Board in Madras and Madurai now amounts to 32 per cent of the total generating capacity. This thermal capacity alone is as much as 221,000 kW while the aggregate installed capacity of the State's hydel and thermal units is now 560,000 kW. Including 150,000 kW of capacity of the three thermal units at Neyveli, the total installed capacity is 710,000 kW. This is truly an impressive figure apart from the fact that the thermal capacity alone is equal to the total generating capacity

of some of the neighbouring States. This emphasises the fact that power consumption for both agricultural and industrial purposes has increased phenomenally in the past decade while domestic consumption also has gone up appreciably. This accounts for the increase in 'per capita' consumption of electricity to 72 units from only 12 units in 1951. It is difficult to comprehend what would have happened if power from Neyveli had not been available in the present context. Neyveli itself is accounting for a capacity of 30,000 kW for its own purposes.

Mr. R. Venkataraman, therefore, emphasised in his speech the need for firming up power availability by the erection of more thermal capacity in the coming years. Actually, there will be no problem of power availability in the next three years as some more units in the Kundah Project are expected to be commissioned in the immediate future, while all the four sets under the Mettur Tunnel Scheme will be completed before the beginning of 1965. Besides, the fourth unit at Periyar should also be available. This would result in a substantial addition to hydel capacity. But the problem of meeting the demand for power in the summer months will remain especially as a large number of industries will be reaching the production stage in the next three years and the consumption of the existing industrial units also is increasing sharply.

The Industries Minister has, therefore, suggested that the greatest emphasis should be laid on the expansion of the capacity of the Neyveli Thermal Station. In fact, he has indicated that the Madras Government had urged on the Centre for drawing up a scheme to raise the aggregate capacity of the Neyveli Thermal Station to 1,000 mW instead of 600 mW as originally anticipated. Besides this ambitious expansion, the State Electricity Board has also proposals for erecting thermal units at Ennore (near Madras), Cuddalore or Nagapattinam, and Tuticorin, each station having a capacity of 100 mW each. The objective is to have fresh thermal capacity of about 1,000 mW during the fourth Plan apart from the Kalpakkam

announces

FULLER/TRAYLOR, U.S.A. &

TRAYLOR ENGINEERING & MANUFACTURING, a division of Fuller Company, are one of the leading manufacturers of cement machinery in the world and have over 50 years experience in the line. Traylor have made some of the largest Grinding

Mills and Steel Plate Jaw Crushers in the world. Traylor's outstanding know-how, research and laboratory facilities will now be at the disposal of AVB for designing machinery for the Cement, Mining and Metallurgical Industries.

Crushers

Driers

Mills

Feeders

In addition to the Fuller equipment that AVB are already manufacturing under licence, viz., Fuller Grate Coolers, Fuller-Kinyon Pumps, etc., the range of Fuller/Traylor equipment that they will now make includes:

Apron Feeders, Crushers, Rotary Kilns, Rotary Coolers and Driers, Mills, Air Separators.

ACC-VICKERS-BABCOCK LIMITED

Technical Collaboration Agreements with

KLOECKNER-HUMBOLDT-DEUTZ W. GERMANY

Humboldt Air Suspension Pre-Heater is an invention that has revolutionised the manufacture of cement by the dry process. It comprises basically a series of cyclones through which hot gases arising from a considerably shortened kiln are passed and into which the finely ground dry raw material is introduced, the Air Suspension Pre-Heater rapidly raises the temperature of every particle. This system results in considerable fuel economies, and is recognised as the most efficient cement making process in the world. The Pre-Heater has very few moving parts, is trouble-free and simple to operate.

Kloekner-Humboldt-Deutz have manufactured and sold more than 115 plants all over the world during the last 15 years.

Humboldt's expertise in fuel economy is now available to the Indian cement industry through

a powerful partnership for progress

WORKS AND ADMINISTRATIVE OFFICE : P.O. DURGAPUR-1 (WEST BENGAL)

Nuclear Power Station. It is emphasised that this latter unit also should have an initial capacity of 500 mW so that the power problem would have been satisfactorily solved at least for some time.

There will necessarily have to be greater emphasis on the creation of additional thermal capacity in the State in 1966-71 because easily harnessable hydro power resources have been tapped and the allotment for power projects in the next Plan will have to be mainly for thermal units. The coastal towns have been selected because coal can be easily brought by sea even though the cost of fuel will become appreciably higher thereby. It is considered advisable in the present context to have more high cost power rather than be subject to periodic crises which result in the loss of industrial production running into several crores. How all these proposals will be implemented remains to be seen. But from the manner in which the whole scheme has been drawn up, it would appear that the projects put forward by the industrialists would not be sponsored. This will indeed be tragic especially as the latest reports suggest that, besides the scheme drawn up by a group of industrialists to have a thermal station at Tiruvottiyur, it is proposed to have a thermal unit for supplying the power to industrial consumers in a different suburb of the city.

★★

The effect of the cut in power supply has been disastrous on many producers. The textile mills have virtually stopped production of cloth and yarn except where some units have been able to work partially with power produced by their own generating sets. Even the engineering units in Madras, which are engaged in supplying nearly the whole of their output to the Defence Services, are not able to operate for more than two days in a week. The loss in production of all industrial units in a fortnight is estimated to be over Rs. 15 crores. This loss can be only partially made up because many of the units are working on a three shift basis and the lost time cannot be regained in these cases. There is, therefore, a great anxiety to know whether at least after July 4, the cut will be restored. Unfortunately, there are as yet no indications of the vigorous onset of the monsoon and the position in the Nilgiris particularly, which is the main source of supply of hydel power, is very precarious.

★★

For quite a long time there was a controversy whether Boeing aircraft of Air India should touch down Madras Airport on its International flights to and from the East. On the plea that the necessary additional ground was difficult to be acquired from the Military authorities and the additional facilities needed would also be costly, the question was put off for some time. Actually, it was suggested that Bangalore should be used for this purpose. Ultimately, however, as a result of vigorous representations by the Madras Government and a recognition of the claims of the Madras Airport for handling the air traffic to the East, it was decided to build a large runway and create also the necessary servicing facilities in order to enable easy landing and handling of Boeing aircraft. After the additional ground was acquired from the military authorities, the work of constructing the new longer and stronger runway was taken up and it was found when the Boeing "Everest", of Air India, landed in Madras on Tuesday last week that the runway was very satisfactory and is now even considered the best in the country. Two demonstration flights were arranged on that day and the large number of visitors, including journalists, that flew in the aircraft were greatly impressed by its performance. International flights have been handled by the Madras Airport authorities when the Comets were in operation. With the airport now in

a position to receive much heavier and faster aircraft, it is only to be expected that the complaint about the lack of originating services from Madras, on account of the lack of requisite workshop facilities would be removed. Madras is now handicapped considerably as there are no early morning flights to the principal centres in the country. Businessmen have to spend more time while travelling to New Delhi, Calcutta or Madras on account of the lack of facilities for leaving the city in the morning and returning to the same place by the evening.

Need facts about importing from Australia?

Alert, progressive importers have much to gain from Australia's rapidly expanding export potential. The Bank of New South Wales, Australia's first and largest commercial bank, is uniquely equipped to provide vital up-to-date information on importing from or investment in this fast-developing Continent.

The moving finger writes

WITH NEHRU away in Pahalgam, "The Times of India" to a great degree and some other newspapers to a lesser extent were working their leaderwriters and columnists over-time to advise and admonish the Prime Minister on the reconstitution of the Cabinet. The common theme there was that the Government we now have is a tired and stale government, wholly inadequate for the responsibilities it faces and that the country must have a new leadership if it is to survive, not to say thrive.

It is curious in the circumstances that any suggestion that Mr. Nehru himself should leave has been carefully avoided. This certainly shows good sense. For it is a patent fact that, although Mr. Nehru is 74 and is no longer in the enjoyment of that phenomenal good health which had been among the greatest assets of the Prime Minister of India in the last 16 years, there is nobody in the Congress hierarchy who can safely be expected to substitute satisfactorily for him in the difficult and dangerous times through which the country is now passing. It is of course true that, when necessity arises, another Prime Minister will certainly be found. But that is no argument for deliberately making a choice when the need for choosing has not actually arisen.

At the same time, it must be confessed that it is not good for any country that it should burden indefinitely a man of 74 with prime-ministerial responsibility now running into its sixteenth year. How then is the matter to be dealt with? As was suggested in these columns recently something could be done to make the best of a bad situation by the Prime Minister himself nominating a second man in the Cabinet by reviving the post of Deputy Prime Minister (cf. "Eastern Economist" dated June 21, page 1419). Another step which Mr. Nehru may take is to shed as many as possible of his direct departmental or administrative functions. Thus, while retaining the general and ultimate direction of foreign policy in his own hands, he could still appoint a separate Minister for External Affairs. Again, in the context of the suggestions which have been made in the first leading article of this issue for the reconstitution of the Planning Commission, the Prime Minister need not retain the Chairmanship of that body. Finally, the portfolio of Atomic Energy can be safely merged, surely, with the portfolio of Mines, Fuel and Power.

★★

I like the candour of Mr. Nambodripad's statement that he and his wife are going to Moscow on the invitation of the Soviet Communist Party to take a holiday in the Soviet Union. I wish some of our Ministers, Central or State, and the large number of high government officials who have managed to spend some part of this summer, despite the emergency, in more salubrious climates outside this country, had been equally honest about the real character of their peregrinations. I confess, for instance, that I do not quite know what really had Dr. Sushila Nayar accomplished, during her recent visit to the United States, by way of bringing health and happiness to the people of this country. And I certainly do not believe that Mr. R. K. Nehru, who is or should be leaving the Government of India soon, since the third extension of his tenure is about to end, is justified in contemplating a whole series of leave-taking visits to all the capitals of Europe at the tax-payers' expense. It is not to the credit of the Government that while, on the one hand it is setting itself up as a stern judge of the necessity of foreign travel where private citizens are concerned, it has no scruples at all in encouraging a state of affairs where quite a number of Ministers and high officials are able to travel so widely and so frequently

that if one is to write to them one might normally have to address the letter to "c/o Thos. Cook and Sons."

★★

I make no apology for appending the following list of Ministers with details regarding their age and period of office in the Central Cabinet. This would serve to illustrate some of the points made in the first leading article in this issue.

- Mr. Jawaharlal Nehru (74), Prime Minister and Minister of External Affairs, since Independence.
- Mr. Morarji R. Desai (67), Minister of Commerce and Industry, 1956-58; Minister of Finance since 1958.
- Mr. Jagjivan Ram (55), Minister of Labour since Independence — May 1962; Minister of Communications, May 1952 — Dec. 1956; Minister of Transport and Railways, Dec. 7, 1956 — April 16, 1957; Minister of Railways, April 17, 1957 — April 9, 1962; Minister of Transport and Communications, since April 10, 1962.
- Mr. Gulzarilal Nanda (65), Minister for Planning, 1951; Minister of Planning, Irrigation and Power, 1952-57; Minister of Planning, Labour and Employment, since April 1957.
- Mr. T. T. Krishnamachari (64), Minister of Commerce and Industry, 1952-55; Minister of Commerce and Industry and Iron and Steel, 1955-56; Minister of Finance and Iron and Steel, 1956-57; Minister of Finance, April 17, 1957 — Feb. 18, 1958; Minister without portfolio, June — Nov., 1962; Minister of Economic and Defence Co-ordination, since November 1962.
- Mr. Lal Bahadur Shastri (59), Minister of Railways and Transport, 1952-56; Minister of Transport and Communications, 1957-58; Minister of Commerce and Industry, 1958-61; Minister of Home Affairs, since 1961.
- Sardar Swaran Singh (56), Minister of Works, Housing and Supply, 1952-57; Minister of Steel, Mines and Fuel 1957-62; Minister of Railways, April 10, 1962 — June 25, 1963; Minister of Railways and Minister of Mines and Fuel, since June 26, 1963.
- Mr. K. C. Reddy (61), Minister of Production, 1952-57; Minister of Works, Housing and Supply, 1957-61; Minister of Commerce and Industry, since 1961.
- Mr. Y. B. Chavan (49), Minister of Defence, since Nov. 1962.
- Mr. S. K. Patil (63), Minister of Irrigation and Power, April 1957 — March 1958; Minister of Transport and Communications, April 1958 — August 1959; Minister of Food and Agriculture, since August 1959.
- Mr. A. K. Sen (50), Minister of Law, since 1957.
- Mr. B. Gopala Reddi (56), Minister of Revenue and Civil Expenditure, 1958-61; Minister of Works, Housing and Supply, 1961-62; Minister of Information and Broadcasting, since April 10, 1962.
- Mr. C. Subramaniam (53), Minister of Steel and Heavy Industries, since April 10, 1962.
- Dr. K. L. Shrimali (53), Parliamentary Secretary (Ministry of Education), December 1953 — May 1955; Deputy Minister of Education, May 1955 — April 1957; Minister of State (In the Ministry of Education and Scientific Research), April 1957 — March 1958; Minister of Education, since March 1958.
- Mr. Humayun Kabir (57), Minister of Civil Aviation, 1957-58; Minister of Scientific Research and Cultural Affairs, since 1958.
- Mr. Satya Narayan Sinha (63), Minister of State for Parliamentary Affairs, 1948-52; Minister of Parliamentary Affairs, since 1952.

Trade Winds

COMPULSORY DEPOSIT SCHEME

WITH A VIEW to simplifying the working of the Income-Tax Payers and Employees Compulsory Deposit Schemes and to relieve the congestion at the Post Offices and branches of the Reserve and State Banks of India, the Government of India have announced a number of important procedural changes. These are briefly summarised below.

It has been decided that scheduled banks having an all-India character may also, on the recommendation of the Reserve Bank, be authorised to maintain the accounts of compulsory deposits in the same way as in the Post Offices and branches of the Reserve and State Bank of India. Meanwhile, in so far as the compulsory deposits recoverable during the month of July 1963 are concerned, the period within which they should be remitted to the deposit offices is being extended from 14 days to 45 days. In order that this extension may not involve any loss of interest to the depositors, interest on all such deposits will be allowed with effect from 1st August, 1963. It has been further decided to allow factories and establishments, which have been exempted under Section 17 of the Employees' Provident Fund Act, to maintain the individual accounts of Compulsory Deposits recovered from their employees. They will have to open only a single account in the name of the factory or establishment with a Head Post Office, or with the Reserve Bank or the State Bank or its subsidiary banks conducting Government treasury business in which the amount recovered by them from month to month will be credited in lump. Detailed instructions on this point will be issued separately.

It has also been decided to waive the requirement for getting an application form filled by individual employees. As the only purpose of the application form was to establish a direct link between the depositor and the Post Office, or any other authorised office where the account is maintained, to facilitate withdrawal of the amount, and as withdrawal is ordinarily permissible only after five years, it is not considered necessary to delay or complicate the opening of accounts by getting applications individually filled at this stage. Accordingly, the employers can get the account opened in the name of their individual employees by applying to the deposit offices. The facilities outlined above will materially reduce the pressure of work at Post Offices and other authorised offices and minimise inconvenience to individual depositors as well as to employers who have the responsibility of collecting these deposits from a large number of employees.

GOLD CONTROL RULES

In an attempt to standardise the supplies of primary gold and minimise the chances of evasion of sales, the Government has announced a series of changes in the Gold Control Rules. The new rules, notified in the Gazette of India Extraordinary dated June 24, 1963, directs refineries and dealers to convert within a week their stocks of gold into gold of 14-carat purity. Production of gold of higher purity in any primary form will hereafter be illegal. The rules as amended provide for the licensing of some non-power refineries in areas which are not served by any refineries at present. All refineries including those operated by power which are already in existence and are working or those which may be licensed in future, will be required to restrict the purity of any primary gold which may be produced by them to a maximum of fourteen carats, and (except in certain very special cases where pure gold has necessarily to be used and the permission of the Gold Board has also been obtained) the production of gold of any higher purity in any primary form will hereafter be illegal. Existing stocks with refineries and dealers

and any stocks which may be acquired by them hereafter will also have to be converted into gold of a purity not exceeding 14 carats within a period of seven days. Provision has also been made in the amended rules for the hall-marking of all primary gold which is produced by the refineries, and the necessary particulars, which are to be included or specified in the hall-marks, will be prescribed separately as soon as possible.

It has also been provided that the use of gold for the manufacture of anything other than ornaments or primary gold will also have to be authorised and regulated by the Gold Board. The existing provisions relating to control over the transactions of persons who are dealers as well as money-lenders or pawnees have been clarified and amplified. The new rules provide that the manufacture or sale of ornaments and the lending of money against the pledge of gold ornaments or other gold should be carried on in separate premises and that the return of pledged or pawned ornaments will be regulated to the extent necessary for checking evasion or contravention of the various provisions of the law. The opportunity provided by these amendments has been utilised to clarify the position regarding the search and seizure of gold and documents or records relating to articles in respect of which any contravention of the rules has taken place or is suspected as well as the prosecution and compounding of offences.

INCREASE IN SUGAR INDUSTRY CAPACITY

The Government of India have decided to resume licensing of additional capacity in the sugar industry. Consequently, applications for the establishment of new factories and expansion in the existing factories which have been recommended by the State Governments and are pending consideration are being taken up. A special Committee representing the Departments concerned has been set up for scrutinising these applications and advising the Ministry of Food and Agriculture with regard to the suitability or otherwise of the proposals, in the light of availability of sugarcane, economy of existing units and new ones which may be set up, and the prospects of early completion of the projects. The intention is to achieve installation of an additional capacity of five lakh tons during the next two or three years. The committee is expected to complete its work in about three months' time.

LOAN FOR RAJASTHAN CANAL

A further loan of Rs. 40 lakhs to the Rajasthan Government for financing the Rajasthan canal project during the current year has been sanctioned by the Union Ministry of Irrigation and Power. This brings the total amount sanctioned to the State Government for the project since 1957-58 to Rs. 27.24 crores. The Rajasthan canal, when completed, will be 425 miles long — 110 miles in Punjab and 315 miles in Rajasthan. Estimated to cost nearly Rs. 135 crores for the canal system and about Rs. 100 crores for the Pong Dam on the Beas river, it will convert the endless arid stretches of sand in the desert of Rajasthan into extensive farms and pastures. In all, it will irrigate an area of 15 lakh acres in Kharif and 21 lakh acres in Rabi, producing foodgrains and other agricultural products to the extent of 2.5 million tons annually.

The construction of the canal is planned in two stages. The first stage covers the Rajasthan feeder and the main canal up to 122 miles and is expected to be completed by 1968-69. The second stage, scheduled to be completed by 1975-76, covers the remaining length of the main canal up to the tail and all the branches and distribution system. Progress is being maintained on the construction of the project. The Rawatsar Distributory, commanding an area of 87,000

acres and the Suratgarh branch, commanding 2,75,000 acres, have already been completed.

PROGRESS OF GLASS INDUSTRY

In spite of the many difficulties in obtaining raw materials the glass industry has made a considerable headway. In 1960 the production increased to 224,740 tons compared with 124,200 tons in 1955. In the first two years of the third Plan, the onward march was well maintained and in 1962 production reached 2,50,000 tons. By the end of the third Plan it is expected that the production would reach around 4,40,000 tons. Accordingly, provision has been made in the third Plan for an additional capacity of 3,16,000 tons to be attained by the setting up of thirty units and substantial expansion of 18 existing units. A large number of units are located in West Bengal and U.P. Uttar Pradesh has the largest number of factories (28) accounting for a capacity of 83,000 tons.

Although imports are fast dwindling, some specialities still continue to be obtained from abroad. The industry has already entered the export market but progress in this direction cannot be said to be very satisfactory. This is because its products are unable to compete with others in respect of prices.

Speaking at the recent annual meeting of the Bengal Glass Manufacturers Association, Mr. P. P. Chandra, the president, pointed out that the future of the industry was bright. The Study Team of the National Productivity Council of India which visited the UK and the USA last year had made a number of valuable suggestions and recommendations for the production and development of the Indian Glass Industry and it is to be hoped that early action will be taken towards implementing them.

PRICE SUPPORT FOR LEMONGRASS OIL

The State Trading Corporation of India is entering the lemongrass oil market with a view to giving price support to the lemongrass oil industry. Purchase depots are being set up at Telicherry, Calicut, Alwaye, Cochin and Alleppey. Producers and collectors will be able to sell at these depots lemongrass oil of requisite citral content at the minimum prices fixed by the Government. The S.T.C. purchase price of lemongrass oil with 76 per cent citral content will be Rs. 13.75 per kg. The prevailing prices at present below Rs. 12.00 per kg.

Lemongrass is chiefly grown in Kerala. At present India is exporting about Rs. 2 crores worth of lemongrass oil annually to countries like the U.K., West Germany, the U.S.A., Switzerland, Japan and Italy. Lemongrass oil is mainly used for the manufacture of synthetic vitamin 'A' and as a base for some perfumes for the soap-making industry.

JUTE MARKETING CO-OPERATIVES

Under the price support scheme of the Central Government, Jute Co-operatives in Assam, West Bengal, Bihar, Orissa, U.P. and Andhra Pradesh and the Union Territory of Tripura purchased nearly 4 lakh maunds of jute during 1962-63. Under the price support scheme the jute co-operatives are likely to procure some 17.50 lakh maunds of jute during 1963-64.

In order to protect the interest of the jute growers, the State Trading Corporation was allowed to enter the market in 1962-63 and make purchases of jute from co-operative marketing societies of the eastern region on the basis of Rs. 30 per maund. Since co-operative marketing societies needed continuous revolving funds, the State Trading Corporation also provided special financial assistance of Rs. 50 lakhs to the Government of Assam and Rs. 5 lakhs to the Tripura administration to enable them to finance co-operatives undertaking jute procurement operations.

While reviewing the progress of the price support scheme during 1962-63 season, the ad hoc committee of the National

Agricultural Co-operative Marketing Federation which met recently recommended some measures which are necessary for the successful working of the scheme. These include the provision of adequate revolving finance to the co-operatives participating in the price support scheme, priority in the allotment of wagons to co-operatives and arrangements regarding weighment inspection and storage of jute stocks.

EMERGENCY RISKS INSURANCE

The rates of premia under the Emergency 'Risks (Goods) Insurance Scheme and the Emergency Risks (Factories) Insurance Scheme' revised from July 1, 1963 for the next quarter are 7.50 naye paise and 11.25 naye paise respectively for every hundred rupees or any part thereof of insurable value.

The rates for the previous two quarters were:

	Goods	Factories
1st Quarter	15 nP.	25 nP.
2nd Quarter	10 nP.	15 nP.

DEDUCTION OF SPT BY COMPANIES

Section 349 of the Companies Act, 1956, lays down the manner in which the net profits of a company are to be determined for purposes of computing the remuneration of the managing agents, managing directors, etc. Clause (d) of subsection (4) of the said section 349 provides that in determining the net profits any tax notified by the Central Government as being in the nature of a tax on excess or abnormal profits shall be deducted. In pursuance of this provision the Central Government have decided to notify the super profits tax chargeable under section 4 of the Super Profit Tax Act, 1963 as being in the nature of a tax on excess or abnormal profits.

INVESTMENT IN DEVELOPING COUNTRIES

Mr. Manubhai Shah, Minister for International Trade, in his speech at the Round Table Conference in Berlin, convened by the Association for Study of the Problems of Europe, on the subject of "Private Foreign Investment in Developing Countries", stated that the importance of the contribution which private foreign capital can make in not only providing capital but also in providing foreign exchange plus know-how and managerial capacities, should be fully recognised. The fields in which foreign capital can make contribution need to be identified with reference to a long-term picture of a country's development. Foreign capital can usefully play a role in import-saving or export-oriented industries. Of these the latter are more important from every point of view. Developing countries, Mr. Manubhai Shah stressed, should provide adequate climate for foreign investment along with the necessary infrastructural facilities. Levels of taxation are not such great impediments as is generally believed and in so far as concessions and incentives are concerned, perhaps the industrialised countries could at this juncture make a much more significant contribution than the developing countries themselves. Among the impediments to the flow of capital one of the most important is the lack of adequate knowledge of the actual conditions in an economy and this knowledge is better disseminated through influential channels rather than by inter-governmental negotiations or agreements. It is in this field, Mr. Manubhai Shah added, that he would urge large scale publicity measures and creation of sufficient intelligence and information services in both the industrialised and less developed countries.

CREDIT TO SMALL INDUSTRIES

In the issue of "Eastern Economist" dated 21st June on page 1420 under the above caption erroneous figures were mentioned inadvertently. Rs. 130.2 crores, Rs. 103.8 crores and Rs. 64 crores should be read as Rs. 13.02 crores, Rs. 10.38 crores and Rs. 6.4 crores.

Company Affairs

HINDUSTAN MACHINE TOOLS

THE ANNUAL Report of the Hindustan Machine Tools Ltd., for the financial year 1962-63 indicates a net profit of Rs. 2.15 crores, which is a substantially good progress when seen in the light of last year's net profit of Rs. 1.28 crores. The chairman in his annual report indicates that the gross revenue for the year stood around Rs. 7.68 crores, while the domestic sale prices of all Hindustan Machine Tools were nearly 10 to 20 per cent below the cost of European machines of equivalent quality. The Company has decided to pay 10 per cent dividend which is the highest in the public sector. The annual bonus based on profit and productivity equivalent to an average of Rs. 125 is proposed to be paid to every employee. The production of the two machine tools factories in Bangalore registered a record output of 185 machines during November 1962 which was maintained for the remaining period of the financial year. Work on the third machine tool factory at Pinjore is progressing well and the construction of a training centre was completed in February 1963 and training commenced in March. The factory is expected to be ready for commencement of production before the end of the year. A fourth machine tools factory is to be built at Kalamassery in Kerala, at an estimated cost of Rs. 7.5 crores. A temporary training centre was established in Trivandrum which was inaugurated by the Union Minister of Steel and Heavy Industries in May this year. The proposal to establish a fifth machine tools factory in Secunderabad with the foreign exchange credit to be made available by the Government of Poland is under consideration. When all the five machine tool factories are in operation, it is intended to decentralise the various production lines in Bangalore and permit each factory to specialise in one or two families of machines in order to ensure greater efficiency and lower costs. The Company's watch factory is progressing well and during the year 51,562 watches were assembled out of imported components and indigenous manufacture of components commenced from January 1963 with the manufacture of 25 components making 48 per cent of the total components. The Company has exported 26 machines valued at Rs. 10.62 lakhs to West Germany, Switzerland and Nepal and further orders have been booked for exports to Europe.

METAL BOX

Mr. M. K. Vellodi, Chairman of the Metal Box Company of India Ltd., at the annual general meeting held recently, reported about the successful performance of the company in spite of adverse conditions that prevailed during the year. The sale proceeds of the company increased from Rs. 10.50 crores last year to Rs. 11.35 crores during the financial year 1962-63, showing an increase of nearly 13 per cent. It continued its efforts to sell large quantities in the foreign market and in spite of various political changes in South-East Asia, its direct exports stood around Rs. 21.37 lakhs. It may be added that apart from direct exports the production of this company helped many other exporters by providing them with containers and packing materials made to international standards of quality. The Chairman highlighted the problem of raw material shortage especially of tinplate which was not being produced within the country. At various stages, he indicated, the company had to discontinue its manufacture though by and large the Government did realise the necessity and allowed them to import their requirements. The Chairman mentioned various schemes to develop alternate package products. The company developed its manufacturing of treated and laminated papers and boards and containers made out of them which will save a lot of tinplate. It has also started storage and printing of tinplate and the manufacture of open

top cans in new factory, and at Cochin the service installation for the prawn can industry has been expanded into a full-fledged manufacturing unit. It is also developing a wide range of flexible packages for indigenous raw materials and a new plant has now been commissioned to supply printed polyethylene bottles and a variety of canned and laminated flexible packages and flexible package materials.

ENGEL INDIA MACHINES

Specialised machine tools are planned to be produced by Engel India Machines and Tools Limited at its Calcutta factory where the construction has already started. Its authorised capital is Rs. 1 crore out of which Rs. 50 lakhs is being issued in the first instance. The directors and their friends and foreign collaborators will take up shares worth Rs. 20 lakhs and the remaining shares worth Rs. 30 lakhs will be issued to the public. The entire public issue is underwritten by the Industrial Finance Corporation of India, West Bengal Financial Corporation, Jardine Hendersons Ltd., and the L.I.C. The Company has also recently been granted a loan of Rs. 25 lakhs by the Industrial Finance Corporation. The total cost of the project, after its full implementation will come to about to Rs. 1 crore. The Company has secured the technical collaboration of Maschinenfabrik Ludwig Engels K.C. of Austria. The turnover of the Company is expected to be around Rs. 1 crore during the initial period. It has got exclusive export rights to the neighbouring countries. The plastic industry in India will thus be able to obtain latest type of machines locally. The Union Carbide India Limited has been appointed as the sole selling agents of the Company, for both the home and foreign markets.

BRITISH INDIA CORPORATION

Mr. Satish Chandra, Chairman of the British India Corporation Ltd., highlighted the quick response given by the company to the defence requirements while reviewing the working of the company at the annual general meeting held recently. A quick change, he said, was effected in the manufacturing programme of the woollen, textile and leather units and, to some extent in cotton textile units also. Production for military and civil requirements which was in the ratio of 20 to 80 in the woollen branches was reversed by the company and production targets were well maintained. Similarly, the Cooper Allen Boot Factory which was closed for several years was reopened to meet the defence needs. This increased operation was reflected in profits which stood around Rs. 133.38 lakhs—about 27 per cent more than last year's figure of Rs. 105.36 lakhs. The Chairman indicated that the balance sheet on the liability side shows a bank overdraft of Rs. 226 lakhs as against Rs. 129 lakhs a year before. This is attributable to a record level of production which required substantial increases in stocks. During the year, the cotton group carried through a programme of rehabilitation and modernisation and a licence was received for the installation of 12,000 additional spindles. An overall rehabilitation and modernisation programme was envisaged for its sugar factories too.

DALMIA CEMENT

Mr. V. H. Dalmia, Chairman, Dalmia Cement (Bharat) Ltd. highlighted the problem of packing charges faced by the industry while speaking to the shareholders at the annual general meeting held recently. He pointed out that the packing charges announced by the Government on a quarterly basis are determined as an average of the prices of new and of second hand bags. In determining the price, the proportion of second hand bags was raised by the Government with effect from the quarter October-December, 1962, to 50 per

IISCO-STANTON Cast Iron Spun Pipes

Made to BS 84 1211 of 1955 and Vertically Cast Pipes to BS 84 78 of 1955. IISCO pipes are used throughout the length and breadth of the country. Among the big projects that have already used IISCO pipes are: the Mattanchery Project at Ernakulam, 8,62,000 Rft; the Water Supply and Drainage Scheme in Madras State, 48,02,000 Rft and the Ajmer Water Supply Scheme, Rajasthan, 3,69,000 Rft. Today, IISCO pipes are being employed at:

Barren Water Supply Project A/c. Chief Engineer, P.H.E.D., Bihar, Patna.	4" to 30" Spun Pipes	1,36,050 ft.	5355 tonnes approx.
Coal Mines Water Supply Scheme A/c. National Coal Development Corporation Ltd.	14" to 27" Spun Pipes	1,25,591 ft.	5456 ..
Municipal Corporation of Delhi.	24" to 36" Spun & V.C. Pipes	53,613 ft.	11943 ..
Ahmedabad Municipal Corporation.	60" V.C. Pipes	5,676 ft.	2345 ..

shopfront

For the finest,
most durable glass
you can depend
on HPG

A customer is inside this shop long before she actually steps in! And no wonder. Thanks to the clear, bright, glass exterior, your display has gone half way out to greet her.

Inside too, glass counters are hard to beat. Goods are effectively displayed but stay protected at the same time.

And glass is so elegant, so easy to clean and so very functional. It lets in natural light but shuts out the dust and noise of the street.

Available in a wide variety of sizes and thicknesses, and quality tested at every stage of manufacture, there's an HPG sheet glass to suit every purpose.

Hindusthan Buildings, 4 Chittaranjan Avenue, Calcutta-13

JWTHP 5449

cent from 25 per cent, without even consulting the industry. This presupposes the procurement of something like 90 million second hand bags for cement packing which is an impossible figure. Moreover, an insistence on the extensive use of second hand bags is likely to lower the standard of packing which would go against the interest of the consumers, and lead to considerable wastage. He urged the Government to review its decision in determining the average price by taking into account second hand bags to the extent of 25 per cent. The Chairman indicated that the profit of the company has risen considerably from Rs. 34.02 lakhs to Rs. 146.62 lakhs during the year under review. The provision for taxation, however, has increased considerably, but it has been possible to maintain the dividend. Referring to iron ore produced by the company, the Chairman expressed satisfaction that the railways have increased their capacity for the transport of iron ore by the all meter-gauge route from the Bellary-Hospet region to Cuddalore Port and he expected that the company will be able to increase its pace of export with the development of Cuddalore Port. He also pointed out that Japanese steel mills had contracted with the State Trading Corporation to buy more iron ore which is a favourable development for this company.

JAIPUR METALS

Jaipur Metals and Electricals Ltd. during 1962 recorded satisfactory results with sales and profits showing new heights. Earnings at Rs. 23.79 lakhs were nearly 40 per cent higher than last year's figure of Rs. 16.23 lakhs. The Directors have recommended a dividend of 6 per cent on ordinary shares, which is lower than last year's dividend because of higher appropriations on account of depreciation, taxation, etc. Mr. R. H. Kamani, Chairman of the company at the annual general meeting held recently, pointed out that the production of "Jaipur" meters has been very encouraging and has reached a record production which is 20 per cent more than last year's. The production of "Siemens" meters taken in hand in 1961 was also well maintained. The working of the metals division was also quite satisfactory. The Chairman pointed out that a major part of machinery for the manufacture of cycle-meters and magnets, the two most important components for the manufacture of "Jaipur" meters has arrived and the company hopes to be nearly self-sufficient in the manufacture of final products. He has also pointed out that the company has obtained industrial licence for the manufacture of enamelled copper wire and cotton, silk and paper covered wires and strips. The Chairman hopes that the import licence required for machinery will soon be received. The Industrial Finance Corporation of India has approved a further loan of Rs. 65.26 lakhs for the above development and expansion programme. The company also issued during the year 25,000 equity shares of Rs. 100 each at a premium of Rs. 15 per share by way of rights shares.

LEINER-KNIT ISSUE

The subscription list for the public issue of Leiner-Knit Gelatine Company Ltd., will open on July 1, 1963 to close on July 13 or earlier but not before July 3, 1963. It has an authorised capital of Rs. 50 lakhs, all in equity shares of Rs. 100 each. It has already issued shares of the value of Rs. 6.62 lakhs to the promoters, directors and friends and Rs. 1.87 lakhs to the foreign collaborators. It is proposed to issue shares worth Rs. 16.50 lakhs of which shares of the value of Rs. 1 lakh have already been allotted to the directors, their friends and associates and the foreign collaborators will be allotted shares of the value of Rs. 3 lakhs against the supply of machinery. Offer to the public will be in the form of 12,500 shares of Rs. 100 each. The entire public issue has been underwritten by the Industrial Finance Corporation of India, the ICICI, and the L.I.C. The Company proposed to establish a factory in Madhya Pradesh for the manufacture

of industrial, pharmaceutical, photographic and edible gelatines and allied products. It has been licensed to manufacture 1,200 tons of gelatines of various types and by-products every year. It has also been granted the licence for the manufacture of 12,000 tons of ossein and 10,200 tons of di-calcium phosphate every year. It has secured the collaboration of Leiner & Sons Ltd., of England who will supply machinery of the value of Rs. 3 lakhs for the project. The bulk of the machine to be imported has already been shipped and the plant is expected to go into production in the second half of this year. The total capital outlay on the project is expected to be around Rs. 50 lakhs which will be financed by the equity capital to the extent of Rs. 25 lakhs, a loan of Rs. 19 lakhs from the M.P. Financial Corporation and the bank borrowings of the order of Rs. 6 lakhs. The Company's annual turnover is estimated at Rs. 75 lakhs.

TRAVANCORE CEMENTS

The working of the Travancore Cements Limited during 1962 was quite successful in the sense that the sales of white cement increased steadily and 4,623 tonnes were sold against 3,447 tonnes a year before. The net profit of Rs. 9.68 lakhs was recorded against Rs. 4.99 lakhs during 1961. The Directors have recommended the payment of dividend at the rate of 7 per cent (taxable) against 6 per cent a year before. The Chairman, Mr. C. S. Loganathan, informed the shareholders at the Annual General Meeting held recently, that a research institute to be called "Cement Research Institute of India" has been formed by the Association of Cement Manufacturers, where scientific research will be conducted on cement and allied industries. The company has contributed its due share. The Chairman made a pointed reference to the recent decision taken by the Government of India in respect of cement prices which have been raised by Rs. 2.75 per ton with effect from June 1, 1963 on account of increase in prices of coal, railway freight, electric charges etc., and additional expenditure by way of Emergency Risk Insurance. It is quite unfortunate that this increase in price has not been allowed to this company. There cannot be any justification, as the Chairman pointed, for the Government to exclude this company alone from getting the benefit of this price increase. It is true that this factory is working very efficiently but it cannot be denied that raw materials and the cost of production of various other items have increased for this company too.

BURN AND COMPANY ISSUE

The board of directors of Burn & Company Ltd., have decided to approach the Controller of Capital Issues for consent to the capitalisation of free reserves to an extent of Rs. 84 lakhs and make a bonus issue in the ratio of one ordinary share for every such share held.

CAPITAL ISSUES

Five companies have been authorised by the Controller of Capital Issues to raise capital aggregating over Rs. 2.10 crores. One company is issuing part of its capital on a right basis to its foreign collaborators. One is issuing equity plus preference shares. One company is a public sector enterprise. The consent in all cases is valid for 12 months.

Saund Zweirad Union (India) Private Ltd., Delhi, a company registered last year to manufacture auto-cycle, mopeds and allied products in collaboration with Zweirad Union AG Nurnberg, West Germany, has been accorded consent to issue capital of Rs. 20 lakhs divided into 20,000 equity shares of Rs. 100 each. Out of this shares of the value not exceeding 24.99 per cent will be offered to the foreign collaborators against import of plant and machinery and the balance for cash at par.

Hindustan Machine Tools Limited, Bangalore, a Govern-

July 5, 1963

ment of India undertaking, is raising further capital of Rs. 1.44 crores, divided into 14,400 equity shares of Rs. 1,000 to be subscribed privately by the Government of India.

Everest Cycles Limited, Gauhati, will issue capital of Rs. 10 lakhs divided equally into equity and preference shares of Rs. 5 lakhs each. The capital is required for repayment of loans for acquiring a factory at Gauhati for the manufacture of bicycles.

Reichhold Chemicals India Limited, Madras, is to issue further capital of Rs. 20 lakhs, divided into 20,000 equity shares of Rs. 100 each, to be issued privately for cash at par. Out of this shares of the value not exceeding Rs. 9 lakhs, will be offered to its U.S.A., collaborators, on rights basis. The money will be used for manufacturing synthetic resins.

The Commercial Printing Press Limited, Bombay, with a paid up capital of Rs. 16,50,000 will issue capital of Rs. 16,50,000 in equity shares of Rs. 1,000 each for cash at par. The proceeds for the issue would be utilised for the purchase of land and construction of building for the printing press.

LICENCES ISSUED

The Union Ministry of Commerce and Industry has granted licences to the following firms under the Industries (Development and Regulation) Act, 1951 during the week ending 22nd June, 1963. The list contains the names and places of the licensees, articles of manufacture and annual installed capacity.

IRON & STEEL CASTINGS

Orient Steel and Wire Industries Private Ltd., 2, Brabourne Rd., Calcutta (Lillooah, Howrah, West Bengal) — Chilled cast iron shots 1,200 tons. **Saru Smelting and Refining Corporation Private Ltd.**, Sardhana Road, P.B. No. 58, Meerut (Uttar Pradesh) — Chilled iron shots and grits 1200 tons, Steel wire grits 240 tons.

OTHER METALS

Bhandary Metallurgical Corporation Private Ltd., Vekh-rol, Bombay-79 (Maharashtra) — Brass/Bronze, wires and rods 600 M.T.

ELECTRICAL LAMPS

India Carbon Co., Ganesh Bag, Nehru Road, Bombay-80 (Greater Bombay, Maharashtra) — Cinema Arc Carbons 3 million pairs per annum, Midget Electrodes 75 million pieces per annum, miscellaneous carbon products like slabs etc. 30 tons.

ELECTRICAL CABLES

Universal Cables Ltd., P.O. Satna (Madhya Pradesh) — Thermoplastic power cables 240 miles.

ELECTRONIC EQUIPMENT

Lalji Ramji & Co., 17, Keshavji Naik Road, Post Box No. 5013, Bombay — 9 (Greater, Bombay, Maharashtra) — Magnetic tapes of different varieties used in recording and re-producing sound 90 million linear ft. per annum i.e. 75,000 spools.

TEXTILES MACHINERY

Lakshmi Card Clothing Mfg. Co. Private Ltd., Avenashi Road, Pappana Lokenpalayam, Coimbatore (Palladam (Coimbatore), Madras) — Licker-in-wire 30 tons.

MACHINES TOOLS

Manek Lal & Sons 115/116, Narayan Dhum Street, Bar-bhai Mohalla, Mandvi, Bombay-3, Proposed name: Yodoguwa

Maneklal Press Mfg. Co. Private Ltd. (Udhna, Surat, Gujarat) — (1) Single and double crank presses up to 300 tons, (2) High speed notching Presses (5-10 ton capacity), (3) Friction screw Presses (50-200 ton capacity), (4) Knuckle Joint Presses (50-200 ton capacity), (5) Deep drawing presses (45-100 ton capacity), (6) Plate shearing machines (capacity up to 3/8" x 8"), (7) Press Brakes (3/8" x 8") Capacity Rs. 6 lakhs worth in the first year going up to Rs. 50 lakhs in the 5th year. **Tak Machinery Ltd.**, Janmahoomi Bhavan, Ghoga Street, Fort, Bombay-1 (Maharashtra) — Guillotine Shearing Machines 50 Nos. per annum Combination punching Cropping and shearing machines 100 Nos.

PLASTICS MOULDED GOODS

M. Varadarajan, B/15/16, Industrial Estate, Sanatnagar, Hyderabad-18, (Proposed name: M/s. Wavin India Ltd., (Near Madras, Madras) — Hard PVC Pipes and fittings 600 to 1000 tonnes. **Bhor Industries Ltd.**, Sir Vithaldas Chambers 16, Apollo Street, Bombay-1 (Baroda, Gujarat) — PVC Flooring material 1200 tonnes per annum. **Bhor Industries Ltd.**, Sir Vithaldas Chambers, 16 Apollo Street, Bombay-1 (Baroda, Gujarat) — PVC rigid pipes 480 tonnes. **Shri Surinder Kumar Jain**, 4639/40, Sundar Bhawan, Deputy Ganj, Delhi-6, Proposed name: Synthetic Foams (India) (Kota, Rajasthan) — Synthetic Foams 720 tonnes.

PORTLAND CEMENT

Chettinad Cement Corporation Ltd., 80, Sembudoss Street, Madras-1 (Karur, Thiruchirappuli Dist., Madras) — Portland Cement 400,000.

HAND TOOLS

Steel and Allied Products Ltd., 17, Brabourne Road, Calcutta (Majerhat, Calcutta, West Bengal) — Threading taps 2,50,000 Nos., Chasers/dies 20,000 sets.

CHEMICALS

Excel Industries Private Ltd., 184-87, Ghodbunder Road, Jogeshwari, Bombay-60 (Jogeshwari, Bombay, Maharashtra) — Camphor 120 M. tonnes. **Indian Copper Corporation Ltd.**, C/o Gillanders Arbuthnot & Co. Ltd., Post Box No. 174, Gillander House, Calcutta-1 (Ghatsila, Bihar) — Nickel Sulphate 260 tonnes.

JUTE

The Kelvin Jute Co. Ltd., Mcleod House, 3 Netaji Subhas Road, Calcutta-1 (Calcutta, West Bengal) — Wide Hessian (Carpet Backing cloth) 120 Broad looms for producing 12,600 tonnes. **Khardah Co. Ltd.**, Post Box No. 140, 7, Wellesley Place, Calcutta-1 (West Bengal) — Wide Hessian (Carpet Backing cloth) 116 Broad looms for producing 12,180 tonnes. **The Nuddea Mills Co. Ltd.**, 2 Fairlie Place, Calcutta (West Bengal) — Wide Hessian (Carpet Backing cloth) 40 Broad looms for producing 4200 tonnes.

SHEET AND PLATE GLASS

Andhra Pradesh Industrial Development Corporation Ltd., Nizam Sugar Factory Building, Fateh Maidain Road, Hyderabad-4, Proposed name: Andhra Pradesh Glass Works Ltd., Andhra Pradesh) — Sheet glass 24 M. sq. ft., Glass Bottles 12000 tons, Glass shells 20 M. pieces i.e. 900 tons, Glass Tubes 900 tons, Crystal Glass and glass ware 1500 tons.

CHANGES IN THE NAMES

(During the week ending 22nd June, 1963).

From name of the undertaking: **M/s. Dhemo Main Collieries Ltd.**, Asansol to name of the owner: **Shri S.K. Rungta**, Calcutta. From licensee: **Dr. M. S. Patel**, Bombay to name of the undertaking: **M/s. Cashew Shell Products and Chemicals Ltd.**, Bombay.

July 5, 1963

Readers' Roundtable

IS THE RUPEE OVERVALUED?

Sir, — During my speech on the Finance Bill on the 25th April, 1963, I argued that the over-valuation of the rupee in relation to sterling and dollar was one of the persistent causes for India's unfavourable balance of trade. The following is the text of my remarks on the subject.

There is also another element which has upset our balance of payments and which is making our export drive largely ineffective. It is a fact that our rupee is over-valued in terms of foreign currency. If we take the price indices of 1939 and 1963 and find out how much a dollar or a pound bought in terms of ordinary goods before the World War and how much they buy today, and similarly if we calculate how much a rupee bought in 1939 and how much it buys today, we find that today the dollar and the pound buy a proportionately greater quantity of goods than the rupee. Therefore our rupee is over-valued, because the same 1 shilling 6 pence continues, while its internal value has deteriorated; our rupee is highly over-valued, and unless it is brought on a par with other currencies there will be a fundamental disequilibrium in our economy, which cannot be remedied. It has been the experience of all the countries of the world that an over-valued currency is like a burden, which one carries when one is walking up a hill. Therefore, I suggest that this matter should be seriously examined by experts of the International Monetary Fund, and I have no doubt that their experts will advise our Government to devalue the rupee. If we can have one shilling as the rupee equivalent, then our economy will be on a more even keel than it is today. It is quite true that on account of exchange control and import control we are prevented from reaping the full disadvantages of this over-valuation — they are partly counter-balanced — but still it makes our economy permanently sick, and I do not believe that all the efforts and concessions in relation to the export drive will succeed. Over-valuation means that our exports are proportionately more costly, and our imports are proportionately less costly. Therefore, it makes for a greater disequilibrium in the balance of payments."

After making the speech I had gone away on a tour to Maharashtra in connection with the Study Team for Panchavati Raj Finances. The Finance Minister replied next day and he vehemently repudiated my contention that the rupee was over-valued. He argued that between 1949 and 1963, the depreciation of the rupee was not much greater than the depreciation of other currencies including the sterling and the dollar.

To be fair to the Finance Minister, the reporter of the Rajya Sabha had made a mistake in my speech by putting the year 1949 instead of 1939 and if the wholesale price index of 1949 were taken as a base, there was some justification for his contention though even during this period the rupee deteriorated to a greater extent than the sterling and the dollar. The indices of wholesale prices given in the table opposite have been taken from the Report on Currency and Finance of the Reserve Bank of India for the year 1961-62.

It will be seen that between 1953 and 1961 Indian wholesale prices increased by 21 points as against 16 points in the U.K. and only 8 points in the U.S.A.

But my main contention was based on the relative value of 1939 and 1960. With the same base index of 1953 equal to

100, the following figures have been calculated from the statistical year books of the United Nations:

	India	U.K.	U.S.A.
1939 ..	27	31	46
1948 ..	93	67	95
1955 ..	90	104	101
1960 ..	118	102	109

From this it will be clear that the prices in U.S.A. increased by 240 per cent and U.K. 330 per cent, while in India the increase was as much as 440 per cent. On 18th September, 1949, the sterling was devalued by 30.5 per cent so that it was brought into pre-war parity with the dollar. The Indian rupee also was devalued simultaneously to the same extent but there was a wide gap between the depreciation of the rupee and the sterling which was not made up in any manner. It is this disparity that has been weighing down our economy. As I pointed out, owing to our stringent controls on imports and foreign exchange the disadvantages of over-valuation were partly counter-balanced. This is a kind of artificial respiration which cannot be continued indefinitely.

The Finance Minister, protested that anyone who talked of over-valuation of the rupee or the need for its devaluation was doing harm to the country. I agree with him that this is a delicate issue on which it is wrong to speak, or write without due sense of responsibility. But I am convinced that the Indian economy is not in a healthy condition and this is the reason why, in spite of all the herculean attempts at planning and injection of a thousand crores a year, the national income is not rising appreciably. I feel that one of the causes of this sickness is the lack of proper relation between the rupee and the principal foreign currencies of free countries which are dominated by the dollar and the sterling. At the present rate of exchange of the rupee at one shilling six pence, the cost of production in India is so high in relation to international prices of almost all manufactured articles that exports of our industries cannot be increased without heavy subsidy, direct or indirect. The Finance Minister

INDEX NUMBERS OF WHOLESALE PRICES (Base 1953 : 100)

	India	U.K.	U.S.A.
1950 ..	105	85	94
1955 ..	88	103	100
1956 ..	99	107	104
1957 ..	104	110	107
1958 ..	107	111	108
1959 ..	111	112	109
1960 ..	118	113	109
1961 ..	121	116	108

is not in a position to provide the requisite subsidy in the form of sacrifice of taxation, reduction of railway freights etc. Hence all the highly advertised export promotion schemes are not likely to yield satisfactory results.

BOOKS BRIEFLY

When the Monarch Trades

Nationalisation of Industries in India: By K. C. Bhandari; Academic Publishers, 11, Panchanan Ghose Lane, Calcutta-9; Pp. 221; Price: Rs. 10.

Reviewed By "M. M."

THE QUESTION of nationalisation of industries has been agitating many minds in India and abroad, especially after the independence of the country in 1947 and the incorporation of a rapid programme of industrialisation in India's five-year Plans. Dr. Bhandari tries to give a short, but comprehensive, account of the whole subject, and he succeeds in this.

Dr. Bhandari's book is divided into nine chapters, three Appendices, a Bibliography and an Index. Chapter I deals with the controversy about the meaning and implications of the term 'nationalisation' and with the historical aspect of the theory of nationalisation. Chapter II discusses the economics of public enterprise in relation to some standard criteria, such as, maximum welfare to the whole community, maintaining full employment, and others. Chapter III gives the views of well-known thinkers, scholars and economists on the subject. Chapter IV narrates Nationalisation elsewhere, that is, in other countries. Chapter V examines the economic policy of the "State vis-a-vis nationalisation". The nationalised sector in India is reviewed in Chapter VI. Various forms of administration of public enterprises in India are discussed next in Chapter VII.

In Chapter VIII, Dr. Bhandari discusses the problems of 'nationalisation' in India under two broad heads: (a) Problems of nationalisation, and (b) Problems of nationalised industries and services. This, according to the author, can claim to be an "original contribution to the subject". This chapter is interesting, specially the second part. Some of his observations merit serious consideration, such as, Members of Parliament and Ministers should not find a place on the Boards of Corporations or of Directors, there should be no Civil Service personnel on the Boards, the arguments against creating an "Economic Service", etc. This chapter should be enough for a busy reader.

The weakest chapter is, however, the last one devoted to 'Conclusion'. No one disagrees with Dr. Bhandari's main conclusion that "Nationalisation" is a 'fait accompli' — it is accepted fairly widely. But some of his other conclusions are rather scrappy, and smack of political rhetoric. For example, take the last paragraph of Chapter IX which reads as:

"Nationalisation as an important part of the planned economy of the country has come to stay. With its future is linked the future of the country. It must, therefore, succeed, as failure would be a national disaster. Let us, therefore, be cautious, vigilant and watchful and the future is ours."

Again, there are two lines in this Chapter on page 172 (last para) which read:

"It may, however, be stated that Fertilisers Industry should also be developed exclusively under the public sector. Public ownership of such an industry in an under-developed country like India which is fighting its food battle, is bound to accelerate the development of agriculture which is the mainstay of the country's economy."

The sentiments expressed above may be sound or otherwise, but the way they are expressed do not carry conviction. If the author's idea was to justify public ownership of the Fertilizer Industry, then he could have done it much better

by giving some hard facts.

Dr. Bhandari's book — "Nationalisation of Industries in India", however, is, on the whole, a good introduction to the subject and is a good compilation of much scattered materials that have appeared at many places before from time to time.

CREATING AN IMAGE

Foreign Trade of India: Journal of the Ministry of Commerce and Industry, Government of India.

THE MINISTRY of Commerce and Industry has brought out a monthly journal, "Foreign Trade of India", for export publicity abroad. The first issue, dated April 1963, is devoted to cotton textiles. There are some excellent articles by specialists on various aspects of this industry which make good reading. The reviewer feels that these things have their place, but only a very limited one, in journals of this sort that aim at creating a certain image of Indian Industry—or any specific branch of it—in the minds of the overseas public. A useful lesson to this end may be learned from similar journals in other countries. In fact, in this sort of business cost should be no consideration and there should be no relaxation of standards in colour printing and general layout. A riot of colours is in order, in fact, called for—in contrast to the melancholy specimens of models and designs as they have come out in print in this issue.

It is good to learn that subsequent issues of the journal are scheduled to cover some important sectors of the Indian Export Industry. While the new venture has much to commend itself, the reviewer still feels that the business at hand calls for a more colourful journal and should perhaps be left to professional publicists conversant with the world market. An image of India by definition will not be attained by statistics and learned articles, but by deft handling by trained specialists. The creation of an Indian image abroad is too serious a task to be left to the erudites of a government department however well-meaning; they rarely know the difference between red and scarlet, yellow and gold....

ECONOMY IN PERSPECTIVE

Industry in India: Published by Industry & Trade Services, 4/9 Asaf Ali Road, New Delhi; Pages 416; Price Rs. 15. THE PUBLICATION of 'Industry in India' at a time when we are devoting full attention to various plans and economic programmes is highly useful. A genuine attempt has been made in it to present a fairly comprehensive picture of not only the Industry of India, but of the whole economy as such. There is hardly an aspect which has not been touched upon in this volume. If one is taken into the dry fields such as stock exchanges which, of course, play a substantial role in mobilising risk capital, one is also taken out of it and provided with a deep insight into the land of India and its people. A separate section is devoted to the State sector where the entrepreneur is given an idea as to how some of the State Governments have been taking a keen interest in providing many facilities for the establishment of new industries within their respective territories. To the industrialists and entrepreneurs, it should, therefore, be of greater value for it places before them in clear terms the vast opportunities of industrial expansion in the country. The considerable scope that exists for starting many new industries and also in diversifying existing ones is unravelled by the experts on the subject. The results of the first two five-year Plans and a brief outline of the third five-year Plan acquaint the reader with what has been achieved and the task that lies ahead.

COMPANY MEETINGS

ASIAN CABLES CORPORATION LIMITED

Extracts from the Address of Shri Girdharlal B. Kotak, Chairman, Asian Cables Corporation Ltd., delivered at the Third Annual General Meeting of the Shareholders of the Company, on the 27th June, 1963.

Gentlemen,

It being the first year of production your Directors had to take very important and far reaching decisions on certain matters involving policy such as bifurcation of Accounts of Project I and Project II, allocation of pre-operational expenses to appropriate Heads of Capital Assets, valuation of closing stocks, etc. This necessitated the extension of the time for holding the Annual General Meeting which the Registrar of Companies was pleased to grant.

PROGRESS

The Corporation has made during the year under report a loss of Rs. 11.52 lakhs after providing for depreciation of Rs. 6.60 lakhs which would leave an actual working loss of Rs. 4.92 lakhs, not unusual in the initial year of production. This is inevitable in all new ventures, at least in the first one or two years of production. Our Company came into regular production in January 1962. It will be seen from month to month production that the output has been steadily rising from about Rs. 25,000 in January 1962 to about Rs. 7.50 lakhs at present, our full-rated capacity.

The production has now stabilised round the figure of about 12,50,000 core metres of cables per month valued at about Rs. 7.50 lakhs on a single shift basis. In the month of March 1963, the production touched a record figure of Rs. 8 lakhs. I have no doubt that with the efficient and competent staff that we have and the happier relations we are maintaining with the labour, we should be able to maintain this progress, and show better results for the current year.

MARKET REVIEW

I am happy to inform you that on the removal of the prospects of an immediate threat of further Chinese attack, and improvement that is now felt in the general economic conditions in the market, sales have started picking up and have increased considerably in the recent months. Our quality is being considered as good as the best produced in our country, and even in the United Kingdom.

RECENT INCREASE IN EXCISE DUTY

I may make here a reference to an additional factor which has affected more or less all the industries, but more the newly established industries. For Cables, the Government had imposed last year an excise duty for the first time. Simultaneously the percentage of excise duties on several other articles used in the manufacture of Cables was also increased. During this year the incidence of excise duty on many of the basic articles that go in the manufacture of Cables has been increased further. It will be thus seen that levies have to be paid at various stages on the same articles which are used as ingredients in the manufacture of Cables. This naturally affects the cost structure; obviously all this extra burden on the cost of finished products cannot wholly be recovered from the customers. The Industry itself will have to bear some part of these multiple additional imposts.

PROJECT II

The foundation stone of our Project II was laid on 25th February, 1963. The construction of the buildings for the new Project has already begun. Orders have already been placed for the necessary machinery and equipment and we expect the shipment of the machinery to commence before the end of

this year, and production to start before the end of the next year. Some technicians have already been recruited and five of them are now under training in England in the Power Cable Factory of M/s. Enfield Standard Power Cables Limited. I am glad to report to you that our Collaborators agreed to contribute their full part of investment in the equity capital of our Company amounting to US Dollars 11,30,000. We as citizens of this country really feel grateful to those who have been unstintingly assisting this country in order that better standards of living are obtained here and thus creating enduring prospects for peace and security and goodwill amongst the nations of the world.

I may also refer to the unpaid balance which remains to be called up on the right shares of the Company. The unpaid balance could have been called earlier. But actually the Company has not been in need of this much of money so soon. Collecting these balances earlier and when not needed would unnecessarily deprive the shareholders of the interest that may be accruing to them on their bank balance though the company would have certainly been benefited by the interest advantage that would accrue on such called-up capital. It will, therefore, be appreciated that the Company has not called up the balance share capital for the sake of convenience and benefit to the shareholders.

I am very thankful to Industrial Credit and Investment Corporation of India Ltd. and Industrial Finance Corporation of India who have stood by us all along in our need of Foreign Currency. I extend my thanks to Company's Bankers for their hearty co-operation.

I take pleasure to inform you that we have in our midst as Shareholders, besides the Banks and Insurance Companies, the Life Insurance Corporation which has invested Rs. 2,56,000 in the Equity Share Capital of our Company.

Before I conclude I should not fail in my duty to thank on behalf of the Board, the shareholders and on my own behalf, the Engineers, the Staff and the employees of the Company, for the efforts they have put in and the spirit of co-operation they have shown which have greatly contributed to the successful and satisfactory progress of the Company during the year under report. This encourages your Directors to look to the future with greater confidence. Our thanks are also in no small measure due to the spirit of sacrifice and service of the two Managing Directors who worked without any remuneration for nearly 3 years and even after that on a remuneration of Rs. 1,250 per month only because of the inadequacy of profits.

Note: This does not purport to be a record of the proceedings at the Annual General Meeting.

COMPANY MEETINGS

DALMIA CEMENT (BHARAT) LIMITED

Summary of the speech of the Chairman, Shri V. H. Dalmia, delivered at the Eleventh Annual General Meeting of the Company held at Dalmiapuram (Madras State) on 28th June, 1963.

Gentlemen,

It gives me great pleasure to welcome you to the Eleventh Annual General Meeting of your company. Since we met last, many eventful developments have taken place. The most significant, of course, was the unprovoked aggression on our northern frontiers towards the end of last year.

2. Your company was quick to respond to the emergent situation. Apart from the contributions to the Defence Fund, special attention is being given to maximising the production. The Joint Production Committee consisting of representatives of the employees and the Management has done a good job in raising the production at your Dalmiapuram Works to a record level.

3. I am sure you must have received with satisfaction the working results of your company for the year ended 31st December, 1962. The gross profit has risen from Rs. 84.02 lakhs to Rs. 146.62 lakhs — an increase of Rs. 62.60 lakhs. At the same time, the provision for taxation has gone up by Rs. 46.50 lakhs. Taxation will take away over 74 per cent of the increased profit made in 1962, partly due to the newly levied Super Profits Tax. It is, however, a matter of satisfaction that despite the heavy burden of taxation, it has been possible to maintain the dividend as also to strengthen your company's Reserve position by transferring Rs. 13.50 lakhs to the General Reserve.

4. Cement continues to be in short supply throughout the country and the position has somewhat worsened with the increased requirements of the Government on account of the Emergency. The expansion of cement industry has not, however, kept pace with the demand for various reasons including the difficulty in procurement of essential plant and equipment. In 1962, the installed capacity touched 9.728 million tonnes against 9.4 million tonnes in 1961, an increase of barely 3.5 per cent. The available estimates of the likely expansion of the production capacity within the third Plan period would indicate a continued shortage of cement. I am glad to inform you that there has been a distinct improvement in the utilisation of the installed capacity by the removal of such impediments as inadequate supply of coal, wagons for supply of raw materials and despatch of the finished product etc. The Government is also giving active consideration to encourage the manufacture of blended cements by the admixture of fly ash and other pozzolonas and blast furnace slag. Blended cements are used widely in other countries and an early start should be made in our own country also to mitigate the persisting shortage of cement.

5. The cement industry is being put to considerable loss by the recent changes made by Government in the system of computing the packing charges. The packing charges announced by the Government on a quarterly basis are determined as an average of the prices of new and second hand bags. In making out the average, the proportion of second hand bags was raised by Government with effect from the quarter October-December 1962, from 25 per cent to 50 per cent, without consulting the industry. This envisaged procurement of something like 90 million second hand bags for cement packing, which would not be possible. Besides, insistence on extensive use of second hand bags would lower

the standard of packing, which would not be in the interest of the consumer. Nor would it be desirable to permit the wastage of this important commodity, which is in short supply, through avoidable seepage. Despite the best efforts made by the Industry, it could procure and use second hand bags during 1962 to the extent of only 34 per cent of the total packing. I would urge the Government to review its decision at an early date and at least revert to the earlier practice of taking the usage of second hand bags at 25 per cent for determining the average packing charges.

6. Since I spoke to you last, there has been a marked improvement in the raisings of coal and its distribution, on which Government, the Railways, and the Coal Industry are to be congratulated. One of the factors, which have undoubtedly contributed to this improvement, is the carriage of coal by the rail-cum-sea route. I regret, however, that I am unable to express myself with equal satisfaction over the performance of the authorities in the implementation of the scheme, which was announced by the Government of India on August 1, 1961, to subsidise the movement of coal by sea so as to equate approximately the cost of sea-borne coal with coal carried by the all rail route. In February 1963, the Coal Controller had postulated a formula for the computation of coal subsidies which, while effecting a simplification in procedure, has aggravated further the gap between the subsidy which could thus be realised and what should be given if the cost to the consumer of seaborne coal is to be, more or less, the same as the cost of coal transported by the all rail route. It is to be hoped that the Government will rectify this defect and, at the same time, arrange for a very expeditious payment of subsidy claims.

7. Partial recession in the Steel Industry on a world-wide basis and large scale development of new sources of iron ore have tended to depress the international prices of iron ore and have greatly increased the competition which India must face in world markets. However, the State Trading Corporation of India had concluded a contract with the Japanese Steel Mills for export to Japan of 2.54 million tons of various grades of iron ore in 1963-64 and 2.65 million tons in 1964-65, including the supply of certain quantities of high grade iron ores. Your company may now hope to make further supplies of high grade iron ore from their mines to Japan through the State Trading Corporation of India.

8. Simultaneously with the development of new sources of iron ore and the consequent extension of the supply lines, the steel industry in various countries and particularly in Japan are faced with the urgent need to lower and stabilize transportation costs and to secure reliable supply routes. This had led to a growing trend towards the building of larger and faster exclusive ore-carriers capable of taking 40,000 tons and more of ore. Unfortunately, Indian ports are, by and large, not equipped to handle such large ore-carriers and therefore, India will continue to be at a disadvantage vis-a-vis those countries, such as South Africa and South America, at some of whose iron ore ports larger ore-carriers can be accommodated. I am sure that the Government of India will rise to the occasion and that the port facilities in our country will be developed as rapidly as possible to meet this challenge. Until such time as the major developments required for the

accommodation of such carriers are carried out, I would suggest that ports, such as Cuddalore, be improved rapidly to allow of their handling smaller ore-carriers of 20,000 to 30,000 tons.

9. It is gratifying to note that the Railways have increased their capacity for the transport of iron ore by the all meter-gauge route from the Bellary-Hospet region to Cuddalore port and we may expect that they would be able to increase this still further to keep pace with the development of Cuddalore Port.

10. There is an urgent need of a greater sense of security being given to the iron ore mining industry and particularly to those mines who are supplying ore for exports. Given reasonably long term contracts for supplies of iron ore, some of the mine-owners could introduce a degree of mechanisation in their mines and, where necessary, instal ropeways for the carriage of the ore from the mines to the rail-heads thereby reducing costs of operation and transport. This together with other measures, which Government will doubtless plan and implement, would enable Indian iron ores to meet competition in international markets more effectively.

11. I am sorry to advise that, contrary to expectations, there has been a recession in the deadburnt magnesite industry which is reflected in the working results of M/s. Dalmia Magnesite Corporation, in which your Company is a partner. This is due mainly to the fact that the Steel Industry, which directly or indirectly through the refractory industry consumes nearly the entire output of deadburnt magnesite in the country, has not progressed according to the Plan target. It is now apprehended that the Steel Industry may be able to reach a production of barely six million tonnes per annum by 1965-66 instead of the target of 10 million tonnes, to which the deadburnt magnesite industry, as part of the refractory industry in the country, was gearing itself. While there was thus a tapering off of the demand for deadburnt magnesite, the installed capacity of the industry was increased substantially by the commissioning, last year, of a new plant with a capacity of 18,000 tonnes per annum. Exports of deadburnt magnesite would be facilitated if special export incentives were granted to the industry and if a substantial rebate in Railway freight to the ports for the exported material were allowed. I must also strike a note of caution in estimating the future demands for deadburnt magnesite, due to the growing preference for L.D. and other Oxygen processes for the manufacture of steel. The industry, must, therefore, wait for reliable advice on the trend of the future expansion of the steel industry before planning for any further substantial increases in its own capacity.

12. I would now like to refer to the Scheme for conversion of the deferred shares of your company into ordinary shares by the issue of one ordinary share of Rs. 10 in lieu of every four deferred shares of Re. 1 each. The Central Board of Revenue has taken the view that Capital Gains Tax will be attracted in the event of the conversion of the deferred shares into ordinary shares. Representations have been made to the Board by the Chambers of Commerce that the law should be amended, if necessary, to take such conversion of shares out of the purview of the Capital Gains Tax, since it would be unreasonable to levy Capital Gains Tax, when the shares are not disposed of and continue to be held by the same person though the nature of the holding is changed. I hope that Government would relieve shareholders from the levy of Capital Gains Tax on the conversion of the deferred shares into ordinary shares in view of the considerations that I have just mentioned. It is desirable to encourage such conversion and eliminate the deferred shares so as to streamline the capital structures of the companies.

13. In their report, your directors have explained how interest paid by the company to your subsidiary, Dalmia Cement Limited, on the amounts due to the latter has been disallowed in the tax assessments of your company. The value of the assets taken over by your company from Dalmia Cement Limited has, ever since the scheme came into effect, been shown as due and payable to the latter company and interest has been paid on the outstanding amounts in the usual course of business. It appears to me to be taking too narrow and legal a view to suggest that interest on such outstandings is not allowable as the same does not pertain to capital borrowed for the purpose of business. In such matters, an appreciation of the real nature of the transaction should be made and the arrangement should be viewed from the commercial point of view. When the interest is being treated as income in the hands of the recipient, it is unreasonable not to allow it as a deduction in the tax assessment of the payer. A representation has been made to the Central Board of Revenue and it is my hope that an equitable view will be taken in this matter and relief granted to your company.

15. Before I conclude, I would like to express on your behalf and on behalf of your directors, our appreciation of the services rendered to the company by all the executives, staff and workers and for the goodwill and co-operation which continue to mark the relations between the employees and the management of the company.

JAIPUR METALS & ELECTRICALS LTD.

Speech of the Chairman Shri R. H. Kamani delivered at the 19th Annual General Meeting of the Shareholders of the Company on 29th June, 1963 at Jaipur.

IT GIVES me great pleasure to greet you and welcome you on behalf of my colleagues and myself to this Nineteenth Annual General Meeting of your Company.

Since we met last year, we have been passing through grave national crisis caused by the unprovoked and dastardly violation of our country's border by the Chinese which has made it absolutely necessary for all of us, as true Indians, to keep ourselves fully prepared for any situation that may arise. This crisis, however, shall not stop us from contributing our mite towards building our national economy and bringing prosperity through industry to our people. We have already offered our services to the Government in these critical times and I am confident that your Company will be able to serve the country in many ways. I am really happy to inform you that during the year under review, the workers, and the staff have voluntarily contributed a sizable amount, which along with your Company's contributions amounted to Rs. 87,000, to the National Defence Fund.

I cannot but mention the novel tax — the Super Profits Tax — which has come into force from the beginning of the current financial year for the first time in India. Plenty of criticism has been made on this legislation which is likely to have very far-reaching effects on the Corporate Sector. No doubt the Government require very large funds for the defence and development of the country and we do not grudge towards paying the same. However, the rigours of this tax are rendered slightly less unbearable due to various concessions provided by the same. Since it is an emergency measure, I earnestly hope it will be withdrawn when the emergency no longer exists.

The Directors' Report, Audited Balance Sheet and Profit and Loss Account for the year ended 1962 have been with you for some time past and with your permission, I propose to take them as read.

ACCOUNTS:

The working of the Company for the year under review has shown satisfactory results with sales and profits touching new heights. The earnings of the Company during the year under review amount to Rs. 23,79,314 as against Rs. 16,22,825 of the previous year.

Allocations include Rs. 1,48,499 for the Managing Agents' Remuneration as against last year's remuneration figure of Rs. 1,02,919 and Rs. 7,38,247 for Depreciation as against Rs. 4,33,709 for the previous year. The provision for taxation has been increased from Rs. 3,90,685 to Rs. 6,85,000 (including Rs. 52,000 for Super Profit Tax) and Development Rebate Reserve has increased from Rs. 3,05,000 to Rs. 3,50,000. A sum of Rs. 1,22,049 has been added to the General Reserve.

The Directors in their Report forwarded to the members of the Company have recommended a dividend of 6 per cent on Ordinary shares, which is 4 per cent less than the previous year's owing to higher appropriation on accounts of Depreciation, Development Reserve, General Reserve and Taxation including Rs. 52,000 for Super Profit Tax. The Directors have also recommended a dividend on Preference Shares. After providing Rs. 3,39,694 for the proposed dividend, a sum of Rs. 6,068 has been carried forward as against Rs. 7,561 brought in.

PRODUCTION

The production of "JAIPUR" Meters has been very encouraging. It has reached a record production which is about 20 per cent more over the production in the previous year. The production of "SIEMENS" Meters which was taken in hand only during the last quarter of the year 1961 has maintained the same average during the year under review.

As far as the working of the Metals Division is concerned, 1817 metric tons of material was produced as against 1717 metric tons in the previous year. As the Government did not allocate any copper for the manufacture of Copper Conductors from March 1962, the above production was achieved due to your Company having secured orders on conversion basis.

DEVELOPMENT AND EXPANSION

You will be happy to know that a major portion of machineries for the manufacture of Cyclometers and Magnets — most important components for the manufacture of JAIPUR METERS — has arrived and the balance is expected in a few months. The Company hopes to be nearly self sufficient in the manufacture of JAIPUR Meters in the very near future.

You will be happy to note that the Company has commenced production of A.C.S.R. and All Aluminium Conductors thus switching over to Aluminium from Copper as per the directive of the Government of India who desire to minimise use of copper in order to save foreign exchange.

The Company has already obtained Industrial licences for the manufacture of Enamelled Copper Wire and Cotton Silk and Paper covered wires and strips. It is hoped that the Import Licences for machineries for the manufacture of those two items, for which applications have been made some time back, will soon be received and the Company will be in a position to manufacture these items as early as possible. This opens fresh sources of income to your Company.

You will also be happy to note that the Industrial Finance Corporation of India have approved a further loan of Rs. 65.26 lakhs to the Company for implementation of the above development and expansion programme.

During the year your Company issued 25,000 Equity Shares of Rs. 100 each at a premium of Rs. 15 per share by way of Right Shares. All the shares have been fully subscribed and paid for.

RESEARCH

In order to improve the existing high quality and workmanship of the products manufactured by your Company as also to achieve still higher production and better efficiency, the technical personnel are always experimenting and improving on the methods of production. The increase of more than 20 per cent over the previous year's performance in case of Jaipur Meters is entirely due to this.

Our present achievements and hopes for a bright future are a result of good efforts, co-operation, devoted service and loyalty of workers and the staff of your Company and the encouragement and appreciation that your Company has received from all of you from time to time for which I thank you all.

Note: This does not purport to be a record of the proceedings at the Annual General Meeting.

RECORDS AND STATISTICS

Consents for Capital Issues: 1962-63

DURING THE year ended 31st March, 1963, the Controller of Capital Issues gave consents for the issue of capital to 424 applicants to the tune of Rs. 444.17 crores as compared to 426 consents involving an amount of Rs. 272.72 crores given during the previous year.

A break-up of consents given between agriculture and allied activities, industrial and non-industrial groups indicates that out of the total amount consented to, Rs. 4.42 crores was for agriculture and allied activities, Rs. 371.49 crores for industrial and Rs. 68.26 crores for non-industrial groups.

A study of the consents given during the year 1962-63 according to different size-groups shows that in 72 cases the amount of capital consented to was Rs. 1 crore or more each and aggregated Rs. 347 crores, which accounts for 78.1 per cent of the total capital consented to. In 63 cases the amount consented to in each case was Rs. 50 lakhs and below Rs. 1 crore, in 115 cases the amount involved ranged between Rs. 25 lakhs and below Rs. 50 lakhs and in the remaining 174 cases the amounts involved were less than Rs. 25 lakhs. The table opposite gives the number of consents and the amount involved according to different size-groups of consents.

An analysis of the types of securities to the issue of which consents were given during the year under review shows that 19.6 per cent of the consents were for initial issues, 48.0 per cent for further issues, 2.4 per cent for bonus issues, 10.3 per cent for debentures and 19.7 per cent for loans etc.

A split-up of the consents given between public and private companies shows that consents for total amounts of Rs. 210.49 crores and Rs. 233.68 crores were given to public and private companies respectively.

The table below gives an analysis of consents between

DISTRIBUTION OF CONSENTS BETWEEN GOVERNMENT AND NON-GOVERNMENT COMPANIES

(Amount in Rs. Lakhs)

Type of Security	Non - Government Companies				Government Companies			
	Public		Private		Public		Private	
	No.	Amount	No.	Amount	No.	Amount	No.	Amount
Initial	104	74,35.59	18	5,83.00	5	6,25.00	3	90.00
Further	107	39,24.89	15	7,17.25	1	50.00	34	1,66,25.94
Bonus	54	9,62.23	20	98.17	..	..	..	..
Debentures	15	44,24.17	1	40.00	..	..	1	1,00.00
Loans etc.	33	34,80.57	7	43,56.78	3	1,47.43	3	7,56.68
TOTAL	313	2,02,27.45	61	57,95.20	9	8,22.43	41	1,75,72.62

* The data given under this group refer to the issue of capital by banking and insurance companies and to the issue of bonus shares to which exemption does not apply.

Government and non-Government companies.

It will be seen from the table that of the total consents given, shares of Government and non-Government companies come to Rs. 183.95 crores and Rs. 260.22 crores respectively.

DISTRIBUTION OF CONSENTS ACCORDING TO SIZE GROUPS

Size-groups of consents	No. of Consents	Amount (Rs. crores)
Below Rs. 10 lakhs*	78	2.98
Rs. 10 lakhs and below Rs. 15 lakhs	32	3.94
Rs. 15 lakhs and below Rs. 25 lakhs	64	11.81
Rs. 25 lakhs and below Rs. 50 lakhs	115	38.46
Rs. 50 lakhs and below Rs. 100 lakhs	63	39.98
Rs. 100 lakhs and above	72	347.00
TOTAL	424	444.17

Inter-Company Investments

UNDER SECTION 372 (4) of the Companies Act, 1956, a company has to obtain the approval of the Central Government, if it intends to subscribe for or purchase the shares of other companies in excess of the limits laid down in sub-section (2) of Section 372.

During the period from the 1st December, 1962 to the 30th April, 1963, the Central Government accorded approval to the proposed investments in terms of sub-section (4) of Section 372 to the following cases:

Serial No.	Name of the Investing Company	Name of the Investee Company	Amount of proposed investment
1	2	3	4
			Rs.
1.	Associated Cement Companies Ltd., Bombay	M/s. Tata-Robins-Fraser Ltd.	12,00,000
2.	Atul Products Ltd.	M/s. Cynamid India Ltd.	11,34,847.20
3.	Bombay Dyeing and Mfg. Co. Ltd., Bombay	Chatsworth Mfg. Co. Ltd., of U.K.	£5,000
4.	Bombay Safe Deposit Co. Ltd., Bombay	In one or more of the thirty-two companies named in the resolution	30,000
5.	Burn and Co. Ltd., Calcutta	M/s., Reyrolle Burn Ltd. (Proposed)	15,00,000
6.	Coimbatore Cotton Mills Ltd., Coimbatore	M/s. Lakshmi Machine Works Ltd.	5,00,000
7.	Globe Motors Ltd., New Delhi	M/Luk Auto Ancillary (India) Pvt. Ltd.	10,20,000
8.	India Motor Parts and Accessories Ltd., Madras	M/s. Brakes India Pvt. Ltd.	10,00,000
9.	India Pistons Ltd.	M/s India Pistons Repco Pvt. Ltd.	12,75,000
10.	Indian Iron and Steel Co. Ltd.	M/s. IISCO Stanton Pipe & Foundry Co. Ltd. (Proposed)	2,00,00,000
11.	Indian Tube Co. (1953) Ltd., Calcutta	The Cyanides and Pigments Ltd.	2,33,250
12.	Indo-Burma Petroleum Company Ltd., Calcutta	M/s. Indo-American Electricals Ltd.	7,00,000
13.	Industrial Development Corporation of Orissa Ltd., Bhubaneswar.	M/s. Indian Metals & Ferro Alloys Ltd.	22,00,000
14.	Khatau Makanji Spg. & Wvg. Co. Ltd., Bombay	The Khatau Dyes & Fibres Ltd.	1,00,000
15.	Metal Distributors Ltd., Calcutta	M/s. Cominco Binani Zinc	42,00,000
16.	Madan Mohan Lall Shri Ram Ltd., Delhi	M/s. Usha Refrigeration Industries Ltd.	15,67,650
17.	Octavius Steel and Co. Ltd., Calcutta	The Chundeecherra Tea Co. Ltd.	9,180 equity shares of Rs. 10 each, at Rs. 23.12 per share or the prevailing market price, if less.
18.	Premier Mills (CBE) Ltd., Udumalpet	M/s. Lakshmi Machine Works Ltd.	5,00,000
19.	Rajalakshmi Mills Ltd., Coimbatore	M/s. Lakshmi Machine Works Ltd.	5,00,000
20.	Ritz Continental Hotels Ltd., Bombay	M/s. A Firpo	9,50,727.78
21.	Shashi Finance Ltd., Calcutta	Gaya Ganga Tea Co. Kores (India) Ltd.	14,57,549
22.	Shaw Wallace & Co. Ltd., Calcutta	(i) Matheson Bosanquet & Co. Ltd.	14,403
		(ii) Wallwood Plantations & Agency Ltd.	3,540
		(iii) Criickshank & Co.	15,493.80
23.	Sindhu Resettlement Corporation Ltd., Bombay	The Gandhidham Spg. & Mfg. Co. Ltd.	17,45,000
24.	Tata Iron & Steel Co. Ltd., Bombay	M/s Tata-Robins-Fraser Ltd.	18,60,000
25.	Tata Oil Mills Co. Ltd., Bombay	M/s. Tata Finlay Pvt. Ltd.	12,50,000
26.	West Coast Electric Supply Corporation Ltd., Madras	(i) Srisunder Welders & Engineers Pvt. Ltd.	5,55,594
		(ii) Spheroidal Casting Pvt. Ltd.	

Foreign Collaborations

APPROVED DURING JAN.-MARCH 1963

Serial No.	Name & Address of Indian Firm	Name of the Foreign Firm	Item of Manufacture
1.	M/s. Acme Pig Iron & Centrifugal Pipe Works Ltd., 8-Hammam Street, Fort, Bombay.	M/s. North British Steel Foundry Ltd., U.K.	Steel Castings.
2.	M/s. Bombay Dyeing & Mfg. Co. Ltd., Neville House, Graham Road, Ballard Estate, Bombay.	M/s. Fothergill & Harvey Ltd., Littleborough, Lancashire, U.K.	Tygan Blind Cloth and Tygan Screen Cloth.

INDUSTRIAL IBCON CONSULTANTS

The industrial consultancy services offered by the group fall under the following headings:-

IN THE PLANT—

PLANT CAPACITY AND LAY-OUTS • PRODUCTION PLANNING AND CONTROL
STORES ORGANISATION • CONSUMABLE STORES CONTROL
RAW MATERIALS CONTROL • FUEL AND STEAM UTILISATION
TRANSPORTATION METHODS • MECHANICAL HANDLING
PRODUCT QUALITY CONTROL • OPERATIONAL RESEARCH
WORK STUDY • BUDGETARY CONTROLS
VALUATION OF PLANT & BUILDINGS
DESIGN AND ESTIMATES OF EXTENSIONS

ON LABOUR—

METHOD AND WORK STUDY • PRODUCTIVITY INDICES
TIMEKEEPING SYSTEMS • WAGE PAYMENT SYSTEMS
JOB EVALUATION • WAGE STRUCTURES
PERSONNEL RECORDS • LABOUR POLICIES
HUMAN RELATIONS • COMMUNICATION
REORIENTATION LECTURES • FOR LABOUR AND SUPERVISION

IN OFFICES—

MANAGEMENT ORGANISATION • EXECUTIVE LEVEL WORK
CLERICAL PROCEDURE • MANAGEMENT CONTROLS
WORK MEASUREMENT • BUDGET FORECASTS
LAYOUT, COMMUNICATIONS AND EQUIPMENT

AND

THE SETTING UP AND TRAINING OF THE
CLIENT'S OWN INDUSTRIAL
ENGINEERING DEPARTMENT

MARKET RESEARCH

PLANNING FOR MODERNISATION AND EXPANSION OF INDUSTRIES
TECHNOLOGICAL STUDIES IN RAW MATERIALS, PROCESS AND PLANT PERFORMANCE

IBCON PRIVATE LIMITED

C.D.S. Gets Off to a Start

THE COMPULSORY Deposit Scheme got off to a good start on July 1 in a calm atmosphere, contrary to the predictions of the prophets of gloom. Their predictions, of course, were not altogether baseless or irresponsible, if the original plan of the Government to launch the scheme is taken into account. In particular, the procedure—and this is what matters most for every single depositor — was so cumbersome that it could not but have caused considerable irritation and annoyance to all, who either endorsed the scheme from its very inception or subsequently reconciled themselves with its necessity in the present emergency. The irritation and discontent generated by it were the two factors on which the opposition was hoping to capitalise. But the last minute changes announced in the procedure and the machinery for collection of the deposits proved effective in taking the wind out of the sails of the opposition.

Even those who wished well of the scheme had genuine and profound doubts about the smooth and efficient implementation of the scheme, looking at the half-hearted manner in which matters were allowed to drift practically until the last moment. Criticisms advanced against the practical procedure could have been met and corrective action could have been taken to rationalise the machinery and procedure for collection in good time. But the fact that these inescapable measures of reform were announced on the eve of the launching of the scheme indicates that wisdom dawned upon the authorities rather late in the day. Even if belated, the improvements, which have now been introduced for the smooth and efficient operation of the scheme, are welcome. They will undoubtedly go a long way in removing much of the irksome liability originally foisted on the depositor and, in addition, they will also relieve the three accredited agencies — the post offices, the Reserve Bank and its branch offices and the State Bank and its branch offices—of the mounting pressure of work arising from the volume of deposits.

Some credit may be claimed in all fairness by the Finance Ministry for removing the hardship that was involved in the original procedure. But it cannot be gainsaid that the eleventh hour changes were clearly a product of after-thought whose necessity was brought home to it by the magnitude of the paper work that would have to be gone through in too short a time. If the haphazard manner in which the War Risk Insurance Schemes were introduced without the completion even of the elementary pre-conditions are fair indications of official planning in such matters, there could be no doubt that a good deal of confusion and chaos as well as harassment to the public would have been caused in diverse ways, particularly in procuring the application forms and account books. And it is no secret that the Government had approached employers to print the requisite forms for the benefit of their own employees. The procedure now evolved directly goes to scrap much of this superfluous paper work. It makes the introduction of the scheme easy for the Government and convenient to the depositor. The extension of the period of grace from 14 days to 45 days to make the initial deposits will serve to ease pressure on both the parties.

Possibly the most sensible change now introduced is to dispense with the obligation first laid upon every single depositor to tender his application form. Authority is vested in large-scale employers coming within the purview of the Employees' Provident Fund Act to maintain a single account with the accredited collecting agency for the entire body of their employees liable to make the deposits. This one radical reform has saved individual employees from going through the troublesome procedure on their own. Individual accounts of the depositors will, of course, be

maintained by the employer in regular official registers, which would enable repayments as well as payments of interest to be made in accordance with the scheme. This procedure does not cover income-tax paying employees. In their case the one difficulty which makes it impracticable to collect their deposits at the source is the possibility in a majority of cases of other earned or unearned income accruing to them and in consequence raising the proportion of the amounts of deposit they have to make. The employer cannot necessarily be aware of this additional income and it would be too much to place an obligation on him to collect and verify facts relating to the full extent of such income.

Seven scheduled banks, having a comprehensive network of branch offices throughout all the parts of the country, have been brought in the picture as agencies for the acceptance of deposits and the subsequent supervision of their accounts. The accretion of these banks, with a large number of branches or offices, will greatly relieve the official agencies of the high pressure of work and, simultaneously with it, it will also be conducive to the convenience of the depositors, many of whom would prefer to make their deposits with banks which are far more specialised by long years of experience in this type of work than the post offices that were the mainstay of the collecting apparatus in the

Upgrading Sugar Target

THE UNION Government has decided to raise the third Plan target of sugar production to 4 million tons as against the earlier target of 3.5 million tons. The timing of this decision has created the erroneous impression that the present shortage of sugar in the country was due to the insufficiency of installed capacity and that, perhaps, an immediate stepping up of the target for the third five-year Plan was extremely urgent. Since the present capacity of the industry is around 3.35 million tons and with the available capacity the output of the industry has been, in 1960-61 and 1961-62, at levels well above the total of domestic demand and exports, the emphasis on expansion in capacity is not fully justified. The problem in the sugar industry today is not one of capacity; it is one of the supply of adequate quantities of sugarcane to the factories and stoppage of diversion to khandsari and gur producing units.

Three weeks ago, the President of the Indian Sugar Mills' Association, Mr. G. M. Modi, had warned the Government that the stipulated target of 3.3 million tons of sugar production for the 1963-64 season is not likely to be achieved primarily because the khandsari producers and the gur manufacturers are likely to attract large quantities of sugarcane vitally needed by the factories since the khandsari producers are at present happily placed in so far as the price situation is concerned. Because they can afford to pay higher prices for sugarcane — the market price of khandsari being almost double that of the controlled price of sugar—they will definitely, in the current season, offer higher prices to

original scheme. The delay in announcing the names of the seven scheduled banks, after the scheme was launched on July 1, indicates that negotiations for enlisting their co-operation were started too late.

The opposition parties have been baulked of the initial sharp weapon with which to launch the attack on the Compulsory Deposit Scheme and the quiet atmosphere in which it is being introduced over a period of six weeks has taken them by surprise. Nevertheless, there can be no doubt that persistent efforts would be made by them to organise resistance to the scheme. The ground on which their resistance is based mainly relates to the sacrifice and hardship involved in effecting 'forced savings' to comply with the new proposal. *Eastern Economist* does not take the view that the Compulsory Deposit Scheme is either irrational in concept or onerous in its impact. Its justification lies in the emergency measures by which resources must be raised by the State to finance fresh outlays. A patient and firm policy on the part of the Government in pursuing the scheme, coupled with a vigorous, though tough, educative propaganda to be conducted by the party in office, should prove equal to the task of countering the mischief which the opposition is bent upon creating, despite its approval and acceptance of the extraordinary expenditure for defence and development.

the sugarcane growers and thus once again repeat the story of the last season. The burden of the excise duty on khandsari producers being extremely light, they are able to offer higher prices for sugarcane even when their yield is extremely poor in relation to the factories, and thus keep the level of factory sugar output at a considerably reduced level.

It is a pity that no effective steps are being taken to curb the diversion of sugarcane from the factories to the gur manufacturers and the khandsari producers. The two measures which have recently been announced seem half-hearted in the sense that they are not likely to bring about the desired objective of feeding the sugar factories with all the cane that they need. In the first place, the Government has banned the movement of khandsari from one State to another and, in the second place, the Union Government has asked the States to licence wholesalers in gur and khandsari on lines followed in respect of sugar. As the price of khandsari has been rising steeply because of the shortage of factory sugar, the Government has taken the second measure, as clarified in the official announcement, only to "keep a watch over the trade". In plain terms, the Government has acknowledged that licensing of gur and khandsari wholesalers is not the solution of the problem and that it is just a preliminary to collecting the requisite data on the basis of which alone a concrete policy may be evolved to regulate the production of khandsari. It is, however, a patent fact that the high differential between the excise duties imposed on the factories and the khandsari manufacturers has acted

as a potent factor against the factories. Unless the Union Government raises the excise duty on khandsari to the same level as in the case of the factories, the diversion of sugarcane is likely to continue. Again, the sugar acts in some States (particularly in U.P.) need to be modified in such a way that the diversion of cane from the factories to the other producers is completely stopped.

Basically, there is nothing wrong in extending the target of sugar production for the third five-year Plan if the additional licensing of factories is so planned that the production of the present units is not affected. In the past, licences have been granted to new factories without giving full attention to the demands of the existing factories in regard to the supplies of their raw materials. Sugarcane being a perishable commodity, the factory can draw its cane only from its immediate neighbourhood. It is, therefore, essential that the extension of the target and the establishment of new factories should be so arranged that the "cane zones" of existing factories are not in any way affected.

Another element which needs to be taken into consideration while planning an expansion in the sugar industry is that wherever possible preference should be given to the extension of the existing factories. It is a known fact that the cost of manufacture can be lowered by economies of scale in all industries and the sugar industry is no exception. In the case of all the major sugar producers of the world, the Governments have encouraged the factory owners to raise their installed capacity, and in any scheme of expansion, a preference is given to an increase in the capacity of the existing units over the establishment of new factories. It is an unfortunate fact in this country that the weakness of the Government for the co-operative sector has acted very often against the national interest; co-operative sugar factories have been allowed to be set up while the national interest demanded an expansion of the existing units. Wherever possible, therefore, the Government should allow an increase in the capacity of the operating units. The applications for the establishment of new factories as well as expansion in the

Postscript on Policy

THERE HAVE been postscripts and postscripts on policies of countries but never one so pertinent to our country at the present juncture as the "postscript on policy" left behind by Prof. J. K. Galbraith, US Ambassador to India, on his last visit to Bombay on the eve of his laying down office. If only for this compelling reason, one must hope that neither the Government of India nor the US Government will take Prof. Galbraith's sporting remark: "Anything that I say that seems inconvenient can be readily dismissed by your Government and disavowed by mine." Although some of his remarks appear critical of our Government, one could not consider these so inconvenient as to dismiss them as such. They might not be novel but are certainly thought-provoking and ought to make our planners take stock of the situ-

existing factories have been with the Government for the last so many years. In the sanctioning of new capacity, due regard, therefore, should be given to the task of lowering the cost of manufacture and maximisation of output.

An attempt has been made by the official spokesmen of the Union Government to prove that the target of 3.3 million tons of sugar fixed for 1963-64 is likely to be achieved because the cane needed for the factories is available within the country. It is stated, for instance, that the total crop in 1963-64 is estimated to be around 90 million metric tonnes while the demand of the factories is not more than 1/3rd of the total production. It is well-known that the cane needed for the factories is there in the country but the other major economic pull i.e. the prevailing market-price is so dominant—as clearly shown by the experience of the last year — that unless some fiscal concessions are announced well in advance of the crushing season, it may not be possible to hit the target which the Union Government have assigned to the factories.

It has become a fashion with the official spokesmen to exhort the industry to modernise plant and machinery and thus reduce its cost of manufacture. Every time the case of the industry has gone before the Tariff Commission, the demand for an increase in selling price of sugar for modernisation and rehabilitation of the plants has been set aside. In these circumstances, the industry has no option but to carry on with its uneconomic units. There are some units in east Uttar Pradesh which are likely to close down their operations because at the present levels of sugar and sugarcane prices, they find it absolutely unremunerative to operate their factories.

Eastern Economist has recommended on earlier occasions that the obvious solution out of the present impasse is to decontrol sugar which, in the short run, may cause a little strain on the consumer but will ultimately result in allowing the industry to buy all the sugarcane it needs from the farmer at the competitive price and operate the factories to full capacity.

ation and render their policies more practical by giving them a realistic reorientation.

Stating that the need to escape from poverty, a legacy of past neglect, constituted the established point of concentration not only for India but for many countries in Asia and Africa, Prof. Galbraith wondered whether the definition of the problem by our economists and its attempted solution on the present lines would answer the needs of the situation. Of course, he did not dispute the need for increased investment in industrial and agricultural plans to ensure a minimum annual increase in total output, but he maintained that investment and economic growth alone were not the ultimate purpose of economic advance. Rather, he said, it was the ends that these things were meant to serve, namely,

improvement in well-being and popular enjoyment of life by the average person. And a poor country must achieve these ends with promptness. In this context, the Harvard Economist made the notable point (which is often missed by our planners) that the basic comparison in human affairs is always the present with the recent past. "The average person does not compare (as do our politicians) his economic position with that of the remote rich. He does compare his position this year with his position of last year. If his income is improving, he naturally takes the credit to himself, but he also takes a benign view of the Government that makes it possible. The result is political contentment and stability. If his income and living standard is deteriorating, he unhesitatingly blames it on the State. He will be in a difficult and angry and possibly even a revolutionary mood. The result will be damaging to orderly progress and perhaps the democratic process."

This sums up many an average Indian's reaction to the prevailing conditions. It is axiomatic that one judges every course of action by its results, i.e. whether it promises to improve one's position or tends to damage it and also that, while one welcomes the former, one regards the latter with the gravest concern. Alongside this simple and valid test, the accepted tests of the economist, namely the rate of investment and economic growth, cannot but lose their significance, especially if the dangerous consequences of such emphasis are recognised. It was not casually that Prof. Galbraith stressed that an undue emphasis on rate of growth can, and in important cases has, led to undue emphasis on current saving and on increase of these savings through taxation.

As a result, in the name of increasing output in the long run, there has been reduction in the well-being of the average person in the short run. This, it will be evident, can be dangerous policy. The average person may know of the hopes for the future. But he knows even more acutely that he is now poorer than before. This can rarely be accepted with grace and contentment when living standards are close to the margin." While criticising the rate of investment, the Ambassador was not oblivious of the necessity of savings for economical advance, but he was not also oblivious of the fact (as some of our politicians are) that "if these must be squeezed in toto from the small budget of the average citizen, the process of improvement is very painful."

Prof. Galbraith, who is a keen student of the economic growth of underdeveloped countries and has made no small contribution to the literature on the subject, was further of the view that, if savings could come from abroad in the form of grants or low interest rate loans, then the process of growth would be much less painful. While on this point he contrasted the position of India with that of China. "Whereas," he said, "India has had friends on whom she could fall for help, the Chinese have had to face the grim task of getting the wherewithal for their advance out of their own limited resources." Un-

doubtedly this has proved unpalatable to China and, according to Prof. Galbraith, China's jealousy that India's democratic planning has yielded better results than her own with Marxian rigidity probably explains China's military adventures of last autumn.

When Ambassador Galbraith spoke of too many things competing for the attention of the planners and of one of the best ways of introducing a sense of strategic concentration was to apply the test of individual well-being, one again could not resist the inference that he had the Indian Planners' experience very much in his mind, besides, may be, the experience of several others. How meaningful is this observation of Prof. Galbraith: "...individual well-being in a country such as India is overwhelmingly a matter of food supply, education, clothing, health and simple shelter".... "If these are available in growing amount and at reasonable prices, the well-being of the average person is secured and so is the development process. And so most likely will be the political and social institutions which depend on the consent and well-being of the people at large."

Prof. Galbraith had no doubt whatsoever that anything that impaired Indian economic performance was a source of weakness. Although the Chinese might not have looked at the defence preparations of India to resist her from this angle, he felt convinced of the suggestion of the implied danger in it. For he said: "One could imagine a design for Indian defence which would place an inordinate demand on Indian resources which would be sustained by heavy taxation of the average citizen and forestall (or is it stall?) all economic advance. If this defence would be at the cost of India's ultimate strength, it would be no defence at all".

Eastern Economist 20 Years Ago JULY 9, 1943

The air prospects that future holds for India cannot be exaggerated. A vast sub-continent with important industrial and cultural centres all over can quicken its pace of all-round progress with a network of internal air transport, and situated as India is on the great commercial route between Europe and the Far East, the importance of her geographical position in any system of inter-continental airways is obvious. Hence it is necessary from now on to guard against foreign corporations getting a controlling hold on the enterprise in India. It might be recalled that the Government of India's agreement with the Indian Trans-Continental Airways vested controlling authority in the Imperial Airways. If it is found that Indian enterprise is not able to stand on its own legs at the beginning, it might have to be subsidized. A precedent has already been set for subsidizing airways in the case of the Indian Trans-Continental Airways which has received at more than Rs. 20 lakhs per annum by way of direct and indirect subsidies. Finally in any scheme of inter-continental air transport, involving agreements with foreign countries, India should not be treated as just an appendage to Great Britain, and her territory made use of as a thoroughfare controlled by Britain. Any reciprocal advantages accruing to us out of our allowing passage to foreign services over India should be actually enjoyed by us, and not by Britain or British interests in India on our behalf.

Highlights of the Week

POPULATION AND PRICES

ADDRESSING THE press on July 3, 1963, Mr. Gulzarilal Nanda, Deputy Chairman of the Planning Commission, painted a very gloomy picture of the Third Five-Year Plan, which, according to him, necessitated an immediate review of the priorities. Tentative estimates had indicated that the rates of rise in India's population had taken an upward course, from 2 per cent per annum assumed in the Plan to 2.4 per cent per annum. Even this 0.4 per cent per annum increase in the rate of rise of population meant 1.8 million additional mouths to be fed every year, which ultimately exerted additional pressure on our supplies of food and other consumer goods.

In sharp contrast to the complacent attitude adopted by him in April this year in Parliament, while discussing the price situation, Mr Nanda admitted that the wholesale prices in India had risen by about 8 per cent during the last fifteen months. Significantly alarming was the 7 per cent rise in respect of basic necessities such as food articles (rice, pulses, sugar, gur, etc.). Whereas the preliminary estimates had shown that the impact of the new taxes imposed in the last budget on the price situation would not be more than one per cent, Mr Nanda agreed that, in the ultimate analysis, the pressure of the taxes would be much heavier than had been earlier anticipated. It was obvious that the effective demand in consumer goods had outstripped supplies and, hence, an imbalance had been created which could not be corrected by controls and consumers' co-operatives only. Mr Nanda, however, trotted his pet horse of consumer co-operatives stating that the price situation could not be kept under control unless about one-fourth of the total off-take of consumer goods was organised through the co-operatives. Citing statistical data in support of his thesis, he said that nearly 51,000 fair price shops and 959 consumers' co-operatives were set up in the country and that many more similar units were needed to keep a check on prices. He even went to the length of stating that a part of the rise had been caused by the profiteering undertaken by the trading class despite the assurances held by them to the contrary at the time of the declaration of the emergency and was of the opinion that the Defence of India Rules should be put into effect in order to curb profiteering.

The sudden spurt in population which the Planning Commission's recent study seems to have indicated cannot be corrected by any short-term measures. The population problem, in fact, is a long-term one and its solution can be had over a number of years. Striking an alarming note on an issue which is by no means a discovery at all is nothing short of a clever device to attempt to cover the failure of the price policy. Consumers' co-operatives and fair price shops can at best suffice to tinker with the problem. The stagnation on the food front and the comparative neglect of the production of consumer goods have brought about a situation where the increasing purchasing power in the hands of the people due to enhanced defence-cum-development expenditure of the Government have gone to add to the impact of demand. Controls, consumers' co-operatives, fair price shops and all similar measures are feeble instruments to tackle the price situation.

The Deputy Chairman of the Planning Commission, however, struck a note of optimism when he said that he was sure that the total output of foodgrains in the Third Plan will hit the target of 95 million tons, if not 100 million tons. Even if the scaled-down target of food output were

achieved, the pressure on prices would certainly be mitigated, but not completely eliminated, because the impact of other factors would continue to operate.

CANE-PRICE RATIONALISATION

THE SEMINAR which was held at Kanpur from July 3 on the problems arising out of the acceptance of the formula of fixing cane prices on the basis of quality helped to clarify a number of doubts existing in the minds of the State Governments as well as cane-growers and the sugar mill managers and in demonstrating in a convincing manner how the application of this new formula would be in the interest of the cane growers, sugar producers as well as of the consumers. It was an indefensible anomaly which was tolerated for long years whereby the price of cane was paid according to weight. Political embarrassments prevented removal of this anomaly earlier. But it was quite clear that so long as India did not fall in line with other cane-producing countries and did not relate the price of cane to its quality, one of the basic causes of the high cost structure of the sugar industry would not be rectified. In November last year, the Government introduced this rational scheme of paying the price for cane according to its sucrose content. Considerable experiments at the Government level went behind the introduction of this scheme. Initially the tentative basis has been accepted to pay the price for cane in accordance with the recoveries recorded by the factories in the previous crushing season.

But the real and decisive scientific step is being taken now to pay the price according to the sucrose content directly at the time of purchase. The difficulties which are usually raised as impediments to the practical application of this formula were, by and large, plausible excuses put up on behalf of cane-growers without adequate knowledge and information. Determination of the sucrose content and quality of the cane is neither a very complicated matter nor are the means necessary for it beyond access for the sugar mill areas. At Kanpur the important announcement was made that payment of price on the basis of quality would be implemented in 6 sugar factories in the Southern States on the individual grower basis and in 30 factories in other parts of the country on a zonal basis during the crushing season 1963-64. This limited start would serve to educate the parties concerned on the practical problems of the application of the new price formula, so that its subsequent extension to the entire sugar-producing regions would be facilitated. It appears from the discussions at the Seminar that the areas to be selected for the prior application of the formula would be those where the competition from gur production is not quite powerful or effective. But eventually its application everywhere is an accepted policy. The progressive enforcement of the scheme of payment of price according to quality cannot but produce the healthy effect of creating quality-consciousness. To accelerate this process, incentives for the production of quality cane would be necessary and the Government intends to provide them. To the extent that this new trend will improve the quality and competitiveness of Indian sugar, it will be an additional gain to stabilise our hold on the export markets.

AGRICULTURAL REFINANCE

THE AGRICULTURAL Refinance Corporation inaugurated on Monday this week by the Finance Minister, Mr Morarji Desai, is being equipped with strong resources to perform its task of refinance. The existing agencies for the provision

of agricultural credit have proved to be quite inadequate and in some cases inefficient. But for the vigorous part which the Reserve Bank of India is playing in the sphere of agricultural credit, the entire credit machinery would have continued to move slowly. Agriculture has a strategic place in our economy not only for sustaining the ever-increasing demand of a growing population for food but for providing raw materials to a wide range of industries. There has always existed, therefore, the urgent need for an agency supplying term credit for agriculture. The Corporation is intended to fill this gap.

The Agricultural Refinance Corporation will refinance the eligible institutions in respect of loans or advances made by them. It will function like a central banking institution interested more in financing and strengthening all primary institutions for lending than being itself a major primary lender. Working through the existing apex co-operative and land mortgage banks and also the scheduled banks, the Corporation will provide finance for sound and organised schemes up to a limit of Rs. 50 lakhs for a single transaction. In view of the long gestation period of such schemes, the Corporation will supervise and control their implementation in order to ensure that the expenditure on these schemes is economical, productive and useful. The schemes that are eligible for assistance include (a) reclamation and preparation of land, (b) development of special crops like arecanut, coconut, cashewnut, cardamom, orchards, vineyards, tea and coffee plantations, (c) development of mechanised farming, use of electricity through tube-wells, pumping sets, and (d) development of animal husbandry, dairy farming, pisciculture, and poultry farming.

The financial resources of the Corporation are adequate for the initial phase. In addition to the present issued capital of Rs 5 crores—the authorised capital is Rs. 25 crores—it will get on deposit without interest Rs. 5 crores from the Government of India. To augment its resources further, it is entitled to accept fixed deposits for a period of 12 months or more from the public sector and can also raise money by the issue of bonds or debentures, and through a special provision, funds in foreign exchange from abroad, the total borrowing limit being twenty times its paid-up capital and reserves. The provision for the grant of dividend out of the profits of the Corporation has also been made; but the Reserve Bank, under the Agricultural Refinance Corporation Act, will deposit all the dividends accruing to it during the period of the first 15 years with the Corporation free of interest. This will help in strengthening its resources position to operate its business in the initial stages. Being free from the responsibility of having to maintain a large network of branch offices, and also because of the fact that it will be working in close co-operation of the Reserve Bank, it will have at its disposal all the knowledge and information which the Bank has. The choice of the members of the Board of Directors gives assurance of its sound and efficient management.

ECAFE: EXPORT HURDLES

THE ECONOMIC Commission for Asia and the Far East in its survey for 1962 has focussed attention on the foreign trade problems of the countries of the region, pin-pointing the major obstacles which they have faced hitherto in increasing their export earnings. An analysis of the export trends in recent years has revealed the fact that the growth of exports of the region has lagged behind even the aggregate output. Most of the countries have tried hard to raise their exports, but have come across certain hurdles which they have not been able to overcome even after putting into practice the time honoured advice they have been given

regarding quality control, reduced costs, etc.

It is a well-known fact that a large volume of exports of this region consists of primary products, mainly raw materials, whose demand in the industrially advanced countries has not been rising in an encouraging manner. The Common Market countries particularly have recorded a decline in the imports of raw materials from the ECAFE region. In the face of this hard reality, the countries of the region have been advised to turn their attention to the manufacturing industries so as to diversify their export lists. Here again, there are certain basic difficulties which the ECAFE countries have failed to overcome because of the unhelpful attitude of the developed countries. In the case of cotton textiles—in which India is particularly interested and in whose case exports have steadily declined for the last few years—the non-imaginative attitude of the industrial countries has again thwarted the plans of the countries of the region to earn more by exports. It is at this point that the analysis prepared by the Secretariat of the ECAFE has done a little plain speaking. It has recommended that the industrial countries “may consider the desirability of attaching a time schedule for gradually shifting labour and other resources away from this industry as a concrete measure of implementing the general principle of helping the trade expansion of the less developed countries.” It has further stated that the financial burden of these readjustments is not likely to be so heavy as the rich industrial countries may not be able to bear. In fact, this measure would be in line with the general spirit of the new Trade Expansion Act of the United States.

Stress on Trade, Not Aid

While the change-over recommended above will take some time to materialise the EEC and EFTA countries should bring about substantial changes in their tariff systems if they really desire a rapid development of the countries of the region. High tariff walls have so far forbidden the exports of many commodities and manufactured products; unless these countries take a positive step in lowering the tariff rates, the developing nations may not be able to earn additional foreign exchange. It is to be conceded that the developing countries have in recent years received substantial foreign aid, but the feeling is getting strong in the region that they must endeavour to enlarge their trade rather than have enhanced aid and also to repay the credits obtained through the aid.

During the recent negotiations between the United Kingdom and the EEC countries, it was stated that tea in particular—one of the largest foreign exchange earners for India—would be allowed duty-free entry into the Common Market. While the negotiations between Britain and the Common Market countries have not ended happily, yet at the same time, the Indian Union and the other ECAFE countries have not succeeded in selling more to the Common Market. The quantitative import restrictions also have restricted the entry of some of the light engineering goods such as sewing machines and electrical fans, which have recently appeared on the export lists of the Asian countries. If these goods also encounter the same difficulty as cotton textiles, then the belief that the ECAFE region countries could raise their export earnings by diversification will be belied and may cause further frustration in the region. Partly, the initiative for expanding the trade of this region, lies with the rich industrial countries and unless they move in the matter, the development plans of many of the countries of the region are not likely to attain the modest targets set for them by the United Nations in its Development Decade Programme.

A POLICY FOR RAILWAY—V

Are Our Railway Finances Sound?

By T. M. RAO

THE INDIAN Railways have been functioning as a profitable business for a number of years and have been able to show a clear margin of net earnings. But this does not mean that their financial position is satisfactory. On the other hand, there are many disturbing features.

One is the fact that heavy deficits are incurred in passenger operations. Between 1957 and 1960 the deficits (on a fully allocated basis) amounted to Rs. 183 million. This has not always been so. Prior to 1957, passenger operations were indeed profitable and yielded net income as the figures in Table I will show.

TABLE I.
PASSENGER TRAFFIC

(Rupees in millions)

Year	Gross Earnings	Expenses including interest	Percentage of expenses to earnings
1955-56	1282.1	1262.9	98.5
1956-57	1370.5	1324.8	96.6
1957-58	1429.8	1478.1	103.3
1958-59	1400.3	1505.7	107.5
1959-60	1508.3	1537.5	101.9

Source: Committee on Transport Policy and Co-ordination, Preliminary Report, New Delhi, February 1961.

These deficits have occurred in spite of the fact that the volume of passenger traffic increased 25 per cent during the period 1956-1961. This is unlike the situation in the United States where passenger deficits have mainly stemmed out of a rapid shrinkage in passenger traffic. There may be many reasons for the faster rise in expenses than revenues. Yet it is unthinkable that such deficits could have occurred under private ownership. In spite of these severe losses, the railway management has continued to extend travel concessions to various groups. One good example is a half-fare ticket sold to professional artists for their rail journey to and from their place of performance. Also, in the name of passenger amenities, heavy expenditures have been incurred without regard to their proper utility. For instance, Mangalagiri, a small station on the Southern Railway was completely rebuilt a few years ago with a high level platform and a huge passenger shelter with electric fans and lights although the passenger traffic at the station except during festival times is

1. Committee on Transport Policy and Co-ordination, Preliminary Report, Government of India, Planning Commission, New Delhi, February 1961, p. 59.

IN THIS searching study of the finances of the Indian Railways, Mr. Rao criticizes sharply the Railway Administration's failure to control operating expenses. He gives instances of uneconomic and un-businesslike expenditures and urges that the series of passenger deficits which have characterized railway earnings in recent years should be brought to an end without further delay.

relatively small. Is there any wonder then that passenger expenses have mounted steeply so as to obliterate the net revenues completely?

The story on the freight side is somewhat better than the passenger side as shown in Table II with the percentage of expenses (including interest) to earnings going down from 90.6 per cent in 1955-56 to 87.5 per cent in 1959-60. However, this is nothing to be satisfied about. An analysis of the financial statements will reveal the following facts:

1. The operating ratio has steadily gone up from 77 per cent in 1951-52 to 78.8 per cent in 1960-61 reaching a high of 82.4 per cent in 1958-59. (Table IV).
2. The increase in the volume of traffic is not adequately reflected in the increase of gross revenues. This would indicate that gain in volume has been mainly in the low-rated commodities. “It will be observed that between the years 1955-56 and 1958-59, the total originating tonnage in respect of the low-rated commodities has increased by about 22 per cent, i.e., from 57.4 million tons to 69.8 million tons. During the same period the tonnage in respect of other commodities which are comparatively high rated has declined by about 4.9 per cent.”¹

TABLE II.

FREIGHT TRAFFIC

(Rupees in Millions)

Year	Gross Earnings	Expenses including interest	Percentage of expenses to earnings
1955-56	1992.0	1806.1	90.6
1956-57	2259.0	2007.8	88.8
1957-58	2558.3	2248.5	88.7
1958-59	2677.8	2398.0	89.5
1959-60	2909.1	2544.2	87.5

Source: Committee on Transport Policy, and Co-ordination, Preliminary Report Government of India, Planning Commission, New Delhi, Feb. 1961.

3. Operating expenses have gone up steeply for which a rising wage bill and increased fuel costs offer only a partial explanation.
4. The rate of return on capital outlay is extremely low. It may be noticed from Table III that the net return has been well below two per cent in eight of the last 10 years.

Operating Ratios

Tables IV and V show figures of operating ratios (the ratio of railway operating expenses to operating revenues) for the last several years for the Indian Railways and corresponding figures for the Class I railroads in the United States respectively.

A comparison of the operating ratios for the two countries shows that the figures are slightly better for the United States Railroads (see graph). One would have normally expected the opposite because the volume of traffic is rapidly rising in India whereas it is declining on the United States railroads.

TABLE III
INDIAN RAILWAYS—RETURN ON CAPITAL-AT-CHARGE
(Rupees in millions)

Year	Capital at-charge	Net Earnings	Net Earnings as percentage of capital-at-charge	*Net Return on capital-at-charge (after deducting interest charges on capital)
1951-52	8,501.1	617.5	7.3	3.6
1952-53	8,373.8	471.8	5.5	1.8
1953-54	8,693.0	369.1	4.3	0.6
1954-55	9,015.8	440.6	4.9	1.2
1955-56	9,689.8	503.4	5.2	1.5
1956-57	10,717.1	583.8	5.5	1.8
1957-58	12,224.4	577.8	4.7	1.0
1958-59	13,565.9	593.2	4.4	0.7
1959-60	14,328.8	745.5	5.2	1.4
1960-61	15,208.7	878.7	5.8	2.1

*The figures under this head may vary slightly from the official figures published by the Railway Board because of certain approximations made by the author in the calculations.

Source: 'Investments', Douglas H. Bellemore, Simmons-Boardman Publishing Company, New York, 1962, p. 724.

While revenues may decline, expenses do not come down in the same proportion which tends to increase the operating ratio. The railroads in the United States have also been plagued by high labour costs and so-called feather-bedding, which according to the railroad management represents annual costs of \$500 million. All these have an adverse effect on the operating ratio. It may be argued, however, that operating ratio is sometimes a misleading statistic because a railroad may show a low operating ratio by skimping on its maintenance expenditures. This is true and has been the case for many railroads in the United States. While it is conceded that the operating ratio by itself is not a proper index to judge the efficiency of a railroad, it is still a matter for concern that the operating ratio on the railroads in India is so high, particularly in the face of steadily rising revenues. This is one of the aspects of operation which the railway management in India may well bear in mind.

WINDOW ON THE WORLD

Next Stage in the Common Market

From Our Special Correspondent

PARIS:

THE REDUCTION of tariffs inside the Common Market on July 1, and the simultaneous adjustment of external tariffs nearer the future common tariff, are a timely reminder that despite paralysing disagreement on major subjects, the Six continue their march toward economic unity. The ECM Commission said lately, after referring to some of the most serious causes of dispute among the Six, "it is clearer than ever that the movement toward integration in Europe is not only irreversible but irresistible". Since the Commission's own programme for further integration is temporarily on ice, this might seem optimistic. But the Commission did not put up that programme as a suggestion for closer co-operation that the Six might or might not adopt depending on how well disposed they felt toward each other; if that were all it were, the programme could indeed accumulate dust as long as political friction persists. On the contrary, its programme is a sketch of the sort of collaboration that the Six will be forced into willy-nilly if they maintain their schedule of tariff disarmament.

That schedule, as we see this month, is being maintained and in fact hastened. Tariffs fell 50 per cent in the first four and a half years (another 10 per cent on July 1), and the remaining 50 per cent reduction will no doubt be achieved in the same period. That is to say, duties within the Community will be zero on December 31, 1966, three years earlier than was foreseen in the Rome Treaty. At that date, goods will be traded tariff-free between the Six, they will have a common external tariff and the last exceptional import-quotas will be abolished. Though various members will try sundry shifts and compromises to prolong protection for individual sectors, no one has suggested that the formation of a Customs union can be delayed. The disappearance of tariff barriers is so obviously in each nation's interest, on balance, that the implementation of this part of the Treaty is assured.

Harmonisation of Policy

Now, the Commission argues, it is an illusion to think that nations can form a Customs union and still refuse the sort of harmonisation of economic policies that is suggested in its programme. At the present moment, to be sure, the Six are behaving as though tariff disarmament could continue while they sulkily decline to discuss forms of political collaboration, but events must cure them of this idea. Simply to restore the free movement of goods, men and capital on the Continent would just take Europe back to the situation known in the 19th century, but modern nations could not rest in that position for long. The reason is that, since the 19th century, the State has become the largest enterprise in each country (controlling between 30 and 50 per cent of investments) and is regarded by its citizens as responsible for the whole economy—yet when the national States surrender the right to control the movement of goods, men and capital across their frontiers, they have lost the prime instruments of their intervention. They then have no alternative but to co-operate between themselves on questions of economic policy, as the first cyclical downturn in European business will demonstrate. In putting forward its programme, the Commission is not urging something extra in the way of integration, that the Six may take or leave as they wish, but is outlining the forms

of co-operation to which the member-nations will be obliged sooner or later.

On one point, I think that the Commission is somewhat too optimistic, and it refers to that "sooner or later". As they encounter trade difficulties or find that the pace of expansion is slowing down, the Commission imagines that the Six must necessarily turn at once to closer economic integration. In the long run, this is true: it is only by consenting to a more radical specialisation of tasks that the Six can maintain their expansion. But in the meantime, they will be tempted to try an alternative procedure, which we see illustrated in the current economic policies of most of the major Western nations: this is the idea that reform at home can be avoided or made painless, and collaboration between government made unnecessary, simply by extending the geographical area of free trade. This is the idea behind the Kennedy plan which is expected to revivify American industry merely by opening up new markets for its goods in West Europe, without the USA having to accept any of the international responsibilities that are sketched in the Common Market's proposals for harmonisation of policies. It was the motive for the British effort to enter the Common Market, as far as that was conceived as a commercial operation that Britain could effect without having to make any concessions to the supranational aspects of that association. And it is the reason why many Continental firms, notably but not only in West Germany, hanker after an extension of the Common Market, first to Britain, then to other West European nations, and tomorrow to heaven knows who.

European Plan

In other words, there is what a psychiatrist might call a "flight into free-trade" which is just a symptom of the desire to postpone the inevitable adjustments of economic policies between nations. Are France, West Germany and Italy making too many motor cars? Then let's not seek to co-ordinate their automobile investments because that is planning, and as every hypocritical neo-liberal knows "planning" is a dirty word. Instead, let's extend the area of tariff-free trade in motor cars to include Britain. Still too many cars, too many conflicting investments, too much waste and too little specialisation? Then let's extend the area of free trade in cars to all West Europe. Still too many? Then let's bring the USA into the party. And so on. Like all defence mechanisms that involve running headlong away from problems, this one must break down somewhere, so it is better to face the difficulties earlier rather than later. That is what the ECM Commission's programme suggests, and that is why it includes a proposal for a sort of European plan.

When those difficulties are faced up to, says the Commission, the first sort of integration that will be recognised as needful to make a Customs union viable is harmonisation of indirect taxation. It will be seen, when tariffs are abolished and in fact well before, that conflicting tax systems still oppose formidable barriers to trade. Instead of dodging this problem by seeking to exchange mere tariff concessions with yet other nations, it will be necessary to make indirect taxation uniform as between the present members of the Customs union. Hence the first item in the Commission's programme is introduction of a single tax along the lines of the French "tax on added

ASP/UBI-10

"value" in all the Six nations. Gradually the amount of this tax would be equalised until the Customs union exists in fact and not only on paper.

At that stage, it will become urgent to co-ordinate short-term economic policies, in other words to move toward a single Budget for the whole Community. Simultaneously, the need of a joint monetary policy will become evident, for one cannot have a single market where various monetary authorities follow incoherent ideas as to the creation and movement of money. No more is a full Customs union conceivable without fixed rates of exchange between the national monies; if one currency were to be suddenly devalued or up-valued in an area where goods and capital move freely, all the other members' affairs would be thrown into confusion. And once rates of exchange are fixed and guaranteed as between members the association in reality has a common cur-

rency, of which the national monies are just different-sized coins. In that event, it becomes easy, and desirable, that the Six should have a common monetary reserve.

No one will dispute that in a unified market social welfare and labour policies must tend toward uniformity. The need for a Customs union to find a joint agricultural policy, a common line of transports and energy, and a joint approach to questions of external trade and aid will be mentioned here only for completeness sake, because this is admitted, and discussions on these laborious matters are in progress. It is the final element in the Commission's programme that arouses most controversy: the desirability of a long-range European plan, along the lines of the national plans now practised in all member-countries except West Germany. Opposition to this idea is as lively as it is irrational, so this is the one point where the Commission's suggestions are probably premature.

Can the U.K. Do It?

By JOSSLEYN HENNESSY

LONDON:

THE BRITISH National Economic Development Council's growth target for the UK is 4 per cent a year between 1961 and 1966. This implies a similar increase in imports. To pay for these, to allow for increased aid to developing countries, and to prevent checks to expansion from unfavourable balances of payments, UK exports as a whole will have to rise by 5 per cent a year and of manufactured goods by 5.5 per cent. Can the UK do it?

Some light on this question is thrown in a newly published survey "Export Trends" (H.M. Stationery Office. London. 2sh. 6d.), compiled by NEDC.

The UK's postwar record seems, at any rate at first glance, discouraging. Her total share of world exports of manufactures fell from 21 per cent in 1953 to 15.2 per cent in 1962, and while the world's average rate of increase in manufactured exports was 7.6 per cent, the UK's average rate was only 3.2 per cent. On the other hand, this means that the UK has only to increase her share by 2.3 per cent to achieve the 5.5 per cent increase that she needs, and NEDC's analysis of the content and pattern of geographical distribution of the UK's exports suggests that the task — although admittedly difficult — is not impossible. Both content and pattern are now more favourable than they were in the early 1950s. The proportion of UK exports consisting of goods in which world trade has risen relatively slowly—e.g. textiles—fell between 1954 and 1962, whereas the UK's proportion of the faster growing groups — e.g. machinery — rose. It used constantly to be emphasised that the UK sold over 60 per cent of her exports in the sterling area and that this was a handicap because the sterling area was a more slowly expanding market than Europe. In 1961, the UK was still sending as much as 43.4 per cent of her exports to the sterling area — a higher percentage than any other country — but NEDC says that these sterling area markets, and those of other primary producers, may grow at a faster rate in future. The terms of trade of the primary producing countries worsened in the 1950s, but NEDC's assumption of 5 per cent as the UK's minimum overall export requirement was based on the further assumption that the terms of trade would improve for the primary producers. Certainly since the publication of NEDC's original report, developments in sugar, wool, rubber, sisal, silver, tin, lead, coffee, cocoa, and other commodities, have confirmed its forecast.

UK exports should also benefit from tariff cuts in the European Free Trade Area (EFTA) and from the "Dillon

Round" in the USA and the EEC. On the other hand, the UK will suffer as the EEC countries reduce their internal tariffs on each other's goods, but NEDC thinks that, on balance, these various changes should help the UK's exports.

An important factor in NEDC's calculations is that a survey of plans and forecasts made by governments and international organisations suggests that, if the various targets were all hit, world manufacturing production would rise by 6 per cent a year between 1961 and 1966. This would be a faster growth rate than the 4.5 to 5 per cent achieved in recent years. NEDC's researches suggest that world exports of manufactured goods will grow at the rate of about 5 per cent a year. As already mentioned, the UK needs to attain 5.5 per cent a year if she is to achieve her domestic growth target, that is she has to do half a per cent better than the expected world average. On this point NEDC comments sedately "... the required expansion in our exports may not be forthcoming unless prices of manufactured goods on the home market fall relatively to foreign export prices of manufactures. At the least, the past relative increase in home prices of over 1 per cent a year must be eliminated." NEDC does not point out that this implies that the UK must be able to enforce a really effective Wages Policy—an achievement which, so far as I know, no country in the world has brought off so far.

Tricky Position

On prices and costs, the UK's situation is tricky. On the one hand, the index of export prices (1958=100) showed the USA going up from 105 in 1960 to 108 in 1962, and Western Germany soaring from 100 to 107, while the UK rose somewhat less — from 102 to 106. Unfortunately, up to 1961, the UK's wages costs per unit of output in manufacturing rose faster than those of any other country. This more rapid increase was due more to a slower rise in productivity than to a faster rise in hourly earnings. In this connexion, however, the "Economist" recently pointed out that a considerable amount of re-equipment and expansion of capacity took place in the UK between 1959-61. This did not raise productivity significantly in 1962, but much of it matured at a time when the government was restraining demand. There could therefore be considerable reserves of growth in productivity in the expanded capacity that is at present under utilised — providing always that the trade unions see to it that restrictive practices and demarcation disputes do not cancel out any rise in productivity.

Can the UK do it? The pros and cons seem neatly balanced.

Way Behind in Welfare

By GUY SIMS FITCH

WASHINGTON :

THE SOVIET Union is no newcomer to the field of economic development. It has been 45 years since the Communist take-over. Moreover, by the standards of today's developing lands, the Russia that the Communists seized hardly qualified as a less-developed area, ranking at the time among the top half-dozen or so industrial powers of the world.

Yet, progress in advancing the living conditions of the Soviet peoples has lagged well behind the acknowledged Soviet progress in further building up Russian industry. Consumer goods and services have received the lowest priority among Soviet planners, and in a land supposedly dedicated to the broader sharing of the fruits of production, State control has merely tended to accentuate the economic gap between the rich and the poor.

History has rendered academic the question of whether or not the Soviet peoples would have fared better under a system more akin to that developed in the United States and other free nations. But there is no denying the fact that it is in the United States, which itself has undergone a dramatic socio-economic transformation in the past 30 years, that history has seen and sees today the widest and most prolific sharing of the national wealth.

Living Standard up

The personal income of all Americans and their aggregate consumption expenditures have been increasing steadily to new highs year by year. What this has meant in the way of real living standards may be seen in this statistic: on a per capita basis and after adjustment for price rises, disposable income—that is, income after taxes and available for spending, saving or investing at the discretion of the individual—has grown from \$913 in 1933 to \$2,051 in 1962.

Today, more than 60 per cent of all American households own their own homes. About 80 per cent of American farms are operated by individual owners. Individual savings in banks and other financial institutions exceeds \$165,000 million. More than 46 million Americans own income-bearing federal, State and municipal bonds, and about 17 million Americans own shares in private industry. More than 85 per cent of all American families own some kind of life insurance, totalling about \$600,000 million in value. More than 75 per cent of American families own automobiles, and of these a growing number own more than one car.

These scattered examples of the kind of personal well-being that is characteristic of the American scene are further reflected in a dramatic democratization of US economic society. In the homes they live in, the furnishings they buy, the clothing they wear, the food they eat, the schools and churches they attend, the substance and variety of all the goods and services they enjoy, Americans of all backgrounds and income levels are hardly distinguishable one from another.

Yet Americans differ one from another in that each is free to express his own individuality and taste in the enjoyment of those goods and services. They are free to do what they will with their lives, and they have the resources with which to make that choice meaningful. This is a natural outgrowth of a society in which individual rights are protected by law, and in which production and marketing are geared to satisfying the needs and wants of the consumer—presented by the will of a growing population that has already passed the 186 million mark.

The differences in US and Soviet living conditions are best delineated, perhaps, in the two essential realms of food

IN THE issue of March 22, in an article "The Economic Race: A Soviet View", Yuri Pokatayev of the USSR State Planning Commission, maintained that his country would overtake the United States in per capita production by the year 1970. Guy Sims Fitch has evidently been provoked to reply.

and shelter. While the Soviets have been expending their resources in building up heavy industry and military hardware and sending rockets to the moon, the housing situation in Soviet cities remains desperate. Including rural construction, only about 1,100 million square feet of residential floor space were built in the Soviet Union last year, or about 25 per cent less than in the United States, a country with a smaller population and no housing shortage.

Even the most modern of Soviet apartments has only about 400 square feet of space, compared with 900 square feet in the average American dwelling. In the Soviet Union's jam-packed cities, where privacy is at a premium and too often unknown, housing provides about 100 square feet of space per person, only a third of the US average!

Just as the Soviets have drawn upon the industrial technology and methods of the United States and other free countries, they have relied on private constructions to keep housing conditions from being even worse. But now, driven by faulty centralized management and faltering building resources, as well as by ideological considerations, the regime has chosen to curtail this private activity. Ironically, the new edict does not ban construction of private estates outside city limits—usually the preserve of high Communist functionaries in that "peoples' paradise."

Communist agricultural failures are too well known by this time to require much documentation. A recent report notes that the Soviet Union and other East European countries experienced another disappointing agricultural year in 1962, aggravating food shortages in the area. Among the hardest hit are East Germany and Czechoslovakia, two relatively prosperous areas in pre-Communist days.

An all-too-familiar excuse is the reportedly bad weather which hampered production in Eastern Europe—an excuse which also is being applied now to the industrial sector. But this same weather also hit many parts of Western Europe, without any startlingly ill effects on industrial or agricultural output.

Agricultural Output

The US agricultural performance supplies a sharp contrast to the Communist failures. US farmers now are in the midst of a spring planting season, following an abnormally hard winter, that promises to bring a record 1963 harvest, two per cent over the record output of 1962.

As a result of this farm productivity, food in the United States is plentiful and inexpensive. The average American family spends only 19 per cent of its income on food, compared with about 30 per cent in many West European countries, and no less than 60 per cent in the Soviet Union. Its agricultural abundance also enables the United States to help feed hungry people all over the world.

So rapid and extensive has been the rise in farm productivity, that the US Government has instituted measures to control agricultural output by encouraging the diversion of farmlands to conservation and other productive uses. But

one important point should be noted in this regard. American farmers are free to make their own choices, even to the extent of determining the course of government farm policies through the direct exercise of the ballot. Next month, for instance, farmers will vote in a nation-wide referendum on the government's new and tightened control plan for wheat, and approval by at least two-thirds is required to make the plan effective.

In the Soviet Union, on the other hand, it is not too much to say that the status of the peasants remains what it has been since the introduction of collective farming. In the eyes of free men, they are still serfs, with the State as their landlord, telling them what to do and how to do it, and how much they will receive for their produce.

Herein lies a basic difference between the US and Soviet systems. In the United States, the socio-economic structure is what the people ultimately determine it to be, not what a bureaucratic oligarchy decides for them. Abraham Lincoln once described the United States as a government of the people and by the people, as well as for the people.

In such a society, change and growth are inherent. The people find much of their well-being, which includes their security as well as their prosperity, in what they do for themselves as well as in what they decide the government can and should do for them.

Personal Security

Over the years, by popular will, the government's role in promoting personal security has been widening steadily. More than 140 million Americans, for instance, are now covered by the government's social security laws, entitling them to old-age, retirement and disability benefits. More than \$26,000 million have already been paid out to Americans under this public programme.

The government also has steadily improved and widened its many other protection programmes, such as unemployment insurance and special assistance to the handicapped. It also engages in a variety of other activities, such as insuring individual savings accounts up to a value of \$10,000 each, and setting minimum-wage levels for industries and companies engaged in inter-State commerce.

In the field of enterprise, the government has put in place a vast rural electrification system, has built dams and other power projects such as the Tennessee Valley Authority, and regulates a wide variety of industries, such as electric power, transport, communications, and securities exchanges, to ensure their operation in the public interest.

Equally impressive is the truly amazing volume of private protection Americans have amassed against the vicissitudes of old age, ill-health and disability. In their impact, these private efforts not only supplement, but in many cases outweigh the public programmes in the benefits they afford the individual and his family.

As of 1960, for instance, 132 million Americans were participants in private voluntary health and hospital insurance plans, designed to pay the bulk of major medical expenses. On their own and through their labour unions, Americans also have expanding private pension plans, in addition to such other growing "fringe" benefits as paid vacations and employer-financed supplemental unemployment insurance funds to complement the government's unemployment insurance.

In 1960, private pension plans worked out by employers

and employees paid about \$1,700 million to some 1.8 million annuitants, many of whom also were receiving retirement payments under the Public Social Insurance System. Employers, incidentally, finance about 75 per cent of the cost of all private pension and welfare plans.

In keeping with their status as free men in a free society, moreover, American workers can form and operate their own labour unions, through which they bargain collectively with management on wages, working conditions and other benefits. This in itself is a prime source of sustained and rising incomes and of personal well-being.

This broad recital still is far from all-inclusive, and can only indicate the nature of the constantly developing American system and the way it works to the advantage of the individual and his family. Nor should this recital imply that all problems are thereby solved.

One of the virtues of a free society is its capacity for self-examination, for seeking out and correcting what needs correction, improving what needs improvement, and advancing further in areas where advancement is desirable or needed. This is a never-ending process, one in which the US Government is engaged today as conscientiously as ever.

Suffice it to say that in the growing and complex mixture of public and private institutions and activities they have developed, the American people have created a way of life through which they have achieved an economic abundance and an opportunity for personal fulfilment unprecedented in human history — and they have done it within a political framework of individual freedom and democratic government.

Review of Cement Capacity Expansion

By Our Correspondent

NEW DELHI :

THE TARGET for the installed capacity of the cement industry under the third Plan is placed at 15.24 million tons corresponding to a production of 13.2 million tons a year. A recent review, however, has indicated that the capacity, likely to be set up by the end of the Plan will be 13.65 million tons. The Government therefore has considered necessary that new schemes, found suitable from the point of view of availability of raw materials, power, fuel, water, rail transport facilities and demand and supply in the area concerned should continue to be approved, formal licences to be issued only after the parties had made satisfactory arrangements for the supply of machinery and equipment.

Enquiries show that as many as eleven applications have been recently approved. Of these five are for one unit each in Andhra, Bihar, Himachal Pradesh, Mysore and Pondicherry and two each in Madhya Pradesh, Orissa and Uttar Pradesh. Of these, three applications are for expansion. They are in Bihar of Kalyanpur Lime and Cement Works to 400,000 tons, in Orissa, of Orissa Cement, Limited, for substantial expansion to 30,000 tons, and of U.P. Government Cement Factory at Churk to 25,000 tons.

Details of the new units are as under :

Location	Annual capacity
Alampur, Andhra	200,000
Rajban, Himachal Pradesh	100,000
Patharia, Madhya Pradesh	200,000
Near Bhilai, Madhya Pradesh	200,000
Wadi, Mysore	400,000
Tuba Padwa, Orissa	200,000
Pondicherry	100,000
Rajpur, Uttar Pradesh	200,000

In Gujarat, a cement factory to be located at Bhavnagar is being asked to increase its capacity from 50,000 tons to 100,000 tons. In Maharashtra proposals to set up a 33,000 tons factory at Ahmednagar and of 100,000 tons factory at Shivpur are under discussion here. In addition, there are plans to set up two units of 150,000 tons and 100,000 tons in Assam, of 200,000 tons and 185,000 tons in Madras and of 462,000 tons and 200,000 tons of slag cement at Durgapur in West Bengal.

★★

The Federation of Indian Chambers of Commerce and Industry at its regional meeting at Hyderabad last month, had expressed "grave concern over the sharp fall in joint ventures and declining trend in foreign collaborations." Although the emergency had affected foreign investment, the Federation felt that special conditions imposed by the Government and dilatory procedure followed have had a very serious and discouraging effect on foreign investment. The Federation has supported its statement by figures. A member of the Planning Commission has recently written to the Ministry of Finance, suggesting one unified control for industrial licensing. That there should be one contact point is not in dispute. What is under discussion is where this contact point be located. The member of the Planning Commission, referred to earlier, had suggested its location in the Ministry of Finance. The other view is that it should be the Ministry of Commerce and Industry which is vitally concerned with the administration of the Industrial Policy. The ideal solution, it is suggested, is to appoint a Director-General for Industrial

Licensing. He will be the contact point for Indian and foreign entrepreneurs.

In the nature of the administrative set-up and the number of agencies, which deal with this problem, it will neither be possible nor desirable to clothe this person with overall powers to take final decisions. It will, however, be his main function to take such decisions as were within his delegated authority and to have final decisions taken by the appropriate persons as speedily as possible. The Ministry of Commerce and Industry had created a very much similar post last year and it is within the common knowledge that the experiment had worked fairly satisfactorily. The Emergency, following the Chinese aggression disturbed this system, which had again been re-started last month. It may be further added in this connection that a reform of procedure is urgently called for. Under the scheme referred to above, a foreign collaborator could have a single point of contact. The officer concerned would be helpless, if the Under-Secretaries, say, in the Ministry of Finance, were to send for the parties to discuss issues on which they had no power to take any decision. What is needed is a manual of easily understood and speedily executable rules of procedure.

In respect of joint ventures involving financial participation, the most important formality is the Government approval of the terms of collaboration between the Indian entrepreneur and the foreign firm. It is found that this formality has in many cases taken a fairly long time with the result that on the one hand the foreign investors feel somewhat frustrated and on the other the project under consideration is delayed. It is, therefore, suggested that a broad framework of policy should be formulated and the necessary authority for sanction should be delegated to the Ministries concerned. In exceptional cases which are not covered by such delegated authority or where there are special features requiring further consideration, a high-level inter-Ministerial machinery may be created to take speedy decisions in respect of collaboration.

It is suggested that in the light of experience gained in the approval of collaboration agreements of over 1000 cases, Government may formulate broad principles regarding (a) financial participation, (b) rate of royalty in respect of know-how, (c) consideration for know-how fees either in lump sum or in the form of shares, (d) lump sum consideration for research and development, (e) fees for design engineering etc. in respect of important industries.

★★

The following is the schedule of production for Bokaro steel mill in tons as recommended by the US team.

	First stage	Second stage	Third stage
Hot rolled sheets and strips	300,000	500,000	860,000
Cold rolled sheets and strips	250,000	600,000	1,000,000
Galvanized sheets	130,000	130,000	300,000
Plates	360,000	570,000	750,000
TOTAL	1,040,000	1,800,000	2,910,000
Ingots	1,400,000	2,500,000	4,000,000

★★

Negotiations are on in regard to the utilization of the £30 million credit United Kingdom has offered to India towards financing the third year outlay of the Plan. Of this £3.5

million is being utilized for the import of steel from Britain. A portion of the loan will be earmarked to finance maintenance imports from Britain.

Sir Norman Kipping of the Federation of British Industries who came out to India last winter has made some important observations on the maintenance imports in his report on India. Sir Norman says:

"The managements of Indian factories dependent on sterling maintenance supplies are therefore having to contend with a variety of difficulties and from what we have seen are doing so in good heart and with ingenuity, for they understand the dilemma which has brought about this situation. They are having to accept materials from unfamiliar sources and to varying specifications; they are having to press forward harder than ever to bring local supplies up to the quality standards they require; and they have a constant struggle to get licences for sterling supplies, ending up usually with 'too little and too late'.

Blanket Licences

"We therefore represented to the Government of India that a change of system would be desirable so that companies manufacturing products to which India gave priority and dependent on sterling supplies were given blanket licences of this kind. These representations were accepted in principle, subject to safeguards which, it was said, could be worked out in time for the procedure to be introduced in the April, 1963, Red Book on import licensing policy.

"We have also requested that the cash allocations should be extended to companies having servicing organisations in India for the maintenance of, namely, machine tools, business machines, weighing machines, as this would be more economical than having each end-user carrying his own spares.

"Before coming to India we obtained particulars from a large sample of companies with factories or licence agreements in India, showing that they already found themselves restricted below their needs for efficient operation. In the course of our discussions with the Government of India, they agreed to measure the extent of this shortfall, concentrating on the metal-working and engineering factories in which de-

pendence on sterling imports predominates. (In general, chemical works in India — with the possible exception of pharmaceuticals — can work satisfactorily from base materials of any origin).

"The estimates show that on the basis of the allocations made in 1962-63, the shortfall in the sum needed to finance the import of components, specialised raw materials and spare parts needed from Britain lies between £4 million and £10 million a year. The extent to which newly established capacity is taken into account, the range of industries covered and the degree of austerity assumed would determine the amount within this range. The average of £7 million should cover reasonable requirements.

Sterling Shortage

"The possibility cannot be excluded that shortage of sterling may oblige the Indian Government to make still further cuts in the licence for-maintenance imports in the coming licensing period. Any such event would be deplorable, but it would not, in our view, affect the rightness of the change in licensing procedure we have recommended. We are satisfied on the basis of a very large number of cross-checks that within the allotted level, whatever it may be, companies will be better off and will be able to turn a given amount of sterling to better use if given greater personal control of the use of their allotments.

"It was to be expected that dependence on sterling maintenance supplies would occur principally in British-based companies and those making products under British licence agreements. The study showed that in fact 75 per cent of the total need arose from such companies, and the remainder from various other Indian companies."

It is, therefore likely that £1.75 million would be earmarked for the maintenance imports by the British based industrial houses.

A similar provision of 75 million D.M. has been made in the West German loan.

The utilization of Dutch and Belgian credit is still facing difficulties. The Dutch credit of one hundred million guilders for three years includes thirty-five million guilders for exports

RENUNCIATION !

guaranteed credits. So far India has shown interest in a dredger for Murmagoa.

The Belgian credit was for one year. It has been extended till the end of 1963 to enable India to purchase coal mining machinery for which a mission had gone to Brussels.

Children's education is the major problem for the members of the Diplomatic Corps, whose number may always increase. A diplomat is normally posted for a period of three years, which may be extended. The problem of education of their children in confined to those ranging between five and twelve after which they can be and are sent to the diplomat's own country for higher education.

There are three schools for such children organised and run by the Embassies of the USA, West Germany and France.

Second Phase of Loan Programme

By R. V. MURTHY

BOMBAY :

AN IMPORTANT event in the capital market, conditions in which have rightly been exercising the attention of the authorities, was the announcement of the second phase of its loan programme, by the Government of India, on July 1. The first phase of the loan programme, it will be recalled, consisted of the Government's offer, in May last, of conversion of two maturing Government of India loans, namely the 3½ per cent 1963 with an outstanding amount of Rs. 58.06 crores and the 3 per cent 1963-65 loan with an outstanding amount of Rs. 116.17 crores, as also the Hyderabad loans of the aggregate value of Rs. 8.75 crores. Holders of the maturing loans were given the choice to convert into either or both the 4 per cent short-dated loan (1969) and the 4½ per cent long dated loan (1986). The decision to have only a conversion loan two months ago was obviously made after noting that conditions in the money market prevailing at the time were still not propitious for a wholly cash or even a cash-cum-conversion loan.

Pattern of Borrowing

Although the 1963-64 borrowing programme began with only a conversion offer thus, it may be said to have set the pace and pattern for the current year's borrowing programme all right. It indicated, for instance, the Government's determination to finance both development and defence expenditure on a 4½ per cent basis. Accordingly, when the terms of the new loans were announced last week, there was hardly any element of surprise. Nor was the absence of a long-term loan unexpected this time; and there was complete unanimity of view in market circles that the new loan announcement would positively include a medium-dated loan. In the event, the two new loans announced happen to be broadly in line with market expectations. Thus, the two new loans are (1) a six-year 4 per cent loan—which is a further tranche of the existing 4 per cent 1969 loan—at an issue price of Rs. 99.50 i.e. at a discount of 50 nP., and (2) a ten-year 4½ per cent loan—4½ per cent 1973—at Rs. 100, i.e. at par. On this basis, the yield on the first loan, i.e. the short-dated loan, works out to 4.10 per cent and that on the medium-dated loan to 4.25 per cent. These may be compared with the latest ruling quotation of the 4 per cent 1969 loan of Rs. 99.60 (which gives an yield of 4.07 per cent) and of the 4½ per cent loan 1972 of Rs. 100.30 (which gives an yield of 4.21 per cent) to confirm the view that the terms of the new loan are in line both with market expectations and prevailing money conditions.

Unlike the first phase, the second phase of the borrowing programme provides for both cash subscriptions and conversion. Unlike the May loans, again, the present loans are for both the Centre and the States—a consolidated loan programme, the wisdom and the benefits of which remain to be

A lacuna is being filled up by another school to be started in September next by the UK High Commission. A British School Society, under the Chairmanship of H.E. Sir Paul Gore-Booth was formed last month. The object of the Society is to provide education according to British standards and practice for British children in India and, at the discretion of the Committee of Management, to the children of other Commonwealth nationals, including India, and foreign nationals resident in India. The management has been able to secure the services of Mrs. D. E. L. Shankland, an Oxford M.A., to be the first Head Mistress of the School. She will be assisted by three others, also with foreign qualifications.

In due course, the Society hopes to have its own building. In the initial stages, the school will be housed in a rented building. Mrs. R. M. Bailey, wife of the Economic Adviser to the High Commissioner, is the Secretary of the Society.

seen. At least there is this to be said for the new experiment, namely that it will enable the Centre to re-imburse itself for the heavy advances that it has been obliged to make to quite a few State Governments to tide over their difficulties. As against this must be set down the effect on the prices of State Government loans which bulk large in the Government securities portfolio of institutional investors like the LIC and the removal of the urge on the part of State Governments to exert their utmost to get their respective loans subscribed as they used to do in previous years. There is also the point about the State Governments surrendering away yet one more of their rights.

Credit Contraction

Be that as it may, the total amount to be borrowed now and the conversion programme in May together work out to Rs. 364 crores, as compared with a gross market borrowing target of Rs. 393 crores envisaged by the Union Finance Minister in his Budget for 1963-64. The gap of Rs. 29 crores is of the 4½ per cent National Defence Bonds, 1972. Of course, the extent of the gap indicated here is based on the assumption that both the loans would be fully taken up by the institutional investors and the public. There is no doubt that the rations, the Provident Funds, the LIC, the Finance Corporation banks (who, incidentally, have been reminded that they have to reach the higher liquidity ratio indicated by the Reserve Bank by September, 1964) will account for the bulk, if not the entire loan amount, although there is a school of opinion which insists that, as on previous occasions, the Reserve Bank will have to and will make up any deficiency that there may be. By and large, however, the circumstances are extremely favourable to the success of the new loans. For one thing, the inter-bank call money rate has come down to a bare half a per cent. Again, since the past month or so, there has been considerable credit contraction, coupled with some increase in deposits also although the latter is not to the same extent as during the corresponding period of last year. Thirdly, unlike in the first phase, the facility of a medium-term loan has been made available now. The authorities have managed to meet the possible criticism about the absence of a long-term loan too by promptly resuming the sale of the 4½ per cent 1986 loan which had been suspended. In view of these favourable conditions there is good reason for the authorities to hope for an encouraging response, and the expected cash subscription part alone has been estimated at around Rs. 90 crores.

★★

The Maharashtra Government has taken a progressive step in the field of secondary education by making it mandatory in non-Government secondary schools to esta-

blish teachers' councils. Permanent teachers of a school will elect one representative to the school committee which is to be responsible to the Government. A non-teacher member of the school committee will be nominated to the teachers' council. It has been laid down that with effect from the current year non-permanent teachers, unless they are serving in a purely temporary capacity, will be entitled to the October and summer vacation salaries provided they have served for three months in the first term and four months in the second. Restrictions have been prescribed for private tuitions by the teaching staff of a school. The retiring age for teachers in non-Government secondary schools has been raised from 55 to 58 years, but in Vidharbha teachers in service on June 1 will be allowed to retire at the age of 60. A reserve fund, which will not be less than four months' normal expenditure, will have to be maintained by every school. The existing quantum of aid to schools—45 per cent of permissible expenditure in the urban areas and 50 per cent in the rural areas—has been retained.

The school managements are required to deposit an amount of not less than Rs. 3,000 with the Government. Such deposit money which is estimated to amount to Rs. 1.5 crores from the existing institutions would be available for paying teachers whose salaries had not been paid by the school managements. The Government of Maharashtra deserves congratulations for boldly coming out in defence of the 'teaching community'. The new code which replaces the 1956 code, was the result of the deliberations of a committee, under the chairmanship of the Director of Education, appointed by the Government to suggest a new unified code for the re-organized State of Maharashtra

★★

Nearly 5,000 Compulsory Deposit Scheme accounts were opened in various post offices in Bombay City within the first couple of days of the inauguration of the Scheme. About eight lakhs of people in the city are expected to be covered by the Scheme. The postal authorities are reported to have made arrangements to send special staff to industrial and business establishments to collect deposits. More than 60 millowners are reported to have contacted the authorities so far. There are nearly 2½ lakh workers in these mills who are covered by the scheme. Since wages are paid to industrial labour by the tenth of every month, the rush for opening the accounts is expected to increase by mid-July. There will be more than 300 offices in the city, including the 140 branches of commercial banks (seven), permitted to accept compulsory deposits. Additional counters are to be opened in the 138 post offices in Greater Bombay to facilitate collection. 200 clerks are recruited for the purpose. In these days of rising prices, the defective construction of cost of living indices has been adding its due share to the suffering of middle and working classes. A few days ago, the Reserve Bank employees received reduced dearness allowance following a fall in the quarterly average cost of living index figure. While the prices of every commodity have been spiralling, the Bombay cost of living index registered a fall. curiously the cost of living index of Bombay City is outmoded. The present cost of living index is computed on the basis of the and unrealistic. The index is computed on the basis of the family budget inquiry conducted in 1932-33 taking the prices in 1933-34 as 100. The index is shortly to be revised and it will have 1960 as the base. The reconstructed series are

Reviving the Capital Market

From Our Correspondent

CALCUTTA :

THE RECOVERY in sentiment following the resumption of forward trading on Lyons Range has been well maintained though as yet it is confined largely to the more speculative issues. In particular attention is concentrated on Indian Irons and this appears to be due to two reasons. In the first

expected to be issued in a few months. The consumption pattern has undergone material alteration in the last three decades and it is to be hoped that the index would be changed to reflect true changes in retail prices so as to avoid undue hardships to labour and middle classes through administrative shortcomings.

★★

A broad outline of an integrated plan to rehabilitate the unemployed goldsmiths was announced by the Gold Board in Bombay. The estimated expenditure of rehabilitation is placed at Rs. 10 crores spread over two or three years. The plan will cover 75,000 goldsmiths affected by the Gold Control Order. The three main highlights of the plan are: Provision of training facilities to unemployed goldsmiths in any craft or industry suitable to them and giving them stipends; making available facilities for the education of their children; and granting them loans to start small industries, business or trade. The dimensions of the rehabilitation question thus proved to be more limited than what had been announced from time to time. Steps were being taken to introduce early the system of hall-marking primary gold. Under the system, refiners would have to register themselves and get their code approved by the Board. The Gold Control Order, it was revealed, mainly hit only 3 per cent of the 92 million households in the country, because they accounted for about two-thirds of the demand for gold. The annual demand was about Rs. 60 crores. The Board is expected to meet more frequently hereafter than before.

During his visit to Bombay, the Finance Minister is reported to have suggested that institutions like LIC, IFC, ICICI should evolve a plan to work jointly to revive and sustain activity in the stock exchanges. These institutions work already in close co-operation and it was not clear what was the type of co-operation meant by the Finance Minister. The Finance Minister is understood to have discussed the relaxation of two-tier system of bank credit, the proposed investment trust in the public sector and the chances of success of the Government's borrowing programme. Leading representatives of the financial institutions attended the conference.

The Indian Banks' Association met informally to discuss the slow-down in the rate of growth in deposits. The sizable expansion in currency in the six months ended April 1963 had not percolated to the banking system. Against an expansion of Rs. 189 crores in deposits in the first half of 1962, deposits in the first half of 1963 went up by only Rs. 100 crores. The principal cause of slow-down is the Government's tax policies. To meet the growing requirements of industry in the coming busy season, the bankers require funds. A prompt settlement of amounts due by Government to suppliers in the private sector is expected to release at least Rs. 60 crores. The emerging tightness could also be partly relieved by relaxing the two-tier system of lending introduced by the Reserve Bank. Since banks would be required to maintain a higher liquidity from September 16, 1964, there is no danger of over-lending by banks. The question of diversion of deposits into companies was also discussed. The companies have been borrowing funds directly from the public at attractive rates compared with those offered by banks. One source estimated such deposits around Rs. 25 crores on a very conservative basis. The Reserve Bank is to be requested to look into the question

place, operators are optimistic of the impending announcement of the dividend. Earlier it was believed that the company might be thinking in terms of a bonus issue, but this now seems to have been dismissed as highly improbable in view of the heavy loan commitments. The belief about a higher dividend distribution, however, still persists and such

calculation stems from the fact that the past year had witnessed a sizable rise in the production of the company. In the second place, operators have derived considerable encouragement from the recent indication that Government may decide in favour of lifting controls pertaining to distribution and price of salable steel. In this connection the week-end meeting between the steel producers both in the private sector and the public and concerned Ministry in the Centre, presumably to discuss the proposal regarding the removal of the control on price and distribution of steel has aroused considerable interest. The belief that a Government decision in favour of decontrol will not be long in coming has gained strength lately as the Central Minister of Steel and Heavy Engineering, Mr C. Subramaniam, is said to be favouring the removal of restrictions. It is however unlikely that a quick decision on this issue will be taken because of several practical difficulties in the reversal of a policy that has been long in operation.

Whether decontrol comes or not, there is no gainsaying that there has been, over the past few months, a change for the better in Government's attitude towards the private steel producers, although the latest announcement of a rise in steel retention price has once again failed to take note of the companies' demand for an equitable compensation for the increase in the cost of production. An important gain for the steel companies in the private sector has been the clear official declaration that they will be allowed to expand their capacity to the fullest possible extent.

The Big Deterrent

Current stock market optimism is also sustained by the expectation that something will be done soon to activate the stock market if only to whip up the flagging enthusiasm of investors to lend support to new issues. Although the few new issues that have come on the market in recent weeks have not exactly floundered, the fact remains that not every new issue will be a success. It is generally felt that if investors are to be attracted to take an active interest in industrial equities, there is urgent need for reviving confidence in the stock market. The one big deterrent to an expansion in stock market activity in recent months has been the Super Profits Tax which even after the substantial modification it has undergone has not lost much of its crippling effect. As a direct consequence of it many a corporate enterprise has been obliged to reduce dividend distribution to shareholders and either to postpone expansion programmes or to drastically reduce plough-back into business.

Even though Mr Morarji Desai is adamant in his belief that the SPT is not as bad as it is made out to be, he nevertheless seems to be concerned about the continued depressed condition of the capital market. For it has been reported that at a meeting in Bombay early last week he has emphasized the need for reviving the capital market. Among the various steps reported to have been discussed are the active support to the stock market by the various financial institutions and the LIC and relaxation in rules relating to capital issues.

It would appear that in view of its anxiety to revive the capital market Government may expedite the setting up of the promised Investment Trust. In his speech at Bombay some time ago Mr Morarji Desai revealed that the idea of the Investment Trust was being actively pursued. It is now reported that the proposal has already taken shape in that the Reserve Bank has worked out a scheme for the establishment of an Investment Trust in the public sector. While welcoming the proposal for the establishment of an Invest-

ment Trust in the public sector, the Federation of Indian Chambers of Commerce and Industry has pointed out that similar trusts should be allowed to be set up in the private sector also.

★★

While the present depression in the gunny market is in part due to the inevitable reaction to the excessive bullish enthusiasm displayed by the market some six weeks ago following the power crisis in Calcutta and industrial region, the continued absence of foreign enquiries of any importance is another important adverse factor in the situation.

In a review of the gunny market last month, the latest issue of the Jute Bulletin assigns, among others, the following reasons for the serious setback in market sentiment: "Singly, the biggest disappointment for operators has been caused by the lack of Government buying. Other export outlets have also been disappointing. For understandable reasons there has been no Russian buying in June. In the preceding five months, Russia had brought 50,000 bales of mostly hessian hags and another 50 million yards of hessian cloth. From what is known of Russian requirement, business of this order cannot be a regular thing. Cuba, which was believed to be buying 100,000 bales, had actually purchased only 30,000 bales. Over 50 per cent of this business had, however, gone to Pakistan. Pakistani mills have also bagged the entire Burmese order for 10,000 bales of B Twills, over and above 90 per cent of the West African tender for 30,000 bales and 50 per cent of the Australian business of about 5,000 bales of cornsacks and woolpacks. Exclusively to India's share has come only one order, that from Indonesia for about 6,000 bales."

Bleak Prospect

All this goes to show that overseas buyers' first preference is for goods from Pakistan. This is particularly true of sacking which forms the bulk of the output of Pakistani mills. The main reason why foreign consumers go in for Pakistani goods is of course their comparative cheapness. The question of price advantage that Pakistani goods now enjoy does not appear to be capable of easy solution. Despite the grave concern by the industry and trade, (and it is inconceivable that Government can be less concerned in view of the vital part played by jute goods in export earnings) there appears to be no early prospect of the removal of the present difficulties in the overseas sacking markets for our industry.

Evidently, the Government is reluctant to embark on any plan that gives a direct subsidy to the industry as such a measure is not in conformity with accepted trade practices. It would appear that Government is in favour of the problem being tackled by the industry itself while on its part it will be exploring ways and means for arriving at an amicable settlement with Pakistan. But any attempt to underestimate the magnitude of the threat from Pakistan will be fraught with grave consequences for the Indian jute goods industry. As it is, the position is that overseas orders for our sacking goods are most likely to materialise only when Pakistan has no disposable surplus. In the meantime, the fact should not be lost sight of that Pakistan is fast expanding its productive capacity. The threat to our sacking exports will soon afflict our hessian exports and even our exports of carpet backing hessian, for in these two departments also Pakistani mills are increasing their capacity.

There is every indication that during the current jute season that has just commenced raw jute will be in plentiful supply. There is a large carryover from the previous season.

—the surplus has been augmented by smuggled jute from Pakistan to the tune of about 10 lakh bales—and the current crop will be even bigger than the 71 lakh bales harvested last season in view of the uniformly favourable weather and

the slightly larger sowings. It is some consolation that unlike last year this season's crop will contain a larger proportion of quality jute, but the tasks of ensuring an equitable price for the grower may not prove to be easy for Government.

Urgency of Thermal Power Units

From Our Correspondent

MADRAS

THE HEAVY rains in the catchment areas of the various hydel reservoirs in Madras State in the past week have helped the State Electricity Board to lift the restrictions on the use of power from July 4. Till July 2, the State's Minister for Industries and Power was unable to arrive at any definite decision. In fact, it was feared that the cut would have to be continued for some more time as there was no use taking a fresh risk and compel the high-tension consumers to resort to fresh lay off of workers and interruption to production. Luckily, heavy rains for two days in succession saved the situation and all industrial units are working without any restriction in regard to use of power from the mid-night of July 4. But the regulations that were in force on account of the Emergency will still have to be observed and there will probably have to be a severe staggering of working hours and working days as several new units have not yet been given full supply of electricity. It is felt that the newly created capacity should be utilised effectively and industrial production raised to the maximum extent by allowing these new units to work on a multiple shift basis wherever the arrangements can be made to achieve this purpose. Till the end of the year there will be no difficulty in meeting genuine needs.

Reducing Imbalance

But with the substantial additions to hydel capacity in the next two years it is recognised that the lesson of this year's crisis cannot be overlooked and active steps should be taken immediately for reducing the imbalance between hydel and thermal power. Some units in the Kundah Project will be completed during the course of the year while the four units in the Mettur Tunnel Scheme will be commissioned early in 1965. The Parambikulam Project also will be able to supply larger blocks of power besides additional energy from the fourth generating unit at Periyar. These are all hydel generating units and the imbalance will be prevented from getting worse only by the completion of two more units at Neyveli having a capacity of 50,000 kW each.

The State Government are no doubt aware of the seriousness of the situation and Mr R. Venkataraman, the Minister for Industries and Power, indicated a few days back that, besides the ambitious expansion of Neyveli, three thermal units having a capacity of 100,000 kW each would have to be located in the coastal towns.

Mr. O. V. Alagesan, Minister of State for Irrigation and Power, who visited recently Madras City, also concurred with the view of the State Government that thermal capacity on a large scale should be installed. But there was no mention of the proposals of the State Government to construct three thermal stations in different coastal towns. Only he pointed out that the two sets of 6,000 kW and 5,000 kW which had gone out of commission on account of old age in the Madras thermal station would be replaced by a much larger unit of 30,000 kW. He, however, emphasized the need for completing the first and second stages of the expansion programme of Neyveli before the second year of the fourth Plan and suggested that it would be more advantageous to raise further the capacity to 1 million kW. If need be,

arrangements should be made sufficiently in advance for raising the additional quantities of lignite that would be needed to run a plant of this size. At the same time, it is gratifying to note that the Kalpakkam Nuclear Station would have a capacity of around 600,000 kW. The two big Central projects would naturally be of great help in bringing about the much needed firming up of the Madras Grid.

But the State Electricity Board is justifiably of the view that it would be necessary to have additional thermal capacity especially as the scheme proposed by a group of industrialists has not been acceptable and it would appear that there is no chance of this project coming through. It is felt that even if coal has got to be brought by sea from West Bengal and Orissa, it would be preferable to have high-cost power rather than no power. The loss in output in the past few years would by itself have financed the construction of many thermal units. Since in any case it would be necessary for the Madras State Electricity Board to utilize a sizable proportion of its outlay in 1966-71 on the creation of thermal capacity, there will have to be a co-ordinated programme of action so that the mistakes of earlier years can be avoided.

In the context of power shortage all over the country and the difficulty in securing generating equipment, the arrangements now being made to manufacture boilers in Tiruchirapalli in Madras State and electrical equipment at Ramagundam in Andhra Pradesh have to be welcomed. There will also be a third new unit at Hardwar which will manufacture mainly hydraulic turbines. It is now expected that the Heavy Boiler Factory at Tiruchirapalli will be completed in 1965 and the first two boilers will be supplied to the Kothagudium Power Project which is being constructed with the help of a loan from the World Bank. There was a happy function last week when the Training School attached to the Heavy Boiler Project financed with Czechoslovakian assistance, was inaugurated. There was a gathering of top leaders, the Chief Ministers of Madras, Andhra Pradesh and Kerala, besides the Union Minister for Heavy Industries and Steel, being present.

The project report for the Boiler Factory was received only in August last year and the sanction from Government in May last. In a short period the training school has been very nearly completed and it is pointed out that it is only the first of the three inaugurations which would take place during the current month, the second and third being held at Ramagundam and Hardwar. The first batch of students trained from the schools at Tiruchirapalli and Ramagundam are expected to be ready by the time the two projects commence production in 1965. The boiler factory will be able to supply initially boilers for running electrical equipment having a capacity of 800,000 kW. But it is the intention to raise this capacity ultimately to meet the needs of generating equipment for 2 million kW. It is expected that the industrial estate and the allied industries would be able to supply factors of boilers. When in full production, the turnover is expected to be Rs 20 crores.

The project report for the Ramagundam unit which will specialise in the manufacture of steam turbines and turbo-

HONEYWELL INSTRUMENTATION at Nirlon Synthetic Fibres & Chemicals Ltd.

The critical processes in the manufacture of nylon require critical control of variables such as temperature, pressure, flow, level, speed, etc. They call for instruments that are accurate, reliable, and fast enough to deliver the precise integrated control needed.

That is why Nirlon Synthetic Fibres & Chemicals Ltd. selected Honeywell instrumentation for their new plant at Bombay.

With Honeywell automatic control, you can improve quality, increase production and reduce costs per unit, make better use of manpower, improve operating techniques, and increase profits.

Have Blue Star custom-fit a Honeywell control system to your specific requirements.

The custom-designed Honeywell Control Cubicle for Spinning Machine No. 2

Vinyl Graphic Cubicle for VK-Tube Polymerisation

BLUE STAR Comprehensive Service includes:

- Expert assistance in selection of instrumentation
- Engineering, installation and start-up
- Prompt, competent after-sales service
- Tuition-free training for your instrument engineers at Blue Star-Honeywell Education Centre, Bombay

GLOBAL SUPPLY SOURCES
Depending upon the currency available to you, you can obtain Honeywell instruments from any of their plants in U.S.A., U.K., Europe and Japan.

Sold and serviced in India exclusively by

Honeywell

**DURABLE FIREBRICK JOINTS
INCREASE PRODUCTION
and lower maintenance
costs**

ACCOSET-50

HIGH TEMPERATURE REFRACTORY CEMENT

produces strong joints, as impermeable to the action of furnace gases as the best firebricks. Consequently, air infiltration is reduced and the thermal efficiency of the furnace improved.

Bricks jointed with **ACCOSET-50** are not easily dislodged and remain bonded together throughout the whole temperature range of the furnace.

ACCOSET-50

- * has air-setting properties * produces thin strong joints
- * allows only the minimum shrinkage * is highly refractory
- * is economical in the long run

Technical literature sent free on request.

alternators was received in September last year. The programme is to manufacture units having a capacity of 12, 25, 55 and 100 mW. This project also is expected to be completed within the next two years and the heavy electrical equipment produced from this source will be coming in very handy. While the Hardwar project will be able to produce turbines even upto 30,000 kW in view of the doubling programme in the Fourth Plan for generating electricity, it will probably be necessary to instal additional capacity for manufacturing heavy electrical and allied equipment which would mean that the existing units will have to be expanded considerably before long. It is only to be hoped that the regional economies will benefit to a great extent from the functioning of these big projects.

★★

The by-election of a member from the Tiruvannamalai constituency in North Arcot District to the Madras State Legislature was bitterly fought, there being a straight contest between the Congress and DMK candidates. The Madras Chief Minister, who is well-known for his experience and organising ability in election matters, supervised personally the preparations for this by-election which was caused by the death of a Congress member. There was a heavy poll and till the counting was completed it was not clear which candidate would win. The DMK has been successful by a narrow majority. The ruling party is naturally bitterly disappointed. While it has been widely reported that caste and communal considerations more than political issues have weighed with the

electorate, the feeling has nevertheless gained ground that the recent policies of the Central Government have been to a great extent responsible for this latest defeat of Congress at the polls and that the majority for DMK would have been much more flattering but for the strenuous efforts made by the Madras Chief Minister. While the DMK party has secured fresh success and the strength of its opposition to Congress in the Legislature has increased, it would be incorrect for it to hug the belief that its policies are being endorsed by the electorate and the defeat of the Congress at the next elections is a certainty. The Congress Party has still the advantage of a good administrative set-up and active contact with the people and a better understanding of their problems can still help it to serve the country in a better way.

It is true that even the rural folks are getting more and more tired of the heavy indirect and direct taxes levied in the past few years, while the blunders committed in implementing the Gold Control policy have been most unfortunate. The nation is prepared for heavy sacrifices. But the rise in prices in the past few months and the scarcity of many essential commodities have created a sense of bitterness and the support given to the DMK party by other political organisations has resulted in the Congress defeat. The Madras Government is keenly aware of the change in the wind and is anxious to adopt remedial measures. It is only to be expected that the Centre will extend the necessary co-operation to the various State Governments and undo the grievous harm caused by many recent tax measures.

Trade Winds

India experienced a sharp reduction in its foreign exchange reserves during 1961 and 1962. Since that time, the country's reserves have been rising, due in part to an upward trend in India's exports and to a larger flow of non-project foreign assistance. Indian financial measures have included new taxes that are expected to provide an additional annual revenue yield amounting to over 2 per cent of national income. The assured availability of fund resources under the standby arrangement will help the Indian authorities to meet any temporary difficulties in the country's balance of payments situation.

MARKET DEVELOPMENT FUND

A three-member committee has been appointed by the Government of India to administer the Rs. 3.8 crores Market Development Fund which has been provided for in the current year's budget for export promotion. The Secretary of the Economic Affairs Department of the Finance Ministry will be the chairman of the committee, while the Secretary, Department of Expenditure and the Secretary, Department of International Trade will be the members. The Fund will be utilised specially for market research, commodity research and other research programmes; export publicity and the dissemination of information; participation in trade fairs and exhibitions; trade delegations and study teams; establishment of offices and branches in foreign countries; grants in aid to export promotion councils and other organisations for the development of foreign trade; quality control and pre-shipment inspection, export assistance for exportable commodities, including transport assistance and export risks insurance.

MACHINE TOOL PRODUCTION

Arrangements have been made for the supply of machinery worth Rs. 23 crores on the basis of long-term credit between India and Czechoslovakia for the machine tools industry. The Government of India have now established a Central Research Institute for machine tools technology and design at Bangalore by utilising a gift of Rs. 60 lakhs in the form of financial assistance offered by the Government of Czechoslovakia.

Two thousand Czechoslovakian technicians would be arriving in India in the course of next year. They would be utilised for Heavy Machine Tools Plant in Ranchi, the installation of the Boiler Plant at Tiruchy, in the Heavy Electrical Industry in Bhopal and the Steam Turbine Plant at Ramachandrapuram near Hyderabad. It was disclosed at a press conference by Mr. R. V. Ramiah, Joint Director of Central Machine Tools Research Institute that machine tools and laboratory equipment required for the institute had already been fabricated in Czechoslovakia and shipments of these will be received in India commencing from October, 1963 onwards. The Mysore Government had agreed to make available workshops space in the industrial estate at Rajajinagar for starting the preliminary activities of the institute.

SOVIET AID FOR FARRAKA PLANT

Under an agreement signed recently between the Russian Foreign Trade Organisation and the Punjab State Electricity Board, Russia will supply complete equipment and material for the Punjab State Electricity Board's Bhakra right bank power plant. The plant will comprise four hydro-electric units of 120 mw. capacity each. There is provision for a fifth.

LOAN PROGRAMME FOR 1963-64

THE GOVERNMENT of India have announced the floatation of two new 6 and 10 year loans aggregating Rs. 225 crores. The loans are:

- 1) a further tranche of the existing 4 per cent Loan 1969 to be issued at Rs. 99.50 per Rs. 100 (nominal), repayable on the 8th of May, 1969, and
- 2) 4½ per cent Loan 1973 to be issued at par, repayable on 22nd July, 1973.

In addition to cash subscriptions, the holders of the under-mentioned loans have been given the option to offer their holdings into the new loans;

2½ per cent Hyderabad Loan 1953-63.

4 per cent State Development Loans, 1963 of Hyderabad, Bihar, Bombay, Madhya Bharat, Madhya Pradesh, Mysore, Saurashtra, Travancore-Cochin and Uttar Pradesh.

4 per cent loan 1963 of Madras and West Bengal, and Mysore Government 4 per cent Conversion Loan 1953-63.

Subscriptions will be received from 22nd of July 1963 to 27th of July 1963 but the subscription lists may be closed earlier without notice as soon as the total subscriptions amount to Rs. 225 crores. The Government reserves the right to retain subscriptions up to ten per cent in excess of the notified amount.

With the exception of 2½% Hyderabad Loan 1953-63, all other loans will be accepted for conversion at par. 2½% Hyderabad Loan 1953-63 will, however, be accepted at Rs. 85.00 per Rs. 85.71 (o.s. Rs. 100) of the value of securities tendered.

Interest on the 2½% Hyderabad Loan 1953-63, 4 per cent Hyderabad State Development Loan 1963 and 4 per cent Mysore Government Conversion Loan 1953-63 tendered for conversion will be paid at the respective rates up to 21st July, 1963. On the other loans offered for conversion, interest will be paid at the rate of 4 per cent per annum up to 14th July, 1963, and for the period 15th to 21st July, 1963, at the rate applicable to the new loan as applied for. Interest on the new loans will accrue from 22nd July 1963. Interest on 4 per cent loan 1963 will be paid on 8th November, 1963, for the period 22nd July to 7th November and thereafter at half-yearly intervals. Interest on 4½ per cent loan 1973 will be paid half-yearly on 22nd January and 22nd July. Interest will be subject to tax under the Income-Tax Act, 1961.

\$100M CREDIT FROM IMF

The International Monetary Fund has entered into a new standby arrangement with the Government of India that authorises drawings from the Fund up to the equivalent of \$100 million over the next twelve months. This succeeds a similar arrangement between the Fund and the Government of India which was announced in July 1962. Under that arrangement, which also authorised drawings up to \$100 million, the equivalent of \$25 million was drawn and subsequently repaid to the Fund. Net drawings from the Fund on the part of the Indian Government currently amount to \$250 million. India's quota in the Fund is \$600 million, of which \$77.5 million has been paid in gold.

July 12, 1963

unit of the same capacity to be installed in future. The contract is valued at Rs. 5.60 crores, payment to be effected out of the credit granted by Russia under an agreement with the Government of India in February, 1961. The detailed project report was prepared by the Soviet Designs Organisations and approved by the Punjab State Electricity Board. The Russians have agreed to depute specialists to render technical assistance for erection, adjustment and commission of the equipment and to train Indian engineers in the operation of the equipment.

OCCUPATIONAL WAGE SURVEY

An Occupational Wage Survey, the first of its kind, conducted on the country-wide basis, has been completed by the Labour Bureau of the Union Ministry of Labour and Employment. This Survey covers 44 major manufacturing, mining and plantation industries in the country. It has yielded data on occupational wage rates and the characteristics of wage structure and composition of labour force in various industries. The survey reveals composition of the working force, systems of payment, wage rates and dearness allowance, pay roll earnings, levels of average daily earnings, wage rates and earnings of workers in various occupations, overtime working and earnings and incentive bonus scheme.

Seventy-six per cent of the labour force has been covered in the manufacturing, almost 100 per cent in the plantations and about 85 per cent in the mining industries. Among the important industries covered are cotton, jute, iron and steel, coal and iron ore mines, tea, coffee and rubber plantations.

MANUFACTURE OF COAL MINING MACHINERY

For the manufacture of coal mining machinery, an agreement was recently signed at Ranchi between the Heavy Engineering Corporation Ltd., and Messrs. Mavor and Coulson, Glasgow, U.K. The machinery, including items like samsons crawler and mounted coal cutter which is required by the National Coal Development Corporation Ltd., will be produced at the Bharkhakana workshop of NCDC. The new manufacturing programme is in addition to the coal mining machinery plant at Durgapur, which has been undertaken with Soviet collaboration for the manufacture of diverse items of equipment for the coal industry in India. The manufacture of prototypes of items like pumps, conveyors and booster fans has already begun at the Durgapur plant.

COMPULSORY DEPOSITS

The Government of India have authorised the Central Bank of India, the Punjab National Bank, the United Commercial Bank, the Bank of Baroda, the Bank of India, Devkaran Nanjee Banking Co. and the United Bank of India to receive and maintain the accounts of Compulsory Deposits with effect from August 1, 1963.

With the inclusion of these banks, there would be nearly 14,000 offices including head post offices, departmental sub-post offices, offices and branches of the Reserve Bank of India, the State Bank of India and its subsidiary banks authorised to receive the compulsory deposits.

PRODUCTION OF HIGH GRADE STEEL

It is calculated that high grade steels form from 5 to 15% of the total crude steel production in the industrial countries. The U.S.A. has high grade steel percentage of 7 to 9%; Japan, 9 to 11%; West Germany, 6 to 8%. On this basis, the Indian high grade steel production should amount to 0.5 to 1.5 million

tons at the end of the Third Five-Year Plan, in accordance with the planned production target of 10 million tons of steel. The Planning Commission has fixed a production capacity of 215,000 tons up to the end of the third five-year Plan and 390,000 tons by the end of the fourth five-year Plan. All responsible quarters acknowledge the fact there is an acute shortage of high grade steels in India at the moment. The present requirement is estimated to be 70 to 90 thousand tons per month. The extent to which the requirement will further increase depends on the realisation of the envisaged mechanical engineering programme. If all plans can be realised, specialists estimate an annual requirement of 200,000 - 300,000 tons over the next few years.

SLAG GRANULATION PLANT

The slag granulation plant of the Bhilai Steel Works is expected to be commissioned by the end of 1963. The plant, which is part of Bhilai's expansion programme, has a capacity to produce 9,50,000 tons of granulated slag per year but in the initial stages, the availability will be about 700,000 tons per year. A separate section has also been organised in the construction department of the Bhilai Works for studying slag utilisation. The engineer in charge of the section has been deputed to the Hindustan Housing Factory in Delhi to study the utilisation of slag as also preparation of precast reinforced concrete elements for housing construction.

Steps are already under way to develop the uses of granulated slag so that when produced it can be fully utilised. Certain commitments have already been entered into for the supply of granulated slag for the manufacture of slag cement. The rest of the output is proposed to be utilised for making slag blocks, slag bricks and other building materials.

K.C.P.'s SUGAR PLANT

The K.C.P. Limited, Madras, have signed another agreement recently with The Kallakurichi Co-operative Sugar Mills Ltd. Kallakurichi, for the manufacture and supply of a 1000 to 1200 tonnes per day capacity sugar plant. This is the seventh complete sugar plant to be supplied by The K.C.P. Limited. Recently, they have signed an agreement with the National Co-operative Sugar Mills Ltd. Madurai, for the supply of a similar plant.

Sugar and Cement Plants are manufactured in K.C.P.'s Workshops at Madras in collaboration with Messrs. Fives Lille — Cail, Paris, France.

NEW CEMENT FACTORY

A licence for the setting up cement factory at Karur in Trichy district has been granted by the Government of India. The factory will produce four lakh tons of cement per annum. The factory is likely to use furnace oil since its location will be far away from the collieries.

To the Steel Industry of India McKee offers specialized, experienced engineering and construction services

Among the major steel plant projects designed and built by McKee in every steel producing area of the world is the completely integrated steel plant illustrated above. Occupying a site two miles long and a half mile wide at Volta Redonda, Brazil, it is the largest steel plant in South America. After three consecutive expansions made by McKee it has an ingot capacity of 1,250,000 tons per year. The plant includes facilities for all phases of steel-making

from processing of raw materials to production of finished steel in various forms: rails; structural shapes; plate; hot and cold rolled sheets; tin plate.

The same specialized talents and capabilities responsible for this South American project can produce equally efficient facilities in India. We will welcome an opportunity to give you complete information on our comprehensive, diversified engineering-construction services.

Company Affairs

ENFIELD INDIA

ENFIELD INDIA Limited, which has been successfully producing light and heavy motor cycles in the past few years and has achieved a fairly high indigenous content, launched on its scooter project last year after incurring a capital expenditure of Rs. 25 lakhs. But just when the pilot plant operations had been concluded and marketing arrangements also had been finalised the Emergency was declared and it was necessary to suspend production of scooters as well as light-weight motor cycles. This led to a dislocation of the production programme and also affected sales to a certain extent during last year. But the working results for 1962 have still made better showing and a dividend of 4 per cent has been maintained on an increased capital.

It has been emphasised by the Chairman of the company that sales during the current year will be very much higher as the output of heavy motor cycles will be much larger, thanks to the special facilities provided by the Government for the reason that the entire output of heavy motor cycles is being taken up for the Defence Services. The company expects to resume manufacture of scooters in a small way while a new model of light-weight motor cycle is proposed to be introduced later this year. The company will also have the advantage of marketing industrial engines in the closing months of the year. Some part of the increase in sales will be due to the commencement of operations by several units in the Industrial Estate attached to the factory. Besides the manufacture of scooters and motor cycles, it is expected that the scheme for producing industrial engines will be a remunerative source of investment. There will, however, be no need for incurring large capital expenditure on this project by the company itself as the bulk of the components and parts required for the assembly of industrial engines will be supplied by the small-scale producers in the Industrial Estate. It is expected that sales of industrial engines alone will aggregate to Rs. 100 lakhs annually when all the units in the Estate are working. With the various projects likely to yield better results during the current year and the next it is expected that the shareholders will get a better deal.

HINDUSTHAN WIRES

During the year ended March, 1963, Hindustan Wires Limited has recorded encouraging results with a higher level of production of Rs. 87.16 lakhs as against Rs. 44.45 lakhs. The net profit after depreciation amounts to Rs. 11.25 lakhs as against Rs. 3.04 lakhs a year before. The directors have recommended the payment of dividend of 60 nP. per share free of tax as against 40 nP. last year. The company, it is indicated, has undertaken important defence orders. Plant and machinery valued at Rs. 13.41 lakhs has been received and is being installed after which some of the high carbon tensile wires output is likely to increase. The company's application for furthering expansion of its present wire manufacturing capacity has been granted by the Government and a licence has been issued for the manufacture of 5,000 tonnes of prestressed concrete and other high tensile wires. This is in addition to the licence for 4,200 tonnes of wires. The company has entered into technical collaboration with Kobe Steel Works Limited and its subsidiary company, Shinko Wire Company Limited, Japan. Additional plant and machinery valued at Rs. 35 lakhs is to be imported. The Government of India has agreed to the importation of the same under yen credit. Agreement for supply of equipment has already been signed subject to the approval of the Government of India and the Government

of Japan and shipments are expected to be completed in six to nine months. The total cost of the project on block including the expansion programme and manufacture of tyre bead wire will be Rs. 1.27 crores. For this purpose, the company has negotiated with the Industrial Finance Corporation for a loan of Rs. 54 lakhs.

ASIAN CABLES

Mr. Girdharlal P. Kotak, Chairman, Asian Cables Corporation Ltd., indicated at the annual general meeting held recently, that the company has started regular production since January 1962 and output has been steadily rising from Rs. 25,000 in January, 1962, to about Rs. 7.50 lakhs at present which is the full-rated capacity. Output has now stabilised around a figure of 12,50,000 core metres of cables per month on a single shift basis. Now that it has reached its installed capacity, the company is likely to record profit in the next year's balance-sheet. The chairman also informed the shareholders that on Project II for which the foundation stone was laid in February, 1963, the construction is progressing well. Orders for machinery and equipment have been placed which will be shipped before the end of this year so that the project will start producing before the end of 1964. He added that sufficient arrangements have been made to train technicians who will handle the project and five of them are now under training in England in the Power Cables Factory of Messrs. Enfield Standard Power Cables Ltd. He indicated that collaborators of the company have agreed to contribute their full part of the investment in equity capital which amounts to U.S. \$1.13 million.

MADRAS FORGINGS

Madras Forgings and Allied Industries (CBE) Limited has offered for public subscription Rs. 11 lakhs in 11,000 equity shares of Rs. 100 each. The company has an authorised capital of Rs. 25 lakhs in equity shares of Rs. 100 each. The present issue is for Rs. 15 lakhs out of which the promoters, directors and their friends have been allotted 4,000 equity shares valued at Rs. 4 lakhs. The company was registered early in 1963 with the main objective of manufacturing heavy, medium and light steel forgings and heavy cast iron castings. The company has planned to set up forging and foundry units with a capacity of 6,000 tons per annum. The factory will also manufacture all types of steel forgings required by Railways for rolling stock as well as parts for wagon building industry. The Government has agreed to grant licences for importing machinery from rupee currency areas. About 75 per cent of the machinery, it is stated, will be available indigenously. The estimated capital outlay of the project is Rs. 15 lakhs which will be met by the issue of shares. The company, it is added, can raise loans from financial institutions whenever there is any further necessity.

TATA OIL MILLS

There was a marked improvement in the turnover of the Tata Oil Mills Co. Limited during the year to March 31, 1963 from Rs. 11.19 crores to Rs. 12.89 crores. Profit during the year stood around Rs. 50.73 lakhs, as against Rs. 38.79 lakhs a year before. The provision for taxation had to be higher at Rs. 23.03 lakhs against Rs. 15.77 lakhs and a sum of Rs. 2.40 lakhs has been provided towards the general reserve. The Directors have proposed to provide a sum of Rs. 2.75 lakhs towards plant modernisation and development reserve and Rs. 19.50 lakhs towards dividend reserve. They have recommended a dividend of 22 per cent on ordinary shares as against 23

July 12, 1963

per cent paid during the last three successive years. It may be added that new shares issued during the year at a substantial premium are also entitled to a proportionate dividend.

ZENITH STEEL PIPES

The Directors of Zenith Steel Pipes Ltd. have decided to recommend a maiden dividend of 60 nP. per share. The company has made impressive progress. Zenith is one of the few among the newly started projects in recent years to show such good results and to declare a dividend after the very first year's working.

The company has made a net profit of Rs. 11,68,733 after providing for: Depreciation Rs. 4,86,298, Statutory Development Reserve Rs. 12,58,031, Development Rebate Rs. 4,19,343 and writing off preliminary expenses and brokerage Rs. 1,18,689.

Together with Rs. 30,649 carried over from the previous year, the total net profit aggregates Rs. 11,99,382, out of which the Directors have decided to provide Rs. 7,50,000 for General Reserve Fund, Rs. 4,20,000 for Dividend (at 60 nP. on 7,00,000 equity shares) and to carry forward Rs. 29,382.

The company is entitled to a tax holiday under Sections 84 and 101 of Indian Income Tax Act on an estimated income of Rs. 5,13,000. Total sales in 1962-63 aggregated a little over Rs. 1.48 crores. Zenith tubes have a ready market and the company's order books are full up to January next. The company issued its capital only in September, 1960, while the final call was made exactly a year later. Import licence for machinery was obtained in January, 1961, and the company was able to complete the establishment of the factory by April, 1962. Commercial production commenced only from May 1962. Since then Zenith has been making steady progress, having attained the full rated capacity at the end of that year.

Had enough steel been made available to the company, it would have attained its rated capacity even earlier, that is during the first year of working itself. Fortunately the raw material position is now better, except for zinc. There are proposals to get over this difficulty by reclaiming zinc from dross and the necessary plant will be imported provided the authorities grant the relevant import licence.

CAPITAL ISSUES

Three companies, two of which are public sector enterprises, have been authorized to issue fresh capital aggregating Rs. 4.5 crores. The consent is valid for 12 months in all cases.

Indian Drugs and Pharmaceuticals, Limited, Delhi, a Central Government undertaking is to issue further capital of Rs. 400 lakhs, divided into 40,000 equity shares of Rs. 1,000 each for cash at par.

Andhra Pradesh Small-Scale Industrial Development Corporation, Hyderabad, a State Government undertaking, is to issue capital of Rs. 30 lakhs in equity shares of Rs. 100 each, to be subscribed by the Government of Andhra Pradesh. The proceeds will be utilized for the development of small-scale industries.

Seshasayee Industries Limited, is raising additional capital of Rs. 20 lakhs in equity share of Rs. 10 each, to be issued for cash at par. The money will be used for the company's expansion programme.

LICENCES ISSUED

The Union Ministry of Commerce and Industry has granted licences to the following firms under the Industries (Deve-

lopment and Regulation) Act, 1951 during the week ending 29th June, 1963. The list contains the names and places of the licensees, articles of manufacture and annual installed capacity.

IRON & STEEL

The Vijay Engineering Co. Ltd., Das Chambers Dalal Street, Bombay-1 (location Howrah, West Bengal)—Shots and grits 12000 tons. Abdul Aziz Abdul Kadar, President, Fort Taluka Congress Committee, (Mandal No. 1, Tulloch Rd., Appollo Bunder, Bombay-1, Proposed name: M/s. Maharashtra Ferrous Industries, Bombay (Thana, Bombay, Maharashtra) — Heavy structurals 5,000 tons.

COAL

National Coal Development Corporation Ltd., Darbhanga House, Ranchi, Proposed name: Singrauli Colliery (P.O. Waidan, Dist. Sidhi, Madhya Pradesh) — Coal 3.05 million tonnes. National Coal Development Corporation Ltd., Darbhanga House, Ranchi, Proposed name: Bijuri Colliery (Tehsil, Sohagpur, District Sahdol, Madhya Pradesh) — Coal 0.36 million tonnes. Shri Gajadhar Lodha, Central Tentulia Coal Co., P.O. and T.O. Katrasgarh, Dist. Dhanbad (Katrasgarh Dist. Bihar) — Coal 30,000 tonnes. P. Chanchani and Co. Private Ltd., P.O. Siduli Dist. Dhanbad (at East Sinidih Colliery P.O. Tundu, Dist. Dhanbad) (Dhanbad, Bihar) — Coal 16,000 tonnes. National Coal Development Corporation Ltd., Darbhanga House, Ranchi, Proposed name: Sonawani Colliery (Tehsil, Manendragarh, Dist. Surguja, Madhya Pradesh) — Coal 0.56 million tonnes.

ELECTRICAL EQUIPMENT

Automatic Electric Private Ltd., Rectifier House, 570, Naigaum Cross Road (East) P.O. Box 7103, Bombay-31 (Bombay, Maharashtra) — Silicon diodes and allied devices C-cores-toroidal, the capacity would be assessed when the plant goes into production. S.F. Products India Ltd., 2A, St. Georges Terrace, Hastings, Calcutta-22 (Maheshtola, 24-Parganas, West Bengal) — Industrial Propeller fans and Blowers for low, medium and high pressure and Accessories 1,500 pieces. Maharaja Kumar Prodeep Chandra Bhanj Deo, Mayurbhanj House, No. 3, Rainey Park, Calcutta-19, Proposed name: Molecular

Electronics Private Ltd. (Durgapur, West Bengal) — Ferrite materials hard ferrites and soft ferrites 180 tons. Delton Cable Co., 3455/3457, Delhi Gate Post Box No. 1179, Delhi-6 (Delhi) — 4 way PVC Insulated/sheathed coiled coil cord, 2 way PVC Insulated/sheathed straight cord 2.2 million core yards.

TEXTILE MACHINERY

Marsden Spg. & Mfg. Co. Ltd., Rakhial Road, Ahmedabad-1 (Ahmedabad, Gujarat) — Fiber Meter (fiber blending machinery, blow room machinery 20 Nos.

JUTE MACHINERY

Reed & Comb Mfg. Co. Private Ltd., 138, Canning Street, Calcutta-1 (Calcutta, West Bengal) — Broad looms (168" and 210" R.S. for jute industry) 120 Nos. Duncan Bros. & Co. Ltd., 31, Netaji Subhas Road, Calcutta-1, Proposed name: Giddings & Lewis - Fraser India Ltd., 24-Parganas (West Bengal) — Short fibre feeder 36 Nos., Silver dispersal units 120 No., Softener feeder 24 Nos. Softener 24 Nos. per annum. Cards 48 Nos.

MINING MACHINERY

Volitas Ltd., 19, Graham Road, Bombay-1 (Maharashtra) — Diamond Core Drills 22 HD 60 Nos. per annum, Diamond Core Drills Model 45—20 Nos. per annum Mines fans size

36" — 250 Nos. per annum, Spares of above items Rs. 10 lakhs worth.

CONVEYING EQUIPMENT

Kamani Bros. Private Ltd., Kamani Chambers, Nicol Road, Ballard Estate, Bombay-1, Proposed name: Eastern Engineering Corporation Ltd. (Bihar) — Ropeway Structures, buckets, cranes, conveyors, medium heavy structures 12,000 tons. Gujarat Industrial Trucks Private Ltd., India House, Fort, Bombay-1, (Udhana-Chauryasi, Dist. Surat, Gujarat) — Industrial Trucks (Land operated only) and Industrial Trolleys 650 Nos.

SIZE SEPARATION UNITS

Deepak Industries Ltd., 62, Hazra Road, Calcutta-19 (Calcutta, West Bengal) — Mechanical lever or spring and electro magnetic operated clutches, Centrifugal clutches Rs. 15 lakhs. Adarsha Engg. (P) Ltd., Shrirampur, P.B. No. 44, Dist. Ahmednagar, Proposed name: Adarsha Engineers Private Ltd., (Chinchwad, Tehsil Naveli Dist. Poona, Maharashtra) — Flexible coupling spindle, pin and cloud type, Shaft couplings, rigid, sleeves and compress type — 1,08,000 Nos.

POWER DRIVEN PUMPS

Johnston Pumps India Ltd., 2, Fairlie Place Calcutta-1 (Calcutta, West Bengal) — Johnston submersible pumps, Johnston vertical propeller pumps, Johnston vertical mixed flow pumps, Johnston vertical pumps 720 Nos.

MACHINE TOOLS

Voltas Ltd., 19, Graham Road, Ballard Estate, P.B. No. 1198, Bombay-1 (Maharashtra) — Hydraulic equipment Rs. 50 lakhs. New Bemco Engineering Products Private Ltd., Udyambaug Industrial Estate, Khanapur Rd., P.O. Udyambaug, Belgaum (Mysore) — Hydraulic equipment Rs. 30 lakhs worth. Precimaxmachine Tool Corporation, 5, Stadium House, 81/83, Veer Nariman Road, Bombay-1 (Village Monji, Dattapara Road, Borvli, Bombay, Maharashtra) — Universal machine tools 150 Nos. per annum, Bench lathes 150 Nos., Variable speed drive units 250 Nos. Cooper Engineering Ltd., Chinchwad, Dist. Poona (Maharashtra) — Shaping machines 200 Nos. Wellman Incandescent India Ltd., 8, Harington Street, Calcutta-16 (Calcutta, West Bengal) — Industrial furnaces — worth Rs. 1 crore. Pratap Steel Rolling Mills, Pratap Estates, Chheharta (Punjab) — Furnaces, Oil Burners, Capacity will be determined after the unit commences production. Blue Star Engineering Co. (Bombay) Private Ltd., P.B. 10042, Sukhsagar, Sandhurst Bridge, Bombay-7 (Maharashtra) — Hardness tester 250 Nos. per annum, Impact tester, 100 Nos. per annum, Universal testing machines 25 Nos.

PLASTIC MOULDED GOODS

Svadeshi Mills Co. Ltd., Bombay House, Bruce St., Fort, Bombay (Kurla, Greater Bombay, Maharashtra) — Laminated Plastics (Special water and acid proof packaging material for textile and other goods, with paper, cloth and metallic foils as base materials) 24,000,000 metres. Swastik Rubber Products Ltd., Swastik House, Behind Kirkee Rly. Station, Poona-3 (Kirkee, Poona, Maharashtra) — Plastic Tubings and Extrusions; Injection moulding (one machine) — 6 to 8 ozs., Extrusions (two machines) — 150 mm. aggregated capacity.

HAND TOOLS

Lekhraj Manoharlal Agarwal, 151, Asoka House, Narayan Dhuru Street, Bombay-3 (Bombay, Maharashtra) — Industrial machine knives (excluding wood working band saws) 400 tons, Miscellaneous tools 10,000 Nos. Hakimrai Jaichand, United Bank of India Building, 6th Floor, Sir P.M. Road, Fort, Bom-

bay-1 (Bombay, Maharashtra) — Engineers' steel files including Rasps and precision files 60,000 dozens.

AIR CONDITIONERS

Voltas Ltd., 19, Graham Road, Ballard Estate, Post Box 1198, Bombay-1 (Bombay, Maharashtra) — Basic Equipment: A—Window-type room Air conditioners, 1 H.P., 1½ H.P. and 2 H.P. units 8350 to 15100, B—Self contained packaged units, 3 H.P., 5 H.P. and 7.5 H.P., 350 to 500, C—Hermetic compressors, High speed model for use with unitary equipment and commercial refrigeration 1 H.P. to 7½ H.P.—12,000 to 21,000, D—Central Plants, (1) Carrier high-line compressors 7½ to 60 H.P. — 210 to 420, 60 H.P. to 125 H.P. — 40 to 80, (2) Accessories to, Match the above compressors (water chiller plants, low side fan coil equipment, water and air-cooled condensers, etc. (To match the compressors manufactured as above) (S.E. for the manufacture of N.A.)

ORGANIC HEAVY CHEMICALS

Camphor & Allied Products Ltd., Jehangir Building, 133, Mahatma Gandhi Road, Bombay-1 (Bareilly, Uttar Pradesh) — Formic Acid — capacity to be fixed later.

MISCELLANEOUS CHEMICALS

The Fertilisers and Chemicals (Travancore) Ltd., Eloor, P.O. Udyogamandal, Kerala (Udyogamandal, Kerala) — Dry Ice 1,800 tons.

COTTON TEXTILES

Lucknow Textiles, C/o M/s. Automobile Financing Corporation, Halwasiya Court, Hazrat Ganj, Lucknow (Lucknow, Uttar Pradesh) — 1200 spindles for the manufacture of cotton waste yarn. V.M. Salgaocar Eirmao Ltd., Vascodagama, Goa, Proposed name: Salgaocar Industries Textiles Ltd. (Mormugao, Goa) — 25,000 spindles for the manufacture of cotton yarn.

VEGETABLE OILS

Shri P. V. Devassy, Pokkath House, South Bazar Road, Irinjalakuda (Irinjalakuda, Kerala) — Vegetable oil from oil cakes by solvent extraction process 7,500 tons in terms of oilcakes. Delhi Cloth and General Mills Co. Ltd., Bara Hindu Rao, Delhi (Najafgarh Road, Delhi) — Vanaspati 180 tons per day, (S.E.) by shifting and existing plant from M/s. Kathiawar Industries Ltd., Junagarh (Gujarat) to Delhi.

INSULATORS

Gujarat Insulators and Ceramics Ltd., Hill View, Ridge Road, Malabar Hills, Bombay-6 (Ahmedabad, Gujarat) — High tension Insulators 1950 tonnes per annum, Low Tension Insulators 490 tonnes.

CHANGES IN NAMES

(During the week ending 29th June, 1963)

From M/s. Hindustan Gas and Industries Ltd., New Delhi to M/s. Industrial Plants Ltd. From M/s. Paramount Industrial Stores, Bombay to M/s. Nitin Engineering and Manufacturing Co. Private Ltd., Bombay. From Shri L. G. Bala-krishnan, Hindupur to M/s. Madanapalle Spinning Mills Ltd., Madanapalle. From M/s. Jay Shree Textiles Ltd., Rishra to M/s. Jaya Shree Textiles and Industries Ltd., Rishra.

LICENCES REVOKED

(During the week ending 29th June, 1963)

M/s. Britannia Engineering Co. Ltd., Calcutta — Grinding machines. M/s. Gopal Rice Oil and Fertilizer Company Sakkottai Kumbakonam Tanjore Dist. — Rice bran oil. M/s. Modi Sugar Mills Ltd., Modinagar (U.P.) — cycle tyres and tubes.

ELECON INSTALLATION OF GRAVITY ROLLER CONVEYOR AT AIR-INDIA WORKSHOP, SANTACRUZ

with ELECON'S modern mechanical handling equipment

If you have a problem in handling bulk material in your factory, mine or quarry, ELECON can solve your problem. ELECON'S modern conveyor systems — Belt Conveyors, Bucket Elevators, Screw and Spiral Conveyors, can handle your materials with speed and efficiency and also cut your cost-per-ton.

ELECON — TAKES THE LOAD OFF YOU

ELECON ENGINEERING COMPANY LIMITED, Works No. 1, Vallabh Vidyanagar, Gujarat. • Works No. 2, Goregaon, Bombay. For full details and for our Technical Catalogue ES/120/63 please write to our Sole Selling Agents: THE MILLING TRADING CO. PVT. LTD., 'Steelcrete House', 125, Dinsha Vachha Road, Churchgate Reclamation, BOMBAY-1 • 4, Netaji Subhas Marg, Daryaganj, DELHI-6 • 31, Brabourne Road, CALCUTTA-1. Agents for South India: WILLIAM JACKER & CO. LTD., First Line Beach, MADRAS. REC. 907 EVEREST

RECORDS AND STATISTICS

Quality Control for Export Goods

THE GOVERNMENT of India has decided to introduce compulsory quality control and pre-shipment inspection for exports of jute and cotton textiles before the end of the current calendar year. The Regulation will be applied to the export of processed foods with effect from September 1, 1963, and to engineering products from the beginning of 1965.

Agricultural Products

With regard to the agricultural products, it has been decided to introduce compulsory quality control and pre-shipment inspection within this calendar year. The phasing of the programme, the standards that are to be implemented and agencies to be entrusted with this work are indicated in the table below:

Name of product	Date from which quality control and inspection schemes are to be made compulsory	Standards	Agency
(1)	(2)	(3)	(4)
Pulses	between 1-7-63 and 30-9-63	Agmark already framed	Agricultural Marketing adviser
Onion	-do-	-do-	-do-
Ginger	-do-	-do-	-do-
Turmeric	-do-	-do-	-do-
Walnuts	-do-	-do-	-do-
Groundnut oil	-do-	ISI stds. already available	-do-
Groundnut oil refined	-do-	-do-	-do-
Linseed oil	-do-	-do-	-do-
Linseed oil double boiled and refined	-do-	-do-	-do-
Castor oil	-do-	-do-	-do-
Castor oil for pharmaceutical purposes	-do-	-do-	-do-
Vetiver oil	-do-	-do-	-do-
Potato	-do-	Agmark stds. under preparation	-do-
Senna leaves	between 1-10-63 and 31-12-63	Agmark stds. under preparation	-do-
Sennapods	-do-	-do-	-do-
Tendu (biri) leaves	-do-	-do-	-do-
Edible mushrooms	-do-	-do-	-do-
Bannana powder	-do-	-do-	-do-
Bannana dried	-do-	-do-	-do-

MEAT AND SEA FOODS

Animal castings	between 1-10-63 and 31-12-63	ISI stds. available	Agricultural Marketing adviser
Pork and meat of sheep and goat canned in brine.	-do-	ISI stds. under preparation	-do-
Pork (chilled, frozen ham and other types)	-do-	ISI stds. already available	-do-
Frozen meat	-do-	ISI stds. under preparation	-do-
Frozen shrimps	1-8-63	ISI stds. available	Fisheries Development Adviser in collaboration with marine products E.P.C.
Prawns or shrimps canned in brine	1-8-63	-do-	-do-
Prawns dried or prawns pulp	-do-	-do-	-do-

Processed Foods

Compulsory quality control is already being exercised for fruits and vegetable products under the Fruit Products Control Order, 1955, for vegetable oil products through the Vegetable Products Control Order, 1955, under the Essential Commodities Act, 1955 and food articles through the Prevention of Food Adulteration Act, 1955.

In addition to these, it is proposed to introduce compulsory ISI certification marking scheme for the following processed foods: corn flour, baking powder, dextrose, macaroni, vermicelli and spaghetti, breakfast foods, (such as corn flakes, wheat flakes, pearl barley, barley powder etc.), biscuits, confectionery and malted milk foods.

Indian standard specifications for these products are available and the major portion of the organised sector of the indigenous industry for some of the products has already introduced ISI certification marking scheme on a voluntary basis. By the extension of the ISI scheme on a compulsory basis for exports from September 1, 1963 the quality of goods for export will be ensured.

Tea

It has been decided to include tea as one of the commodities for introduction of compulsory quality control and pre-shipment inspection in this year's programme. Certain measures of quality control of tea are being exercised under the Tea (Distribution and Export) Control Order, 1957, by virtue of which the adulteration of tea, as defined in the order, is prevented. The order also prohibits the export of tea by persons other than a licensee. The licensees have to fulfil certain requirements in regard to packing and marking of containers. There are also some other regulatory provisions.

However, the Control Order does not stipulate pre-shipment inspection. There is, however, a voluntary pre-shipment inspection scheme of tea. This is to be operated only on prior request being made by the importers and is only for tea exported from the ports of Calcutta and Cochin. This scheme ensures that supplies are in conformity with the contracted samples. With regard to compulsory pre-shipment inspection, it is felt that till the formation of specification by Indian Standards Institution in respect of minimum requirements of main kinds of tea, the present voluntary pre-shipment scheme of the commodity is to be made compulsory.

Jute Products

The Government has already initiated action as a prelude to the introduction of quality control and pre-shipment inspection to exports of jute and jute goods. A study group under the chairmanship of the Jute Commissioner has prepared a draft specification for hessian and sacking and these specifications are to be finalised by the middle of July, 1963. The Jute Commissioner has also advised all jute mills to set up quality control units in each of their manufacturing units and it is envisaged that quality control and pre-shipment inspection on a compulsory basis for exports of jute products would be introduced this year.

Textiles

The Government proposes to start control and pre-shipment inspection for all textile exports before the end of the current year.

The plan could be divided into the following three groups: (1) Items for which measures are already being exercised and require to be strengthened immediately, namely, — (a) cotton textiles and yarn covered by ITEX, FACTUAL and ad hoc survey inspections (b) Handloom textiles covered by quality marking schemes. For all other handloom products, compulsory inspection has to be introduced immediately on the same lines as for Bleeding Madras etc. (c) Art silk and synthetic fabrics are already being inspected on a compulsory basis.

(2) Items for which preliminary thinking has already been done and for which arrangements on a compulsory basis would be completed by September 30, 1963, namely—(a) items like pure silk fabrics, and one of two items of handloom textiles such as furnishings, shirtings etc.

(3) Rest of the items for which compulsory quality control would be completed by December 31, 1963 namely — woollen fabrics, hosiery goods and other handloom products.

It is proposed to set up or adequately strengthen regional offices for inspection purposes at the following 11 centres, which will cater for the needs of inspection most expeditiously within the areas concerned: Amritsar, Delhi, Kanpur, Banaras, Calcutta, Nagpur, Ahmedabad, Bombay, Sholapur, Madras and Salem.

Coir

A scheme for voluntary pre-shipment inspection for the following products is expected to be put into effect from August 1, 1963 under the control of chairman, Coir Board: (1) Creel Mats (2) Rod Mats (3) Bit Mats (4) Fibre Mats. Indian standard specification for these types have been utilised in this scheme. This voluntary scheme is a fore-runner to the compulsory scheme that may be introduced in due course

after making such modifications as may be necessary in the light of experience gained.

Handicrafts

A Study Group set up by All-India Handicrafts Board has done some preliminary thinking for introduction of quality control and pre-shipment inspection for the following items of handicrafts: (1) Carpets (2) Namdahs (3) Druggets (4) Art metalware (5) Wood carving (6) Ivory (7) Zari (8) Brocades and silk goods (artistic) (9) Printed textiles (cotton and silk) hand blocked (10) Silver jewellery and silverwares. The Handicrafts Board has also introduced a voluntary labelling scheme for carpets.

Mineral Ores

The State Trading Corporation has been requested to follow the Indian Standards in sampling and testing of the following ores: (1) Iron ore (2) Bauxite (3) Kyanite (4) Sillimanite (5) Magnesite. For Mica, the Mica Export Promotion Council is administering a voluntary quality control scheme. The scope of all these schemes are likely to be enlarged further.

Engineering Products

The question of extending quality control and pre-shipment inspection to the engineering products was examined by the study group set up under the chairmanship of the senior industrial adviser (ENGG) and the articles have been divided into six broad groups.

Arrangements for exercising the necessary quality control and pre-shipment inspection will be completed by December 31, 1964, so that the scheme may be introduced from January 1, 1965.

The itemisation and grouping of various engineering products and their treatment for purposes of quality control and pre-shipment inspection is given below:

Group 'A'

For items falling in this group, a small group of technicians will be charged with the specific task of inspecting shop and quality control methods of exporting factories.

This group will then assess the export worthiness of the products of the exporting factories concerned and will recommend to the Government of India for necessary certification of export worthiness of these products.

The following items can be covered under this group: (1) motor vehicles, scooters, motorcycles and mopeds (2) diesel engines (3) air compressors (4) power-driven pumps (5) electric motors, transformers and switch gears (6) electric wires and cables (7) dry batteries (8) storage batteries (9) electric fans (10) GLS electric lamps and fluorescent tubes (11) radio receivers and equipment (12) refrigeration and air conditioning equipment (13) fabricated steel structures, including pressed steel tanks and bridge and roof (14) transmission line towers (15) bicycles (16) sewing machines (17) typewriters and duplicators (18) small tools (19) coated and bonded abrasives (20) crown cork (21) metal closures, capsules and cap seals (22) bolts, nuts, rivets, screws, wire nails, panel pins, and split and cotter pins (23) steel, aluminium and tinplate packages in made-up or component form (24) printed metal hardware, toys and advertisement novelties (25) steel furniture, including tubular furniture for home, office, and security purposes (26) steel pipes and tubes (27) cast iron pressures and non-pressure pipes (28) steel castings (29) precision iron

castings (lathe beds cylinder blocks, crank cases and machine castings) (30) dies, jigs and fixtures and (31) non-ferrous alloys, semis, extrusions and forgings.

Group 'B'

The following type of engineering products could be grouped here and the inspection for export purposes undertaken by the inspection wing of the Director-General of Supplies and Disposals: (1) machine tools (2) railway track fasteners and accessories (3) railway signalling equipment and train lighting equipment and (4) railway wagons.

Group 'C'

For the types of products falling under this group, no export inspection may be considered necessary because of the known quality control technique already being exercised. This group will cover the following three types of engineering products: (1) locomotives (2) industrial shunters, and (3) integral coaches.

Group 'D'

In this group, as will be seen from the following list, machinery used for specific industries has been categorised and here too the treatment as for group 'A' will have to be given to the goods meant for export: (1) textile machinery, (2) jute mill machinery, (3) sugar mill machinery, (4) paper and pulp mill machinery, (5) tea processing machinery, (6) industrial machinery not otherwise specified, (7) automobile

ancillaries and (8) high tension power transmission line equipment (where package export contracts are concerned).

Group 'E'

These are more or less such items which can be called consumer goods and for which the certification marking scheme of the ISI should be able to determine the export-worthiness of these products. These products are: (1) utensils of aluminium, copper, brass and stainless steel, (2) EIPNS ware, (3) buckets and bath tubs, (4) ghamellas, (5) enamel-ware, (6) cutlery, (7) locks and padlocks, (8) builders' hardware, (9) steel trunks, (10) umbrellas and umbrella fittings, (11) barbed wire, gauze mesh, and netting and weld mesh, (12) expanded metal, (13) pressure lamps and stoves, (14) thermos flasks, (15) zip and snap fasteners, (16) manhole covers, pulleys and counterweights, (17) flash light cases, (18) box cameras and (19) water and steam pipe fittings.

For aluminium utensils meant for export ISI certification mark has already been made compulsory.

Group 'F'

In this group will fall rolled steel sections produced both by the main steel producing plants (such as of TISCO, IISCO and HSL) as well as by smaller units namely re-rollers. In the case of sections produced by the main plants, no inspection other than already carried out by the plants will be considered necessary. In the case of re-rollers, however, ex-works assessment of quality will have to be made by some independent agencies like the Metallurgical Inspectorate of the Directorate General of Supplies and Disposals.

Rise in Foreign Share of Equity Capital

FOREIGN participation is the equity capital of Indian companies has shown a remarkable rise in 1962-63. Foreign collaborators subscribed about 23.2 per cent of the capital issued in 1962-63 as compared to 7.9 per cent in the previous year, according to an interesting analysis made by Mr. S. M. Dugar of the Company Law Administration. The study is based on the capital issues of 55 companies which issued shares worth Rs. 21.73 crores in 1962-63. They included the following ten companies with capital above Rs. 50 lakhs each:

GIANT AND BIG ISSUES DURING 1962-63

(Rs. in lakhs)

Name of Company	Amount Issued
1. Associated Bearings Company	390.00
2. Asiatic Oxygen	160.00
3. Kirloskar Cummins	150.00
4. Oriental Power Cables	105.00
5. SLM - Maneklal Industries	80.00
6. Assam Sillimanite	70.00
7. English Electric Company of India	60.00
8. Gammon India	60.00
9. Prabhat Udyog	60.00
10. Pyroteam India	55.00
TOTAL	1190.00

Regional Break-Up

An analysis of the pattern of share subscription shows a significant rise in the subscription of the foreign collaborators as compared with 1961-62. As against 7.9 per cent during the previous year, about 23 per cent has been taken up by them during the current year. The finance from foreign collaborators accounted for nearly 31 per cent of the capital raised by companies in the Western Region. In the other Regions also there was an increase though not as high as in Western Region in the absorption of shares by them. It was about 19 per cent in the case of Eastern and Northern Regions as compared to 14 per cent and 10 per cent respectively during the previous year. The Southern Region recorded an increase from 7.6 per cent to 8.4 per cent.

REGIONAL PATTERN OF SHARE SUBSCRIPTION

(As % of capital issued)

Region	1962-63	1961-62
Western Region	30.9	4.4
Northern Region	19.1	10.1
Eastern Region	18.0	14.0
Southern Region	8.4	7.6
All - India	23.2	7.9

Pattern of Foreign Participation

A further study of the pattern of participation in the capital of companies discloses that 15 of the 55 companies which issued prospectuses sought collaboration from other countries. The companies have issued shares to the foreign collaborators in consideration for the technical know-how and other technical assistance. Generally, the agreement with the collaborators consists of planning the layout of factories, supply of machinery and equipments, permission to use the "trade marks" of foreign collaborators in relation to Indian products, training of Indian personnel etc. The amount contributed by them aggregated to Rs. 503.44 lakhs which forms 23.2 per cent of the total capital issued. The subscription of foreign collaborators in the case of 6 out of the 15 joint-ventures came to 50 per cent or more. Of these 6 there was majority of foreign participation (i.e. more than 50 per cent) in only 2 companies and in the remaining 4 the foreign interest was 50 per cent. In the case of 9 other companies their share varied between 8.5 per cent and 43.8 per cent. The names of Indian Companies and the extent of foreign capital participation therein are listed in the table below:

Name of Company/Country of foreign collaboration	Amount of capital invested by foreign collaborators (Rs. lakhs)	% to capital issued
1. Asiatic Oxygen (U.S.A.)	25.00	15.5
2. Assam Sillimanite (W. Germany)	6.00	8.5
3. Associated Bearing Co. (U.K. & Sweden)	240.00	60.0
4. English Electric Company of India (U.K.)	35.00	58.5
5. Facit Asia (Sweden)	15.00	50.
6. Hind Rectifiers (U.K.)	3.00	15.0
7. Hindustan Dowidat Tools (W. Germany)	6.50	27.7
8. Kirloskar Cummins (U.S.A.)	75.00	50.0
9. Kirloskar - Asea (Sweden)	7.50	30.0
10. National Standard Duncan (U.S.A.)	25.00	50.0
11. Neiveli Ceramics & Refractories (W. Germany)	3.77	8.4
12. Prestolite of India (U.S.A.)	17.50	43.8
13. Pyroteam India (U.K.)	27.50	50.0
14. Simco Meters (U.K.*)	6.67	19.0
15. SLM - Maneklal Industries (Switzerland)	10.00	12.5

*Subscribed by Commonwealth Development Finance Corporation Ltd.

The study shows that Sweden and UK have jointly contributed the largest amount to the capital (Rs. 240.00 lakhs) to Associated Bearing Co. If this joint venture is excluded, the country which has contributed the largest amount is USA with Rs. 142.50 lakhs. UK and Sweden are ranked 2nd and 3rd with contributions of Rs. 72.17 lakhs and Rs. 22.50 lakhs respectively. The subscription of the participating countries and its proportion to total foreign capital subscribed are given in the following table:

Country	Capital Invested (Rs. lakhs)	Percentage to total
USA	142.50	28.3
UK	72.17	14.3
Sweden	22.50	4.5
W. Germany	16.27	3.2
Switzerland	10.00	2.0
Jointly by UK & Sweden	240.00	47.7
TOTAL	503.44	100.0

Individual well-being is linked with national prosperity and only planned efforts can ensure both in the shortest possible time. And planning, for its success, largely depends on savings, individual as well as national. Saving in the form of Bank Deposits provides resources for the National Plan.

Desai's Golden Hopes

THE FINANCE Minister's broadcast of July 9, reviewing six months of gold control, was timely, necessary, logical and persuasive. Mr. Morarji Desai concentrated his attention on three major aspects of the working of the restrictions placed on the possession of and trade in the yellow metal. He pointed out that one of the prime aims of gold control had been substantially achieved. This is the more effective prevention of smuggling of gold into the country. Evidence in this matter must necessarily be indirect in character, but the Finance Minister and other official sources have certainly given sufficient material to support the impression that gold control has succeeded in making it considerably more difficult for traffickers in smuggled gold to carry on their business.

This ought not to be surprising. Before the introduction of the gold control measures the Government had to depend mostly on the vigilance of the Customs to keep out or track down smuggled gold. The weakness here was that once the yellow metal had been successfully smuggled into the country avoiding the Customs guard, the authorities were largely helpless in identifying and pursuing the contraband through the various tortuous channels of its disposal within the country. This limitation had to be overcome by devising some machinery of physical obstruction of domestic traffic in smuggled gold. This is what the gold control measures have aimed at and, as might have been expected, have substantially succeeded in achieving. Mr. Desai mentioned several indications of the fact that smuggling has sharply declined. He referred to the easing of gold prices in the principal world markets, the decline in turn-over of Indian refineries, the fall in the demand of refining aids such as nitric acid (is this relevant in this context?), the relative strength of the rupee in many of the leading financial centres and the evidence that we have of our foreign exchange receipts.

The Government certainly is in a good position to judge what the facts are in this context and we have no reason not to accept the Finance Minister's verdict that he is satisfied that the situation with regard to smuggled gold has improved. It is no doubt true that other factors such as increased Customs vigilance and the various steps which the Government has been taking lately to prevent the outflow of Indian currency and the leakages in the accrual of foreign exchange reserves have also played an important part in obstructing the smuggling of gold. But the internal measures of control are surely to be assigned the lion's share of the credit.

It is, however, necessary to point out that, although the Finance Minister has substantially succeeded in checking smuggling, which is the prime purpose of his gold policy, he has not been proved right in his original expectation that gold control would bring down the domestic price of the yellow metal and that this would be a further factor in the decline of smuggling. Actually the price of gold has not only not gone down in comparison with its pre-control level, but has, in illegal and clandestine transactions, even firmed up further. This is not all. It is the common experience of the public that 14-ct gold jewellery, trading in which is permitted, is dearer in relation to the prices at which jewellery of purer gold used to sell before gold control. The explanation is simple. Precisely because smuggling has been checked and the normal trading in non-ornament gold of higher purity has been banned, the market is squeezed for supplies which have to be provided mainly through sales of existing ornaments of gold of higher purity which their possessors are naturally not too willing to part with since they cannot be replaced by gold of the same purity. It is possible that, as the Government's policing measures

become more effective in checking the illegal manufacture of gold ornaments of higher purity and as the rush to buy 14-ct. ornaments, which may be a relatively temporary phenomenon, subsides, the price of gold may soften. But we are sure that the Finance Minister is no longer as hopeful as he was before of bringing down the Indian price of gold to the world level within a reasonable period of time. That kind of development would be possible only if there is a revolution in the social customs and the mental attitudes of the people in relation to the possession and the use of gold. This was the second important aspect on which Mr. Desai dwelt in his broadcast.

There was never at any time the least doubt that Mr. Morarji Desai was wholly and truly concerned about the social welfare aspect of the deglamorising of gold in the public view. But there has also been some suspicion that the difficulties of forcing the pace of public thinking in this matter were not being properly appreciated. That the hoarding or the holding of gold beyond a certain limit is a barren economic activity is plain enough and in a poor country the indulgence in the hoarding habit is clearly a folly for individuals and a waste of resources for the nation. But how are the people to be weaned away from their age-old addiction to gold? Quite obviously there has to be mass popular education spread over a period of years. It is sad and surprising that neither the Government nor the Congress, which is the ruling party, has in the past six months thought of undertaking this educative propaganda on the scale on which it is needed.

As is only to be expected this lapse has been exploited by Opposition parties who have been carrying on highly artificial campaigns, whipping up discontent and agitation among the public generally and goldsmiths in particular. It is being suggested even by Mr. Desai's colleagues in the Congress Party that the reverses suffered by the Party in recent by-elections were to some extent due to popular dissatisfaction with gold control. We do not know to what extent this assumption is true. But even if it is it does not by itself constitute any sound criticism of gold control. On the contrary, it is a reflection on the failure of the Government's publicity apparatus as well as the Congress organisation to take adequate steps for explaining and justifying to the people what must in its very nature be a controversial programme. We are constrained to say that the Finance Minister has been ill-served by his fellow-leaders in the Government and the Congress party in this respect. It is clear that an economic and social measure of such a far-reaching character could not have been introduced if it had been only the personal whim of Mr. Desai. It is therefore fair to presume that gold control represents the considered decision of the Government and the ruling party. In such circumstances both political good sense and public morality demand that the Government and the Congress party should

throw themselves more wholeheartedly into what is necessarily a gigantic task of converting public opinion to the support of the gold control measures. Unless this is done, the enforcement of the control is bound to remain defective and inadequate and the social purpose of the gold policy will not be easy to realise.

At the same time, the Finance Minister also owes it to the country to think a little more seriously and realistically than he appears to have done on the investment implications of gold. He is quite right in saying that gold is a wasteful form of investment, but he is completely wrong in contending that there are many other sufficiently attractive outlets for saving and investment. The various small savings schemes could appeal only to a very limited extent. If no sufficiently attractive alternative opportunity for investment is available to the public then it will not be easy to dissuade them from looking upon gold as a store of value. Even if people could be discouraged from hoarding gold, their savings might only be diverted into some other equally sterile or even more socially injurious channels as that of speculating in urban housing sites. There is already evidence in the trend of land values in some of our cities and larger towns that this kind of harmful diversion of savings is taking place.

It follows, therefore, that the Finance Minister should consider whether it is not a logical corollary of his gold policy to encourage people to invest their savings in the industrialisation of the country. The formation of unit trusts, which is stated to be under consideration, will no doubt help to direct people's savings into the financing of industries, old or new. But much more than this surely needs to be done and if Mr. Desai really means what he says about the necessity of the people's savings being invested productively in the economic improvement of the country, he should not hesitate to take the several fiscal, credit and other measures which are needed to improve the investment climate and stimulate vigorously the launching of new industrial enterprises, big or small, with or without foreign collaboration. The need for a positive and forward-looking policy of engineering a higher level of industrial activity in the country must be seen as a logical consequence of the Government's anxiety to ensure that such of us as have some surplus to put by do not lock up their savings in gold but make them available for augmenting the industrial capital of the country.

Finally, Mr. Desai in his broadcast spoke gently and soothingly of the discomforts caused to goldsmiths by the gold control measures and the ameliorative steps taken or contemplated by the Government. While social and economic distress caused to any section of the community by Government policies must certainly invite public sympathy and interest, there is no denying the fact that much of the agitation that this country

has seen in this case has been organised by politicians or political groups for their own purposes. The economy of this country is changing fairly fast, although not fast enough, and it is idle to pretend that in the last fifteen years or even more, no vocation or trade had been adversely affected by pressures of altering economic situations. The business of goldsmiths has not been the first, nor will it be the last to suffer, as the old order keeps constantly giving place to the new in the economic life of the country; and we have not seen it suggested anywhere that bus or rail transport should not be increased or extended because that might cut into the livelihood of the people who are engaged in bullockcart transport. Nevertheless, since the dislocation caused to the community of goldsmiths has been rather sudden and is the direct consequence of an act of the Government, there is undoubtedly a case for a certain extent of interim relief and assistance during a period of transition to the affected trade or profession.

Accelerating Exports

GREAT SATISFACTION was exhibited in recent weeks over India's export performance in April and May this year, when a rise of nearly Rs. 22 crores was recorded as compared to the corresponding two months in the preceding year. The rise in exports in April (over April 1962) was of the order of Rs. 10 crores, while in May it was of the order of Rs. 12 crores (over May, 1962) and, for May the figure of Rs. 66.15 crores represented one of the highest levels attained in any single month in recent years. Is it an indication that the Indian Union is at last turning the corner in her export trade?

A commodity-wise analysis of export data indicates that the spurt witnessed in April and May this year was due to the improvement registered in the case of jute manufactures and sugar. Both these commodities were responsible for a total increase of about Rs. 13 crores out of the total rise of Rs. 22 crores. Small gains were also registered in the case of vegetable oils (non-essentials), oil cakes, raw cotton, tea, coffee, leather, gums and resins. The rise of about Rs. 6 crores in the exports of sugar was due to a previous commitment and does not promise to be a recurring feature in view of the difficulties that the country is currently facing in regard to the production of sugar. It means that the gain — nearly one-third of it — is due to a commodity which has not attained a permanent status in India's export list. The results of the April-May increase in exports do not seem to offer any long-abiding hopes of improvement in exports.

In a recent meeting of the Board of Trade at New Delhi, the pendulum swayed towards traditional goods after the continuous hammering, for more than a decade, in favour of the diversification of the export trade. Times out of number the Ministry of Commerce and

The Centre's own policy in this respect has been clear. It has readily offered to provide funds for schemes of relief and rehabilitation which State Governments may be able to implement in order to help goldsmiths. Some States, as is always the case, have been more alert or efficient in undertaking and administering relief procedures than others and we now have the welcome assurance of the Finance Minister that the Central Government would try to ensure that no State Government neglects its responsibilities in this matter. The essential fact is that the country needs welders, electricians and persons of other such skills which are relevant to the industrial development of the country more than it needs, say, priests and pujaris, goldsmiths, or let us add—despite the alleged demand for astrologers in high places—, soothsayers and fortune-tellers. And what the country needs it will no doubt get in due course but it is only sensible to help it get it sooner.

Industry had dinned into the ears of the people that India's balance of trade problem, particularly relating to exports, could only be solved if the country diversified its exports, and ceased to depend for its exports earnings on a limited number of commodities. The wisdom has now dawned that the traditional items such as tea, jute manufactures, cotton textiles, oils, leather and leather products, hides and skins, etc. must receive added attention and should not be ignored. The type of diversification which has been attempted in the recent years has been spread over thousands of commodities and processed goods which have been of dubious avail in earning additional foreign exchange. Any small down-turn in the earnings of one single commodity such as tea or jute manufactures has usually wiped out the gains registered in the case of hundreds of lesser known commodities. Rightly has the emphasis been shifted to the traditional items which are likely to be the mainstay of India's export earnings for a long time to come.

It has also been felt that India's publicity abroad had been so poor that our products, whether new or old, failed to create a favourable image in the markets abroad. With this objective in view, the Ministry of International Trade decided earlier this year, with the consent of Parliament, to set up a new fund called the Marketing Development Fund consisting of Rs. 3.8 crores for 1963-64 for the development of markets abroad. A lot of paper work, according to Press reports, has been done so far in order to further the aims of the new scheme which has no less than ten broad objectives. The papers distributed at the Board of Trade meeting indicated that the objectives of the fund embraced market research, export publicity, participation in trade fairs, trade delegations and study teams, establishment of offices and branches abroad, grants in aid to export promotion

July 19, 1963

councils, quality control, export assistance for exportable commodities, export risks insurance and, in short, any such scheme which may promote the development of the markets for our products. It would have been wiser to concentrate on a small number of objectives so as to produce the right effect in the shortest possible time. The spreading of funds over so many schemes is likely to prove wasteful in the short period. A wave of frustration passes throughout the land whenever targets set down in the beginning of the year are required to be scaled down near the end for one reason or the other. It is now time that the Three-Man-Committee appointed for the purpose of screening schemes for the utilisation of the fund should take up a few major activities and concentrate attention on them so that some concrete results might flow out of the dissemination of the funds earmarked for this purpose.

A study of the direction of India's exports in 1962-63 as compared to 1956-57 (the first year of the second Plan) shows that India's exports have encountered stiff resistance in Western Europe, excluding the United Kingdom. The rise in India's exports to the whole of Western Europe between 1956-57 and 1962-63 was of the order of Rs. 10 crores out of which Italy alone was responsible for about Rs. 2.6 crores. The exports to France were almost static between Rs. 8 and 9 crores. Similar was the case with West Germany. The balance of trade was acutely unfavourable to India in so far as

West Germany was concerned. The imports from West Germany in 1956-57 exceeded exports by as much as Rs. 74.97 crores. In 1962-63 again, India's exports fell short of imports by Rs. 80.08 crores. The glaring imbalance with West Germany and France has been of considerable concern to this country and at the recent meeting of the Board of Trade, it was disclosed that an Indian team would visit Bonn in November to undertake the possibilities of increased exports to West Germany. The French Government has also agreed to send in October this year a high-powered delegation to India to explore the possibilities of a long-term trade and economic relations agreement between the two countries. While all this may no doubt be useful, how much and how permanently our export trade would gain in consequence remains to be seen. Similar delegations visited the West European countries a number of times in the past and a certain degree of reciprocity in sending delegations to India was observed by the European countries. They have failed to bring about any result which might be described as favourable to India. Selling some of the Indian products, particularly engineering goods in Europe has been a difficult proposition and unless some sort of linking up of our exports with imports from the West European countries is initiated, the unfavourable gap in trade is not likely to be bridged in the short period.

In sharp contrast to the slow and hesitant rise of

A longer crushing season?

July 19, 1963

EASTERN ECONOMIST

103

exports to Western Europe, this country has raised her exports to Eastern Europe by about four times. In the first year of the second Plan, India's exports to East European countries were Rs. 22.2 crores; in 1962-63 they had jumped to Rs. 81.9 crores. The rise in exports in 1962-63 over 1961-62 was of the order of Rs. 30 crores. These figures clearly show that India's exports are poised for liberal expansion in so far as the East European countries are concerned.

There has been some rise in exports to the United States but it is of a marginal nature as compared to the spectacular growth in the case of Indo-East European trade. Japan has also not increased its imports from India much in recent years; but for iron ore, its imports from India may not add up to a worthwhile total. This also applies to Africa and Australia. India's traditional partners in trade have, in fact, bought less in recent years. Whereas in 1956-57 Indian exports to the United Kingdom were valued at Rs. 181.9 crores, the level of its purchases stood reduced to Rs. 163.7 crores in 1962-63. Even though the United Kingdom and the United States continue to be our largest partners in trade, East European countries seem to be catching up at a very fast rate.

India's trade with the Asian countries has remained static for the last seven years because of our failure to compete in cotton textiles exports with Japan and China. India's exports of cotton textiles to industrially advanced countries have also suffered heavily. The Board of Trade has come to the conclusion that the "ready-made-garments-movement" all over the world was responsible for this decline and that Indian factories should specialise in mixed fabrics if they want to capture a part of the world market. The emergence of synthetic fibres is also in part responsible for the fall in India's exports of cotton textiles. The belief that in the prevailing world market conditions any increase in exports was not possible seems to be a gloomy and unrealistic assessment of the situation. The cotton textile industry must be given all the assistance possible to raise exports. Incentives need to be provided in the shape of imports of necessities and import quotas for improved performance in exports. In the case of the advanced countries, a positive response is needed. The ECAFE Secretariat has recommended that the advanced nations must initiate a programme of curtailment in their capacity for cotton textiles so as to accommodate India and other Asian countries.

There is a close and positive relationship between exports of various commodities and the level of their domestic production; wherever an increase in export earnings has been recorded, it has come from increased production. This may look like a very prosaic and straightforward statement but the intrinsic worth of this truth does not seem to have percolated the thinking of the authorities concerned. Production of sugar,

which offered possibilities of earning foreign exchange every year, was bungled last year because the accent on output was lacking. In the midst of the present shortage in sugar, the Government's decision to step up production to 3.5 million or even four million tons by the end of the third Plan and provide for an export quota of over one million tons looks like a tall order. Unless all the vitally needed steps are taken to encourage domestic production, the hope to earn more through exports is likely to prove a pious wish. This also applies to oilseeds, tea, jute manufactures, cotton textiles, etc. A few of the commodities may fail sometimes to earn more through exports because of certain peculiar conditions in the international markets, but the fact that increased exports must flow out of increased production holds true in the case of all commodities on India's export list.

Lastly, attention needs to be drawn to the findings of a Study Group which was appointed by the Government of India in May last year to study export finance. It has recommended the setting up of an "export credit and guarantee body" with which should be merged the Export Risks Insurance Corporation, which is currently underwriting insurance against possible losses to exporters. The Working Group has rightly stressed that the recommendation in regard to the setting up of a new Corporation is of a supplementary nature and that the other demands of export trade such as quality control, increased production, reduced prices, market research, etc. are vital components of the whole scheme of India's exports.

Eastern Economist 20 Years Ago

JULY 16, 1943

Further official figures regarding India's war finances are now available. The total Defence expenditure from April, 1938, to March, 1944 (taking into account the budget estimates for the current year) comes to nearly Rs. 7,118 millions — as against revenue of Rs. 8,196 millions during this period. The total expenditure — Defence and other — during this period was Rs. 10,402 millions. This gives an idea of the enormous increase in Defence expenditure in comparison with the total revenue. As revenue has increased from Rs. 845 millions in 1938-39 to Rs. 2,194 millions in 1943-44 (Budget estimates) one gets also an idea of the increase in taxation, direct and indirect, during these war years. In fact the general view in Assembly circles has been for some time that the limits of taxation have been reached. In its Report on Currency and Finance for 1942-43 the Reserve Bank observes: "The comparatively low proportion of defence to total expenditure before the war in the Dominions and the United States is in striking contrast to the substantial percentage in the United Kingdom and India and partly explains the relatively large increase in their budgets since the war. That the limits of economic mobilization for war are being reached is also apparent from the slowing down in the rate of increase of the defence expenditures."

Highlights of the Week

SUGAR-COATING THE PILL

THERE IS no justification at all for any controversy over the proposal of the Union Food and Agriculture Ministry that the sugar industry should aim at a longer crushing season in 1963-64 by starting to crush earlier than usual as well as stopping later than usual. As things are, the output next season is unlikely to exceed 2.8 million tons under the most favourable circumstances. Mr. S. K. Patil, however, insists on talking of a production goal of 3.3 million tons. While that figure, to put it mildly, seems to be based more on the Minister's characteristic optimism rather than on a rational calculation of probabilities, there can be no denying the fact that it is in the country's interest to produce as much sugar as may be possible in the coming year. One condition of the increased output surely is a longer crushing season and provided reasonable conditions are assured the industry should certainly be willing to co-operate with the Government in this respect.

The crux of the matter, therefore, is not whether the crushing season would be longer, but what the Government proposes to do to make it economic for factories to crush cane during periods of lower recovery. It has been suggested in some quarters that one necessary condition for a longer crushing season is that there should be an adequate output of cane. This misses the point that there is no overall shortage of cane in the country. The problem is to ensure that a sufficiently large portion of the cane that is grown finds its way to the vacuum pan factories. We have always held the view that the only reasonable solution of the nation's sugar difficulties is complete decontrol. We have never been impressed with the argument that de-control would in some sinister manner expose the consumer to the tender mercies of the industry or the trade. Actually it is the existing jumble of controls over the industry which is preventing a rational evolution of the sugar industry in harmony with the growth in domestic consumption and the emergency of export possibilities.

It is, however, pointless to press the case for decontrol so long as the Government, for reasons best known to it, is not prepared to contemplate action in that direction. In the circumstances all that might profitably be pleaded is that the fiscal burden on industry should at least be eased to the extent necessary to ensure a longer crushing season and an additional production of sugar. The Food and Agriculture Ministry is reported to be working on a suitable formula but since the idea is not new and the Government has in fact given such fiscal incentives to the sugar industry in the past, it is rather difficult to understand all this feverish cerebration at this stage. It will be more to the point if the Ministries concerned (which means also the Finance Ministry) take an early decision and announce it promptly. It is possible that a step of this kind may have a salutary influence on the current high price of sugar, even in advance of the start of the new crushing season.

Meanwhile it is amusing to find Mr. S. K. Patil pleading that the entire rise in sugar price should no be attributed to the muddle in sugar policy resulting in a decrease in production. He argues that part of the blame should also rest on the Compulsory Deposit Scheme and other fiscal measures in this year's Central Budget. This should cause no considerable embarrassment to the Finance Ministry the spokes-

men of which have been working overtime to deny that the Central Budget had in any appreciable manner contributed to the upward trend in prices. It is time that somebody or other, who can and will speak on behalf of the Government as a whole, comes forward to tell the bemused public why precisely prices are rising, what factors are responsible and to what extent in each case and whether anything could be done about it at all and if so whether the Government might be expected to do it. Until the public is put wise thus, Mr. Patil's attempt to blame the sugar industry or the sugar trade (in addition to the Finance Ministry) cannot be taken seriously. Especially since Mr. Patil claims to hold 700,000 tons of sugar for release between now and the time when fresh production would start flowing, which would be ten weeks hence, it is pertinent to ask whether this policy of sitting tight on a substantial portion of the low production of sugar in the current season has not in itself been a factor contributing to the current high level of sugar prices.

The truth is that, given the low level of sugar output this time, the Food and Agriculture Ministry has had a difficult choice to make. It could either have released more sugar in the past months to keep prices relatively lower in the current period, but this would have run the risk of the consumer being confronted with a scarcity of supply and famine prices during the festival season at the fag-end of the sugar year or the Ministry could have spaced out releases frugally so that some stocks could be kept for the closing weeks of the current sugar year when the festival demand would be at its peak. The Food and Agriculture Ministry has quite rightly chosen to follow the latter course. But one inevitable consequence of this is that the consumer has had to reconcile himself to a high plateau of sugar prices for the greater part of the current season. This may be a bitter pill to swallow for the Food and Agriculture Ministry which has been justly (but in our view not sufficiently) castigated by public opinion for a muddled policy which has unnecessarily depressed sugar production in the current year and which, if not suitably revised, threatens to jeopardize the long-term growth of the sugar industry, but Mr. Patil's attempt to sugar-coat it may perhaps arouse sympathy but is unlikely to evoke admiration.

REPORT ON EXPORT FINANCE

THE STUDY Group on Export Finance, appointed under the chairmanship of Mr. K. P. Mathrani, by the Ministry of Commerce and Industry, in its report tendered last week-end, strikes a note of urgency in calling for steps to fill this lacuna in the export promotion machinery. It emphasises that it is high time India has aligned itself with other countries, industrialised as well as developing, which are making special provisions to supply credit and guarantee facilities to their export agencies. Keener competition in the world market is being progressively reflected in the longer terms of credit offered by the exporting countries to the importers abroad. Accommodation provided to the overseas customers in the matter of payment of the price of the imported goods is certainly one of the strong points which helps to promote the volume of exports from any country. India cannot afford to lag behind its competitors in this crucial matter. The Study Group strongly recommends that, at least in the beginning, the Corporation which it wants to be established for this purpose should be started under the auspices of the Government. The initial authorised capital should be Rs. 10

crores and the issued and paid-up capital should not be less than half this amount.

A compact single finance-providing institution is recommended as being likely to be more effective than the existing small ones for the obvious reason that the former can operate on a large scale. To avoid multiplicity, the Study Group urges that the Export Risks Insurance Corporation should be merged with the proposed Corporation for the provision of export credit and guarantee. The suggestions of the Study Group revolve around three important aspects of export finance, whether it is intended by way of credit or guarantee or a cover against risks. In the first place, it is urged that the function of providing insurance against export risks should devolve upon the projected Corporation. The type of guarantees which will be required by the export trade in the different export markets cannot all of them be envisaged at once. With expansion of exports and as experience is gathered in the process, more forms of guarantees may be found necessary to safeguard the financial interests of the export trade. The Study Group recommends that the conventional schemes of guarantees should be undertaken by the Corporation from the very start and additional responsibilities in this behalf should be placed on it as necessity for them would arise. It also places emphasis on the provision of supplementary credit facilities for intensifying the export drive. The pattern of the Corporation, including in particular its functions, has been drawn up by the Study Group after a careful scrutiny of the existing institutions of this kind in the export-advanced countries.

Provision of Credit

Among the recommendations which the Study Group has made, initial attention needs to be drawn to certain urgent types of provision of credit. As regards pre-shipment credit, which is currently provided by the Export Risks Insurance Corporation to the extent of giving the guarantee to commercial banks up to a limit of 50 per cent of the value of exports, the Study Group stresses the need for immediate upward revision of the limit to 66-2/3 per cent. This would remove many of the financial handicaps of exporters at the pre-shipment stage. Then comes the question of improving guarantees with particular reference to the packing credit facilities made available by the banks. It is urged that this should be liberalised so that exporters would be entitled to discounting facilities which are now inadequately available to them. Liberalisation of packing credit facilities, together with the insurance cover from the Export Risks Insurance Corporation, would give exporters ample protection against defaults or insolvency on the part of the importer or political risks such as restrictions on exchange remittances and imports as well as political revolutions in rare cases. At the present time the need of the export trade is for provision of short-term credit for its finance. But the stage when medium-term and long-term credit would also come in greater demand will not be far off. The Study Group analyses this problem from that angle. Allied with this problem of credit is the question of its cost. The Study Group makes the suggestion that the Reserve Bank should examine the problem of interest rates on credit for the export trade and devise ways and means to reduce their incidence on the prices of export commodities.

STC AND IRON ORE EXPORTS

A STOUT defence of the policy pursued by the State Trading Corporation in respect of export of iron ore was put up by its Chairman, Mr. Govind Narain. He stated that the Corporation had sought to obtain the best possible terms for its exports of iron ore, keeping in view the market conditions

which were currently not highly favourable. The world demand for iron ore had slackened because the tempo of iron and steel industry all over the world had slowed down. Japan in particular had reduced its demand for iron ore as its earlier programme of expansion of the steel industry was being scaled down. At the same time new sources of supply of the ore have emerged. Faced with these unfavourable market conditions, the Corporation took a realistic and flexible attitude and agreed to enter into a two-year agreement with Japan according to which it agreed to export 2.2 million tons of ore in 1963-64 and 2.25 million tons in 1964-65 at the reduced price of 74 sh. per ton. Earlier, the Corporation had obtained up to 81 sh. per ton for its ore. The Chairman supported the decision to accept the lower price by the argument that some other sellers were willing to offer basic grade iron ore to Japan even at 60 sh. per ton. In view of the fact cited by the Chairman, it is to be conceded that the decision of the STC to lower its prices is business-like and in the best interests of the mining industry. But the fact remains that not enough attention has been paid to the export of low grade ore. At the present time when the market is weak, it would be extremely difficult to push up the export of low grade ore. The mining industry, therefore, has a legitimate grievance that exports of low grade ore were neglected when the demand was brisk and the Corporation was in a position to push up its sale.

Purchase Programme

The Chairman threw light on the Corporation's programme to purchase Japanese steel. He emphasised that there was no link between the Corporation's purchase of steel from Japan and its exports of iron ore. Whereas the total value of iron ore exports to Japan was Rs. 13 crores per annum, the Steel Agreement stipulated purchase of steel worth Rs. 2 crores in 1963-64, and Rs. 2.2 crores in 1964-65. They were, according to him, two different and independent agreements.

The expansion in our exports of iron ore is dependent considerably on the facilities offered in India's major ports. The STC had taken active interest in the expansion of the facilities available at both the large and the small ports. The Corporation, according to the Chairman, had taken special pains to induce buyers to take delivery of the ore at some of the smaller ports. Unfortunately the loading capacity of the Indian ports is limited and the loading technique in many cases is slow and outmoded. No port in India, except Madras, has the capacity to take more than 10,000 tons ore-carriers. Madras alone can handle 15,000 tons-carriers. The Corporation is taking active interest in the development and expansion of such ports as Cochin, Mangalore and Hunavar.

Mr. Narain disclosed that the Corporation had decided to open an office in Goa so as to assist the local mine owners to increase their iron ore exports. The STC will help the small mine owners while the bigger ones will continue to operate independently. Preliminary studies are being conducted by the Corporation to ascertain the manner in which assistance can be provided to the smaller mine owners in Goa.

A POLICY FOR RAILWAYS—VI

Return on Capital

By T. M. RAO

ANY COMMERCIAL undertaking worth its name must show a clear return on investment, after all expenses, interest on debt capital and taxes are deducted. It must be comparable to the returns earned on similar investments. Moreover, the return on investment must be clearly greater than the prevailing interest rate, if it is to be called a successful venture. For instance, business corporations in the United States including public utilities aim at a minimum of 20% gross return on their capital investments.

It is legitimate to ask: "What is the rate of return on the capital invested in the Indian Railways?" It may be difficult to answer this question because they are State-owned and do not pay income and property taxes as ordinary businesses do. And yet, it may be possible to make some comparisons and evaluate the performance of a nationalized undertaking.

In the existing capital structure of the railroads in India, the total capital outlay of Rs. 15.63 billion is considered as capital borrowed from the Central Government, for which annual interest at the rate of four per cent (raised to 4.25 per cent recently) is paid by the railways in the shape of dividend to general revenues. In order to make comparisons meaningful, let us assume that the total capitalization of Indian railroads consisted of 50 per cent funded debt and the remaining 50 per cent equity capital. The corresponding figures for the United States railroads for 1957 are 57 per cent debt and 43 per cent capital stock. Let us further assume that the Indian railroads, as a private corporation, paid 10 per cent of its revenues (this is the figure in a recent year for the United States railroads) as income, property and other taxes. Then

the financial results of the Indian railway organization would look somewhat as shown in Table I.

Table II shows the rates of return on stockholders' equity and net investment for Class I railroads in the United States. While the rate of return on stockholders' equity on United States railroads ranged between 2.6% and 5.7% over the last decade, the rate of return on the basis of the assumptions made for the Indian railways has been negative for five of the last ten years. Some of the assumptions may seem rigid as, for instance, the amount of taxes being 10 per cent of gross revenues. It is true that income taxes tend to be lower in years when net operating revenue is low. But it must be noted that the railroads in the United States are obliged to

TABLE I

*Includes net miscellaneous expenditure.

pay property and right-of-way taxes regardless of the fact whether the railroad concerned is earning a profit or incurring a loss. But the quantity of taxes is really not the point at issue. If the tax rate seems high at 10 per cent it may be assumed as five per cent. The figure chosen does not matter.

The point at issue is that looking at railway finances as at any other private corporation, the conclusion seems irresistible that it is a losing concern from beginning to end. As a commercial venture, it could not stay in business for a day. Which stockholder would risk his money in a company yielding less than one per cent return on his investment? These are therefore serious issues which the railway administrators in India must face.

Professor Louis Lefebvre arrives at similar conclusions when he recommended a sharp increase in the level of freight rates prevailing on the Indian Railways. An example which he gave to indicate the heavy deficits that the railroads incurred under the existing rate structure is contained in Table III.

Depreciation may be defined simply as decline in economic usefulness. It reflects such factors as physical deterioration, inadequacy and obsolescence. In the modern era of transportation obsolescence has become the most important of the factors mentioned above. For example, in the field of international aviation, the super-constellation, while still in excellent shape and condition, has become completely obsolete with the advent of the commercial jet-airliners. The steam locomotive became outmoded in the United States with the emergence of the diesel-electric locomotive. It did not matter that a new steam locomotive built in 1945 had a thirty year life. Even so, it was written off in the next five years due to obsolescence. Allowance for depreciation must therefore take into account all these factors if attrition of capital is to be avoided. Here is a fundamental point of difference between the accountant and the economist. For the accountant, cost is always associated with some outlay of money or expenditure. But the economist will recognize true costs even where a single dollar has not been expended. Depreciation

It is not enough if allowance for depreciation takes into account the decline in economic life of railroad plant and equipment, it must also recognize the effects of inflation. We are living in an era of secular inflation when the value of the dollar as well as the value of the rupee is being constantly eroded. The rupee today is less than a quarter of its value in 1939 as may be seen from the following index of wholesale prices.

INDEX OF WHOLESALE PRICES — INDIA

Year	Coal	Iron & Steel	Cement	Timber	Overall (All commodities)
1938-39 ..	100	100	100	100	100
1955-56 ..	350	319	279	350	355
1959-60 ..	469	374	367	417	456

Source: Committee on Transport Policy and Co-ordination, 'op. cit.'

Nominal rupee accounting, which forms the basis of railway accounting system in India, does not reveal the real costs of operation nor results obtained thereof. It mixes together 1938 rupees with 1962 rupees which are in fact less than quarter in value of the former. How can any accounting system succeed in presenting a true financial picture, when it mixes up elements of such diverse value as 1938 and 1962 rupees? But this is only a part of the argument. In making allowance for depreciation, it is necessary not only to take into consideration the decline in economic value but also the steady decline in the value of the rupees. If a "WG" locomotive costing Rs. 5 lakhs needs replacement in 20 years time, the allowance for depreciation must take into account that a new "WG" twenty years hence may cost much more than the original price.

Discussing the possible objectives of a depreciation policy, Professors Hill and Gordon observe that "the first possibility is that the policy might be aimed at recapturing from period revenue a sufficient number of dollars either to provide for replacement of the asset on retirement or, alternatively, to recover the original investment (i.e., acquisition cost). A second feasible objective of depreciation is that of reflecting in the amortization charge for any given period the share of the total asset service potential that has expired during that period. This concept, which has become the accepted basis of modern practice, does not necessarily conflict with the recapture thesis, but purports to be descriptive of economic events rather than simply opportunistic."

Depreciation Allowance

The traditional view regarding depreciation allowance has been that it is a programme of cost amortization. That is to say it has been, until recently, looked upon as a method by which the cost of the asset is recaptured over the estimated life of the asset. Now it has dawned on businessmen that with inflationary pressures mounting steadily, the cost charged to depreciation is inadequate for meeting the cost of new asset at the time of replacement. This, according to them, is an erosion of capital and is an inadequate recognition of the true nature of depreciation during an inflationary period. Based on this reasoning, depreciation then should not be based on original cost but on replacement cost and that earnings should be charged with the economic value of the capital consumed each year and not just its dollar value. In practice this will mean a reduction in the book value of net earnings during a period of inflation and a greater tax-free amount for re-investment in the business.

The replacement cost theory may be viewed as an attempt to insulate a certain sector of business from the effects of inflation. This is perhaps the first time that depreciation is considered as a provision for replacement and not as a provision for amortization of the asset cost.

Now with these considerations in mind, let us examine the depreciation policies pursued by the Indian railways.

The first thing that invites comment is the terminology used. The financial statements speak of what is called "contribution to the depreciation reserve fund." This sounds misleading on two counts. In describing allowance for depreciation as a "contribution to the depreciation reserve fund," the impression is given that it is not a cost incurred by the railways, but an additional contribution that they make to a fund. Secondly, the concept of a Depreciation Reserve Fund is somewhat outmoded. In modern accounting practice, the term is wholly replaced by "allowance for depreciation" in recognition of its true nature.

Furthermore, most large corporations do not keep liquid funds separately under an account head called Depreciation

Reserve Fund for two reasons. The allowance for depreciation which is a legitimate cost for which no current expense has been incurred comes in as a big stream of cash flow and helps in supplying the necessary working capital and other demands for cash. Secondly businesses have now recognized that internal financing provides the major sources of capital for new investment and that there is no better source than the funds generated through the depreciation allowances. This has the additional merit that the funds could be used for current investment in one's own business where they may earn a higher return, than if they were deposited in a bank for nominal interest.

As far as depreciation charges are concerned, a flat 4 per cent. i.e., 25 year depreciation of assets, seems to be the basis on which the contribution to the Depreciation Reserve Fund is calculated. This is unimaginative as well as unrealistic. It seems fair to assume that the railway administrators in India have not yet realized the fact of technological obsolescence and its major role in depreciation. As dieselization has dramatically shown in the United States, the era of the steam engine is gone. This fact should be reckoned with in India too. The economics of coal transportation in India make it particularly urgent for the railways to be geared to dieselization in southern and western India which are far removed from coal fields. Under these circumstances what justification can there be for allowing a 25 year span of life on such

assets as locomotives? A life span of 10-15 years is perhaps more realistic.

A depreciation policy based on a flat four per cent is also unimaginative because it inhibits change and impedes a vigorous renewal and replacement programme. "Whereas a large part of the railway plant consists of assets older than 25 years, it is also true that had the railways undertaken a more vigorous depreciation and renewal policy in the past, their plant would be more adequate to cope with current demand".² There is one further danger in charging a relatively low annual depreciation allowance. To the extent that depreciation charges have been under-estimated, the operating expenses would also be understated by the same amount. The conclusion would therefore be that had the Indian railways followed a policy of adequate depreciation, gross expenditure figures would have been higher than the reported figures which in turn would have meant higher operating ratios. This is not a cheerful conclusion when we remember that earlier in this analysis it was found that the operating ratios for the Indian railways were already generally high.

WINDOW ON THE WORLD

Company Law Reform

From Our Special Correspondent

PARIS:

IT IS unusual for a book to be "reviewed" at meetings of industrial associations or to be the subject of angry articles in stock market weeklies. Yet this has been the case, last month and this, with F. Bloch-Laine's 'Pour Une Reforme de l'Enterprise' ("Toward a reform of the business enterprise"). Since it seems bound to find its way into English before long, a preview of the ideas it contains, and some hints as to the reasons for the opposition those ideas have aroused, might be opportune. M. Georges Villiers, the eternal president of the CNFP (the French Employers' Association), and M. Rene Damien, president of the Steel-Makers' Association, have both denounced it to their members as a dangerous work, not only for what it says but for the personality and influence of its author, or rather its authors. For Bloch-Laine insists that his book is really a joint effort by over 100 people who have discussed and approved every line of it, and those hundred are employers, officials, trade unionists and academics who meet in the commissions that write the French national plan. So its suggestions on company reform represents ideas acceptable to a wide and influential sector of opinion. But even if they were his own personal ideas, this would already be significant because Bloch-Laine is head of a major State bank, one of the chief planners and, although he has refused the Finance portfolio so far, he remains one of President de Gaulle's leading economic advisers. For all these reasons, his critics fear that some at least of his suggestions have a chance of acquiring force of law eventually.

Logical Implications

Whether or not this is so, will concern only Frenchmen—although any extensive recasting of company law in France, at this moment, could not remain without consequences for the whole Common Market. What will interest others is that Bloch-Laine's proposed reforms claim to be drawing the logical implications of the accepted analysis of how contemporary business works in practice. He makes no contribution to that analysis, but takes over current business theory, which is of course mainly American in origin. What some startled business men are taking as subversive and revolutionary in his book is familiar to all who have followed the researches of, say, Peter Drucker, the Professor of Management at New York University. He takes it as common ground (and indeed few will deny it) that present-day management of business enterprise is illegitimate. This does not mean that it is nefarious or sinister; on the contrary, most will agree that it is efficient and, granted that it remains subject to the checks and controls of other social powers, beneficial. But it is nevertheless illegitimate in that corporation managers cannot show how they got their power, except that they were co-opted by other managers. True, there is a pretence that they were elected by the shareholders, but everyone knows this to be hollow mockery. The "democratic" theory of business organisation, according to which the enlightened owners of the firm elect and control their representatives, probably never was true (Adam Smith was already deploring the disinterest of shareholders in "their" company) and it certainly is not now.

American economists and "economic sociologists" have described this state of affairs in great detail but they have not suggested making the law square with practice. They are content to let an antiquated company law stand, while recognising that it has little connection with the way corporate

business operates, and to rely on "the conscience of the king" (i.e. the goodwill and sense of responsibility of today's managers) or on "countervailing powers" outside the firm to ensure that illegitimate power does not become irresponsible power. Despite what socialist critics say, there is nothing especially innocent or trusting in this attitude. It matters less that economic power should be formally legitimate than that it should be checked and controlled, and it mostly is. Nor, as a general rule, are corporate managers set on abusing their power; most of them recognise that it is illegitimate and feel decidedly uncomfortable about the fact. Perhaps because he is French and a jurist, Bloch-Laine is dissatisfied with this illogicality, this contradiction between business theory and practice, and he outlines the changes in the law that would be required to bring it into line with the way modern companies work.

Democratic Pretence

For example, he says that if most shareholders play no real role in company affairs, then there is no reason why the law should make such a clear distinction between them and debenture-holders. The only distinction that matters is between those who take a sustained and active interest in the business and those who do not. For the latter, there will be no harm in doing away with the democratic pretence of shareholders' meeting. On the contrary, those who have put their money into a business and are not just occasional shareholders or proxy-holders should get a special status: they would come out into the open by having their shares registered and their ownership made public, they would give an undertaking to the other active partners in the business not to sell their shares without notice, and they would get specially effective representation in management. Critics have exclaimed that this means that such shareholders would be "trapped" in the company: they would get real influence over it but they would have to acknowledge some loyalty to it, unlike the ordinary investor who can buy and sell his stock freely. But of course Bloch-Laine knows that the only stockholders liable to accept this special status are not individual investors but the parents of subsidiaries, business banks and these secret "minorities of control" that today run many companies behind the democratic facade. In short, they are always other companies, and the point of the suggestion is to separate out this way of "owning" firms from the empty "ownership" represented by buying shares on the stock market.

Next, Bloch-Laine wants to formalise in law the fact that boards of directors are today a hodge-podge of people with very different degrees of control over, or even interest in, the firm's affairs. In a company there is always a kernel of real decision-making power alongside directors who are just advisors, figureheads, delegates of outside interests and so on, who play the role of the chorus in Greek tragedy, issuing vague warnings and uttering laments after the event. He suggests that the men who hold effective responsibility and are answerable to no higher authority be grouped in a college of directors, charged with running the business and with co-opting new members to their college. The rest of the directors should be grouped in a commission of controllers, where they would be joined by the nominees of the above-mentioned loyal or permanent shareholders, the elected representatives of the firm's employees and, where the firm's business was of importance to the national plan, the delegates of the planning commission. But this board of controllers would have only powers of checking and control, advice and contestation, and it would meet relatively infrequently.

of it sharing the power of the college of directors, and Bloch-Laine insists as vigorously as any employer could wish on the absolute necessity of unified direction in business enterprise.

He claims to know that the trade unions recognise this necessity as well as anyone, and that they have no wish to share managerial power, if only because this would compromise their right to contest freely managerial decisions by the accepted ways of trade-union action. The workers would be content with representation on the control-commission along with the State and outside capitalist interests. The only place where they want some measure of participation in decision-making concerns the social welfare activities of the firm where they resent one-sided paternalism.

These are only the principal ideas in Bloch-Laine's book but they suffice to show that his intention is to consecrate in law the death of the myth that owners control modern industry, and to separate out clearly the real controllers of business, leaving their powers of decision virtually intact but organising along formal lines the influence exerted over them by other social powers. When eminent business leaders denounce these proposals as "revolutionary", I think there must be misunder-

Innovation, Enterprise and Exports

By JOSSLEYN HENNESSY

LONDON:

THE COMING into being of the National Economic Development Council in the U.K. has led to much hard thought aimed at clarifying the objects, methods, and, indeed, the limitations of planning. An outstanding example is the publication this week by the independent Institute of Economic Affairs (66 A Eaton Sq., London. SW. 1) of a report entitled "The Way of Enterprise" (Price 30 sh.).

The theme of the report is that economic progress does not consist in multiplying the existing supply of goods and services. Progress consists, first, in cheapening existing products, so that yesterday's luxuries for the few become today's mass produced amenities for the many; secondly, in improving their quality until they are transformed and are, in fact, no longer the same product, except in name. Compare, for example, the price, capabilities, and amenities of the motor car of 1900, 1918, 1945, and 1963. Thirdly, progress consists in proliferating new goods and services. As you go back over the decades, the range of goods available today narrows—TV, radios, washing machines, typewriters, telephones, cycles, etc., etc., disappear from sight, and a whole series of obsolete goods, such as oil lamps, vehicles with iron-tired wheels, stage coaches, quill pens, and sand (in place of blotting paper) come back into view.

The record shows that, characteristically, innovations originate more often with the small entrepreneur than with the big established firm. This is not surprising. New ideas come from non-conformists, disturbing men, whose prime motive is an urge to independence, men who do not fit easily into the routine of being someone else's salaried employee.

But planners, the Institute's report points out, inevitably favour the foundation of large units. They think in terms of whole industries rather than of individuals, because a compact industry is easier to manipulate than an untidy, many-sided one. Planning tends therefore to promote a monolithic economy that progresses slowly. It is no reply to this to say that the USSR, and some other planned economies, have faster growth rates than many non-planned economies. To say this is to identify growth with spectacular State projects, armies, H-bombs, and cosmonauts. Admittedly many planned economies show an increase in known and established consumer goods (usually of a quality that cannot

standing for there is nothing less revolutionary in intention than Bloch-Laine's programme. He urges a concordance between law and actual practice, and if his ideas are really dangerous on some points it can only be because he is mistaken about current practice, not that he wants to change it substantially. So the denunciation of such danger could as well come from the fact that some business leaders do not recognise how modern corporations really work; they are content with a hollow theory inherited from the last century and think it subversive simply to point out that their own practice diverges from it. They imagine, for instance, that to draw the implications of the fact that ownership is no longer control constitutes an "attack on private property".

More intelligent conservatives will be franker: while admitting that formal law today bears no relation to economic realities, they will doubt the need and the wisdom of trying to square them as long as the system functions fairly satisfactorily. Whereupon the debate must turn on such general questions as whether the free-enterprise system is now working "satisfactorily" from everyone's point of view and whether it is ever wise for a society to live for long in discord with its own principles.

compare with a similar item manufactured outside the Iron Curtain), but this is not growth in the sense of the economic progress which leads to the continuous proliferation of new kinds of goods and services, which provide a higher standard of living for the masses. (Incidentally, another new Institute of Economic Affairs' publication, "Studies in Communist Economy," offers evidence of the resurgence of independent enterprise in the USSR).

In a striking paragraph, the Institute's report says: "A good supply of active entrepreneurs is of national, and not merely of industrial, importance. Enterprise is not indestructible; it can be reduced in quantity by obstruction and business enterprise is not easy to divert into other channels . . . It cannot . . . (except in rare cases) find an outlet in established industry or the public service. It can be bred out of the nation by the removal of opportunity, impoverishment, self-reliance, leadership, can flourish as a corrective to the general indifference and cult of safety."

The report glances at, but unaccountably fails to elaborate, the contribution to the balance of payments that innovating entrepreneurs make, in any country which gives them the chance. Germany's fantastic postwar economic progress sprang from her success in exporting and this was based on the innovations of innumerable entrepreneurs. The innovator's advantage is that, for a considerable period at any rate, he is the only source of his product. When penicillin was first produced in the UK, consumers all over the world wanted it too badly to haggle about the price. The same when electric typewriters were first produced in the USA. A country, such as India, for which foreign exchange is a matter of life or death, has the strongest motive to encourage goods have India's State directed enterprises contributed to independent entrepreneurs have contributed nothing new to India's exports, but the economic history of the UK and since 1945, shows that a country gets innovation in proportion to the extent that it creates conditions favourable to it.

The basic condition is that the entrepreneur must be

free to make, and keep, "abnormal" profits. No progress has ever come out of "reasonable" profits. Taxation in the UK today bears hard on the small entrepreneur. In the 19th century, it did not matter if his business credit was non-existent, because there were plenty of savings in private hands to which he could turn. Today, an unknown man has difficulty in raising initial capital, because private savings are small. Once started he has even greater difficulty in accumulating profits to plough back to back his judgment

further, because he incurs the surtax that applies to individual incomes but not to public companies. There has certainly been innovation in the postwar UK. The Institute's report gives full, and fascinating, case histories of 21 examples of brilliantly successful new small enterprises. But in Germany, with maximum income tax at 55 per cent, inventions, new techniques, and labour saving devices, have been correspondingly more numerous. Hence Germany's vast accumulation of foreign exchange.

U.S. Economy in Excellent Shape

By GUY SIMS FITCH

WASHINGTON:

THE AMERICAN economy has passed the halfway point of 1963 in excellent shape. Record is being piled on top of record in what is the third year of a remarkable economic upswing, one that in strength and durability already has outperformed the average rise in this century.

A comprehensive and reliable indicator of the economy's performance is the Gross National Product (GNP), which measures the total output of goods and services. While the GNP for the April-June period is yet to be officially released, unofficial estimates place it at an annual rate of about \$581,000 million, up nearly \$10,000 million from the first quarter rate and some \$30,000 million above the rate for the second quarter of 1962. One has to go back to the final three months of 1961 to find a more robust quarterly advance.

While the rise is expected to continue, many economists question whether its current pace will be sustained in the second half of the year. In retrospect, it is clear that its main elements of support in the past two years have been consumer and government spending. Both of these should continue to advance, though their rates of gain could conceivably be slower.

Consumer debt has been increasing, particularly to sustain the record purchases of such goods as automobiles and appliances and the rate of consumer savings has tended to dip this year. Retail sales, which moved up sharply last year, have been registering only modest gains for the past few months when adjusted for seasonal variations. While renewed buoyancy has been detected in retail sales reports in recent weeks, and retailers as a group are optimistic enough to predict a five per cent rise in this sale during the second half of this year, economists obviously are not placing as much reliance as before on consumer activity as a major expansionary force.

Much the same attitude prevails with respect to Government spending. State and local outlays can be expected to maintain their steady upward movement to meet the rising needs of a growing population for public services and facilities. The strong upward thrust of federal spending appears to be tapering off, however, and this GNP component may well be rising more slowly for the rest of this year.

On the other hand, there are other important sources of economic strength to consider. Capital spending by business, notably for new plants and equipment, clearly is on the upswing and will help sustain the economic advance. Housing, along with construction generally, also has been rising markedly of late, and should continue to improve.

Inventory accumulation is likely to prove another supporting force, even though industry will have to work down some of the steel stocks that were accumulated against the possibility of a strike that never came. By and large, a tight rein has been held on inventories throughout the economy, and inventory-sales ratios in general are well below levels reached in other upswings. Even the steel adjustment, which already is under way, should be completed easily and soon, in view of the basically strong demand for steel this year.

Some slowdown in the rate of the GNP rise thus can be expected in the third quarter which is just now starting. But this is normal during the summer months, anyway, what with the usual worker vacations and reduced plant operations, and it will be further influenced this year by whatever let-up in steel output may be acquired to run down excess stocks.

There is no doubt, however, about the economy's direction in the months ahead. It will be up, and by the fourth quarter of this year both steel and business in general should again be spurting ahead more rapidly.

LIC Deal Clarified

By A Special Correspondent

NEW DELHI:

IN "EASTERN ECONOMIST" of June 14, it was mentioned in these columns that the LIC had sold a block of shares in a South Indian tea company to a third party although the managing agency concerned had reportedly offered to buy this lot. It now transpires that this statement is not correct and that the LIC had not received any such offer from the managing agency. The LIC's sale has been through brokers and it is learnt from authoritative sources that, as is usual in such cases, the LIC was not aware of the identity of the other party when it put through the business. In other words, this transaction was just like any other ordinary commercial transaction of its kind and that in making the deal all that the LIC was concerned to see was that it got a good price for shares it desired to dispose of. It is pointed out, that in these cases, the LIC's prime obligation is to its policy-holders and that it should be expected to buy or sell shares at the proper time on the most profitable terms. In the circumstances, it is clear that there is no justification for questioning or casting doubt on the propriety of the transaction under reference and it is therefore regretted that the earlier note on the subject in these columns should have created an impression to the contrary.

★★

The Union Ministry of Irrigation and Power does not share the view that the phase of large-scale development of multi-purpose river projects in India is almost over. On the basis of a survey carried out by the Central Water and Power Commission during 1951-53, it is pointed out that, after allowing for uses of river waters other than for power, a total hydro-electric potential of 41 million KW. at 60 per cent load factor can be technically and economically developed. Of this, not more than 5 per cent (1.93 million KW.) had been developed by the end of the second Plan. During the current Plan period, it is estimated that development of another 5.1 million KW. will raise the exploitation ratio to barely 12.4 per cent.

Some ambitious schemes of hydel power development, therefore, are proposed for the next three Plans. The tentative programme drawn up envisages development of 5.90 million KW. hydel power potential in the fourth Plan, 7.55 million KW. in the fifth Plan and 9.29 million KW. in the sixth one. Even after the completion of the sixth Plan, the exploitation of the hydel power potential in the country may not exceed 55 per cent.

It is recognised that some of the hydel power schemes may be implemented on their own. A number of others, however, will still have to be multi-purpose. Some of the giant multi-purpose schemes planned are given in the table alongside.

Bifurcation of the Union Irrigation and Power Ministry into its two components is also not favoured. The main reason for this is stated to be the fact that 75 to 80 per cent of the cost of any hydro-electric project has to be incurred on civil engineering works such as barrages, dams, tunnels, hydel channels, surge shafts, balancing reservoirs etc., the investigation, planning, designing and construction of which requires irrigation engineers at each stage. There is said to be a considerable area common to both the Water and Power Wings

so far as hydro-electric projects are concerned. The fact that the two functions are performed separately at State levels is, if anything, considered to be an argument in favour of having a unified organisation at the Centre, which would be capable of taking an integrated view of the water and power developments in the country. Experience in other countries, it is further pointed out, shows that advantages of a combined authority for water and power development are being increasingly recognised and there is a move for better integration in the field even in countries such as the USA and China.

The total cost of development of the hydel projects contemplated to be included in the fourth, fifth and the sixth Plans is estimated at Rs. 18,000 million. Of this, the expenditure on civil works alone is estimated in the neighbourhood of Rs. 14,500 million.

The Union Government, of course, is alive to the fact that along with the development of the hydel power potential, concerted efforts have to be made to augment the thermal and nuclear power generation capacity in the country. This is considered to be necessary not only for meeting the staggeringly increasing requirements of power in areas where there is no hydel power potential available or where it has been nearly exhausted, but also for mitigating hydel power shortages resulting from the proverbial vagaries of Indian weather.

For an optimum use of the power resources of the country, setting up of regional agencies for zonal power grids is also planned. It is proposed to hold talks in the near future with

Scheme	Power Potential	Irrigation Potential
	Mil./KW.	Mil./Acres
1. Development of Hydro Power & Irrigation in the Narmada Valley ..	2.0	4.0
2. Development of Irrigation & Power in Orissa — Machkund, Balimela, Tikkerpara, Indravati, Baraket and Bhimkund Projects ..	4.00	6.7
3. Beas-Sutlej Complex i) Unit No. I—Beas-Sutlej Link ..	0.8	4.8
ii) Unit No. II—Beas Dam ..		
4. Pochampad Project in the Godavari Basin ..	0.06	5.7
5. Ram Ganga Project (U.P.) ..	0.14	1.7
6. Upper Ganga Project ..	1.0	Being investigated
7. On the Brahmapura River, there is need for development of projects for flood control and power generation of over 3.5 million KW.

State Government at the Ministerial level so that these agencies are established as early as possible.

So far as the availability of power is concerned, a draft report prepared recently by the Electric Power Survey Committee reveals that the total demand for power in the country at the end of the third Plan will be of the order of only 8.14 million KW. The scheduled capability at the end of 1965-66 is expected to be 10.95 million KW. A surplus of 2.8 million KW., however, will not mean that power shortages will end during the current Plan period. Because power systems in the country are mostly independent and isolated, the all-India margin between capability and demand gives a misleading picture. According to the draft report, power shortages will continue in a number of regions in the country not only during the current Plan period, but also during the next one. They are expected to be acute in the Eastern Ghats area (comprising North Andhra, South Orissa, East Maharashtra and Central and Southern Madhya Pradesh) and the Eastern Himalayan region (comprising Bihar, Bengal, the DVC area and North Orissa). It is felt that in the conditions obtainable today in the country, the gross margin between capability and peak load should be 30 to 40 per cent until the different power systems are integrated.

Advance action has been instituted in respect of some of the power schemes to be included in the fourth Plan. Production of over half a million KW. of generating capacity is said to have been already sanctioned. A number of other schemes are stated to be under consideration and may be cleared in the next two months.

★★

According to the indications available here, the third Plan target of creating a capacity of 50,000 tons of synthetic rubber may not materialise. Capacity of this order had been licensed to be set up by two concerns—Messrs. Synthetics & Chemicals Ltd., Bombay (30,000 tons) and Messrs. Duncan Brothers, Calcutta (20,000 tons). The latter have surrendered their licence owing to the fact that raw material for their project was not found available to the required extent from the natural gas in Assam. Consideration of a few other applications received for setting up synthetic rubber manufacturing units has been deferred by the Government, pending an assessment of the availability of raw materials for them from the oil refineries and naphtha cracker/butadiene plants.

In 1965-66, therefore, India will have to continue to import rubber in sizable quantities. The demand for all types of rubber at the end of the third Plan is estimated at 140,000 tons per annum. With the Synthetics & Chemicals' 30,000 tons plant working to full capacity and about 50 per cent of the demand being met otherwise from natural or reclaimed rubber, the indigenously produced rubber supply will amount to not more than 75 per cent of the requirements. Increased defence needs may even widen this gap.

With Messrs. Duncan Brothers abandoning their synthetic rubber project, alternative uses for Assam's natural gas resources are being explored. Oil-India, it is understood, is examining the possibilities of setting up a small channel black plant based on these resources.

★★

Progress reports on the programme for the expansion of the Durgapur steel plant from a capacity of one million tons to 1.6 million tons show that firm orders are being placed for the various items of equipment with manufacturers of steel plants in the United Kingdom. Since it takes about 30 months from the date of placing of orders to the commissioning of the plant, the expansion project may perhaps

be expected to reach the production stage early in 1965. Meanwhile it is of interest to note that some of the contracts which are being placed with British firms have gone to parties who are not members of the Indian Steel Construction Company, or ISCON, which is the Consortium responsible for co-ordinating the parent steel project of Durgapur. Since it is being assumed that ISCON will continue to be employed as a co-ordinating agency for the expansion project as well only if at least 60 per cent of the successful tenderers are members of the Consortium, the question is raised whether the placing of some of the major contracts with non-members may not adversely affect the status and prospects of ISCON.

★★

The Government has recently granted a licence to National Instruments, Limited of Calcutta, a Government of India undertaking, to manufacture Ophthalmic glass and lenses in collaboration with the USSR. This unit, when in full production, will turn out 300 tons of ophthalmic glass and lenses per year. The foreign exchange cost of this project will be met by the USSR. The rupee expenditure is placed at Rs. 36.1 lakhs.

★★

An agreement has been signed between the Government of India and the Federal Council of Switzerland for setting up a pilot project in Munnar, Kerala State, for the development of fodder resources there. This should help in raising the milk yield per cow from the current $\frac{1}{2}$ decilitre to about $2\frac{1}{2}$ decilitres per day. The Swiss Government is giving a grant

"And C.D.S. will mean the death of the pocket..."

July 19, 1963

of 1.64 million Swiss francs (slightly less than Rs. 1.8 million) for covering the first stage of this project to be implemented in a period of three years.

The project, the first of its kind in India and the biggest one in the technical co-operation field to be launched by Switzerland, envisages (1) construction of a fodder station at Munnar to explore the soil and to determine the most suitable kinds of grass seeds; (2) construction of a veterinary and a sperm station for artificial insemination and for combating epidemics and pests; and (3) construction of two cattle breeding farms (for 50 units each) to start cross-breeding experiments. Training courses will be held under this project for the agricultural advisers in Kerala on the subject of cattle breeding and fodder production. If the first phase at

Munnar proves successful, the project is proposed to be extended to the Peermade District of the State.

The Swiss assistance for the first phase will cover approximately 75 per cent of the expenditure to be incurred on it. The remaining 25 per cent of the expenses will be met by the Government of India. The Swiss Government will provide the services of four experts, all the required machines, sperm and dairy equipment, improved grass seeds, chemicals, etc. along with technical know-how. The Government of India will be providing land and other ancillary facilities available locally. The management of the project will be entrusted jointly to an Indian and a Swiss Director. Both of them will be placed on equal footing. The Swiss Director is expected here in a couple of months.

The State of Housing

From Our Correspondent

BOMBAY:

THE MAHARASHTRA Government's plans on the housing front were discussed recently by the Chief Minister, Mr. Kanamwar, and the Minister for Housing, Mr. H. J. Taleyarkhan, when they inaugurated the State Advisory Council on Housing. The Chief Minister rightly suggested that cities such as Bombay should consider their needs in the next 20 years while planning housing etc. When an industrialist acquired land for a new factory he should reserve some land for housing the workers.

The Chief Minister stressed the need for giving greater importance to rural housing since villagers did not have fixed income like the townfolk and needed houses to suit their pockets. The State Government doubled its housing activity last year although it had yet to spend Rs. 4 crores allocated at the end of 1962-63 outside the Plan expenditures. According to Mr. Taleyarkhan, the Housing Department experimented with several schemes for housing. These included bamboo-cement-plaster tenements. Such two room tenements, with a carpet area of 250 sq. feet cost Rs. 1700 without counting the price of land. The difficulties in acquiring land for housing were briefly mentioned. Although 4,000 acres of land was proposed to be acquired, so far only about 500 acres of land could be acquired due to legal and other delays.

New Schemes

The State Government was introducing two new housing schemes, namely, the employers' contributory scheme for their employees and the housing scheme for the economically weaker sections of the community.

The first scheme, he said, had already received an enthusiastic reception and about 5,000 tenements had been booked by the Tatas, the Kirloskar Group and the Coopers. Under the subsidized industrial housing scheme, the Government had completed the construction of 30,000 tenements. Slum clearance in cities could be expedited if civic bodies contributed 12½ per cent towards its expenses. The legislation to regulate the ownership flats' construction was under way and would be placed before the Legislative Assembly in its next session. The Maharashtra Government has made rapid strides in its Housing activity probably like no other State Government in our country. Yet the problem of housing accommodation continues to be acute. A study conducted by the Reserve Bank some time ago revealed that the housing conditions would be progressively deteriorating. Unless attempts are made to disperse industries and Government offices, the activities of the Housing Board or the private constructors will hardly succeed in coping with the demand for housing. Al-

though decentralisation and dispersal of industries is spoken of day in and day out, nothing concrete has been done so far in this direction. On the other hand, the available evidence points to a fresh influx of job seekers into the city area

★★

The employees of the (Bombay) Civic corporation have demanded a 25 per cent increase in dearness allowance. It was only last year that an agreement was arrived at on the previous dispute between the Corporation and the employees. The Municipal Commissioner, it is understood, laid down certain conditions for starting the negotiations. These pre-conditions are believed to include an understanding that there will be an agreement covering all points in dispute and that this agreement will operate for the next five years. During this period, should there be any increase in the cost of living index and the State Government gives its employees an increase in the DA, then alone will the question of further increase in dearness allowance to civic employees be considered.

It was revealed earlier that the Corporation is 'not in a position to concede the unreasonable demand' for a substantial increase in dearness allowance to civic workers. This decision was unanimously taken at a meeting of the Municipal Congress Party Committee appointed to consider the situation arising out of the strike threat. The Committee included strangely, the Chief Minister of Maharashtra, Mr. M. S. Kanamwar. The resolution approved by the Committee stated that 'such a demand would entail great hardship on citizens and prove an unbearable burden on the Municipal finances'. The members of the Committee alleged that the Union leaders, on behalf of the employees, promised not to raise the issue of enhancement of dearness allowance at least for a period of two years. This was denied by the spokesman of the Union. Probably, this is the first time that the demands of civic workers were clubbed with those of other State employees by the authorities.

★★

In spite of a satisfactory contraction of bank credit in the current slack season, bankers seem to feel anxiety over the credit conditions in the next busy season which will commence within another four months. It is the general expectation that the busy season would start much earlier and bankers feel that the banking system might be put to difficulty in financing the genuine credit requirements of trade and industry.

Leading bankers met the Governor of the Reserve Bank to impress upon him their point of view. They wanted a modification of the two-tier system of interest rates, removal of

the ceiling on accommodation from the Reserve Bank, postponement in the implementation of enhanced liquidity and an assurance that the individual difficulties of bankers would be sympathetically considered. The bankers seem to have chosen a wrong moment to see the Reserve Bank chief. This is because the contraction of credit in the present slack season has been sizable. The credit contraction, since the commencement of the slack season, amounted to Rs. 60 crores as against Rs. 20 crores in the corresponding period of last year. The deposit expansion in the slack season came to Rs. 50 crores — almost the same increase as in the last year. The money market has been ruling extremely easy with the call rate quoted around $\frac{1}{2}$ per cent on an occasion. In the next few weeks, the return flow of funds is expected to gather further momentum. The Governor of the Reserve Bank, it is understood, gave a sympathetic hearing. It is difficult to imagine what else he could have done. Obviously, he cannot recommend any dilution of credit control at a time when the inflationary forces in the economy are gathering further momentum. The bankers were not made to suffer in the last busy season and there is no ground for their fear that they would countenance difficulties which will not be taken care of by the Reserve Bank.

The volume of Compulsory Deposit work in the banking system is likely to be given a boost. This is because the Reserve Bank has announced that its offices in provincial headquarters other than Bombay would not be receiving deposits. The State Bank made the announcement that its pay offices all over the country will not accept deposits. This would mean more business for banks. The more important question in this connection is whether the volume of work will be commensurate with the benefits which would accrue from the operation of the scheme. As against the cost of employing additional personnel the banks must balance the yield on the funds kept with them interest free for a period. The general consensus of opinion is that it is more bothersome to accept these deposits and the attendant advantages are not commensurate with the trouble taken.

In an analysis of bank credit during the 1962-63 busy

season, the Reserve Bank Bulletin has shown that industry's share of credit showed a sizable expansion. Bank credit expanded by Rs. 208 crores to Rs. 1,592 crores in the 1962-63 busy season against Rs. 193 crores in the 1961-62 busy season. Of the Rs. 197 crores increase in secured advances, as much as Rs. 137 crores, about two thirds of the total, was accounted for by advances against industrial raw materials (Rs. 102 crores) and manufactures and minerals (Rs. 35 crores). The pattern of expansion revealed that there has been a sustained rise in advances against manufactures and they do not show any contraction even during the slack season. Actually, there is a larger expansion in the slack months. Advances against industrial raw materials, and food articles show sizable variations. These rise sharply in the busy season and contract substantially in the slack season. For instance, the entire contraction in the 1962 slack season was under these groups shared equally. The major portion of contraction in the slack months of 1963 is likely to take place under industrial raw materials because this group accounted for more than 50 per cent of the secured credit expansion in the 1962-63 busy season. The analysis reveals that the economy is getting fast diversified and that the Reserve Bank must make its credit estimates more realistically than before.

★★

Led by steels, Dalal Street staged an impressive recovery. Extreme gains were however pared somewhat due to realising but the tendency remained upward. The improvement was mainly due to heavy professional short covering in leading counters. The higher dividend declared for Tata Steel work-cussions at the Centre and Bombay to activate the capital market helped the sentiment. From the angle of corporate news, Zenith Steel declared a maiden dividend and this was derived by the news that Britain and the United States had submitted their proposals for joint air exercises with the IAF in India. It is however relevant to note that the basic factors responsible for the depression in the share market have undergone no material alteration. The current rally in equities might not probably make much headway unless there is something positive in the basic developments.

Hope Springs Eternal

From Our Correspondent

CALCUTTA:

WITH THE announcement of a higher net dividend of Rs. 7.70 for the year ended March 1963 as against Rs. 7.25 paid for the previous year by TISCO, stock market sentiment has shown further improvement. On Lyons Range, active trading in the pivotal scrip, Indian Iron has lifted the price in initial trading, following the TISCO, dividend announcement, by more than half a point and though profit-taking has since been interfering with its onward march, there is no gain-saying its popularity with the operators. For some days now Indian Iron has been the market favourite on the growing belief that the shareholders of the company will get a higher dividend. Such belief is based on the well reasoned assumption that the company's working during the year ended March 1963 would show a higher profit as production has increased sizably over the previous year's record. Many also continue to rate the chances of a bonus issue high. In the event, these hopes have not come true. The Indian Iron dividend has merely been maintained. The sustained interest in steel shares stems also from the indications that have become available in recent weeks of the Government's sympathetic attitude toward the problems of the steel industry. The very fact that

a high level meeting has recently discussed the question of decontrol of distribution and price of steel is taken as an encouraging sign. Though the meeting, as was to be expected, discussed, it is significant that the matter is not shelved. It has been reported that Government will not be averse to giving its approval to a scheme of decontrol both of distribution and price provided it does not impinge unduly on the interests of any one section of consumers. The stock market has interpreted this to mean that Government is willing to abolish controls but it will not take a firm decision before the full implications of such a change are carefully gone into.

It is, however, not the steel prospect alone that is motivating the optimistic appraisal of the investment outlook. Hope springs eternal in the human breast and marketmen are only too human. It is believed that the realisation is slowly depression in the stock market that the continued orderly growth of industry and hence conducive to an done to revive the confidence of investors. Till recently, been to reiterate in a general way that the economy is get-

ting stronger and stronger as a result of the various developmental programmes. But what the investor is looking for is concrete evidence that the enterprises in which he has deployed his funds are earning higher profits so as to distribute increased dividends and to put by larger and larger amounts for the expansion of their productive capacities. Such evidence has been woefully lacking during the past few months and many a hope has been blasted by the last Central budget with its new-fangled levies.

Not only has the investor been told that a large number of industries has been obliged to keep a big portion of their capacity idle for want of raw materials and/or power but he has also found to his great disappointment that his investments have come to yield in most cases a lower return than before, thanks to the Super Profits Tax. The one effective way of dispelling the investor's gloom will be to abolish the SPT. Though the Union Finance Minister has so far shown no indication of doing away with it, it would appear that before long he may be persuaded to jettison it by sheer force of the mounting evidence of its crippling effect. In the meantime, the operators at least have been cheered by the indication that the Government is contemplating some measures to revitalise the capital market. One step that is generally believed to be certain is that the LIC and other financial institutions will be asked to lend active support to the stock market. The Central loans will be out of the way soon and then the LIC will be able to spare funds for investment in equities. It is also expected that the measures contemplated by the Government will include some relaxation in the present margin requirements governing forward trading in shares as well as a directive to banks to be more liberal about margins against share advances. The reduction in the emergency insurance premium rate has also been helpful in bringing about the present improvement in sentiment.

★★

Despite a fall in prices, business passing in the jute goods market has continued to be meagre over the past couple of weeks. While sacking has been neglected partly because overseas buyers have been placing their orders increasingly with Pakistan, only scattered enquiries have come to hessian. Presumably consumers abroad are content to draw from their stocks, expecting a further fall in prices, to replenish their supply. The lack of buying interest on the part of buyers abroad is understandable as they know that there won't be any dearth of jute goods in view of another bumper crop that is in the offing for India. Apart from the extremely favourable weather conditions, the prospects for a bumper crop in India have been enhanced by the fact that even according to official reckoning there has been a slight increase in the area under jute. A declining price trend by itself will not disturb the freedom to the Indian industry is extremely limited in view of the fact that it has no control over the cost of most of the major items that go to make up the final cost of production. Since nearly 60 per cent of the cost in the jute industry is accounted for by raw jute, it follows that what it pays for the raw material influences a great deal its cost of production. Therefore the minimum operational price of Rs. 30 per maund basis Assam Bottoms renders it impossible for the industry to sell its products below a certain level. The fact that mills have not shown much interest at the lower price levels indicates that they will be only incurring loss in such transactions.

The unenviable position in which the industry is placed with regard to its obligation in respect of maintaining the operational price of jute has been brought into sharp focus last week when the Jute Commissioner issued compulsory quotas to the tune of 4.4 lakh bales of raw jute to be lifted

during the current month by the industry — 4 lakh bales by the IJMA mills and 40,000 bales by other mills. Earlier it was believed that in view of already heavy stock of jute with mills and the IJMA recommendation to member mills that they co-operate in maintaining the minimum prices, no compulsory purchase quotas would be issued. Thus the mills have been placed in a difficult position as on the one hand manufactures are not moving as fast as they are produced and on the other their godowns are already overfull with stocks purchased on their own account and on behalf of the Jute Buffer Stock Association.

A redeeming feature in an otherwise unsatisfactory situation is that there are indications that efforts are in train to help the industry to solve some of its urgent problems. The industry's plea for help in countering the Pakistani competition has been endorsed by the Board of Trade at its latest meeting. It has called for an examination of the present position of jute sacking. Both prices and offtake are continuously falling and the Board has called upon the Government to assist the industry in some suitable way to promote exports. It has referred to a scheme that is being drawn up jointly by the industry and the Jute Commissioner and has asked the Government to take it up for early consideration. Among other recommendations of the Board are the establishment of a permanent exhibition of jute goods in Calcutta, increased attention to research on jute products and diversification programmes, immediate initiation of steps for increasing the productivity of raw jute and improving its quality, and the immediate acceptance by Government of priority programme of the Food and Agriculture Ministry

EASTERN ECONOMIST

Twentieth Anniversary Number

In this special issue of June 7, 1963 Eastern Economist takes pleasure in presenting its readers with a rich fare of articles on various aspects of the Indian economy and a special section devoted to the study of industrial development in the various States. Contributors include the U.S.S.R. Ambassador in India, Mr. K. D. Malaviya, Dr. P. S. Lokanathan, Mr. K. Santhanam and Mr. Tarlok Singh.

Extensively illustrated with charts and statistical tables, this special number is priced Rs. 5 per copy, but is available to regular subscribers without any extra charge on annual subscription.

for raising the productivity and improving the quality of jute.

An indication of the intense competition that Indian sack-ing is facing in foreign markets from Pakistan can be had from the latest Fibre Supplement of the Commonwealth Economic Committee. According to the Committee the total value of Indian exports during 1962 was Rs. 154.2 crores, 6 per cent higher than in the previous year. This compares with the 19 per cent increase by weight. Pakistan exports by value are estimated to have fallen over the year to Rs. 30.9 crores, or by 11 per cent although by weight they were 11 per cent greater than a year previously.

★ ★
Presiding over the twenty-ninth annual general meeting of Indian Soap and Toiletries Makers' Association last week in Calcutta, Mr. P. N. Talukdar has called for a careful investigation into the working of the soap and toiletry industry both by the manufacturers and Government. A probe however would have been in order even some ten years ago. For, large idle capacity has been plaguing the industry during the past several years now. Only 13 per cent of the installed capacity was put to productive use in 1950-51 and since then not much improvement has taken place for in 1962-63 the percentage of idle capacity stood at 42. The organised sector of the soap industry (the above statistics refer to this sector only) is expected to attain a production of 2,20,000 tonnes with a capacity of about 2,55,000 tonnes but at present the output is no

more than 1,50,000 tonnes per year (which by the way represents only 75 per cent of the first Plan target of 2,00,000 tonnes).

It will be evident that the meagre output of the industry is not due to any dearth of capacity. What then is standing in its way of utilising its capacity in full? Mr. Talukdar has pointed out that "the conclusion is inescapable that perhaps the Planning Commission has not bestowed enough care on the question of mobilising the physical resources required to enable the industry to meet the target". As things stand, the industry is experiencing serious difficulty in securing the necessary raw materials. The drastic cut in imports makes it almost impossible for the industry to get its raw materials in sufficient quantities and whatever is available gets inflated in cost since the State Trading Corporation has been authorised to import and distribute them. The fact that the industry is still dependent for certain essential items on imports has shortage of these items has become chronic. Hardly any note has been taken of the fact that even with regard to indigenous materials the cost has gone up by as much as 69 per cent in certain cases. It is, however, wrong to say that Government is completely ignoring the industry: like other industries the soap industry is expected to maximise production and what is more, it is asked to sell one of its products at a particular price!

Inter-State Talks on Rivers

From Our Correspondent

MADRAS.

THE MADRAS and Kerala Governments have had the first round of talks on the utilisation of the waters of the west and east flowing rivers. The Madras Government has for some time past been requesting the Kerala authorities for a diversion of waters from the east flowing rivers like Periyar, Pambar and Kallar. The diversion of waters from these rivers will help backward areas in Madurai and Ramanathapuram Districts particularly. There is also anxiety to know how the Kerala Government propose to utilise the waters of the east flowing rivers, Bhavani, Siruvani and Kabbini, in their areas. The effective utilisation of available water resources in the upper reaches will naturally benefit the river basins in Kerala. But, at the same time, it is being asked whether joint projects will result in larger availability for the lower regions.

An integrated programme will probably help to prevent waste and lead to a satisfactory sharing arrangement. The working of the Parambikulam-Aliyar Project is also being examined. In regard to the Siruvani River, Coimbatore will get its drinking water supply from this source but Kerala has not agreed so far to the suggestion of the Madras Government that Siruvani waters should be available for irrigation purposes as well. In a complicated question like the sharing of river waters no immediate progress can be expected. But engineers on both sides have been asked to gather the relevant data and there will be a fresh meeting of the representatives of the two Governments in Madras after some time. The Kerala Government may probably agree to help Madras if the latter in turn were prepared to supply power from Neyveli or other sources. In any case, the attempt at closer collaboration between the two States is to be welcomed.

★ ★
Dr. Dharma Teja's proposal for erecting a 200 mW. thermal station at Ramagundam in Andhra Pradesh and handing

it over to the State Government has caught the imagination of the public. Dr. Teja has his own way of doing things and the spectacular additions to the fleet of Jayanti Shipping have aroused great curiosity in his proposals for starting other ventures. At first, it was suggested that the thermal plant and the power generated was to be sold on a bulk basis to the State grid. It has now, however, been indicated that the power station would be completed as a package deal and handed over to the State Electricity Board and that payment by the State Government would commence one year after the date of purchase. The State Government is reported to have reacted favourably to this proposal and as the Industrial Policy Resolution would not be violated, the Centre's permission is awaited. It has been suggested that a similar proposition should also be placed before the Madras Government if the ever, resurrected the Republic Forge Company and arrangements have been completed with Renaults of France for undertaking the manufacture of heavy trucks at Hyderabad. Originally, Republic Forge Company was to manufacture forgings with the help of International Finance Corporation. The scheme was not, however, implemented on account of subsequent unfavourable developments.

★ ★
The newly formed association of pharmaceutical and chemical manufacturers had its inaugural meeting in Madras a few days back. This is the first time the various manufacturers in the Madras State have got together and formed a society. The Health Minister, Mrs. Jothi Venkatachalam, who presided over the meeting stressed the need for under-basic materials that might be made available by Neyveli Lignite Corporation when its briquetting plant begins operation in 1965. The Health Minister complained that the

July 19, 1963

EASTERN ECONOMIST

123

response from private industrialists was not encouraging and the State had not made the desired progress in the manufacture of chemicals except in particular directions. The main difficulty relates to the availability of raw materials and the high cost of production due to heavy indirect taxes. But there is also need for collaboration with foreign interests and so far no attempt has been made, as in Maharashtra and Gujarat, to start chemical manufacturing units in a big way. Mr. R. Venkataraman, naturally expressed the hope that the industrialists would bestir themselves and conduct research in a way that new drugs manufactured would suit the requirements of the population.

★ ★
The performance of Hindustan Machine Tools in the past few years has been quite satisfactory and there is confidence that the requirements of the country can be met to a considerable extent from indigenous sources. HMT itself will be responsible for promoting three more units in Punjab, Andhra Pradesh and Kerala, the second unit having already been constructed in Bangalore. Mr. C. Subramaniam, Union Minister for Steel and Heavy Industries, has actually indicated that it is the intention to have a machine tool factory in every State ultimately. A few days back he laid the foundation-stone for the Central Machine Tools Institute in Bangalore sponsored by the Central Government with financial and technical assistance from Czechoslovakia. It is feared, however, that the target for the third Plan may not be reached in regard to the output of machine tools as sufficient progress has not been made so far. The institute is expected to be completed in 18 months. It is expected to be of considerable assistance in the development of design and research associated with the machine tool industry. Bangalore will also be having an institute for training steel engineers.

★ ★
There has been greater activity in the Madras Stock Market and business in planting shares particularly has been on a much larger scale. The steadier advices from Bombay earlier in the week and the subsequent announcement of a higher dividend by Tata Iron & Steel Company for the year ended March 31, 1963 have had a stimulating effect. In the absence of selling by holders prices have improved all round. In the Peirce Leslie group of plantation shares there has been interested buying for some time past and prices for Chembra Peak, Kil Kotagiri and Periakaramalai have been marked sharply higher. Following the successful cornering of shares

of Ouchterlony Valley it is felt that the interested buying will continue in evidence for some time and there may be a bid for changing the Board of Directors if the cornering operations prove successful. Calcutta interests seem to be involved. Other shares, too, have been marked higher and it is expected that cotton textile and rayon units will be able to do better on account of the likelihood of a revision of selling prices. India Cements has been sticky for some time past as it was reported that the results for 1962-63 were not satisfactory. But it is expected that the working for the current year will make better showing as the new factory now being constructed at Sankaridrug, near Salem, will commence production some time in October next. The initial capacity will be two lakh metric tons annually. There are already plans for increasing the output to four lakh tons annually. As ample limestone deposits are available locally, it is even expected that the capacity can be raised to 800,000 tons annually ultimately. The existing factory at Talaiyuthu has already a capacity of 500,000 tons.

Underwriting Arrangement

The steadier tone of the stock markets, however, has not been helpful to the sponsors of new companies for completing the underwriting arrangements through broker-firms. Actually, it has been necessary to approach the statutory financial corporations for finalising the underwriting arrangements. It is expected that Laxmi Machinery, Sakthi Pipes, Chemicals and Plastics, Seshasayee Industries and others will be raising their requirements some time in the last quarter of this year.

After the pending capital issues have been successfully floated there may be a vacuum for some time as many units which have got industrial licences are unable to proceed with their schemes on account of the unwillingness of the foreign collaborators to enter into fresh commitments and the difficult foreign exchange situation. It is learnt that the promoters of the fertiliser project which was proposed to be located at Tuticorin may not proceed with their scheme as the American participants have not shown keen interest after the new budget measures were announced while the fertiliser unit in Mangalore may not also be proceeded with expeditiously until the various hurdles have been got over. It is, however, stated that the project of Parrys to locate a large-sized fertiliser factory at Visakhapatnam will be pushed through and that the American collaborators have been persuaded to implement this project.

The moving finger writes

I HAVE just returned from a brief visit to Madras (which incidentally explains why "Moving Finger" was missing last week), where the DMK is gloating over its victory in the Tiruvannamalai by-election for the State Assembly. Tiruvannamalai has always been a difficult proposition for the Congress. In the 1957 general elections, that party lost it to the DMK, which secured a majority of 14,000 votes. In the last general elections the Congress succeeded in reversing the verdict, but its majority was a meagre 2,000 votes. In the recent by-election, after the contest had been made a prestige issue by both sides, the DMK edged its way to victory by a majority of 1,500 votes. From the Congress point of view what gives significance to this result is that the Chief Minister, Mr. Kamaraj Nadar, had not only thrown the entire resources of his party into this battle of the ballot, but had himself taken a direct and personal part in the campaigning. Elsewhere Congress electoral reverses could have been attributed in part to schisms within the Pradesh Congress Parties or the poor level of State administrations. In Madras neither of these factors were present to help the Opposition. In the circumstances the adverse verdict of the Tiruvannamalai voters should certainly be taken as an expression of disillusion, if not discontent, with the Congress party over national issues.

By saying this I am not implying that the Tiruvannamalai vote is a vote for the DMK ideology of Dravidisthan or even that it is an anti-Hindi vote. I am even less sure that the feeling of dissatisfaction of those who voted against the Congress candidate in Tiruvannamalai had much to do with gold control or the Compulsory Deposit Scheme or the burden of taxation in general. What, I fear, is happening is that people in different parts of the country are gradually losing faith in the morals and manners of the Congress party as a national organization. Even apart from the glaring illustration which New Delhi has been providing from time to time of the Rajaji thesis that the Congress monopoly of power is corrupting public life and administration, large sections of the people are ceasing to look upon the Congress as a national institution, pure and perfect in its personnel or purposes and incapable of doing anything wrong or ignoble.

It is necessary that the Congress leadership should take note of this changing mood and sentiment of the people. Rajaji, through his incessant talk of quotas, permits and licences, has no doubt been responsible to a large extent for this disillusionment of the people with the Congress, but he could not have succeeded if erring Congressmen and groups had not so generously been providing him with evidence through their acts of commission and omission. But while the success of the Rajaji propaganda may have meant a loss to the Congress it does not seem to be bringing any gain to the Swatantra party. This is because Swatantra lacks the organisation needed to build it into a real challenge to the ruling party on the national front or even in individual States. Hence it is that the chief beneficiaries of the Rajaji line are third party Opposition groups which happen to be better organised. In Madras, the DMK is clearly benefiting as much from the Swatantra denigration of the Congress as from its own direct efforts against the ruling party.

This brings me to the very pertinent point which the Prime Minister made at his last press conference when he said that in most cases the elections were decided by better

organisation. The question now is what the Congress is going to do to improve its organisation. There is little doubt that in the last 15 years the organisational obligations of the party had been sadly neglected. The abler, even if not the better men, had all been attracted to what is called the legislative wing with its pretty feathers of pelf, power and patronage. The damage can be made good only by a deliberate movement of Congressmen of quality back into the organisational echelons of the party. This is the basic problem of the Congress which has been there for some time and has now been highlighted by the recent electoral reverses. The difficulty is that no Congress leader, not excluding Mr. Nehru, is prepared to face this problem squarely since the solution will so clearly demand a reorientation of personal preferences which none of them seems prepared to contemplate.

★★

I am really glad that before Prof. Galbraith left Roosevelt House, he had at least been able to see agreement reached on US collaboration with the Tarapore Nuclear Power Station Project. It is no secret that he had set his heart on the finalisation of American assistance to Bokaro during his tenure as Ambassador. It must have disheartened him not a little that this particular scheme is still in a talking stage, with Washington insisting on a second raw material survey which, as Prof. Galbraith has clearly stated on more than one occasion, cannot by any means be regarded as a necessary condition for an initial American commitment on aid. It is interesting to recall that on a recent occasion when Prof. Galbraith was talking informally to a few journalists in the Capital, he tried to hide his unhappiness over Bokaro by suggesting that, while a steel plant, however important in itself, could not be regarded as being of revolutionary significance in the technological sense, the Tarapore Nuclear Power Station which the United States would soon be helping India build would certainly be an outstanding instance of the importation of the most modern development in science and technology into the Indian economy.

★★

Last Sunday in the Capital the Chief Justice of India inaugurated a newly floated "Chit Fund" company, and the Union Minister for Transport and Communications presided over the function. The presence of Mr. Jagjivan Ram on an occasion of this kind is perhaps more easily understood than that of the Chief Justice of India. Politicians have to keep themselves in the public eye and not all of them are always in a position to pick and choose among the opportunities available to them for the purpose. Members of the Judiciary, however, are in quite a different position. They need not of course isolate themselves in ivory towers and they, like the rest of us, are certainly entitled to participate in the social and cultural activities of the communities in which they live. At the same time, I do not see much point in the Chief Justice of India inaugurating a Chit Fund.

Incidentally, Chit Funds are a recent institution in the Capital (and indeed in Northern India) and there has been some talk in the Union Finance Ministry and elsewhere that their functioning should be regulated in the interest of the public. No step, legislative or other, however, seems to have been taken so far, although in its original home States in the South, the institution of the Chit Fund is being required to work subject to certain safeguards for chit holders.

V.B.

Trade Winds

ADVISORY COUNCIL FOR INDUSTRIES

THE CENTRAL Advisory Council of Industries has been reconstituted with the Minister of Commerce and Industry as Chairman and 25 members representing industrial owners, employees, consumers and producers. The new Council will function for two years. The owners' interests are represented by Mr. Bharat Ram, President Federation of Indian Chambers of Commerce and Industry; Mr. A. R. Foster, President, Associated Chambers of Commerce of India; Mr. J. R. D. Tata, Bombay; Mr. K. K. Birla, Calcutta; Mr. Keshub Mahindra, Bombay; Mr. Arvind N. Mafatlal, Bombay; Mr. S. L. Kirloskar, Poona; Mr. T. S. Krishna, Madurai; Mr. B. V. D. Menon, Kalamasseri, Kerala; Mr. Neville N. Wadia, Bombay; Mr. Abhijit Sen, Calcutta; Mr. V. S. Kudva, Mangalore; Mr. K. C. Maitra, Bombay; Mr. N. M. Wagle, Bombay; Mr. J. V. Jardine Paterson, Chairman, Indian Jute Mills Association, Calcutta; and Mr. N. B. Prasad, Secunderabad.

Mr. S. R. Vasavada, General Secretary, INTUC; Mr. Michael John, Vice-President, INTUC; Mr. Manohar Kotwal, General Secretary, Hind Mazdoor Sabha and Mr. K. G. Srivastava, Secretary, All India Trade Union Congress, represent employees. Mr. M. P. Bhargava, M.P., Agra; Mrs. Raksha Saran, New Delhi; and Mr. P. R. Ramakrishnan, M.P., Madras are the representatives of consumers and Dr. A. Ramaswamy Mudaliar and Mr. N. Mahalingam, Pollachi, represent producers.

U.S. GRANT FOR GRAIN STORAGE

The US Government has extended a grant of Rs. 1.8 crores to the Government of India from PL 480 rupee counterpart funds for the construction of 90 food grain storage godowns in different parts of the country. These godowns will have a total capacity of 1.8 million tons and are being financed entirely by the US. Last year the US Government granted Rs. 10.3 crores for this project. The third Plan calls for doubling the existing food grain storage capacity to five million tons. Adequate storage plays an important part in stabilising prices. It helps the consumer by making food available throughout the year and discourages hoarding by speculators. It prevents a sharp fall at harvest time and averts a steep rise at other periods.

A factor in the high productivity of US agriculture is the existence of plentiful storage capacity. The Government of India has attached importance to building up storage capacity in this country and has launched this large godown building project.

In addition to this rupee grant, the US has already financed the import of two silo-cum-elevators, 50 prefabricated godowns and equipment for experimenting with new techniques of food grain storage. The silos are located at Hapur, U.P. and Calcutta. The USAID Mission has also made available to the Government of India the services of a number of American technicians.

STANDARDISATION OF MACHINE TOOLS

To guide its technical committees and accelerate the pace of work relating to the standardisation of machine tools, the Indian Standards Institution obtained the services of Mr. F. Danek for two years under the United Nations Programme of Technical Assistance. During his stay Mr. Danek assisted

in the formulation of over 50 standards on machine tools and small tools. Some of his important recommendations relate to the setting up of standards units in factories, implementation of standards, production of standardised parts, obtaining the technical information, and training of standards engineers in particular branches.

It is expected that standardisation will help in exporting the machine tools as the standards which have been formulated by ISI have been prepared taking into consideration the practices prevailing in various countries.

PATENTS LAW AND D.I.R.

There seems to be a certain amount of misunderstanding about the purpose and effect of certain changes which have been made to the provisions of the Defence of India Rules in so far as they affect the Patents Law of the country. The Ministry of Commerce and Industry has indicated that the object of the powers taken under the Defence of India Rules is not to extinguish the existing patent rights or to make them usable with appropriate compensation, but merely to ensure that in an emergency there are no occasions for delay in production or scarcity supplies leading to exorbitant prices for essential items like drugs and medicines. So far, no such action has been taken under the Defence of India Rules in question. Similar emergency powers have been taken by different countries in times of war. The long-term policy regarding patents is a matter which is still under consideration and will be the subject matter of fresh regular legislation, it has also been considered advisable not to register under the existing law any fresh patents in the field of drugs and medicines. This is also secured by the amendments that have been promulgated to the Defence of India Rules.

LONG-TERM POWER PLAN

The Union Ministry of Irrigation and Power has drawn up a 15 year perspective plan for generating 22.74 m. KW. of hydro power and 13.8 m. KW. of thermal power including 9.81 m. KW. from coal and 4.68 m. KW. from nuclear sources at a cost of Rs. 1,800 crores. The proposal is for generating 5.90 m. KW. of hydro power by the end of fourth Plan, 7.55 million KW. by the end of fifth Plan and 9.29 million KW. by the close of the sixth Plan. Taking into account the magnitude of this programme a committee of the Central Water and Power Commission has come out with forceful arguments against any move to split the Irrigation and Power Ministry into two. Most of the projects, it is indicated, call for joint efforts of power and irrigation experts.

PARTICLE BOARDS FROM COCONUT HUSK

Investigations at the Central Building Research Institute, Roorkee, have shown that particle boards possessing attractive appearance, good strength and satisfactory resistance to decay and fire could be prepared at a low cost from the unfretted husks of mature coconuts. The boards are suitable for use as partitions, ceilings and cheap roofings in buildings. Husks for board manufacture could be collected in the same manner as for retting and coir manufacture. The proportion of synthetic resin binder required for their preparation is only 0.5 per cent compared to 6 to 10 per cent required in the conventional manufacturing process. The cost of production

of one sq. metre of board of density 640 kg./cum. and 1.9 cm. thickness is estimated to be Rs. 3.11 as against the wholesale price of Rs. 8.3 to Rs. 10.5 in U.K. India is one of the largest coconut growing countries with an annual production of about 3,000 million nuts. About half the quantity of husks obtained from these nuts is utilised by the coir industry while the other half does not find any industrial use at present. Even if only 10 per cent of the husk which is not being industrially utilised were to be converted into particle boards, the production would be about 3.7 million sq. m.

INDUSTRIAL FASTENERS' ASSOCIATION

The Screw Manufacturers Association and the Indian Bolt and Nut Manufacturers Association have been amalgamated to form a new association to be called the "Industrial Fasteners Association of India" at a joint special meeting of all the members of the two associations held recently in Calcutta. The main object of this association is to safeguard the interests of the manufacturers of the industrial fasteners and allied items in the country. The Industrial Fasteners Association of India is affiliated to the Engineering Association of India.

SPOILAGE IN CANNED PRODUCTS

The Central Food Technological Research Institute, Mysore, have investigated the types of spoilage of canned vegetables and fruits under conditions characteristic of India and suggested remedial measures. Hydrogen swell, the major cause of spoilage in fruits can be minimised by properly exhausting the cans and storing them at low temperature. In the case of canned vegetables and their products, spoilage was due to infection from cooling water, autosterilisation, heat resistant organisms and overfilling or incomplete exhausting of the cans; the relative incidence of the different types being 42.6, 29.8, 14.8 and 12.8 per cent respectively. Chlorination of cooling water, adequate processing of the vegetables, and complete exhausting of the cans are the corresponding preventive measures for different types of spoilage.

BHASKARPARA PROJECT

The National Coal Development Corporation has approved the plan for a colliery in Madhya Pradesh. It will be an underground mine at Bhaskarpara in Surguja District. The targeted output from the colliery is half-a-million tonnes per annum and the total reserve in the area has been estimated at over 31 million tons of Grade I coal. The project will involve a net capital outlay of a little over Rs. 2½ crores and is expected to yield a return of 11.4 per cent per annum.

Bhaskarpara adjoins the Kutkora project of the Corporation. A third project will, in all probability be coming up in this region shortly. A central washery is also likely to be set up here for beneficiating the coal produced in these collieries. Though no firm data about gassiness are available, all precautions have been taken which are usual in the case of gassy mines. Extraction of coal will be by the re-treating longwall method with caving, in view of the low thickness of the seams and non-availability of stowing materials. It is proposed to use coal-combines which will not be used also be completely mechanised — fast ploughs will be used as at the Corporation's Churcha project. The number of residential quarters for miners and others will exceed 1,100. Provision has also been made for an 11-bed hospital, pithead

bath, canteen and such other amenities as are usually provided in all Corporation's projects.

PUBLIC SECTOR CHIEFS' MEET

The conference of heads of public sector undertakings last week under the chairmanship of Mr. Gulzarilal Nanda, Minister for Planning, Labour and Employment, took a number of decisions relating to labour matters. It was decided that, as far as possible, disputes would be resolved by voluntary arbitration so that they may be settled quickly. Delays in settling such disputes would be avoided and letters and other references, in this connection would be replied to with minimum delay. By and large, there was no need to go to courts and engage lawyers for this purpose.

The conference went into details about the grievance procedure followed by various undertakings. It was felt that in some cases the procedure had taken a long time and the conference decided that every effort should be made to modify procedure in such a way as to cut out the delay. It was also decided that wherever a particular undertaking had no established grievance procedure, it should adopt one immediately. The chairman stressed that while the interests of the workers should be safeguarded as far as possible, the general tone of discipline in an undertaking should not be allowed to get undermined. Services of conciliation officers could be utilised as arbitrators to settle the problems quickly.

AGRICULTURE SHOW IN MOSCOW

The Indian exhibition which will open later this month in Moscow will have an agricultural section portraying the salient features of India's progress in the field of agriculture since Independence. The large number of agricultural crops which India is able to raise with the help of the varied agro-climatic conditions in the country and several farm products which have a demand in world markets will form an impressive part of the exhibition. Each of India's important crops and commodities like oilseeds, tobacco, sugarcane and sugar products, cotton, jute, spices, essential oils and fruits will be given sufficient space to enable visitors to get a clear idea of the wide variety of farm crops and products of India and the progress made in increasing agricultural production and development of quality products.

SOAP INDUSTRY'S PROBLEMS

Mr. P. N. Talukdar, President of the Indian Soap and Toiletries Makers' Association, made a pointed reference to the low utilised capacity in the organised sector of soap industry while addressing the annual general meeting of the association held recently. He indicated that even the current production is nearly 60 per cent of the installed capacity. The idle capacity, however, has tended to decrease over the last few years. It has declined from 57 per cent in 1951 to 50.5 per cent in 1955-56. But even the present idle capacity of nearly 42 per cent in 1962-63 is quite high. This wastage of capacity, he added, is not due to lack of demand for soap in the country. As a matter of fact, the third Plan target of 2,20,000 tons fixed for the organised sector in addition to the estimated production of 2,80,000 tons in the unorganised sector is considered quite modest. He pointed out that there are certain factors which impeded the growth of this industry and perhaps of largest consequence are the difficulties experienced in securing the necessary raw materials like copra, coconut oil, palm oil, mutton tallow or aromatic chemicals and essential oils. In addition to this the fiscal levies have further added to the costs.

Company Affairs

TELCO'S DEFENCE EFFORT

MR. J. R. D. TATA's survey of the progress and problems of the Tata Engineering and Locomotive Company Limited, in his statement to the shareholders for the year 1962-63, strikingly illustrates both the opportunities offered by the defence effort for speeding up the industrialisation of the country and the difficulties in terms of financial and physical resources which unfortunately, if unavoidably, seem to go hand in hand with those opportunities. Mr. Tata noted with satisfaction that the company was able to increase its turn-over by about five per cent over that of the previous year. It had also succeeded in extending the range of its products by establishing the production of excavators and diesel shunters. The detailed planning for the expansion of the automobile, foundry and forge divisions has also been completed. Of the company's expansion programme intended to double the output of Tata Mercedes-Benz vehicles from 12,000 to 24,000 per year, the Chairman gave interesting details. Thanks to the emergency, the original proposal for executing this expansion in two stages has been reviewed and at the Government's instance, the company is planning to speed up work on the second stage. Meanwhile arrangements for financing the first stage of expansion which would increase capacity to 18,000 units per year have been completed to the extent that the Agency for International Development has approved a loan of \$13.65 million (Rs. 6.5 crores), while the Government of India has agreed to release another sum of Rs. 1 crore of foreign exchange. The company is now submitting a second application to A.I.D. for another loan to cover the needs of the second stage of expansion. As for the rupee finance, Mr. Tata indicated that the Directors were considering the most appropriate method of raising the funds required.

All this is one side of the picture, and while it is good that the setting up of important engineering capacities has come to receive added attention in view of the emergency, it has also to be noted that, unless steps are taken simultaneously to engage available capacity fully, the benefits from expansion will remain largely unrealised both in terms of defence and development. From this point of view it is distressing to learn that the increase in output by the rate of about 20 per cent, which was achieved through additional shifts and overtime working introduced after the emergency could not be sustained for more than a few months as the Government failed to provide additional foreign exchange for the import of raw materials and components. While it is true that there is a foreign exchange shortage, there can be no denying the fact that the available resources could be utilised in terms of a more rational scheme of priorities. In this connection, Prof. Galbraith's friendly criticism of our planners that they seem to give equal importance to all projects needs to be listened to.

Mr. Tata quite frankly said that at the present rate of progress of the automobile industry, the commercial vehicle target of 60,000 vehicles by the end of the third Plan "will not be attained because there is just not enough capacity either with the main manufacturers or with the components industry". Thus goes overboard another important industrial ambition of the third Plan. Here is one more reason why Mr. Nanda should make up his mind to examine whether the present planning policies and attitudes do not have to be revised for the sake of better implementation of planned programmes.

Mr. Tata referred, among other things, to the fiscal policies both in terms of their general aspect of affecting investment and corporate activity and in terms of one of their particular consequences of discouraging the development of road transport by imposing onerous burdens on manufacturers,

operators and users of motor vehicles. It is to be hoped that, as the Finance Minister and other Ministers in charge of the economic Ministries come to realise more and more the crippling effects of the accumulating fiscal burdens on the economy, some effort will be made to rationalise taxation measures, not indeed as a favour to industry or commerce, but as a minimum measure of protecting the economic development of the country.

NEW INDIA ASSURANCE

Mr. A. D. Shroff, Chairman of the New India Assurance Company Ltd., told the shareholders at the annual meeting held recently that the company had suffered heavily from the crisis in the investment market. The appreciation on the company's investments amounted to Rs. 112 lakhs by the end of 1961, which dwindled to Rs. 49 lakhs by the end of 1962. The latest valuation shows a complete wiping out of all appreciation. He pointed out that the conditions in the investment market during the past eight months have been showing increasing crisis of confidence. There has nearly been a catastrophic fall in prices of shares irrespective of merits and investments over a large field have practically become frozen. He deplored the setback and indicated that there were various factors responsible for this trend. The introduction of super profits tax, he added, was perhaps the principal reason. The acute stringency of money and the lower pace of growth of additional banking facilities aggravated the crisis. Other measures taken by the Government, however, desirable in their objectives like the Gold Control Order and the introduction of Compulsory Deposit Scheme, tended to create a weakened credit structure in the country. Mr. Shroff added that the New India Assurance Company had continued to play its due role of investment in the floatation of new sound enterprises. Even in the present crisis the company has continued to extend its co-operation and support to a large number of units through investment.

JAY SHREE TEA

The Board of Directors of Jay Shree Tea and Industries Ltd., has finalised the basis of allotment of shares in respect of the recent issue of 24,800 redeemable cumulative preference shares (9.3 per cent) of Rs. 100 each. Applicants who have desired to have five to 125 shares will get the full number of shares applied for; for 105 to 125 shares — 100; for 150 to 205 — 120; for 250 to 300 shares — 100; shares — 160; for 400 shares — 150; for 350 shares — 180; for 500 shares — 200; for 1,000 shares — 250; for 1,250 shares — 300; for 2,000 shares — 400; for 2,500 shares — 500; and for 5,000 shares — 1,000. For the allotment of 24,800 shares applications received were 806 for 45,590 shares.

The company has now applied to the Controller of Capital Issues for consent to issue bonus shares to the existing shareholders in the proportion of one bonus share for every four existing shares. It is proposed to capitalise Rs. 22 lakhs from reserve.

HIND CYCLES

The Hind Cycles Ltd. has completed the production of two million bicycles. The company's factory at Worli, Bombay, went into production in 1941 and today it produces 550 units a day. Some 200 components go into the manufacture of bicycles and this factory is perhaps the only one in the country where all the components are produced under one roof out of indigenous material and under entirely Indian skill. The company has been exporting bicycles in large numbers to neighbouring countries like Iran and Iraq. The export target

The State Bank of India, through its many branches, is ready to offer help and advice to small industrialists in need of a loan. Please call on the Agent of the branch in your town for full particulars.

fixed by the Ministry of International Trade is 50,000 units in which all the manufacturers participate. A scheme of subsidy has been devised by the manufacturers so that Indian bicycles can compete effectively in the foreign markets. The domestic demand as assessed by the Planning Commission is 1.3 million units, but actually the demand is considerably more than the supply. The diversification and expansion scheme of the company envisages scooter manufacture and assistance to defence efforts by producing some defence items as well.

TATA IRON

The Directors of the Tata Iron and Steel Company Ltd. have announced a higher dividend of Rs. 11 per share (gross) for the year ended March 31, 1963, against Rs. 10.36 per share (gross) paid last year. This higher payment is in line with the profits of the year which have risen from Rs. 19.24 crores to Rs. 22.21 crores. The directors have provided for depreciation at the rate of five per cent on the original cost which amounts to Rs. 7.70 crores. The additional provision to make up the total amount admissible under the Income Tax Act amounts to Rs. 3.95 crores, and the provision for development rebate reserve is Rs. 8.70 crores. The provision for taxation is Rs. 8 lakhs. The directors have transferred a sum of Rs. 126 lakhs from general reserve No. 2 and Rs. 258.30 lakhs from general reserve No. 1. The proposed dividend including the preference dividend will absorb Rs. 488.56 lakhs. The turn-over for the year has also increased from Rs. 86.25 crores to Rs. 99.53 crores.

MADRAS MOTORS & GENL. INSURANCE

During the year ended December 31, 1962, the Madras Motors & General Insurance Co. Ltd. recorded a profit of Rs. 10.95 lakhs. A sum of Rs. 4.50 lakhs has been separated towards the general reserve. The directors have proposed the payment of dividend at the rate of 18.5 per cent (subject to taxation) which will absorb Rs. 5.55 lakhs. The company during the year has written a premium of Rs. 71.39 lakhs as against Rs. 59.28 lakhs last year. The claims paid and outstanding amounted to Rs. 27.35 lakhs against Rs. 18.99 lakhs. Motor claims continued to be unfavourable. Due to increase in the price of motor-vehicle components and high labour charges, repair bills are rising sharply. Many State Governments have appointed Claim Tribunals for settlement of third party claims and it has been experienced that the compensation awarded by them is very liberal. The Chairman has, therefore, pointed out that generally the cost of the claims is going up steeply. The reserves for unexpired risks continued to be maintained at 50 per cent of the net premium and at the close of the year it stood around Rs. 31.08 lakhs as against Rs. 26.51 lakhs a year before.

Net premium in fire insurance amounted to Rs. 5.94 lakhs as against Rs. 2.78 lakhs last year. In case of marine insurance also the net premium was higher at Rs. 2.17 lakhs as against Rs. 1.31 lakhs a year before. The Chairman added that income from investment has not risen in the same manner as underwriting profits. In order to build up the investment income, in such a manner, the company is now investing in equity shares and preference shares of new floatation as well as established companies, which, in the opinion of the Directors, have growth potential.

GOOD YEAR'S PROBLEMS

The Directors of Good Year India Ltd. indicate in their annual review that sales of its products during 1962 showed a marginal decline of 2.6 per cent against those of the previous year due to the below-capacity production at their Balabgarh factory. The year's trading consequently resulted in a loss of over Rs. 57 lakhs. The Directors have recommended to pass the dividend this year. The Managing Director indicated that the chief problem that caused lower output in the

Balabgarh factory was the overall power shortage and the widely erratic nature of the power supply. The Directors, however, hope that through the efforts of the Punjab Electricity Supply Board the factory will be able to get sufficient continuous supply of electricity. During some months of 1963 the Balabgarh factory achieved the monthly rated capacity based on annual installed capacity of 210,000 tyres and tubes. The company has followed the policy of diversification and, therefore, apart from traditional lines of automotive accessories, industrial products, chemicals and adhesives, it is marketing a wide range of products manufactured to its specifications and designs by small scale industry ranging from items as simple as bells and locks for bicycles to precision products like dock fenders, water-stops and automotive batteries. In this sense it is furthering the interest of many small industries too. It was indicated that the proposal for expansion of the company is still under active consideration and sanction for the expansion has already been approved by the Central Government.

OIL INDIA

During 1962 Oil India Ltd. recorded lower sales of crude oil. The Chairman of the company indicated at the annual general meeting held recently that unit costs of production excluding drilling as well as development cost has improved to Rs. 8 per ton in 1962 as compared to Rs. 13 per ton in 1961. He added, however, that with the commissioning of the first stage of pipeline and creation of further assets in oil fields, the company has to make a much larger provision for depreciation as compared to the previous year. The Directors have recommended the final dividend of Rs. 90 per share for the year 1962. An interim dividend of Rs. 40 was declared and paid in December, 1962, and the remaining of Rs. 50 is being paid now. The dispute regarding royalty was settled with the Prime Minister's Award last November which fixed it at a rate of Rs. 7.50 per ton and Oil India is paying royalty on this basis. It obtained a prospecting licence for 1,290 sq. miles in area "A". Another application for exploration licence of 595 sq. miles is now pending with the Government. Last year 25 wells were drilled of which 19 were oil producers, two dry and four await further testing. During the year the crude conditioning plant in Nahorkatiya was completed which is the first one of its kind in any part of the world. The plant had been brought into commission from February 1963. The company floated Rs. 30 crore debenture issues to finance the rupee cost of the pipeline.

SHAMSHER STERLING CABLE

The Shamsher Sterling Cable Corporation Ltd., proposes to issue for public subscription capital of Rs. 35 lakhs which will raise its capital to Rs. 65 lakhs. The company plans to expand its plant for the manufacture of plastic coated and rubber coated wires. Showa Electric Wire & Cable Co. Ltd. jointly with Mitsui & Co. Ltd. of Japan will take up shares to the tune of Rs. 10 lakhs in the forthcoming issue. Shamsher Sterling Cable Corporation has been receiving technical assistance from Showa Electric Wire and Cable Co. Ltd., under a collaboration agreement signed in 1961. Under this agreement Showa Electric, one of the leading cable manufacturers in Japan, is to provide technical information in the nature of designs, engineering techniques, production processes, compositions, etc. and to arrange for the training of the company's technically qualified personnel at the factory in Japan. The scheduled investment by the Japanese firms will be made with the rupee fund which the former Mitsui & Co., (the predecessor of the present Mitsui & Co. Ltd.) has held in India as frozen assets.

HINDUSTAN TWYFORDS

Hindustan Twyford Ltd., which was officially opened by the Chief Minister of Punjab in March last, is gradually increasing production to attain its rated capacity. Mr. J. R. T.

Hay, Chairman of Twyford Ltd., the parent company in the U.K., in his annual statement to the shareholders circulated along with the report and accounts, has indicated that the company is expected to be operating profitably by the early autumn and to reach the full production early next year with a turnover of the order of Rs. 111.50 lakhs (£750,000). Twyford Ltd., London, holds 26 per cent interest in the equity capital of the Indian company.

CAPITAL ISSUES

Five out of seven companies which have been authorized to raise fresh capital will issue bonus shares. Out of the grand total of Rs. 99.05 lakhs for all the companies, Rs. 32.36 lakhs will be in bonus shares. The consent is valid for 12 months.

The New Shorrock Spg. and Mfg. Co. Ltd., Ahmedabad, will issue Rs. 14,10,625 capital. Of this, Rs. 14,01,625 will be in bonus shares and Rs. 5,000 in 40 equity shares of Rs. 125 each to be sold in the market at the best price obtainable.

Rohit Mills Ltd., Ahmedabad is to issue bonus capital of Rs. 5,85,000 on capitalization of the company's reserves to a like extent.

Steam & Mining Equipment (India) Private Ltd., Calcutta is to issue further capital of Rs. 5.50 lakhs, divided into 55,000 equity shares of Rs. 10 each, on capitalization of reserves to a like extent to be issued as fully paid up bonus shares.

Kumergode Estates Ltd., Mangalore is issuing further capital of Rs. 2 lakhs, divided into 1,00,000 ordinary shares of Rs. 2 each, on capitalization of its general reserves to a like extent, to be issued as bonus shares to the existing shareholders in the ratio of one such share for every two shares held.

Sree Saraswati Press Ltd., Calcutta is issuing further capital of Rs. 5 lakhs, divided into equity shares of Rs. 10 each, on capitalization of the company's reserves to a like extent, to be issued as bonus shares to the existing shareholders of the company in the proportion of one such share for every equity share held.

Guest, Keen, Williams Ltd. will issue 2,14,583 equity shares of Rs. 10 each at par. The shares will be issued to Tata Iron & Steel Company Ltd. in consideration of transfer by them of 15,606 fully paid up equity shares of Rs. 100 each held in Sankey Electrical Stampings Ltd.

Cooper Engineering Ltd., Bombay is raising further capital of Rs. 45.20 lakhs, divided in 45,200 equity shares of Rs. 100 each, for cash at par.

LICENCES ISSUED

The Union Ministry of Commerce and Industry has granted licences to the following firms under the Industries (Development and Regulation) Act, 1951 — during the week ending 6th July, 1963. The list contains the names and places of the licencees, articles of manufacture and annual installed capacity.

COAL

M/s. National Coal Development Corporation Limited, Dharbhanga House Ranchi (Proposed name: Sudamdih Colliery) (Dhanbad, Bihar) — Coal 2.16 million tonnes. Diamond Angarpathra Colliery Co., P.O. Katrasgarh, Distt. Dhanbad, Bihar (Dhanbad, Bihar) — Coal 13,000 tonnes. Bhowra Kankanee Collieries Ltd., 25, Brabourne Road, Calcutta-1 (Amlabad Colliery Distt. Dhanbad, Bihar) — Coal 60,000 tonnes. Shri Biswa Nath Agarwalla, M/s. Surindra East Loyabad Colliery Co., P.O. Kusunda, Distt. Dhanbad (P.O. Kusunda, Distt. Dhanbad, Bihar) — Coal 28,000 tons.

ELECTRICAL CABLES

Shamshir Sterling Cable Corporation Ltd., Vaswani Mansions, Dinsha Wacha Road, Bombay-1 (Maharashtra) — ACSR and AA Conductors — 2,400 tons (on two shifts).

CONVEYING EQUIPMENT

National Engineering Works, 25, Dalal Street, Fort, Bombay-1 (Maharashtra) — Conveyors — Rs. 12 lakhs E.O.T. Cranes 48 Nos. Chemical Vessels and Tanks 600 tons.

SCIENTIFIC INSTRUMENTS

Shri R. K. Singh, Engineer Manager, Govt. Precision Instruments, Factory, Lucknow (Lucknow, Uttar Pradesh) — Microscopes, Pathological Research and Special varieties like Binoculars etc. 1500 Nos., Stereo-Corneal, Workshop and Tool maker's microscopes 1,500 Nos.

COTTON TEXTILES

Deccan Co-operative Spg. Mills Ltd., Ichalkaranji Distt. Kolhapur (Maharashtra) — Cotton yarn 12,000 spindles. Vishnu Narayan Naik, Margoa, Goa; Proposed name: "The Goa Textile Mills" (Margoa, Goa) — Cotton yarn 12,000 spindles. M.M.A. Rasiwalla & Co., 17, Janjekar Street, Hus-sinbhai Building, Mandvi - Kaliwada, Bombay-3 (Gujarat) — Cotton ropes—1,80,000 Kgs., Threads—60,000 Kgs., Cotton and Nylon Fishing twines 3,60,000 Kgs. Jute ropes 21,000 Kgs. (on single shift). Bhalakia Mills Co. Ltd., Khokhra Mehmedabad Road, Ahmedabad-8 (Ahmedabad, Gujarat) — 1,760 spindles for the manufacture of cotton yarn. Mysore Spinning & Manufacturing Co. Ltd., 70, Forbes Street, Fort, Bombay-1 (Maharashtra) — 6,400 spindles for the manufacture of cotton yarn. Modern Mills Ltd., Temple Bar Building, 70, Forbes Street, Fort, Bombay-1 (Maharashtra) — 6,160 spindles for the manufacture of cotton yarn.

JUTE

Hooghly Mills Co. Ltd., Post Box No. 2280, 10, Clive Row, Calcutta-1 (West Bengal) — Wide Hessian (Carpet Backing Cloth) — 102 Broad looms for producing 10710 tonnes.

WOOLLEN TEXTILES

Raymond Woollen Mills Ltd., Pokharan Road, P.O. Jekegram, Thana, Maharashtra, Proposed name: "M/s. Baijnath Bankey Beharilal Woollen Mills," (Kanpur, Uttar Pradesh) — Woollen yarn — 12,000 lbs.

SYNTHETIC FIBRES

The Delhi Cloth and General Mills Co. Ltd., Bara Hindu Rao, Delhi-6, P.B. 1089 (Delhi) — Pure silk fabrics 20 power-ooms per day per shift. The Narasinha Mills (P) Ltd., Kannaipalayam, Suler P.O., Coimbatore-1 (Coimbatore, Madras) — Staple fibre yarn — 12,000 spindles after effecting expansion. The Suguna Mills (P) Ltd., Bashyakaralu Road, R.S. Puram P.O., Coimbatore-2 (Madras) — Staple fibre yarn — 12,000 spindles after effecting expansion. Essorpe Mills Private Ltd., Periaswamy Road, R.S. Puram, Coimbatore (Madras) — Staple fibre yarn 12,000 spindles after effecting expansion. Raja-lakshmi Mills Ltd., Singanallur Post, Coimbatore-5 (Coimbatore, Madras) — Staple fibre yarn — 12,000 spindles after effecting expansion.

MILK FOOD

Glaxo Laboratories (India) Private Ltd., Worli, Bombay-18 (Maharashtra) — Complian (special type of Milk Food) 120 m. tonnes.

CHANGES IN NAMES

(During the week ending 6th July, 1963).

From M/s. Freezing Products Private Ltd., Madras to M/s. Refrigerators and Home Appliances (Private) Ltd., Madras.

LICENCES REVOKED

(During the week ending 6th July, 1963).

M/s. Mithisons Private Ltd., Calcutta — Radiators for trucks and cars. M/s. Hind Laboratories Private Ltd., Ahmedabad — Classlined vessels for chemical and pharmaceutical industries. M/s. Carrier International Ltd., Bombay — Air-conditioning and refrigeration equipment. M/s. Pioneer dolites.

Dr. Rao on a Gift Horse

Foreign Aid and India's Economic Development: By Dr. V. K. R. V. Rao and Dr. Dharm Narain; Asia Publishing House, 1963; Pages 111; Price Rs. 12.

Reviewed by K. RANGACHARI

THE ROLE of foreign aid in India's development is a subject of great topical interest, particularly in view of the proposed inquiry into delays in utilization and other related aspects by a special committee set up by the Planning Commission. Except in official reports and in purely quantitative terms, no proper assessment has yet been made of the effectiveness of the use of aid under the five-year Plans. In a timely and useful introduction to the subject, prepared at the instance of UNESCO, the authors have tried to fill this gap. This study analyses the character and magnitude of aid, offers a glimpse into the procedures of the granting and receiving authorities and discusses some of the problems created for both parties. Private foreign investment does not fall within the scope of the study nor has an attempt been made to discover specific reasons for lags in utilization of foreign aid earmarked for projects. But the authors have drawn a number of conclusions—some of them of questionable validity—on future policy.

While it is true that any attempt to estimate the value of foreign aid will suffer from the limitations arising out of artificial exchange rates and price factors (especially when aid is tied to purchases in the donor country), the danger of overestimating the importance of aid in our economy may be much less than the authors assume. Their idea of disinterested foreign aid (which leads them to doubt the character of aid used as a means of trade promotion, or imposing repayment terms beyond the debtor country's visible capacity) seems too idealistic. So is their assumption of soundness of Indian planners' judgments on priorities, which they would dislike to see influenced by donor countries or financing institutions; the technique of "illuminating choices," which Mr Eugene Black regarded as integral to the diplomacy of aid, has not been given due place as the authors seemed to be more keen on proving that India has not been influenced in any way in her policies and that her efforts and performance have established the desire and determination to make the best use of aid resources. Safeguards desired by aiding countries are therefore regarded as a positive hindrance to the proper use of aid.

Not many intimately in touch with the formulation and implementation of our Plans will share this somewhat one-

sided and romantic view, which leads to the recommendation that the maximum of non-project aid, with liberty to use it for purchases anywhere, will maximise benefits. Even if it were wholly true, we are not prevented from appreciating the valid reasons for linking dollar aid with purchases from the U.S.A. (when that country has been losing its gold reserves rapidly) and for American insistence on Western Europe matching its aid contribution to developing countries, to make it share the burden when the dollar is weak and Europe has grown prosperous through Marshall aid. In a world in which creditor nations are still reluctant to play their part, it seems naive to recommend that by making aid fully convertible, the donor country will invariably benefit from the consequent expansion of world trade.

It is not easy to assess the social effects of foreign aid in the receiving country, though it is possible to point out examples of gross abuse by certain powerful ruling groups in some countries which have helped themselves to the benefits of aid and aggravated social inequalities. India is certainly not one of these; aid for the "infra-structure" projects and social services like health and education, food supply and other social services have widely spread the benefits of planning. That emphasis by aid-givers on private enterprise in the industrial sector may retard our social revolution is an unwarranted presumption; President Kennedy's aid policy, for example, has fully recognized the importance of reducing social and economic inequality.

Opinions will differ on the effects of the cold war and ideological rivalries on the volume of aid to developing countries, but the record is clear enough to prove that European and Japanese reconstruction was (and many will say the U.S.A. and the World Bank; the problem of large U.S. agricultural surpluses also emerged later when aid policy gathered momentum. There will be broad agreement with the authors' view that India has on the whole adopted the right attitude to both blocs and profited by the balance it provided to planning in both the public and private sectors. The blame for slow utilization should not be laid entirely on the terms of aid or on our overworked administrative machinery; political decisions involving the regional location of projects or their allotment to the public or private sector have been no less responsible. The study should stimulate interest in these and other detailed aspects on which a more objective view is possible.

Readers' Roundtable

WHERE THE FAULT LIES

Sir—Although the Supreme Court has ruled the price-page schedule measure as unconstitutional, the President of the Indian Language Newspaper Association has repeated his plea for introduction of a price-page schedule. The idea behind this proposal is to limit the size of big dailies, and thus divert the advertisement to language newspapers most of which are small in size and resources. This approach is hardly a healthy one even assuming that advertisers will readily divert their advertisements to smaller papers if the measure is implemented. In a visit to a number of newspaper offices in different parts of the country, I found that the real problem of language papers is one of organization. Of course, there are a few exceptions.

The editorial staff of these publications is too big. A large part of this is nothing but a translation bureau. The rest is engaged in writing editorials and articles on world

situation which has little local readership interest. The advertisement and business departments are ill organised. In one case, I found that the functions of an advertisement manager, news editor and chief reporter were all combined in one person! Little or no attempt is made to educate local industrial and business enterprises of the importance and use of advertising. It is interesting to note that papers which have striven in this direction are doing well.

Instead of attempting to bring down the well-organised papers through legislative coercion, the Indian Language Newspapers Association should concern itself immediately with infusing better business skills among its less healthy members. That way lies the prosperity of our small language papers which are bound to grow in importance in years to come with growth of literacy and of consumer goods industries whose mass markets will obviously lie with the readership of language papers. Bombay.

COMPANY MEETINGS

TATA ENGINEERING & LOCOMOTIVE CO. LTD.

STATEMENT OF THE CHAIRMAN, SHRI J. R. D. TATA

The following is the statement of Shri J. R. D. Tata, Chairman of the Tata Engineering & Locomotive Co. Ltd., for the year 1962-63.

The year under review was a somewhat disturbed one for your Company marred by shortages of materials and foreign exchange as well as the aftermath of the declaration of the National Emergency. But for the shortage of steel, particularly flat products and specials, the output would have been appreciably greater.

2. In spite of this shortage, your Company was able to increase its turnover by about 5 per cent over that of the previous year. The establishment of production of excavators and Diesel shunters has helped to diversify the range of products manufactured. The successful execution of these two projects as well as the completion of the detailed planning for the expansion of the Automobile, Foundry and Forge Divisions is a matter of satisfaction to your Directors as I am sure it will be to you.

PROFITS AND APPROPRIATIONS:

3. In spite of an increase of Rs. 2 crores in the year's turnover, the gross as well as the disposable profits are lower than those of the previous year. The reasons for this setback, which were beyond the Company's control, have been explained in the Directors' Report. I am sure the shareholders will approve of the action taken by the Directors in drawing a sum of Rs. 6 lakhs from General Reserve No. 1, in order to make it possible to maintain the dividend on ordinary shares at the same level as in the previous year. I trust, however, that shareholders will not interpret such action as any kind of commitment in regard to next year's profits or dividend. It would naturally be the wish of the Directors to maintain the present rate of dividend, and I hope that profits will in fact prove to be adequate for the purpose. At the same time, it must be borne in mind that we live and operate in difficult and uncertain times in which our own wishes and intentions are necessarily conditioned by circumstances and developments beyond our control. Much will depend, amongst other factors, on whether the Finance Minister will find it possible or be willing to repeal the super profits tax, and also on the level of production we are able to achieve in the current year. This itself will depend, to a large extent, on the availability of raw materials and foreign exchange. Notwithstanding the minor setback in profits in the past year and the difficulties and uncertainties which we may have to face in the current year, the fact remains that your Company's productive capacity and financial strength continue to grow and its prospects therefore continue to be bright.

EXPANSION PROGRAMME:

4. The shareholders are aware of the Company's expansion programme, referred to as the 'C' Programme, intended to double the output of Tata Mercedes-Benz vehicles from 12,000 to 24,000 per year. As I said in my statement last year, the Government of India desired, in view of the critical foreign exchange situation that this programme should be spread over two stages and that only the first stage—limited to an increase

in capacity to 18000 units per year—should be taken in hand for the present. Accordingly during the year under review, the Company submitted, with Government's approval, an application to the Agency for International Development for a loan of \$13.65 million (Rs. 6.5 crores) for implementing the first stage of expansion. This loan has been approved by A.I.D. and an Agreement has been executed. Government have also released to the Company, as agreed, a sum of Rs. 1 crore of foreign exchange from "free sources" for import of special items to be purchased from West Germany.

5. Since the advent of the National Emergency, and in view of the accelerated demand for our products for defence purposes, Government have now decided that the second stage of expansion should be implemented as soon as possible. We are accordingly submitting a second application to A.I.D. for a further loan to cover the foreign exchange requirements of the second stage.

6. The most appropriate method of securing the Rupee finance for the contemplated expansion is receiving the consideration of your Directors.

AUTOMOBILE DIVISION:

7. It is only in times of emergency such as the one we are now experiencing that the vital importance of an efficient and self-supporting automobile industry can be properly evaluated and appreciated. This emergency has also revealed weaknesses in the structure of the Indian automobile industry, particularly for meeting the requirements of the special types of vehicles needed for our Defence Services. There are reasons to believe that Government is now directing its attention towards eliminating some of these.

8. Immediately after the declaration of the Emergency, with a view to raising to the maximum the output of Tata Mercedes-Benz vehicles for the Army, additional shifts and overtime working were resorted to and the output was stepped up by as much as 20 per cent. Unfortunately, this high rate of output could not be sustained for more than a couple of months as Government could not provide the additional foreign exchange required for the import of raw materials and components.

9. The first stage of the expansion from 12,000 to 18,000 vehicles per year has been planned in such a manner that the additional output will be secured sometime towards the end of 1964. Deliveries of plant and equipment from the United States are reasonably short, varying from 9 to 12 months. As all the buildings and services will have been completed by then, the Company will be in a position to secure additional output no sooner this equipment is installed.

10. Commercial vehicles continue to be in short supply. The position has become particularly acute as a result of the diversion of a major portion of our output for Defence purposes. During the Company's financial year 1962-63, the

production of commercial vehicles in the country totalled 25,385, of which 12,200 or 48 per cent were Tata Mercedes-Benz. The commercial vehicle target for the third Plan has been set at 60,000 vehicles by 1965-66, but this, of course, will not be attained because there is just not enough capacity either with the main manufacturers or with the components' industry.

11. The Commercial Vehicles (Distribution and Sale) Control Order, which came into force in May, 1963, is evidence of the deteriorating position regarding the availability of commercial vehicles. The directions issued by the Controller of Commercial Vehicles result in 80 per cent of our output being reserved for priority allocation by Government. Whilst the preference of the Government authorities for Tata Mercedes-Benz vehicles is a matter of gratification, the reservation of these vehicles for non-Defence purposes not only operates unfairly on our dealer organisation, but is also likely to influence adversely our long-term market position. These facts have been brought to the attention of the authorities and we are hoping that suitable modifications to the Control Order will be issued before long.

12. Our dealers, whose reasonable expectations of continued supply of vehicles has been greatly and unexpectedly upset, have shown a great deal of patience and loyalty to the Company. During the past several years, a first class sales and service organisation has been set up, the successful functioning of which depends on a steady supply of vehicles and spare parts. Not only has the vehicle supply to our dealers dwindled to a mere trickle, but the spare parts position also is becoming critical due to a decision of Government not to grant import licences to manufacturers even for such items which are not currently being produced in the country by component manufacturers.

13. The growth of the road transport industry has always had to contend with high taxes and duties, multiplicity of regulations and inadequacy of good roads. At present the magnitude of the tax burden on road transport is so great that a recent estimate made by the Indian Road Transport Development Association reveals that taxes and duties on goods transport average 6 Naye Paise per ton-mile or approximately equal to the average freight per ton-mile charged by the Railways. This industry whose growth is vital for the development of our nation will now suffer additionally from the non-availability of vehicles. The inescapable conclusion is that the vital importance of encouraging the vigorous growth of the automobile and road transport industries has yet to be appreciated by our Planners and Government. If there is any appreciation, it has certainly not been translated into any effective action up to now.

GENERAL ENGINEERING AND FOUNDRIES DIVISION:

14. The release of production facilities as a result of the planned reduction in steam locomotive output has made possible a worthwhile increase in the turnover of the General Engineering Division, the performance of which would have been very much better if operations had not been plagued by several handicaps which appear to have become an inherent part of the Indian engineering industry. Though our excavators, shunters and paper and pulp making machinery contribute significantly to the country's development and save a great deal of foreign exchange, the actual position is that engineering companies such as ours are unable to obtain any assurance of supplies of steel in adequate quantities and of the required types; numerous orders for steel placed over the past couple of years remain outstanding without even an

indication of when we may expect deliveries. It has to be appreciated by the controlling authorities that for the effective utilisation of high grade engineering capacity put up at considerable cost by companies such as ours, it is vital that the flow of materials through the shops be planned in detail and long in advance of actual operations. The uncertainties created by material shortages result in the processing of uneconomic batches, frequent setting, low labour productivity and lock up of funds in works-in-progress. Such inefficient operations inevitably raise our costs and lead to a wastage of production facilities, which is as undesirable as idle plant and equipment, even though this may not be equally evident.

15. Discussions are in progress with Government regarding the continuance of manufacture of steam locomotives after the current order for 325 units which will be completed during the latter half of 1966. We have brought to the notice of the Railway Board that the new projects which we have undertaken are very high up on the list of foreign exchange savers and the increase in their output and the rapid growth in their indigenous content is dependent on the availability of the skilled men and machines to be progressively released by the reduction in locomotive production. We have drawn their attention to the fact that further large-scale investment by the Railways in obsolete motive power such as the steam locomotive, which in any case will have to be prematurely retired, is not calculated to solve the nation's transport problem. We are pursuing this matter with Government.

16. In Jamshedpur, as in most of India, industrial production has been hampered by power shortages. The Company's Foundries Division has been particularly affected; frequent furnace shut downs due to power cuts have limited the tonnage of both the foundries to about the same levels as during the previous year. It is to be hoped that the additional power to be generated by a number of Government projects in eastern India will become available according to schedule so that the crippling effects of such shortages on industrial production can be avoided.

17. The installation in the Alloy Iron Foundry of the new equipment ordered from the U.S.A. under the A.I.D. loan will greatly increase its capacity and further improve its efficiency. Some of the latest techniques and processes of foundry practice are being introduced and it is confidently expected that the performance and quality of the foundry products will compare favourably with those of automobile foundries in other parts of the world.

NEW PROJECTS:

18. The execution of the projects undertaken recently and the implementation of our expansion programmes have fully extended our financial and managerial resources. Your Directors, therefore, consider as inadvisable at this stage any which we are fully committed. An exception has, however, been made in regard to a plant which we propose to set up production of press tools, dies and production devices needed in increasing quantities by the repetitive engineering industry. Such an operation apart from saving and earning foreign assets — the skills and techniques required for designing and producing various types of production devices. This is a specialised field in which a beginning has scarcely been made in India, but one which forms an essential element in the country's engineering industry.

19. The Government of India have granted to the Company a licence to establish such a plant. Though the location

of the project has not yet been finalised, negotiations are in progress for securing suitable land in the Poona region.

LABOUR AND PERSONNEL:

20. During the past years I have referred to one of our most important though intangible assets — our engineers, administrators and craftsmen. The attention that we have paid to the training and development of our personnel resources constitutes the principal assurance of our future vigorous growth. We have now over 700 persons on the Company's rolls who have obtained one or more University degree in a wide range of technical, commercial and other subjects. The number of our engineering graduates exceeds 400, apart from over 1,300 employees who hold engineering or technical diplomas and certificates. These constitute an asset that we must maintain and develop with as much care as we devote to our plant and equipment. It will continue to be the Company's policy to provide adequate compensation to its employees and to keep the avenues of promotion open for those who prove their ability to undertake greater responsibilities.

21. Our growth and expansion will continue to demand an increasing number of skilled and qualified personnel. The pool of trained and experienced men in the country is strictly limited and in view of our increased demand we shall need to establish in due course additional facilities for their

training and development. Towards the end of the year under review there were under training at the Telco Works 473 trade apprentices and 125 graduate engineers and supervisors.

22. The labour situation at the Works continues to be satisfactory. There were no strikes and other disturbances to production during the year under review, although during May this year there was a stoppage of work in the Rear Axle Section of the Automobile Division resulting in a loss of 13,901 man-hours.

23. Your Company is taking active steps to build up a co-operative relationship with the recognised Union so that the productivity of our labour can increase and emoluments and conditions of work improve.

24. In conclusion, on behalf of the Directors and on your behalf, I would like to express my thanks to the Company's workers and staff for the results achieved during the year in the face of so many difficulties, only some of which I have mentioned.

J. R. D. TATA
Chairman.

Bombay, 5th July, 1963

THE NEW INDIA ASSURANCE COMPANY LTD.

Mr. A. D. Shroff Exhorts all Insurers to Co-operate

Summary of Chairman's Speech

Addressing the shareholders of the New India Assurance Co., Ltd., at the 44th Annual General Meeting, on Wednesday, the 10th July, 1963, the Chairman, Mr. A. D. Shroff, expressed satisfaction at the better standards of conduct and understanding achieved in the General Insurance Industry in India due to the efforts of the Executive Committee of the General Insurance Council and increasing measure of co-operation amongst general insurers. He once again appealed to all Insurers, Indian and non-Indian, to pool their resources to make the Industry a strong and viable sector of the national economy.

TAX BURDEN

Alluding to the crisis of confidence prevailing in Stock Exchanges in India, he referred to the heavy tax burden imposed by the Government, particularly the Super Profits Tax, and said that fears expressed by a number of experienced businessmen and industrialists at the time the proposal for the Super Profits Tax was made are unfortunately being completely confirmed by the behaviour of the new capital issue markets in India and reduction in Dividends declared by a number of Companies. He added that unless this ill-conceived new tax was abolished, there would be a serious retardation in the industrial development of the country.

DAMAGE TO SAVINGS

He further stated that Government's measures, including Gold Control Order and the Compulsory Deposit Scheme, have tended to create a sort of natural resistance and negative psychology as also to weaken the process of capital formation, and to undermine the credit structure in the country. According to him, common sense understanding of human psychology suggested that the habits of thrift and saving cannot be fostered by measures of compulsion. Such measures of compulsion invariably invite resistance. He felt that the most effective mobilisation of people's savings could only be achieved through hard selling of the concept of savings.

APPEAL TO L.I.C.

In this context he stated that the Life Insurance Corporation of India must adopt unorthodox measures to make a much larger contribution to national savings than it was doing at present. As regards the Unit Trusts, he opined that a Unit Trust, as a public sector monopoly, would not serve a real purpose.

NOTE: This does not purport to be a record of the proceedings of the Meeting.

RECORDS AND STATISTICS**Export Performance in 1962-63**

INDIA'S exports totalled Rs. 693.7 crores in 1962-63 as compared to Rs. 660.3 crores in 1961-62, recording an increase of Rs. 33.4 crores. This is the highest rise in exports recorded during any single year. The revised targets for exports during 1962-63 were Rs. 700 crores (Rs. 720 crores including exports from Goa). Compared to this target, the shortfall is about Rs. 6 crores. The target for exports for 1963-64 however has been set at Rs. 745 crores.

An important feature about India's exports during 1962-63 has been that the increase in exports compared to any of the previous years was due to an increase in the quantum of exports of practically all the commodities rather than to an increase in the price of any of the major commodities. This is all the more significant because commodity prices are falling in the international market.

India's exports, commodity-wise and country-wise are presented in the following tables. It will be seen that the traditional commodities on the whole had given a good account of themselves. Substantial increases were recorded in jute manufactures (Rs. 11 crores), tea (Rs. 7 crores), tobacco (Rs. 4 crores), sugar (Rs. 2.5 crores) and raw hides and skins (Rs. 2.6 crores). The poor performers had been cotton textiles, leather, manganese ore, raw cotton and waste, raw wool, ferro-manganese, iron and steel and steel scrap, while the other items had shown more or less an even trend.

Increased Export to U.K.

As regards direction of trade, India's exports to the U.K. increased from Rs. 161 crores in 1961-62 to Rs. 164 crores in 1962-63, thereby recording an increase by about Rs. 3 crores. There had been increases in the exports of tea, oil cakes, shellac, groundnut, groundnut oil, jute cloth and coir mats and matings. On the other hand, substantial declines were recorded in respect of cotton piecegoods, raw cotton, cotton waste, jute bags, mica, manganese ore, coffee and tobacco unmanufactured.

Exports to Western Europe (excluding the U.K.) recorded an improvement by over Rs. 4 crores. There was a decline in the exports to Western Germany by Rs. 4 crores, Belgium Rs. 1 crore and small declines in respect of Austria, Norway and Portugal though in all other West European countries there was some improvement. As far as the individual commodities are concerned there had been improvements in the exports of oil cakes (+Rs. 203 lakhs), tea (+Rs. 110 lakhs), jute bags (+Rs. 74 lakhs), rose wood (+Rs. 59 lakhs) groundnut oil (+Rs. 25 lakhs) and cotton waste (+Rs. 5 lakhs) but these increases were not sufficient to compensate for the loss in regard to the decline in exports of coffee (—Rs. 270 lakhs), leather (—Rs. 213 lakhs), manganese ore (—Rs. 126 lakhs), jute cloth (—Rs. 65 lakhs) and essential oils (—Rs. 10 lakhs).

Exports to Americas increased from Rs. 150 crores to Rs. 160 crores mainly because of increased exports to Canada and Argentina. There was a general increase in the export to these countries and exports would have been still higher but for the decline in the export of ferro-manganese and jute bags to the U.S.A. Exports to the U.S.A. in particular recorded substantial increases in respect of cotton piecegoods

(handloom fabrics), mica, vegetable oils, jute cloth and fish and fish preparations.

Exports to the East European countries increased from Rs. 58 crores in 1961-62 to Rs. 82 crores in 1962-63. There was an increase in the exports to all individual countries, the most significant increase being in respect of Poland wherein exports increased from Rs. 4.5 crores in 1961-62 to Rs. 11.7 crores in 1962-63. Exports to U.S.S.R. increased from Rs. 32 crores to Rs. 39 crores. There were increases in the export of coffee, tea, tobacco (unmanufactured) and raw hides and skins to the U.S.S.R. However, moderate declines were recorded in respect of pepper, jute bags, and lac. Exports of iron ore and manganese ore to Poland increased from Rs. 61 lakhs to Rs. 111 lakhs and from Rs. 22 lakhs to Rs. 34 lakhs respectively. Export of oil cakes to Czechoslovakia also recorded very substantial rise from Rs. 9 lakhs to Rs. 131 lakhs. The other commodities recording increases are manganese ore, hides and skins (tanned or dressed), castor oil, coir fibre and yarn and mica. There was, however, sharp decline in the export of coffee, gunny cloth and groundnuts.

Import Restrictions

Exports to Asia (excluding Japan) recorded a decline by about Rs. 3 crores i.e. from Rs. 96 crores to Rs. 93 crores. Among countries in Asia there was a decline in the export to Ceylon and Indonesia mainly because of the decline in the export of cotton textiles to these countries. The decline in the export of cotton piecegoods to Ceylon was due to import restrictions imposed by the Ceylonese Government because of the worsening of their balance of payments position. Exports to Afghanistan and Iran, however, recorded small increases.

Exports to Japan amounted to Rs. 34 crores in 1962-63 as compared to Rs. 40 crores in 1961-62 thereby recording a decline of Rs. 6 crores. The decline was due mainly to a sharp fall in the export of iron and steel scrap from Rs. 616 lakhs to Rs. 191 lakhs, pig iron from Rs. 107 lakhs to Rs. 27 lakhs and manganese ore from Rs. 291 lakhs to Rs. 145 lakhs. Decline in the export of scrap was partly due to export restrictions placed at our end and partly to the slackened demand from the Japanese steel industry. Similarly increase in domestic requirement of pig iron was to some extent responsible for decline in export of this item to Japan. Among other items there was a sharp decline in the export of cotton waste from Rs. 204 lakhs to Rs. 75 lakhs. There was, however, some improvement in the export of iron ore, mica and leather manufactures.

Exports to Africa decreased from Rs. 56 crores to Rs. 50 crores during the year under review. The decrease was in respect of most of the countries in Africa. Exports to some of these countries came down because of less offtake of Indian cotton fabrics there. Exports to Egypt, however, recorded a small increase. There was improvement in respect of jute sackings bags and spices, while exports of jute hessian bags and hessian cloth recorded declines. There were declines in the export of cotton piecegoods and jute manufactures to Kenya. A small increase, however, was recorded in the exports of blankets, rugs and art silk piecegoods.

COMPOSITION OF INDIA'S EXPORTS

Commodity.	(Value in Rs. Lakhs)

Companies at Work During 1962-63

A STUDY has been made of the distribution of companies at work in the country according to the region in which their registered offices are situated. Of the total of 25,519 companies reported to be at work in all the four regions into which the Indian Union has been divided for the purpose of the administration of the Companies Act, 1956, the largest number of companies were at work in the Eastern region comprising the States of West Bengal, Bihar, Orissa, Assam, Manipur and Tripura, the number being 9,693.

These 9,693 companies at work in the Eastern region

constituted 38 per cent of the total number of companies at work in this country as on 31st March, 1963. It is worth mentioning that the Eastern region continued to be leading all the other three regions because of the State of West Bengal wherein alone there were 8,754 companies at work during 1962-63. The Eastern region was followed by the Western region in which were 6,374 companies at work on 31st March, 1963. These 6,374 companies accounted for 25 per cent of the total number of companies at work in the whole of India during the period under review. Of the other two regions 5,106 companies were at work in the Southern region

July 19, 1963

and 4,346 in the Northern region accounting for 20 per cent and 17 per cent respectively of the total companies at work in the Indian Union during the year ending 31st March, 1963. In terms of paid-up capital also the Eastern region surpassed all the other three regions in having the largest amount of paid-up capital i.e. Rs. 926.3 crores, of which one Government

company alone viz. Hindustan Steel Ltd., amounted for Rs. 350 crores. The paid-up capital position of the companies at work is Rs. 649.9 crores, Rs. 320.2 crores and Rs. 214.7 crores in the Western, Southern, and Northern regions respectively. The table below shows the number and paid-up capital of companies at work in the four regions during 1962-63.

REGION-WISE DISTRIBUTION OF COMPANIES AT WORK

The Case of the
Tactless Tarts

EXPLAINING HIS decision not to relinquish office when the storm over the Profumo affair was at its height, Britain's Prime Minister recently said that he was determined that no British Government should be brought down by the action of two tarts. We believe that tarts in the literal sense are unlikely to constitute a threat to the Government of Mr. Nehru, but a pair of tarts, using the term in a figurative sense, certainly seem to have brought into jeopardy the prestige and the good name at home and abroad of the Government of India.

The tactless action of the two Ministries of Information and Broadcasting and External Affairs in concluding a deal with the US Information Agency for a high-powered transmitter for All India Radio in exchange for broadcasting time for "Voice of America" programmes is certainly a case of bartering away principles for a mess of pottage. It is being argued that, in the interest of defence and national security, the Government of India urgently needs a high-powered transmitter in the eastern region to counter China's anti-Indian propaganda in South-East Asia. It has been further contended in defence of the transaction with the US Information Agency that this stroke of business has helped India to obtain a transmitter sooner and on easier terms than may otherwise be possible. Under the agreement now reached the transmitter would be ready and functioning within two years whereas, if India is to attempt to procure one as an ordinary commercial transaction, it may be five years before this custom-built facility could be constructed and commissioned. It has also been stated that we would now be paying only for the installation and that the equipment itself would cost us nothing, while a normal purchase would have cost us in foreign exchange many times the amount of Rs. one crore which we may be spending in terms of the agreement with the US Information Agency. All this may be true, but it may still be asked whether the Government of India should have sought to pay for these advantages by agreeing to VOA programmes being relayed through the transmitter.

The Voice of America is a US Government programme and it has a certain political history in the context of the global cold war between the Western democracies on the one hand and the Communist countries on the other. To allow this programme to be broadcast from Indian soil therefore has certain deep implications for our foreign policy and our relations with certain nations and governments with whom we are on friendly terms. Since, unfortunately, the Government of India, through maladroitness mismanagement, has not taken the elementary step in good public relations of releasing the full details of the agreement with the US Information Agency on an issue which, as could easily have been foreseen, was bound to become controversial and agitate the public mind, we do not know whether any understanding has been reached between the Governments of India and the United States on the precise nature and contents of the programmes which will be relayed under this arrangement. From such details as are available, however, it appears that the Government of India will have no voice or control over the material of the relayed broadcasts. All the information we have on this point is an extremely vague observation of the Deputy Minister for Information and Broadcasting that certain types of broadcasts to certain countries could not be made through the transmitter. It is necessary to know what precisely are the obligations which the Government of India has accepted under this provision and what the US Information Agency, on its part, has agreed to. Meanwhile, it has been mentioned that All India Radio cannot use the

July 26, 1963

transmitter for broadcasts in Bengali and Urdu. It has been suggested that this restriction is intended to ensure that the transmitter is not employed for Indian propaganda against Pakistan, but it is absurd to suggest that this or any other condition which Washington may prescribe is likely to forestall Pakistani protests against the transaction in the present mood of the Ayub regime.

There is in fact a need to question what precisely are the advantages to the Americans themselves of the terms which they have insisted on in this transaction. It cannot be said that Voice of America lacks relaying or transmitting facilities in the Pacific. It already has powerful broadcasting stations in this region. There is, therefore, no obvious reason why the US Information Agency should have held out for relaying facilities in the present case. The countering of Chinese Communist propaganda is as much the business and the concern of the United States as it is of this country and we are sure that American public opinion and the US Congress would have no difficulty at all in extending approval to the supply of the transmitter to AIR without the quid-pro-quo which is now being exacted. In fact, on any thoughtful view of the matter, the US Government as well as the Indian Government should be able to see that the effectiveness of counter-propaganda against the Chinese would have been far greater had there been no strings attached to the supply of the transmitter to India by the United States. It is clear that the status and the prestige this counter-propaganda may be expected to enjoy in the South-East Asian region will not be improved by any seeming compromise on the part of the Government of India over cold war issues. While

the Government of India's anxiety to secure this essential facility as early as possible is to be appreciated the conclusion is hard to resist that our diplomacy has failed to employ the arguments available to it to persuade the US Government to provide the transmitter on a more acceptable basis.

The contention that there was no alternative cannot stand examination. In our view we could have even explored the possibility of securing broadcasting facilities from VOA stations in the Pacific area for conducting our counter-propaganda against China. An arrangement of that kind would certainly be more acceptable than the present one. Whether the Government of India has already decided to seek a revision of the agreement or not, it is clear that it cannot ignore the fact that the implications of the transaction are certainly not very agreeable for this country. The U.S. Government too may not want to ignore the adverse reactions of public opinion in this country. In all its dealings in the sphere of economic and military assistance, the U.S. Government has always been guided by a desire to establish and promote enduring understanding, goodwill and friendship between the peoples of the two countries. In the process it has gifted away vast amounts of money and materials to the Government and people of this country. Viewed in this context, the cost of the transmitter is a mere bagatelle and we have no doubt at all that the leasing of the transmitter to the Government of India or even its outright sale or gift can and ought to be arranged by the U.S. Information Agency without creating for itself as well as others the kind of complications to which the present agreement must necessarily give rise.

Truce Under Strain

THE PLANNED publicity, systematically organized by the Central Ministry of Labour and Employment, on the eve of last week's annual session of the Indian Labour Conference, raised genuine hopes that the Conference would apply its collective resources to discussing fairly and frankly the problems which posed threats to industrial truce. But those hopes were not realised. The problems were discussed very broadly and issues raised by them were not probed into fearlessly to fix responsibility where it lay for the breaches of the truce. Managements in the public sector and labour had the best of the bargain, while employers in the private sector were made the target of sustained attacks, as if they were the sole villains of the piece. Price inflation has an immediate and intimate bearing on industrial peace. But the Conference adopted an innocuous recommendation on price increase and on remedies to prevent violations of the truce. So great was the anxiety shown by the Chairman, Mr. Gulzari Lal Nanda, in particular, to steer hurriedly through controversial questions that

this important session, scheduled to last for a bare two days, was cut short to the opening day.

Before the tripartite Indian Labour Conference was due to start, official conferences at the levels of the Secretaries to Labour Ministries at the Centre and in the States as well as at the Ministerial level, were convened, as usual, to take stock of the situation. These conferences need not be brushed aside as mere formalities, since they generally result in focussing attention on topics to which special attention should be devoted at the Tripartite Conference. Two issues figured prominently on the agenda—the breaches of the Industrial Truce Resolution and the threat which the shooting trends in the price level hold to the observance of industrial peace. It is now a matter of common knowledge that real concern is felt at the Government level over the disturbing rise in overall prices, in particular in the prices of essential goods which have a vital influence on the cost of living. Mr. Nanda once again

July 26, 1963

EASTERN ECONOMIST

149

made an exhibition of his lack of firmness in coming to grips with this baffling question of price increases. At his suggestion the Conference adopted the recommendation that fair price shops and consumers' co-operatives should be given free play to counter profiteering tendencies and, in the event of their ineffectiveness, physical controls should be attempted. To ensure prevention of lapses from the Industrial Truce Resolution, the Conference appointed a tripartite committee, under the chairmanship of Mr. Nanda, to follow the progress of industrial relations and to prevent interruptions to productive activity.

The main grievances regarding violations of the Industrial Truce Resolution revolved round the specific charge of the "intransigent" attitude of employers in the private sector. Speaker after speaker from the other two parties to the Conference indulged in extreme and one-sided criticism against the attitude of private managements. The gravamen of the charge was that private employers showed a deliberate attitude of defiance of the clause in the Truce Resolution, which called upon the parties to settle the dispute by voluntary arbitration wherever mutually agreed solutions could not be reached. It was alleged that in spite of several cases of dismissals, discharges, retrenchments, lay-off etc., employers in this sector were adamant in their refusal to abide by the voluntary arbitration clause.

Mr. Naval Tata put up a candid and convincing defence on behalf of the employers, but the logic of his clarifications and explanations appears to have gone unheeded. His main contention was that voluntary arbitration is not such a simple technique to be adopted in every single case as is uncritically assumed. There are positive difficulties and far-reaching implications of this technique which need to be given due thought. In particular he pointed out that arbitration must be binding on both the parties in an industrial establishment if it is to have any sense at all. This pre-supposes that the trade unions would bind themselves by the award of the arbitrator. But it is the bane of Indian trade unionism that a multiplicity of trade union organizations exists practically in all the industries and because of their allegiance to four different all-India apex organizations, there is a continuous and keen inter-union rivalry which is generally pushed to the point of jealousy to resort to all manner of practices. A settlement accepted by one trade union may, after some time, be upset by another trade union in a bid to tighten its hold on labour in that particular establishment. Mr. Tata made it absolutely clear that employers had no intention of making capital out of inter-union rivalries and jealousies; but if voluntary arbitration was to have any abiding effect, labour owed it to itself and to the nation's industrial economy to compose its differences at least during the period of the emergency.

It is significant that public sector managements,

when they were called upon to explain, at the Secretarial and Ministerial level deliberations, the reasons for their hesitation to resort to voluntary arbitration, emphasized this very central stumbling block of inter-union jealousies. In an apologetic tone they gave the assurance that they would try their best to make voluntary arbitration a more and more common way of settling industrial disputes. There were numerous instances of breaches or deviations from the Industrial Truce Resolution committed by managements in the public sector. But they were all bypassed during the discussions at the Indian Labour Conference. It must be recalled here that at the last annual session of the Indian National Trade Union Congress, the major target of attack was the attitude of public sector managements in encouraging and giving recognition to minority trade unions, in particular to the Communist-dominated All-India Trade Union Congress. Specific instances of deviations from the Truce Resolution were pointed out at this forum. When violations of the truce by public undertaking managements were thus brought to light, it was nothing short of discrimination to adopt a policy of hush-hush over their lapses and to hold private managements alone responsible for the breaches of the truce. A memorandum circulated at the Ministerial Conference makes clear mention of work stoppages and go-slow as among the major factors of the violation of the truce. But at the Labour Conference

Eastern Economist 20 Years Ago

JULY 23, 1943

The U.P. Government has in recent months exhibited its anti-inflationary zeal in a number of ways, and the "collective subscriptions" and the enhanced entertainment tax were the principal measures. A report today says that the U.P. Government has issued instructions that every zamindar should invest in defence loans an amount equal to at least half the total amount of land revenue he has to pay to Government. Subscription to the war loans implies the existence of a surplus and the high prices have certainly put the large landed zamindari class in possession of much money. But there is no reason why a Provincial Government should seek by isolated action to compel the investment of the funds in Government bonds. There seems no reason to fix 50 per cent of the land revenue as the amount of compulsory investment, because the surplus saving is not proportional to income, but dependent on the total commitments of the income-earner. Such isolated provincial action will create an undesirable disparity in the fiscal treatment of the zamindars in the different provinces, not to mention the overriding consideration that combating inflation is essentially a function to be tackled on an all-India scale by the Central Government. Something might, perhaps, be said for tapping the higher reaches of agricultural incomes for loans, just as the excess profits have been subjected to compulsory deposit. But it is part of the larger problem of bringing agricultural incomes within the purview of the financial system and cannot be taken up now. Meanwhile, such provincial measures of a compulsory character seem ill-advised.

this highly objectionable attitude of labour managed to escape attention.

It is a pity that the INTUC refrained from making any constructive contribution to the discussions at the Labour Conference. It is universal knowledge that Mr Nanda had to intervene personally to persuade the INTUC not to boycott last week's session of the Indian Labour Conference because of its demand for the exclusion of the AITUC for its attitude in regard to the emergency. So obsessed were all the spokesmen of the INTUC with the unpatriotic activities of the AITUC that they refused to see that measures to safeguard industrial peace and to contribute to the maximization of production were the overriding necessities of the times.

Press reports of the Conference make a passing reference to the fact that complaints against breaches of the Industrial Truce Resolution were examined. What particular points were brought to light by this examination and how responsibility was apportioned cannot be gathered from these reports. In the result, one has to remain content with the evidence of certain statistical estimates of interruptions of work. These estimates are contained in the memorandum prepared for the consideration of the Ministers and also circulated among the parties to the Conference. A broad classification of the types of disruption of work is important as suggesting whether liability for lapses from the truce can be foisted upon private employers who were undoubtedly held solely liable at the Conference. Among the causes leading to dislocation, an important one was the closure of the establishments. There were as many cases of retrenchment as 9,730 in the sphere of the Central Government, while the corresponding number in the sphere of the State Governments was 7,000. Then come two telling figures. In the Centre's sphere, cases of lay-off were as high as 25,000 and in the States' sphere they were still much higher at 42,000. Lay-off, it is safe to presume, was enforced on the managements because of shortage of imported materials, lack of power, transport and such other factors. It surpasses comprehension how responsibility can be attributed exclusively to the managements in a situation where the causes necessitating the lay-off were beyond their control in a majority of cases.

Rising price trends have their inevitable impact on workers' wages in real terms. It is but natural that they should cause not only concern but also discontent to the worker when he finds the purchasing power of his pay-packet declining with the progressive rise in prices of essential commodities. Theoretically, therefore, there was some force in Mr Dange's contention on behalf of the AITUC that compulsory savings are inconsistent with declining real wages. This proposition, however, would hold sound in normal conditions, but the extraordinary situation of the emergency demands special attitudes, forbearance and sacrifice. It need

not be supposed that the opposition of the AITUC (as also that of the Hind Mazdoor Sabha and the United Trade Union Congress) to the Compulsory Deposit Scheme is grounded on economic reasoning. In particular the AITUC has given ample proof that it is bent upon making political capital out of the enforcement of compulsory deposits to foment discontent among the workers. The AITUC has explicitly demanded the exclusion of Mr. Morarji Desai from the Central Cabinet in the expected reshuffle on the ground of his confirmed commitment to a policy of high taxation.

In one breath, Mr. Dange gave the assurance that industrial peace would be safeguarded by the AITUC, but in another breath he had no qualms of conscience to assert that if the Compulsory Deposit Scheme inflicted great hardship on workers and they went on strike, his organization would not let them down. He was impervious to the pleadings of Mr. Nanda and others that this particular grievance cannot be made a pre-condition to the observance of the Truce Resolution. It is pertinent to underscore the fact that out of six million workers in industrial establishments (other than the public sector establishments and private shops) only about 1.8 million come within the purview of the CDS. They invite the application of the scheme because of the relatively higher level of their wages. The grievance regarding the hardship of compulsory deposits is probably magnified. But even so, there is the assurance of Mr. Nanda that modifications may be considered and introduced in the application of the scheme to workers.

The entire position taken up by the AITUC, HMS and the UTUC against compulsory deposits runs counter to the spirit as well as the letter of the Industrial Truce Resolution. It is no argument at all to point out that the CDS does not form any part of the Truce Resolution. The plain truth is that the Industrial Truce Resolution was adopted by the three parties on November 3, 1963, whereas the CDS was announced long afterwards in the budget proposals on February 28, 1963. But there are positive and unequivocal obligations accepted by the parties in terms of the Truce Resolution. There are no conditions precedent and no reservations to be subsequently brought into play.

At the outset the Resolution declares that "*under no circumstances* should there be any interruption in or slowing down of production of goods and services." This commitment is unqualified and if the parties which have endorsed it have any sense of integrity, it is their bounden duty to carry it out without any reservations. It is a commitment which is accepted to meet the threat to the very freedom of the nation and to plead escape clauses is to betray lack of allegiance to the nation. The Truce Resolution makes a specific mention, in a subsequent context, to the necessity of maintaining the stability of prices. It stipulates that all efforts should be made to ensure that prices of industrial goods and essential commodities are not

allowed to rise. The one effective way to do this is to sustain and also to raise the levels of production. But price stability, in the exigency created by the emergency, cannot be made a pre-condition to the observance of industrial peace. Finally, this resolution places an obligation on workers to contribute their mite to the defence effort in the form of savings. It exhorts them,

Food Prices: Facts and Fancies

THERE CAN be no doubt that current difficulties in the food situation have been brought about by a sharp fall in internal production in the wake of two bad crop years which has greatly reduced the available supplies. It is a delusion to hold, as the otherwise realistic Union Minister for Food and Agriculture did the other day, that there was no justification for the recent rise in food prices, as domestic production of foodgrains amounted to some 96-97 per cent and the marginal shortage of only 3-4 per cent had been amply taken care of by P.L. 480 imports and commercial procurements. This contention is not correct, because all food-grain prices have not gone up. Wheat, for instance, is still available at reasonable prices and in adequate quantities. But the position as regards rice is deplorable. There has been a fall of as much as one million tons in rice production. Surely the P.L. 480 imports and commercial procurements of rice together have not been of such dimensions as to offset this sharp fall in production which, be it noted, is over and above the hardy annual of the 3-4 per cent marginal shortfall.

In order to appreciate how bad the rice situation has become, one must take a look at the plight of rice mills. Most of them are said to be working at only 30 to 40 per cent of their capacity, while some have actually closed down for want of stocks of paddy. Why is this happening? One explanation is that a substantial portion of the harvested crop is being withheld by producers with a view to reaping a handsome profit later on, when prices go up further. Now all producers in our country cannot afford to do this, if only because they grow hardly enough to meet their own requirements, for family consumption, seeds and exchange of commodities. Even the few big producers (such as our land reforms have left unscathed, if any) who may be guilty of hoarding may really not be having all the surplus they are alleged to be having, after making due allowance for their own requirements, especially after two bad harvests. Any attempt to force out these supposed hoarded stocks from these quarters may actually reduce the quantity ear-marked by them for seeds for the next sowing. Before resorting to this extreme measure, therefore, it is of the utmost importance to make sure that there are adequate stocks left with growers for purposes of seed.

What is inexplicable is the apparently leisurely

as a matter of imperative necessity, to contribute at least one day's earnings per month to the defence effort which comes, in the case of all the workers without exception, to about 3½ per cent of their wages. In the light of these solemn commitments, it does not lie open to the AITUC to hold a threat of unilateral withdrawal from the Resolution.

way in which the authorities have chosen to deal with the situation. It is not as though the shortage in foodgrains has descended on us all of a sudden. Even as early as in March last, symptoms of the developing crisis manifested themselves in West Bengal in the form of a firm trend in foodgrain (in particular, rice) prices. When the attention of the authorities was drawn to this disturbing trend, there were assurances from the highest in the land that this was but a passing phase and that all would soon be well. Unfortunately, the passing phase has proved anything but passing and, in the meantime, there has been a "passing" rise of over 59 per cent in prices of medium varieties of rice in West Bengal.

Explaining the rise in prices of rice in the country, Mr. Mahomed Hasham Premji, President of the All-India Foodgrain Dealers' Association, told the fifth convention of foodgrain dealers in New Delhi, a few days ago, that it was "mainly on account of the mis-conceived policy on the part of the authorities, both Central and State, of imposing increased rice levy in the States and building up buffer reserves of rice in the State and Central Government godowns, instead of diverting the procured rice stocks from the surplus to the deficit States." Specifically, he recalled that the Association had drawn the attention of the Government, as early as in January last, to the shortage of 2½ lakh tons of rice in the Eastern Rice Zone and of one lakh tons in the Western Rice Zone. These could easily have been met out of the surplus from the Northern and the Southern Zones, but, according to Mr Premji, this was not done. Instead, the Government clung to its stocks, which are today estimated at about 800,000 tons. How much of it has been damaged by weevil while in transit or storage is anybody's guess. Even when allotments were made, it is alleged, there were inordinate delays in the issue of permits, as, for example, when an allotment of 15,000 tons of Surti Kolan rice was made from Andhra Pradesh to Maharashtra and Gujarat. It is delays like these, coupled with prejudices, that give rise to avoidable restrictions in the form of unworkable rice zones and quite some unimaginative food laws and, not the least, the anomalous state of sales tax levies that have been the bane of our food distribution system all these days. The sooner that these are done away with, the better it will be for all concerned.

Highlights of the Week

MUCH ADO

THREE SHORT press communiques, issuing from Rashtrapati Bhavan on July 18, put an end, at least for the time being, to the private canvassing and the public speculation that have been going on for some time now with regard to the reshuffling of the Nehru team. The changes which the Prime Minister has been willing and able to make are few as well as relatively minor. The only new entrant is Dr K. L. Rao who replaces Mr O. V. Alagesan as Minister of State in charge of Irrigation and Power. Dr Rao's appointment is in the nature of a surprise but is not, for that reason, any the less welcome. He is an eminent engineer who had held high positions in Government and retired as Member (Designs and Research) of the Central Water and Power Commission. He contested the elections to the Lok Sabha in 1963 as a Congress candidate and was returned from the Vijayawada constituency of Andhra Pradesh. During the short time he has been a Member of Parliament, Dr Rao had spoken in the House on the subjects of irrigation and power with knowledge and effect. His career as a political administrator in a portfolio of which he has adequate technical information and expertise will be watched with interest.

Mr O. V. Alagesan leaves the Ministry of Irrigation and Power to take up the Ministry of Mines and Fuel as Minister of State in charge. Although his predecessor in the portfolio, Mr K. D. Malaviya, was a Minister of full Cabinet rank, it may not be correct to infer that the portfolio has now been downgraded. Mr Malaviya's elevation in the Cabinet hierarchy, when the Government was reconstituted after the last General elections, was more in the nature of a personal distinction and reward than anything else. His successor has no doubt been called to a delicate and difficult assignment which is not likely to be rendered easier by senior Ministers who, whether they have any regular responsibility or not in the area of Mr Alagesan's direct jurisdiction, may only be too ready to try to assist him by offering counsel on how he should deal with the many controversial issues which he has inherited as part of his legacy from Mr. K. D. Malaviya.

Tame Attempt

The third change in the Government is the departure of Mr K. C. Reddy, Minister for Commerce and Industry, who tendered his resignation for reasons of health. The Prime Minister has decided, at least for the present, not to fill this vacancy. Instead the Ministry of International Trade and the Ministry of Industry have been declared two separate and independent charges with Mr. Manubhai Shah being responsible for the former and Mr. Nityanand Kanungo for the latter and both continuing in their existing rank as Ministers of State.

The general impression given by the decisions of the Prime Minister is that, even if he had been willing to make more substantial changes in the composition of his team, he had not done so because it was not possible for him to find ways of reconciling conflicting demands among Ministers and would-be Ministers for portfolios or promotions. Reports had credited the Prime Minister with a desire to effect changes in the Ministries of Railways and Food and Agriculture. It is possible that he had in mind other changes too. If he has not been able, in the event, to effect them it is essentially because Mr. Nehru has never felt strongly enough about a rational ordering of personnel and portfolios and to resist the pressures or pleadings of scheming or reluctant colleagues in the Government or the party. In the wake of the Cabinet changes there is a feeling in some quarters

that this cannot be the end of the affair and that, whether he likes it or not, Mr Nehru will have to make more changes soon in order to clarify responsibilities and coordinate functions within the Government. Whether this prediction turns out to be true or not, it is obvious that there are quite a few loose ends left. It is significant that four economic Ministries and a somewhat larger number of economic subjects have been entrusted to the independent charge of junior Ministers, that is Ministers who are not full members of the Cabinet. If there is a method in this madness, it could be that scope has been deliberately created for the evolution of some kind of factual, if not formal, overlordship by a senior Minister or Ministers in these areas. This should mean that, even if the Prime Minister does not intend to make any further political changes in the composition of his Government in the near future, he may at least be making quite a few procedural ones. From this point of view such rearrangement of subjects and departments as may be made in the coming weeks will be watched with more than ordinary interest; in particular, it will be studied carefully how it is proposed to improve the effectiveness of the coordinating authority of Mr. T. T. Krishnamachari over defence production and economic development, or of Mr. S. K. Patil over governmental agencies and activities impinging on agricultural planning and production.

C.D.S. MODIFIED

THE FINANCE MINISTRY'S Press Note on the modification of the Compulsory Deposit (Employees) Scheme issued on July 17 makes further modifications in the C.D.S. in its application to industrial workers. It will be recalled that the income earning group with an annual income between Rs. 1,500 and above (but not subject to income-tax) was placed in a separate category in the case of those income earners engaged in undertakings to which the Employees Provident Fund Act, 1952, applies. In the case of this class or income earners, liable to make compulsory deposit, a comprehensive modification in the scheme was already introduced on the eve of the introduction of the C.D.S. The employer was placed under the obligation to make a single or collective deposit in the Deposit Office and the stipulation about every individual employee having to make a separate application for opening his account was dispensed with. However, accounts or the deposits would be maintained separately in the name of each single employee to facilitate repayment of deposits on maturity without the intervention of the employer. This facility would reduce delay in obtaining repayments. In case the actual annual salary or wages of the employee turn to be less than Rs. 1,500 in any year, the Press Note announces that refund would be made immediately after the close of the year with interest. Then there is a modified provision for determining the annual income from salary or wages for the specific purpose of applying the exemption of 11 per cent permissible under the scheme, wherever the income contains variable ingredients like the value of food concessions, dearness allowance, etc.

The major modification, however, brings a more far-reaching benefit to this class of employees than would appear from a superficial perusal of the Press Note. It is related to the determination of the conditions under which a cut in the salary or wages can be made by the employing establishment for the purpose of the deposit. The new provision stipulates that compulsory deposits should be applied to salary or wage earners of a minimum amount of Rs. 1,500 per year if, and only if, they were in continuous service of the same employer for a period of not less than 240 days, but

not otherwise. It seems clear that in the case of employees who had interrupted periods of service under different employers of less than 240 days, the attempt to recover deposits will be given up, since it will be extremely difficult in practice to determine in each case the actual aggregate income per year before July 1, 1963. This modification is introduced on the analogy of the provision in the Employees Provident Fund Scheme. Similarly, deposits will be made from the salary or wages of the workers subsequent to July 1, 1963, if they will be in continuous employment for a minimum period of 240 days under the same employer. This provision implies that the wage cuts on account of deposits after July 1, 1963, will be deferred for a period of 240 days. Will the entire amount due for the year be recovered from the wages in the remaining period of four months? Ostensibly, the employer will have no right to make the cuts in the wages for the first eight months. This creates a new problem of making accelerated deposits and it would call for a further modification of the scheme to spread the liability over a reasonably sufficient period. In the meantime, if the worker ceases to be employed in that particular establishment, the claim to the recovery of the deposit from him will very probably have to be abandoned.

SOUR SEVENTEENTH

THE SCOPE for mischief of the proposed amendment to the Constitution—the Seventeenth Amendment—is in inverse proportion to the length of the relevant bill. Obviously, the reason for the proposed amendment is to give fresh lease of life to certain agrarian laws passed by State Governments, some provisions of which were challenged and invalidated by both the Kerala High Court and the Supreme Court. The most controversial of these was, of course, the Communist Government-sponsored Kerala Agrarian Relations Act, and the Congress Government, which replaced the Communist Government in that State shortly after this legislation, gave a solemn assurance to the people of Kerala to amend this "mischievous legislation" of the Communist regime. It was expected that the Central Government would bear in mind this promise of the Kerala Congress Government whilst framing the proposed amendment. However, the form that the amendment has now taken goes much beyond this limited requirement and, in the process, seems to defeat the main purpose of the amendment. This is evident from the reported reactions of the Kerala Government and the 27-member Action Committee headed by Mr Mannath Padmanabhan, the well-known "Liberation Struggle" leader of Kerala.

While the Kerala Government is believed to have made it known to the Government of India that "it is more than enough if Article 31 (A) of the Constitution is changed as proposed in the amending bill," Mr. Padmanabhan is reported to have stated at a public meeting in Changanacherry on June 30 that "the State Government's promise to amend the 'mischievous legislation' of the former Communist regime would be frustrated by New Delhi's proposal to include it in the Ninth Schedule." Now, there was no suggestion at any time, whether by the public or by the State Governments concerned, that the legislative enactments listed in the Bill should be included in the Ninth Schedule, although, after seeing the proposal in the Bill, certain sections of the public in Kerala, mainly Communist-dominated bodies, have since begun to demand that this is the right thing to do and have been urging that State Government not to oppose their inclusion in the Ninth Schedule. Those who resist the inclusion do so for the reason that, once this is done, the parties affected by any of the legislative enactments listed will be deprived of their rights to move the courts. The State Governments concerned also object to this, because, if it is

done, their freedom to make changes in the enactments affected will be greatly curtailed. It is not known how many State Governments (besides the Kerala Government) have informed the Union Government of their opposition to the proposal, but there is reason to believe that most of them will do so, if they have not already done it.

But the Constitution (Seventh Amendment) Bill, 1963, does not stop there. It seeks to substitute the existing sub-clause (a) in clause (2) in Article 31A of the Constitution by another sub-clause which will alter beyond recognition the accepted meaning of the expression "Estate." As proposed, the term "Estate," in relation to a given area, will have the same meaning as that expression or its local equivalent has in the existing law relating to land tenures in force in that area and shall also include any 'jagir,' 'inam' or 'muafi' or other similar grant (including 'janmam' right in Kerala), any land held under 'ryotwari' settlement for agricultural and ancillary purposes, including waste land, forest land, pasture land and even sites of buildings and other structures occupied by cultivators, agricultural labourers and village artisans. This extension of the meaning of the term "Estate" is not as innocuous as it may seem; it may be said to deal a death blow to all landowners, including industrial undertakings owning farm lands in which they have made large investments in the form of buildings, etc.

DEFENDING THE DOLLAR

THE UNITED STATES Government announced last week a series of measures designed to relieve the pressures on the nation's balance of payments. The significance of these measures is that the U.S. Government is determined to maintain existing basic policies regarding the preservation of the present par value of the dollar and its interchangeability into gold at \$35 an ounce, the continuance of the broad programmes of U.S. military and economic assistance to allies and friendly nations and the pursuit of international agreements for the liberalisation of trade. These objectives have been clearly spelt out in President Kennedy's announcement of July 18.

Among the measures which have been announced to mitigate the strain on the U.S. balance of payments are the decision of the Federal Reserve Board to increase the discount rate from three per cent to 3½ per cent coupled with another decision to allow banks to pay up to 4 per cent interest on time deposits or certification of 90 days or more in amendment of the previous position in which the 4 per cent rate was permitted only on deposits of more than one year and a temporary "interest equalization tax" on foreign long-term borrowing in the United States which goes into effect immediately and will remain in force only up to the end of 1965. Mr Kennedy has also indicated economies in the Defence Department's military spending abroad and has disclosed that his Administration would be mounting a drive to persuade American tourists to see America now, by making travel at home a more appealing alternative to travel abroad. Simultaneously the President also announced that the United States intended to draw foreign currencies equivalent to \$500 million from the International Monetary Fund

While the common purpose of all these measures is to stem the flow of American gold abroad, the higher interest rates are intended specifically to hold within the United States itself such "floating" capital as is apt to go abroad in search of higher returns in short-term investment. Explaining the purpose of the "interest equalization tax", the President said:

"The outflow of long-term capital for portfolio investment has been, in 1963, at an annual rate of more than \$1.5 billion. Given both the existence of direct controls and the inadequate capital market mechanism in foreign countries,

the wide differentials in interest rates, the unacceptability to the U.S. under present circumstances of a substantial increase in the whole long-term interest rate structure and the fact that we cannot employ direct capital controls because they are contrary to our basic precept of free markets, we must turn to a third alternative. To stem the flood of foreign security sales in our markets, consistent with both economic growth and free capital movements, Congress is requested to enact effective July 18 through the end of 1965, a temporary 'interest equalization tax' which would, in effect, increase by approximately one per cent the interest costs to foreigners of obtaining capital in the United States. There will be no limitations on the marketing of foreign issues and no governmental screening of borrowers. The tax would not apply to (a) direct investment; (b) debt maturing in less than three years; (c) loans of commercial banks; (d) purchase of securities of less developed countries or companies operating primarily in such countries; (e) transactions in foreign securities already owned by Americans; and (f) the purchase of securities by foreigners. Underwriters and dealers would be exempted from the tax on stocks and securities resold to foreigners as part of the distribution of new issues. The tax will not apply to offerings for which active registration statements are now on file with the Securities and Exchange Commission. Purchase commitments already made will not be affected. All Americans who purchase new or outstanding securities from foreign users or owners would be subject to the tax graduated from 2.75 per cent to 15 per cent of the value of the debt obligation, according to the maturity of the obligation. The tax will be 15 per cent in the case of equity stocks."

Partial Mitigation

It is estimated that the new proposals made by President Kennedy would save about \$2 billion in the next 18 months. This saving, however, could only mitigate in part the large payments deficit of the United States which in 1962 was of the order of \$2.2 billion. In the circumstances, the President's decision to conclude with the IMF a stand-by arrangement for the next twelve months and to utilize this authority to finance a portion of the payments deficit is easy to understand. This is the first time that the United States has sought accommodation from the IMF and it is an interesting question whether this experience will strengthen U.S. faith in the adequacy of the current machinery of the Fund or whether it will lead Washington to explore with greater willingness than it has already shown the various formulae which have been put out from time to time for increasing international liquidity. Mr Kennedy has for the time being promised that the U.S. would hold consultations with its allies on possible improvements in the international monetary system.

Following is the text of the IMF announcement relating to the stand-by Fund arrangement with the U.S. Government:

"The International Monetary Fund has entered into a stand-by arrangement that authorizes the United States to draw the currencies of other members of the Fund up to an amount equal to \$500 million during the next 12 months. The quota of the United States in the Fund is \$4,125 million, of which \$1,031 million has been paid in gold. The amount of the stand-by arrangement represents a little less than half the amount the United States could draw on a virtually automatic basis under Fund practice.

The United States has not previously made use of the Fund's resources. Drawings of U.S. dollars from the Fund by other members have amounted to approximately \$4.2 billion since the Fund's operations began in 1947. In recent years, Fund policy has encouraged drawings in non-dollar

currencies and repayments to the Fund in U.S. dollars. This policy has provided assistance in financing the U.S. balance of payments deficit. As a result of repayments, the Fund's dollar holdings are now almost at the subscription level which is 75 per cent of quota or about \$3 billion, and the articles of agreement prevent repayment to the Fund with U.S. dollars beyond that level. In these circumstances the stand-by arrangement, which is available for general balance of payments needs, is intended to facilitate repayments by other members. This would be accomplished through United States drawings of other convertible currencies which would be sold to Fund members for dollars and used by them to make repayments to the Fund."

Need facts about importing from Australia?

Alert, progressive importers have much to gain from Australia's rapidly expanding export potential. The Bank of New South Wales, Australia's first and largest commercial bank, is uniquely equipped to provide vital up-to-date information on importing from or investment in this fast-developing Continent. A POLICY FOR RAILWAYS—VII

Is Our Railway Management Outdated?

By T. M. RAO

THE RAILWAY organization as it exists today displays all the characteristics of its checkered past. It developed as a curious mixture of private and public enterprise. In the early days, the railroads were built and operated by private companies under what is known as the "guarantee system." Under this system the government undertook to guarantee return on capital invested in the construction of railways at five per cent per annum. Beginning in 1870 the government itself entered the field actively to build and operate railroads. There were many considerations in doing so but the chief among them were strategic and defence considerations and the prevention of famines.

By 1907 the major railroad lines existing today had been constructed and those which had been originally built by private companies were purchased by the government; these were then leased out again to private companies for purposes of management. Starting with the East Indian Railway in 1924, the government began to take over the railways under direct State management as and when the contracts with the private companies expired. By 1950 with the integration of the former Indian States the railway lines belonging to Princely States were also merged in the government railways.

Centralized Working

The railroads at present are run as a department of the Central Government with the Railway Minister at the head being responsible to Parliament. Under the Minister the permanent establishment is headed by the Railway Board which is the chief administrative organization of all Indian railroads and at the same time functions as the secretariat of the Railway Ministry. The control of the Board over the large railway net work is exercised through the General Managers of the eight regional railway systems, and who function more as representatives of the Board than as heads of autonomous railway units. All policy making is centralized in the Board with the General Manager having certain powers to incur capital expenditures within strictly specified limits.

It is now proposed to lay bare the weaknesses of the existing organization and suggest changes which will make it a more effective instrument in meeting the demands of a developing economy.

Let us take finance. The analysis in an earlier article has shown that the return on investment is extremely low. This has necessarily hampered the rehabilitation and modernization programme of the railroads. This should not be surprising because it is rather difficult for a government department to run an enterprise on sound business principles.

The financial statements published by the Railway Board are not easy to understand. They are prepared mainly for presentation of the annual budget to Parliament and they show actual receipts and expenditures for the previous year, revised estimates for the current year and budget estimates for the following year. A layman looking at the figures cannot understand how well or poorly the railroads are doing. It may be asked why the railways cannot publish, along with

The author examines here investment policies and operating techniques of the Indian Railways and comes to the conclusion that planning has been poor and management far from modern.

the budget statements, a balance sheet and an income statement of their operations as business firms do. Like the latter, the railways should also be able to publish a ten-year financial summary which at a glance would reveal the financial health of the organization.

In recent years the source and application of funds statement has come to occupy an important place in the annual reports of many companies. Such a statement seeks to show whence the funds were derived and where they were used in a given year. A typical statement on the receipts side would consist of net income, depreciation and retirements, borrowings and working capital; on the expenditure side, capital expenditures, dividends, debt reduction etc. As an example, Sun Oil Company's Funds statement for 1960 is reproduced on page 156. While the balance sheet gives the financial picture of a business enterprise at any given moment and the income statement concerns itself with revenues and expenses in a given period, it is the source and application of funds statement that gives a company performance. It has now become common to furnish therefore using the funds statement more and more to appraise company performance. It has now become common to furnish these statements to stockholders along with the other financial statements.

It may be pertinent at this point to make a comment on the annual reports and statistical statements published by the Railway Board. They are both voluminous and dull. Presentation of statistics must serve two purposes. First, they must serve as a tool for management in appraising and improving performance. Second, in so far as they are meant for the public the statements must help them gain a clear appreciation of the performance of the enterprise. Judged by these two standards, the annual reports of the Railway Board must be considered a complete waste of money.

Next let us consider the question of planning. Some of the major decisions made by the Railway Board over the last 10 or 15 years will throw revealing light.

1949 was the last year in which steam locomotives were built in the United States by a manufacturer for domestic use. About the same time the Railway Board decided to build the first steam locomotive works in India at Chittaranjan. Already in the early '50s there were indications of growing difficulties of coal transport in India and the need for another source of energy on the Southern and Western Railways particularly. If at that time the decision had been made to build diesel-electric locomotives side by side with the steam

locomotives, the Indian railways would have been in a far different position today as regards their locomotive needs. The argument against diesels was that crude oil was not locally available and had to be imported. But it was known even at that time that there was an excellent chance of oil wells being discovered, considering the geological strata in the different parts of the country.

This was the kind of information that an effective planning organization would have kept track of. Even if India had to depend upon foreign imports of crude, the overall economies of dieselization and the boost that indigenous production of diesel-electrics would have given to the economy would have certainly recommended itself.

Technological Advance

But what is more important is the fact of technological advances. The diesel-electric locomotive, represents a definite technological advance over the steam locomotive just as the commercial jet airliner does over the propeller aircraft. Without constant innovations and technical advances a developing economy can hardly ever reach the take-off stage.

Another example of poor planning is the conversion of Gudur-Renigunta metre-gauge line on the Southern Railway into broad-gauge at a cost of over Rs. 4 crores. The stated purpose of the conversion was to by-pass Madras city and provide a shorter route for south-bound freight traffic to Madras and Kerala States. But the railway authorities seemed to have forgotten that this link could not serve its purpose until the time that rail capacity was augmented beyond Renigunta on the broad gauge line down to Erode.

With the same capital investment if centralized traffic control were introduced on the Vijayawada division, it is fairly certain that the bottleneck that the division had become

in the North-South rail transportation could have been eased and the costly double-tracking of the single line could have been avoided. There is some question about the increase in line capacity that would result from centralized traffic control. It may be appropriate to quote here from the remarks of John W. Barriger, President of the Pittsburg and Lake Erie Railroad Company before the American Transportation Research Forum recently:

"The addition of second, third and fourth main tracks to provide for increasing train density in distant past years proved that train movement capacity increased as the square of the comparative increase in their number. Thus, ratios of capacity of 1 to 2, 3 and 4 track lines were, respectively, as 1 is to 4, 1 is to 9, and 1 is to 16, always assuming physical characteristics of grades, curves and distances remained unchanged. CTC will increase train movement capacity of a single track 80 per cent compared to one without it. A second track will provide a 300 per cent increase. However, an 80 per cent train capacity increase usually is sufficient to avoid building a second track."

Static Thinking

In discussing this subject with Indian railway officials, one comes away with the impression that they still think of "line capacity" in static terms. In reality, however, it is a function chiefly of train loads, signal spacing, terminal capacity and operating rules. For instance on many United States railway systems, 150-wagon freight trains with a gross load of 10,000 tons are a common feature. On the Vijayawada Division two such goods trains in each direction will suffice to meet the current and future needs and leave adequate capacity for passenger and way freight trains.

Secondly the Absolute Block System of operation with tokens is the most restrictive method. Conversion to Auto-

THE COMPASS
THAT POINTS DOWN

By studying rocks exposed on the earth's surface, the geologist can uncover evidence of rock formations that lie hidden thousands of feet under the ground. The clues he seeks in his search for areas where oil may have been trapped occur in irregularities and upheavals of rock. A rapid geological reconnaissance over a likely area can be made with a special compass which measures the slope, or dip, of the rock layers, and also the direction, or

strike, in which they extend. With this data, and with other information resulting from geological surveys, a map is made of formations deep inside the earth.

The application of scientific skills is a cardinal aid to all oil prospecting, but other factors that contribute to success in the hunting grounds are a bold and adventurous spirit on the part of the searchers, a willingness to bear costly risks, and good luck.

matic Block System with colour light signalling would in itself increase capacity enormously. On a single line this might presuppose long passing sidings and some kind of centralized traffic control system.

The purpose of the above discussion is to show that costly and conventional double tracking is not the only solution to the problem of inadequate capacity on the railways. In fact new concepts in signalling and operational methods may yield additional capacity that would meet the growing demands of traffic on many of the present congested sections. It therefore leads to the suspicion that the art of developing alternatives and making a rational choice from the determination of the opportunity costs involved in each case, is not widely practised by the Railway Planning Organization.

Another example on the Southern Railway is the remodeling of the Madras central station at a cost of Rs. 1.5 crores. The purpose of the scheme was to increase the number of platforms and to provide capacity to deal with passenger trains adequately. The old mechanical interlocking has been completely replaced by a push-button route-relay interlocking plant. No one can take objection to facilities provided for improving passenger operation. The need for technological improvements in railway operation particularly in signalling is long overdue. What is being pointed out here is that the allocation of railway investment has been irrational and the choice of priorities unsound by any yardstick.

The railways are faced with two urgent tasks, viz., (i) increasing rail capacity on the major trunk lines and at terminals in order to carry the steadily increasing freight traffic and (ii) attaining self-sufficiency in the indigenous manufacture of railway equipment like electric and diesel locomotives, signalling and communication equipment etc. All this must be done within the limited resources available. That is why the direction of railway investment is so important. The railways cannot, at this juncture, afford to spend large amount of money on building high level platforms and impressive passenger stations. Even in the hey-days of railroad construction in the United States, only a relatively few stations were provided with high level platforms. It may be interesting to note that in the entire suburban region of the New York Central System there is only one station that can boast of high level platforms and that is the Grand Central Terminal in New York City. This should serve as an important lesson to the railway administrators in India.

ACCOPROOF

CEMENT WATERPROOFING ADDITIVE

—a top-quality **ACC** product

Protect your walls with a rendering of cement mortar admixed with a small quantity of **ACCOPROOF**. This will safeguard your walls from damp and will also preclude the development of efflorescence on their surface.

ACCOPROOF also stops leaks and seepage. It is excellent for water storage-tanks, reservoirs, conduits, sewers, roofs, basements—in fact it is essential wherever waterproofing is desired.

The ACC's expert engineers will be happy to give free technical advice on all waterproofing problems, big or small.

ACCOPROOF is manufactured by the **ACC** and is available from

WINDOW ON THE WORLD

Europe and the U.S. Deficit

From Our Special Correspondent

PARIS:

EUROPEAN financiers are expecting for the near future a more determined effort by the USA to correct its balance of payments. This may have been foreshadowed in President Kennedy's statement in West Germany the other week, to the effect that "the great nations of the free world must get control of their monetary problems if we do not want those problems to overwhelm us." Those who tried to read between the lines of this utterance began forecasting resort to some more or less heroic remedy. So there was a feeling of relief when Mr. Douglas Dillon's testimony before a joint Congressional committee on Monday of last week was published, for the Treasury Secretary firmly ruled out drastic measures and "visionary schemes". This still leaves open to possibility of a sharp rise in short-term interest rates in the USA, which is the counter-measure that the Europeans expect and would approve.

While approving any orthodox steps to correct the US payments balance, it is natural that the Europeans are in two minds about the consequences for themselves. The American deficit has gone on so long that Europe has learned to live with it, while recognising that it contains dangers as well as advantages. The disappearance of that deficit similarly would bring advantages and dangers of a new sort. However great the uncertainties (and a world in which the USA was not pumping vast liquidities into international circulation would be a disturbingly unfamiliar novelty), there is no doubt that the European Finance Ministers want to see the dollar restored to health. This banal fact requires mention because of fantastic rumours to the effect that Paris was considering demanding conversion of all its dollars into gold, which it is entitled to do but which would touch off a global panic and a run on the dollar.

Bursting the Bubble

Any such intention is so far from the mood of the French Finance Ministry (and, also, from that of the West German monetary authorities who would have to be consulted in the matter by Paris, according to the terms of the Franco-German co-operation treaty) that one casts about for reasons why the possibility should have been reported by serious papers in the USA. As far as monetary reasoning comes into the affair, it must be a misunderstanding of M. Jacques Rueff's persistent campaign against the gold-exchange standard, to which the Finance Minister, M. Giscard d'Estaing, has to reply almost every week. First of all, note that he does reply to it, in fact rejects it: M. Rueff's opinions, for all their plausibility, are not official doctrine. But even if they were, even if officials accepted the notion that the gold-exchange standard (the holding of dollars as a reserve currency "as good as gold") is causing dangerous global inflation, it would not follow that Paris would seek unilaterally to convert all its dollars into metal. M. Rueff has never suggested that the way to avoid shipwreck is to sink the vessel immediately and drown everybody. He says that what was created by an international conference after the first world war can be undone by another similar conference today, and should be if world-wide inflation is not to be followed by an inevitable bursting of the bubble and consequent slump.

Yet monetary reasoning is not alone involved. The vision of General de Gaulle slamming his wads of dollars down on the counter of the US Treasury and saying "Give me gold!"

(the way a Rothschild once did in the Bank of England after being insulted by the Governor of the Bank) looks like a diplomat's idea of how the monetary system works. And of course the diplomats are correct in feeling uneasy about the current contradiction in US policy: it is unusual for nations or individuals to go seeking gratuitous quarrels with other nations or individuals who, in theory, have the power to bankrupt them overnight. This power the General has, in pure theory, but it is no use to him unless he never uses it, since France would have nothing to gain and as much to lose as everyone else by ruination of the present unsatisfactory monetary system.

Disregarding these rumours, then, it is clear that European financiers would welcome a successful attack on the American deficit by way of higher interest-rates in New York. This solution would nevertheless have its risks. The first is that dearer money would further slow down, or even reverse, the modest expansion of the American economy, with a resultant contraction of world trade that would gravely incommode West Europe. It is hoped that this could be avoided by combining dearer money with tax concessions and a bigger budget deficit in the USA. The second risk therefore seems graver: that a recovery of the dollar would be at the expense of sterling, precipitating a devaluation of the pound which would be scarcely less embarrassing for the Common Market countries.

Eliminating U.S. Deficit

While keeping their fingers crossed on these risks, Continental financiers point out the gains that would flow from a gradual elimination of the American deficit. In the first place (and to this extent M. Rueff's case is generally accepted) a double source of inflation would be stopped: the growth of domestic liquidities in the USA would cease, and the Continental countries would stop creating domestic liquidities inside their borders by way of the payments surplus they are scoring with the USA. It is not believed that present inflation in West Europe is entirely monetary in origin; in France for example, there are other causes of spiralling prices than the payments surplus. But a powerful contributory factor would have been removed.

Secondly, the accumulation of American deficits has other consequences that are as unwelcome to some European countries as inflation. Their surpluses remain blocked, for a large part, in the form of dollars in American banks where they earn little interest — while American firms and capitalists go on investing in Europe at much more profitable rates. It is as though the creditor nations of West Europe were organising inflation at home (by creating money to match their payments surpluses) in order to raise funds which they hand over to the Americans for next to nothing, so that American firms can buy up European firms. Fears of the "dollar invasion" and of the "domination" of European business by American corporations might be exaggerated, but it is obviously paradoxical that European nations should finance this invasion themselves, which is what they do when they support the dollar (leave their surpluses in dollar balances instead of taking gold, repay debts to the US, etc.) while Americans use these dollars to invest in Europe.

Higher interest-rates in the USA would encourage American firms to invest at home rather than in Europe and this would slow down the invasion of capital that has caused anxiety in at least some quarters in Europe. It would also

stimulate the American economy to faster growth, which would be welcome news to European exporters. Faster growth in the USA, incidentally, would disarm many of the fears about the unilateral American gains from tariff reductions. At present, many Europeans think that tariff cuts (especially if they were more generous in Europe than in the USA) would lead to dumping on this side of the Atlantic by over-equipped US corporations. Finally, dearer money in New York would make it less attractive to foreigners to borrow there and would encourage them to lend there so that a reversal of the tides of capital might occur more speedily than is sometimes imagined.

Of course, such a reversal would impinge at once on the European moneys but the Common Market countries consider that they are strong enough to stand the strain. Their anxiety relates to Britain, who is patently not strong enough, especially at a time of rising raw material prices. If the prices of commodities continue to firm up, it is calculated that Britain's annual import bill could grow by £100 million. With elections in the offing, an effort will be made to stir the economy from its long stagnation, with further consequent strain on the import bill. If to this is added a reflux of funds, drawn back to the New York market by higher interest-rates, another and more serious sterling crisis seems very possible. True, there are numerous expedients to hand, thanks to inter-

national co-operation, to meet a challenge to sterling but they all entail increased Continental assistance at a moment when the flow of funds back to the USA will make that assistance more costly. So the eventuality of a devaluation of sterling, dismissed as unthinkable in London, is taken seriously on the Continent.

In any event, a period of painful adjustment is foreseen in the international monetary order for the months ahead. Whatever its inconveniences, it will be preferable to continuation of the present situation which is becoming intolerably ambiguous for the creditor nations (let alone the problems it sets for the debtor, the USA). They are accumulating surpluses that they could well do without, they are obliged to hold them in a currency that inspires little confidence but they cannot demonstrate their lack of confidence (e.g. by demanding conversion of their dollars into gold) without bringing down the whole system—and yet they know that the USA cannot go on incurring deficits, so that it becomes less and less defensible each month to treat dollars as though they were as good as gold. There is still time to extricate the world from this vicious circle without resort to heroic remedies such as reversion to a pure gold standard, a revaluation of gold or transformation of the IMF into a manipulator of a world paper-money. But time is running out and decisive action is awaited from Washington this year.

Strains on Gold Exchange Standard

By PAUL BAREAU

LONDON:

FOR THE MOMENT everything seems to be going well in the foreign exchange market and on the international payments front. The two reserve currencies, sterling and the dollar, are standing up to the heavy responsibilities they bear. Sterling has emerged almost unscathed from the recent political flurries in Great Britain. Its strength in the exchange market has been such that during June the British Treasury was able to pay back the £89 million which had been borrowed from foreign central banks last February and March in order to provide ammunition with which to repel the speculative attack on sterling which was then unleashed.

The dollar, too, remains steady in the foreign exchange market. It is supported by a welter of bilateral arrangements between the United States and the other principal financial and commercial countries of the world. Under these arrangements mutual credit facilities are available. They can be drawn on to the extent of nearly \$1,500 million. The most sensitive of all thermometers measuring confidence in the dollar is that of the price of gold in the free markets of the world and for many weeks past this has registered a temperature of normal.

Deceptive Appearance

These appearances may, however, prove deceptive. The present calm is not an indication that the fundamental position of the key currencies is in every way beyond reproach and doubt. The pound sterling has yet to face the impact of the announcement of the date on which the next General Election will be fought. With the increasingly confident prospect that Labour will be victorious, the resulting strain on sterling is likely to be considerable. There are abundant means of defence but it would be well to anticipate a period of considerable stress and strain in the market in the pre-election days.

As for the United States, the major feature of the situation is the balance of payments which shows a tendency to drift into larger deficit. The deficit in 1961 was \$2,360 mil-

lion. In 1962 it jumped to \$2,900 million if we allow for the prepayment of foreign debts of nearly \$700 million. In the first quarter of this year the deficit appeared to be running at a rate slightly greater than that for 1962. This state of affairs raises some questions. Will the various devices which are propping up the dollar hold out indefinitely? Can an international payments system be run on the principle of inducing other countries to hold their reserves in currencies they do not really want to hold?

Economic Chaos

Together with these doubts and uncertainties of the market place we have to look at the intellectual, rational revolt against the principle of the gold exchange standard, of which the two reserve currencies are the essential feature. That revolt is led first and foremost by the eminent French economist, M. Jacques Rueff, who has long intoned warnings against the gold exchange standard, the system by which countries are prepared to hold their reserves not only in gold but in currencies convertible into gold. This, he argues, is a system which is automatically calculated to create world inflation. Under this system, he says, the key currency countries can run a permanent deficit without being called upon to remedy the faults which are creating that deficit. This they can do because the deficits they incur and the amounts that they have to pay to the monetary authorities of other countries are automatically lent back to them because the creditors do not take their payment in gold but are prepared to hold the currencies of the debtors. M. Rueff is convinced that the great depression of the 1930s was caused by the imbalance created by the invention of the gold exchange standard after the First World War. He is equally convinced that the return to this form of international standard after the Second World War will inevitably lead the world to another and perhaps greater economic collapse.

If, however, the world is to abandon the gold exchange standard and if the reserves now maintained in key currencies are to be converted into gold, it is self-evident that there will not be enough gold to go round, assuming gold to remain

at its present price. M. Rueff does not follow his argument to its logical conclusion; but this is done by Professor Heilperin of the Graduate Institute of International Studies at Geneva, in an article he has recently contributed to the quarterly review of the Anglo-American Corporation of South Africa. He also wanted the world to go back to a genuine gold standard. The first step would be that countries would undertake to pay in gold all new balance of payments deficits. The second step would be an increase in the price of gold to a level which would enable the United States to pay off in gold its current liabilities to foreign central banks and which would, in addition, provide a sufficient increase in international reserves to forestall a move towards deflation in the world economy. These various operations, he says, need have no effect on the existing pattern of exchange rates, since all currencies would become fully convertible into gold at rates which would maintain the relation of their present exchange rates.

A third, and somewhat unexpected, voice raised in favour of the same cause is that of Dr. Schweizer, the chairman of the Board of the Swiss Bank Corporation. He, too, stresses

the weaknesses of the present monetary system and urges a return to a genuine gold standard. He advances a subtle argument to convince the Americans by suggesting that the United States, who are now losing and exporting gold at the price of \$35 fixed in 1933, are in fact selling this gold for a fraction of what it cost them in terms of goods and services. Dr. Schweizer is also in favour of an increase in the price of gold, but he fears the inflationary effect of a sudden and sharp marking up of the price and suggests that it should be raised very gradually, year by year, each increase being so small in relation to the rate of interest that no one would be tempted to hoard gold as an investment operation in anticipation of the increase in its price.

There is a common thread running through these three theses. It is that gold is better than paper—any paper. After the experience of the last two decades, who will gainsay this view? About 40 years ago the late Lord Keynes described gold and the gold standard as "relics of a barbarous age." In spite of that disparagement, gold is still going strong and its role as the great monetary metal of the world looks assured for many decades to come.

Economic Growth, Employment and Civil Rights

By GUY SIMS FITCH

WASHINGTON:

THE AMERICAN economy clearly is in good shape. Activity is at an all-time high and rising, and no real difficulty is anticipated in adjusting to changing short-term influences.

There is a nagging domestic problem of a more fundamental nature, however, which is detracting from the general aura of satisfaction. Ironically, it is in an area in which the economy has just reached a new and dramatic peak—the employment situation.

Total employment in the United States rose by 1.3 million last month and passed the 70 million mark for the first time in history—a milestone which in other days might have occasioned much self-congratulation. Yet today, perhaps reflecting a growing economic sophistication, the nation's cheer is tempered by an awareness that unemployment still is high enough to account for 5.7 per cent of the labour force on a seasonally adjusted basis.

Food for Thought

Aside from the obvious implication that total demand has not been rising fast enough for the economy to absorb more of the jobless, the make-up of the 4.8 million in the ranks of the unemployed offers additional food for thought.

Teenage unemployment is running at about 16 per cent of the labour force. Admittedly, many youngsters, particularly in these summer months of school vacations, are looking for part-time or temporary work. But this cannot explain away the persistent high rate of unemployment among teenagers, or the fact that the entire rise of 800,000 in the June jobless total was accounted for by the teenage jobseekers, who numbered some 1.9 million. A significant contrast is the unemployment rate among married men, which dropped last month to 3.1 per cent, well below the 1962 level.

Compounding the problem are the nation's demographic trends. Young people in increasing numbers will be entering the labour force in the years ahead. This year, for instance, one million more youngsters will be reaching age 16 than last year, and it can be expected that a number of

these will not be continuing their schooling but will be looking for permanent jobs.

A related problem with strong social as well as economic overtones, is the status of the Negro worker. Unemployment among Negroes stands at about twice the national average, and it is especially high among Negro teenagers.

Socio-Economic Unrest

It would be too much to say that the boiling up of racial tensions in the United States and the intensification of the civil rights struggle is tied solely to a lack of employment opportunities. On the other hand, it cannot be denied that unemployment, especially among Negroes, is aggravating socio-economic dissatisfactions, no matter how well the economy is doing over-all. Concentrated efforts to cope with these related employment and civil rights issues are in keeping with the prevailing national mood.

The Kennedy Administration has been taking strong steps to deal with them in a number of ways, culminating in the dramatic civil rights legislation the President recently recommended to Congress.

Significantly, much of the President's proposed civil rights legislation is in the sphere of economics, complementing other measures designed to accelerate the nation's long-term growth and to make fuller and more effective use of its manpower resources—vocational training, broadening of job hiring, special youth employment programmes, and many more.

Potentially, the most effective of the administration's economic proposals could be the recommended tax reduction, months. The tax programme, which would help speed the nation's economic expansion over the long term, shapes up as an essential counterpart to other efforts—educational, job-creating and anti-discriminatory—to cure unemployment in general and among Negroes in particular. As U.S. Secretary of Labour, Mr. Wirtz, has pointed out, it would do little good to train people for productive positions or to wipe out discrimi-

July 26, 1963

EASTERN ECONOMIST

165

minatory employment requirements if there were not enough jobs to go around.

In this sense, it would be unfortunate if preoccupation with civil rights proposals were to relegate to a secondary place, to delay inordinately or block completely, effective Congressional action on tax reduction. Both are important, and both have the highest administration priority.

Battle Over Air Fares

By GILLIS GOODMAN

MONTREAL:

A FEW WEEKS after they had ended a heated debate over raising international airline fares, the world's carriers prepared for another over reducing them. At the heart of the matter was a proposal by two U.S. airlines to drop transatlantic fares by some 39 per cent below present economy-class levels, and what happens on transatlantic fares is more than not soon felt in other international air travel, as well.

The growing tension over the prices of international flight has grown out of the different methods of arriving at the same goal—the lowest possible costs for the maximum efficiency in communications among the various parts of the world. And although the present discussion is over transatlantic air fares, the problem is a universal one. The disagreement is making itself felt at the International Air Transport Association headquarters here.

Fringe Economies

What Pan American and Trans World Airlines propose to do is to introduce a new class of transportation, eliminating all food and beverages in flight and doing away with two-class aircraft, such as are operated at present. The two airlines, among the world's major carriers, argue that such an arrangement makes economic sense and that it will attract more passengers.

Not so, say many non-U.S. airlines. Despite the fact that early-summer vacation travellers were only using 51.6 per cent of capacity on the 17 main transatlantic airlines, fares should stay where they are and other means of attracting more passengers should be found.

Economy-class fares were recently raised by 5.5 per cent on transatlantic flights after a stormy controversy. Non-U.S. carriers, faced with mounting deficits and with summer reservations disappointingly low, believe, in many cases, that marginal services, such as increased food and beverage service, will bring more passengers. They say that improving conditions in economy-class accommodations will bring an upswing in reservations. Besides, they point out, in many countries these services are cheaper than in the U.S. and represent one of their competitive mainstays.

The U.S. carriers say that expense is the main barrier to larger payloads on transatlantic aircraft. The present New York-London round trip ticket is \$499.70 on all airlines which are members of IATA. The U.S. proposal is to drop this to \$320 by using aircraft space more efficiently. The argument behind this is that because of the relatively short time a jet airliner takes to fly the Atlantic, many amenities are not necessary and that a 39 per cent drop would bring transatlantic vacations within the reach of thousands more middle-income families annually.

The strength and durability of the current economic expansion, essentially devoid of inflationary pressures, indicates that the United States can sustain a stable and respectable economic growth. But economists, by and large, join with the Kennedy administration in a realization that in the final analysis demand economic activity in general must be further stimulated if related problems of employment and social justice are to receive adequate treatment.

Other airlines, especially the European ones, say that vacations abroad are becoming more expensive with increased prosperity anyway, and that the fare reduction would do little to help boost it. They prefer to concentrate on "package" tours and on extended-flight tickets. Under the latter system, a passenger may buy a round-trip ticket to one European city and may fly, under certain conditions, to other European cities for the same price.

The present status of the argument is that the non-U.S. carriers are, in the polite language of competitive business, "studying" the Pan Am and TWA proposals. But the battle will really be joined in September at IATA's meeting in Salzburg, Austria. The U.S. will press its proposals there, and the non-U.S. members are likely to resist them with all vigour. But since IATA's decisions must be unanimous, it was likely that a compromise was in the offing, probably instituting a "thrifty class" but with a smaller reduction in fares.—FNS.

Subdued Optimism on Consortium Aid

By Our Correspondent

A SENSE of subdued optimism pervades in the official circles here about the outcome of the current round of Aid-India Club's deliberations. The postponement of the Consortium's meeting from July 24 to July 30, it is hoped, will be final, the intervening period of six days being utilised for ironing out the differences between the member countries.

The postponement of the July 24 meeting, according to Washington reports, was occasioned by the United States' stress that the other member countries of the Consortium, particularly West Germany, should liberalise their terms of aid by lowering their interest rates and increasing the period of repayment. As a quid pro quo, West Germany is reported to be wanting the US contribution to match not only the assistance from the other member countries but also from the World Bank and IDA, as has been done by her in the case of Pakistan.

Britain, West Germany and Japan, it is understood, have evinced their inclination to step up their contributions from the levels agreed to at the June meeting of the Consortium. How much? It is not revealed as yet. Expectations, however, are that the total aid that may be available from this source during the current financial year may be around \$1000 million. This is on the presumption that the United States may not be able to agree to the West German point of view, since the upper limit set by her for her contribution this year is \$450 million. Of this, assistance to the tune of \$375 million has already been pledged by the USA at the June meeting. The World Bank and IDA commitments have been of the order of \$220 million.

★★

The Union Ministry of Mines and Fuel is deeply distressed over the unsatisfactory working of the Rumanian-built Noonmati Refinery and the delay in the completion of the first stage of the Russian-aided Barauni Refinery.

Despite its being commissioned into production over 18 months ago, the Noonmati Refinery has not been able to overcome its teething troubles. At no time during this period has it worked at more than 50 per cent capacity, with the result that it is suffering a heavy loss on overheads and other expenses. The teething troubles of this Refinery have been unusually prolonged by frequent breakdowns in its kerosene unit.

Mr. P. R. Nayak, Managing Director, Indian Refineries Ltd., is understood to have had detailed discussions last week with the Rumanian Ambassador here in which he exchanged views with the Ambassador on what steps should be taken to rectify the defects in the Noonmati kerosene unit. The matter is also stated to be engaging the attention of the new Minister for Mines and Fuel, Mr. O. V. Alagesan.

Official sources are reticent and decline to throw any light on the measures contemplated to put the matters at Noonmati right. Negotiations with the Rumanian Government, they say, are at a delicate stage. It is, however, believed that the main cause of the trouble is the defective "Rotary compressors" of Swiss make. The present compressors may in the first instance be replaced by new ones, also of Swiss make. If the trouble is not overcome, American compressors might be tried. As an ultimate resort, the necessity of replacing the entire kerosene unit at Noonmati is not ruled out. Under the technical collaboration agreement on this project, the Rumanians are required to hand over this Refinery to Indian Refineries Ltd., in a satis-

factory working order. All replacements of equipment not found suitable are to be done by them at their expense.

The Barauni Refinery's first stage is now expected to be commissioned into production in January next, instead of October. This three months' further delay has been caused by two factors: (i) the labour trouble which has hindered construction work since January last, and (ii) some delay in the receipt of equipment from Russia. The Indian Refineries Ltd., is currently holding talks with the contractors engaged on the construction job with a view to resolving the differences between them and their labour force. Some of the outstanding construction work, it is understood, may have to be taken up by the Refinery management itself in order not to delay its completion further. All these matters, it is learnt, will be sorted out by Monday next.

Despite the delay in the commissioning of its first stage, attempts are said to be made to complete the Barauni Refinery's second and third stages according to the present schedule—the second stage by April-May next year and the third one in another four or five months. No upward revision of the cost of the Refinery from the recently revised figure of Rs. 37 crores is also considered necessary.

Benefiting from Experience

Gaining from the experience of the Noonmati Refinery, suitable adjustments have already been made in the kerosene unit to be installed at the Barauni Refinery. American compressors are favoured to be used in this plant.

The lubricating oils plant to be set up at this Refinery during its third stage is now envisaged to produce only 50,000 metric tons of medium and low viscosity index lubricants. High viscosity index lubes, it is pointed out, can be produced from the Assam crude only to a very limited extent due to the high aromatic and wax content in it. If the Assam crude is mixed with other suitable reduced crudes, either from the Vizag Refinery of Caltex or from elsewhere, the capacity of this lubricating oils plant, however, may be increased to about 80,000 metric tons per annum. Originally, this plant was planned to produce jute bleaching oil. In view of the comfortable supply position of this petroleum product, it had been decided before drawing up the detailed project report for it to go in for the production of industrial and automotive lubricants which command a better price. The cost of setting up this plant is estimated at Rs. 4.5 crores.

★★

The European Economic Community's postponing the decision on suspension of its tariff on tea imports till the end of the current year has caused a good deal of disappointment here. According to an understanding reached between the EEC and Britain during the latter's negotiations on her entry into the Common Market, the nil tariff on tea imports by the EEC was to be brought into force with effect from July 1, 1963.

The disappointment caused is not so much over the fact that this tariff has not been reduced to zero as over its wider implications. The postponement of the application by the EEC of nil tariff to tea is said to have been prompted by some surcharges which Ceylon levied recently on the customs duties on her imports from Europe. If this is true, it is feared, it represents a change in the EEC's attitude towards trade with the under-developed countries. At the recent Ministerial level meeting of the GATT, the consensus of opinion was stated to have been that in scaling down of tariff rates, the

developed countries should not insist on reciprocal steps being taken by the under-developed ones.

New Delhi, however, is gratified at Britain's acceding to its request not to abolish unilaterally duty on her tea imports from African countries and to synchronise it with the institution of nil tariff by the EEC. A unilateral decision by Britain, it was felt, would place Indian tea in a disadvantageous position at a time when India faces an acute foreign exchange shortage.

The Indian Ambassador at Brussels, Mr. K. B. Lall, it is understood, has been asked to take up the question of abolition of tariff on tea with the EEC authorities.

★★

The two Ministries—the Ministry of Industry and the Ministry of International Trade—created out of the erstwhile Union Ministry of Commerce and Industry, have been assigned the work to be handled by them.

A Presidential Order, issued on July 20, states that the Ministry of Industry will have two departments, one for industry and the other for Company Law Administration. The Department of Industry will deal with the general industrial policy; administration of the Industries (Development & Regulation) Act, 1951; industrial management and productivity; and planning, development and control of and assistance to all industries except those falling under the Ministries of Steel & Heavy Industries and Food & Agriculture. The specific industries listed to be handled by this Department are: cables; light engineering industries; optical glass project; light industries such as plywood, stationery, matches, cigarettes, etc.; light engineering electrical industries; chemical industries; insecticides; antibiotics; salt; power alcohol and small-scale and village industries excluding handlooms. It will also deal with industrial co-operation (excepting in regard to sugar), patents, designs and all matters relating to the Indian Standards Institution, the Khadi & Village Indus-

tries Board, the Central Silk Board, the All-India Handicrafts Board and the Salt Commissioner's establishment.

The Department of Company Law Administration will look after the work it is handling at present. There was a proposal to transfer it to the Ministry of Finance but it apparently did not find favour.

The Ministry of International Trade will deal with all matters relating to foreign and internal trade; commercial intelligence; trade marks; enemy property; plantation industries—tea, rubber & coffee; textiles and handloom industries; tariffs and customs. Matters relating to the Forward Market Commission, the Tariff Commission; the Jute and Textile Commissioners' organisations; the Rubber, Tea, Coffee, Coir and Handloom Boards, the State Trading Corporation and the Export Risks Insurance Corporation will be within the purview of this Ministry as also the Indian trade representations abroad.

The position of Mr. S. Ranganathan, Secretary to the erstwhile Ministry of Commerce and Industry, has not yet been clarified. Although he was formerly looking after mostly the work in the Department of Industry, he was Secretary to the overall Ministry and acted as a useful link with the Department of International Trade.

★★

A meeting under the chairmanship of Professor M. S. Thacker will shortly be convened here to review the principles to be adopted to govern approvals to the establishment in India of consultancy, design and related services by foreign firms in the light of experience gained and in particular with reference to the following:— 1. What are the fields in which scope exists for the setting up of technical consultancy organisation? 2. What should be the scope of activities of the organisation, namely, whether they should be limited to technical consultancy/design only or whether it should extend to undertaking turn-key jobs also? 3. What are the safeguards to be observed to see that foreign exchange is not spent abroad

WITH APOLOGIES TO "HIS MASTER'S VOICE"

on jobs that can be undertaken in India by Indian organisations?

In 1961, a number of applications were received from reputed foreign firms for the establishment of technical consultancy organisations in India in various engineering fields. In a series of discussions, in which the representatives of the economic ministries participated, the basic principles to be taken into account while considering the grant of approval to such firms were evolved. These principles were also given wide publicity by the Indian Investment Centre.

On this basis, 9 cases have so far been approved. It is learned that with the exception of Messrs. Simon Carves and Messrs. Hydrotherm, in all the other cases the approval is limited to the firm undertaking consultancy/design services only.

Some of the firms which have already been licensed as well as other firms whose applications are pending have represented that unless they are permitted to undertake turn-key jobs, their ventures, besides being uneconomic, will not permit them to offer the best service to their customers, hence the review.

★★

The question of foreign brand names is under reappraisal here. It is felt that the policy so far followed has been too rigid and needs a revision. A foreign brand name may not be permitted, if it were to be detrimental to an old and established Indian industry. It should, however, be allowed, if it were to accord with a larger consumer acceptance.

Government is also committed to discourage monopolies. Competition, incidentally also improves efficiency of an undertaking and or quality of goods. The case of the lamp industry should illustrate the point. What are called S.L.S. Lamps have been in short supplies and even the essential requirements have not been adequately met. To introduce competition and increase the capacity, the Government recently approved the scheme of Mysore Lamp Company to increase its output by installing additional equipment in collaboration with International General Electrics. The foreign collaborator however wanted to manufacture lamps under its own brand name. This has also been agreed to by the Government.

★★

One of the latest reports of the National Productivity Council on Machine Building Industry in the U.S.S.R. and Czechoslovakia is a useful compendium relating to machine building industry in India as also in the two countries visited by the productivity team. Some of the recommendations made by the team are not endorsed by the representatives of workers. They relate the linking of wages to production and productivity, suggestion that the workers should not get automatic annual increments and that trade unions should not be allowed to fall into the hands of irresponsible leadership.

In regard to linking the wages to productivity, the workers' representatives in a minute of dissent state as under:—

"In the conditions obtaining in India, this recommendation is unacceptable to the trade union movement. In the U.S.S.R. and Czechoslovakia, the socialist system of production ensures that the product will be utilised for the common good of all, and wages are only one part of return which workers get. Constant reduction in prices, elaborate and cheap housing facilities, medical aid, educational facilities, recreational and holiday arrangements, provisions for cultural activities, etc. all contribute to the well-being of the workers and ensure a real wage which increases much more rapidly than nominal wages. In India, at present, all these facilities

are either totally or practically non-existent. Available data show that in the past years, productivity has outstripped real wages by as much as double.

"Apart from this in the prevalent conditions in industry in which there is no standardisation of jobs, or wages, where patterns, tools, machines and materials are also not standardised and where piece-rates are often changed arbitrarily by the employer, the real meaning of linking wages to productivity will be only to increase the exploitation of the workers. There is no minimum fall back wage in India, no unemployment insurance, no old age pension, and retrenchment benefits are meagre. This contrasts sharply with conditions in U.S.S.R. and Czechoslovakia.

"In view of this we feel that this recommendation is not warranted by the prevailing conditions in India. All trade union organisations are opposed to it and, in fact, if an attempt is made to enforce it, the workers will be forced to resist it."

In Workers' Interest

As against this, the majority has cited the observations of the Russian team, which visited India in 1961. It had suggested that wages should be linked with productivity. "This is in the interest of the workers themselves inasmuch as they can earn money according to their skill and output. This principle has been established all over the world, specially in Russia and Czechoslovakia where workers earn more money by producing more norms which are periodically revised with the change of techniques. It is also in the national interest that wages are linked with productivity in order to curb inflation. In India it is found that wage increase without linking it with production gives rise to increase in costs resulting in inflation of prices. With the increase in wages the cost of living also increases with the result that no benefit accrues to the working class."

The majority has added that the so-called exploitation of workers by employers is not a fact now due to various legislations provided to safeguard the working class and a few small employers who may disregard these laws, cannot be taken as representing whole industry.

The unanimous recommendations are as under:— (1) A central agency should be set up to translate into English the technical literature already available and published from time to time in other languages. (2) For effective maintenance of machines, each industrial unit should have a maintenance section adequately staffed and equipped to foster maintenance consciousness. (3) Similarly each unit should have a design office adequately staffed and equipped for preparation of designs. For this purpose, a machine building section, either as part of tool room or as a separate unit, should be set up in each plant for making its own special purpose machines. (4) A continuous supply of skilled operatives and technicians is essential and properly organised apprenticeship training schemes and educational and training facilities for adult workers should be provided throughout the country.

★★

Two representatives of the U.S. A.I.D. have arrived here to undertake a survey of the raw material potential required for the Bokaro Steel Mill. This is in modification of an earlier plan to send out a full team for this appraisal.

★★

Owing to shortage of foreign exchange, no import of tractors is allowed at present except from the U.S.S.R. and East European countries. Arrangements have been made for the import of 1,800 tractors from the Soviet Union during 1963 and the possibilities of arranging imports from some East European countries are being explored. Five firms in India have been given licences for the manufacture of larger types

of tractors in 12-45 D.B.H.P., the demand for which is expected to rise to about 10,000 a year by 1965-66. Three firms have been licensed to manufacture smaller tractors of 10 D.B.H.P. Three other firms have already started production of wheel tractors. The number of wheel tractors so far produced in the country is placed at 2,461 and at 3,600 by the end

Shipping Target Unambitious

By R. V. MURTHY

BOMBAY:

THE FIRST meeting of the re-constituted National Shipping Board (NSB) under the chairmanship of Mr. C. H. Bhabha has begun well by taking stock of "the unusual rapidity with which maritime countries of the world have built up and are building up, their navies of supply and commerce" in contrast to the unusual complacency of our Planning Commission, which, it may be recalled, actually reduced the target of 14.22 lakh GRT (to be reached by the end of the third Plan as recommended by the NSB) to 11 lakh GRT and also stipulated that ships should be acquired on deferred payment terms. As though this was not enough, the Government of India followed this up with an announcement of its inability to release any foreign exchange for acquisition of ships. All credit must, therefore, go to Indian shipowners who have been able to place orders, or will soon do so, to raise the Indian tonnage to over 15 lakh GRT by the end of the third Plan. This clearly suggests that it is not so much the calculations, if any, of the Planning Commission as the enterprise and resourcefulness of our shipowners that have contributed to this modest increase of our shipping. In spite of this increase, not only are we nowhere near the overall national target of 20 lakh GRT worked out by the Government of India in 1947 (vide their Shipping Policy) but we are also lagging behind even countries without previous maritime record like Brazil and Argentina.

"Guestimates"

It seems to me, in retrospect, that the basis for the Planning Commission's target for shipping in the third five-year Plan was the principle accepted by the Government of India in 1947 regarding the respective shares in overseas, adjacent and coastal trades of this country. I draw this conclusion from the figures in this respect given by Mr. Bhabha, which are 50 per cent of overseas, 75 per cent of adjacent and 100 per cent of coastal trades. Only, instead of applying these percentages to the latest trade position, the Planning Commission probably adopted the same (pre-war) figures of 120 lakh tons overseas, 47 lakh tons adjacent and 24 lakh tons coastal trades, on which basis the application of the principle adopted by the Government of India gives 11.9 lakh tons. This naturally inadequate estimate of the figures of our coastal, adjacent and overseas trades by the Planning Commission is highlighted by the approximate figures of cargo handled by our major ports ("in the absence of official statistics or data, it would be difficult to give any exact figures, said Mr. Bhabha). According to him, the total cargo handled by all the ports, including Marmugao, in 1961-62 was of the order of 46.5 million tons, of which 32 million tons represented cargoes in the overseas trade. Mr. Bhabha estimated that, by the end of the present Plan, about 50 million tons of cargo would be handled by all the ports of India. All these, however, are at best what we may call "guestimates", and it is just as well, therefore, that the NSB lost no time in appointing a committee to evaluate the rate of growth of India's foreign trade and assess the extent to which Indian shipping could participate in the increased trade, with particular reference to the tramp and tanker sectors. The reference to tanker and tramp tonnage here is significant, because, as Mr. Bhabha underlined, when we are thinking of raising

of 1963. By 1966 indigenous production it is hoped will meet the demand for agricultural tractors in full.

The Defence Department has already taken up production of the "Komatsu" type high horse-power crawlers with the collaboration of a Japanese firm.

our tonnage in a big way, due care and attention must be paid to the acquisition of different types of ships so as to ensure a balanced fleet. So far, the expansion of Indian tonnage has been mostly in liner services, so that we continue to be short of tankers and tramps, especially bulk carriers. It is heartening to note that, latterly, every effort is being made to encourage these types of ships. But, as the leeway to be made up is still considerable, more positive inducements such as advance of loans at reduced rates of interest (even lower than 3 per cent, as suggested by Mr. Bhabha) should be offered to shipowners desirous of acquiring bulk carriers.

Higher Targets

Laying down a higher target may not present a problem, except perhaps to our wise men in the Planning Commission. The really important question is that of finding the finance for acquiring the tonnage as per the determined target. As the new Chairman of the NSB observed, this should be carefully thought out. For, in the first place, owing to our slender foreign exchange resources, we cannot expect the Government to provide very much for this purpose. In other words, to quote Mr. Bhabha, "the policy of securing cent per cent credit for obtaining tonnage is one that is now cast on shipowners". In view of the strain that such a policy imposes, e.g. competitive capacity of Indian tonnage, failure or inability to contribute to the foreign exchange pool, as debts due to shipyards have to be cleared first, Mr. Bhabha welcomed the 40 per cent foreign participation policy decision taken by the Government recently. With such participation, he hoped, it might be possible to raise credits abroad. In this connection, Mr. Bhabha drew pointed attention to the fact (not so well known at all) that Indian shipping has not succeeded in getting the World Bank and the IDA to give substantial credits as they have done to several wings of transport in other countries. One really fails to understand why this should be so, if, as Mr. Bhabha said, as early as in 1948, the World Bank made a loan of 12 million dollars to four shipping companies in the Netherlands. Both the NSB and the Government of India should lose no time, therefore, in taking up this question with the World Bank. This is absolutely necessary to re-establish Indian shipping in its proper position in the maritime world.

Another important question pinpointed by Mr. Bhabha relates to the large cargoes at the disposal of our Government. While welcoming the preference given to the Indian Flag for carrying these Government-controlled cargoes, he called for accurate data about the total of such cargoes, freights paid on such cargoes, freight on such cargoes taken away by non-Indian bottoms and other similar vital statistics of shipping. In insisting on this, he said: "the carriage of cargoes by Indian ships is an active instrument of shipping policy of assisting the development of the merchant navy and, therefore, it is of prime importance to find out periodically what the real position is about the total cargo under the control of the Government and how much of that cargo is available to the Indian Flag and how much of that cargo has been made available to the Non-Indian Flag." It should not be very difficult for the Government to provide this information, especially now that a Chartering Wing has been established specifically to be in charge of this work, which has hitherto been handled by the India Stores Department, in London, and

the India Supply Mission, in Washington. The information, when made available, would surely be revealing.

★★

The interim margins on the Bombay Stock Exchange on forward deals in shares were unrealistic and hampered the normal working of the market mechanism. This was the impression of Mr. Dhirajlal Manganlal, Vice-President of the Indian Merchants' Chamber and a Member of the Governing Board of the Bombay Stock Exchange. Instead of imposing margins on a broker irrespective of the 'bull and bear' positions the correct way would be to impose a margin against a bull in a rising market and against a bear in a falling market. The daily margin of 40 per cent payable by a broker on his business over Rs. 10 lakhs was excessive. The State of the capital market was described by him as 'lamentable'. The heavy dose of corporate taxation, the insistence on issuing shares by the CCI at premium by established companies, the RBI credit policy and the Government's insistence that new companies should be formed for undertaking new business are some of the factors at the root of the trouble. The paid-up capital of 1348 securities listed on the nation's seven stock exchanges was Rs. 1,059 crores in 1961; the market value of these shares was around Rs. 1,900 crores in 1962. It had declined by about Rs. 350 crores in recent months. The new issue activity came to a complete standstill since the declaration of the Emergency.

Equities on the Bombay Stock Exchange, after opening lower, staged a smart rally. A majority of the counters recorded handsome gains. Encouraging corporate news was the main bullish factor; the easy money conditions and absence of untoward political developments aided the sentiment. The rumours that the margin system might be revised assisted the situation favourably.

★★

Thanks to the energetic measures taken by the State Government, adequate stocks of rice have been built up. The Maharashtra Government has promised of 2,20,000 tons of rice; further stocks, if necessary, will be provided from Andhra Pradesh account. Since last October, the State Government has succeeded in doubling the stock position of rice. The off-take of rice in fair price shops in Greater Bombay works out to an average of 7,500 tons per month; in the districts, monthly off-take is 12,500 tons. The total off-take of rice in Maharashtra is therefore around 20,000 tons per month. The State being deficit in the production of rice, it has to depend mainly on Madhya Pradesh for its open market rice. The State received 2.68 lakh tons from Madhya Pradesh during 1962 season; so far, this year, it has received 90,000 tons. The short-fall in rice production in Madhya Pradesh sent up the rice prices in Maharashtra. Hence the new arrangements. The wheat position is extremely comfortable since October.

1962. It has been found that the highest expenditure incurred by an individual in Maharashtra is on food group. The middle classes in Bombay City spend 42 per cent of the income on food and the city's working class spends 57 per cent. In Poona City, 60 per cent of income is spent on food by the working class. In the rural areas of the State the proportion is as high as 73 per cent. The expenditure on clothing and footwear comes to 3 per cent for middle classes, 9 per cent for labour classes in Bombay City and 11 per cent in the rural areas. The importance of holding food prices cannot be under-emphasized. Speaking to a Study Group during the week-end, the Finance Minister, Mr. S. G. Barve, expressed the opinion that full-scale rationing of essential commodities was no trouble-free solution to the present problems. A much more practicable alternative was the fair-price shop system. Those who advocated introduction of full rationing of essential commodities did not appreciate the administrative difficulties and abuses to which such rationing was likely to give rise.

★★

The Maharashtra Housing Board has been contemplating to evict several hundreds of Housing Board tenants in industrial workers' colonies with incomes exceeding Rs. 350 per month. These tenements are heavily subsidized and it is the contention of the Board that such workers belong to low income group and do not come under the category of industrial workers. Those in the higher income bracket in the Housing colonies would be given 18 months' time to vacate. Although this rule was in the original Agreement, the Housing Board has chosen to enforce it now. If the rule is enforced, nearly 50 per cent of the tenants in industrial workers' colonies in Bombay will have to vacate their premises. The representatives of tenants are meeting the Housing Minister next week. Why not declare

the industrial workers' colonies into low income group colonies and charge them additional rent? The Government would do well to consider this alternative and avoid large-scale misery in the context of acute housing shortage in the city.

★★

There was a further spurt in deposits and sizable contraction in bank credit during the week ended July 12. Deposits increased by Rs. 14 crores and credit contracted by Rs. 16 crores. The investments went up by an equivalent amount (Rs. 30 crores). The slack season (1963) contraction in credit so far has amounted to Rs. 77 crores as against Rs. 18 crores in the corresponding period of last year. The deposit growth in the period too has been satisfactory because it amounted to Rs. 68 crores as compared to Rs. 46 crores in the corresponding period of 1962. It is evident that the loan floatations are coming at the right moment. The Deputy Governor, Mr. M. V. Rangachari, summoned the leading bankers to discuss the support for the loan programme. It is understood that they promised to do their best but requested that liberal facilities at the Bank rate should be given to banks against Government securities in the next busy season. The bankers seem to stipulate relaxation of credit control for supporting the Government loan programme.

The results of important banking institutions in the first half of 1963 published so far clearly indicate that the impact of the super profits tax has not been heavy and that on account of a higher level of earnings the disposable profits have been well maintained more or less at the same level as in the corresponding period of 1962. With a larger capital ranking for dividends in many cases, the transfers to reserves may not be probably on the same scale as before. All the banks which declared results so far, Dena, Bank of India, Bank of Baroda and Central, maintained dividends on higher capital.

Lyons Range Regains Confidence

From Our Correspondent

CALCUTTA:

IT IS A MEASURE of the revival of confidence in the stock market that Lyons Range has continued to look cheerful despite the fact that two of its important guesses were proved wrong. Enthusiasm had been whipped up following the higher dividend announced by TISCO and bulls on Lyons Range took it for granted that equally good news awaited the shareholders from the other private sector steel company. But before long the authoritative news of the IISCO dividend was announced and it falsified expectations. It was announced by the company that it had decided to recommend to the general meeting of shareholders a dividend of Rs. 1.60 per share subject to tax for the year ended 31 March, 1963, same as last year. According to a brief report issued by the company, net profit for the accounting year ended March 1963 after providing for depreciation, taxation and allocations to reserves amounted to Rs. 1,91,87,975 as compared with Rs. 2,24,90,390 in the previous year. Provision for depreciation is higher at Rs. 3,40,18,269 against Rs. 3,35,24,699 while allocations to reserves have also been increased to Rs. 3,64,01,226 from Rs. 2,98,38,206. Taxation gets a smaller provision at Rs. 3,56,00,000 as against Rs. 3,95,50,000 last year. As is to be expected the news caused some disappointment and consequent marking down of the price of the scrip. Even so bulls were not deterred and continued to maintain their hold on the market presumably encouraged by the assumption that the high reserves and lower allocation to taxation were favourable factors that augured well for some good news to the shareholders, if not now, at least in the immediate future. Similar disappointment awaited the market two days later in the shape of a cut in the dividend by Hindustan

Motors, another active forward scrip about which there had been much speculation immediately prior to the announcement of the dividend. A dividend of Rs. 1.15 per share subject to tax has been recommended by Hindustan Motors as against Rs. 1.25 paid last year. This again failed to diminish bullish fervour to any appreciable extent and after the initial disappointment had been overcome the stock market was found to resume its twice interrupted onward march.

Bright Outlook

It is evident that operators at least believe that the outlook for stock market has brightened in the past few weeks mainly in view of the interest evinced by Authority to revive the capital market. It is confidently believed that before long institutional investors may be persuaded to lend active support to the stock market, while on its part Government may think it necessary to relax the present restrictions governing trading. It is also believed that the working of industries will receive much more attention than hitherto by the increasing availability of raw materials. The fact that more of untied foreign aid will be available for the current year has encouraged optimism in this regard. The comparatively minor changes in the Central Cabinet have also helped the revival of confidence. A significant feature of trading during the past few days when speculative activity has been gathering momentum, is that the genuine investor has been by and large a passive spectator. There are too few incentives still for him to make purchases worthwhile and he can ill afford to withstand another landslide if it should come. The investment situation is too nebulous what with the emergency on and the corporate sector reeling under the weight of this

year's taxation to enter the stock market with the confidence that his investments will bring him an equitable return in the near future. And it is doubtful if the present steadiness of the stock market can last long if the investor continues to remain unresponsive.

★★
The overall statistical position of jute goods seems to be fairly satisfactory. Production during June was placed at 100,300 tonnes comprising 41,500 tonnes hessian, 40,000 tonnes sacking and 18,800 tonnes other categories as compared with 104,900 tonnes in the previous month. The decline in production last month is mainly due to the fact that it was a short working month when mills worked for 194 hours as against 216 hours worked in the previous month. The decline in production has been shared by both the main categories while the output of other categories has been maintained at the previous month's level, indicating the growing demand for carpet backing hessian etc. That the outgo during June has been at a satisfactory level is borne out by the figures for despatches. Despatches of jute goods in June amounted to 99,000 tonnes and these are only 1,300 tonnes lower than the month's production. A closer look at the figures for despatches will show that while hessian and other goods continue to be in good demand the position of sacking is getting weaker on the export markets. The total despatches of 99,000 tonnes are made up of 75,300 tonnes for export abroad and 23,700 tonnes for local purposes. Hessian despatches for export have been higher at 39,100 tonnes but those of sacking at 19,500 tonnes are 3,700 tonnes lower than in the previous month. The growing importance of new products in the export trade of jute goods is shown in the rising trend of offtake in other goods the despatches of which for export abroad during June totalled 16,700 tonnes.

Barlap Consumption Falls

For the current month however the indications so far have not been very encouraging. Foreign enquiries have not been many and even hessian has come to be neglected. The apprehension that buyers in US may slow down purchases has been heightened by the decline in burlap consumption in that country during last month. Consumers in US absorbed only 68.8 million yards in June as compared with their offtake of 76.2 million yards in the previous month, while the stocks at the end of the month declined only slightly to 259.9 million yards. The decline in burlap consumption in US has been interpreted to mean that buying in that country is being influenced by the large availability of jute this season. During the past few days trading in the jute goods market in Calcutta had been governed by various rumours. At one time rumour had it that Argentina would be placing a sizable order but nothing came out of that. The market is however

still entertaining the hope that prospects for exports to the UK would improve in view of the reported move in that country to substantially reduce the mark-up on jute goods. It has been reported that following the representation made both by the Indian Jute Mills Association and the Jute goods trade in UK, the Board of Trade has under consideration a proposal to cut the mark-up from the prevailing level of 20 per cent to as low as 5 per cent. At present consumers of jute goods in UK are obliged to pay a high price for their requirements as imports are marked up in price to accommodate the domestic jute industry whose cost of production is high. This at once puts the domestic consumers at a disadvantage and the exporting countries like India are also not able to expand their despatches to UK.

★★
It is just as well that the recent meeting between Government representatives and the steel manufacturers both in the private and public sectors has not come to any hasty decision over the removal of control over distribution and price of steel. For a change in the present system of steel distribution should have decided advantages and should also ensure that the reasonable requirements of all consumers, big and small are satisfied. That the present system of distribution needs revision is now the opinion of experts also. How the present arrangement militates against the effective use of even available supplies has been explained last week in Calcutta by Mr. D. K. Moondhra when he presided over the annual meeting of the Steel Importers Association of India. It is the experience of consumers that they do not either receive supplies in time from the main producers or if received such supplies are not balanced so that the job on hand is delayed in its execution. Mr Moondhra says that the reason for this state of affairs will be found to be the undue emphasis on production figures by the steel producers without paying much heed to the actual requirements. In their anxiety to show high levels of output, sections for which there are heavy orders and which give them a large production in comparison with other sections are preferred while scant attention is paid to sections for which the demand is not so heavy. The question of decontrol has therefore to be very carefully examined for its repercussions on various consumers. Some of the safeguards that should obtain even when control is lifted are indicated by Mr Moondhra and will bear repetition: prices should not be increased to an unreasonable level as otherwise consumers who have pending orders would be adversely affected; regular supplies to medium and small scale industries should be assured; sections which are in short supply should be regularly planned for rolling and equitable distribution to the different parts of the country should be assured.

Will Lignite, Oil Infuse Greater Hope?

From Our Correspondent

MADRAS:

THE DISCLOSURE by Mr. R. Venkataraman, the Madras Minister for Industries and Power, at the Industrial Seminar held at Karaikudi in Ramanathapuram District last week that efforts are being made to locate lignite deposits in the district has raised hopes that the Madras State may be able to overcome its deficiencies in regard to coal and water power resources and develop into an even more important industrialised area. What lignite can achieve is now being clearly demonstrated by the developments in the Neyveli area where, even under difficult conditions, lignite or brown coal is being mined and thermal power is being generated using this mineral as fuel. From 1965, chemical fertilizers, briquettes and various by-products will begin to be available. Extensive drilling operations are being carried out in Ramanathapuram

District which is the most backward area in the State and the quality of lignite drilled so far has been found satisfactory. In fact, it is claimed that it is even superior to Neyveli lignite and, if sufficient reserves are available, there will not be any serious problem of mining because there would be no water below the lignite seam. For quite sometime, the authorities at Neyveli had to contend with the problem of keeping down the pressure of under-water aquifers and there were doubting Thomases who were sceptical of lignite being mined successfully in the Neyveli area. As thermal power, fertilizers and various by-products from briquettes can result in the industrialization of a large area, the availability of lignite in another part of the State in fairly large quantities would be helpful to generate more thermal power besides enabling the establishment of fertilizer units or such other industries as could be based on lignite as fuel or raw material. Pending

the completion of the drilling operations and a reliable estimate of available reserves, it would be incorrect to draw up plans for industrialization of this area. But the positive manner in which Mr. R. Venkataraman made the disclosure has given rise to the expectation that lignite in sizable quantities would be located in the Karaikudi-Devakottai area and Ramanathapuram District can expect to develop in a better manner on account of this discovery.

This backward region can hope to benefit from the efforts made to locate also oil reserves. Already, some exploration parties of the Oil & Natural Gas Commission are working in this area. There is a feeling that the oil belt may extend from Pattukottai in Thanjavur District to Tiruvadanai in Ramanathapuram District. It is premature to say that oil reserves in commercial quantities would become available in the Cauvery Basin. But the Russian geologists who have been very successful in the Ankleshwar and Cambay region seem to be optimistic about a similar success in their exploration for oil in the South. It is needless to say that the discovery of lignite and oil in exploitable quantities can make all the difference to the economy of the districts concerned not to speak of the State as a whole.

Utilizing Known Resources

It is, however, pointed out that even if oil and lignite were found, it may take a number of years to make the necessary arrangements for their exploitation. In the meantime, it was, therefore, agreed at the Seminar, which was sponsored by the State Government and attended by a large number of industrialists belonging to the District, that immediate steps should be taken to utilize known resources and ancillary light engineering industries, which would feed the Central projects at Tiruchirappalli and Bangalore, should be promoted. Besides, the large deposits of high-grade limestone could be used for manufacturing cement and soda ash. There is already a cement unit (the first stage of expansion for installing a kiln having a capacity of 350 tons daily has just been completed taking the total to the licensed capacity in existence) while there are plans for promoting another unit based on limestone deposits in the coastal area in the same district. The State Government has also suggested that a large-sized unit for manufacturing soda ash can be located while there are proposals for establishing a number of spinning units to supply the yarn required by the handloom weavers in the area. A steel rolling mill is in operation in Virudhunagar while there are numerous spinning units at Rajapalayam and elsewhere. The Chief Minister, who hails from this district, is naturally anxious that arrangements should also be made to provide irrigation facilities for the parched areas with the help of Kerala. The course of developments in the next few years is sure to be watched with keen interest.

But what is noteworthy is the alertness of the State's Industries Minister to achieve balanced industrial development in all the districts and put to maximum use available resources. It is intended that similar seminars should be held in every district and Madurai will be the next venue.

★★

The need for increasing agricultural production by using to the maximum extent the newly created irrigation facilities has been latterly emphasised. The Planning Commission is naturally upset over the waste of new resources in West Bengal, Orissa and Andhra Pradesh. In the traditionally rain-fed areas the ryot has not been keen to use water from the new projects on payment though it is clear that the value of additional output would be very much more. However, in Andhra Pradesh and Mysore, the former State particularly, the problems that have to be confronted are different. The large arid areas served by the Tungabhadra project require heavy capital expenditure and farm labour in large numbers. As the population in the district served by this project is sparse, for quite a long time, the cultivated

area was only a fraction of the potential area. Latterly, good progress has been made and in the next three years the Rs. 108-crore Tungabhadra project would be irrigating over a million acres and the value of additional output of paddy and commercial crops would be easily Rs. 20 crores. The power generated from the units having an installed capacity of 172 MW. ultimately would also help the promotion of many industries besides relieving considerably the shortage now being experienced in Andhra Pradesh.

★★

Two South Indian banks have published their results for the first half of 1963. Following the experience of bigger institutions in Northern India, it is gratifying to note that both Indian Bank and Indian Overseas Bank have been able to report an increase in their earnings notwithstanding a higher level of working expenses. The performance of Indian Bank, however, should be considered more gratifying as, after the setback suffered by this institution sometime back, deposits have been growing in volume and now stand at the highest level in the history of the institution. In the past twelve months particularly there has been an increase of over Rs. 4 crores taking the total to over Rs. 49 crores. The net profit for the six months under reference, after providing for income-tax and super profits tax, was higher at Rs. 8.96 lakhs against Rs. 8.29 lakhs for the corresponding period of 1962. It is learnt that the liability towards super profits tax was roughly about Rs. 1.8 lakhs. The addition to working funds has therefore, enabled the bank to earn larger profits though the shareholders have not derived any benefit on account of the better working results. After transferring to general reserves Rs. 1.80 lakhs, a dividend and bonus of 7 per cent, taxable, is to be paid which is half the distribution for the whole of 1962. In the first half of 1963, the distribution was 7½ per cent, taxable, but it was found necessary to reduce the final payment to 6½ per cent making a total payment of 14 per cent, taxable. Actually, prior to the announcement of the new tax measures, the Directors had declared a final dividend of 7½ per cent making the total for the year 15 per cent, taxable. The distribution had to be reduced because of the need to provide an additional amount towards SPT. This bank has recently been authorised to collect deposits under the Compulsory Deposit Scheme.

Indian Overseas Bank has also earned a larger profit, before taxation, of Rs. 20.76 lakhs for the first six months of 1963 against Rs. 19.33 lakhs in the corresponding period of 1962. This bank has also been adding to its deposits and it is expected that when its programme to open a large number of branches during the year is completed the increase in working funds would be quite sizable. No interim dividend has been declared as this bank usually makes annual payments.

★★

In the Madras Stock Market there has been continued activity especially as Bombay advices have been encouraging. It was also felt that there would be a suitable revision of selling prices for Rayon Yarn and Travancore Rayon and South India Viscose would, consequently, be able to report better results during 1963. But there was brisk buying of plantation issues and the three counters belonging to the Peirce Leslie group were very active. Calcutta interests are still reported to be keen on absorbing large parcels. As other interests also got active, there was a sharp rise in the rates for Chembra Peak, Ouchterlony Valley and Periakaramalai. At one stage, there was a rise of nearly Re. 1 in less than a fortnight to Rs. 3.90 for Periakaramalai while OV were done up to Rs. 4.60 and Chembra Peak to Rs. 4.50. At the higher levels, the main buyers withdrew from the market, perhaps temporarily. With offerings from holders, prices were marked down. The cornering operations, have still to be completed and the three scrips may continue to be in favour for some time yet.

THE E.I.D.-PARRY GROUP
1963

INDIAN SUGAR

FOR CANADA

"The State Trading Corporation has concluded a contract for the supply of one lakh tons of sugar to Canada, during 1963. Half of the estimated sale proceeds of Rupees Four Crores will be utilised for importing fertilisers, newsprint and wood pulp. The other half will be a nett foreign exchange saving."

—News Item.

The five sugar factories of the E. I. D.—Parry Group, located at Nellikuppam, Pugalur, Pettaivaythalai, Samalkot and Tiruvalla, produce 90,000 tons of sugar every year—the largest production from a single group in South India, representing one-fifth of the annual consumption in South India. In addition, 3000 tons of confectionery are also produced.

Both sugar and confectionery are exported, earning foreign exchange for the country.

The E.I.D.—Parry Group is also concerned with the production and distribution of substantial quantities of fertilisers and in 1963 the Group expects to supply about 200,000 tons.

This significant contribution is expected to be further increased when expansion programmes are realised.

Other manufactures of the Group include sanitary-ware, light railway equipment, acids, chemicals, carbonic acid gas and industrial and potable alcohol.

Started as a small trading concern in 1788, the Group today comprises nine companies of substance, offering employment to more than 10,000 people, and keeps on expanding its activities in pace with the nation's march to economic independence.

THE E.I.D.—PARRY GROUP, MADRAS

PLAY YOUR PART IN THE NATIONAL DEFENCE EFFORT

The moving fingerprints

WHAT I LIKE most about the changes in the Government announced by Mr. Nehru last week is that they have been so successfully kept secret. If I am not mistaken "The Hindu" alone among the national newspapers was able to anticipate—and this it did the day before the announcement—the induction of Dr. K. L. Rao, but even "The Hindu" correspondent went wrong in the matter of portfolios; he indicated that Dr. Rao was to be given the Ministry of Mines and Fuel. It is, of course, true that most papers agreed that Mr. K. C. Reddy would be out, but Mr. Reddy's exit, I would point out, was in the nature of a foregone conclusion and no sleuthing was, therefore, involved. It is possible, of course, that the changes could be kept secret only because they were a few and that, had Mr. Nehru decided to add to or subtract from the Cabinet on a more substantial scale, news would certainly have leaked out. It would have been difficult also to keep his intentions secret had he put through a plan of considerable reshuffling of portfolios. It is largely because Mr. Nehru did so little that not much was known in advance of what he was going to do. In this sense, embarrassed newsmen in the Capital, who have been "foxed" by the Prime Minister, need not perhaps entertain as poor a view of themselves as newspaper readers, recalling some of the front-page stories on impending Cabinet changes which appeared in the earlier part of last week, might be inclined to adopt.

About the recruitment of Dr. Rao, there are two views in Government and political circles here. One view of course is that the selection of a technical expert for a portfolio which is, in its day-to-day administration, largely of a technical nature, is an appropriate decision. But I have also heard a different opinion expressed. I have heard it said that, while Dr. Rao may be wise about high dams and all that, the Ministry of Irrigation and Power is being frequently called upon to consider high policy issues of which disputes over inter-State rivers are only one. Those who hold this view doubt that Dr. Rao has sufficient background or will have enough political authority to play effectively the role of mediator or co-ordinator at a national level. There is also a suggestion that the elevation to ministerial rank of an ex-official, who had only recently retired from a post rather in the middle ranks of Government service, is likely to cause embarrassment to senior Civil Servants. Incidentally, it appears that Dr. Rao's name was considered in April, 1962, for a Deputy Ministership in the Irrigation and Power Ministry. His present appointment seems to have been sponsored by the President, Dr Radhakrishnan.

I had always thought that news is made when man bites dog, not when dog bites man. I am, therefore, rather amused by the fuss which the columnists in the daily Press have been making over the Voice of America deal not having been discussed in the Cabinet before the agreement was signed. I could have understood the excitement had the Cabinet been consulted, for is it not one of the established conventions of the Nehru Government that important issues of policy are not as a rule, brought on the agenda for Cabinet meetings? There has also been a complaint that our Ministers lack a sense of collective responsibility and one explanation perhaps is that Mr. Nehru in fact has no use for collective responsibility. It has been complained again that our Ministers tend to talk behind one another's back about policy matters as well as personal affairs. But is it not only natural that they should do so, seeing that they have no legitimate opportunity for discussing policy questions among themselves? It is, of course, true that, while Mr. Nehru may be the principal sinner, he is surely not the only sinner in respect of the state

of affairs. It does seem to suit many Ministers that collective responsibility should not be enforced through adequate consultations and discussions at Cabinet meetings. Some of them certainly seem to want to enjoy the privilege of detached observation and criticism of colleagues' policies — a privilege which they cannot lay claim to with an easy conscience if policy matters are properly discussed at the Cabinet level before decisions are taken in the name of the Government.

I learn with great interest—which I have no doubt that my readers will share—that for Mr. J. R. D. Tata, who joined Tata Sons as an Assistant in July, 1922, today marks his silver jubilee as Chairman of that organization. The 'Tata Monthly Bulletin' notes: "The years of Mr. Tata's stewardship have been years of dynamic growth. Leafing through our records, we find that in the last 25 years most of our older companies have expanded rapidly and a large number of new enterprises have been born. These include the Tata Engineering and Locomotive Company, Tata Chemicals, Voltas, National-Ekco Radio, Investa Machine Tools, Indian Tube Company, Tata-Fison and Tata Finlay. Into this family was also born Air-India International, now no longer with us, yet maintaining its proud position under the Chairmanship of Mr. Tata. In other fields, the Tata Memorial Hospital for Cancer, now gifted to the nation, the Tata Institute of Fundamental Research, which has grown into one of the most advanced institutions of its kind, and the Tata Institute of Social Sciences, an acknowledged leader in its field, all bear testimony to Mr. Tata's contribution to the growth and vitality of our organization."

As one of our most dynamic business leaders for over 41 years now, Mr J. R. D. Tata, I am sure, may look forward to opportunities even more spacious, as India's industrialisation progresses and makes increasingly important demands on entrepreneurs of high character and calibre.

V.B.

A HARE OF SORTS

Trade Winds

INDIAN EXHIBITION IN MOSCOW

THE FIRST Indian national exhibition, the biggest ever organised by India abroad, was opened by Mr. Khrushchev, the Soviet Premier, July 20, 1963. The main object of the exhibition is to further strengthen the friendship and co-operation between India and the USSR. No exhibition ever held abroad has been more representative of India's trade and industry than the present one. About 850 units, representing different industries in public and private sectors are participating in the exhibition. The exhibition has been so conceived as to give the visitor a fairly comprehensive and integrated picture of the economic and industrial development of India since independence as also the progress made in the social and cultural spheres.

The atomic energy appliances, iron and steel products, heavy engineering goods, machine tools and steel forgings, agricultural machinery and diesel engines, electrical appliances, radios, chemicals and pharmaceuticals are all well displayed in the engineering section. Indian textiles, transport services and agricultural products have each a section to themselves and depict the progress attained in their respective fields.

Stress is laid on small and medium industries and consumer goods. The bronze and wood sculptures, several centuries old, bring to life the masterly workmanship of India's famed artists and sculptors. Kashmiri handicrafts, carpets and woollen and leather products take one whole wing to show the Kashmiri craftsman's artistry. Bhilai takes pride of place with huge pictures showing molten steel pouring out of this plant to help industrialisation of India. There are pictorial sections of heavy machine building plant and other ventures being undertaken with the collaboration of the Soviet Union. There are also innumerable charts, photographs etc., showing one aspect of India or the other. One can see in them Bhakra, Damodar Valley, Hirakud, Chittaranjan, Rourkela, Sindri etc.

The organisers of the exhibition have taken pains to display as attractively as possible all the commodities that India sells or would sell in the Soviet Union and have taken every care to see that the Soviet trade organisations are able to have a close and comprehensive view of a wide variety of goods produced by India's growing industry. For this purpose, the first two hours of every day are set aside exclusively for representatives of import and export agencies and other trade officials. The exhibition is bound to give a further boost to Indo-Soviet trade which has been rising steadily ever since the first trade agreement was signed in December, 1953 between the two countries.

FOREIGN TRADE INSTITUTE

The Board of Trade had recommended last year the establishment of the Indian Institute of Foreign Trade in order to conduct market and area surveys so as to locate the potential consumer areas for our exports all over the world in an effort to raise India's export earnings. On August 5, 1963, the Governing Body of the Institute will meet at New Delhi to formulate and adopt the Memorandum and the Articles of the new body. It will be an autonomous organization and will have the support of the Government, trade and industry, university and educational and research institutions. Broadly, the Institute will take within the domain of its activities all those functions which have a direct or indirect bearing on India's external trade. In addition to conducting market surveys, the Institute will undertake specialized documentation and publicity on all the facets of foreign trade. It will also collect and disseminate information on foreign trade and will attempt to imbibe all that is useful from its counterparts in the U.K. and the Soviet Union. It may be stated that in the United Kingdom the

"Institute of Exports" plays a very important part in the foreign trade of the country and in the Soviet Union the "Academy of Foreign Trade" and the "Marketing Research Institute"—which function as apex bodies—assist in a large measure in the foreign trade of the country.

The management of the Institute will be in the hands of a Governing Body; the Chairman of the Body will be nominated by the Government and the Governing Body will function through a Director-General having overall executive responsibilities for the day-to-day functioning of the Institute. It is proposed to appoint Directors for Marketing Research, Commodity Research, Commercial Intelligence and Training for the assistance of the Director-General; all the necessary staff will be recruited for the achievement of the objectives outlined above.

A special feature of the Institute is that the membership of the General Body of the Institute has been thrown open to all persons, companies or other institutions who are willing to pay a sum of Rs. 2,000 per annum or Rs. 20,000 lump-sum. It will ensure the participation of all those who are interested in India's foreign trade and will go a long way in establishing a liaison between the Institute and the exporters.

While the broad objective of the Institute is to increase India's exports, the Institute will also conduct commodity surveys within the country in order to determine the export potential of the various commodities. These surveys will assist in formulating long-term plans for the export of particular commodities and processed goods. The Institute proposes to have a comprehensive training programme also for all persons engaged in foreign trade whether in the Government or in the private sector. The basic course for training will be organised once in a year and will train 25 students. A refresher course will also be organised.

The thinking behind the setting up of the Institute is a good one and needs all support, but, unfortunately, the pace at which it is progressing is a depressing one. The Institute, at the present rate, may not start functioning by the end of the year. It means the fruits of work of the Institute will be available some time at the end of the third Plan and can be of avail in formulating export targets for the fourth and the fifth five-year Plans only.

EXPORT OF LAMBRETTA SCOOTERS

S.S. "Flying Trader" sailed away to Bangkok (Thailand) last Wednesday (24th July) with 76 Lambrettas. This is the first consignment of India-built scooters to be exported so far. The order, which will fetch a little over a lakh of rupees of foreign exchange, was from the Police Department of the Government of Thailand and could well be the first of such orders from South-East Asia, provided the Italian principals (Messrs. Innocent) of the producers of Lambretta in India raise no objection. It is not clear whether such approval would be always and readily forthcoming. Even in the present instance, India got the order by open global tenders—there were 23 bidders from all over the world—because Italy was prevented from quoting, as the deal happens to be part of a US aid programme which stipulates that the purchases should be only from underdeveloped countries.

The Automobile Products of India Ltd., who are the manufacturers in India of Lambrettas, have a capacity to produce, only 40 units per day, with the result that there is a large backlog of unfulfilled orders. On the basis of their present capacity, it is said, they are fully booked for the next ten years! Meanwhile, of the other five units or so licensed, only two have been commissioned and one more is on the way to start, but unable to do so, being stalled for some parts and raw materials, consequent on the emergency. Notwith-

standing all this fortuitous advantage, it does not seem API has made any profit on its first export deal, even after making allowances for the drawback of import and excise duties on the exported units and the benefit of import licences for goods permitted to be imported accruing therefrom. If this is the case when the API is producing only 68 per cent—this will rise to 90 per cent by next year — of the components of a scooter, it is obvious that the authorities must offer far better inducements than now to enable the industry to build up an export market for our scooters.

CENTRAL MECHANISED FARM AT JETSAR

The Government of India have accepted the recommendations of the Damle Committee in regard to the setting up of a second central mechanised farm at Jetsar. To begin with, the farm will be of 10,000 acres. By marginal adjustment in operating costs, the area may be expanded to 12,500 acres. The land required for setting up the farm is proposed to be taken from the Rajasthan Government on lease for a period of thirty years in the first instance under the same terms and conditions as for the land under the Suratgarh farm. Machinery and equipment for the farm such as tractors, agricultural implements etc., will be obtained from the Soviet Union against rupee payment. In the initial stages the Jetsar farm will be run as an extension of the Suratgarh farm. The cropping pattern in the Jetsar farm will have a greater bias in favour of cash crops like oilseeds and cotton. Under perennial irrigation conditions the farm is expected to be self-financing. Perennial irrigation supplies for the entire area of the Jetsar farm are expected to be provided from the Rajasthan Canal by 1970.

SWISS CREDIT FOR INDIA

Switzerland has agreed to extend long-term credits to India by another 30 million Swiss francs. The credits are to enable India to continue to buy Swiss equipment for her development projects. Since July, 1960, Swiss banks have loaned to India 110 million francs under federal guarantee. The additional credits bring the amount to 140 million francs, all payable in 10 years.

GOLD REFINERY FOR MADRAS

For the supply of 14-carat gold to goldsmiths, a gold refinery is proposed to be set up in Madras on a co-operative basis early next month. The refinery, which is being organised by the industrial co-operative wing of the Industries Department at the initiative of the State Industries Minister to provide employment for goldsmiths and to rehabilitate them, will convert daily 5 kgs. of pure gold into 14-carat gold of weighing nearly 9 kgs. by alloying it with copper, silver and a small quantity of zinc. About Rs. 1.80 crores worth of 14-carat gold is expected to be turned out annually at the refinery and supplied to over 450 goldsmiths for the manufacture of 14-carat jewellery.

BRITISH AID FOR DEVELOPING COUNTRIES

That the British aid to India and Pakistan has been growing over the last few years is evident from the report of the Bank of England published in London recently. This aid has not only increased for India and Pakistan but for many other countries as well which have achieved political independence more recently. To cite the figures, British aid for developing countries expanded over the last five years by 83 per cent. Development aid by the countries of the Organisation for Economic Co-operation and Development (of which Britain is a member) rose by about 80 per cent during the same period. In the financial year 1962-63 assistance by the British Government amounted to £143 million—an 83 per cent increase over the figure of £81 million in 1957-58.

MANUFACTURE OF PRINTING MACHINERY

The Government of India have accepted the recommendations of the Panel appointed in June, 1962 to investigate and

report on the printing machinery industry in the country. The terms of reference of the Panel were to assess the requirements of various kinds of printing machinery, to review the existing capacity for the manufacture of printing machinery and to recommend to the Government measures for making the country self-sufficient in regard to printing machinery.

The Panel has recommended that collaboration with reliable foreign manufacturers should be encouraged while approving the schemes for indigenous manufacture. The Panel feels that steps should also be taken to ensure that only the latest successful models are approved for indigenous production. The sizes of printing machines to be developed in the country should be such as to conform to the international sizes of paper, with adequate margin. Other considerations in determining the types of machines to be developed are the raw materials used in the manufacture of paper, the increase in the demand for colour printing, the wide variations in the circulation demands of newspapers arising out of the use of a large number of regional languages and the lack of power in the rural areas. The Panel favours the manufacture of platen presses (other than the cylindrical inking type), cylinder machines, rotary machines and proof presses.

The output of printing machinery in the country in 1961 was worth Rs. 10 lakhs. The demand has now been assessed at Rs. 7.5 crores per year by the end of the third Plan and Rs. 12 crores per year by the end of fourth Plan.

FREIGHT RATES FOR CARGOES

Under an agreement signed with the United Kingdom-Continent/India-Pakistan Conference in September, 1962, the quantum of rebate accruing on governmental cargoes imported from the United Kingdom and north continent was enhanced from 10 per cent to 15 per cent, resulting in foreign exchange saving of about Rs. 50 lakhs per annum. A three-man delegation led by the Chief Controller of Chartering has now gone to the USA to negotiate concessions in freight rates for governmental cargoes.

With the encouraging response from the Union Ministries, State Governments and over two hundred public sector undertakings concerned in making purchases on f.o.b. basis and sales on c.i.f. basis, and with better liaison and co-ordination with the shipping lines, it has been possible to allocate a substantial proportion of cargoes to Indian vessels. The tonnage of government cargoes allocated to Indian shipping has increased from 158,974 tons (13.3 per cent) in 1960 to 329,260 tons (38.2 per cent) in 1962, against corresponding tonnage of cargoes lifted by foreign shipping totalling 10,34,337 tons and 5,32,775 tons respectively.

EXPORT OF MANGANESE ORE

A six-member committee has been appointed by the Government of India to examine measures to step up exports of manganese ore. The committee will be headed by Mr. M. Butt, Joint-Secretary, Union Ministry of Mines and Fuel. Its other members will be Mr. T. V. Rama Rao, Divisional Manager, State Trading Corporation, Mr. S. Rajagopalan, Director (Transport), Ministry of Commerce and Industry, Mr. R. S. Stead, Managing Director, Manganese Ore (India) Ltd., Mr. S. Lal of S. Lal & Co. (Private) Ltd., Mr. J. C. Gandhi, Western Indian Trading Company and Mr. A. M. Hussain, Assistant Mineral Economist, Indian Bureau of Mines.

The terms of reference of the committee are to review and report on the present state of affairs of the manganese mining industry in all sectors and examine the projected developmental measures that are being contemplated and the extent of competition being faced by the industry in some principal markets such as the USA, Japan and the UK. It will recommend appropriate measures for the rationalisation and modernisation of the manganese mining industry in its various sectors such as labour, management of mines, blending and beneficiation and transportation, including facilities at ports.

Company Affairs

OIL INDIA: AN EVENTFUL YEAR

MR. KHANDUBHAI K. DESAI, M.P., Chairman of Oil India Limited, highlighted some important events which marked the progress of the company, while addressing the shareholders at the annual general meeting held recently. The Chinese aggression, he stressed, has inspired Oil India to be more productive because oil is a vital commodity for the country's defence. With a view to achieving maximum output, steps are being taken to expand the capacity of Barauni and Gauhati refineries by 1966 so that the total production of refined products in this area including also the Digboi refinery could be increased to over 4.50 million tons. With that end in view Oil India obtained its prospecting licence for 1,291 square miles in area 'A' during the year. Another application for exploration licence of 595 square miles is now pending before the Government. Further survey work is being pursued and the company has obtained the services of the seismic team from the Oil & Natural Gas Commission. Considerable work has been done by this survey and hopeful results are expected.

The Chairman indicated that during the year 25 wells were drilled of which 19 were oil producers, 2 dry and 4 await further testing. The company also claims credit for being the first to adopt the new technique of "dual completion" which would enable simultaneous production from two horizons in the same well. Another new technique which it adopted is directional drilling in order to tap oil resources under the bed of Burhi Dihing river. These techniques are being implemented for the first time in India. Another major achievement was the completion of the crude conditioning plant in Nahorkatiya. The 16" sector of the company's pipeline was put into commission in March 1962, and it has been supplying crude continuously to the Gauhati Refinery. The 720-mile long pipeline connecting the oilfields in Nahorkatiya and Moran with the Government refineries is now ready and supplies to the Barauni refinery can start as soon as necessary. The final tele-communication facilities are expected to be completed by October, 1963. A special sub-committee set up with the representatives of the Assam Government has made a study of the problems connected with production and supply of gas from the company's oil fields to potential consumers. The Chairman hopes that actual demand for gas will develop in two years, when the State Electricity Supply Board and the fertilizer factory at Namrup start production.

HIND MOTORS

The Board of Directors of Hindustan Motors Ltd. has decided to pay a taxable dividend of Rs. 1.15 per equity share for the year ended March 31, 1963, as against Rs. 1.25 per equity share taxable paid previously. This excludes those preference shares converted into ordinary shares on and after April 1, 1963. In order to pay this dividend, a dividend reserve is created to the extent of Rs. 93.13 lakhs. A dividend of 8.57 per cent is recommended on the preference shares. According to a short report, the net profit after providing for depreciation, development rebate and taxation works out to Rs. 1.19 crores as against Rs. 152.45 lakhs last year. A sum of Rs. 25 lakhs has been provided for general reserve and Rs. 3,043 have been carried forward.

TATA OIL

The Chairman of the Tata Oil Mills Company Ltd. has given indication of a long-term view of the company's modernisation and expansion programme in the statement appended to the annual results of the company. He indicates that the company is enjoying an incentive against its exports as a part

of the foreign exchange is available to it for import of machinery and spare parts. The company is taking special advantage of this situation and has imported machinery to modernise its plants. The laundry soap plant in Bombay has been completely reorganized and partly the plant at Calcutta too. The factory at Ghaziabad will have the modern laundry soap plant from the start. Steps are also being taken to reorganise the oil refinery and deodourisation units of the vanaspati plant at Tatapuram which are more than 30 years old. The company has been granted a licence to manufacture synthetic detergents and the Government has approved of the company's taking a foreign exchange loan from ICICI for the import of plant from Europe for which orders have already been placed.

Another venture in which Tata Oil along with other Tata concerns is participating is manufacture of instant tea and packaged tea to be undertaken by Tata-Finlay Private Ltd. This project has made good progress and has been approved by the Government. The Tata-Finlay instant tea will be manufactured under licence from a wholly-owned subsidiary of James Finlay and Company who have developed the process and patented it. The instant tea factory is being built at Munnar and is expected to be ready for operation in about a year's time. This tea will be made available, in the first instance, for export to European and American markets. The additional capital expenditure involved in the instant tea project is expected to be around Rs. 90 lakhs and the total capital of Tata Finlay Ltd. will be about Rs. 150 lakhs of which Tata Oil will take about Rs. 37.50 lakhs.

ELECTRIC CONSTRUCTION'S ISSUE

Electric Construction and Equipment Company Ltd., propose to raise additional capital shortly by the issue of preference shares to finance a part of its programme for expansion of the existing units and the execution of new development schemes. The company's authorised capital is Rs. 3 crores made up of 50,000 preference shares of Rs. 100 each and 25,00,000 equity shares of Rs. 10 each. The issued and paid-up capital is Rs. 60.93 lakhs, all in equity shares.

It has proposed to issue 15,500 redeemable cumulative preference shares (9.3 per cent) of Rs. 100 each repayable in 12 years. Of these, 3003 shares have already been subscribed by the existing shareholders and the balance of 12,497 shares will be offered for public subscription. The company was incorporated in West Bengal with the object of repairing and servicing electrical equipment. Later on, it started manufacturing electrical equipment after considerable expansion programme and is now one of the leading manufacturers of power and distribution transformers, switchgears, electric motors and starters with foreign technical collaboration. It is also manufacturing Schindler lifts with the collaboration of Schindler and Company Ltd., of Switzerland. The company has a chain of factories. A new unit for the manufacture of power and distribution transformers commenced production in March, 1962 under the name of Andhra Pradesh Electrical Equipment Corporation at Visakhapatnam. The company proposes to increase the transformer capacity of this unit and also undertake the manufacture of switchgears.

A new unit for the manufacture of energy meters is under construction at Hyderabad in technical collaboration with an East German firm. The licensed capacity is 60,000 single phase meters and 18,000 polyphase meters per year. The

TALK SHOP— IN EUROPE

Europe is a busy centre
for world trade—and the right
market for your goods.
Jet them with Air-India—and profit.

Our Boeings serve Europe
7 times a week! Speed, safe
handling and 10000 lbs. of capacity
per flight are at your service for promoting
your exports to expanding European
markets—and it is economical too!

Take advantage of bulk discounts
and low commodity rates and save on
packaging, insurance and handling charges.

Cut down your lubricants Cut out your paper-work

Help your Purchase Officer to eliminate the stacks of paper that collect in his office...the unnecessary flood of Purchase Orders. When each department in a plant specifies a lubricant without reference to the purchases of other departments, there is bound to be duplication and waste.

The Caltex "Stop-Loss" programme can do away with this lubrication waste...can cut a great deal of Purchase Order paper-work.

Caltex "Stop-Loss" is a complete plan for organising lubrication on an efficient basis. There is no other programme like it.

It will be worth your while to find out specifically how Caltex "Stop-Loss" can help to ease the problems in your plant.

Help your operation to greater profit with the Caltex "Stop-Loss" programme.

required plant and machinery have been imported and production is expected to commence shortly.

KEYTUO CHEMICAL PROJECT

Keytuo Chemicals Ltd. proposes to undertake the manufacture of styrene emulsions, plastisol from PVC for coating and foam and basic inorganic chemicals like potassium chloride, magnesium carbonate, sodium sulphate and table salt. The first two items, styrene emulsions and plastisol are relatively new industrial items to be manufactured in the country for the first time and offer a variety of uses. The capital outlay on this project is estimated at Rs. 10 lakhs of which 51 per cent will be held by the directors and their friends, while 49 per cent is to be offered for public subscriptions. The factory will be located at Andheri near Bombay.

KIRLOSKAR PNEUMATIC

The Kirloskar Pneumatic Company Ltd. continued to record steady growth. After making usual provisions, it showed a net profit of Rs. 8.86 lakhs against Rs. 6.52 lakhs during the previous year. A sum of Rs. 4.60 lakhs has been provided or depreciation, Rs. 10.22 lakhs for taxation, Rs. 1.86 lakhs for statutory development rebate reserve and Rs. 2.34 lakhs for managing agents. The ordinary dividend has been cut from 12½ per cent to 10 per cent, both subject to taxation. Holders of equity shares converted from preference shares are entitled to preference dividend up to effective date of conversion and the equity dividend after that date.

KIRLOSKAR OIL ENGINES

The Kirloskar Oil Engines Ltd. has shown higher gross profit of Rs. 109.76 lakhs for the year to March 31, 1963, against Rs. 95.73 lakhs in the previous year. The net profit, however, is lower at Rs. 28.85 lakhs against Rs. 40.58 lakhs. This decline is essentially due to heavy provision for taxation at Rs. 61 lakhs as against Rs. 37 lakhs last year. Other provisions include Rs. 13.49 lakhs for depreciation, Rs. 3.86 lakhs for development rebate reserve, Rs. 10 lakhs for general reserve and Rs. 4 lakhs for rehabilitation reserve. It may be noticed that sales during the year had moved up from Rs. 3.95 crores last year to Rs. 4.72 crores during the year under review. The ordinary dividend has been reduced from 16 per cent to 12 per cent, subject to tax, but it is on increased capital.

CENTRAL BANK

The Directors of the Central Bank of India Ltd. have maintained the interim dividend distribution at Rs. 2.40 a share, subject to tax for the half year ended June 30, 1963, absorbing Rs. 30.28 lakhs. The net profit for the period is slightly better at Rs. 89.88 lakhs compared with Rs. 88.33 lakhs in the corresponding period last year. The carry forward from last year's account is only Rs. 93,249 against a substantial sum of Rs. 23.36 lakhs brought in during the period last year with the result that the carry-over in next account is substantially lower at Rs. 60.53 lakhs, subject to taxation, against Rs. 81.45 lakhs carried forward at this time last year.

BANK OF INDIA

The Bank of India Ltd. has reported a lower gross profit of Rs. 47.01 lakhs for the half-year ended June 30, 1963, as compared to Rs. 47.50 lakhs in the corresponding period of 1962. The Directors have, however, proposed to maintain the ad-interim dividend at Rs. 4 per share, subject to tax, on the increased capital of Rs. 4.05 crores. The dividend will absorb Rs. 32.40 lakhs as against Rs. 24 lakhs. A sum of Rs. 27.71 lakhs, subject to tax, has been carried forward against Rs. 13.10 lakhs brought in.

BANK OF BARODA

The Bank of Baroda Ltd. has shown a higher profit of Rs. 26.10 lakhs for the half-year ended June 30, 1963, as com-

pared to Rs. 25.40 lakhs for the corresponding period of 1962, after providing for taxation inclusive of super-profits tax for 1962 and for the first half of 1963. The Directors have proposed to pay an ad-interim dividend of Rs. 4 per share, subject to tax, on the increased capital which will absorb Rs. 16 lakhs. A sum of Rs. 13.57 lakhs has been carried forward against Rs. 3.47 lakhs brought in.

RUBY GENERAL INSURANCE

The Ruby General Insurance Company Ltd. has shown considerable progress in its working for the year 1962. The next premium income in respect of fire, marine and miscellaneous accident departments has increased from Rs. 181.80 lakhs last year to Rs. 185.12 lakhs during the year under review. All the three departments have shown underwritten profits which amounted to Rs. 21.91 lakhs. The reserves for the unexpired risks at the end of the year stand at Rs. 99.48 lakhs and the funds of the company have increased by Rs. 10.77 lakhs to Rs. 167.75 lakhs. The profit, including interest and dividend income and after meeting other expenses amounts to Rs. 30.36 lakhs. The net profit, after transferring Rs. 17 lakhs to reserve for taxation and including the carry-over of Rs. 4.95 lakhs from the previous year is Rs. 18.31 lakhs. The Directors have proposed to provide Rs. 3.5 lakhs towards general reserve, Rs. 5.00 lakhs towards dividend equalisation reserve, Rs. 4.70 lakhs towards investment reserve and Rs. 5.11 lakhs towards dividend reserve. The Directors have recommended the payment of a dividend at the rate of Rs. 1.25 nP. per share subject to deduction of tax (against Rs. 1.05 including Silver Jubilee bonus of 25 nP. a share paid last year) from the dividend reserve, which will absorb Rs. 5 lakhs. It is indicated that general reserve has been further strengthened by transfer of Rs. 50,000 and Rs. 1,00,000 respectively from doubtful debts reserve and forfeited dividends respectively and now stands around Rs. 10 lakhs. The Company has purchased a plot of land in Calcutta to erect a multi-storeyed office building.

ORIENTAL INSURANCE

During the first quarter of 1963, the Oriental Fire and General Insurance Company Ltd. has received over 2,50,000 applications under the Emergency Risks (Goods) Insurance Act and the Emergency Risks (Factories) Insurance Act and dealt with various enquiries from the public relating to these schemes. This was disclosed by Mr. B. K. Kaul at the annual general meeting of the company held recently in Bombay. The year 1962 may be termed as the full year of the working of the company as an integrated unit after the passing of the Bombay High Court orders in December 1961 regarding the amalgamation of the National Fire and General Insurance Company Ltd. and the Asiatic Government Security Fire and General Insurance Company Ltd. with this company. The process of amalgamation has been smooth both in India and abroad. The company is exploring the possibility of further expansion.

During 1962 the total net premium written was to the extent of Rs. 492.29 lakhs against Rs. 434.30 lakhs in 1961. Net claims were Rs. 276.16 lakhs and Rs. 213.04 lakhs respectively for 1962 and 1961. The Directors have recommended the payment of a dividend of Rs. 6 (six per cent), subject to deduction of tax, on the paid-up value of shares for the year under review.

CAPITAL ISSUES

The Controller of Capital Issues has authorized the following six companies to issue capital totalling Rs. 3.55 crores. The consent is valid for 12 months.

Bharat Auto Parts Manufacturers (Private) Ltd., Gujarat, is to issue Rs. 50 lakhs capital. It is divided into 4,000 equity and 1,000 preference shares, of Rs. 1,000 each,

Shares of the value of Rs. 45 lakhs will be issued to Indian nationals resident in Africa.

East India Pharmaceutical Works Ltd., Calcutta is raising fresh capital of Rs. 11 lakhs divided into 1,10,000 equity (bonus) shares of Rs. 10 each on capitalization of the general reserves.

International Tractor Company of India Ltd., is raising Rs. 1.50 crores equity capital in shares of Rs. 10 each. This is in supersession of the previous consent dated November 20, 1962, for Rs. 1 crore capital. Shares of the value of Rs. 25.50 lakhs will be issued to International Harvester Co. of Chicago, against capital goods.

Assam Coke Oven & Briquette Co. Ltd., has been given consent to issue capital of Rs. 20 lakhs, divided into 2 lakh equity shares of Rs. 10 each, for cash at par.

Industrial Plants Ltd., Calcutta will issue capital of Rs. 75 lakhs for cash at par. The capital is divided into Rs. 55 lakhs in equity and Rs. 20 lakhs in 9.3 per cent preference shares.

Modi Sugar Mills Ltd., Modinagar, is to issue capital of Rs. 50 lakhs divided into 5,000 7 per cent debenture units of Rs. 1,000 each for cash at par.

LICENCES ISSUED

The following firms have been granted licences under the Industries (Development and Regulation) Act, 1951, during the week ending 13th July, 1963. The list contains the names and places of the licensees, articles of manufacture and annual installed capacity:

IRON & STEEL

Miss Sarojini Nanavaty Sannidhi, Rajghat, New Delhi, Proposed name: M.S. and Alloy Electrodes (Pvt.) Ltd., (Punjab)—Mild Steel and Alloy welding electrodes 60 million R.Ft.

OTHER METALS

Shri R. Venkataswamy Naidu, The Madras Aluminium Co. Ltd., Race Course, Coimbatore (Mettur, Madras)—(1) Aluminium Rods for the manufacture of ACSR/AAC—3000 Metric tons. (2) Aluminium rolled products (including about 1500 Metric tons of Aluminium strips) — 3500 Metric tons. (3) Aluminium extrusions 1000 Metric tons.

COAL

East Jamuria Coal Co., 135, Canning Street, Calcutta (West Bengal)—Coal 6,000 tonnes.

INTERNAL COMBUSTION ENGINES

Mercantile & Industrial Development Co. Pvt. Ltd., National House, 6, Tulloch Road, Appollo Bunder, Bombay-1 (Maharashtra)—Micro-Filters 470 Nos. per annum. Water Separators/Filters—250 Nos.

GENERATION EQUIPMENT

W.S. Insulators of India Ltd., 33, Errabalu Chetty St., Madras-1 (Madras)—Porcelain fuse cutouts of all types, Enclosed, open & distribution by pass switches and of all voltages—1200 Nos.

ELECTRONIC EQUIPMENT

Permanent Magnets Ltd. Janmabhoomi Bhavan, Ghogha St., Fort, Bombay-1 (Maharashtra)—Hard Ferrite (Ceramic Magnets)—180 tons.

AUTOMOBILES

Punj Sons (Pvt.) Ltd., Punj House, M-13, Connaught Circus, New Delhi-1 (Delhi)—Bodies for Trucks 3000 Nos.

CONVEYING EQUIPMENT

Shri A. K. Sen, P.7, Belegghata Main Road, Calcutta-10. Name of the Undertaking: M/s. Conveyor Equipments Ltd.

(24 - Parganas, West Bengal). Different kinds of roller conveyors, overhead trolley conveyors, for bulk and package handling—Rs. 70 lakhs.

POWER DRIVEN PUMPS

S.L.M. Maneklal Industries Ltd., Bank of India Building, Baroda, Ahmedabad-1 (Vatwa, Ahmedabad, Gujarat)—Root blowers and watering pumps shifting from Maharashtra to Vatwa, Ahmedabad, Gujarat.

MACHINE TOOLS

Pioneer Equipment Co. (Pvt.) Ltd., 139, Meadows Street, P.B. No. 1909, Bombay-1 (Gujarat). Grarity die casting Machine—25 Nos. per annum. Presme die casting machine 10 Nos. per annum. Dies for the above Rs. 10 lacs worth.

COTTON TEXTILES

The Kaleeswarar Mills Ltd., 10/8, Annupperpalayam Road, Coimbatore (Kalayar Koil, Madras)—Cotton yarn 16,000 spindles. Change of location of part of the capacity within the same state from Coimbatore to Kalayar Koil. The South India Co-operative Spg. Mills Ltd., Pethai Post, Tirunelveli-4 (Pettai P.O., Madras)—Cotton yarn 12,000 spindles. Shri M. B. Kadadi, Chief Promoter Sholapur Co-operative Spg. Mills Ltd., Ganga Niwas Railway Lines, Sholapur (Sholapur, Maharashtra)—Cotton yarn 12,000 spindles.

WOOLLEN TEXTILES

Oswal Woollen Mills, Millerganj, Ludhiana (Ludhiana, Punjab)—Woollen fabrics 16 power-loom.

SYNTHETIC FIBRES

Samridhi Spg. Mills, Agra Road, Ghatkopar, Bombay-77 (Maharashtra)—Staple fibre yarn 12,000 spindles after expansion.

VEGETABLE OILS

Shri Navin Chandra Chandulal Parikh, Petlad, Distt. Kaira (Petlad, Gujarat)—Cotton seed oil by solvent extraction process—100 tons of cotton seed per day or 20,000 tons of cotton seed.

LICENCES REVOKED

(During the week ending 13th July, 1963)

M/s. Mehrotra Bros., Calcutta—Steel forgings. M/s. Tata Chemicals Ltd., Bombay—Lindane. M/s. Ullas Oil & Chemical Industries Private Ltd., Bombay—Tamarind seed oil and oil free tamarind seed powder.

CHANGES IN NAMES

(During the week ending 13th July, 1963)

From M/s. Mohanwi Corporation Private Ltd., New Delhi to M/s. Allied International Products Ltd., New Delhi. From Shri L. G. Ramamurthi, Coimbatore, to Name of the Undertaking: M/s. Festo Elgi Private Ltd., Coimbatore. From M/s. Bombay Oxygen Co., Bombay, to M/s. Industrial Oxygen Company Private Ltd., Bombay. From Name of the original undertaking: M/s. Hind Mills Ltd., Ahmedabad, to (1) Name of the new undertaking: M/s. The Ahmedabad Jupiter Spinning Weaving and Manufacturing Co. Ltd., Jupiter Mills No. 2, Ahmedabad. (2) Name of the new owner: M/s. M. Parakash and Co. Private Ltd., Ahmedabad-1. From name of the undertaking: The Calicut Modern Spinning and Weaving Mills Ltd., Bombay. From name of the Licensee: Shri K. N. Ananthasivan, Kottayam, to M/s. Kottayam Textiles Ltd., Kottayam. From M/s. Shri Arwind Cotton Mills Ltd., Calcutta, to M/s. Dumraon Textiles Ltd., Calcutta. From M/s. National Magaldi Private Ltd., Calcutta, to M/s. the National Tannery Co. Ltd., Calcutta.

BOOKS BRIEFLY

Some Unorthodox Verdicts

British Statesmen in India: By V. B. Kulkarni; Published by Orient Longmans, Bombay; Pages 550; Price Rs. 20.

THIS IS by no means a collection merely of the biographical sketches of a cross-section of Governors-General and Vice-roys who ruled this country during the British regime. It is a frank attempt to trace and interpret historical currents during the British period in the context of the personalities that were deputed to preside over their course and occasionally to determine their direction. About half of the Governors-General have been selected in this volume as representing the different aspects of British rule in India. But the central thesis on which this book rests is that the historical forces are far more important than the personalities who were themselves propelled by them, that the events in which these statesmen participated were far more momentous than their contribution to them.

They were subject to a positive limitation which restricted whatever freedom would have been otherwise available to them to produce their personal impact on the events and developments during their tenures — barring, of course, exceptional cases of domineering personalities. They had to function as agents to execute policies framed in London and certainly they were not clothed with the authority of plenipotentiaries. The author has effectively dispelled the impression that they were allowed to exercise any substantial discretion in shaping or modifying the policies. Those who attempted to act on such an assumption or who opposed authority at home had to quit office. Lord Wellesley was overbearing and arrogant in his attitude to the Board of Directors whom he openly held in contempt. It was more for this insufferable attitude than on account of the defeat of Monsoon and Lake at the hands of Indian forces that he invited recall. Lord Northbrook refused to yield to the pressure of Lancashire, exerted through Lord Salisbury, the Secretary of State for India, and vehemently upheld the policy of non-intervention in Afghanistan, besides making no secret of his radical differences with his chief. His inept handling of the Gaekwar affair served as an occasion to make resignation an

honourable way of departure. More instances of this kind can be picked up.

A change in our appreciation of British rule is bound to come, leading to a more objective view. It is a question of time only before the lapses and excesses committed during the period are forgotten. This process has already started—earlier than expected—because of the voluntary transfer of power by India's erstwhile rulers. The author firmly believes in a more rational appraisal of British rule and is, on that account, rather unconventional in his verdict. Warren Hastings, for instance, is adjudged to be a statesman devoted to promoting the cause of friendship and understanding between the two countries. Lord Dalhousie is assessed in an altogether unorthodox light. It is asserted that he was "by no means an innovator either in initiating the doctrine of lapse or in chastising misgovernment by annexation." If he really had an insatiable expansionist lust, as is generally believed, "free India would not have inherited the problem of States in such heart-breaking complexity. Expediency rather than a well-considered and consistent policy guided his relations with the States". A high tribute is paid to him, when he is acclaimed as the maker of modern India and in corroboration it is emphasised that the "political settlements which he made endured in all their essentials till the country's partition in 1947"—for nearly a full century. Both these assessments are not altogether devoid of an element of exaggeration.

Among the other outstanding personalities, Bentinck and Curzon attract attention in his book. Bentinck's unique contribution was his bold policy of social reform born out of his faith in the philosophy of liberalism. Reference to the abolition of the practice of 'sati' is appropriately accompanied by the amplification that, on the highest authority, self-immolation of widows was practised among the ancient Scythians and Thracians as well as, much later, among the Greeks, Germans, Slavs and other continental races. Time has falsified Curzon's dogmatic belief in the impracticability of self-rule for India. But recognition has been made frankly for his one contribution of survival value—the preservation of our ancient monuments and the stimulus given to historical research.

Readers' Roundtable

WHERE THE BLAME LIES

Sir, — The rise in prices in recent months has affected apparently everyone and everything except the cost of living index. The index is based on a pattern of consumption which no longer obtains in the country, and hence does not give a correct picture of the price situation.

Various explanations have been given by the planning authorities for the rise in prices. It is said that agriculture has failed to develop sufficiently; that the administration has failed to develop sufficiently; that the administration has failed to develop sufficiently; that taxes have increased cost of production and prices; that profiteers and hoarders are active, etc. It is surprising that the main culprit responsible for this price rise, the Planning Commission itself, has escaped all attention.

The current price rise is the direct result of the Soviet model of planning adopted by the Planning Commission and implemented through the second and third five-year Plans. The emphasis on heavy industry to the neglect of our basic asset, viz. agriculture, and of consumer goods industries; the attempt to invest beyond the saving capacity of the country, thus occasioning inflationary deficit financing; the creation of a large Public Sector of industries wherein investment of about

Rs. 1,200 crores is fetching a negligible return of barely 4 per cent; the setting up of intricate controls and creation of a huge bureaucracy (about 75 lakhs at all levels) to implement them, leading to frustration of the productive enterprise of private citizens; the evolution of a class of professional politicians who thrive on public funds; and heavy direct and indirect taxes on productive enterprise with a view to levelling down all people in the name of equality — all these have led over a period of time to a steep rise in prices. Unless the Soviet model of planning is given up and more realistic planning is adopted, the crisis will persist and deepen. Moreover, the curious position of the Planning Commission, possessing unlimited powers over the economy, without any accountability to the public or Parliament, has increased the scope for irresponsible experiments. The anomaly needs to be rectified.

The Government has to revert to its primary functions of defence, of maintaining law and order, and providing the institutional framework (law of contract etc.) and the infrastructure (good roads, education, communications etc.) of economic development. The productive energies of private citizens should be allowed to produce more wealth for the country unhampered by ideological measures.

BOMBAY

"ARISTIDES"

COMPANY MEETING

OIL INDIA LIMITED

(A 50:50 Cooperative Enterprise of the Government of India and the Burmah Oil Company for Prospecting, Drilling, Production and Transport of Crude Oil from Upper Assam to Refineries in Gauhati, Assam and Barauni, Bihar)

Statement of the Chairman, Shri Khandubhai K. Desai, M.P., to the shareholders on the occasion of the fourth annual general meeting of the Company held on Friday, 21st June 1963, at Duliagan, Upper Assam.

GENTLEMEN: I have pleasure in presenting to you the Report of the Directors, and the Annual Accounts of the Company for the year 1962. Owing to certain restrictions imposed under the emergency, I regret that it has not been possible to circulate these Reports as usual.

GENERAL: The past year has been a most eventful one for our country due to the Chinese aggression and their attacks on our NEFA border in October. This event has had its repercussions, both directly and indirectly on Oil India. Our oilfields are situated in the North-East corner of Assam. At the height of the emergency last year it became necessary to make arrangements for evacuation of the families of our personnel from the oilfields. I am glad to say that this was done smoothly and efficiently and within the shortest possible time. Subsequently, it has been possible to allow the families to return to their homes. Our staff, however, stuck to their posts through the period, and carried on with the motto "business as usual". I would like to pay here my tribute to the staff—labour, clerical and executive for the spirit of constancy they showed throughout.

Security precautions due to the emergency required, however, a certain diversion of our resources, and this has resulted in some slowing down of operations and of our construction works.

In a wider sphere the Chinese Aggression has highlighted the need to maximise our production of petroleum products both to save foreign exchange and as a vital necessity of our defence effort. As far as the Eastern area is concerned, steps are being taken by the Government of India to expand the capacity of Barauni and Gauhati Refineries by 1966 so that the total production of refined products in this area including also the Digboi Refinery could be increased to over 4½ million tons. Naturally Oil India would have to make every effort to increase the production potential of crude oil both in our existing oilfields as well as in the new areas for which we have been granted exploration licences in order to meet as much as possible of these increased requirements. The Oil and Natural Gas Commission will be making a similar effort in their own areas in Assam.

I would now like to refer particularly to some of the highlights which marked our activities during the past year.

ROYALTY & EXPLORATION: I am happy to say that the dispute regarding Royalty has been satisfactorily settled with the Prime Minister's award last November, which fixed this at a rate of Rs. 7.50 per ton and Oil India is now paying royalty on this basis. Soon after, we also obtained our prospecting licence for 1291 sq. miles in Area 'A'. Another application for exploration licence

of 595 sq. miles is now pending before the authorities concerned. Arrangements for starting a seismic survey in the former area were taken in hand immediately, but this had to be postponed due to the Emergency. However, early in 1963, we decided to speed up the survey work and for this purpose, we were fortunate in obtaining the services of a seismic team from the Oil & Natural Gas Commission. The seismic survey started in March, 1963 and a considerable amount of work has already been done. Needless to say in the light of the latest requirements, these operations including drilling of test wells will have to be carried out on the most intensive scale possible and this question is now engaging the Management's attention. I would like here to express my thanks to the Oil & Natural Gas Commission and the Ministry of Mines & Fuel for their assistance in making this survey party available and also express our appreciation of the very good work done by the seismic team in this relatively short period.

OILFIELD OPERATIONS: Last year, 25 wells were drilled of which 19 were oil producers, 2 dry and 4 await further testing. Our progress in drilling was somewhat delayed, partly because of troubles in land acquisition during the middle of the year and later on with the slowing down of certain operations necessitated by the emergency. Owing largely to the assistance and co-operation given to us by the Assam Government and the local authorities, we were able to overcome the difficulties in regard to land acquisition and the work is now going on unhampered.

Oil India can claim credit for two 'firsts' in our drilling programme. Recently we adopted the new technique of "Dual Completion" which would enable simultaneous production from two horizons in the same well. This is still more or less in an experimental stage though we have successfully drilled one dual well and the second one is in progress. Another new technique which OIL adopted is directional (deviated) drilling in order to tap oil resources under the bed of the Burhi Dihing river; and up to date we have successfully completed three wells through this method. This is the first time these techniques in oil drilling are being employed in India.

CRUDE CONDITIONING PLANT: Another major achievement of this year was the completion of the Crude Conditioning Plant in Nahorkatiya, the first one of its kind in any part of the world. The plant has been brought into commission from February, 1963, and conditioned crude is now being supplied to the Gauhati Refinery. A similar plant is under construction in Moran.

PIPELINES: The 16" sector of our pipeline was put into commission in March, 1962, and has been supplying crude continuously to the Gauhati Refinery. I am glad to say that the 14" sector is also now ready for commissioning with the completion of hydraulic testing in February, 1963. Actually this testing would have been completed even earlier, but was delayed due to a number of pipe failures which had to be rectified.

The 720 mile long pipeline connecting the oilfields in Nahorkatiya and Moran with the Government Refineries is now ready and supplies to the Barauni Refinery can start as soon as required. The final telecommunication facilities are expected to be completed by October, 1963, but sufficient facilities have been installed already to enable the pipeline to be commissioned and operated manually. The Burmah Oil Company (Pipe lines) Limited, which superintended the design and construction of the work and the contractors who participated in this effort deserve to be congratulated on a difficult job well done.

FINANCE: In the financial sphere the outstanding event was the floatation of our Rs. 30 crores debenture issue to finance the rupee cost of the pipeline. This is the largest single debenture stock so far put on the Indian Market and I would like to take this opportunity of placing on record our deep appreciation for the keen interest and invaluable guidance given by the Reserve Bank of India and the State Bank of India in making this debenture issue a success. In addition, I would also like to thank all the many other financial and banking institutions who also gave assistance in the issue.

A second major event related to the conversion of our Sterling overdraft of £10 million with the Bank of Scotland to a medium-term loan. Arrangements have now been finalised for raising these funds partly by loan from banking institutions; and partly by debentures floated in London by The Burmah Oil Company Limited, and this amount will now be granted as a direct loan from the Bank of Scotland to Oil India repayable over a period of 15 years.

I should like to refer briefly to our Profit and Loss Account for this year. Owing to certain recurrent troubles in the Refinery the offtake of crude by Gauhati was much less than anticipated. The commissioning of Barauni Refinery has also been delayed and it is now expected that the first stage will go on stream only in October-December, 1963. The result has been a corresponding curtailment in our sales of crude oil, the total being only 5,50,000 tons. Our unit costs of production excluding drilling and development costs have improved, the figures being Rs. 8 per ton in 1962 as compared to Rs. 13 per ton in 1961. On the other hand with the commissioning of the first stage of our pipeline and the creation of further assets in our oilfields, we have to make a much larger provision for depreciation than last year. After taking into account the price adjustment under the Second Supplemental Agreement, providing for full depreciation for assessed properties and transferring last year's surplus to the profit and loss account, we have recommended a final dividend of Rs. 90 per share for the year 1962. An interim dividend of Rs. 40 was declared and paid in December 1962, and the remaining Rs. 50 is now being paid. The net return on equity for 1962 will thus be 6½ per cent after deducting dividend tax.

GAS: A Special Sub-Committee set up for this purpose, with the representatives of the Assam Government has made a study of the problems connected with the production and supply of gas from our oilfields to potential consumers and has made certain recommendations which are now being considered by your Board. It is expected, however, that the actual demand for gas will only develop in

about 2 years time when the State Electricity Supply Board, and the Fertilizer Factory at Namrup commence production, along with the development of other industries in this area. Meanwhile we have begun to supply gas requirements to some of the surrounding tea gardens in Assam and we are also continuing to sell our gas to meet the requirements of the Assam Oil Company.

STAFF: The year 1962 was the first year in which Oil India directly employed its own staff and became a distinct and separate organisation. As from January 1st 1962, we had taken on our own pay rolls all the staff required who were hitherto employees of the Assam Oil Company Limited although the Assam Oil Company will continue to render certain residuary services under a new services agreement which we have concluded with them. As you would gather from what I have said, the year has been marked for Oil India by some notable achievements and I would like to record here my appreciation to all the staff for the loyal services rendered and the good work done by all the employees of the Company, during the year. I would also like to thank my colleagues in the Board for their active assistance and cooperation on all occasions. In particular, I would like to mention Mr J. C. Finlay, Managing Director and Shri P. Govindan Nair, Financial Director, who have worked most closely together to make this year a successful year for Oil India Limited. I also take this opportunity of expressing my thanks to the Ministry of Mines & Fuel and the Government of Assam for their valuable assistance.

EASTERN ECONOMIST

Twentieth Anniversary Number

In this special issue of June 7, 1963 Eastern Economist takes pleasure in presenting its readers with a rich fare of articles on various aspects of the Indian economy and a special section devoted to the study of industrial development in the various States. Contributors include the U.S.S.R. Ambassador in India, Mr. K. D. Malaviya, Dr. P. S. Lokanathan, Mr. K. Santhanam and Mr. Tarlok Singh.

Extensively illustrated with charts and statistical tables, this special number is priced Rs. 5 per copy, but is available to regular subscribers without any extra charge on annual subscription.

RECORDS AND STATISTICS

Export Finance

THE MINISTRY of Commerce and Industry appointed in May last year a Study Group to review the credit facilities available in the country for developing export trade and to suggest measures which would be necessary to strengthen and supplement the existing financial export institutions. The eight-member Study Group was headed by Mr. K. P. Mathrani, chairman of the Industrial Finance Corporation of India. The Study Group has released its Report and a summary of their findings and recommendations is given below:

Since the end of the last war, there have been significant changes in the character and composition of world trade. New methods have been employed to capture overseas markets; and international competition has become intense. For countries like India the task of increasing export trade is rendered all the more difficult by import restrictions, tariff barriers, and the formation of economic communities.

The overseas buyer now dictates terms in regard to price, quality and dates of delivery; and, above all, insists, more than ever before, on credit terms. The difficult balance of payments position in many countries makes it imperative for importers to ask—and sometimes to hold out—for credits of varying duration. Indeed in some countries the source of external finance and payment terms are often reckoned, by the import and exchange control authorities, nearly as important a deciding factor as price and quality, and official regulations have been aimed, for understandable reasons, at influencing payment terms.

Export credit—its supply and cost—has thus assumed a new significance in international trade. In consequence, the leading exporting countries of the world have had to develop their own systems and institutions of export finance with a view to fostering their external trade. It is against this background that an attempt is made here to analyse the problem of supply and cost of credit, in its broad perspective, in the light of the country's needs. An export drive designed to attain, in the next seven to eight years, the targets of our Plans will require, inter alia, credit facilities over a wide range of our export trade.

Short-Term Finance

Essentially, the problem of export credit boils down to its: (a) availability and (b) cost. The question of availability of pre-shipment credit needs to be viewed from the standpoint of both the manufacturer-exporter as well as the trader engaged in export business. Whereas the well established exporters are largely able to secure their credit requirements from the banks, the 'second line' borrowers have some special problems and difficulties in obtaining pre-shipment credit which tend to stifle their export effort. Several instances have been cited.

The experience of banks in the 'new' markets has not been altogether satisfactory; and they are somewhat hesitant to grant credit for exports to these areas. The problem is not merely of adequate security but of assessing the risk on the basis of information about the markets and overseas buyers. Firstly, the representatives of exporters and Indian banks should be encouraged to go abroad to explore markets, estab-

lish connections with the banking institutions and importing agencies at the receiving end. Secondly, the machinery for providing continuous information regarding the pattern of trade, market conditions and business links for Indian exporters with local buyers should be strengthened. This will enable the Indian banks to liberalise their credit facilities to Indian exporters in respect of these new areas.

An important problem which faces a large number of exporters is the financing of the 'gap' between the domestic prices and the f.o.b. value of the exported goods. No doubt various incentives compensate the exporter, to an extent, for the 'difference' in the two sets of prices. But the issue of incentive licences takes some time. Meanwhile, the commercial banks make their advances on the basis of the f.o.b. values. In consequence, if the f.o.b. values are lower than the domestic prices, say, by 25 per cent, the amount of credit which the exporters can get would be of the order of about 60-70 per cent in terms of the domestic prices. When credit is provided subject to such a large margin, the exporter finds it difficult to finance the balance of 40 per cent. It would greatly enhance the effectiveness of the scheme of incentives, if some arrangement could be devised whereby the exporters are able to obtain credit, as far as practicable, on the basis of domestic prices, with due regard to the schemes of incentives and not merely on the basis of the f.o.b. value of the exported goods.

Post-Shipment Credit

Post-shipment credit may take the form of either 'negotiation' of export bills (demand and usance) or 'acceptance' of export bills for collection. According to an estimate of the Reserve Bank, the proportion of export bills for 'collection' was 19.8 per cent in 1961. The ratio is rather high, considering that from the viewpoint of banks' earnings, as well as the availability of funds to exporters, 'negotiation' of bills should be preferable to their 'collection'. It is understood that about 71 per cent of the total volume of bills accepted by them for 'collection' in 1961 was from the big exporters (i.e. exporters with an annual export turnover of Rs. 10 lakhs and more). As the bulk of the exporters whose bills are accepted for 'collection' are predominantly big exporters, it should be presumed that they would have been able to secure their advances from the banks; and it is predominantly the small and medium exporters who seem unable to get from banks their full requirements.

Suggestions

(i) **Pre-shipment credit facilities.** Banks, no doubt, give 'packing credit' — i.e. finance at the pre-shipment stage for the purpose of purchasing, processing and packing goods for the export market. These facilities are normally available to persons of undoubted means and standing; but banks are somewhat hesitant in making such advances to the second line exporters. To meet the difficulty ERIC is now offering a cover — "the packing credit policy" — which is designed to assist exporters to secure credits somewhat above the line of the banks' normal rating of their capacity. ERIC indemnifies the lending institution against exporter's default to the extent of 50 per cent of the loss. Some banks have represented that if ERIC could raise the limit of its indemnity to them, it will be possible for them to liberalise their pre-shipment advances to exporters. As ERIC's experience in regard to its packing

credit policy has been satisfactory, it seems to us that it could improve its guarantee to banks from the present limit of 50 per cent to 66-2/3 per cent, without incurring undue risk and with considerable advantage to exporters. If the proposed measure is taken, some of the difficulties of the exporters at the pre-shipment stage would be resolved.

We recommend that the Reserve Bank should obtain, periodically, information on packing credit advanced by banks and exercise its moral suasion with them to follow a more liberal policy.

(ii) **Post-shipment Credit Facilities.** Whenever a bank grants packing credit facilities to exporters, it normally gives them also the facility to discount their bills. When, on the basis of the proposed improved guarantees to banks by ERIC, packing credit facilities become available in a more liberal measure, exporters will also be eligible for the discounting facilities, which, at the moment, are not readily available to them. Thus their problem of post-shipment export credit will be considerably facilitated, the more so if exporters partaking of the benefits of packing credit facilities also obtain ERIC's 'Shipments Risks Policies' which will give them complete protection against commercial and political risks arising from the default or insolvency of the buyer or hazards of political upheavals, embargoes on exchange remittances, import restrictions etc. ERIC's policies are a useful collateral acceptable to banks; and if the knowledge about their benefits spreads more widely among exporters and full use is made of them, the banks will be more forthcoming in discounting the exporters' bills which are now accepted only for collection.

(iii) **Facilities in respect of Exports on Consignments.** The main items sent on consignment are tea, mica iron and manganese ores, handicrafts and tobacco. These goods accounted for nearly 64 per cent of the total bills accepted by leading banks for 'collection' in 1961. As far as tea is concerned, the drawers, in the main, are the producers themselves; and so the need of export credit, by and large, does not arise. On the other hand, in the case of mica, mineral ores and handicrafts lack of standardization and wide price fluctuations render the task of banks somewhat difficult. Banks can do little to help these exporters, unless steps are taken by Government to provide suitable pre-shipment inspection and grading facilities; and, if necessary, suitable guarantee to them against losses, based on pre-shipment inspection, grading and standardization of goods.

(iv) **Credit against the Price Gap.** Export credit is related to the value stated in the shipping documents. As the f.o.b. values are often lower than the domestic price of the goods in question, it follows that the credit which the exporter is thus able to get is considerably smaller than what he would get on the basis of hypothecation of his goods to finance his local sales. This shortfall in the bank advances available to him inhibits his export effort. To enable the banks to bring their lending to the exporter in line with their advances on the basis of domestic prices, it will be necessary to give an assurance to the banks to the effect that should the exporter default the bank will be recompensed to an agreed extent. Accordingly, a scheme of guarantee should be evolved, in consultation with the Reserve Bank, on the basis of which banks would be covered against the loss in financing the difference between what they would normally lend on the basis of export bills and the domestic value of goods destined for the export market.

ERIC's guarantee might cover up to 25 per cent of the f.o.b. value of the goods exported, the size of the price gap or the amount to be covered being left to the lending bank to determine.

We recommend that the administration of the scheme be entrusted to ERIC. Should any loss occur, ERIC could have recourse to the Guarantee Scheme, much in the same way as do the Reserve Bank and the Refinance Corporation. Separate proforma account of these transactions should be maintained. When ERIC is merged in the new institution, this activity inter alia would be transferred to it.

ERIC's indemnity to the banks should be 75 per cent of the possible loss, and the amount should be reimbursed to the banks six months after the due date of payment.

We also recommend that the Reserve Bank should give additional borrowing facilities to the banks to enable them to finance transactions arising from the price gap mentioned above.

The scheme should ordinarily apply only in respect of such exporters, as come within the purview of the export incentive schemes. This would make it possible to deal with defaulters departmentally.

If ERIC's export risks insurance covers and its 'non-acceptance' policy are more widely used, the banks will have at their disposal a useful collateral; and this should enable them to liberalise their lending policies in respect of exports to new markets.

Medium and Long-term Credit

The problem of medium-and long-term credit has not yet assumed any large dimensions in India. But our assessment is that the problem will arise in the near future.

Indian exporters will, necessarily, have to offer credit facilities in line with their competitors. If India does not get ready to meet these credit needs, some valuable opportunities may be lost. Of course, the risks flowing from the extension should not be under-estimated and proper safeguards should be undertaken.

Connected with the problem of medium and long-term export credit is the question of providing suitable performance

Individual well-being is linked with national prosperity and only planned efforts can ensure both in the shortest possible time. And planning, for its success, largely depends on savings, individual as well as national. Saving in the form of Bank Deposits provides resources for the National Plan.

offers complete banking service

guarantees for: (a) delivery of plant and equipment on due dates; and (b) the quality and performance of the capital goods and services supplied.

Banks do not readily provide such guarantees, though it is understood that one or two general insurance companies in India do undertake such work. Some arrangement needs to be made to enable the insurance companies to go into this business and provide suitable guarantees.

A plentiful supply of raw materials is an essential prerequisite of a dynamic export industry. In this connection the Mudaliar Committee have recommended the creation of an 'Import-Export Stabilisation Fund' through which imports of essential commodities could be financed on a revolving basis. The matter has been discussed by us and the Department of International Trade with the Reserve Bank and the Associations of Indian and Exchange Banks. It is felt that the proposed revolving arrangements will be an important measure of export promotion and be of general benefit to the economy.

In view of the many facets of the task which have been explained at some length, it can best be handled through a central or co-ordinating agency which should have, as indeed was suggested by the Mudaliar Committee, "all the authority of the Government to ensure high priority to these activities". However, as the banks will be the main springs of foreign exchange, it will be necessary to keep their interest alive and to enlist their co-operation and support.

Govt.-to-Govt. Credit

Several developing countries are much in the same situation as India has been in the recent past. They require massive foreign exchange assistance to finance their development programmes. India is vitally interested in their economic progress. If their economic growth is to be assisted, and intra-regional trade is to be fostered, it will be necessary to make arrangements to enable these countries to buy their requirements on credit terms in India. The provision of credit on Government-to-Government basis, or through a governmental institution, has the advantage of leaving the foreign buyer free to choose his Indian suppliers; and this makes the credit arrangement more attractive and flexible from the business point of view. When Government decides to grant such credit, under its techno-economic co-operation agreements, to other developing countries, it may be an advantage to have an agency other than the Government itself to handle the procedural and administrative matters relating to disbursement and recovery of credits.

The representatives of the export trade have stressed that as they have to meet keen competition in the world market the rates of interest charged by banks on their pre-shipment as well as post-shipment advances should be reduced and brought in line with the rates of interest current in the industrially advanced countries. The promotion of India's export trade is no less important than the development of our agriculture or small-scale industry. In advanced countries aid to exports is given in diverse ways; and among them, preferential rates of interest is not the least important.

We have been in consultation with the Reserve Bank and are gratified to note that it has agreed, inter alia, to exclude export credits from the purview of its system of slab rates so that the banks, in their turn, can pass on the benefit to ex-

porters to enable them to meet effectively international "non-price" competition.

Pre-shipment Rates

The Reserve Bank should examine the structure of rates charged by banks on export bills. We are inclined to think that the rates charged by banks for demand or sight bills are reasonable and in accordance with international practice. As regards the discount rates, which form an element in the usance bill rates charged by banks, we feel that the discount element of the sterling usance bills should have a basic relationship with the Bank Rate in India. The Reserve Bank may, therefore, fix a ceiling in respect of the discount element of the rupee, sterling and dollar usance bills at such levels as are competitive with similar rates abroad. The ceiling rates so fixed by the Reserve Bank should continue to apply, notwithstanding any rise in the structure of interest rates in India; and whenever the discount rates in the UK and in other major countries fall below the base level with reference to which the discount rates are fixed by the Reserve Bank on foreign currency bills, the ceiling should be so modified as to minimise or eliminate the disadvantages, if any, to the Indian exporters.

The Reserve Bank has recently introduced an 'Export Bill Credit Scheme' under which the banks will have the facility of an additional quota for borrowing from the Reserve Bank at the bank rate in respect of their holdings of eligible usance export bills drawn in Indian rupees. This is a step in the right direction; but even so the Indian short-term rate of interest will be higher than the rate charged in some of the important countries. We recommend that on the analogy of its preferential rates of advances for agriculture and small-scale industries, the Reserve Bank may consider the feasibility of making available short-term pre-shipment export finance to the banks, say, 1½ per cent below its Bank Rate. If the banks were to charge their clients up to 1½ per cent it would follow that the Indian exporters would be in a position to secure their credit lines at about 4½ per cent, and be at no disadvantage in relation to their competitors abroad.

It might be argued that it may not be easy to identify the exact measure of credit that goes to produce specifically the goods for the export market. But this is a problem by no means peculiar to India; and it should be possible to evolve a suitable drill in this behalf.

Post-shipment Rates

A similar policy could be followed in respect of post-shipment of export credits, namely, that the Reserve Bank may advance the requisite sums to the lending banks at, say, 1½ per cent below its Bank Rate. The banks, in their turn, would add to this rate up to 1½ per cent on all post-shipment borrowings required for export purposes.

We have also considered the question whether the preferential rates of interest should be given on all exports or be limited to any specified commodities. Having regard to all circumstances, we are of the view that preferential rates should be applicable to all the non-traditional items and such other items as Government finds to be deserving of assistance in this form.

The Refinance Corporation has decided to make available to the banks its funds at 5 per cent to which the banks will add about 1½ per cent as their own margin. Thus the lending rate of the banks would become 6½ per cent which is still on the high side. We suggest that the Refinance Corporation

The Sino-Soviet Rift

DURING the brief span of the conference held at Moscow between China and the Soviet Union, there were too many suspensions of the talks which were described as recesses. Their frequency gave a foretaste of the final outcome. On July 20 the Conference was adjourned *sine die* and in this context it would mean postponement for an inordinately indefinite period. The Chinese statement explains that the talks would be resumed at a convenient time agreeable to both the parties, but this cannot be taken as anything more than a mere white-wash for the haste with which the termination of the conference was brought about. Whether this conference really yielded any fruit in the discussion of ideological issues will always remain a mystery because of the thick veil of secrecy purposefully thrown around it.

One conclusion which can be safely drawn is that the talks have proved inconclusive and failed to repair the serious breach in the Sino-Soviet alliance. This state of affairs in the relationship between the two leading countries of the Communist world may drag on, according to present reckoning, for an unexpectedly long time. The issues which have caused the great schism cannot be resolved by experts in the Communist doctrine; they spread over a much wider area of power politics. The beginning of the rift is traced by many, who have acquired an insight into the internal working of world communism, to the upsets caused in the balance of nuclear power. The Soviet Union and China took radically different views on the eventual consequences of the race for nuclear power. China has insisted with all the revolutionary passion on racing ahead with the struggle to achieve world revolution, while the Soviet Union's attitude is clear-headed and realistic. It has recognised the inevitability of caution and ultimate compromise with the Western nuclear powers. China's dream of forging ahead and precipitating a nuclear clash, thereby opening the way for the Communist powers to inherit the world is characterised by the Soviet Union as patently amateurish. The Soviet Union fully realises that an unmitigated nuclear race would admit of no alternative to co-destruction.

The background to the ascent to power of the Communist Party of China explains the over-confidence of Mao Tse-tung and his lieutenants. The CPC carried out the revolution in China independently with its own theory and technique and in open defiance of stern warnings from Stalin. Success created a sense of supreme self-confidence. But there are other factors which explain why the Communist leadership in China simply refuses to accept dictates from the Soviet Union in matters of internal policy or strategy on world communism. China has not only charted an independent and revolutionary course for herself but she is too big, populous and hyper-sensitive to tolerate anything savouring of the status of a satellite. But while that has been her stiff-necked attitude from the start, economic compulsions have made it expedient for her to bide her time during the interregnum in which technical and economic collaboration from Russia would be indispensable for rapid progress in arms and economic prosperity — a goal on which she would not prefer to yield.

But here precisely lay the weak spot in her strength. The rift really began to deepen and widen in 1960, when Mr. Khrushchev abruptly decided to turn the screw to 'induce' China to take a realistic view of her relationship with the Soviet Union and to appreciate the wisdom of some practical measure of compromise. The 1,300 and odd Soviet experts and technicians, who were feverishly busy helping build China's industrial economy, were withdrawn in August, 1960. Other economic aid in funds and materials as well as equipment was either seriously interrupted or stopped, with

the result that practically all the agreements of collaboration were reduced to a dead letter. In her indignation, China let out the truth that this calculated Soviet policy to inflict something like a temporary paralysis on her struggle for progress has caused incalculable losses and difficulties to her economy, scientific research and, be it noted, the offensive arms build-up, which she euphemistically described as "national defence". This first open clash removed the parties far apart. The frustration and bitterness with which China openly threw to the winds the code of secret diplomacy and hurled charges of deviationism against the Soviet Union are to be traced mainly to this great economic injury.

China's letter of June 14, enumerating the 25 points at issue between the two countries, need not necessarily be taken as a historic document on ideological differences. Ideological issues were no doubt stated there explicitly. But equally, or perhaps more, important was the emphasis on issues of national interest and the bid for the leadership of the Communist world. Being a young revolutionary country, China still retains far more of the dogmatic fervour and zeal for doctrinaire communism of the orthodox type than the Soviet Union is capable of due to the passage of time. China's letter has a ring of the original dogmatism of Marx which makes an appeal to many a communist thinker in spite of the radical change in the world set-up which has knocked the bottom out of many of the Marxist assumptions.

If issues of ideology are involved in this conflict, they have been stressed in the China letter with ample emphasis. They relate to the leadership at the Centre of world communism and, by implication, China means to contest the right of the Soviet Union to that position any longer. There is again highlighted the question of the theoretically correct view that ought to be taken for carrying out the revolution in the underdeveloped countries. Then also comes the issue of co-existence between the two blocs. As if to forestall the charge of narrow nationalism, China avers that fidelity to the Soviet Union cannot be regarded as a touchstone of true faith in communism. Fidelity must be owed to the Marxist-Leninist line and it is the open accusation brought by China against Mr. Khrushchev personally that his leadership constitutes a definite departure from that line. Further charges of revisionism and reformism against the Khrushchev regime were but a logical outcome of this first accusation. In Kremlin's policy of reconciliation with Marshal Tito, China has found ammunition for launching an attack on "revisionism" which is anathema to Communist dogma.

For a time it looked as if the initiative was wrested by China and Western analysts, who followed the course

of the Sino-Soviet talks, were inclined to take the view that the rift was essentially caused by differences on ideology. But, on second and sober thoughts, it would seem, they have positively veered round to the view that issues of national interest and struggle for power were the really dominating factors in China's contentions. The China letter makes much of the interference by the Soviet Union with the internal affairs of the Communist parties of other countries, and, going a step ahead, it charges Mr. Khrushchev with inter-meddling in the affairs of the CPC. Precisely this is the subject of a strong counter-accusation by the Kremlin in its famous letter of July 14 which has been given conspicuous publicity in *Pravda*. Whether Mao Tse-tung demanded the removal of Mr. Khrushchev from power as a pre-condition to amicable settlement of the dispute can be anybody's guess and no evidence to substantiate it may be available for a long time to come. But there can be no doubt that the CPC too is intent on interfering in the internal affairs of the Soviet Union. In this acrimonious debate charges and countercharges were made with marked vehemence.

The issue of struggle for power inside the Communist bloc could not be suppressed in spite of China's ingenuity to raise the smoke-screen of ideological differences. In the recent past, China has made calculated attempts to draw within her orbit the Communist parties in the several countries of Asia, Africa and Latin America. In this bid to "wean away" the Communist parties of the underdeveloped countries from Soviet influence, China has gone to the extreme length of importing racialism and regionalism in international communism.

Available indications leave no doubt that the two countries have not been brought any the nearer as a result of the talks. The simple reason was that, while neither of the parties was prepared to yield ground on the basic issue of leadership, neither of them could entertain the idea of assuming responsibility for wrecking the conference. This negative attitude has brought forth the only outcome that was possible — the two countries remain in estrangement as before. The continuance of the deadlock has its own moral. China's bid for leadership is in vain for a considerable time to come. The Communist countries of Europe will not conceivably oblige her. And she cannot create the necessary surpluses in money, materials, machinery, equipment and technicians to attract the underdeveloped world to her. The deadlock is not without its significance to India. It promises no likely change or interruption in the Soviet Union's policy of aid to this country (which China resents bitterly) and non-intervention in the Sino-Indian dispute.

Sabha have pleaded the case of their own constituencies which, according to them, were relatively backward and needed greater attention in the matter of investment. The third five-year Plan contains a special dis-

cussion on this subject in a separate chapter and indicates the various steps which were being taken to carry all the regions of the country on the onward march to economic prosperity. It was conceded in the third Plan that certain parts of the country, for reasons of economic and geographical pressures, tended to grow at a faster rate than others and that this trend was likely to continue in the future. However, in the larger interest of the country, the third five-year Plan had clearly laid a greater stress on dispersion of resources to areas which had remained relatively underdeveloped. One of the most ticklish problems facing the planners was to define the degree of backwardness of particular States or regions. It was believed that the "State income" estimates could be of considerable use in studying the economic development of the various States and regions. The Central Statistical Organization, the State Statistical Bureaus and the Indian Statistical Institute had been called upon to furnish these estimates.

The National Council of Applied Economic Research has released this week its own estimates of "Inter-District and Inter-State Income Differentials" for the year 1955-56. The estimates of the Council will be read with interest in view of the fact that it has been engaged during the last four years in the preparation of techno-economic surveys of the States; in its investigations regarding the potential for growth of different areas, it had gathered a considerable amount of statistical material which has now been processed so as to yield not only State incomes but also district incomes. Even though the conclusions of the Council are based upon the results of a single year, the Director-General, Dr. P. S. Lokanathan, has held out the assurance that similar estimates of State incomes and district incomes will be released soon in regard to the year 1960-61. Surely, when these figures are made available, it will be possible to test if planning in India has been an instrument in accentuating disparities between the various regions or it has eliminated some of the disparities.

Before passing on to a discussion of the estimates released by the Council, it is necessary to state that district-wise and State-wise estimates of income are of great interest to the business community and to industry because they reveal the trends in the increase in the purchasing power of the various parts of the country. Those business firms which are planning to double and treble their production can, on a scrutiny of these figures, find out the areas where new pools of purchasing power are developing and where their goods will have a ready market. Accurate estimates of regional incomes are, therefore, of great importance not only to the planners, but also to all the new and old industries which are raising their production levels and are keen to capture the expanding market within the country.

The Council had set before itself the broad objec-

tive of analysing "the inter-district and inter-State income differentials", so as to spotlight the geographical distribution of the backward districts. The concept of regional income adopted by the Council is the one relating to income originating from current production of goods and services within the geographical boundaries of a State or a district, i.e., the concept of *net domestic product* at factor cost has been pressed into service even though for an analytical purpose it is desirable to calculate the district income estimate corresponding to the concept of *net national product* at factor cost. Because figures in regard to the inflow or outflow of incomes from the districts or from the States were not available, the Council had no alternative but to restrict its definition to the income originating within a region. It may not amount precisely to the purchasing power of the region, but it does indicate the level of economic development of a particular region in relation to others. Broadly, the method of calculation follows the technique employed in the National Income Committee Report. The product method is used for computing income from the primary and the secondary (organised industry only) sectors of the economy, while the income approach is used in the case of the tertiary sector including small-scale industries, com-

Eastern Economist 20 Years Ago

JULY 30, 1943

No new promise or assurance came from the Finance Member in answer to the many interpellations addressed to him. Today he was asked by Mr. Neogy about the representation from Indian Life Assurance Companies, praying for the fixation of a maximum limit for the taxation of the income of such companies for the duration of the present war, but Sir Jeremy would not commit himself to anything more than the assurance that the matter was engaging his attention. He was also not prepared to give the amount of Lease-Lend goods received in India, for he said that the Government of India were still engaged in the task of completing their records of Lease-Lend aid and reconciling them with those which the Indian Supply Mission had been asked to maintain in America. One of the first questions addressed to him related to the anti-inflationary measures taken by him but he merely referred to his September answer and added: "More recent measures in the Central sphere apart from taxation and borrowing taken with this end in view are— (1) summary provisional assessment of Excess Profits Tax, (2) compulsory deposits of Excess Profits, (3) restriction of the extent to which purchase of raw materials and bonuses to employers will be allowed to count for Excess Profits Tax purposes, (4) control over new capital issues, (5) prohibition of forward contracts and options of certain commodities including bullion and (6) cloth and yarn control. Lobby comment is, however, sceptical about the actual effect of these measures. Particularly the Government's measures for controlling capital issues has aroused a good deal of uneasiness in Assembly circles. Later on in the session when opportunities for discussing the question occur, there is likely to be sharp criticism."

August 2, 1963

munications, construction, railways, organized banking and insurance, other commerce and transport, professions, liberal arts, domestic services, Government and miscellaneous services and house property.

In computing income originating from the primary and secondary (organised industry only) sectors at the district level, the set of prices used are the same for the different districts within a State on the broad assumption that they do not vary violently between different districts of a State. In regard to the tertiary sector, the differentials in net value added or net earnings per person employed being unknown for the various districts and even for the various States, all-India averages have been utilized which is, indeed, a very sweeping assumption and tends to blunt the degree of sharpness of the estimates; because of the non-availability of the required data at the State level, the Council had, however, no option but to fall upon this expediency. The oddity of the last assumption may be brought out by stating that the annual income of a carpenter in Kerala is assumed to be the same as that of his counterpart in the Punjab. In view of the assumption made in estimating the State-wise and district-wise incomes, it is obvious that they broadly follow the levels of output of the primary and the secondary sectors and not the tertiary sector which constitutes nearly one-third of the total economy and whose share in certain districts is more than half of the total district income.

Table I below lists the per capita income estimates of the Council along with the estimates of the State Statistical Bureaus and the estimates which appeared in the November, 1961, issue of the Monthly Abstract of Statistics of the Central Statistical Organization for 1958-59 based on the income approach and the expenditure approach for the various States. The degree of variation between some of them is of a high order. Between the estimate of the Central Statistical Organization based on the income approach and the National Council's estimate for Andhra Pradesh, the variance is of the order of 33 per cent; whereas the Central Statistical Organization had estimated that the consumer expenditure per person in Andhra Pradesh was Rs. 172 in 1958-59, the National Council's estimate for 1955-56 was Rs. 229. In part, the explanation of this big difference lies in the fact that the estimates pertain to different years. Again, the difference between the per capita income estimates prepared by the State Statistical Bureau and the Council in the case of Uttar Pradesh is as high as 50 per cent. As against the figure of Rs. 112 given by the U.P. State Statistical Bureau as the per capita income of the State in 1955-56, the Council has estimated the same at Rs. 178. Whatever the reason for this wide divergence, it is essential that the Council should iron out these differences after consultation with the State Statistical Bureau. The table also highlights vast differentials in the case of some other States, but there are others for which there is

close proximity between the National Council's estimates and of the other units. The case of Orissa needs a special mention because the estimate prepared by the State Statistical Bureau is almost 30 per cent above the estimate of the National Council. Usually, it is believed that the State Statistical Bureaus tend to depress their figures under political pressure in order to seek a higher allocation of funds from the Centre. In the case of Orissa alone, the reverse seems to be the truth. In this particular case, the estimate of the National Council is far below the estimate prepared by the State Statistical Bureau. The C.S.O.'s estimates are lower than those of the Council and the State Statistical Bureau. One fact, however, is clear that Orissa, according to the Council, is not the poorest State in this country in so far as the standard of living of the people based on per capita income is concerned. The lowest position goes to Bihar which shows a per capita income of Rs. 149 as against Rs. 187 for Orissa and Rs. 178 for Uttar Pradesh. Among the most prosperous, West Bengal stands on top with per capita income of Rs. 295 followed by Maharashtra at Rs. 287.

One irresistible conclusion emerging from the findings of the Council is that the South Indian States of Andhra Pradesh, Madras, Kerala and Mysore are happily placed in relation to some of the North Indian States, such as Bihar, Orissa and Uttar Pradesh. The level of living in Andhra Pradesh, Madras and Kerala seems to be almost the same as their per capita

* Relate to personal income; culled from an article published in November, 1961, issue of the Monthly Abstract of Statistics — a publication of the C.S.O. The article was entitled "Estimates of Personal Income by States" and was signed by K. N. C. Pillai and T. V. Grace.

† Corresponds to 1954-55. ** Refers to 1956-57.

August 2, 1963

incomes in 1955-56 were between Rs. 228 and Rs. 230. Mysore alone had a lower per capita income of Rs. 203 and was the least prosperous of the South Indian States. In any case these figures give a lie to the D. M. K. propaganda that the South had been neglected and that the standard of living there was lower than that of the North unless for the D.M.K. North means Bengal and Maharashtra only.

The sector-wise analysis of income originating from the various States has illustrated another well-known thesis that the industrial States have a higher level of per capita income than the agricultural States (see table II). Maharashtra and West Bengal which had the highest per capita income in 1955-56, had the least share (a little over 30 per cent) in income from agriculture. Conversely, the States having the maximum percentage of income from manufacturing had the highest per capita income. Punjab alone was an exception which had a high per capita income despite a small percentage of income originating from manufactures and a considerable portion—nearly half—of the income originating in the agricultural sector. The conclusion set down by the Council that backward districts are, by and large, concentrated in three or four States (Uttar Pradesh, Bihar, Madhya Pradesh and Orissa) is broadly true because various other economic indicators also endorse this finding. (Incidentally, the variation of district per capita income is the highest in Maharashtra—one of the most pros-

perous States.) How far it will be possible for the Planning Commission to divert its resources to those areas is yet to be seen. The maximisation of national income is a basic and primary objective which cannot be dispensed with at an early stage in India's economic development; also the "iron laws" of economics demand diversion of resources to productive areas for most fruitful results.

How reliable are these district income estimates? The Council has stated that it is unable to assess the degree of reliability of the district income estimates and feels that in all probability the margin of error at the district level is much larger than at the State level or at the national level, because "the district output from agriculture, which constitutes the major source of income for most of the districts, is estimated on the basis of a much smaller number of observations than the State or national output from agriculture". It may be recalled that the National Income Committee Report had conceded, in one of its appendices, that the margin of error in the national income estimates was of the order of 10 per cent (plus or minus). At the district level and the State level, the margin of error may be much larger (around 20 to 25 per cent). In other words, the estimates of district incomes (and State incomes to a certain extent) prepared by the Council should be used as indicative of broad differentials in income between the districts and the States and should be used with caution for any other purpose.

TABLE II
SECTORAL COMPOSITION OF INCOME WITHIN STATES (1955 - 56)

Name of the State	Per cent of income originating from				Total Income (Rs. crores)	Popula- tion (d) (Lakhs)	Per Capita Income (Rs.)
	Agriculture	Manufac- turing (b)	Service (c)	All Sectors			
1. Andhra Pradesh ..	49.34	13.65	37.01	100.00	767.82	335.49	229
2. Assam ..	53.55	26.38	20.07	100.00	277.04	103.52	268
3. Bihar ..	58.78	14.78	26.44	100.00	633.76	426.20	149
4. Gujarat ..	41.96	23.94	34.10	100.00	497.58	184.48	270
5. Kerala ..	50.18	17.40	32.42	100.00	346.40	152.26	228
6. Madhya Pradesh ..	57.63	14.16	28.21	100.00	632.14	292.22	216
7. Madras ..	43.12	16.94	39.94	100.00	732.37	319.03	230
8. Maharashtra ..	31.90	26.58	41.52	100.00	1026.63	357.78	287
8.a Maharashtra excluding Greater Bombay (a) ..	42.87	18.23	38.90	100.00	760.99	..	..
9. Mysore ..	51.32	18.10	30.58	100.00	436.98	214.94	203
10. Orissa (e) ..	54.07	11.53	34.40	100.00	306.73	163.88	187
11. Punjab ..	46.82	11.37	41.81	100.00	505.56	182.21	277
12. Rajasthan ..	48.32	14.14	37.54	100.00	418.52	180.63	232
13. Uttar Pradesh ..	46.29	12.90	40.81	100.00	1221.23	684.81	178
14. West Bengal ..	31.77	29.98	38.24	100.00	836.68	283.50	295
15. West Bengal excluding Cal- cutta and 24-Parganas (a) ..	44.23	26.54	29.23	100.00	515.66	..	..
16. All-India (f) ..	45.3	18.5	36.2	100.00	..	..	255

(a) Includes income from animal husbandry, fisheries and forestry besides agriculture proper.

(b) Includes income from mining, factory establishments, small enterprises and construction.

(c) Includes income from all service industries.

(d) Population figures relate to the end of the period 1955-56 for all States except Orissa. For Orissa they relate to the end of the period 1956-57. These have been estimated on the basis of the 1951 census population, totals assuming simple average rate of growth population over this decade.

(e) Estimates relate to the year 1956-57.

(f) Estimates refer to the country as a whole including Jammu and Kashmir, and Union Territories.

Highlights of the Week

NUCLEAR TEST BAN

THE DRAFT Treaty on the partial ban on nuclear weapons tests was initialled at Moscow on behalf of the Governments of the U.S.A., the U.K. and the U.S.S.R. on July 25. This will be hailed as a great event paving the way to eventual disarmament. Nevertheless, it would be well to appreciate that the present ban on nuclear tests is a measure of limited effectiveness, although as an initial step it is of potential value. The nuclear arms race will certainly be slowed down and international tensions will be reduced to that extent. It will be recalled that ever since active talks were started in October 1958 at the Conference on Discontinuance of the Nuclear Weapons Tests and a tentative draft treaty was put up for consideration, it was discovered that suspicion and fear blocked their course. It is a great gain that suspicion has now been replaced by trust and confidence.

The text of the Draft Treaty makes it clear in its preamble that "an agreement on general and complete disarmament under strict international control" in accordance with the objectives of the United Nations is the principal goal of the signatories. It may not be irrelevant here to point out that the Draft Treaty of April 18, 1961, which was placed for consideration before the Conference on Nuclear Tests Ban, made a specific provision for a system of international control and international inspection in doubtful cases. This proved to be a stumbling block in the way of the adoption of that treaty. The new Draft Treaty declares in the opening Article that the parties undertake to prohibit nuclear test explosions. But the sanction of an international system of control has not been incorporated in the treaty. Apparently it is left to the goodwill and good sense of the parties to carry out their solemn undertaking by coming to terms on a workable formula.

The Draft Treaty puts a ban on nuclear tests in the atmosphere, in the outer space and under water. But it leaves out explosions and tests underground. The earlier Draft Treaty of April 1961 prohibited underground tests also, except those which produced signals of less than 4.75 seismic magnitude inasmuch as detection methods below this magnitude have not been evolved. Presumably, underground tests have been left out from the present Draft Treaty provisionally, since confidence is expressed that they, too, would be brought under purview of the ban. Underground explosions present very difficult and intractable technical problems of detection since it is difficult to distinguish natural explosions due to earthquakes from manmade explosions. A successful ban on underground nuclear tests must await further intensive research to arrive at reliable methods of detection.

The door has been naturally kept open for other countries to sign the treaty, but the three sponsoring countries retain a special status as original parties. One special feature of the Treaty is that any amendment to it can be carried out by a majority of votes, but they must include the votes of all the original parties. By implication, any of the original parties may exercise its veto on an amendment. The duration of the treaty is for an unlimited period of time. But there is a clause which provides that any party may assert its national sovereign right to withdraw by a notice of three months from the treaty in case it takes the view that extraordinary events jeopardise its national interest if

it continues to be bound by its obligations. Considering the spirit in which the Draft Treaty has been drawn up, this may be treated as an enabling provision.

JOINT AIR EXERCISES

THE PROTRACTED negotiations between the U.S. and the U.K. Governments, on the one hand, and the Government of India, on the other, on the measures to strengthen the Indian Air Force so as to enable it to become an effective instrument in the defence of the country have culminated with a happy note. An announcement made in New Delhi last week revealed that American and British "high performance fighter aircraft" will be coming here shortly to participate in joint air exercises to be held under the "overall aegis of the I. A. F." These exercises will be preceded by the installation of radar and connected communications equipment which will cover almost our entire northern border. A major portion of this equipment will come from the United States. Britain is envisaged to give electronics and communications assistance. As permanent installation of a modern radar system will take time, mobile radar sets are to be used in the intervening period.

Lest the arranging of joint air exercises should create an erroneous impression that India has departed from the policy of non-alignment and is assuming an aggressive posture, a specific mention has been made in the announcement that these exercises will only be "temporary" and will not amount to a commitment on the part of the U. S. or the U. K. to assist this country in its defence should it be attacked again. In the event of such a contingency, consultations, however, will take place among the three Governments on the steps to combat aggression. A high-powered mission has also been sent to the Soviet Union to look for military equipment that is available there. For the Doubting Thomases who impatiently allege that joint exercises imply surrender of sovereignty by India, it has been clarified that the defence of the country is "wholly and solely the responsibility of the Government of India".

The proposed exercises can be carried out provided hostile clouds from across the Himalayan border do not burst in the near future—heavy concentrations of Chinese troops have been reported in the last few days all along the border from NEFA to Ladakh and the Indian Army Chief, General J. N. Chaudhuri, has been summoned back from his tour of the United States. But they should provide an invaluable experience to the I. A. F. personnel in handling the sophisticated air equipment — an essential prerequisite to acquiring of supersonic aircraft.

NON-FERROUS METALS STOCKPILE

THE RECENT decision of the U. S. Office of Emergency Planning to reduce substantially the maximum stockpile requirements for four non-ferrous metals is of quite some consequence to India. The four non-ferrous metals involved are aluminium, copper, lead, and zinc, in none of which can we claim to be comfortably placed. And, to the extent that the American stockpile of these metals is proposed to be reduced — from 1.2 million tons to 450,000 tons (—750,000 tons) in aluminium, from one million tons to 775,000 tons (—225,000 tons) in copper, from 286,000 tons to nil (—286,000 tons) in lead and from 178,000 tons to nil

McKee can apply an unmatched fund of diversified engineering knowledge to India's steel plant projects

Typical of the work of the McKee Metals Division is the General Manuel N. Savio Steel Plant at San Nicolas, Argentina, part of which is illustrated above. Argentina's first large, integrated steel plant, it has the second highest capacity in South America. The McKee Metals Division supplied

engineering and construction services on about two-thirds of the \$300,000,000 plant. The McKee designers, engineers, technical specialists and construction experts that functioned on this project can apply their knowledge and experience to produce effective results for India's steel industry.

(—178,000 tons) in zinc—and placed on the world markets, consuming countries like India which are mainly dependent on imports for their requirements of non-ferrous metals, would welcome the decision. For that would mean an increase in total supplies of these on the world markets, and consequently, also a probable fall in the international prices of these metals. There is no question, however, of any sudden dumping of the excess stocks or a sharp drop in prices, thanks to the moral and material responsibility on the part of America not to disturb abruptly the world equilibrium of demand and supply of these markets, on the one hand, and not to affect adversely the interests of the U. S. taxpayer, on the other.

Ordinarily, in the past, the practice for surplus disposal has been to route the commodity from a surplus country to a deficit country according to a mutually agreed plan. In exceptional cases, such as those caused by droughts, famines or floods, the affected countries have been enabled to draw supplies from the surplus countries without payment but, even then, only up to a point, this being determined as the point where any such philanthropic act starts impinging on the normal pattern of international trade in the commodity. This may be said to have worked with a fair measure of success. It now seems this relaxation of controlled movement of commodities may have to be extended further to accommodate countries like India which do not have the foreign exchange to pay even for some essential imports—and non-ferrous metals fall in this category. In these cases, perhaps, surplus countries may be allowed to supply, either free or for future payment, up to the normal limits of the imports of these countries over a basic period. The merit of this suggestion lies in the fact that, while economic activity in countries, which want the surplus commodities but cannot afford to go in for them for want of foreign exchange, is not impaired, the normal world markets for these commodities of underdeveloped or undeveloped countries are also not lost to them. (The loss of the Indian or any other market, for example, is not taken into account here, because, in any case, these markets would have dried up for want of the wherewithal to pay for their imports.) Also to the extent that the burden of the surplus in a given commodity is reduced by the above arrangement, the unhealthy impact on prices of an otherwise unwieldy surplus is mitigated.

MECHANISATION OF INDIAN FARMING

TWO GREAT innovations of the nineteenth century—chemical fertilizers and tractors—have revolutionised agriculture in the western countries. The economic prosperity which the peasants there enjoy today can, to a very large extent, be correlated directly to the use they make of these two modern means of farming. In India, their application on a significant scale has been, however, of only recent growth, dating back to not earlier than 1951. Even since that year, which marked the launching of the first five-year Plan, whereas application of inorganic manures has caught up well with the result that acute shortages have come to be felt in their supplies, especially those of nitrogenous fertilizers, after 1958, the use of tractors has gone up only falteringly. Between 1951 and 1961, the number of tractors in use for agricultural purposes in this country is said to have risen from 8,500 to 34,000. But it will be presumptuous to assume that all these are actually utilised to the optimum extent. Nearly 50 per cent of them are estimated to be lying idle for want of repairs.

In India, tractorisation on the scale evidenced in the U. S. A. and the other highly developed countries, obviously, has its practical limitations owing to small holdings of the majority of our agriculturists, their weak financial position

and large-scale unemployment or under-employment in the countryside. But this does not imply that mechanisation of Indian agriculture can be ruled out altogether and for all times to come. There are many an agricultural operation even today which call for urgent improvement in farm implements. For tilling on small holdings too there is a good scope for the Japanese type small tractors or power tillers. With gradual improvement in the economic position of our agriculturists and the siphoning of excess labour force from the rural areas through industrialisation, their use henceforth can be expected to grow at a faster rate. It was, therefore, just appropriate that the Union Ministry of Agriculture recently called a conference of the various interests concerned to deliberate upon the manufacture and popularisation of improved farm implements.

Casual Treatment

Many of the measures recommended by this conference for developing new farming tools and for popularising them, of course, are the same which have been talked about ad nauseam on various occasions. What is needed is more energetic action to implement them. The casual manner in which the State Governments have been dealing with this matter—the latest instance of this is to be found in the fact that during the current emergency when the cry for saving on unproductive and non-essential expenditure went up, the States' first cuts included slashing of the Plan outlay on this vital activity—is hardly warranted. Now that adequate supplies of steel have been promised for the manufacture of farm implements and an Agricultural Implements Board, consisting of one representative each of the Planning Commission, Ministries of Food and Agriculture, Community Development and Co-operation, International Trade, manufacturers of big and small tractors, dealers, fabricators, co-operative societies, and four or five farmers' representatives, is being set up, it is hoped the rate of progress will pick up soon.

There is apparently a need for urging upon the licensees for manufacture of small tractors or power tillers to implement their programmes of production at an early date. Association of progressive farmers in the task of evolving new cheap farming machines and tools will also be a step in the right direction. So also standardisation of a few implements suitable for the different parts of the country. In this regard, whereas there is need to pay greater attention to the improvement of our cattle, as pointed out by a West German team of experts sometime ago, much can be gained if research in farm implements is undertaken, keeping in view the draught capacity of the cattle.

The use of improved farm implements, of course, can be fostered at a rapid pace only if service and repair facilities are provided in an adequate measure in the rural areas. Training of village artisans and opening of service workshops at the block development headquarters should go some way in this regard. But the large-scale manufacturers also need to be asked to provide after-sales service. This is a recognised practice in all the engineering trades in the West. Why should it not be followed here?

A POLICY FOR RAILWAYS—VIII

Needed: Federal Railway Authority

By T. M. RAO

THE TOP-MANAGEMENT of the Indian Railways consists of men trained as railway men throughout their careers. In the Railway Board, there is only one member who is not a traditional railroad man and he is the Financial Commissioner. He is usually a senior secretary on loan from the Ministry of Finance. The rest of the Board members as well as the additional members are men trained for railway careers as soon as they have finished college. By profession they are either engineers or transportation men who served in their respective departments in various capacities for several years. Normally before going to the Board as a full member, one would have served for a term as general manager of a zonal railway system. It is rather unfortunate that none of the Board members are trained as business managers, comptrollers or economists. No one for a moment doubts the fact that they turn out to be excellent railway officers. But at the top level that is not enough. At the top there must be men who can grasp the changing needs of the economy, the role of the transportation industries and a dynamic ability to lead a vast organization to desired goals. Managers must not only manage and lead but must be able to anticipate the future. Because of rapidly changing technology, tomorrow's markets and customer needs are going to be very different from what they are today. They should be able to cut through red tape and go to the very heart of a problem. They must get things done at the least possible cost. At the same time they should realize that in a democratic set-up all this must be done not through 'diktat' but through persuasion and co-operative effort.

The Manager of tomorrow will have to be able to relate his product and industry to the total environment, to find what is significant in it and to take it into account in his decisions and actions. And increasingly the field of vision of tomorrow's manager will have to take in developments outside his own market and his own country. Increasingly he will have to learn to see economic, political and social developments on a world-wide scale and to integrate world-wide trends into his own decisions.¹

Autonomous Body

For the aforesaid reasons, there appears to be a need for vesting the control and administration of the Indian Railways in an autonomous statutory body which may be designated as "The Federal Railways Authority." It cannot, of course, be completely independent. Like the British Railway Board, it would be responsible to the Minister for Transport. In the absence of stockholders, public corporations will of necessity have to be accountable to Parliament, indirectly at any rate, through the Minister concerned.

While still accountable to the Minister and through him to Parliament, the Federal Railway Authority can function as an autonomous body and with a high degree of independence and free from political influence.

The idea of a Federal Railway Authority is nothing new. It was first recommended in the Government of India Act, 1935 which included provisions for the creation of such an authority. The idea was again revived by the Indian Railway Enquiry Committee (1936-37) which observed that "while political interference is the high road to bankruptcy, administrative interference leads to stagnation and is almost to be equally deplored."² The Committee suggested that in future the Government should confine its interest in railways to that of a debenture holder and delegate wide powers to the Railway

In this concluding article of the series Dr. Rao calls for the reorganisation of the top management of Indian Railways. He outlines a scheme for a Federal Railway Authority which would work with a high degree of autonomy and through a scientific system of decentralized administration and management. He believes that only an organisation of this kind will be capable of functioning imaginatively and efficiently in the fields of pricing and financial management, research and development, operating concepts and personnel practices.

Authority. Later the Indian Railway Enquiry Committee, 1947, while strongly criticizing the departmental set-up for the administration of railways, recommended the creation of a statutory authority responsible for developing an efficient, adequate and economical system of railways.

Some of the arguments advanced in favour of the departmental set-up of the railways as existing today are that it speeds up consultation on inter-ministerial matters and that any radical change in the central controlling authority of the railways would adversely affect the progress of the railways' five-year Plans.³

Red-tape Rampant

It would seem that both the above arguments would not hold water. Those who think that questions requiring inter-ministerial consultation are expedited now may not know that it takes months for a decision to be taken which needs inter-departmental consultation within the Railway Board itself, not to speak of those which involve other ministries. Secondly the Board members and senior officials do not have the time necessary to devote to planning and policy formulation because they are constantly distracted by work connected with parliamentary affairs such as appearance before the Estimates and Public Accounts Committees, preparation for annual budget sessions of Parliament and answering questions raised in both the Houses. To make matters worse, administrative details and close supervision exercised on the zonal railways take away the rest of the time not claimed by parliamentary work. One illustration should make this point clear. Most of the working day of the Director and Joint Director of Traffic (Transportation) in the Railway Board's office, is spent in chasing freight cars (wagons) at the major yards and between the different zonal railway systems. It would not be rash to suppose that this is characteristic of the other directorates in the Railway Board.

It is needless to emphasize that the FRA will be largely a policy-making body unlike the present Railway Board. That is to say it will lay down broad policies in such areas as allocation of resources and future investment, research and development, co-ordination between different railway units and certain financial and personnel matters.

The rest of the functions including administration and financial management of the zonal railway systems should be vested in the General Managers of the autonomous regional systems. In the matter of rates and fares they should have the power to introduce innovations without reference to the FRA or to the Railway Rates Tribunal. Each General Manager will be accountable not only for the efficient administration of his regional system, but also for running it profitably. The

net profit earned in any year should serve as a yardstick in judging his performance.

In appointing General Managers, the FRA should have complete freedom to go outside the railway organization and recruit outstanding men in business and administration. If men from private business should be attracted then the salary should be correspondingly high and this must be a matter for negotiation between the FRA and the individual concerned. It is not implied here that railway career officers cannot aspire to the General Manager's position. On the other hand an outstanding railway servant would be a natural choice for the post.

For the men to preside over the FRA the Minister for Transport should, of course, have complete freedom to select from any quarter. A good example to emulate is the appointment of Dr. Beeching, the former Technical Director of the Imperial Chemical Industries as Chairman of the British Railway Board. Another example that comes to mind is that of Mr. B. W. Heineman, Board Chairman of the Chicago and North Western Railroad. A lawyer by training, Mr. Heineman has proved successful in changing the course of the railroad, from a company going into bankruptcy to one of relative prosperity. Members of the FRA should be men who can think in terms of change, technological advance and above all innovations. For innovation is going to be the most important thing in the railways' future, if they are going to meet the demands of a growing economy effectively. It will include pricing and financial policies, research and development, rules, operating concepts and personnel policies.

Personnel Policies

Let us take personnel policies first. It would not be incorrect to say that they are highly cumbersome at present. They are guided by the Establishment Code which consists of two large volumes and innumerable correction memos. It is a sad commentary that in the field of personnel relations, Indian Railways are an example of what ought not to be. Innovation must therefore begin with the personnel policies. They should be written in clear and simple words and should be as brief as possible. The booklet on personnel policies may indicate the categories of employees, salary scales, duties and privileges of employees and lay down certain canons of propriety. The rest must be left to the supervisors and executive officials. The administration by rigid rule must give place to a more flexible approach based on an understanding of human relations.

In the modern corporation there is a great emphasis on the development of people and the training of managers. On both these points the Establishment Code does not have anything to say. That brings us to the point that nowhere does it spell out what the objectives of the railway personnel policies are. This may not be surprising because under the British Administration, the predominant concern was the maintenance of law and order. But today it should be possible to develop a set of personnel policies based on the principles of scientific management such as autonomy, performance by objectives and positive motivations.

There has been a growing realization in American industry that great untapped opportunities lie in finding ways to develop more fully our human resources — particularly the managers of our business enterprises. Technological advances and the increasing complexities of managing under today's and tomorrow's conditions have made manager development a necessity as well as an opportunity. Those who have been closest to this field believe that an opportunity exists in General Electric to increase productivity 50 per cent in the next ten years through better management alone.⁴

It is rather unfortunate that the Indian railroads have been for so long tied to the British Railway operating con-

cepts. This was to some extent a historical development; but it must also be attributed to the reluctance of the railway management to adapt the organization to the growing technological advances.

Suffice it to mention here only a few examples. Let us take the construction of freight cars. In the United States most of the freight car fleet is of the four-axle twin truck type. It has the advantage of hauling a greater payload at higher speeds than the four-wheeled freight car, which is the most predominant type on the Indian railroads. There is no reason why for instance the Indian railroads cannot think in terms of building freight cars of 100 and 150 ton capacity for hauling bulk freight.

Technological Improvements

It may not be wrong to say that the antiquated signalling and operating rules on many of the trunk routes have been responsible for the bottlenecks and capacity limitations by which the Indian Railways have been plagued. In Japan the absolute block system has been replaced by the permissive block system. It is fairly certain that with innovations in operating rules and concepts traffic could have been moved quicker on some of the heavily worked lines in India. If CTC (Centralized Traffic Control) had been introduced, double tracking could have been avoided on many sections resulting in considerable savings in capital outlay.

Mechanized track maintenance in the United States has not only helped to reduce labour costs but has also raised the standards of maintenance resulting in higher permissible speeds. In India in the context of a high rate of unemployment, labour intensive techniques may have some merit and may determine the government's policy guidelines in a welfare State. But it does not mean that it can be applied to all situations alike. If the railroads, by superior techniques, can cut costs and consequently finance higher investment expenditures through greater profits, then they would not only accelerate income generation but also add to the employment potential in the long run. It would be unwise for a developing economy to divorce itself from the broad stream of scientific and technical advances.

Here it might be worthwhile to repeat what Peter Drucker has pointed out in an article on Japan's unprecedented industrial growth.

Yet in some Japanese factories it takes six times as many employees to produce the same amount of the same goods as in a comparable American factory. The reason is Japan's traditional system of "lifetime employment" with layoffs or dismissals only for very serious misconduct. As a result most of Japanese industry is grossly overstaffed and thousands of people for whom there are no jobs are kept on doing almost nothing in the plant or office. Very few Japanese employers know (just as very few American employers know) that it costs three to five times a man's salary to have him on a job — in supervision, in space, in paper work and record keeping, in heat and light, in materials and so on. . . . As a result older industries and businesses bear the heaviest burden of overstaffing; and the coal mines and railroads, as they are everywhere else, are in the worst shape of all.⁵

If this is true of Japan which ranks fourth among all nations in total industrial production, how much more is it true of Indian Railways?

To illustrate the point, there is an employee force of 1.2 million to run a railway system consisting of about 35,000 route miles in India. This is in contrast to the labour force of about 700,000 in the United States who are engaged in running a railway network six times as large as that in India. Not all this difference could be ascribed to superior technology of the American railroads.

In Europe and in the United States teletype has suppl-

mented telegraph and telephone circuits in railroad communications. For instance teletype is used exclusively for transmission of messages, yard positions and train consists (known as train load or train formation in India). A few weeks ago there was an interesting news item in the United States about a train consist having been dispatched from one station to another via the Telstar communication satellite.

The need for innovations in pricing policies has been discussed earlier in this series. In developing accurate costs of different phases of railroad operation, it would be necessary to rely on electronic computers. A computer installed at each of the zonal headquarters can be used for a variety of tasks such as critical path scheduling for construction jobs, programming stores purchase and inventory levels and taking care of the employee payrolls.

It would be misleading, indeed, to suggest that innovations are inextricably linked with new and costly machinery. An innovation may follow the introduction of a new machine or it may not. In India the sort of innovations required are particularly those which are applicable in the field of administrative methods, organization and management.

One such innovation is making each zonal and divisional manager accountable for the profit position of the operations within his unit. A government official suffers from a "trained incapacity" to introduce innovation and adjust to change. That is why the urgent need is for creating the railway organization as an independent authority run on commercial lines. It will also help its removal from the close ambit of political influence and set it on the path of healthy growth.

Dieselisation

The most outstanding event in recent railroad development in the United States has been the introduction of the diesel engine. It is estimated that in 1946 diesel electric locomotives hauled 9.7 per cent of total freight traffic and 15.3 per cent of passenger traffic. In 1960, the corresponding figures were 97 per cent for freight and 95 per cent for passenger traffic, the remainder being electric.

UNITED STATES CLASS I RAILROADS

Year	Net ton miles per loaded car mile	Car miles per freight train mile	Freight ton miles per train hour	Gross ton miles per freight train hour
1953	32.1	63.2	18.2	51,750
1954	31.4	65.0	18.7	53,897
1955	32.1	66.2	18.6	55,770
1956	33.0	67.2	18.6	57,071
1957	33.4	69.3	18.8	59,218
1958	33.0	70.7	19.2	60,807
1959	33.3	69.6	19.5	61,924
1960	34.0	70.2	19.5	63,096
1961	34.7	71.0	19.9	65,621
1962	35.7	71.5	20.0	67,491

(9 months)

Source: Railway Age Weekly, January 7/14, 1963

In the United States the railroads have introduced many economies in operation to reduce costs and increase efficiency. With less track maintenance higher speeds have been achieved by the use of improved longer lasting ballast and crosstie sleepers. The use of Sperry car has helped in locating defects in the track without removing the track. Welded rail joints have saved many man hours of labour besides providing an improved track. Automatic freight car classification yards have helped to expedite traffic and reduce switching costs. Centralized traffic control has permitted automatic control of the flow of traffic over hundreds of miles of line from one central point. The weight of rails has increased over the years and at present 139 pound rail is the standard for most main line operation.

One of the major indicators of efficiency is the handling of freight and passengers with relatively fewer engines, cars and personnel than before. The total number of locomotives in operating service for all types combined declined from 41,719 in 1947 to under 29,000 in 1962. Notwithstanding this decline in motor power, the total number of gross freight ton miles handled by Class I railroads for 1959 exceeded that for 1946 by approximately 3.0 per cent. This accomplishment was, no doubt, made possible by many technological advances leading to increases in the average speed of trains and decline in the turn-around time of rolling stock.

On some of the railroads in the United States industrial engineering departments have been created whose function is to devise methods to cut costs, rationalize operations and strive for higher efficiency. The rise in the productivity index on the United States railroads to which reference has been made above may bear testimony to the useful role played by the industrial engineering groups. The railroads in India may well emulate this example and set up industrial engineering departments in each of their regional systems.

Operational Efficiency

Now let us look at the trend of operating statistics of the Indian Railways. The table on page 207 gives some of the more important indices of operating efficiency over the last ten years.

The figures in the table indicate that while there is no improvement in the operating statistics the average freight train speed on both gauges and wagon turn-around time on the meter gauge have generally deteriorated. (See graph). The figure "net ton miles per freight engine hour" is well-recognized as a rough index of operational efficiency. The numerator consisting of total net ton-miles gives a good measure of the revenue earnings of the railroad. The total freight engine hours in the denominator is a measure of the expenditure incurred in carrying the freight.

The quotient must provide a rough index of earning power per unit of expenditure, which in this case is an engine hour. If the numerator goes up as a result of an increase both in the volume of originating freight and in the trip distance, it is normal to expect (because of characteristics of the volume sensitive industry like the railroads) the quotient to go up even without any improvement in operational efficiency. The figures under net ton miles per freight engine hour in the table have been adjusted for variation in the average tractive effort of locomotives in different years and do not show much change. The natural conclusion to draw from this as well as the decline in average freight train speed and wagon turn-around time is that there has been a deterioration in operational efficiency on Indian Railways. It may be considered rash to make such a statement on the basis of the figures so far examined but the author has had personal experience of working on three different Divisions of the Southern Railway, where drive, organization and above all innovations have been instrumental in raising freight train speeds and efficiency indices by 50 to 75 per cent. And all this was achieved with the existing equipment and facilities and without any large capital expenditures.

The railroad plant is an admirable example where relatively minor changes and investment can yield large dividends provided there are dynamic and innovating managers. Fortunately such men are available in the railroads.

The railway organization as it exists today as a department of the Central Government, however, does not appear to be conducive to the training and development of such men. Here therefore is the *raison d'être* for the creation of a Federal Railway Authority as an independent body with broad decentralized functions.

Here we face a fundamental issue. In a free enterprise economy such as the United States, appraisal of management goes on continuously through the following media: (a) profits which reflect the

of common stock equity in particular and (b) market price of common stock shares. While the latter statement may be questioned, as the stock market fluctuations are highly capricious, it is yet undeniably true that the popularity of such stocks as IBM, GM Corp, and DuPont may be attributed to the dynamic leadership of these companies and is an expression of public confidence in their managements.

Now, what yardsticks do we have for managerial appraisal in publicly owned undertakings? This is still a difficult and fuzzy area. "The first responsibility to society is to operate at a profit, and only slightly less important is the necessity for growth. The business is the wealth-creating and wealth-producing organ of our society." These remarks of Peter Drucker apply equally to the management of public enterprises. The same problem has recently come up for a good deal of discussion in the Soviet Union, in which two questions were posed. One is, how to increase the productivity of state enterprises? The other is, how to judge the managerial efficiency of the enterprises? At the heart of the debate is a suggestion put forth by Professor Liberman of Kharkov Institute who proposed that factories be awarded their annual bonuses on the basis of their profits. At present, a bonus is granted when the factory meets and surpasses its production quota, regardless of the enterprises' profitability.

Profitability the Essence

This is, however, not startlingly new. It was reported a few years ago that "it may seem paradoxical that this responsibility of management is most clearly recognized in the Soviet Union. Profitability is the first and absolute law for Soviet management and the essence of what the Russians proudly proclaim to be their great economic discovery: 'Management by the rouble.'"

It is, of course, easy to see that profits alone are not a reliable guide. Short-sighted executives can so manipulate figures as to show good profits for a few years by letting the assets run down or by extravagant use of raw material reserves. On the other hand, a firm which has not shown profits may be just on the verge of spectacular success because years of developmental work and far-sighted management have begun to yield results.

It would, however, seem to the writer that in so far as public undertakings are modelled after business enterprises and in so far as rate of return is applied as one of the yard-

sticks in evaluating their performance, they would prove successful not only as testing ground for the managers who run them but in the ultimate analysis justify themselves as viable economic units.

WINDOW ON THE WORLD

Belgian, Italian and Spanish Planning

From Our Special Correspondent

PARIS:

THIS IS the quiet season in the European economies, when industry and trade slow down for the summer holidays. The statisticians cannot collect figures because their informants are away, so the statisticians leave for the beaches too. In many Continental countries there will be no further economic indicators published until September, when a joint July-August figure will be published, showing the usual dip in activity — which gets deeper each year as more people get longer holidays. So this is the usual time for the planners to review the progress of the national economy and to set it against the forecasts of their plans. In this natural, seasonal pause they take stock of the impact of the winter on economic expansion and prepare their guesses for the autumn "ren-tree." There are more such reviews in Europe this year than ever because, while the doctrinaires of liberalism maintain their opposition, planning is gaining ground. Apart from the now traditional meeting of the French planners, there have been in recent weeks similar plan reviews in Spain, Italy and Belgium for all these countries are henceforth committed to an effort to plan their economic growth over a longer term (and in more detail) than is possible with annual budgeting.

It is notable that three countries so differently placed should think that flexible planning methods have something to offer them. Belgium is one of the smallest European nations, and enjoys (despite a relative loss in recent years) living standards that are still among the highest; it has no unemployment problem of importance; its economy is closely integrated with international trade and is, moreover, engaged in the process of European integration. Italy, in contrast, is a large nation at a quite different stage of economic development; it is still relatively little involved in world trade, in proportion to its national product; it has known a long boom, quite unlike Belgium's period of stagnation, which very likely could continue for years yet without resort to national planning. Spain, in turn, is at the other extreme: a backward economy that is only now, after several false starts, entering the era of industrialisation.

The Common Character

For all these differences, there are similarities too, and there is an obvious one that may well account for their simultaneous adoption of democratic planning. (The label democratic may justly be applied to the Spanish conception too for, although that society is not a democracy, the plan is a timid step toward freer and more open methods of economic management, away from the arbitrary and unenlightened dictatorial techniques that led to bankruptcy a few years ago.) That common character is that all three nations ran into grave problems of regional unbalance, and lost all faith in the ability of free-market mechanisms to overcome them unassisted by some system of centralised consultation. The ruling parties in Brussels, Rome and Madrid were never ideologically inclined toward planning, which indeed they were tempted to dismiss as "Communist". They are all of them associated with powerful capitalist interests who are apt to take a rather narrow-minded view of economic "liberalism".

Yet they all encountered insuperable difficulties in main-

taining (or introducing) roughly equal economic progress in the various parts of their territories. Worse, they found that these discrepancies were heightened, rather than relieved, by entire reliance on unco-ordinated free enterprise. Economic inequalities between regions are most marked in Spain, and least in Belgium. And yet the political consequences have been most dangerous in Belgium, and least (in recent years) in Spain — which suggested that such inequalities could become more and more troublesome as average living standards rose and political freedom increased. Indeed, unequal economic advance in the Walloon and Flemish parts of Belgium has lately threatened Belgian national unity, and it is notable that passions ran highest precisely in Brussels, the capital of the free-enterprise system that had made Belgium wealthy but unbalanced.

Troubles Ahead

Italy was plainly heading for similar, but starker, troubles; it is well known that the gap between the poor south and the industrialised north actually increased throughout the first decade of rapid economic expansion. While in Spain it is only the dictatorship (continuing in this respect the task of the monarchy and the republic) that has held the nation together; a period of greater freedom, even if (or especially if) accompanied by fairly fast expansion, would have sorely tested the nation's ever insecure unity. The resort to planning in each case is motivated by the wish to ensure a spread of economic benefits that will be less dangerous politically. The spread here referred to is as between regions, rather than as between classes. True, the inhabitants of less privileged regions have more in common than mere cohabitation, so the regional problem is always complicated by other factors which may come to get more attention, as with the "communal" conflict between Catholic Flemings and the godless Walloons. But the regional issue is fundamental, and it is never a question (as it was in socialist planning) of equalising economic classes, promoting, the welfare of the working classes as against the possessing classes.

Another thing that the Belgian, Italian and Spanish plans have in common (and this applies to current French planning also) is that none of them seeks to maximalise output at virtually any cost. In fact, they all set targets that have been achieved in years gone by without the aid of planning — achieved at least once in Spain, and habitually in the other countries. Unlike the Russian five-year plans which sought to pull a nation up by its bootstraps, to achieve output records and to quicken the pace of development, these democratic plans take as their function the stabilising of progress at a level that has been proven possible by recent performance. Planning still suggests to many of its liberal critics the desire to force growth at an unnatural and surely uneconomic speed, which is why they hold it must inevitably deteriorate into compulsion when sacred and irrational targets remain unfulfilled. One will find no such targets in the West European plans being discussed. As a whole, the nation is nowhere being asked to do more than it has done in the past, but there is the hope that performance can be better sustained by anticipating the bottlenecks and balances that interrupted previous upswings.

The Belgian plan calls for a 17 per cent increase in national product between 1962 and 1965, which is four per cent a year.

This rate of expansion was easily achieved in 1961 before the plan began, so it is no surprise that it has been so again in 1962. The Italian plan sets the objective of a five per cent annual increase in national product, which again has often been seen in the recent past. The plan does not even recommend any heroic attack on the unemployment problem, which is not expected to be resolved before 1973, because to try to cut corners would imply quickening the pace of expansion beyond known and proved performance. As the Saraceno report on the Italian plan puts it, "The idea is not an acceleration of national economic development but the maintenance of a persistent and regular rate of expansion adapted to the possibilities of the moment. It is in essence an anti-cyclical policy." The Spanish objective of a six per cent annual increase in gross national product per capita seems, indeed is, more ambitious. Spain has several times lately done better than six per cent yearly for the global GNP but on a per capita basis, this increase was achieved only once, in 1961. Still, there is nothing superhuman about the Spanish target, when you consider that the base-figures are very low and substantial percentage increases are thus easier to reach. The Government takes six per cent as a maximum, which there would be no interest in exceeding, although at that speed it will take the Spaniards 13 years to attain present Italian standards and 20 years to catch up with existing French levels of income per head.

A final similarity between these different plans is a projected rapid development of public investments in the infrastructure of economic life: transports, urbanism, occupational training for the large sectors of the population that must change their way of life, and the like. Further government

Is a Wages Policy Possible?

By JOSSLEYN HENNESSY

LONDON:

THE RECENT speech of the Leader of the Opposition, Mr. Harold Wilson, to the Transport and General Workers Union was a major declaration of Labour policy before a large group of Labour supporters (although a lone Conservative TGWU worker, evidently of suicidal tendencies, took the occasion to proclaim, from the rostrum, the virtues of private enterprise, thus reminding any reflective observers present that about one-third of British trades unionists vote Conservative).

Mr. Wilson had a number of constructive points to make, but in order to render them palatable to his Labour audience, he felt it necessary to interlard them so heavily with barbs aimed at employers and the City of London, and derisory comments on the Conservatives, that the significance of his points, although clear enough to those capable of reading between the party political lines, must have been largely lost on the conscientious party rank and file.

Mr. Wilson said that a Labour government could not afford restrictive practices or out of date methods on either side of industry, could not afford unofficial strikes, or tax avoidance or financial manoeuvrings for quick profits, and would have to ask for restraint on all incomes, wages, salaries, profits, dividends, and rents. Such importance does Mr. Wilson evidently attach to an Incomes Policy that, after preparing the way by pouring ridicule on the Tories, he returned to the theme of incomes to emphasise, in case any should overlook the fact, that increased incomes could only come from expanded production and increased productivity.

What Mr. Wilson said was reasonable as far as it went, but he left some fundamental questions unanswered. Mr.

ventures in productive industry are not envisaged, even in Italy where Rome has foresworn new nationalisations after the take-over of electric power. The production of goods remains exclusively a private-sector affairs, and if the State's share in the distribution of the national income is expected to increase in each country this is because of a fresh emphasis on communal responsibilities and collective tasks which hitherto were neglected — especially in the backward regions of each country. Liberals could still say that planning is accompanied by socialisation in the sense that the State's role is extended, but this is only in matters that have always been regarded as the State's business (plus nuclear energy, a new field where, given the smallness of European nations, there is no room for competitive private ventures). This is so even in the Spanish plan, which is being written along the lines of the French plan and under the supervision of the I.M.F. and the World Bank, two institutions much less favourable to government enterprise than was the Francoist regime before it went broke in 1959.

Apart from these similarities in design, all the plans face an identical danger, which is already familiar from French experience: the impact of rising prices on development plans. In other words, they pose the problem whether it is possible to co-ordinate activities without co-ordinating the competition for higher revenues, without, that is, a national incomes policy. When it is realised that this must include not only a control over wages and salaries, but over all forms of income including profits and dividends, it will be seen to entail a calling in question of the present economic system. But that sort of problem will arise in all economies afflicted by secular inflation, whether or not they adopt national planning.

Wilson would certainly agree that if no profits are made, expansion is impossible, but he seems to imply that profits are only respectable if they are ploughed back into the business. If, however, all expansion is based on ploughed back profits, what guarantee is there that the right industries are being expanded? The best allocation of national resources can be made only if profits are paid out to shareholders, who then spend or re-invest them in accordance with the state of the capital market as a whole and the comparative attractions of individual investment possibilities. Failure to pay out good dividends leads to the under valuation of shares and opens the door to take over bids, of which Labour (for obscure reasons) disapproves. If, moreover, a company's retained profits happen to be insufficient to meet its plans for expansion, investors will be slow to invest in a market governed by dividend restrictions.

Just as there are fashions in the clothes of Western women, so there are fashions in the ideas of Western intellectuals. At the present time, it is fashionable among both Socialists and Conservatives to believe that the solution to all the UK's problems lies in a "sound" Wages and Income Policy. It amounts to a ritual incantation but neither Mr. Macmillan nor Mr. Wilson have explained to their respective congregations what the term means.

From the viewpoint of an economist, a Wages Policy implies that some authority has made an estimate of the national income for the coming year and of the share in it that could be paid out to increase wages without inflation. If this total of the share could be agreed, and agreement on this is, as the Cambridge economist C. W. Guillebaud has pointed out, a very big initial assumption indeed, then suppose for the sake of argument that wages and salaries are running at a total of £10,000 million, and that the agreed sum available

for increases is £600 million. Some authority would then have to be responsible for dividing out that £600 million among the various claimants in accordance with "fairness" and the "national interest."

I confess that I should hate to be one of the committee charged with this thankless responsibility. What criteria could I apply? Increase in productivity per head? But in innumerable occupations — bus drivers, policemen, civil servants, municipal employees, waitresses — productivity is difficult to measure and still more difficult to compare with that of other workers. Yet bus drivers, policemen, etc., may feel themselves for other reasons equally entitled to an increase of pay. A rise in productivity could also come from more capital invested per worker. If so, is the shareholder, who saved and invested the capital, entitled to no increase of dividend? Or increases in productivity might be greatest in industries, such as armaments, which contribute nothing to increase the supply of "wage-goods", i.e., the consumption goods of all kinds on which wage earners spend their money incomes and on the supply of which the value of real wages depends, since a rise in money wages without an increase in workers' consumer goods merely ends in higher prices. In any case, armaments is the kind of industry in which a large output from piece work, or production bonuses, automatically gives the workers higher earnings. Nor does productivity solve the problem of differentials within an industry — the claims of the lower paid workers on the ground that they are hardest hit by a rise in the cost of living versus the claims of the skilled workers on the ground that their greater skill or responsibility is inadequately rewarded.

Is an industry's capacity to pay a criterion? There are

Indonesia: Challenges Confronting Guided Economy

By D. R. RAJAGOPAL

JAKARTA:

INDONESIA ranks among the topmost countries which are endowed with bountiful natural resources. She is capable of producing basic industrial commodities and also those of every-day consumption like rice and sugar in great abundance, not to speak of spices from which she traditionally enjoyed lucrative export earnings. Her known deposits of fuels like petroleum and kerosene and of minerals like tin, bauxite, coal, iron, manganese, copper, nickel and to some extent gold and silver are also vast. Then there is the nature's bounty of plantations in high demand like rubber and dense forests which can yield quality timber. The marine resources over a multitude of islands constitute another fruitful source for exploitation. The potential for generation of hydro-electric power has been assessed as among the highest in the few countries plentifully endowed with it. But these resources can be successfully mobilised provided adequate scientific planning, application of investment capital, technical know-how, managerial skills and trained labour as well as a careful programme of marketing are brought into play in a comprehensive and integrated scheme for continuous development over a long period. Thirteen years have passed by since Indonesians became masters of their own house, free to lead their country to its economic destiny. During these 13 years, it was only the short-lived Korean boom which brought in its wake a passing phase of prosperity. For the rest, these long thirteen years have a tale of mismanaged State planning to tell. The resources are lying dormant and on the contrary there have been impressive declines in the production of many commodities badly needed for home consumption as well as for exports.

If Indonesia's economy is undergoing intermittent and

few countries today in which inflation is not prevalent and high gross profits on paper are inevitable with inflation. Paper profits enable inefficient firms to prolong their existence, induce employers to hoard labour, and to bid up wages against each other.

What about a higher share out of the agreed £600 million to attract fresh labour into undermanned industries? But in time of overfull employment (implied in the demand for a Wages Policy at all) most industries are short of labour.

Theoretically, it would be possible to work out an index of the relative importance of each category of job in every industry, and to allocate increased pay accordingly. But in practice would any worker accept as "fair" the index points allotted to his job? Would a railway worker agree to lower points than a bus driver, or a baker to fewer than a waitress?

Enthusiasts for a Wage Policy in the UK point to the alleged success of such policies in the Netherlands and Sweden. The statistics do not support them. With 1953 as 100, UK wages rose from 80 in 1950 to 137 in 1958, prices from 81 to 119; in the same years, Dutch wages rose from 89 to 140, prices from 88 to 117; Swedish wages rose from 68 to 135, prices from 79 to 119. The differences are thus seen to be small.

What the two Harolds — Macmillan and Wilson — shrink from telling their supporters is that (1) with inflation, centralised wages stabilisation is impossible; without inflation, it is unnecessary; (2) inflation comes from ever increasing government expenditure, especially on welfare; if government slashed this, the lower taxes and stable prices that would follow would enable the overwhelming majority of people to afford their own welfare in education, health, pensions etc., as well as the cost of helping the indigent minority.

prolonged spells of stagnation, it is mainly because of the lack of positive direction, a sound plan of sustained development and an administrative machinery geared to its implementation. She has accepted socialism as the goal to be achieved for the new social and economic order after liberation from Dutch colonialism. But this policy has remained with the rulers more of an article of faith than a challenge to be successfully met by transformation of the economy to the socialist model in practice. The policy of nationalisation of industry is being attempted to put into force, but it is significant that out of the 500 enterprises currently owned and operated by the State, 300 and odd are former Dutch enterprises which were taken over in 1957 in the virtual expropriation bid following the bitter hostile turn which the West Irian dispute took at that time. The nationalised enterprises, excluding those which were taken over from the Dutch, are run with inadequate resources on medium or small scales. For quite a long time Indonesia's economy was caught in the doldrums and it is doubtful whether the Government's attempts to lift it from the state of stagnation have proved successful to any mentionable extent. The state of affairs at the present time is too difficult for extricating the economy from this plight.

It is estimated that the installed industrial production capacity, such as it is, is seriously under-utilised, so that about three-fourths of it is lying idle for want of maintenance imports, particularly replacement machinery, spare parts and a wide range of semi-manufactured and raw materials which must inevitably be procured from abroad. Transport and communications could not be given the resources they need to function effectively as integral parts of the infra-structure of the economy. In spite of all the multiplicity of islands which demands highly developed shipping facilities, the merchant fleet is still in its rudimentary form. Motor transport

has received relatively great attention, but the proportion of vehicles forced to lie off the roads is in several regions as high as 50 per cent. This again is due to the scarcity of imported spares and components.

The ambition of the Indonesian people and their Government to lift their economy from the current stagnation and to give it acceleration is quite understandable and completely justified. But this is only so far as the ambition goes. It is difficult to be sure that the economic policy of President Sukarno has been conceived with sufficient attention and thought to its practicability. The socialist orientation which the group in power is determined to give to the nation's economy broadly falls in line with popular approval. But there is not much evidence of achieving this goal. It is to be found in the high-sounding slogans which President Sukarno has given to his people in his Economic Declaration of March 28 last. But slogans cannot be substitutes for the hard reality of a practical economic policy and sustained endeavour to mobilise and exploit potential wealth. Considering the vast extent of unutilised industrial capacity (about 75 per cent), the talk about launching the ambitious eight-year Plan of Economic Development sounds unrealistic. It is only logical that the economy as it has grown up to the present time must be consolidated first before any investment outlays are undertaken on schemes of new expansion.

Emotional Attitude

Indonesia's guided economy has not so far received effective guidance (and the indications that such guidance would be forthcoming in good time are lacking) for the main reason that President Sukarno and his advisers are still overcome by the emotional attitude to colonialism which is fast fading out everywhere. They still think in terms of economic imperialism and neo-colonialism in making decisions on pressing and urgent problems of importing capital investment and technical skills for the exploitation of the nation's resources. Foreign private capital has been tabooed for this very reason, in spite of the experience of a majority of the underdeveloped countries, liberated from colonialism after the last war, which demonstrates that a new system of economic collaboration for mutual benefit is rapidly replacing the former colonial domination. The virtual expropriation of the Dutch economic enterprises in the dark phase of the West Irian dispute has created a vast vacuum. Domestic resources in Indonesia, as in other underdeveloped countries, are not equal to the task of filling such a vacuum and the practical ban on private foreign investment and flow of technical co-operation which accompanies it, threatens to prolong the essential period of transition.

President Sukarno has relied solely on foreign credits at the government level to fill the gaps in the available capital resources. When it is remembered that indigenous capital in this country is shy and there is a dearth of enterprise, it is not difficult to infer that foreign capital and enterprise as well as skills (even if procured from friendly Governments and international agencies) would be the mainstay for expanding the economy. But it cannot be assumed away that the flow of government credits and such skills would be available in the volume in which they are desperately required. Indonesia's policy of non-alignment has enabled her to obtain economic aid from both the blocs. But aid from the Western bloc far out-strips that from the Communist bloc. Within the Communist bloc itself the Soviet Union is the virtual or potential supplier of aid. It is significant that Soviet goodwill has been utilised to obtain economic aid as well as military assistance, the latter for the preparation of the liberation of West Irian. Soviet economic aid is estimated to have totalled US \$600 million, while its military aid is said to have been

of the order of \$400 million. There is another windfall which President Sukarno, taking a short-view confined to the immediate future, is attempting to exploit. It is the intra-Communist bloc rivalry and the new offensive launched by the Soviet Union and China to impress the under-developed countries with their individual earnest desire to assist them economically. The Communist Party of Indonesia, it is no secret, is inclined to take the hard Chinese line. But economic aid from China is inevitably small as compared to that from the Soviet Union. It is assumed to aggregate \$30 million only, but the terms of repayment are easy extending over a period of 15 years with the lowest interest rate of 2½ per cent, which compares favourably with the terms for the Soviet credit.

The other government credits which Indonesia has received fall into two categories as regards maturity according to their purpose. Credits for capital goods are repayable over 15 years and those for industrial raw materials fall due in about half this period. So far Indonesia's total foreign credits are said to add up to \$2,225 million. Budgeting in Indonesia tends to disclose the severe strains which will be exerted on the finances of the country as the credits become due for repayments even if in instalments. The magnitude of budgetary deficit is many a time high extending to as much as 20 million rupiahs. This is apart from the secret defence budget necessitated by West Irian operations which in some years is said to have run as high as 30 million rupiahs. The share of defence expenditure in the total budget is stated to be normally of a great magnitude, but the exact measurement of defence expenditure does not seem to be easily assessable. The course which economic development has taken so far does not reflect a fruitful utilisation of foreign credits for investments either in heavy industries or in export industries or import-saving industries. The potential which normally should be built in the earlier phase to give a self-generating orientation to the economy is lacking in Indonesia's planning. President Sukarno is thus leaving a legacy of foreign debt servicing problems to be taken care of on an ad hoc basis.

Among the credit suppliers of Indonesia for purely economic assistance, the U.S. easily ranks as the first. Relations with Holland have been strained to the utmost. The value

MENU-BHAI SHAB

of expropriated Dutch property and plantation holdings as a consequence of the West Irian controversy is estimated to be \$2,500 million. But there are others like West Germany in Western Europe which are extending help on the basis of a tie-up of credits with trade. China, in recent months, is showing a special solicitude for Indonesia's development and the bonds of co-operation between the two countries are becoming closer. Indonesia is desirous of importing from China complete textile plants to be set up in Sumatra or Borneo, but this is to form part of the credit of \$30 million provided by Peking. At the present time China is supplying cotton textiles and rice to Indonesia of which she is desperately in need and, in return, China is importing increasing quantities of rubber from Indonesia. China's off-take of Indonesian rubber is now said to have reached the significant proportion of the 16 per cent of the total valued at \$50 million. Japan's textiles are being steadily replaced by those from China, but Japan's trade is still valuable as supplying the vital gaps in domestic supplies. Among the Communist countries which are offering economic aid to Indonesia are Yugoslavia whose loans between 1959 and 1962 were of the order of \$25 million, out of which \$10 million were intended for building ships. The balance is to be utilised mostly for the supply of textile machinery. Poland has offered a credit of £10.7 million and Rumania has agreed to provide an unspecified credit for the supply of equipment for the exploration and subsequent exploitation of oil. It seems from the past trends in imports from Japan that the debts due to Indonesia from Japan on account of war reparations of the order of \$500 million would be absorbed partly by credits and partly by the continuous supply of essential goods.

The stagnation in which Indonesian economy has been sunk is a far cry from the high-sounding promises given in the Eight-Year Plan of Economic Development. How badly the country's economy is in shape can be gathered from the crucial indicator of the value of the rupiah in the free market. As against the official exchange rate of 45 rupiahs to the dollar, the quotation in the free market is 1,500 rupiahs to the dollar. A recent market trend disclosed that in Jakarta the price of rice which was around 35 rupiahs per litre in December 1962, shot up to 120 rupiahs in March this year. The downward fluctuations in the production of rice reflect the deterioration in the domestic production in important crops with which this country is richly endowed. It has been one of the repeated promises of President Sukarno that the economy would not only provide ample rice to a population of

250 million, but be in a position to produce an export surplus of 2.3 million tons per annum by 1968. This promise has no relation to the post-independence trends and the present outlook for the rehabilitation of the rice economy of the country. Indonesia, which was once a steady and regular exporter of rice, has gone on importing this staple foodgrain of daily consumption in increasing quantities. She is currently importing rice worth \$100 million and this level has been more or less in evidence during the last fifteen years or so.

Economic Disruption

It is true that the war of liberation against the Dutch resulted in serious disruption of the country's economy, but it cannot be gainsaid that rehabilitation of agriculture is comparatively a much easier task than the rehabilitation of broken down industry. It is not only in rice that Indonesia has been unable to regain her pre-independence production level, but the experience is repeated in the case of valuable commercial crops like rubber (whose output fell even between 1951 and 1960 from 800,000 tons to 577,000 tons), copra, tea, coffee and tobacco and pepper, the output of the last three being estimated to be just about one-fifth of the pre-independence or rather pre-war level. Rubber and tin are two strategic commodities in short supply in the world where Indonesia's loss has proved to be Malaya's gain in recent years. The production of tin in Indonesia declined during 1955-60 from 36,000 tons to 22,000 tons. The overall position is reflected in the trade balance. The position as estimated at the beginning of 1962 was that the trade deficit was of the order of 5,146 million rupiahs and the forecast was that export earnings would take long to recuperate and expand so that a trade deficit would continue to be a normal condition for some years to come. The foreign exchange reserves had to be depleted at a rather fast rate, while the economy was thus in a condition of stagnation and imports were imperative even for essential goods of ordinary consumption.

It would be wrong to lay the blame for this state of affairs in the economy squarely on the shoulders of the Sukarno regime. War and the revolt against Dutch colonial rule inevitably resulted in a considerable dissipation of the nation's wealth and set-back to its agricultural and plantation production in particular. But it cannot be denied that during the post-independence period since 1949 far less than adequate attention was given to harnessing the natural resources and people's energies to the rehabilitation of the economy and its development. Much of the public attention was diverted to

problems like that of West Irian (and now the confrontation in Brunei). The aspiration of the Indonesians for the liberation of West Irian is quite understandable. But emotional attitudes have been allowed to take the upper hand by the Executive Government in shaping economic policies. The experience of all erstwhile colonial countries shows that foreign economic

Balance of Payments Programme

By GUY SIMS FITCH

WASHINGTON :

IN A MAJOR message to Congress, President Kennedy has dealt with the second of the two basic economic problems that have been confronting the United States. The first, largely domestic, is the matter of employment and related questions of economic growth. The second is largely international. It concerns the nation's balance of payments—the continuing deficit in the U. S. transactions with other countries.

Actually, there is a close correlation between the two, and moves undertaken to deal with one can have important effects on the other. Also, as in the case of employment, the balance of payments problem and the measures being taken to cope with it do not stem from any underlying economic weakness. On the contrary, the American economic situation, at home and abroad, is essentially sound, and the long-term trends are moving in favour of the United States. This very strength gives the U. S. Government time to take the kind of short-term measures that are appropriate to safeguard the nation's position.

The President's message makes these points clear. His Administration has consistently sought a course that would increase economic growth and reduce unemployment at home, while simultaneously strengthening the dollar and eliminating the deficit in the international balance of payments. Much progress has been made in both the directions.

The domestic accomplishments should be well enough known by now. All the major elements affecting production, employment and purchasing power are at record levels and rising. The economy's over-all growth rate has been stepped up markedly.

On the international front, the U. S. dollar remains strong, bulwarked by nearly 40 per cent of the Free World's monetary gold stock and by a network of financial arrangements with the other free countries to help stabilize international currency flows. The U. S. gold outflow has been cut to half in the past few years, and the deficit in the balance of payments has been reduced from \$3,900 million in 1960 to \$2,200 million in 1962.

Foreign Assets

The payments deficits, moreover, have been consistently equalled or exceeded by growth of the nation's long-term foreign assets. Today, Americans hold more than \$60,000 million in private investments abroad, and dollar loans repayable to the U. S. Government total more than \$11,000 million. At the beginning of this year, these assets, in toto, exceeded liabilities to foreigners by about \$27,000 million. They have shown an increasing strength over the years, and income from them has been rising.

Also working in the U. S. favour, and indicative of the nation's strong foreign exchange earning ability, are its large trade surplus of exports over imports and a domestic price-cost stability that has enhanced the competitiveness of American products in world markets.

Offsetting this trade and dollar strength, however, and chiefly responsible for the payments deficits, has been a huge net outflow of capital from the United States for such pur-

aid, whether in the form of government credits or import of private capital, is indispensable in the initial period. Indonesia does not appear to have put the economic aid which she received to the tasks of reconstruction and development which demand the highest priorities. The road to economic betterment seems hard for this country for some years more.

poses as Government economic and defence assistance, and private investment and travel.

In this sense, continued improvement of the domestic economic performance is a key to balance of payments progress. In addition to strengthening the afore-mentioned favourable factors, it would make capital investment in the United States more attractive, thereby helping to reduce and possibly reverse the outflow of funds. Hence, the Kennedy Administration still considers its Domestic Tax Cut Programme a top priority item, essential to both economic growth and payments equilibrium.

The problem right now, however, is to deal with a payments deficit that has shown signs of becoming larger rather than smaller this year, mainly as a result of unexpectedly heavy outflows of private funds, and to do this in a way that adheres to historic U. S. policies of freer trade, unfettered capital movements, and continued assistance to the defence and economic development of the free nations.

This means also that the dollar will be maintained freely interchangeable with gold at \$35 an ounce as the foundation stone of the Free World's trade and payments structure, and that any short-term steps to cope with balance of payments deficits on the way to equilibrium will not interfere with the smooth functioning of the international monetary and trade systems.

Short-term Steps

The action Programme President Kennedy has drawn up meets these criteria. It is designed largely as a composite of short-term steps which would contribute to a substantial reduction of the payments deficit until such time—probably within a few years—as the favourable long-term trends begin to have their full effect. Where the Programme goes beyond such standard procedures as export expansion, restraint in Government spending abroad or resort to the facilities of the International Monetary Fund, it does so without imposing direct controls on trade or capital markets and without retreating from international obligations.

Much of the Programme's stress is on curtailing the troublesome outflow of funds, largely through an increase in short-term interest rates at home which would not restrict domestic economic activity, and through an "Equalization Tax" on American purchases of foreign securities which would, in effect, make borrowing in U. S. capital markets more expensive. Significantly, the President is asking Congress to make this tax effective only through 1965. As recommended, moreover, it would not apply to less-developed areas, where the need for capital is great. It presumably would also be subject to special exemptions in exceptional circumstances, as in the case of Canada.

In the meantime, the U. S. Government probably will be studying, along with other countries, possible long-term improvements in the international monetary system. The Administration, however, has no specific recommendations to make on this matter at this time. Nor does it consider that talk of long-range reforms—whether or not they come to pass—is any substitute for actions the United States should take now.

Concern for the Common Man

By Our Special Correspondent

NEW DELHI:

DESPITE a very significant leeway left in the implementation of the third Plan during the first 27 months of its operation, the Planning Commission is not unduly pessimistic about its final success. While it is conceded that it may not be possible to achieve many a crucial target of production fixed under it—for instance, those of steel, coal, fertilizers and foodgrains—the overall performance may not be in any way worse than those of the first two Plans. It may even be slightly better.

This subdued optimism on the part of the Commission presumably emanates from the fact that as a sequel to the intensive efforts made during the past few months to locate the bottlenecks in the way of implementation, action is now being taken to put the matters right. Moreover, as in the first two Plans, the progress of the current Plan had to be slow in the first two years because of the preliminary work that had to be undertaken in drawing up of project reports and gearing of the administrative machinery to the task.

Meanwhile, the restlessness that pervades the length and breadth of the country today over the state of the Indian economy has created an unprecedented impact on the Planning Commission. Never before during its 15 years' existence, has the Commission been found in such a state of ferment as it is in today. This is reflected in not only its becoming more tolerant and responsive to the public criticism, but also in its undertaking a thorough heart-searching exercise which has made it more vocal on various issues. There is a greater desire today on its part to face the facts as they are. Shortcomings and failures are not attempted to be minimised. Nor is protection being sought behind such excuses as rise in prices being a concomitant to a rapid rate of economic growth.

Holding Price Line

The anxiety to contain the price level and to push up production has resulted, among other things, in the Planning Commission's pleas for invoking the Defence of India Rules for holding the price-line, expansion of the two private sector refineries at Bombay and release of more foreign exchange for import of fertilizers.

The mid-term appraisal of the third Plan, undertaken recently, is not only aimed at assessing its progress till now, but also at finding out what can be done for mitigating the distress faced by the common man today. While the targets fixed for the essential production programmes in the basic and infrastructure fields may not be scaled down for the simple reason that it is always good to aim high and strive for achieving it, a realistic upward revision of the targets of production of some consumer goods should not be ruled out. It has already been done in the case of sugar. The discussions in the Planning Commission can as well be expected to have its repercussions on the fiscal policy of the Government.

Along with the mid-term appraisal of the third Plan, the Planning Commission is also engaged these days on the

work of drawing up the fourth Plan. Some preliminary exercises have already been done in this regard. They will be looked into again as the thinking crystallises on the basic objectives to be kept in view. The consensus of opinion today appears to be that while the fourth Plan should, in continuation of the first three ones, aim at raising the standard of living of the people, stepping up of the rate of savings, development of basic industries and infrastructure and taking the economy further towards the take-off stage, it should be less dependent on external assistance and contain a distinct bias in favour of the common man's expectations. The question frequently asked is: How much longer the man in the street is to wait for a perceptible improvement in his lot? The two overriding criteria to be followed in drawing up the fourth Plan may, thus, be improving the balance of payments position and affording of some relief to the common man in the foreseeable future. This implies greater stress to be placed in the fourth Plan on the development of export-oriented and consumer goods industries than had been the case hitherto.

The work on the fourth Plan has been started early so that there may not be any slackening down of developmental activity even in the first year of its going into operation. This is another indication of the renewed emphasis being placed by the Planning Commission on the implementation of the planned programme.

★★

Although, according to a message from Tehran, the name of the Oil and Natural Gas Commission does not appear in the list of some twenty parties approved by the National Iranian Oil Company as "potentially acceptable bidders" for offshore oil concessions in Iran, for which tenders are to be invited next year, this does mean that ONGC has no plans to bid for these concessions.

The Government of India is said to be anxious for Indo-Iranian collaboration in the oil industry if for no other reasons than for ensuring crude supplies for the rapidly expanding refining capacity in this country. Two refineries are proposed to be set up in the fourth Plan at Madras and Calcutta. The prospects of oil discovery in the Cauvery Basin and West Bengal still being obscure, they may have to be fed on imported crude.

The Oil and Natural Gas Commission, it is understood, will be bidding for the offshore oil concessions in Iran and the matter is likely to be taken up shortly on Government-to-Government basis. Even if the ONGC fails in its bid for the offshore concessions, the possibilities of its looking for concessions elsewhere in that country are not ruled out.

★★

The bid made by British Petroleum and Shell International to take over the Burmah Oil Company, the summary rejection of the offer by BOC Directors and their circular letter to the shareholders explaining the reasons why they turned down the BP-Shell proposals, bring into focus certain fundamental issues relating to the working of the oil industry.

The bid, if successful, would have involved the breaking up of a major oil company possessing the resources and

experienced personnel which enable it to play an affective and expanding role in the world oil market.

These developments are of particular interest to India. One of the main reasons for the BOC's turning down the BP-Shell offer is the expectation of a larger contribution in future to the profits of the company from its operations here. The BOC, as is well known, stands for a policy of co-operation with the national governments, particularly in the Eastern Hemisphere. In India it works in collaboration with the Government of India for the development of crude resources of Assam. Besides, it has large refining and distribution interests in this country. If the BP-Shell bid had resulted in the acquisition of BOC, these arrangements would have been disturbed considerably, particularly the future investments of the company. The BOC Board has no doubt taken note of this factor in arriving at the decision it has come to.

Another important point clarified by the BOC Directors' statement is that BOC's holdings in Shell and BP were no longer the main sources of its income. Although BOC has described its holdings in BP as of considerable importance, the letter to the shareholders makes it clear that trading income of the company has virtually trebled from 4d. to 11d. per share of £1 over the past three years, while the income from dividends from BP and Shell has shown little change. This trend is not only expected to continue but is anticipated to gather momentum because BOC plays a predominant role in the oil industry in India, Pakistan, Peru—three of the fastest growing oil markets in the world.

Now that BOC has stayed as an independent entity, it is looking forward to the continuation of its joint efforts with the Government of India in building up the oil industry in this country. Mr. J. A. Drysdale, an Executive Director of the company, who flew to New Delhi last month, conveyed to the Union Government the intention of the BOC management to expand their operations in India.

★★

The Union Minister for Heavy Industries, Mr. C. Subramaniam, is planning to set up a Committee to examine the progress of the Indian automobile industry, particularly in respect of manufacture of cars. The World Bank report submitted to the Government of India and the Aid-India Club sometime ago, pointed out that production of a whole car here under one umbrella had led to its high costs. It is only in the recent years that some ancillary industries have been developed. This should lead to some reduction in costs. A bigger snag, however, is said to be the comparatively small scale of production. Some of the well-known foreign manufacturers are stated to have shied away from the small car project because of a restricted market for such cars in this country.

There is a growing realisation that the Government of India's automobile policy was unrealistic and erroneously conceived. As against India, some of the South American countries, it is stressed, had permitted freedom to foreign entrepreneurs to set up car manufacturing plants there provided they did not import any components after, say, five years. This brought in not only self-supporting units but also competition, which compelled reduction in prices through cut in costs and even profits.

Two other features of Indian manufactured cars are also pin-pointed. Firstly, it is felt that the Indian manufacturers had adopted the American system under which an article is produced, say, for one year's usefulness. The Americans, it is pointed out, can afford to change their cars every year.

But this is not possible for the majority of car users in India. Secondly, the state of the Indian economy does not warrant going in for a car every year. What is, therefore, desired is to evolve an Indian car model which should remain unaltered, say, for ten years. This implies that the model should have durability to the requisite extent. In order to reduce prices, it is also felt that manufacture of cars should be undertaken on a bigger scale than has been attempted so far.

The Committee proposed to be set up may have some foreign experts on it, particularly from the U. K. and West Germany. A decision on the proposal is expected shortly.

★★

Two important amendments are proposed to be made in the Employees' State Insurance Act. One relates to the rate of disablement and dependents' benefit which is envisaged to be increased by 25 per cent. Through the other amendment, it is contemplated to raise the exemption limit for employees' contribution from Re. 1 to Rs. 1.50. While the former amendment is expected to result in a substantial gain to the employment injury beneficiaries, the latter will bring about considerable relief to the low paid employees receiving daily wages of less than Rs. 1.50. The qualifying conditions for sickness and maternity benefits are also proposed to be considerably simplified.

Certain tentative proposals have also been formulated for extending the activities of the Employees' State Insurance Corporation. These include extension of the ESI Scheme to all factories as defined under the Factories Act, 1948, and to all shops and commercial establishments, including transport companies, employing 20 or more persons in all areas having an insurable population of 500 or more, and provision of medical care and in-patient treatment to the families of the insured persons. More attention and resources are as well proposed to be devoted to the prevention of sickness than has been possible hitherto.

★★

Thirteen new bills are envisaged to be introduced in the coming Session of Parliament starting from August 13.

One is the Press Council Bill, 1963, which seeks to provide for the establishment of a Press Council so as to preserve the liberty of the Press and the standards of newspapers.

Three Bills relate to excise or income-tax. The Customs and Central Excise (Amendment) Bill, 1963, is for levying duty on all goods exported or imported or produced by State Governments irrespective of the nature of their end-use. The Central Excise and Salt (Amendment) Bill will amend the parent Act so as to bring in certain changes in the tariff descriptions. The Income-tax (Amendment) Bill seeks to alter the provisions of the Income-tax Act, 1961, regarding development rebate.

Through the Dakshin Bharat Hindi Prachar Sabha Bill, 1963, the Sabha is to be declared an institution of national importance.

Two bills relate to Delhi. They are, the Delhi Development (Amendment) Bill, 1963, and the Slum Areas (Improvement and Clearance Amendment) Bill, 1963. The Government will also seek powers through the Public Premises (Eviction of Unauthorised Occupants) Amendment Bill, 1963, to expedite the removal of unauthorised squatters from Government lands.

To make the provisions of the Food Adulteration Bill

more stringent, an amendment will be brought through the Prevention of Food Adulteration (Amendment) Bill, 1963..

The proposed labour legislation includes the Industrial Disputes (Amendment) Bill, 1963, which seeks to give effect to the recommendations of the Indian Labour Conference and the Standing Labour Committee, and the Personal Injuries (Compensation Insurance) Bill, 1963, which will impose on employers a liability to pay compensation to workmen sustaining personal injuries. It also provides for the insurance of employees against such liability.

The other two bills are the Antiquities (Export Control) Amendment Bill which seeks to remove certain lacunae experienced in the working of the parent Act, and the Code of Civil Procedure (Amendment) Bill, 1963, which raises the exemption limit of attachment of salaries and will extend the benefit of Section 80 of the Act to the State of Jammu and Kashmir.

The other business likely to come before Parliament during its forthcoming session includes the reports of the Commissioner for Scheduled Castes and Tribes, of the University Grants Commission and the Scheduled Areas and Scheduled Tribes Commission. The Supplementary Demands for Grants (General) for 1963-64 will also be discussed.

★★

The meeting of the Aid-India Club to consider further assistance for the third Plan has again been postponed. It

may now be held sometime next week. The discussions between Bonn and Washington on the two issues — the U.S. stress that the other member countries of the Club, particularly West Germany, should liberalise their terms of lending and the West German plea that the U.S. contribution should match all the non-American assistance routed through the Consortium — are not yet over.

★★

The Union Ministry of Industries is planning to set up a small Committee to review the procedure for industrial licensing and to make recommendations for such amendments in it as are considered necessary. The Committee, it is learnt, will have among its members the Secretary of the Ministry of Industries, Mr S. Ranganathan, the Secretary, Department of Economic Affairs, Mr. L. K. Jha, the Special Secretary, Ministry of Defence and Economic Co-ordination, Mr. T. Swaminathan, the Joint Secretary, Ministry of Heavy Industries, Mr R. V. Raman, the President of Associated Chambers of Commerce, Mr. A. R. Foster, and the President of the Federation of Indian Chambers of Commerce and Industry, Mr. Bharat Ram.

★★

Mr. Manubhai Shah and Mr. D. S. Joshi left for Rangoon on July 31, to discuss with the Burmese Government plans for expanding Indo-Burmese trade. The possibilities of Indo-Burmese collaboration for setting up some industries in Burma will also be explored by them. They will as well hold discussions on import of some additional quantities of rice.

Short-Sighted Cotton Textile Policy

By R. V. MURTHY

BOMBAY:

THE ABSENCE of a clear-cut cotton textile policy indicating the precise roles which the mill sector, the handloom sector, and the powerloom sector should play in the country's economy has created conditions which have adversely affected the consumer of cloth as well as the quality and cost of cloth in our country. In the absence of a well-defined policy, the practice of tackling the problems as they arise, that is on an ad hoc basis, has resulted in avoidable privations to the consumer and in loss of export markets to the country. This is the theme of a memorandum submitted by the Indian Cotton Mills' Federation (I. C. M. F.) to the Powerloom Inquiry Committee.

The Memorandum recounts how, in its zeal to encourage the handloom industry, the Government has taken various steps, such as prohibiting the mill sector to instal additional looms (1951); reservation of certain varieties of cotton textiles for production exclusively by the handloom and the powerloom sectors; restriction of the production of dhonis by mills to 60 per cent. of their packing in the 12-month period April 1951 to March 1952 (1952), and imposition of a handloom cess of three pies per year on mill production for making available to the Government sums from which the development of the handloom industry could be financed (1953). In addition to these, the I. C. M. F. complains, the authorities have prevented modernisation of the mill sector by discouraging replacement of ordinary looms by automatic looms, perhaps for fear of labour opposition.

Leaving aside the controversy over the number of powerlooms working with cotton yarn in the country, the Memorandum points to the acceptance by the Government itself of the existence of "fugitive" and "elusive" powerlooms.

Moreover, it adds, taking it for granted that the production of cotton textiles in the decentralised sector in 1962 was 2,640 million yards (as the Textile Commissioner has estimated the share of the powerloom sector to be 2,000 million yards), only 640 million yards remain as the share of the handloom sector. And, for this hardly sizable benefit to the handloom sector, argues the Memorandum, the mill sector has been unnecessarily penalised. The I. C. M. F. enquires whether it is just to make the mill sector suffer thus, when the Government is itself not able to stop the inroads of the powerloom sector into the sheltered sphere of the handloom sector.

Remedial Measures

Having pointed out the various lacunae in the present set-up and policies of the authorities, the I. C. M. F. proceeds to suggest certain remedial measures. These are: (1) The authorities should impose excise duties (such duties as they may wish) at the yarn stage and the processing stage so as to cover the "elusive" small powerloom sector; (2) The aims of the textile policy should be clearly laid down, so that it should be possible for the authorities to take appropriate decisions in regard to the problems that may arise from time to time in the three sectors of the cotton textile industry; (3) The existing restrictions must be removed as they have not achieved their purpose, and, (4) the provision for installation of four million additional spindles in the decentralised sector during the third Plan period should be covered by a provision for corresponding loomage in the mill sector, the existing spinning mills being encouraged to become composite mills.

It is the considered view of the I. C. M. F. that these measures would not only help the handloom industry but

also broadly meet the basic aims of "making available to the consumer better and better quality of cloth at lower and lower prices", and that, in turn, it feels, would strengthen the export potential of the country too.

★★

The Bombay Mazdoor Sangharsha Samiti has taken a decision to launch a token general strike in Bombay city on August 20 to draw attention to a six-point charter of demands on behalf of the working class. A mammoth 'morcha' is scheduled for August 9. The termination of the 'morcha' is likely to be either Raj Bhavan or the Chief Minister's residence. Mr. Madhu Limaye disclosed that all categories of workers would be participating in the agitation. He envisaged, for instance, participation by dock, BEST, municipal, taxi, engineering, chemical, rubber, hotel, silk, woollen, oils press and other workers. He was confident of securing the support also from the six lakh textile workers in the city. Mr. Dange, General Secretary of the All India Trade Union Congress, however, announced that textile workers would be advised not to join the token strike. Mr. Datta Deshmukh, the trade union leader, revealed that the workers of the engineering units could go on strike but this should be done on the same day when the civic workers strike work.

Over 7,000 employees of the State Bank of India and the State Bank of Saurashtra in Gujarat, Maharashtra and Madhya Pradesh have also decided to go on a day's token strike, if their demands are not responded to favourably by the authorities. Mr. C. Couto, the General Secretary, told that a committee had been already appointed to fix a date of the strike. If the token strike did not yield fruitful results, the Union would resort to an indefinite strike. The recent conference of State Bank employees held at Junagadh has urged the Government to re-consider the Compulsory Deposit Scheme, since rising prices and heavy taxation had already made life miserable for poor and middle class people who are absolutely incapable of making any saving envisaged under the scheme. Other employees mostly middle classes in Reserve Bank etc. are said to be likely to join hands. In the meanwhile, the Bombay dock workers have refused to allow deduction for Compulsory Deposit on the ground that their salaries are of a casual nature; the Central Government employees too have decided to observe August 8 as a protest day against the Compulsory Deposit Scheme.

On War Path

It has been demanded that all employees drawing up to Rs. 6,000 a year should be exempted from the Scheme. The 'fixed' income groups are thus on a war path. With the wholesale prices going up by over six per cent. since March last and the cost of living shooting up still higher, they are verily in a desperate situation. The Union Labour Ministry was giving the 'greatest attention' to checking the rise in prices of essential commodities. A scheme to open co-operative societies with an apex society having heavy investment to supply commodities direct from the producers had been finalised. Special officers had been appointed to promote societies among the working classes and for each society the workers were expected to purchase 250 shares of Rs. 10 each and the employers were to contribute Rs. 10,000 as their share. The Government would also give loans, if necessary, besides contributing Rs. 900 a year to each society to meet the managerial expenses. A survey conducted by the Union Labour Ministry had revealed that only 27 to 30 per cent. of the working class in the country were affected by the Compulsory Deposit Scheme. The survey had covered nearly six million workers excluding those of the Railways and the Central Secretariat services. Only one per cent. of plantation labour was affected by the scheme. The

largest number of workers affected was in the textile industry.

★★

The Reserve Bank closed the subscription lists of the Central Government loans at 1-30 p.m. on July 26. The lists were opened on July 22 and the notified amount (Rs. 225 crores) had been "fully subscribed". The lists were closed one day before the scheduled date. The total public subscription is stated to have amounted to about Rs. 135 crores, including the conversion of Rs. 35 crores. The LIC is known to have subscribed Rs. 39.3 crores and the banking system, including the State Bank, Rs. 53 crores. Subscriptions from other institutional investors are placed around Rs. 40 crores. The Reserve Bank seems to have made good the estimated shortfall of Rs. 90 crores. The response from the banking system has been somewhat below expectations, presumably because they are unwilling to lock up funds against which they are not permitted to borrow (funds) freely from the Reserve Bank. The total borrowings for the year thus come to Rs. 370 crores so far, which is Rs. 23 crores short of the Government's borrowing programme for the year 1963-64.

Spurt in Deposits

Between April 26 and July 19, bank deposits swelled by Rs. 94 crores (against Rs. 65 crores in the corresponding period of 1962) and bank credit contracted by Rs. 90 crores (against Rs. 33 crores in the corresponding period of 1962). During the week ended July 19 alone, deposits spurted by Rs. 26 crores to Rs. 2,180 crores and bank credit went down by Rs. 13 crores to Rs. 1,500 crores. The inflow of resources into the banking system, therefore, seems to be much larger than the draft made by the Government loan programmes on bank funds. The inter-bank call rate declined to 1 per cent; it had been pushed up from 0.75 per cent to 3.50 per cent on the day the lists for the Central loans opened. The decline stemmed from easy money conditions and coincided with the closure of subscription to the Government's loan floatations.

The Governor of the Reserve Bank, addressing the tenth anniversary meeting of the Bombay Bankers, ruled out any relaxation of credit controls in the next busy season (1963-64) in no uncertain terms. This is because the Reserve Bank's monetary policy is guided by the dual necessity of generating enough credit to meet the requirements of productive activity and regulating the overall quantum of credit. He claimed that the monetary and credit policies have been operated in a flexible and judicious manner. The banks should explore the idea of participation or co-operation in lending to big projects so that the commitment might be limited in respect of any single party and incidentally provide relief to the over-extended position of some banks. The Governor has given a reply to the representation made by bankers asking for relaxation of credit restrictions in the coming busy season.

★★

The sharp rise in the prices of silver during the past few days had intrigued both the trade and the authorities. The spot quotation went up in the last few days from Rs. 224 to Rs. 236 per Kg. The prices are likely to look up further since the demand for the white metal continues to remain unabated. The bullish outlook for silver has provided a sharp contrast to the usual experience during the monsoon when prices generally seek lower levels due to want of support. The present buying spree in silver has been mainly on 'investment account.' The value of silver as a storing metal has gone up after the Gold Control Order. Floating stocks of the metal are placed at not more than 1,500 bars, while the daily offtake is about 10 bars. Imports are not

permitted and prospects for smuggled silver are not bright in view of the nominal margin of profit in the business. The inflationary conditions also aided the bullish sentiment in silver. It is interesting to note that the price outlook for silver the world over is encouraging in view of the fact that industrial demand for the metal is fast increasing against the background of limited supplies.

★★

The bulls in the cotton market are likely to find themselves in a tight corner, because the sudden spurt in futures prices in the context of bearish factors has not gone unnoticed in official quarters. The Forward Markets' Commission has started discreet inquiries to find out the extent of 'cornering' in cotton. It is learnt that nearly 75 per cent. of the total transaction in the August contract is accounted for by four bulls, one of whom is credited with an outstanding commitment to the tune of 40,000 bales. The authorities have reason to take a serious view of the price rise

Lyons Range Suffers Set-Back

From Our Correspondent

CALCUTTA :

AT THE TIME of writing, conditions akin to panic prevail over Lyons Range with several pivotal shares shedding a large part of their earlier gains. This sudden reverse change in sentiment is due to the reports of renewed massing of troops by the Chinese on our northern borders accompanied by violations of the territory demarcated by themselves in their own declarations. What has perhaps convinced the market men that the present border developments are to be considered rather serious is the news of the return to the Capital of the Army Chief cutting short his foreign tour programme. In a way, such developments have come as a complete surprise to the stock market because the general belief earlier in the week had been that the lull in the border would continue unchanged and, if anything, there would be only news of some improvement. That the market people hardly anticipated any deterioration was borne out by the fact that easy credence was given to a Pakistani Radio report earlier in the week that the Chinese had accepted the Colombo proposals. Though the Pakistani report was promptly characterised as baseless by the Government of India, nothing was farthest from the thought of the stock market than a sudden flare-up. So, for the time being, sentiment is dominated by the border issue and will continue to be governed by it as the present developments have brought into sharp focus the undercurrent of anxiety on the score of the Chinese aggression.

Morale Boosters

Had it not been for this renewed anxiety which is by far the most powerful adverse factor in the present investment situation, the stock market would have gone on merrily scaling further higher levels for some more time. For in the course of the past few days market morale had received a boost. In the first place corporate news has been fairly encouraging though company results show the scars left by the Super Profits Tax. Notwithstanding a cut in dividend or the mere maintenance of the previous level of distribution, the satisfactory progress of expansion and diversification plans of companies such as Birla Jute, whose working results were available in the course of last week, were encouraging factors which even investors could not ignore. The initialling of the nuclear test ban agreement by the three nuclear powers perhaps is not of much direct significance to the stock market, but its indirect impact on market sentiment has been

since the emphasis is on holding the price line. The imposition of margins may be one of the ways of checking the price rise, but it should be noted that it had limited effect on bulls, especially the stronger among them, in the recent past.

★★

While the Government of India is anxious to improve the investment climate, the leading industrialists have expressed themselves against the LIC using its funds to revive the stock exchanges. The Finance Ministry's idea seems to be to pool the resources of the LIC, IFC and the ICICI to lend adequate support to markets and to revive confidence in new issues. The LIC funds should be used only for promoting approved Plan projects. No private sector insurance company, it is stated, would have ever contemplated the type of move which is reported to be on the anvil. Meanwhile, the Reserve Bank is understood to have sent to the Ministry of Finance its proposals for investment trusts.

quite considerable. A corollary to the test ban is a slow-down of the nuclear arms race that is now consuming the greater part of the resources of the developed nations.

Now that the Central loans are out of the way, more active support to the stock market especially from the LIC is to be expected and the reportedly growing concern of the Government over the sluggishness of the capital market is expected to result in measures calculated to foster investment interest in industrial equities. Aiding the steady expansion of interest in equities has been the growing belief that more and more companies will be issuing bonus shares. And this expectation has been fortified by the announcement last week that the Indian Aluminium Company has decided to apply to the Controller of Capital Issues for permission to issue Rs. 16,025,530 further capital divided into ordinary shares of Rs. 10 each to existing ordinary shareholders as fully paid-up bonus shares in the proportion of one share for every three shares held. Another important point on which the stock market has been expecting favourable news is the present rather harsh restrictions on forward trading. Some relaxation of the margin requirements has been considered essential in order to bring about an expansion of business.

★★

Although there has been some improvement in sentiment in the gunny market over the past few days, especially in the sacking department, an undercurrent of anxiety continues to persist in the jute industry over the outlook for this category of goods in particular and the whole range of its products in general. Last week's steady trend in sacking has been solely brought about by the considerable buying by the Government of India and there has been hardly any other buyer in the field. It is becoming increasingly evident that Indian sacking has come to rely heavily on domestic consumption as foreign off-take has been steadily decreasing over the past few years, thanks to the aggressive sales policy adopted by our principal rival in the field, Pakistan. How Pakistan is pricing our sacking out of its traditional markets is well known to need repetition. Suffice it to note that Indian sacking is unable to compete with Pakistani, which, apart from its low cost of production, is having in its export bonus scheme a very powerful competitive advantage which the Indian industry finds it impossible to counter unaided.

The plea that the Government of India should give our

industry a countervailing advantage in the shape of a subsidy has not found favour with it presumably because such an action will be against international trade practices. It has been reported that Government wants the industry itself to devise a scheme to help itself. And recently at the Board of Trade meeting it has been disclosed that a scheme is being worked out jointly by the IJMA and the Jute Commissioner. While it is urgent that something effective must be done expeditiously to enable our jute goods to go on world markets on an equal footing with those from Pakistan, some serious thought also seems necessary even now on the long-term prospects for our heavy jute goods. For, indications are that most developing countries which are the main consumers of sacking are taking active steps to become self-sufficient at least in this category of jute goods. Countries like Thailand which grow jute are naturally better placed to embark upon setting up their own jute industry and it has been reported that that country is planning to put up jute mills with Indian collaboration. It has also been reported since that Ceylon is thinking of putting up a plant to manufacture bags by using some indigenous fibre which has properties similar to jute. It is therefore imperative that diversification of production should be given greater emphasis by our jute industry than is being done now.

Foreign Interest Waning

The continued absence of foreign interest even in hessian during the past several weeks only confirms the apprehension that even North America which is our hessian's by far the most important customer is taking its own time to send its enquiries. It is true that so far this year — January to June — burlap consumption in this country is running far ahead of the corresponding period of last year, 464 million yards as compared to 445 million yards. But reports from that country go to show that consumers lately are reducing their offtake and prices are falling. This means that even prevailing prices in the primary market do not constitute an attractive level from the point of view of the American buyer.

But the question arises, will our industry be enabled to oblige the overseas buyer? The answer has been already given and it is in the negative. As a matter of fact the industry has drawn the attention of Government to the prevailing uneconomic level of jute goods prices. The crux of the problem is of course the price the industry has been obliged to pay for raw jute. The fixation of the minimum price for raw jute gives little room for manoeuvre for the industry on its cost of production while the price of manufactures is dictated by world trends. It is not clear how Government proposes to maximise jute goods exports and maintain

minimum prices for raw jute at the present level, at the same time.

★★

The dispute between certain mine-owners in the Eastern region and the State Trading Corporation seems to have reached a stage wherein it no longer can be considered a minor one. For it would appear that, if it is left unresolved, one of its consequences will be rather serious to the nation as a whole. It has been reported that though there had been suspension of movement of iron ore to two of the public sector steel plants for a day or two earlier this month, there is no possibility of production being adversely affected because of want of iron ore. Be that as it may, it is clear that there is some dispute between a section of the mine-owners and the STC and that loading had been suspended, if only for a short period, of iron ore intended to be exported and for supplying two of the public sector steel plants. Whatever may be the reason, there cannot and should not be any interruption in the movement of iron ore, which will either go into the production of steel or will be exported, for the simple reason both internal production of steel and foreign exchange earning are vital to the economy especially at the present juncture when the nation is under an emergency.

Mine-Owners' Grievance

It would appear that ever since the latest agreement for the export of iron ore to Japan at a reduced price was finalised, some of the mine-owners have been critical of the STC's iron ore export deals. Some time ago the Chairman of the STC, Mr. Govind Narain, explained why a lower price had been agreed upon. Japan is the single biggest buyer of iron ore from India accounting for half of its export and the lower selling price has been agreed upon with a view to maintaining good relations with that country and in response to Japan's request for a reduction. The cut in the price will necessarily be reflected in a reduction in the price payable to the mine-owners by the STC. The STC Chairman is reported to have said that the lower price payable to the mine-owners will be applicable equally to all regions in the country. This will mean a reduction in the profit of the mine-owners but that is inevitable especially in view of the fact that the STC itself will be incurring loss in its iron ore exports this year. Regarding the supply of iron ore to the public sector steel factories, it is said that the increase in royalty to which the mine-owners are entitled as a consequence of the increase in the steel retention price, has not been implemented by the STC. If the agreement is clear on this point, the matter can be easily settled. In any event, suspension of loading appears to be a short-sighted policy.

Green Signal for Srisaillam and Pochampad Projects

From Our Correspondent

MADRAS:

AFTER Hafiz Mohamad Ibrahim made a statement in Parliament regarding the interim allocation of the waters of Godavari and Krishna rivers amongst the three riparian States, Maharashtra, Andhra Pradesh and Mysore, the latter two States have started in right earnest the implementation of some major projects. Appropriately enough, the Prime Minister, Mr. Nehru, agreed to lay the foundation stone and corner stone for the Srisaillam and Pochampad projects. In Mysore, work has already commenced on the Malaprabha Project. There was considerable controversy over the Srisaillam Project on the Krishna river especially as Maharashtra

had been pointing out that it would be losing its potential for generating power and that her needs should be given greater preference. Ultimately, however, the Srisaillam Project is to be constructed in a modified form and the storage of waters to some extent alone might enable the Andhra Pradesh Government to generate power on a large scale. In the initial stage, it is proposed to install four generating sets having a capacity of 110 mW. each, one set being kept as stand-by. It is estimated that the cost will be Rs. 42 crores. There will be a central masonry dam. The storage of the reservoir will be 158 TMC ft, and total length of the dam, including the non-overflow section, about 1,685 ft. The power house at Srisaillam dam on the left bank will be able

to accommodate ultimately seven sets of 110 mW. each. It is expected that the continuous rating with minimum flow at 60 per cent load factor will be 260 mW. The first unit is expected to be commissioned early in the third year of the next Plan. Since Andhra Pradesh is in need of additional power in large blocks, efforts should be made to expedite the construction of this project.

The Pochampad project on the Godavri is the first big scheme to be undertaken on this river in the post-Independence period. There was also considerable objection to the starting of this project from Maharashtra. But this scheme also is to be undertaken in a modified form being mainly an irrigation project. As at present conceived, an area of 5.7 lakh acres in the backward districts of Nizamabad and Karimnagar will be cultivated. The total cost of the project is estimated at roughly Rs. 40 crores out of which the headworks will cost a little over Rs. 19 crores and the canal section nearly Rs. 21 crores. The scheme consists mainly of a masonry dam to a length of 2,550 ft. in the bed of the river with flanking earthen dams for a length of 41,300 ft. The South canal will be 70 miles long. Ultimately, it is expected that the length of this canal will be 251 miles and the area covered as much as 2 million acres. As Mr. Nehru pointed out, the utilisation of the river waters, even on the basis of the new award, will take 30 or 40 years and the whole question of reallocation of surpluses left over will arise only at a later stage. It is indeed apprehended that the State Governments concerned may not be able to find the required resources to complete the projects in the next few decades. It is comforting to note that the Andhra Pradesh Chief Minister has shown a spirit of accommodation and there are reasons to believe that the three riparian States will not quarrel again over the allocation of the waters of the two rivers at least for some time. In this favourable atmosphere, it is only to be expected that the project for taking Krishna water to Madras City for drinking purposes will also be implemented at an early date.

★★

The representations made by the Madras Government regarding the need for installing additional thermal capacity within the State and expanding ambitiously the Neyveli thermal station seem to be having some effect. Though it is not known what exactly will be the ultimate shape of the proposal to establish three thermal units having an installed capacity of 100 mW. each, the Basin Bridge power thermal station will have a new set with a capacity of 30 mW. in the place of two small sets which have gone out of commission on account of old age. The Planning Commission has given its permission for this scheme. It is, however, pointed out that the Central Government will direct the Neyveli Lignite Corporation authorities to examine the possibility of establishing an entirely new power station with a capacity of 1,000 mW. The present power house is proposed to be expanded to have a capacity of 600 mW., the existing station being able to accommodate a sixth unit of 50 mW. capacity. A separate power house will be constructed to accommodate three large units of 100 mW. each. But it has been considered advisable to carry out further expansion in a different place so that the whole scheme can be executed without difficulty and interruption. It will obviously be necessary to increase the output of lignite. But work has already been started on the preparation of the second mine-cut and it is felt that even if the Salem iron and steel plant were to be pushed through, adequate supplies of lignite will be available. In view, however, of the precarious position in regard to hydel power and the fears that even a monsoon failure might have an upsetting effect on the plans of the State Electricity Board,

it has been latterly emphasised that available lignite resources should be used, as far as possible, for generating power and that the existing reserves should not be depleted at a fast rate as a result of the steel plant requiring large quantities. The picture may probably be altered after the exploratory work now being carried out in Ramanathapuram District to locate new lignite deposits proves to be successful. Mr. C. Subramaniam, however, indicated during his recent visit to Madras that the report of the consultants on the Salem steel project might be submitted to Government within the next few months and that there was no question of a second look regarding the feasibility of the project.

★★

The working results of two leading companies in Kerala and Mysore States have been published during the week and the impact of the Super Profits Tax on the earnings of these two units has been clearly brought out by the big increase in provision for taxation that had to be made. Aluminium Industries Limited has done extremely well in the year ended March 31, 1963 and the profits at Rs. 55.40 lakhs, after depreciation and before taxation, constitute a record in the history of the company, the figure for 1961-62 being only Rs. 41.37 lakhs. It should be mentioned, however, that the latter figure by itself was another record. The provision for taxation, however, including the liability on account of Super Profits Tax for about Rs. 11 lakhs is as much as Rs. 39.50 lakhs against only Rs. 18.20 lakhs for 1961-62. As additional equity capital has been issued sometime back it has been considered advisable by the Directors to reduce the dividend on equity shares to 15 per cent, taxable, from 18 per cent, taxable, previously. A final dividend of 6 per cent, taxable, has been declared against 9 per cent, taxable, on the former occasion, the interim dividend being unchanged at 9 per cent, taxable. General reserve gets Rs. 1 lakh (nil) and dividend equalisation reserve Rs. 2 lakhs (nil). The transfer to development rebate reserve is much lower at Rs. 69,200 (Rs. 4.91 lakhs). As it is expected that the two units for manufacturing sheathed cables both at Kundara and Hyderabad will be in operation shortly there might be a further increase in earnings. In fact, it is expected that in 1964-65, with the plant for manufacturing Solidol cables also reaching the production stage, there will be a further increase in earnings. But the Directors have not preferred to anticipate developments as allocations to reserves would be helpful to some extent in reducing the liability towards Super Profits Tax.

The Radio and Electricals Manufacturing Company Limited has also reported excellent results, there being an increase in the net profit, after depreciation and before taxation, for the same accounting period to Rs. 37.84 lakhs from Rs. 31.24 lakhs in the previous year. The provision for taxation is higher at Rs. 17.53 lakhs against Rs. 16 lakhs, while the charge on account of Super Profits Tax alone is Rs. 5.43 lakhs (nil). The transfer to development rebate reserve is Rs. 3.58 lakhs (Rs. 23,600) and general reserve Rs. 6.75 lakhs (Rs. 8.50 lakhs). The appropriations have had to be helped with a transfer from reserves to some extent. The dividend, however, has been maintained at 18 per cent, taxable. The new shares will receive a proportionate dividend.

★★

There has been a setback in the stock markets on account of the latest developments on the northern border. Even earlier a cautious tendency had been in evidence as the cornering operations in the three planing scrips had subsided. Investors were inclined to await fresh developments. The sharp decline in prices in Bombay had naturally a depressing effect in Madras as well. Once again, fears of a Chinese attack have had an upsetting effect.

U.S. EXPORT PROMOTION DRIVE

TO SET right the U.S. balance of payments problem, a number of measures have been suggested in President Kennedy's Special Message to the Congress. At present six measures are being taken to increase exports.

A wholly new programme of export finance has been created by the Export-Import Bank which now provides U.S. business with credit facilities equal to any in the world. The major element of this new programme is the guarantee of short and medium term export credits by the Foreign Credit Insurance Association, composed of more than seventy private insurance companies in conjunction with Export-Import Bank. The Message urges the Congress to act promptly to restore the Bank to full operating efficiency by renewing its charter and authorising adequate financing.

The Departments of State and Commerce have strengthened and expanded efforts overseas to probe for new markets and promote the sale and distribution of American products. The Department of Commerce has developed a broad programme of education and assistance to present and potential American exporters. A relatively small amount of additional funds to strengthen the Department's effort to stimulate exports has been requested. These funds, amounting to \$6 million, were not approved by the House of Representatives. The President stressed in the Message that it was essential, if America was to increase her trade surplus, that they be included in the final appropriation bill. This modest sum would pay for itself many times over in increased exports, lower payments deficits, and protection for gold reserves.

The Department of Agriculture announced last March a new auction programme for direct sales of cotton abroad. It is expected that this new technique will ensure competitive pricing for America's cotton in export markets and will increase exports by as much as \$100 million over last year's level.

Present ocean freight rates discourage America's exports as compared to imports. The freight charges on Atlantic crossing are far higher for East bound freight than for comparable items bound for the United States. A similar situation prevails on other trade routes. While these substantial differentials may have been acceptable in the immediate post-war period of the dollar shortage when Europe was struggling to get on its feet, their magnitude is clearly unjustified today. Accordingly, the Secretary of Commerce has been directed to take corrective action through the Maritime Administration and the Federal Maritime Commission has been urged in its role as an independent regulatory agency to question those specific export rates which appear unduly high. Should the legislation prove necessary, it will be sought. In order to give further momentum to the expansion of America's export performance, it is proposed to convene a White House Conference on export expansion on September 17 and 18, to alert American firms, whether or not they are now exporting, to the opportunities and rewards of initiative or expanding export efforts. This opportunity will be utilized to emphasise to the American business men that vigorous action to increase their exports would serve their own private interests as well as the national interests. Tourism will be encouraged and funds are to be provided to strengthen the U.S. Travel Service. An all-out campaign will also be launched to encourage Americans to learn more about their own country.

The Treasury Department, in consultation with the State Department, will develop, with the financial community an active programme to promote foreign investment in securities in U.S. companies. The programme will identify and appraise restrictions in the capital markets of other nations

which prevent the purchase of American securities and hamper U.S. companies in financing foreign operations from non-U.S. sources, review U.S. Government and private activities which adversely affect foreign purchases of U.S. private securities and bring about an intensive effort by the U.S. financial community to market securities of U.S. private companies to foreign investors and increase the availability of foreign finance for U.S. business operations abroad. It is mentioned that the securities of U.S. private firms could be and should be one of America's best selling exports. While there is no doubt that all these measures are comprehensive in nature but so far as selling of U.S. securities of private firms is concerned, it would depend on the lifting of restrictions that have been imposed by various west European countries. Until these restrictions are done away with it would be extremely difficult to sell the securities of U.S. private firms. It now remains to be seen to what extent the Kennedy Administration succeeds in achieving its objective.

SUGAR CONTROL ORDER

As one of the measures to deal with anti-social activities in the sale of sugar, it has been considered necessary to issue an order under the Sugar (Control) Order, 1963, stipulating the following:

- (a) No licensed wholesale sugar dealers shall sell sugar to any other licensed wholesale dealer.
- (b) The licensed wholesale dealer, who is allotted a quota of sugar, shall sell the sugar only to retailers registered with him or nominated by the State Government or the district authorities at prices not exceeding the wholesale price fixed.
- (c) Every licensed wholesaler shall keep a register of retailers registered with him with such particulars as may be required and maintain a proper record of supplies made to them, prices charged and date on which the supplies were made.
- (d) Every licensed wholesaler shall display prominently the sale price of sugar according to the grade of sugar in stock with him.

The licensed wholesalers are enjoined to observe these rules strictly. Any instances of evasion of these provisions brought to the notice of the Government by Central and State Governments' inspection staff will be severely dealt with. The District Magistrates have already powers to prescribe similar margins in case of retailers wherever necessary. Instructions are being separately issued to deal with breaches of any such instructions by the retailers under the Defence of India Rules.

CODE OF GRANTS-IN-AID

To utilise the Marketing Development Fund of Rs. 3.8 crores a Code of Grants-in-Aid has been formulated. The code gives the Export Promotion Councils, Commodity Boards, Export Promotion Advisory Committees, Export Houses and other institutions and exporters, all information about the grant which the Government of India will provide to them for specific programmes connected with the export effort. Among the programmes and activities for which grants might be available from the Government are trade delegations, study teams, market and areas surveys, commodity surveys, export publicity, commercial intelligence, advertisements abroad, documentary films and opening of foreign offices. The quantum of grants-in-aid for these activities differs according to the nature of the work.

In the case of trade delegations and study teams, the Fund may grant 50 per cent of the expenditure. For market studies,

out of the total expenditure incurred in conducting commodity surveys within the country for determining export potential and market studies abroad, the Fund may grant 75 per cent to 100 per cent, where the studies are sponsored or undertaken by universities and institutes recognized by the Fund for this purpose, two-thirds when the studies are sponsored or undertaken by the approved organisations, and 50 per cent for studies undertaken by a recognised export house with the prior approval of the Fund.

In the case of export publicity and information, the Fund may grant about 75 per cent of the net expenditure on publications including journals, directories, brochures, pamphlets and folders. There are varying rates of grants for advertisements abroad, public relations and for making publicity films. For opening foreign offices, the Fund may grant 75 per cent of the total expenditure for the first two years and 50 per cent of the third year in the case of offices which are opened by an approved organisation. Where foreign office of an Export House agrees to function also on behalf of an approved organisation, the Fund may grant one-fourth of the amount spent on accommodation and staff for the first three years. In permitting the opening of foreign offices, the objective will be kept in view that to the extent feasible, the offices at any selected place should jointly serve two or more organisations. Provision is also made in the code for grants for quality control and pre-shipment inspection schemes, for trade fairs and exhibitions and transport assistance.

BHILAI STEEL'S EXPANSION PROGRAMME

The work on the expansion programme of the Bhilai Steel Plant is likely to be completed by the end of 1965. It envisages an increase in production capacity from one million tons to 2.5 million tons. Under the expansion programme, the Bhilai Steel Plant will have three more coke oven batteries of 65 ovens each, in addition to the existing three batteries. There will be two more blast furnaces (1,719 cubic meters each) in addition to the existing three furnaces (1,033 cubic meters each). Also, there will be four more open hearth furnaces, each with a capacity of 500 tons. An existing 250 ton furnace will also be converted to 500 tons capacity. In all, there will be ten open hearth furnaces after the expansion. The new wire rod mill will increase the number of Bhilai's mills to five. When the expansion programme is complete, Bhilai will produce 2.5 million tons of ingot steel per annum. It will be rolled into 1,965,000 tons of finished and semi-finished products. The new wire rod mill will produce 4,00,000 tons of wire rods annually. During the expansion programme, large number of Indians would be employed as specialists and only a few of the Soviet specialists would be invited. The iron ore mine at Rajhara and the limestone quarry at Nandini will be further developed to give the required momentum to the programme.

DUTY ON SOFT COTTON WASTE ABOLISHED

In accordance with their policy of keeping export duties under constant review, the Government of India have decided to abolish the export duty on soft cotton waste. The decision to abolish the export duty on this commodity has been taken as an export promotion measure. The effective rate of duty so far had been 15 per cent ad valorem. The export of soft cotton waste during 1962-63 was approximately 39,000 tons valued at Rs. 4.80 crores.

COIR BOARD RECONSTITUTED

The Coir Board has been reconstituted with 23 members. It will function for three years. The outgoing Board had 33 members.

The members of the reconstituted Board are Mr. Jagannath Mishra, President Sakhigopali Coconut Growers Co-operative Society, District Puri, Orissa State, Mr. R. Srinivasa Iyer, Pattukottai, Madras State and Mr. K. K. Shetty, M.L.C. Mangalore (representing growers of coconut and producers of husks and coir yarn);

Mr. P. Ravindran, M.L.A. Kerala, Shri T. Perachen, President, Central Coir Marketing Co-operative Society, Kozhikode, and Mr. P. K. Dewar, Ernakulam, (representing those engaged in the production of husks, coir and coir yarn and in the manufacture coir products);

Mr. V. Z. Job, Kerala Balers' and Exporters' Association, Alleppey; Mr. V. Sankara Narayana Pillai, Perinad; and Dr. E. K. Madhawan, President, Central Coir Marketing Co-operative Society Ltd., Mattancherry, (representing dealers in coir yarn and coir products including both exporters and internal traders);

Mr. Panampilli Govinda Menon, Member, Lok Sabha, Mr. P. K. Vasudevan Nair, Member, Lok Sabha, and Mr. Joseph Mathen, Member, Rajya Sabha;

The Joint Director of Industries and Commerce, (Industrial Co-operatives), Madras; Mr. G. Gangadharan, Special Officer (Coir), Kerala; the Joint Director of Industries and Commerce, Rural Industrialisation, Mysore; the Joint Director of Industries and Commerce, Small Scale Industries, Andhra Pradesh; and the Deputy Director of Industries (Cottage), West Bengal, (representatives of Governments of the principal coconut-growing States;

Mr. K. Newton, Alleppey, Mr. P. P. Hussan Koya, Kozhikode, and Mr. T. S. Krishnamurthy, Chief Development and Liaison Officer for coconut, arecanut, spices and cashewnuts, Ernakulam, (other interests).

PACKING FOR TOBACCO EXPORTS

The Ministry of Food and Agriculture has advised the Indian Central Tobacco Committee to encourage the use of certain species of timber for manufacturing packing cases for tobacco. The species chosen are mahrukh, chatian, upas, white dhup, karani, rudrak, kambali, jhingan, banati, machilus, mango, narikel, udal, maina, gutel and vela pincy. A considerable quantum of timber is required by the industry for packing tobacco meant for export. At present the timber is procured from the northern parts of the country. The exports of tobacco from India during 1962-63 were valued at Rs. 19 crores as against Rs. 15 to 16 crores in the previous two years.

OUTLOOK FOR WORLD TEA

According to the US Agricultural Department, world tea production of 2,239 million lb. will be about 1 per cent above last year and slightly above 1961 record output. Moderate increases are expected in Ceylon, Indonesia and Japan, while India's production is expected to be near last year's highest of 759.7 million lbs. African tea production of about 13.7 million lb. will advance that Continent's rising importance in tea production. South American tea production of 28.1 million lb. will remain small but about thrice the 1955-59 average.

World tea exports last year of 1,239 million lb. were three per cent above 1961 shipments. India and Ceylon exported about three-fourths of this amount with other Asian countries, Africa and Latin America respectively exporting 16 per cent, 9 per cent and one per cent. The UK last year retained its position as the world's leading tea importer and user by taking over 40 per cent of the world tea exports.

Company Affairs

92,500 shares will be offered to the public at a premium of Rs. 2 per share.

The Company was incorporated in 1945 as a private limited one and was converted into public limited company recently. It manufactures machinery and equipment for the chemical, pharmaceutical, food, dairy and other similar industries. It is also manufacturing and fabricating a wide variety of equipment, such as reaction vessels and autoclaves, heat exchangers and condensers, storage tanks, reservoirs, evaporators and vacuum pans, distillation columns and absorption towers, etc. The company also holds agencies of U.K. and the Continental manufacturers for products complementary to its own manufacture. The company proposes to widen its scope of activities by manufacturing other specialised equipment not at present being manufactured in this country.

BRITANNIA ENGINEERING

The Britannia Engineering Company Ltd. has been able to record a higher level of net profit as a result of higher sales which stood around Rs. 3.52 crores as against Rs. 2.72 crores last year. After providing for depreciation and taxation, the net profit was Rs. 15.07 lakhs for the year under review as against Rs. 7.48 lakhs in the preceding year. The depreciation is higher at Rs. 12.19 lakhs as against Rs. 9.05 lakhs and taxation also is considerably more at Rs. 9.10 lakhs against Rs. 4 lakhs last year. The Directors have provided Rs. 3.70 lakhs towards development rebate reserve and Rs. 1.80 lakhs for general reserve. They have proposed to maintain the dividend at Re. 1 per share on the increased capital. It is indicated that the wagon division of the company at Mokameh has shown larger output and the production of cone winders and cop loaders has already started. The setting up of a separate works with plant and equipment for the manufacture of road rollers has been completed. With a few more machine tools, due to be received in the last quarter of this year, it is planned to produce road rollers of 100 per cent indigenous content. The steel foundry will be ready to commence production by the middle of next year.

BENGAL CHEMICAL

There has been an increase in sales of the Bengal Chemical and Pharmaceutical Works Ltd. during the year ended March 31, 1963, at Rs. 2.28 crores as against Rs. 2.13 crores last year. The net profit, after providing for depreciation and taxation, is Rs. 7.13 lakhs as against Rs. 4.07 lakhs in the previous year. Depreciation is raised to Rs. 5.48 lakhs from Rs. 5.37 lakhs and the development rebate reserve to Rs. 1.06 lakhs. The directors have proposed to maintain the dividend at 10 per cent, less tax, on the ordinary shares. The rights attached to the cumulative preference shares have been altered so that the shareholders will henceforth continue to receive about the same dividend which they were getting before the passing of the Preference Shares (Regulation of Dividends) Act, 1960. They indicate that capital schemes at Panihati factory, already taken up for increased production of heavy chemicals, are progressing well.

CITRIC INDIA

The chairman of Citric India Ltd. has indicated that the company will commence trial production in the first quarter of 1964 and attain the rated capacity within six months thereafter. Speaking at an ordinary meeting of the company

BIRLA JUTE

A PRELIMINARY annual report of the Birla Jute Manufacturing Company Ltd. shows a rise in gross earnings from Rs. 160.28 lakhs to Rs. 207.29 lakhs for the year ended March 31, 1963, which is a reflection of the increase in sales from Rs. 9.30 crores to Rs. 10.45 crores. All allocations have been increased—depreciation to Rs. 67.43 lakhs from Rs. 63.62 lakhs, taxation to Rs. 60 lakhs from Rs. 42 lakhs, general reserve to Rs. 30 lakhs from Rs. 17.82 lakhs and development rebate reserve to Rs. 14.12 lakhs from Rs. 4.33 lakhs. On account of increased allocations, the directors have proposed to maintain the ordinary dividend at 15 per cent less tax. All the four units of the company worked efficiently throughout the year. Over the last year the number of broad looms has been increased to 64 and all of them are in operation. The carpet backing section of the mill worked seven days in a week round the clock, thereby earning foreign exchange for the country as the entire output is exported to the U.S. There has, however, been slump in prices of carpet backing principally because of increased production.

At the company's cement plant at Satna, the total clinker production was 213,923 tonnes and total cement production was 221,477 tonnes. The entire plant for the expansion of the company's cement production has been received and is now under erection. Trials are expected to begin in October. Out of the two new kilns, the first is expected to commence production from October and the second from January next when the total capacity will be increased to 1,750 tonnes a day. The Directors have decided to give up the licence for a refractory plant as, in their opinion, there is already enough capacity in this industry. The company has obtained a licence for a new cement plant with a capacity of 600 tonnes to be situated at Chittorgarh. Prospecting has been completed and civil engineering work has already started. The cost of this project will be about Rs. 2.75 crores. Provisional orders have been placed pending receipt of the import licence. The Government has already granted the import licence against free foreign exchange. It is hoped that the plant will be in production from June, 1965. It is proposed to finance this project mainly from the company's own resources and partly from bank borrowings.

The staple fibre spinning mill has an installed capacity of 30,000 spindles. The calcium carbide factory also worked satisfactorily to its rated capacity. With regard to the new project for making oxygen and acetylene gas, the company has received the licence against D. L. F. credit and orders are being placed for the required plant. It is hoped to commission this unit in April, 1964.

A.P.V. ENGINEERING

APV Engineering Company Ltd., a wholly-owned subsidiary of APV Holdings Ltd., U.K., will shortly enter the capital market with a public issue of equity shares at a premium of 20 per cent. The authorised capital is Rs. 50 lakhs and the issued and paid-up capital is Rs. 12.50 lakhs. It is proposed to issue a further 170,000 shares of Rs. 10 each. Out of this issue, the U.K. holding company will be allotted 35,000 shares at par. Port Engineering Works Ltd. of Calcutta will take the up 40,000 shares at a premium of Rs. 2 per share and the directors and their friends have agreed to subscribe for 2,500 shares at a premium of Rs. 2 per share. The balance of

held recently, he explained that the work on the fermentation and production building was interrupted on account of lack of adequate funds which, he said, will now start and every effort is being made to complete it as early as possible. The capital cost of the factory, he added, has gone up much beyond the original estimate of Rs. 90 lakhs mainly due to the nature of process of manufacturing citric acid, increase in import duty from 10 per cent to 22½ per cent, the revaluation of DM and an overall increase in the prices of steel, cement and other construction materials. The revised estimates are placed at around Rs. 150 lakhs. Additional funds have been raised by the re-constitution of the board of directors. The re-constituted board has taken the necessary steps to arrange for additional finance by raising further equity capital from the existing shareholders as well as from the public by issuing equity shares and redeemable preference shares respectively. Negotiations are also progressing for raising further medium term borrowings from banks.

NEW GREAT MILLS

It is indicated that the New Great Eastern Spinning and Weaving Company Ltd. had a change of management following the finalisation of the deal for the purchase of 22,500 shares held by Mr. S. P. Jain, Mr. S. R. Damani and others. The company offered recently 5,000 ordinary shares of Rs. 100 each to the shareholders in the ratio of one share for every six shares held by them. With the purpose of this block, the New Great Eastern Spinning and Weaving Company comes into the hands of the management which owns the New City of Bombay Manufacturing Company Ltd. In a way, the management of the two mills which was once in the hands of W. H. Brady and Company Ltd., is again under one roof.

NEW STANDARD ENGINEERING

The New Standard Engineering Ltd. has reported satisfactory results for the year to March 31, 1963. The gross profit has increased from Rs. 22.26 lakhs to Rs. 22.89 lakhs. The turnover has gone up from Rs. 1.60 crores to Rs. 1.82 crores. After providing Rs. 8.48 lakhs for depreciation, Rs. 1.57 lakhs for development rebate reserve and Rs. 5.10 lakhs for taxation, the net profit of the company comes to Rs. 7.73 lakhs. A sum of Rs. 4.12 lakhs is transferred to special reserve. The Directors have recommended a dividend of 9 per cent on equity shares (8 per cent out of the special reserve which is exempt under Section 84 of the Income Tax Act, 1961, and the balance of 1 per cent subject to tax). The company has sought the advice of the Central Board of Revenue with regard to the claim of preference shareholders in exempt profits under Section 84 of the Income Tax Act. If the advice is not received in time, the tax will be deducted at the standard rate of 30 per cent. Further payment will be made to the shareholders on the basis of the decision of the Central Board of Revenue. Pending this clarification, the recommendation is to be considered as provisional. Assets of the company have increased by Rs. 29.44 lakhs out of which Rs. 8.85 lakhs represent the purchase of new machinery.

INDIAN ALUMINIUM

The Directors of the Indian Aluminium Company, Limited in a meeting held recently decided to apply to the Controller of Capital Issues for permission to issue Rs. 16,025,530 further capital divided into ordinary shares of Rs. 10 each to existing ordinary shareholders as fully paid-up bonus shares in the proportion of one share for every 3 shares held. The unpaid balance of the par value of the partly paid-up ordinary shares issued in February 1963 is to be called up before the bonus issue, so that holders of

such shares may also qualify to the full extent for the bonus shares.

BRITANNIA BISCUITS

The Britannia Biscuit Company Limited has recorded higher sales at Rs. 5.08 crores during the year to March 1963 as against Rs. 4.28 crores last year. The profit too has improved from Rs. 72.75 lakhs to Rs. 86.52 lakhs, after providing Rs. 9.99 lakhs towards depreciation. Taxation provision, including Rs. 15.20 lakhs for super profits tax is much higher at Rs. 59 lakhs against Rs. 38.26 lakhs last year. For reasons of higher taxation and the need to set aside funds for replacement and expansion, the directors have proposed to cut ordinary dividend (taxable) from 25 per cent to 21 per cent including a final dividend of 15 per cent. The directors also indicate that high taxation has reduced the capacity of the company to finance capital projects and hinder long-term expansion. They are also disappointed because the scheme to set up a basic foundry in South India could not be implemented as the Government was not willing to give the industrial licence. It is felt that unless production is increased it will be difficult to hold the unit production cost down.

PUNJAB NATIONAL BANK

The directors of the Punjab National Bank Ltd. propose to maintain the interim dividend for the half year ended June 30, 1963, at 10 per cent. The working of the bank during the half year has recorded a profit of Rs. 50.19 lakhs compared with Rs. 49.55 lakhs for the corresponding half year of 1962. The profit has been arrived at after providing for corporation tax and super profits tax for the whole of 1962 and for the first half of 1963 and making other necessary provisions. After bringing in Rs. 15.21 lakhs, the directors propose to utilise Rs. 20 lakhs for the payment of the dividend leaving Rs. 45.40 lakhs to be carried forward.

INDIAN OVERSEAS BANK

The net profit of the Indian Overseas Bank Ltd. for the half year ended 30th June, 1963, subject to audit, including the sum of Rs. 2.03 lakhs brought forward from the last year's account, amounts to Rs. 22.79 lakhs as against Rs. 22.06 lakhs in the corresponding period of last year.

HONGKONG AND SHANGHAI CORPORATION

The Hongkong and Shanghai Banking Corporation has declared an interim dividend of five shillings a share on its paid-up capital of 3,161,845 shares (£4,940,343). This interim dividend is a distribution of £790,461 and is unchanged from that declared in July 1962. The Hongkong and Shanghai Banking Corporation is the parent company in a group comprising the Mercantile Bank Ltd. and the British Bank of the Middle East.

CAPITAL ISSUES

Eleven companies have been authorized to raise capital aggregating over Rs. 5.31 crores. A twelfth company, whose capital is in sterling, has been authorized to issue units of stock as bonus shares. The consent is valid for 12 months in all cases.

Ashok Leyland Limited, Madras, is raising further capital of Rs. 55,25,000 divided into 11,05,000 equity shares of Rs. 5 each, for cash at par. Of this, shares of the value of Rs. 33,15,000 will be offered to the U.K. collaborators on rights basis, against the imported plant and machinery at par.

**COTTON
MILLS, LTD.**
BIRLANAGAR (M.P.)

incorporated in Madras, has been given consent to issue capital of Rs. 280 lakhs. The capital is divided into 2,30,000 equity shares of Rs. 10 each and 50,000, nine per cent (free of company's tax but subject to deduction of all taxes at source at the prescribed rates) cumulative preference shares of Rs. 100 each, to be issued for cash at par.

Thakur Shipping Company Limited, Bihar, is to issue capital of Rs. 1 crore divided into Rs. 20 lakhs in 9.3 per cent preference shares and Rs. 80 lakhs in equity shares.

Chowgule Steamships Private Limited, Maharashtra, has been given consent for the issue of further capital of Rs. 40 lakhs, divided into 40,000 equity shares of Rs. 100 each, to be issued privately for cash at par.

The Orissa Forest Corporation Limited, a State Government undertaking, is to raise further capital of Rs. 10,00,000 divided into 10,000 equity shares of Rs. 100 each for cash at par to be subscribed privately.

Max-Designs & Process Works Pvt. Ltd., Bombay, is to issue capital of Rs. 1,72,500 divided into 1,725 equity shares as bonus shares by capitalization of the company's reserves to a like extent.

Electro Metallurgical Works Private Limited, Bombay, is issuing further capital of Rs. 1,00,000 divided into 1,000 equity shares of Rs. 100 each. On capitalization of the company's general reserves to a like extent, the capital will be issued as fully paid up bonus shares to the existing shareholders of the company.

Sarvaraya Textiles Limited, Kakinada, is to issue further capital of Rs. 12 lakhs, divided into 1,20,000 equity shares of Rs. 10 each, to be issued for cash at par.

South Punjab Electricity Corporation Limited, Rohtak, is to issue further capital of Rs. 6,29,920. This is divided into 62,992 equity shares of Rs. 10 each to be issued as bonus shares in the ratio of 1:1, on capitalization of the company's undistributed profits and reserves to a like extent.

The Indo-Ceylon Dental & Surgical Company Limited, Madras, is to issue further capital of Rs. 35,440 divided into 3,544 equity shares of Rs. 10 each. On capitalization of the company's general reserves to a like extent, it will be issued as fully paid up bonus shares to the existing shareholders of the company.

Madanapalle Spinning Mills Limited, Andhra Pradesh, is raising Rs. 25 lakhs, divided into 40,000 equity shares of Rs. 50 each, and 5,000 preference shares of Rs. 100 each, to be issued for cash at par. Of this, shares of the value of Rs. 18 lakhs (Rs. 13 lakhs in equity shares and Rs. 5 lakhs in preference shares) will be offered for public subscription by prospectus.

Indian Copper Corporation Limited, Calcutta, is to issue 68,56,500 units of stock of 2 shillings each as fully paid up bonus shares on capitalization of reserves to the extent of £6,85,650 in the ratio of one bonus share for two units held.

LICENCES ISSUED

The following firms have been granted licences under the Industries (Development and Regulation) Act, 1951 during the week ending 20th July, 1963. The list contains the names and places of the licensees, articles of manufacture and annual installed capacity :

IRON AND STEEL

Pioneer Iron and Steel Corporation, 119, G. T. Road, Belur, Howrah, West Bengal, Cast iron castings 3,500 tons per annum Steel forgings 300 tons. The Indian Smelting and Refining Co. Ltd., Industry House, 159, Churchgate Reclamation, Bombay, (Thana, Maharashtra) S. G. Iron and Special steel castings; shifting from Bhandup to Thana (Maharashtra) (Shifting). Shri V. Pandurangiah C/o Vammidiars (Mfrs). Private Ltd., 162, Mount Road, Madras-2 (Madras). Stainless Steel (Sheets) 7,000 tons. BOOKS BRIEFLY

Common Market and Economic Growth

The United Kingdom and the Six: By A. Lamfalussy; Macmillan & Co. Ltd., London; Pages ix + 147; 1963.

REVIEWED BY L. C. CHUGH

Dr. Lamfalussy's book is of more than passing interest. The contents are worthy of study by economists, business men and statesmen. The author asks two fundamental questions as he puts in preface to his book:—(i) "If not Common Market, what then made the E.E.C. countries grow faster than Britain?" (ii) "Will the E.E.C. encourage the Six to continue their past performance, and if so, on what conditions?"

Britain's rate of growth has been half of that in the E.E.C. countries during 1950-61, price rise has been double that in E.E.C. (except France), Britain has been up against balance-of-payments difficulties too often as against easy external position of the E.E.C. countries which have been accumulating surpluses.

Where the author departs from others is in the explanation of this, more or less, static phenomenon in Britain. The post-war recovery, no doubt rapid, cannot be the cause of faster growth in the E.E.C. because by 1950 the E.E.C. countries had recovered and reached the British level of gross national product, and by 1953-54 they had attained the same rate of growth of gross national product per head. The author refutes cogently the stock argument of Britain's high initial income per head as the cause of slower growth by proving that Britain did not have any "structural disadvantages" as the increase in productivity of manufacturing industry was much higher than productivity in Belgium and France, which had, relatively to Britain, a smaller service sector to start with in 1950. Lamfalussy is making comparisons countrywise rather than between the E.E.C. region and Britain. What the latter comparison will show is anybody's guess.

Shortage of labour is also not the cause of slower growth, though Colin Clark would maintain otherwise. Employment increased at the rate of 1.1 per cent per annum in British manufacturing industry, one of the highest rates for E.E.C. countries. The balance of payments problem is not the cause of slow growth but only a symptom. The difficulties in British external accounts can be partly explained in terms of larger grants and capital outflows, but the export performance has been the least hopeful. The UK's exports increased at the rate of 4 per cent in 1959-60 as against a rate not less than 11 per cent for any of the E.E.C. countries, though the highest rate has been 19 per cent in Italy in the same year. Exports are vital to the development process from both the supply and demand sides. Exports are in a real sense current savings and they enable larger imports for industrial production. The author calculates, according to the Tyszynski formula, (one wonders why India's export performance has not been judged in these terms) that Britain has lost the "competitive position" in the world market, relatively to the E.E.C. countries.

The wage rate has not increased that fast as in some other E.E.C. countries, though British unit labour costs have gone up to the highest. The upshot of the argument is that productivity in Britain has lagged behind. Britain has suffered

from a lower investment ratio to national income with lower growth of output and high resultant capital-output ratio. Secondly, more important to the author and which has been statistically found out, the productivity of investment in capital, as measured by the "Investment-Productivity Ratio" (ratio of investment per head to increase in output per head), has been the lowest in Britain except in manufacturing. There has been wrong allocation of resources. The author conjectures that British investment has been of the "defensive type"—making small additions and modifications to the existing capital, whereas the E.E.C. countries have been having "enterprise investment" involving new plans and lay-outs.

Dr. Lamfalussy discusses "export led growth" to break the vicious circle of deficit in balance of payments, inflationary prices and low investment. Greater exports will increase profits, investments and savings. The balance of external accounts of the E.E.C. countries, particularly Germany, Italy and Netherlands, had the advantage of probably undervalued currencies, available labour force and low defence expenditure. France had to exhaust her foreign exchange resources and devalue her currency twice to import and then "take off" to an "export lead".

Lamfalussy suggests that Britain's "joining the E.E.C. would offer a more adequate framework for effective growth policies than the present situation", for the E.E.C. offers the advantages of integration, possibilities of greater investment and co-operation to achieve equilibrium.

ADVERTISING AND MARKETING

Admars: 3rd Annual Number & Advertising Directory, 1963; Bombay-1.

ADMARS Annual Number 1963, with an imposing get-up, presents in brief important developments in the advertising and marketing world which may be of particular interest to admen and PR men and others who are thinking of making it a career. Apart from extensive newsy notes, this Number has a few selected articles written by men of considerable experience. Mr. D. G. Bell, Managing Director, Bomas Ltd., writes on how a modern agency should function and in what way it can help the advertiser. Mr. R. K. Sirkar, Manager, Publicity Department, Dunlop Rubber Co. (India) Ltd., pleads for a centralised and highly specialised Export Information Bureau which would evolve, after having studied all published information, a thorough and efficient index of information for the use of any exporter interested in that. Mr. Sirkar considers some amount of research into consumer tastes and habits is necessary and urges the formation of Export Research Centres which would study not so much the existing tastes and preferences as the possibility of creating new ones in order to find new markets for our exports. Among other suggestions put forward by him, the most appealing is perhaps the creation of distinctive brand image for our goods which has become a good marketing technique in advanced countries.

THIS IS an informative review of Railway problems and progress. The articles are technical and are chiefly concerned with discussing development work in the various Zones during the year.

COMPANY MEETING

THE ORIENTAL FIRE & GENERAL INSURANCE COMPANY LTD.

Speech delivered by the Chairman, Shri B. K. Kaul, I.C.S., at the fifteenth Annual General Meeting of the Shareholders on Wednesday, the 17th July, 1963.

1. The Report, Accounts and Balance Sheet for the year ended 31st December 1962 are already in your hands and, with your approval, I propose to take them as read. Before we proceed to consider these for adoption, I would like to review some of the points which had a bearing on your Company's working during the year.

2. The year 1962 witnessed an unprovoked and treacherous attack on India's northern borders by the forces of the Chinese People's Republic. The Government of India declared a state of emergency in the country and initiated steps to prepare the nation for the defence of the country and for the shift in the country's economy to cater to the defence needs on a priority basis. On the insurance front, the emergency resulted in the Parliament passing the Emergency Risks (Goods) Insurance Act, 1962, and the Emergency Risks (Factories) Insurance Act, 1962. On 26th December 1962, your Company was appointed by Government as its sole Agent in connection with the Schemes which were framed under these Acts and which came into force from 1st January 1963. As a result, the Company had to make arrangements throughout India at an extremely short notice for accepting applications and dealing with queries from the public in connection with the Emergency Risks Insurance Schemes. A very considerable amount of detailed work had to be done within a few days in setting up procedures and making arrangements at as many as 163 centres all over India and in preparing material for the purpose of explaining the Schemes to the public and answering their queries. I am glad to report that with the unstinted efforts put in by the officers and the staff of the Company, we were able to complete the necessary arrangements in time. During the first two quarters of 1963, the Company received over 2,50,000 applications under these Schemes and dealt with innumerable inquiries from the public and with voluminous correspondence relating to the Schemes.

I may mention here that this work is being done by the Company entirely on a non-profit basis. I am sure that Members will derive a feeling of satisfaction from our having been able to contribute in this manner to the defence effort and the requirements of the Emergency.

3. On the international scene, the recent years have witnessed the granting of independence to some of the territories in which your Company operates. Tanganyika and Uganda became independent on 6th December 1961 and 9th October 1962 respectively. As you will be aware, Kenya will be attaining independence in December next. We join in welcoming these countries to the comity of free nations.

I am also glad to note that the agreement to launch the Federation of Malaysia covering Singapore, Malaya, North Borneo and Sarawak has been reached very recently. I have every hope that the Federation will bring increased strength and prosperity to the people of these territories and in turn will provide further scope for insurance.

4. Coming now more particularly to ourselves, the year

1962 may be termed our real first full year of working as an integrated entity after the passing of the Bombay High Court Orders in December 1961 regarding amalgamation of the National Fire & General Insurance Co. Ltd., and the Asiatic Government Security Fire & General Assurance Co. Ltd., with your Company.

The process of amalgamation was completed very smoothly both in India and abroad. We are functioning in India through a set-up of five Regional Offices at Bombay, Calcutta, Delhi, Kanpur and Madras which control, in turn, Divisional, Branch, Sub-branch and Inspectorate offices at a total of 85 centres in the country. The working of the Regional Offices is co-ordinated by the Central Office functioning at Bombay.

The foreign operations of the "Oriental Fire" before amalgamation were of a limited character and these have widened considerably with the accession to the now combined organisation, of the foreign operational centres of the "National Fire" and the "Asiatic". Our activity abroad is not yet very large and we are exploring the possibilities of expansion in this field. As, however, there are considerable changes taking place in the political as well as economic character of many of the foreign territories where such possibilities exist, we are progressing in the matter of expansion with caution. The present can therefore be considered only a formative stage for our foreign organisation.

5. Turning now to the results of the year's working, you will be gratified to note the increase in the balance for appropriation from Rs. 20.50 lacs for 1961 to Rs. 44.69 lacs for 1962.

The net total premium of all departments increased from Rs. 434.30 lacs in 1961 to Rs. 492.29 lacs in 1962, showing a rise of about Rs. 58 lacs, i.e., 13.35% over the previous year's figure. This increase was made up of Rs. 46.5 lacs from business effected in India and Rs. 11.5 lacs from business outside India. Considering the market conditions in India and abroad, this rise may be considered satisfactory.

The ratio of net claims to net premiums in 1962 was 34.83% for the Fire Department as compared to 28.97% for the year 1961. The increase in the Fire claims ratio was mainly due to the adverse experience abroad arising out of some large fires. On the Miscellaneous side, the trend of rise in Motor accidents and their costs contributed to the increase in claim ratio from 48.56% in 1961 to 57.79% in 1962. Despite these increases, the claims ratio for both these departments can be considered satisfactory. On the Marine side, the general market experience continued to be unsatisfactory particularly in the Cargo section. The claims ratio in our case, however, has shown a small decrease from 96.45% in 1961 to 93.26% in 1962.

The overall ratio of commission and expenses of management to net premiums has been maintained around 32.5%, which is very satisfactory.

The Company is liable to payment of Super Profits Tax in respect of this year's profit and the estimated tax liability has

been provided in the Accounts.

Our investments as at 31st December 1962 aggregated to about Rs. 399 lacs and the total depreciation in these investments was of the order of Rs. 6.65 lacs and is fully covered by the Investment Reserve. Considering that the total investments of the "Oriental Fire", "National Fire" and "Asiatic" as on 31st December 1960 were only about Rs. 175 lacs and that we invested Rs. 224 lacs in the course of 1961 and 1962, it will be seen that the depreciation of Rs. 6.65 lacs is very nominal in the light of the great fall which took place in prices of shares and securities during the last few months of 1962. The policy of the Company of exercising the utmost care and prudence in making investments during the period when the prices of most Ordinary Shares continued to be unrealistically high, has now paid us dividends in keeping down the depreciation to a very nominal value even under the present difficult circumstances. Whilst as a result of our policy, we did not make large book appreciations in our investments, we have neither been required to provide for large amounts by way of depreciation.

6. As in the past year, your Directors have recommended a dividend of 6% (subject to deduction of tax at prescribed rates) on the paid-up value of the shares. In doing so, they have kept in mind the desirability of strengthening the reserves of the Company. Against the paid-up capital of Rs. 110 lacs, we now have reserves totalling Rs. 46.68 lacs (excluding investment reserve and dividend reserve). We have also additional

reserves for unexpired risks of Rs. 3 lacs each in the Fire and Miscellaneous departments in excess of the reserves main ained on the required basis of 50% of the premium income for the year. The financial strength of the Company has, I am happy to say, increased considerably after amalgamation.

7. Coming to staff matters, your Company signed a new agreement on 1st June 1963 with the Staff Union. The agreement provides, amongst other benefits, for merger of Dearness Allowance by an amount ranging from Rs. 47 to Rs. 55 per month in the basic salary of the employee, and of the linking of the Dearness Allowance scale with the All India Working Class Consumers' Price Index (Base 1949=100). This agreement is the first of its kind in the General Insurance Industry and marks a departure from the old practice of having an arbitrary system of Dearness Allowance. The agreement applies retrospectively from 1st July 1962 and the relevant increase in the Management Expenses for the year 1962 has been fully provided for in the accounts.

8. In conclusion, I take this opportunity to express my thanks to our clients and well-wishers both in India and abroad who have continued to extend us their support. I also thank the officers, staff and development officials of the Company for their loyalty and good work.

N.B.: This does not purport to be a record of the proceedings of the Annual General Meeting.

ASSOCIATION MEETING

INDIAN INSURANCE COMPANIES' ASSOCIATION

Mr. P. U. Patel Surveys Current Problems

ADDRESSING THE 35th Annual General Meeting of Indian Insurance Companies Association, held in Bombay on July 30, the Chairman, Mr. P. U. Patel reiterated the point he had made on a previous occasion that the Formula prescribing Expenses of Management for General Insurers, introduced 12 years ago, was neither fair nor equitable. Mr. Patel pointed out how the operational costs such as salaries and amenities for staff, stationery, fares for travel etc. had all since gone up and the Insurers found it difficult to manage their affairs within the limits provided. Accordingly, he urged the need for evolving a more realistic Formula in consultation with insurance interests.

Mr. Patel, who prefaced his speech with a reference to the political situation caused by the unprovoked Chinese aggression, referred to the Insurance Industry's spontaneous contribution to the National Defence Fund and added that should a similar situation unfortunately arise in future, the Industry would consider no sacrifice too great to make for the sake of the Nation.

Referring to the niggardly increase in the National Income and rising price-levels, he felt that there had been faulty planning and false priorities all along. Increased production on all fronts was the only solution to the situation facing the country today. He emphasised that it was high time it was realised that mere sanctimonious sermonising by Ministers would not and could not lead to increased production either in the fields or in the factories.

Referring to the Budget proposals, he said that the Super Profits Tax was bound to have a deleterious effect on the economy and a reorientation of outlook was clearly indicated. He deplored that the Government had rejected the

Association's plea for allowing Insurers to take into account Departmental Reserves together with Paid-up Capital and Taxed Reserves before being made liable to Super Profits Tax. He said: "It is my regret that while Government allowed certain reliefs to Banking, they preferred to ignore our representation altogether. It is my submission that an industry like ours, which is an integral part of the National Economy, should have received more considerate treatment.

The Chairman next referred to two specific developments in the Insurance Industry, the reduction in Fire premium rates and the growing adverse claims experience in the Motor Department. He stressed that the cut in the Fire rates with effect from July 1, 1962, coming as it did on top of a similar reduction in 1960, would come in the way of Indian Insurers building up the necessary Reserves and expressed the hope that the Industry would not be called upon to make yet another reduction in the foreseeable future. While the increase in Motor rates to take effect from August 1, 1963, would provide some relief to Insurers, he wondered whether it provided a lasting solution to the problem.

In conclusion, Mr. Patel said that the joint efforts of the Administrative Machinery and the Insurers had helped to raise the tone of the Market. However, a lot more remained to be done. Pleading for greater co-operation from the Industry in terms of the undertaking given by the Insurers and a more pragmatic approach on the part of the personnel of the Administrative Machinery, in the working of the Voluntary Agreement, Mr. Patel said: "Only when Insurers, who scrupulously comply with the provisions of the Agreement, are assured that others shall not divert any business by adopting unfair methods, then only there can be real hope for the future."

Of course, Mr. Executive, you have the LISTERINE Antiseptic twice-daily good health habit!

Teach them young...
Teach them right...
First thing in the morning, last at night!

LISTERINE
will protect them all their lives!

Ordeal by Slander

UNNOTICED IN the rest of the country, unappreciated by the rest of the nation, the business community in Calcutta has been going through the traumatic experience of an ordeal by slander. Over the past weeks some business houses in that city have been subjected to search and seizure of documents by the Customs authorities and/or by the Foreign Exchange (Regulation) Act Enforcement Directorate of the Central Ministry of Finance. Among the firms which have attracted these raids is a business house of outstanding status in the industry and foreign trade of this country, which is about to celebrate its centenary and an export house doing possibly the largest individual share of the nation's foreign business in jute goods.

Perhaps the most surprising part of these raids is that no formal or official declaration has ever been available of either the provocations for or the purposes of these extraordinary activities on the part of the Government agencies concerned. There has, however, been a spate of speculation in which the less responsible section of the Press has naturally been participating with undisguised glee. The raids have let loose a flood of gossip, insinuation and innuendoes according to which the raids are alleged to have been carried out in the process of investigating violations of customs or foreign exchange regulations by the firms concerned.

It has been alleged that these business houses have been guilty of what is described as "under-invoicing of exports" with a view to by-passing Government regulations concerning the holding and use of foreign exchange earnings. Against such a smear campaign the firms concerned have been left without any effective means of defence or protection since the way in which the raids have been or are being carried out has placed the victims in a most equivocal and embarrassing position. The searches have been conducted without any formal statement of the grounds the authorities may have for such action. Documents dating back to several years have been seized wholesale and removed from the premises without any explanation being forthcoming regarding the objectives or purposes of such seizure. Worse still, weeks have gone by in some cases without the affected firm being enlightened in any manner about the results of the search or seizure. The consequence of such an extraordinary investigatory process is that the business houses affected have been placed, at least for the time being, under a cloud of adverse public speculation which is likely to do permanent harm to their reputation and which they have no means of attempting to dispel so long as the authorities decline to offer any kind of explanation or justification for the raids.

It is not implied here that, where there are sound grounds for investigating allegations of violation of the law or for taking such other legal proceedings as may be necessary against defaulters or offenders, the Government should refrain from adopting the measures that may be indicated. It is not also argued here that just because some business houses are rich and resourceful and of long standing they may claim to be treated with special leniency where violations of the law of the land are concerned. It may be conceded again that, in view of the great strain on the economy of the country, particularly in the foreign exchange field, any attempt to violate the foreign trade and exchange control regulations should be proceeded against with the utmost strictness and severity, irrespective of the standing of the persons suspected of the violation. But, at the same time, there can be no question that the way the investigations are conducted should

not merely conform to the legal technicalities but should also be substantially just and fair.

It may be that the relevant laws permit the Customs or the Exchange Control authorities to search for and seize documents without a proper warrant or without having to make a formal charge or complaint. But surely such drastic powers must be used with the greatest circumspection and restraint. In the raids with which we are now concerned, it appears to be the case that the authorities have been acting largely on vague allegations made by informers who are perhaps being paid for their services. It is also apparent from the fact that there have been indiscriminate and sweeping seizures of documents and papers and that days and weeks have passed after the raids without any formal case being filed in the courts, that the raids have been or are being carried out not so much as to get possession of incriminating evidence in support of specific charges as for the purpose of a general hunt for material on the off chance that such material may perhaps contain proof of infringement of government regulations. It seems to us that this is a very objectionable way of enforcing laws in a civilized community. Such practices surely smack of organised persecution of private citizens by government agencies which would be more in keeping with the character of a police State than with that of a fair and orderly Administration.

Apart from the general principle that no democratic community can permit such goings on without damaging its character and purposes, there is, in these particular cases, also this added consideration that the grave damage that is being done to the reputation of leading business houses must inevitably hurt the export trade of this country and particularly the proud position which Calcutta occupies in international commerce. We doubt that the Government generally and the Ministries of Finance, Industry and International Trade specially, have properly assessed the possible repercussions on this country's economic interests, of the

The Plan is Dead Long Live the Planning Commission

IN TERMS of performance and purposes the third Plan has now clearly ceased to be an operative proposition. In the Planning Commission and the Ministries of the Central Government this fact is now being largely accepted. At the same time, a attempt is being made to draw a red herring across the trail. The nation is now being told that the failure of the Plan has been essentially in the field of agriculture. While the virtual stagnation of agricultural production points no doubt to one of the principal areas of default, it is not possible for the Government or those who claim to speak on its behalf to pretend that failure elsewhere has been less grievous.

Actually all the current breast-beating about the

present state of affairs where certain subordinate agencies of the Central Government have apparently been allowed to run wild in the business world of Calcutta, thanks to the exuberant, but ill-disciplined, enthusiasm of a handful of witch-hunting officials. As we have made clear earlier, we are not in any way opposed to suspected infringement of the law being investigated properly, however high or important may be the parties involved; at the same time we would assert once again our firm conviction that the way in which raids have been carried out against some business houses in Calcutta is inconsistent with justice and fair-play for the reasons we have explained here and is also likely to do grave damage to this country's fair name and reputation in world commerce.

The Central Government has erred sadly in letting this sorry state of affairs continue for as long as it has done already. It is imperative that the Government should immediately clear up this mess by, in the first place, suspending such indiscriminate and high-handed searches and seizures on a sweeping, hit-or-miss basis and secondly, either filing promptly cases in the law courts where grounds have been found to exist for legal action or where no such grounds have been discovered, immediately restoring the seized documents to their owners with a suitable public apology for the unwarranted official persecution. It is no doubt highly regrettable that the raids have been exploited by a section of the Press to sling mud at the names and reputations of many business houses, but the Government will no doubt agree that its own responsibility for making possible such a smear campaign is heavy and inescapable. It is therefore only proper that the Government should undo as much as possible of the mischief that has been done. The ordeal by slander to which some leading business houses have and are being subjected to is also an ordeal for the Government of India since its reputation for fair and proper conduct is equally involved.

Long Live the Planning Commission

lack of agricultural progress seems to be intended to divert public attention away from the even more disagreeable fact that the Plan has also substantially failed in the industrial sphere. The lapses in the agricultural field could at least in part be blamed on natural forces and the difficulties of solving the complex problems of organisation and administration presented in the sphere of State governments. In industry there is less scope for explanations or excuses. The Government itself began by admitting that the targets of the third Plan were modest in relation both to current needs and future requirements. Again, when the emergency arose, one official spokesman after another came forward to declare that the Chinese aggression had made it all the more necessary to step up and speed up the

industrial effort and to undertake to ensure that this is done. Those bold declarations and promises have not been kept, for we see all around us a definite slack in the industrial effort. Not only is no adequate new effort being made to mobilise resources for the purposes of the emergency but it is being accepted in a spirit of resignation that even the initial targets of the third Plan in respect of important industries must now be written off as being in the nature of too high ambitions for the year 1965-66

Among the important industries where development programmes have sadly failed to keep to schedules are cement, coal and coal washeries, finished steel, petroleum products, fertilizers and machine tools. It is quite clear that the long delay which must ensue in the development of these important industries will inevitably weaken and prolong the processes of the long-term expansion of the industry and general economy of the nation. Not less adverse is the development that in the areas of consumer goods industries the rates of growth of production and capacity have been kept depressed to such an extent that not only have the chances of improving the living conditions and consumption standards of our people been rendered negligible but the risks of inflation and deepening unemployment and social distress have been considerably enhanced. Industries which may be mentioned in this connection are sugar, vegetable oil products, cotton textiles, paper and paper board, sewing machines, electric lamps, electric fans, automobiles, bicycles and radio receivers. A curious aspect of this development in the consumer goods field is that, simultaneously with the slackening of the growth of production, there has also been a slackening of effective demand for a wide range of industrial products which are relevant to and useful for improving standards of living of the people above the level of subsistence.

We do not deny that this must be a disagreeable economic landscape for the Planning Commission to be called upon to contemplate at this stage in its history. But we must insist on facts, however disagreeable, being faced squarely, for that is an obligation which the Government owes to the people from whom it has been exacting year after year increasingly heavy sacrifices for the cause of economic development. Even more clearly we must insist on the truth being recognised that if there has been so much disappointment in the industrial sphere, it has been largely because of a long series of errors of commission and omission for which the Planning Commission cannot escape responsibility. It is clear that, if industrial development has lagged behind our essential needs, it is not because there have been compelling physical limitations, but because the human agencies functioning in the sphere of government have failed to do their jobs properly.

Here again, the blame, let us repeat, must rest

squarely on the Planning Commission. There are two vital areas of government policy, relevant to industrial expansion, where the Planning Commission has grievously failed to do its duty as a friend, philosopher and guide. The first is the area of fiscal policy. This journal stoutly opposed the last Central budget because it could so readily see that the fiscal policies incorporated in that budget were bound to pull down the tempo of industrial growth. In the months that have since passed there have been accumulating indications that our worst fears will be realised. The market for new capital issues is now virtually dead and this, on any reckoning, is a most damaging development for a country which is supposedly engaged in a vast industrialization effort. The Finance Minister, or at least the Finance Ministry, is reportedly inclined to blame this slump on what is being described as an unwarranted agitation over the super profits tax. We cannot possibly agree with the view that any agitation over the super profits tax can be described as unwarranted but we are prepared to concede that the super profits tax may not be the sole criminal. The virtual killing of the capital market, in effect, is not a mere crime but is a conspiracy. It is the consequence of a whole series of fiscal acts perpetrated over the last few years in utter disregard of their cumulative effect on investment attitudes and investment resources. The grossing of dividends, the stepping up of the rate of corporate taxation, the withdrawal of the exemption from wealth tax in case of investment in the shares of new companies, the various attempts to whittle down concessions in the form of tax holidays and development rebates and finally the super profits tax have all combined to destroy stage by stage many of the conditions and circumstances which go to make up a reason-

Eastern Economist 20 Years Ago AUGUST 6, 1943

A number of important statements were made by the Finance Member in the Assembly this week. It was revealed by him that up to 24th July, 726 applications had been received by the Examiner of Capital Issues. Out of 271 applications sanctioned up to that date, 18 represented conversions involving no money and 112 related to industrial concerns. Out of the 271 consents given, 132 related to new companies. The Finance Member said that the duties of the Examiner of Capital Issues are to see that all necessary information has been supplied, to obtain the advice of the appropriate authorities and thereafter to get the orders of the Government of India. In the case of financial concerns such as banks, insurance companies, finance and investment companies, a reference is made to the Reserve Bank of India. According to another statement made by the Finance Member, the response received from EPT assesses has not been satisfactory, the amount deposited up to May 31 being about Rs. 2 crores only which is a little more than half of the amount that could have been deposited.

able climate for the flow of risk-taking, capital into the continuing and expanding industrialization of the nation.

Now the question arises what steps the Planning Commission took at all at any stage in the recent fiscal history of this country to assess the impact of these trends in fiscal policy on the course or prospects of industrial development. The Planning Commission wants to be taken as a brains trust or a high command in the field of economic planning. But in practice it has bulged out, if not petered out, into a vast and meaningless bureaucracy engaged in frustrating, if not frivolous, activities largely irrelevant to its pretensions. That is why it has been unable to discharge its primary and proper functions of exercising vigilance over and imparting broad directions to the basic economic policies of the Government bearing on the implementation of the Plans so proudly put down on paper.

Another area of Plan implementation where the Planning Commission has not only failed to exercise proper discipline but has itself positively contributed to the messing up of the implementation of the Plan is the functioning of the administrative machinery for processing development projects. We are told that everybody, from the Prime Minister down, is worried over the slowing down of industrial growth. If this is true, why then is nothing being done to rationalise and speed up departmental procedures which keep constantly coming in the way of the starting of new industrial projects? Among the lessons which the emergency should have taught the Government surely must be an awareness that a policy of business as usual would not do. But if the Government has learnt any lesson at all, it is only in the sense that the conduct of government business now is actually worse than usual.

It is the experience of numerous industrialists and entrepreneurs all over the country that the processing agencies of the Government have actually slowed down in the work of considering and passing the new industrial projects. One of the most serious causes of delay is the stubborn practice in the Government departments of interminable inter-ministerial consultations and endlessly detailed discussions at intermediate and even junior official levels. It is now a common experience that it takes anything up to four months for a letter of intent or an industrial licence to be obtained, for even relatively simple projects and something like nine months or even more for the subsequent approval of a foreign collaboration agreement. It also seems to be the case that much of the delay is because the cross-movement or idling of files at relatively junior official levels is encouraged by the helplessness of the officers of senior ranks in the matter of assuming responsibility and by the absence of a sense of urgency at ministerial levels. The common attitude in the concerned departments or the Ministries of the Government seems to be

that the heavens will not fall if a project, which could be processed in, say, four months, is in fact passed after 24 months. We have no doubt that the Planning Commission owes it to the people to have given some serious thought to this problem before it has assumed such enormous proportions. Even now it is not too late for the Planning Commission, if it desires to retain any semblance of justification for its continued existence, to address itself seriously to the question of administrative delays in the processing of industrial projects and bring about some sensible changes in the relevant policies of the Government.

For instance, where an entrepreneur is in a position to secure the foreign financial collaboration needed to finance the foreign exchange needs of his project, it should be possible for the Government to cut down processing formalities to a few simple essentials of broad regulation. The position at present is quite different. Not only are the Government agencies concerned most reluctant, at the initial stages, to give any reasonably accurate indication of the nature of conditions that might be imposed with regard to the terms of foreign collaboration but they are apt, at a later stage, when the collaboration agreements have been negotiated, to insist on going too minutely into details and demanding modifications which are not always easy to obtain from the foreign collaborators at that advanced stage. The result is that, apart from the implementation of industrial projects being generally delayed and frequently frustrated, industrialists are often placed in an embarrassing situation in negotiating with foreign collaborators. This state of affairs obviously cannot be conducive to a greater flow of foreign capital into this country, nor can it help promote goodwill and understanding between our Government and businessmen on the one hand and foreign industrialists on the other.

We wonder whether the Government and the Planning Commission can really be blind to the enormous harm done by obstructive and dilatory administrative procedures which are currently holding up the industrial expansion which this country and its people so urgently need. We are sure that no good or useful purpose is being served by the kind of ubiquitous policing of new industrial projects which officialdom at all levels is currently exercising. We are confident that it is possible and that it would be highly beneficial if business men are required to adhere only to a simple and standard formula relating to the broad terms of foreign collaboration and are otherwise left free to process their projects as speedily as they can by being required to deal with as few Government departments as possible, especially where the foreign exchange required for the project is to be obtained by the Indian entrepreneur himself. It is surely the duty of the Government to ensure that as little of his time as possible is taken up in dealing with Government departments and Ministries. There is no doubt at all that this is a matter where, as in other areas of sound and sensible imple-

mentation, the Planning Commission has completely failed so far to discharge its primary obligations. This kind of failure is bound to make more and more people question the point of the continued existence of the Planning Commission in its present form and ways. It may be that the Planning Commission itself is convinced

Industrial Wages

THE HUNGER for statistics seems to be insatiable in this country since, for any policy decisions, the commissions and committees invariably demand full facts which usually are not readily available. This applies in particular to industrial wages for which the available data have not only been incomplete, but "ill-suited to serve the new wage problems." The Labour Bureau of the Ministry of Labour and Employment conducted a sample survey in 1958-59 covering 44 major industries in the manufacturing, mining and plantation sectors. The results of the survey—the first of its kind setting out occupational wage rates on a comparable basis—have now been released in the form of a general report entitled "Occupational Wage Survey", which is proposed to be followed by detailed industry-wise studies. As a fact-finding survey, it has no doubt been a success though its findings will have to be supplemented by other vital information to provide guidance for the new wage policy.

Broadly the industries which were covered approximated to 76 per cent of the employment in factories, nearly the whole employment in plantations and about 85 per cent of employment in mines. The survey was based on a representative sample; the total number of units selected for the purpose was 2,953 though for purposes of analysis only 2,949 units were studied. The largest number of units sampled were the factories; their precise strength was 2,253. The mines and the plantations had 350 samples each.

The general analysis provides data regarding the composition of the working force, the various systems of wage payments, the wage rates and dearness allowance, pay-roll earnings, levels of average daily earnings and wage rates of workers in comparable occupations. Studies were also made for over-time working and earnings and the incentive bonus schemes.

The distribution of the working force indicated that women workers constituted 13.5 per cent of the factory labour, more than 50 per cent in plantations and about 17 per cent in mining industries. In plantations, 4.9 per cent of the workers were children; in other industries, child labour being forbidden by law, the percentage of children was insignificant. The strength of women workers is likely to shrink in view of the "growing tendency among the wage-fixing authorities to fix equal wages for men and women". Currently, women workers draw lower wage rates than men but statutory obligations to pay women workers wages equal to those paid to men will force the hands of employers to reduce

that it is entitled to go on, but the number of people whom it may find to be in agreement with itself is bound to decrease steadily if it does not make a serious attempt soon enough to spare some thought from its preoccupation with keeping itself alive to the task of keeping the Plan alive.

the percentage of women workers as they will find it less economical to employ women.

One of the merits of the study is that a detailed analysis has been made of the various occupations in industry. It is revealed, for example, that in certain industries the number of occupations is extremely large, while in others, the number is very small. In cotton textile mills, for example, the number of occupations is as high as 250, whereas in plantations there are no more than 10 different occupations. An attempt was made to simplify the classification of these occupations and it was discovered that nearly 25 occupations in each industry covered the major part of the working force. In all cases, the wage rates were obtained on a comparative basis for these 25 occupations.

The heart of the survey lies in the analysis of wages and dearness allowance in the various industries. Because of diverse practices in the different regions and industries, the term "wage rate" was defined as including the basic wage and the dearness allowance and figures were collected both in relation to the maximum and the minimum wage rates. The results of the findings are set out in a table published on page 286 of the current issue in the section "Records and Statistics". A cursory glance at this table shows wide dispersion in wage rates amongst various industries and amongst different industrial centres in the same industry. In the case of the cotton textiles industry, for example, the difference between the average (minimum) wage rate per day per worker in Bombay and Bangalore was nearly four times; whereas the minimum wage in Bangalore was Rs. 1.37 per day, the corresponding figure for Bombay was Rs. 5.01. The lowest wage was recorded in the cashewnut factories in Kerala where the average (minimum) daily wage was 62 nP. The dispersion in the average (minimum) wage rates was, thus, more than eight times, the highest paid being the cotton textile worker in Bombay and the lowest, the cashewnut worker in Kerala. Among cashewnut workers, the lowest-paid workers were the peelers and the shellers, a majority of whom were women. The lowest average (minimum) wage recorded was at 42 nP. per day for peelers in Kerala.

At the other extreme were noticed the "blowers" in the metal extracting and refining industry whose average (maximum) wage per day was as high as Rs. 37.46. There were no less than 24 of them. In other words, the difference between the maximum and the

minimum wage rates in industry was 89 times.

There were various rates of payment in between these two extreme levels. At the lower end of the scale was the match industry which, along with the cashew-nut factories, commanded the average (minimum) wage rate of less than one rupee per day. The bidi factories, tobacco curing works, tea, coffee and rubber plantations and mining industries excluding coal paid the minimum average wage rates between Re. 1 and Rs. 2 per day. The industries whose average (minimum) wage rates lay between Rs. 2 and Rs. 3 per day were the jute and woollen textile industries, some of the engineering industries, cement, paper, sugar etc. Cotton and silk textiles, railway workshops, aircraft building and repairing and soap factories paid between Rs. 3.01 and Rs. 4 per day as the average (minimum) wage rate; those paying more than Rs. 4 per day were metal extracting and refining industry, ship-building and repairing, petroleum refineries, cigarette factories etc.

A comparison of the wage rates in the case of various occupations in similar industries shows the degree of disparities which exist in the different parts of the country. The minimum wage rate for a carpenter working in a silk textile mill in Jammu and Kashmir at Rs. 2.45 per day is less than half of the earnings of his counterpart in Bombay employed in a cotton textile mill and earning Rs. 5.55 per day. Similar comparisons have been made in the case of jobbers, weavers, twisters, winders, reelers, warpers, etc., in the case of the textile mills; in the case of the engineering industries, wage rates of mistries, electricians, carpenters, blacksmiths, masons, moulders, etc., have also been compared.

What were the basic reasons for these vast differences in wage rates among the various industries? The survey has not attempted any answer to this question; it has given the opinion that "the differentials in wage rates between industries or broad sectors of industries like factories, mines and plantations arise from many diverse economic and other factors. A proper study of these factors is necessary before drawing any conclusions from these differentials". In other words, unless the statistical information thrown up by this survey is supplemented by additional details to explain the various "factors and forces involved in the evolution of the occupational wage structure," no definite guiding posts for the wage policy will emerge. The wage-fixing authorities, however, will find of considerable use the data regarding the wage rates and wage-differentials "according to specific jobs and occupational nomenclature". In general, it may be stated that the level of wage rates tended to be low in all industries "akin to agriculture"; to this category belonged cashewnut factories, tobacco curing, plantations etc. The industries fetching higher wage rates were those of metal extracting and refining, ship-building and re-

pairing, petroleum refineries, cigarette factories etc., both because of the degree of skill needed in the manufacturing processes and the relatively higher hazard to life.

The Bonus Commission, which is currently studying the problems associated with the various wage incentive systems in the country, will find the analysis of bonus schemes in this survey quite revealing. A very small proportion of industrial units have incentive bonus schemes in operation. This may be deemed rather discouraging in view of the fact that the ostensible aim of all such schemes is to encourage workers to raise their productivity. Since only 4.7 per cent of the units in industry have incentive bonus schemes, it means that the practice of linking up incentives and productivity in industry will perhaps take a long time to fructify. Only in the plantations the units having incentive bonus schemes is high, that is, at 31.1 per cent. Even mines have a better record than the factory establishments with 6.4 per cent of them having incentive bonus schemes in operation. In certain areas, the very idea of bonus is non-existent. In the cotton textile sub-group, in Howrah and Calcutta, Bangalore, Bombay and Bombay Suburban, Sholapur,

EASTERN ECONOMIST

Twentieth Anniversary Number

In this special issue of June 7, 1963 Eastern Economist takes pleasure in presenting its readers with a rich fare of articles on various aspects of the Indian economy and a special section devoted to the study of industrial development in the various States. Contributors include the U.S.S.R. Ambassador in India, Mr. K. D. Malaviya, Dr. P. S. Lokanathan, Mr. K. Santhanam and Mr. Tarlok Singh.

Extensively illustrated with charts and statistical tables, this special number is priced Rs. 5 per copy, but is available to regular subscribers without any extra charge on annual subscription.

Indore, Kanpur, Jaipur and Ajmer, the bonus scheme was not at all in operation, presumably because of the linking of the dearness allowance with the cost of living index. The rising prices have invariably brought increased money earnings to the workers in these industrial towns and there has been no move to initiate any bonus scheme.

A decision has been taken to repeat this survey

LIC: Progress and Problems

ADDRESSING THE fourth All-India Divisional Managers' Conference recently, Mr. B. K. Kaul, Chairman of the Life Insurance Corporation claimed that the LIC "has been well launched on its way to meet the objective laid before it". Now, the objective laid before it at the time of nationalisation was primarily to accelerate the tempo of savings through the medium of life insurance and canalise the savings so collected to aid economic growth, keeping, at the same time, the interests of the policy-holders in view. This presupposes two specific roles for the LIC, one, as an organisation to stimulate individual savings and, two, as an institutional investor to further the social advancement of the country. That the Corporation has been able to perform the first task (although the question will continue to be asked whether the rate of growth of life insurance might not have been greater, had life insurance not been nationalised) well enough is clear from the increase of almost Rs. 100 crores in new business done during the year 1962-63 (15-month period) over a similar period of 1961-62. The increase in business by about three times since nationalisation cannot but be considered as satisfactory, although the Rs. 1,000-crore target fixed at the time of nationalisation may still be far off. The LIC Chairman, however, hopes to reach this figure also soon and the LIC may well do so, because, even Mr. Kaul's announcement of a new business of Rs. 745 crores in 1962-63 was prefaced by the restrained remark that it was not being made with a feeling of complacency or satisfaction that the LIC "had achieved its objective", but rather as "an earnest of the Corporation's desire to further improve its working standards" in spite of all the odds that the Corporation has to face. Mr. Kaul, perhaps, was unduly modest when he said that the target itself "was not fixed in any scientific manner with relation to population or economic trends". Quite possibly, however, he might have meant merely that the target was by no means a biblical injunction and that it could be achieved in six or seven years and not necessarily in five years.

There will be general agreement with Mr. Kaul that the stability and stature which the LIC has been able to acquire is mainly due to the integrity, vision, and skill of its executive officers, what with their technical knowledge and wide experience of controlling the affairs of the successful erstwhile Indian insurers. Again, if the

after some time. A note of caution needs to be struck at this stage in that the basic definitions adopted in this particular survey should not be altered in the re-survey so that the findings of the two surveys should be comparable. A mistake in this regard was made in the case of the Agriculture Labour Enquiry where the alteration — in the case of the repeat survey — in the definition of agricultural labour family took away much of the value of the re-survey.

LIC has emerged as "a live-wire national institution with an individuality and personality of its own", as Mr. Kaul claimed, it is mainly because of the happy blending (as he himself said) of the best features of both the public and the private sectors—"a judicious process of cross-breeding" or mixed economy in action. The LIC is not merely an amalgam of all that is best in insurance tradition in the shape of actuarial theory and practical knowledge in the successful running of life insurance institutions thus, but it also embodies the marrying of this laudable amalgam with the enlightened theory of the Welfare State, according to its Chief.

The second role of nationalised life insurance becomes important by reason of its having developed into the country's largest single institutional investor. Although the Insurance Act of 1938 provides the framework and the Union Finance Minister's statement in Parliament of August 25, 1958 enunciates the Corporation's investment policy, and even the guide lines have been provided by the Government, fresh problems are bound to arise in a dynamic economy such as ours. The recent controversy over the sales of certain shares held by the LIC which have reportedly had certain repercussions on the composition of the management of the company concerned is a case in point. While nobody need question the right or *bona fides* of the LIC's sales of the shares as such, the instability in company managements that might result, even if unwittingly, by such sales is a new development that has occasioned some concern at least to a section of the shareholders. Notwithstanding its initial fears about the extent of shareholdings of the LIC in a public limited company (fears that it might pave the way to eventual nationalisation by the backdoor), this section has since come to look upon the LIC holdings as a sort of fortuitous, if not God-sent, protection to them. Inasmuch as the LIC has a stake, they reckon, it will, by its vigilance, serve as a watchdog to safeguard the interests of other shareholders also indirectly. This fond belief has received a rude shock, whether justifiably or not, by the recent deal in question, and, if only for this reason, it seems necessary that the LIC, which speaks in terms of national welfare and is, therefore, quite unlike an ordinary investor or speculator in shares, should give some thought to the implications of such sales, not all of which may be desirable.

Highlights of the Week

JUTE COMMITTEE'S REPORT

THE SRIVASTAVA Committee on Jute has made a number of far-reaching recommendations for putting the jute industry on a sounder footing, so as to enable it to derive the fullest possible advantage out of the increased world demand for jute goods. The recommendations cover all aspects of the industry.

So far as raw material supplies are concerned, the Committee favours only limited imports of superior quality fibre, provided they do not hamper indigenous production and are available at reasonable prices. Stepping up of the indigenous production, it recommends, should be sought not through diversion of area from foodgrains to raw jute cultivation but through increasing unit-area yields. Area under jute and mesta cultivation, the Committee suggests, should be stabilised around 2 million and 0.8 million acres, respectively. To facilitate an effective implementation of the jute development programmes, setting up a high-powered Jute Development Board under the control of the Union Ministry of Food and Agriculture has been recommended.

Referring to the instability of jute prices, which has affected the competitive position of Indian jute manufactures in foreign markets, the Committee says that the Government should have full operational control over any agency that might be entrusted with buffer stock operations and the price support arrangements. The proposed Jute Development Board, it adds, can play a useful role in this regard. It should also be entrusted with the functions of jute marketing, stabilisation of jute prices and jute transport. The Committee further recommends that in order to make the price support scheme for jute effective, "derivative" prices corresponding to the "floor" prices in Calcutta should be fixed in all secondary markets and supported by buffer stock operations. High priority has also been urged to be given by the State Governments to the establishment of a series of regulated markets in the jute growing areas so that no jute grower has to take his jute more than five miles to reach such a market.

In regard to the expansion programme of the jute industry, the Committee suggests that the first priority should be given to the existing uneconomic units. The next priority should go to units which, though economic, can have additional economies by expansion. The licensing for new units should only be on the basis of regional needs, provided raw materials and other facilities are available there. The Committee does not favour the continuation of the Working Time Agreement of the Indian Jute Mills Association, because of certain disadvantages inherent in it and owing to the self-sufficiency having been achieved in raw jute supplies.

The Committee underlines the necessity to bring down production costs in the jute industry. For achieving this end, it suggests that whenever additional production of jute goods becomes necessary, it should be achieved by working more looms on double shift, and that the Government should offer all assistance to enable the industry to replace worn-out and obsolete carding equipment by high-speed winding machines and pre-beamers which improve both quality and output. Grant of loans for modernisation has also been called for. The foreign exchange requirements of the jute industry, the Committee suggests, should be given priority and within the industry itself, higher priorities should be accorded to machinery manufacturers' requirements of capital goods and components.

In the field of exports, the Committee wants further efforts to be made to study and develop markets abroad in a

systematic manner and on a long-term basis. Special attention, it is suggested, needs to be paid to exports to the USSR and East European countries. Consultations are recommended between the Government of India and the East European countries for determining the extent to which India's production of jute goods can be co-ordinated with the five or seven-year Plans of these countries. For expanding trade with the West European countries, the Committee recommends detailed studies of the quantitative restrictions placed in these countries on India's exports so that effective steps could be taken to negotiate increased intake by them. The negotiations with the E. C. M. countries, the Committee suggests, should aim at securing nil or a very low tariff on jute goods, especially sackings, and removal of quota restrictions.

As an incentive to export, the Committee recommends that a scheme may be worked out for import entitlements in respect of essential jute machinery. Further, as a special case, in view of the high export potential of the industry, the import of machinery may be extended even to machinery for priority industries other than jute.

For diversification of production, the Committee suggests creation of a Product Development Cell in the Jute Commissioner's Organisation under the supervision of an experienced jute technologist. In respect of quality control, the recommendations of the ad hoc Committee on Quality Control and Pre-shipment Survey have been endorsed.

A DECADE OF COMMUNITY DEVELOPMENT

MR. S. K. DEY'S address of welcome at last week's Ministerial Conference on Community Development was an exercise in hyperbole at a time when serious and ruthless introspection was necessary to assess the achievements of the Community Development Programme in its first decade. The Minister waxed eloquent and asserted that "today we were at a momentous cross-roads in the growth of this movement. It had reached the adolescent stage, a stage of ferment which needs special guidance for stability." Nor was his inaugural speech three days earlier at the Annual Conference on Community Development and Panchayati Raj less extravagant. It is curious that the Minister who showed so much confidence in the success and key importance of the Community Development Programme also betrayed confusion of thought when he pleaded for a clear mandate about the direction in which this movement should now swing into action. Neither the philosophy nor the mandate for the movement were ever in doubt. Mr. Gulzari Lal Nanda, who spoke on the occasion, made it clear that the mandate was nothing less nor more than to place the central emphasis on the growth of agricultural production and to promote the sound development of the social and economic life of the village community in general.

Both the speeches of Mr. S. K. Dey taken together disclose that he has been swayed by the mere expansion of the Community Development blocks and the Panchayati Raj in their outward size, number of workers and ramification of activities. The Community Development Programme is now a decade old. Mr. Dey rested content with pointing out that the Community Development movement covered 99 per cent of rural India and on October 2 it would bring the entire countryside under its wing. The Panchayati Raj was established in ten States, it would be introduced in two more States in the next few months and it would not be long before the remaining two States are brought under this experiment. The "Sahakari Samaj", or the co-operative sector of the economy, the Minister maintained, would hold "a healthy balance between the private and the public sectors".

It is rather astonishing that Mr. Dey, who frankly ex-

pressed his disillusionment about the progress of Community Development only last year, did not think it necessary to bring home to the Ministers and the Development Commissioners some plain truths about the quality of the work that has been performed. In the final analysis, it is quality that matters and it should be quite clear that the coverage, particularly of the Community Development and Panchayati Raj, has been spread widely, rather too impatiently, without proper regard to the consolidation of the progress already made wherever those movements were introduced in the first phase. The result has been a rapid and unwieldy growth with inadequate attention to the content and quality of work. Perhaps the Prime Minister, who inaugurated the Ministers' Conference, made a proper assessment of the work in the triple field, when he bluntly expressed his view that the Community Development movement was beginning to lose its dynamism and failing to improve the quality of village workers, that the Panchayati Raj was in the danger of degenerating into feudal regimes and that the co-operative movement was overridden by officialdom.

RURAL INDUSTRIES

A TWO-DAY Conference of States' Chief Ministers and Industries Ministers, held in New Delhi last week, discussed ways and means to strengthen the rural industrial sector and to accelerate its growth. Rural industries, the Conference reiterated, should be, by and large, based on local raw materials and the consumption needs of the surrounding areas. The growing realisation in the official quarters of the fact that if rural industries are to prosper, there is a paramount need to reduce their cost of production is welcome. Such measures as the provision of subsidies, sales rebates, curtailment, or even elimination of, competition from the organised industry, etc., may be necessary for the development of rural industries in the initial stages of their growth. But their continued use over any long period is bound to create distortions in the economy and stultify its growth. It is only through steady and persistent increase in their operational

efficiency that the rural industries can be made to stand on their own legs. If despite the advantages they enjoy in regard to overheads and the nearness to their markets and sources of raw materials, the rural industries are not able to compete with the urban ones, it is because of the outmoded techniques they employ. The only way to reduce their cost of production, without cutting into the pitiable low level of wages prevalent in the rural areas, is the application of modern technology and scientific knowledge. The Ministers' Conference did well in according pride of place to this step in the programme for rural industrialisation which it recommended.

There are, of course, some obvious limitations to a rapid application of modern technology and scientific knowledge to village industries arising out of factors like low level of literacy in the countryside and poor economic position of the majority of the people there. Non-availability of electricity at cheap rates in many parts and dearth of qualified technicians to man instructors' jobs are two other main hindrances in the way. In the face of these it will be apparently imprudent to diffuse energies over a vast area. Concentration of efforts in selected areas is called for lest disappointment should follow as has been the case with the Community Development Programme. In this connection the recommendation of the Planning Commission's Working Group on Rural Industries that the industrial policy should make it incumbent upon the major industrial units to develop in the adjacent rural areas small-scale industries to manufacture some of the stores and parts required by them deserves pertinent note. The feasibility of such satellite industries has already been proved by the pioneering work done in this respect by Hindustan Machine Tools. One snag in this scheme, of course, is that all the raw materials required by the rural industries thus established may not be available locally. For their successful and efficient working, it is, therefore, necessary that the Government should undertake the responsibility for ensuring regular and adequate supplies of raw materials to be brought from elsewhere in the country or from abroad.

CLEAR AS "DEYLIGHT"

WINDOW ON THE WORLD

Outlook for U.S. Balance of Payments

By WALTER W. HELLER

Chairman of President Kennedy's Council of Economic Advisers

WASHINGTON:

OVER-ALL, steady progress has been made in reducing the international balance-of-payments deficit of the United States. From an average of \$3,700 million in the 1958-60 period, the U.S. payments deficit has been reduced to \$2,400 million in 1961 and \$2,200 million in 1962.

But excluding special government transactions, progress has been less marked: from a \$3,900 million deficit in 1960 to a \$3,000 million deficit in 1961, and a \$3,600 million deficit in 1962. It stayed at about the same level in the first quarter of this year. And early indications are that second quarter figures also will be disappointing.

However, there are indications that the outlook is better from here on.

Much of the reason for the apparent lack of balance-of-payments improvement so far this year can be traced to the sharp increase in net long-term capital outflow. A moderate increase in 1962 to a \$2,500 million rate has been followed by a remarkable rise this year — to about a \$4,000 million annual rate in the first quarter.

But of more basic significance are recent developments on both the export and import fronts, and these have been encouraging.

In the first quarter of this year, our trade surplus increased, reversing the decline experienced during the second half of 1962. While the first quarter surplus, at a seasonally adjusted annual rate, was a little below the \$4,300 million figure for the year 1962 as a whole, it would have matched or exceeded that rate if adjusted for the adverse effects of the January dockworkers' strike.

Encouraging Prospect

Prospects are good that the trade surplus will stay above last year's figure during the remainder of 1963. Export record has been particularly encouraging since the second quarter of 1962. Our exports are heavily weighted with capital goods, and a Department of Commerce analysis shows that these exports are accordingly sensitive to the rate of increase in industrial production in other industrialised countries. This rate of increase has been declining in the past year. But instead of dropping, our non-agricultural exports have continued to rise.

At the same time, our imports have risen less rapidly than the experience of past expansions of the U.S. economy would have led us to export. During the first quarter of this year, merchandise imports were about 2.8 per cent of the Gross National Product — compared to 2.9 per cent for 1962 as a whole. Since the import ratio normally tends to increase during expansion periods, this is an encouraging sign.

These developments may signify that our relatively stable costs and prices, combined with our export promotion programme, are beginning to pay off.

Another favourable aspect of this year's balance-of-payments picture is the relatively small gold outflow — reflecting both confidence in the dollar and European co-operation in

meeting our balance-of-payments problem. Through the week ending July 24, the total 1963 outflow amounted to \$345 million — compared to \$681 million over the same period last year.

Although 1963's balance-of-payments developments demonstrate again that progress is slow on this front, real advances have been made and we find grounds for cautious but convinced optimism in looking further toward the future.

The Brookings Institution has recently completed an analysis of the outlook for the U.S. balance-of-payments in 1968, undertaken at the request of the Council of Economic Advisers. The conclusion of this study is essentially optimistic; given sustained expansion here and abroad we can look forward during the next five years to attaining basic balance — or even a surplus — in our international accounts.

Moreover, this study supports and supplements the analysis in the Council's 1963 annual report which suggested that domestic expansion would have a favourable impact on our international payments.

Several factors are working toward improvement of our basic balance-of-payments situation, in the areas both of trade and investment.

Impact on Trade

There has been a marked improvement in the competitive position of U.S. exports in world markets. Since 1959, U.S. prices have risen significantly less than those of our major industrial competitors. Moreover, in the United States wage increases have remained in line with productivity increases, so that unit labour costs have not risen.

In the Continental countries, on the other hand, wage rate increases have substantially exceeded productivity gains, and unit labour costs have been moving upward.

It is true, of course, that, to a large extent, our superior price performance in recent years has reflected the high levels of unemployment and unused capacity in our domestic economy. As we move toward the fuller utilization of our available resources, avoidance of price increases will become more difficult.

But our prospects for success in this task are bright in comparison to prospects in the Continental countries of Western Europe. In those countries, the labour supply is growing much less rapidly than here, and upward pressures on prices seem likely to continue for some time to come.

As we move toward full employment, we can still expect significant productivity gains from higher utilization of our resources. Moreover, the added investment stimulated by tax reduction and continued expansion will help to reduce costs and improve quality through modernization of our aging factories and equipment.

Expansion will also stimulate the introduction of technical improvements and innovations, as well as the introduction of new and improved products.

Finally, the pay-off to our current export drive can be

10 YEARS OF NEW HEADINGS

New compass settings for new routes. New schedules signifying quicker journeys. New aircraft flying you at new heights of comfort. 10 years of heading towards broader horizons since 1953 when eight different airlines were merged to form IAC. 10 years of steady growth, of careful planning which have led to better air travel—symbolised above all by the Caravelle, with its rear mounted jet engines, shortly to fly in Indian skies.

substantial as new firms are made aware of profit opportunities in the export field.

But while these basic forces at work suggest an improved competitive position for U.S. exports, there are several problem areas.

Sustained European expansion is of critical importance to U.S. export industries. If, through investment difficulties or balance-of-payments pressures, the pace of economic growth in European nations should slacken, U.S. exports would feel the impact sharply.

In addition, the successful conclusion of the GATT trade negotiations now under way is vital. Up to now, the discriminatory impact of the formation of the European Economic Community has been moderated by the rapid growth of the EEC economies. But, looking to the future, the importance of the discrimination may grow, and accordingly our stake in tariff reduction is substantial.

Finally, there is the knotty problem of continued access for our agricultural exports to European markets.

Long Range Outlook

Continued domestic economic expansion will have its most direct effect on our capital account deficit. By increasing profit opportunities at home, relative to those abroad, vigorous economic expansion should reduce the net outflow of U.S. long-term capital. Foreign investors are also likely to respond to improved profit opportunities in the United States.

In addition, it appears that part of the outflow of U.S. long-term capital to Europe in recent years can be attributed to a once-for-all adjustment to the formation of the EEC and the re-establishment of widespread convertibility. The great surge of direct investment by U.S. firms interested in getting under the EEC umbrella may be past.

Moreover, we look to continuing European progress in strengthening and expanding their own capital markets. This will eventually make it possible for European countries to provide for an increasing share of their own capital requirements out of domestic savings, and perhaps even to help in financing the needs of non-European nations, thus reducing the pressure on our capital markets. However, this will be at best a slow process.

Though we believe that the basic economic currents are favourable for the U.S. balance of payments, it will nevertheless take time for the effects to be fully felt. Our optimism about the balance-of-payments in the long run in no sense reduces the urgency of action to meet out short-run problems. To enable us to continue an orderly financing of our deficit, we must make demonstrable progress in reducing it.

At the same time, the experience of recent years has clearly shown that we cannot purchase balance-of-payments

security by a lagging domestic economy. It is in the setting of our dual need — to spur balance-of-payments improvement while encouraging continued domestic economic expansion — that an important series of policy measures was recently announced.

The policy measures recently taken and proposed represent a determined effort to deal with our balance-of-payments problem. But the administration has not taken the blind alley of crisis measures which would sacrifice our world-wide economic and political objectives for balance-of-payments reasons.

To weaken our overseas defences, to slash our aid programme, to increase import restrictions, to negate hard-won progress toward currency convertibility by imposing direct exchange controls — such measures might temporarily reduce our payments deficits, though they would hardly increase world-wide confidence in the dollar and in the United States. The price we would pay for such measures would far exceed their worth.

The development of an improved international monetary system is important to the long-run expansion of the world economy.

The elimination of the current U.S. balance-of-payments deficit will not mean the end of world balance-of-payments problems. Other countries will have deficits when we get into surplus, and we ourselves can expect the periodic recurrence of deficits.

New Proposals

Many proposals have been advanced for improving the international monetary system. A number of these proposals would operate through the International Monetary Fund, increasing the scope and flexibility of its operations. U.S. officials have not yet arrived at a judgment concerning the merits of specific proposals. But we are studying them carefully both within our own Government and in joint deliberations with other interested countries.

Moreover, we remain fully open to any new proposals and initiatives advanced by other countries.

Strengthening the international monetary system, however, is a process that will inevitably take time. Agreement will have to be reached among the participating countries on the particulars of the improvements to be adopted. Moreover, it cannot be looked upon as a solution to our immediate problem, or as a substitute for a determined attack on our balance-of-payments deficit — although a more effective payments system, if it were now in operation, might help the United States in its present situation.

We must, therefore, continue to take prudent and responsible action to deal with our deficit. In the final analysis, a full-employment and full-utilization economy offers the soundest basis for mastering our balance-of-payments problems in a way fully consistent with leadership in the Free World.

Europe and the Dollar-Defence Plan

From Our Special Correspondent

PARIS:

THE "DECISIVE ACTION" in support of the dollar which, as was said in an article here a fortnight ago, was expected by Continental financiers had in fact been taken by the time that article appeared in print. As foreseen, the increase in U. S. money rates was favourably received by the European banks, with the exception of the Belgian

National Bank which promptly raised its own discount rate half a point. There were special reasons for this decision, but it was nevertheless disapproved by Belgium's neighbours and partners. Firstly, because it opened the way to a chain reaction of money-rate competition, such as occurred several years ago to no one's ultimate advantage, and such as would today render the American action useless. Secondly, because it revealed how far the Common Market nations still are

from a joint or even a harmonious monetary policy. The Six Finance Ministers meet regularly for consultations, but—just as in 1961 when West Germany and Holland upvalued their currencies by surprise—Brussels acted alone and without so much as a by-your-leave once its vital interests seemed to be involved.

The bank rate decision being foreseen and "discounted", interest centred on the other parts of Washington's programme. French finance officials, who in days gone by used every trick in the book to prop up a faltering currency as long as they could, were the first to express admiration for the deviousness and subtlety of the disguised American resort to something resembling exchange controls and a double exchange rate. Without actually agreeing with the Wall Street Journal when it denounced such "gimmicks" as "dangerous manoeuvres" which only serve as distress signals easily read by distrustful foreigners, they recalled from their own experience that such subtle subterfuges have never worked for long. As the vice-president of the Common Market Commission observed, "In the matter of restrictions on capital movements, European countries have a long and checkered experience. It indicates that it is hard to make such restrictions work effectively (unless) conditions in the domestic market are brought into harmony with the external objectives sought". In other words, sophisticated action at the monetary frontiers—such as the current American attempt to fix differential prices for capital depending on whether it is local or foreign—do not exempt nations from economic reform at home.

Still, even such critics admit that, however much the American problem looks like the exchange difficulties known a few years ago to Europeans, its very magnitude makes it different. Everyone has an interest to see that the dollar is shored up, by whatever means, and if the "gimmicks" work for a time they could succeed in starting a reversal of the tides of money that will restore confidence in the dollar. What scepticism remains, then, is based on the huge exceptions that Washington has already made to its own rules within a few days of their being announced: the exemption of Canada, and perhaps soon Japan too, from the discriminatory tax on loans floated in New York. Out of the \$880 million in fresh loans raised in New York in the first six months of this year, \$590 million went to Canada, so if an exception is made in favour of that country, the measure loses much of its importance. European financiers are watching for other such watering down of Washington's programme as it passes through Congress before pronouncing on its long-term efficacy.

Dual-Capital Market

They can afford to be detached because the dual-capital market introduced in the USA in July does not, by and large, affect the Europeans. Take, for example, the sliding scale of taxes on foreign bond issues, which will increase the cost of borrowing in New York by about 1 per cent. Most of such issues, as noted, have come from Canada, followed by Australia and Japan. French borrowers have not appeared in New York since the Credit Foncier sold \$50 million in bonds there in 1959, because Paris has been actively discouraging them from appealing to the American capital market, and other European capitals have observed similar restraint. So the rate of annual foreign bond issues in New York could fall from its present abnormal level of \$1500 million back to the 1961 figure of \$500-700 million without West Europe being at all inconvenienced. Incidentally, European bankers point out that the increase in the cost of borrowing in New York will not automatically reduce dollar outflows. Firstly, much of the money lent against foreign

bonds in New York has come from nationals of the borrowing country, who sought the security of scrip labelled in dollars. (Just as British firms sell debentures in Switzerland to British capitalists who want their bonds marked in Swiss francs rather than in pounds.) Secondly, even if it becomes 1 per cent dearer, the New York issue market is still cheaper for borrowers than many others and has the added attraction of permitting very large flotations at one swoop, such as few other centres could handle.

As for the 15% tax on American purchases of foreign stock, the results will have to be seen in practice. For my part, I have found brokers here giving quite contradictory forecasts, and the confusion seems no less in other Continental bourses. It is clear, however, that the measure will not dry up any large flow of American buying orders—because they had already dried up months ago. No European exchange has been supported by American investors for some time past. In London, they virtually ceased buying after Britain's exclusion from the Common Market; West Germany has not been an attractive market for more than a year; in Paris American buying is one-tenth of what it was a year ago and in any case French stock is still very expensive, with average yields under 2 percent; and of course American and other foreigners have not been able to buy Swiss shares since the "gentleman's agreement" has been in force. Once again, it emerges that the real victims are the Canadians. It is said that 67 percent of foreign stock bought by Americans is Canadian, and last year American orders made up 12 percent of the turnover of the Toronto stock market.

Share Prices Ease

For all that, one would have expected the European share markets to react bearishly on this news. After a moment's pessimism, the only one that did was Amsterdam and this is natural because the leading counters of that market are in reality largely American owned. Some 30-35 per cent of the stock of Philips is held in the USA, at least 30 per cent of Royal Dutch Shell and 25 per cent of Unilever. Such levels are not attained by private U. S. investors in many other European companies; so they were not subject to big selling in July. Share prices eased everywhere, for the removal of potential American interest as a floor to possible declines is disturbing, but it will be some months before one can judge the effects of the measure.

What concerns Europeans more is that the tax will not be imposed on direct American investment in their industries, as distinct from portfolio buying through the stock markets. Direct investment has been very generously defined by Washington as the taking up of at least 10 per cent of a company's stock and an active participation in its affairs. So there is no bar to a continuation of the so-called "dollar invasion", the taking over of European firms by the giant American corporations. Yet, according to the Europeans (and not only the French, who have been alone in open opposition to this practice), this is the main single cause of the U. S. payments deficit. It is not the purchase of listed shares in European exchanges for purpose of passive investment, nor the arbitrage operations of Merrill Lynch in European bourses, (both of which now become expensive because each purchase attracts the 15 percent tax) that has been weighing on the American balance of payments. It is the take-over operations leading to direct American control of European firms that have produced the dollar outflow, and these are exempt from Mr. Kennedy's 15 per cent tax.

So the only prospect of such operations diminishing in

HOW TO GET YOUR BANKING WORK DONE 70 MILES ABOVE THE EARTH

When you order the Union Bank to transact business abroad, they do things in double-quick time, using Telex. Telex transmits the message in radio waves to the ionosphere seventy miles above the earth, from where they bounce back and are picked up abroad, at the required station. The Union Bank is one of the few banks in India subscribing to Telex. Open an account with us to ensure that you get prompt banking service in keeping with space-age speed. The Union bank has correspondents in 50 countries, with 24,007 offices!

volume remains a reactivation of the U. S. economy (for example, by means of the tax reductions proposed by President Kennedy), which would make domestic investment more interesting for the big corporations. Which takes us back to the general point already made by the vice-president of the ECM Commission, that domestic economic policy is always more important than clever adjustments at the monetary frontier. By a coincidence, the report of the European Monetary Accord (the former European Payments Union) for 1962 was published a few days after the American decisions, and it said just this. It pointed out that restoration of the balance of payments of the USA required the maintenance of stable costs and prices in the deficit coun-

try (America) and the maintenance of a high level of business activity in the surplus countries (the Common Market, essentially). Given these conditions, the unbalance would gradually correct itself, and indeed the process has already begun, according to the E. M. A. economists. They recall that the combined reserves of nations belonging to the E.M.A. increased last year by only \$760 million, against \$2,300 million in 1961 and \$4,400 million in 1960. Writing before Washington's plan was known, they declared optimistically that the situation was favourable to a return to balanced international payments. If this is true, the American decisions, for all their evident shortcomings, might well succeed in hastening the movement of a tide that was already turning.

Survey Reveals U. K. Discontent

By JOSSLEYN HENNESSY

LONDON:

AS THE general election looms larger over the horizon, it is becoming clearer from the verbal explosions that the Socialists and Conservatives are hurling at each other that one outstanding issue at stake on polling day will be whether the U. K. gets a bigger new dollop of increased expenditure on health, education, and pensions, from the Socialists or from the Conservatives. The one point on which politicians of both parties have agreed since the war is that the way to win votes is to multiply the benefits of the state welfare services and to enlarge their coverage to the widest extent.

Many prominent economists have criticised this policy on the grounds that the true welfare state should aid the poor and the helpless in such a way as to correct, not to increase or perpetuate, helplessness. In other words, that as society becomes more affluent, those who fall below an agreed level of income should receive state aid, but those above it should be encouraged to organise their own health, pensions, and education of their children. In this way, the standards of national health, education, and pensions services would be raised as consumers exercised their choices on the competing varieties and qualities that the end of the state monopolies would call into being, and that the allocation of resources modified accordingly. After all, the economists argue, producers of consumer goods, who have to sell in competitive markets, spend money and time in market research to ensure that they produce what the public wants, and also to try out the innovations that bring change, growth, and progress. Why, alone, should the monopolist suppliers of state welfare services insist that they know exactly what consumers want? To all such arguments, the Conservatives have hitherto replied that to promote variety and quality by charging for welfare services would be "politically impossible". The Socialists agree, and add that it would be against the "accepted egalitarian trend" of the social climate.

Now, however, a national public opinion survey, by the well-known Mass Observation group, has created consternation and disarray among Socialists and Conservatives alike by revealing that a substantial proportion of the British people would like to contract out of state welfare services. Such a result could, of course, have been predicted if the survey had been confined to conservative voters, so what is truly significant is that of those questioned by Mass Observation, no fewer than 44 per cent said they were Socialists and only 24 per cent Conservatives. The survey, which is the first comprehensive enquiry into British attitudes towards state and private welfare services, was sponsored by

the Institute of Economic Affairs (66 A Eaton Sq. London, S. W. 1.) whose preliminary 50 page report, "Choice in Welfare" (Price £2-2) was published recently.

Everyone in the U. K. is, of course, compelled to belong to the national health service, but this survey shows that out of a total of 2,005 respondents, covering a cross-section of all ages, social classes, and political sympathies, 20 per cent insured privately for additional health services (e.g. private hospitalisation, specialists' fees, etc.). Of the 80 per cent not so additionally insured, between 27 and 38 per cent said that they would be interested in a voucher covering half, or most of the cost, of special private treatment. Only 10 per cent of respondents educated their children in, or had been to, private schools, but no less than half of the remaining 90 per cent would use private schools if offered a voucher to cover half or most of the cost. Other questions suggested that many people did not use private health or educational services because they had exaggerated ideas about costs and did not realise that they could afford them.

Voucher Scheme

The voucher scheme referred to is one suggested by Professor Milton Friedman of Chicago University, whereby people who contract out of state health or educational services would be given vouchers representing all or part of the saving to public funds. One great merit of this scheme is that it would promote the efficient use of resources. The boast is frequently made, for example, that the British National Health Service is the best in the world. In fact, anyone who has had experience of prewar private medical attention and hospitalisation can testify to the fall in the quality of the personal services and of standards in the hospitals. Only recently there have been striking revelations in the press of the spread of infections from hospital operating theatres, because it is more economical (sic) to try to ward off infections by giving patients antibiotics than to employ sufficient nursing staff to keep operating theatres sterilised.

Mass Observation asked those interviewed to say whether they wanted the state services to go on expanding out of taxation, as at present, if incomes continue to rise. 51 per cent favoured this in education, 43 per cent in pensions, and 41 per cent in health. The other 50 to 60 per cent were evenly divided between those who wanted the state services to concentrate on people in need and those who wanted existing services to continue but that individuals should be allowed to contract out in favour of private services.

The survey's 12 statistical tables are the first documented evidence to challenge the conventional assumption of univer-

sal support for the British welfare state, and to reveal the substantial degree of readiness among all ages, classes, and parties, to look after themselves, if relieved from the taxes and social insurance contributions required to pay for universal state welfare. These facts should suggest to our ideologically warring political leaders how out of touch with reality they are. The first political party to digest the lessons of this survey and apply them to its election campaign might achieve something spectacular, not only by winning the election but by subsequently diverting funds from non-productive social expenditure into economic growth, which would reduce the risks of inflation and balance of payments crises. Over to you Mr. Wilson, and Mr. Mac-who?

★★

Before the 1959 general election Labour publicised a series of policy statements, which led the Conservatives to warn the electors that a Labour victory would mean more nationalisation, and a revival of the licences and physical controls, so unpopular under the last Labour government, which the Conservatives had dismantled.

This is why the Labour party has been so sensitive to renewed Conservative attacks in 1963, alleging that a Labour victory would mean nationalisation and controls. The Socialists ridicule such attacks as "Tory propaganda". Since both parties officially proclaim their faith in (a) planning as the means to (b) the economic expansion which is their goal, it is not easy for the non-party observer to decide what exactly the difference in their methods and policies is. There are nevertheless various straws flying about which suggest which way the Labour wind is blowing.

The first is a book published earlier this year entitled "The British Economy in the Nineteen-Fifties" (Oxf. Univ. Press. 50sh), by a group of Oxford economists, several of whom might well attain influential positions if Labour wins in 1964. Just as President Kennedy, an old Harvard man, has relied heavily on Harvard economists, the portents are that Mr Harold Wilson, a former Oxford economics tutor, may surround himself with an Oxford brains trust. Judging by "The British Economy in the Nineteen-Fifties", these Oxford economists have their eyes on the past rather than the future. They generally apply the static form of analysis of future supply and demand that dominated thinking in the late 1940s, whereas the Conservative experience in the 1960s was that when you move either from a stagnating to an expanding economy, or from expansion to stagnation, the marginal quantities that the statisticians are trying to analyse are apt to change spectacularly. The lesson of 1950s was that marginal productivity per factor employed proved, under expansion, to be higher than under stagnation, so that when the government set out to expand, or restrict, demand they were taken by surprise to find their policy was not merely altering the totals of demand but was creating a new pattern of production. But too many of these Oxford dons obviously hanker after the permits and import controls which Mr. R. A. Butler ended.

The same trend of thought was significantly revealed by a leading member of Labour's shadow cabinet, Mr Douglas Jay, M.P., who recently asserted (without explaining why) that "internal laissez faire cannot possibly give expansion without rising prices and payments deficits", that we must therefore restore a "large measure" of planning, but that this will not be easy because "the excellent organising machine, perfected during the war and available in 1945, has been dismantled and demoralised by the Tories". As I said here on May 31, the U. K.'s basic problems are the same whichever party is in power: to reconcile the conflicting demands of full employment, widening social services, over-

seas expenditure on defence and development aid, unrestricted wage bargaining, and stable prices. You can achieve this reconciliation either by putting stable prices and economic growth before full employment as in Germany (this, in the U. K., probably means an average of 2.5 per cent unemployed) or by Soviet-style total control.

Between 1945-51, the Labour party tried to combine rising public expenditure and direct taxation with low rates of interest plus rationing and controls to keep prices stable. Mr. Jay showed himself aware that such policies logically end in the total control, which Labour's chief supporters, the Unions, will not accept. Admitting that a "general regime of planning" with "all sorts of new instruments" of control would be difficult to launch, Mr. Jay said that it might be "more effective to concentrate on specific aims such as full employment, better pensions, education, and housing". But this begs the whole problem of how to ensure the industrial growth, without inflation, needed to pay for full employment, pensions, education and housing.

Labour Party Thinking

Another indication of Labour's economic thinking is that the party plans to divert traffic to the faltering railways by taxing the 573,000 "C" licence lorries off the roads. (A "C" licence allows a trader to carry his own goods.) Labour does not plan to re-nationalise all the 50,000 "A" and "B" licence lorries, which carry other people's goods as paid freight, but favours some method whereby British Railways could selectively take over those companies whose "A" and "B" lorries were doing valuable business, thus monopolising the profitable freight for the state and leaving private enterprise with the less profitable.

The implication seems to be that Labour is less intent on absorbing unemployment by planning for growth than by sharing the existing volume of work all round. The Labour party castigates Beeching's "surgery" and his "narrow accountant's approach to railway problems", which suggests that instead of seeking to establish what the railways can do profitably, as Dr. Beeching wishes, Labour wants to keep these white elephants alive in the interests of 500,000 railway-worker-voters at the expense of industry and the taxpayer.

Labour's plans to control food imports through a network of Commodity Commissions, which will buy in bulk as under the last Labour government, are obviously designed to attract the million electors employed in agriculture. Labour hopes to organise a U. N. O. world food plan in order to enable Western surpluses to go to areas where people are starving. This splendid idealism brushes aside the practical problems. The level at which prices may be "stabilised" depends on the nature of the product, the number of countries producing it, their relative efficiencies and volumes of output, and the size of the demand of the countries importing it. Since the U. K. imports, for example, ten million tons of cereals a year, she could not easily agree to the increases of £5 a ton or more involved in the French Baumgartner plan. A high stabilised buying price would not only increase the U. K.'s import bill, but would stimulate even greater Western surpluses. Nor is it any solution to give these surpluses away. Ad hoc famine relief is admirable, but a large and regular flow of Western food could impede the development of agriculture in Asia, and it is sometimes forgotten in Asia that, historically in the West, agricultural surpluses preceded industrialisation and made it possible. Surely you want to rely more on efficient domestic agriculture in India than on food imports? "World food plans" should not be an excuse for Western dumping.

something Psychological...

Psychologists tell us to resist any comparison of our children with other kids. It hinders normal growth, they say. So it is with metric weights!

To get the best out of the young ones (and metric weights), accept them as they are.

Birla Delegation to Moscow

By Our Special Correspondent

NEW DELHI:

THE JUTE Mill Industry is sponsoring a high-powered trade delegation to the Soviet Union and Eastern Europe to explore the possibilities of increasing jute goods exports to these countries. The delegation will be headed by Mr. M. P. Birla and will have as its other members Mr. D. P. Goenka, Mr. N. L. Kanoria, Mr. R. H. Morrison and Mr. H. S. Singhanian representing the jute goods trade and industry and Mr. A. G. V. Subramaniam from the Ministry of International Trade.

The delegation will be arriving in Moscow on August 9 and later visit Warsaw, East Berlin, Prague, Budapest, Belgrade, Sofia and Bucharest. It is expected to return to New Delhi on September 9.

Although the delegation's visit has been sponsored primarily as a follow-up of Mr. Manubhai Shah's recent tour of the Soviet Union and some other East European countries, it has assumed added significance in the light of the recommendations of the Srivastava Committee on Jute.

The Srivastava Committee, while reporting that large increases have taken place during the last one decade in the consumption of jute goods in the planned economies of Eastern Europe, has called for consultations between the Government of India and the East European countries to determine the extent to which India's production of jute goods can be co-ordinated with the five or seven-year development plans of each of these countries. Further the Committee has suggested that India should endeavour to persuade the economic planners in these countries, that there should be mutual advantage in their importing additional quantities of low-cost packing and floor-covering materials from the Indian jute industry in preference to expansion of their own manufacturing capacity for similar materials which depend either on imported fibre or on high priced alternative fibres grown locally.

Besides looking for opportunities of immediately increasing exports of jute manufactures to the East European countries, the delegation is, therefore, likely to hold consultations with the Governmental authorities there on these two issues.

★★

The Indian Exhibition currently being held in Moscow is widely recognized to be very well-organized. It should be interesting to know which among the vast number and varieties of goods on display have caught the imagination of the import organisations of the USSR.

According to Mr. M. D. Dalmia, Executive Director of Birla Cotton Mills, Delhi, who had an opportunity of studying Soviet reactions during his 9-day stay in Moscow, textiles (cotton, rayon and woollen), handicrafts, beverages (tea and coffee), light engineering goods, jute manufactures and consumer goods such as tinned fruits and vegetables, cigarettes, shoes, etc., were the principal commodities in which the import organization showed keen interest. Here is good scope for Indo-Soviet trade. In fact, a number of contracts have already been concluded by the Soviet authorities for the import of some of these items, particularly shoes, cigarettes and some other consumer goods. Several more deals are expected to be signed in the next few days.

Among cotton textiles, the varieties that can command a good market in the USSR are towels, poplins (bleached, dyed and printed), superior quality sheetings, tapestry and tarpaulins. In the case of cotton clothing, check designs are favoured for men's wear and attractive prints for women's wear.

Among woollens, too, the interest is mainly for superior varieties. Rayons offer only a limited scope for exports, presumably owing to the fact that their domestic supplies and production are quite adequate. Printed rayon cloth is the favoured variety.

As regards handicrafts and handlooms, keen interest is shown in decorative pieces and materials. Among the items fancied are silver ware, ivory craft, reticules, table cloths, etc.

In engineering goods, there is considerable scope for export of textile equipment, particularly looms. Bicycle exports have very little chance. The interest of the U.S.S.R. authorities in Indian engineering manufactures seems to emanate primarily from balance of payments considerations.

A very lucrative trade can be developed with the Soviet Union in fresh as well as tinned fruits and tinned vegetables. Fresh lemons also offer a particularly good scope; they are used in the making of tea. Fresh fruits, especially bananas, can also command a good market. Indian cigarettes are providing a hot favourite with the Russians. A good market can be developed for Indian cosmetics and toilet goods also. The trade in shoes, tea, coffee and jute goods can be stepped up considerably. There is scope for export of linoleum.

★★

The decision of the European Economic Community's Council of Ministers to abolish all duties on loose tea imports with effect from January 1, 1964, has come as a pleasant surprise to New Delhi. Barely a fortnight ago reports from Brussels had suggested that the question of nil tariff on tea would be reviewed by the EEC towards the close of the year. This naturally had caused a good deal of disappointment here since during Britain's negotiations for entry into the Common Market an understanding was stated to have been reached to apply nil tariff on all tea imports, both by the EEC and Britain, with effect from July 1, 1963.

The decision of the EEC to retain a tariff of 5 per cent on imports of tea in packets is not expected to affect adversely Indian exports. There might be some slight set-back to tea exports to the United Kingdom where the blenders pack loose tea in small packets for export to the Continental countries. But this loss is expected to be more than offset by increased intake by the EEC. A pre-requisite to this, however, is an extensive propaganda campaign by the major tea exporting countries, severally or jointly, to allure the EEC population to tea drinking. A substantial part of this population, particularly in West Germany, is at present coffee drinking.

The EEC's decision on tea imports can be said to have wider implications as well. The Community presumably is veering round to the fact that in trade relations with the

under-developed countries, the developed ones should not insist on reciprocity. This presumption is based on the fact that the decision on nil tariff on tea had earlier been postponed by the EEC on the ground that a surcharge had been levied by Ceylon on her imports from that source.

★★

The dates of commissioning of the four new washery projects currently under execution by the National Coal Development Corporation are understood to have been postponed by another six to nine months. The Kathara and Gidi washeries are now expected to start production only in December, 1965. The Swang washery may go into production in January, 1966. According to the 1961-62 balance sheet of the N.C.D.C., these three washeries were expected to be commissioned by April, 1965. The fourth washery at Ramgarh is not likely to be commissioned during the current Plan period.

The Kargali Washery Expansion Scheme has also been delayed. The probable date of commencing production under this scheme is now May, 1965.

The production envisaged from the expanded Kargali washery and the Swang, Kathara and Gidi washeries in 1965-66 is of the following order: Kargali 1.50 million metric tons; Swang 1.10 million metric tons, Kathara 0.40 million metric tons and Gidi 0.30 million metric tons. Their target input capacities are two million metric tons, three million metric tons, 2.8 million metric tons and about one million metric tons, respectively.

The existing Kargali washery, it is further understood, continues to suffer from various handicaps. In June last, its output amounted to 107,854 metric tons. The production, it is stated, could have been higher but for insufficient raw coal receipts from Kargali mines due to a major landslide there and non-availability of adequate number of wagons, particularly box wagons. The Railway Board, it is learnt, has been asked to ensure adequate supplies of box wagons so that the production of washed coal does not suffer from lack of movement from washeries to consuming destinations.

★★

As a measure of import substitution, the Planning Commission is understood to have advised the Railway Board to take to the use of wooden sleepers more and more in place of cast iron sleepers. Pre-stressed concrete sleepers, which are another substitute for cast iron sleepers, however, are not favoured; they involve the use of cement and high tensile steel. Cement is in short supply and high tensile steel is mostly imported.

With a view to not delaying the railways' development programme, pig iron allocations, however, are not to be curtailed in the current year. From 1964-65 onwards, these allocations may be reduced as the availability of timber sleepers increases in consequence of the measures proposed to be taken for augmenting their supplies. The State Departments of Agriculture have been asked to implement the decision arrived at in the meeting of the Central Forestry Board held in November, 1962, which stipulated that each State should supply to the railways at least 12½ per cent of its total production of timber of species suitable for sleepers. The Union Ministries of Home Affairs and Agriculture have been asked to work out a suitable scheme for better exploitation of timber resources in the Andaman and Nicobar Islands and to proceed with its implementation at an early date. The scheme is to take into consideration the seasoning of timber which increases the life of timber sleepers from 10-15 years to about 25-30 years.

The Railway Board has also been advised to consider steps for increased utilisation of ferrous scrap.

The substitution of cast iron and sleepers by wooden sleepers should help in better utilisation of the foundry industry in the country. Till lately, the supplies of pig iron effected to the class "A" foundries amounted to about 46 per cent of their requirements. Class "B" and Class "C" foundries' requirements could be met only to the tune of 27 per cent and 20 per cent, respectively. The railways used in 1961-62 as much as 390,000 tonnes of pig iron.

In 1962-63, there was experienced a shortage of pig iron to the extent of 0.4 million tonnes. By 1965-66, the deficit in supplies is expected to grow to about 0.8 million tonnes; demand in that year is estimated at about 2 million tonnes and the anticipated indigenous production at not more than 1.2 million tonnes.

Pig iron imports have already been arranged to the tune of 100,000 tonnes at a cost of about Rs. 2.5 crores. Further imports may be necessary if the indigenous production fails to catch up with demand.

★★

The Government of India recently approved of a scheme for the manufacture of Starch and Dextross Powder in collaboration with an American firm, Pan-Alliance Corporation. The American firm will provide the necessary drawings etc. for the part of the plant to be indigenously fabricated as also the necessary know-how etc. for manufacture of the products.

For the continuous supply of know-how and research and development of technology etc., Pan-Alliance will be paid royalty at 2½ per cent subject to Indian Income Tax on the net ex-works value of products meant for internal sale.

The American firm will assist in promoting exports and will be paid a royalty at five per cent (subject to Indian Income Tax) on the f.o.b. value of the products exported.

The Indian company will undertake to export at least 75 per cent of its production of Starch and Dextross Powder and will furnish satisfactory guarantees towards this end.

★★

The Ministry of Heavy Industries had a meeting with the manufacturers of ball and roller bearings during the week when it was agreed to rationalise production, as far as it was

"That is too much Panditji, just a berth for Bombay will do."

feasible and practicable. A Committee was set up for the immediate examination of the problem of phasing the production of railway and automobile ball bearings in the country. An advisory panel for the industry was also set up.

The break-down of the estimated annual requirements of ball and roller bearings at the end of the third five-year Plan (1965-66) is as follows:

Consuming Industry	Ball Bearings upto 2" dia bore	Above 2" dia bore	Roller Bearings.	Total
Electric fans	3,500,000	—	—	3,500,000
Electric motors	600,000	—	—	600,000
Passenger cars	300,000	120,000	420,000	840,000

Railway wagons including coaches and locos	—	—	150,660	150,660
Miscellaneous industries including machine tools, H.E.P.	650,000	331,000	50,000	1,031,000
	8,368,700	1,144,800	2,815,760	12,329,260

In addition, the replacement requirements have been estimated at 2.7 million bearings by 1965.

The present installed capacity is 3,270,500 bearings per year divided between two enterprises, on three shift basis. Production in 1961 was about 3,228,000 bearings. A third unit has recently come into production.

In order to reach the production target of 15 million bearings by 1965, 11 enterprises have industrial licences from the Government of India to set up new units or expand existing ones.

Some of these companies have secured foreign collaborations, approved by the Government of India for the total production of around 10,000,000 bearings per year. Actual production of some of the additional units is expected to start in 1963-64.

Imports		
Year	Value (Rs. million)	(\$ million)
1957	33.60	7.06
1958	20.80	4.37
1959	20.15	4.23
1960-61	36.88	7.74
1961-62	46.98	9.86

In 1961, the effective domestic demand for original equipment as well as spares was placed at 6,300,000 bearings. As the production was 3,228,000 bearings, it appears that almost 50 per cent of the consumption of ball bearings was covered by imports.

At the moment high carbon chromium steel bars, tubes and wires are still being imported. These materials are expected to become available within the country in two or three years when the alloy and tool steel plants which are being established come into production.

The other important raw materials, namely, mild steel bars, plates and tubes used for nuts and sleeves of adapter bearings, mild steel wire, bars, strips and rods for rivets, cages etc. are available within the country. In addition, production materials and tools, like emery lapping compound, grinding wheels of special types and sizes, machinery spares, special alloy and tool steel for tools and dies and some chemicals like heat treatment salts, are imported.

The ball bearing industry being a comparatively new one in India, is protected by an import duty of 95 per cent ad valorem. The protection will continue at least till December 31, 1965.

In this sheltered market, moreover, the demand is likely to outstrip the supply for a number of years to come.

At the invitation of the Government of India, a Nepalese delegation led by His Excellency Mr. Yadu Nath Khanal, the Royal Nepalese Ambassador, visited Delhi from July 26 to August 2, 1963, and had talks with officials of the Government of India concerning transit facilities required by Nepal and other matters connected with Nepal's trade.

The delegation asked for transit facilities from Radhikapur on East Pakistan-India border and Wagah on West Pakistan-India border. The Government of India agreed to provide them, within the framework of the Indo-Nepal Trade and Transit Treaty of 1960. Nepal was requested to indicate the expected volume of its trade, requirements of wagons and the points of destination etc., so as to enable the authorities in India to determine the character and quantum of facilities to be provided.

The Bond System provided for in the Indo-Nepal Treaty to regulate Nepal's transit trade was also discussed. The Nepalese delegation contended that the system stood in the way of the normal development of Nepal's transit trade, and suggested that it should be abolished. But the Government of India undertook to remove any practical difficulties arising out of the operation of the Bond System. The two delegations agreed to resume discussion on this question of the Bond System at Kathmandu during the next series of talks scheduled for October, 1963.

The Indian delegation stated that some of the tariffs of the Nepalese Government seemed to discriminate against India, and that the rates of import or export duties on some goods coming from or going to India had been increased contrary to what, in the view of the Government of India, was contemplated in the Treaty. The Nepalese delegation gave the assurance that rectification, where necessary, would be promptly effected. It was agreed that there should be further exchange of information in this connection.

Nepal's needs of iron and steel goods, galvanised iron

sheets etc., and the ways and means of supplying the same from India were considered at some length. The Nepalese delegation was assured that India would continue to endeavour to meet Nepal's requirements to the full, despite shortages in India and India's own pressing requirements.

It was agreed that as envisaged in the Treaty of Trade and Transit between Nepal and India, periodic consultations should take place between the Nepalese Government and the

Reactions to Shipping Rates

From Our Correspondent

BOMBAY:

THE DECISION of the Karmahom Conference to effect a general increase of west-bound freight rates to a maximum of 12½ per cent from August 1 has come as a 'surprise and disappointment' to shippers in Western India. Simultaneously with this announcement the news has come that the Government of India has recommended that the general increase in freight should be restricted to 7½ per cent on the India-UK-Continent trade. The Union Government has further stressed the need to exclude sensitive commodities like cotton piecegoods, cotton yarn, oil-cakes, vegetable oils, engineering goods and specified categories of ore from the purview of the above decision. Mr. Vallabhdas Mariwala, President of the Western India Shippers' Association, has expressed the feeling that the decision of the Conference 'does not reflect an adequate appreciation on part of the Conference' of the need for assisting the country's efforts to expand and promote the export trade. It would not be surprising if the Conference's decision encouraged shippers to opt for non-conference lines for effecting the shipments. He expressed the hope that the Conference would even now fully co-operate with shippers and the Government by restricting the increase in freight rates to not more than 7½ per cent as recommended by the Government.

Shippers Disappointed

Shippers of oil-cake particularly felt deep disappointment as they fear that they would be obliged to incur substantial losses against the export commitments for August, September and October deliveries. India is now exporting about 50,000 tons of oil-cake a month, mostly to the British market, at £35. sh. 15. per ton. Even with a drastic fall in Indian prices, Indian oil-cake exports would be priced out. The export prospects for castor oil and groundnut oil would likewise be affected. It has been reported that the Government of India has taken a serious view of the Kharmahom Conference decision and, according to current indications, it is likely that the British Government might be approached to dissuade the Conference from implementing the decision.

A two-day conference on Krishna-Godavari Waters Allocation was inaugurated by the Maharashtra's Minister for Irrigation and Power at Poona. The Conference was presided over by Mr. N. V. Gadgil, the former Governor of the Punjab. Mr. D. R. Gadgil, President of the Deccan Agricultural Association, welcomed the gathering. Mr. S. Chavan, the Irrigation Minister, had discussions earlier along with the Chief Minister, Mr. Kannamwar, with the new Minister for Irrigation and Power, Mr. K. L. Rao, and the Prime Minister on the question of river waters. Mr. Chavan stated categorically at the conference that Maharashtra would not agree to any fresh commitments for the allocation of the Krishna waters to Andhra Pradesh after September 1976 when the physical commitments on Nagarjunasagar Project would take effect.

He also pointed out that the recent interview with the

Government of India at regular intervals, and that delegations of the two countries should meet for this purpose, once every quarter, at Delhi or Kathmandu, as convenient.

The Government has approved of the scheme of Parry and Company of Madras to raise a 27 million dollar loan from the Export-Import Bank of the U.S.A. to finance its Vizagapatam fertilizer project. Parrys have two U.S. firms as collaborators, together holding 43 per cent in equity capital.

Prime Minister at Delhi was encouraging and held out hopes that justice would be done to Maharashtra. It was revealed that Mr. Nehru would be giving personal attention to the dispute to solve the problem of river waters on the basis of universally accepted principles. Mr. N. V. Gadgil complained earlier that political considerations had entered the discussion of the problem during the last 15 years. 'It has been our experience that even obviously legitimate demands of the people of Maharashtra have been opposed and we have been able to get our claims accepted only after great trouble and trials.' The Union Minister had overlooked the claims of Maharashtra and had virtually allocated the Krishna waters up to 1976. The Conference has organized an exhibition to explain the needs of the three States—Maharashtra, Andhra and Mysore—in the river waters dispute. The exhibition will be taken to Bombay, Delhi and other parts of the country to enlighten the public all over the country.

The small savings collections in Greater Bombay during the first four months of 1963-64 reached a record figure of Rs. 7.3 crores. This is in excess of the quota for six months while the target for the entire year is Rs. 14 crores. During the corresponding period of last year, the collections were of the order of Rs. 3.6 crores. Even during the month of July, 1963 when the Compulsory Deposit Scheme was enforced and the Union Government floated many loans, the net collections touched a record figure of Rs. 2.6 crores; last year, during the same period, the sum realised was Rs. 1.1 crores. In contrast, the collections of small savings in districts did not show a promising trend. After the harvest, the buying tempo might gather momentum. Four festival cricket matches would be played towards the end of the year at Bombay, Poona, Nagpur and Aurangabad to swell the collection of small savings. Foreign players would be participating in the matches. The State Government has suggested to the Union Government to allow commission on cumulative time deposit schemes also to agents to make them popular.

The long-awaited Bill on the ownership of flats in Maharashtra has been published. It follows closely the recommendations of the Paymaster Committee whose Report was published 15 months ago. The Bill's main aim is to provide security to ownership flat purchasers and to remove the defects in the system. The promoters of building societies are required to maintain separate accounts of money paid by prospective purchasers and to refund it if the flat is not handed over by the agreed date. The promoters are also enjoined to take steps within the prescribed time for the formation of co-operative societies and to convey their right, title and interest to them. These provisions should put an end to the principal abuses of the ownership racket in Bombay.

A most salutary provision of the Bill is the compulsion on promoters to rectify defects which come to light within a year of the handing over of the flat or to pay compensation if the

defects cannot be rectified. There are several punitive clauses in the Bill which subject the promoter to a year's imprisonment or a fine of Rs. 2,000 or both for failure to comply with the provisions. A more heavy punishment is enjoined for criminal breach of trust of monies advanced or deposited with the promoters. "Black money" will continue to be paid probably by the needy persons as before. It is to be seen whether while preventing the more glaring abuses, the Bill would in no way inhibit the ownership flat system. It should be remembered that it (ownership system) serves a very useful purpose and has, to a large extent, helped in the solution of housing problem in cities at least for those who are able to pay. As the Paymaster Committee Report opined 'nothing should be done to affect adversely the construction activity called forth by the ownership flat system.'

★★

The share and commodity markets staged a steep nose dive on the reported intrusion of Chinese troops into the border area. The sharpest fall was recorded in cotton where the Jarilla August Contract lost nearly 18 points from the previous overnight closing on Wednesday (July 31). Many popular scrips in the share market lost nearly 5 per cent of the grains suddenly. Later on, the share market staged a recovery mainly due to short covering and investment support by the LIC at lower levels. The Union Deputy Minister for Finance, Mrs. Tarakeshwari Sinha, in an address to the Surat Chamber of Commerce on the next day deprecated the 'crisis' mentality of the Bombay Stock Exchange operators. She also criticised the President of the Surat Chamber for presenting a gloomy picture of the economy. She attributed the strains and stresses in the economy to a speedy and unexpected capital formation right from the middle of the second

Uncertainties in Jute

From Our Correspondent

CALCUTTA:

THE GUNNY market is currently experiencing rather steady conditions—thanks mainly to sustained speculative interest following the renewed threat of Chinese aggression. The improvement, however, is mainly confined to the sacking section where prices have gained sizable ground during the past few days. Operators have evidently been encouraged to extend commitments by the expectation that substantial buying on Government account will ensue in coming weeks in view of the Chinese threat. To a certain extent interest has been sustained by the belief that supplies will diminish as mills' working continues to be adversely affected, if only to a smaller extent than in May last, by power shortage which has again come to pose a problem in the Calcutta and industrial regions as a result of a diminution of supply from Rihand. Even so, the industry continues to feel concerned about its prospects for two reasons.

In the first place the fact that raw jute prices have been sought to be maintained at Rs. 30 per maund basis Assam Bottoms is deemed to be unrealistic in the context of the declining trend of jute goods prices. The experience of the past seven or eight weeks is that overseas buyers naturally expect the prices to decline in line with the plentiful availability of raw jute in the current season. As against this reluctance of overseas buyers to pay the current level of prices, there is the determination of the authorities, reiterated by the Jute Commissioner, to maintain the minimum operational price for jute. According to the Commissioner, Government has already initiated measures to give support to the raw jute market. Evidently, the policy of allotting compulsory purchase quotas to jute mills is to be

Plan, which had created an imbalance in several other sectors including raw materials, steel, electricity and foreign exchange. She had voiced much the same sentiments a little earlier at Bombay while addressing the Progressive Group.

Mrs. Sinha visited Panjim (Goa) to inaugurate a branch of the United Commercial Bank. She urged bankers to form a consortium and co-ordinate their resources to finance industrial development under a phased programme and establish institutions for training personnel for banking work. She found fault with Indian bankers on the ground that they were too cautious. Successful businessmen always took risks, but with intelligence, imagination and drive. If some banks had failed, it was, according to Mrs. Sinha, not because they took risks but because 'mistakes were deliberately committed.'

★★

The Kamani Metal Works, a leading non-ferrous metal products manufacturing firm of Bombay, has agreed to provide technical collaboration to an Iranian firm. The Ayineh Company of Iran will manufacture non-ferrous metal sheets with Kamanis and the Development Bank of Iran has blessed the project, the Indo-Iranian venture, by granting a loan of the order of Rs. 25 lakhs. This is probably the first time that a Bombay firm is collaborating with Iran. The investment of the Kamanis in the venture is placed around Rs. 10 lakhs. The Iranian Government has agreed to the repatriation of profits and capital. Although Kamanis are exporting substantial quantities of non-ferrous products to the Iranian market it was stated that the new venture would not affect Indian exports. It is interesting to note that Kamanis have provided technical collaboration for some projects in other neighbouring countries such as Ceylon and Sikkim.

continued. As against the 440,000 bales allotted last month, the compulsory quota for the current month has been increased to a total of 650,000 bales — 600,000 bales for IJMA mills and 50,000 bales for the rest of the industry. According to the Commissioner, the State Trading Corporation and jute co-operative societies are expected to acquit themselves better than last year.

A serious limiting factor to large scale purchases by these sources had been the lack of storage space and this year the difficulty will be somewhat reduced as provision has been already made for building additional storage capacity to the tune of 200,000 tons of jute. Even so, the problem of satisfactory disposal of the crop this year will not be quite easy. It is to be noted that the Jute Commissioner himself only believes that it will not be as acute as last year. For according to official estimates the new crop is expected to be of the order of seven million bales and this together with the large carry-over from last year and the quantity that had entered India across the border from Pakistan last year will swell the total availability of raw jute this year to near about 10 million bales. Mill consumption will account for about 7 million bales and still there will be about 3 million bales to be accounted for. This calculation does not include any jute that may be smuggled into India from Pakistan this year also. Unlike last year the problem of unauthorised jute has been receiving the attention of authorities in India and now we have the assurance that everything possible will be done to ensure that supplies do not enter our country across the border. But the possibility of contraband jute finding its way into India from Pakistan cannot be lightly dismissed so long as a wide disparity in raw jute prices in the two neighbouring countries exists. A redeeming feature, however, is

that this year's crop has shown an improvement in quality. This will facilitate mill purchase as well as exports.

The second concerns export prospects. The USSR may be increasing its offtake of jute goods in view of the recently concluded trade agreement with India and a delegation is shortly leaving for the Soviet Union and other countries of the Communist bloc to explore market possibilities for jute goods. The steps that are being taken to ensure stricter quality control of jute goods and to explore new markets may be expected to give a fillip to exports. But it is unfortunate that one of the major problems affecting our exports of jute goods is yet to be effectively tackled. So long as Indian sacking continues to be elbowed out of most of its traditional markets by Pakistan, other remedies will be of little avail. It was generally believed that the Shrivastava Committee would make a suitable recommendation in this regard. But the Committee's recommendations published on Friday last are silent on this important point. Its main recommendations are for the establishment of a Jute Development Board and a Buffer Stock Agency for jute goods to be administered by the existing Jute Buffer Stock Association. It has also recommended the discontinuance of the Working Time Agreement of the Indian Jute Mills Association under which the industry has been regulating the production of jute goods for over thirty years now.

★★

Although it is too early to come to a valid conclusion about the size of this year's tea crop, the trend so far is rather discouraging. In the first six months of 1963, production of both north and south Indian tea gardens has been lower. As compared to the corresponding period of last year, production in Northern India is 15 million lbs. lower while in the case of South Indian tea gardens, the decline is much less at one million lbs. The declining trend has brought into focus the prospects for hitting the third Plan targets for tea. Production last year had been lower than in the previous year and if again the current year shows a fall, there will be only two years left of the third Plan to make up the shortfall. It will be unfortunate if production cannot be stepped up to the requisite level year by year because considerable effort is being put forth to promote tea exports both to our traditional markets and to new ones. The abolition of import duty on tea by the EEC countries on an experimental measure for two years beginning from next year has afforded the Indian tea industry a very good opportunity to foster tea consumption in the European countries where

tea is yet to make headway. The abolition of the export duty on tea in the last budget coupled with the vigorous propaganda for our tea abroad is bound to expand the market. The essential prerequisite for reaping a dividend from these efforts is steadily increasing availability of tea. But the outlook for stepping up production to the extent required does not appear to be quite bright as the progress of replanting has been slow.

Although from time to time Government has been telling the industry that it will get all the incentives needed to expand production, in actual practice the facilities and the fresh burden heaped on the industry cancel themselves with the result that much needed funds are simply not available for the industry to get on with its development work so essential for increasing production. What little is available by way of assistance is so difficult to get that its usefulness is greatly reduced. An instance in point is the loan assistance that is being given by the Tea Board. It is pointed out that though a large number of applications has been made to the Board for assistance, the actual disbursement uptodate adds up to only a few lakhs of rupees. It will be wrong to suggest that the Board can dispense financial assistance just across the table as it were; but the Board which is quite conversant with the problems of the industry should know that long delays in processing the loan applications will correspondingly delay much needed improvements in the applicant tea estates and consequently the hitting of the third Plan targets.

★★

Although there has been slight recovery in sentiment on Lyons Range lately the undertone continues to be unsettled. It would appear that the main influence governing the behaviour of the stock market will continue to be the border situation. The slight improvement in sentiment noticeable at the time of writing is attributed to some buying by the Life Insurance Corporation. It is quite on the cards that this institution which is the largest single investor in equities in the country may step up its buying in the coming weeks now that the Central Loans are out of the way. The recent sharp decline in equity values appears to have spoiled the chances of any relaxation in the rules governing forward trading. Stock exchange authorities who have been asking the Government to relax the rules will now be hard put to it to advance their claim. On the contrary, already there is the demand in some quarters that margins should be more rigorously enforced with a view to preventing wide fluctuations in prices as had happened during the past few days.

Mysore Asks for Rail Link

From Our Correspondent

MADRAS:

MYSORE HAS been frequently impressing on the Central Government the need for taking up construction work on the Mangalore Port and the Mangalore-Hassan railway line. Sometime back, when Mr. S. V. Ramaswamy was in this part of the country, it was represented to him that the Centre was not keen on construction of the railway line and there was every danger of both the projects not being taken up in the immediate future. It was indicated then that the delay was mainly due to the absence of any final decision about the location of the Mangalore Port and also the difficulty in deciding about the alignment of the railway line. Sardar Swaran Singh, however, stated recently that the final report about the alignment of the railway line had been submitted to the authorities and that it was being considered by experts. He gave the assurance that both the port and the railway

projects would be taken up as early as possible and, in the absence of any announcement to the contrary, there was no reason for fear that these projects would be dropped. It is emphasised that the alignment of the railway line has to take into consideration many factors as the construction had to be taken up on a difficult terrain. The ghat section also has to be carefully planned as heavy loads will be involved. Provision is also being made, when constructing tunnels and bridges, for the conversion of the metre-gauge line into broad-gauge, if this was found necessary at a later stage. Indeed, the Railway Minister indicated that the ultimate objective was to have a broad-gauge line up to Goa depending upon the availability of iron ore reserves in the hinterland. The Karwar port is being developed along with the necessary railway facilities as it is felt that iron ore shipments from Bellary-Hospet area can be increased to as much as one million tons. Exports last year, however, amounted to

only 4 lakh tons. The Mangalore port, too, would be able to handle larger quantities of iron ore and other minerals, when it is converted into an all-weather port and the necessity for additional railway and port facilities on the west coast of Mysore has been recognised. There is naturally anxiety to know when the new projects will take concrete shape.

★★

The cement industry in Madras State has grown considerably in stature in the past few years and at the present moment four units alone are accounting for nearly 15 per cent of the country's output. While one of the established companies is busily engaged in the construction of a new factory having an initial capacity of 2 lakh tons annually a recent entrant into the field, Madras Cements Limited, commissioned into production a second kiln having a capacity of 400 tons daily taking the total to 600 tons daily. The plant and machinery for the expansion project were imported from Czechoslovakia against rupee payment. The first stage also was completed with machinery supplied from the same source. The company can expand its capacity further as large deposits of high-grade limestone are available from nearby quarries. The lighting up of the second kiln was done by Mr. R. Venkataraman, Minister for Industries and Power.

While the possibility of establishing another cement unit in Ramanathapuram District is being explored, it has been announced that a new company has been formed by name "Chettinad Cement Corporation Limited" for erecting a factory at Karur in Tiruchirapalli District. The company has secured an industrial licence for installing a plant which will have a capacity of 4 lakh tons annually. It is learnt that the required plant and machinery will be imported from West Germany and in about 2 years the first kiln having a capacity of 600 tons daily will be commissioned. The second kiln having a similar capacity is expected to be in operation by the third year. There are large limestone deposits in the Karur-Dindigul area and it is stated that the factory's capacity can be raised to very much higher levels in later years. The Corporation has received permission from the Controller of Capital Issues for raising Rs. 2.8 crores consisting of equity shares of Rs. 10 each for Rs. 2.3 crores and of 9 per cent gross preference shares of Rs. 100 each for Rs. 50 lakhs. The promoters belonging to the Raja of Chettinad group expect to come on the market later in the year.

★★

Madras State has the reputation for being a large producer of salt and marine chemicals. Production of this essential commodity has increased at a fast rate in the first and second Plan periods. But with sharp rise in industrial consumption and the growing needs of the population, it has been considered advisable to manufacture larger quantities of salt in the State and elsewhere. In Madras particularly, industrial consumption has increased significantly in the past few years as both the heavy chemical units at Mettur in Salem District and at Athoor in Tirunelveli District have been expanding their capacity for manufacturing caustic soda and other products. Dhrangadhra Chemical Works Limited has just completed its programme of expansion raising the capacity to 140 tons of caustic soda, while Mettur Chemical and Industrial Corporation Ltd. is expecting to complete its plans for raising output of caustic soda to 100 tons daily by September next. As this company has also a proposal to manufacture the more sophisticated chemicals and the annual requirements of this industrial unit alone are around 75,000 tons of salt, it has been considered advisable to produce this raw material in larger quantities.

Salt for industrial consumption has got to be in a much purer form than the article in common use as some marine

chemicals have to be eliminated. These emerge as by-products and have their uses. Mettur Chemical has, therefore, thought it is advisable to have its own salt division and a large area has been acquired from the Madras Government on lease near the coast in Thanjavur District. The salt works at Vedaranyam was inaugurated by the State's Industries Minister only a few days back. It is the intention to produce annually 2 lakh tons so that the needs of other consumers also can be met from this source. The factory is expected to be fully mechanised and will be the most up-to-date of its kind in the East.

The Madras Government is anxious that some more chemical units should be started. They have actually asked a Japanese team of experts to draw up a project report for establishing a caustic soda plant. It was also announced at the industrial seminar held in Karaikudi recently that there was scope for establishing a soda ash plant in the coastal area of this backward district. The chemical industry can, therefore, be expected to grow in stature considerably in the coming years.

★★

The Pierce Leslie group is not very much in the lime-light now because of the slump in stock market, following disturbing reports from the northern border. Even earlier, there was no aggressive buying on behalf of the interested parties and prices were tending to come down with larger offerings from investors. The results of some of the companies in the group for the last accounting period have not also been encouraging. Cochin - Malabar Estates particularly has done very badly during the year ended February 28, 1963, and the dividend on ordinary shares had to be reduced to 12 per cent, taxable, from 20 per cent, taxable, for 1961-62. The output of rubber was slightly lower on account of a larger area coming under the re-plantation scheme and the decline in the number of rubber yielding trees. The output of rubber was thus lower at 11.05 lakh kg. against 11.60 lakh kg. in the previous year. As working expenses were also higher, the profit declined sharply to Rs. 10.54 lakhs from Rs. 16.87 lakhs in the previous year. There were necessarily reduced allocations to reserves. The chairman has pointed out that, for sometime, there will be a decline in the output of rubber. But once the re-planted areas come into the production stage the trend will be reversed.

Chembra Peak Estates, however, has maintained its dividend on ordinary shares for the year ended March 31, 1963, in spite of a decline in the profit to Rs. 6.06 lakhs from Rs. 7.16 lakhs in 1961-62. After making provision for taxation, depreciation and other reserves, the dividend on ordinary capital has been maintained at 20 per cent taxable.

★★

Even under difficult conditions in the capital market, Madras Rubber Factory Limited has been lucky to make a success of its issue of additional capital in equity shares for Rs. 62.50 lakhs. In order to find part of the funds for implementing the expansion programme, a licence has been received for raising the capacity to 3.6 lakh sets of tyres and tubes from 3 lakh sets of tyres and tubes, and also ease the ways and means position. The company was permitted to issue new equity shares of Rs. 10 each at par to the existing shareholders in the proportion of one share for every two shares held. As the rights for the new issue were quoted at a premium of Rs. 3 per share there was enthusiastic response from the shareholders. It is understood that quite a number of small shareholders have asked for an additional allotment and the issue was oversubscribed to the extent of 50 per cent. This is indeed a creditable achievement in the present circumstances.

The moving finger writes

NEW DELHI is not by any means the most cheerful spot these days on God's good earth. But a recent visit to Calcutta and Bombay (which, by the way, helped me to play truant from these columns last week) showed that gloom over national affairs was not by any means confined to the Capital. From the talks I had with people in various walks of life in those two metropolitan cities, I have come back with a feeling that distance does not serve to blunt the public's disappointment (and even resentment) with the Central Government's attitudes of drift and dalliance in defence and development matters.

★★

In Calcutta, however, I was glad to hear informed people talking well of Mr. P. C. Sen's leadership of the State Government. He has already won quite a reputation as a purposeful and clear-headed administrator. His training and background as a Chartered Accountant seem to have stood him in good stead. Mr. Sen is credited with the capacity for taking decisions promptly and with a minimum of paper work. It is also said that his instructions to his officers are always firm, clear and precise. I found many Calcutta citizens speaking admiringly of the "I will stand no nonsense" attitude which the Chief Minister has apparently taken up in his efforts to discipline that monstrous leviathan, the Calcutta Municipal Corporation. Legislation is being sponsored for curbing the wayward behaviour of that body by vesting more authority in the Commissioner. Indeed, so impressed was I by all that was being said about Mr. Sen's performance and potential that I even had the illusion that Shambazar had already become a little less noisy and a little less smelly than it used to be.

★★

I am glad to find the Finance Ministry developing, so to speak, a split personality. While one part of it is arguing for public consumption that there is no truth in complaints that fiscal policies, climaxing in the super profits tax, are killing industrial expansion, another (and a wiser) part of it is trying behind the scenes to undo at least some of the mischief that has been done. I learnt on good authority in Bombay that the virtual collapse of the new issues market has got the Finance Minister worried more than he might care to admit. This explains the frequent consultations which Mr. L. K. Jha has lately been having with the heads of various institutions concerned with the capital market. One of the consequences of these consultations, apparently, is the selective purchases of equities which are now being made by the LIC to lend support to the share market.

Another result is that the Industrial Finance Corporation and the Industrial Credit and Investment Corporation of India (ICICI) may hereafter be more forthcoming in under-writing new floatations. These steps would no doubt help, but their utility will clearly be very limited. The LIC purchases should release funds to the capital market, but much of this finance is likely to be used up in the further extension of their existing businesses by corporate investors selling their holdings to the LIC. Hence there will be no great direct support on this account to the new issues market. As for more and readier under-writing by the IFC and the ICICI, it is clear that neither of these institutions has unlimited funds for carrying unsubscribed stock. These two bodies cannot remain in busi-

ness indefinitely if public investment demand for new issues does not pick up within a reasonable period. The present position is that banks and under-writing firms have been put out of business through repeated failures of new issues which, in many cases, have left the under-writers concerned nursing up to 70 per cent of the issues. A Finance Minister, less intellectually honest or politically courageous than Mr. Desai, may hesitate to recognise that the prevailing fiscal policies are inconsistent with industrial expansion, but he himself should not.

★★

I should be surprised if the Prime Minister does a Hamlet in the matter of Mr. S. K. Patil. I am not concerned here with the merits of his decision to shift the latter from the Food and Agriculture Ministry to the Railway Ministry. I should also agree readily with those who might be disposed to point out that, while the transposition of Mr. Patil and Sardar Swaran Singh may perhaps result in a gain to the Railway Ministry, it is not by any means equally likely that it will result in a similar advantage to the Food and Agriculture Ministry. All that I am interested in, for the moment, is that Mr. Nehru himself seems to be unusually determined in effecting the transfers. Mr. Patil for his part is not objecting to a change of portfolio as such. Indeed he has apparently consented to his transfer provided it could be effected in such a way as to avoid any suggestion that he is deemed to have failed in his present job. In the circumstances there is obviously scope for Mr. Lal Bahadur Shastri to spread sweet reasonableness all around and secure a result which would meet Mr. Nehru's wishes without hurting Mr. Patil's feelings. In other words, it is only a question of time before the Food and Agriculture Ministry has a new Minister.

★★

There is, of course, no truth in the report circulated in a section of the Tamil Press and denied by Mr. C. Subramaniam that he is likely to return to the Madras Government. This report evidently was prompted by the fact that the Minister for Steel and Heavy Industries recently accompanied Mr. Kamaraj Nadar to Hyderabad where the Madras Chief Minister met Mr. Nehru. At that meeting Mr. Nehru was supposed to have discussed with Mr. Kamaraj the latter's suggestion that Congress Ministers should relinquish office to take up organisational work with a view to putting new life into the Congress Party. Even if this suggestion becomes a policy and Mr. Kamaraj, in pursuance of it, relinquishes Chief Ministership for a time, he is more likely to pick on Mr. Bhaktavatsalam, the present Finance Minister of Madras, to deputise for him and keep the 'gaddi' warm for him than make it necessary for Mr. Subramaniam to go back to State politics.

My own explanation of Mr. Subramaniam's presence at the Hyderabad meeting would be that he was needed as an interpreter. Mr. Kamaraj's knowledge of English is no better than his acquaintance with Hindi, while Mr. Nehru can hardly be said to possess a working knowledge of Tamil although he has gone on record as saying that Tamil is a great language which northerners might try to learn as part of the grand process of national integration.

FREIGHT RATES ON EXPORT CARGOES

THE GOVERNMENT of India has accepted the recommendations of the Maritime Freights Commission to increase the freight on west-bound cargo carried by the India-Pakistan-U.K.-Continent Conference Lines. The Conference had demanded a general increase of 15 per cent but the Commission agreed to only 7½ per cent for a period of two years subject to the condition that certain sensitive commodities whose export prospects are likely to be adversely affected, should be exempted. The sensitive commodities are cotton piece-goods, cotton yarn, coir fibre, coir yarn, coir carpets, mats and matings, oil cakes, vegetable oils, coffee, hides and skins (tanned and dressed), engineering goods, kyanolite ore, magnesite and chrome ores and manganese.

The plea of the Conference Lines delegates was that costs of operations had been steadily increasing and in the present day conditions shipping industry as a whole was not obtaining a capital return of 12½ per cent and there was a deficit of 33 per cent. It was also put across that there had taken place an increase in freight rates in coastal shipping, railways, road transport etc., during the last two years. Besides, there had been increases announced by the Conference Shipping Lines on various trade routes all over the world since 1960. It is claimed by the Lines that if the deficit has come down from 47 per cent in 1961 to 33 per cent now, it is because of the vigorous action on the part of the Lines themselves. This may be true, but it does seem odd that a 15 per cent increase should be asked for whereas a ten per cent increase was considered adequate when the deficit was far larger.

The Karmahom Conference has announced its decision to restrict its general increase in west-bound rates of freight to a maximum of 12.50 per cent instead of the flat 15 per cent which it had originally contemplated. Though the figure is less than the flat rate of 15 per cent which the Conference had asked for earlier, it is far above the 7.5 per cent increase recommended by the Maritime Freights Commission and accepted by the Government of India. The relief of 2½ per cent is, therefore, a poor consolation when the export trade is almost under great strain. Under the rates fixed by the Karmahom Conference an increase of 7.50 per cent will be made on crushed bones and canned provision, while the rate on oilcake will be sh. 125 per 1,000 kg. gross. The freight on manioc meal and rice bran extraction will be increased to sh. 125 and sh. 117.6 respectively, both for 1,000 kg. The rate on tea from Calcutta and East Pakistan as also from Malabar will be increased by 12.50 per cent. All this re-emphasizes the need for rapidly increasing our shipping tonnage and larger share for it in the exported cargo.

JUTE PROMOTION

A long range research and development programme for jute products has been launched in the US by the Indian jute industry. Following approval by the Government of India a contract has been signed by the Indian Jute Mills' Association with Fabric Research Laboratories of Dedham, Mass. to conduct a product development programme designed to expand the uses of jute fabrics as packaging, industrial and consumer textiles in the Western Hemisphere. The decision to pursue the research effort in the US on behalf of the Calcutta producers of burlap was made in the belief that the best results would be insured in the progress of the programme by working closely with US converters and consumers with the object of adapting jute textiles to the requirements of

American market and meeting competition from synthetics and other natural fibre substitutes.

The contract with Fabric Research Laboratories will continue for several years and involves a substantial fee. It is a follow-up to a market and product analysis study completed for IJMA in 1961 by this leading textile research organization. The initial phase of the Fabric Research Laboratories project will include field investigations of potential new uses for Indian jute fabrics, laboratory development of new or modified fabric constructions and recommendations for the production of woven jute fabrics to yield better quality and uniformity.

Future targets of the programme envision many new and varied uses for jute as the fibre of the Centuries. Costing only ten cents a pound, Indian jute is the cheapest fibre available in volume in the world and is approximately one third the cost of cotton and as much as 90 per cent cheaper than some leading synthetics. Potential applications which are considered promising as products of the research programme include re-enforced coated fabrics and laminates for industrial uses, improved protective coverings and a wide range of decorative fabrics where interesting surface appearance is desired.

PUBLIC SECTOR STEEL

Following a recommendation of the Public Accounts Committee, the Ministry of Steel and Heavy Industries has decided to set up a three-man committee to make a comprehensive study of steel plants in the public sector. The Committee will consist of Mr. S. Ratnam, formerly Secretary, Union Finance Ministry (Chairman) and Mr. B. S. Sindhu, retired Member (Engineering), Railway Board and Mr. U. Ananda Rau, retired Special Engineer, PWD, Madras, (Members). The terms of reference of the Committee will be to study the problems connected with the setting up of the first phase of the three steel works of Hindusthan Steel Limited in the public sector viz. the one million ton plants at Bhilai, Rourkela and Durgapur, with particular reference to the agreements with consultants, project reports, contracts, and arrangements made for training of personnel. The Committee will also examine in particular the contracts for civil engineering works, blast furnaces and rolling mills at Rourkela and more generally the other contracts entered into by Hindusthan Steel Limited in the past. The increase in estimates of the cost of the power plant at Rourkela will be examined by the Committee.

FERTILIZER PROGRESS

The Trombay fertilizer plant will start production by the middle of 1964. This public sector plant is being set up by the Fertilizer Corporation of India and will have a designed capacity for production of 99,000 tonnes of urea and 3,30,000 tonnes of nitro-phosphate per year. It is estimated to cost over Rs. 33 crores. Good progress is reported in the erection and installation work. Contracts for the supply of raw materials for the production of ammonia, namely, refinery gas and petroleum naphtha have already been signed with nearby refineries. It is learnt that Burmah-Shell will supply 50,000 tons of refinery gas per year for ten years, while ESSO will provide 45,000 tons of petroleum naphtha per year for ten years. The State Trading Corporation will arrange for the supply of rock phosphate; the factory's requirements are estimated at 126,000 tons of rock phosphate per year. Arrangements for the supply of water and power have also been made. About six to eight million gallons of water per day will be supplied by

the Bombay Municipal Corporation. Messrs. Tata Power Company will provide 35,000 kw of power for the fertilizer group of plants and 5,000 kw of power for the methanol plant. As for technical personnel about 50 engineers have already been posted after completing their training and about 200 apprentices are under training at Sindri and Nangal.

EXPANSION OF BOMBAY PORT

The port of Bombay is being expanded by four additional deepwater berths in the Alexandra docks and a new landing-place for ferry-boats near the Prince's dock to make room for three deepwater berths. The Ballard pier will be extended by 750 feet to allow construction of another berth. The main channel will be deepened to 32 feet.

The port of Madras will receive new ore handling equipment, handling capacity being three million tons a year and costs 25 million rupees. The Government plans to expand and modernise the port of Marmugao in Goa. The costs will come to Rs. 24.71 crores.

EXPORT PROMOTION TECHNIQUES

For promoting India's exports, the US Government have extended dollar and rupee grants totalling Rs. 25 lakhs to the Government of India. A team of five industrial and commercial experts and a number of short-term specialists will be assigned to the Engineering Export Promotion Council under this project. The specialists, whose services will be made available by the US Agency for International Development, will undertake a demonstration study of modern techniques for improved sales by the engineering industry in all world markets. In recent years, the Indian engineering industry has effected a large increase in its exports, but it is felt that, with the adoption of the latest marketing techniques, the industry could make a significantly higher contribution towards earning foreign exchange for India.

EMPLOYEES' PROVIDENT FUND

To provide non-refundable advances to the members of the fund to the extent of Rs. 30 or their own share of contribution whichever is less to enable subscribers to buy shares from a consumers' co-operative society with a minimum membership of 250, the Employees' Provident Fund Scheme framed under Employees' Provident Fund Act, 1952, has been amended. Members desirous of availing of this facility may apply to the Regional Provident Fund Commissioner in the prescribed form accompanied by an authorisation for payment to the society and an undertaking by the society that the shares will not be transferred without prior approval of the Regional Provident Fund Commissioner.

CONSTRUCTION OF PIPELINES

A contract between Indian Refineries Ltd., and ENI was signed recently for the construction of two petroleum product pipelines in the eastern part of the country. The contract is valued at about Rs. 11.33 crores. The foreign exchange cost of about Rs. 5.30 crores will be met out of the \$100 million of credit which ENI had offered to the Union Government in August, 1961 for various oil projects. Construction of the lines—one of the largest single systems in the world—will involve crossing of 78 rivers, 42 railway tracks, 300 roads and 150 canals and water courses. The first line, 530 Km. long will start from Haldia and terminate at the Barauni refinery. The second line, 680 Km. long starting from the Barauni refinery will end at Kanpur. The Haldia-Barauni pipeline will be a two-way line capable of carrying products to

Haldia and crude from Haldia to Barauni. This is the fifth contract signed in pursuance of the credit agreement.

EXPORT OF SEWING MACHINES

It has been announced by the Jay Engineering Works that they will be exporting 720,000 Usha sewing machines to West Germany during the next three years. This is the largest single export order that Jay Engineering Works has received in recent years. The company is exporting monthly 1,500 Usha sewing machines to the USA and 1,000 machines to the UK. Pioneers in the export of light engineering goods, Jay Engineering Works has broken all records in the exports of sewing machines and fans.

SWEDISH PULP AND PAPER

The demand for Swedish pulp and paper has been increasing of late. Sales of Swedish cellulose at the end of the first half-year amounted to 70 per cent of the estimated annual output of just over three million tons. Deliveries in the first six months totalled over 1.4 million tons compared with 1.2 million tons in the depressed market situation last year. Even if production so far this year has been 10 per cent larger than in 1962, most sectors of the cellulose industry are still working below capacity. Since the fall in prices ceased towards the end of last year, sales in the first and second quarters of this year were made on a uniform price level. At the beginning of May prices for paper pulp were adjusted upwards by 4–5 per cent and for dissolving pulp by 2 per cent, a level now accepted by purchasers for the third quarter. Yet, current prices are still 5–10 per cent below those quoted at the beginning of 1961.

Production of paper and paperboard during the first four months of this year was 8,72,000 tons, an increase of close on 9 per cent on the corresponding 1962 figure. A similar development was noted in May and June. Sweden's total productive capacity for all kinds of paper and paperboards is about 2,870,000 tons. This capacity cannot at the present moment be utilised to the full, particularly in the newsprint and kraft paper sectors. Minor price increases have lately been effected for kraft and sulphite wrappings.

Key to

Planning
& Prosperity

Individual well-being is linked with national prosperity and only planned efforts can ensure both in the shortest possible time. And planning, for its success, largely depends on savings, individual as well as national. Saving in the form of Bank Deposits provides resources for the National Plan.

Company Affairs

TISCO EXPANSION

MR. J. R. D. TATA, Chairman of the Tata Iron and Steel Company Ltd., has informed the shareholders in the annual report for the year ended March, 1963, that there was a possibility of further expansion and modernisation of the unit. The Government of India is currently studying proposals for the fourth five-year Plan and discussions are being held for further expansion of the steel industry in the private sector. The Government has sounded TISCO if it would be interested in further expansion during the fourth Plan period.

The expansion programme, however, is at an exploratory stage and a final decision will be taken after considerable time. A preliminary study of the expansion project is being made. The overriding consideration for the adoption of the expansion plan would be the availability of finances. Mr. Tata has stated that an effort would be made to save the Company from undue strain on its resources and, at the same time, the interest of the shareholders would also be safeguarded.

Preliminary studies made so far have indicated that further expansion of the plant from 2 to 2½ or 3 million tons might be feasible within the existing plant area. In any case the final decision in regard to expansion will be taken after studying the technical and economic soundness of the project, the financial stability of the Company and the interests of both the shareholders and the country.

According to rough, preliminary estimates the total cost of expansion may be around Rs. 100 crores for a million tons. Half of this amount is likely to be in foreign exchange. Consultations will have to be held with the World Bank from which the Company took loans amounting to Rs. 32 crores for the doubling programme.

Assessing the overall steel situation for the fourth Plan, Mr. Tata gave the opinion that the fourth Plan target may not exceed 15 million tons. In view of the vast scale of finances needed for steel plants, the private sector may not be in a position to set up additional plants or expand the existing ones without Government help.

Mr. Tata also referred to the statutory control over steel prices and distribution which had been in force since 1941. He stated that the industry would welcome de-control of steel provided such steps, as were necessary, were taken to ensure smooth transition and the industry was promised fair prices. If the industry was allowed to conduct its own affairs, he said, under a carefully thought-out scheme, it might benefit all sections associated with the steel industry.

The working results for the year ended March 31, 1963, which have already been reviewed in these columns, indicated a healthy growth both in gross revenue and in net profit. The gross revenue indicated a sharp increase from Rs. 92.99 crores to Rs. 103.44 crores. Net profit was higher at Rs. 9.76 crores against Rs. 6.09 crores last year. The Directors' report had indicated that even though the profits for the year had showed a gratifying increase, the return on the total capital employed was not sufficient keeping in view the legitimate needs of a heavily capitalized industry such as steel.

HINDUSTAN MOTORS

Hindustan Motors Limited has made considerable progress towards self-sufficiency by increasing the indigenous content of its Ambassador car and Bedford truck. The output for the year ended March 31, 1963, the Directors stated in their annual report, could have been still higher but for the fact that there was a drastic cut by the Government in the company's foreign exchange allocation for the import of components. The company's application for a loan from the US Agency for International Development for \$15.8 million

has been sanctioned. This will enable the company to raise the indigenous content of its vehicle and to increase, to some extent, its truck manufacturing capacity and will also help in renovating some of its old equipment. The implementation of this scheme has already commenced and orders for most of the plant and machinery have been placed. The company has further negotiated for a loan of 60 lakhs from the Commonwealth Development Finance Company Limited, UK, which has agreed to sanction the required amount. Besides, cash licences for the import of some machinery from the UK and Germany have also been received. After the installation of these machines, the company will be able to reach the target of indigenous content for cars and trucks.

The expansion of the company's manufacturing capacity for trucks to 15,000 a year has been sanctioned by the Government along with the company's programme for the manufacture of Bedford diesel and petrol engines. Negotiations for the requirement of capital goods for this programme are in progress. The company has been permitted to fit its own manufactured Bedford engines from September, 1965, by which time the manufacture of engines is hoped to be completed. The programme for increasing the manufacturing capacity of trucks will be taken in hand simultaneously with the manufacture of engine components, while foreign exchange will be arranged from such sources as may be suggested by the Government. An application to the US Agency for International Development for a loan for equipment to manufacture shovels is still pending before the Government. It is expected that the decision will be taken by AID before long when orders for machinery will be placed.

In spite of the various difficulties such as drastic cut in foreign exchange allocation and shortage of power and raw materials, the company has reported satisfactory working results for the year ended March 31, 1963. Sales have risen to Rs. 29.29 crores from Rs. 24.90 crores while the net profit after providing for depreciation amounts to Rs. 350 lakhs against Rs. 313.12 lakhs last year. The allocation for taxation is considerably higher at Rs. 222.50 lakhs against Rs. 152 lakhs last year. The net profit naturally has fallen to Rs. 127.50 lakhs from Rs. 161.20 lakhs. Provision for depreciation is Rs. 71.50 lakhs and for general reserve is Rs. 25 lakhs. Development rebate reserve absorbs Rs. 9.75 lakhs. The Directors have proposed a dividend of Rs. 1.15 per share against Rs. 1.25 last year on ordinary shares.

ORISSA CEMENT

Mr. J. Dalmia, Chairman, Orissa Cement Ltd., praised the incentive scheme introduced by the Government for maximising production of cement, while addressing the annual general meeting of the Company. The objective underlying is indeed commendable but he indicated that it should be spread over to be valid for years beyond the current one. He suggested that the norm should be related to the average production of each unit during the last three years, instead of maximum production attained in any calendar year, during 1960-62. He also informed the shareholders that the Government has allowed an increase of Rs. 2.75 per tonne in the retention prices payable to the cement producers with effect from June 1, 1963. This he felt, however, fell short of the demand made by the Company.

He spoke about the refractory industry which is facing a problem of demand. The expansion of refractory industry was based on the steel production capacity reaching a target of 10 million tonnes per annum by the end of the third Plan. If the installed capacity for fireclay, silica and basic bricks increases to 12,00,000 tonnes during 1965, he indicated that the industry would have an idle capacity of as much as 50 per cent. There is a possibility, he added, that

there is an over-estimation in the rate of consumption of refractories per tonne of steel production. He pointed out that fortunately the Company has developed the manufacture of certain special types of refractories, such as, silica coke oven bricks, forsterite bricks, blast furnace bricks, burnt basic roof bricks, chemically bonded steel clad basic roof bricks etc. which, to a great extent, were being imported till now.

IMPERIAL TOBACCO

The Directors of the Imperial Tobacco Company of India Limited have decided to recommend, at the forthcoming annual general meeting the payment of a final dividend for the year ended 31st March, 1963, of 3 per cent (subject to tax) which, together with the two interim dividends of 2½ per cent (subject to tax), makes a total of 8 per cent for the year as against 9 per cent for 1962. The net profit for the year is Rs. 1.80 crores as against Rs. 1.46 crores after deducting all charges and expenses and after providing for taxation amounting to Rs. 2.62 crores against Rs. 1.76 crores last year. The Directors also intend to declare a first interim dividend of 2 per cent (subject to tax) in respect of the year ending 31st March, 1964, as against 2½ per cent declared for 1963. The impact of the 1963 Budget on the Company's business has been severe and the Directors have considered it prudent to recommend a reduction in the final dividend and to declare a lower first interim dividend. The final dividend, if approved, and the interim dividend will be payable on 30th September, 1963.

DHRANGADHRA CHEMICAL

The working of the Dhrangadhra Chemical Works Limited for the year to March 31, 1963 shows a gross profit of Rs. 90.30 lakhs against Rs. 52.10 lakhs last year. Consequently, net profit has risen from Rs. 20.49 lakhs to Rs. 55.60 lakhs. Directors have proposed to step up equity dividend from six per cent taxable to eight per cent taxable on increased capital of Rs. 107.50 lakhs against Rs. 64.50 lakhs. Higher gross output is the reflection of increased production and improved efficiency of both the soda ash and caustic soda units. The installed capacity of the caustic soda plant has been raised from 80 tons to 140 tons per day. The production level at present is 110 tons per day and is expected to reach the installed capacity of 140 tons per day in about a month. The company has signed an agreement with a Japanese firm for the import of plant and machinery under the second yen credit from Japan for setting up a liquid chlorine plant with an installed capacity of 60 tonnes per day. The Directors proposed to finance this project from internal resources and borrowings. Plastic Resins and Chemicals Limited, sponsored by the company, has entered into collaboration agreement for technical know-how and supplying of plant and machinery with a Japanese firm for the manufacture of PVC and calcium carbide. The company is expected to enter into capital market at an appropriate time.

INDIAN CABLE

Indian Cable Company Limited has reported a higher net profit of Rs. 156.85 lakhs during the year ended March 31, 1963 against Rs. 136.47 lakhs last year. As the taxation provision is substantially higher at Rs. 93 lakhs against Rs. 69.50 lakhs last year, the net profit works out to Rs. 63.85 lakhs—slightly lower than last year's figure of Rs. 66.97 lakhs. Taking into account Rs. 29.56 lakhs being provision no longer required and Rs. 60.15 lakhs brought forward from the previous year, there is an amount of Rs. 153.56 lakhs out of which the directors have transferred Rs. 87.40 lakhs to reserves. The dividend is proposed to be maintained on 22.5 per cent, less tax.

BAJAJ ELECTRICALS

A sizable increase in gross profits for the year ended March 31, 1963, has been reported by Bajaj Electricals Ltd. As against the gross profit of Rs. 16.69 lakhs last year, the

profit for the year under review was Rs. 27.04 lakhs. A part of the explanation in the happy financial results lies in the improved sales from Rs. 2.84 crores in the previous year to Rs. 3.58 crores in 1962-63. Amongst the allocations mention needs to be made of Rs. 14 lakhs for taxation, Rs. 2.17 lakhs for depreciation, Rs. 13,000 for development reserve and Rs. 4.05 lakhs for general reserve. A sum of Rs. 6 lakhs has been transferred to dividend reserve out of which all dividends — preference, equity and deferred — will be paid.

Hind Lamps Ltd. in which the Company has 50 per cent interest has raised its output of electric lamps, fluorescent tubes and lamp components and a further increase is expected in the current year. Because of the foreign exchange shortage the Government has turned down the application of the Company for a further expansion in capacity. A new instruments factory is proposed to be set up at Poona; land for this purpose has already been bought and construction is likely to commence shortly.

MACHINERY MANUFACTURERS' CORPORATION

The net profit of the Machinery Manufacturers' Corporation rose from Rs. 18.94 lakhs to Rs. 22.75 lakhs for the year ended March 31, 1963. Sales improved sizably from Rs. 149.26 lakhs to Rs. 203.64 lakhs. The appropriations include depreciation at Rs. 10.27 lakhs, development rebate reserve at Rs. 1.91 lakhs, provision for gratuity at Rs. 3.50 lakhs and taxation at Rs. 17 lakhs. The ordinary dividend of Rs. 1.50 per share (of Rs. 10 each) will absorb Rs. 4.52 lakhs.

An encouraging feature of the working of the Company is that its order book is full with orders. Even though the shortage of coke and pig iron and of power at Sonai works slowed down the tempo of production, yet both production and despatches of cards increased by 15 per cent.

POLYCHEM

A lower profit has been declared by Polychem Ltd., for the year ended March 31, 1963, despite a substantial increase in sales. Whereas sales rose from Rs. 163 lakhs in 1961-62 to Rs. 196 lakhs in the year under review, the gross profit declined from Rs. 39.87 lakhs to Rs. 38.49 lakhs. The provision for depreciation has been reduced from Rs. 7.06 lakhs to Rs. 6.30 lakhs while the allocation for taxation has been raised from Rs. 15.50 lakhs to Rs. 17 lakhs. Development rebate reserve at Rs. 2.44 lakhs was almost eleven times the provision in the previous year at Rs. 0.22 lakhs. The disposable profit, therefore, was lower at Rs. 12.69 lakhs as against Rs. 16.74 lakhs in the last year. As against the allocation of Rs. 6 lakhs to general reserve in the preceding year, no allocation was made this year. The transfer to the dividend equalization reserve was also reduced from Rs. 3 lakhs to Rs. 2 lakhs. The taxable dividend (proposed) at Rs. 7.50 per share will be paid out of a dividend reserve of Rs. 12 lakhs earmarked for this purpose. The styrene monomer and alcohol plants have been completed and are expected to be commissioned shortly.

SIDHPUR MILLS

The gross profit of the Sidhpur Mills Ltd., for the year ended March 31, 1963, declined to Rs. 2.61 lakhs as against Rs. 15.82 lakhs in the preceding year. The down turn in profit has resulted in a reduction of the dividend from 12 per cent to 8 per cent, though the lower dividend is on the enhanced capital. The provision for depreciation is slightly lower at Rs. 4.91 lakhs as compared to the preceding year's allocation of Rs. 4.96 lakhs. There is a sizable drop in the managing agents' commission from Rs. 1.01 lakhs to Rs. 40,000. The statutory development rebate reserve has been allocated a sum of Rs. 25,600 (Rs. 1.23 lakhs in the last). The proposed dividend would absorb Rs. 1.60 lakhs. The Company is continuing its modernization programme so as to improve the quality of its products and make them more competitive

in the local and the export markets. The Company also proposes to convert its boilers to oil firing in view of the difficulty in obtaining coal supplies.

CAPITAL ISSUES

The following eight companies have been authorized to raise capital totalling about Rs. 12.72 crores. The consent is valid for 12 months.

The Fertilizer Corporation of India Limited, Delhi, a Central Government undertaking, has been accorded consent to issue further capital of Rs. 7.60 crores in equity shares of Rs. 1,000 each, for cash at par. The entire issue will be subscribed by the Central Government.

The Nagargali Cement Company Limited, Hubli, will issue capital of Rs. 1 crore divided into 10,00,000 equity shares of Rs. 10 each for cash at par. Of this, 7,50,000 shares will be offered for public subscription. The money will be used for setting up a factory for the manufacture of portland cement.

Graphite India Limited, Calcutta, is to issue capital of Rs. 90 lakhs in equity shares of Rs. 10 each. The capital is required for the manufacture of various types of graphite and carbon products in collaboration with the US firm of Great Lakes Carbon Corporation, which will subscribe Rs. 25 lakhs.

The Indian Graphic Arts Equipment Company Limited, a new company to be incorporated in Madras State for doing business as manufacturers, dealers and assemblers of all types of printing presses and machinery for the graphic art, is issuing capital of Rs. 30 lakhs. This amount is divided into 3,00,000 equity shares of Rs. 10 each for cash at par. Out of this shares for Rs. 15 lakhs will be offered to the company's foreign collaborators Miehle-Goss-Dexter Inc. of Chicago, against supply of plant and machinery.

Bellary Spinning and Weaving Company Limited has been given consent for a further issue of Rs. 26,85,500 divided into 26,855 equity shares of Rs. 100 each, to be issued for cash at par. Of these, not less than 14,700 shares will be offered for public subscription by prospectus. The capital will be used for setting up a spinning mill at Bellary (Mysore State). This consent is in supersession of the one granted previously for Rs. 25 lakhs.

Ahmedabad Electricity Company Limited will issue 7½ per cent debenture stock of the value of Rs. 2 crores in units of Rs. 1,000 each for cash at par. The money will be spent in strengthening its distribution mains and other power service facilities.

Kalyan Pulp and Paper Mills Private Limited, Bombay, is to issue capital of Rs. 34,93,000 divided into 2,99,300 equity shares of Rs. 10 each and 5,000 redeemable cumulative preference shares of Rs. 100 each, for cash at par. Out of this, equity shares worth Rs. 18 lakhs and all the preference shares will be offered for public subscription. The capital will be used for the establishment of a new project for the manufacture of pulp and paper.

Ajanta Textiles Limited, Delhi, recently incorporated for manufacturing cotton yarn of various counts, will raise capital of Rs. 30 lakhs (inclusive of Rs. 15,040 already issued, subscribed and paid-up capital by the company) divided into Rs. 25 lakhs in equity shares of Rs. 10 each and Rs. 5 lakhs in 9.3 per cent cumulative redeemable preference shares of Rs. 100 each for cash at par.

LICENCES ISSUED

Following licences have been issued under the Industries (Development and Regulation) Act, 1951 — during the week ending 27th July, 1963. The list contains the names and places of licensees, articles of manufacture and annual installed capacity.

Atta's Iron Foundry 171, Grand Trunk Road, Salkia, Howrah, (West Bengal) — C.I. Railway sleepers and other

C.I. Products 7,000 tons. **Sri Ramakrishna Steel Industries Ltd.,** 1/9, Naranapuram, Pappanaickenpalayam, Coimbatore-1 (Coimbatore, Madras) — Steel castings 4,800 tons per annum on the basis of maximum utilisation of the Plant capacity.

ELECTRICAL EQUIPMENT

The Bihar State Industrial Development Corporation Ltd., Sikandar Manzil, Fraser Road, Patna, Proposed name: **The Bihar General Electric Co. (Tatisilwai, Dist. Ranchi, Bihar)** — L.T. Oil Circuit Breakers 300 Nos. per annum, Motor Starters 3,600 Nos. **Bihar State Industrial Corporation Ltd.,** Sikandar Manzil, Fraser Road, Patna, Proposed name: **The Bihar General Electric Co., (Tatisilwai, Dist. Ranchi, Bihar)** — A.C. Industrial Motors above 1 H.P. and up to 100 H.P. 63,000 H.P. p.a. on double shift basis. Aluminium Cables and Conductors (U.P.) Private Ltd., 47, Hide Road Extension (Off Transport, Depot Road, Calcutta-27) — A.C.S. Rand, A.A. Conductors — 3,200 tons per annum on two shifts.

DRUGS & PHARMACEUTICALS

Martin and Harris Private Ltd., Mercantile Bldgs., Lall Bazar, Calcutta-1 (West Bengal) — Mand H. Cabalamine 500 inj., Mand H. Plax B. Inj., Mand Calcium C-250 Inj., Mand Inj. of Aminophylline B.P., Mand Adrechrome — Inj., Mand Inj. of Procaine Hydrochlor with adrenaline, Dienol, Durabolin, Deca-Durabolin, Menstrogen, Testanon, Progestin, Gestyl. Pregynl, Distilled water (0.5 phenol) — 13,00,000 ampoules per annum.

COTTON TEXTILES

Ankay Cloth and General Mills, Hathras (U.P.) — 6,184 spindles for manufacture of cotton yarn. **Ahmedabad New Cotton Mills Co. Ltd.,** Near Khokhra Mohmedabad, Ahmedabad (Gujarat) — 922 spindles for the manufacture of yarn.

MILK FOOD

The Officer-in-charge Composite Milk Plant, Department of Animal Husbandry, Amritsar (Verka near Amritsar, Punjab) (Skimmed Milk Food Powder) — 1,500 m. tonnes.

MALTED FOOD

Dyer Meakin Brewries Ltd., Mohan Nagar, Gaziabad (Uttar Pradesh) — Malt Extract 1,800 m. tonnes.

GLASSWARE

Bawa Glass and Croceries Private Ltd., Chandni Chowk, Delhi (Delhi, Administration) — Lead Crystal Glassware 1,800 tons.

CIGARETTES

Vazir Sultan Tobacco Co. Ltd., Post Box No. 6, Hyderabad-20, (Azamabad, Hyderabad, Andhra Pradesh) — Cigarettes 360 million pieces.

CHANGES IN NAMES

(During the week ending 27th July, 1963)

From M/s. Shah Steel Industries, Bombay to M/s. Shah Malleable Castings Ltd., Bombay. From M/s. The General Electric Co. of India Manufacturing Private Ltd., Calcutta. to M/s. The General Electric Co. of India Private Ltd., Calcutta. From M/s. Lalji Ramji & Co., Bombay to M/s. Magnotape Co., Bombay. From M/s. Tata Iron and Steel Co. Ltd., Bombay to M/s. Tata Robins-Fraser Ltd., Bombay. From M/s. Bayer Agrochem Ltd., Bombay to M/s. Bayer (India) Ltd., Bombay. From M/s. National Air Products, New Delhi to M/s. National Air Products Private Ltd., New Delhi. From M/s. New Pahlad Mills to M/s. Sayaji Mills No. 2, Bombay. From M/s. Viswan Mills (Spinning) Erode to, Name of the new owners: M/s. J. K. K. Angappan and Bros. Erode. Name of the new undertaking: M/s. Kandaswamy Spinning Mills, Erode.

LICENCES REVOKED

(During the week ending 27th July, 1963)

M/s. M. Dinesh & Co., Khadia, Char Resta, Ahmedabad. (M/s. Geeta Oil Industries (P) Ltd., Ahmedabad) Rice Bran Oil.

BOOKS BRIEFLY

Economic Consequences of Chinese Invasion

The Impact of Emergency on the Indian Economy: By Prof. M. S. Krishnamurthy: C. Nagiah Chetty and Co., Madras: Pp. 138: Price Rs. 4.

REVIEWED BY R. P. RAO

EXPANSIONIST China's mass invasion of India on the Himalayan border in October 1962 has brought about adjustments in the foreign and economic policies of the latter. Although the basic factors in both the fields have not been affected, there have been shifts and changes, variations in emphasis and directions. India continues to be non-aligned though it is moving towards the democracies without antagonizing the Soviet Communist camp. In the economic field, progress through the Plans continues to be its policy, though the urgent needs of defence have been given priority over other activities.

A study of the effects of changes is highly necessary not merely to meet the dragon's challenge but also to preserve India's sovereignty and freedom. India's success will be a success for Asia and all freedom-loving nations.

'The Impact of Emergency on the Indian Economy' tries to bring home to the readers the injury caused to India's economic life by Communist China. However, even a casual reader cannot overcome the feeling that the author could have spent some more time and made the book more informative, readable and interesting.

Prof. Krishnamurthy, like many of his Indian contemporaries, has generally narrated the various measures adopted by the authorities since the declaration of emergency in a chronological order. The book fails to present a critical analysis of the measures taken. This is necessary for a proper appreciation of the situation and to correct loop-holes, if any, in the present set-up.

Writing on the budget, deeply coloured by the impact of the emergency, the author says: "It is doubtful whether it would be possible to maintain this huge effort over a period, were the emergency to last a few years. The actual aggre-

gate expenditure works out to Rs. 3,672 crores. Even in 1961-62 the total of the revenue and capital budget was only of the order of Rs. 2,350 crores. Even in 1962-63 the Rs. 3,000 crore mark would not have been exceeded in case the emergency had not occurred." The arguments and the statistics do not tally with each other. If the expenditure rose between 1961-62 and 1962-63 by about Rs. 650 crores when there was peace in the country, there is no reason why almost an equal amount of extra expenditure between 1962-63 and 1963-64 should alarm any person, including the author, and why the peace-time rate of increase in expenditure should not be maintained even in times of emergency?

Speaking about the gold bond scheme, Prof. Krishnamurthy says: "As a policy, the Government probably decided to possess all gold available in the country on Government account only. It might have been the result of the Government's resolve to follow its non-alignment foreign policy by purchasing arms and defence equipments only against payment. Such a step might have been the outcome of the country's foreign exchange reserves having declined very near to the statutory minimum level." The author has obviously not given sufficient thought to the problem. It is difficult for any democratic Government to entertain hopes of possessing all the gold in the country on its account. It is much more so in a country like India. Further, even a casual study of the scheme does not warrant any such conclusion because it does not cover existing jewels of even 22 carat and also allows free circulation and manufacture of new jewels of 14 carat gold. It surpasses the imagination of this reviewer how the learned professor entertains the fantastic impression that the Government's motive behind the Gold Control Order is to acquire monopoly ownership of all the gold in the country. The basic idea is to prevent smuggling and put a stop to the drain on the foreign exchange.

In spite of the few shortcomings the book deserves to be read by all persons interested in the economic growth of this country.

Readers' Roundtable

QUESTIONS FOR HMT

Sir,—The Hindustan Machine Tools deserves a pat on the back for its reported performance of 33 per cent net profit on share capital in 1962-63. There are, however, some claims of HMT which need clarification. The Parliamentary Estimates Committee, in its 94th report, had observed: "The sale price of all machines produced by Hindustan Machine Tools is stated to be below the landed cost of the imported machines, although the landed cost of such machines has not been given in the Report." This deficiency has now been made good. HMT's Annual Report for 1962-63 claims that its current selling prices, in force from 15th April, 1963, are uniformly 15 per cent below the current landed cost of European machines of equivalent quality. A set of figures is also given. But clarification is needed (a) on the range of prices compared, (b) comparability of the HMT machines with foreign ones and (c) prices of accessories, etc.

(i) The report cites a price of Rs. 33,000 for a high precision lathe as against the "comparable landed cost of imported machine" of Rs. 48,362. But HMT's price list (Cir. No. 6/15-4-1963) gives 'ex factory' prices for different high speed precision lathes (Model H-22) from Rs. 41,000 to Rs. 49,000. Similarly, milling machine price in the Annual Report is Rs.

39,500; "comparable landed cost" given in the report is Rs. 51,802, but the HMT price list quotes 'ex works' price from Rs. 44,000 to Rs. 70,000. How does this difference arise between the Annual Report and the price list? Which machine in the group is quoted against the foreign one?

(ii) A machine tool is judged by the 'rate of metal removal' and sustained accuracy over a number of years. The design of HMT's lathe is said to be about 12 years old, while machine tools abroad have progressed considerably both in rate of metal removal and convenience of operation. How does the comparison work out on this basis?

(iii) Comparison with foreign machines becomes difficult when it is said that HMT charges extra for many of the accessories and also for packing. Inland packing charges alone cost anywhere between Rs. 750 and Rs. 1,400 per HMT machine. The landed cost of foreign machines, which includes freight and insurance charges, would be less if India were a free market for them as bulk rates would be quoted in that event.

It should be useful if the HMT would throw light on these points.

Bombay.

"ARISTIDES"

COMPANY MEETINGS

THE INDIAN IRON & STEEL COMPANY LIMITED

The following statement by Sir Biren Mookerjee, Chairman of the Indian Iron & Steel Company Ltd., dealing with Company's working for the year ended 31st March, 1963, has been issued to Shareholders. The Annual General Meeting of the Company will be held on Tuesday, the 3rd September, 1963, at 3 p.m. at the Royal Exchange Hall of the Bengal Chamber of Commerce and Industry, 6, Netaji Subhas Road, Calcutta-1.

The highlight of the year under review was the attainment by the Burnpur Works of a production of iron and steel approximating to the rated capacity of the plant, an achievement which reflects great credit on the entire operational staff, who have refused to admit defeat in the face of the many adverse circumstances with which they have had to contend.

ACCOUNTS:

The effect on profits of the increase in production is not immediately apparent from the Profit and Loss Account. I should, therefore, perhaps point out that in the 1961-62 account there was included a sum of Rs. 2,28,51,875 arising from the retrospective increase in retention prices but relating to the year 1960-61. Against this has, however, to be set the adjustment of Rs. 1,40,01,141 relating to previous periods by which the value of the sales for 1961-62 had to be reduced by reason of the disallowance by Government of an element in the retention prices to compensate the interest chargeable on their Special Advance. The net special inclusion was accordingly Rs. 88,50,734 and if this is deducted from the gross profit of Rs. 9,18,78,416 shown for 1961-62, the comparative gross profit figure for that year becomes Rs. 8,30,27,682 in relation to the gross profit of Rs. 9,11,89,201 earned in 1962-63.

The 1963-64 Budget proposals in regard to the levy of a Super Profits Tax at penal rates on profits earned in excess of 6 per cent on Capital and Reserves caused us grave anxiety, since in their original form they would have imposed on our Company a liability for the year exceeding Rs. 1 crore. As a result of widespread protest, these proposals were, however, subsequently considerably modified, the concessions primarily affecting us being the allowance of a deduction of 10 per cent of total income in the computation of chargeable profits and the inclusion in Reserves of Development Rebate Reserve (in our case amounting to some Rs. 867 lakhs) not originally admissible. Although, in the result and in the circumstances explained in your Directors' Report, the possible immediate liability for the year is in our case now small, I cannot but regard the tax as ill-conceived. I say this for the reason that the tax can so readily operate to impose a penalty on efficiency and to constitute a positive disincentive to the expansion of the industries of India on which the entire future of the country depends.

OPERATING CONDITIONS:

You will be fully aware from my previous Statements of the difficult conditions under which operations are perforce carried on at Burnpur, the transport position, both as regards irregularity in the movement of wagons and the utilisation of wagons of unsuitable types, posing a constant problem in the handling of raw materials and the quality of purchased coal and limestone being a matter of the gravest concern. The position in regard to the latter materials was rendered still more acute by the commissioning of the remaining blast furnaces of the Hindustan Steel Limited during the year which led to a further deterioration in the quality of our supplies, the average ash content of our coal being 18.22 per cent as against 18.01 per cent for the previous year.

We are, in the matter of raw materials, contending against conditions far worse than those being experienced by the other

producers due to our very small allotment of washed coal (about 8 per cent of our requirements against nearly 100 per cent in the case of all other producers) and might, therefore, with some justification boast of our production achievements in keeping with the example set in certain other quarters. I must, however, confess to some feeling of inquietude at the position which has been forced upon the industry by the apparent view of the Steel Ministry that quantity of production alone shall be the criterion of efficiency without regard to quality. For the two years ended 31st March, 1962, in our fight to maintain quality, we produced to approximately 90 per cent of our rated capacity, about 80 per cent of our outturn of saleable steel being of tested quality. This position was accepted by the Tariff Commission after full investigation and their recommendation as to the sales retention prices for the period based accordingly. Despite this and the fact that a basis of 90 per cent capacity production constitutes also practically a world standard for the steel industry, these recommended prices, as I advised you last year, were cut by the Steel Ministry by no less than Rs. 19.50 per tonne, the major part of this reduction being made on the grounds that "the plants should have worked at 100 per cent of capacity instead of 90 per cent optimum mentioned by the Tariff Commission." The effect of the cut made by Government was in our case to impose on us a penalty by way of loss of gross earnings for the two-year period of no less than Rs. 405 lakhs. Faced with such a position where we have been penalised for our performance in place of the commendation we might justifiably have expected, we have had no option but with the greatest of reluctance to lower standards, for the maintenance of which I have fought throughout my entire association of over thirty years with the Company, and the attainment of a production of 100 per cent of rated capacity has been achieved only at the expense of a drop in the proportion of tested quality steel to about 60 per cent of the total outturn, the rest being of commercial quality, with further reduction possibly still to come.

A constant drive for more and more production is fraught with many risks which, although apparently contrary to the views of those in authority, I cannot help but feel should not be taken, particularly having regard to the period of emergency through which the country is now passing. With the present quality of raw materials and the irregularity of their supply, the task of maintaining production is difficult enough in all conscience, for the efficient working of a steel plant is, in effect, a combination of art and science superimposed on an essential and fundamental background of rhythm. To the extent that more constants can be established so is the rhythm improved but where there are many and serious variables as now, then is the rhythm broken, this in turn cutting into production and quality — a set of conditions which the steel producer most dreads.

A modern steel plant is robustly built but nevertheless there are many delicate sections in it where constant care and vigilance is needed. Hence, maintenance must get the highest priority even at the cost of some loss in production. Just like the human body, where, although the stomach can stand a lot, the heart, brain and lungs are very delicate, so in a steel plant the Turbo-Blowers, the Ilgner Plant and the Cogging Mill are the vital points. Unless these are attended to regularly with special attention at the slightest sign of

irregularity a major breakdown may ensue. The position is particularly hazardous in the case of our Indian steel mills where the holding of a large quantity of spares of all kinds is not possible owing to foreign exchange shortage and where any major breakdown could accordingly involve a prolonged and very serious loss in production. If, therefore, at the goad of the Steel Ministry capacity production must be obtained to avoid penalty, there is always the danger of chances being taken which might result in disaster. These are commonsense and practical matters allowing no scope for arbitrary decisions which, I suggest, should not have been and should not be made without the support of the highest expert advice available within or, if necessary, without the country.

FURTHER EXPANSION

I advised you last year that dependent upon the availability of raw materials in general of the requisite quality and, in particular, of coking coal of reasonable ash content, there existed a potential for further expansion of the production capacity of the Burnpur Works by approximately one million tonnes of crude steel per annum and that such expansion for planning purposes had been phased into two parts. Phase I, which is that under immediate consideration, would cater for an increased annual production of some 300,000 tonnes of equivalent ingot steel to be processed in the existing Rolling Mills, while Phase II, to follow in due course to accord with the overall planning of Government, would cover the balance increase of some 700,000 tonnes of crude steel, the form of final processing of which would be dependent upon the future requirements of the country. The World Bank has expressed its interest in the implementation of Phase I and the position so far as Government are concerned is that they have officially announced that there is no objection in principle to the further expansion of the Private Sector steel plants and have called for technical and financial reports in regard to this first phase of the Company's expansion programme.

It has been pointed out to Government that the availability of adequate quantities of good quality metallurgical coal is a prerequisite to any further expansion and that since Government have previously indicated that the Private Sector plants must make themselves self-sufficient in the matter of their coal requirements, the position, of necessity, hinges upon the ability of the Company to implement the Chasnalla Project for the development of the Company's coal-bearing properties, for the finance of the foreign cost of which a loan of \$19,500,000 has been negotiated with the World Bank as reported last year. The difficulty in this matter lies, therefore, not in connection with the foreign cost which is fully covered by the loan, but in the finding of the finance necessary to cover the local cost of the Project in view of the fact that the position in this latter respect has gravely deteriorated since arrangements were concluded with the World Bank in December 1961.

This deterioration is due to two factors. Firstly, an increase of Rs. 459 lakhs in the estimate of such local cost caused by (a) lack of Governmental support in the matter of land acquisition which has necessitated the abandonment of the proposed open-cast mining section of the project and a compensatory enlargement at considerably greater expense of the deep-mining section and (b) the very heavy impact of the 1963-64 Budget on construction costs by reason of the enhancement of import and excise duties, higher freight charges and increase in the prices of various controlled commodities, together with the general rise in the cost of all materials and services that must inevitably follow under the present economy of the country. And secondly, the severe loss of earnings, to which I have earlier referred, caused by

the drastic cut imposed by Government on the sales retention prices of steel that were recommended by the Tariff Commission.

Certain proposals by which the position could be covered have, however, been put forward to Government whose reply is awaited.

In view of the remarks made in the Report by your Directors you may perhaps question my present reference to the Chasnalla Project and I should therefore explain that since the date of that Report, an Order has been promulgated by Government under the Defence of India Rules, 1962, relaxing the provisions of Rule 52 in their application to the Company.

KULTI FOUNDRIES

To prejudice still further the financial position, another adverse factor has recently been introduced in the shape of attempt by the Steel Ministry to impose a cut on the supply of pig iron from Burnpur to Kulti and to divert supplies to such extent for the benefit of other and competing iron foundries and pipe manufacturers despite the fact that at the time the agreed decision was reached some years ago to scrap the two obsolete blast furnaces of Kulti it was made clear to and accepted both by the Ministry of Commerce and Industry

*Here with a loaf of
Bread beneath the bough,
a bottle of Gold Coin,
a book of verse and thou,
Beside me singing in
the wilderness—and wilder-
ness is Paradise enow.*

— with apologies to 'Omar Khayyam'

(at that time having jurisdiction in the matter of iron and steel) and the Planning Commission that the full requirements of Kulti must be met from Burnpur before any iron could be made available by the latter Plant to outside parties. The effect of the proposed cut, if imposed, would be a curtailment of operations at Kulti which, apart from rendering surplus 3,263 staff and workers involving payment of retrenchment compensation of approximately Rs. 20 lakhs, would result in a loss of earnings to the Kulti Foundries to the extent of some Rs. 55 lakhs per annum. Moreover, such a situation would inevitably lead to the gravest impairment of labour relations not only at Kulti but also at Burnpur, the possible result of which could be disastrous both to the Company and to the country.

The Company has naturally made the strongest representations in the matter the result of which is awaited and I may perhaps be forgiven if, in the face of the many adverse circumstances with which we have to contend, I confess to some feeling of frustration at times at the difficulties it would appear are unnecessarily and without due consideration thrown in the path of the Company in seeming discouragement of its efforts towards the advancement of the industry of the country.

DECONTROL:

You will doubtless be aware that Government have presently under consideration the possibility of decontrol of the distribution and prices of steel. In this connection a meeting was convened in New Delhi by the Steel Minister on

the 6th July, 1963, which was attended by the Chairmen of the Public and Private Sectors of the industry when the overall aspects of the matter were discussed. The relaxation of one of the multifarious Governmental controls over the industries of the country would naturally be welcomed. It must, however, be appreciated that the steel industry is not yet in a position to meet the full demands of the country and that the fullest and most effective utilisation of capacity must therefore be ensured, this involving the elimination of wasteful competition and the most economic usage of the over-strained railway transport system. It will be apparent, therefore, that in the interests of the country, the consumers and the industry, direct Governmental control would of necessity have to be replaced by some form of possibly modified control on a voluntary basis by the industry itself and the detailed joint proposals of the main producers in this connection are now being worked out for submission to Government.

ACKNOWLEDGEMENTS:

In conclusion, I would express on behalf of the Board of Directors our appreciation of the services rendered by the General Manager, Mr. J. McCracken, the Executive Heads and the entire Staff and Workers of the Company who by their ability, determination and wholehearted effort have made possible the results that have been achieved.

Note: The above statement is not a document purporting to be a report of the proceedings of the Annual General Meeting.

A friend in a foreign land

that is what the Bank of Baroda will be to you when you want to transact business abroad. And a faithful friend at that. The Bank of Baroda through any of its foreign branches or its correspondents all over the world, is fully equipped to offer all the services needed in foreign trade and to handle every type of foreign exchange business—including the negotiation/ collection of export bills, clean bills and cheques, issue of letters of credit and travellers cheques, foreign remittances, credit information, etc., and will be pleased to assist you in solving your problems concerning imports, exports, and foreign travel.

For your foreign
business, make it a
point to depend on...

Branches in London, Nairobi, Mombasa, Moshi, Mbale, Mwanza, Jinja, Kampala, Kisumu, Dar-es-Salaam, Narainganj (E. Pakistan), Port Louis (Mauritius), Lautoka and Suva (Fiji Islands), and correspondent banks acting as agents in all the other principal cities of the world.

THE TATA IRON AND STEEL COMPANY LIMITED

Statement of the Chairman

The following statement by Mr. J. R. D. Tata, Chairman of the Tata Iron and Steel Company Limited, dealing with Company's working for the year ended March 31, 1963, has been issued to shareholders. The Annual General Meeting of the Company will be held on Thursday, August 29, 1963, at 4-30 p.m. at the Birla Matushri Sabhagar, 19, Marine Lines, Bombay-1.

TO THE MEMBERS,

1. The year under review has been a difficult one for India, overshadowed by the Chinese attack on our Northern Frontiers. While military operations, which ceased abruptly with the Chinese withdrawal in December 1962, left substantially unaffected the country's territorial integrity, the economic aftermath of the invasion has been a serious one. Although viewed in retrospect the limited Chinese attack on India may prove in the long run to have been a blessing in disguise for having swept away dangerous illusions and policies based on them, concerning China's avowed friendship for India, it has placed on us a grievous, and possibly permanent, burden of additional defence expenditure at a time when all our resources were required for economic development. With the realisation of our military unpreparedness against such a powerful and ruthless enemy, the need to strengthen and modernise our defence apparatus at the cost of a much larger part of total available resources, slender as they are, became inescapable.

2. The Finance Act has made only too clear to us all the magnitude of this new burden. While there is, I am sure, none amongst us who would deny the need to provide whatever funds are required to strengthen our defences, much concern and doubts have been expressed in regard to specific provisions of the Act and particularly in regard to the Super Profits Tax. The matter was so fully argued and discussed both publicly and privately at the time that little purpose would be served by my using this occasion to repeat here what has been so thoroughly ventilated earlier. We can only hope that the Finance Minister who, much to his credit, gave the assurance that he would review this particular measure if it was found in practice to be detrimental to the country's economic growth, will, in fact, do so at a suitable opportunity. It is fortunate that, in our own case, the Super Profits Tax will place no burden on our Company, thanks to the large capital and reserves employed in our business.

3. Coming to our own affairs, shareholders will see from the Directors' Report and the Accounts that the Company made gratifying progress during the year under review. Both output and profits have risen appreciably and the Company has now begun to reap the fruits of its heavy investment in money and effort undertaken over the last seven years.

4. I am particularly happy, that the improved results have made it possible for the Directors to recommend a slightly higher dividend on ordinary shares. The fact that the dividend in the hands of the shareholders is still considerably less than prior to the Expansion Programme is solely due to the change in the tax laws of the country since 1960, but that is a matter entirely beyond our control the burden of which would have been felt even if the Expansion Programme had not been undertaken. In fact, there is no doubt in my mind that had we not grasped the opportunity of doubling the capacity of our plant, the position of the shareholders would be less favourable than it is today and it would progressively deteriorate year by year as the plant got older and more costly to operate.

5. Shareholders will remember that, when the Expansion Programme was first mooted and some of them expressed serious doubts as to the wisdom of spending so much money on expansion, I pointed out that the Company's prosperity and, in fact, its ultimate survival would depend on its continued ability to remain competitive in the changed situation in the Indian Steel Industry as a whole which would emerge from its rapid growth and the creation of a number of large modern plants.

6. Competitiveness, in a controlled industry like ours, means, in essence, the ability to produce steel cheaper, or at least at no higher cost, than the rest of the industry. We could never have achieved this with a plant most of which was built after the first World War and which required an unduly large labour force in relation to its output. In any field of industry, an enterprise that fails to grow and to replace old plant and machinery with new and more efficient equipment must inevitably decline and ultimately die.

7. I am sure that even our most sceptical shareholders are today glad that the Company embarked upon the Modernisation and Expansion Programme (MEP) and the Two Million Ton Programme (TMP) and I have no doubt that the wisdom of this step will become more evident as the years go by. I hope, at the same time, that they will realise that this process is a continuous one and that the Company, so long as it exists, can never afford to sit back and feel content that the modernisation and expansion achieved between 1956 and 1960 will be sufficient for ever after. We must be prepared not only to replace old plant and machines as they wear out and as new and better ones become available, but also to expand further if and when we are given the opportunity to do so on a sound remunerative basis. Efficiency and low costs nowadays are increasingly linked with large-scale production. Whereas a few years ago, a million ton steel plant and, say, a thousand ton a day blast furnace were considered exceptionally large and efficient, today even a two million ton plant is small by world standards and a two thousand ton blast furnace is by no means amongst the largest built. In this heaviest of all industries particularly, the size of steel plants and of the individual items in them has grown continuously over the years not only in order to make more steel, but because, by the better and more efficient use of materials, power, transport and labour, they are able to produce at lower cost. In addition, technological advances and new processes have increased efficiency and lowered costs.

8. Those, therefore, who intend to remain shareholders of this great Company of ours must, in their own interests, be prepared to take a long term view and allow the Company to accept the additional burdens and responsibilities involved in continued modernisation and, wherever the opportunity occurs, in further expansion. For only by such means can we remain strong, efficient and competitive and can dividends be maintained or improved.

9. An opportunity for further modernisation and expansion may, in fact, come our way sooner than expected. As shareholders will have gathered from recent press reports, Government, in their advance planning of steel-making capa-

city in the fourth Plan period, are considering a further expansion of capacity in the Private Sector in addition to that proposed for the Public Sector. We have been asked whether our Company would be interested in a further expansion at Jamshedpur and willing to undertake it during the Fourth Five-Year Plan. This matter is still at an exploratory stage and no decision is likely to be taken for a considerable time. The Management of your Company is at present engaged in a preliminary study of such a project. In the meantime, we have informed Government that we would in principal be willing to play our part in the expansion of the Indian steel industry as a whole provided such an expansion could be financed without undue strain on the Company's resources and would safeguard the interests of the shareholders.

10. From the preliminary studies we have already made, it would seem that a further expansion of something between half a million and a million ingot tons could be undertaken economically within the existing plant area. In considering this matter, we will be guided solely by the technical and economic soundness of the project, the financial stability of the Company, the interests of the country and, by no means last, the interests of the shareholders.

11. The most important obstacle to surmount will be the question of finance. The cost of such a scheme, if for a million tons, would probably exceed Rs. 100 crores, at least half of which would be in foreign exchange. The World Bank, to which we still owe Rs. 34 crores, out of the Rs. 51 crores they lent us for the Two Million Ton Programme (TMP), would obviously be primarily concerned in such a scheme, whether they financed it themselves or not, and we would have to satisfy them that it could be undertaken without affecting our capacity to service their existing loans, let alone any fresh borrowing raised for the new Expansion Project.

12. Shareholders would probably look upon such a proposal from their own point of view and particularly the effect it would be likely to have on their dividends and on the market value of their shares. It is too early for me to give shareholders any indication of how these will be affected by a further programme of expansion. I can, however, assure them on behalf of my colleagues on the Board and myself, that we will recommend a scheme of further expansion only if we are thoroughly satisfied that the project is technically and economically sound and that it can be undertaken on terms wholly fair, and even attractive, to the shareholders.

13. While on this subject, I may refer briefly to Government's plans for the expansion of the industry as a whole. While the present steel-making capacity of the five major plants in India is about six million ingot tons, the Planning Commission have estimated the country's requirements at ten million tons at the end of the Third Plan and eighteen million tons at the end of the Fourth Plan.

14. Because of the long time it takes to expand existing plants and to build new ones and the many and difficult problems involved in correspondingly increasing supplies of raw materials, coal, transport and power to cope with the increased output of steel, it is doubtful that these targets will be reached according to schedule.

15. It is my personal view that the maximum practical target that can be reached at the end of the Fourth Five-Year Plan will not exceed fifteen million tons which itself would be a considerable achievement and in my view adequate. Of the present firm decisions taken, the proposed creation of the Bokaro plant is by far the most important. Some shareholders and others may have been surprised that, as Chairman of the largest producer in the Private Sector, I should have gone out of my way to support publicly the Bokaro project both in India and abroad. I am sure, however, that

most people, including our shareholders, will approve of my action. India's economy and the standard of living of our people cannot grow without additional steel and it is clear that the Private Sector, even if permitted to do so, would not be able to undertake on its own a programme of expansion at an average rate exceeding a million tons of new capacity per year.

16. Assuming a capital cost per ton of installed capacity of anything between Rs. 1,500 and Rs. 2,000 per ton, the sums involved are so enormous, as to be clearly beyond the present and foreseeable resources of the Private Sector. It would be both unreasonable and unpatriotic of anyone to place the interests of private enterprise above those of the nation as a whole, and I therefore had no hesitation in publicly supporting the Bokaro project, when it seemed that such support might help in allaying some of the doubts expressed in America in regard to aid for this project. I sincerely hope that the U.S. Government and Congress, who have contributed so generously upto now to India's economic development, will find it possible to give their support to this vital project.

17. Shareholders will also have learnt from press reports that the Government of India were considering the possibility of abolishing wholly, or in part, statutory control over steel prices and distribution which has been in force since 1941. With the increased availability of steel from the five major plants in the country and the gradual narrowing and, in some cases, disappearance of the gap between retention and selling prices, the situation in the country in regard to steel supplies has materially changed, and Government have decided to review the whole question of continued control over the steel industry.

18. The Minister for Steel and Heavy Industries is to be complimented on taking a lead in reviewing Government's approach to the complicated and difficult problem of steel distribution and pricing. It is also gratifying to find that, before coming to a final conclusion on the subject, he decided to seek the views of the industry. For this purpose the Minister called a meeting of the three main producers early in July 1963, at which the whole subject was tentatively explored.

19. In expressing their views and suggestions in Delhi, the representatives of the basic steel industry informed Government that they would welcome decontrol provided that, at the same time, steps were taken to ensure that the transition was a smooth one and that reasonable prices were fixed which would be fair to both the consumer and the producer.

20. The meeting was purely of an exploratory character and no decision was taken. The tentative views expressed by the industry were sympathetically heard, and I am grateful to the Minister, who was good enough to preside over the meeting, for his fair-minded and pragmatic approach to the problem. The Minister asked the representatives of the three main producers to discuss the matter further amongst themselves and to place their considered views before Government as soon as possible.

21. At this early stage it would not be proper for me to express any views on the subject. I can only say that I personally believe that if the steel industry is allowed to conduct its own affairs in future, under a carefully thought-out scheme which will safeguard the public interests, a progressive step will have been taken to the advantage of all concerned and of the country as a whole. I therefore hope that these constructive discussions will fructify.

22. I regret to report that the Special Alloy Steel Project, which the Company has had under consideration for the last three years, has had to be shelved for the time being for two reasons: First, it has been found impossible upto now

to interest a foreign collaborator in participating in the project on the condition imposed by Government that the whole of the foreign exchange cost should be wholly provided by the foreign partner and, second, the Government of India have decided that this project should be transferred to the Public Sector. I can only regret this decision and hope it will be possible to revive our project at some time in the future.

23. In last year's Directors' Report and the Chairman's statement a reference was made to Government's request that we should increase the output of our coal mines by about 1.5 million tons of raw coal or 1 million tons of washed coal so as to become self-sufficient in coking coal supplies. The study of this project has taken longer than expected mainly because, owing to the prohibitively high estimates of cost first submitted to us, we had to have the matter re-examined by another firm of consultants whose preliminary techno-economic report has just been received. The estimates contained in this second report are, I am glad to say, substantially lower than in the first. Discussions on the subject have been initiated with the World Bank, who have taken a special interest in the development of the Indian coal industry, and I hope that by the time the next annual report is submitted to you, a satisfactory decision will have been taken.

24. I have nothing special to report in regard to the ope-

rations of the Company during the current year, of which four months have elapsed at the date of this statement. A further advance in production may be expected during the year, particularly as a result of the commissioning of the Tonnage Oxygen Plant which is to supply oxygen to SMS 3. The erection of this plant will be completed shortly and should be in operation before the end of the year. I must, however, point out once again that in such a complex industry as ours, involving the close co-ordination of many elements and factors beyond our control, continuous operation at hundred per cent of capacity is not an easy task. I can assure shareholders, however, that every effort will continue to be made to bring the plant to its full production and efficiency of which over ninety per cent was achieved by the end of the year under review.

25. In conclusion, I am sure the shareholders would like to join my colleagues on the Board and myself in thanking our officers, staff and workers whose sustained efforts over the past few years have been largely responsible for the continuous improvement in the performance of the Company.

BOMBAY,
25th July, 1963.

J. R. D. TATA,
Chairman.

RUBY GENERAL INSURANCE COMPANY LIMITED

Chairman's Speech by Shri B. M. Birla

Delivered at the Twenty-seventh Annual General Meeting on Tuesday, the 30th July, 1963

Gentlemen,

It gives me great pleasure to welcome you to the 27th Annual General Meeting of the Company. I hope you have noted with satisfaction the good results for the year under review.

The net premium has increased from Rs. 70,38,000 in 1952 to Rs. 1,85,12,000 in 1962 and the Capital and Funds from Rs. 76,83,000 to Rs. 1,88,73,000.

FIRE DEPARTMENT:

The net premium income for the year amounts to Rs. 78,21,000 as against Rs. 71,99,000 during the year 1961. The Department has shown good increase in the premium in spite of considerable reduction in rates from 1st July, 1962. The working has resulted in a profit of Rs. 16,43,000. The reserve has increased from Rs. 35,99,000 to Rs. 39,11,000.

MOTOR AND MISCELLANEOUS DEPARTMENT:

The net premium income for the year is Rs. 93,07,000 and shows a small reduction in comparison to the previous year due to the cautious underwriting policy followed by the Company, particularly in respect of automobile business in foreign countries. The Department has shown a profit of Rs. 4,17,000 and the Reserve now stands at Rs. 46,53,542.

I am glad that the Insurance Association has increased 'No Claim Bonus' to a maximum of 50 per cent for a claim-free period of 5 years though the premium rates on Motor Cars had to be increased from 1st August, 1963, due to adverse claims experience.

MARINE DEPARTMENT:

The net premium income for the year is Rs. 13,84,000 as against Rs. 15,78,000 during the previous year. The reduction in premium income is in respect of business written outside India which mainly consisted of foreign Hull business where the results had not been good. The working for the year has resulted in a profit of Rs. 1,31,000. The Reserve amounts to Rs. 13,83,622.

GENERAL:

The total premium income for the year amounts to Rs.

1,85,12,000 as against Rs. 1,81,80,000 in the previous year. The profit after deduction of tax at source and provision for taxation amounts to Rs. 13,35,783. This has enabled your Directors to provide for additional reserves and recommend a Dividend of Rs. 1.25 per share as against Rs. 1.05 per share for the year 1961.

The Government has brought into force the Emergency Risks Insurance Acts for compulsory insurance of Factories and Goods during the period of emergency and has authorised only one General Insurance Company, which is the Subsidiary of the Life Insurance Corporation, to receive the application forms and to issue the Policies. It is regretted that the Government did not accept the offer of voluntary services by other General Insurers for the purpose. It would have been convenient for the insuring public and economical to the Government if all the general insurers were authorised to undertake this work.

The Government has introduced Super Profits Tax to meet the increased defence requirements. The Insurance Companies by the nature of their business should have been exempted from this tax. However, the Government should allow the reserves for unexpired risks to be treated as part of the Capital under the Super Profits Tax Act.

The voluntary measures by the Executive Committee of the Insurance Association of India under the revised Code of Conduct for improving the working of the Insurance Industry are showing results but the success would depend on the extent of co-operation and support it would receive from the Insurance Companies themselves.

In concluding this review I wish to express our thanks to our Patrons for their continued support and to the Executives, Staff, Fieldworkers, Agents and other representatives in India and abroad for their co-operation and devotion to duty which has enabled the Company to achieve these good results.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

ORISSA CEMENT LIMITED

Summary of the Speech of the Chairman, Shri J. Dalmia, delivered at the Thirteenth Annual General Meeting of the Company held at Rajgangpur (Orissa State) on 5th August, 1963.

Gentlemen,

I have great pleasure in welcoming you to the Thirteenth Annual General Meeting of your Company. Despite an increase of 10 per cent in the gross sales, the profit earned by your Company is lower at Rs. 142.20 lakhs compared to Rs. 160.59 lakhs in 1961 for the reasons discussed in the Directors' Report. After a good deal of thought your Directors decided in favour of strengthening the General Reserve by transferring Rs. 13.50 lakhs to the said reserve even though this necessitated a reduction in the dividend from 15 per cent to 10 per cent. I am, however, glad to inform you that the representation made by your company to the Central Board of Revenue for grant of tax concession pursuant to Sections 84 and 101 of the Income Tax Act 1961 in respect of the profits from the various refractory plants has been successful. The total quantum of the tax exempt profit available amounts to Rs. 31,01,873 and this being more than the dividend for the year 1962, no deduction of tax at source will be made from the said dividend. An amount of Rs. 6,17,873 out of the tax exempt profit is carried forward and would be available for future dividends.

Incidentally, I would like to point out that the system of tax deduction at source from dividends and interest on Government securities is causing a great deal of hardship to the lower income groups, in spite of the provision in the law for grant of exemption certificates to persons whose income might be below the taxable limit. These people with low incomes are already finding it difficult to sustain themselves and their families especially with the persistent rise in the cost of living. They deserve to be assisted and I would urge the Finance Minister to consider and give exemption from tax deduction in respect of dividends of say Rs. 300 or less to an individual shareholder.

As mentioned in the report of your Directors, on account of difference of opinion between the two Arbitrators, the dispute regarding electricity charges had been referred to the Umpire, Mr. M. C. Mahajan, Ex-Chief Justice of India. The Umpire has given his award in which he has decided the basis to be adopted in computing the electricity charges to be paid by the Company. Actual calculations will take some time but the amount payable by your Company would work out to well below half the figure of Rs. 92.09 lakhs which has been shown in the Balance Sheet as Contingent Liability.

I would now like to refer to the incentive Scheme introduced by the Government of India with effect from 1st January 1963, for maximising production in the cement industry. In the case of your company, the incentive would become payable at Rs. 5.50 per tonne for the extra tonnage, if any, produced in 1963 over 3,80,000 tonnes. The objective underlying the scheme is indeed commendable and I hope that this scheme which is valid only for the current year to begin with, would be made a regular feature of the price system so long as the retention prices are regulated by Government. I should like, however, to point out that the norm adopted for the purpose of this scheme, that is, the maximum production attained in any calendar year during 1960-1962 places at undeserved disadvantage those producers who kept up their efforts to maximise production and reached the optimum or near optimum level during any of the three years of the reference period. Worked on this basis, the incentive will be self-defeating and will cease to provide the continuous impetus necessary to make the scheme a success.

A better and more workable method would be to relate the norm to the average production of each unit during the last three years. I am sure that with this and a few other minor modifications, the scheme would well serve its purpose by providing a positive incentive for all the cement units.

After examining the impact of various levies, which have been imposed from time to time since the cost investigation by the Tariff Commission, the Government has now allowed an increase of Rs. 2.75 nP. per tonne in the retention prices payable to the Cement Producers with effect from 1st June, 1963. The retention price payable to your company would now be Rs. 72.25 nP. per tonne. The increase falls short of the demand made by your company and covers partially the increased cost consequent on Governmental action. Moreover, this has not been given retrospective effect from 1. 11. 1961. I hope the Government would take a realistic view and would provide adequate relief to the Cement Producers for the actual increases in production costs due to Governmental actions, which are beyond their control.

The Refractory industry is today faced with certain crucial problems. The installed capacity of the Industry (excluding mortars and deadburnt magnesite) at the end of 1962, and as anticipated at the end of year 1963 and 1964 on the basis of figures discussed at recent meetings of the Panel on Refractories are 6,67,400; 8,31,700; 9,40,700 tonnes respectively and with the licences under active implementation and plants under construction, it may rise to about 12 lakh tonnes during 1965. This expansion of the Refractories Industry was based on the steel production capacity reaching a target of 10 million tonnes per annum by the end of the Third Five-Year Plan. It appears, however, that by 1964-65 and perhaps even in 1965-66, the steel industry would not exceed a production rate of about 6 million tonnes per annum.

I will now turn to the requirements for refractories, actual and anticipated. In 1962, the production which may be taken to represent approximately the demand of Fire-clay, Silica and Basic refractories, was 5,32,787 tonnes i.e., 80% of the installed capacity. The requirements for 1964-65, when the steel industry may have a production rate of about 6 million tonnes per annum, would be 6,35,501 tonnes i.e. 67% of the installed capacity in 1964-65.

A consideration of these figures will show a progressive deterioration in the position of the industry when its overall unutilised capacity of 20% in 1962 would increase to 33% in 1964-65. If, as I have mentioned earlier, the installed capacity for fireclay, silica and basic bricks increases to 12 lakh tonnes during 1965, and the demand remains around the same level as in 1964-65, at only somewhat over 6 lakh tonnes, the industry would have an idle capacity of as much as 50%. This in itself would be disastrous. The Industry also cannot ignore the possibility that there is an over estimation in the rate of consumption of refractories per tonne of steel produced. This is particularly so in the case of basic refractories, as I had mentioned last year. We are further concerned with the indications that new capacity in the steel industry may be largely planned for making steel by the L. D. process or by other Oxygen processes where instead of the conventional basic refractories, only tar bonded dolomite bricks are required.

The changeover in the steel industry to all basic open hearth furnaces is taking place even more rapidly than was

expected with a consequent rapid decline in the demand for silica bricks. I realise that while very major expansions are being planned in the capacity of the steel industry, the demand for refractories cannot remain at a constant level, linked only to the operational requirements of the steel industry. This will be increased appreciably by the constructional requirements for refractories, which might increase the demand by about 20%. It would be to the mutual benefit of both, the steel industry and the refractory industry, if the steel industry were to formulate and place its demands for refractories for constructional purposes well in advance so as to enable the refractory industry to utilise its capacity most gainfully and at the same time eliminate the risk of the steel industry having to import refractories which they are unable to get in the country at short notice. Even allowing for some inbuilt surplus in the capacity of the refractory industry, it is apparent from what I have said earlier that there can be no justification for any further expansions in the capacity of the refractory industry, for several years to come.

It is fortunate that your company has developed the manufacture of certain special types of refractories, such as, silica coke oven bricks, forsterite bricks, blast furnace bricks, burnt basic roof bricks, chemically bonded steel clad basic roof bricks etc., which, to a great extent, were being imported hitherto. In this manner, we would not only be able to contribute to savings of foreign exchange but, would be able to equip ourselves better to meet the difficulties created by over-production in the industry.

Both the steel industry and the refractory industry would benefit if shapes and sizes of bricks are standardized as far as possible and common specifications are adopted for all the steel plants. This would not only facilitate manufacture but would enable supplies to be made at short notice. The adoption of the Indian Standard Specifications would also discourage any tendency to resort to imports of refractories according to certain foreign specifications. I am sure that the authorities concerned are fully alive to this problem and that they will continue to cut down still further whatever imports are taking place.

The difficulties in the procurement of the right type of raw materials for the industry, due to the mineral licensing policy and the manner of its implementation by certain States, continue to exist. I am happy to advise, however, that the importance of removing these difficulties is being given greater recognition by the Panel on Refractories. The tendency on the part of certain States to impose restrictions on the grant of mining leases for minerals to be used for industrial purposes outside their boundaries, also appears to be diminishing. There are, however, frequent delays in the disposal of mining lease and prospecting licence applications, but in view of the present emphasis on efficiency and economy in the country, we may hope that there will be more expeditious disposal of such cases.

The industry is grateful to the Geological Survey of India for the investigation which they have undertaken on finding new sources for the supply of important raw materials required by the industry, such as, high alumina plastic and non-plastic fireclays, chrome ores and bauxite.

At the Fourth Session of the Industrial Committee on cement held on 15th September, 1962, it was decided to appoint a Tripartite Sub-Committee to consider in the light of the workload studies already carried out in the three cement factories, the question of undertaking similar workload studies in other cement factories and to recommend, inter-alia, the appropriate agency for carrying out such studies. The Sub-Committee has been constituted only recently after the

lapse of nearly seven months and has yet to begin its labours. I would once again urge that these studies should be expedited so that the assessment of the workloads is completed well before the question of revision of the wage structure in the cement industry comes to be considered.

In the end, I would like to express on your behalf and on behalf of your directors our sincere appreciation of the services rendered by the workers, staff and officers of the company during the year under review.

N.B.—This does not purport to be a report of the proceedings of the Thirteenth Annual General Meeting.

Need facts about importing from Australia?

Alert, progressive importers have much to gain from Australia's rapidly expanding export potential. The Bank of New South Wales, Australia's first and largest commercial bank, is uniquely equipped to provide vital up-to-date information on importing from or investment in this fast-developing Continent. RECORDS AND STATISTICS

A Review of Commodity Prices for 1962-63

THE OFFICIAL index of wholesale prices (with the year ended March 1953 as 100) rose steadily from 124.2 in April 1962 to the peak level of 131.1 in August 1962. Thereafter it moved within narrow limits till November but fell substantially to 125.8 in December 1962. In the first three months of 1963 the index again showed a rising trend and was at 127.2 in March 1963. The increase in the index during March 1963 was partly due to the recent Budget measures. The average index for the fiscal year 1962-63 worked out to 127.9 depicting a rise of 2.2% over the average of 125.1 for the year 1961-62.

During the year under review, 'Food Articles' advanced by 5.0 per cent to 126.1, 'Tobacco' by 0.6 per cent to 97.4, 'Fuel Power, Light and Lubricants' by 1.8 per cent to 124.3, 'Intermediate Products' by 0.5 per cent to 139.5 and 'Finished Products' by 2.0 per cent to 127.1 while 'Industrial Raw Materials' declined by 4.3 per cent to 136.5.

Food Articles

The index for 'Food Articles' exhibited a rising trend in the beginning of the year under review. It stood at 120.5 in April, 1962 and reached the level of 131.5 in August 1962. In the next four months the index showed a fall and came down to 122.8 in December 1962. Thereafter, the index witnessed a rise and was at 124.2 in February 1963 but came down to 123.4 in March, 1963. The sub-groups which exhibited variations during the year were: 'Cereals' (+3.2%), 'Pulses' (+14.5%), 'Milk and Ghee' (+6.9%), 'Fish, Eggs and Meat' (+6.2%) and 'Sugar and Gur' (+21.2%), 'Fruits and Vegetables' (-1.5%) and 'Edible Oils' (-2.7%).

The monthly index for 'Cereals' rose from 102.2 in April 1962 to 109.5 in August 1962. In the next two months it witnessed a declining trend and stood at 108.5 in October, 1962. It, however, rose to 109.4 in the next month. Thereafter it showed a continuous fall and stood at 102.0 at the end of the year under review. The monthly index for rice went up from 105.7 in April 1962 to 116.4 in November 1962. It witnessed a fall during the next two months and stood at 108.1 in January, 1963. Afterwards, it started rising and was at 109.6 at the close of the year. The fiscal year average for rice for 1962-63 worked out to 111.0 as against 105.0 for 1961-62, exhibiting a rise of 5.7 per cent. The index for wheat which was at 92.0 in April 1962 fell during the next two months and stood at 87.8 in June, 1962. The index, however, rose to 92.6 in August, receded to 91.2 in September and remained around this level until November. Finally it fell from 88.9 in December to 87.2 in March 1963. The annual average index of wheat for 1962-63 stood at 89.8 as against 91.0 for 1961-62, showing a fall of 1.3 per cent. The yearly average for jowar for the period under review recorded a rise of 15.3 per cent to 129.6 over the earlier year's average of 112.4. The fiscal year average for bajra declined by 6.0 per cent to 124.4, barley by 8.8 per cent to 90.2, maize by 8.3 per cent to 101.1 and ragi by 9.8 per cent to 107.0. Gram rose by 6.9 per cent to 88.9 as compared with the average of the previous year. Among 'Other Pulses' arhar moved up by 28.9 per cent to 116.9, masur by 24.4 per cent to 109.2 and urad by 21.0 per cent to 129.4 while moong registered a slight fall to 101.4. As regards the 'Fruits and Vegetables' sub-group, potatoes, onions, oranges and cashew-nuts declined by 9.2, 9.2, 13.9 and 5.9 per cent to 127.0, 145.8, 198.9 and 68.9 respectively while bananas rose by 9.7 per cent to 130.1. Milk and ghee advanced by 5.7 and 8.2 per

cent to 123.3 and 125.7 respectively. 'Edible Oils' were lower by 2.7 per cent to 152.3 when compared with 156.5 for the earlier year as a result of a fall in the prices of groundnut oil (-10.5% to 128.8), gingelly oil (-14.9% to 133.4) and vanaspathi (dalda) (-2.0% to 145.4). Mustard oil and coconut oil, however, moved up by 3.7% to 183.6 and by 17.6% to 188.1 respectively. A rise of 6.2 per cent to 143.6 in the index for 'Fish, Eggs and Meat' was due to an all round increase in the prices of fish (+14.8% to 136.5), eggs (+7.4% to 148.1) and meat (+1.1% to 145.7). Sugar was higher by 4.5 per cent to 131.0 while gur went up by 31.7 per cent to 153.3. The annual average index of tea for 1962-63 stood at 174.9 as against 193.2 for the earlier year, showing a fall of 9.5 per cent. Coffee recorded a rise of 4.9 per cent to 92.4 as compared with 88.1 for the previous year. Among 'Other Food Articles' the commodities which showed variations during the year were: turmeric (+29.8%), chillies (+19.4%), cummin (+9.6%), cloves (+7.9%), salt (+12.4%), black pepper (-19.9%), cardamoms (-18.4%) and betelnuts (-2.6%).

Tobacco

The annual average index of 'Tobacco' stood at 97.4 as compared with 96.8 for 1961-62. Raw tobacco showed a fall of 2.0 per cent to 93.6, while tobacco manufactured recorded a rise of 10.9 per cent to 113.4 during the year under review.

Fuel, Power, Light, Lubricants

The average index of this group for the fiscal year 1962-63 worked out to 124.3, which was higher by 1.8 per cent when compared with 122.1 for 1961-62. Prices of kerosene, diesel oil and petrol moved up by 3.0, 2.0 and 1.9 per cent to 102.1, 125.8 and 115.7 respectively. Lubricating oil exhibited a slight fall. Aviation spirit also declined by 3.1 per cent to 98.7.

Industrial Raw Materials

The index for 'Industrial Raw Materials' which stood at 135.1 in April 1962 came down to 134.9 in the next month. Thereafter the index witnessed a continuous rise and reached 139.8 in September 1962. Afterwards it exhibited a fall and moved down to 133.7 in February 1963, rising again to 135.2 at the close of the year. The average index for raw cotton for 1962-63 worked out to 112.7, showing a rise of 3.8 per cent over the earlier year's average of 108.6. The annual average index for raw jute stood at 146.7 as against 178.0 for the previous year, exhibiting a sharp decline of 17.6 per cent. The fiscal year average for raw hemp also witnessed a fall of 12.1 per cent to 125.3 whereas the annual indices of raw wool and raw silk registered a rise of 16.0 and 5.8 per cent to 144.7 and 165.2 respectively. The fiscal year average for groundnuts was lower by 9.4 per cent to 140.3 as compared with that of the earlier year. The monthly index for groundnuts which stood at 148.9 in April 1962 recorded a fall in the next two months and was at 144.3 in June 1962. It witnessed a rise during the next three months reaching 151.6 in September 1962. A declining trend was noticed thereafter and the index moved down to 127.0 in January 1963. The index registered a rise in the next two months and reached the level of 133.8 at the close of the year. The annual average indices for linseed and gingelly seed declined by 2.4 per cent to 139.1 and 17.2 per cent to 137.7 respectively, whereas copra moved up by 19.5 per cent to 167.1 and rape-

seed by 5.2 per cent to 180.5. Amongst other commodities which exhibited significant variations during the year under review were: manganese ore (—7.3%), raw skins (—9.9%), lac (—32%), rubber (—1.2%), raw hides (+2.5%), logs and timber (+1.8%) and bamboos (+4.2%).

Intermediate Products

The index for this group advanced from 136.9 in April 1962 to 143.1 in August 1962. It, however, fell to 142.9 in September rising to 144.2 in October 1962. Thereafter it fell gradually and reached 136.2 in January 1963 and stood at that very level at the close of the year under review. Prices of tin (+54.7%), lead (+11.0%), aluminium (+7.6%), copper (+7.3%), coir yarn (+6.3%), cotton yarn (+4.3%), pig iron (+3.5%) and brass (+3.3%) registered a rise while zinc (—9.4%), linseed oil (—6.6%), rayon yarn (—6.5%) and leather (—3.3%) moved down during the period under review.

Finished Products

The index for the 'Finished Products' group which was at 125.3 in April 1962 went up to 127.2 in June 1962, and after a decline to 126.7 in September 1962, it advanced slowly to 128.5 at the close of the year under review. The index for cotton cloth (mill) which was at 131.4 in April 1962 showed a rise and reached 132.1 in June 1962. Thereafter it remained unchanged at that level till September 1962. The index exhibited a fall in the next two months and came down to 131.7 in November 1962. It remained at this level upto February 1963, but showed a small rise to 131.9 at the close of the year. The average index for 1962-63 for cloth (mill) worked out to 131.9 as against 131.2 for 1961-62. The fiscal year average for handloom cloth stood higher by 8.5 per cent at 127.8 as compared with 117.8 in the earlier year. The index for jute manufactures which was at 115.0 in April 1962 witnessed a fall in the next month and was at 113.2 in

May 1962. It went up to 118.1 in June 1962. During the next two months it again receded and stood at 111.1 in August 1962. In September 1962 it moved up to 113.3 but came down to 108.9 in October 1962. It showed a rise to 112.8 in November 1962. In the next two months it showed a fall and reached the level of 105.3 in January 1963. It witnessed a slight rise in February and stood at 105.4. The index, however, fell to 102.1 at the end of the year under review. The fiscal year average of jute manufactures for 1962-63 stood at 110.9 as against 122.4 for 1961-62, registering a fall of 9.4 per cent. The index for woollen manufactures rose from 130.5 in April 1962 to 141.3 in June 1962 and maintained that level till February 1963. It, however, rose further to 142.4 at the close of the year under review. The fiscal year average for woollen manufactures worked out to 140.4 as against 122.7 for the previous year, showing a rise of 14.4 per cent. The index for rayon and silk manufactures, which stood at 128.6 in April 1962 witnessed a rising trend till October 1962 when the index went up to 134.7. During the next two months it showed a fall and the index came down to 127.0 in December 1962. Afterwards the index exhibited a continuous rise and reached the level of 39.2 at the close of the year under review. The financial year average for 1962-63 stood at 131.8 as against 119.9 for the previous year, depicting a rise of 9.9 per cent. The fiscal year average for iron and steel manufactures recorded a rise of 5.5 per cent to 159.9 as against 151.5 for the earlier year. The financial year average for aluminium utensils was also higher by 6.4 per cent at 163.3. Other commodities which exhibited variations during the year were: general chemicals (+12.7%), bobbins (+9.7%), matches and medicines (+4.6%), coal-tar products (+5.4%), drugs (+3.8% each), lime (+3.7%), shoes (leather) (+3.5%), cement (+3.4%), soap (+3.2%), paints (+2.6%), vehicles (+2.5%), paper and newsprint (+2.3%), glass (+2.2%) and plywood tea chests and bricks and tiles (+2.0% each), fertilizers (+2.9%) and dyeing materials (—1.4%).

Oliver Twist Gets More

THE LABOURS of the Aid India Consortium this year have taken longer than expected, but the results have been better than expected. As against \$1,255 million asked for, the assistance now pledged amounts to \$1,052 million besides another \$60 million to be made available outside the scheme of the Consortium. True, the gap still remains between India's estimated needs and the amount which has been subscribed, but once West Germany, France and Italy had firmly indicated — as they had done early in the discussions — that they would be offering considerably less this year than last, it became obvious that India would not be obtaining the total assistance it had applied for.

The only question, therefore, was how large the cut was to be. At the Paris meeting in June the pledges, totalling \$1,017 million, fell appreciably short of the Indian request. At the same time, with the United States offering up to another \$75 million on condition that other Consortium members stepped up their assistance, there was a fair chance of the final figure drawing much closer to India's estimated needs. This chance has been turned to good account in the final discussions in Washington last week. West Germany has substantially stepped up its contribution from \$65.35 million offered at the Paris meeting to \$99.5 million, while Italy has stepped up its contribution by \$10 million, Japan by \$5 million and Austria by \$3 million. These increased commitments have enabled the United States, for its part, to step up its assistance from \$375 million to \$435 million on the "matching" principle. Another significant addition is in respect of the combined contributions of the World Bank and IDA which would now be providing \$245 million as against \$220 million promised in Paris. The final figures of aid pledged by the Consortium are tabulated below:

AID PLEDGED FOR THIRD PLAN

(Million of U.S. dollars)

Consortium	1961-62	1962-63	1963-64
Austria ..	—	5	7.0
Belgium ..	—	10	10.0
Canada ..	28	33	30.5
France ..	15	45	20.0
West Germany ..	225	139	99.5
Italy ..	—	53	45.0
Japan ..	50	55	65.0
Netherlands ..	—	11	11.0
United Kingdom ..	182	84	84.0
United States ..	545	435	435.0
World Bank and IDA ..	250	200	245.0
TOTAL: ..	1,295	1,070	1,052.0
Additional Offers:			
From Consortium members (West Germany, U.K. & Japan) ..	—	—	30
Three non-members (anonymous) ..	—	—	30

It will be seen from the above table that while the World Bank and the IDA, the United Kingdom, Japan and Austria will be giving more than

they did last year and the United States the same as before, the other members of the Consortium have reduced the extent of their assistance. This reduction is the sharpest in the case of West Germany but even so West Germany has managed to retain its position as the second largest aid-giving country in the Consortium after the United States.

A departure from the usual practice is the offer of the additional aid of \$60 million outside the scheme of the Consortium. Half of this amount has been pledged by three countries which do not like to have their identities disclosed for the reason that they do not want to enter the "aid market" permanently. What is meant evidently is that these countries do not want their present action to be taken as a precedent either by India or by other aid-seeking nations. The reason why West Germany, the United Kingdom and Japan, who certainly are in the aid market definitely and in a big way have chosen to keep their extra contributions out of the Consortium scheme is that they do not desire to extend to this part of their assistance the "softer" terms applicable to assistance under the Consortium scheme. The extra German credits are stated to be for shipping and the extra British and Japanese credits for textile machinery.

Just over half of the aid pledged will be in the form of grants or long-term loans with substantial grace periods and repayments extending over 15 years or longer. It is claimed that the Washington meeting has succeeded in softening considerably the terms on which assistance is to be provided. The World Bank as well as the United States Government have been arguing strongly in favour of soft loans, and the bulk of U.S. assistance, of course, is already being provided in the form of loans carrying a nominal rate of interest and repayable over forty years with a grace period of ten years. Other members of the Consortium cannot still match the United States in this respect but the British Government has agreed to waive the interest payments for the first seven years of the 25-year loan period, while West Germany seems to have agreed to a longer payment period of 25 years instead of 20 years. It must however be noted that it would be wrong to suggest that the revision of the British and West German terms has been brought about at the Washington meeting. Actually, the British decision was announced earlier while Bonn had indicated even at the Paris meeting that it was agreeable to a marginal softening of its terms of assistance.

It will also be a mistake to suggest, as has been done in some quarters, that the period between the Paris and the Washington meetings has been further used to secure liberalisation of loan terms in the form of the raising of the portion of untied aid (that is, aid not tied to specific projects but is available for general development and

balance of payments support). The United States had agreed even at Paris to provide about half of its total assistance on the general purposes basis and Britain about 75 per cent of its assistance. It is possible that West Germany, which at Paris indicated its intention to tie about three-fourths of its aid to the financing of particular projects, and some other members of the Consortium may have been persuaded since the Paris meeting to increase the degree of untied assistance, but the consequent additions to untied assistance are unlikely to have been substantial.

As it is, only \$400 million will in all be available in the form of untied loans and bulk of it, if not most of it, will be provided by the United States and the United Kingdom which were heavily inclined in favour of untied assistance even at the Paris meeting. It may also be pointed out here that the Government of India had asked for non-project or untied assistance of the order of \$449 million. Since the untied assistance actually promised is considerably short of this amount, the strain on the country's balance of payments must continue to be heavy and the Government has taken the precautionary measure of arranging from the IMF a stand-by credit up to \$100 million.

A communique at the end of the Washington discussions says that the Consortium will be meeting again before the end of the Indian fiscal year 1963-64 to review the progress made in the development of the Indian economy and to consider India's programmes and prospects for the remainder of the third Plan. For the first three years of the Plan assistance from the Consortium would aggregate to \$3,417 million, apart from the extra \$60 million. It is evident that this country would like assistance from this source to be continued at about this level for the remaining two years of the third Plan as well. On the whole the prospects of assistance of this order forthcoming for the completion of the Plan seem firm enough. The aiding countries have already given ample evidence of their concern for the smooth and sustained implementation of India's development programmes and there has been added evidence this year, in the light of the anxious and energetic consultations of the Consortium, that the assisting countries will endeavour their utmost to meet India's essential and reasonable needs. At the same time, we, for our part, must realise that the peak level of assistance by the Consortium countries had probably been passed as early as in 1961-62. It would be very unwise on our part not to appreciate the fact that resistance is developing in the aiding countries both to the indefinite expansion and the indefinite extension of the aid programmes. It is also in our interest to take note of the fact that leading members of the Consortium, such as West Germany, are beginning to emphasize the desirability of development finance being made available more and more through investments of private capital

rather than government loans or credits.

In the circumstances, it is obviously desirable that the Government of India — and the Planning Commission particularly — should review prevailing ideas on external assistance on an inter-governmental basis. While, unfortunately, such assistance cannot be dispensed with to any large extent as early as we might desire, it is surely possible to limit our requests for such assistance to what members of the Consortium would readily and willingly provide from year to year. With a more enlightened attitude towards foreign private investments and by taking the fiscal and administrative measures necessary for encouraging and facilitating collaboration of foreign and domestic capital, it ought to be possible for us to reduce steadily the present unhealthy dependence on assistance by foreign Govern-

Jute: Sense and Nonsense

THE SRIVASTAVA Committee, which has reported on the development of the jute economy and the jute industry, no doubt had its heart in the right place. Rightly differing from the pessimistic view which a FAO study took in 1960 of the prospective growth of world consumption of jute manufactures, the Committee looks forward to an expansion of consumption in the world outside India and Pakistan of over one million tons of jute manufactures by 1970. This is a view with which the jute industry as well as shippers in this country would appear to be in agreement. The Srivastava Committee also assumes a steady growth in demand for jute goods within India as well as Pakistan and suggests that Indian consumption is likely to grow by about 30,000 tons a year in the remainder of the third Plan period reaching a level of 400,000 tons per annum by 1965-66 and 600,000 tons per annum by the end of the fourth Plan. The Committee consequently advocates that production targets should be set at 1.7 million tons for the fourth Plan, so that apart from providing for internal needs, this country could also export by 1970-71 at an annual rate of 1.1 million tons (as against 850,000 tons in 1962) thereby securing a reasonable share in the expected expansion in world consumption and trade.

Planning for increased production involves planning also for the expansion of production aids. Noting that an acute shortage of power in the Calcutta area has already operated to limit any short-term increase in jute goods production and, since the supply of power in that region is likely to remain deficient for some time, the Committee has urged that the jute industry should be permitted to install one or more captive generators within the State electricity grid and that foreign exchange should be released to mills for setting up small diesel or fuel oil generators. These expedients are of course only to be subsidiary to the

ments. It should also not be forgotten that a steady increase in our export earnings, a progressive saving in imports through building up corresponding production at home and the avoidance of waste and delays in the execution of projects are, in the ultimate analysis, of far more significance to our foreign exchange balance sheet than the marginal increases which individual members of the Consortium might be persuaded to make in their contributions. India's economic planning has had the very good fortune that, although the assisting countries are fully alive to its shortcomings, they are so keenly interested in our economic progress that they have always tended to view our request for assistance generously more than critically. This makes it all the more necessary that we should realise our responsibility for self-improvement in the area of framing development programmes and executing them.

long-term planning for power supply in the Calcutta area. The Committee points out that, if by the end of the fourth Plan period, the production of jute manufactures is to rise by 400,000 tons over the third Plan, on the basis of the calculations earlier referred to, the additional power needed would be about 40 MW. The industry's own view appears to be that the additional power requirements would be somewhat larger, but in any case the central point is that the power facilities in the Calcutta area need to be augmented considerably and quickly and that the requirements of the jute industry should be given a very high priority in the planning of this programme.

The Committee has also addressed itself realistically and earnestly to the great importance of the supply of raw jute which has to keep pace with any planned increase in the output of jute manufactures. The raw jute problem of course has—and has always had—two aspects, viz., quantity and quality. Quantitatively, this country is now more or less self-sufficient in raw jute, if marginal imports of long jute and cuttings for mixing are excluded. The expansion of the jute industry however would call for the output of raw jute, which is about 7.5 million bales at present, to be raised to 8.2 million bales by 1965-66 and 10 million bales by the end of the fourth Plan. What is perhaps equally important is that the proportion of high quality jute fibre in the Indian crop has to be steadily increased. This becomes particularly important in the light of the fact that a good deal of the prospective world demand for jute manufactures is bound to move in the direction of sophisticated products.

The Srivastava Committee has frankly stated that official development programmes for improving the yield per acre of the quality of raw jute have not been as effective as they should have been. Reading between

August 16, 1963

the lines, it is clear that the Committee attributes this failure largely to deficiencies in promotional effort at the level of the State Governments concerned. The Committee therefore quite logically asks for a Jute Development Board which would more than co-ordinate the activities of the State Agriculture Departments. The Committee has proposed an agency with executive powers functioning under the control of the Ministry of Food and Agriculture. This is a formula which should no doubt appeal to Mr. S. K. Patil whose views on the implementation of agricultural production programmes by State Governments are by now fairly well-known. In terms of agricultural technology, the task of meeting the expected requirements of an expanding jute industry for adequate quantities of raw jute of the required grades through improvement in yield per acre and quality of the crop is not, apparently in any sense, formidable. What is needed is the efficient organisation of sufficient promotional facilities for propagating the use of improved seeds and fertilizers and providing proper retting facilities.

One lacuna in the Committee's otherwise admirable scheme for the Jute Development Board is the insufficient appreciation shown of the value of associating the jute industry with the work of the Board. We would strongly urge therefore that not only a Board of the kind advocated by the Srivastava Committee should be set up at an early date, but also that its membership should not be confined only to Central and State officials. On the contrary, it would be advantageous to associate the Indian Jute Mills Association with the working of this Board. There have been complaints in some quarters that the jute industry has not shown sufficient interest in organizing the supply of its raw material on sound and scientific lines. The industry's own explanation has been that, in the sensitive area of rural politics in eastern India, particularly West Bengal, any attempted activity on its part, however well-intentioned, might quite easily lend itself to propaganda in the countryside. In these circumstances it would appear to be all the more desirable to give an opportunity to the industry to contribute to the raw jute development programmes through the agency of the proposed Board.

We have already said that the Srivastava Committee had its heart in the right place. This is true enough except that, possibly because the Committee was entirely composed of Central Government officials, it seemed to have suffered from too many unnecessary jitters in evaluating the role which the jute industry itself could play in regulating its affairs. We are sorry that the Committee has failed to take note of the cardinal fact that the jute industry is one of our most compactly and efficiently organised industries with a long and sound tradition of self-government. The IJMA is one of our premier trade associations and the authenticity of its representative character cannot be question-

ed at all. It should surely have been obvious to the Committee that in any programme that the Government may have for the expansion of the jute industry in the strenuous days ahead it would be a definite advantage to trust the IJMA to guide the industry on bold and progressive lines.

It is quite unfortunate that the Srivastava Committee has not shown enough awareness of this truth. On the contrary, it has allowed itself to be influenced by a bias in favour of government action and government intervention even where the better alternative would be to concede reasonable autonomy to the industry to manage its affairs in a flexible and dynamic manner. This prejudiced approach is evident in the Committee's dogmatic assertion that the Working Time Agreement of the IJMA, under which the number of looms worked has been fixed from time to time, should be scrapped and the decisions regarding the regulation of production should be taken only by the Government and not by the industry. The grounds on which the Committee has taken this stand are merely plausible. Surely, its contention that the Agreement operates to protect inefficient units is disproved by its admission elsewhere in the Report that "the mill industry has modernized itself almost 90 per cent up to the spinning stage, rationalised its operations by amalgamating uneconomic units and diversified its production by increasing its output of specialities from about 30,000 tons to 150,000 tons a year."

As regards the Committee's other complaint that the Agreement is basically restrictionist in outlook and has in the last ten years, at any rate, been operated to keep the level of production of Indian mills static in the face of an expanding world demand for jute manufactures, it is clearly unfair on the part of the Committee to have slurred over the basic fact that, after partition, Pakistan, under any circumstances, was bound to develop the manufacture and export of jute goods. Nothing that the IJMA could have done would have prevented Pakistan from promoting its jute industry and capturing a share of world trade. It may be argued of course that the Indian mills could have offered more strenuous competition to the industry in Pakistan. But here, surely, more than the Working Time Agreement or any other factor, the Government of India's consistent refusal to consider means of compensating the Indian jute industry for the export subsidy and incentives adopted in Pakistan must bear the lion's share of the blame. That the Srivastava Committee, as a body of officials, had to reckon with a bad case of guilty conscience in this matter is apparent from the fact that, in that part of its report where prospects of foreign competition are discussed, mention of Pakistan has been cursory and casual.

Broadly speaking, in the matter of the day-to-day regulation of production to suit market conditions, it

August 16, 1963

is always advisable to leave individual units of an industry or its representative association a high degree of autonomy in the making of policy. This is for the simple reason that, although even if the industry's judgment of market situations or trends may not always be sound or perfect, it certainly must possess far greater professional knowledge and competence than any government department or agency. In any case, it is an undeniable fact that the level of business intelligence and skills in the Government today is certainly not such as to support the belief that, over a period, the Government is likely to know better than the industry itself what is good for the latter. The suspicion or charge that the industry may restrict production in its own narrow self-interest but to the detriment of the larger interests of the national economy is more easily said than substantiated. In any case, in view of the wide, even arbitrary, powers which the Government has of putting pressure on the industry both formally and informally, it must be conceded that the Government does possess even normally adequate authority and sanctions for ensuring that the industry does not abuse its autonomy.

The Srivastava Committee has erred also in suggesting the institution of a buffer stock for jute goods in order to ensure stable levels of production and prices. This proposal is wholly amateurish. In an industry producing mainly for export, the fortunes of any buffer stock arrangement will be swayed far too much by world factors to be capable of being regulated at a national level. A case may perhaps be made out for an international buffer stock by agreement among the countries concerned in the world trading in any particular commodity, but to advocate a national buffer stock in a commodity in the case of which our share of world exports is at best 70 per cent is, to say the least, an irrational and irresponsible suggestion. We wish the Srivastava Committee had given more time to the commercial, financial and administrative implications of a proposal of this kind before it thought fit to sponsor it. We do not propose here to go into the weaknesses of the proposal in greater detail since we feel that the recommendation has been made more in a spell of enthusiasm than after adequate consideration.

Elsewhere too, the Srivastava Committee has allowed itself to be carried away by a partiality for governmental intervention not warranted by the facts. This is in the matter of the maintenance of floor prices for raw jute. While it may be readily conceded that an assurance of a fair level of raw jute prices from year to year is quite essential for creating the conditions in which a sufficient supply of good quality fibre may be ensured, it is by no means clear that price support could be efficiently operated only through an agency of government. On the contrary, experience in 1962-63 has shown that, without any elaboration of the acti-

vities of the State Trading Corporation, a reasonable level of raw jute prices can be maintained through the mills' own buffer stocks agency. Actually state trading last year had not only been of negligible significance in terms of the quantities purchased, but had only served to introduce unnecessary complications. Right now mills are being virtually compelled to take over from the STC jute which it had purchased for purposes of price support and which it now finds difficult to dispose of in the normal course without incurring losses.

It may no doubt be contended that, with experience, the State Trading Corporation will be able to operate on a larger scale as well as with better knowledge of the trade, but the question is why this activity should be undertaken at all when it has been made clear in practice that the industry itself is both able and willing to co-operate with the Government in maintaining a reasonable level of raw jute prices through its own buffer stock operations. From this point of view the Committee's pronouncement that, since the respon-

Eastern Economist 20 Years Ago

AUGUST 13, 1943

In the debate on food on August 9 last in the Central Legislative Assembly, the Hon'ble Sir M. Azizul Haque gave a "faithful picture" of the actions taken by the Government in the face of the rapidly deteriorating food situation in the country. His speech is a dismal narration of the general unpreparedness of the Government, inability to anticipate events, extemporizing from crisis to crisis, dispersion of power and overlapping of responsibilities. The net harvest of Government efforts so far to tackle the food situation, consists of six price-control conferences, three food conferences and one basic plan found to be basically unworkable.

The Food Member admitted that even before the war food production was lagging behind growth of population; that new consumer classes have been created due to the war effort; and also that recently the military and export requirements have been at the rate of nearly 700,000 tons per year. Yet even now the Government continues to pretend that our "statistical position" is good and that although our stomachs may in fact be empty, they are in reality statistically full. It is a bit late in the day for the Government to complain after four years of war that "it is not possible within a period of few weeks or even a few months to neutralize the effects of all the (adverse) factors or set up any effective machinery to deal with these problems fully".

sibility for determining the minimum level of jute prices and for ensuring that prices are supported at this level rests with the Government, any agency which may be interested in price support arrangements should necessarily be under the full operational control of the Government, does not readily carry conviction. On the contrary, the assumption of total responsibility by the Government in a matter of this kind will have many disagreeable consequences.

There is, in the first place, the risk that the price support scheme might be operated rigidly instead of with the flexibility demanded in the circumstances of an industry so dependent on movements in world trade. Secondly, as the present attempt of the Government to force mills to take over the raw jute purchased by the STC has clearly demonstrated, there is the constant danger of losses in the Government's buffer stock arrangements and the Government's price support operations being passed on to the industry. Finally, where price support becomes a hundred per cent Government affair, there is bound to be an undesirable import of politics into price fixation. For these reasons a flexible price support scheme operated mainly through the buffer stock agency of the jute industry would appear to be the safest and the most sensible proposition. That this arrangement has worked with fairness to the cultivator is shown by the fact that the area sown to jute this year has increased in the various jute growing States.

The Committee itself has, in a more constructive mood, emphasized that the return to the grower has to be raised in the main through stepping up the yield per acre and improving the quality of the fibre. It has also sensibly recommended the expansion of storage facilities in the mofussil areas and the establishment of regulated markets in primary and secondary marketing centres with sufficient facilities for grading. Here certainly are the right lines of approach. The Committee has also urged the promotion of co-operatives in the marketing of jute. The co-operatives, however, will develop on healthy lines only if they are based on the performance of necessary and useful services to the grower. To foster them artificially through the patronage of state trading would be to encourage the emergence of mushroom agencies of no real value to the grower.

The Committee has given considerable attention to the problems of export promotion. While we would readily agree with the suggestion that market intelligence services and surveys of consumption trends and developing new uses should be built up on a generous scale, we are not in sympathy with the proposal that the Jute Commissioner's Organisation should be saddled with these responsibilities and that its staff should be enlarged to take up those jobs. We are convinced that

no department of the Government can really attempt to undertake such essential commercial activities as market surveys and market research. Here surely is an area, where the IJMA is well qualified to do the job. Actually, the IJMA has already commissioned in the U.S.A. an expert study of possibilities of new uses for jute goods in that country and there is a proposal to conduct a similar survey in Western Europe. We believe that more will be gained by the Government by encouraging and supporting these activities than by the employment of public funds in official activities in the same field.

The Committee is right in emphasizing the fact that the success of any export promotion effort will be considerably conditioned by the extent to which tariff and quota restrictions are liberalised by importing countries. It has urged that trade negotiations should be taken up with the European Economic Community, United Kingdom and Japan. The Committee's expectation that the U.S.S.R. and other Communist countries in Eastern Europe could take up more of our jute goods in the future is a view which is very widely held at present. A trade delegation led by Mr. M. P. Birla left last week for Moscow and other East European capitals to explore the content of these expectations.

Meanwhile, it is necessary to emphasize the fact that no export drive can really be complete if it does not include some element of compensatory measures in respect of the highly subsidized competition from the jute mills in Pakistan. We have deprecated earlier the failure of the Srivastava Committee to notice this problem. We are sure that this is a point which cannot be indefinitely ignored. Both jute manufacturers and shippers are agreed that export assistance in some form or the other will have to be provided to the Indian jute industry if it is to compete on anything like equal terms with the industry in Pakistan. To what extent fiscal policies could be readjusted to provide this assistance is a matter which the Central Finance Ministry will have to consider sooner rather than later, not indeed as a concession to the industry but as a practical measure of securing more foreign exchange for the country through increased export of jute goods.

The Government is at present disbursing considerable public funds for securing marginal increases in exports over a wide range of "new lines" of export merchandise. Substantial funds are also being devoted to the promotion of exports of handicrafts and cottage industry products. We have no doubt that if a part of the resources thus spent is diverted to the provision of basic supports to the conventional export trades, such as jute goods, the gain in additional foreign exchange earnings will be larger, more prompt and more definite. In the field of exports, as elsewhere, an ounce of action is worth tons of studies and it would be no disparage-

ment of the Srivastava Committee report to suggest that the point on which the Government needs to act most promptly is the one which that report seems to have deliberately and diplomatically avoided, viz., the framing of an export assistance scheme which would

Government as Borrower

THE DETAILS of the total subscriptions to the Rs. 225-crore Central-cum-State loan floatation cannot be said to make altogether satisfactory reading, although, in certain respects, they may have turned out to be more or less in line with market anticipations. Thus, as against the total loan of Rs. 225 crores, the subscriptions aggregated Rs. 226.17 crores, comprising conversions to the tune of Rs. 19.14 crores and cash subscriptions of the order of Rs. 207.03 crores. Again, as much as Rs. 207.03 crores came in the form of cash subscriptions against the maximum market expectation of Rs. 100 crores. Finally, the reported actual subscriptions by the State Bank of India (Rs. 33 crores), the other commercial banks (Rs. 30 crores) and the L.I.C. (Rs. 39.38 crores) compare not unfavourably with market anticipation of Rs. 20 crores, Rs. 30 crores and Rs. 25 crores respectively.

But, if, out of the total cash subscriptions of Rs. 207.03 crores, nearly Rs. 200 crores (assuming that the contributions of the Reserve Bank and the Provident Funds were, as reported, of the order of Rs. 85 crores and Rs. 15 crores, respectively) have come from institutional investors, the actual receipts from individuals would be found to be negligible at only about Rs. 7 crores. Again, if only Rs. 19.14 crores have been offered against the total amount due for repayment on account of both the Centre (Rs. 9 crores) and the States (Rs. 39 crores), the question of having to return nearly Rs. 29 crores would eventually reduce the net borrowing of the Government further. In other words, if the main purpose of the borrowing programme is to absorb surplus purchasing power in the hands of the public, it cannot be said to have been achieved through this latest loan programme. It may be noted here that, in spite of two loan floatations, or rather three if we take the subscription to the National Defence Bonds also into consideration, the target for borrowing for the year 1963-64 has yet to be achieved, the actual shortfall as at present being Rs. 22 crores.

It has been suggested that this amount may be made good by another issue later in the year. It is perhaps premature to speculate on whether the Centre should again enter the market to raise this paltry amount or leave it to the States to exert themselves and collect it. But, considering the poor response by way of conversion which related, in the main, to the States, the inference is permissible that the State Governments did not exert their utmost, or at least as much as they did in the past. This failure on their part will have two consequences; it will lead the State Governments to approach the Centre for fresh accommodation to repay

compensate the Indian jute industry for the subsidies enjoyed by its competitor in Pakistan so that the Indian jute industry has a fair chance of securing its share of the expected expansion of the world consumption of jute manufactures in the coming years.

their respective loans and it will make them ask the Centre for further funds to carry on their day-to-day administration. This would mean that their special overdraft liabilities to cover special deficits with the Reserve Bank would continue to mount. The only way they could be made to understand that this cannot go on indefinitely is to compel them to enter the market on their own and raise the requisite amount. There is one other reason why the State Governments should come out with their own loans. If they do so, they are bound to offer a slightly higher rate of interest than the Centre is in a position to offer, and this would certainly contribute a definite attraction at least to such institutional investors as the L.I.C. In fact, the L.I.C. would appear to have actually drawn the attention of the monetary authorities to this aspect.

There seems to be an impression that the commercial banks have not extended as much support to the latest borrowing programme as was expected of them. It is not clear how this impression has come to be formed, when the Reserve Bank statement for the loan-week shows a decline of Rs. 25.73 crores in the deposits held by the scheduled banks with the Reserve Bank which must have been due to investments in the new loan and the actual amounts subscribed by the banks according to reports have been almost the same as their quota forecast in market circles on the eve of the loan floatation. Perhaps there were exaggerated expectations about the response of commercial banks in certain quarters, and, to some extent, the insistence of the Reserve Bank on the commercial banks raising their statutory liquidity ratio to 28 per cent by September 16, 1964 must also have prompted the hope that at least some banks would go in for the loan in a big way. Quite possibly there might also have been the expectation that those banks which generally maintain only enough liquidity ratio in terms of current requirements would oblige by generously subscribing to the new loan this time. The least that could be said for hopes based on these hypotheses is that they were very slender hopes indeed.

If it is conceded, as it must be, that the response to the latest loan floatation has not been satisfactory, or even if it is admitted that it has not come up to official expectations, the situation calls for rethinking on the part of the monetary authorities about the state of the capital market. Surely there must be something radically wrong when the public refuses to be tempted by the attraction alike of equities and Government securities.

Highlights of the Week

FICCI SEMINAR

AT THE SEMINAR on problems of private and public industrial undertakings organised by the Federation of Indian Chambers of Commerce and Industry (FICCI) last week, there was a meeting of minds on many points. That controls were cumbersome and that there should be a systematic exchange of managers between private and public sector undertakings was agreed to generally between Mr. Bharat Ram, President, Federation of Indian Chambers of Commerce and Industry and Mr. C. Subramaniam, Union Minister of Steel and Heavy Industries. A happy note was struck by Mr. Bharat Ram, who in his welcome address deplored the fruitless controversy over the respective positions and shares of the two sectors. Mr. C. Subramaniam, in his inaugural address said "that controls are necessary but where they interfere with efficient industrial management, they require a careful look." He proceeded: "It is a painful but inexorable fact that today an industrial manager spends more time getting across or around controls than he does in the task of management. Many of these controls may have served useful purpose in the past but they have become too cumbersome and detailed for a developing industrial society such as ours". Agreeing with Mr. Bharat Ram, that there should be an exchange of managers between the public and private sectors, Mr. Subramaniam said the country should pursue a rational policy in laying down service conditions for managers in industry, both public and private, so that the best talent was attracted to the best jobs, irrespective of which sectors these jobs were in.

The discussions actually brought managers in the two sectors so close to each other that they occasionally joined hands to criticize the Government for delays and indecision in matters of importance to the industry. The speeches at the open discussion underlined the need to train urgently needed personnel particularly at the executive level to man efficiently projects in the public and private sectors. The paucity of such personnel was cited as one of the major handicaps to industry especially in the public sector which was unable to compete with the private sector in the matter of paying high salaries to executives. It was also stressed by various speakers that the managers should be given greater powers and autonomy. No large enterprise can work efficiently unless there is wide dispersal of authority. There is no doubt that all this has been said before, but the need now is to find out what action can be taken by the two sectors to train enough managers to cope with the tasks.

Mr. Bharat Ram was of the view that our approach to planning was not flexible and this had led to appreciable idle capacity in industries such as steel ingots, cement, machinery, machine tools, heavy electrical equipment, fertilizers, etc. So it is no wonder that they have fallen behind the planned targets. Efficiency, he opined, must be the norm by which we should judge and value the functioning of both public and private sectors.

The position in regard to bolstering the capital market was clarified by Mr. L. K. Jha, Secretary in the Ministry of Finance. He indicated that credit institutions such as the IFC and ICICI would enter the market in a bigger way to see that the depression did not retard industrial development. The Finance Group of the Seminar had suggested that the IFC, the ICICI and the LIC should invest in good shares with high intrinsic value to generate wider confidence in the shares of companies. Other suggestions for reviving the capital market include definite tax incentives, such as the restoration of an initial depreciation allowance, the increase of development rebate to 25 per cent, suspension of Section 23A of

the Companies Act and exemption of new shares from the wealth tax. Referring to certain restrictive elements in industrial financing, the group recommended review of the limitations imposed by the Capital Issues Control relating to debt equity ratio, transferability of shares and premium shares. A sub-committee is to be set up to process the suggestions and take them up with the Government for further study and action.

STEEL IN THE FOURTH PLAN

THE TISCO'S Chairman, Mr. J. R. D. Tata's advice that a 15 million tonnes steel ingots target for 1970-71 would suffice has apparently not found favour with the Steering Group set up for planning steel development during the fourth Plan period. After five-day long deliberations last week, the Group and its various sub-committees have recommended that the 1970-71 steel output targets should aim at 18 million tonnes of ingots, four million tonnes for foundry grade iron and about one million tonnes for tool, alloy and special steels. The demand for ferro-alloys arising from this is to be studied in further detail in consultation with the National Metallurgical Laboratory.

These ambitious targets for the production of various categories of steel during the fourth Plan, presumably, have been recommended by the Steering Group with a view to avoiding the repetition of the third Plan phenomenon of demand outstripping domestic supplies by a fairly wide margin. Since the present foreign exchange difficulties are expected to continue during the next Plan period, no risk, it is felt, can be taken in respect of augmenting the supplies of steel. Otherwise, the defence build-up might be adversely affected.

To attain a production level of 18 million tonnes of ingot steel, an installed capacity to the tune of 20-21 million tonnes will have to be set up. A total capacity of about nine million tonnes would have been established by the end of the third Plan. Additional capacity to the order of nearly 11-12 million tonnes will have to be created during the fourth Plan period. This task, though stupendous, is not considered to be impossible. The expansion of the five existing steelworks — TISCO and Indian Iron by one million tonnes each, Bhilai by 1.5 million tonnes, Durgapur by 1.4 million tonnes and Rourkela by 0.7 million tonnes—should yield 5.6 million tonnes additional capacity. The proposed Bokaro and Salem plants would have by then augmented the installed capacity by about 3.4 million tonnes. For the rest, two new integrated steelworks will have to be set up. The possibilities of setting up an integrated steel plant in the Vizag belt and another in Goa are being explored.

So far as tool, alloy and special steels are concerned, it is estimated that a capacity of about 330,000 tonnes would have been created by 1965-66. Stepping up this capacity to one million tonnes will involve the doubling of the proposed Alloy Steel Plant at Durgapur, setting up another new plant and licensing considerable capacity in the private sector.

AGRICULTURE: MID-TERM APPRAISAL

THE MID-TERM appraisal of the third Plan agricultural development programmes, conducted last week by the Planning Commission in consultation with the Union Department of Agriculture, reveals that given normal weather conditions, only 95 million tons. This will represent a shortfall of slightly more than 20 per cent in the planned target of raising food production from 76 million tons in the base year 1960-61 to 100 million tons at the end of the Plan.

Even the attainment of a production of 95 million tons, it is emphasised, calls for extra effort and resources. Renew-

THOMAS PARRY
Founder

PARRY'S CORNER THEN.....

PARRY'S CORNER—one of the well-known landmarks of Madras city, took its name from the firm that was founded at that spot in 1788 by THOMAS PARRY. The illustrations show how Parry's Corner looked in the early 1860's, and how it looks today.

Time has marched on for 175 years. The E. I. D. — Parry Group of today consists of 9 companies of substance—manufacturing sugar, confectionery, fertilisers, sanitaryware, light railway equipment, industrial and potable alcohol, carbonic acid gas, chemicals, and acids, formulating plant protection products, distributing mechanical and electrical power, pharmaceuticals and consumer goods and exporting sugar and confectionery, molasses, spirit and other commodities to earn valuable foreign exchange.

.....AND NOW

PARRY'S PROGRESS AND THE PLANS

The Group provides employment to more than 10,000 people today. The strong position it has achieved gives it courage and confidence further to increase and broaden its activities, in tune with the country's Five-Year plans, to manufacture more, to provide employment more.

ed stress is to be placed on measures yielding quick results. The Planning Commission has increased the outlay on minor irrigation and soil conservation programmes by Rs. 72 crores and Rs. 13.5 crores, respectively. The new targets for these two programmes have been fixed at 13.8 million acres and 11.7 million acres. The additional funds to be provided are conditional on their utilization for the two specific purposes. A greater amount of foreign exchange is also to be released for augmenting the supplies of chemical fertilisers, pesticides, drilling equipment, etc. High priority is to be accorded to agriculturists' requirements of cement and steel.

Certain decisions have also been taken to ensure greater co-ordination among agencies concerned with agricultural development and also to secure continuity of administration of development programmes. Thus, in future, authorities dealing with the licensing of construction materials, such as cement and steel, will be required to keep themselves in touch with other agencies of State Governments charged with farm development programmes which may involve the use of such materials. Again, officials engaged in agricultural development are not to be transferred from their present posts or stations. This is to avoid wastage of time through the transferred officials having to get themselves acquainted with new environments and their special problems. Such officers are to be kept at their present stations at least for the remaining period of the Plan. If they are due for promotion, the promotion will be given to them at their present stations. Finally, in order to avoid diffusion of energies and resources, attention is to be concentrated on the development of selected areas which hold the greatest promise of increased production in the short term. The Package Programme approach will presumably be followed in these areas.

APPLIED RESEARCH IN FARMING

IN A FRANK and provocative address in New Delhi on July 24, 1963, Mr. A. D. Pandit, Vice-President of the Indian Council of Agricultural Research, brought out the intrinsic weakness of the state of applied research in agriculture in this country. He rightly stated that research which was confined to laboratories had no economic value unless it could be "transferred to the farm". Unfortunately, the extension services which are supposed to be the "medium of communication" between the farmer and the universities as well as the research institutes, have failed to deliver the goods. At present there is hardly any contact between the two and, therefore, it is not at all surprising that research has made very little contribution to raising agricultural productivity.

Visual demonstration plays an important role in educating conservative farmers and making them take to new techniques in raising crops. The demonstrations which were held in some States had recorded a high degree of failure which caused incalculable harm to the propagation of the new agricultural methods. Mr. Pandit said that recently Planning Commission teams had visited some of the States and had found that in some cases the percentage of failure of the demonstrations was as high as from 60 to 75 primarily because the task had been allotted to incompetent workers. This state of affairs clearly points to the extreme urgency of allowing only qualified and competent agricultural graduates to handle the demonstrations.

Not to speak of the communication between the researcher and the farmer, he also deplored the fact that there was very little communication among agricultural scientists themselves. The research journals published by the Council did not receive many contributions from the State research institutions and universities and even healthy controversy was avoided "lest it may give offence". This "conspiracy of silence" was neither in the interest of

research nor of the country. The dismal state of research is expected to be set right by appointing a Project Co-ordinator who would co-ordinate the research being conducted in the various institutes and would bring about an annual report describing the progress of the various projects. It needs to be stressed that the Co-ordinator will succeed in his efforts only if scientists changed their outlook and conducted their researches not "to secure personal renown" but to solve the intricate problems associated with agricultural productivity.

Mr. Pandit also dilated upon the lack of co-ordination in the research work conducted in the country. The Indian Council of Agricultural Research, which had been set up with the express purpose of co-ordinating agricultural research, had failed to perform its functions because of absence of co-ordination among the States. He said: "This Council has merely become a scrutinising committee for disjointed schemes often of an overlapping nature coming from different States instead of a body of experts which periodically takes stock of the volume and quality of scientific work going on in the country". This is, indeed, a sad commentary on the manner in which the Council has been discharging its obligations.

In order to rectify some of these maladies, proposals — which have Mr. Pandit's blessings — are being put forward to establish three boards (in place of the existing Agricultural Research Board) consisting of "scientists who could meet more frequently, review the progress of research in the country in the subjects coming under the purview of the respective boards, indicate the gaps in our knowledge and encourage research institutions to concentrate more effort so that these gaps may be filled as early as possible". While Mr. Pandit's analysis of the problems associated with applied research in agriculture is incisive, he seems to have fallen a prey to the old bureaucratic habit of resolving problems through the multiplication of boards and committees.

SAFETY ON RAILWAYS

THE ANNUAL REPORTS of the Commissioner of Railway Safety are released to the public somewhat too late. The latest report for the year 1961-62 was made available on July 28 last. The reports, nevertheless, do not lose their value as correctives for the future. There were 15 accidents to passenger trains for which statutory enquiries were held by the Additional Commissioners in 1961-62. The number was identical in the previous year too. A comparison of the responsibility of the accidents during the two years is not readily available. But during 1961-62, out of 15 accidents to passenger trains, there were ten cases of derailment of which five were due to failure of the staff mostly at the station and some times in combination with the train crew. Three of the collisions were due to the failure of the station staff. This source of responsibility for accidents is becoming common in railway operations. It would appear that stricter care and action by way of provision of sufficient staff or appropriate penal action are essential to minimise its frequency. But this particular source of responsibility seems to be dealt with leniently by Railway administrations.

Including major and minor accidents, there occurred 7,667 accidents in 1961-62 which were slightly below the figure of 7,682 in the preceding year. Accidents to trains in 1961-62 however, were marginally higher at 3,938 than the previous year's figure of 3,925. But it is significant that out of the 2,363 major and minor accidents analysed by the Inspectorate, nearly one-half were due to the failure of the human element. This finding again shows laxity or leniency in dealing with erring personnel. Equally significant as many as 847 of the accidents analysed in 1961-62 were attributed to technical defects which might point to poor maintenance. In both areas Railway administrations ought to take a more serious view of errors of commission and omission.

What is Wrong with the Rupee?

By Dr. B. M. BHATIA

MR. K. SANTHANAM'S plea for the devaluation of the rupee (in the "Readers' Roundtable" on page 35 of "Eastern Economist", July 5) needs to be scrutinised. According to him "the Indian economy is not in a healthy condition and this is the reason why, in spite of all the herculean attempts at planning and injection of a thousand crores a year, the national income is not rising appreciably". Mr. Santhanam feels that over-valuation of the rupee is one of the principal causes of this malady. "At the present rate of exchange of the rupee at one shilling six pence, the cost of production in India is so high in relation to international prices of almost all manufactured articles that exports of our industries cannot be increased without heavy subsidy, direct or indirect. The Finance Minister is not in a position to provide the requisite subsidy in the form of sacrifice of taxation, reduction of railway freights etc. Hence all the highly advertised export promotion schemes are not likely to yield satisfactory results."

Mr. Santhanam bases his conclusions on rather shaky grounds. He quotes index numbers of wholesale prices in India, the U.K. and the U.S.A. to prove that prices in India have risen much more than in the other two countries. But these statistics do not support his contention. According to the figures quoted by him, the Indian price level was in step with the price level in U.S.A. and U.K. till 1959. It is only in 1960 that prices in India rose more sharply than in the other two countries. But even in 1961 the price index in India stood at 121 as compared with 116 in the U.K. and 108 in the U.S.A. The difference between the price level in India and that of the U.K. or the U.S.A. is not so great as to justify a change in the rate of exchange of the Indian rupee, much less a drastic reduction from one shilling six pence to one shilling as Mr. Santhanam suggests.

Equilibrium a Mirage

At the back of Mr. Santhanam's mind is the Purchasing Power Parity Theory which is valid only, if at all, under conditions which do not obtain in any part of the world today. Trade is everywhere subject to various restrictions and exchange rates are everywhere controlled. If national price levels continue to be out of step with each other under these conditions, it need hardly be a matter of surprise or concern. That unique equilibrium exchange rate which "over a certain period of time, keeps the balance of payments in equilibrium", is under present conditions, a mirage. As Mrs. Joan Robinson has pointed out, the world conditions are such today that "for better or worse, international trade must be directed by a conscious policy" and not left to be determined by market forces and price mechanism. From the national point of view, it may be sometimes even desirable to maintain a rate of exchange which keeps national price level in disequilibrium with prices in other countries rather than disturb it and face all the consequences that may be even more unpalatable. Therefore, even if it were accepted that prices in India are higher than those in the U.K. and the U.S.A., and that the external value of the rupee is more than its internal value, the case for devaluation of Indian rupee remains far from being established.

To be convincing, the case for devaluation must be based on the persistent deficits in the balance of payments that the country is facing since 1956 and the advocates of devaluation must prove that devaluation would help in

bridging the gap between imports and exports. Devaluation could achieve these results if the deficit in balance of payments arose from high prices of exports and low prices of imports. Mr. Santhanam asserts that "the cost of production of almost all manufactured articles is so high in relation to international prices of almost all manufactured articles that the exports of our industries cannot be increased without heavy subsidy". Now what are the principal components of the costs of manufactured articles in India? Will devaluation not raise the prices of imported raw materials (e.g. cotton, jute), machinery, fuel, spare parts, and foodstuffs, and push up the industrial costs and industrial wages still further? Will that not further reduce the competitive power of our exports in world markets and thus increase the balance of payments deficit? And what about the increase in the burden of foreign debt that we have already incurred and interest payments on it?

In the context of broad objectives of rapid economic development this last point may be considered to be of minor importance. What is more important from the national point of view is the increase in exports. It is argued that devaluation constitutes a general subsidy to exports, cheapens our goods in the world markets and increases the off-take of our manufactures and other articles by foreign countries. That, however, presupposes a high price elasticity of demand for our goods in other countries. In spite of

the serious debate in the last two years in the economic journals in India over the question of devaluation, no scientific study of demand elasticities of principal items of India's exports has been undertaken so far either by the Government or by the academic economists. It is obvious that devaluation will serve the purpose only if the price elasticity of demand in all export commodities or at least in most of the commodities, is greater than unity. If this condition is satisfied in one or two commodities only, it would be better to encourage the exports of those commodities by granting subsidies to them than by granting a general subsidy to all export articles in the form of devaluation irrespective of the fact whether subsidy is needed by an industry or not.

The demand for the devaluation of the rupee is found to be resting on still more shaky grounds when we consider the import side. Imports are completely controlled in India at present and consist mainly of machinery and machine tools, fuels, chemicals, essential raw materials, foodstuffs etc. These goods are imported not because it is cheaper to do so than to produce them at home but because either we do not produce them at all or produce them in insufficient quantities for our domestic requirements. Imports in the present phase of our development are necessary for national existence and rapid development. We simply cannot cut them down without imperilling the rate of growth, which is already quite poor.

Our present balance of payments difficulties arise from the phase of economic development through which we are currently passing. With the solitary exception of Great Britain, which had the advantage of early start and of possessing colonies at the time of development, every country in the world has faced that problem. Thus Japan from the time it first entered into her modern commercial relations with the rest of the world till 1929 faced, with the exception of war years, a chronic deficit in her balance of payment. In Russia, the Finance Minister called upon the na-

tion as far back as the nineties of the last century: "Let us starve but export." In more recent times in the same country we are told by Baykov: "In spite of the fact that the Soviet State monopoly of foreign trade made it possible to restrict imports in order to achieve a positive trade balance, the need to import, especially equipment and raw materials for the industry, was considered so urgent that imports were maintained even in the face of the impossibility of paying for them by exports". Both the U.S.A. and Canada imported large amounts of foreign capital from the U.K. and other countries in the last quarter of the 19th and the first decade of the present century to finance their development.

In Good Company

Balance of payments deficit and therefore borrowing from abroad to meet it in the initial stages of economic development is not the experience of India alone. All the developed countries had faced that necessity. In no country was the remedy found in devaluation or depreciation of the currency. (Devaluation in Japan, the U.K. and other countries during the depression of 1930's was effected to safeguard employment and incomes rather than secure a favourable balance in trade). As soon as a country passed the "take off" stage, the balance of payments problem got automatically solved. The balance of payments problem will not be solved by tinkering with the value of the rupee in the hope that it will give a great boost to our exports. The scope for increase in exports at the present time through devaluation or export subsidies is very much limited. At best devaluation can serve as a palliative for a very short time. A more permanent remedy lies in raising productivity in agriculture and in our manufacturing industries and expanding production of the "import substitution" industries within the country. Low productivity and industrial bottlenecks are the real causes of the present "sickness" of our economy. The present exchange rate has very little responsibility in the matter.

DELAYED MONSOON IN THE CAPITAL

WINDOW ON THE WORLD

Back to the Dollar Gap?

From Our Special Correspondent

PARIS:

A GRAVE monetary crisis in West Europe is forecast for 1968, at the latest in the report that the Brookings Institute sent to the White House some days ago. This document was presumably in the press when President Kennedy took his series of dollar-defence measures in July, so the prophecy is independent of the effects of those steps. Or rather, to the extent that Mr. Kennedy's plans (supposing they are approved by Congress) are effective, they will bring nearer the date of the exchange crisis in West Europe, foreseen by the Brookings economists. Their assumption is that the USA will be unable simply to restore balanced external payments; it will inevitably go from one extreme to the other, and bring back the dollar-gap. The gold that has flown east across the Atlantic in recent years will fly back again, in at least an equal amount, leading to acute payments difficulties for the European nations and, in turn, to import restrictions, cuts in foreign aid and perhaps deflationary curbs on European economic growth.

The American experts describe accurately enough the factors that will tend to produce these results in the next few years. What is lacking is any proof that such tendencies will be allowed to go far enough, unchecked, to have the dismal consequences forecast. Perhaps one needs to point out at once that the Brookings document concludes with the recommendation that the International Monetary Fund be empowered to create a new world-money which will inflate international liquidities to a level adequate to the 35 per cent increase in world trade forecast for the next five years. Now, exponents of the theory of inadequate liquidities and of the need for a new world money-of-settlement always assume that the nations will oscillate from dollar-gap to dollar-deficit; in other words, they take it for granted that a greater volume of world trade must be accompanied by bigger deficits. The managed money-of-settlement is intended to meet these deficits, and to further their schemes they must suggest that more trade necessarily means bigger deficits.

Pessimistic Assumption

The new chief of the IMF, M. Schweitzer, pointed out on taking office a few weeks ago that this notion was not necessarily true. World trade could grow by 35 per cent, or more, without liquidities proving insufficient, if approximate balance were maintained and if national monetary authorities continued and extended their co-operation to curb speculative attacks on individual currencies. Obviously, it will be difficult to achieve these conditions but it is altogether too pessimistic to assume that it will be impossible. For example, there is one eventuality that one nowhere sees taken into account: the formation of a common reserve currency for the six members of the Common Market, which would replace the present five payments-balances (the Belgo-Luxemburg Union has joint payments) by one payments-balance for the whole region. By putting an end to competition for gold and dollars among the Six, this pooling of reserves would reduce the need for liquidities by a consi-

derable amount. (The present reserves of the Six, indeed, equal those of the USA.)

Actually, the Brookings experts take indirect note of this possibility but they put it forward as one of their suggestions for action, instead of as something that is very likely to happen in any event. The suggestion referred to (and it was immediately rejected with indignation by Mr. Robert Roosa from the Treasury) was for a floating exchange rate between two currency blocs: the dollar and sterling on the one hand, the Common Market currencies on the other. Within each bloc exchange rates would be fixed, but the parity between them would float. The wisdom of such a scheme may be doubted but the point is that the Brookings economists envisage the possibility of a fixed exchange rate between the five currencies of the Common Market—but without seeing that five currencies with fixed exchange rates are in fact one currency expressed in five different denominations, which implies one reserve pool, which in turn reduces the need for liquidities and thus attacks the foundation of their argument that liquidities will be inadequate.

However, the point of this digression into the question of liquidities was to hint that advocates of a managed world-money have a vested interest in prophesying immense payments deficits. With this caution in mind, one may look at the factors which, according to the Brookings report, will land West Europe in such a deficit within a very few years. They mention four things which will tend to produce a large U.S. surplus at the expense of West Europe.

Decline in Arms Expenditure

Firstly, American military outlays will fall by \$400 million between 1961 and 1969, while foreign arms purchases in the USA will increase by an equal amount. The decline in military expenditure indeed seems more likely since the report was drafted, thanks to the suspension of nuclear tests, so this point is well taken—but if the detente between the blocs makes further progress, foreign purchases of U.S. arms (notably for the equipment of the Bundeswehr) might not increase as much as expected either.

Secondly, the "tying" of U.S. development aid, which means that it almost all comes back to the USA in the form of purchases of U.S. goods by the assisted nations, will lighten the aid burden on the payments balance. So aid could rise from \$4,000 million to \$6,400 million between 1961 and 1968 and yet the payments deficit on this score could virtually vanish.

Thirdly, the outflow of private U.S. capital seeking profitable investment in West Europe will decline as business picks up at home, thus removing one of the principal negative factors in the balance of payments. We can go further and add that if American industry becomes so much more attractive than European as an investment, then foreign funds will be placed there on a large scale. Moreover, within

a few years the substantial U.S. investments in Europe made in recent years will begin to pay off, and earnings on this account will be considerable.

Fourthly, and this seems to be the main ground of the Brookings forecast, the U.S. trade surplus will swell from \$5,000 million in 1961 to \$9,100 million in 1968 if prices in the USA continue to rise by only 0.5 per cent yearly whereas European prices rise 1.5 per cent annually. In fact this supposition looks improbable, for one cannot imagine the Europeans passively watching such a discrepancy over the years, so the Brookings experts add that even if West Europe curbs its inflation, the U.S. trade surplus will rise to \$6,700 million by 1968.

The French Stand

There is little doubt that if these four conditions are realised, within a few years the U.S. deficit will have been replaced by a large payments surplus, most of it at West Europe's expense. The question is whether the Europeans are going to let this happen. With General de Gaulle's Monday Press conference fresh in mind, one is inclined to doubt it. For the French President made it plain that "France cannot and will not see either her own economy or the nascent European economy liquidated in some sort of 'Atlantic Community' which would be nothing but a new version of 'integration'", and by "integration" the General means American domination. And he was quite specific on the point of American agricultural exports when he said that "Europe must, for the greater part, feed itself with its own agricultural products which are amply sufficient". The West Germans showed the next day that they agreed on one point at least, by refusing to make any concession on the vexed question of American poultry exports, so that American officials were moved to threaten reprisals. If the Common Market refuses to take U.S. farm produce on the scale hoped

for, the forecasts given above for the trade surplus later in this decade will have to be reduced considerably. On the other hand, as the French President also hinted, if some such preference is not given to European food, then the tariff negotiations with the USA will be blocked indefinitely—because, he asked, "whatever would France be doing in an association where there were no Customs duties except for her wheat, her meat, her wine, her milk and her fruit?"

In short, some forecasts of likely American trade gains seem based on optimistic assumptions about the Europeans consenting to be flooded with American goods while they blithely let inflation take its course in the Common Market. One finds it hard to see Dr. Erhard presiding over the depreciation of the Deutschemark, and any countermeasures he took would at once have to be imitated in France because of the imbrication of the two economies since 1958. It is correct to say that in the next few years some trends will be working against Europe in favour of the USA, but the Europe of today is not that of the days of the dollar-gap. (Besides, such trends must not be exaggerated; recent U.S. orders for jet aircraft in Europe and current European automobile exports show that the tendencies are not all one way.)

Quite apart from corrective measures the Europeans will take, one must ask too whether the U.S. Government will be interested in scoring a payments surplus on all counts, supposing that it was in its power to do so. Once the tide has turned in favour of the dollar, it is improbable that Washington will persist and go on boosting its surplus until it has as much gold again as in the 1940's. If it did persist too long in that course, the first casualty would be, not the Common Market, but Britain; well before the European deficit reached the proportions forecast by the Brookings experts, the pound would have been devalued, an event that Washington has no interest in bringing about.

U.K.'s Gremlins on the Way Out?

By JOSSLEYN HENNESSY

LONDON:

DURING THE war when, from time to time, a well maintained aeroplane developed a series of inexplicable failures, the R.A.F. decided that it had been attacked by "gremlins", evil sprites whose delight it was to cause disaster. Whole battalions of gremlins seem to have fallen on the U.K. since Christmas. In the first quarter of 1963, Arctic weather disrupted the economy, output fell, unemployment soared from 1962's average of 463,000 (2.1 per cent) to 878,000 (3.9 per cent) in February, 1963. Then President de Gaulle vetoed Britain's entry into the European Economic Community. At about the same time the Government began to get its hair tangled in one scandal after another. The innocent minister, Mr. Thomas Galbraith, was wrongly rumoured to have had improper relations with the spy, Vassal, a clerk in the Admiralty. Next, Mr. Profumo, Minister of War, gratuitously landed himself and his colleagues in trouble by denying his acquaintance with one, Christine Keeler, whose name has since become as well-known as that of 20th Century Fox's Elizabeth Taylor, and who will doubtless be picked to replace Miss Taylor in any new edition of "Cleopatra". Lastly, the death of Peter Rachman brought an unsavoury housing racket to light. But dawn ends the blackest night, and some rosy streaks in the sky suggest a return to preoccupation with economic progress rather than with this Hogarthian rake's progress of tarts, pimps, and racketeers.

The ice and snow of December, January and February are now re-emerging disguised as statistics in "Economic Trends" (published monthly by the Central Office of Statistics). The July issue shows that the effects of the year's disastrous start were temporary. Building—the worst hit industry—far from being idle is now the sector of the economy most in danger of overstrain. Public investment is on a sharply rising trend. Industrial production in May, at 118 (1958=100), attained a new high level, and the demand for labour is increasing. Unemployment has fallen more than seasonally since April. Above all, the balance of payments is officially regarded as "most satisfactory". Exports in the second quarter were 3 per cent more than in the first quarter and nearly 5 per cent more than in the third quarter of 1962. A Federation of British Industries enquiry shows widespread improvement in confidence and the expectation of a substantial rise in production. In these circumstances, the dangers of expansion for the balance of payments, and for sterling, seem to be receding, and the Chancellor, in asking the I.M.F. for the renewal of the \$1,000 m. standby credit for another year, explained that this was only a precaution. In effect, this agreement increases the U.K.'s gold and convertible currency reserves by more than one third. The money may never be needed: the standby was not, in fact, touched during the troubled period for sterling earlier this year, when temporary aid was taken from European control banks instead. In future, the U.K. may again request this

central bank aid to counter speculative movements. The I.M.F. standby would then be available to meet any deterioration during the early stages of expansion. Even then, the mere existence of the standby may be enough to ensure that its use is not needed.

By a dramatic chance the publication of "Economic Trends" statistics this week coincided with the second Report of the National Incomes' Commission. The Commission, having been violently criticised for its alleged desire to keep wages depressed, now urges that firms should not increase profits by more than 3½ per cent p.a., and that any surplus above this should be used to reduce prices. It is, therefore, noteworthy that the statistics show that the whole burden of last winter's disasters fell not on wages but on profits. Rising wages managed to balance the increase in unemployment and cuts in overtime. The whole of the fall in incomes was carried by profits, which fell from £908 million to £774 million, their lowest point for several years. That companies were able to stand this means, first, that they had built up reserves from the profits of previous years into which they could dip. Secondly, NIC forgets that whereas wages are a predictable cost, profits are an unpredictable surplus, out of which risks must be borne. NIC's doctrine amounts to saying that an efficient firm which finds a way to cut costs and reduce prices, but wants to reap some of the benefits through higher profit margins, is anti-social. The point, as I see it, is that taxation can keep average profits in line with average wages but efficient firms are always above the national average. In any case, what incentive is there to raise efficiency if the firm and its shareholders cannot benefit from it? Suppose that by adopting a certain process, or investing capital in new plant, an additional profit of £1 million can be envisaged, if the whole is to be given away to consumers and tax gatherers,

why bother? NIC's doctrine would lead to economic stagnation.

On the political front two out of three public opinion polls show that Labour's lead over the Conservatives slumped in July from 18½ per cent to 8 per cent, a figure confirmed by recent by-elections. The "Economist" commented that this apparent Conservative recovery occurred during a fortnight when Labour concentrated the whole political battle on its revived electioneering campaign against the Rent Act. "A campaign", said the "Economist", "of the old vote-ogling sort which most people nowadays see through". While not sharing the "Economist's" faith in the electorate's rising IQ, I agree that to blame racketeering on the Rent Act is to stand the facts on their heads. The Act provides that controlled premises remain controlled as long as statutory tenants continue in them, but become decontrolled if they leave. This normally means that a new tenant's rent is 30 to 40 per cent higher than that of the departed statutory tenant. In order to expedite their departure, Rachman employed gangs to make life impossible for statutory tenants by giving all-night parties, or by physical threats. Once empty, the flats were repaired and redecorated, ceased to be slum property, and were let out to respectable tenants. Most reprehensible, no doubt. But rent control was not abolished. As long as rent control exists, landlords will not sink money in repairs or in building; the people willing to buy such properties can only make profits illegally; and the housing shortage will continue. Remove control and, at present prices, capital would pour into housing ventures until rents sank to a reasonable equilibrium. If the "Economist" is right in thinking that the mass of the electors now understand this, the millenium is around the corner, and the UK's growth rate will leave the German miracle at the starting post.

TENDER NOTICE

Tenders are hereby invited from the approved contractors of the Punjab P.W.D. B & R Branch on the prescribed form obtainable at Rupees Two each for the following works upto 15.30 hours on 30-8-1963.

S. No.	Name of Work	App: Cost	Earnest Money
1.	Expansion of Existing Sheep Breeding-cum-Experimental Station in Government Live Stock Farm Hissar. Construction of Laboratory, Office and Sheep Pens).	65,000	1,300
2.	Re-organisation of Government Live Stock Farm, Hissar:		
(i)	Construction of 75 Nos. Class IV Unmarried quarters.	1,80,000	3,600
(ii)	Construction of 28 Nos. Officers/Officials quarters.	2,32,000	4,700
(iii)	Construction of 78 Nos. Class IV married quarters.	2,75,000	5,500

Note: Detailed Notice Inviting Tender can be seen in the Office of the undersigned during office hours.

(ii) Earnest Money is acceptable only in shape of Treasury Challan, Deposit at Call on any Scheduled Bank of India or National Saving Certificate duly pledged in the name of the undersigned by Designation.

(iii) Tender form will only be issued on production of Earnest Money.

EXECUTIVE ENGINEER,
PROVINCIAL DIVISION, HISSAR.

LISTENING POSTS

Acharya on the War Path

By Our Special Correspondent

THE PRIME MINISTER's advice to his Party men on the eve of the Monsoon Session of Parliament to be prepared for trouble was, of course, well-founded. Mr. C. Rajagopalachari having arrived in the Capital for a week's stay to organise the forces of Light against the forces of Darkness (i.e., the Congress) and Acharya Kripalani in the Lok Sabha promptly getting down to business with a "No Confidence" motion, the Congress Parliamentary Party has its work cut out to keep its flag flying. The Speaker counted 72 members (from the non-Communist Opposition) standing in support when Acharya Kripalani asked for the leave of the House to move the "No Confidence" motion. But some Opposition Members claimed that those who had stood up actually numbered 74. Since, however, only 50 is the minimum prescribed by the Rules of Procedure, this difference did not matter.

This is the first time since India became independent that leave was granted in Parliament for a motion of "No Confidence" in the Government. The motion, of course, is only a gesture of defiance since the Congress is in overwhelming majority in the Lok Sabha. It is to be taken up only next week.

★

The Union Finance Ministry is understood to be quite perturbed over the current listless mood of the capital market. Quite a few new issues in the recent past had not met with the success they deserved, with the result that underwriters were left with fairly large blocs of shares on their hands. This phenomenon is attributed to two main factors. Firstly, the withdrawal from the equity market of the speculative investors of about a year ago, who supported the new issues on expectations of quick appreciation in capital. With the boom in the stock market coming to an end after the Chinese attack in October last, the premium on new issues has evaporated. Secondly, the rate of saving in the economy for long-term investments has not been adequate.

Consultations have been going on in the past few weeks between the Union Finance Ministry, the Reserve Bank of India, the State Bank of India, the Industrial Credit and Investment Corporation of India, the Industrial Finance Corporation and the Life Insurance Corporation on devising of ways and means for sustaining the capital market. As a result, conditions are expected to improve steadily. The Finance Ministry, it is gathered, has impressed upon the ICICI and IFC that if in pursuance of their objective to foster the growth of the private sector they are now called upon to underwrite new issues in a larger measure, they should do so. Even if they are left with any large proportions of the new equities underwritten by them, they need not lament over it.

To enable these two institutions to play their role more effectively in the task of sustaining a healthy growth in the capital market during the current lean period of investments, the Government is prepared to provide them additional financial resources. Pooling of their resources by the underwriting institutions is considered imperative so that no new industrial unit which is of key importance for the achievement of the developmental goals fixed under the third Plan, suffers for want of funds.

The shortage of working capital for the private sector industries, it is anticipated, should end in the near future when outgoings on Government account start. Bank depo-

sits then would start growing. Conditions in the money market during the ensuing busy season, it is felt, should be comparatively less stringent than last year, since governmental expenditure, especially on defence, is of a higher magnitude this year. The Reserve Bank of India proposes to have a fresh look at the scheduled banks' liquidity position at the start of the busy season so that it can realistically decide what measures are called for to meet the situation.

Another healthy development in so far as provision of working capital to the private sector enterprises is concerned, has been the liberalisation effected in the State Bank's lending operations. Of late the State Bank has shed its conservatism, inherited from its predecessor, the Imperial Bank of India, of doing business with only "A" class industrial units and that too on the principle of not sharing it with the other scheduled banks. Joint financing with other banks has been recently resorted to by the State Bank for accommodating industry's requests for working capital. This trend is likely to gather momentum.

The Government apparently is not much concerned about the sharp setback in equity values brought about by political and other non-economic factors. It, therefore, does not favour any abnormal open market operations by the Life Insurance Corporation. The LIC, it is pointed out, is not an agency for supporting stock market booms. It, however, cannot but support the stock market to the limited extent of safeguarding its own interests. This is one sector where substantial savings accrue month by month. Underwriting of new issues by the LIC has also to be selective and restricted to those which it would not mind having to hold and nurse.

★

An agreement has been signed between the US Administration and the Government of India for setting up a 380 MW. nuclear power station at Tarapore. The US Agency for International Development has agreed to extend a loan of \$80 million (Rs. 38.1 crores) for financing the foreign exchange component of this project. As is the case with the other US Aid credits, this loan will be free of interest, but will be subject to three quarters of one per cent service charge. It will be repayable over a period of 40 years with no repayments falling due during the first ten years.

In addition to this credit, the US Atomic Energy Commission will provide the initial uranium fuel charge, estimated to cost \$15 million (Rs. 7.1 crores), on a long-term deferred payment basis.

The General Electric Company has been selected by the Government of India to be the prime supplier and contractor for the project. The Company will also provide for the fabrication and installation of the station's initial nuclear charge.

The project is expected to be completed within a period of five years from the date actual construction starts.

★

Following the decision of the Government to permit the three manufacturers of Commercial vehicles to manufacture their engines as well, proposals from them have been received here, indicating the capacity they propose to create and asking the Government for the release of necessary foreign exchange. TELCO plans to step up its production from 18,000 vehicles a year to 24,000 a year while Hindustan Motors and Premiers

August 16, 1963

propose to increase their output from 9,000 to 15,000 each. TELCO's requirements of foreign exchange are placed at Rs. 6 crores and those of the other two at Rs. 10 crores each. US aid is being sought for financing the foreign exchange requirements.

**

Further enquiries in regard to the manufacture in India of a cheaper motor car shows that the proposed study through committee will relate to the fourth five-year Plan. That India needs a cheaper car of a model which will remain unaltered for a reasonably long period is not in dispute. In view of the fact that European and British automobile manufacturers have done excellent work in this field, it is proposed to enlist the services of experts from Britain, West Germany and the USSR for selecting a model of an inexpensive automobile for manufacture in this country.

**

The Indian Investment Centre in New Delhi has announced that the two-sub-committees of their Advisory Committee of Industrial Experts have finalised their reports detailing their findings and recommendations in respect of many engineering and chemical industries. The Centre will forward these reports to Government for consideration.

As part of its service to Indian and foreign entrepreneurs, the Indian Investment Centre had, early in 1962, initiated a programme of industrial surveys and feasibility studies of specific industries enjoying high priority for development in the third five-year Plan. The main object of these studies is to locate specific areas where industrial development is now essential and feasible and where investment opportunities exist. The Union Minister for Economic and Defence Co-ordination, Mr. T. T. Krishnamachari had suggested that such a programme could profitably be linked with a study of those sectors in the industrial structure which are not developing according to schedule and that the centre should seek the advice and guidance of such specialists and experts as have knowledge and experience in the fields in which they are now serving.

Accordingly the Governing Body of the Indian Investment Centre constituted an Advisory Committee of Industrial Experts and requested them (1) to undertake a study of the gaps in our industrial structure; (2) examine why production in certain sector was lagging behind and (3) indicate measures necessary to stimulate and increase production in order to achieve a more balanced industrial growth.

It was also suggested that necessary survey of different industries should be carried out specially with a view to selecting those products which are capable of manufacture locally. This had a direct bearing on the development of medium and small scale ancillary industries.

The Advisory Committee had constituted two sub-committees:

1. Committee on Raw Materials for Chemical and Process Industries;
2. Committee on Machinery and Machinery Parts.

The Committee on Raw Materials was to survey the field of the chemical industries and locate areas where production was lagging behind and also point out vital items of raw materials whose accelerated development is essential in the national interest. The Committee on Machinery and Machinery parts has concerned itself with the study of basic and raw materials, semi-processed materials, plant and machinery, instruments and a number of other miscellaneous items. Both these sub-committees have held meetings in Bombay and Delhi and submitted their final reports.

Both the committees have indicated a number of new

opportunities for industrial development and investment.

The Raw Materials Committee had examined in detail the scope for organising domestic production from materials, intermediates and ancillaries in important industries such as nitrogen fertilizers, sulphur and pyrites, soda ash and caustic soda, viscose staple fibre supplementing cotton, newsprint, paper and paper board, paper pulp and dissolving grade pulp, non-ferrous metals, organic chemicals, synthetic dyes, drugs, intermediates and antibiotics and miscellaneous chemicals.

The Committee on Machinery and Machinery Parts had examined several metallurgical and chemical industries and have pointed out the opportunity for investment and technical assistance in a number of engineering industries such as machine tools; steel castings; steel forgings; stainless steels of different qualities; tool and alloy steels of selected qualities; printing machinery; textile machinery; material handling equipment; ball and roller bearings; compressors; blowers; furnaces; foundry equipment; wood working machinery; industrial process control instruments; optical instruments; electro magnets for lifting purposes and so on.

The Advisory Committee of Technical Experts included several senior officers of the Technical Development Directorate of the Ministry of Economic and Defence Co-ordination, as well as top executives of industries in India. The Chairman of this Committee was Dr. A. Nagaraja Rao of the Heavy Engineering Corporation, Ranchi.

The Indian Investment Centre would release the findings and recommendations of the Committees as soon as they are finalised after discussions with the Government of India.

Amsterdam, gateway to Europe—so easy to reach by KLM

Read why so many experienced travellers and shippers choose reliable KLM jet routes to Rome, Zurich, Frankfurt and Amsterdam with connecting flights to London, Glasgow, Paris, Hamburg, Brussels and 35 other cities in Europe

They know that KLM was the first European airline to fly to the Far East. They know that 'Golden Circle Service' is offered on KLM flights from the Far East to Europe via the South Asian routes and over the Pole. They know that KLM has had longer than any other airline to perfect its reliability—43 years. Read more KLM facts...

1. A KLM DC-8 jet leaves for Europe on Friday night from Calcutta, on Tuesday night from Delhi, and on Mondays, Wednesdays, Thursdays, Saturdays and Sundays from Karachi.

2. In addition, in conjunction with its interline partners, KLM makes it possible for you to fly out of Calcutta, Delhi or Bombay any day of the week, by providing connections at Karachi, Cairo, Beirut or Teheran (depending on the day of travel), with KLM flights to Europe.

3. KLM has its own fully air-conditioned resthouse at Karachi airport called 'Midway House'. It has spacious, comfortable rooms with shower/baths and provides many facilities e.g. a supervised nursery, a barber shop, a souvenir and carpet shop and a floodlit tennis court. The service there matches the standards of a good European hotel.

4. After every 3000 hours in the

air, a DC-8 jet is completely stripped. Even the seats come out. They go to the carpenters and upholsterers, the precision instruments to the electrical and radio workshop, and the engines to the testing tunnel.

5. Every KLM intercontinental flight carries a travel information case full of tourist information. Amongst other things, it contains a set of Tourist Information leaflets, covering more than 100 countries. These leaflets are also available at all KLM offices.

Service for young and old

6. Every KLM DC-8 jet has a luxuriously appointed lounge, located in First Class. It is a perfect place to meet your fellow travellers over free drinks.

7. KLM prepares special food for passengers who request it as they book their seats. KLM pursers are always briefed on these

special diets before passengers come aboard.

8. KLM pampers babies—and their mothers. KLM supplies comfortable cribs that hook firmly to the overhead racks, leaving mother's lap free.

Higher discount for students

9. KLM offers registered students between 12 and 30 years, travelling between India and Europe, a discount of 30% on the normal one way or round trip adult fares. Ask your travel agent or KLM for further details.

Amsterdam—offering so much for so little!

10. On your next trip to Europe, take advantage of 'Hilton Special'—a stay of two days and a night in the Hilton Hotel, Amsterdam; plus sightseeing tours covering a canal boat trip, visits to the Queen's Palace, Rijksmuseum, the Rembrandt House, a diamond

cutting factory and other places of tourist interest. And all this for just £ 6.1 sh.

11. When you route your journey via Amsterdam, you have the advantage of going in for tax-free shopping at the airport (including ShipSide cars), and availing of Holland Minitours at a cost of £ 1.8 sh. 7d. per person.

KLM serves 44 cities in Europe

12. KLM's network of services in Europe alone covers 44 key cities: London, Paris, Geneva, Hamburg, Munich, Vienna, Copenhagen, Stockholm and many other important business centres in Europe are served daily by KLM from Amsterdam.

13. Your Travel Agent will tell you more about the advantages of flying KLM via Amsterdam. Get in touch with him or contact the nearest KLM office: 7 Chowringhee Road, Calcutta; 9A Connaught Place, Delhi; Taj Mahal Hotel, Bombay.

See your travel agent, call KLM or mail coupon for free travel information to:

KLM ROYAL DUTCH AIRLINES
7 Chowringhee Road, Calcutta-13

Please send me further information on:

- Tax-Free Shopping Centre at Amsterdam Airport
- ShipSide Tax-Free Cars
- Holland Minitours
- Students'/Children's Discounts

the future and to limit the actual amount of royalty to three per cent. The question whether the existing patents for food products, drugs and medicines would be respected and if not whether there should be any compensation for their abrogation is still under discussion. It is proposed that there would be no appeal to courts of law for an aggrieved party, who could, however, appeal to Government, whose decision shall be final.

★★

Hindustan Aircraft Ltd. are reported to be building a new small transport aircraft capable of a short take-off, on the pattern of the Canadian Otter. Hindustan Aircraft have also entered into a technical collaboration agreement with Messrs. High Duty Alloys Ltd. of Britain for the manufacture of light alloys and forgings.

★★

The yearly Indo-British negotiations of the Cotton textile industries of the two countries are due to commence in London in the middle of September. Mr. Naval Wadia will lead the Indian side. The negotiations will largely relate to "dumping" of certain categories of textiles, alleged by Lancashire. From India's point of view, the price war has reduced the earning of foreign exchange by cotton piecegoods.

★★

A team of six from Arthur D. Little, Inc of the USA is in India to examine defence production vis-a-vis civil industries with a view to integrating both of them in various fields of production and to maximise their output.

★★

The Development Wing of the Ministry of Economic and Defence Co-ordination has placed demand for heavy duty

vehicles at 2700 a year. Ashok Leyland are being permitted to step up their output to produce 2,000 vehicles a year.

★★

Belgian credit for the third Plan, it is expected, will be utilized by purchasing electric locomotives and three ships of 10,000 tons capacity. The ships have been ordered by a private sector company. British shipping firms have also offered to supply ships to India on usual long-term credit terms.

★★

The Central Water and Power Commission has announced a shortfall of 245 MW in the installation of power generating capacity during the first two years of the third Plan.. A number of important projects, notably in the South, are well behind schedule. The commissioning of two 75 MW sets at the Durgapur Thermal Station later this year and the installation of the additional 50 MW alternator belonging to CESC are expected to ease Calcutta's immediate power problems to some extent. An interim report is expected in July from the high-level committee set up by the Government to look into India's future energy requirements and supplies.

★★

Production at the two public sector fertiliser factories at Sindri and Naya Nangal exceeded the 1962-63 target. However, total fertiliser output at the end of the third Plan period is expected to amount only to 475,000 tons, by comparison with the original target of 800,000 tons and the revised target of 650,000 tons. The shortfall can be attributed to delay in the building of other public sector plants and to the inability of private firms to make use of their licences to build fertiliser factories when prices are not sufficiently remunerative to attract foreign collaboration.

Sugar in the Deccan

From Our Correspondent

BOMBAY:

PRESIDING OVER the 24th annual general meeting of the Deccan Sugar Factories Association (D.S.F.A.), Mr. M. L. Apte had a legitimate grouse when he said that, for all its impressive achievements, the reward that the Deccan sugar industry had received was only stifling taxation by way of Agricultural Income Tax and Education Cess, not to speak of crippling measures like ceilings on land. This apart, Mr. Apte elucidated how the sharp rise in sugar costs has been considerably more than the increase in price sanctioned by the Government. Besides the Agricultural Income Tax and the Education Cess, he listed a number of other contributory factors such as the Emergency Risks Insurance, increases in irrigation cess, electricity duties, import duties on stores and spares and railway freight — all items of cost beyond the control of the industry. Inasmuch as the control price does not reflect these additional burdens, the industry has a case for demanding a higher price.

While there are obvious difficulties in the way of sanctioning a straight rise in sugar prices or, for that matter, in the prices of any other essential commodity at the present time, there can be no excuse for the authorities not doing everything in their power to make sugar production more economical than at present. This can be done by expanding the capacity of the existing units, wherever possible (and certainly where cane supply is assured) and by preventing the gur and khandsari producers (and, in Maharashtra, co-operative units) from impinging on the established zones of supply. According to the Report of the Productivity Study Team on Sugar Industry which toured countries like Hawaii and the U.S.A., referred to by Mr. Apte, the present concept of economic size for a sugar unit is a minimum capacity of

1,500 to 2,000 tons. As Mr. Apte rightly added, to maintain efficiency and productivity the industry must continue to expand. This applies particularly to the sugar industry in the Deccan and the South, where the rise in costs has been steep and continuous for reasons beyond the control of the industry.

Against this background, the conclusions of the high level conference of the representatives of Andhra Pradesh, Madras, and Mysore, convened by the Union Minister for Food and Agriculture recently in Hyderabad, make gratifying reading. Thus, subject to the approval of the Cabinet, a three-point programme would appear to have been decided upon to step up sugar production from the present 28 lakh tons to 32 of higher export possibilities, the third Plan target for sugar production had been stepped up to 40 lakh tons). The programme as above provides for regulation of the production of gur and khandsari, incentives to cane growers to supply cane to sugar factories instead of, to cane growers of gur and khandsari and payment of compensation to factories working beyond the normal season to make up for the additional cost incurred by them. It is for the first time that the Government has thus made bold to tackle the problem of competition (from the available cane supply) as between the sugar industry and the gur and khandsari producers. The positive incentives to the cane grower to sell to the sugar factory and the preventive measure of regulation of gur and khandsari production constitutes an integrated attack against a long-standing evil or, to put it differently, the distorted cane economy of our country. This problem can be effectively tackled not only by fixing cane prices at levels attractive to the grower, but, as the D.S.F.A. President rightly urged, "by impressing upon the cane grower the advantages of a steady income through stabilised cane prices". The

State Governments also must display a better sense of realism when they fix retail prices of gur. It would be ironical, as Mr. Apte said, to fix a retail ceiling price for gur of Rs. 115, when retail sugar prices are controlled at Rs. 86, exclusive of excise duty and cane cess amounting to Rs. 33 (or Rs. 119 in all).

What is bound to prove the toughest problem in bringing about the proposed expansion of sugar output will be the competition between the co-operative sugar factories and the joint-stock sugar factories. To quote Mr. Apte, "the existing cane supply position for the joint-stock factories is far from happy. In fact, many of the existing units are finding it increasingly difficult to combat the membership drive of the co-operative factories There are many instances where the normal cane supplies to the joint-stock factories have been diverted to the co-operative factories by the enrolment of new members". It remains to be seen how the sub-committee, appointed by the Maharashtra Sugar Cane Committee to consider the formation of factory zones to ensure adequate sugar cane supplies to all, will tackle this tough problem.

★★

The Maharashtra Government proposes to levy a cess on coastal cargo. This is the first time that a measure of this nature has been contemplated. The cess will cover inter-State movement of goods as well as shipments to and from other States. The measure is expected to yield the Exchequer Rs 10 lakhs annually. The Government intends to utilise the money thus collected for the construction of jetties and warehouses with navigational aid for cargo traffic. The amount collected from passenger tickets will be used for passenger amenities. According to draft rules, importers and exporters have to make their own arrangements for landing or shipping. If cargo is landed or shipped in streams, lighterage charges will be levied in addition to the dues on imports and exports. The Government of Maharashtra has taken a bold step in taxing the coastal cargo. In recent years, the volume of coastal traffic on the Konkan has shown an increase. It is a right step which deserves to be followed by other State Governments with a wide coastal line and heavy coastal traffic.

★★

The exclusion of cotton growers and traders from Bombay at the recent all-India conference held at Delhi has caused surprise in cotton circles. Bombay handles around 50 per cent of the total business in the country and the chances of putting up a united front on current issues affecting trade would be dim. It would also be a misnomer to call the conference an all-India body without the Bombay team. The dramatic acquiescence of the EICA with the Government decision regarding supervisory system only a day ahead of last year's conference had agitated the minds of many delegates from other centres. At that time, sensing the mood of the delegates, the EICA declared its decision to form an all-India body. No progress has been reported so far in this respect although a whole year has elapsed since then. Looking to the complexities of the cotton trade and

Coal in the Doldrums

From Our Correspondent

CALCUTTA:

THE DECISION of quite a few of the private sector collieries to surrender the import licences given them under the World Bank Loan Scheme has brought into sharp focus the unenviable position the coal industry is placed in today. It is evident that those collieries who have returned their import licences unutilised have no hope of mobilising the requisite matching rupee finance notwithstanding the fact that the

the diverse interests involved, it would have been advisable if the regional bodies for different cotton tracts had been formed as a first step. Somehow, the conference decided to put the cart before the horse. The deliberate keeping out of Bombay body from the conference deprived the deliberations of the vast experience of the EICA.

★★

The Chairman of the Forward Markets Commission, Mr. A. S. Naik, told the members of the Bombay Oilseeds and Oils Exchange that the trade should avoid the temptation of indulging in speculation and conduct forward deals in a healthy manner. He expressed satisfaction over the rise in exports of oil-cakes and meal and observed that with the issue of licences for the manufacture of groundnut meal, the groundnut economy had been kept on a sound footing. This was incidentally in line with the policy of exporting finished products rather than primary commodities. The question of hedge trading in groundnut meal would be considered after a year or two.

Mr. Chandulal Kasturchand, senior vice-president of the Exchange, succeeded Mr. Ramdas Kilachand who has been president of the body for the last several years. Mr. Kasturchand is the President of the Bombay Bullion Association, and a veteran trader.

★★

Mr. N. A. Palkhiwala, a leading legal luminary of Bombay, inaugurated a series of ten lectures on 'Taxation in India' organised by the Daver's College of Commerce. He observed that the contention of the Reserve Bank that many other countries had levies similar to the super-profits tax was 'entirely unfounded' and 'exactly contrary to the truth.' In Belgium to which the Bank had made a reference, tax had to be paid only on undistributed profits and tax reductions were given on the basis of tax payments in earlier years. Progressive rates of company taxation existed in Belgium, Holland, Denmark, Austria and Italy. But in all these countries the Government had a standard rate in mind and sought to give concessions to companies making lower profits. Progressive countries in fact, would not levy progressive rates of taxation on companies because such levy inflicted the higher rates of taxes on thousands of shareholders—most of them men of small means. He said that there was no such thing as a rich company or a poor one. As dividends declared by the company were taxed at progressive rates at the hands of the shareholders, a progressive rate of taxation on the company itself affected the poorer shareholders to a larger extent. No country levied corporate tax rates exceeding 61 per cent as in India. The 'fantastic rates of taxation' in India would result only in lower revenue to the Government through wealth-tax, income-tax and even excise. The companies could transfer their entire profits to reserves at the end of the accounting year and thus widen the capital base and reduce the incidence of the super profits tax. Taxes and dividends could be paid out of reserves later in the subsequent accounting years. It is interesting to note that the Central Bank, among the commercial banks, transferred its entire profit to reserves and made appropriations, including the payment of dividends from reserves in its 1962 balance sheet.

of Industry has been reported to have initiated discussions some time back with the parties concerned with a view to finding a way out of the difficulties, the deadlock has remained unresolved to date.

It may be recalled that under the third Plan, the private sector collieries have been required to reach an additional production of 17 million tons. In order to reach this level, the collieries have to modernise their equipment and it has been estimated that the capital outlay will be Rs. 60 crores with a foreign exchange content of Rs. 28 crores. The World Bank has agreed to make available to the private sector collieries Rs. 17 crores of foreign exchange in the first instance with an indication that the balance will be made available as a second loan at a later stage. While what appeared to be the most difficult part of the programme has been satisfactorily solved thanks to the World Bank, the collieries have found the task of raising the matching rupee finance quite insuperable. After much loss of time the guarantee scheme has been evolved and that too has flopped. A few of the larger collieries had been able to take advantage of the World Bank loan and utilise it because they could get the matching rupee finance either from their own resources or market borrowings. But a large section of the industry has to depend entirely on the guarantee scheme as what little resources it has have been mopped up by the super profits tax and the increase in the cost of production.

Enthusiasm Lacking

It would appear that the reluctance of some of the collieries to undertake modernisation and expansion programme in part stems from the growing apprehension that demand for coal may not catch up with the increase in production. Already stocks at pitheads are increasing and demand for several months now has shown no sign of picking up. The reason for the sluggish demand is not far to seek. Industrial expansion so far in the current plan period has been slower than planned and as a consequence demand for coal has also slackened. It is not expected that even supposing that concerted measures are taken to quicken the pace of industrial development in the remainder of the Plan period, the earlier shortfall can be completely made up. A result of this line of reasoning is that there has been a demand for downgrading the third Plan target of coal production. It has been pointed out by some that in the changed context of the slowdown in industrial expansion a target of 80 million tons will be about all that will be required though some other estimate would like to have a more drastic reduction of the target.

It is to be noted in this connection that the third Plan target of 97 million tons has been considered too low by the Planning Commission and that body has indicated that the target may have to be raised to 105 million tons. This position has become untenable now and this august body will soon have to face the realities of the situation and effect such modification of the coal production target as will be dictated by its mid-term appraisal of the Plan. It is hardly surprising, therefore, that the coal industry is not very enthusiastic about entering into fresh financial commitments in respect of its expansion plans. After all, the loans are to be serviced and ultimately repaid. And what are the incentives for taking up such additional commitments? Almost nil. On the contrary, the industry is faced with the prospect of unlifted pithead stocks and even if the additional output is sold the return will be inadequate to cover the servicing charges of loans contracted in respect of the expansion plans as under the present level of selling prices the profit margin is little if not non-existent.

Knowledgeable circles, however, have hastened to emphasise the need for a revision of the output target for

the current plan should not be allowed to impede the progress of the expansion programme of the coal industry for the simple reason that with plans for accelerating the pace of industrial development in the next two years, demand for coal will show a marked rise in the first year of the fourth Plan. It is relevant here to remind ourselves of the disastrous consequences of cutting down sugar production because there was a large surplus in one year. Another very important reason why the modernisation programme of collieries should proceed apace is that though overall output is in excess of demand, quality-wise there is serious imbalance. While low quality coal is available in plenty, industries requiring quality coal are not getting it in adequate measure. And high quality coal production can be increased only by accelerating the mechanisation of mines.

Finance the Stumbling Block

This again brings us back to the question: How to bring about this much needed modernisation for which the needed foreign exchange is assured but matching rupee finance has proved to be the stumbling block? The guarantee scheme has been found to be of little avail. The easiest way out of the impasse is to enable the industry itself to earn the money needed, by increasing the selling price of coal. This is a question that has been handled only half heartedly by Government so far. Price increases there have been — eight in the past four years — but all the time much below the industry's expectations and only just enough to cover the increase in labour costs. In effect no price increase to cover the increased cost of production as a result of other factors has been granted to the industry in the past several years. The argument that a general price increase at a juncture when demand is slack will be wrong is not valid because Government has not hesitated to fix the minimum price for jute at the previous year's level even when jute is expected to be in plentiful supply. Besides a general price increase, it is also necessary to fix the prices for various grades of coal so that there is greater incentive for collieries to raise better grades. A higher differential between lower grades and higher grades will also help eliminate the present indiscriminate use of high grade coal the supply of which is by no means super abundant in our country.

♦♦

Despite a sizable rise in stocks at the end of July, the jute goods market continues to rule steady. The improvement is mainly confined to the sacking section where over the past few days there had been enquiries from a number of foreign countries. Even so, it would appear that the present enthusiasm in sackings stems from the rapid expansion in internal consumption of this category of goods. The outlook for sacking exports however does not appear to be bright for two reasons. Firstly, with the Government of India showing no sign of countering growing competition to Indian sacking in overseas markets, Pakistan is steadily increasing exports of these goods. Secondly, the erstwhile importing countries are intensifying their efforts to become self-sufficient in sacking by putting up their own jute mills using either their output of jute or obtaining raw material from Pakistan.

In the meantime, the Indian jute goods industry is studying the implications of the far reaching recommendations made by the Srivastava Committee. One of the recommendations of the Committee is that the working time agreement of the IJMA should be scrapped as in its opinion there is no longer any scarcity of raw jute which has been in plentiful supply for the past three years. The unrestricted production of goods is not expected to pose any problem of disposal because the Committee has also recommended the establishment of a buffer stock agency for jute goods. The recommendation that concerted efforts should be taken to increase

the per acre yield of jute should be particularly welcome to the industry because a sizable increase in yield will go a long way toward reducing the cost of production of jute and consequently the industry will be able to obtain its raw material

Dearer Electricity?

From Our Correspondent

MADRAS :

MR. R. VENKATARAMAN, the Minister for Industries and Power in Madras State, gave a definite hint, when he presented the annual financial statement of the Madras State Electricity Board for 1963-64 to the Legislature, that an increase in electricity rates was being considered. It has been explained that the State Electricity Board has need for additional funds and during the current year, on account of the fast implementation of work on the various projects, the allotment of funds is likely to be exceeded. It is expected that, apart from the regular provisions towards depreciation and sinking funds, there will not be any surplus and the State Government would have to give a loan of very much more than Rs. 9 crores earmarked earlier. The rapid completion of projects is no doubt to be welcomed, but the bigger consumers might probably feel that they are being unnecessarily fleeced as not long ago there was a revision of the tariff rates and the State Government also levied a duty of 10 per cent for revenue purposes when the Budget was presented earlier this year.

Thermal Power Dearer

There is no doubt a case for charging higher rates to the consumers if the duty had not been levied, because the State Government is now purchasing large quantities of thermal power from the Neyveli Lignite Corporation. With the prospect of several more units being commissioned during the next few years in this centre and the proposal of the State Government itself for installing three thermal plants, having a capacity of 100 mW each, it will be necessary to revise upward electricity rates as thermal power is more costly to generate. Indeed, the rate at which power from Neyveli should be supplied to Madras has not yet been definitely decided as the authorities in Neyveli are unable to have a clear idea of the cost of power generation and what exactly is the policy that should be followed in regard to the allocation of development expenditure. The mining overheads can be spread over larger raisings of lignite only when all the units are in operation and the two other integrated projects also have been completed. The cost will necessarily be high. The State Electricity Board cannot, however, be asked to bear the full burden of development expenditure. However, there can be no denying the fact that the average cost of power generation will move up as the content of thermal power to total power generated increased in proportion. The view has somehow gained ground that costly power will not be resented though loud complaints have been heard in other States also that electricity duty and higher charges for power consumption have inflated costs, particularly in the case of industries which consume large quantities for processing purposes. A tax on electricity is undeniably a convenient source of revenue. But it should be remembered that the rates cannot be raised beyond a particular stage and there should be no disposition on the part of a monopolist agency to exploit a situation.

Mr. R. Venkataraman has again indicated that it is the intention of the State Electricity Board to install three thermal stations at Ennore, Cuddalore or Nagapattinam, and Tuticorin, having a capacity of 100 mW each as these centres will be convenient for receiving coal by sea. It has not been made clear, however, so far what is the reaction of the Planning Commission to this proposal especially as it has been stated that it would be far more advantageous to erect an entirely

at a reduced cost. At present the fact that it has to pay a minimum of Rs. 30 per maund basis Assam Bottoms while prices of jute goods are dictated by trends in world markets often makes it difficult for the industry to earn a profit.

new thermal station at Neyveli having an ultimate capacity of 1000 mW.

As regards the projects for the current Plan period, it is expected that there will be an increase in the generating capacity to 1,220 mW from 560 mW at the end of the second Plan and the total outlay will be considerably in excess of the allotment of Rs. 100.19 crores. It is expected that the third generating unit of 20 mW in Power House No. 1 at Kundah and the fourth generating unit of 35 mW in Power House No. 2 will be commissioned early next year while Power Houses 3, 4 and 5 under this scheme are also expected to be completed during the course of 1964. The entire installed capacity of 245 mW envisaged under this scheme is expected to be in operation by 1965 bringing the total capacity of the Kundah project to 425 mW in five power houses. Under the Mettur Tunnel Scheme too, it is expected that all the four units will be in operation during the third Plan and equipment from USSR has started arriving at site. The first two units will be ready during the monsoon of next year and the remaining two units in 1965. The Periyar expansion scheme will be completed next year so that with the remaining units also in Neyveli in operation before March next year, the power position should be very comfortable in the latter half of 1964. It is, however, difficult to anticipate the course of developments during the next summer as the current monsoon has been a failure and the level of water storage in the various reservoirs for this time of the year is rather disappointing.

★★

The Madras tax payer might perhaps feel more aggrieved because the amendment to the Sales Tax Act empowering the Government to levy a higher rate of 10 per cent on luxury items has been passed by the Legislature. The increase in the rate from seven to 10 per cent has no doubt been agreed upon between the various States sometime back. But the rate will operate inequitably as buyers of cars, refrigerators, radio receivers and other items will feel the burden of the enhanced sales tax heavily because it comes on top of the higher excise duties recently levied by the Central Government. The feeling is gaining ground that both the Central and State Governments have been responsible for an increase in prices of many essential articles on account of heavy indirect taxes and that along with higher direct taxes and the compulsory deposit scheme, the middle income groups have been unduly oppressed.

★★

When the Budget for 1963-64 was presented by Mr. K. Brahmananda Reddy to the Andhra Pradesh State Legislature earlier this year it was suggested that the Government might later propose the reorganisation of the sales tax structure on the basis of the recommendations of Dr. Lokanathan and that a tax on non-agricultural urban land also would be levied. The reorganisation of the sales tax system has since been carried out and the State Legislature recently passed an amendment bill which would fetch the Government an additional revenue of Rs. 2 crores in a year. The new changes will bring about better sales tax administration and simplified assessment procedures. The loop-holes which resulted in the loss of revenue to the State will also be plugged. An amendment exempting the levy of sales tax on text books for schools and colleges moved by Mr. Tennetti Viswanathan has been accepted. The Non-Agricultural Land Assessment Bill is expected to yield over a crore of rupees in a year.

The moving fingerprints

I MUST leave serious comment on the Kamaraj Plan to the editorial columns next week. Meanwhile, I cannot help wondering what all this is going to mean in terms of day-to-day government. It is clear that, whatever the Prime Minister wants to do, he must do quickly, otherwise the prevailing uncertainty about ministerial futures must necessarily force the administration into an uneasy holiday. There are, of course, two views on what is likely to happen. The cynical verdict of one school is "precious little"; but this thinking is definitely in a minority. The more general expectation is that the mountain in labour cannot, on this occasion, afford to bring forth merely a mouse — it must at least let loose a scurry of mice. It is a mercy for the mice, if not also for the mountain, that August 20 is not far off — the pundits seem to agree that by that day it must become fairly clear what, if anything, is to be done to whom, if any one.

★★

Among the professional clowns of the Congress Party, Mr. Mahavir Tayagi, of course, is in a class apart. His clowning has the quality of Shakespeare's Fools — the quality that is of wisdom wrapped up as folly. This is a special talent which not everyone can lay claim to, as Mr. Hanumanthaiya discovered to his cost when he tried to play the joker in the pack at the meeting of the AICC last Saturday. The question is not whether he was in fact told by any Chief Minister that by spending a crore of rupees one could become Prime Minister, but whether an ex-Chief Minister should have been naive enough to take such a statement, assuming that it was uttered, seriously enough to repeat it in the AICC meeting. Mr. Hanumanthaiya evidently is one who knows neither the value of anything nor even the price.

★★

That the final decisions of the Aid-India Consortium on assistance for the third Plan during the current year have turned out to be so satisfactory in scale and terms is largely due, no doubt, to the United States (and the World Bank) lobbying among the other members of the Consortium. At the same time, it must go on record that at least two officials of the Government of India have played a persevering role in persuading the assisting countries. One of them is Mr. C. S. Krishnamurthy, who has just returned to the Finance Ministry here after a most fruitful spell of work in the Economic Affairs wing of our Embassy in Washington. The other, of course, is Mr. L. K. Jha who went to Washington during a difficult spell in the consultations of the Aid-India Consortium.

One of the difficulties that Mr. Jha had to contend with was that the fact that part of the aid which had been committed earlier still remained unutilised by this country was brought up against the Government of India. Some of the assisting countries naturally tended to argue that India's case for increases in further aid was weak as there were arrears in the utilisation of funds already offered. Mr. Jha evidently was successful in convincing the critics that the blame for the delayed utilisation could not be made to rest on the Government of India alone. In some cases, delays in utilisation were, at least in part, due to governmental procedures at the giving end. In many other cases difficulties in prompt utilisation were inherent in the terms on which a particular scheme

of assistance was framed. Thus, where aid is tied to a project, the rate of drawing of money is determined by the physical progress of the project, which again is dependent on a number of factors not all of which are within the control of the aid-receiving country. Incidentally, the Finance Minister himself never seemed to have had any serious misgivings about the final adequacy of the Consortium's offer this year. In fact, even when the aid talks were at their stickiest, Mr. Desai seemed quite confident that India's friends would not let her down.

★★

Life Insurance, certainly, is a necessity of modern life. Unfortunately, it is not one of those commodities which sells itself. It has to be sold sedulously. This is especially so in this country where both prejudice and ignorance have to be reckoned with. In a surprisingly large number of households, especially among the women folk, there is still a vague feeling that insuring one's life is somehow "inauspicious". This is the prejudice part of it. Ignorance comes in where the benefits of life insurance are concerned. Not many have a clear idea of what precisely are the advantages which life insurance confers. It is plain that both the prejudice and the ignorance have to be dispelled by efficient publicity if the life insurance habit is to spread among our people as rapidly as it should.

The ubiquitous life insurance agent is, of course, an indispensable and certainly the most important instrument of education. But his efforts need to be aided through the skilful employment of modern means of mass communication. From this point of view, the Life Insurance Corporation of India has certainly shown commendable enterprise in getting up a series of educational film shorts on life insurance which are evidently to be shown all over the country. There was a special screening of these film shorts at Rashtrapati Bhavan last week. Some of them are produced by the Films Division of the Ministry of Information and Broadcasting, while the others have been commissioned from independent producers. The shorts are, by and large, successful in dealing with prejudice by driving home the point that, although life insurance is essentially a cover against risks, it need not always and necessarily be associated with the idea of death and that a life insurance policy can also serve such agreeable purposes as providing finance for a child's education, a daughter's marriage or one's own life of retirement in old age, and with ignorance by illustrating vividly and effectively the many schemes of life insurance which are available for particular needs and for specified benefits.

At the same time, I must say that more than one of these film shorts was corny stuff, especially the one which lingered over the life story of a couple of Saurashtra families in a mood of sickening sentimentality and in the most cloying fashion. And I do think it a mistake not to keep shorts of this kind really short. I would suggest to the LIC to have a look at some of the market documentaries which commercial enterprises, such as Hindustan Lever, for instance, are screening. When a point is to be made it is always wise to try to make it pointedly.

V.B.

Trade Winds

IMPORT RESTRICTIONS ON U.S. POULTRY

THE IMPORT restrictions placed by the European Economic Community on U.S. poultry appear to have disappointed the U.S. officials and now they seem to be threatening a serious action against it. The retaliatory measures might affect the West German Government most because it is West Germany that has imposed the highest tariffs. West Germany's charges on imports of U.S. poultry have risen within a year from 4.9 cents to more than 13 cents a pound. Among the products apparently being considered as retaliatory items are French wines, German trucks and various chemicals. Industries affected by these changes would be consulted in advance and under GATT procedures, the United States would be required to give 30 days notice to signatory nations before withdrawing trade concessions.

As a result of the restrictions imposed, U.S. exports of poultry to the EEC, mainly to Germany, have dropped substantially from a rough monthly average of 6,000 tons in 1962 to a total of 2,000 tons in the first four months of 1963. The value of affected U.S. trade is placed at about \$46 million. The major loss, however, may well have been to the European consumers, who have had to pay higher retail prices for poultry. Before the retaliatory measures are taken, the entire question would be discussed in detail at public hearings in Washington starting from September 4. There will be a Presidential proclamation, presumably around 16th September, which will make the retaliatory measures effective in nearly thirty days. Thus, the entire action would not be final until mid-October, giving the EEC more than two months in which to prevent the withdrawal of U.S. concessions by offering satisfactory arrangements on poultry. Incidentally, these moves are in complete conformity with the GATT and that GATT principles make ample provision for the kind of action, the U.S. is initiating.

FERRO-MANGANESE INDUSTRY

At the third quarterly general meeting of the Maharashtra Chamber of Commerce, Mr. Lal Chand Hirachand, President of the Chamber, in his speech while dealing with Maharashtra's economy referred at length to the problems faced by the ferro-manganese industry. He pointed out that the industry has been heavily priced out of the international market on account of the high-cost production arising out of high cost of manganese ore, high cost of hard coal, high rates of electricity and railway freight. All these four factors which constitute more than 80 per cent of the cost structure, are directly under the control of the Government. It may be noted, he said, that foreign producers get manganese ore of Indian origin at a cheaper rate than what Indian purchasers are paying for their ferro-manganese plants. Again it is surprising that high grade manganese ore has been earmarked for export and low grade is diverted to meet the requirements of indigenous industries.

It would have been apt if priority would have been given to meet the needs of the industry first for such high grade manganese ore.

In regard to power the situation is equally worse. Indian producers of ferro-manganese have to pay the highest rates for power, while in other countries the cost of power consumption per ton of ferro-manganese ranges from Rs. 20 to Rs. 25. The comparative power cost in India is anything between Rs. 135 to Rs. 225 per ton. With these variations, can this industry, however efficiently it may be functioning, compete with foreign producers when it has to pay such high

rates for power alone? In view of its export potential and in view of the fact that all factors that contribute to its cost structure are at the direction of the Government, the Ministry of International Trade should find ways and means to evolve a special formula to reduce the cost of its production and stabilise this basic industry for the benefit of the country. A delay in this matter may have adverse repercussions to such an extent that we may lose foreign markets permanently for this commodity.

INTERNATIONAL SHIPPING SITUATION

The ninth annual report of the Maritime Transport Committee published recently by the O.E.C.D. deals with shipping supply and demand as well as the situation of the freight markets and other new developments in 1962. The world movement of seaborne trade, the report underlines, continued to rise but for dry cargo the rate of increase was appreciably less in 1961 than in 1960. The slump on the freight market which began in 1957 persisted in 1962 for the fifth year in succession, despite a slight improvement in tanker freight rates.

The world merchant shipping fleet rose from 132.4 to 136.5 million gross registered tons between mid-1961 and mid-1962, i.e. an increase of about 3 per cent. But owing to the higher efficiency of new construction, the increase in carrying capacity in 1962 exceeded the increase in tonnage. Tankers represent one-third of world tonnage with 45.1 million gross registered tons. About 70 per cent of world tanker tonnage is less than 10 years old. The OECD countries own two-thirds of the world tanker fleet. The dry cargo fleet has now reached a total of 91.4 million gross registered tons. The increase in ore carriers and bulk carriers is particularly striking. The tonnage of new vessels delivered from the shipyards in 1962 amounted to about 8 million gross registered tons. New orders for vessels at mid-year represented 17.6 million gross registered tons as compared with 18.2 million in 1961. This is 50 per cent lower than the 1957 figure, but still reflects the situation which has depressed the freight market over the last five years, i.e. the large surplus of available tonnage.

The efficiency and capacity of harbours often leave much to be desired, whether in the developing or so-called developed countries. Improvements in efficient and profitable operation of ships have not been accompanied by comparable progress in the use of port facilities. The OECD Maritime Transport Committee has begun a survey of the economic importance of harbours. A logical assumption is that in certain countries action should be taken to improve harbour facilities and their use before building a fleet. This is a problem which vitally affects the world economy.

EMPLOYMENT OPPORTUNITIES

The Union Ministry of Education has set up a Committee to examine the problem of education in relation to employment opportunities. Headed by Professor M. S. Thacker, Member (Education) Planning Commission, its members will be Mr. P. N. Kirpal; Dr. C. D. Deshmukh; Mr. G. D. Birla; Mr. G. K. Chandiramani; Mr. Abdul Qadir; Mr. Ranchor Prasad; Mr. V. K. Ramaswami; Mr. Pitambar Pant; Mr. I. G. Patel; Mr. R. A. Gopalaswami and Mr. A. C. Deve Gowda. The Committee has the following terms of reference:

- (1) To examine the trends concerning the output of educated personnel at different levels of education and

DOLLARS FOR DEVELOPMENT

Since April 22, further assistance to the tune of \$96.7 million has been received by this country from the U.S. carrying the total to \$4,977.8 million (Rs. 2,370.4 crores) as on July 26, 1963.

The aid announced since April 22, 1963 includes the following:

Dugda Coal Washery Expansion Project ..	\$5.1 million
Jharia Ropeways	\$7.7 million
To Bharat Forge Co., of Poona to purchase machinery for manufacture of high quality precision forgings. .. .	\$3.9 million
Nuclear Power Station at Tarapur .. .	\$80.0 million
Ramagundam Thermal Power Project in Andhra Rs. 3.7 crores, taking the total commitments to Rs. 77.8 crores.	

EXPORT OF CONSUMER GOODS TO USSR

A contract was recently signed between the State Trading Corporation of India and the Soviet Foreign Trade Corporation, Raznoexport, for the export of consumer goods to the Soviet Union worth Rs. 2.2 crores. An agreement was also signed between the Indian firm, Mohanlal and Company and the Soviet Foreign Trade Organisation, Medexport, at the Indian National Exhibition in Moscow, according to which India will import Soviet medical equipment and instruments. Hitherto India used to import from the Soviet Union only medicines. Their value this year will exceed one million dollars. Soviet medical equipment and instruments are shipped to 30 countries including all socialist countries, the United States, the Federal Republic of Germany, Japan and the United Arab Republic.

SOVIET ECONOMY

The Central Statistical Board of the U.S.S.R. has announced that the Soviet industry has fulfilled its half-year gross production plan. The volume of production during the six months of 1963 increased by 8.5 per cent as compared with the corresponding period in 1962. The operating equipment was largely modernized in all branches of industry. During the period under review, about 300 major items of machinery, equipment and instruments were manufactured. Labour productivity in industry grew by 6 per cent as compared to the first half of last year. The Board announced that in agriculture the plan of sowing was over-fulfilled despite unfavourable climatic conditions this spring in most areas of the U.S.S.R. The volume of capital investment in the State plan amounted to 14.1 billion roubles. The overall growth of the volume of capital investments is 4 per cent, while in the chemical industry it is 15 per cent, in the gas and oil industries 7 per cent and in agriculture 12 per cent.

The Board reported that the number of factories and office workers employed in the national economy of U.S.S.R. equalled 69 million — a two million increase as compared with the first half of the last year.

In the six months private deposits in savings banks grew by six per cent and amounted to 13.6 billion roubles. The population of the U.S.S.R. received 15 billion roubles from special public funds during this period (free tuition, free

medical aid, paid leaves, pensions and other grants), i.e. a billion roubles more than in the corresponding period last year.

SAVINGS IN JAPAN

According to a study published in June by the Japan's Savings Promotion Council, the Japanese save a greater percentage of their income than any other people in the world.

The Council reports that in 1961, savings by individuals averaged 22.3 per cent of personal income after taxes, compared to 7.0 per cent for the U.S., 10.7 per cent for Britain, 8.8 per cent for West Germany and 7.8 per cent for France. The Council gave four major reasons for the high savings rate among Japanese. The first was the increase in income levels as a result of continuing economic prosperity. The second was the fact that the absence of adequate social security, as in advanced Western countries, encourages private savings as a substitute. The third was the impact of national savings promotion campaigns. The fourth combined the traditional thriftiness of the Japanese and their confidence in the national currency.

Total individual savings at the end of 1961 were placed at \$43,415 million, broken down into 55 per cent in straight savings, 22.5 per cent in stocks, 10.2 per cent in investment trusts, 9.8 per cent in insurance, and 2.5 per cent in public bonds and debentures. By comparison total individual savings in 1954 amounted to \$10,150 million. This was divided into 66.5 per cent in straight savings, 18.8 per cent in stocks, 7.7 per cent in insurance, 4.1 per cent in investment trusts, and 2.8 per cent in public bonds and debentures.

IISCO PLANS EXPANSION

SIR BIREN Mookerjee, Chairman of the Indian Iron and Steel Company Ltd., in his statement circulated along with the annual report of the company for the year ended March 31, 1963, reviewed the attainment of the rated capacity of the Burnpur Works and also outlined the growth prospects during the coming few years. He pointed out that there was potential for increasing further the capacity of the Burnpur Works by nearly 1 million tons. This expansion is proposed to be taken up in two stages. In the first phase, the company proposes to raise the capacity by 300,000 tonnes of equivalent ingot steel to be processed in the existing rolling mills. In the second phase, which will follow in due course to accord with the overall planning of Government, there is a plan to execute an increase of some 700,000 tonnes of crude steel. The form of final processing will depend upon the future requirements of the country. By and large, the Government has approved of the first phase in principle and called for a technical and financial report on this expansion programme. The World Bank has also expressed its interest in this expansion. Sir Biren pointed out that the expansion project depends greatly on the capacity of the company to implement the Chasnalla Project for the development of the company's coal-bearing properties. A loan covering the foreign exchange cost of this coal project of the order of \$19.5 million has been negotiated with the World Bank. The estimate of rupee expenditure has, however, risen sharply mainly due to the lack of Government support in respect of land acquisition which has necessitated the abandonment of the proposed open-cast mining section of the project. Moreover, the prices of various commodities have been inflated by a heavier taxation.

Reviewing the working of the Kulti foundries, the Chairman has indicated that recently an adverse factor has been introduced, in the form of the cut on the supply of pig iron from Burnpur to Kulti. The supply has been diverted to other producers as a result of which the earnings of the Kulti foundries may suffer to the extent of Rs. 65 lakhs a year.

An encouraging factor in the Chairman's review is that the Burnpur Works has reached the rated capacity of one million tonnes of ingot steel during the year under review. It is unfortunate, however, that the Government has flouted the recommendation of the Tariff Commission in respect of fixing the retention price of steel. As a result of the uneconomic level at which it has been fixed, there has been a considerable loss of earnings for the company. The Profit and Loss Account shows a profit of Rs. 9.12 crores for the year as against Rs. 9.19 crores last year. The taxable ordinary dividend of 16 per cent has been repeated. A sum of Rs. 22.14 lakhs has been separated towards development rebate reserve and Rs. 3.64 crores towards general reserve.

GWALIOR RAYON

The Gwalior Rayon Silk Manufacturing (Weaving) Company Ltd., has recorded a higher gross sales at Rs. 13.08 crores during the year ended March 31, 1963 against Rs. 12.06 crores last year. The gross profit, however, declined to Rs. 4.11 crores from Rs. 4.24 crores. The directors have proposed to maintain the dividend at Rs. 2.50 per share absorbing Rs. 62.50 lakhs which is to be paid out of the general reserve. Other allocations are Rs. 21.44 lakhs for donations, Rs. 83.89 lakhs for depreciation, Rs. 15 lakhs for capital redemption reserve

and Rs. 1.72 lakhs for general reserve. A sum of Rs. 3,547 is carried forward. With the commencement of the trial production of the company's pulp factory, the provision for development rebate reserve has increased to Rs. 112.36 lakhs.

CALTEX INDIA

The net profit of Caltex Oil Refining (India) Limited for the year ended December 31, 1962 has declined rather sharply to Rs. 146.35 lakhs from Rs. 241.98 lakhs in 1961, thereby there is a drop in income from refining to Rs. 2.63 crores from Rs. 3.56 crores previously. As there was some difficulty in getting licences for the import of crude oil the through-put was lower at 7,079,000 barrels against 7,382,000 barrels. Efforts, however, have been made to increase the yield of middle distillates in order to mitigate the problem of imbalance in production of petroleum products in the country. Difficulties were also experienced in the import of stores and chemicals which caused some anxiety but arrangements are being made to secure spare parts as far as possible from internal sources. The provision for depreciation is Rs. 90.55 lakhs and for taxation Rs. 54.18 lakhs. Out of the credit balance of Rs. 4.23 crores brought in from the previous accounts, a sum of Rs. 40 lakhs was transferred to Reserve No. 1 and Rs. 50 lakhs to Reserve No. 2. It is stated that the directors will determine the desirability of declaration of dividends out of 1962 earnings later in this year. The company has been permitted to manufacture liquid petroleum gas. Another licence has also been received for the manufacture of naphtha, which is essential for the fertilizer industry.

TATA ELECTRICS

The Tata group of hydro-electric companies — the Tata Power Co. Ltd., the Tata Hydro-Electric Power Supply Company Limited and the Andhra Valley Power Supply Company Limited—has raised the distribution for the year ended March 31, 1963 by one per cent by way of bonus in addition to the final dividend. The distribution is subject to taxation. The final dividend recommended by Tata Power is Rs. 50 per share, in addition to a bonus of Rs. 10 making a total contribution of Rs. 90 per share for the whole year. The Tata Hydro has recommended a final dividend of Rs. 5 per share and a bonus of Re. 1 per share making a total of Rs. 9 for the whole year. Andhra Valley has recommended a final dividend of Rs. 50 per share and a bonus of Rs. 10 per share making a total of Rs. 90 per share for the whole year.

LARSEN & TOUBRO

Mr. H. Holck-Larsen, Chairman of Larsen and Toubro Ltd., in a statement appended to the annual report and accounts for the year ended March 31, 1963 has expressed confidence in the growth prospects for the company. Sales during the year under review of machinery components, spare parts, contracting and service aggregated to Rs. 7.41 crores as against Rs. 5.71 crores last year. At the same time, income from commission, compensation, engineering fees and other sources amounted to Rs. 34.17 lakhs as against Rs. 25.88 lakhs previously. Similarly, the profit before providing for depreciation, development rebate and taxation amounted to Rs. 66.17 lakhs as against Rs. 55.43 lakhs for the previous year. Provision for taxation including Super Profits Tax has absorbed Rs. 24.42 lakhs as against Rs. 21.00 lakhs. The directors have appropriated Rs. 4.06 lakhs for the general reserve, Rs. 1 lakh for dividend equalisation reserve and Rs. 20.23 lakhs for

dividend reserve. They have recommended the maintenance of the last year's dividend at the rate of Rs. 1.40 per equity share, subject to provision for tax, for this year also. The 5,50,000 equity shares allotted and paid up during the year qualify for dividends for half year.

Additions to manufacturing facilities, together with increasing efficiency, have enabled the Powai workshops to step up their output of high quality engineering products by 40 per cent. The company's general machine and fabrication workshops were fully occupied with the manufacture of plant and equipment notably for the chemical, pharmaceutical, dye-stuff, dairy, distillery and brewery industries. The switch-gear factory turning out electrical switchgear, motor-starters, control and instrument panels and also kerbside petrol dispensing and metering pumps, has considerably increased its originally planned output and continues to perform satisfactorily.

SUTLEJ COTTON

The directors of the Sutlej Cotton Mills have maintained the dividend for the year ended March 31, 1963 at Rs. 8.57 per share, subject to tax. The gross profit for the year is Rs. 25.78 lakhs compared with Rs. 30.90 lakhs in the previous year. The directors have withdrawn a sum of Rs. 2.20 lakhs from the provision for taxation. A sum of Rs. 8.65 lakhs is allocated for depreciation, Rs. 6.54 lakhs for development rebate reserve and Rs. 12.85 lakhs for dividend reserve. This year's dividend is being paid out of the dividend reserve. The annual report reveals that the construction work and the erection of the Rajasthan textile mills has made satisfactory progress despite many difficulties. Part of the mill started working from April this year and it is expected that all the machines would be in production by October this year. The quality of yarn manufactured by the mills has been well received in the market.

The textile mills in Pakistan did not show good results because of the general slump in the price of cotton textiles and the adverse results were partly due to more spindles and looms coming into production. The mills in Pakistan and exported over 9 million yards of cloth during the year and the trend is being maintained during the current year as well. This good performance of the company in the field of export has been appreciated by the Government of Pakistan. The company has added two new comber sets, mercerizing plant and 50 automatic looms, which went into production towards the close of the year. The company proposes to install further 10 automatic looms during the current year. It also proposes to install a high draft system to improve the quality of the yarn. With the addition and modernisation of the mills it is expected that the working will improve considerably.

PAYMENTS TO RETIRED DIRECTORS

Some cases have come to the notice of the Department of Company Law Administration where public limited companies have allowed certain monetary benefits purporting to be for past services rendered, such as gratuity, salary in lieu of leave etc. to their retired managing or whole-time directors or managers, which apparently they were not entitled to receive according to their service contracts. The Department is of the view that such payments are not in conformity with the scheme of the Companies Act and if any public company or a private company which is the subsidiary of a public company proposes to make such payments, it would be well advised to seek the prior approval of the Central Government as if these payments amounted to an increase in the remuneration of the directors under Section 310 of the Companies Act, 1956.

ration of the directors under Section 310 of the Companies Act, 1956.

HIND WIRED GLASS

The Hindustan Wired Glass Manufacturing Company Ltd., is expected to go into production in the last quarter of 1963. The construction work is almost complete and machinery is being erected. The diesel sets will also be commissioned shortly. According to the report of the directors for the year ended March, 1963, there has been some delay in the procurement of materials, partly because of the strike at New York port. The cost of the project has also gone up by Rs. 30 lakhs over the original estimate of Rs. 108 lakhs, which is proposed to be met from borrowings.

CAPITAL ISSUES

The Controller of Capital Issues has authorised five new capital issues for a total sum of Rs. 2.5 crores. One of the companies was established last year while another is a new one. Two companies are offering a part of their capital to foreign collaborators. One of the companies is raising capital to put part of it in the scrips of another company. Only one of the companies is issuing equity capital. The consent for all the capital issues is valid for twelve months.

Deepak Insulated Cable Corporation Limited, Bangalore, a new company, has been given consent for the issue of capital of Rs. 30 lakhs in equity shares of Rs. 100 each for cash at par. Of this, shares of the value of Rs. 20 lakhs would be issued to the public by prospectus. The money will be utilized for the manufacture of enamelled copper wires and double and triple paper cover copper wires and strips.

S. M. S. Investment Corporation (P) Limited, Delhi, is raising Rs. 20 lakhs equity capital in shares of Rs. 100 each to be issued at par. Half the shares will be issued for cash and another half for consideration other than cash. The money will be spent on acquiring land and constructing buildings on it as well as for purchasing scrips of other companies as an investment company.

Capstan Meters (India) Limited, registered last year in Delhi, is to issue capital of Rs. 25 lakhs (inclusive of Rs. 10 lakhs already issued). This capital is divided into 2,00,000 equity shares of Rs. 10 each and 5,000, 9.5 per cent cumulative preference shares of Rs. 100 each. Out of this issue, equity shares of the value not exceeding Rs. 6,66,670 will be offered to the foreign collaborators against supply of technical know-how, jigs, tools and fixtures and import of plant and machinery, the balance will be issued in India for cash at par.

Kutch Salt and Allied Industries Limited, Bombay, will issue capital of Rs. 12,50,000 divided into 1,25,000 equity shares of Rs. 10 each at par. The shares will be offered to the public by prospectus.

Union Carbon India Limited, will issue Rs. 1,55,35,000 (in supersession of the previous consent for issue of Rs. 1,62,50,000) in equity shares of Rs. 100 each, of which not exceeding 40 per cent would be issued to United Carbon Company, Houston, Texas, and the remaining 60 per cent issued in India. The money will be used for the manufacture of carbon black.

LICENCES ISSUED

The following licences have been granted under the Industries (Development and Regulation) Act, 1951 — during the week ending August 3, 1963. The list contains the names

and places of the licensees, articles of manufacture and annual installed capacity.

IRON AND STEEL

Bharat Iron and Steel Corporation, 12, Gopal Ghose Lane, Salkia, Howrah (West Bengal) — C.I. pipes and fittings, C.I. sanitary fittings, C.I. Railway castings, rice mills parts, electrical goods, C.I. polishing machine, C.I. jute mill castings, machinery castings and miscellaneous. 5,000 tons.

ELECTRICAL EQUIPMENT

Rallifan Limited, Ralli House, 21, Ravelin Street, Fort. Bombay (Maharashtra) — Fractional Horse Power Motors — The capacity would be fixed on the basis of the actual production achieved and to that extent the existing capacity for fans would be modified. Universal Electrics Ltd., 15, India Exchange Place, Calcutta-1 (West Bengal) — Safety Breakers 120,000 nos.

CONVEYING EQUIPMENT

Otis Elevator Co. (India) Ltd., Gateway Building Apollo Bunder, Bombay-1 (Kaju Tekdi, Agra Road, Bhandup, Bombay, Maharashtra) — passenger and goods lifts, 120 nos.

COTTON TEXTILES

Sarguna Textile Pvt. Ltd., Avnashi Road, Coimbatore-1 (Madras) — 5,830 spindles for the manufacture of cotton yarn. Chowgule and Co. Ltd., Mormugao Harbour, Goa (Zambaulim/Quepem/Chandor, Goa) — 25,000 spindles for the manufacture of cotton yarn. Raipur Mfg. Co. Ltd., Outside Saraspur Gate, Ahmedabad-10 (Gujarat) — 1,976 spindles for manufacture of cotton yarn. Commercial Ahmedabad Mills Co. Ltd., Asarva, Ahmedabad (Gujarat) — 1,465 spindles for manufacture of cotton yarn.

JUTE

Ludlow Jute Co. Ltd., 14, India Exchange Place, P.O. Box No. 596, Calcutta-1 (West Bengal) — Wide Hessian (carpet backing cloth) 242 broad looms already installed for producing 25,410 tonnes. The Fort William Co. Ltd., 14,

Netaji Subhas Road, Calcutta (West Bengal) — Wide Hessian (carpet backing cloth) 100 broad looms for producing 10,500 tonnes.

SYNTHETIC TEXTILES

J. K. Synthetics Ltd., Kamla Tower, Kanpur (Rajasthan) — Nylon, 6.6 lakh kgms. per annum after effecting expansion.

PAPER

Packaging Paper Corporation Ltd., Post Box No. 134, K. K. Road, Kottayam (Angamali, Ernakulam, Kerala) — Fluting media and liner paper 30,000 tonnes per annum. Pulp 30,000 tonnes

CHANGES IN NAMES

(During the week ending 3rd August, 1963)

From M/s. The General Electric Company of India (Manufacturing) Private Ltd., Calcutta to M/s. The Central Electric Company of India Private Ltd., Calcutta. From M/s. Himco (India) Private Ltd., Delhi to M/s. G. M. C. Himco Industries Ltd., Delhi. From M/s. Dominion Plastic Industries to (Name of the new owner:) Mr. S. Viswanath, Director, M/s. Garware Plastics Pvt. Ltd., Bombay. From M/s. Malur Cotton Mills Ltd., Malur to M/s. Malur Durga Mills Ltd., Malur. From M/s. Somasundaram Paper Mills, Coimbatore to M/s. Somasundaram Paper Mills Ltd., Coimbatore.

LICENCES REVOKED

(During the week ending 3rd August, 1963)

M/s. Shri Digvijay Cement Co. Ltd., Sikka, via Jamnagar — cast iron cylpebs. Shri Amritlal Khimji, Calcutta — Clutch plates for automobiles. M/s. Jaisukhlal Ratilal Shah, Surendarnagar — Grinding media forged steel balls, cylpebs and special heat resistance cast iron case parts. M/s. Sanitex Chemical Industries Ltd., Baroda — Oxalic acid. M/s. Mahalaxmi Laghu Udyog Pvt. Ltd. Kota — Cotton waste yarn. M/s. Ram Prakash and Sons, Madi Bans, Moradabad — Cotton yarn. Shri Ram Shaker Gupta, Kanpur — Cotton yarn. M/s. Govind Oil Mills, Mandi Bans, Kanpur — Vegetable oils.

BOOKS BRIEFLY

Problems of Economic Growth

National Income of India: The Indian Merchants Chamber Economic Research and Training Foundation, Bombay; Pages 270; Price Rs. 15.

THIS BOOK puts together all the available information on the various facets of India's national income, and has been rightly described by Mr. G. P. Kapadia, Chairman of the I. M. C. Economic Research and Training Foundation, in his Foreword as a "factual documentation of the data". Even assembling the published material on any subject is extremely useful and in this the volume under review has succeeded considerably. It will be read with interest by all researchers and students of the Indian economy who wish to be enlightened not only in regard to the growth and distribution of national income but also regarding the problems of economic growth as explained by the changes in national income during the decade 1950-51 to 1960-61. It provides, to some extent, answers to some of the questions—especially the distribution of the increase in national income during the first two Plans—which the Mahalanobis Committee has been asked to study and whose report the country has been awaiting for the last two and a half years.

The book has been divided into three parts. Part I deals with the economic base of national income describing the chief characteristics of the economy, especially the operational characteristics and the flows in the economy. The last section of Chapter I dealing with "flows" is rather sketchy not because of any fault on the part of the authors but because "no conclusive" evidence is available from the research papers on national income regarding the "location of the flows". The conclusion that "a large part of the economic activities (about 55 per cent) is outside the monetised sector" needs to be questioned because the data collected by the National Sample Survey has fixed the non-monetised sector of the economy around one-third of the consumer expenditure and the authors' guess of the non-monetised sector at about 55 per cent seems to be very much wide of the accepted level. Again, it is not indicated if the estimate of the non-monetised sector refers to 1950-51 or to 1960-61. Has not the monetisation of the economy increased during the first two Plans? A look at the money supply data (47 per cent increase in 1960-61 over 1950-51) released by the Reserve Bank and a visit to a typical Indian village—one removed from the urban economic waves—will convince any research worker that the non-monetised sector of the economy is gradually but surely declining.

The analysis of national income based on the figures released by the Central Statistical Organisation has been prefaced by the basic assumptions made in the computation of the national income estimates and the various problems for which the researchers have failed to find answers. The evaluation of depreciation in the various sectors of the economy to derive estimates of "net" national income, the non-inclusion of estimates of changes in inventories, the deductions in the services sector etc. are problems which enhance the margins of error in the final estimates and, hence, make them unfit for refined mathematical techniques.

Special mention needs to be made of the section on "Price-Velocity" in Chapter V. The point has been rightly made that the "relative price charges" in the various sectors tend to under-estimate or over-estimate the variations in national income. In this connection it may be mentioned that the selection of the base year itself tends to distort the rise or fall in national income. This has been shown by shifting the base from 1948-49 to 1955-56; it is likely to be much more marked between 1948-49 and 1960-61.

A discussion of the key ratios of economic growth in

Chapter IX draws attention to the controversy regarding the savings-income ratio. The authors have opted in favour of Reserve Bank's estimate of 7.2 per cent (for 1951-52 to 1958-59) as against the Planning Commission's estimate of 8.5 and the NCAER's estimate of 10 per cent. Since the definitions adopted in the three estimates are different, it is difficult to favour one against the other. Recently, experts from the Reserve Bank, the National Income Unit of the CSO and the NCAER have been comparing their estimates and it is hoped that very soon we will have one accepted estimate on which the three organisations will agree. Part III studies distribution of income between rural and urban areas, amongst various income groups and between the States.

TWO CENTURIES OF BRITISH SHIPPING

The Rise of the English Shipping Industry: By Ralph Davis; Published by Macmillan and Co. Ltd.; Price 50s; Pp. 427.

Reviewed by T. SADASIYA SARMA

Dr. Ralph Davis narrates the story of the shipping industry in England during the 17th and 18th centuries—the two centuries within which England had established itself economically. In itself the shipping industry did not do much to the economic prosperity of England, but "it helped to create a favourable background on which rapid industrialisation was built". British shipping played a vital role in transporting raw materials from the colonies and taking manufactures back to them.

Dr. Davis discusses the economic and management problems of the shipping industry at some length. He describes in a very interesting manner the life and opportunities of the merchant seaman. The industry was growing so rapidly that its need for seamen was outpacing the slow growth of population up to the end of 17th century. (When the population had hardly doubled, the tonnage of ships multiplied nearly seven-fold). The seamen earned a great deal of money for all the risks they undertook. Dr. Davis creates an appropriate atmosphere by bringing in stories of huge fortunes made by shipowners in those early and adventurous days and by quoting from contemporary correspondence.

NATIONAL ECONOMY IN PERSPECTIVE

Statistical Outline of India 1963: Department of Economics and Statistics, Tata Industries Private Ltd., Bombay; Published by Popular Prakashan, Bombay; Pp. 110; Price Rs. 3.

The present issue is sixth in the series of this tidy and highly informative publication. The Statistical Outline carries in a handy format as many as 112 tables relating to the growth of the national economy in many of its aspects, such as population, agriculture, fuel and power, industry, transport, trade, balance of payments, labour, company affairs, banking and insurance, public finance, social services and economic planning. In a compilation of this kind there is always need to observe a certain upper limit on the matter to be included, otherwise the publication becomes too voluminous. Nevertheless, since it seems to be the intention of the compilers to make the "Outline" as comprehensive as possible, we venture to suggest that regional statistical data (State-wise) may also be included in future additions, at least in respect of the main trends of economic progress. As regards data relating to industry, greater use may be made of the information covered in publications such as the official Annual Survey of Industries. The inclusion of tables of general interest relating to matters such as newspaper readership and the general elections may serve to enhance the popularity of the "Outline".

Readers' Roundtable

CONSTITUTION (SEVENTEENTH) AMENDMENT BILL

Sir, — Sardar Patel, as Chairman of the Fundamental Rights Sub-Committee of the Constitution, strongly held the view that rights of ownership of land were sacred to a peasant. And any interference with them would be a loot and robbery and produce chaos and anarchy. It was, therefore, the duty of the State to protect them from wanton attack.

There was, however, a strong group in the Constituent Assembly, led by Mr. Nehru, with opposite convictions, which held that socialistic progress would be held up if the rights of property were fully safeguarded. So long as the Sardar was alive this group could not get the chance to enforce its ideology, but unfortunately, after his demise, the socialist group, which has been holding complete sway since then, has started eroding property rights and place them at the mercy of the executive. In the series of this legislation for so-called social reforms comes the Constitution (Seventeenth) Amendment Bill which was introduced in Parliament during the last session and is scheduled for discussion during the coming session. The Bill contemplates changing the definition of "estate", as contained in Article 31A(2) of the Constitution so as to include thereunder ryotwari lands also.

Based on the history of land legislation in various parts of the country, especially in the State of Madras, where the usual feature of land tenure was the ryotwari form but in some districts a landlord class had grown up, "the basic idea of ryotwari settlement is that every bit of land is assessed to a certain revenue and assigned a survey number for a period of years, which is usually thirty, and each occupant of such land holds it subject to his paying the land-revenue fixed on that land. But it is open to the occupant to relinquish his land or to take new land which has been relinquished by some other occupant or becomes otherwise available on payment of assessment." (Supreme Court Judgment in K. Kunhikoman v. State of Kerala, A.I.R. 1962, S.C. 723). It is further stated in the same judgment that "though theoretically . . . the occupant of ryotwari land held it under an annual lease, it appears that in fact the Collector had no power to terminate the tenant's holding for any cause whatever except failure to pay the revenue or the ryot's own relinquishment or abandonment." The ryot is, therefore, "generally called a tenant of Government but he is not a tenant from year to year and cannot be ousted as long as he pays the land-revenue assessed."

In the Manual of Administration, as quoted by Baden-Powell, in Vol. III of Land Systems of British India at p. 129, the ryotwari tenure is summarised as that —

"of a tenant of the State enjoying a tenant-right which can be inherited, sold, or burdened for debt in precisely the same manner as a proprietary right, subject always to payment of the revenue due to the State."

Though, therefore, the ryotwari pattadar is virtually like a proprietor and has many of the advantages of such a proprietor, he could still relinquish or abandon his land in favour of the Government.

It was because of this position that the ryotwari pattadar was never considered a proprietor of the land under his patta, though he had many of the advantages of a proprietor.

The word "estate" is defined in the Constitution which came into force on January 26, 1950. Before that too this connotation was defined clearly and meant (based on Madras Land Estate Act, No. I of 1908) —

a) any permanently settled estate or temporarily settled zamindari;

- b) any portion of such permanently settled estate or temporarily settled zamindari which is separately registered in the office of the Collector;
- c) any unsettled palaiyam or jagir;
- d) any inam village of which the grant has been made, confirmed or recognised by the British Government, notwithstanding that subsequent to the grant, the village has been partitioned among the grantees or the successors-in-title of the grantee or grantees."

The Constitution did not alter the meaning of "estate" and hence it is clear that "estate" did not include the lands of ryotwari pattadars, however valuable might be their rights in land as they eventually came to be recognised.

It was on this basis that the Supreme Court declared 'ultra vires' the Kerala Agrarian Relations Act, 1961 in its application to ryotwari lands transferred from the State of Madras to Kerala. The Act was further struck down by the High Court of Kerala in its application to lands other than estates in Malabar and Travancore. While striking down this Act in the case of K. Kunhikoman v. State of Kerala that ryotwari lands "are not estates within the meaning of Article 31A(2) (a) of the Constitution and therefore the Act (which included ryotwari land as coming under the definition of "estates") is not protected under Art. 31A(1) from attack under Art. 14, 19 and 31 of the Constitution."

Evidently neither the framers of the Constitution ever intended nor the legal position contemplated that ryotwari land should come under the purview of "estate". Otherwise it would have been defined as rights pertaining to all agricultural land, which was not the case when the local equivalent of "estate" in the then existing law relating to land tenures was specifically recognised as the thing intended; sub-clause (2)(b) of Article 31A, was even more specific when it referred to, by way of illustration, "rights vesting in a proprietor, sub-proprietor, under-proprietor, tenure-holder or other intermediary" meaning that only intermediaries were intended. Ryotwari land-holders are assuredly not of this kind.

This Bill, when passed, will put out of the purview of the law courts all land legislation enacted by States for fixation of ceilings or for regulation of tenancy rights and will give protection to the sphere of public purposes as envisaged by the Plans and as accepted by the Planning Commission.

"Peasants holdings", writes Prof. N. G. Ranga in "Swarajya" of July 6, "are evidently in danger of being notified as coming within the sphere of activity of any co-operative farming society and peasants being presented with the alternatives of either pooling their lands with the co-operative farm or being offered the compensation fixed by a land tribunal for compulsorily acquiring them for the farm." Compensation is sure to be nominal without there being any protection from the law courts, as compared to what a peasant is now entitled to under the Land Acquisition Act. The ruling party is violating the spirit of the Constitution as in the Constituent Assembly it was strongly held that unless adequate compensation was paid, as determined by law courts, no land should be acquired by the State for a genuine public purpose. The framers of the Constitution were convinced that the country's economy could not be built by the loot of the landlords and peasants.

The manner of achieving agrarian reform should not be open to ridicule. All land cannot be classified as "estate" merely because that definition would protect legislation against the challenge in the courts. Parliament must frustrate this mischievous attempt on the part of the ruling party to undermine the stability of peasant proprietorship.

Castor Oil for the Congress

FOR OVER 16 years the Congress has been a gross feeder on the power and pelf of office. In the process it has inevitably accumulated much useless and even harmful stuff in its system. The Kamaraj plan which the All-India Congress Committee has accepted may be described as a massive purging operation which is intended to restore the Congress elephant to political good health. That, however, is not the entire purpose of the plan. As Mr. C. Rajagopalachari has been quick to point out, one of the important effects of the AICC scheme is a total endorsement of Mr. Nehru's leadership of the Party and the Government and a massive affirmation of confidence in him.

We do not know whether Mr. Kamaraj himself intended this to be one of the consequences of his proposal, but we would be surprised indeed if the thought had not crossed his mind that this sort of thing was likely to happen. It is significant that, when the Prime Minister promptly offered to give up office for organisational work, the Chief Minister of Madras declared equally promptly that, in that event, he would not proceed further with his proposal at all. Not very long ago Mr. Nehru said that if ever he decided to quit office it would be not because some Opposition groups were clamouring for his departure, but because he himself was convinced that the Party no longer wanted him to be Prime Minister. Now Mr. Nehru has had it put unequivocally on record that his Party does want him to continue.

In this sense, the Kamaraj plan is first and foremost a personal victory for and vindication of Mr. Nehru. This fact is further emphasized by the absolute authority given to him by the AICC resolution to decide which Congressmen in office are to continue in government and which are to move over into the organisational field. As a consequence, Mr. Nehru is confirmed not only as the absolute leader of his party but also as the sole arbiter of the political destiny of each and every individual Congress leader. It is possible that this is the way which the AICC has chosen of answering outside suggestions that Mr. Nehru's authority among his colleagues is weakening or that his hold over the rank and file of the Congress is beginning to lose its grip. It is also possible that this is the way the AICC has chosen of serving notice on Congressmen themselves that no serious questioning of Mr. Nehru's leadership on the part of any of them will be encouraged or even countenanced. On this reckoning the immediate and possibly the most important consequence of the Kamaraj Plan is to underwrite more firmly than ever the personal ascendancy of Mr. Nehru in the counsels of the Congress in the conduct of the Government.

It is no new thing, of course, for Mr. Nehru to be hailed as the indispensable saviour of the Congress, if not the country. But the almost idolatrous terms of adulation in which his absolute authority was confirmed at the proceedings of the AICC session would have irked even those whose sensibilities were far less fine than his. Particularly sickening, in their sentimentality, were the speeches of Mr. Dhebar and Mr. S. K. Patil. Said Mr. Dhebar, "It is a matter of great pride for the Congress that there is one man on whose mere asking people are prepared to sacrifice even their lives". It did not occur to the ex-President of the Congress that it ought to be right for people to consider what are the purposes for which sacrifices are called for rather than who is calling for sacrifices.

What, however, was really surprising was the most extravagant language in which Mr. Patil eulogized Mr. Nehru as "leader of leaders". If his speech left the impression that he was perhaps trying to make up for his recent recalcitrance in the matter of portfolios, he had only himself

to blame. It is really a lamentable thing that at a serious moment in its history, when the Congress so clearly needed all the adult maturity that its leadership could summon in its service, there should have been such ridiculous exhibition of a father complex.

From this point of view and in psychological terms the Kamaraj plan has probably not been given as sound a start as it may have deserved. Consequently, the responsibility cast on Mr. Nehru has become all the more onerous. Just because he has been hailed as a being of indefinite indispensability, Mr. Nehru has to keep all the more firmly in his mind the sobering thought that, if the Congress organisation has come to need any shock treatment at all after sixteen years of his stewardship, his leadership, with its almost unlimited authority cannot escape responsibility of blame. In what was perhaps the most sensible and certainly the boldest speech of the AICC session, Mr. Mahavir Tyagi, it will be recalled, stood up and said that having failed to build up a second line of leadership so far, Mr. Nehru should at least now try to mend matters before it was too late by trying to bring about some kind of collective leadership of the party. It is true that, so long as even leaders of the status of Mr. Dhebar or Mr. S. K. Patil could make the kind of speeches that were heard at the recent AICC meeting, the temptation to ignore the wholesome advice of Congressmen like Mr. Tyagi may perhaps be too strong for Mr. Nehru. But it must be emphasized that Mr. Nehru ought to try to deserve the trust reposed in him by the AICC resolution by instituting measures for the emergence of a more normal and healthy structure of leadership which will not continue to be so helplessly involved in the single person of himself. This will not be the least important aspect of the implementation of the Kamaraj Plan.

Fortunately, judging from such indications as we have of how the Prime Minister's mind is working on the AICC resolution, there is ground to hope that Mr. Nehru will come out much better than may be expected. For one thing he seems to recognise well enough that the Kamaraj plan has necessarily created a state of uncertainty in the affairs of government as well as of the party which should be ended as quickly as possible. His decisions on the shifting of Ministers to party work may, therefore, be expected fairly early. So far as Chief Ministers and other Ministers in the States are concerned his intention might perhaps have been announced by the time this issue is in print. His plans for such Central Ministers as he might like to charge with organisational work may possibly take somewhat longer to crystallize, but it is to be hoped that, even in their case, decisions will not be delayed very much beyond this month.

Mr. Nehru quite rightly thinks that only such Ministers should be asked to take up organisational work as can really make a significant contribution in that field and produce a powerful impact on the people's mind. If this test is rigorously applied, the number of

Ministers in the States and at the Centre who may be asked to leave office is bound to be limited. This would not altogether be a bad thing as the resulting disturbances in government will not be extensive. A necessary corollary to the Prime Minister's dictum that only Ministers who are likely to be effective in the organisational work should be commissioned for the purpose is that Ministers who are doing good work in the Government should not be disturbed unless it is absolutely necessary, for it would be clearly an absurd denouement if the net result of the Kamaraj plan were to be to leave the Central Cabinet with a load of Shrimalis and Kabirs.

An intriguing question is whether the Prime Minister should keep himself to the strict letter of the Kamaraj plan or he should avail himself of the opportunities before him to ease out in a painless manner useless and ineffective Ministers at the Centre and in the States. Although the Kamaraj plan is primarily intended to improve the image of the Congress in the public

eye by replacing the power motive by the service motive, it is clear that the future of the Congress Party in the public life of this country would depend not merely on its invigorating its means of mass contact and mass communication, but also in its ability, as the ruling party, to provide the people with good government. It is only partly true that neglect of the organisational aspect has led to the Congress falling from popular grace to a certain extent. Part of the explanation also

Our Bullock-Cart Age

THE STUDY undertaken recently by the Programme Evaluation Organisation on behalf of the Committee on Transport Policy and Co-ordination to assess the changes that have taken place in the relative importance of bullock-drawn vehicles reveals that this mode of transport still plays an important role in the rural economy. The study has been confined to the most important type of trade, namely, marketing of agricultural commodities by villagers and their purchase of commodities produced outside. Rural traffic in goods has been assumed to be determined and conditioned by the nature, volume and direction of such trade. This assumption, in turn, has served to give the necessary focus to the study by implying that the share and role of different carriers in rural traffic could be analysed and observed with the help of what is described as the 'trade-centre' approach. The study has accordingly been based on field data, collected in December 1960 and January 1961, for a few selected markets or mandis representing different regions in the country. The selected mandis are Tindivanam, South Arcot district, Madras; Lasalgaon, Nasik district, Maharashtra; Sirhind, Patiala district, Punjab; Gorakhpur, Gorakhpur district, U.P. and Sainthia, Birbhum district, West Bengal.

From this study, it is easy to gather why bullock carts still hold the field in carrying agricultural produce to the markets. Many villages are connected to markets or mandis by kutchra roads which are quite often too narrow for motor trucks to negotiate. The unit of farming being small, the marketable surplus per household is small and that too is sold in more than one instalment. So carts are both suitable and economical. The growers prefer to send the produce to the nearer sub-mandis or even periodical mandis. This practice makes for a shortening of the hauling distance. The cultivators use carts for various agricultural uses, such as carrying fertilizers and manures to the fields, carrying produce from the farm to the storehouse, sugarcane to crushers or fodder from distant fields. Thus their use for marketing operations involves none or very little additional outlay or expenditure.

For intra-mandi movement only bullock carts and thelas are generally used on account of the short distances which such traffic has to cover. Trucks have not yet made much of a dent on this traffic pattern. The carts used are of ordinary type with wooden wheels and iron rings; pneumatic tyres are increasingly evi-

is that the standards of administration have also steadily deteriorated over the years. The Kamaraj plan will succeed substantially only if this factor is also taken into account. The real test for Mr. Nehru therefore is not merely whether he is able to find enough good men for the organisational work of the Congress party but also whether simultaneously he succeeds in retaining (and discovering) equally good men for the vital tasks of good government.

dent only in Sirhind. They are mostly used by the carters for bringing their own produce to the mandis.

If trucks have been able to wrest traffic both from the railways and the carts in certain areas with regard to intra-mandi and outgoing traffic, it is mostly because of the construction and improvement of roads brought about in those regions. Another factor favouring trucks is the increased production of cash crops such as sugarcane, onions and cotton, which are either perishable or relatively high-priced. The correlation of truck transport with the functional organization of marketing agencies or links has also to be taken note of. A shortening of these links through telescoping or rationalization may make for a larger penetration of trucks into the villages.

The data relating to the frequency of visits of trucks to the villages bring out that till 10 years back (except in the case of one village each in two mandi areas), the trucks were not visiting the villages at all. The position has changed but little during the intervening decade. In some mandis trucks are being used because carts are not available. In the Tindivanam area, even now trucks do not visit the selected villages. In Sainthia, the frequency of visits by trucks has increased in only one of the six simple villages because of the recent improvement of the connecting road. In Sirhind, the change is also marked only in one village, where despite its being in the interior, more trucks have begun plying. This is due to the very large increase in the production of onion which is collected by the traders from the village by the trucks. In Lasalgaon, there has been some improvement in the use of trucks mainly because of the improvement in the connecting road. In another village the contributing factors are rise in the production of cotton and the prospect of getting better prices at Lasalgaon. The share of trucks is generally higher in the higher distance groups. They handle 90 per cent of the traffic originating from points between 10 and 20 miles away in Sirhind and 25-100 per cent of that coming from beyond 20 miles in Gorakhpur. The affinity between distance and mode of transport is, therefore, clearly discernible. The complete exclusion of carts in the despatches from Tindivanam, Lasalgaon and Sirhind is due to the longer distances to which goods are exported from these markets as compared with those from Gorakhpur.

The number of carts during the decade ending

1959-60 rose by about 16 to 49 per cent in four of the selected mandi areas, the increase being most marked in the case of Lasalgaon, Sirhind and Sainthia. Rise in production and the prosperity of the cultivators apparently contributed to this increase. In the Sirhind area, however, the increase is also attributed to the introduction of paddy, rise in the area under sugarcane and the break-up of joint families. It is only in the selected villages of the Gorakhpur mandi that the total number of carts has decreased by about 16 per cent mainly because of a steep fall in the number of carts in one village, Mithaura, due to the restrictions on the movement of goods from Nepal and the increasing use of trucks.

In three mandi areas (including Gorakhpur), the rise in the number of carts has been much less than in the volume of exports with the result that the volume of exports per cart has risen by 5 per cent to 91 per cent. In Sainthia on the other hand, there has been an appreciable decline as the rise in the number of carts was faster than that in exports. Taking the last 10 years, in three mandi areas both the number of carts and volume of exports have risen. But the rate of increase being slower for the former, in two of them the volume of exports per cart has gone up by 1 to 5 per cent. The table below mentioning the percentage changes in the number of carts and volume of exports during the last decade is quite revealing:

1949-50 TO 1959-60

(Percentage Changes)

Mandi Area	No. of Carts	Volume of Exports	
		Total	Per Cart
Tindivanam	16.4	22.4	5.2
Lasalgaon	33.1	N.A.	N.A.
Sirhind	37.7	39.2	1.1
Gorakhpur	-16.3	59.9	90.8
Sainthia	49.0	21.5	-18.4

In Good Hands

TWO YEARS are too short a period to assess the achievements of any organisation, least of all an organisation such as the Indian Investment Centre (IIC), which has had a lot of preparatory ground to cover. However, even within these two years, the Indian Investment Centre has proved its usefulness to investors, both Indian and foreign. The fact that so many appreciative comments about the work of the IIC have been received from *entrepreneurs* in this country as well as from abroad is a clear proof that the Centre has made an impact on the investment scene, as claimed by Mr. G. L. Mehta, Chairman of the Centre, recently in Bombay. It is true that only 1,050

August, 23, 1963

The volume of incoming traffic to the villages was higher in 1959-60 than that in 1949-50 by between 52 and 131 per cent except in Gorakhpur. This occurred mainly because of a rise in the imports of fertilizers, oil-cakes, cement, foodgrains and coal. The volume of outgoing traffic increased considerably between 1949-50 and 1959-60. The increase was 60 per cent in two mandi areas of Lasalgaon and Gorakhpur, about 40 per cent in Sirhind and 22 per cent in Sainthia and Tindivanam. Sugarcane, gur, onion, groundnut and cotton among the so-called cash crops and paddy, wheat, maize among the food crops, accounted for the bulk of the exports from the villages.

When there is disequilibrium between the number of carts and the volume of outgoing traffic it becomes necessary to ensure the regular supply of carts to keep pace with the requirements of traffic. Nevertheless, the fact that carts are underutilised indicates considerable scope for rationalisation of road transport. As to how this should be brought about, there is no indication in the report. Particularly when 23 to 69 per cent of the carts carry less than three-fourths of their capacity, a study of this kind should have suggested ways and means for saving in transport resources (bullocks and carts) or for their further utilization, but surprisingly it is silent on this subject. It, however, throws interesting light not only on the transportation pattern as such, but on the consumption and production pattern as well and the growth of the economy in the rural sector. A fair inference to be drawn from the findings of the survey is that, but for the millions of bullock carts still in use, the transport of vast quantities of produce would not have been possible at all. Unscheduled though it has been in the Plans, the large number of bullock carts has to a great extent served to make up for the failure of planning to extend the road system and modern transport capacity to match the ever-growing demand of increased production. The conclusion is inescapable that a major shift in the mode of rural transport could come only if structural changes involving changes in the unit of farming and marketing take place.

inquiries were received in 1962-63, as compared with 1,300 in the previous year, but the circumstances in which investment inquiries come depend on the investment climate prevailing at a given time. Indeed, as Mr. Mehta observed, the Chinese aggression of last October has naturally affected the investment climate in the country.

The role of the IIC in attracting investments to this country is certain to increase in importance for a variety of reasons. In the first place, the entire international investment outlook has been undergoing a change—a change for the better. No longer is the subject of aid

EASTERN ECONOMIST

343

to underdeveloped countries a question of mere debate or even of ideology. It has almost become, in at least a few conspicuous instances, a case of *nishkama karma*, duty done without expectation of any return. The industrially advanced countries have not only realised the desirability of raising the standard of living of people in the underdeveloped countries, but they have also become reconciled to the fact that the aid must take a form that will not present insoluble post-aid problems of repayment and servicing (soft-term loans). Secondly, although aid has all along taken the form of government-to-government loans and grants for economic development, it is tending to become a matter for negotiation between *entrepreneurs* and investors in the aid-receiving and aid-giving countries, respectively. With their experience of the past few years, governments of underdeveloped countries should gradually come to accept that, while it is their responsibility to provide all the infrastructure facilities, the building up of industries is best left to the initiative of their citizens, if they have to be saved from being eternally dependent on government and foreign aid. This, in any way, would seem to be the dominant psychology of the people in the investing or aid-giving countries. So there would appear to be growing scope for interesting investors and *entrepreneurs* in different countries, and, when it is a question thus of having to go to the people rather than to their governments, it is only organisations such as the IIC that can really deliver the goods.

Viewed against this background, the IIC's approach has been ideal. The establishment of an office with a resident-director in New York, the visits to foreign countries by the Chairman and the Executive Director, the meetings with representatives of foreign firms, the high-level conferences held in foreign countries such as West Germany, and the seminars such as those held in the USA, not to speak of releases of publications, pamphlets, fact-sheets, impulse letters and so on, are all well-conceived. The Centre's future has been assured too by the active interest of not only the Government of India but of a number of other foreign Governments and international bodies. From the way in which the Centre has begun to operate, it should be possible for it, in the next few years, to give a prospective investor or *entrepreneur* practically all the information that one needs to start an industry in this country, information for which one has today to run from ministry to ministry, if not from post to pillar. A notable feature, which, it is to be hoped, the Centre will not abandon at any time, is its readiness to advise the *entrepreneur* at any stage of a given project.

In the first two years of operations, i.e. from March, 1961 to March, 1963, the Centre had either concluded, or had in process of negotiation, as many as 147 proposals by Indian and foreign *entrepreneurs* for collaborations in joint industrial ventures in this country. Thirty-six of these proposals have already been approved by the Go-

vernment, 18 have been concluded and submitted to the Government, and the rest are in various stages of negotiation. It is noteworthy that, out of the 36 joint ventures concluded, a majority was from the USA. Thus, 15 of the foreign firms concerned in these thirty-six joint ventures were from the USA, six from the UK, five from Japan, three each from France and West Germany, two from Canada and one each from Belgium and Switzerland. The estimated total capital outlay for setting up these projects is Rs. 355 million, including both local and foreign exchange requirements. The foreign equity investment alone is placed at Rs. 25 million.

Although, as stated earlier, there was a decline in the number of total inquiries in 1962-63 as compared to the previous year, it is significant that there was actually an increase in the number of inquiries from foreigners. Mr. Mehta listed three reasons for the overall decline in the number of Indian inquiries, namely the effect on the investment climate in the country of the Chinese Invasion; the almost fully licensed target capacity for various industries scheduled for development in the third Plan; and the revocation of a number of licences which were not effectively implemented. He also mentioned the unfavourable reaction among both Indian and foreign investors produced by the Super Profits Tax, in particular, and the heavy incidence of taxation in India, generally. A very valuable service that the IIC has started is its industrial surveys and feasibility studies on specific industries. *Entrepreneurs*, who would avail themselves of the authentic information contained in such studies, should be well-equipped to negotiate projects with the ICICI if the latter's help is required. The appointment of advisory committees of industrial experts, both Indian and foreign, is yet another useful activity of the Centre.

Eastern Economist 20 Years Ago

AUGUST 20, 1943

Recently the Federation of Indian Chambers of Commerce and Industry addressed the Government of India on the subject of the slaughter of cattle for the purpose of meat supplies to the Army in India. A statement made by the Commander-in-Chief in the Council of State reveals the seriousness of the problem. The number of cattle slaughtered in 1942-43 for prisoners of war was 62,000 and for the Chinese Army, the American Forces and the British Army stationed in India the figure was 216,000. The Commander-in-Chief stated that no cattle are slaughtered for export outside the Indian Command. More than one member suggested in the course of the discussions in the Central Legislature that owing to the seriousness of the food situation in the country, His Majesty's Government should be requested to make arrangements in some other part of the Empire for the prisoners of war now stationed in this country.

Highlights of the Week

STATUS QUO IN KASHMIR

IN A STATEMENT to Parliament on the Indo-Pakistan talks on Kashmir which were held some time ago, the Prime Minister reiterated last week the Government of India's continued desire to reach a settlement of our problems with Pakistan, based on rational and realistic considerations. At the same time, he very firmly rejected proposals "for internationalising or division of the valley or joint control of Kashmir and the like". He also made it clear that the concessions which the Government of India offered to Pakistan in the course of the abortive talks "are no longer open and they must be treated as withdrawn." Mr. Nehru did not, however, specify what those concessions were, but he was evidently referring to marginal modifications of the cease-fire line. Pakistan, however, had insisted, as Mr. Nehru indicated, on claiming almost the entire territory of Jammu and Kashmir, barring "an insignificant area at the extreme south, roughly coinciding with the district of Kathua". A point which was forcefully made in Mr. Nehru's statement was that coincident with the various stages of the talks, Pakistan was drawing increasingly closer to China in an undisguised process of support to and association with the latter in common hostility to this country. The Prime Minister ended his statement by pointing out that "while the break of the talks is a matter of deep regret, we have to accept the facts and we must wait for a more opportune moment for a settlement of our differences with Pakistan." This conclusion also expresses the Government of India's reaction to US suggestions on the possibilities of mediation.

ARMS AID

MR. T. T. KRISHNAMACHARI succinctly informed Parliament of the results of his visits to Canada, the United States and the United Kingdom during May-June for the purpose of securing military assistance. In a statement laid on the Table of the Lok Sabha last week, he said that we could count on the friendship of the Canadian administration and support from Canada generally. So far as the British are concerned, details of aid going beyond the Nassau Agreement are yet to be worked out, but they are expediting supplies of the aid under the Nassau scheme and also the finding of the spares for aircraft of United Kingdom origin. The Minister for Economic and Defence Co-ordination summed up the results of his discussions in Washington as follows:

"We might expect assistance from the US towards equip-border areas. short term.

"We may also expect assistance towards augmentation of our fleet of transport aircraft. The Americans will also help us in improving the utilisation of the existing aircraft.

"As a complement to the Airlift programme, we might expect assistance for speeding up road construction in the Border areas.

"There was agreement on the high priority attached by us to the installation of radar and communication facilities. Help in this regard would be forthcoming.

"In regard to Defence Production, the U.S. has agreed to help us with plant for the manufacture of small arms and ammunition. They also agreed to provide any technical consultative services we might require and also technical training facilities for our personnel."

Mr. Krishnamachari added that it was clearly understood in the United States that Nassau aid having been almost ex-

hausted so far as that country was concerned, it was necessary that further steps should be taken for the flow of fresh assistance. The Minister described this as a significant advance. He explained that the Americans desired to move forward step by step on an itemwise basis. "The aid from the U.S. is likely to be in three phases. The first phase comprises what has already been shipped or is under way. The second phase consists of items which are being discussed. The third phase of further assistance will be worked out after the Military Assistance Programme is voted upon by the U.S. Congress around August-September."

In a significant concluding paragraph the statement emphasized the importance of the Government of India maintaining adequate machinery for continuous consultation and processing of requirements with these countries. This would need the strengthening of organisations for liaison both in India and in our Missions abroad. The question whether adequate effort is being made on our side in these directions is one which the Krishnamachari statement must obviously give rise to. The answer will have to be provided as discussion during the current Session of Parliament proceeds on the various aspects of Defence preparedness.

CHINESE INTRUSIONS

IN WHAT is perhaps the classic understatement of the year, the Prime Minister, making a statement in the Lok Sabha on Chinese troop concentrations along the India-China border, said that it was clear that China's intentions "are not exactly friendly". Mr. Nehru informed the House that the Chinese had set up seven so-called civilian posts in the demilitarized zone in the western sector in violation of the Colombo proposals which had laid down that there should be civil posts of both sides in this area. In the demilitarized zone in the eastern sector, in which there were to be 16 Chinese civilian posts according to Peking's own unilateral ceasefire declaration, there are today as many as 52 combined military and civil posts. There is also considerable offensive patrolling and probing activity along the borders, particularly in the eastern sector.

This is not all. The Chinese have inducted fresh troops into Tibet and have augmented the strength of their forces along the borders to a point where it is larger than what it was at the time of the unprovoked massive attacks of October, 1962. Apart from this augmentation of Chinese forces, a further development has been the forward movement of these troops to camps and strong points nearer the Indian border than they were last October. There has been, during the last few months, considerable activity by way of construction of barracks, gun emplacements, storage dumps, and air-fields near the Indian border. There has also been great activity in the construction of roads, laying of underground telephone lines and construction of inter-connecting subterranean trenches along these border areas. China's land and air intrusions into Indian areas and Indian air space have also increased considerably, particularly during the last few months.

While it is clear that all these activities have the effect, currently, of consolidating Chinese military position immediately to the northern Indian border, the possibility cannot be ruled out of Peking using these forward bases for another thrust into India. The fact that the Chinese Government had presented a Memorandum last month to the Heads of Missions of the Colombo Conference countries in Peking alleging military provocations by India adds to the ominous import of

China's current aggressive activities along the borders as it is possible that ground is being prepared for renewed aggression against this country on the specious plea of "counter-acting in self-defence", an excuse which, it will be recalled, had been employed earlier in October, 1962, in an attempt to justify the wanton invasion of this country at that time. Mr. Nehru said that the Government of India had brought these developments to the notice of the Governments of the Colombo Conference countries. He underlined the supreme importance of our resolutely intensifying "our defensive preparations to resist any further threat to our territorial integrity."

SUPPLEMENTARY DEMANDS

THE UNION Finance Minister, Mr. Morarji Desai, and the Railway Minister, Sardar Swaran Singh, tabled in the Lok Sabha last week supplementary demands for grants for the current financial year aggregating Rs. 33.9 crores and Rs. 2.5 lakhs, respectively. Of the total supplementary expenditure asked for authorisation by the Finance Minister, a sum of Rs. 21.59 crores relates to revenue account and Rs. 12.31 crores, to capital account. The bulk of the additional expenditure, however, is proposed to be met from higher receipts, recoveries and surrenders, the net outgo from the Consolidated Fund amounting to barely Rs. 29 lakhs.

By far the major portion of the supplementary demands on revenue account — Rs. 14.78 crores — is being occasioned by the establishment of new political and administrative set-ups in the four Union Territories of Himachal Pradesh, Manipur, Tripura and Pondicherry. This virtually is in the nature of book transfers; provision of similar expenditures was made on Central account in the February 28 Budget estimates. Of the remaining additional expenditure on revenue account, Rs. 6.8 crores have been earmarked for the Marketing Development Fund, constituted recently for giving fillip to exports. A sum of Rs. 3.8 crores is being transferred to the Fund as such. The remaining amount would be spent on the various export promotion and marketing schemes during the current year.

The Rs. 12.31 crores supplementary demands on capital account have been necessitated by two major items — Rs. 5.14 crores as loan to the Union Territories for their capital expenditure and Rs. 6.5 crores for the Refinance Corporation. As in the case of the supplementary demands for them on revenue account, the proposed loan of Rs. 5.14 crores to the four Union Territories for their capital expenditure will involve only book entries. A similar provision is already there in the Central Budget. The loan to the Refinance Corporation has been necessitated by the liberalisation effected recently in its refinance facilities for industrial loans and medium-term export credits in view of the stringency in the money market.

The supplementary demands on capital account also include a sum of Rs. 25 lakhs for the purchase of shares in the Cochin Refineries Ltd., a Central Government undertaking floated in partnership with, Phillips Petroleum and Duncan Brothers, and part of an amount of Rs. 73.35 lakhs for meeting the capital outlay on setting up the Central Consumer Co-operative Store in Delhi. The store will have a number of branches in the Government staff residential colonies and major office buildings in Delhi and New Delhi.

Of the supplementary demands for grants to the tune of Rs. 2.5 lakhs made by the Railway Minister, a sum of Rs. one lakh is proposed to be spent on doubling the capacity of the wagon-ferry at Farakka from 200 to 400 wagons per day each way. The remaining Rs. 1.5 lakhs are required for meeting the expenses on preliminary investigations in

connection with certain works on the Eastern and Southern Railways. Defence requirements presumably have occasioned a major portion of the supplementary demands for grants by the Railway Minister.

TRANSPORT PLANNING

REALISATION HAS apparently dawned on the Planning Commission that if the rate of economic growth in India is to be stepped up to any substantial degree, the approach to transport planning has to undergo some far-reaching changes. Hitherto, the growth of various transport services had been sought to be fostered in isolation to each other, emphasis being placed on the strengthening and expansion of the railway system. Besides this segmented approach, stress has been laid on what could be achieved in a given period of time rather than on what was necessarily required. Further, the traffic projections had been made not on a sector-wise basis but in aggregate terms. The result had been that a number of bottlenecks had cropped which could perhaps have been avoided if the approach to transport planning had been a realistic one.

Profiting from past experience, the Planning Commission experts, it is understood, have now decided that in drawing up the fourth Plan transport development programmes, not only a co-ordinated view should be taken of all the transport services — railways, roads, inland waterways, shipping, pipelines and civil aviation — but these programmes should also be closely related to the industrial and agricultural targets. Whereas, therefore, the various transport services are to be assigned their due role in the next Plan, studies are to be undertaken of the traffic requirements of the more important industries and essential consumption and export commodities. In the case of industries, these studies will aim at ensuring raw material supplies as well as disposal of the end-products. The industries included in this list are iron and steel, cement, coal, power generation units, petroleum refining, petrochemicals, aluminium, fertilizers, glass, paper, salt, sugar, jute and cotton textiles. The essential consumption goods to be covered by these studies are foodgrains, sugar and salt. The major export items, apart from those covered in the afore-mentioned list of industries, for which studies are to be conducted, are tea, manganese ore and iron ore. Transport requirements of all of these industries and commodities are to be studied in general terms right up to 1975-76 and in a detailed manner up to 1970-71.

Two other changes are also contemplated in the approach to transport planning. They relate to regional development and the location of new industrial enterprises. Individual State considerations are proposed to be subordinated to the national interests. The development of railways and roads is to be attempted on zonal basis, the country is being tentatively divided into eight regions: (1) Madras and Andhra Pradesh; (2) Mysore and Kerala; (3) Maharashtra and Gujarat; (4) West Bengal, South Bihar and Orissa; (5) U.P. and North Bihar; (6) Punjab, Himachal Pradesh and Jammu and Kashmir; (7) Rajasthan and Madhya Pradesh; and (8) Assam, NEFA, Manipur and Tripura. The development of ports will take into account the requirements of the whole of their hinterlands.

As regards dispersal of industries as a means of regional development, the thinking appears to be in favour of developing emerging new industrial towns and cities into big complexes rather than going in for further large-scale dispersal. This is considered to be necessary for keeping the transport development plans within manageable proportions. Defence needs, of course, have to be reckoned in some detail. A more rapid growth of civil aviation is considered necessary.

FROM THE PRESS GALLERY

Monsoon Session Begins

NEW DELHI, Tuesday.

EVEN ANTICIPATING the discussion of the "no confidence" motion moved by the non-Communist Opposition groups in the Lok Sabha on Monday, the Monsoon Session of Parliament which began on the previous Tuesday, started its work in an atmosphere of tension. It was clear from the outset that the Opposition groups in both Houses had come prepared to make use of every opportunity, legitimate or otherwise, to harass and annoy the Treasury benches in particular and the ruling party generally. The tactics adopted to this end were more often than not clearly obstructive to the proceedings of the House and repugnant to its rules and conventions. The naming of a member of the Socialist Party in the Lok Sabha today was only the climax to a series of unseemly incidents day after day on the Floor of the House which the Chair quite often found impossible to control.

It is clear that some Members — fortunately only a few in number — have made up their mind to use Parliament as a forum for political agitation of a kind which is more properly confined to the market place. What lends a peculiarly disagreeable complexion to this state of affairs is that some Opposition front benchers too seem to be playing into the hands of the disrupters. It is high time that responsible members of the Opposition realise the dangerous drift of this kind of conduct. It is a legitimate political ambition for Opposition groups to seek to pull down the ruling party but in a democratic constitution party tactics as well as party strategy have to adhere to democratic decencies. If this is not realized, it may well come to be the case that the Opposition groups find themselves to be the losers in the bargain.

Question Hour

QUESTION HOUR on the opening day of the Monsoon Session of the Lok Sabha, August 13, was largely taken up by a volley of interrogation fired at Mr. S. K. Patil, Minister for Food and Agriculture. Scarcity of rice and high prices were the main causes of concern which prompted as many as 27 Members to put the joint question on rice alone. Members sought clarifications on the steps that the Government was taking to hold the price of this staple article of food. It was pointed out that in some areas of Assam and West Bengal the retail price of coarse rice was Rs. 35 per maund and that of finer varieties rocketed to Rs. 85 per maund. The Food Minister explained that in the immediate context the problem of rice distribution was aggravated by reason of the fact that there was a shortfall of 1.5 million tons in the normally surplus States of Madhya Pradesh and Orissa. The situation would improve when the next crop would start arriving in the market. He stated that the Government was opening an increasing number of fair price shops particularly in the two States of Assam and West Bengal. As for the criticism of the quality of rice, he maintained that rice supplied in the fair price shops was quite edible. He also claimed that there were no reports of non-availability of rice from the Government of West Bengal as was suggested in the course of the supplementaries.

The Food Minister stated that stocks of wheat were quite adequate and wheat was supplied in certain areas where there was a shortage of rice. This "little diversion", so he claimed, would cause no hardship to the rice-eating population. Building up of buffer stocks of rice by means of internal procurement was difficult in view of the present inadequacy

of domestic output. In the premier rice-producing countries of the world the quantities of surplus rice production were low this season. Arrangements were being made to expedite the shipment of one million tons of rice contracted under the prevailing P.L. 480 Agreement with the United States Government. In the projected new P.L. 480 Agreement, which is very likely to be negotiated in about a year's time, the Government proposes to obtain two million tons of rice from the U.S. for the buffer stock. An essential preliminary was the construction of modernized store houses for holding the stocks to safeguard their quality as well as quantity intact from damage. He repudiated the allegation that there were differences between him and the Planning Commission on the issue of building up buffer stocks.

Mr. A. V. Thomas, Deputy Food Minister, informed the Lower House that the Government had not taken any decision to set up the organization for State trading in foodgrains which would presumably include rice also. Questions about price and the distribution of sugar were not pursued in detail by means of supplementaries because the Speaker intervened to suggest that a separate debate may be allowed later during the present session.

Refineries: Expansion Issues

Mr. O. V. Alagesan, Minister for Mines and Fuel, explained the position in the Rajya Sabha in regard to the expansion of the refining capacity of the two oil refineries at Trombay and the third one at Vishakhapatnam. He disclosed in the course of his reply to a question on this subject that the Burmah-Shell Refinery and the ESSO Refinery, which started production in 1955, with the originally installed capacities of 2 million tons and 1.2 million tons respectively, had now expanded their outputs to 3.75 million tons and 2.5 million tons respectively. This expansion was achieved without incurring any appreciable capital outlays. The Caltex Refinery at Vishakhapatnam also raised its refining capacity by some margin. ESSO had sought the Government's permission to expand its capacity, but the other two refineries did not specifically adopt that course. The Minister, however, clarified the position by stating that the expansion of capacity was in the interest of the country and it was, therefore, permitted. Probably, he implied that the expansion was ratified by the Government.

A point of policy with regard to the future was raised in a supplementary and the Minister was asked whether the Government was not committed to the principle of permitting no further expansion of the capacity of the private refineries. He replied that even long before he took over the Mines and Fuel portfolio, the question of private capacity expansion was under examination. Therefore, there was no violation of the policy as suggested and the expansion did not amount to any contradiction of any principle in this matter. He also stated that in considering the request from private refineries into account would be the prospective demand for petroleum products and the respective possibilities of the public and private sectors.

Nunmati Refinery

The Minister for Mines and Fuel explained to the Rajya Sabha the salient features relating to the dislocation in the operations of the Nunmati Refinery. The kerosene unit of this refinery had stopped functioning for some time and the

Ali Khan and his tool kit have travelled together for 13 years!

The score: one all. Two minutes to go. Khan traps the ball, dribbles past two defenders and shoots. It's a goal! Khan grins. He likes getting things done. And he invariably does—whether it's winning a football game, selling his Credit Co-op. Society on a new scheme or tackling a stubborn petrol pump.

PREVENTION AND CURE

Khan is an experienced fitter with Burmah-Shell, New Delhi. Guided by his Divisional Engineer, he carries out repairs to tanks, pipelines, pumps, air gauges and other equipment, and also handles preventive maintenance—the regular inspection and testing of all mechanical parts. Khan has done his work with care and efficiency for thirteen years.

CHOOSING THE RIGHT TOOL

...is the first step in a job that will be done skilfully and well. It's a pleasure watching Khan. His hands are hard and capable...the hands of a man who knows machines. He works unhurriedly, accurately and with complete economy of movement. One gets the impression of precise, controlled efficiency employed to the best possible effect. This is typical of the man.

TODAY, AS EVER, PEOPLE LIKE KHAN ARE WORKING FOR YOU

You would never say Khan was thirty-eight years old. Or that the eldest of his three daughters was nine. He sees a good future for his family and plans to educate his daughters well. 'They must learn to stand on their own,' Khan says. It's been his working philosophy.

Khan and people like him—at all levels of responsibility—are Burmah-Shell. Today, as ever, they are hard at work... working to ensure that vital petroleum products, essential to India's growth and progress, are brought to you at the right place and time, in the right quantities.

BURMAH-SHELL are People
in the service of the People

McKee-WKE engineers can bring practical experience from fifty countries to India's Steel Industry

Successful execution by McKee-WKE engineers of some 4,000 contracts in fifty countries, including India, has created for our organization a fund of specialized knowledge and experience unequalled by any other company.

McKee-WKE men know local laws, customs and conditions in the mining, steel and non-ferrous metals-producing and petroleum refining areas of the world. They know how to get a construction rig into remote locations—how to get men and materials on the job at the right time—anywhere. But above all, *they know how to do the job*—efficiently, rapidly and economically. That's why about 80% of our contracts are repeat contracts from satisfied customers—a good indication of the quality of McKee engineering and construction services. We will be glad to show you how these services can work effectively in India for the nation's basic industries.

ARTHUR G. MCKEE & COMPANY

UNITED STATES: CLEVELAND • NEW YORK • CHICAGO • SAN FRANCISCO • HIBBING

ABROAD: LONDON • PARIS • TORONTO • MEXICO CITY • SAO PAULO • BUENOS AIRES

Represented in India by DR. B. S. GILANI 29 Jor Bagh, New Delhi 3

METALS DIVISION: Comprehensive engineering-contracting services for Blast Furnaces, Steel-Making Shops, Rolling Mills, Coke Ovens, Agglomerating, Sintering and Pelletizing Plants and related off-site facilities.

PETROLEUM & CHEMICALS DIVISION: Complete Refineries and individual Processing Units for all modern petroleum and petrochemical processes and for a wide range of organic and inorganic chemicals and chemical products.

WESTERN KNAPP ENGINEERING DIVISION: Plants and facilities for production of Non-Ferrous Metals, mining, preparation, handling, beneficiation and storage of Ores and Industrial Minerals, Coal and Aggregates.

refinery as a whole could not be operated at full capacity. The reasons for the temporary closing down of the kerosene unit were the prolonged mechanical troubles in the compressors and corrosion and malfunctioning of the related equipment. The loss incurred owing to the closure of the kerosene unit and the partial operation of the refinery was estimated at Rs. 1.8 crores. This refinery was set up and started with the collaboration of the Government of Rumania. A team of Rumanian experts is now in Gauhati to carry out a full and comprehensive inspection of the kerosene unit of the refinery.

The Moscow Exhibition

Mr. Manubhai Shah, Minister for International Trade, informed the Lok Sabha that in the first 15 days of India's Trade and Industrial Exhibition at Moscow orders were booked for goods worth Rs. 11 crores. As many as two million exhibits were on display. He said that the exhibition evoked great interest in the USSR as well as in other countries of Eastern and Western Europe from which purchase organizations paid visits. He gave the assurance that the success so far achieved at the exhibition would be consolidated and care would be taken to ensure that shipments conformed to the samples. As regards the long-term impact of the exhibition, he maintained that it was premature to make any categorical assessment at this stage. A 2,000-foot documentary of the exhibition was being prepared by India with Soviet collaboration to continue the publicity function as a supplement to the exhibition. The Minister stated that the anticipated cost of the exhibition would be about Rs. 84 lakhs.

The export of shoes to the USSR was not only being stabilized but progressively expanded. India expected to export shoes worth Rs. 1.4 crores in 1963 on payment of foreign currency and these earnings were most likely to be doubled in another three years. He expressed the confidence that, in view of the rapidly rising demand for Indian shoes, mechanized factories also would be asked to produce shoes for export.

Growth of Shipping

Mr. Raj Bahadur, Minister for Shipping, informed the Rajya Sabha that the total tonnage owned by private Indian shipping companies in August, 1947, was 2,49,000 GRT, from where it increased to 4,69,369 GRT on March 31, 1957 and then nearly doubled to 8,72,166 GRT on June 30, 1963. Out of this private tonnage, 1,70,530 GRT was under foreign registry in August 1947, but none in March 1957 and June 1963. As for the public sector of the shipping industry, he recalled the fact that in 1947 the State did not enter this sphere. The tonnage of the Eastern and Western Shipping Corporations combined added up to 55,260 GRT on March 31, 1957. On June 30, 1963 there was only one public sector corporation, the Shipping Corporation of India, owing to the merger. Its tonnage was 2,11,019.

The approximate earnings of the private shipping concerns during 1961-62 were Rs. 35.36 crores and those of the public sector undertaking were Rs. 9.27 crores.

Transport in Assam

Intervening in the debate on the demands for supplementary grants for the current year, Mr. Raj Bahadur, Minister for Shipping, explained how the Government was preparing to strengthen the transport system of Assam. During the Chinese aggression, river transport services in Assam were paralysed owing to the abrupt and deliberate strike of the Pakistani crew in joint steamer companies. The Government of India took the necessary warning from this unexpected

experience and immediately set down to the task of developing the road and rail transport network to cope with any additional traffic loads as also to meet any emergency. One handicap under which the Indian seamen, seeking employment in the joint river boat services, were now put was the increasing employment of non-Indian crew by the foreign shipping concerns. He stated that the proportion of Pakistani crew in these services was being raised rapidly, among other reasons, owing to the conversion of Chittagong as a recruitment centre though it was not officially recognised as such. The Indian Government was keeping a watch to safeguard the interests of the Indian seamen.

Gold Control: The Aftermath

Mr. Morarji Desai emphatically denied in the Lok Sabha that the Government was giving second thoughts to its policy as reflected in the Gold Control Order. On the other hand, constant thought was being given to ensure how it could be improved upon and implemented more effectively.

The aftermath of the Gold Control Order, resulting in the displacement of goldsmiths from their traditional trade, was the subject of a barrage of supplementaries. Mr. Desai repudiated the suggestion that the rehabilitation of goldsmiths had proved a failure and maintained that it was being pursued with determination.

Mr. B. R. Bhagat, Deputy Minister of Finance, earlier placed a statement on the Table of the House to explain the various aspects of the rehabilitation programme. The statement disclosed that bona fide goldsmiths were being registered at all the employment exchanges with the specific purpose of giving them appropriate priorities in employment in Government departments or avenues under the Government's control or influence. The State Governments were asked to provide facilities for the training of goldsmiths in other trades. Conditions of admission to the training institutes concerned would be relaxed in their case. Displaced goldsmiths who preferred to undertake other trades or professions were to be granted loans for which purpose schemes are being drawn up. Other concessions such as priority in the grant of statutory licences, allotment of land etc. were being extended to them. Their children were being granted scholarships and educational concessions up to the school leaving stage. Eight State Governments were provided by the Centre with loans and advances amounting to Rs. 124.96 lakhs for financing the schemes of rehabilitation and additional sums would further be provided to them after necessary scrutiny.

Mr. Bhagat informed the House that the aggregate amount of gold collected by the sale of Gold Bonds was 16,471,000 grammes, valued approximately at Rs. 8.83 crores. The maximum collection came from Maharashtra State. He further explained that the sale of Gold Bonds was discontinued from March 1, 1963, and it was not in operation now.

Steel Plants

Bokaro: The deep feeling of concern for suspense over the negotiations for setting up the Bokaro Steel Plant with US assistance was evinced by the fact that as many as 41 members put a joint question on this subject. In the nature of the negotiations and the delicacy with which they are surrounded, Mr. C. Subramaniam, Minister of Steel and Heavy Industries, could not but be brief in his replies. He informed the Lok Sabha that negotiations to set up this plant in the public sector were under way with the US Government. But preliminary steps which were not dependent on any substantial foreign aid, such as acquisition of land, arrangement for power, water, raw materials and their transport and so forth, were already being taken. A decision had been taken

by the Central Cabinet that the Bokaro Plant would be managed and operated by an entirely separate company from Hindustan Steel. But the details of the organizational structure of the new company were still under consideration.

In-reply to another question, he disclosed that the short-fall in the production of finished steel at the end of the third Plan from 6.8 million tons to 5.8 million tons, which was unavoidable, would be due to the delay in establishing the Bokaro Plant.

Goa: The Minister disclosed in the Lower House that there was no provision for establishing a million-ton steel plant in the Goa-Hospet region during the period of the third Plan. But the feasibility of a plant of this capacity or higher capacity to meet the increasing demand in the fourth Plan was being actively investigated. The question of French financial and technical co-operation for this plant would be taken up at the appropriate stage.

Rourkela: The Minister confirmed the fact that a fresh agreement for a loan of DM 400 million (approximately Rs. 48 crores) for the expansion of the Rourkela Plant was signed between West Germany and India on April 25, 1963. The amount of the loan was intended to meet the cost of supplies of materials and equipment and technical services to be procured from West Germany for the projected expansion. The loan will be for a period of 20 years with interest at 5½ per cent per annum. No delegation was deputed to West Germany for the purchase of machinery and equipment, but the delegation that has been sent there is charged with the task of finalising the procedure of disbursement of the loan and related matters.

Bailadila: Mr. C. Subramaniam informed the Lower House that studies were being undertaken to ascertain the feasibility of establishing a new steel plant in the public sector at an appropriate site in view of the fact that the Bailadila iron ore mines disclose likely potentialities of yielding sufficient supplies. The site might be located somewhere in the Bailadila-Visakhapatnam area in the region adjoining the border of Madhya Pradesh and Andhra Pradesh.

Plant in the South: The Minister stated in the Lok Sabha that the firm of consulting engineers had not so far submitted the project report for setting up a steel plant in the South. The question of starting the preliminary work for the projected plant would be taken up after the site is located in the light of the consultants' report.

Durgapur Alloy Steel Mill: Mr. Subramaniam stated in the Lok Sabha that the report about setting up the Alloy Steel Mill at Durgapur with the collaboration of the Japanese consortium was not wholly correct. The Mill is being set up by the Hindustan Steel which has issued a letter of intent to a Japanese consortium for the supply of bulk of the plant and equipment as well as for erection, supervision and putting the mill into commission. The collaboration is thus of a restricted nature. The contract is expected to be concluded and signed shortly and the Mill may be fully erected by 1965-66.

—And Pig Iron: Mr. C. Subramaniam gave the following information about the erection of pig iron plant: **Goa-Hospet:** The preliminary report envisaged a pig iron plant of the capacity of 300,000 tons at Goa. But in the light of subsequent additional information, the scope of the enquiry was enlarged and the engineering consultants are engaged in examining the feasibility of a full-fledged steel plant. **Punjab:** The Central Government has approved in principle the Punjab Government's proposal to set up a pig iron plant in the Public sector with a capacity of 100,000 tons for which the iron ore deposits in Mahendragarh would be utilized. The plant is likely to

be sited at Satroda, a village near Hissar-Delhi road. The letter of intent is to be issued in due course. **Yellandeo:** A licence to set up a pig iron plant at Yellandeo in Andhra Pradesh was granted to Messrs. Kalinga Industries of Calcutta in August, 1962. Its capacity was to be 100,000 tons. But later the company in question surrendered its licence to the Government.

Bills

The Textiles Committee Bill: The Lok Sabha passed the Textiles Committee Bill, 1962. Its salient features are that it supersedes the earlier enactment for the constitution of the Cotton Textile Fund (established in 1944) and enlarges the scope of the activities of the Fund by extending it to all textiles, namely, cotton, wool, silk, art silk and fibre. It also extends to textiles machinery. The scope of examination and inspection of the quality has been extended to textiles and textile machinery in response to the desire expressed by the trades and industry concerned and endorsed by the Tariff Commission. The balance of Rs. 78 lakhs standing to the credit of the Cotton Textile Fund on October 10, 1962, would be transferred to the Textiles Committee. For the present, new financial aid will be required by the Committee. But a provision has been made in the Bill for grants, loans and other financial assistance to be provided by the Centre to the Textile Committee to meet the salary bill of the staff and administrative expenses as also to meet expenditure consequent on enforcement of its duties of carrying investigations and inspections into the qualities of the textiles and machinery. Under Clause 12(1), the Textiles Committee is empowered to levy fees for investigations and inspections and other services it would render. Its non-recurring expenditure is placed at Rs. 4 lakhs and recurring expenditure at Rs. 26.3 lakhs. The scheme is intended to be self-supporting. The maintenance of quality and standards is intended for domestic supplies as well as for exports. A penal clause in the Bill arms the Committee with the power to prohibit sales of varieties of textiles and types of textile machinery which fail to conform to the standard specifications. Subsequent violation of quality standards is made punishable with imprisonment or fine or both.

The Customs and Central Excise (Amendment) Bill, 1963: It was introduced in the Lower House to amend the Customs Act, 1962, and the Central Excise and Salt Act, 1954. The need for these two amendments arose because under Article 289 of the Constitution, the State Governments claimed exemption from the customs and excise duties on the plea that the Article in question provides for exemption from Union taxation on the property of a State. The question was raised whether what the two Acts taxed were property or proceeds of trade or business. This point of law was referred to the Supreme Court for its advisory opinion. The Supreme Court expressed the view that the duties were not a taxation of property but they related to trade and business for which the exemption did not enure. The two amendments clearly specify the liability of the State Government to pay the customs and excise duties under the two Acts.

The Iron Ore Mining Labour Welfare Cess (Amendment) Bill: This Bill seeks to amend the Act of 1961 which received the President's assent on December 14, 1961. The Amendment is procedural rather than substantive. The Government of Orissa has moved the Central Government for exemption under Section 6 of the Act from its application on the ground that there was a separate State Act in respect of this cess. The State High Court has declared the State Act to be inoperative, but the validity of the enactment is still 'sub judice' in further proceedings. The Amendment Act, therefore, provides that the original Central Act of 1961 may be brought into force in different States on different dates.

The Achilles Heel of Railway Organization

By T. M. RAO

HERE IS a typical morning scene in a Divisional office of the Railways:

7:30 A.M.: An Assistant Operating Superintendent is seen on the telephone for over half an hour answering questions from the Head Office about the previous day's performance.

A little later another officer from the Head Office comes on the phone and asks more or less the same questions. This time it is the Divisional Transportation (or Operating) Superintendent who gives more or less the same answers as his Assistant did a while before. No sooner that is over than the Deputy Chief Operating Superintendent from the Head Office would call him again to elicit the same information in perhaps a different order.

By now it is 10 A.M. and the Headquarters' offices are rapidly filling with the top brass. And then it is the turn of the Chief Operating Superintendent to do some more questioning. He would, of course, talk to the Divisional Superintendent and there is not much variance either in the questions or the answers.

Past Problems "Solved"

By the time the so called "Yard Report" conference ends it is nearly 11:30 A.M. Most of the officials were there from 8 o'clock in the morning. They have all worked up a good appetite. Thank heavens, it is lunch time anyway! In the afternoon, well there is paperwork to do and files to dispose. What does it matter that they have not done a thing about today's performance? After all, have they not "solved" all of yesterday's problems?

What seems astonishing in railway management is that this goes on day after day, the same questions and the same excuses for bad performance, congestion and undelivered wagons. Why does not someone get to the root of the problem and remedy the situation that seems to cause the same trouble every day? If it is constant engine failures, something must be done at the loco sheds. If trains are delayed en route, the movement office must do something about scheduling of trains. Sometimes the only thing required may be an additional siding at a crossing station, or it may be installation of a water column at another station. At one time a slight change in the schedule of a passenger train helped ease the movement of freight trains remarkably on a congested section in the Guntakal Division of the Southern Railway.

But the railway operating officials just don't have the time to think and remedy the causes. As we have seen above, much of their time is spent in dissecting previous performance and answering the Head Office. Whatever time is left, goes for endless paperwork and of all things, accident inquiries.

A drawback in railway operation may well be the plethora of operating officials. A second is lack of clear demarcation of duties and responsibilities amongst them. Let me illustrate these points. To supervise the movement of trains, and passenger and freight operations in a Division there are five people including the Division Transportation Superin-

A series of eight articles by Dr. T. M. Rao on the Nature of the Rail Transport Problem was published in the June - August issues of "Eastern Economist." Here Dr. Rao stresses the importance of the human element in the improvement of railway performance.

tendent and his Assistant, the Chief Controller (or Despatcher) and his Deputy and Wagon Controller. In some Divisions there is a Transportation Superintendent II, besides. It is revealing to know that all the above named are highly-paid supervisory officials. But I doubt if any of them is aware what his specific duties and responsibilities are. The result is that all of them seem to be doing more or less the same thing. So much so the picture of a movement office is one of confusion and perpetual post-mortem examination of train delays. To make matters worse, there is endless questioning by an array of officials from the Head Office. No wonder that in the whole of a working day, save for jangled nerves and frayed tempers, very little gets accomplished.

It would seem obvious that in any organization men should be judged by their results. In a Divisional set up, the Divisional Superintendent is, of course, responsible for the performance of the Division as a whole. Then on the Indian Railways, why is he not judged by the results over a month or a quarter? Instead why is there daily interference in the performance of the Division? No one would, of course, deny for a moment that the Headquarters' office has responsibility for overall co-ordination of operations and stock movement between the several Divisions and with other contiguous zonal railways. What is being pointed out here is that if each Division were left to run its affairs and each Division Superintendent held accountable strictly for his performance and results, there is reason to believe that it would by itself improve railway operation.

Exhilarating Feeling

It may sound strange but this is what it would mean. First the Divisional officers would have more time at their disposal to think and plan their operations and improve their performance. They will no longer be satisfied with offering excuses for bad performance; they will begin to do something about it. Secondly, a feeling of autonomy is certainly exhilarating and it would help fresh thinking and experimentation which are so badly needed on the railways today.

One of the chief organizational lapses in the railways is the lack of cohesion between the transportation and mechanical branches. While the Divisional Superintendent is the head of all branches in the Division, transportation and mechanical remain two separate branches and this leads to constant friction and difficulties. For efficient railway operation the two must work as a single team.

An innovation that is urgently needed is to give effective control over locomotive power requirements to the Transportation Superintendent. In the existing set-up he is handicapped because the official in charge of locomotive power distribution reports not to him but the Division Mechanical

Engineer. This has naturally reduced the effectiveness of the Transportation Superintendent in the Division besides leading to serious operational difficulties. An organizational change that cannot brook any further delay is to have the Assistant Mechanical Engineer (Power) and along with him the Power Controller and engine crews work directly under the Transportation Superintendent rather than the Division Mechanical Engineer. This is the extension of the same organizational principle in which the Deputy Chief Mechanical Engineer (Power) reports to the Chief Operating Superintendent at the System level.

On the same lines, Train Examiners (called Car Inspectors in U.S.A.) located at major terminals and yards, should report to the Transportation Superintendent instead of the Division Mechanical Engineer. Such a change would undoubtedly reduce the yard and terminal delays that have become so characteristic of present-day railway operations.

The suggestions made above are nothing revolutionary; they are, in fact, what may be found in the United States railroad practice. But there is every reason to believe that these changes, minor as they may seem, would go to improve the results of railway operations on the Divisions significantly.

Another innovation that would bring in fresh thinking is to appoint Mechanical and Divisional Engineers as Transportation Superintendents. Apart from new ideas that would come from such an interchange of officials between different branches, it could also be viewed as a 'training position' for promising men. If a man proves himself successful as a Transportation Superintendent and produces results then he should be able to go up quickly to higher management positions.

The Division Superintendent is certainly the keystone in the railway administration at the Divisional level. On him depends the efficiency of operations in the Division. He sets the tone as well as the pace of the railway administration in the Division. In view of the important role that he plays and in order to reflect the true nature of his office, it would seem more appropriate to designate him Division Manager rather than Division Superintendent.

Two-fold Advantage

Once a Division Manager is appointed he should be given a free hand in running his Division. He would be accountable to the General Manager for only two items; viz., the profit position of his Division and, second, the efficiency of operations. The rest including personnel matters within the Division would be entirely within his province. Needless to say, neither he nor his assistants would be subjected to daily questioning and interference from the Head Office. This would have a two-fold advantage. As mentioned earlier, it would free the Divisional officers to concentrate on their immediate tasks. Secondly, it would leave the Head Office to work on co-ordination, planning, research and development, which are so badly neglected now.

Unless decentralization is brought in as the cornerstone of railway organization, it would turn unwieldy as undoubtedly it has become now.

One of the reasons for high efficiency in United States industry is the high degree of 'mobility' of personnel. If you don't like your position in a company and you feel you are not getting anywhere, you quit and join another company, usually in a better position and much higher salary. The reverse is also true. If a supervisor feels that he is not getting the best out of you he would tell you so and it is a signal

for you to leave the organization. Job mobility such as this constantly secures the right people in the right places and helps build high motivation in each employee.

To some extent this has been possible because of a large number of competing organizations as also a wide variety of job opportunities. It should not be forgotten, however, that there is a high rate of unemployment in the United States. The fact that high employee mobility still exists would go to show that it is not only a characteristic of the American scene but that it is independent of the unemployment picture.

On the Indian Railways, jobs are looked upon as life tenures. This cannot but affect efficiency adversely. The situation can be corrected by encouraging greater mobility of personnel. A few changes in rules can bring this about. For instance, it should not be necessary for employees to send applications through the proper channel, when applying for outside jobs. As a rule, applications for other jobs sent through the official channel should not be withheld. Similarly, it should be possible for the administration to dispense with the services of those who are found wanting. It should not be necessary to go through complicated disciplinary proceedings to discharge an employee.

Another measure that could be tried is to bring in some fresh blood at the Division Manager's level. A few of these positions in each zonal system could be filled by direct recruitment from the open market. Successful business leaders, military officers and civilian administrators with a flair for leadership would be some of the desirable categories from which to draw new management talent for the railways.

Employee Discontent

An important factor that inhibits efficiency on the railways is the employee discontent arising out of personnel policies. Suffice here to give a few examples.

In one Division of the Southern Railway, the employees felt that a 'miracle' had happened when they found that they were in receipt of leave sanction and railway passes within a couple of days after sending their applications to the Divisional Office. Until then, it was an accepted fact that replies from the Divisional Office could not be expected in less than a month. What speeded up the whole process was a slight change in the procedure for sanctioning leave and communicating it.

Another example is the policy regarding mutual transfers. Where two employees want to exchange their places and there are no other issues involved, it should be a fairly simple matter to allow such a transfer. But because of an inflexible attitude towards mutual transfers, all such applications were automatically rejected causing a good deal of discontent amongst the staff. In one Division with which the author was associated, a reversal of this policy proved itself as a great morale booster.

There is a good deal of confusion as to what role the personnel department should play. Looking at the way that the personnel department has been functioning on the railways and the conventions that have been established so far, it would seem that the personnel department has become a 'line' organization. But this cannot happen without eroding the authority of the true 'line' organizations such as Transportation, Engineering and Mechanical departments. This is what exactly has taken place, however. Company executives can obtain a free copy of this booklet by writing on their official letterhead to their nearest Caltex Office.

The Caltex "Stop-Loss" plan was the headache antidote... When each department in a plant specifies a lubricant it wants without reference to the purchases of other departments, there is bound to be a lot of waste and costly over-lapping. The Caltex "Stop-Loss" programme helps to eliminate this waste of lubrication by effectively reducing the total plant lubricant inventory. Caltex "Stop-Loss" is a complete plan for organising lubrication on an efficient basis. There is no other programme like it.

Find out today how Caltex "Stop-Loss" can specifically stop the problem in your plant. Help your operation to greater profit with the Caltex "Stop-Loss" Programme.

SAVE FOR SECURITY

August 23, 1963

masters (in certain categories) in a Division are transferred without the knowledge and much less the approval of the Division Transportation Superintendent. This cannot but lead to the weakening of the authority of 'line' departments and detract from the usefulness of 'staff' people.

The objective of the 'staff' department should be to create healthy human relations in the organization. The 'staff' man can achieve this objective only by working through the 'line' management, whose function it is to integrate and direct the activities of all the people comprising the organization. The 'staff' expert, if he is to be successful, must therefore confine himself to advice, counselling and the 'method of augmentation' as Professor Douglas McGregor of M. I. T. calls it.

If our prevailing notions of line and staff relations are correct, then much indeed will have to be done to remedy the situation on the railways. It would mean, first and foremost, bringing the day-to-day personnel activities under the authority of 'line' managers. It would also mean that if an employee has a 'grievance', he would seek redress from his own supervisor and not from the personnel officer. Thus, 'line' people who demand and get work done will also be the men who would be concerned with the morale and welfare of their employees.

Where then do the staff or personnel people come in? As experts in personnel policies they would come in to interpret rules and guide 'line' departments. In the field of labour relations, their superior knowledge would be taken advantage of by the 'line' people. As men with a view from the 'outside', the personnel experts could keep a vigilant eye on employee morale and promote healthy human relationships through which organizational objectives could be achieved.

It is unlikely that innovations in organization and management suggested here would be introduced so long as the railways are run as a department of the Central Government. Particularly is this true in the field of personnel policies. Under Article 211 of the Constitution of India, no employee could be reduced in rank or removed from service without a 'show cause notice' being served on him. This would, of course, serve to reduce the effectiveness of supervisory officials. What is more characteristic of a government department is its apathy and resistance to change which are not conducive to the spirit that must pervade a dynamic business organization such as the railways. For these reasons as well as those advanced in the previous articles, the conclusion seems inescapable that the creation of an autonomous Railway Authority may well be the first step in streamlining the railway administration and providing it with new management sights.

durable
protective paint
for wood
**SHALIMAR
WOODKOTE**

Specially formulated and ready-mixed, Shalimar Woodkote is an ideal finishing paint for all woodwork—indoors or out. Impervious to moisture, Shalimar Woodkote gives a hard, glossy, long-lasting surface, and the special varnish medium that it contains ensures elasticity and durability. Available in 26 distinctive colours.

WINDOW ON THE WORLD

The European Plan

From Our Special Correspondent

PARIS:

THE LATEST label that the Common Market Commission has put on its draft of a European plan is "medium-term economic policy". The Commission, it will be remembered, began by referring incautiously to its plan as a "plan", but in West Germany this word is taboo, so it had to be christened "economic programming". The Germans soon became sensitised to that word too, so it has been censored in Brussels in favour of the newest label in the hope that no one could be allergic to anything so innocuous. This terminological hide-and-seek is not just comical; it is accompanied by a genuine effort to clear up misunderstandings that now divide people who are doing similar things but calling them by different names. For it would be quite mistaken to believe that the Europeans are sundered, in practice, into socialist planners and free-enterprise libertarians. On the contrary, it is notorious that French "planning", as applied to what the ECM Commission wants, suggests a striking contrast between German and other European economic behaviour, it is not only sentimentally objectionable but inaccurate.

Dogmatic Criticism

In discarding it for "medium-term economic policy", the Brussels executive is obliged to seek a clearer understanding of what it really wants. It has thrown overboard much of the paraphernalia of French planning and finds that it is still left with all that is important and all that is effective in French practice. Dr. Erhard's dogmatic criticism of planning is not wasted, however much it is beside the point. For example, he accuses the planners of favouring centralism against federalism; of having unfounded pretensions about fixing long-term targets for free economies; and of seeking to increase the responsibilities of the bureaucrats. When the Commission is forced to reply that it is not trying to do those things, and to put up proposals immune from such criticism, it is sifting out the essential from the incidental in its own ideas. The residue, which comes down to harmonisation of medium-term economic policies, is what matters and happens to be what the advocates of democratic planning have always demanded.

The document that the Commission sent to the Council of Ministers in the last days of July shows this reduction of the planning ideology to its essentials. As far as five members of the Common Market are concerned, it is preaching to the converted; its arguments in support of harmonisation of medium-term policies are all directed at the West Germans. The Commission has no trouble in demonstrating that all member-States, and not least the Federal Republic, already practise some sort of economic forecasting over the middle range; they have to, because many of their governmental actions have repercussions that go beyond the annual budget span. Some of the clearest examples may be found in West Germany: the "German Plan" for agriculture, superhighway construction, subsidies for ports, and so on. Since the six nations are being economically integrated in many other ways, there is an evident necessity to co-ordinate such policies at the European level. If you do not want to call this "planning", you are well within your rights, but it is going to

entail procedures of consultation and forecasting that pass by that name elsewhere.

The procedures that the Commission suggests in its memorandum are instructive, as an effort to state the fundamentals of democratic planning in ways that could not offend the doctrinaires of liberalism. It outlines three successive steps. First, the stage of "prospective study", where it is a question of organising joint reflection on the future using all the information at hand. This work is to be entrusted to independent experts recruited from competent private and governmental organisations; specifically, in this case, the Commission recommends that they study the five-year period 1966-70. They are not required to fix growth targets for the Community, nor to set out any objectives that would be binding on governments or on the European institutions. They would draw "projections" from current trends, using various hypotheses so that they got, not one forecast, but a certain range of possible and probable developments. In particular, they would try to foresee the longer-term implications of the various economic policies that might be adopted. National governments presumably do something very like this now — at least one hopes that before they put a tax on oil that disadvantages it against coal they have stopped to think whether this makes sense in terms of a long-term fuel policy. The only innovation here would be that forecasts would be established at the Community level, instead of each nation trying to guess in isolation.

A Running Commentary

The second stage would be the elaboration of a programme for the period in question. A "committee for medium-term economic policy" would be set up in Brussels, its members being designated by government and by the Commission. Working from the forecasts of the independent experts, it would outline, in fairly general terms, the most rational economic policy relevant to the period 1966-70. This committee would remain in existence after adoption of its programme (which is stage three), in order to keep up a running commentary on its implementation. Especially, it would find out for what reasons actual developments were diverging from expectations, and would make recommendations in consequence.

The third stage is that of decision. The programme would be sent to the European Parliament in Strasbourg for its views and to the Economic and Social Council, which groups private business and trade union interests as well as officials. After this discussion by those liable to be affected, the programme would get the approbation of the Council of Ministers which is the real cabinet of the Common Market. Such approval would commit national governments and the ECM Executive to "take such steps as lie within their competence and to follow such policies as would ensure the realisation of the programme".

Anticipating Bonn's criticisms, the Commission says that the European programme thus elaborated would be an instrument of co-ordination of economic policies, not an attempt to co-ordinate the activity of economic agents. It would not try to tell anyone what to do, but to ensure that when governments took decisions impinging on the economy, they were not acting at cross-purposes as between themselves. Such co-ordination, it adds for Dr. Erhard's benefit, "should

not in any instance have the effect of increasing the intervention of public authorities". In other words, granted that governments already exercise extensive responsibilities, they are not making any further invasion on the scope for free enterprise when they seek to ensure that they act in unison and in accord with the most probable future developments in their economies. Indeed, the part of the programme that would be most precise would relate to spheres where public action is already dominant, i.e. where untrammelled free enterprise no longer exists. The Commission specifies four such regions.

The first is general financial policy, where of course the government's budgeting and its control over investment and the money market are decisive. The aim here would be to co-ordinate, at least in broad outline, what governments are doing in allocating expenditures as between private consumption and collective facilities, in encouraging the various forms of saving, in influencing the financing of investment, and in controlling the capital markets.

The second is regional development. All the member-States have their relatively backward regions and they practise, unashamedly, planned interventions with a view to repairing these regional discrepancies. This is of course as true of the Federal Republic as of any other country; a subtle co-ordination of housing development and employment assistance aims to benefit one region as against another, and more extensive action will no doubt have to be taken in favour of Schleswig-Holstein. The Italians, in turn, have ambitious regional plans for their poor South, the French for Auvergne and Brittany, the Belgians for the Flemish regions. It is necessary, says the Commission, that such actions be compatible as between themselves, and in line with the Common

Market's development. This is indeed important, because the tendency of the process of European integration is to polarise industrial development in a central region, while exacerbating the backwardness of the periphery. The whole context of regional "uplift" changes with the emergence of a unified market, and present planning techniques will have to be transferred to the European level.

Over-riding Policy

The third is harmonisation of pluri-annual development programmes for roads, ports, urbanisation, inland navigation, education and scientific research. All the States, whatever their official doctrine, have such programmes in hand and it would be idle to deny that they all impinge on each other and need to be compared at a European level. The fourth and last point is so obvious as hardly to need mention: all the States (and again West Germany is not the least active in this respect) restrict free enterprise in agriculture, transport and fuel in favour of an over-riding national policy. The necessity to co-ordinate these "sector plans" is so plain that the Common Market already has inter-governmental groups working on them.

This, then, is the style and the content of what the ECM Commission means by planning or programming or medium-term economic policy. Whatever name it be given, it points to necessities that cannot be dismissed with doctrinaire defences of free enterprise nor impugned with observations on the wickedness of socialist planning. If the Common Market survives the four-month reprieve that President de Gaulle has given it, when he demands resolution of its disagreements about trade in farm produce by the end of December, it will no doubt adopt a plan of this sort.

Inflation and the Small Saver

By JOSSLEYN HENNESSY

LONDON:

THE BRITISH people have, since the war, achieved one of the highest rates of private saving in the western world.

In 1938, they saved 5 per cent of the gross domestic product; in the lean immediate post-war years, when people were replacing the goods that they had done without during the war, private savings fell to 0.4 per cent, but by 1959-61 they averaged 6 per cent; and in 1961 alone they attained 7.7 per cent of GNP. This equals 10.5 per cent of personal disposable income and is expected to rise to 11.75 per cent within three years. Personal savings constituted 48 per cent of all savings (compared with company savings at 52 per cent) in 1938, fell to 3 per cent in 1949-51 (compared with company savings at 57 per cent), and rose to 43 per cent (compared with company savings 41 per cent) in 1961. The actual figures of all personal savings in 1961 were: Persons £2,031 million; Companies £1,954 million; Nationalised Industries £381 million; Government £461 million; Statistical Error — £107 million; Total £4,721 million.

Since very rich personal savers, owning comparatively substantial capital, have become a vanishing handful, it is clearly the rise of the lower and middle ranges of the population to affluence — real disposable income between 1952 and 1961 rose by over 40 per cent — which is contributing the bulk of personal savings.

What do they do with their savings? Life assurance funds rose from £351 million in 1952 to £821 million in 1961; investments in non-financial assets (private business, houses etc.) rose from £289 million in 1952 to £921 million in 1961;

increases in identifiable debt (hire purchase, and other private loans) rose from £130 million to £270 million; but the most interesting post-war change in investing habits has occurred in financial assets, as follows:

NET INCREASES IN IDENTIFIED INVESTMENTS IN FINANCIAL ASSETS*

	(In £ million)					
	1952	1955	1957	1959	1960	1961
Personal deposits with clearing banks†	60	74	153	52	116	271
Shares and deposits in building societies	119	191	171	270	203	204
National Savings	—80	41	68	390	338	213
Other	2	7	10	10	13	12
	101	313	402	722	670	700

* Households and non-profit-making bodies.

† Net of increase in personal advances.

If one could disentangle the amounts invested in (a) shares and (b) deposits in building societies, and couple the resulting figures with the steadily declining trend in National Savings Certificates, we could "quantify" the slowly widening understanding of what inflation means and how it can, to some extent, be countered. More people gradually came to realise that the belief that gilt edged government stocks were "safe" amounted in the 1950s to no more than a racial memory of the golden interlude in the history of inflation — the year 1816 to 1913 in which the U.K. never had a balance of payments deficit, in which the national product grew at the

(then incredible) rate of 2.8 per cent a year, and the £ could be solidly linked to gold. The new post-war middle classes began to get the point as economists wrote popular articles recalling that, for example, in 1536 the price of a sheep was 6sh.; that in 1906, a man with 3 sh. in his pocket could buy a seat at a music hall, three pints of (genuine undiluted) ale, and an ounce of tobacco; and, that in 1963, a man absent minded enough to go out with only a solitary shilling in his pocket could only buy one cup of coffee (10d) and a box of matches (2d).

Theoretic Answer

Early on after the war, the emerging new middle classes learned that equity shares were the answer, but this knowledge remained largely theoretic, because the mysteries of the Stock Exchange were outside their experience; the amounts that they had to invest were not large enough to make it economically possible for them to get first class advice, and being small inevitably meant the big risk of too many eggs in one basket.

The solution for the small investor was the unit trust, which will accept small amounts (often down to a pound), which, combined with thousands of other small amounts, add up to a vast fund with the risks well spread over several hundred expertly selected shares.

Unit investment trusts started in the U.K. in 1932, but they never really got under way because the comparatively wealthy pre-war investor had no need of their services. In

1938, savings invested in unit trusts totalled only Rs. 104 crores. By 1959, the total was still only about Rs. 123 crores. Since then, however, the movement has begun to snowball and the investments of some 40 trusts have risen at an average of Rs. 71.5 crores a year to a combined total of Rs. 390 crores, divided among 857,000 shareholders. This gives an average of only Rs. 4,550 for each shareholder, which suggests that unit trust investors are genuine small holders.

The movement, obviously still in its infancy, continues to gather pace. In illustration of the admirable job that it is doing among people unfamiliar with investment problems may be cited the recently launched monthly journal, "The Unit Holder" (Price 1sh. 9d.; 64 Aldermanbury, London E.C.2), which reviews the portfolios of the unit trusts, points out additions and switches, and discusses the reasons for them. Particularly useful to the small investor are the analyses, in non-technical language, of the differing aims and records of the various trusts, with suggestions for switching from one to another. The intelligent small investor can, for example, spread his risks in different trusts which specialise in, e.g., insurance, electrical, consumer and other industries, overseas shares (giving a spread around the world), new issues etc. etc.

As evidence of the efficiency of the management of these trusts, out of 40 recently reviewed in the "Statist", only six failed to attain the level of the "Financial Times" share index, and the top scoring trust's units stood 128 per cent above the "Financial Times" index.

Petroleum consists almost entirely of hydrocarbons—compounds of the elements hydrogen and carbon. In picture form one atom of carbon can be shown as ● and one of hydrogen as ●, the arms linking them together being a measure of their power to combine chemically. A simple combination, or molecule, is *methane* (top picture) which is the main constituent of natural gas. A more complex molecular structure is *iso-octane* (lower picture), used in making aviation spirit.

Hydrocarbons are present in crude oil in a great variety of patterns, differing not only in the number of atoms in their molecules but also in the way in which the atoms are bound together. Through the application of petroleum chemistry, the rings and chains can be separated, reassembled or rearranged in different ways to obtain a widely varied assortment of petroleum products. The plant where the processes take place is the oil refinery—a chemical laboratory on a giant scale.

Paper Targets Only on Paper

By Our Special Correspondent

NEW DELHI:

THE DEVELOPMENT Council for paper, pulp and allied industries, meeting earlier this year, noted that, although the total capacity for paper and paper boards licensed was far in excess of the third Plan targets, the actual performance was not very satisfactory. Against a target capacity of 820,000 tons per year fixed for paper and boards, the total capacity which could be expected to materialise within the Plan period was only 680,000 tons per year thus leaving a big gap of 140,000 tons per year. The actual production that could be expected on the basis of this trend was only 580,000 tons per year while a production target of 700,000 tons per year had been fixed in order to fulfil the demand anticipated by 1965-66. The shortfall of 120,000 tons per year would create serious scarcity conditions.

The main difficulties of new schemes were problems of raising rupee finance, lack of assurance of sustained supplies of raw materials and the profitability of the industry being inadequate to attract fresh capital, internal as well as foreign. "Licensing of new units at this stage will not be a real solution as the basic problems confronting the existing licensees will have to be faced by the new licensees as well. The only way to narrow down the gap between the anticipated demand and production during the remaining plan period is for the existing units to increase production by effecting suitable modifications and adjustments to their existing equipment within the shortest possible time and the least amount of investment. The experience of some of the mills like Bengal Paper Mills, West Coast Paper Mills, etc., has proved that there is considerably large scope for such an increase in production in many of the existing units."

The Council noted that during 1963-64, the Government demand for paper would be of the order of 110,000 tons against 87,000 tons in the previous year. A substantial part of the increase was due to the larger defence requirements.

During the next three years the internal production of paper would fall short of the demand by about 120,000 tons annually. With the increased offtake by Government, the quantity left for civil consumers would be much lower than under normal circumstances. Shortage in supply being inevitable, the Council considered measures that should be taken to ensure equitable distribution of the restricted supplies of paper to civil consumers.

No progress is reported in respect of the following six units:

	Capacity per year
Northern India Paper Mills	27,000 tons
Delhi Cloth and General Mills	36,000 tons
Somani Pulp and Paper Mills	15,000 tons
Bedi and Company, (Panipat)	30,000 tons
Sohan Lal	4,200 tons
K. L. Gupta	37,000 tons

The U.P. Paper Mills has been permitted to negotiate a loan from Export/Import Bank. Its licensed capacity is 21,000 tons a year. Another unit, Asok Paper Mills, licensed in 1956

is expected to go into production in 1964. Its capacity is 15,000 tons. The following licences have been revoked:

Bilaspur Paper Mills	Capacity 30,000 tons
Madhya Pradesh Paper Mills	Capacity 18,000 tons
Century Paper Mills	Capacity 6,000 tons
Megna Mills	Capacity 30,000 tons
Assam Pulp Mills (paper grade pulp)	Capacity 312,000 tons

A similar tale is told of the rayon grade pulp schemes. Out of five units licensed, Gwalior Rayon, with a capacity of 4,500 tons a year, has gone into production while the scheme for West Coast Paper Mills, Mysore, capacity 27,000 tons and National Rayons, Bombay, capacity 30,000 tons are being implemented. No progress is however reported of Greater Mysore Rayons Grade Pulp and Paper Mills, capacity 30,000 tons and Rohtas Industries, Limited in Assam, capacity 60,000 tons.

★★

The Ford Foundation's Team on Small Industries, which submitted its report to the Government of India a few days ago, has indeed done a good turn in suggesting a new perspective for the thinking on the development of what in technical jargon is known as the decentralised industrial sector. Hitherto, the growth of small enterprises had been sought to be fostered with a view to effecting better utilization of the unused resources of capital and skill, for augmenting the supplies of some essential consumers and simple producers goods, for helping regional development, for creating employment and for ensuring a more equitable distribution of the national income. The pursuit of these objectives has brought in its trail a host of problems, the most important among them being large-scale under-utilization of the installed capacity which has pushed up industrial costs by no small extent.

To put matters right, the Team suggests that the small-scale industry's positive contribution to development should be the principal criterion by which its future growth plans should be judged. This is to say that the economic test should be paramount: "Will a small firm in this product and place be efficient, competitive in cost terms, and capable of growth?" The Team is categorical on avoidance of subsidies except in strictly pioneering areas where also they should be only temporary and has opined against reservation of certain lines of manufacture for small enterprises under common production programmes. For reducing the cost of production of the existing units and avoiding wastage of capital assets, the Team rightly calls for consolidation of the progress already made before indiscriminately going in for setting up of new small units. The latter course will aggravate the raw material and components starvation that small industries are experiencing today.

For the optimum utilization of existing capacity, the Team recommends a scheme divided into two parts. In the short term it recommends the placing of small-scale industrial units on an equal footing with the larger ones for allocation of scarce materials, both of indigenous source and those imported. From the long-term point of view, it has advocated a single price-tax system for all commodities, by virtue of which a more or less open market will be established for the various raw materials, excessive margins of profit being mopped up by enhancing State taxes. The over-riding crite-

tion for allocation of scarce materials through distribution controls, the Team suggests, should be the use to which the end-products are put. High priorities should be fixed only in a limited number of cases.

The regulation of the future growth of the small-scale sector, the Team recommends, should be brought about indirectly through utilizing the foreign exchange available for small industries more for the import of raw materials than for additional capital equipment. Any further loans to the small-scale industrial sector are also suggested to be provided on this basis. The present efforts of the Central and State Governments to bring into being new small industrial units, it is further recommended, should be subordinated to technical assistance programmes designed to make the existing units more efficient and productive.

Centre's Role

The Team calls for some far-reaching changes in the role of the Central Small Industries Organisation and quite appropriately observes that the Central Government's role in small industry's development should be to make and enforce rules and not operate the programmes except in unusual circumstances and then only temporarily. The CSIO should assist and stimulate the States, quasi-public associations, private associations and individual firms to perform function of value in the building up of an efficient small industry. It should be prepared to disengage itself from activities that it has demonstrated and which can be carried forward by others. Consideration is recommended for setting up a society or quasi-governmental institute, similar to the National Productivity Council, to take over extension services on an essentially self-sustaining basis with only limited Government subsidy. Turning over of the local small industries service institutes, especially in the localities where industry is more advanced, to societies having mixed boards of control representing the Central and State Governments and perhaps the municipality and trade associations, with the CSIO assisting originally in the change-over, is also suggested. A wide range of other recommendations has been made for making the Small-Scale Industries Corporation and the Prototype Centres effective in their role of fostering the development of small enterprises as also on provision of finances for the small-scale industrial sector.

The Committee does not favour the formation of small industries as the sole or even major means of achieving regional growth or the desired spread of industry. It suggests that large industry locations, transport and power facilities must be combined to produce an effective dispersal programme. The economic advantages and disadvantages of location should not be ignored with impunity. The focus for industrial development under a dispersal policy, it is recommended, should be neither the metropolis nor the village, but rather the large range of potentially attractive cities and towns between these two extremes.

The small-scale industries, it is further recommended, should be differentiated from the rural industries because the former have an integral relationship with the large factories, have an orientation towards urban locations and need modern requirements for their growth. In this connection, the ancillary role that the small-scale industries can play to the large-scale industries is highlighted.

★★

The Ministry of Industries has suggested a working formula to streamline the basis of calculating capacity in a particular unit of industry. It has been decided that capacities in industries should normally be expressed only on the basis of maximum utilisation of plant and machinery on an annual basis. For this purpose industries may be divided broadly into two categories — (a) the 'continuous process'

industries, which work continuously (whether on the basis of 330 or 300 working days per year or, as in the sugar industry on a seasonal basis), and (b) the remaining industries. Having regard to the conditions obtaining in India, it has been decided that, in the case of industries falling in category (b), capacity on the basis of maximum utilisation would normally be deemed to be the capacity as assessed on the basis of double shift operation.

While assessment of capacity on a double shift basis in other than 'continuous process' industries will be the normal rule, it may be that in certain of these industries units are generally running on a three shift basis or are fully capable of running on 3 shift basis. In such industries a "no objection to capacity" certificate will be required.

To give effect to these instructions, the following action is suggested, namely:-

The appropriate authority may examine each industrial licence so far issued, and, in cases where capacity has been expressed on a shift basis, review the position so as to express the capacities of all units on an annual basis. The appropriate authority will also arrange for a random check of some of the licences already issued even on the basis of annual capacity with a view generally to ascertain that the capacities licensed are appropriate. Subject to the limitations of staff, it is considered desirable to have a physical check or verification of at least an important cross-section of cases by technical officers of the appropriate authority.

Excess Installed Capacity

In order to keep this work within manageable limits, verification may be confined to some of the larger units in important industries only. There may be cases where it is found that the capacity actually installed is substantially in excess, say by more than 10 per cent, of the capacity licensed. Such cases should be reported to the Licensing Committee by the industries sections concerned before they are regularised. Before the revised capacities, as assessed above, are communicated to the parties or published, it is proposed that the result of the factual survey regarding the existing capacity in different industries should be discussed at an inter-ministerial meeting including the Planning Commission.

In the case of all industrial licences to be issued hereafter the capacity will be specified on an annual basis only, without any reference to shifts. In certain industries where there are more than one major processed or end products, capacities are required to be stated separately, as for instance for pig iron, steel ingots and rolled products in the Iron and Steel Industry. In such cases the appropriate authority should recommend fixation of capacities separately for major processed or end products.

★★

The Bhakra Right Bank Power Station which is being erected with economic and technical assistance from the U.S.S.R. is being further expanded by the installation of a fifth 120 MW hydro-unit. This will raise the total installed capacity of the hydro stations in India. The foreign exchange cost of this project is being met out of the 112.5 million roubles (Rs. 59.53 crores) credit granted to India in February, 1961.

The first 120 MW hydro-unit will start arriving from the Soviet Union in a few months and the fifth unit is expected to be made available in 1965. Work on the construction of the power station is going ahead and it will be equipped with the latest types of Soviet machinery. A number of Indian engineers have already visited the USSR where some of them have participated in drawing up the project report. Some others have attended model tests of the hydro-units at the Soviet manufacturing plants. Soviet engineers will help in

the construction, erection and commissioning of the power station.

★★

A five-member delegation left for West Asia and Europe on August 19 to explore the markets for export of Indian bananas. The delegation during its four-week tour will visit Teheran, Baghdad, Basra, Damascus, Beirut, Brussels, Frankfurt, Hamburg, London, Stockholm, Paris, Zurich and Rome. Arrangements are under way for the delegation to receive at each place it visits a sample quantity of fresh banana fruits, flown from Madras, for distribution to the prospective consumers.

The West German quota of duty-free imports of bananas from countries outside the European Economic Community in 1963 will be increased from 347,000 tons to 443,000 tons shortly. This has been agreed between West Germany and the other EEC members in Brussels. Earlier estimates had put West Germany's banana consumption at 477,000 tons this year. The possible difference between the estimate and the newly fixed tariff-free import quota could either be covered by duty-free imports from other EEC members or associated overseas territories, or by imports from countries outside the EEC for which, however, an import duty of six per cent (present rate) would have to be paid.

★★

The Government is taking active steps to replace copper by aluminium in this country. In the manufacture of conductors, for example, aluminium has already replaced copper. Barring switchboard cables and flexible cables, it is now proposed to replace copper by aluminium in the manufacture of cables also. It is also proposed to train adequate number of people for this change over and in particular for the purpose of joining cables.

There is a re-thinking in regard to export commitment by new industries in general and of aluminium industry in particular. Industrial development under existing conditions is confined to such industries, the produce of which was in demand and was imported into India. It should, therefore, be unwise to insist on export of such items, which were being imported and which were also in short supply. Aluminium is already in short supply and with few exceptions, the units licensed have not made any noticeable progress. With the proposed switching over from copper to aluminium, the internal demand for aluminium will further increase. It

A City Held to Ransom

From Our Correspondent

BOMBAY :

CIVIC EMPLOYEES launched their fourth strike within the last six years to secure their demands. According to the Chief Minister, Mr. Kannamwar, the civic body will have to bear an additional expenditure of Rs. 2 crores if the demand of the workers for an increase of 25 per cent in dearness allowance was conceded. In spite of prohibition of the strike by the State Government under the DIR, as certain municipal services constituted an essential category, it (the strike) was successful since a majority (95 per cent) of 30,000 civic employees stayed away from work. Although 300 arrests were made on the first day, the strike was completely peaceful. The Maharashtra Government made adequate arrangements through volunteers and Home Guards to maintain the essential services. The minor leaders of the strike continued to be rounded up by the Government. The situation took a more serious turn on Friday last, the fifth day of the strike, when the central figure of the strike, Mr. Madhu Limaye, was arrested by the Government. The strike spread to municipalised transport services at midnight on Friday

may be added that almost twentyfive percent of aluminium is for electric power.

★★

After considering the recommendations made by the two foreign experts commissioned to study the scope for economy in the use of fuel in industry, the Government have decided to set up Fuel Efficiency Service. The organisation of this Service and its operation have been entrusted to the National Productivity Council. The main objective of the service will be to advise industry on efficient utilisation of fuel. While the service may ultimately cover all aspects of economic utilisation of coal and other fuels including aspects such as substitute fuels, fuel handling and transportation, utilisation of generated heat energy etc., to begin with it would concentrate on the effective utilisation of coal through adoption of, what may be called, "First-aid Measures", "Instrumentation" etc.

It has been decided that to begin with, the Fuel Efficiency Service would operate in the Greater Bombay industrial area. It is proposed to charge fees from industry for the services rendered.

★★

Licence has been issued for setting up a cement factory in Madhya Pradesh. This licence has been granted to Messrs. Associated Cement Companies Ltd., for setting up a slag cement factory at Jamul near Bhilai. The factory is expected to be commissioned by the middle of 1964.

A letter of intent has been granted to Mr. P. V. Krishna Reddy, Gudur, for setting up a cement factory of capacity of 200,000 tons a year at Yerraguntla.

★★

The Metal Corporation of India, a private limited company, has been licensed to set up a new Zinc Smelter at Udaipur and also to expand its existing Lead Smelter at Tundoo (Bihar) for refining the lead/zinc ores mined by the Corporation from its mines in Zawar near Udaipur. The Corporation will also manufacture cadmium and sulphuric acid for further manufacture of superphosphates as by-products at their Zinc Smelter.

★★

The landed cost of synthetic rubber of the S.B.R. type is of the order of Rs. 2,900 per ton, inclusive of an import duty of 22 per cent ad valorem. The Indian producer has proposed to sell this product at Rs. 4,400 per ton and the reasonableness of this price is under examination.

last, when 13,000 employees of the BEST Undertaking joined hands with the 30,000 civic workers. Two hundred and odd buses which ply on 15 routes in the city and suburbs went off the roads.

At the time of writing, the position is that the transport strike, in the first instance, will last till Tuesday midnight (August 20) when it will dovetail into the proposed token general strike. The Hind Mazdoor Panchayat which controls several labour unions, such as the fire brigade personnel, taximen and hotel workers, among others, gave a call to these unions to keep themselves in readiness for an indefinite strike to support the municipal employees. The Government declared the BEST and fire brigade services as essential once again under the Emergency powers but this is unlikely to have any significant effect on the strikers' decision. While a civic strike was successfully averted at Poona, it is not understood why it was allowed to take place in Bombay city. The Municipal Commissioner, Mr. S. E. Sukhtankar, who was a former Labour Commissioner of Bombay, made the fantastic claim that, since the last settlement, in July,

1962, with the municipal workers, the Cost of Living Index Numbers had not gone up! He quoted the All-India Consumer Price Index Numbers month-wise to support his contention and concluded that the Union did not have even an 'iota of a case.' The Corporation meeting convened to discuss the strike situation therefore adjourned amidst scenes of confusion and disorder and the city fathers showed that the 30,000 civic employees, who went on strike, had better discipline and a sense of purpose.

★★
Incessant rains in Bombay brought all dock operations to a near standstill on the day of civic strike. Hardly 2,000 tons of general cargo were loaded or unloaded daily during last week against the usual average of 20,000 tons a day. The number of ships tied up in the anchorage for want of dock accommodation rose to twice the usual number (15). The waiting period for a ship in the harbour varies from three to seven days. One of the ships waiting, it is learnt, is carrying foodgrains.

Several old buildings in the city came down due to heavy rains causing damage to property and human life. In view of the acute housing shortage, several families continue to occupy dilapidated buildings. The buildings are left in disrepair, especially this is the case with Trust properties, in view of the uneconomic rents fixed in the pre-war period which makes impossible proper repairs to properties. The Municipal Corporation has not somehow taken energetic measures to compel the landlords of Trust properties to keep the buildings in good condition.

★★
A Tripartite Conference was convened by the Maharashtra Government on August 16 to consider implementation of the Delhi decision to open fair-price shops in industrial establishments having more than 300 employees. The representatives of the All India Trade Union Congress led by Mr. S. A. Dange staged a walk-out when the Labour Minister Mr. S. G. Mane, who presided, refused to allow any discussion on the cost of living index and the actual prices which workers had to pay and which affected their dearness allowance. Mr Dange insisted on a discussion of the question because the dearness allowance was at the root of the agitation and the strikes. It was a clear violation, according to the communist leader, of the understanding and decision taken at the Delhi meeting a few days earlier and they had no alternative except to voice the protest at the unreason-

Tea Target in Trouble

From Our Correspondent

CALCUTTA:

WHILE IT is encouraging that India is steadily emerging as an exporter of finished goods, the fact remains that the traditional commodities will continue to be the mainstay of our exports for a considerable time to come. Despite severe competition in world markets, some of these commodities notably tea and jute manufactures had shown good results last year and there is every reason to hope that, given the necessary effort on our part, they will continue to make still larger contributions to the national exchequer in coming years. Take, for instance, tea. Thanks to increased attention given to fostering overseas trade, exports in 1962 were higher by 9 million kg compared to the previous year. Concerted efforts are now being made to popularise Indian tea in consuming countries. During the past one or two years the Tea Board has considerably intensified propaganda abroad by opening tea centres in a number of countries, including the UK. These efforts are bound to bring in rich dividends.

But if we are to obtain full results from these promotion-

able attitude of the Government. The representatives of employers agreed at the Conference to give full facilities for opening fair price shops and assist the Government in holding the price line. The shops will not however sell all essential commodities but only rice, wheat, sugar and jowar. It is therefore doubtful that they will help in containing the price level. The Tripartite Conference should have discussed the present municipal strike and other questions like the CDS, increase in dearness allowance and revision of cost of living index which are agitating the minds of workers. The Government of Maharashtra has lost yet another opportunity to iron out the differences in view-point on these matters and take the workers into confidence.

★★
In view of the slack conditions in credit and money market and sufficient return flow of funds, the banks are placing deposits with business houses. Two or three big banks are understood to have placed three days' notice money with a few renowned business houses. The deposits will fetch the banks an interest of 4.50 per cent per annum. Although banks collect deposits from the public at rates varying between 3 to 5 per cent per annum, the average interest rate paid on deposits does not work out to more than 2.4 per cent per annum. Banks lend these funds to industry at a minimum rate of 6.50 per cent —2 per cent above the Bank rate. Business houses themselves offer between 5 to 7 per cent on term deposits, up to one year, from public. The amount of public funds with industrial houses is not more than Rs. 500 crores or about 5 per cent of aggregate deposits with scheduled banks. The opinion among bankers is divided on the desirability of placing deposits with business houses. A section considers such deposits as call money and not as advances and the placing of idle funds with business houses is in order. The opposing section considers such notice money as advances under the counter and criticises such advances as violation of the inter-bank agreement on advances. The agreement prescribes the minimum interest rate on advances, as referred to earlier, at 2 per cent above the Bank rate and the 3 days' notice money has been lent at 4.50 per cent per annum. The inter-bank call rate was ruling around 2½ per cent per annum and the Treasury Bill rate at 2.3 per cent. Hence the attraction of placing notice money with business houses. It should be noted that there is no specific provision in Advances agreement prohibiting such a practice. But it is not a healthy tendency especially if the deposits are kept with the directors' firms.

al measures, two main conditions have to be satisfied. It is a truism that larger exports need larger production. It will be useful for everyone concerned with the tea industry and targets for tea production and exports are 408 million kg and 277 million kg respectively. Let us consider what is the progress that has been made in the first two years of the Plan towards hitting the output target. Tea production which reached a level of 354 million kg in 1961 declined in 1962 to 344 million kg. In the first half of the current year production trend has been disappointing but according to the Deputy Chairman of the Tea Board, there are already signs of the shortfall being made up. In his opinion tea output in the current year may reach a level of 370 million kg. But this optimism is not shared by tea producers. In his presidential address to the annual general meeting of the Tea Association of India, Mr. S. R. Daga has pointed out that prospects for attaining sizable increase in production are not very bright. He is of the view that "it is only towards the end of the fourth five-year Plan that we can expect an in-

crease in production from the new plantation that will be carried out now". Mr. Daga has made it clear that a marked increase in production will result only if more area is brought under tea together with a higher rate than hitherto of replanting and replacement. He has suggested some tax incentives to speed up the work, one of them being a new plantation rebate similar to development rebate on plant and machinery.

The need for stepping up production is also emphasised by the fact that internal consumption is increasing rapidly. It is true that official policy is to discourage any runaway rise in internal offtake. The excise duty on the commodity is having a restraining influence. There has been a welcome drop in internal consumption during 1962-63 to 130 million kg from 137 million kg in the previous year. In marked contrast to its activities a few years ago, the Tea Board has progressively turned its attention on propaganda outside the country. Even so, with the steady increase in the standard of living of the people within the country, last year's drop in consumption cannot be taken as a valid indication. It is only proper to expect that internal consumption will increase since tea in spite of the increase in excise duty will still continue to be the cheapest beverage available to the poorer sections of the community.

Quality the Main Factor

A high level of tea production alone will not ensure higher exports. Current efforts at projecting the image of Indian tea in foreign countries will no doubt go some way towards increasing our exports. But in the ultimate analysis, the factors that will help our tea to move faster in world markets are its quality and price. The delegations which visited various parts of the world during the past two or three years agree on one point and that is that the main deterrent to the larger sales of our tea in overseas markets is its high price. Quality for quality, Indian tea is dearer than almost all other teas. Tea producers in India point out that they are helpless because production costs have gone up and are still going up for no fault of their own. Mr. Daga has given a list of factors that go to inflate cost of production. Even the abolition of export duty has been made ineffective by the additional surcharge on excise duty. Mounting labour costs, the recent increase in the rates of Agricultural Income-tax by the Assam Government and the statutory obligation on the industry of providing each year eight per cent of the total number of houses for labour are some of the more serious burdens that the industry has to bear. The decision of the Karmahom Conference to raise freight charges on West bound cargo by 12½ per cent will further add to the cost of our tea in foreign markets. It is therefore imperative that serious consideration is given by Government to devising ways and means of enabling the industry to reduce its cost of production so that our tea is able to compete on level terms with teas from other producing countries in respect of price also.

★★

Curiously enough the reported directive of the Central Government to the various financial institutions and the State Bank of India to lend support to the corporate sector has not engendered much en-

thusiasm. As expected the LIC has been extending support to equities, though as yet in a modest measure; but operators are not hopeful of any sizable buying from this quarter as this institution cannot be expected to invest its funds without first ensuring that such investments will be in the interests of policy holders. There has been some good news from the corporate sector during the past few days. Reports of bonus issues from Anglo-India Jute and Kumardhubi Engineering have been welcomed with an immediate rise in the prices of these shares but the general tone of the market has not changed much. The old apprehensions about dividend and expansion prospects continue to be the main stumbling block in the way of the genuine investor taking an active part in the trading.

★★

The continued firmness of sacking prices seems to indicate that earlier fears that Pakistan would continue to dominate the overseas markets in this category of goods longer than usual this year were exaggerated. For some weeks now there has been a steady stream of orders from various quarters and indications are that more orders are in the offing. It is evident that Pakistan has almost exhausted its availability and future enquiries have perforce to come to Indian mills. The recent flow of orders has been so encouraging that it is now expected that before long there will be a squeeze in certain constructions. Besides the orders from overseas, it is expected that a substantial order for B Twills will be forthcoming from the Government of India soon. All this has somewhat helped forget the essentially unsound position of sacking the performance of which on the export front last year had been none too good.

In marked contrast to sacking, there has been practically no overseas business of note in hessian for some time. Despite this, hessian prices too have improved. This is because of the sound statistical position of this category. At the end of July hessian stocks at 32,500 tonnes were only 100 tonnes higher than at the corresponding date of the previous month while production during July was 4,300 tonnes higher at 45,800 tonnes. Stocks with the industry are thus much less than a month's output. Trade circles believe that there will be a revival of foreign interest in hessian also in coming weeks. The improvement in sentiment has extended to the raw jute section as well where buying has been going on by mills to fulfill their quotas for the current month. The firmness in the gunny market has also been a contributory factor. A feature of the current trend in raw jute is the rapid narrowing down of the gap between the market price and the official minima. Jute growers do not seem to be in a hurry to dispose of their harvest in view of the concerted steps taken by authorities to ensure them an equitable price. The expectation is that in view of the recommendations of the Shrivatsava Committee, goods production will continue to be maintained at maximum capacity of the industry and this will mean larger offtake of the raw material. Since indications are that effective measures will be taken by both Pakistan and India to stop smuggling of jute across the border into India, the pressure from unauthorised supply will not be felt to the same extent as last year. The report that crop outturn has not been uniformly good in all the growing regions also seems to have entered into the calculations of jute holders.

Sugar: Plans and Prospects

From Our Correspondent

MADRAS:

AT THE MEETING held in Hyderabad recently between the Union Minister for Food and Agriculture and the two Chief Ministers of Andhra Pradesh and Mysore and the Madras Minister for Agriculture, the question of providing additional incentives to cane-growers and sugar mills in order to in-

crease the output of sugar during the next season was considered in its various aspects. A higher minimum price for sugar-cane for the 1963-64 season has already been announced with variations in the premium paid for changes in the sucrose content of cane. But it is feared that even the higher prices for cane might not ensure adequate supplies to the mill as

prices for jaggery are ruling high even now. Actually, it is expected that there will be no larger accumulation of stocks on account of the larger demand for gur and khandsari following the rather serious decline in output of factory sugar in the current season. The Southern States have acquitted themselves creditably as even with a slight reduction in cane supplies the output is not expected to be very much lower in Andhra Pradesh, Madras and Mysore. Many new mills have been commissioned into production. It must be accepted, however, that the output would have been very much higher but for the fact that in some jaggery areas, where new factories are operating, the full capacity for crushing could not be utilised. The price realised by the grower on the basis of current demand for gur would no doubt be high being nearly double the minimum price for cane paid by mills. Only it cannot be said that the full benefit of higher prices is derived by the cane-grower as the trade has been exploiting the situation and it is not expected that prices will go down appreciably until the new season sugar arrives in fairly large quantities and it is also clear that no serious difficulties will be encountered later in the next season.

Graded Rebate

It is anticipated that there will be a rebate in the cane price for early crushing by mills though this will benefit mainly mills in Northern India. If a rebate can be given for late crushing many units in the South would probably be benefited. But there is a demand that the rebate in excise duty should be so given that equal benefit is derived by mills which have been able to maintain production at a fairly high level and which consequently would have a higher average production in the basic period. It has, therefore, been pointed out that the rebate in excise duty should be given on a graded basis so that mills which step up output appreciably can benefit to a greater extent. The announcement of Government's policy for the next season is keenly awaited and there is a general anxiety that the output of sugar in the next season should be raised substantially. Otherwise, it would not be possible to meet fully internal demand and at the same time maintain exports at a fairly high level.

★★

Madras and Mysore States have developed in recent years into an important region for the production of components and parts for the automobile industry. While the recent boom in the capital market has been responsible for the promotion of ancillary industries in different parts of the country, in this part of the country many industrial units were even earlier in the process of being erected in collaboration with foreign interests. Without the investing public being asked to put up large sums, Madras City particularly has grown into an automobile centre though the bigger producers are operating from Bombay and Calcutta. Ashok Leyland which is an important producer of heavy trucks has been engaged in an expansion programme for some time past and with the promotion of a sister company, Ennor Foundries Limited, the indigenous content has been substantially increased. It is now felt that it would be necessary to increase continually production capacity as with a shortage of trucks and the strengthening of roads and bridges, there would be a larger demand for heavy duty trucks.

Standard Motor Products of India Limited has also been making efforts to double production of cars. The facilities for manufacturing certain types of components and parts have been increased latterly. But it is now felt that, in order to be able to raise the indigenous content appreciably and utilise more effectively the allocation of foreign exchange for import of components the manufacture of car bodies should be undertaken. Towards this end, the Directors of the company have proposed that an expenditure of about Rs. 85 lakhs

should be incurred on the installation of presses and press-tools. Efforts are being made to keep down capital expenditure by fabricating press-tools more advantageously within the country. The presses are expected to be imported and it is anticipated that, by the end of next year, it would be possible for the company to increase the indigenous content to about 90 per cent. When this target is reached it is felt that there would be scope for increasing substantially the output of cars besides achieving economies through the manufacture of car bodies.

In order to finance this expansion scheme, it is proposed to raise Rs. 25 lakhs by way of additional capital from the existing shareholders and specific proposals are expected to be made after getting the consent of the Controller of Capital Issues. There is naturally anxiety to keep down the paid-up equity capital because, on account of the rather unremunerative nature of car manufacture, attractive dividends cannot be paid. It is, however, emphasised that, after sometime, there would be improved profitability especially if the Government agree to the suggestion of the company to undertake the manufacture of one-ton trucks. This scheme has been under consideration for some years.

In order to find the balance of funds it is felt that there may be need to borrow from the Industrial Finance Corporation or other sources. While some part may be available from internal sources, the borrowing from outside agencies may be for about Rs. 50 lakhs.

Standard Motor Products has, however, done well during the year ended December 31, 1962 in spite of various handicaps. Till the close of the year, the output was running at a fairly high level and the net profit, before taxation and depreciation, has risen slightly to Rs. 31.37 lakhs from Rs. 29.07 lakhs in 1962. The provision for depreciation is the larger sum of Rs. 13.95 lakhs against Rs. 11.08 lakhs formerly and development rebate Rs. 5.25 lakhs against Rs. 2 lakhs. The charge on account of taxation is lower at Rs. 5.2 lakhs against Rs. 8.25 lakhs and there is no liability towards Super Profits Tax. The dividend on equity capital has, however, had to be reduced to 6 per cent, taxable, from 7 per cent, taxable, on account of the larger allocations towards depreciation and development rebate.

Ancillary Industries

The success of the various producers in raising the indigenous content to around 80 per cent is in great measure due to the sudden growth in the stature of various industries. While the automobile producers themselves are manufacturing some of the major items like engine blocks, gear boxes, axles and the like, the ancillary industries have been producing nearly the whole of the requirements of engine valves, spark plugs, truck wheels, dynamos, shock absorbers, springs and the like.

In Madras, one big group has been developing in a big way. The TVS group of enterprises have launched in an ambitious way on the manufacture of truck wheels, electrical equipment, air-brakes etc. Wheels India Limited which is collaborating with Dunlops can supply very nearly the whole of the country's requirements in terms of truck wheels while TVS-Lucas, which has already spent over Rs. 2½ crores on erecting a new factory, will be producing the whole range of electrical equipment for the automobile industry. A different unit is under construction for producing air brakes in collaboration with US interests. There is also a proposal under consideration of the Government for producing steering gears. It will be readily agreed that the developments in the automobile industry in the past three years have been truly

The moving finger writes

I think the devil put it in his mind.
In all arithmetic you couldn't find
Until today so tricky an equation.

Chaucer: *The Summoner's Tale*

THE PRIME Minister's statement on Mr. Justice Das's report on Mr. K. D. Malaviya's dealing with Serajuddin and Company was a clumsy exercise at eating one's cake and having it. It showed Mr. Nehru in an unusual light — as one lacking in courage, personal or political. If it is true, as he said, that he is not convinced that Mr. Malaviya has done anything which casts a reflection on his impartiality and integrity, the Prime Minister showed lack of personal courage in agreeing to throw a colleague to the wolves. If, on the other hand, as Mr. Nehru's grossly vague reference "to those high principles of Parliamentary government by which the office of a minister is governed" suggests, Mr. Justice Das's findings against Mr. Malaviya on two counts had left him with a feeling that the latter's conduct has been less than what is correct and proper in the case of a member of the Government, the Prime Minister's anxiety that the matter should end with the acceptance of the resignation of Mr. Malaviya shows that he lacks the political courage to countenance a complete and thorough inquiry, either judicial or Parliamentary, which might possibly unearth transactions of a nature likely to damage seriously the status and fortunes of the Congress Party.

In either case the Prime Minister's statement must produce the impression that he has merely tried to evade unpleasant, or possibly dangerous, issues. Incidentally, his repeated description of the Das findings as "prima facie conclusions" makes no sense at all since he, for reasons best known to him, is reluctant to order a further and full inquiry. "Prima facie", in any case, does not mean "insufficient", "provisional" or "tentative" as Mr. Nehru evidently wants the phrase to be taken to mean. All that "prima facie" amounts to is that sufficient ground exists for a further inquiry and that in all fairness this inquiry should be made.

If the Prime Minister's performance was pathetic, that of some members of the Opposition was positively repulsive. Mr. Dwivedi and Mr. Hem Barua apparently, fancied themselves in the role of a Hound of Heaven, but in reality they seemed and sounded like the Hound of the Baskervilles. I had not seen before such a naked exhibition of venom and vindictiveness and I have no desire to see another such again. It is clear that they were pursuing no principle but were only attempting to persecute a person.

In the result, Mr. Malaviya it was who came out best out of this sorry episode in the Lok Sabha last week. His explanation of the handicaps imposed on him by the procedure adopted by Mr. Justice Das was natural and restrained, his claim for his work as a Minister dignified and his assertion of innocence firm and clear. This is not to say that I am prepared to believe that Mr. Malaviya is as innocent as he claims to be, but I do certainly hold the view that, innocent or guilty, he has had no fair deal either from his prosecutors or from his Prime Minister, especially the latter. Well might Mr. Malaviya have asked to be saved from his saviour.

★★

After Mr. Nehru's admission, although grudging, of responsibility, even if partial, for the misadventure of the VOA deal, it is pointless to try to apportion blame among the Minister for Information and Broadcasting and the Secre-

taries of the two Ministries concerned. It is, of course, plain that there has been a degree of amateurishness and absent-mindedness about this piece of business at almost all levels, but it can hardly be denied that the prime responsibility was the Prime Minister's, he having been brought into the transaction at some point or another. I have heard it suggested in political circles here that the Prime Minister was perhaps not as unconscious of the implications of the Agreement when it was being negotiated as he would now like Parliament and the public to believe. What seems to have happened probably is that he is having second thoughts. The raucous support which the Agreement had received from certain sections of the Press and political opinion in this country, which are known to be opposed to non-alignment and all its works and the conclusion drawn widely by commentators abroad that the VOA deal should be taken as a point of departure from the foreign policy hitherto pursued by Mr. Nehru seem to have frightened the Prime Minister into wanting to retrace his steps.

★★

The IAC has been rightly criticized, I believe, for dropping Tiruchirapalli out of its flight schedules in the South. It is true that considerations of commercial profitability cannot be ignored, but then what becomes of the boast made at the time of nationalisation that the IAC would provide a national network of services more efficiently and economically than private airlines could ever hope to? It is not as if Tiruchirapalli can be regarded as an insignificant place of call. Even as it is, its importance as an urban centre in Tamilnad is next only to that of Coimbatore and Mathurai, apart from Madras itself.

I hope the decision to abolish the halt at Tiruchirapalli is only a temporary measure and that IAC will soon be able to restore the status quo ante. The point is that the only way to remedy a situation caused by insufficient traffic potential is to bring down the cost of air travel. It is obvious that if air freights are lower, more people will travel by plane. Unfortunately, air fares in this country have been going up and up with the result that marginal traffic is being continuously discouraged instead of being encouraged. Surely there must be some way of effecting economies in air transport operations. It will not do for the IAC to plead helplessness in this matter. Now, far be it for me to suggest that this country is in any way comparable to West Germany in economic circumstances, but it still leaves a bad taste in the mouth that the IAC should be so far away from developing internal transport services to the extent demanded in this vast country when Lufthansa has been able to operate a very successful air bus service between Frankfurt and Hamburg and is planning to convert its entire domestic services to the air bus system, where no check-in procedures are necessary and the fare is paid by the passenger while airborne.

★★

Finally, I cannot resist referring to the delicious episode of old King Ibn Saud and his corrupt Finance Minister who was caught in the act of uttering a false cheque. It appears that the King, who is being treated for stomach ulcers and is evidently in no mood to be played with, beat the errant minister with an ivory stick until it broke and, in breaking, restored its wielder to good humour. I wish Mr. Nehru could use an ivory stick rather than a Judge's report which he could neither discard nor disclose. It would so simplify matters for everybody.

V.B.

Trade Winds

SURPLUS STAPLE

THERE IS a large accumulation of staple fibre in the country with the indigenous producers as well as the Indian Cotton Mills Federation. The total value of stock-pile today is conservatively estimated at over Rs. 6 crores. The justification for importing staple fibre was that it could well take the place of the relatively costlier long-staple raw cotton which has also to be imported in sizable quantities. So far so good, but it is a pity that the Government of India has not been able to tackle the problem of surplus staple fibre so far.

To stimulate sales, the two indigenous producers have effected a cut in their price from Rs. 3.72 per kg. to Rs. 3.57 per kg. but the Government apparently seems to have done nothing. Failing to get any response from the authorities for their gesture, both the producers of staple fibre in the country have put forward a proposal to the powers-that-be that complete relief from excise duty be given to staple fibre when it is mixed with cotton. The two producers could have well pleaded for abolition of the excise duty on all staple fibre, but they have not done that. Obviously it means that even after the proposed exemption is given, excise duty will continue to be payable by those who convert staple fibre into yarn and use it as such. It means that the proposed abolition of duty will not cause any substantial loss to the exchequer. If the proposal is accepted by the Government, the textile mills in the country will find it economical to resort to staple fibre in place of raw cotton. If the textile mills have not been mixing staple fibre with cotton to any appreciable extent so far, at least part of the explanation is to be found in the uneconomical price of staple fibre by reason of its being loaded with heavy excise duty component. In case the authorities do not wake up in time, it is feared that there will not only be loss in quality especially of the imported stock, but there will also come about a curtailment in production capacity affecting in turn adversely the employment situation as such.

JUTE GOODS IN U.K.

A review of the policy regarding British imports of jute goods from India and Pakistan was recently made by the Board of Trade in the light of various developments including the breakdown of the negotiations for Britain's entry into the European Economic Community (under which certain arrangements for jute goods had been determined), the judgment of the Restrictive Practices Court, which found against the jute industry's uniform price agreements and representations from the Government of India and other interests. Following consultations with the jute industry changes in the arrangements for the import of jute goods from India and Pakistan into Britain were announced by the Board of Trade on August 13. They include a reduction in the mark-up on common hessians from 20 per cent to 10 per cent and the return of imports of heavy bags and sacking to private trade. It was made clear by the Minister of State in the Board of Trade (Mr. Green Allen) that the changes will continue to give a very substantial measure of protection which for a year will be very similar to that at present available for the vast bulk of goods which the industry produces. Below are given the details of the present and future arrangements, by broad categories, for imports from India and Pakistan.

Jute Goods Imports from India and Pakistan

"Category: Cloth and bags: (1) Heavy bags, common sacking and wool-packs.

Present treatment: imported by Jute Control and sold without mark-up.

New arrangements: being returned to private trade.

"(2) Common hessian cloth, mainly used for bag-making. Present treatment: sold by Jute Control with 20 per cent mark-up.

New arrangements: the mark-up reduced to 10 per cent with effect from August 16, 1963.

"(3) 'Equated' goods:

Present treatment: sold by Jute Control at "Dundee price" (i.e., based on prices charged for similar goods by the Dundee industry under the uniform price agreements now terminated).

New arrangements: Jute control to import and continue to sell with a variable mark-up for one year pending the outcome of the inquiry. If the inquiry produces no satisfactory alternative proposals after a year, a uniform percentage mark-up will be introduced.

"(4) 'Excluded' goods:

Present treatment: not imported.

New arrangements: cloth to be imported by the Jute Control, against specific orders, and sold for one year at a 50 per cent mark-up or the Dundee price, whichever is lower; the treatment of bags is one of the technical matters still subject to discussion. If the inquiry produces no satisfactory alternative proposal after a year, a uniform percentage mark-up will be introduced.

"Yarn:

Present treatment: Jute Control does not hold stocks, but imports against specific orders; no mark-up applied.

New arrangements: as at present."

RUMANIA'S ECONOMY

The Rumanian economy has made progress by leaps and bounds. In the first three years of the six-year Plan, Rumania's national income exceeded by over 30 per cent the 1959 level. The national income is now nearly 3.5 times bigger than in 1938. State investments in the first three years of the six-year Plan amounted to 82,000 million lei. Due to these investments, many new and modern industrial units were built and put into operation.

Steel output per capita amounted in 1962 to 130 kg. compared with 18.2 kg. in 1938. In the first three years of the six-year Plan the average annual rate of growth of production reached 15.7 per cent. The electric and thermal power output at the end of 1962 was 15 times bigger than in 1938. The Rumanian trade registered in 1962, a 282 per cent growth over 1950. An analysis of the statistical data reveals that per cent of the total volume of Rumanian foreign trade, and Latin American countries represent 32.1 per cent. The Soviet Union holds the top place in Rumania's foreign trade. Next are, according to the value of mutual deliveries, Czechoslovakia, land, Hungary, Britain, France, Austria, the UAR, Bulgaria, Switzerland and Syria. Trade with India has increased considerably. While exports from India to Rumania in 1956-57 were of the value of Rs. 22 lakhs, in 1962-63 they were of

In Factories, Hospitals, Schools, Public places...

PUT AN END TO THE DANGERS OF

SUDDEN DARKNESS

In factories sudden darkness can cause injury and damage to machinery. Emergency lighting is the obvious safeguard—and that's where Keepalite comes into its own. Keepalite is an automatic emergency lighting system employing lead-acid storage batteries which are automatically triggered into operation by the actu-

al mains failure. Modern methods of control and 'trickle' charging mean that Keepalite equipment has outstandingly long life and requires minimum of maintenance. That's why architects everywhere specify Keepalite as sure inexpensive protection for factories, hospitals, schools, banks and public places.

the value of Rs. 3.41 crores. Imports, on the other hand, in 1956-57 were of the value of Rs. 19 lakhs and in 1962-63 of the value of Rs. 3.83 crores.

TEA PRODUCTION

At the seventh annual general meeting of the Tea Association of India, Mr. S. R. Daga in his presidential address, dealt at length on problems of the tea industry and how an increase in production of tea could be brought about. According to him irrigation of tea plantations could play an effective part in raising the production of tea from the existing bushes. Since the industry was burdened with all sorts of taxes, he pleaded that the Assam Government should provide finance to the industry for sinking tube wells which could be utilized for irrigation purposes in the drought area. To increase the production considerably, it was also necessary that more area was brought under tea and simultaneously replanting and replacement were done at a higher rate. To enable the industry to do these, Mr. Daga suggested that some tax incentives should be provided by the Government. He urged that cost of replacement of tea areas on virgin land should be allowed to be charged to revenue expenditure, provided the uprooting was done either simultaneously or before the replacement. In the event of uprooting taking place subsequent to the date of replacement, the capitalised value of the uprooted tea areas should be allowed to be charged to revenue expenditure. In all the cases where the cost of the new extension was capitalised afresh, a new replantation rebate of 20 per cent of the capital cost should be granted, which might be more or less in the form of development rebate on plant and machinery.

Although the export duty on tea had been abolished, the Government had sought to make up the loss by levying additional surcharge on excise duty on tea. The excess duty being made non-refundable at the time of export, played its part in raising the cost of production. In order to reduce the cost of production, he stressed that no additional levy should be put on export teas. It was also necessary that the drawback of excise duty should be allowed. Mr. Daga also suggested that the Assam Government should reconsider their decision to increase the rates of agricultural income tax.

MACHINE TOOLS BLOCKED

At a press conference at Harihar (Mysore State), Mr. S. L. Kirloskar, President, Indian Machine Tool Manufacturers Association, stressed the fact that private machine tool manufacturers find it hard to attract capital because the industry requires a large initial investment on which substantial profitable returns are slow to accrue. The most frustrating handicap which the private sector had to face in its formative period was a conservative licensing policy coupled with delays in finalising foreign collaboration agreements and in obtaining import licences for capital goods and components. Even as late as January this year, no less than eight leading firms cancelled their machine tool projects. It is obvious that the manufacturers in question risked cancellation of their licences, because they found themselves in a blind alley as far as finance and import facilities were concerned. The private sector also suffered from a slow tempo of orders. At one time it was urged that the third Plan target of machine tool manufacture should be stepped up from Rs. 30 crores to Rs. 45 crores. But, as matters stand, it is hard to say whether the private sector will at all be able to lift its share of Rs. 15 crores even by the end of the third Plan.

ROURKELA EXPANSION

The expansion programme of Rourkela steel plant was inaugurated by Mr. C. Subramaniam, Union Minister for Steel and Heavy Industries on August 12. The programme will

cost Rs. 130 crores of which Rs. 56 crores is expected to be spent on plant equipment, civil works, erection and other auxiliary services. On completion in 1966, the programme will enable the steel project to produce 1.8 million tons of ingot steel a year. The financing of foreign exchange would be done largely from the additional credit of D.M. 400 million made available by the Federal Republic of Germany. The civil engineering work would provide temporary employment to 25,000 persons in various categories. The plant has 244 German, 15 Austrian and 15 American technicians helping the various departments.

MINIMUM PRICE FOR SUGAR

The Deputy Minister of Food, Mr. A. M. Thomas, announced in the Lok Sabha that the Government has decided to relate the minimum price of Rs. 1.62 per maund of sugar cane to a sugar recovery of 9.4 per cent during the ensuing season 1963-64 instead of relating it to a recovery of 9.8 per cent as in the season 1962-63. This would mean a general increase of 6 nP. per maund in the sugar cane price. He said that prices were fixed factory-wise and that the incidence of increase in each factory would depend on its recovery of sugar. The minimum prices of sugar cane payable by individual factories was being worked out and would be notified well before the start of the crushing season.

LEIPZIG TRADE FAIR

During the first week of September, the city of Leipzig in East Germany will play host to business executives from all over the world coming to attend its autumn Fair at which as many as 50 countries are likely to be represented. It has added importance for the Indian Union in view of India's growing trade with the G.D.R. The total volume of India's trade in 1958 was around Rs. 7.6 crores and it rose to Rs. 22.5 crores in 1962. According to present indications, the total turnover in 1963 is likely to be about Rs. 26 crores. Within the span of five years India's total trade with the G.D.R. has, thus, multiplied almost four times.

A salient feature of India's trade with the G.D.R. is that there is no balance of trade problem. A minor balance of payments problem continues because the G.D.R. is slow in picking and choosing the commodities and goods which it would like to buy from the Indian Union in exchange for machinery and other products supplied. The most important commodities which have been exported to the G.D.R. in recent years are tea, coffee, pepper, cardamom, iron-ore, mica and cashewnuts. Large quantities of tobacco have also been exported. Cotton fabrics for shirts and bed-sheets, jute for packaging material and handicrafts from India are popular in the G.D.R.

The only countries from the Communist bloc which are not participating in this Fair are China (Mainland) and Albania.

LAUSANNE AUTUMN FAIR

The Forty-fourth Lausanne National Autumn Fair will be held this year from September 7 to September 22. It will be a general fair divided into 38 different sectors, with the main emphasis on consumer goods. It will also include a number of specialised displays of agricultural machinery, building, and arts and crafts, as well as the salons of watch-making and elegance. Each year, the Lausanne National Autumn Fair invites a foreign country to participate as its guest of honour. This year it will be Japan's term to present an official exhibition within the framework of the 44th Lausanne National Fair.

Company Affairs

ASIATIC OXYGEN

LAST WEEK foundation stones were laid for two factories, one at Hyderabad and the other at Madras, for the manufacture of industrial gases. The factories will be set up by the Asiatic Oxygen Ltd. of Calcutta. Mr. B. L. Jalan, Chairman of the company, stated at these ceremonies that the company had secured collaboration of international manufacturers of industrial gases such as the Air Products and Chemicals Inc., M & T Chemicals Inc., K. G. M. Equipment Co. and Westinghouse Electric International Co. Mr. Jalan also said that the company had a programme to set up six gas factories throughout the country. There was another programme to set up three factories for the production of electrodes, welding and cutting equipment and welding transformers. The factories at Hyderabad and Madras will produce, in addition to the gases, the essential accessories and other requirements of the gas industry such as welding and cutting equipment, electrodes and welding transformers.

KESORAM

The working results of Kesoram Industries and Cotton Mills Ltd., for the year ended March 31, 1963 make cheerful reading. The gross profits rose to Rs. 201.01 lakhs as against Rs. 182.82 lakhs in the preceding year. After providing for depreciation and taxation, the net profit amounted to Rs. 99.12 lakhs compared to Rs. 64.74 lakhs in the last year. The provision for taxation for the year under review was lower at Rs. 8 lakhs in relation to the allocation of Rs. 36 lakhs last year. The provision for depreciation was, however, raised to Rs. 82.49 lakhs from Rs. 69.43 lakhs. "Development Rebate Reserve" was also raised from Rs. 13.38 lakhs to Rs. 39.21 lakhs. After making a few other marginal adjustments, the available balance was Rs. 62.27 lakhs (Rs. 53.80 lakhs last year). The Directors proposed a transfer of Rs. 22 lakhs to General Reserve and Rs. 40 lakhs to Dividend Reserve, leaving a balance of Rs. 26,969 to be carried forward to next year. A taxable dividend of 13 per cent on the Ordinary Shares (and also a proportionate dividend on the Ordinary Shares pending allotment) has been recommended by the directors. This as well as the dividends on both classes of Preference Shares were proposed to be paid out of the Dividend Reserve. It may be recalled that last year a taxable dividend of 12 per cent was paid.

MINERVA MILLS

The audited accounts for the year ended December 31, 1962, of the Minerva Mills Ltd., showed a gross profit of Rs. 9,28,397. The provisions for depreciation and development rebate were Rs. 4,45,255 and Rs. 1,36,572 respectively. The net profit after various other allocations, came to Rs. 1,95,677. Credit was taken of over-provision for depreciation during the period 1957 to 1961 amounting to Rs. 2,65,630. The Cumulative Preference shares of Rs. 100 each are proposed to be paid a dividend for the year 1962 at 9½ per cent (subject to deduction of tax) absorbing Rs. 31,027. On the equity shares of Rs. 100 each, a dividend of Rs. 3.50 per share (less tax) is proposed, absorbing Rs. 1,03,590. The directors have drawn attention to the high prices of Indian cotton which ruled throughout the accounting period under review owing to failure of the cotton crop all over the country; the prices of yarn and cloth remained stationary under the voluntary price control scheme undertaken by the cotton industry which reduced the profit margins. At the same time, the compulsory export obligation scheme which was introduced in July, 1962, also had an un-

favourable impact on realisation in respect of cloth sold abroad.

NUDEA MILLS

The gross profits of the Nudea Mills Company Ltd., (Managing Agents: Macneill & Barry Ltd.) for the year ended March 31, 1963, at Rs. 47.74 lakhs showed a marked increase over the preceding year's level of Rs. 12.25 lakhs. This was made possible by the resumption of 48-hour week from the commencement of the year under review. Adequate supplies of raw jute were available throughout the year and the demand from the world consuming centres was appreciably strong. After providing Rs. 8.49 lakhs for depreciation, the net profit for the year was Rs. 39.25 lakhs as against Rs. 3.53 lakhs in the preceding year. Development Rebate Reserve at Rs. 4.93 lakhs and Provision for Taxation at Rs. 17.90 lakhs have been allocated. A sum of Rs. 3.65 lakhs has been transferred from the Development Rebate Reserve while additions have been made of Rs. 38,375 being "Reserve for Doubtful Debts no longer required" and of Rs. 18,442 being the "Adjustments on account of previous years". With the carry-forward of Rs. 65,041, the total amount available for disposal was Rs. 21.29 lakhs. The directors have recommended dividend of Rs. 5 per share (or 10 per cent per annum) absorbing Rs. 6.68 lakhs. The transfer to "General Reserve" was Rs. 7.25 lakhs. "Reserve for Building Replacement" was Rs. 6.73 lakhs. A sum of Rs. 50,000 was transferred to "Investment Depreciation Reserve" leaving a credit balance of Rs. 13,111 which the directors have recommended to be carried forward.

GOURPORE

The working results of the Gourpore Company Ltd., (Managing Agents: Macneill & Barry Ltd.), for the year ended March 31, 1962 showed a steep rise in gross profits to Rs. 88.24 lakhs as against Rs. 24.15 lakhs in the last year. Taking into account "Reserve for Doubtful Debts" at Rs.

Individual well-being is linked with national prosperity and only planned efforts can ensure both in the shortest possible time. And planning, for its success, largely depends on savings, individual as well as national. Saving in the form of Bank Deposits provides resources for the National Plan.

SAVE FOR NATIONAL DEFENCE

IN ASSOCIATION WITH B.O.A.C. AND QANTAS

14,625 and "Adjustment on account of previous years" at Rs. 60,919, the gross profits rose to Rs. 88.99 lakhs. Deductions made were: "Depreciation for the year" at Rs. 14.75 lakhs, "Provision for Taxation" at Rs. 47.10 lakhs and "Development Rebate Reserve" at Rs. 4.83 lakhs. Adding a sum of Rs. 49,518 as "amount brought forward", the net profit available for disposal was Rs. 22.81 lakhs out of which, according to the recommendations of the directors, dividend on preference shares at the rate of 8.75 per cent per annum will absorb Rs. 2.32 lakhs and dividend on ordinary shares at 20 per cent per annum will utilize Rs. 9.60 lakhs. Transfer to various reserves were recommended as follows: "Reserve for Doubtful Debts" at Rs. 10,063, "Investment Depreciation Reserve" at Rs. 4.50 lakhs and "General Reserve" at Rs. 6.00 lakhs. The balance of Rs. 28,659 was recommended to be carried forward.

UNIVERSAL ELECTRICALS

The working results for the year ended March 31, 1963, showed a net deficit of Rs. 25,840 (which is proposed to be carried forward) after transferring Rs. 202,950 to "Expenses during Construction Period" Account and providing Rs. 15,230 for depreciation.

The construction of the House Service Meters factory was completed early this year and the factory went into production in May 1963. The initial teething troubles, according to the directors, have been overcome and it is anticipated that the rated capacity of the plant would be achieved soon. A heartening feature of the performance of the unit is that the quality of the meters produced has been found to be satisfactory both by the company's own tests and by the reports of the Government's Test House. Valuable assistance and co-operation was received from the collaborators, Messrs. Mitsubishi Electric Corporation, in the completion of the project.

SANKEY WHEELS

Six lakh shares of Rs. 10 each are being offered by Sankey Wheels Ltd., for public subscription. The subscription list will open on August 26 and close on September 9 but not before August 28. The entire public issue has been underwritten—Rs. 40 lakhs by the ICICI and the balance of Rs. 20 lakhs by two stock brokers. While the authorised capital is Rs. 2.50 crores, the subscribed and paid-up capital is Rs. 1.10 crores, distributed as under: Rs. 38.50 lakhs held by Joseph Sankey and Sons Ltd., of England, a promoter and technical collaborator in this project, Rs. 38.20 lakhs held by Guest Keen Williams Ltd., of Calcutta, a promoter, Rs. 10 lakhs held by the Commonwealth Development Finance Corporation, of London, Rs. 21.60 lakhs held by Mr. Sant Singh Sahney, a promoter and Rs. 1.70 lakhs by other directors and friends.

All types of wheels will be manufactured by the company at Durgapur. The manufacture of truck wheels is being undertaken with a new plant largely imported for the purpose, the foreign exchange for which is provided by the CDFC. Production is expected to start in the middle of 1964. The manufacture of car wheels will be carried out with the plant transferred to GKW. It is proposed to move this plant to Durgapur soon after the commencement of production of truck wheels, but pending this, the plant has been hired to GKW, which has agreed to manufacture and sell to the company its entire production of wheels. There is no other licensee for the manufacture of car wheels in India except GKW and there is only one other unit in this country which has been licensed for the manufacture of truck wheels.

MUKUND IRON

A substantial increase in sales from Rs. 4.73 crores to Rs. 6.46 crores has been reported by Mukund Iron and Steel Works Ltd., for the year ended March 1963. The gross profit

has also increased from Rs. 61.43 lakhs to Rs. 67 lakhs. After providing Rs. 15.25 lakhs for depreciation, Rs. 4.25 lakhs for development rebate reserve and Rs. 29.75 lakhs for taxation, the net profit was Rs. 17.48 lakhs. Taking credit of "provision for gratuity written back" at Rs. 8 lakhs, "tax refund" at Rs. 3.33 lakhs and "excess provision written back" at Rs. 1.47 lakhs, the surplus available was Rs. 30.84 lakhs out of which Rs. 15.30 lakhs are proposed to be transferred to general reserve and Rs. 15 lakhs to dividend reserve. The proposed dividend, maintained at the last year's level, at Rs. 1.20 a share (subject to tax) and the dividend on the deferred shares will absorb Rs. 14.01 lakhs.

KARANPURA COLLIERIES

The Karanpura Collieries Ltd., (Secretaries & Treasurers: Bird & Co. Private Ltd.) have not published their audited accounts for the year ended February 28, 1963 because of the prohibition under Rule 52 of the Defence of India Rules, 1962. The directors have recommended dividend on ordinary shares at the rate of 10 per cent per annum (subject to deduction of tax) and, in the case of the 5½ per cent Cumulative Preference Shares, a dividend of 4.579 per cent per annum (subject to deduction of tax) in accordance with the provisions of the Preference Shares (Regulation of Dividends) Act, 1960.

CAPITAL ISSUES

The Controller of Capital Issues has authorised five capital issues aggregating Rs. 1.68 crores. Only two of them are from new companies. Three companies will offer their shares for public subscription by prospectus. One company will issue part of its shares to its foreign collaborator. The consent is valid for 12 months in all cases.

Sri Ramakrishna Steel Industries Limited, Coimbatore, a new company incorporated in the State of Madras, has been

The Truth about Man-Made Fibres...III

How Man-Made Fibres Will Help CLOTHE 117 MILLION EXTRA PEOPLE In The Next 10 Years

AN ALARMING population explosion! India's population is estimated to spiral upward to 555 million in the next decade. Already the demand for textiles far exceeds the country's production. How then, will 117 million extra people be clothed? Improved standards of living make this problem even more acute as more people will be requiring better fabrics every year.

The Problem With Natural Fibres

If these extra textile requirements are to be met by cotton alone, 2000 million more yards of cotton fabrics will have to be produced! This creates an impossible dilemma...for by increasing its production of cotton the country will have to sacrifice arable land, desperately needed for growing more food. Alternatively, we will have to forfeit valuable foreign exchange to buy fibres from abroad. Today we are already in the grip of an acute fibre shortage. A decade from now our planners may be confronted with critical problem.

Man-Made Fibres The Answer

Man-made fibres like rayon and nylon are both a substitute and a blend for cotton. The raw materials required for them comes from petro-chemicals, coal, oil and trees on mountain slopes—not from land needed for food crops. Man-made fibres can thus meet the country's textile requirements without affecting the nation's food production.

Compared to other fibres very little foreign exchange will be needed for the production of man-made fibres. India has already imported cotton and other fibres worth nearly 250 crores in the past three years. A fifth of the sum will exceed the capital costs needed by the man-made fibre industry to expand and fulfil India's entire textile needs. The recurring costs will also be nominal, declining with India's increasing self-sufficiency in wood pulp, sulphur and chemicals.

Food and clothing are both basic needs and one cannot be sacrificed to achieve self-sufficiency in the other. By increasing the production of rayon and allied man-made fibres the problem can be

satisfactorily solved—and valuable foreign exchange conserved. What is now needed is an objective and far-sighted policy by the Government to encourage more production of man-made fibres.

Man-Made Fibres Serve India's Vital Needs

The Association of Man-Made Fibre Industry, Resham Bhavan, Vir Nariman Road, Bombay 1

given consent to issue capital of Rs. 50 lakhs. It is divided into 50,000 equity shares of Rs. 100 each to be issued for cash at par. This is inclusive of 1,172 shares already subscribed by the signatories to the memorandum of association. Out of these, such number of shares as would enable the company's scrip to be listed on a recognised stock exchange will be offered for public subscription by prospectus. The money will be used for establishing a new undertaking to be located in and around Coimbatore for the manufacture of 4,800 tons of steel castings per annum.

Borax Morarji Limited, Bombay, a new company, will issue capital of Rs. 30 lakhs divided into 60,000 equity shares of Rs. 50 each for cash at par. Out of this, shares of the value of Rs. 13.50 lakhs will be offered for subscription to Borax (Holdings) Limited, London, and Rs. 7.50 lakhs to Dharamsi Chemical Company Limited. The balance of Rs. 9 lakhs is to be issued to the public by prospectus. The capital will be used for the manufacture of borax and boric acid.

Simon Carves India Limited, Calcutta, a subsidiary company of Simon Carves Limited, UK, is to issue capital of Rs. 60 lakhs divided into 60,000 equity shares of Rs. 10 each. Of this, shares of the value of at least Rs. 24 lakhs will be offered for public subscription by prospectus for cash at par. The balance of Rs. 36 lakhs will be issued to the foreign collaborator partly for cash and partly for consideration other than cash. The capital will be used for taking over a part of the assets of the Indian branch of the British company.

Bajaj Electricals Limited will issue additional capital of Rs. 27.50 lakhs in equity shares of Rs. 100 each to be issued for cash at par. The money will be used in providing working capital for the company and also investing in Matchwell Electricals Limited.

LICENCES ISSUED

The following licences have been granted under the Industries (Development and Regulation) Act, 1951, during the week ending 10 August, 1963.

The list contains the names and the addresses of the licensees, articles of manufacture and annual installed capacity.

ELECTRICAL EQUIPMENT

M/s. National Electrical Industries Ltd., Industrial Estate, Lalbaug, Bombay-12 (Maharashtra) — Power and distribution transformers 5,000 to 15,000 KVA and voltage ranges up to rating 132 KV. 2,40,000 KVA per annum.

AUTOMOBILES

M/s. Ghatge Patil Industries Private Ltd., Rajaram Road, Kolhapur, Urchagaon, Distt. Kolhapur, (Maharashtra) — Clutches and power-take-offs for heavy duty engine, 1,500 Nos. per annum.

MACHINE TOOLS

M/s. Bengal Enamel Works Ltd., 60/2, Dharamtala Street, Calcutta-13, (Titagarh (Noapara) 24, Parganas-West Bengal) — Industrial furnaces Rs. 50 lakhs worth per annum.

EARTH MOVING MACHINERY

M/s. Garden Reach Workshops Ltd., 43/46, Garden Reach Road, Calcutta-24 (West Bengal) — 8-10 ton diesel engine driven road roller 120 Nos. per annum.

SMALL TOOLS

M/s. The Indian Tool Manufacturers Ltd., 101, Sion Road, Sion, Bombay-22 (Maharashtra) — Carbide tipped tools 1,80,000 Nos. per annum.

DRUGS AND PHARMACEUTICALS

M/s. Alembic Chemical Works Co. Ltd., Alembic Road, Industrial Area, Baroda-3 (Gujarat) — Inhaler for 5,00,000

units — Hompro first aid spray for 1,50,000 bottles of 50 ml. each — Glare lotion (mild antiseptic) for 50,000 bottles of 100 ml. each — Antiseptic shaving cream for 2,00,000 tubes of 75 gm. — Glare liquid (for scalp hygiene) for 25,000 bottles of 200 ml. — Antiseptic dentifrice for 5,00,000 tubes of 100 gm. — Glare cream (for scalp hygiene) for 25,000 bottles of 200 ml. each.

CHANGES IN NAMES

(During the week ended August 10, 1963)

From M/s. Zwick UC I Testing Machines (India) Ltd. or Zwick Bharat Testing Machines Ltd., Bombay to M/s. Bharat Zwick Testing Machines Private Ltd., Bombay. From M/s. Modi Vanaspati Manufacturing Co., Modinagar to M/s. Modi Gas and Chemicals, Modinagar. From M/s. The Vishnu Pratap Sugar Works (P) Ltd., P.O. Rajabazar, Khadda, Distt. Deoria (U.P.) to the new owners: 1. Rani Rebati Devi, 2. Kr. Ram Pratap Narain Singh.

LICENCES REVOKED

(During the week ended August 10, 1963)

The Ways of Small Industry

Small-Scale Industries of Mysore: National Council of Applied Economic Research, New Delhi; Pages 215; Price Rs. 12.50.

THIS STUDY undertaken for the Mysore Government covers a field where ignorance of factual details has probably been as much responsible as mere apathy for the traditional stagnation. The modest entrepreneur is, in effect, every body's poor cousin There is, in fact, a big gap between the loud profession of concern for small industry and the difficult conditions of birth and survival in this field where costs are exorbitant and earnings uncertain. It is to be hoped that the details relating to the terms on which trading capital is available for the small-scale sector as well as the recommendations regarding future development (growth possibilities) will attract the Government's attention.

The study was undertaken after a survey of about 150 small industries covering 19 districts, and makes original suggestions on how to turn small-scale industry into productive and value-yielding enterprise. The chapter entitled "Development pattern and policy", apart from the novelty of its methodology for economists, will be useful as a guide of action to practical statesmen.

MODERN MANAGEMENT PRACTICE

Fundamentals of Business Organisation: By Y. K. Bhushan; Saitan Chand & Sons, Delhi; 1963; Pp. 756; Rs. 13.00.

WITH THE character of business organisation getting inevitably complex, business practice calls for a far more systematic and specialised training than a mere reliance on inborn business acumen and it is to this end that Mr. Y. K. Bhushan's book appears to be a valuable addition to the literature on

the subject. Aspects of management such as production control, budgetary and cost control, marketing, personnel management etc. have been dealt with in a lucid manner. The author's analysis is generally acceptable, but not always. For example, in the chapter 'Industrial and Corporation Finance', the author says that it is a sign of over-capitalisation when a company does not earn sufficient profits to pay interest and dividend at "proper" rates. This view may not be fully subscribed to, as it is known that much of the financial results depends upon the uninterrupted working of the company which again may depend on factors such as the availability of power, transport, raw materials and imported components, changes in fiscal policies, price levels at home and abroad and the state of industrial relations. Similarly, the view that under-capitalisation is the reverse of over-capitalisation but "also leads to low dividends and low quotations at the stock exchange" does not seem to be wholly true. After all, business activity is in essence a part of the economy in general and it would be wrong to hold otherwise.

PROGRESS DOCUMENTED

Industrial March, 1963: A Kirloskar Publication; Edited by M. S. Kirloskar, Poona-2.

THE ANNUAL number of 'Industrial March', which is incidentally its May issue, is a useful documentation of the industrial progress of the country and of the various problems of production which press for solution in view of the emergency. A special feature relates to a symposium "Is foreign collaboration helpful?", sponsored by this periodical and attended by Mr. G. L. Mehta, Mr. B. D. Sonani and Dr. R. J. Rathni among others. Among contributors to this issue are Mr. Bharat Ram, Prof. M. S. Thacker, Prof. M. P. Gandhi, Dr. S. K. Muranjan and Mr. F. S. Antia

Readers' Roundtable

HIGH FENCE AND OLD HORSE

Sir,—“You can't jump high fences on an old horse.” Mr. Khrushchev quoted this folk-saying at the 22nd Congress of the Communist Party criticising various aspects of Soviet planning. Our country has been subjected by the Planning Commission to the comprehensive centralised planning of the Soviet model since 1956, with results which are apparent — rising prices, economic stagnation and frustration of productive economic activity by administrative controls, the latest protest against which is from the Union Minister for Steel and Heavy Industries.

A recent study of the economies of Russia, Poland and Yugoslavia by the Institute of Economic Affairs, London, published under the title "Communist Economy Under Change", shows that the discipline of the free market is gradually substituting centralised comprehensive planning in those countries. There is relaxation of central planners' grip over the economy, introduction of incentives and more attention to consumer goods and agriculture. The inexorable laws of economics have driven even Communist countries to relax their doctrinaire planning. Should India persist in this error?

"ARISTIDES"

CHIT FUNDS IN THE CAPITAL

Sir,—With regard to the item which appeared on page 125 of the issue of your journal dated July 19, regarding the operation of Chit Funds in Delhi, I would like to mention that the Madras Chit Fund Act, 1961 has been extended to the Union Territory of Delhi vide Government of India, Ministry of Home Affairs, Notification No. 1311 dated September 26, 1962. It is understood that the Delhi Administration authorities have taken in hand the framing of the necessary regulations in this connection and that the operation of the Act is likely to be enforced in Delhi very soon. Mr. S. P. Bansal, an officer belonging to the Sales Tax Department of the Delhi Administration has been appointed as Registrar of Chit Funds, Delhi.

I shall be grateful if the present position is brought to the notice of the readers of your journal.

S. K. BHATTACHARYYA,
Registrar of Companies, Delhi.

New Delhi

COMPANY MEETING

THE SOUTH MADRAS ELECTRIC SUPPLY CORPORATION LTD.
Tiruchirapalli

Address delivered by Sri K. A. P. Vishvanatham, Chairman, at the 23rd Annual General Meeting of the company held on 9th August, 1963.

I have great pleasure in welcoming you to this Twenty-third Annual General Meeting of the Company.

Under the Defence of India Rules, which have been promulgated under the present National Emergency, your Directors were enjoined not to publish the Balance Sheet and any other accounts of the Company, nor reveal statistical data as to the activities of the Company. Hence these documents, on which we usually have such lively and illuminating discussions from all of you, have not been published and circulated to you. Opportunity was, however, given to such of the shareholders as desired to do so, to see the accounts of the Company at the office. This was done with the distinct expectation that the information will be deemed by them to be confidential.

You have now my assurance that the Company's affairs as to its various phases like construction, expansion of rural electrification, prudent management of its revenues and expenditure, have all been carried out diligently and with care; this has reflected in the dividend we have been able to declare which you will observe is higher than what it was last year. In addition, I would also like to say we have given supply to ten more villages than we did last year; there has also been a substantial increase in revenue. I trust this will give you satisfaction.

I am confident that in the years to come this rate of progress will be maintained and I also hope that our National Emergency will soon be over and that we will again be free to discuss with you more fully the affairs of the Company at similar future meetings.

The Company's staff have been working loyally and there has been great cordiality in the labour-management relationship. Your Managing Agents were able to successfully negotiate and conclude a further 3-year agreement commencing with 1st April, 1962 giving substantial benefits to all grades of staff and I am sure this has been appreciated by labour and earned their general satisfaction.

You will notice that amongst the retiring Directors are Messrs. V. Ramaiah who has been the Vice-Chairman of the Company and Sri G. Sreenivasulu Chetty. Both these gentlemen, having attained the age of 65 offered not to seek re-election after retirement this year, in accordance with the conventions set up by us in the Board and in fulfilment of the promise that the strength of the Board shall be reduced to ten elected Directors. I have however requested that Sri V. Ramaiah should seek election and be a colleague on the Board, as he is an eminent engineer, very fit in spite of his being 65 years old and his services are invaluable to the Board. I am sure you will all heartily support this suggestion of mine.

Sri G. Sreenivasulu Chetty, as a Director of over five years standing has been extremely helpful to me in the discharge of my duties. On behalf of you and on behalf of myself and my colleagues on the Board, as well as of the Managing Agents, I wish to tender to him my sincere and heartfelt thanks.

Though he has retired from his directorate, I am confident he will continue to take an abiding interest in the affairs of the Company.

This year again we had a few anxious days due to acute water shortage in the hydro-electric reservoirs, and power position became critical during the month of June and part of July. Though the cut has been now removed, I regret to say that the position is still unsatisfactory. Let us hope that, soon, this state of affairs will improve.

As a consequence of power shortage on the one hand and increasing operational costs all round, your Company was perforce compelled to make some slight increases in tariffs to meet the unforeseen added expenditure.

The Company received a peculiar request from some shareholders; it was a petition to table a resolution before you, to pay, retrospectively, from the beginning of times, increased gratuity benefits to all retired staff on the basis of some very recently agreed formula. While the Directors were clear in their mind that such a decision is outside the scope of their powers or of the General Body as the proposal has nothing to do with either the accounts or day-to-day administration of the Company, they still sought legal opinion and were advised that the proposal was ultra vires and should not be placed before the General Body. I am sure you will appreciate the position.

I referred earlier to the National Emergency in the country on account of the threat of a Chinese invasion. There was a lull in the minds of people for sometime, but we are again hearing of the massing of troops by the Chinese on the borders, giving rise once again to feelings of perturbation all over the country.

It is a matter of gratification, that people all over the country are alive to this threat and have the single minded resolve to fight aggression of any time and at any cost. It is also heartening that all over the World there is sympathy and support for us. All the members of staff of this Company have subscribed voluntary contribution to defence funds, and the Company has offered its unqualified support with its resources of every kind to fight this threat to our Nation, apart from a cash contribution to the above fund of Rs. 32,500. I join you all in my sincere prayers to the Almighty that we are soon out of this grave situation and that we will be free to carry on our peaceful avocations as usual. I am very happy to inform you that a number of our staff are in Defence services and quite a large number are active members of the Home Guard teams. I convey to them my good wishes and yours.

With the request that the discussions do not relate to any aspect of the Company which will conflict with the principles of discretion laid down by the Defence Rules, I now request your kind comments, before we adopt the various resolutions relating to dividends, elections, etc.

NOTE: This does not purport to be a record of the proceedings of the Annual General Meeting.

RECORDS AND STATISTICS

Company Finances: 1961-62

A STUDY of the finances of large and medium-sized public limited companies during the period July 1961 to June 1962 has been published by the Reserve Bank of India in its June 1963 issue. The analysis is based on the financial results of 1333 companies, (as compared with 1001 companies in the previous years) which accounted for 87 per cent of the paid-up capital of all the companies in the corporate sector. Like the previous ones, the present survey does not include banking, insurance and investment companies, Government companies, non-profit companies and associations, and companies limited by guarantee.

Rates of Growth: The working results of the 1333 companies during the year under review disclose a fall in the rate of growth of total income, sales, profits and capital formation as compared with the growth rates observed in the case of 1001 companies in 1960-61 (Vide Table I). The comparatively smaller rise in agricultural production, bottlenecks in coal, power and transport, the continued import restrictions and under-utilisation of capacity in most of the industries accounted, by and large, for the slow-down in the rate of progress of the companies in 1961-62.

The smaller turnover nearly halved the rate of growth in profits. It fell steeply from 14.8 per cent in 1960-61 to 7.4 per cent in 1961-62. With the enhancement of the rate of Corporation Tax from 45 per cent to 50 per cent the pro-

vision for taxation was much higher (21.3 per cent) and as a percentage of profits before tax it increased substantially from 38 in 1960-61 to 43 in 1961-62. The higher allocation for taxes resulted in a fall in the profits after tax for the first time in three years.

Distributed profits however increased by 3.6 per cent. This was partly as a consequence of the rise of Rs. 38 crores in paid-up capital. Consequently the retained profits recorded a substantial fall of 8.6 per cent in 1961-62 as against a rise of 13.6 per cent in 1960-61.

The combined income and expenditure account of the 1333 companies is summed up in Table II. Sales which constituted the main income of the companies improved by Rs. 260 crores to Rs. 2831 crores in 1961-62. Appreciable rise in sales was recorded in cotton textiles, jute, sugar, chemicals, iron and steel and trading and they accounted for three-fourths of the aggregate rise. Among the individual industries, the cotton textile industry contributed the largest increase of Rs. 70 crores in sales.

The higher income of the companies was accompanied by a corresponding rise in manufacturing expenses. Raw materials consumed and "other manufacturing expenses" which claimed the bulk of the expenses increased by 7.5 per cent to Rs. 1623 crores. The rise in manufacturing expenses was shared by most of the industries. In contrast, declines in

TABLE I.
GROWTH OF THE CORPORATE SECTOR

Item	1960-61 (1,001 Companies)	1961-62 (1,333 Companies)

17. Total ..	2,981,78	3,280,97
INCOME		
18. Sales ..	2,571,27	2,830,99
19. Other income ..	31,40	34,96
20. Closing stock of finished goods and work-in-progress ..	379,11	415,02
Total ..	2,981,78	3,280,97

manufacturing expenses was recorded by aluminium, mineral oils and transport equipment industries. Salaries and wages, too, increased during the year under review; they went up substantially by Rs. 28.91 crores to Rs. 415.53 crores.

Profitability Ratios

Profitability ratios, industry-wise, are presented in Table IV. They indicate a set-back in the profitability of the companies in a majority of the industries. Sugar, plantations, jute textiles, chemicals and most of the engineering industries recorded declines in the ratio of gross profits to

sales and in the ratio of gross profits to total capital employed. In contrast, the profitability ratios were improved in the case of mineral oils, cotton textiles and transport equipment.

An analysis of the pattern of profit allocations, is given in Table III. The ratio of tax provision to profits before tax, which increased moderately from 36.6 per cent in 1959-60 to 38.4 per cent in 1960-61, shot up to 43.4 per cent in 1961-62. The larger tax provision resulted in a fall in distributable profits. Consequently the retained profits and dividends as a percentage of profits before tax declined from 24.2 and 37.3 in 1960-61 to 20.6 and 36.0 in 1961-62 respectively.

Performance of Indian Railways: April-June 1963

THE FOLLOWING statement compares approximate gross earnings for June, 1963, with both approximates and actuals for June, 1962.

(Rs. crores)			
Earnings	Approximates June, 1962	Actuals June, 1962	Approximates June, 1963
Passenger	15.12	15.41	17.24
Other coaching	2.45	2.31	2.75
Goods	25.49	23.69	30.25
Others	0.83	1.14	0.91
Total	43.89	42.55	51.15

The position of cumulatives to end of June, 1963, compared with the corresponding period of the last year is as follows:

Earnings	April-June, 1962-63 (Actuals)	April-June, 1963-64 (Approximates)
Passenger	45.18	51.58
Other coaching	7.07	8.00
Goods	76.26	91.74
Others	2.41	2.61
Total	1,30.92	1,53.03

Wagon Loadings (excluding ballast and other railway materials loaded in departmental wagons):—During the month the number of wagons loaded with goods traffic increased by 12.2 per cent on the Broad Gauge and by 1.30 per cent on the Metre Gauge as compared with June, 1962. From 1 April to 30 June, 1963, the number of wagons loaded increased by 12.6 per cent on the Broad Gauge but decreased by 2.30 per cent on the Metre Gauge as compared with the corresponding period of the previous year.

The details of wagons loaded (originating and transshipment) during the month of June, 1963, as compared with June 1962 and the cumulatives to end of June 1963 as compared with the corresponding period of last year are given below:

(In terms of 4-wheelers)			
	June 1962	June 1963	% change of (2) over (1)
	(1)	(2)	(3)
Broad Gauge	529,675	594,244	+12.2
Metre Gauge	279,430	283,054	+ 1.3
	1962-63	1963-64	% change of (2) over (1)
Broad Gauge	1,632,295	1,837,591	+12.6
Metre Gauge	900,016	879,274	- 2.3

How Poor Are the Poor?

ONE OF THE principal issues in debate when Acharya Kripalani's motion of "no confidence" in the Council of Ministers at the Centre was recently discussed in the Lok Sabha, was whether the three five-year Plans had succeeded in improving the living conditions of the mass of the people. Most of the leading speakers from the Opposition benches made it one of their main charges that the policies and programmes of economic and social development pursued by the Government in the last 15 years had not only not reduced mass poverty but had accentuated it. Acharya Kripalani, Mr. M. R. Masani, the three musketeers (one of them a woman) of the Communist group, and last but not least, Dr. Ram Manohar Lohia, all attempted to maintain, on differing grounds, the charge that the poor had become poorer.

That, of course, was nonsense and the grossest part of the nonsense, surely, was Dr. Lohia's noisy contention that 270 million people were earning per capita no more than three annas a day. This assertion is, on the point of it, so fantastic that we would ordinarily not have troubled to discuss it here. If, however, we proceed to do so it is for two reasons. In the first place the Prime Minister was so ill-served in his briefing that he could not clearly and promptly rebut Dr. Lohia's statistics. Secondly, thanks to the boom which Dr. Lohia's antics (we would not call them politics) currently enjoy in certain sections of the Press, two of our national newspapers seem to have been taken in by this bluff.

The Hindustan Times wrote on August 23 as follows: "Dr. Lohia was evidently sure of the facts of his case that 27 crores of the population were earning no more than three annas a day. More than 30 per cent of the national product is accounted for by 5 per cent of the population (sic) and the remaining 70 per cent is shared by 95 per cent of the population. The distribution of the balance is such that a large part of the 95 per cent of the population receives much more than the per capita income of Rs. 25 a month. It is, therefore, inevitable (sic) that a sizable section of the community should be earning even less than three annas a day mentioned by Dr. Lohia".

That Dr. Lohia seemed to be sure of the facts of his case ought surely to mean less than nothing. Persons who are ill-informed are generally very sure of their facts, and the more ill-informed a man is the more convinced he is that he has the facts. We do not know where Dr. Lohia gets his facts from. Like his opinions they must be peculiarly and uniquely his own. The wonder is that so many people should be so ready to make them their own too. *The Statesman*, writing a day after *The Hindustan Times*, obviously eager to make up for lost time, went one better than *The Hindustan Times* and said: "What the Prime Minister overlooked, despite Dr. Lohia's challenge to him, is the equally well-known fact (sic) that one per cent of India's population earns nearly 50 per cent of the total national income—from which it follows that a large mass must be earning much below the national average."

It should be interesting to know on what authority it is stated that 5 per cent of the population takes more than 30 per cent of the national product. It should be even more interesting to know on what evidence the other suggestion is made that 50 per cent of the total national product goes to one per cent of the population. The Prime Minister described Dr. Lohia's statistics as absurd; we could only characterise these assertions as grotesque. The point is that, when the daily Press begins to attempt economic analysis in its news columns, it should at least indicate the sources for its more adventurous statistics. We readily grant that even official statistics regarding the pattern of income distribution and consump-

tion are inadequate, provisional and far from up-to-date. Nevertheless, they ought to command more respect than some of the figures which had been scattered around in Parliament and elsewhere lately. The Perspective Planning Division of the Planning Commission has made certain estimates indicating the distribution of income and consumption among the population of this country:

DISTRIBUTION OF INCOME AND CONSUMPTION				
Decile of population	Percentage distribution of		Maximum value of consumption in the groups	
	Income	Consumption	(Rs. per capita per month)	
Lowest	2.4	2.98	9.6	
Second	3.4	4.45	12.6	
Third	4.3	5.56	15.2	
Fourth	4.8	6.61	17.9	
Fifth	6.3	7.74	20.8	
Sixth	7.8	9.00	24.3	
Seventh	9.2	10.54	28.6	
Eighth	10.6	12.57	34.6	
Ninth	14.5	15.69	45.1	
Highest	36.6	24.86	—	

Although, as the table shows, the highest 10 per cent of the population receives 36.6 per cent of the national income, the top 40 per cent, it will be observed, is receiving only 71 per cent of the national income. We do not suggest here that there is no gross inequality in incomes when 60 per cent of the people receive only 29 per cent, but we do emphasize that the figure of 36.6 per cent for the top 10 per cent of the population should be taken together with the figure of 71 per cent for the top 40 per cent if a more balanced appreciation of what these statistics indicate is to be secured.

From the estimates of the Perspective Planning Division it would appear that, even in the case of the lowest 10 per cent of the population, per capita consumption per month reaches up to Rs. 9.6 or about twice the figure urged by Dr. Lohia for 60 per cent of the population. It would also be seen that the average of the maximum values of consumption for the first six deciles is Rs. 16.7, whereas Dr. Lohia contends that these 270 million people earn only three annas a day, or Rs. 5.62 per month per capita.

There is also the further evidence of estimates of consumption expenditures made by the National Sample Surveys. The data given in the table alongside relates to a period in 1956-57 and is the latest available to the public.*

* Since this was written, more recent figures were made available to the public in a statement which the Minister for Planning made in the Lok Sabha on August 28. This statement fully corroborates the arguments of this article, and is published in some detail in a following section "From the Press Gallery" dealing with the proceedings in Parliament.

From this table it will be seen that per capita expenditure of less than Rs. 8 per month was noted only in respect of 14.89 per cent of the rural population and 7.54 per cent of the urban population which together constitute about 60.4 million people. The "three-anna class" of Dr. Lohia should be even less than this number, in which case his estimate of 270 million is an outrageous exaggeration.

We are certainly not arguing here that India is not a poor country. There are indeed large areas of mass poverty in this land where there is economic and social distress of a kind not as often met with in other economically backward or underdeveloped parts of the world, but at the same time, we must point out that Dr. Lohia has greatly exaggerated the extent and degree of our poverty which obviously does not need to be exaggerated. We must also point out that it is just not true that our people are poorer today than they were 15 years ago or that they are even as poor today as they were in 1947 or 1950. Acharya Kripalani, Mr. Masani and from the Communist group, Mr. Hiren Mukherjee, Mr. Gopalan and Mrs. Renu Chakravathy were not adhering to facts when they tried to make out that there had been no progress at all in the economic conditions of our people since Independence. Inadequate as our planning effort has been at most levels, it is still not true that the nation's economy has stood still or that

NATIONAL SAMPLE SURVEYS: CONSUMERS' EXPENDITURE

55 and above	1.06	7.27		
TOTAL	100.00	100.00		

the living conditions of the people have not changed for the better.

It is not an insignificant achievement that the death rate has been halved since 1947, when it was 19.7 per thousand population, subsequently coming down to 10.3 per thousand population in 1960. Over the same period mortality from malaria and other fevers has fallen from 10.8 per thousand population to 4.2, mortality from cholera from 0.4 to 0.05 and mortality from respiratory diseases from 1.5 to 1.0 per thousand population. It is not also irrelevant to the state of well being of the people that the infant mortality rate has been brought down from 146 per thousand live births in 1947 to 91 per thousand live births in 1960. There is, again, clearly, no suggestion of deteriorating living conditions for the mass of the people in the fact that the expectation of life which was 32.09 for males and 31.37 for females in 1941, and was only slightly higher ten years later at 32.45 and 31.66 respectively, had in the subsequent ten years improved so appreciably that the figures in 1961 were 47 for males and 46.33 for females.

It is, moreover, no mean thing that the literacy rate has gone up from 166 per thousand persons in 1951 to 240 per thousand persons in 1961. Enrolment of students in Primary classes has gone up from 17.7 million in 1949-50 to 38.4 million in 1961-62, while enrolment in the Middle school course had correspondingly increased from 3 million to 7.5 million. In 1961-62 66.7 per cent of children in the age-group of 6-11 and 26.6 per cent of the children in the age-group 11-14 were at school, whereas in 1946-47 the respective percentages were only 35 and 9. Whereas expenditure on education met by fees had only gone up from about Rs. 21 crores in 1949-50 to Rs. 58 crores in 1960-61, expenditure on education by Government and local bodies had increased in the same period from under Rs. 70 crores to very nearly Rs. 249 crores. Now, since the assumption must be that the well-to-do groups in the community have benefited less, both absolutely and relatively, than the less well-to-do from government expenditure on public health and education, especially Elementary education, it follows that a part of the distribution of the benefits of public expenditure has also to be taken account of in judging whether the living conditions of the people have improved or are being improved.

Again, if it is granted that the well-to-do-people have always been consuming sufficient quantities of basic consumption goods, it would follow that any substantial increase in the production or availability of essential consumer goods should be taken as reflecting an improvement in the standard of living of the mass of the people. We give below the per capita increase in the availability of a number of essential commodities over the last 11 years. The increase in the population since the beginning of the first Plan has been around 27 per cent. It will be found that the total availability as well as the domestic production of quite a number of essential articles has improved at a rate

not unsatisfactory in relation to the growth of the population.

PER CAPITA CONSUMPTION (Annual)			
Item/Unit	1950	1961-62

It is, therefore, singularly pointless to challenge the hard facts of the very real progress which this country has made in a general sense in its economy and in a more specific sense in the living conditions of the mass

Eastern Economist 20 Years Ago

AUGUST 27, 1943

It is extremely unfortunate that India's economic and financial policies are shaped by day to day considerations and should be the plaything of every passing event or incident. How else to explain the extraordinary optimism and almost self-complacency of the Finance Member who in replying to the debate on the currency policy of the Government expressed himself in these terms? "Government had satisfied themselves that it was not necessary to submit to any automatic advance of prices because of increase in the volume of currency. He himself was not sure of it three months ago but he was sure today that the Government could stop that nonsense." He further went on to say that "in a vast country like India there was no need to be alarmed by the currency figures of Rs. 750 crores or even of a Rs. 1,000 crores. In relation to the population of the country and other factors it was not an intrinsically excessive figure but it was important to check the tendencies which that figure seemed to indicate." These words abound in ignorance, misunderstanding and wrong appreciation both of the actual economic and financial situation in the country during the last one year and more and of the criticism of the Government's financial policy.

August 30, 1963

of its people. What may, however, be legitimately debated is whether the rate at which economic progress has been achieved could not have been faster. Here apart from Mr. S. K. Patil's somewhat complacent attitude towards agricultural production, it cannot honestly be said that the Government itself is not conscious of the fact that the quality of planning and the implementation of our development plans could have been better. The Prime Minister and earlier the Finance Minister speaking in the debate had not claimed that more could not have been done. The only real issue, therefore, is how could better results have been achieved, or rather how, in the future, the policies and implementation of the five-year Plans could be done in a better way so that the growth of the economy becomes faster and also the benefits of economic growth are shared increasingly widely. The spokesmen of the Communist group gave their own prescription.

They spoke vaguely of agrarian reform — and Mr. Patil had no difficulty in showing that agrarian reforms of the Communist conception whatever else they may or may not achieve have certainly not shown themselves to be effective in increasing agricultural production. The Communist group also uttered its favourite battle cry against monopolies and big business and demanded the nationalisation of banking — and Mr. Morarji Desai in turn had even less difficulty than Mr. Patil in proving that the Communist formula was wholly irrelevant to the task of more rapid economic expansion. Acharya

Pressure on Prices

IN A LEADING article entitled "Holding the Price Line" in our issue dated May 17, 1963, it was pointed out that the economy was entering an inflationary phase which, according to the major economic indicators, was not likely to be controlled in the short period. It was stated that "at the present pace of advance, the index of prices may be expected to cross, by the end of the current month, the all-time peak at 131.9 recorded in the week ended August 4, 1962". Since then the Economic Adviser's Index for Wholesale Prices (Base: 1952-53 = 100) after touching 132.6 in the last week of May, had attained a new high at 135.6 by the middle of July. This has, naturally, caused grave concern to vast sections of the population.

On August 10, 1963, *The Times of India* carried a frontpage story announcing a "40 per cent rise in cost of living in one year" on the basis of an India-wide survey. The banner headline was rather misleading because the survey which followed merely suggested that "where a householder would have needed a sum of Rs. 100 a month a year ago to feed, clothe and to maintain his family in good health, he would need now between Rs. 115 to Rs. 140," indicating that the 40 per cent increase in cost of living was the upper limit for certain areas in the country (or for certain sections of the popu-

Kripalani probably had his own ideas, but he did not state them very clearly. Judging, however, from his plaintive plea that he did not ask for more radio sets or things like that for the common people and all that he wanted was food and some clothing for them, it is difficult to be greatly impressed by his vision of a prosperous India. Surely, if our people are to be content with subsistence we are quite sure that most of them would secure it without much special effort through the five-year Plans in another five or ten years even if they have not done so already. But it is precisely because we, as a people, are not prepared to be satisfied with subsistence and are determined to share in the benefits of modern science and technology along with people in other countries and enjoy, as some of them are already doing, and all of them are wanting to do some time or other, the good things of life, that we are entitled to be dissatisfied with the rate of economic progress that it has been possible for us to achieve so far. It appears that, in the Perspective Planning Division of the Planning Commission, it has been estimated that our rate of economic growth has to be stepped up to at least 7 per cent from the rate of 5 per cent projected in the third Plan if, in another ten years, a minimum monthly income of Rs. 125 is to be ensured to the third decile of the population. If that is the case we must stoutly say that we will not be satisfied with a 7 per cent growth, but must have an even higher one. This is the real challenge which intelligent and responsible public opinion should pose to the Government.

lation), but not an average for the whole country.

The survey, it was claimed, attempted to measure the comparative increase in the cost of living of "middle- and lower income groups" but no information was provided as to how these groups were selected and if any standard consumer survey questionnaire was used to determine the composition of the consumer expenditure of these groups. On the face of it, the survey seems to be defective in more ways than one, and it cannot be taken to be much more than a write-up based on impressionistic accounts filed by the regional correspondents of the paper. The merit of the survey lay in focussing attention on the rising trend in prices and in highlighting the many ways in which the current pressure on prices and the cost of living has been unfolding itself. In Madhya Pradesh and Orissa the major cause was the poor rice crop which also had its repercussions on Maharashtra, Gujarat and West Bengal. In Bangalore, *tur dal* prices and rent and transport costs brought all along the line in such items as cereals, pulses, meat, fish, eggs, vegetables, fruits, etc. Education and transport costs increased in Kerala while food prices made an indent into the household expenditure in Himachal Pradesh because of their substantial rise. The impact

August 30, 1963

EASTERN ECONOMIST

395

of rising prices was, thus, uneven throughout the country, and certain goods and services put greater pressure on the household expenditure in some selected centres than in others.

Unfortunately, the imperfections in official indices do not readily permit a more scientific measurement of price trends. Table I shows in broad groups and sub-groups the price changes (as measured by the

(f) Others	128.4	125.5	+ 2.3
VI. All commodities	135.3	129.6	+ 4.4

official index number of wholesale prices) in the third week of July of this year in relation to the corresponding week in the preceding year. It is seen that except for a few commodities, the prices have risen sharply in all the groups. Amongst the major groups, food articles recorded a rise of 7 per cent while the rise in the case of the manufactures was marginal at 1.3 per cent. Steep increase in prices was registered by "Liquor and Tobacco" and "Fuel, Power, Light and Lubricants" at 21.9 per cent and 10.7 per cent respectively. The highest

increase in prices at 29.9 per cent amongst the sub-groups took place in the case of "Sugar and Gur". The general index was up by 4.4 per cent at 135.3.

Important commodities, prices of which rose by more than 30 points of the index, were gur, tea, oranges, kerosene and diesel oil. Those with a rise of between 20 and 30 points were tobacco, hides (raw), silk (raw) and petrol. An increase of between 10 and 20 points was witnessed in rice, milk, oil cakes, cotton seed, raw wool, coffee and aviation spirit. A large number of commodities which had the combined weightage of nearly 35 out of 100 had a rise of less than 10 per cent. Fall in prices was reported in the case of some of the commodities, the combined weightage of which was about 33 out of 100.

It is a known fact that the Economic Adviser's Index tends to under-estimate the degree of rise in prices because of the inclusion of "controlled prices" or "fair-price-shop" prices. The households which were forced to buy sugar at Rs. 2 per kilo in recent months will certainly look down upon an index which takes the controlled price of Rs. 1.09 per kilo only into consideration. The effect of this practice in the computation of the official indices and their lack of sensitivity will be apparent from Table II which compares the consumer price indices of the working classes for the major industrial centres. If these indices were to be believed, there was no rise in the cost of living of the industrial workers in Kanpur and Madras, while the increase was of a marginal nature in Delhi (2 points). Bombay recorded a fall by one point. Calcutta alone had the highest rise of 9 points, presumably because of the sharp rise in the price of rice. The upshot of this discussion is that the official indices tend to suppress the rise in prices but even according to these indices — especially the Economic Adviser's Index of Wholesale Prices — the rise in prices has been of no mean order.

It was explained in our article of May 17, 1963, that

"the current inflationary spell was the outcome of a multiplicity of factors such as stagnation in the output of food and industrial goods, deficit financing, enhanced development expenditure, doubling of the defence expenditure and increase in indirect taxation". During the past three months it has become increasingly clear that the downturn in the supply of consumer goods (both agricultural and industrial) and the excessive burden of taxation are two of the outstanding causes of the rising prices.

Considering the second factor first, while text-books on economics proclaim the deflationary impact of taxation — which is true enough where total consumption or economic activity is concerned — the indiscriminate imposition of fiscal burdens, both direct and indirect, has been to raise costs all round. Table III shows the rise in national income and taxation (Centre plus States) since 1955-56. During the second Plan, the

TABLE III
NATIONAL INCOME AND TAXATION
(1955-56 — 1963-64)

	National Income (Rs. Crores) in Current Prices	Increment over the base (1955-56 or 1960-61) (Rs. Crores)	Taxation (Rs. crores) over the base (1955-56 or 1960-61) (Rs. Crores)	Increment over the base (1955-56 or 1960-61) (Rs. Crores)
1955-56	9,980		761.0	
1956-57	11,310	1,330	860.6	99.6
1957-58	11,390	1,410	1,047.3	286.3
1958-59	12,600	2,620	1,090.2	329.2
1959-60	12,950	2,970	1,219.8	458.8
1960-61	14,180	4,180	1,354.9	593.9
		12,510		1,767.8
1961-62	14,630	470	1,538.0	183.1
1962-63	15,300	1,140	1,717.6	382.1
1963-64	16,000	1,840	2,072.9	718.0
Total		3,450		1,263.2

cumulative increase in national income (at current prices) with reference to the level of Rs. 9,980 crores in 1955-56 was Rs. 12,510 crores. The cumulative increase in taxation in these five years with reference to the 1955-56 level of Rs. 761.0 crores was Rs. 1,767.8 crores. The increment in the tax burden, thus, was 14.1 per cent of the increase in national income. During the first three years of the third Plan, the increment in taxation (with reference to 1960-61 at Rs. 593.9

crores) was Rs. 1,263.2 crores as against the estimated rise of Rs. 3,450 crores in national income with reference to the 1960-61 level of Rs. 14,160 crores. The percentage of additional taxation to additional income was thus multiplied more than two and a half times at 36.6. This steep rise in taxation made even the Planning Minister, Mr. Nanda, admit on July 3, 1963, that the impact of the new taxes on prices "might be more" than what had been anticipated earlier.

Meanwhile the production of consumer goods, both in the agricultural and the industrial spheres, has lagged behind demand. In agriculture, it is vital to understand that mere increase in the so-called development expenditure is not likely to raise production. Our experience bears testimony to this. The quality of development spending and the economic implications of recent farm policies ought to receive more careful attention hereafter.

In the industrial sphere, a comparative study of the growth of consumer goods and producer goods industries since 1956 shows that the producer goods industries have nearly doubled their capacity while the increase in the consumer goods industries has been less than 20 per cent. In 1962 as compared to 1961, the rate of growth of consumer goods industries was only a seventh of the rate of expansion of capital goods industries. During the current year, the consumer goods industries have received a setback and the level of their output has declined instead of increasing. Table IV shows that cloth production during the first five months of the current year was 4.7 per cent lower than the output in the corresponding period in 1962. Because of the heavy weightage of the cotton textiles industry amongst the consumer goods industries and the poor performance of the sugar industry, growth in the consumer goods industries is likely to be even less than last year. Without a more sensible policy for consumer goods the price line certainly cannot be disciplined.

Highlights of the Week

WIND OF CHANGE

A WIND OF change is sweeping through the Congress Party. Mr. Jawaharlal Nehru, Prime Minister of India and 'de facto' leader of the Congress Party, has acted earlier than expected and far more decisively than was predicted by political pundits on what has come to be popularly known as the "Kamaraj Plan" for revitalising the Congress Party in the organisational as well as the parliamentary and administrative spheres by drafting leading Congressmen who are holding ministerial positions at the Centre and in the States for party work. Mr. Nehru, who was authorised by the All-India Congress Committee earlier this month to decide which of the Cabinet Ministers at the Centre and which of the Chief Ministers in the States who were willing to resign their offices and take up Party work should be permitted to do so, announced to the Congress Working Committee on August 23, the names of the persons on whom his choice had fallen.

The six Central Ministers who are to leave office and take up Party organisational work are: Mr. Morarji Desai, Minister of Finance; Mr. Jagjivan Ram, Minister of Transport and Communications; Mr. Lal Bahadur Shastri, Minister of Home Affairs; Mr. S. K. Patil, Minister of Food and Agriculture; Mr. B. Gopala Reddi, Minister of Information and Broadcasting; and Mr. K. L. Shrimali, Minister of Education.

The Chief Ministers in the States who are to be similarly drafted for Party work are: Mr. K. Kamaraj (Madras); Mr. B. Patnaik (Orissa); Mr. Binodanand Jha (Bihar); Mr. Chandra Bhanu Gupta (Uttar Pradesh); Mr. B. A. Mandloi (Madhya Pradesh); and Bakshi Ghulam Mohamad (Kashmir).

It has been reported that the six Cabinet Ministers have asked to be relieved of their responsibilities within a week. It is expected that their departure will be followed by very considerable reorganisation and transfers of portfolios. It is also likely that the Prime Minister might make a few new appointments to the Cabinet, but it is more or less certain that the new Central Cabinet will be much smaller in size than the present one.

The Congress Working Committee, in further implementation of the Kamaraj Plan, has reconstituted the Party's Parliamentary Board and included Mr. Morarji Desai in it in the place of Mr. U. N. Dhebar who has resigned in order to devote more time to his work as Chairman of the Khadi and Village Industries Commission. The strength of the Parliamentary Board will be increased from five to seven in order to accommodate Mr. Lal Bahadur Shastri and Mr. S. K. Patil who, until this increase is ratified by the A.I.C.C. will attend the meetings of the Board as special invitees. The Working Committee has also directed the Parliamentary Board to set up a sub-committee to inquire into charges of corruption and other serious complaints against Congressmen. The personnel of this Committee will be decided later. Meanwhile, another committee of eleven members, including the Congress President, has been set up to look into organisational affairs. Among the members of this Committee are Messrs Lal Bahadur Shastri, Jagjivan Ram, S. K. Patil, K. Kamaraj, B. Patnaik, C. B. Gupta and Bakshi Ghulam Mohamad, all of whom come from the 12 (Cabinet and Chief) Ministers who have been drafted for party work.

STREAMLINING ADMINISTRATION

ADDRESSING LAST week a meeting of the Informal Consultative Committee of Parliament attached to his Ministry, the Union Home Minister, Mr. Lal Bahadur Shastri, disclosed that it was proposed to set up a high-powered Commission to go into the question of administrative reforms. The need for setting up such a Commission can hardly be over-emphasised.

The manifold increases in the Governmental activity both at the Centre and the State levels during the past fifteen years has brought into operation the Parkinson's Law on employment, which has created not a few labyrinths in the administrative set up. Administrative procedures have become complicated and are affecting expeditious disposal of work. Co-ordination between the various departments of the Government too has become a difficult job.

It is heartening to note that the Commission will be headed by a non-official with not only administrative experience but also a status in public life. Since most of the increase in Governmental activity has been the result of fostering the pace of economic development, which has brought in its trail cumbersome controls, it is as well appropriate that some representatives of industry are to be associated with this august body. Its other members will include some officials and non-officials. The latter presumably will be from amongst the eminent public men representing various general interests and the country's bar.

The Commission will be on the lines of the one appointed in the USA with the ex-President, Mr. Herbert Hoover, as Chairman. The appointment of some foreign experts on it is not considered necessary as the country has enough experienced administrators to undertake the task.

BOKARO DROPPED

THE UNITED States House of Representatives has accepted an amendment to the Foreign Aid Bill debarring the US Government from providing assistance "for the construction of any enterprise with respect to which the aggregate value of such assistance to be furnished by the US will exceed \$100 million." This restriction is not absolute because it is qualified by the proviso that it will be effective until the enactment of next year's Foreign Aid Bill. The effect of this condition is that the US Government cannot provide assistance to the Bokaro steel plant which is the only project seeking US aid of an amount larger than \$100 million. By this amendment, the House of Representatives secured that no money would be committed to Bokaro this year and that the Foreign Affairs Committee would be consulted before any decision was taken with regard to assistance next year.

Congressional opposition in the US to aid for the Bokaro project seems to stem from three sources: (a) a growing mood that foreign aid should be progressively reduced and finally ended; (b) a widespread view in important circles of American opinion, both business and academic, that the growth of the public sector, whether at home or abroad, should be discouraged and should in any case, not be actively promoted; and (c) a not unnatural feeling on the part of many Congressmen that, when it is the case that various domestic projects which they may sponsor have to go through gruelling examination before public funds are committed to them, there is no reason why they should not be given a similar opportunity of detailed investigation of the worthiness of projects abroad for which they are required to vote large amounts of the American tax payer's money.

Meanwhile the Union Minister for Steel and Heavy Industries, Mr. C. Subramaniam, reiterated at a meeting last week of the Informal Consultative Committee attached to his Ministry that even if the US assistance for the Bokaro plant were not forthcoming for any reason, the Government would still go ahead with the project. The steps now under way had taken into account all the eventualities. Stressing the point that the Government was quite satisfied about the adequacy of raw materials, Mr. Subramaniam pointed out that if the raw materials position for Bokaro had been 'pre-

carious", the Government certainly would not be thinking in terms of building some more steel plants to attain the target of about 18 million tonnes of ingot steel during the fourth Plan period. The preliminary steps not dependant on large-scale foreign aid for the construction of the plant had already been taken on hand, he added. Among these, he listed the acquiring of land for the steelworks township and ancillaries, soil and contour, surveys development of Kiruburu iron ore mines, tests on coal blends for the selection of alternative blends for this project and arrangements for water and power. Limestone supplies would be drawn from Bhavanatpur and Sarna. New mines are being developed for the purpose. It has been decided to construct a railway line from Bhavanatpur to Ramna. The question of transport of raw materials and finished products had also been settled with the Railway Board.

Mr. Subramaniam also disclosed that the project report for Bokaro submitted by the Indian consultants, Messrs. Dastur & Co., was being scrutinised by the Technical Committee of Hindustan Steel Limited. According to this report, Bokaro could reach four million tonnes capacity by 1970-71 in two stages—about ten years earlier than the target suggested by the American Survey Team in its three-stage plan. The cost estimates of the Indian consultants, taking the indigenous machine-building capacity into account, were also more favourable than those of the American Team. The Government of India, it is stated, has not yet approached any other country for assistance for this project.

HIGHER EDUCATION

THE REPORT of the University Grants Commission for the year 1961-62, placed on the table of Rajya Sabha last week, draws pointed attention to the deteriorating standards of our college education. The decline, it is suggested, has been brought about by the very large and rapid number of students going in for higher education. This has resulted in the staff-student ratio going up (in 1961-62 it stood at 1:15.5, as against 1:15.3 in 1960-61) and creating a heavy strain on the resources of universities. "If increasing number of students continue to be admitted in our universities without corresponding expansion of facilities", the report warns, "there is grave risk of the academic standards being impaired further". A plea is, therefore, made that only such students should be admitted to universities as are most likely to benefit from university education.

The report spotlights, however, three heartening features of our higher education. The standards at the post-graduate and research level in many of the universities, it is pointed out, have improved substantially during the last few years. The second outstanding feature has been a rapid increase in the number of women students. In 1961-62, women students accounted for 16.1 per cent of the total (1.16 million) college

and university enrolments. Women students are also increasingly taking up professional studies. The most gratifying fact, however, is that enrolments are going up at a particularly strident pace for subjects such as engineering and technology, medicine, agriculture and education. As against an 11 per cent increase in the total enrolments in 1961-62 over the past year, enrolments for the above four subjects went up by 56.8 per cent, 48.2 per cent, 78.6 per cent and 46.7 per cent, respectively. The Commission suggests a priority central and primary subject of study and research. This field has been neglected in the past and there is a great leeway to be made up here.

For improving the teacher-pupil ratio, besides urging that only such students as can benefit most from university education should be allowed to be admitted for higher studies, the report suggests that State Governments should help private colleges in meeting the additional expenditure over and above the assistance offered by the UGC for implementing the revised pay-scales. This would enable these institutions to attract talent which is now shying away from the teaching professions to employment offering better emoluments and the age of retirement of teachers in all the universities and colleges should be raised to 60 years, with a provision for further extension by five years in deserving cases. Thirty-1961-62 have agreed to the 60-year age-limit for retirement. The others need to follow suit.

Among the other measures to improve academic standards, the Commission suggests increased use of tutorials and seminars and reform of the examination system in the light of the Examination Reforms Committee. The centres of advanced studies being set up in selected universities, it is hoped, will help in raising educational standards further as they should encourage communication and movement among senior teachers and scholars. In the interest of economy and quality, the Commission favours careful regulation of the expansion of a new university is also considered justifiable only if it can help to maintain and raise standards.

As regards the medium of instruction at the college and university level, the Commission reiterates its view stated in the previous reports that transition from English to an Indian language should be brought about in as short a period as possible consistent with the maintenance of proper standards. Students welfare, the Commission opines, forms an integral part of educational development. Several schemes such as construction of hostels and non-resident students centres, constitution of students aid funds and provision of facilities for the physically handicapped were being implemented for this

FROM THE PRESS GALLERY

A Matter of Confidence

From Our Parliamentary Correspondent

NEW DELHI, Tuesday:

AFTER A DEBATE of full four days the "no confidence" motion moved by Acharya Kripalani in the Lok Sabha seeking to express want of confidence in the Council of Ministers was defeated by 346 to 61, with 24 abstentions. It is rather interesting that, whereas 72 (or is it 74?) stood up to support admission of the motion, the non-Communist Opposition groups could only muster 61 when it came to a Division on the adoption of the motion. Evidently, quite a few Independents had second thoughts.

Although the debate was advertised in advance by the Opposition groups and in certain sections of the Press as a historic episode, the course and content of the discussion was hardly different from the usual debates on Planning or Foreign Policy or the Central Budget, which are being held in the Lok Sabha from time to time. The only new feature was the import of a very private animosity which Dr. Lohia entertains (and openly expresses) for Mr. Jawaharlal Nehru both as a person and as a personality. It is possible that Dr. Lohia's tirade did succeed in impressing a few persons in the House or outside, but it can hardly be claimed that it has given any worthwhile new dimensions to the discussion of public affairs. It is true that parts of his speech forcefully expressed criticisms, more or less valid, of some aspects of the Government's conduct of foreign and economic policies, but that was not enough to give cover to the essential vulgarity of his performance. Every man to his taste, but where the uncritical admirers of Dr. Lohia's Performance are concerned, it may perhaps be useful to point out that the only distinction that Dr. Lohia could lay claim to was that he was able to speak on the Floor of the Lok Sabha a language which the conventions of an Assembly of that kind were meant to discourage.

Food Control

It is interesting that the two outstanding speeches of the debate came from the Congress benches. Mr. S. K. Patil has been justly praised, by friend and foe alike, for the virtuosity and range of his debating skill. While his overt target, most of the time, was the Communist groups, nobody could have missed the point that he also wanted to give a bit of his mind to Mr. Gulzarilal Nanda, who had clashed with him on the issue of food control and to the Prime Minister, who had recently suggested that he should give up the Food and Agriculture portfolio. Mr. Patil has always been right in declining to be stampeded into controlling food and he explained very lucidly why elaborate physical controls were neither necessary nor likely to be useful. But when he attempted to argue that the Government had not done badly in the matter of agricultural production, he was clearly on weak grounds. He claimed that food production since 1951 had increased from 52 million tons to 80 million tons. The truth is that a part of this alleged increase of 28 million tons must be attributed to the improvement in the coverage and collection of agricultural statistics. Thanks to the improved statistics, the latter estimate is probably reasonably accurate. But the estimate for the earlier year is certainly a gross under-estimate as is being freely admitted, even if not publicly, in the relevant official quarters. It follows that food production has not risen at the rate at which Mr. Patil says it has, but has risen much more slowly. Still, handsome is as handsome does, and it must be admitted that Mr. Patil's assertive self-confidence certainly did much to boost the morale of the Government benches and bring discomfiture to the Opposition, particularly the Communist group, who had specifically called for his and

the Finance Minister's exit from the Cabinet.

Mr. V. K. Krishna Menon, whose speech was, in its own way, quite as remarkable as was Mr. Patil's, adopted, of course, quite a different style. He rebutted firmly, but in a scholarly way Mr. Masani's arguments for proportional representation, while his elucidation of non-alignment was certainly one of the most restrained and persuasive exposition of this controversial issue. It was a pity that he provoked interruptions from the other side of the House by entering into the explosive area of his handling of defence, especially after the commencement of Red China's aggressive activities. But having been charged with political interference in the conduct of a military campaign, it was perhaps not unreasonable on his part to seek to place on record his refutation of the charge, while it was certainly unfair on the part of Mr. Frank Anthony, who was among those who had made the allegation, to have attempted to gag Mr. Menon at this point by attempting to raise a wholly frivolous "Point of Order".

Educating the Opposition

The Prime Minister as well as the Defence Minister chose to be wholly non-aggressive; both spoke more in sorrow than in anger. And it cannot be said that they were wrong or ineffective. By the time they got up, the Opposition had used up most of its ammunition and much of that ammunition had been found to be powder not so dry. Mr. Desai and Mr. Nehru therefore had the function no so much of defending the Government as of trying to educate the Opposition and possibly parts of their own following. Mr. Desai, as is usual with him, readily admitted faults and shortcomings in Government performance, but gently pointed out that there was also another side to the balance-sheet, rebuked dissenters for the error of their ways and ended with predicting that they would return to their senses in the end. Mr. Nehru, — again, as is usual with him — spoke of the "larger vision" with his characteristic earnestness, but lectured rather amateurishly on heavy industry in an attempted rejoinder to Mr. Masani who had earlier pleaded for a more proper order of priorities in Planning.

The mover of the motion has been found fault with in Press comments for eschewing passion and satire in his opening speech. But Acharya Kripalani was surely right in initiating the debate in civilised terms and attempting to launch it on a high plane. It was not his fault if his effort was frustrated by others less wise than he. In any case, his opening speech was certainly more effective and useful than his reply which was among and, for the most part, irrelevant since he seemed to be more concerned with defending himself than in damaging the Government's defence of itself.

Among the good speeches that were heard during the debate must be mentioned Mrs. Renu Chakravarty's and Mr. H. V. Kamath's. The Communist Member seems to have been very efficiently briefed by the party Secretariat and to the extent that any Communist come-back could have made an impression at all, after Mr. S. K. Patil's devastating onslaught, Mrs. Renu Chakravarty certainly succeeded in holding up the party flag. Mr. Kamath spoke briefly, but enough to demonstrate that quality of sincerity which he alone among the PSP men seems to share with the original leader of the party, Acharya Kripalani.

Mr. Morarka and Mr. Masani always make solid contributions to debates, since both are well-informed and they do not skip their home work. But Mr. Masani's declaration that

HATE YOU HATE YOUR DOG
Dr. Lohia complained in the Lok Sabha that the Prime Minister was spending Rs. 3 per day on his dog.

his party stood by mixed economy was somewhat surprising in view of the fact that the founder-leader of the Swatantra Party seems to be unreservedly opposed to Planning and all its works, especially the public sector.

3-Anna Controversy

In the course of the debate on the "no confidence" motion, Dr. Lohia had stated that 60 per cent of the households in the country subsisted on Rs. 25 a month, i.e., 270 million people were living on only three annas a day per person. This was refuted by the Minister for Planning, Mr. Gulzarilal Nanda, in a statement which he made in the Lok Sabha on August 26.

Mr. Nanda said that, according to the information collected by the National Sample Survey, the 60 per cent of the population to which Dr. Lohia had referred had an estimated average per capita consumption of 7.5 annas per day. Within the 60 per cent group itself there was a wide range of variation between the consumption of the first 10 per cent and that of the sixth 10 per cent. The average per capita expenditure of the sixth 10 per cent in the rural areas was ten annas and in the urban areas 14 annas per head per day. The poorest 10 per cent of the population have a monthly per capita average expenditure of Rs. 8 in rural areas and Rs. 10 in urban areas, or a daily per capita average expenditure of 4.3 annas in rural areas and 5.3 annas in urban areas. The figure of three annas per head per day given by Dr. Lohia was not even true of five per cent of the population, or 22 million people as against the 270 million mentioned by him. For the population as a whole, urban and rural, including all-expenditure categories, the average consumer expenditure for 1961-62 has been estimated at 12 annas per head per day. The Minister's statement concluded with the following table:

Average per capita consumer expenditure per month by fractile groups, based on 17th Round of National Sample Survey, September 1961 — July 1962

All India — Rural and Urban				
Fractile groups per cent of population	Average consumer expenditure (per month) (in Rs.)	Average expenditure in nP. per day per capita for population included within the upper limit of the specified fractile group		
		Rural	Urban	
0 — 5	7.09	8.53	24	28
5 — 10	9.09	11.55	27	33
0 — 10	8.09	10.04	27	33
10 — 20	10.67	13.88	31	40
20 — 30	12.82	16.61	33	45
30 — 40	14.62	19.56	39	50
40 — 50	16.47	21.94	42	55
50 — 60	18.79	25.50	45	60
60 — 70	21.25	27.68	49	64
70 — 80	24.70	35.65	53	71
80 — 90	29.95	43.86	58	80
90 — 100	51.16	88.76	70	101
0 — 100	20.85	30.36	70	101

(Note: 1 anna = 6.25 nP.; or 19 nP. = 3 annas).

Consumer expenditure comprises all expenditure incurred by the household exclusively on domestic account, including consumption out of home-grown produce, barter, gift, loan, etc., Consumption out of home-grown produce is evaluated at ex-farm rates.

The population has been arranged in ascending order of

per capita consumer expenditure of the households. The fractile groups are formed from this ordered population in specified per cent of total population. The fractile group 0—10 represents the 10 per cent with lowest per capita expenditure and the fractile group 90—100 the top 10 per cent with the highest per capita expenditure.

The last two columns give the average consumer expenditure in naye paise (nP.) per capita per day for rural and urban India respectively for all the population included within the upper limit of the fractile group to which the figure pertains. For example, looking at the sixth 10 per cent i.e. row number 8 in the statement, the figure of 60 nP. under column (5) means that 60 per cent of the urban population, from the poorest upwards, have an 'average' consumer expenditure of 60 nP.; and 45 nP. under col. (4), the average for the poorest 60 per cent in rural areas. Figures under columns (4) and (5) against row 13 likewise show the average consumer expenditure per head per day for the whole population, inclusive of all expenditure classes, separately for rural and urban areas.

Bose Commission Report

Although a discussion of the Vivian Bose Commission's report on the affairs of certain companies of the Dalmia-Jain group occupied a good deal of the time of the Rajya Sabha, it took much the same course as the corresponding debate in the Lok Sabha, last session, had done. There was, however, one difference in that the Minister for Industries, in his reply, was able to disclose that the Government had come to the conclusion that there was a possibility of launching successful criminal prosecutions against the managements of ten companies which were covered by the Commission's investigating prosecution had to be collected through a laborious process of going through as many as 4,000 documents and 'obtaining secondary evidence wherever original documents were not available. Mr. Kanungo assured the House that the Government would bring forward a Bill to amend the Companies Act in the light of experience since the present Act came into force as well as the recommendations made by the two jurists, the Attorney General and Shri Vishwanath Sastri, on the basis of the findings on facts in the Bose Commission's report.

In the course of the debate several members urged that company donations to political parties should be banned, a suggestion which Mr. Kanungo declined to entertain. However, an interesting suggestion which secured support from two leading members on the Congress benches, such as Mr. Khandubhai Desai and Mr. P. N. Saprú, favoured the nationalisation of audit. Mr. Khandubhai Desai also advocated the imposition of a statutory obligation requiring that only one financial account should be maintained in respect of all the companies under the same management or group of managements. He argued that this step was necessary for preventing transfer of funds from one company to another for purposes of window-dressing. Mr. Kanungo conceded the importance of ensuring proper auditing of companies but said that this could be secured by impressing on Institute of Chartered Accountants the need for upholding high standards by means of a professional code of conduct.

Pig Iron Shortage

Mr. C. Subramaniam, Minister of Steel and Heavy Industries, made a statement in the Lok Sabha on the shortage of pig iron for different types of consumers and the extreme difficulty in improving the situation in the next two years at least. He stated that the availability of foundry grade iron as at present was of the order of 1.1 million tonnes and it was unlikely to increase in the next two years or thereabout. The main reason of the stagnation in domestic production was that most of the schemes licensed for the manufacture of pig iron in the private

STEPPING OUT TO TOMORROW

Day by day, month by month, the face of India changes fast. Mighty steel penstocks guide the rushing river waters to turn the turbines to produce electric power. Massive generators, dotted across the country, send this power vibrating along wires to turn the wheels of industry. Electric lamps are switched on in village homes. Long lines of steel pipes girdle vast stretches of land, carrying water to thirsty villages and liquid gold to refineries. Automatic signals guide rolling wheels along a criss-cross of steel tracks. Radio waves race across the skies to help mighty Jet planes land on our soil with their precious cargo. And thus a nation steps out to tomorrow.

As electrical and mechanical contractors and maintenance specialists on behalf of leading West German manufacturers, we too are contributing our bit towards building a new India.

sector did not materialise, with the exception of two out of which the Kalinga unit had come up to a high standard. Meanwhile foundry capacity in the small-scale sector had expanded rapidly, especially in the last two years. Out of the production of 1.5 million tonnes, envisaged in the third Plan, one million tonnes were to come from the integrated steel works and half a million tonnes were expected from the licensed private pig iron plants. The shortfall would be 400,000 tons, but perhaps it may be reduced fractionally.

Mr. Subramaniam stated that the foundries were also using, along with pig iron, substantial quantities of cast iron scrap over which there was no control. In view of this supplementary source of supply, the small-scale foundries should be able to work up to 20 to 30 per cent of their capacity. Foundries which were approved for awarding Government and railway sleeper orders were receiving appropriate allotments for executing these orders, which would keep their capacity engaged up to the level of 60 to 70 per cent

Question Hour

DR. K. L. RAO, Minister of State for Irrigation and Power, stated in the Lok Sabha that the Government would be in a position to finalise its policy for the establishment of integrated zonal power grids, transcending the State frontiers, after the views of all the State Governments had been obtained. Up to now the Governments of Uttar Pradesh, West Bengal, Andhra Pradesh, Punjab and Orissa had tendered their views and raised objections to the proposal. A Committee of Experts had suggested that a regional agency should be made responsible for the planning as well as operation of the integrated power systems. The fear has been expressed by some State Governments that this pattern of administration might take away the decisive voice from State Governments and facilitate the transfer of electric power from the surplus States to deficit States. Dr. Rao explained that as a matter of fact the scheme prepared by the experts neither envisaged nor intended such a deprivation of the resources of surplus States.

Defence Equipment

Mr. Y. B. Chavan, Minister for Defence, informed the Lok Sabha that active steps were being taken to increase the manufacture of arms and equipment and the production of other ordnance stores of key importance. The first phase in the programme of the accelerated development of domestic manufacturing capacity was the establishment of six new ordnance factories for which the necessary plants were being obtained from the USA. The existing ordnance factories were also being expanded in regard to their manufacturing capacity. The total value of defence equipment scheduled to be manufactured in the ordnance factories during 1963-64 was estimated to be of the value of Rs. 100 crores which was equivalent to more than double the value of the output in 1961-62.

Mr. Chavan gave details about the expansion of the transport aircraft fleet of the IAF. Although the existing transport aircraft could be considered as adequate for immediate requirements, provision on a larger scale had become a matter of top priority in view of the urgency and unforeseeable character of the frontier situation. The Minister reiterated the Government's decision about the rejection of the recommendations of the Tata Committee to close down the manufacture of AVRO-748s. Their manufacture would be continued. Asked by several members whether the Kanpur Aircraft Manufacturing Depot possessed all the equipment for the manufacture of the types of aircraft other than AVRO, the Minister replied that the Kanpur unit would be raised to the required level of capacity by enlarging its equipment and elevating from a depot to the status of a full-fledged manu-

facturing plant.

The Minister for Defence gave the details of the agreement entered into with the Government of Canada for the supply of 16 Caribou aircraft, specially intended for transport in high mountain terrain. He disclosed that the 16 Caribous were agreed to be delivered to India by Canada. For this purpose the Canadian Government had undertaken to provide credit with a ceiling of \$12.5 million intended to cover the cost of the aircraft and their necessary spare parts and associated equipment. The amount would be repayable in ten equal half-yearly instalments and would carry interest at the rate of 5½ per cent per annum. Since the Caribous would be purchased from a non-Government manufacturing company in Canada, a separate formal contract would be concluded between the Government of India and the company in question after which the Canadian Government's credit could be utilized.

Mr. R. Raghu Ramaiah, Minister for Defence Production, gave additional information stating that the question of undertaking the manufacture of Caribou transport aircraft or any similar aircraft would be examined in greater detail for which object detailed information would be obtained as the first preliminary. This was to suggest that the manufacture of aircraft in addition to the approved programme for the production of 29 AVRO-748s would necessarily take some time for a careful scrutiny of the question of obtaining other manufacturing potential.

The Government of Yugoslavia has agreed to supply to the Government of India ammunition on rupee payment which is to be spread over a period of three years. The Deputy Defence Minister who gave this information denied that the Yugoslav Government had made any offer for establishing an arms factory in India.

LIC Investments

In the Lok Sabha, Mr. B. R. Bhagat, Deputy Finance Minister, disclosed that a decision had been made to the effect that the Life Insurance Corporation of India may subscribe for 30 per cent of the debentures floated by any land mortgage bank in any State of India during the remaining three years of the third Plan. However, a ceiling of Rs. 6 crores per year would be placed on the amount of the LIC's investments in the debentures of the land mortgage banks.

Mr. Bhagat also stated that the question of the establishment of a Unit Investment Trust, about which the Finance Minister made an announcement in his Budget speech, was being actively pursued as to its appropriate requirements for this country. The details of the projected Investment Trust were at the same time being worked out. But he gave no information as to when this agency would be brought into being.

Sugar Buffer Stock

Mr. S. K. Patil, Minister for Food and Agriculture, informed the Lok Sabha that the Government proposed to create a buffer stock of 5 lakh tons of sugar which would be built up in the course of the coming three years. The estimated production of sugar in the next year has been placed at 33 lakh tons out of which 26 lakh tons would be needed for internal consumption, while 5 lakh tons were being earmarked for export. The residue, equivalent to 2 lakh tons, would be the first quantity to be carried to the buffer stock. This was only a first conception of the buffer stock on a modest scale. Experience has shown that fluctuations in the output of sugar between two years are some times very wide leading to acute shortages or overloads of surplus stocks. These disparities had to be evened out and it could be done by mopping up the surplus to the buffer stock so that producers as well

as consumers would find their difficulties minimised.

Mr. Patil explained the issue of incentives to the cane-grower. He pointed out that under the scheme recently approved and announced for providing incentives to the sugar industry, the cane-grower would receive an additional price of one anna per maund. Government was engaged in formulating another scheme to provide effective incentives to the grower. This scheme would give the farmer anything between three and four annas per maund of sugar as an increment to his earnings to stimulate interest in keeping up the level of production.

Railway Electrification

The Deputy Minister for Railways, Mr. S. V. Ramaswamy, stated in the Rajya Sabha that the programme of the electrification of the highly congested, coal-traffic bearing route from Mughalsarai to Kanpur was being expedited. It is to be executed in two phases. By September 1964, the electrification of the Mughalsarai-Allahabad section would be completed and by September 1965, the electrification of the rest of the section from Allahabad to Kanpur would be accomplished.

Mr. Ramaswamy explained a novel measure contemplated by the Railway Ministry to increase the supply of railway sleepers alongside the traditional timber and iron sleepers as an experimental measure. Cement sleepers were to be laid on a few lines and in the station yards. The question of their large-scale adoption would depend upon their suitability to sustain the train movements as also on the availability of supplies of cement.

Trade Trends

Cotton Yarn Export: The Minister for International Trade, Mr. Manubhai Shah, disclosed in the Lok Sabha that the Government was prepared to consider the plea for railway freight concession of 25 per cent in the case of cotton yarn intended for export in the same manner as the concession already extended to cotton textiles. The views of the Railway Ministry had to be obtained first. The plea for concession for cotton yarn was raised by the Cotton Textiles Export Promotion Council on the ground that the export market for this commodity was tending to become more and more highly competitive. The Minister also said that recently a committee was appointed to promote exports of cotton yarn manufactured by new mills with the latest and most modern machinery.

Second STC: Mr. Manubhai Shah, Minister of International Trade, stated in the Lok Sabha that the second State Trading Corporation would be registered soon under the name and style of the Minerals and Metals Trading Corporation of India Ltd. According to the present plan, it would start functioning from October 1963. This Corporation would handle the export of iron ore, manganese ore and other mineral ores. It will also be entrusted with the import of non-ferrous and other metals as may be decided upon by the Government from time to time. He suggested that the establishment of a separate State Trading Corporation to handle the trade in metals was justified by the anticipated magnitude of the increase in ore exports. According to the present reckoning, the export of iron ore alone would reach the level of 20 million tons by 1970-71.

Uranium Mill: The Prime Minister stated in the Lok Sabha in reply to a question, whether a uranium mill for treating uranium ore from the Jaduguda mines in Bihar is to be set up, that a mill with a capacity of 1,000 metric tons of throughput of ore per day was being set up close to the Jaduguda mine. Its estimated cost would be Rs. 4.34 crores out of which the foreign exchange component would be about Rs. 1.2 crores.

Ilmenite Export: Mr. Nehru stated in reply to a question

August 30, 1963

in the Lok Sabha that in addition to commitments already entered into, approximately 13,000 metric tons of Quillon Grade Ilmenite was exported to the United States by Travancore Minerals Ltd. during March and the first half of April, 1963. Negotiations for exporting further quantities of ilmenite were in progress with different business interests.

Bills

The Warehousing (Amendment) Bill was passed by the Lok Sabha last week-end. The necessity of the amendment arose because the original Act stipulated that the headquarters of the Corporation must be located at New Delhi. But since a shift in the location of the headquarters was found to be essential, the amending Bill was introduced to confer such power on the Central Government. The headquarters would be shifted from New Delhi to Faridabad or Agra after a building was constructed for the office.

Mr. A. M. Thomas, Deputy Minister of Food, who piloted the Bill, informed the House that the Corporation had set up so far 78 warehouses in various parts of the country. Out of these, 11 warehouses were accommodated in buildings specially constructed by the Corporation for this purpose, while 67 warehouses were being run in rented buildings. The storage capacity of the 78 warehouses together was 1,84,756 tons. The Corporation was expected to achieve financial self-sufficiency by the end of the third Plan.

The Personal Injuries (Compensation Insurance) Bill was introduced in the Lok Sabha by Mr. C. R. Pattabhi Raman, Deputy Minister of Labour and Planning. The purpose of the Bill is to raise the obligation on the employers in factories, etc., in respect of payment of compensation for personal injuries sustained in the course of employment. The increase to the excess of the compensation payable under the Workmen's Compensation Act, 1923, above the compensation payable under the Personal Injuries (Emergency Provisions) Act of 1962. Thus, the amount of compensation to which the injured person would be entitled would be equal under both the Acts.

TOUGH CASING

it will take more retreads
and add to your profits

In these days of high running costs (and high taxes!) every operator seeks economy. Tyres are valuable items and choice of the right tyre will mean more profits in the long run. For example, a tyre must be able to take several retreads.

The casings of Dunlop tyres are made in such a way that they will give you the maximum number of retreads. The casings will stand up to the shocks from bad roads and will remain good in spite of very heavy loads on long, fast hauls. One more reason why Dunlop tyres will help run your truck or bus at the lowest cost per mile.

A Seminar on the Sectors

From A Correspondent

SEMINARS ARE not like electronic computers; they do not come up with tidy solutions to problems capable of immediate implementation. They are, nevertheless, valuable in that they facilitate the evolution of ideas and formulation of policies. A well-conducted seminar brings the issues into sharper focus, marks out the areas where reasonable unanimity of views prevails from those that are characterised by conflicting opinions and indicates fruitful lines of approach in tackling problems that do not admit of facile solutions.

The seminar recently organised by the Federation of Indian Chambers of Commerce and Industry on the problems of industrial undertakings in the public and private sectors achieved all this and more. The most significant fact about the seminar was that it provided the opportunity to business executives of both the public and the private sectors to come together on a common forum to discuss the problems of industrial management most of which, they realised, were not dissimilar at the operational level. This awareness served to highlight the fact that the two sectors were not two hostile camps eyeing each other warily but were, in fact, complementary groups whose performance eventually determined the state of the national economy.

Dr. V. K. R. V. Rao, however, struck a different note. To him the two sectors were Kipling's East and West. He contended that profitability was not the objective of the public sector management and it was, therefore, a different kettle of fish from the private sector management. "If there were no differences between them, why establish a public sector at all?" asked Dr. Rao.

Profit Motive

No one can dispute the fact that while the objective of the private sector is to earn a satisfactory return on investment, public sector enterprises are often established to fulfil objectives other than purely commercial. Here one wonders whether Prof. Rao is aware of the distinction between the objective of the promoters of a public sector enterprise and the objectives spelled out to the management at the operational level. Even in instances where the State's avowed purpose in starting an enterprise is to supply the citizen a certain commodity or service at below cost, is it not the duty of the management to run that enterprise on the basis of the minimum cost? The promoter's objective comes into play only at the stage where the question of the use of profit or sharing the gains of productivity comes up for consideration. Unlike the private entrepreneur, the State might well decide to utilise the entire profit for reducing the consumer price or increasing the wages of the workers. This policy decision, however, does not make any difference to the public sector management whose objective is and must remain the same as that of the private sector management — maximising the output of a given unit of input of labour, materials, machinery and management.

Another important fact that emerged from the seminar discussions was that public sector management has so far been denied the chance to play its rightful role in the formulation of policies as regards industrial relations, financial controls, purchase and sales, recruitment, promotion and training, etc.

Dr. Vikram Sarabhai laid his finger unerringly on the confusion of objectives caused by ministerial pronouncements. While the Plan categorically laid emphasis on the need for public sector enterprises earning financial surpluses, the Planning Minister had been contending that social justice should be the primary objective of such undertakings. The predicament of the public sector management in the face of such

conflicting statements could easily be imagined.

A thought-provoking point of view put forward by Dr. Sarabhai pertained to the desirability of the divorce between ownership and control. The objective of the owner might sometimes be different from the objective the enterprise should set for itself. In private family businesses, there is a danger of this happening, but usually the corrective process sets in by the second or third generation of the founder of the business employing professional managers, if only to arrest financial ruin. Since the failure of a public sector enterprise did not affect individuals in the same way, the vesting of ownership and control of public sector enterprises in the same hands was far more dangerous because there was no compelling circumstance in this case which would bring the corrective process into play.

Holding Company

Dr. Sarabhai's suggestion was that government might establish a sort of a holding company (as they have in the private sector) which will be responsible to the government for the monies advanced to it and which would at the same time act as a buffer between the ministries on the one hand and the operating units on the other, thus enabling the latter to function without too much official interference.

For sheer, wilful refusal to face facts, the note circulated by Mr. B. N. Kaul, Chairman, Life Insurance Corporation, on problems of finance was hard to beat. He tended to attribute the present state of the capital market to the investing public's loss of confidence in the industrialists. Mr. Kaul's theme appeared to be: Every prospect pleases the eye, only the entrepreneur in the private sector is vile. Either Mr. Kaul was being incredibly naive or he chose to put on a pair of very effective blinkers. His note was full of insinuations, but was singularly devoid of factual analysis.

Quite a number of participants were for taking suitable steps to implement the conclusions presented by the Finance, Management Development, Purchase and Sales and Labour groups. The conclusions are excellent so far as they go, but it is not realistic to talk about implementing them because they are at the moment in the nature of broad statements; more thought and effort have to be put in before these could be translated into a proper programme with an appropriate modus operandi. This is what the Chairman wisely agreed to do through committees. There is no point in the latter waiting for co-operation from the officials; it is not likely to be forthcoming because such involvement would be regarded as committing the government in advance.

Finally, a word about the speakers and the organisation details. Valuable time was lost on the first day of the seminar by windy speakers who reduced their audience to tears by repeating well-known clichés ad nauseam and which were in complete contrast with the admirably brief and meaty speeches of the President and the Minister for Steel and Heavy Industries. It is a pity that speakers are often billed for what they are, not for what they have to say. The background paper presented by the FICCI secretariat could have been more pointed and confined itself to specific issues instead of trying to cover the entire field. The groups were far too unwieldy to permit effective discussion and quick decisions.

All this, however, is in passing. The seminar, on the whole, was admirably conceived and it was successful in turning the spotlight on several vital issues closely connected with the management of the industries both in the private and in the public sectors.

Indian Economy: A Critical Survey

IN A REPORT submitted to the World Bank earlier this year on the "Progress of Economic Development in India", the view was expressed by a team of experts, who visited this country some time ago on behalf of the Bank, that, though it is easy enough to find fault with what has been done and to demonstrate the limited effectiveness of government policy, the record as a whole is impressive. The report combines criticism of particular aspects of the Government's economic policies with basic appreciation for the very real progress that has been made in India since Independence in establishing a steadily rising trend of production and building up within the traditional society foundations of a modern economy.

The report has recommended continued external assistance to this country for maintaining the momentum of industrial expansion and has pointed out that the most effective form such assistance may take in the present circumstances would be an increase in general-purpose aid not tied to the procurement of particular commodities or in aid that can be used to finance imports of materials, components and spare parts for industry and agriculture. The report has also urged the case for most of the aid taking the form of grants and soft loans.

Following is a summary of the expert mission's findings:

India has just come to the end of the second year of her third five-year Plan. Over the twelve years from the beginning of the first Plan national output in real terms has risen by about 50 per cent or at a compound rate of 3½ per cent a year. The population has increased over the same period by 27 per cent, from about 360 million in 1951 to nearly 460 million in 1963, giving an annual rate of increase of 2 per cent a year. The rise in per capita income has thus been around 1½ per cent a year.

Production in organized industry has doubled since the beginning of the first Plan in 1951, and the transformation in this sector of the economy has been spectacular. Output of steel has been more than trebled, output of cement nearly trebled and output of coal nearly doubled. Over the same period the increase in agricultural production has been about 40 per cent. Here the changes have been more gradual and less obvious. There has been no clear sign of any acceleration in the pace of agricultural expansion in recent years in spite of the large investments made in irrigation and community development during the first two Plans.

Development Expenditure Up

Government expenditures on development have steadily increased from an average of \$823 million a year during the first Plan to just over \$2,300 million in 1961-62. A principal feature of public investment policy has been the growing concentration on industrial development, particularly in iron and steel and heavy engineering. Private investment in industry has meanwhile risen rapidly in response to the stimulus provided by the Government's development programme.

Net investment as a proportion of national income is believed to have more than doubled since the beginning of the first Plan and is now estimated at around 11-12 per cent. The greater part of the increase in investment has been financed from external resources—in the early years of the second Plan mainly through the running down of India's foreign exchange reserves and latterly to an increasing extent by foreign aid and private foreign investment. Domestic savings may be around 8 per cent of national income. There is no conclusive evidence to show that the marginal savings ratio has increased significantly over the past five years.

Wholesale and retail prices, which declined during the first Plan, rose more or less continuously during the second Plan. At no time, however, was the price situation allowed to get out of hand. The index of wholesale prices has levelled off in the past two years, while consumer prices have continu-

ed to move slowly upwards.

India's external balance of payments has been under continuous strain since the beginning of the second Plan in 1956 when imports rose sharply. Between March 1956 and September 1958 (about the time of the first meeting of the India consortium) foreign exchange reserves fell from around \$1,900 million to \$700 million. The loss of reserves has since been slowed down by severe restrictions on imports and increased disbursements of foreign aid, and the reserves are now in the region of \$600 million. Against this, however, India's obligations to the International Monetary Fund amount to \$275 million.

India's exports during the second Plan fluctuated between \$1,200 million and \$1,400 million a year. There has been some increase in exports during the first two years of the third Plan, and in 1962-63 earnings were just over \$1,450 million, including exports from Goa.

The balance of invisible transactions has changed sharply for the worse during the past three years. The main reason for this change has been the increase in the service due on external debt. The rate of disbursement of foreign aid has risen from just over \$400 million in 1960-61 (excluding assistance from the United States under PL 480) to \$510 million in 1961-62 and \$740 million in 1962-63.

Problems and Policies

Much has been achieved in India since Independence in establishing a steadily rising trend of production and building up the foundations of a modern economy. The results have, however, been painfully inadequate to the need. The sheer size and poverty of the country are its greatest problems. For example, it has been calculated that, in order to provide the poorest 20 per cent of the population with an average per capita income of about \$50 a year by 1975, the economy as a whole must maintain an annual rate of growth of 7 per cent over the next twelve years.

Few governments in history have had such daunting problems to tackle or have tackled them with such a high sense of responsibility. Nevertheless, the Indian Government's political and social policies are frequently in conflict with its economic objectives. Examples of such conflict are to be found in the policies for reducing inequalities of income and wealth, for trying to secure balanced regional development and for the protection of inefficient, labour-intensive techniques in village industries.

Recent official projections of Indian population show a dramatic explosion between 1961 and 1976 when population is assumed to grow at an average rate of 2.4 per cent a year. A net increase of 187 million people is forecast by 1976 which would bring the total population to 625 million. The likely increase in the labour force over the fifteen years is equal to the size of the present total labour force in the United States and 2½ times the size of the labour force in Britain. Failure to keep down the rate of population growth would in the long run be disastrous, and a new approach to the problem of family planning is needed.

Agricultural output has not been rising fast enough, and the balanced growth of the economy will require a radical way of bringing this about. Better agricultural administration, larger supplies of fertilizers, an adequate system of price supports and a more effective rural works programme are among the obvious needs.

In industry, the picture as a whole is more encouraging. The progress made in the steel industry during the past few

years is in itself a considerable achievement. The expansion and diversification of the engineering and chemical industries are also impressive.

Many things are still wrong with the organization and management of industry in the public sector, but the faults are being gradually remedied. Industrial costs in India are generally high by comparison with more advanced industrial countries. Up to a point this is inevitable at the present stage of development, but the problem has been aggravated by steady upward pressures on labour costs and by the policy of encouraging the establishment of small and medium-sized units in the private sector in preference to large ones. Policies with respect to the location of industry need to be more carefully thought out in future.

If Indian industry is to operate efficiently, some way must be found of simplifying the present system of controls and de-centralising the process of economic decision. A start should be made by removing or relaxing some of the present controls over prices, so that the price mechanism can function more freely as a guide to the allocation of resources. The policy of controlling prices in key industries, while prices in less important industries have been left free, is particularly difficult to justify.

There is growing recognition in India that the prices fixed for basic commodities and services are too low. A strong case can be made for raising substantially the prices of the better qualities of coal, if not for removing controls over coal prices altogether. Railway freight rates for coal and other bulk commodities need to be increased, electric power rates should be raised substantially, and much higher retention prices should be paid to the iron and steel plants in both public and private sectors. Pricing policies of public enterprises should be guided by the need to generate surpluses out of which to finance future investment.

Reasonable Return

Interest rates in India have been moving gradually upwards, but they are still low by comparison with most other countries which are equally short of capital. It is important for purposes of screening investment projects (and also for deciding the pricing policies of public enterprises) that a realistic price should be attached to capital. In India, there is a good case for arguing that new investments, whether public or private, should only be undertaken if they can earn a return of at least 10 per cent on all capital invested, after covering operating costs and providing conservatively for depreciation.

The inadequate and erratic supply of imported materials, components and spares is the most obvious and immediate restraint on industrial output. The problem of managing import controls has become extremely complex and is one of the principal causes of the overload of administrative work on both government and industry. The most effective form of external assistance to India in present circumstances would be an increase in general purpose aid not tied to procurement of particular commodities or in aid that can be used to finance imports of materials, components and spare parts for industry and agriculture. Apart from its direct impact on production, assistance in this form will help in relaxing the controls over industry. The private sector would be the principal beneficiary.

The Indian Government and Indian industry have become increasingly export-conscious during the past few years, but the measures so far taken to promote exports have barely scratched the surface of the problem. The difficulties are formidable. One of the most serious criticisms of government export policy is that it has failed to take full advantage of

opportunities for developing exports of agricultural and mineral products, particularly from ore.

Internal prices of many of the goods which India exports are out of line at present exchange rates with world prices. A wide variety of special preferences, rebates and subsidies have been introduced as part of the export promotion campaign. The most important export incentive is the scheme under which manufacturers receive additional import allocations for machinery, materials and components on the basis of their export performance with certain exceptions. Articles imported under this scheme may either be used by the exporter or sold to other manufacturers engaged in exporting the same kind of goods. Exporters are, however, restricted to the import of specified items used in their industry, and there is no general scheme for the retention of export earnings or the free sale of import licences.

The tourist trade is a neglected area of export promotion. Schemes for the development of the hotel industry, for the improvement of internal transport facilities and for the relaxation of restrictions on drinking have not been pressed forward vigorously enough. These are probably the three most important conditions for a major expansion of foreign tourist travel in India.

Uncertain Prospect

The immediate outlook for the Indian economy is obscured by the many uncertainties about how defence production, investment and the balance of payments will be affected by the increases in defence expenditure decided upon after the Chinese attack last October. The national emergency does not appear as yet to have had any seriously adverse impact on the development programme, but some conflict between defence and development is unavoidable, not least because consideration of the new problems created by the emergency is slowing down the process of decision-making at the top levels of government.

A primary object of this year's Budget was to make way for additional defence expenditures by cutting back consumption rather than investment. The Finance Minister's proposals for additional taxation are an indication of India's readiness to make great sacrifices for defence. Taking taxation and compulsory savings together, the yield expected from the new measures in 1963-64 is \$663 million. Just over one third of this will come from direct taxation of individuals and companies, including compulsory savings, and nearly two thirds from indirect taxation, mainly increases in customs and excise duties.

All the States have now presented their budgets, and the estimated yield from the additional taxation already proposed would be about \$85 million. Another \$44 million of additional revenue is expected to accrue to the States in 1963-64 from increases in inter-State sales tax which is legislated by the Centre.

The provision in the Budget for a "super profits tax" has been strongly criticized by Indian industry, which contends that the tax will discourage new investment and penalise efficiency and growth. Industry has indicated that it is ready to bear its share of the defence burden, and the Finance Minister is understood to be considering the possibility of some change in his proposal which would meet the objections raised, while still raising the additional revenue expected (estimated in the Budget at just over \$50 million this year).

The Budget provides for defence expenditures to be more than doubled and for development expenditures to be raised by 10-15 per cent above last year's level. Non-development expenditures, apart from defence, are being held down, and

August 30, 1963

the only major increase proposed in the current expenditures of the Central Government is on account of debt service.

The Budget ends up with an overall deficit of rather over \$300 million to be met by an expansion of Treasury Bills. This is somewhat higher than the provision made for deficit financing in previous years, and if the increases in expenditure on defence and development materialise to the full extent allowed for, there could be considerable pressure on prices. However, there are administrative and planning limitations on the speed at which defence expenditures can be increased, and the same is true in lesser degree of development. Since the additional revenues will start to come in from the beginning of the year, the immediate impact of the Budget on the economy could well be somewhat deflationary.

Shortsighted Policy

The further steep increases in indirect taxation and the need for the upward adjustment of prices of many basic goods and services should result in a fairly general increase in the cost of living. Whatever the risks of price increases in the immediate future, the mission believes that it would be a shortsighted policy to try to suppress inflation by maintaining artificially low prices in such industries as iron and steel, coal, transport and electric power.

Changes in agricultural production during the coming year will depend mainly on the weather. For industrial production the critical factor is likely to be the availability of maintenance imports, and this in turn will depend on how much additional external assistance can be provided in the form of balance of payments support and commodity aid. Shortages of transport, power and coal, though less severe than they were a year ago, could again emerge as obstacles to expansion. Transport will be one of the sectors of the economy most directly affected by defence.

The official balance of payments forecasts for 1963-64 en-

visage imports rising by 25 per cent, exports by 2½ per cent, as compared with the past year. If things turn out well, the mission feels that the forecast for total exports might be reached, but that it is unlikely to be exceeded. More than two-thirds of the increase in imports is attributable to the machinery and transport equipment and the remaining one-third to iron and steel, non-ferrous metals, petroleum products and fertilizers. So far as maintenance imports are concerned, the mission has no reason to believe that requirements have been over-stated.

Non-Project Report

The Government is seeking new aid commitments of \$1,250 million in 1963-64 — about \$550 million of non-project aid and \$700 million of project aid. This would be a higher proportion of non-project aid than was received in the first two years of the third Plan. The mission believes that the ratio of non-project aid to total aid must be increased if full advantage is to be taken of the investments already made, and if the start of new investments in manufacturing industry is not to be pushed beyond what the Indian economy can find the foreign exchange to support.

The total amount of India's external public debt on April 1, 1963, was about \$3,900 million. Service payments on this debt would reach their peak in the years 1965-66—1966-67 when projected amortisation and interest combined would average over \$350 million a year. This would be equivalent to around 18-19 per cent of India's gross external receipts on current account at the present time. The indications are that India will require at least as much external assistance in the fourth Plan as in the third if the growth of the economy is to be maintained along the lines at present proposed. Unless most of the assistance extended from now on is in the form of grants or loans with easy terms of repayment, the burden of debt service will rapidly become insupportable.

WINDOW ON THE WORLD

The Chicken War

From Our Special Correspondent

PARIS:

IT HAS often been shown that the problem of agricultural surpluses in the West can find no solution within the Western world but calls for an effort to find a global solution. In a world where hundreds of millions of men and women are under-nourished, one group of nations (West Europe, North America and Australasia) is chronically excess in most of the temperate-zone foods, and no attempt to dispose of these surpluses within that group has any chance of success. Hence the failure of Britain's bid to enter the Common Market bringing with her the surpluses dumped in the United Kingdom by the "white" Dominions; hence, too, the impossibility of continuing to dispose of \$1,000 million of U.S. farm surpluses in the Common Market if that region is to give preference to its own excess agricultural output. All the nations concerned in this competitive dumping are fostering bigger and bigger surpluses by way of subsidies (the cost of which is borne by their manufacturing industries), and yet their farm produce is still too expensive to be sought by anyone but themselves. People outside this favoured circle of rich countries cannot pay even the low dumping prices of their foodstuffs, so the advanced nations go on trying to force their excess food on each other while exchanging accusations of "protectionism".

Ludicrous Punishment

The case may be illustrated in the current "chicken war" between the USA and the Six. The whole affair seems humorous and is indeed the cartoonists' delight but the protagonists are impervious to ridicule — as when Senator Fulbright (who comes from Arkansas, like millions of American chickens) says that the USA will withdraw troops from West Germany and leave the country exposed to Russian pressure unless Germans consent to eat more American poultry. The disproportion between the crime and the punishment seems ludicrous, yet the chicken war is a perfectly serious example of the dilemma facing the industrialised nations whose silos and cold-storage warehouses are bulging with surpluses. It is so because the appearance of a glut of poultry is no accident: it is the direct consequence of surpluses in other branches of agriculture. It is not just that feeding chickens is one way of disposing of excess grain, so that the poultry war is a side-issue in the much larger affair of the cereals excess. It is also that poultry-breeding is the most profitable occupation for farmers whose other products are in excess and whose revenues are falling further behind those of city-dwellers.

The main facts of the case are known: American farmers, followed after a few years by European farmers, turned to poultry-breeding on an industrial scale in order to boost their (relatively) declining incomes. They soon scored spectacular increases in productivity: they found that by using selected strains of birds, automated fowlhouses and improved feeds, they could produce a three-and-a-half pound bird in eight weeks with eight pounds of feed, compared with a three-pound bird in 13 weeks with nine pounds of feed under the old system. This development occurred with a slight advance of two or three years in the USA, but it is now in full swing in West Europe too; it is important to note this point, because the American case rests on the unstated claim that because the USA got in first, it should be allowed to perpetuate its advantage by dominating the European poultry market. (This, inci-

dentally, is another clear instance of what free-trade doctrine has always meant: temporary and historically accidental advantage in the "international division of labour" should be frozen for all time, for the benefit of the present leader.) At all events, the results were as expected, and as already seen in other branches of farming: a glut of poultry developed in the USA, prices fell by 25 per cent, the rate of profit slumped to half a cent per pound of bird, and there was a frantic search for export markets in other rich countries (not of course in poor countries where men were hungry).

The export market was found first in West Germany, where surplus U.S. poultry was dumped in vast quantities: sales soared from \$2.7 million four years ago to \$52.6 million last year. German consumption of fowl rose from 4.4 pounds per head yearly in 1956 to 13.2 pounds last year, and the American share of the market jumped from 2 per cent to around 33 per cent. Needless to say, this could not last; such astounding results reflected nothing more than the slight lag in the European farmers' modernisation of poultry-breeding. Pressed by the same necessities as the American farmers, they soon took up the same methods and scored similar increases in productivity—with the difference that health authorities here properly forbade the use of hormones recklessly pumped into American birds before the question of their safety for human health was settled. European output of poultry is now rising at the rate of 13 per cent a year, whereas demand seems to be expanding at only 3 or 4 per cent annually.

Narrow Lead

As has happened in every previous instance of an economy making up its arrears in regard to a more advanced nation, local producers asked that their fellow-citizens give preference to local goods of which output was expanding rapidly. To do so imports of U.S. poultry would have to be cut back to a more moderate figure, and this is the purpose of the Common Market's duty: by a complex system of minimum prices for imports, the import levy on U.S. birds is raised from five cents to 15 cents a pound. This would reduce American sales in West Germany to what they were around 1960, when they were already many times the sales of 1956 or 1958. But the American poultry farmers' lead over their European rivals was so narrow that Washington has to give a highly peculiar meaning to "traditional" sales outlets: they are taken to mean last year's once-for-all record sales. In other words, the temporary and exceptional advantage taken for a brief period has to be frozen permanently for the benefit of American farmers, and any reduction from that level is an act of "protectionism".

That protection has nothing to do with the case may readily be shown. All the Six run immense trade deficits with the USA: France buys twice as much from the Americans as she sells them and in the first half of this year had a deficit of \$1,117 million, while West Germany this year will lose \$1,000 million in commerce with the USA. There is no special reason why, in this highly unbalanced commerce, farm produce should be singled out, but even if it were it would be seen that the Common Market has been far from protectionist. It has increased its purchases of U.S. agricultural goods by \$282 million in four years. Since the war, U.S. sales of cereals have been multiplied by 13, of poultry by seven, of soja beans by 62, of soja oil by 187, and so on. There is even less reason why trade in frozen poultry should be singled out,

but if it were it would appear that under the proposed new regulations the USA would retain an immense market in Europe, many times the late-1950's figure and only \$20 million below last year's—\$20 million out of the \$4,450 million worth of U.S. exports sold in the Common Market. Obviously, the battle-cry of "protection" can only be raised in bad faith.

Yet it inevitably will be raised as long as the Western nations are trying to force on each other first this and then the other surplus agricultural commodity. There is, of course, no essential difference between the methods by which the various Western nations encourage the production of these surpluses: the systems of price supports and export subsidies used in each country differ in detail but all have the same effects. There is nothing more protectionist about the Common Market system than the American, on which indeed it is modelled. By similar methods, all the nations concerned are producing more food than they can eat and it is absurd for them to complain that it is all the other man's fault. Nor is there any prospect of this soaring productivity on the farms being curbed; on the contrary, output will increase rapidly in the next few years and will be more and more out of relation to what the Western nations can consume. One American farmer can now nourish 26 people; one French peasant can feed only nine, but he is beginning to apply the same techniques as in the USA and will shortly be able to do as well—while meanwhile American agricultural productivity will have increased further, because the revolution on the farms is by no means complete yet in that country.

The absurdity of using tariff reprisals against each other,

in an attempt to dump more food within the club of rich nations, is evident, and current American threats in that sense must be taken as jockeying for position before the forthcoming world trade conferences. It is perfectly clear that with the best will in the world the West Europeans, North Americans and Australasians cannot eat all the food they are producing and trying to sell each other, and much less will they be able to do so in five years' time. Output limitations will not work, for two reasons. Firstly, the technological revolution on the farms is irreversible and even when acreages and farm populations are reduced drastically, harvests continue to mount. Secondly, farm populations cannot be cut much more (least of all in the USA where millions are unemployed in the cities!) and as long as men stay on the farms they will demand revenues comparable with citydwellers', which they can get only by producing more—and if one crop is limited artificially, they will produce more of another. Nor is there any solution to be found in the direction of a better "division of labour" inside the Western agricultural world, because the criteria for any such allocation of tasks are lacking. Certainly, temporary advantage such as the Americans have enjoyed till now in poultry-breeding is no such criterion because it can be reversed in the space of a few years. And in general there exists no economic or rational reason for preferring European intensive farming to New World extensive farming (the latter made possible, incidentally, only by an artificial limitation on immigration.) The only way out is global agreements that will pour off the West's food surplus to the hungry nations that are too poor to buy it. The ludicrous chicken war may bring realisation of that fact somewhat nearer.

Kamaraj Plan: What Next?

By Our Special Correspondent

NEW DELHI:

SINCE MR. MORARJI Desai and Mr. Lal Bahadur Shastri have asked to be relieved for party work within the next few days, the Prime Minister has to make up his mind more or less immediately on their successors in the portfolios of Finance and Home respectively. Rather curious is the fact that Mr. Swaran Singh is being tipped for almost every conceivable vacancy simultaneously. When the Prime Minister was looking for a new Food and Agriculture Minister, Mr. Swaran Singh came into the news. As soon as it became clear that Mr. Lal Bahadur Shastri wanted to resign in pursuance of the Kamaraj Plan, it was Mr. Swaran Singh again who was mentioned for the consequential vacancy. Now one hears him mentioned in almost one and the same breath as the next Home Minister as well as the next Finance Minister. It is possible to interpret all this as testifying to Mr. Swaran Singh's popularity and versatility. It is also possible to interpret this as signifying that he is regarded as a Minister with no particular personality.

While there is certainly much speculation about who the Prime Minister may have in mind for the Finance portfolio, it is generally being assumed that the choice will fall on Mr. T. T. Krishnamachari. Possibilities of any of the existing junior Ministers getting promoted to Cabinet rank are considered to be few. But it is more likely that there may be two or three newcomers to the Cabinet. The Congress President, Mr. Sanjiviah, is regarded as a certainty in the place of Mr. Jagjivan Ram. A name which has cropped up in discussions here is of Dr. Wankhade, currently Industries Minister in the Government of Maharashtra. Some observers are inclined to attach significance to Mr. Nehru's observation in the course of his speech on the "no confidence" motion that the Community Development Ministry had fallen into a rut. It is considered likely that Mr. S. K. Dey's tenure may come to an abrupt end before Mr. Nehru has done his final thinking on the Kamaraj plan.

The Development Council for Automobiles, Automobile ancillary industries and transport vehicle industries recently considered the report of its Sub-Committee which examined the Twentieth Report of the Law Commission of India containing the Draft Hire Purchase Bill, 1961. The Council felt that if the Draft Hire Purchase Bill, 1961 as proposed were enacted, it would have far reaching consequences in the Automobile as well as the Road Transport Industries. The Sub-Committee recommended that:

"... either the applicability of the Hire Purchase Bill be of limited scope similar to the English Hire Purchase Act, namely, the bill be applicable only to transactions where the Hire-Purchase price is Rs. 4,000 and less; or the definition of 'Statutory Proportion' contained in Clause 18 of the Draft Bill be amended so that the owner cannot exercise his right to seize the goods otherwise than through Court when the Hire-Purchase price exceeds Rs. 10,000 when 90 per cent thereof had been paid and when it is Rs. 10,000 or less when 66-2/3 per cent thereof had been paid."

With regard to the provision for the Owner to seek redress in a Court of Law upon default by the Hirer, as provided in Clause 18, it recommended:

"the draft Bill is silent with regard to the procedure that may be adopted by the Courts in dealing with the subject matter. The provisions of the English Hire Purchase Act, 1938, as well as the Country Court Rules pro-

vide for a quick disposal of such actions. Similarly, it is suggested that suitable provisions may be inserted in the Draft Bill for a summary procedure to be adopted by the Courts for speedy disposal of the cases, or in the alternative, Tribunals may be constituted under the Act to go into these actions."

After having considered the report, the Council recommended that there need be no monetary ceiling for the hire purchase deeds and the 'Statutory Proportion' contained in Clause 18 of the Draft Bill be amended in such a way that the owner cannot exercise his right to seize the goods otherwise than through Court when 90 per cent of the value of the goods had been paid.

In regard to development, the Council felt that for achieving the strong industrial base for the full development of the automobile industry, planning of the industry should be on a long term basis, say for 10 years each. The Industry should bring in know-how even for items which would not be economical to take up for manufacture in the country and the Government should also encourage the industry to build capacity for such items to avoid dependence on others.

In this connection the Council pointed out that its earlier estimate of foreign exchange requirement of Rs. 43 crores by way of capital goods to meet its target was based on the assumption that the industry could import machinery from any source but as the foreign exchange available was mostly tied up to different sources, the estimates would go up.

Import Content

The Council felt that a study of the actual current and future import content of automobiles should be made in order to assess the total foreign exchange requirements to achieve the planned targets for the third five-year Plan.

The Council recalled its earlier recommendation to the Government to raise the Octane rating of gasoline to 83, which had been accepted by the Indian Standards Institution also but observed that the Oil Companies were not in a position to do so as the Government would not allow them to increase the price of the fuel, which was only marginal. It recommended acceptance of the marginal increase in price asked for by the oil companies as ultimately this would improve the performance of the vehicles. It was brought to its notice that the Oil Companies had advised the industry that due to insufficient foreign exchange allocation made to them they would not be able to import certain ingredients of the fuel and therefore the future supplies of lubricating oils would also be inferior in quality. As this would prove harmful, the Council recommended that this should be looked into immediately and the Oil Companies should be given facilities to import essential chemicals in order to supply better fuel and oil.

On the prices of automobiles spares, the Council observed that the retail traders who were either within the control of the vehicle manufacturer or the ancillary manufacturer adhered to the price formula recommended by the Council, and approved by the Government. It was the retail traders numbering over 60,000, who were not under the control of either the vehicle manufacturers or the ancillary manufacturers (and who either get the spares imported on their own, or through other agencies) charged high prices for which the manufacturers could not be held responsible. To avoid this malpractice, the Council desired that the Directorate General of Technical Development should take up the matter with the Chief Controller of Imports on the possibility of embossing the con-

August 30, 1963

dition on import licences for motor vehicle spares, in regard to marketing as per the approved price formula. On the suggestion that either the manufacturers or the two Associations, namely, Automobile and Ancillary Manufacturers' Associations, should be given the licences to import the spares which were not being manufactured in the country, and make them available to the consumers at prices conforming to the policy approved by the Government, the Council desired that this should be left to the Association to take up the matter with the Chief Controller of Imports.

The Council recommended that the decisions taken at the meeting held on 16th January, 1961 with the representatives of vehicle manufacturers, should be implemented, so as to remove the restrictions on the axle weight, wheel-base length etc. etc. as this would enable the manufacturers to introduce heavier vehicles than the ones presently produced in the country as this would result in operational economies. The 25 per cent overloading now being permitted, it was observed, was disastrous as generally the maximum load rating specified by the manufacturers tended to be the safe operating maxima.

★★

It was recently reported that the Hindustan Motors and Premier Automobiles have been allowed to manufacture engines for commercial vehicles manufactured by them. So far they had to fit in Perkins PGV Vehicular engines into commercial vehicles produced by them. Under the decision, Hindustan Motors and Premier Automobiles will be allowed to manufacture diesel engines for fitment to its vehicles, up to 15,000 per annum each. This capacity will include petrol engines as well. Side by side Simpson Company is allowed to manufacture commercial vehicle chassis in the 3-6 payload range for a capacity of 12,000 per annum. The specification of the chassis will be subject to approval by the Government.

The Government has fixed September 30, 1966 as the changeover date till when both Hindustan Motors and Premier Automobiles will continue to depend on Simpson for their diesel engine requirements.

★★

Experts from the USA and Britain visited India to assess the plans for increase of production to meet defence requirements, both in the Defence establishments and in the private sector. An Australian team of specialists also visited India in July 1963.

In relation to production for defence requirements in the private sector, the experts had stated that the factories they had visited represented a good source for production of defence material, and that some of the work can be done with the existing machine tools and the other work with additional machinery. They had also recommended that an effective machinery should be set up for utilising fully the capacity in the private sector for production of defence material.

★★

With a view to reducing the drain on foreign exchange resources caused by imports of lead, copper and zinc, considerable thought is being bestowed in official circles on curtailing the consumption of these three non-ferrous metals and on augmenting their supplies from indigenous sources. Two sub-committees, one set up by the Development Council of Non-Ferrous Metals and the other by the Metals Committee of the Council of Scientific and Industrial Research, are now seized of the problem. Their reports are expected in about two months' time.

There is said to be considerable scope for substituting the use of lead with aluminium in cable coverings and that of red lead, litharge and hydrated basic lead carbonate by aluminium composite primer in the manufacture of paints and pigments. Long-term trials conducted at various places

in this regard, it is stated, have yielded very satisfactory results. The use of lead bearing alloys, it is further thought, can be progressively reduced for lining chemical equipment and tea chests, for absorbing X-ray and radio-active radiation, for vibration damping pads of heavy machinery and for coatingterne plates. No reduction is considered possible in the use of this metal in the lead acid storage batteries; consumption on this account may even go up in view of the present emphasis on defence production. The recovery of secondary lead from scrapped batteries and its re-use for the production of new ones, however, is thought feasible. Considerable saving in foreign exchange, it is felt, can also be effected if instead of importing lead in the metal form, lead concentrates are imported to be smelted in refineries to be set up in the country.

As regards copper, decision has already been taken to gradually replace its use by aluminium in the manufacture of all sizes of insulated cables and wires. The VIR and PVC cables of sizes 7/0.04" or its equivalent and above and power cables of all sizes came to be produced out of aluminium after April 1, 1962. Orders have been issued this week to swith over, with immediate effect, to aluminium in the manufacture of cables of seven strands also. This substitution in the case of smaller sizes of wires and cables will follow in another six months. Mining cables, switch boards, wires and flexibles would, however, continue to be manufactured out of copper for the time being. The total foreign exchange saving after this programme is fully implemented is expected to be of the order of Rs. 2.8 crores.

Further, fairly good economies, it is hoped, can follow if aluminium is increasingly made use of in the manufacture of various components of transformers, electric fans, air-conditioning and refrigeration equipment, telephones, automobiles etc. There are, of course, definite possibilities of copper being replaced by cheaper metals or plastic in industries such as zip fasteners, oil pressure lamps and stoves, hardware fittings, lamp caps and fixtures and in coinage metal.

★★

For augmenting the indigenous supplies of copper, there is need to expedite the setting up of the 22,000-ton copper smelter based on the Khetri and Daribo copper deposits in Rajasthan and a smelter licensed to be put up by the Indian Copper Corporation for the manufacture of 8,400 tons of electrolytic copper from imported blister copper.

So far as zinc is concerned, a good deal of saving in its use, it is thought, can be effected by reducing its consumption for galvanising and manufacture of utensils. A decision has been taken recently to curtail the use of zinc for galvanising only the top portions of transmitter towers which are subject to electric corona effect. The remaining parts of the towers can be either hot-dip aluminised or painted. A good amount of reduction in the use of zinc for galvanising purposes (aproximately Rs. 2.5 crores) may follow when decisions are taken on two other proposals — (i) galvanising only the inside of steel pipes and (ii) taking recourse to aluminising instead of galvanising of sheets and plates.

The early finalisation of Messrs. Binani's scheme for setting up a 20,000 ton capacity zinc smelter based on imported zinc concentrates is being emphasised. This project, along with the establishment of a smelter based on zinc ore reserves of Zowar mines, by the Metal Corporation of India should go a long way in bringing down the cost on zinc imports.

For mitigating the hardship caused to the small sector by progressive reduction in copper and zinc allocations, it is considered necessary that small-scale workers should be provided with alternative metals or work.

★★

The Japanese credit carries an interest of 6 per cent per annum and is repayable in 15 years. The sum of 5.4 billion Yen (Rs. 7.14 crores) has been made available for the first two years of the third Plan in addition to the Second Yen credit of 28.8 billion Yen (Rs. 38.09 crores). The total allocation of 34.2 billion Yen (Rs. 45.23 crores) has been used mainly for import of equipment and machinery from Japan required for projects connected with Power, Industry, Railways, Transport and Communications. Among the important projects covered by the credit are the Gorakhpur fertilizer project, Durgapur special and alloy steel plant, Kosi hydro-electric project and the Durgapur power station.

★★

The target of production for motor cycles, scooters, mopeds, etc. by the end of the third Plan period is 60,000 Nos. per annum. This capacity is fully covered by licences issued to eight firms. Five firms are already in production. Their combined production during 1962 and 1963 (January to June) was 25,040 Nos. and 11,947 Nos., respectively. Two more licensed units are expected to go into production during this year or early next year. Manufacturers have, therefore, been given necessary facilities for import of capital goods so as to step up indigenous content. When the indigenous content is increased to about 90 per cent, it would be possible to increase the output which would facilitate reduction in the cost of production and the selling price.

★★

A letter of intent has been granted to the Andhra Pradesh Mining Corporation Ltd., Hyderabad, approving its scheme for setting up a cement factory of annual capacity of 200,000 tons, near Bonakalu.

Limestone for the proposed factory will be drawn from the Jaggayyapeta area of Krishna district.

Two new licences have so far been issued for the establishment of cement factories in Madras State.

One of the licences has been issued to Messrs. India Cements Ltd., Madras, to set up a cement factory of capacity of 200,000 tons a year, near Sankaridrug in Salem district; and the other licence has been issued to Messrs. Chettinad

Cement Corporation Ltd., Madras, to set up a cement factory of capacity of 400,000 tons a year, near Karur in Tiruchirappalli district.

The existing installed capacity of the Kymore Cement factory is about 582,000 tons a year and that of the Satna cement factory about 251,000 tons a year. The expansion schemes at Kymore are for the production of about 25,000 tons of white cement a year and about 180,000 tons of portland cement a year. The expansion scheme at Satna will have a capacity of 330,000 a year.

★★

A licence under the Industries Act, 1951, has been granted to a private firm for the establishment of a new undertaking at Indore for the manufacture of the following items of textile machinery:

Drawing frames	..	..	..	100 Nos. per annum
Speed frames	..	..	..	150 Nos. per annum
Ring frames	..	..	..	600 Nos. per annum
High Speed Winding Machines	..	..	..	50 Nos. per annum
Single Spindle Pirn Winders	..	..	..	50 Nos. per annum

The third Plan target of production of textile machinery is Rs. 20 crores per annum. As against this the present production is of the order of Rs. 14.5 crores. Textile machinery worth about Rs. 20 crores is being imported.

★★

It is proposed to set up a new unit at Bhadravati for the production of pig iron with a capacity of 120,000 tons per annum.

Feasibility studies are being conducted for setting up a new steel plant in the Goa-Hospet region in the fourth Plan period.

★★

Jai Hind Agencies, Cochin have been informed that Government would be prepared to grant them an industrial licence to set up a factory in Kerala in collaboration with an American firm for the manufacture of reclaimed rubber, subject to their being able to arrange the import of plant and machinery on terms and conditions acceptable to Government.

The Factory could be expected to go into production in about two years' time after the issue of the industrial licence.

★★

The Government of India have floated an entirely State-owned limited company in the public sector called the Aeronautics India, Ltd., with an authorised capital of Rs. 25 crores, for the manufacture of MIG supersonic and other types of aircraft.

The company will control and manage the affairs of the complex of factories to be set up for the manufacture of the airframes, aero-engines, under-carriages and other components of aircraft.

Agriculturists Against 17th Amendment

From Our Correspondent

BOMBAY:

THE CONSTITUTION Seventeenth Amendment Bill has caused great concern among agriculturists who do not want to be deprived of their right to appeal against the provisions of the Maharashtra State Lands (Ceiling on Holdings) Act.

Out of 43,37,903 agricultural holdings, there are only 32,539 holdings, i.e. 0.75 per cent of the total holdings which are above 100 acres and which are expected to yield as surplus only 11 lakh acres of land which comes to about 2.02

per cent of the total agricultural land of the State. Secondly, absentee landlords have been almost completely divested of their lands by tenancy legislation. Cultivable waste in Maharashtra State is about 23 lakh acres. Apparently, there is no land hunger among the landless persons to whom the surplus lands are to be given. If it were not so, the cultivable waste with the Government would not have remained to such a large extent. According to declared objects of this Act, the surplus land is to be given to the landless labourers who according to the official statistics number 58,35,000 includ-

ing the dependents. The estimated surplus of 11 lakh acres as a result of implementation of this Act would be a very small fraction of the land required to rehabilitate the landless. Its distribution would create further additional uneconomic holdings. Besides, by implementation of this Act, higher production is not possible; on the contrary production would suffer as the existing large mechanised and scientifically operated farms would be split into several units and their productivity, therefore, would suffer.

While determining the general ceiling on agricultural holdings in the State, the Planning Commission had recommended that it will be necessary to consider the categories of farms to which the ceiling need not apply. Three main factors could be taken into account in deciding upon exemptions from the purview of the ceiling, viz. (a) integrated nature of occupations, especially where the industrial and agricultural workers are undertaken as a composite enterprise, (b) specialised character of operations and (c) from the aspect of agricultural production, the need to ensure that efficiently managed farms which fulfil certain conditions are not broken up. All these factors are applicable in toto to sugarcane and as such, it would have been reasonable on the part of the State of Maharashtra to exempt sugarcane plantations from the Ceiling Act. But unfortunately the Maharashtra Government has disregarded this recommendation of the Planning Commission. By fixing the ceiling at a low level of 18 acres the Government has knocked off 41 per cent of the area under sugarcane as surplus land. Ill-conceived, as this measure is, to allow such an Act to go in the Ninth Schedule of Constitution would be great injustice to 67 per cent of the rural population. It is heartening that the Congress Parliamentary Party itself is giving second thoughts to the Seventeenth Amendment Bill. A sub-committee has been appointed to examine all its implications.

★★

The one day token general strike organized by all the Opposition parties commenced, as scheduled, on August 19 midnight. According to estimates compiled by knowledgeable circles, the nation lost Rs. 40 million in industrial output from the day's token strike by the 7½ lakh workers and white-collared employees. The stoppage, one of the biggest in Bombay City's trade union history, was entirely peaceful and resulted in a loss of Rs. 45 lakhs in the shape of wages. The largest bloc of workers to participate in the strike was from the textile industry whose labour strength is 2,50,000. The strike, however, was far less crippling than its sponsors had hoped and the authorities feared. The essential services such as water, electricity and meat supply were well maintained by the assistance of homeguards and voluntary workers. As the morning of Wednesday wore on, thousands of striking workers, including municipal workers, presented themselves for duty. Normalcy was once again restored in the city on Wednesday by the afternoon. In the post-strike briefing to Sachivalaya reporters, the Chief Minister declared that the Socialist sponsored strike had ended in a 'fiasco'. He reported that the strikers had restarted work even before the union leaders had formally called off the strike. As a goodwill gesture, the Government proposed the release of all people arrested in connection with the nine-day Municipal strike with a few exceptions, that is, those charged with offences involving violence. The Chief Minister further announced that the workers' demands would be dealt with according to the labour laws by the Municipal Commissioner, the Corporation and the Labour Department.

The Maharashtra Government took quick steps to rectify the anomalies in the Bombay cost of living index. A three member expert committee was constituted under the Chairmanship of Professor D. T. Lakdawalla, Director of the Uni-

versity School of Economics. The Committee was directed to submit its report within two months. If it cannot report in time, it has to give an interim report within the prescribed period on the readjustment of the existing series.

An assurance was also given by the Housing Minister of Maharashtra, Mr. Homi J. H. Taleyarkhan, that he had already moved the Union Housing Ministry not to evict industrial workers who exceeded the Rs. 350 income-limit per month. According to the Minister, those workers, who by sheer hard work earned more than Rs. 350, should not be deprived of their shelter provided by the Bombay Housing Board. What steps the municipality and Government would take to remedy the grievances such as the rise in the dearness allowance remains to be seen.

★★

Trading on the Bombay Stock Exchange, on the whole, was featureless. Caution constituted the key note of sentiment with labour unrest in the city and the impending announcement of the Cabinet re-shuffle. The market reacted somewhat bearishly during the week-end to the news that Mr. Morarji Desai and five others, including Mr. S. K. Patil, were to be dropped in the drastic reorganization recommended by the Prime Minister to implement the 'Kamaraj Plan'. Tata Steel slipped down in unofficial trading from Rs. 141 to Rs. 140, Century from Rs. 534 to Rs. 528 and National Rayon from 322 to Rs. 318. The present Finance Minister has become somewhat unpopular recently following the imposition of the Gold Control Order, the Compulsory Deposit Scheme and the controversial SPT but market circles believed that his presence was an indication of the continued support of the Government of India to the private sector. His strong opposition to the demand for nationalisation of banks was welcomed by business circles. There is a general fear that the exit of top administrators might considerably weaken the Central Government as Mr. Nehru has indirectly admitted.

The inter-bank call rate dropped in Bombay from 2 per cent to 1.5 per cent. The rate opened at 2.5 per cent and remained at that level until mid-week. The market reflected lenders all over at that rate. Money market circles expect a further decline in the rate. This is because the prospects of rate there quoted around 0.75 per cent. If the demand for quarterly tax payments develops on expected lines and if banks invest the surplus funds in Treasury bills, there might not be a further fall. The practice of banks keeping funds with industrial houses of directors was not well received in knowledgeable circles. The Reserve Bank is believed to be viewing the matter with considerable concern.

Banks appear to be reluctant to collect compulsory deposits on behalf of the Government, as they cannot retain considered burdensome and costly. For instance, the banks appointed new staff on a temporary basis but even so they have to pay compensation to staff in the event of retrenchment. The Government's agreement to reimburse the expenditure connected with the Compulsory Deposit Scheme does not cover the retrenchment compensation. Banks appear to have sent a request that the Government should bear this liability. The expenditure on stationery and other items is likely to vary from bank to bank. Banks want therefore the reimbursement of actual expenditure and not the expenditure incurred at the average rate per account. Opinion among banking circles is that the compulsory deposit scheme is unwieldy and costly. Although the Government is paying 4 per cent on compulsory deposits, the actual cost is likely to work out around 8 to 9 per cent or nearly twice the Bank rate.

K. K. Birla Urges More Production

From Our Correspondent

CALCUTTA:

ADDRESSING THE first quarterly general meeting of the Indian Chamber of Commerce, Mr. K. K. Birla, President, pointed out that the problem of shortfalls in agricultural and industrial production could not be solved through controls; increased production was the only remedy. Controls, he said, produced a psychology unfavourable to the economy and the vicious circle of shortages, hoarding and corruption vitiates the economic structure. It is necessary that the basic issue of larger production must be given the greatest possible emphasis in the context of the present economic situation.

Experience has shown that the countries which have industrialised at a faster pace are those which have ensured a rapid rate of capital formation. For instance, in the United States the new capital raised by corporations between 1952 and 1961 was almost Rs. 59,000 crores or Rs. 5,900 crores per annum on an average. In Japan the new capital raised by companies between 1953 and 1961 was as much as Rs. 4,000 crores or Rs. 445 crores per annum. In fact, Japan was able to increase its capital formation by as much as 100% during the last few years. In the U.K. the new capital raised was Rs. 3,500 crores between 1954 and 1961 or Rs. 437 crores per annum. During the period 1952 to 1961, India raised only Rs. 591 crores of new capital which comes to Rs. 59 crores per annum only. At present the total new and additional capital raised by companies in India is round about Rs. 90 crores per year, out of which the share of new companies is only about 35%. This will indicate that the available capital for industrial expansion has remained quite insignificant. While our sources for capital formation are not expanding, the need for more capital continues to grow with the requirements of new and modern industries, which are becoming more and more capital intensive. If the Indian economy is to survive the competition with the fast developing and modern industries in advanced countries, it is imperative that we should think in terms of much larger sources of supply of capital to make it possible for Indian industry to expand rapidly and adopt modern methods of production.

Individual Saver's Role

The mainspring of savings in the economy is ultimately the individual. When savings increase at the individual level for investment in productive enterprises, they, in turn, generate more savings and a higher rate of investment. The impact of our rising tax structure has been such that savings at the individual level continue to be depleted and the increasing diversion of income to the exchequer takes away the main source of capital formation. At the same time, expenditure at the hands of the Government continues to be diverted in an increasing manner to unproductive channels so that the economy as a whole is unable to grow faster.

In between the second and third Plans the burden of taxation on the economy has enormously increased. In 1960-61, the final year of the second Plan, the total national income was Rs. 14,160 crores while in 1955-56, that is to say immediately before the second Plan, it was Rs. 9,980 crores. The increase in the national income was thus Rs. 4,180 crores. For the same years, the figures for tax revenue were Rs. 1,355 crores and Rs. 760 crores respectively. The increase in tax revenue was thus Rs. 595 crores. The percentage of additional tax on the additional national income therefore works out to about 14. This was the percentage for the period of the second Plan. Working out the percentage similarly for the third Plan period, it would appear that during the first year of the third Plan the impact of taxation had increased by as much as 38 per cent of the increase in the national income. The sudden jump in taxation right from the beginning

of the third Plan has been largely responsible for slowing down the rate of economic growth. During the last 15 years a country like Japan which had been utterly devastated during the war has made a spectacular recovery and has repaid most of its debt. During this period the Japanese Government had to estimate the growth of the economy carefully year by year and had to adjust the tax rates and hold them down in order to progressively augment savings for investment. This resulted in a greater investment in industrial undertakings and it has been estimated that a quarter of the national income of Japan has been invested in industry every year resulting in an annual average rate of growth of as much as 9 per cent of national income and about 20 per cent in industrial production.

Taxes Retard Progress

In India by taxing the middle and higher income brackets at the rate of 50 to 90 per cent, and with the tax on wealth, it is not possible for those who normally could save more for larger investment to do so. In fact, at certain levels the rate of tax goes up to over 100 per cent which leads to dis-investments in order to pay taxes. It is the individual who finds capital for the corporate sector and if the capacity of the individual is depleted it reacts on the corporate sector as well. In progressive countries it is now recognised that a high rate of tax positively retards economic growth and they are thinking in terms of reducing the tax burden both on individuals and companies. Today our rates of taxes on personal incomes are even higher than in the United States. At a range of annual income of Rs. 30,000 personal taxation as percentage of income in the United States is 12.4 as against 26.4 in India. On a higher income of Rs. 5 lakhs the incidence is 53.7 per cent in the United States and 79.6 per cent in India. The Kennedy administration in the United States feels that even the prevailing rates are high and there are proposals to reduce them further.

The other source of industrial expansion, Mr. Birla said, is ploughing back of corporate profits. Tax system has to be devised in a manner which leaves an increasing amount for utilisation as retained profits. There is a proposal to reduce the company tax in the United States from the present rate of 52 per cent to 48 per cent. In India, the company tax was originally 45 per cent and as the shareholders had the benefit of grossing up, the effective rate of company tax was only 30 per cent. Two years ago it was raised to 50 per cent and in the current year the super profits tax has been levied at a confiscatory rate of 50 to 60 per cent on profits in excess of 6 per cent of capital and reserves. It is difficult to visualise as to how profits above 6 per cent could be described as super profits, when it is impossible to raise debentures at less than 7 to 8 per cent, and preference capital has to be assured a return of at least 9 per cent. Commercial banks charge interest at 8 to 9 per cent or even more on their lendings. This had led to the growing belief that the super profits tax was imposed not so much on revenue considerations, but more on ideological grounds to limit profits at an unrealistic level. If it was merely a question of raising additional revenues it could have been done by an increase in the rate of company taxation during the emergency.

The levy of the super profits tax and the present fiscal structure generally has done considerable harm to the capital market. The depression that has developed in the market more particularly after the last budget has continued to undermine the confidence of the investing classes. Expansion programmes had to be postponed by several well-known companies. Retained profits have dwindled and there has been a pronounced tendency on the part of many firms to curtail

August 30, 1963

dividends. A more serious development has been that several of the new issues which were floated in recent months have flopped miserably on account of diffidence among the investing public. Some of these issues fared badly despite the fact that they were issued by well-known business houses. Even some debentures failed to collect full subscriptions. It appears that capital issues have become unattractive on account of the "growth prospects" and "dividend prospects" of companies being adversely affected by the super profits tax. Mr. Birla urged the Government to give serious thought to the present trends in the capital market and devise effective ways and means to ensure a rapid rate of capital growth for industrial expansion.

Apart from the savings at the hands of individuals and corporations, the other important source of finance is the inflow of larger private investment capital from abroad. All over the world, developing countries have depended on foreign capital for their economic advancement. Even after the last war the economic recovery of Japan and Germany was made possible due to the large inflow of foreign capital into those countries. India cannot be an exception. The market for foreign capital is highly competitive and it is bound to flow into those countries which offer better growth prospect and where the economic climate is helpful. Company rates of taxation in several countries which are on the look out for foreign capital are between 30 and 35 per cent as against 50 per cent in India and moreover they do not have the super profits tax. It will be of interest to note that while private foreign investment of the United States increased from Rs. 1,435 crores in 1956 to Rs. 1,845 crores in 1960, the percentage thereof that represented inflow into India was only 0.5 per cent in 1956 which declined to 0.3 per cent in 1960. This only shows that India had been unable to develop a climate favourable to attract larger inflow of capital from abroad.

Controlled Economy

Another aspect of foreign capital concerns our own administrative set up and the restrictive and a highly controlled economy. Administrative problems resulting in delays and red tape and numerous controls very often deter foreign investors to come to this country. Due to these and various other reasons, there has been a fall in the number of foreign collaborations during recent months. An entrepreneur wanting to set up an industry with foreign collaboration has first to obtain an industrial licence, then to negotiate the collaboration agreement and get it approved by the Government, then to obtain the import licence and so on and so forth. Each stage takes a pretty long time so that it is not less 4 or 5 years before the proposed plant could go into production. Unless such difficulties are removed and a suitable climate created to make investment in India more attractive and unnecessary controls on the economy were removed and procedural delays eliminated, it will become increasingly difficult for Indian industries to grow and for more foreign capital to come in.

Mr. Birla also referred to the inability of the banks to finance on an increasing scale the growth of new enterprises due to lack of resources and the slow rate of increase in the deposits. While the Government have set up many financial institutions which are trying to be helpful to new undertakings there in an overall paucity of funds due to the limited resources in the country and it is becoming increasingly difficult for industry to find funds for expansion from the banking system.

Apart from the report of the Bose Commission on the working of certain Indian companies, there has been much discussion in the country regarding the further amendment of the Company Law. The Bose Commission dealt with matters concerning companies which took place many years ago before the Companies Act, 1956, was enacted. That Act and the comprehensive amendments made in it subsequently in 1960 have already brought about far-reaching changes in Company Administration. While any undesirable practices which undermine the

growth of the corporate sector have to be discouraged, Mr. Birla felt that the present Companies Act, as it stands, is already sufficiently comprehensive to regulate and control corporate activity adequately in every detail. In fact in certain respects it is even now so restrictive that it leads to undue delays and hardships in operation. In view of this, any further restrictions imposed on companies will make it extremely difficult to transact business smoothly and efficiently and this will have the effect of seriously undermining the joint stock enterprise.

Mr. Birla, in this context particularly mentioned the aspect of inter-company financing. The Companies Act and the capital issues control restrict diversification of company activities in other fields or making investments in other companies. This makes the utilization of company's funds extremely difficult and retards the rate of industrial growth particularly when the sources of funds for the corporate sector have already proved to be so inadequate. With the curtailment of savings from personal incomes and the inability of companies to plough back larger profits and the failure of the banking system to make available more funds for industrial expansion, if inter-company loans are also made more difficult it will have a stifling effect on the growth of the corporate sector.

★★
The latest indications about the size of the current year's jute crop do not seem to support the view that the outturn will be smaller than earlier expected. There is of course no official estimate yet but the trade estimates now available place the new crop between 75 lakh bales and 80 lakh bales. Information reaching Calcutta from the various growing areas goes to show that the crop has not been affected adversely to any appreciable extent by inadequate rainfall or floods. On the other hand, the weather has been generally conducive to the healthy growth of the plant in most regions and if the quality of the crop already harvested is any indication, the new crop as a whole should show a marked improvement in quality over the previous year.

Even on conservative reckoning, the total availability of jute will be over 110 lakh bales (75 lakh bales current production plus about 35 lakhs carried over from the previous season). As against this total, domestic consumption may be put at 75 lakh bales at the most. This will leave a balance of about 36 lakh bales. In this calculation three factors have not been taken into consideration: imports from Pakistan, unauthorised jute entering the country across the border from Pakistan and exports, if any. If however the new crop turns out to be larger than reckoned in the above estimate and in the event of continued receipt of smuggled jute from Pakistan, the new crop as a whole should show a marked improvement, the problem of disposal of the crop will still prove a difficult one though at the moment the official assessment seems to be that it will not be difficult to maintain the official operational price of Rs. 30 per maund basis Assam Bottoms. The fact that prices have reached the minimum levels during the past one or two weeks seems to confirm the official optimism but the real test will be when arrivals gather momentum.

In the meantime, the speculative fervour in the jute goods market has considerably diminished and sacking prices are at the moment lower by nearly four points than their level a week ago. Although the figures for despatch of jute for exports in the coming months, they nevertheless give an indication of the trend. The salient features of the July figures are a rise in total despatches, a fall in local consumption and higher despatches of goods intended for export abroad. Evidently, the higher despatches for export poses has encouraged the IJMA to continue capacity working of mills. It is believed that any further orders from overseas consumers for sacking goods will perforce have to come to India as Pakistan is reported to have fully sold its rated

output to the end of the year. However, it is not a satisfactory position for Indian sacking that it can sell in overseas markets only when Pakistan has completed the sale of its output in this category of goods. As for hessian, burlap consumption in the United States in July has been lower than in the previous month by one million yards. Recently there

For the Backward Areas

From Our Correspondent

MADRAS:

THE SEMINARS sponsored by the Madras Government in various district centres have served to focus attention on the backward nature of certain regions in the State. It is expected that, as a result of a close examination of the possibilities for industrial and agricultural developments of selected areas, the best use can be made of available resources for balanced and sustained growth. It is, however, felt at the same time that the major deficiencies which have been responsible for the relatively slower pace of economic development until recently should be overcome and greater emphasis laid particularly on the development of engineering and small-scale industries.

At the seminar held at Madurai a few days back, Mr. R. Venkataraman pointed out that steps should be taken to convert sea water into drinking water so that the needs for the States for various purposes could be more easily met. While efforts are being made to bring Krishna waters to Madras City and irrigate larger areas in the Coimbatore and Ramanathapuram districts by diverting the waters of some rivers from Kerala, there is a feeling that the proposals for the desalinisation of sea water cannot be held back for long and that with intensified research, the cost of conversion of sea water into potable water should be appreciably reduced so that consumers who can afford to pay slightly higher charges can use larger quantities of desalinated sea water. It has been latterly found that many industrial projects which require larger quantities of assured water supply could not be taken up because of the difficulties in getting suitable sites which will serve various purposes.

As regards the availability of power, every effort is being made to install additional capacity by harnessing the remaining water-power sources and erecting new thermal units in the Cuddalore or Neyveli area. It is not known what is exactly meant by the reference to these new sites by the Industries Minister as it was proposed earlier that three thermal stations having a capacity of 100 mW each should be established in three different centres. The Planning Commission is probably not quite agreeable to the transport of coal over long distances. If major units can be located at or near Cuddalore, the boilers can be so designed that they could be fired by coal or lignite as the case may be. While it is too early to anticipate at this stage what exactly will be the final shape of the power plan for 1966-71, the State Government have in the meantime decided to make effective use of the irrigation discharges at the various projects besides tapping small falls in the different river basins. The idea is to route water from the dams through power houses for irrigation purposes thereby utilizing the potentialities for generating electricity. It is expected in this manner to install additional capacity at Pykara and Papanasam while new units will be established at Vaigai and Lower Bhavani, additional power for 38 mW being generated in the process. It is also proposed that new dams should be constructed in some river basins and Upper Tambaraparni particularly is expected to yield a capacity of 100 mW. By the time the civil works are constructed it is anticipated that generating equipment will be available from indigenous sources. The Kodaiyar Project, which will account for a capacity of 75 mW in Kanyakumari district, has already been approved by the Planning

were reports that traders in that country were finding it difficult to dispose of their holdings. The fact that stocks in that country are quite large, equivalent to about four months' consumption, does not augur well for large scale buying by that country. However it is believed in Calcutta gunny market circles that the US may soon be entering the market.

Commission. Barring the Hongenakal project which will have to be taken up in conjunction with the Mysore Government, there will thus be not much scope for constructing major hydro-electric projects in the next Plan period. The emphasis will, therefore, have to be on installing additional thermal capacity.

★★

The ban on exports of out-sized raw goat skins announced by the Central Government recently, on the recommendation of the Leather Export Promotion Council, has created a stir in trade circles in Madras City. There are two opposing groups and somehow there is a feeling that vested interests have manoeuvred to get the ban imposed by the Government as the dealers in pickled goat skins will be benefitted by the fall in prices that has taken place on account of the ban. There is already restriction on the exports of goat skins. But it was not expected that a total ban would be imposed without procedure. The policy of the Leather Export Promotion Council is directed towards the conversion of raw skins into finished leathers as far as possible so that the foreign exchange earnings through exports can be maximised. But it has been pointed out that this changeover can come about only over a period and any hasty step would even result in a loss of foreign exchange earnings due to an unexpected decline in prices for raw skins. The dealers in skins in Madras parts of the country into Madras and it would not be profitable to process skins purchased from Northern India as in the case of EI tanned skins. On the other hand, there seems to be a view that there will surely be a demand for pickled goat skins from the USSR and any decline in prices would be only temporary. As against the views of eighteen members of the trade opposing the ban, it has been stated that thirty-two members, including hide tanners, have forwarded a memorandum to the Central Government supporting the ban decision. The Southern India Skins and Hides Merchants Association, however, has stated in reply to the questions put to it by Joint Controller of Imports and Exports that any hasty step would defeat the very object that is sought to be achieved and there could be only a gradual reduction in exports of raw skins.

★★

The outgoing President of the Madras Stock Exchange has emphasised the need for adopting measures which would revive confidence in the stock markets. When the Silver Jubilee of the Madras Stock Exchange was celebrated in September last year, conditions were different. It is felt that if the buoyant tone of the capital market continued to be in evidence no serious difficulty would be encountered in securing the required capital for promoting new industries. These expectations, however, have been belied and since the declaration of Emergency in November last year, markets have slumped and investors have been unwilling to enter into fresh commitments. Mr. Arunachalam, the outgoing President, emphasised that the slump experienced in 1963 was not a reaction to a boom as no boom existed in 1962 and there was no excessive speculative activity. The lack of confidence in the future is amply borne out by the greater demand for preference shares and the better scope for raising debenture capital.

August 30, 1963

The moving finger writes

MR. NEHRU has once again outwitted political pundits and punters alike. Not very long ago he brought discomfiture to those who were confidently predicting a major Cabinet reshuffle following the resignation of Hafiz Mohamad Ibrahim and Mr. K. D. Malaviya. Now, after everybody had convinced himself that nothing was going to come out of the Kamaraj plan, the Prime Minister has carried out a spectacular blood-letting at the Centre and in the States.

It is obvious that Mr. Nehru was executing not one plan but a number of plans. That Mr. Lal Bahadur Shastri, Mr. S. K. Patil, Mr. Kamaraj, Mr. B. Patnaik, and Mr. C. B. Gupta should have quit office for party work was quite logical in terms of the Kamaraj plan. All of them are good partymen with impressive records of organisational work among the rank and file. It is not equally logical that Mr. Morarji Desai, Mr. Jagjivan Ram, Pt. Binodanand Jha and Mr. B. A. Mandloi should have been required to go for the same or similar reason. B. K. Ghulam Mohamad is, of course, in a class by himself and I for one would not venture to analyse what might have prompted him to act the way he did. But it is quite clear that the resignations of Mr. B. Gopala Reddi and Dr. K. L. Shrimali were accepted for reasons which were only remotely connected with the Kamaraj plan. There was no doubt at all that Mr. Nehru blundered when he elevated Mr. Reddi and Mr. Shrimali to Cabinet rank when he reconstituted his Cabinet after the last election. Another Cabinet Minister who has done nothing to earn that rank either before or after his promotion is Mr. Humayun Kabir and it is certainly some surprise that he has been allowed to continue. In my view the fact that he has left the post of the Director of National Physical Laboratory unfilled since June, 1961 should be enough ground for relieving him of his portfolio.

★★

Talking of the National Physical Laboratory, the spirit of the solar cooker seems to be still going strong in our scientific establishments. The Defence Science Laboratory has reportedly developed a low-cost room cooler for the common man. The various scientific institutes are alleged to have been given high priority work since the emergency. I should therefore imagine that an inexpensive room cooler must have some strategic significance, although I cannot recollect having heard at any time that the non-availability of inexpensive room coolers had anything to do with our reverses in NEFA. And since it is reasonably clear that room coolers, inexpensive or otherwise, cannot be of much use, say, in Ladakh, one might suppose that this latest invention of the Defence Science Laboratory must have a relevance, not altogether obvious, to some such subtle purpose as boosting national morale by symbolically demonstrating that we can keep cool under any provocation.

★★

It is a sheer accident that the two leading articles in this issue have between themselves happened to comment critically on some recent economic reporting by three of the national dailies. In fact, the second of the two articles, "Pressure on Prices", should have appeared a week earlier, but was held

over for "reasons of space". I may perhaps point out that, while our comments on "The Times of India" survey of price trends had anticipated the criticism of that survey which the Finance Minister made in the course of his speech on the "no confidence" motion in the Lok Sabha, we certainly do not agree with Mr. Desai or with Mr. Patil that the cost of living has not been going up appreciably. On the contrary, as has been pointed out in our leading article on "Prices", the substantial increase in taxation, taken with inadequate production, not only of foodgrains but of consumer goods generally, has certainly boosted the cost of living all round. While it is unreasonable to expect the Government to exert itself to keep the price of everything under control—and it is certainly no part of the Government's duty to guarantee that prices of cosmetics and toothpaste will not rise—it is undoubtedly necessary in the interest of political and economic stability, especially in the context of the emergency, that the prices of articles of mass consumption should not be permitted to go up very much. I suggest that this kind of price restraint cannot be exercised except through a deliberate policy of increasing the output of various consumer goods industries which have been assigned a somewhat low priority in the present scheme of things.

★★

Incidentally, I must confess that I do not understand the mentality behind some of the newspaper reporting on the "three-anna" controversy rigged up by Dr. Lohia. It is amusing to find "The Statesman" writing that Mr. Nanda has failed "to substantiate official claim". It is true that Mr. Nanda did not give a break-up of per capita income figures in various fractions of the population and that he could only produce estimates of consumption expenditure while countering Dr. Lohia's allegation that 60 per cent of the population subsisted on three annas per day per person. But then the good Dr. Lohia too was not talking about per capita earnings, but about what 270 million people according to him had to live on. Why has it not occurred to "The Statesman's" Parliamentary Correspondent to ask the learned Doctor where he got his figures from? It occurs to me that if anybody were to be called upon to substantiate anything, it is Dr. Lohia who should first be asked to explain his data.

★★

I see that Mr. Masani is reported to have described Mr. Nehru as a "semi communist". But is Mr. Masani 100 per cent Swatantra? He recently declared in Parliament that he believed in a mixed economy. The Founder-Leader of the Swatantra Party does not seem to have any taste for that mixture. I therefore suggest that Mr. Masani is also only a "semi Swatantrite". I should also say that Mrs. Renuka Chakravarty is no complete Communist, for, while speaking on the "no confidence" motion, she denied that she was in favour of state farming or collectivisation of agriculture. It would therefore appear that to the list of "semi this" and "semi that" there could be no end. As for Dr. Lohia, so much in the news these days, I would suggest that he is simply "semi".

V.B.

Trade Winds

DEMAND FOR STEEL

IN A STUDY prepared by the National Council of Applied Economic Research on the steel requirements during the third and the fourth Plan periods, entitled "Reappraisal of Steel Demand", it has been estimated that, in the category of mild steel, this country would need 6.902 million tons of rolled steel and 9.735 million tons of ingots in 1965-66, and 13.594 million tons of rolled steel and 18.287 million tons of ingots in 1970-71. In the category of alloy and special steel, the estimate for rolled steel has been put at 0.5 million tons and for ingot at 0.834 million tons in 1965-66. The estimates for 1970-71 are placed at 0.966 million tons for rolled steel and 1.610 million tons for ingots. The Council's estimate for foundry grade pig iron is 2 million tons in 1965-66 and 3.462 million tons in 1970-71. The requirements of steel for defence purposes would be about 0.5 million tons by 1970-71. The approach of the Council for these estimates had been the "end-use method" in preference to the usual method of demand forecasting. It is felt that in a planned economy like ours, useful results cannot be obtained even by relating steel demand to any overall index of projected industrial growth.

The Council has warned the Government that delays in the first two years of the third Plan will lead to a heavy shortfall in the supply of rolled and alloy steel in the last years of the Plan. It has, therefore, suggested that provision should be made for foreign exchange to import certain categories of rolled mild steel, alloy steel and pig iron worth Rs. 100 crores in 1965-66. It is recommended that the action on the setting up of additional capacities in the fourth Plan be initiated almost immediately in order that the anticipated demand of 13.594 million tons of finished steel in 1970-71 is fully met. The additional capacity to be established after taking into account all the current expansion schemes is 6.7 million tons of finished steel or about 9 million tons of ingot steel. The Council is of the view that the further expansion of the Rourkela Plant during the fourth Plan as well as an early implementation of Bokaro Plant for flat products are necessary as the gap in this type of products, particularly plates, is expected to be quite substantial—1.38 million tons by 1970-71.

The gap in the non-flat products at the end of the fourth Plan amounting to about 3.2 million tons of finished steel, the study mentions, may be partly met by further expansion of the existing steel plants. However it is recommended that a portion of this gap, say 2 million tons, be planned for production in the South-West region of the country. A wider dispersal on the re-rolling industry should be considered to cater to the regional demands particularly as nearly 50 per cent of the requirements of bars and rods are connected with construction activities in each State. It is felt that a steel plant in Goa can meet advantageously a part of the demand for steel in the Western region of the country, particularly Maharashtra and Gujarat. In view of the substantial economy in steel consumption by adoption of welded structures, the steel plants should concentrate on the production of weldable quality of sections and plates for which there is a large shortage at present.

The Council has recommended 1.5 million tons of finished steel for export in 1970-71 consisting of 1.0 million tons of non-flat products and 0.5 million tons of flat products. So far as alloy and special steels are concerned, it is necessary that schemes as already sanctioned be implemented in the shortest possible time. And, in order to do that, it is necessary that foreign exchange for import of capital goods and equipment be allotted to parties concerned on a priority basis.

The setting up of a large unit of 0.5 million tons for the exclusive production of foundry grade pig iron has also been suggested. The need to organize the collection and publication of complete data on capacity, production and consumption has, of course, not been ignored.

SALT PRODUCTION AND EXPORTS

The Minister of Industry, Mr. Nityanand Kanungo told the Informal Consultative Committee of Parliament for his Ministry recently that the target of 6 million tons fixed for salt production would be achieved by 1965-66. During the third Plan period a sum of Rs. 3 crores would be spent on the development of the salt industry both in the public and private sectors. Production of salt has been increasing year by year and in 1962 it stood at 38,86,000 tons. In the first five months of this year production of salt was 24,02,100 tons. Licences for salt manufacture are being issued freely and every encouragement is being provided to co-operatives engaged in salt production.

So far as exports of salt are concerned, the Union Government proposes to export 4 lakh tons of salt to Japan during 1963-64. Export of salt during 1962 was 1,64,665 tons. During the period January to May, 1963, 1,26,600 tons of salt was exported. The present contract with Japan envisages the export of 2,50,000 tons. In addition to the two year contract for salt exports to Japan, the S.T.C. had also concluded a contract with Ceylon. The quantities exported to that country during 1962 and till the end of May, 1963 were 36,735 tons and 16,000 tons respectively. To ensure that the salt exported conforms strictly to prescribed quality standards, the scheme of quality control and the pre-shipment inspection had been introduced from first of July this year. Special quality control laboratories had been set up for this purpose.

EXPORT QUALITY CONTROL

Mr. Manubhai Shah, Minister of International Trade, told the Informal Consultative Committee of Parliament for his Ministry last week that the Export (Quality Control and Inspection) Bill, 1963, which had been passed by both Houses of Parliament, would enable the Government to extend the field of quality control in export goods. The question of quality control and pre-shipment inspection was of great importance in the present competitive pattern of world trade and in the context of the necessity for India to earn more foreign exchange through exports. Improvement of the quality of our export goods, he said, was not only necessary to maintain the volume of trade on traditional items but also to push up the export of new commodities. Indian goods had to satisfy the buyers' requirements in respect of quality and should command respect in foreign markets.

Compulsory quality control and pre-shipment inspection had been introduced in the case of 14 agricultural commodities and it would be made applicable to 19 more such commodities before the end of this year.

In the case of jute industry, the Jute Commissioner had advised all the jute mills to set up quality control units. It was envisaged that quality control and pre-shipment inspection for the export of jute products would be introduced by the end of next month on a voluntary basis to begin with.

In the cotton textile industry a scheme of voluntary control was already in force under the ITFX and FACTUAL inspection schemes. The quantity being inspected was of the

order of about 16 per cent of the total exports. Such voluntary schemes existed in the case of handloom products, art silk products and synthetic fabrics. It was proposed that for all textile exports compulsory quality control and pre-shipment inspection should be started before the end of this year.

It had been decided to include tea as one of the commodities to be brought under compulsory quality control and pre-shipment inspection in this year's programme. Already certain measures of quality control and voluntary pre-shipment inspection were in force. Measures which could be introduced to safeguard more effectively the quality of tea for export were being considered by the Tea Board and the Ministry of International Trade.

In the case of coir, a scheme for voluntary pre-shipment inspection of creel mats, rod mats, bit mats and fibre mats had been introduced from May this year using the Indian Standard specifications. This voluntary scheme, it was stated, was a step towards the introduction of a compulsory scheme.

Under various Acts and Regulations in existence now, compulsory quality control was being exercised in the case of fruits and vegetable products, vegetable oil products and some other food articles. It was proposed to introduce compulsory ISI Certification Marking Scheme for nine items of processed foods including breakfast foods, biscuits, malted milk foods, glucose and confectionery. It was stated that there was great scope for expanding exports in this field.

Arrangements for introducing quality control and pre-shipment inspection for engineering goods would be finalised and a scheme introduced from the 1st of January, 1965. A Study Group had already examined the engineering articles to be brought under the scheme and drawn up a list of 65 items.

FERTILIZER PLANT FOR U.P.

The contract for construction of a fertilizer plant at Gorakhpur in Uttar Pradesh was signed on August 21, 1963 between the Fertilizer Corporation of India and Toyo Engineering Corporation, Japan. Estimated to cost about Rs. 25 crores, the project will be the biggest in Asia. Equipment worth about Rs. 11.4 crores will be supplied from Japan under Yen credit.

QUESTIONNAIRE ON SALES TAX

The 10-member Committee on Sales Tax set up with Mr. R. G. Saraiya as Chairman, has issued a questionnaire seeking the views of Trade Associations, Export Promotion Councils and other organisations and individuals on problems of sales tax arising out of the need to promote exports.

The terms of reference of the Committee are:

- To study the incidence of State and Central sales taxes on commodities entering the export trade of India and to indicate the quantum of relief to be provided in respect of each commodity;
- to make recommendations in regard to the manner in which such relief is to be provided, whether by way of exemptions, rebates or set-offs, and the procedure to be followed in connection therewith by each of the State Governments and the Central Government and for different export commodities;
- to review the existing provisions in the sales tax laws in different States with particular reference to the provisions relating to the grant of relief in respect of export commodities and make recommendations

for such amplification or modification thereof as may be considered necessary; and

- to suggest such supplementary or ancillary measures as may be necessary in order to remove or mitigate the burden of State and Central sales taxes on exportable commodities in the interests of the development of India's export trade.

The other members of the Committee are Mr. M. N. Hoble, Commissioner of Sales Tax, Maharashtra; Mr. V. B. Gidwani, Chief Secretary, Gujarat; Mr. K. K. Ray, Finance Secretary, West Bengal; Mr. V. M. Bhide, Finance Secretary, U.P.; Mr. C. Thomas, Finance Secretary, Kerala; Mr. C. V. Ramakrishnan, Commissioner of Commercial Taxes, Board of Revenue, Madras; Mr. I. P. Gupta, Director of Incentives, Ministry of International Trade; Miss Anna R. George, Dy. Secretary, Ministry of Finance; and Dr. R. M. Honavar, Dy. Economic Adviser, Ministry of Industry (Member Secretary).

OIL CIRCUIT BREAKERS

The Central Government's Heavy Electrical Factory at Bhopal has completed the hundredth unit of 33 KV oil circuit breaker. Nearly a thousand circuit breakers in the ranges of 11 KV, 33 KV, 66 KV and 132 KV have been supplied by the Bhopal factory to State Electricity Boards, undertakings in the private and public sectors and railways in different parts of the country. Breakers of this type and class are being manufactured in India for the first time thereby effecting considerable savings in foreign exchange. This breaker is suitable for operation from a distant control room. It is extensively used by Electricity Boards for distribution of power to distant areas and the industries consuming power in large quantities.

EMPLOYEES' PROVIDENT FUND

During the last ten years impressive progress has been made by the Employees' Provident Funds Scheme. Starting with only six industries, the Scheme now covers about 81 industries. At the end of May, 1963, over 23,000 establishments and 36 lakhs of workers were covered by this scheme. Further, so far over Rs. 431 crores had been collected as contributions from both exempted and unexempted establishments. An amount of over Rs. 125 crores had been refunded on account of final settlements and advances. About 12,000 claims involving over Rs. 50 lakhs were being settled, on an average, per month. The accumulations in the Fund were invested in the Central Government securities and the total investments now amounted to over Rs. 309 crores.

GUARANTEE FOR GERMAN EXPORTER

In view of the limited funds of the credit giving suppliers, the Federal Republic of Germany has decided to relieve the export section of their economies of part of the unforeseeable risk through the medium of a State guarantee. This is effected by the Federal Government through a Consortium appointed for this purpose comprising the Hermes Kreditversicherungs Aktien gesellschaft and the Deutsche Revisions-und Treuhand-Ag. This covers a part of the economic and political risk on behalf of the Federation. A Federal cover of this nature is considered essential to the long-term financing of a supply contract. If the foreign purchaser is a State or a body incorporated under public law, the term used is "surety" whereas a "guarantee" is assumed when the foreign purchaser is a concern operated as a private enterprise. The Federation insures against the economic risk of the debtor being unable to pay, further, against political risks such as bans on payment, conversion and transfer delays, and sovereign measures which adversely affect the settling of a contract. The German exporter has to bear not less than 20 per cent of the economic risk and 15 per cent of the political risk himself under the Hermes-coverage.

Company Affairs

FOREIGN COLLABORATIONS

IN THE first half of the current year 145 foreign collaborations were sanctioned. The total since 1957 comes to 1560. The United Kingdom is at the head of the list with 465 collaborations and with 37 collaborations in the half-year under review. The collaborations for the USA totalled 252, with 37 for the half year under review. The Indo-German collaborations totalled 210 with 22 sanctioned in the first half of 1963. In the order of importance, Japan and Switzerland followed next with 120 and 62 collaborations respectively; their shares for the half year were 15 and 8 respectively. Not less than 52 collaborations related to financial-cum-technical collaborations; the remaining 93 consisted of purely technical collaborations.

BIRLA COTTON

The Birla Cotton Spinning and Weaving Mills Ltd. made, according to a preliminary report, a lower gross profit of Rs. 42.39 lakhs for the year ended March 31, 1963 as against Rs. 47.10 lakhs in the last year. Taking into account the balance brought forward from the previous year at Rs. 1.67 lakhs, the sum available for disposal came to Rs. 44.06 lakhs out of which the directors allocated Rs. 9.19 lakhs for depreciation, Rs. 11.75 lakhs for general reserve and Rs. 2.44 lakhs for development rebate reserve. A sum of Rs. 12.50 lakhs was provided for taxation reserve and Rs. 7.99 lakhs were set apart for creating a dividend reserve. After adjusting the excess depreciation value of assets written off in earlier years, a sum of Rs. 12.97 lakhs was transferred to general reserve. The dividend on ordinary shares has been maintained at Rs 2 a share (subject to tax).

MOPEDS INDIA LTD.

Ordinary shares worth Rs. 20 lakhs will be offered for public subscription by Mopeds India Ltd., on September 4, 1963. The authorised capital of the company is Rs. 50 lakhs while the issued capital is Rs. 35 lakhs. A sum of Rs. 13 lakhs has been subscribed by the promoters, directors and friends. Messrs. Motobecane, Pantin, France will supply machinery worth Rs. 2 lakhs. The present issue is for financing the company's project for the manufacture of Mopeds (auto cycles). The factory building near Renigunta is under construction. Orders for the machinery have been placed. It is proposed to borrow Rs. 4.30 lakhs from I.C.I.C.I and Rs. 7.50 lakhs from banks and other sources. The total foreign exchange requirements are of the order of Rs. 21.63 lakhs; a sum of Rs. 8.93 lakhs will come through licences on rupee payment countries, Rs. 2 lakhs from the foreign collaborators in the form of machinery and the balance of Rs. 10.70 lakhs by way of foreign exchange by I.C.I.C.I.

SOUTH MADRAS ELECTRIC

Because of the promulgation of the Defence of India Rules, the Chairman of the South Madras Electric Supply Corporation Ltd., Mr. K. A. P. Viswanatham could not discuss in his address the activities of the company as reflected by the balance sheet and other audited accounts of the company. He assured the shareholders that the Company's affairs had been conducted diligently and with care. The dividend for the year was higher than that of last year and there was a sizable increase in revenue. The Corporation had supplied electricity to ten more villages taking the total number of villages electrified to 646. The increasing pressure of operational costs had forced the Corporation during the year to make some increases in tariffs so as to meet the rise in expenditure. The performance of the Corporation during the last decade has been excellent as shown by all the major indicators. The sale value of energy more than doubled be-

tween 1953 to 1962 from Rs. 4.2 million to Rs. 9.6 million. Similar is the case with gross revenue which rose from Rs. 4.5 million in 1953 to Rs. 9.8 million in 1962. The dividend record of the company has been also encouraging. Between 1959 and 1961, it maintained the dividend at 9 per cent and in 1962 it was raised to 10 per cent (taxable). For the year 1962-63, the rate of dividend has been higher than that of the last year. The volume of activities of the Corporation may also be gauged from the fact that at the end of 31st March, 1962 it serviced 58,856 house service connections, 3186 agricultural pump sets for irrigating 12,500 acres of land, had provided electricity to 4061 power service connections and electrified 636 villages.

TATA-ROBINS-FRASER

The Tata Iron and Steel Company Limited has promoted a new industrial undertaking in Jamshedpur in collaboration with Messrs. Hewitt Robins Inc., USA and Fraser & Chalmers Engineering Works of General Electric Company (Engineering) Limited of UK for the manufacture of a wide range of material handling and processing equipment, such as conveyor and vibrating machinery, ore and coal preparation equipment, industrial chain, wire screen cloth for vibrating equipment, and for providing engineering services. An industrial licence granted by the Government of India in the name of the Tata Iron and Steel Company Limited. The new company, Tata-Robins-Fraser, which would manufacture the products and provide the services referred to, has been incorporated as a public limited company with its registered office in Jamshedpur.

The transfer of the industrial licence from the Tata Iron and Steel Company Limited to the new company, namely, Tata-Robins-Fraser, was reported in our issue of August 9 (p. 275) under the general heading "Changes in Names", but it was not made clear that the change only referred to the ownership of the industrial licence. As a result, our report might have given the impression that the Tata Iron and Steel Company was being re-named as Tata-Robins-Fraser, which, of course, is not the case. The correct position has been stated above.

ZENITH STEEL

Zenith Steel Pipes Limited does not propose to raise fresh capital to finance the expansion programme of the company. The company has applied to the Government for raising the present production capacity from 24,000 tons to 36,000 tons. Disclosing this information to the shareholders at the annual general meeting of the company in Bombay on Wednesday, Mr. S. G. Nevatia who was elected to the chair said that the attitude of the Government in the matter was not helpful, for Government seems to be thinking in terms of licensing additional capacity to fresh units. Apparently satisfied with two shift working. Mr. Nevatia assured the shareholders that the company would achieve further economy in production by stepping up efficiency. In fact as a result of certain additions to the plant in recent months the company's production has been progressively rising and is now working to full capacity.

The company is also trying to diversify its production in certain other types of work. It has already obtained a licence for setting up a zinc 'dross' plant with an annual capacity of 600 metric tons. It is a small plant costing Rs. 5 lakhs. A small portion of the plant is to be imported and the company has applied for an import licence. As for the supply of raw materials the company has covered its requirements to meet the increase in production. The supply of steel is satisfactory and the company has in stock four months' supply.

Referring to questions raised by shareholders in the matter of effecting forward sales of pipes at negotiated prices, he said that in the initial stages the company had to sell at lower

August 30, 1963

prices with a view to meeting the competition from three other producers. Although the prices realised was slightly lower than last year it was not very much less and it is not possible to make a comparison since it depended on the different sizes of pipes which varied from producer to producer. The production during the year under report was 12,000 tons.

BENGAL CHEMICAL

The working results of Bengal Chemical & Pharmaceutical Works Limited for the year ended March 31, 1963, showed a rise of Rs. 15 lakhs in sales over the preceding year, though the margin of profit was below expectations due to rising costs of raw materials, transport charges and other levies such as excise duties, emergency risk insurance, etc. Dr. B. N. Ghose, Chairman, indicated in his speech at the Annual General Meeting of the company at Calcutta on August 14, 1963, that a sincere effort had been made by the unit "to hold the price line" and in many cases the margin of profit was reduced. The dividend on all classes of ordinary shares has been maintained at 10 per cent for which the company had to transfer a sum of Rs. 1,55,000 from General Reserve No. I in view of the shortfall in disposable profits. A notable feature of the working of the company was the steady increase in its exports which rose by more than 25 per cent during the year under report. The Chairman also said that the expansion schemes at Panihati were progressing satisfactorily. The alum plant was nearing completion. When the additional 50 ton-day sulphuric acid plant gets completed, better economy in

EASTERN ECONOMIST

427

production is expected. Expansion of Caffeine plant at Manik-tala has also been taken in hand.

ALUMINIUM CORPORATION

A statement has been issued by J.K. Industries, Managing Agents, Aluminium Corporation of India Limited, regarding the question of power supply from the Durgapur power projects to the company. On the floor of the West Bengal Legislature a controversy has arisen from time to time regarding the loss to the Durgapur projects for supplying power to Aluminium Corporation of India. The Managing Agents have explained that electricity being the main raw material for the aluminium industry, it could not prosper in the State unless power was made available at competitive rates. At the suggestion of the former Chief Minister of West Bengal, the late Dr. B. C. Roy, the management had agreed to expand the plant even though the cost of power was equivalent to Rs. 350 per kW year which was more than double the tariff available to existing or newly planned plants in other States. The impact of the relative higher electricity rate was an impost on the cost of production of Rs. 450 to Rs. 625 per ton resulting in an extra burden on the company of Rs. 22 to Rs. 31 lakhs per year on the current volume of new production. Since the electricity tariff rate is subject to coal surcharge, the cost increased with every upward revision of coal prices.

DIVIDENDS DECLARED

Bombay Dyeing: An interim dividend at the rate of one rupee per share of Rs. 25 for the year ended June 30, 1963.

INTERNATIONAL TRADE...

'Export or Perish'—'Import only what and when you must'—'Set right adverse Balance of Payment'—'Conserve foreign exchange'

these are the slogans one meets with day in and day out in the press and on the platform. International trade is indeed a complicated matter today.

You may be engaged in import or export of merchandise and may want to open a Letter of Credit or negotiate Bills drawn on a foreign buyer;

You may contemplate the setting up of a new industry or expansion of an existing unit by importing capital equipment from abroad;

You may wish to offer a guarantee to the supplier of foreign machinery for deferred payment.

In fact, whatever be the nature or size of your business in and with foreign countries, you will always find it advantageous to turn to the **CENTRAL** for advice and assistance.

With a wide network of Branches throughout the country in the major port-towns as well in the hinterland, with a Branch in LONDON and with agency arrangements with first class Banks in all parts of the world, **THE CENTRAL BANK OF INDIA** is well-equipped to solve all your foreign exchange problems.

**THE
CENTRAL BANK OF INDIA LTD.**

N. K. KARANJIA : Managing Director

Regd. Office: Mahatma Gandhi Road,
Bombay-1.

CB/3A/63

has been declared by the Bombay Dyeing and Manufacturing Company Limited.

Jardine Henderson: The ordinary dividend of Jardine Henderson Limited for the current year has been enhanced from 6 per cent to 7 per cent per annum.

Khandesh: The Khandesh Spinning and Weaving Mills Company Limited has declared an ordinary dividend of 12 per cent subject to tax for the year ended March 31, 1963.

Mysore Tobacco: The ordinary dividend of The Mysore Tobacco Company Limited for the year ended March 31, 1963 has been maintained at the last year's level of 10 per cent per annum.

Cannanore Spinning: The ordinary dividend of Cannanore Spinning and Weaving Mills Ltd., has been reduced from 20 per cent to 8 per cent per annum.

Amalgamated Coffee: Amalgamated Coffee Estates Limited has slashed its ordinary dividend for the current year from 10 per cent to 5 per cent per annum.

Midland Rubber: Midland Rubber and Produce Company Limited has reduced its ordinary dividend for the current year from 12 ½ per cent to 10 per cent per annum.

Cimco: A maiden dividend of 7.5 per cent (taxable) for the year ended March 31, 1963 has been recommended by the directors of the Central India Machinery Manufacturing Company Limited.

Hind Cycles: The directors of Hind Cycles Limited have passed over the dividend for the year.

Bradbury Mills: The dividend on equity shares has been maintained at the preceding year's level of 30 per cent, less tax, for the year ended March 31, 1963, by the Bradbury Mills Limited.

CAPITAL ISSUES

The Controller of Capital Issues has authorised twelve companies, including one Central Government enterprise, to raise fresh capital amounting to Rs. 5.28 crores. Five companies are issuing bonus capital, two cumulative plus preference shares, one preference shares, and the rest equities. Four companies are throwing open part of their issues for subscription by the public, one is offering part of the capital to its own employees and four companies are offering part of the capital to their foreign collaborators. The consent is valid for 12 months in all cases.

Hindustan Cement Corporation Limited, Delhi, is to issue capital of Rs. 1.50 crores divided into 1,25,000 equity and 25,000 9.3 per cent cumulative redeemable preference shares of Rs. 10 each for cash at par. Out of this, equity shares of the value of Rs. 1.05 crores and the entire preference shares of Rs. 25 lakhs will be issued to the public by prospectus. The proceeds of the issue is required for financing the manufacture of portland blast furnace slag cement.

The Aryan Brush Company Limited, Bombay, is raising further capital of Rs. 5 lakhs, divided into 5,000 equity shares of Rs. 100 each. On capitalisation of the company's reserves to a like extent, it will be issued as full paid-up bonus shares to the existing shareholders of the company.

D. Macropolo & Company Limited, Bombay, is issuing capital of Rs. 3,15,300 divided into 3,153 equity shares of Rs. 100 each as bonus shares by capitalisation of the company's reserves to a like extent.

Blundell Eomite Paints Limited, Bombay, is to issue capital of Rs. 48 lakhs consisting of Rs. 14 lakhs in equity shares of Rs. 10 each on capitalisation of the company's reserves to a like extent, Rs. 21 lakhs in equity shares of Rs. 10 each for cash at par to be issued to the existing shareholders including the British company, Blundell Permoglaze Limited, and Rs. 13 lakhs in equity shares of Rs. 10 each for cash at a premium of Rs. 11 per share to be issued to the Indian public including

the company's staff. The proceeds of the cash issue will be utilised for the manufacture of paints, varnishes etc.

Wheels India Limited, Madras, is raising Rs. 60 lakhs, divided into 60,000 equity shares of Rs. 100 each to be issued privately for cash at par. Of this, not more than 27,000 shares will be issued to Dunlop Rubber Company Limited, the foreign collaborators, against supply of plant and equipment. The money will be spent on the manufacture of wheels and top rollers for tanks.

Kesar Chemicals, Limited is raising capital of Rs. 80 lakhs in equity shares of Rs. 10 each to be issued for cash at par. Of this amount, shares of the value of Rs. 20 lakhs will be issued to Associated Chemical Company (Mfg.) Ltd., England. The money will be used for the establishment of a plant at Baheri for the manufacture of sodium phosphite and allied chemicals.

Vibgyor Limited, Bombay, is to issue further capital of Rs. 23,82,000 in equity shares of Rs. 100 each for cash at par. Out of this, shares of the value of Rs. 15 lakhs would be issued to the public. The capital is required for the construction of civil works, like dams, bridges, reservoirs, tunnels etc.

Nandlal Bhandari Mills Limited, Indore, is issuing further capital of Rs. 12.50 lakhs divided into 5,000 shares of Rs. 250 each as bonus shares on capitalisation of the company's general reserve to a like extent.

Citric India Limited, Bombay, is issuing Rs. 30 lakhs capital (inclusive of Rs. 10 lakhs equity shares already issued). The balance of Rs. 20 lakhs will be in 9.3 per cent preference shares of Rs. 100 each to be issued for cash at par. The capital will be used for completing the project for the manufacture of citric acid and citrates.

Ahmedabad Manufacturing & Calico Printing Company Limited, Ahmedabad, is to issue bonus capital of Rs. 6.25 lakhs in 5,000 equity shares of Rs. 125 each to be offered to the existing equity shareholders of the company in the ratio of one for 34 shares held on capitalisation of the company's general reserves.

Everest Refrigerants Limited, Bombay, is raising capital of Rs. 60 lakhs for cash at par divided into Rs. 48 lakhs in equity shares of Rs. 10 each and Rs. 12 lakhs in cumulative redeemable preference shares of Rs. 100 each carrying a dividend of 9.3 per cent. Out of this, equity shares worth Rs. 10 lakhs will be offered for subscription to the foreign collaborators, Technical Enterprises Inc., New York, and Rs. 19 lakhs and preference shares of Rs. 6 lakhs to the public by prospectus. The proceeds of the issue will be utilised for the manufacture of fluoro chloro methane gases and its intermediary chemicals.

Indian Oil Company Limited, a Government of India undertaking has been accorded consent to issue a further capital of Rs. 49,55,000, divided into 4,955 equity shares of Rs. 1,000 each to be issued privately for cash at par. The capital will be used for constructing oil installations depot etc.

LICENCES ISSUED

The following licences were issued under the Industries (Development and Regulation) Act, 1951, during the week ending August 17, 1963. The list contains the names and the addresses of the licensees, articles of manufacture and annual installed capacity.

SEMI-MANUFACTURE & MANUFACTURE

Anam Electrical Mfg. Co., Kadiam, East Godavari Distt., (Andhra Pradesh) — Aluminium rods suitable for further manufacture of ACSR/AAC — 3,000 metric tons per annum.

COAL

Selected Satgram Collieries Ltd., F-2, Gillander House, 8, Netaji Subhas Road, Calcutta-1 (Distt. Chanda, Maharashtra) — Coal 98,000 tonnes per annum. Model Dhuri Colliery Co., Hazaribagh, (Village Atna, P.O. and P.S., Mandu, Hazari-

bagh, Bihar) — Coal 15,900 tonnes, per annum. M/s. National Coal Development Corporation Ltd., "Darbhanga House, Ranchi (Tehsil, Baikunthpur, Distt. Surguja, Madhya Pradesh) — Coal 0.5 million tonnes per annum.

MINING MACHINERY

Reliable Water Supply Service of India Ltd., 17, Gokhale Marg, Lucknow (Uttar Pradesh) — (1) Well master RC 627, Reverse circulation Drill Rig — 5 initially and 7 Nos. in the third year. (2) Well master RC 518, Reverse circulation Drill Rig — 5 initially and 7 nos. in the third year. (3) Well master RC 308, Reverse circulation, Drill Rig — 5 initially and 7 nos. in the third year. (4) Well master DR 1,500, Direct Rotary Drill Rig — 5 initially and 15 nos. in the third year. (5) Well master PR 412, Percussion Drill Rig — 5 initially and 7 nos. in the third year.

CONVEYING EQUIPMENT

Shri T. S. Chockalingam, 13, South Street, Santhome, Madras-28. Proposed name: Amaravathi Industries (Vaiyampathi, Kulitalai, Tiruchirapalli Distt. Madras — Heavy structurals E.O.T. Cranes of spans and lifting capacities. Wharf cranes, 1st stage 5,000 tons, and 2nd stage 10,000 tons.

MACHINE TOOLS

M/s. Cooper Engineering Ltd., Chinchward (Maharashtra) — Gear Hobbing machines, 20 nos. per annum.

TYRES AND TUBES

M/s. Premier Tyres Ltd., Maneckjee Wadia Bldg. 127,

COMPANY MEETING

BENGAL CHEMICAL & PHARMACEUTICAL WORKS LIMITED

The following is the summary of the speech of Dr. B. N. Ghose, Chairman of Bengal Chemical & Pharmaceutical Works Ltd., at the 63rd Annual General Meeting of the Company on Wednesday, August 14, 1963 at India Exchange Building, Calcutta.

Gentlemen,

The latter half of the year under review was somewhat disturbed by the unprovoked attack on the borders of the country by the Chinese aggressors.

The working results of the Company during the year under review present a better picture than those in the last year. The sales of the Company recorded an increase of over Rs. 15 lakhs as compared to last year, but the margin of profit was not as much as it was expected. This is due to various factors, chief amongst which are rising costs of raw materials, transportation charges, and various other levies by way of Central excise duties, emergency risks insurance etc.

The special resolutions passed at the extraordinary general meetings in March this year will enable the preference shareholders to receive approximately the same amount of dividend as before. Your directors also recommend that dividend on all classes of ordinary shares be maintained at 10 per cent as in the previous year for which they had to transfer a sum of Rs. 1,55,000 from general reserve No. I in view of the inadequacy of distributable profits for payment of dividend.

You will be interested to know that your Company has been exporting its products for a pretty long time. The export trade of the Company has risen by more than 25 per cent during the year under review. The amendment of the cent during the year under review. The amendment of the object clause of the Memorandum of Association of the Company at the earlier meeting by incorporating therein a suitable clause for recognition of the Company as an export house, will enable the Company to enjoy wider scope in utilizing import entitlement much to our advantage.

The expansion schemes at Panihati are progressing satis-

Mahatma Gandhi Road, Bombay-1, (Kalamassery, Kerala) — Automobile tyres, 60,000 nos. per annum, automobile tubes, 60,000 per annum.

PORTLAND CEMENT

Surrendra (Overseas) Private Ltd., Tanda Road, Jullundur (Samloti, Kangra Distt. Punjab) — Portland Cement 100,000 tonnes per annum.

MISCELLANEOUS

Shalimar Industries Private Ltd., 25, Ganesh Chandra Avenue, Calcutta-13 (Howrah, West Bengal) — Compressed Persimmon wood blocks — 1,20,000 pieces per annum.

CHANGE IN NAME

(During the week ending 17th August, 1963)

From M/s. Madan Engineering Tool Products, Delhi to M/s. Amoteep Machine Tools Private Ltd., Delhi.

LICENCES REVOKED

(During the week ending 17th August, 1963)

M/s. Hindustan Commercial Corporation Ltd., Banaras — Electric motors. M/s. The Basti Sugar Mills Co. Ltd., Basti, Distt. Basti — Sugar. M/s. Bharat Rubber and Allied Industries Ltd., Kapurthala — Other rubber goods. Shri B. P. Modi, Nayasark, Cuttack — Fire bricks. Shri Ramaniklal Bhogilal Shah, M/s. Master Cement Mfg. Co. Ltd., Bhavnagar — Portland Cement. M/s. Varat Plywood, Calcutta — Plywood. Shri I. S. Johar, Bombay — Salt glazed stoneware pipes and specials.

factorily. The Alum Plant is nearing completion and will soon be put to commission provided, of course, the foreign equipment indented for are duly received. On completion of the erection of the additional 50 ton-day Sulphuric Acid Plant better economy in production is expected.

NEW LINES OF EXPANSION

The development work in some new lines or expansion work in some of the existing lines are in progress, expansion of Caffeine Plant at Maniktala factory has been taken up in hand to meet the increased demand.

Your Company was pioneer in starting manufacture of ether in this country. The abnormal price of denatured spirit in West Bengal and scanty supply of the same by the West Bengal distilleries has practically put a halt to the manufacture of ether.

I reported to you last year that reduction of import licence of tallow had adversely affected our production of soap so much so that we could not meet our contractual obligations within the country, not to speak of any exports. Restrictions on the import of tallow and essential oils and levy of excise duties etc. have greatly affected our production of soap.

I am glad to report that the preliminaries with regard to formation of Durgapur Chemicals Ltd. are almost complete and new Company will soon be incorporated with your Company as one of the promoters. From a review of the Company's affairs during 1962-63 you will find that despite various handicaps we had to face in the course of the business your Company's trading results have been better.

N.B.: This does not purport to be the actual proceedings of the Annual General Meeting.

An empty desk— yet District Sales Representative Konery is on the job!

Take one part efficiency, two parts drive, a good dollop of common sense. Mix with a base of sincerity. Season with an infectious smile. Top off with travel. For good measure, add a desk (rarely occupied) and you have W.B. Konery, Burmah-Shell District Sales Representative at Hubli.

A COMBINATION OF TALENTS

Konery is 47 years old and has spent 19 of them with Burmah-Shell. He's invariably on the move. His sales area comprises hundreds of square miles and he knows all of it well. His duties may be summed up in a sentence: Konery must meet the diverse needs of his many customers. His job demands that he keep a cool head in a crisis and he always does. When dealing with Agents, Dealers and customers, Konery combines the talents of Counsellor, Adviser and Constructive

Listener. Above all, he is regarded as a man who keeps his word. Konery has made scores of friends in his job. To them, he is Burmah-Shell.

TODAY, AS EVER, PEOPLE LIKE KONERY ARE WORKING FOR YOU

Konery is a fine example of a man at peace with himself. Married, with three children—two boys and a girl—he admits wryly to a partiality for his 12 year old daughter. 'She commands,' he says, eyes twinkling, 'and I obey.' He plans a future for her in medicine. Konery and people like him—at all levels of responsibility—are Burmah-Shell. Today, as ever, they are hard at work...working to ensure that vital petroleum products, essential to India's growth and progress, are brought to you at the right place and time, in the right quantities.

BURMAH-SHELL are People in the service of the People

BOOKS BRIEFLY

When Governments Spend

Control of Public Expenditure in India: By A. Premchand; Published by Allied Publishers; Pp. 480; Price Rs. 25.

IT WAS in the year 1859 that the British Government, after taking over the administration from the East India Company, created the Finance Department — a replica of the financial bureaucracy of Britain. The Crown had inherited an utterly disjointed financial structure. The Company lords had devised an immensely centralised control over the Exchequer in order to suit their purely commercial ends. The Secretary of State deputed Sir James Wilson, a financial expert of front rank, to take charge of the Indian fiscal scene. This is where Mr. Premchand begins his description and discussion of the evolution of the modern fiscal control of public expenditure in this country.

The author has divided the study into three parts. The first part focuses attention on the formidably vast machinery of fiscal administration and is intended to familiarise the reader with its structure and functions. Some of the topics examined at length here are: growth of financial administration, techniques of controlling expenditures, delegation of financial authority, the process of rendering advisory assistance to various Ministries, planning and controlling of developmental programmes, fiscal autonomy of States, and financial assistance by the Centre to government and private institutions. The treatment is interesting and adequate. The transition in the post-Mutiny period, the delegation of expenditure control to concerned administrative Ministries (a major departure from the traditional system), the availability of qualified fiscal advice from the Finance Ministry to its sister Ministries, are some of the mysteries of governmental high finance which have been lucidly narrated. The author's approach to the subject in this section is historical, his method deductive. He invariably begins his chapters with a recapitulation of the early history of the various movements, then goes

on to narrate at length the contributions of the developmental phases and winds up with a fairly exhaustive record of the currently prevalent practices. The division of chapters into four broad historical phases to facilitate a rational approach is at times conspicuously and at times implicitly evident. These phases are: (i) post-Mutiny to 1919, (ii) 1919 to 1935, (iii) 1935 to 1947, and (iv) post-independence period.

The second and the third parts of the book are devoted to a descriptive examination of the checks exercised by Audit and Parliament respectively on governmental expenditure. The author traces the origin of the present-day institution of the Comptroller and Auditor General back to the year 1857 when Lord Canning brought the accounting offices of the Presidencies of Bombay, Madras and Bengal under the control of one Accountant-General. After this historical prologue he takes up the study of the different aspects of audit control, viz., the statutory implications, duties and powers of C & A.G., audit of Expenditure and Receipt, audit reports, relations between Audit and Administration, Audit's control over the Exchequer etc. etc.

In the last part, the author has undertaken the appraisal of parliamentary control over public expenditure. He has subdivided this part too into three sections — (a) history of parliamentary control: here he compares the Indian system with its counterpart in the U.K., and describes briefly the developments in the various transitional phases; (b) techniques of control and financial procedures adopted in Parliament: this sub-section speaks of Parliament's varied procedural activities in fiscal matters; (c) problems in parliamentary control: the various hurdles which come in the way of an efficacious control by Parliament have been examined here. Although the Cabinet is answerable to the House for its fiscal activities, the impact of Parliament on the Cabinet is virtually negligible.

Readers' Roundtable

CAN CONTROLS GO?

Sir,—The Union Minister for Steel and Heavy Industries has urged "the altering of our framework of detailed controls". Controls in our economy are an outcome of planning. The purpose of planning is to mobilise the scarce resources of the country (and whatever is available by way of foreign aid) to bring about rapid economic development. However, the type of planning adopted in India has led to multiplicity and complexity of controls as a result of which instead of aiding economic growth today they are effectively frustrating that objective.

The laudable objective of the Union Minister will run into trouble from four sources: If bulk of controls are eliminated, (1) the Planning Commission will have to give up the Soviet model of comprehensive, centralised planning and the enormous power and patronage which go with it. This is unlikely. (2) The bureaucracy will lose its sense of power without accountability and source of easy money which administration of controls provides. For instance, it is reported

that the scheme for decontrol of steel has already run into heavy weather in the vast expanse of the Iron & Steel Controller's office. (3) For the corrupt in business and industry, controls make possible accumulation of unrecorded and easy money without being put to the necessity of exerting to produce efficiently and economically goods and services desired by the people in a free, competitive market. (4) And, finally, professional politicians, to whom politics is an uncontrolled industry, have a strong vested interest in controls. It gives them scope for making money by influencing the Executive and the administration on behalf of their "clients". The Union Minister for Health, for instance, had pointed out in Parliament that some MPs were interfering with the administration to get licences for unqualified drug manufacturers.

If opposition from these four categories of vested interests can be overcome, and majority of controls can be swept aside, our economy has a better chance of picking up and making rapid strides. An effort is worth it.

"ARISTIDES"

RECORDS AND STATISTICS

Trade Credits

A STUDY of the significance of trade credits in the finances of Indian companies has been published in the July 1963 issue of the Reserve Bank of India Bulletin. "Trade Credit" has been defined as the grant of "permission to purchasers for delay in payment for the goods they have bought". The granting of trade credits is a normal feature of business transactions and such credits are largely received and given by manufacturing and distributing companies. The volume of trade credits depends on a variety of factors such as the size and growth of business, volume of sales, stocks and stores, financial resources, etc. and in times of credit stringency they tend to take the place of bank credit.

The analysis presented in the study is based on the finances of 1001 medium and large public limited companies, 333 private limited companies and 1,017 small public limited companies and they represent 78 per cent, 30 per cent and 40 per cent of all the companies in the corresponding sectors in terms of paid-up capital. Trade credits given and received (industry-wise) for the years 1959 and 1960 are summarised in Table I. It will be seen that all the companies are uniformly net receivers of trade credits, the largest net receivers being iron and steel, sugar, cotton textiles, transport equipment and machinery other than electrical and transport equipment. A notable exception to this trend is provided by electrical machinery for which credits exceeded trade dues in 1960.

The significance of trade credits in relation to paid-up capital is shown in Table II. It will be seen that on an average, companies with paid-up capital exceeding Rs. 1 crore are the largest net receivers of trade credit followed by those between Rs. 50 lakhs and Rs. 1 crore. In the case of

these companies the trade dues also exceeded bank borrowings.

The inter-relationship between bank credits and trade dues is analysed in Table III. It may be observed here that with the increases in value of stocks and stores there is corresponding rise in bank credit and trade dues. In the case of medium and large public limited companies bank borrowings account for 14 per cent of total liabilities in 1960, while trade dues claim about 18 per cent. In the case of small public and private companies trade dues are almost double the level of borrowings from banks.

An industry-wise analysis reveals that trade dues exceeded bank borrowings in the case of tea plantations, coal mining, iron and steel, transport equipment, machinery and tobacco industries and trading companies. The difference between the two sources is largest in the case of iron and steel (Rs. 26.8 crores) followed by "other machinery" (Rs. 15.0 crores) and trading (Rs. 14.3 crores). The two sources are of equal importance in the case of grains and pulses. In the case of sugar, cotton textiles, jute textiles, and edible oils trade dues are lower than bank borrowings. But in the aggregate trade dues exceeded bank borrowings in the case of medium and large public limited companies. Same is the case with small public and private limited companies. The sources and uses of funds of these companies are presented in Table IV. The aggregate of trade dues for the years 1956-60, though lower than bank borrowings, still account for nearly 15 per cent of the total liabilities in the case of medium and large public companies. But in the case of private companies the aggregate trade dues for five years, 1956-60 exceeded bank borrowings, forming nearly a fourth of the total liabilities.

TABLE I

TRADE CREDITS GIVEN AND RECEIVED

Industry	1959			1960		
	Credits Given	Trade Dues (Credits Received)	Excess of Dues Over Credits	Credits Given	Trade Dues (Credits Received)	Excess of Dues Over Credits
Grains and pulses	0.7	1.1	+ 0.4	0.9	1.1	+ 0.2

Company Tax Rates in Selected Countries

WE REPRODUCE below the table on "the latest known rates of the standard or maximum rate of tax charged on the income of companies" in a large number of countries which appeared in May 1963 issue of "Accountancy", London. An

indication is given in the "notes" column when more than one tax is levied, and where 'slab' scales apply a note of the starting rate is given. Local taxes have been ignored except where they form a 'considerable part' of the tax burden.

Country / Rate per cent	Notes
Aden (32.5)	
Afghanistan (10)	5% industrial profits. Plus 12% undistributed profits tax.
Algeria (34).
